The principle that Central assistance for State plans should be marginal in character is no doubt unexceptionable. But as facts pertaining to financial resources stand, a large quantum of Central assistance is unavoidable. The Madras suggestion that financial assistance should be for non-Plan expenditure, thus leaving the States' own resources free for Plan financing really does not solve the problem. Actually, it would deprive the Centre of the one important means of direction and co-ordination of developmental outlay that it now has. But the review and adjustment of Centre-State fiscal relations, now made every five years, should not only be far more frequent but also more extensive, to include plan formulation and implementation. The suggestion of the two previous Finance Commissions for extending the Commission's role and functions either by merging it with those of the Planning Commission or by endowing it with more powers is extremely pertinent now. The Central Government has chosen to ignore the problem — which is certainly no alternative to solving it.

The Ones That Get Away

IT took courage of a type for the Home Minister to talk of his anti-corruption campaign within a fortnight of the no-confidence motion debate in the Lok Sabha. The debate was precipitated by the Government's alleged failure to take suitable action against Bijoyananda Patnaik and Biren Mitra even though an enquiry by the Central Bureau of Investigation had established a *prima facie* case of corruption against them. Those who read records of the debate and reports of the CBI's findings and the views of the Cabinet sub-committee on them, leaked out through the enterprise of an Opposition Member, could not but agree that the substance of the Opposition's charge had been established. Not only did the defence of the Government by the Prime Minister and two Cabinet Ministers fail to carry conviction, but the disparaging remarks of the Education Minister on the CBI's report seemed to indicate that members of the Government are not above running down a Government agency to save the skins of their partymen.

And yet on Sunday last Nanda was seriously telling his listeners on the All-India Radio that "the (anti-corruption) measures adopted and *even more the climate generated* are acting, to an extent, as a deterrent on the activities of the wrong-doers" (emphasis added). True to form, the Home Minister talked of corruption among businessmen and among Government servants, described in details the steps taken to detect corruption among these two categories of persons and gave statistics of the number of businessmen and Government servants sent to jail or fined or dismissed or punished in other ways; but as far as he was concerned corruption among Ministers might never have existed.

Within days of the debate on the 'Orissa affair' the Deputy Home Minister was telling Parliament that the Government had found no substance in allegations of corruption against an ex-Deputy Minister in the Central Government. Just that and no details about who conducted the enquiry and whether those who had levelled the charges had been given any opportunity to present their case.

The pattern will repeat itself and Nanda's "war on corruption" will increasingly become a sad joke unless the Government musters political courage to lay down procedures which will ensure that charges against the men at the very top, the Ministers, will be enquired into with the same objectivity with which the Government claims those against Government servants and members of the public are at present. The Santhanam Committee on Corruption had laid down such a procedure, but Nanda didn't mention it at all in his broadcast though he had much to say about the "speedy action" taken by the Government on the Committee's other recommendations.

Weekly Notes

Dear Money and Export Finance

THE dear money policy, it appears, is beginning to impinge on export finance. Complaints are being voiced by exporters that costs of both pre-shipment and post-shipment credit have gone up. Further, even availability of pre-shipment credit is becoming restricted in view of the reluctance of banks to expand credit if that means paying penal rates to the Reserve Bank.

These points were brought out recently at the seminar on Engineering Goods Exports in Bombay. According to press reports, the Reserve Bank representative at the seminar referred to the rationale behind the current credit policy, *inter alia*, in terms of the scarcity value of capital in the economy. This is true, of course, but how relevant is it to the problem of export credit? Economic and efficient use of money would certainly call for its employment in export finance, given the scarcity value of foreign exchange!

The Chablani Working Group, which was not unaware of the overriding requirements of credit control—if anything, it was much too conscious of it—had pleaded for cheaper post-shipment credit facilities and for the initiation of steps to that end. But instead of accepting these suggestions, the authorities seem to have done the opposite. That they are seized of the problem is evident from the reference by the Governor of the Reserve Bank to it in a speech in Calcutta. His argument was that the monetary measures were designed to combat inflationary pressures and that correction of domestic inflation would help the export effort.

This is unexceptionable in principle, but two questions may be raised: first, how effective have the credit control measures been in correcting the price rise? and, second, even if they are successful, will not the process of correcting inflation take time to make its impact on domestic costs? Meanwhile, export costs keep rising because of inadequate credit and its higher cost. The problem of insulating export credit rates from domestic rates—incidentally, the U K is faced with a similar problem—does not brook any further delay.

Oily Fertilisers

THE much publicised Bechtel fertiliser deal was known, for quite some time, to have run into difficulties. Initiated partly as a substitute for an American Bokaro, partly as a demonstration of American interest in a basic industry, and partly as a massive diversification by established petroleum suppliers, it never really had much of a chance. What chances Bechtel had were not exactly improved by the kind of feasibility report which its high-power team submitted. Technical expertise in this country is limited and what is available of it is not fully utilised in New Delhi; but it did not need much expertise to uncover the intrinsic worth of the report.

True, the fertiliser industry is going through rapid technological changes, due mainly to the increasing use of naphtha in place of coal. Both Fertiliser Corporation and FACT have relatively little experience of naphtha-based designing and production but that experience and the pool of talent which they have built up is not so nominal as to be ignored. The chief attraction of the Bechtel proposal was its package supply of foreign exchange for all the five plants mooted. The terms of the deal, it now appears, are both stiff and restrictive; the idea obviously is to prevent Government from turning the screw after the deal is struck.

Bechtel wants at least 50 per cent equity participation and management control for a number of years. It estimated the total cost of five plants at Rs 200 crores, reduced it under pressure to Rs 175 crores, of which the foreign exchange component would be Rs 87 crores, which is on the high side even for almost exclusive American procurement. Bechtel undertakes to raise the entire foreign exchange provided it is guaranteed a recovery of the total investment within five years of commissioning of plant. For this purpose, it would, among other things, require the Government to maintain fertiliser prices at a sufficiently high level. Besides, and this is crucial, Bechtel demands that it must have the right to import one-half of the project's crude oil requirements and its oil associates, mainly ESSO, should have counterpart participation in new refineries. It is already upset over the loss of the Madras refinery to the Iranian—independent American consortium but would be mollified with a stake in Haldia. In short, Bechtel wants the door opened really wide, much wider than the Government apparently intended to or the foreign exchange position allows or will be justified in view of available domestic talent and competitive independent offers.

Some valuable time has already been lost. Nangal expansion has been awaiting a decision on Bechtel while FACT is confident of putting up at least one 2-lakh tonne plant, if not two. Imperial Chemicals and Gulf Oil of Texas are also in the field. The main raw material, naphtha, is surplus. Foreign exchange for the equipment is the chief hurdle, and the U S might tighten up on assistance to fertiliser plants when the Bechtel deal finally peters out. All said and done, nevertheless, crude oil and refineries can hardly be smuggled in under cover of fertilisers.

Tinkering with the Superstructure

THE Indian genius, it has often been remarked not unjustly, naturally inclines to sophistication and theoretical nicety. Reading the latest Annual Report of the Ministry of Education, one is truly impressed with the schemes of educational reform that cover its pages. Institutes of Education have been set up in the States to improve the quality of primary and middle school education with a new Department of Teachers' Education to

supervise their work. There are Sahitya Rachanalayas for training authors and publishers in the production of better books for children. There is an Education Evaluation Unit at the Centre which has persuaded the States to open similar units. Correspondence courses will soon be started for untrained secondary school teachers, while the possibility of introducing a scheme of productive labour by students in colleges and schools is being investigated by a committee. The multipurpose schools are to be "strengthened" and Central Schools have been opened which are to emerge as high quality schools. There is a "Crash Programme" for improving science teaching in the schools. In addition, there are, of course, the more well-known 'projects' like the National Discipline Scheme, the Physical Education Scheme, etc.

But the biggest of all is the National Council of Educational Research and Training set up in 1961 and now in its fourth year. The NCER undertakes training, research and extension through the National Institute of Education and the four Regional Colleges of Education established at Ajmer, Mysore, Bhopal and Bhubaneshwar. The National Institute of Education itself can boast of no less than eight separate wings dealing with psychological foundation; curriculum; methods and text books; science education; basic education; audio-visual education; fundamental education; and educational administration. It also has under it the Central Institute of Education.

Now we can really sit back and view this grand array with satisfaction. Does it matter if few of the basic issues in education have been settled? if we have no national policy, no well defined objectives or a basic philosophy of education? if the States can go ahead with chaotic schemes without agreement even about the number of years of schooling? if the question of the medium of instruction is still undecided? or if the impact of all these years of educational planning on our rural economy remains indeterminate?

All these can wait, apparently. In the meanwhile, the National Institute of Education will undertake research on "motivation for higher education", "development norms", "problems of adolescence", among other subjects, and no doubt publish very learned reports. But without having decided on the general pattern of and priorities in education at all levels, is this not tinkering with the superstructure?

The two crying needs of our schools are better teachers and facilities and better books. What one would like to know a little more about from the Education Ministry is what is being done to meet them and with what success precisely.

Raw Rubber Shortage

IT is not easy to understand official policy in regard to import of raw rubber unless attention is paid to the interest groups which actively try to influence it. Imports of natural rubber amounted to about 26,000 tonnes in 1963-64. In 1964-65 they were slashed to 13,000 tonnes. But in 1965-66, it is reported, the Government has decided to restore the cut and allow imports of about 25,000 tonnes. The major interests which are affected by imports of raw rubber are the Rubber Board, representing the rubber plantations, the manufacturers of rubber products and the sole manufacturer of synthetic rubber, the company called Synthetics and Chemicals.

Manufacturers of rubber products are naturally keen to secure the maximum imports so that they can be assured of enough raw material. The opposition of Synthetics and Chemicals to imports is also not difficult to understand. As against its installed capacity of 30,000 tonnes, the company's production in 1963 was less than 9,000 tonnes. Production increased last year but was still no higher than 50 per cent of capacity. And even with such below-capacity production the company has had to carry embarrassingly large stock. Rubber manufacturers fight shy of the company's products because, first, its prices are higher than those of natural rubber and, second, adjustments and alterations have often to be made in plant and equipment to use synthetic rubber in place of natural rubber.

It is the attitude of the Rubber Board, however, which has been difficult to understand. The Board has looked upon both imports of raw rubber as well as any increase in synthetic rubber production as in some way threatening the rubber plantations. At one of its meetings last year the Board passed a resolution calling on the Government to stop the present system of granting licences for import of raw rubber direct to manufacturers and instead to channel all imports through the Board which would allocate supplies to consumers and also suggest to the Government the quantum of imports necessary. At the same meeting, the Board also passed another resolution opposing the issue of licences for new synthetic rubber plants or for expansion of the existing plant on the ground that production of natural rubber would be adversely affected and the Board's efforts to develop the plantation industry would be "defeated".

To anyone who knows the facts about the supply of and demand for raw rubber the Rubber Board's fears will appear rather comical. From as far back as 1961 at least Indian natural rubber has never been able to meet the country's demand and the gap between supply and demand has steadily widened, necessitating ever-larger imports. The dependence on imports is likely to grow further in future. By the end of the Fourth Plan, according to official estimates, demand for rubber will be about 2.25 lakh tonnes whereas production of natural rubber is unlikely to exceed 72,000 tonnes. Unless production of synthetic rubber is stepped up, the balance will have to be met through imports.

Unfortunately, the performance of the country's sole synthetic rubber producer has been hardly satisfactory so far. Even in the best year, the company has had to operate at half-capacity — and that with the assistance of the Government's policy of allotting specified quantities of synthetic rubber to the various manufacturers and of linking offtake of synthetic rubber by them with the processing of their import applications for raw materials and spare parts. These props will obviously have to be continued until steps have been taken to bring down the high costs of production.

It is known that the Government has completed preliminary assessment of the prospects of setting up a second synthetic rubber plant. Final decision on the project is expected to be taken after the details of the petro-chemical complex are finalised. In view of the difficulties of Synthetics and Chemicals, much interest will naturally centre on the estimates of costs of production of the second plant.

Murky Light on Defence

THE five-year plan for defence drawn up in 1963 will cost Rs 5,000 crores, including normal maintenance. It aims mainly at an army strength of 825,000 and 45 air force squadrons. The Defence Ministry's annual report for 1964-65 gives, for the first time, some outlines of the plan, and the programme of improved training and production of standard armaments. Non-technical ranks in the Army have reached full strength; recruitment to the technical branches is slow but should pick up as 'captive' graduates complete their studies. The air force remains short of both equipment and training facilities, operational squadrons continue to be burdened with training flights and there is a considerable backlog of repairs. Measures are in hand to make the army younger and to democratise the officer-corps; the period of active service for Jawans has been cut down and the quota for grant of officers' commissions to JCO's, NCO's, etc, has been raised from 24 to 42 per cent. Shortage of trained airmen has, at the same time, required extension of active service in the air force.

The report lists not with a little pride the new collaborations signed and new weapons and production processes developed indigenously or by modification of foreign designs. There is no mention, however, of the extent to which the infantry has been equipped with the Ishapore semi-automatic rifle and improved sub-machine guns and mortars, nor does one get any idea of the progress in the manufacture and supply of new mountain artillery. There are references to standardisation of arms, ammunition and transport vehicles, and the disposal of old trucks but one looks in vain for the significance, in both quantity and quality, of all these in relation to the requirements of the armed forces. True, ordnance factories and available foreign exchange are strained to the maximum but how much has this maximum strain succeeded in improving army (leave aside the air force) fire-power and mobility? The 825,000-strong army, by itself, is no more than a plan target, the fulfilment of which makes one wonder about the content of the target.

One presumes that, as in civilian matters, the defence programme has had the benefit of foreign collaboration and approval. The U S Military Supply Mission must have cleared it and might probably have applied the McNamara test of getting the maximum benefit for each dollar spent. The major part of the expenditure is, however, in rupees and no material has been provided to the Indian public to enable assessment of the effectiveness of the money spent.

The report opens with the statement that defence policy is part of a country's foreign policy. It also says that there is no precedent for the kind of war that India has to be prepared for on the northern border: no major wars have ever been fought in such terrain. India is, therefore, largely on its own in devising suitable equipment, training and organisation for a Himalayan war. On equipment and training, there is some information; about the organisation of battle formations, there is precious little. We have heard a lot about new mountain divisions but the division by itself is hardly a suitable formation for Himalayan fighting; it is too large, cumbersome and based upon compartmental grouping of various arms, each of which owes its 'loyalty' to the regiment (which is a purely administrative or historical unit) rather than the formation of which it is a part.

Vital gaps in information such as on this point underline once again the fact that if the Government's intention is to promote intelligent appreciation of the country's defence preparations, routine ministry and audit reports are not enough.

LETTERS TO EDITOR

Voluntary Ceiling on Profits

I HAVE read with interest your remarks on the Prime Minister's plea to business men for a voluntary restraint on profits ("Voluntary Ceiling on Profits', March 20). It was gratifying to find some publication challenging this position; but I feel that there is more to the story than you indicated. In my contact with many Indian intellectuals and in my reading of the remarks of Indian politicians, I get the distinct impression that there is some feeling that profit is synonymous with ill-gotten gain and is immoral. There appears to be little understanding of the concept of profit as a return to capital investment and as a reward for risk-bearing. It therefore follows that there is lacking an understanding of the very essence of economic development and growth. Without healthy profits there would be little or no surplus for reinvestment and growth; there would be less government revenue for public investment; and there would be economic stagnation.

It has constantly been a puzzle to me how on the one hand the private sector in India can be exhorted by government officials to fulfill its portion of the plan and on the other hand can be exhorted to aim for low profits which will be taxed at the world's highest corporate rates. Inasmuch as corporate saving plus corporate taxes represent one of the most significant portions of the aggregate resources for development purposes, one could logically expect government leadership to plead with business to operate as efficiently as possible, to take advantage of competitive opportunities, to produce the best quality goods in order to compete in world and domestic markets, and to make the best return possible on capital invested — in other words to help make the land flow with milk and honey.

Surely, if some enterprises develop undue market power, it is the role of government to encourage or even to provide in one form or another adequate competition. But business is a game in which there must be some evidence of winning as reflected in the income statement. An economy with perfect competition would not be a dynamic, growing one. Until it is generally understood and accepted that an investible surplus is the essence of growth, and the greater this surplus, other things being equal, the greater the growth, there will remain resentment of profit and success. Under these conditions, needless to say, growth will not be maximized.

Credit Expansion

I WOULD like to make a few comments on your editorial "More on Viability" in the issue of February 27, 1965. You have noted correctly that though the expansion in bank credit during the current busy season has been at a slower rate than that during the last busy season, the rate was larger than that of the 1962-63 busy season. Taking the monthly averages of the weekly data, during the current busy season from October 1964 to February 1965, the volume of bank credit expanded by Rs 229.60 crores as against Rs 294.58 crores and Rs 125.39 crores during the same period of 1963-64 and 1962-63 respectively. In fact, the rate of expansion during the first four months of the present busy season has been much higher than that in any other busy season during the last seven years with the exception of the 1963-64 season, which, as you had noted, had been exceptional by all accounts.

If we exclude the last busy season, the average rate of expansion in bank credit has been 10.7 per cent per year during the busy seasons of 1958-59 to 1962-63, while during the present busy season, bank credit has expanded by 13.4 per cent. The average rate of expansion in bank credit during the six months of the busy seasons of the previous eight years (1956-57 to 1963-64) was Rs 198.98 crores, and this rate has already been exceeded during the present busy season, with only four months gone. Inspite of the abnormal increase in the volume of bank credit during the busy season of 1963-64, the average volume of bank credit (annual average of Friday figures) amounted to Rs 1568.10 crores, registering a rise by 9.5 per cent over the figure of 1962-63. But during the 11 months of the present financial year, the average volume of bank credit has already risen to Rs 1793.07 crores, which means an increase by 14.5 per cent over 1963-64.

Between April 1964 to February 1965 (monthly averages of weekly data) the economy has, it seems, absorbed Rs 98.96 crores of additional bank credit as against Rs 49.19 crores during the same period of 1961-62, a year, when prices were reasonably stable, and the rate of expansion in industrial production (7.3 per cent) was not very unsatisfactory, considering more recent performances. The average rate of expansion of bank credit during the 11 months (May to February) had been Rs 62.1 crores during the last seven years (1957-58 to 1963-64). It is, therefore, extremely doubtful whether the rate of expansion in bank credit that has already taken place during the first four months of the present busy season can be explained away satisfactorily on the basis of either the expansion in industrial production or the rise in agricultural output, neither of which has been much larger than the average rates achieved during the last six or seven years. If, inspite of this rate of expansion, you think that "credit demand in certain very important sectors is yet to pick up", it furnishes more reasons for a careful scrutiny of the present banking situation.

This does not, of course, mean that the measures taken by the authorities to deal with this abnormal expansion in bank credit are appropriate or adequate.

CAPITAL VIEW

A Pattern in the Double-Talk

Romesh Thapar

SOME of us who have been pointing to the sad state of economic, political and administrative affairs in the country today, and who have been placing the blame on the heads of the men who hold the reins of power, might well have to revise our notions about what goes on. A series of events have taken place which suggest that the thesis about 'the prisoners of indecision', popularised by Vijayalakshmi Pandit, could well be wide off the mark. A sinister pattern of commitments seems to be emerging from the confusion, the drift, the temporising and the indecision.

This fact in the make-up of the Lal Bahadur Government has been sharply highlighted during recent weeks. The budget was the curtain-raiser. Despite Krishnamachari's introductory protestations about loyalty to the principles and perspectives of Congress policy, the fiscal measures announced by him did not in any way suggest a movement in the socialist direction or towards any programme designed to maximise the internal mobilisation of resources and to minimise our reliance on foreign props. On the contrary, in the course of explanations and elaborations, it has become even more certain that the Finance Minister is being permitted to clear the way for an essentially capitalist development of the country in close collaboration with foreign entrepreneurship.

None of the interested lobbies in the Capital hides this new orientation in G O I policy. But the men who control the ruling party, and who had given the Finance Minister the opportunity to take the first steps, are now busy covering his tracks. First, Prime Minister Lal Bahadur involved himself in a strange seminar organised by Jaya Prakash Narayan to tutor industrialists and businessmen on their social responsibilities. The tycoons, to stress their new-found independence, did not show up at the seminar; they sent their representatives and thereby defeated the attempt to commit them to inhibiting 'trusteeship' talk. Aware that TTK's pragmatism might spark controversy within the amorphous Congress, Lal Bahadur then proceeded to tongue-lash the tycoons at a meeting of the Federation of Indian Chambers of Commerce and Industry—FICCI for short, or variously referred to by the untutored in the Capital as 'ficci', 'fichi' and even 'fixci'!

Socialism's New Advocates

The performance of the Prime Minister at FICCI was seized upon by socialistic policy-makers as evidence that Lal Bahadur had 'firmed up' and would curb the free enterprise appetite of his moody and mercurial Finance Minister. But a large section of the political cadres of the party, compelled to face increasing public criticism, were not satisfied that the principles and perspectives forged by Jawaharlal Nehru were being defended. At this point, a surprisingly vocal Kamaraj has entered the national arena as the protagonist of a socialist society. Each day brings us a Kamarajian intervention which, if taken seriously, constitutes an implied attack on the policies being sponsored by the Lal Bahadur Government.

Naturally, the agit-prop needs of the party come first. But this does not mean that the wise men of the Congress lose sight of their own factional battles. For example, it is not without significance that over the last few days the almost forgotten demand for a radical land reform policy has suddenly discovered a most extraordinary supporter—Atulya Ghosh! This experienced political manipulator has been quick to grasp the implications of Kamaraj's radical talk for the crucial presidential contest in the party to be held later on in the year, a contest which will in turn influence the election of Congress candidates for the General Elections in 1966-67.

That all this talk of socialism and independence is so much hot air is clear from the tame pronouncements which emanate from the Ministry of External Affairs—so tame that U S citizens in the Capital are more incensed about the escalation of the dirty war in Vietnam than the spokesman of the GOI. Foreign Minister Swaran Singh has been carefully briefed that 'beggars can't be choosers'. This favourite slogan of the Finance Ministry is echoed by the Defence Minister, too, in Parliament during the debate on defence. The absence of a foreign policy, it is firmly believed, is in the interest of India. Hence the lack of concern when those who think otherwise launch the attack on apathy, incompetence and incoherence.

This 'style' explains the inexplicable procedures adopted in issuing passports to Abdullah and Afzal Beg as well as the facts that a small fortune in foreign exchange (Rs 35,000) was handed over by a surprisingly generous Reserve Bank to men interested only in smearing the GOI abroad and that the Home Ministry pretended not to know what the Prime Minister's office was doing and the Prime Minister's office pretended not to know what the Ministry of External Affairs was up to. This 'style' also explains why it took Lal Bahadur so long to deny the aircraft-carrier story and why he is still silent on the charge, widely publicised in the West, that an official Indian request was made for a number of U S-manned bomber squadrons after the fall of Sela in November, 1962; all manner of rumours are permitted, even sponsored, in order to fuddle clear thinking on the international issues now crystallising.

False Statements

Every now and then, a patently false statement is made, irrespective of its impact on our friends, because we wish to create more confusion over our commitments. For example, Swaran Singh informs Parliament that there is no need for India to take the initiative to call a meeting of the non-aligned nations to consider the grave Vietnam situation because these nations have already issued a joint appeal. It is implied, quite skilfully, that such an initiative by India would be misunderstood. The truth is that Swaran Singh knows that the non-aligned powers would like him to take steps to call a conference of foreign ministers which would prepare for a meeting of Heads of State. Indeed, only a novice could fail to react to the quiet suggestions along these lines made during the last week. But there are advantages in playing the innocent.

This doublt-talk is sinister because it is becoming a style, a norm. Whether it is the destruction of the Dasturco consultancy, ascribed to a Soviet refusal to accept Indian supervision when the real purpose is to highlight the precedent so established with a socialist country and so open the way for Anglo-American consortiums, or the easier facilities offered to private foreign capital, a measure now attempted to be justified on the plea that earlier collaborations dominated by established Indian firms resulted in the growth of monopoly and concentration, the over-riding consideration is to somehow blunt the criticism of those who see the retreat from established policies and principles behind the double-talk. If a revolt mounts within the Cabinet on the scandalous treatment given to Dasturco or opposition builds to the suspect project report on fertiliser production by a U S Corporation, various stratagems are ordered to achieve the same objectives by other devious means.

Dasturco Story

The Dasturco story is most pertinent. A decision by the Cabinet recently forced a review of the Steel Ministry's handling of this aspect of the Bokaro negotiations. It was not stated publicly that the USSR had disassociated itself from the canard spread by the Steel Ministry and the Finance Ministry that Dasturco's services were not required by the collaborators and that the collaborators did not want to work with a private firm. A bureaucrat was asked to examine how Dasturco could be turned into a public sector concern. This supposedly Socialist thrust *(sic)* publicised because it will silence the critics even as the destruction of Dasturco proceeds on a more sophisticated level. A slow enquiry, long-drawn out negotiations, and the GOI's refusal to pay the lakhs of rupees already owing to the consultancy, is expected to exhaust Dasturco to such an extent that it will be compelled to wind up its operations.

Call it what you will, but there is certainly method in all this apparent confusion. The bureaucracy knows that the apparent confusion provides it with the opportunity to gather unto itself more power, more patronage, and more of that influence which results from the appearance of indispensability. Apart from the fact that members of the ICS (including the super-annuated) now monopolise every senior job that falls vacant, including the positions of technocrats in the Planning Commission, other bureaucrats over the past few days have assumed the right to judge which scientific projects will be taken up in our major laboratories (the Finance Minister even refused to permit the Director-General of the Council of Scientific and Industrial Research to be present at the meetings!) and strictly anonymous deputy secretaries are permitted to meddle and juggle with taxes on press advertisements, to kill the small enterprise in the interests of the big, without reference to professional bodies or the Cabinet. This is only the beginning of the *Shastri yug!*

The independent, enlightened bureaucrat, the technician-administrator who still works to implement policies which will make India self-reliant, the policy planner who sets his sights on perspectives which will lift this country from its wretched physical and spiritual poverty, the scientist, the intellectual, the thinker, the writer, the teacher who searches for movements which will carry forward the many unfinished tasks of the Nehru Era are considered inflexible, prejudiced and dogmatic. There is a premium on political-economic conformity, on the ability to twist and turn within the vague boundaries of a meandering policy, and on being a loyal flunkey. But this need not be—that is, if the organs of public opinion start to assert themselves.

The Only Safeguard

The degree of double-talk in ministerial and bureaucratic quarters reflects as always the strength of public opinion which cannot be openly flouted. It is this public opinion which has to be more solidly mobilised within Government and outside. It is a job which was neglected during the stewardship of Jawaharlal Nehru because generally speaking the people and the political parties placed their trust in him. Now, it is being widely realised that it is no longer possible to function as in the past—or the gains of these years of freedom will be sacrificed.

Firm sanctions have to be created for the policies and programmes which will ensure the independent, sovereign future of this State, for without them we would be surrendering curselves to the pragmatic calculations of an opportunist ruling elite. The absence of such initiatives has entrenched the Government of Lal Bahadur even as there is a sharp slump in his political relevance. An odd fact, but a fact nevertheless.

FROM THE LONDON END

Pound under Pressure Again

THE battle to defend the pound which has been quiescent for some weeks has begun again. Everybody is waiting to see what reserves Britain can throw into the line. With devaluation rumours escalating last week, the pound came under severe pressure on the international market. A malicious rumour from Paris hinted at a 10 per cent devaluation. Among London commodity firms, the impression spread that this might become "devaluation week-end", and New York offices were cabled accordingly. The pressure against the pound, particularly in the crucial days before the Budget, has been mounting steadily and sterling weakened last week-end in both spot and forward markets. Indeed, the pound was quoted at $2.78 15/16ths—its lowest point since November 25 and below the recent support point of $2.79. The discount on forward sterling also widened. There is no doubt that the biggest problem is in the forward market.

Forward discounts continue to be wide. Foreign operators were prepared to borrow overnight pounds at no less than 13 per cent per annum in order to renew their open positions rather than buy pounds outright.

Foreign money has not come back to London, and the leads and lags in the pattern of commercial payments which developed last autumn continue. Traders are still tending to buy their foreign exchange earlier than usual, and foreign holders of sterling to hedge their positions by selling short, despite the high level of interest rates which now rules in the international money market. Earlier on in the week, the Bank of England had withdrawn its support for forward sterling that had been given regularly since November. As a result, the discount widened to the point where confidence in the pound was in danger of being further impaired, and support from the Bank of England had to be renewed.

An interesting feature of the present situation is the support tactics of the Bank of England have come under criticism. The Bank, of course, never discloses the latest facts and so no one is in a position to know whether, in fact, it is actually managing the currency efficiently. The Bank's tactics are organised to prevent speculators against the pound, ever-knowing that it may be losing in the battle. A revival of uneasiness regarding the ability of the U K authorities to go on maintaining the $2.80 parity was one of the prime causes of the pressure on sterling. The Bank of England has now to decide how to handle the foreign exchange market in the difficult weeks that lie ahead.

There had been general hope that recovery would take place in the spring when payments returned to normal and exports were at their seasonal peak. This, alas, has not happened so far. All the hopes held out at the end of January that the improvement of sterling and the renewed growth in exports would allow a reduction of the Bank Rate well before the Budget have gone.

It is understood that the Chancellor of the Exchequer is expecting the strain on the pound to continue between now and Budget day—April 6. However, Cabinet Ministers seem confident that there are ample resources to withstand the attack, despite the anxieties being expressed in the City.

Devaluation Ruled Out

There is no doubt at all that the present Government has made it quite clear that it has no intention of devaluing the pound. In a speech over the week-end, Harold Wilson said quite categorically that "a vigorous pound" was the overriding priority in every one of his Government's actions. It is unlikely, had there been any chance of devaluation, that the Prime Minister would have linked his Government's prestige so directly with the strength of the pound.

The pressure on the pound has been caused by a combination of technical weakness and an underlying lack of confidence. City bankers attribute the setback simply to a lack of confidence abroad in advance of the Budget. Fresh doubts have arisen as to whether the British Government will be able to hold the present rate of the pound sterling. The recurring attacks on sterling are caused by the crisis of confidence in the long-term future of the pound and the dollar in banking and business quarters on the Continent.

Although the Treasury assurance over the week-end which said, "this is the last of a long series of rumours against the pound and it is just as baseless as the previous rumours have proved", may do something to restore confidence, the market will continue to be in a suspicious mood until the Budget is announced. There is no doubt at all that the Budget will be regarded everywhere as a crucial test of the Government's determination to maintain the present exchange rate. Although foreign observers admit the disadvantages—including the political impracticability of massive deflation—they seem unable to suggest any alternative policy capable of restoring confidence fully.

Indeed, it is the persistent lack of confidence which has seriously weakened the pound. There is a general belief that the Government has not yet brought the demands on Britain's economic resources within the limit that can be supplied. Of the gold reserves of £844 million, some £357 million is on loan from the International Monetary Fund, and well over £200m is outstanding under the $3,000 million credit granted last November from Basle. Many also believe that the Government is not really in command of the situation. There is a general belief that the Cabinet is divided on this crucial point, with the Treasury and the Bank of England in favour of deflation, but the Department of Economic Affairs under the ebullient George Brown in favour of expansion.

Not that people question the desire of the Government to maintain the pound. For a country like Britain, devaluation is not a policy, it is a defeat.

All this pre-Budget activity in the foreign exchange market obviously makes much more complex the planning of the Budget. It is impossible for the present Budget to appear to pass measures which are irrelevant to Britain's balance of payments problems. This is what triggered off the really serious attack on the pound in November, and certainly sterling cannot stand a similar strain.

However, it appears unlikely that the Government will be politically foolish enough to embark on a massive deflationary programme to impress foreigners. Even European bankers and traders realise that a repetition of July 1961 would do nothing to solve Britain's problems. Britain has to repay her short-term debts and then achieve longer term growth that is free from balance of payments troubles. Any Government that accepts stagnation to keep pressure off the pound will be as unpopular abroad as one which can achieve growth only at a cost of periodic payments crises.

Sterling has been affected by the uncertainty about all currencies triggered off by General de Gaulle's call for an end to the gold exchange standard. Many overseas holders of sterling have been switching into gold. The uncertainty about the gold-dollar parity generated by the French demand for restoration of the gold standard has prompted the central banks of other countries besides France to strengthen the gold element in their reserves at the expense of the dollar element. Since the beginning of this year, out of a total outflow of some $900 mn French transactions account for about $400 mn.

President Johnson's steps to secure a rapid reduction in the U S payments deficit involving restrictions on overseas investment and loans, has reversed the flow of short-term capital. Dollars are now scarce and pounds are being sold to obtain them.

Some of the new strains on sterling are partly the result of the recent strengthening of the dollar and the consequent sudden increase in demand for dollars against sterling, but in the long run, since dollars and sterling are so closely linked, the United States, in its own interests, must help to support sterling. It is generally believed that the U S A would not be able to stand up to a sizable British devaluation; any doubt about Britain's ability to support the pound at its present parity would have repercussions on the dollar and would lead to the conversion of official dollar balances into gold. Thus the U S has an even stronger motive to support the pound in its present difficulties.

In these circumstances, it is unlikely that there will be any devaluation of the pound, although the pressure on it will continue till the Budget is presented.

The Disarmament Stalemate

(From a Correspondent)

THERE has been little progress on the disarmament front since 1963 when the "hot line" was installed, the test ban was signed and Russia and America pledged themselves not to put nuclear weapons into orbit. The Eighteen-Nation Disarmament Conference, which had been plodding along unspectacularly since March 1962, was adjourned indefinitely in September 1964. It is good news therefore that the British Foreign Minister, Michael Stewart has got Andrei Gromyko to agree in principle to its reconvening.

Proposals Not New

Evidently, Stewart also pressed Gromyko to suggest a date, but the latter wanted agreement on the agenda first. He has proposed a list of eleven partial disarmament measures for inclusion: a reduction of military budgets; removal of foreign troops from areas where they did not belong; the abolition of foreign bases; an agreement to prevent the spread of nuclear weapons; prohibition of the use of nuclear weapons; establishment of denuclearised (atom-free) zones; destruction and banning of bombing aircraft; prohibition of under-ground nuclear tests; a non-aggression pact between the NATO and Warsaw pact countries; measures for the prevention of surprise attacks; and reduction of military forces.

None of these proposals is new. Most of them have already been the subject of negotiations at Geneva. The reduction of military budgets is not likely in itself to lead to greater international security, though it will accompany measures such as a reduction of military forces, which might. To be really effective as an isolated measure, reductions would have to be drastic, and would require a much greater degree of verification than the Russians, on present indications, are willing to accept.

Removal of foreign troops from areas where they do not belong, and abolition of foreign bases are linked in the sense that the former necessarily includes the latter. Neither measure is likely to be acceptable to the Americans, because each involves an American military withdrawal from Europe, the dismantlement of NATO, and a drastic change in the military balance in Asia. As part of a comprehensive (that is, covering all nations) and general (covering all categories of arms) disarmament programme the withdrawal of troops and bases to home-soil finds a place in the American GCD plan, as it does in the Russian. But as a partial measure, the Americans are bound to reject it.

The prohibition of the use of nuclear weapons, and a non-aggression pact between NATO and the Warsaw pact countries are examples of the sort of paper pledges which have proved useless in the past. They imply a much greater faith in the efficacy of legal or treaty obligations than international realities justify.

Atom-Free Zones

The delineation of atom-free zones has for long been the theme of various proposals covering Latin America, Africa and Central Europe. The Rapacki Plan for disengagement in Central Europe, first propounded by Polish premier Rapacki, proposed the setting up of a neutralised and nuclear-disarmed zone, consisting of Poland, Czechoslovakia and the two Germanies, under joint East-West guarantee. More recently the Poles have canvassed a watered-down version of the Rapacki Plan, the Polk Plan, which envisages the 'freezing' of nuclear weapons in the zone at a fixed level, instead of eliminating them altogether. Britain has responded favourably, if cautiously, and has asked the Poles to tell them more about the arrangements for verification they envisage. The two likely stumbling blocks to the Plan's adoption are West German suspicion of anything that smacks of discrimination against them and Russian opposition to on-site verification in the Warsaw Pact area. In fact, the Polk proposal never reached the green-table at Geneva on account of Russian opposition.

The destruction and banning of bomber aircraft is referred to in disarmament jargon as the "bomber bonfire". It originated as an American proposal at Geneva for a limited bonfire of 480 American B-47s and 480 Russian TU-16s. The Russians counter-proposed the destruction of all bombers in a definite and short period of time. They later reassured the smaller powers that only the major powers would be affected. The Americans replied that a total bonfire would have to be part of a general and comprehensive programme; otherwise, it would upset the military balance. Apart from this, the impracticability of securing the assent of France and others to a destruction of their bomber forces, whether nuclear or conventional, is obvious.

Underground tests escaped the net

of the Moscow test-ban treaty because East and West could not agree on the number of on-site inspections each side would have to submit to, if called upon to do so. The difference finally resolved itself to seven inspections a year as the minimum the West demanded, and three a year as the maximum the Russians would permit, which presumably is where it still stands. Both figures are based on political rather than technical considerations. It was generally agreed that seven inspections would not have enabled the West to detect every single explosion with absolute certainty, nor would three a year have led it into danger. This being so, it was all the more a pity that the West did not feel able to abandon its insistence on seven inspections a year. Russia regards the secrecy of the location of her strategic nuclear forces, especially her missile sites, as a major source of strength; as such she fears inspection as "legalised espionage". In the process she often consciously exaggerates the risks of inspection to obstruct inspection or verification arrangements without which most arms control is useless, but in this case, where there was so much more to gain than to lose, perhaps the West should have bridged the final gap unilaterally. If all progress in arms control must await a change in Russia's attitude to verification, it threatens to be slow indeed, dangerously so.

Spread of Nuclear Weapons

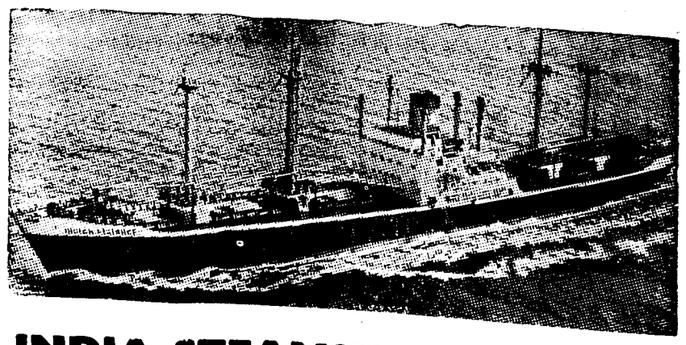
If an underground test ban must be ruled out as impractical at present, so must effective joint measures against surprise attack, which entail even more physical inspection of one another's territory. This leaves us with measures to arrest the spread of nuclear weapons. These include the delineation of atom-free zones and constitute a field in which arms-control measures are relatively promising. First, they involve the forestalling rather than the unravelling of military developments, and secondly, America and Russia share a strong common interest in retaining their present nuclear preponderance, which the rise of China and France as nuclear powers threatens to erode away. Moreover, this is a field in which arms control measures have a very direct bearing on international security, making their adoption all the more urgent. The proliferation of independent nuclear forces, whether by export or independent manufacture, threatens to result in a very unstable world.

Unfortunately for the prospects of advance even in this field, the Soviet Union insists that West German participation in the projected multilateral force is incompatible with any agreement on the dissemination of nuclear weapons. The West argues that on the contrary, shared control of a NATO nuclear force reduces the number of authorities competent to make decisions of war and peace to one. Secondly, it forestalls and precludes an independent West German nuclear force, a prospect which alarms the West as much as the Russians. Perhaps the best hope is for each side to adopt for itself some sort of self-denying ordnance not to introduce nuclear weapons into any more areas or lands than possess them at present.

One is thus forced to conclude that Gromyko's 11-point plan is unlikely to take the world very much nearer disarmament. However, it is believed that the Russians are at present busy working on new disarmament proposals, which may explain why Gromyko did not want to commit himself to a date for re-starting the Geneva conference.

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.



Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Metropolitan City Councils in India

I M Hinduja

One of the serious problems of the big city is the decline in the proportion of the population which participates in the process of governing the city.

This problem has been variously solved in the west. One solution is to have more than one council for a city and another is to have a multi-tier structure which provides, in addition to the major city council, lower tiers of elected councils exercising functions in their respective areas.

In India neither solution has been adopted and as a result the democratic element in the government of the big cities is becoming increasingly notional.

A CITY government is constituted of representative and bureaucratic elements. Both are important from the point of view of efficient governance. An attempt is made here to examine the representative element and matters connected with it in the metropolitan cities of India having municipal corporations as the unit of local government. The representative element in these cities is found in the city council. The degree to which a municipality can be regarded as endowed with democratic local government depends on the composition and functions of the council, and the extent to which the executive organs are subject to popular control either of the council or of the electorate.

There are 23 municipal corporations in India. The composition of the Councils of these 23 Municipal Corporations shows very wide variations. The differences in regard to such matters as the size of councils, qualifications of candidates, the franchise, term of office of councillors, remuneration of councillors, etc, are interesting and significant.

Size of Councils

The size of metropolitan city councils which have the municipal corporation as the unit of local government ranges from 17 in Hubli-Dharwar to 131 in Bombay. Table 1 shows the size of the councils of different corporations. The size of the councils is a matter of great importance. It affects not only the effectiveness of the deliberative body but also the relations between the city council and the citizens. In Bombay, where a councillor represents about 25,000 voters, it must be far more difficult for elected representatives to keep in close touch with their constituents than in Chandorenagar where one councillor represents only 3,500 voters. Yet the Maharashtra Government has decided to reduce the strength of the Bombay municipal corporation from 131 to 120. This is most unfortunate considering the extension of suburbs and the increase in population of Bombay.

One of the serious problems of the great city is the steep reduction in the number of citizens who participate directly in the process of government. Unfortunately in India the size of the council does not vary in proportion to population. This problem has been variously solved in western countries. One method is to have more than one council for a city and another is to have a multi-tier structure, which provides, in addition to the major council, lower tiers of elected councils exercising minor functions in their own divisions. In Moscow one councillor sits on the City Soviet for every 3,000 electors. Thus the size of the Moscow City Soviet is elastic, varying in proportion to the number of electors. The proportion of persons participating in local government is very high in Moscow, for in addition to the 1,392 members of the City Soviet, there are about 1,000 so-called "activists" serving as co-opted members of the Standing Committees. Moscow also has a lower tier of 25 district Soviets, which provide about 3,000 elected district councillors. Thus Moscow seems to have solved the problem of popular participation by having large councils; in doing so it has transformed the City council from a council of city fathers into a mass meeting.

Multi-Tier Structure

The other method by which popular participation is achieved is the establishment of a multi-tier structure. There are 28 such councils in the Administrative County of London and due to this there is one representative for every 2,250 persons. This is definitely a higher rate of people's participation in the local affairs than obtains in our country where even in the case of Chandorenagar which has the largest popular participation, the proportion comes to one councillor for about 3,500 persons. A multi-tier structure possesses definite advantages for our metropolitan cities where population has been increasing rapidly every year due to industrial growth. In the "million cities" like Bombay, Calcutta and Delhi the city councils find great difficulty maintaining close contacts with citizens. The municipal corporation, the councillors, and officials, lack co-ordination and stand apart. In fact, due to expansion of the scope of municipal functions, the bureaucratic element tends to prevail more and more as the size of the city becomes large.

The introduction of a lower-tier of secondary councils is, therefore, an urgent need if we want democracy to work in our metropolitan cities, particularly the "million cities". This involves decentralisation of power in respect of purely local matters to the secondary tiers. These secondary tiers or ward councils will know much more about their own localities than the city councils and so should be able to carry out purely local functions in a more efficient and democratic manner. This will also increase popular participation in local affairs. We have introduced Panchayati Raj in our rural areas and thus decentralised power, but one fails to understand why such decentralisation has not been done in urban areas where the problems are more pressing and complex. Decentralisation is bound to be more successful in urban areas and especially in metropolitan areas because the electorate here is much more literate than in rural areas.

A first step in this direction has been taken by the Madras Municipal Corporation by having circle committees. This, however, falls very much short of a regular multi-tier system, as exists in England. In Madras the City Municipal Act was amended in 1961 to replace the old statutory functional committees with territorial circle committees and a central committee. A circle covers the area of an Assembly constituency and the divisional councillors (a division in Madras is the same as a ward) of the area constitute the circle committee. These changes have been effected from 1962 and results of their working are

yet to be assessed, but considering the vast population and complexity of problems, there is urgent need that our metropolitan councils should be constituted on federal principle so that they will be more efficient in tackling local problems.

Then in certain metropolitan municipal corporations we have aldermen and nominated members. For example, the Calcutta Municipal Corporation has 5 aldermen; Delhi, Agra, Lucknow, Indore, Varanasi and Allahabad have 6 each; and Kanpur 8. No doubt, this practice exists in England and has its advantages as well disadvantages. But it is necessary to ensure that the number of aldermen should be the minimum possible and the purpose should be to accommodate only really deserving persons. Often this power to appoint aldermen is misused by the ruling party.

There are a few Corporations, as can be seen from Table I, where councillors are nominated by the Government. This is another colonial heritage and the sooner we do away with the practice the better it will be for the growth of democratic institutions. In some corporations, e g, Gwalior and Indore, the Government nominates as many as 20 per cent of the total number of councillors. Many corporations also have provision for representation of special interests. If such privileges have to be maintained at all, they should be put on a more rational basis than at present.

In all corporations a person is eligible to contest election for councillorship only if (a) he is a major; (b) pays taxes under the provisions of the Corporation Acts; and (c) occupies any premises for certain specified months during the year preceding the elections.

Franchise Rules

In the case of franchise, there is no uniform practice followed by all the Municipal Corporations in India. For example, in four Municipal Corporations — those of Bombay, Poona, Sholapur and Ahmedabad — a person is eligible to vote if (a) he has attained the age of 21 years; (b) has the requisite residence qualifications; (c) has the taxation qualifications of owning an immovable property under the jurisdiction of the Corporation; and (d) has business qualification consisting of occupation of premises for business. But elections to the Calcutta corporation are not held on the basis of adult franchise. Only those have the right to vote who (a) are liable to pay any tax to the Corporation; (b) have been occupying premises for at least six consecutive months during the year preceding the elections; (c) owns a hut in a *bustee;* and (d) has passed the Matriculation or any equivalent examination of any University in India or holds a diploma of a technical or vocational institution recognised by the State Government.

The educational qualification is a peculiar one considering that even for elections to Parliament and State Legislative Assemblies there are no educational requirements for franchise. If no educational qualification is considered necessary for understanding and dealing with national problems then why should it be considered necessary for understanding and dealing with local problems?

Tenure and Remuneration

The tenure of councillors in the 23 metropolitan cities vary from corporation to corporation. Table 2 shows variations in this respect. For example, in Agra it is 5 years; in Delhi, Ahmedabad, Poona and Sholapur, it is 4 years. Recently the term of the Bombay municipal corporation has been raised to 5 years. But in Madras it is only 3 years. There are those who argue that 3 or 4 years are inadequate to bring to successful completion even a limited number of schemes or efforts

Varanasi	54	6	—	—	60

initiated for certain definite purposes. Hence a longer term of, say, five years is suggested.

The remuneration of councillors of metropolitan cities also varies. There are certain corporations which pay fixed honoraria plus some allowance for attending meetings; there are others which do not pay any honoraria but only allowance for attending meetings. In this matter obviously it is difficult to achieve uniformity since resources of the corporations vary as does the cost of living. But one principle which should guide all the corporations in this respect is that the honoraria and allowances should be sufficient to ensure that councillors do not have to pay too heavy a price for devoting their time and energy to civic affairs.

OFFICIAL PAPER

A Debtor Nation

India's Foreign Liabilities and Assets 1961 — Survey Report; Reserve Bank of India, Bombay, 1964; vii+105, Rs 3.50.

AT the close of 1961, India was a net debtor to the outside world for an amount of Rs 1,800 crores (in round figures), that is, just a fraction over Rs 40 a head of the population. If net short-term liabilities are excluded from this estimate, this latter figure would drop to a little over Rs 30 a head. Even considering the extreme and widespread poverty of the country, by itself this is not an alarming figure. In the context of the economic history of India of the last hundred years also it does not stand out at all disproportionately. Ever since foreign investments began to be made in India in the last century—almost overwhelmingly by the British—we have been a net debtor nation except for a brief period after the last war. As far back as 1887 the following statement appeared in an address which the Bombay Presidency Association presented to Queen Victoria: "India has become the chief customer of British manufacture and it affords a safe investment for the employment of nearly £500 million of British capital in the development of Indian agriculture and trade". Since then various attempts have been made by scholars at different times to estimate the amount and nature of foreign investments in India, in particular long-term investments.

Per Capita Foreign Investment

As some of the basic data were not available for the pre-1939 years, these estimates had often to rest on somewhat imperfect basis. Further, for foreign investments in the ordinary shares of joint stock companies in India the study under review has adopted a basis of valuation which evaluates such investments at a higher figure than in most of the earlier non-official estimates. Making allowance for these facts, the broad conclusion emerges that, quite apart from the changes in the price level since the pre-war years, on a per capita basis total foreign investment in the country at the end of 1961, which year marked the end of the Second Plan, was perhaps just about as large as at the close of inter-war years—even after we had repaid a good part of our sterling public debt in the early 'thirties. This is a sobering thought.

What are, therefore, the developments of major significance in this sphere in the last decade and a half? Of the many very interesting findings of this Survey Report, which is a veritable mine of information on the question of the country's assets and liabilities on short as well as long terms account in mid-1948 and at the close of 1955 and 1961, for reasons of space we can only select a few which are more outstanding than the others. Perhaps the foremost of these findings is the almost sea change that has taken place in the net assets position of the country between 1948 and 1961.

Change in Net Assets Position

For the first time in a hundred years India was a net creditor on official as also non-official account to the tune of Rs 1,504 crores in 1948. In 1961 it was a net debtor for Rs 1,798 crores. During these thirteen crucial years, the net long-term liabilities of India increased by Rs 1,846 crores, and net short-term assets deteriorated by Rs 1,456 crores. In 1948, the official sector had net short-term assets of Rs 1,153 crores—the famed sterling balances of the Second World War—accumulated ruthlessly at heavy cost to the Indian economy not only in terms of the physical shortages due to supplies having had to be made to the Allied Governments but also of the low, controlled prices for such contractual supplies. Thirteen years later the official sector had a net liability of Rs 317 crores—a movement of the order of Rs 1,470 crores net. Add to this, the eighteen hundred odd crores of increased liability on net long-term account, almost three quarters of which was on official account, and we get the total change of Rs 3,302 crores between these two dates, mid-1948 and end-1961. The average annual change is Rs 254 crores over-all, Rs 142 crores on net long-term account, and Rs 112 crores on net short-term account.

Role of Foodgrain Imports

The more substantial portion of these changes took place during the period of the Second Plan. A comparison of the net position of India's assets and liabilities as at the end of 1961 with the position as at the end of 1955 reveals that during these six years there was a net change of Rs 2,324 crores. This is compounded of a deterioration from a net creditor position of Rs 527 crores to that of a net debtor of Rs 1,797 crores. About a third of this change is on short-term account where an increase of liabilities and a decrease of assets had a net effect of Rs 760 crores which was largely on official account. These represented the utilisation of balances accumulated earlier, and a contraction of fresh liabilities—largely for the import of commodities under PL 480 and PL 665. On the long-term account the increase of liabilities of Rs 1,303 crores was a major factor in the turn of the balance by Rs 1,564 crores net. Of this latter amount the official sector accounted for as much as three quarters, representing official borrowings from foreign governments and institutions. The long-term liability of the non-official sector went up by no more

than Rs 305 crores in these six years. As compared with the net total growth of liability of Rs 254 crores a year during 1948-1961, for the six years period 1955-1961, the corresponding total is Rs 387 crores a year. Almost exactly two-thirds of it, namely Rs 260 crores, were on long-term account, and the balance on short-term.

When a substantial part of the total change in liabilities during this six year period is on account of short-term obligations contracted for the import of foodgrains, etc, from USA, obligations which are represented to a large extent in deposit form with the State Bank of India, it is difficult to understand the following statement on page 20 of the Survey Report: "the counterpart of the change from creditor to debtor was, as mentioned earlier, the sizable capital formation in various fields, railways, irrigation and power—which constitute the infra-structure of development—as well as in manufacturing industry".

Foreign Private Investment

It has already been stated that the bulk of the movement of long-term capital to India during last decade has been on Government account. During the thirteen years, 1948-1961, foreign investment in business enterprises in the private sector increased by no more than Rs 416 crores. It is most significant that of the total increase of Rs 416 crores, direct investments, i e, foreign investments involving control of units in which such investments took place, increased by Rs 317 crores (including reinvested earnings). Expressed as a proportion of the total foreign business investments in India, direct investments accounted for 83 per cent of these investments in 1948, improving to 87 per cent in 1955 and falling to 79 per cent in 1961. The fall was largely because of an increase in the flow of creditor capital from official sources during the Second Plan period. Investments in controlled companies, mostly subsidies, have accounted for the bulk of such direct foreign investments.

As much as two-fifths of the gross inflow of foreign investments from private sources is represented by retained profits which perhaps benefit the balance of payment only in a negative manner, i e, by preventing any pressure for remittance of funds. But a substantial part of the benefits accruing from such retained profits of Rs 173 crores was off-set by the repatriation or private capital amounting to Rs 133 crores. It would have been of interest if the Reserve Bank Survey had been able to indicate the likely magnitude of the original value of such repatriated capital.

Over the thirteen years, 1948-1961, the net inflow of foreign investments in business enterprises in the private sector averaged only Rs 28 crores a year. The Survey has recognised this in its statement—"the growth in foreign investments of business enterprises in India over the thirteen and a half years has been modest".

Collaboration with Indian Capital

As in the case of the movements in the over-all balance, the six years 1955-1961 witnessed a somewhat larger trickle of foreign private investments than the earlier period. The average for this period is Rs 39 crores a year. This figure is 40 per cent larger than the average during 1948-1961. But inflows of this order fall short of the level of investments necessary to make any sizeable impact on the economy. After recognising that foreign investments so far have been modest, the Survey Report attempts to point to an extenuating circumstance. It is stated thus on page 18 that collaboration between foreign and Indian industrial entrepreneurship is a notable feature of such investments in business enterprises after 1958. To say this in support of collaboration arrangements in the year 1964 is, to put it mildly, somewhat astounding after all that has been said and written about the manner in which a very large number of such collaboration arrangements have been negotiated at excessive prices. Michael Kidron's article on "Behaviour of Foreign Capital" in July 1964 Special Number of this paper contained a few striking revelations on this subject. A body of informed opinion has been growing up for quite some time now which would want a deeper probe into these arrangements in particular, and foreign equity participation in Indian business in general, in order to protect the broader interests of the country.

There are many other interesting as also significant types of information that the Survey has collected. Thus, the main industries to which foreign capital has been attracted are petroleum, metal and metal products, chemicals, transport equipment and machines, etc, which have high profitability and growth potential, and are vital for the industrialisation of the country. The major traditional industries are dependent on Indian capital and entrepreneurship. Among the countries from which capital for industrial projects has mainly come are still the U K and the U S A which together contribute 57 per cent of the total inflow. It has been a significant finding of the Survey that at least till 1961 the highly industrialised Common Market countries of Europe contributed very little.

Evaluation of Role of Foreign Capital

Foreign capital is needed, fundamentally, as a source of supply of scarce foreign exchange as well as of know-how and technical personnel in the early stages of industrialisation. But it raises at least four major issues: the cost of such capital, both for servicing and repayment; its influence on the international competitive position of the country—whether it is able to develop new export commodities or provide effective substitutes for commodities normally imported; its influence on internal resource mobilisation in general; and the contribution it can make towards advancement of industrial research in general and the building up a growing body of highly qualified technical personnel of national origin. These are not criteria which can, or even should, be applied to every single transaction. They are necessary for an evaluation of the total impact of foreign borrowings over a period of reasonable length for the effects to be noticeable. But even then perhaps much of the foreign capital that has gone into our industries cannot be said to satisfy these criteria.

A major shift in foreign borrowings is perhaps soon to be witnessed. Apart from a more substantial flow in the Fourth Plan period, its terms and the nature of links with domestic capital and entrepreneurship will be different from what it has been so far. It is to be hoped that the lacunae that the developments in this field so far have disclosed will be less in evidence. But that needs, it must be stressed, an alert as also extremely knowledgeable and incorruptible civil service to protect the country's interests by keeping a vigilant eye on the domestic as also foreign entrepreneur.

DRUG PRICES AND PATENTS—I

Drug Prices: Is There a Case for Enquiry?

Arvind Nair

[This article is a rejoinder to our editorial "Drug Prices: Case for Enquiry" in the issue of January 16, 1965. Arvind Nair is Information Officer of the Pharmaceutical and Allied Manufacturers' and Distributors' Association and he presents the drug industry's point of view.

Much of his article is devoted to refuting criticism of the patents system. His arguments on this subject are answered in the article which follows his by S S Sokhey, the wellknown microbiologist, who, as director of the Haffkine Institute, Bombay, for 20 years contributed much to medical and pharmaceutical research in India. Sokhey examines, on the basis of the experience of India as well as other countries and with considerable factual data, the impact of patents on drug prices and on the development of the Indian drug industry.

On the question of an enquiry into drug prices, Arvind Nair says in the last paragraph of his article that such an enquiry, "provided it is impartial and the body conducting it is formed of persons who understand the medical, scientific and business problems of the industry and who will take an independent, objective and long-range view, may do some good in that it will dispel much of the misunderstanding and many of the misconceptions about drug prices". But later on in the same paragraph he opposes an enquiry with the argument that "critics of the industry are sure to make capital out of an enquiry, if one is conducted, as did happen in the case of the Kefauver Inquiry, to tarnish its image and shatter the foreign investors' confidence in the growth potential of the Indian industry". It is not at all clear how an enquiry which will help to remove misunderstanding and popular misconceptions about the drug industry will, at the same time, tarnish its image and undermine the confidence of the foreign investor.

Further, while Arvind Nair begins with the entirely valid statement that to determine whether drug prices are reasonable or not prices must be compared to costs of production, we find not one such comparison in his article. Is it because such comparison will invariably show the industry in unfavourable light? Or, is it that the facts are not available even to one in the confidence of drug firms? In either case, the need for an enquiry of the type we had suggested is emphasised since it will get at the real facts about drug prices and costs.

Finally, since Arvind Nair relies so much on excerpts from reports of the Development Council for Drugs and Pharmaceuticals, it is necessary to state that, though appointed by the Government of India, the Council is in effect a body representing principally the interests of the drug industry. It is definitely not the "impartial" body capable of taking "an independent, objective" view whose impressions can be taken as conclusive evidence for or against an enquiry into drug prices.

—Ed]

THE case for an enquiry into drug prices must surely be based on stronger grounds than those adduced in your editorial. To establish a case for inquiry, it must be shown that drug prices are too high in an absolute or relative sense—high either in relation to the cost of production or high when compared to the prices of other commodities. One looks in vain for a substantiation of this point in your editorial which is fundamental to the case for an inquiry.

The peg on which the case for enquiry is hung seems to be the alleged large differential between the prices charged for librium, a tranquiliser, by the patentee in India and the price at which somebody imported it from Italy. This is cited as evidence of monopolistic exploitation by the patentee. Apart from the question whether isolated fragments can be taken as reflecting the whole picture, there is surely more than meets the eye in the librium case. One wonders how librium could be legally imported into the country from an unauthorised source by a party other than the patentee. But the more important point is that there are no less than 18 different variations of librium, of widely differing qualities, being marketed in Italy and most of them are sold at the same price (some are actually more expensive) as the original product developed by Hoffmann La Roche of U S A. How could Italy export the drug at ridiculously low prices which bear no relation whatsoever to the price charged to the domestic consumer?

Development Council's View

Obviously the assumption is that patents are responsible for drug prices being what they are. This assumption would have some basis in fact had you shown that prices of non-patented drugs are lower as compared with those of patented drugs or that they are on a par with prices of non-patented drugs abroad or that they bear a reasonable relation to them considering the conditions of manufacture in the country. It may be pertinent, in this connection, to quote the Technical Sub-Committee of the Development Council for Drugs and Pharmaceuticals, Government of India, which, after a thorough study of the cost of finished drugs in India, concluded:

> "Despite the fact that the cost of basic drug is usually higher in India than in other developed countries, the cost of finished preparations is, in most cases, much less than the domestic price of similar products in foreign countries. The difference between the consumer prices and the ex-factory cost of the finished preparations is much less in this country than in most of the more developed countries."

Does this mean that drug manufacturers are making excessive profit or that prices are high in relation to cost of production? The following factors responsible for the high cost of production were considered by the Sub-Committee before arriving at the aforesaid conclusion:

(1) Prices of imported raw materials and intermediates are higher in India than in foreign countries due to the heavy incidence of customs duty.

(2) Prices of indigenously available raw materials are 150 to 200 per cent more than the prices prevailing in foreign countries.

(3) The quality of indigenous raw materials is, in many cases, inferior, resulting in higher processing and production cost.

(4) Solvent losses are high due to high temperatures.

(5) Excise duties and the procedures insisted upon by the excise authorities in handling stores, which involve special insurance premium, bank commission, etc, inflate cost by an amount almost equal to the total value of the landed cost of the raw material.

(6) Not only is the cost of imported equipment 35 to 40 per cent higher than in foreign countries, due to all these charges involved, but the cost of indigenously fabricated equipment is even higher in many cases.

(7) The scale of production in Indian factories is much smaller than in Europe or U S with the result that process loss, factory, general and sales overheads, etc, are high.

You point out that, but for patents, we could import drugs from Italy or the East European countries "for a fraction of the prices" we now pay. Apart from the important question whether it is in the larger interest of the country to import drugs from abroad, rather than to manufacture them here, even if the cost of manufacture is high, (and it admittedly is; this is what is being done now at the Government's insistence and rightly), it may be asked whether Italy is in a position to supply our needs. That country is unable to meet its own needs and is itself a large net importer of drugs.

Italian prices are not cheap, as opponents of patents would have us believe. The Kefauver Committee's own price data for a number of major antibiotics, antidiabetic drugs and tranquilisers showed that prices in Italy were significantly higher than those in other European countries with patents. This is clear from the Table.

It is possible that prices of certain drugs are lower in Italy. If that is so, it is not very surprising, because an industry like the Italian pharmaceutical industry which does little or no research and lives by piracy and imitation of the products of other peoples' research efforts, does not have to underwrite the cost of research, which cost the U S pharmaceutical industry alone $300 million last year. Moreover, what is cheap is not always the best, especially in the pharmaceutical field, for quality is the most important ingredient of a drug. One cannot surely equate a generic-named Italian drug, which scarcely identifies its maker, with the product of a world famous patent-holding manufacturer, who stakes his entire reputation and that of the product on the brand name it bears.

Perhaps you are referring to the Kefauver enquiry when you say that investigations in countries like the U S and the U K have established that "prices for drugs manufactured by a patent holding monopoly bears little or no relation to their cost of production". The fact, however, is that the Kefauver investigation signally failed to establish this point which was one of its principal objectives. And, arising from this, its proposal to limit drug patents and to provide for compulsory licensing at fixed maximum royalties, the need for which the inquiry was supposed to have demonstrated, was rejected by the U S Congress and drug patents continue to remain intact in that country. Even Italy, which had so long refused to recognise drug patents, is now reintroducing patents protection for drugs. Japan has unequivocally acknowledged the role patents have played in quickening its industrial development since the second World War.

Patents and Prices

As regards the relation of patents to prices, it may be noted here that, based on a comprehensive analysis of the Kefauver Committee's price data, which attempted to show by invalid comparison of the prices of old, unpatented drugs with the prices of new patented drugs, that patents make for high prices, patent expert George Frost, demonstrated in his evidence before the Committee that "factors other than patents far outweigh whatever influence patents have on prices and that the long run influence of patents on prices is far less than the influence of other facts affecting prices. It follows that there is no demonstration that patents, on the whole, significantly increase prices". (Kefauver Hearings Part 4, pp 2294-2315).

This view has been corroborated by no less a body than the U N Economic and Social Council in its report on the role of patents in the transfer of technology to underdeveloped countries. Here is what is the report, based on a survey of the patent system and its contribution to economic development in 48 countries, has had to say on the relation of patents to prices:

> "The effect of higher prices specifically due to patent protection is almost impossible to disentangle from higher prices due to such factories as exclusive knowhow, trade secrets, restrictive practices or the dominant market position of the supplier, all of which are intrinsically unrelated to the patent system. Since patents are thus only one of the factors which may bring about higher prices, the question arises whether measures directly affecting price levels or general anti-trust legislation are not an economically more effective and administratively more feasible technique of coping with the problem than legislation devoted specifically to the patent system"

None will dispute your contention that only two factors, namely, competition and pressure from Government, could compel price reduction. But the point is whether patents stimulate or discourage competition. That disclosure of invention facilitated by patent stimulates competition by other inventors and companies who naturally desire to go one better and to produce something more effective is not disputed. It is true that a patent insulates the inventors from the hazards of immediate imitation. But it does not protect bim from competition from products and processes either not patented or already patented or which may be discovered and patented in future. This is particularly so in the drugs field where new drugs are continually coming forward. This dynamic character of product competition was demonstrated before the Kefauver Committee by pointing out that in the oral treatment of diabetes there were four different product-leaders in the period 1951-1960.

You refer to the damage done by patents to the development of the

Table: A Comparison of Drug Prices

(Wholesale prices to druggist; in dollars)

Product	Gt Britain	W Germany	France	Italy
Chlorpromazine	0.77	0.97	0.51	1.22
Tolbutamide	1.87	1.85	2.04	2.35
Chloromycetin	2.67	—	—	3.90
Chlortetracycline	4.56	4.31	3.26	5.86
Tetracycline	4.58	4.31	—	5.86

Indian phamaceutical industry but leave one wondering what precisely the damage is. The following quotation from a survey of the development of the drugs and pharmaceutical industry by B Shah, Drugs Development Officer, Government of India, will give an idea of the progress of the industry. After giving figures of the growth of pharmaceutical production since 1948 to 1962, Shah says:

> "The above figures represent only one side of the phenomenal growth of the pharmaceutical industry. Together with these one has also to consider the increased number of products now being manufactured from basic stages. Several in this category include those which were formerly being produced from late intermediates that were imported into India, or merely packaged here from bulk imports. Import of finished products has now stopped with the exception of a very few preparations. New processing units have been established and old ones expanded. Quite a few units designed to undertake the basic manufacture of drugs have also commenced production. Many of these basic manufacturing units are monuments of progress in the field of chemical technology carrying out highly intricate and hazardous chemical reactions with automatic process control.
>
> "Factories established by foreign firms or those working with foreign collaboration have undertaken to manufacture new products according to the latest methods and techniques of production developed abroad after many years of investigation and research. The entry of these firms has conferred advantages on the Indian economy in that the benefits of advanced research and technology achieved in foreign countries have been made available to us at a relatively small expenditure of foreign currency than would have been necessary if the finished drugs were to be imported".
>
> "Indian Pharmaceutical Industry" published by the Development Council (Drugs and Pharmaceuticals), Government of India.

Have, then, patents really hindered the progress of the industry? If, as critics of patents would have us believe, patents are the real stumbling block how is it that not all drugs, and their number is indeed large, patents on which have expired, are manufactured in the country? Many of these drugs are still in use and are produced in the country by the original patent-holder only. Are we merely looking for an excuse to cover up our failings and shortcoming?

No Need for Enquiry

Phenomenal, though the progress of the industry has been, it could have been even faster. But this has nothing to do with patents. If a more liberal policy had been followed in respect of allowing imports of essential raw materials not available in the country and the latest machinery and equipment, if arrangements were made to ensure adequate supplies of raw materials, if expansion of capacity had been allowed more liberally, while taking steps to ensure raw materials, the progress of the industry would certainly have been much faster. There is under-utilisation of capacity to the extent of about 25 per cent due to shortage of raw materials alone. The under-utilisation of capacity not only results in production being less than what it would have been but also makes the limited output carry the entire burden of overheads. The higher production and productivity would have surely enabled prices to be brought down. These are some of the factors responsible for drug prices being what they are. They also point to the lines along which the price question should be tackled.

An enquiry into drug prices, provided it is impartial and the body conducting it is formed of persons who understand the medical, scientific and business problems of the industry and who will take an independent, objective and long-range view, may do some good in that it will dispel much of the misunderstanding and many of the misconceptions about drug prices. It is noteworthy, in this connection, that it is for this reason the British Pharmaceutical Industry has expressed its readines to have an enquiry conducted as demanded by the Trades Union Congress. The T U C had demanded inquiries into many industries but the Pharmaceutical Industry is the first to accept an enquiry. The Indian pharmaceutical industry is still in its infancy, though it is vigorous and kicking, and all efforts need to be concentrated on promoting its growth by encouraging domestic and foreign investment in the industry. Critics of the industry are sure to make capital out of an enquiry, if one is conducted, as did happen in the case of Kefauver Inquiry, to tarnish its image and to shatter the foreign investors' confidence in the growth potential of the Indian industry. Confidence is a sensitive plant of slow growth. Let us not destroy what we have so carefully cultivated.

Why Drug Industry Must be Controlled

"THE ethical (or 'prescription') drug industry has a number of features which tend to make it unique. For one thing there is its critical bearing on public health and welfare... It is this underlying consideration which is responsible for the fact that most nations (including the majority of the highly developed nations) have traditionally followed a policy of refusing to grant product patents on pharmaceuticals. It is this same consideration which is responsible for the existence of price control on drugs in countries which do not impose such controls on the general run of products.

"A second unique characteristic is the difference between buyer and orderer... Once the physician has written his prescription (usually in terms of a brand name), the consumer is limited to the product prescribed under that brand name... The consumer is 'captive' to a degree not present in any other industry.

"The drug industry is also unusual in the extent to which the demand for its products is inelastic... The fact that demand is inelastic means that one of the checks which might serve as a possible constraint upon corporate price policies is absent in ethical drugs.

"The case that measures are needed to stimulate price competition in this field rests primarily upon the assumption that drug prices are unreasonable. The extraordinary margins and profits are made possible by a tight control of the market. The control of the market in turn stems principally from three sources of what in economic literature is referred to as "monopoly power". These are the monopoly grant inherent in patents, the exceptionally large expenditures by the major companies on advertising and sales promotion, and the success of the large companies in persuading physicians to write their prescriptions in terms of trade names rather than generic names. Any effort to bring price competition into the ethical drug industry must come to grips with these three sources of monopoly power."

—*From the Kefauver Committee Report on "Administered Prices in the Drug Industry".*

The Harm Done by Patents

S S Sokhey

When he writes in his article, "one wonders how Librium could be legally *imported into the country from an unauthorised source by a party other than the patentee" (emphasis added), Arvind Nair not only gives his whole case away but unwittingly draws attention to the real damage caused by the pernicious patents system. He is referring to the matter brought to light in the last session of the Lok Sabha and drawn attention to in an editorial in* The Economic Weekly *of January 16, 1965— that a Swiss firm which holds the patent for librium, a tranquiliser, was importing the drug into India at Rs 5,500 per kg, while an Italian firm was supplying it at Rs 300 per kg.*

Arvind Nair is right when he says that the import of the drug into India by a firm and from a firm other than the patentee, regardless of the price differential, is illegal. Thus he himself brings out the fact that the patent law in force in India at present gives protection both for the process and the product and drugs can be bought only from the patentees or their licensees and at prices fixed by them.

It is precisely the monopoly right thus conferred on the patentees and their licensees in India which is holding up the development of the drug industry and standing in the way of the supply of life-saving drugs to the public at low prices.

UNDER the patents monopoly the patentee extracts as high a price as he can get away with—usually almost 20 times the total cost of production. Patent protection for process as well as product for obvious reasons establishes an absolute monopoly, debars further invention and cuts out competition and keeps prices high. Particularly, protection for products effectively bars the development of new processes and thus thwarts supplies from sources other than the patentee. This is borne out by price information on 12 drugs gathered by American embassies from 17 countries (1958). It was found that in 11 countries which granted patents on drug products, the prices were 118.2 per cent to 355.0 per cent higher than in the six countries which did not.

To give a few examples: Rhone Poulene of France sells prochloperazine (Compazine) 50 tablets of 25 mg each for $3.03 in U S A (through Smith Kline and France), for $1.61 in Belgium, but for $0.80 in France. American Home Products sells promazine (Sparin) at $3.00 in U S A, at $3.15 in Canada and at $1.32 in Italy. The American Home Products sells Miltown for $3.28 in U S A, for $1.77 in Italy and for only $1.38 in Germany. Ciba of Switzerland sells Serpasil for $4.50 in U S A but for $1.05 in Germany and $0.83 in France.

Prices Highest in the World

In our country, which grants both process and product protection, the prices of the drugs have been found to be the highest. The Senator Kefauver Committee (1961) states:

> "India which does grant patents on drugs provides an interesting case example. The prices in India for the broad-spectrum antibiotics, Aureomycin and Achromycin, are among the highest in the world. As a matter of fact, in drugs generally, India ranks among the highest priced nations of the world—a case of an inverse relationship between per capita income and the level of drug prices."

The patentees, who are entirely foreign firms, have mercilessly exploited a protected market for over half a century and had shown no inclination to use their patent rights to start industry in India until they saw danger to their interests a few years ago. As recently as 1954, the Pharmaceutical Enquiry Committee of the Government of India made it clear that no essential drugs were being manufactured in the country and the drug industry in India "may be considered to be non-existent". Another report in 1956 showed the state of affairs was no better. It said, "Almost all the essential drugs, the availability of which determines the effectiveness of medical attention in the treatment of the most serious and common diseases in India are not being produced in the country, but imported from outside in 'bulk' form or in the form of completed penultimates from which essential drugs can be produced by methods of simple and easy technological processes."

The Government took up this matter in 1956 and began exploring the possibilities of setting up public sector plants to make India completely independent of foreign imports of drugs. This brought home to the foreign patentees the risk they were running and they hurriedly used their monopoly rights to take out licences and half-heartedly put up some plants themselves or with Indian collaboration. These plants, however, still do not carry out all the stages of manufacture, but mostly use imported penultimate compounds to make finished products by easy technical methods. Besides tying down our domestic technological developments, they have made our balance of payment's position worse.

According to *The Economic Weekly* (December 19, 1964), a Reserve Bank of India study has revealed that since 1956, foreign firms have invested only Rs 5 crores and have already taken out of the country Rs 4.64 crores in foreign exchange in the shape of dividends, royalties and service charges. The main burden of the liability has yet to come, because most of the collaboration agreements were concluded after 1959 and what is equally bad, the value of shares held by foreign firms has already risen from Rs 3.37 crores to Rs 14.87 crores.

Huge Profits

When the foreign patentees start their own plants, they naturally charge any price they like for their products, even when they collaborate with Indian firms or they give licences to them to manufacture, they still retain control of the price level. Because of the under-developed nature of the private chemical industry, odd firms who take up manufacture of drugs go to the patentee for their know-how and are dependent on them entirely for carrying out manufacture. The patentees use all the pressure at their command to see that the licensees sell the drugs at the high prices determined by them which may be even higher than the prices at which they sell in their own country.

We are thus still largely dependent on foreign firms in one way or another and have for long obtained our supplies of finished products and penultimate compounds largely from United States. Our prices of drugs are affected by the U S A prices and the working of the United States drug industry.

The American drug industry makes huge profits. Its rate of profit is more than double that of other United States manufacturing industries, including oil, steel, automobiles and chemicals, and range from 58.6 per cent to 78.4 per cent. The high American prices of drugs keep the life saving drugs out of the reach of most of our people and even the public hospitals cannot use them freely. This situation has been under the consideration of the Government of India for considerable time. Besides considering effective long term measures, the Government fixed prices in 1962 to prevent them from rising still further under scarcity conditions.

Enquiry in UK

This problem of high prices of drugs has begun to worry even the developed countries. Something like the case of librium was brought to light in the House of Commons some time ago. An M P had drawn the attention of the Health Minister to the excessively high price being charged by chemists for tetracycline—an antibiotic very much in demand. An enquiry elicited the information that 16 capsules of tetracycline 250 mg each were sold from chemists' shops (1962) at 28 shillings (Rs 18.20) and Government was paying this high price for all tetracycline prescribed by general practitioners under the free National Health Service, while the Government itself was importing the same 16 capsules at 8 shillings (Rs 5.20) from a country that did not grant drug patents for use in its public hospitals. The drug at that low price could not be sold from the chemists' shops because of the monopoly conferred on the patentee. The patentee objected to even the Government importing tetracycline for its own use from a source other than the patentee and filed a suit; ultimately the case went to the Privy Council which, I learn from a responsible source, abrogated the tetracycline patent on the ground that the patent was being abused to charge high prices.

Recently the Labour Government in Britain has made it known that it is going to conduct an enquiry into the prices of drugs. Canada also has been considering the question of abrogating drug patents to bring down drug prices, I am told. The United States also took up this question some years ago. The Senate under its resolution No 53, 87th Congress had an enquiry conducted by a Senate Committee under the chairmanship of the late Senator Kefauver and its report on "Administered Prices in the Drug Industry" was printed under the Orders of the Senate as Senate Report No 448 on June 27, 1961.

Kefauver Committee Report

It is the only official exhaustive enquiry ever held into the working of drug industry. The official standing of the Committee empowered it to call for and obtain detailed financial statements from 22 leading American drug companies covering their receipts and expenditure for 1958. It held numerous public hearings for about two years. At these hearings, leading drug manufacturers had their full say and a number of directors of research of drug firms and professors of pharmacology gave evidence.

The report is a veritable gold mine of precisely determined facts which throws a flood of light on the practices of the drug industry and the role the patents play. It is of incalculable value to all interested in the drug industry and provides pertinent facts to answer spokesmen of the foreign drug monopolies in India.

The Kefauver enquiry was a painstaking, sober, attempt to unearth facts relating to the drug Indistry. Its report alongwith the previous three reports on administered prices in three other industries—steel, automobiles and bread—prepared by the sub-committee under Senator Kefauver throw light on the practices of these pivotal industries in which the sales are concentrated in the hands of a few large companies. The report on the drug industry is particularly important because of the importance of the industry for health and life itself.

The detailed financial statements of the 22 leading American firms submitted to the Kefauver Committee showed that in 1958 of their total earning of $ 2.3 billion, only 32.1 per cent went to the cost of production, while industry's gross margin came to 67.9 per cent. "Fully three quarters of the margin (or more than half of the industry's receipts) was either used to promote the sales of its products or went into profits. Indeed promotion and profits before taxes in the drug operations of the 22 firms exceeded the combined cost of production, research and administration and all other expenses". Profits before taxes amounted to 25.8 per cent and advertising and selling expenses to 24.8 per cent while only 6.3 per cent went to research. Research expense obviously varies from year to year, but is never very large. It is, however, blatantly cited as the principal justification for the high drug prices and not the fantastic amounts spent on advertising and profits

Cost of Production and Price

Kefauver Committee paid special attention to the production and sale of antibiotics, corticosteroids, oral antidiabetics and tranquilizers, which constitute in money value the largest portion of the total sale of drugs in the United States.

From the information supplied by the companies as to the total cost of production and the quantity of the drugs produced, the Committee prepared comprehensive tables which showed unit cost of production and the sale price. I take a couple of examples. In the case of tetracyclin, a wide spectrum antibiotic much in demand, the Committee computed the cost of production of 16 capsules of 250 mg each at 46 cents. These 16 capsules as well as 16 capsules of the other wide spectrum antibiotics, Aureomycin, Chloromycetin and Terramycin were sold to the chemists at a uniform price of $ 5.10 with suggested price of $8.50 to the consumer, i e, at more than 17 times the cost of production.

The committee noted the fact that in 1959 the same firms sold 16 capsules to chemists in India at $ 6.52 and to chemists in Argentina which controls drug prices at $1.19, i e, at 134 per cent and 23 per cent respectively of the United States prices. The representative of the American Cyanamid admitted at the hearing that they made a profit even at the sale price of $1.19

As regards corticosteroids, I give the example of predinisolone, synthesized, patented and sold under the brand name of Medicortelone by Schering Corporation who licensed Upjohn Company to make it for them. They charge the Corporation $1.19 for 100 tablets of 5 mg each. Schering's cost after bottling came to $1.57 per bottle of 100 tablets. They sold it to

wholesalers at $14.32 who retail it to the druggists at $ 17.00 with a suggested price to the consumer of $29.83 per bottle, i e, 18 times the cost of production. Oral antidiabetics and tranquilizers also tell the same tale.

It is to be noted that the entire American drug industry, including these 22 firms, spent in 1958 as much as $ 750 million on advertising and sales promotion. They lavishly printed circulars and brochures, advertisements in medical journals and employed about 20,000 super-salesmen, each costing about $ 15,000 a year for visits to physicians. This wasteful expenditure compares ludicrously with $200 million which the U S A spent on all its medical schools in 1957.

It is perfectly obvious the fantastically large expenditure of advertising and the huge profits affect the prices of drugs. If these expenditures were made smaller, the drugs could be sold at about half the present prices.

Patents Stifle Research

Patents particularly product patents, though they may not be the sole factors, are the main factor which keeps prices high. Worse still, they stifle research. Patents are now taken by big enterprises largely to pre-empt a field of research and prevent others from entering it. This was the conclusion reached by a British Cabinet Committee during World War II, when Government itself had to take up manufacture on a large scale. The patents system, the committee thought, prevents research and recommended that to meet this evil, patents should be abrogated or held only by Government. The British Council of Medical Research insisted that this should be done at least in the case of patents for drugs.

The same conclusion was arrived at by the 20-year old Pharmaceuticals and Drugs Research Committee of our Council of Scientific and Industrial Research on which are represented important agencies engaged in research on, and the manufacture of, drugs both in the public and private sectors. For several years, it drew the attention of Government to the fact that patents not only prevented manufacture but interfered with research and passed resolutions asking Government to abrogate drug patents.

The most pernicious feature of the sale of drugs produced under patents is that the prices are kept pegged at a high level for years. For instance, the price of antibiotics Aureomycin, Chloromycetin, Terramycin and tetracyclin, which are produced under patents, was kept unaltered at $5.10 for 16 capsules of 250 mg each between 1951 and 1960. The only reduction of 10 per cent in prices was made in 1961. During the same period, the bulk prices of unpatented antibiotics, penicillin and streptomycin, fell by about 90 per cent—from 25 cents to 2.1 cents per mega unit and from 32 cents to 3.6 cents per gramme respectively; this in spite of the world-wide inflationary trends to which Arvind Nair draws attention.

Drug Production in India

The interests of the people of India do demand that all the modern life saving drugs should be manufactured in the country and made available to the people at the lowest possible price, even without an element of profit. This could be effectively done in large state plants. The know-how required for setting up such plants is not any longer the exclusive property of a few western firms but is now widespread and can be had from several sources without having to pay royalties.

In fact in 1956, a proposal was submitted to the Government of India to put up a fully integrated drug industry to make India completely independent of imports consisting of (1) a plant to make 33,000 tons of intermediate chemicals and solvents for making all the drugs and dyes, (2) a plant to produce about 3,500 tons of about 65 essential drugs needed, (3) a plant to make 300 tons of antibiotics. This proposal was made on very favourable terms. If accepted in its original form, the plants would have been set up by the end of 1960. Somehow or the other, the scheme did not go through in its full form. The intermediate chemicals plant was taken out of the integrated plan and turned over to private industry but the plant has not been built up to this day. Intermediate chemicals continue to be imported and those manufactured in the country are made in small plants. The capacity of the plant for synthetic drugs was reduced to 800 tons and the rest of the drugs passed on to small private firms with unhappy results. Take for example, Vitamin-C (Ascorbic acid). If the original proposal of the big plant had gone through, we would have been able to supply a bottle of 100 tablets of 500 mg each at less than Rs 3, but now the price of imported drug or the drug made in India for a bottle of 100 tablets of 500 mg each varies from Rs 13.50 to Rs 21.10.

This retrograde step must have been taken on the advice of the Development Council for Drugs and Pharmaceuticals. So I am not taken in by the Council's wisdom.

Patents Must Go

A lot can still be done for the drug industry in India. The facts I have given above make it absolutely clear that one step we must take, and that too immediately, and which has been called for a long time both in the interest of the state and private industry, is to make inventions in drugs non-patentable both as regards process and product in future and to abrogate old patents which have still more than three years to run after the Bill is passed. For this action, an opportunity now exists, as a new Bill on Patents is going to be introduced in the present session of Lok Sabha. The mere abrogation of product patents, however would not serve the purpose. The process patent must go as well. We can and we must build our drug industry to begin with on the basis of known processes. We can have them for the asking and thus come up to the world level of drug technology. Then we shall be in a position to begin to contribute to the world fund of knowledge by our researches. In the meantime, until we put up our own plants, we shall be free to import our drugs from the cheapest sources.

But I want to stress that abrogation of drug patents would not in any way discourage research workers in India from making new discoveries. Ketauver Committee brings out the fact that the "mere existence of patent protection is not a guarantee of invention nor is its absence much of a barrier". The Committee was surprised to find that "drugs discovered in foreign countries without product patents outnumber those discovered in countries with such protection in the order of 10 to 1". Thus a large number of the most important drugs and the most widely used in the world were discovered either in public laboratories or in countries which have never awarded patents on pharmaceutical products.

State Finances and the Fourth Plan

D C Vohra

When the Central Government is so concerned with curbing inflationary pressures, the States have made no attempt whatsoever in their Budgets for 1965-66 to cover even their revenue deficits.

This fact cannot but have its impact on the Fourth Plan.

The Planning Commission may be compelled to revise downwards its estimates of revenue surpluses at current tax rates and, correspondingly, raise its estimate of the 'resources gap'.

This, in turn, will naturally affect the size of the Fourth Plan.

In this context a major responsibility rests on the Finance Commission now nearing the end of its labours. It will have to evolve a system of financial assistance from the Centre to the States which will meet the genuine needs of the States while requiring the States to make reasonable efforts to raise revenues.

IN what is obviously an attempt to secure enhanced devolutions from the Centre, the States have vied with one another in leaving large deficits uncovered in their budgets for 1965-66. While it may be conceded that States have certain genuine difficulties in imposing new taxation for meeting their deficits, it would be wrong to condone their complacency at a time when the country is about to embark on a crucial phase of its economic planning. When the Central Government is concerned with raising larger internal resources for financing huge investments in the Fourth Plan, the States have not made reasonable efforts even to eliminate or reduce their revenue deficits. If this attitude continues, it may seriously jeopardize the stability and growth of the economy.

Rise in Deficits

The State Governments' tendency to seek the easy way out by relying on the Centre's doles, despite the buoyancy of their own revenues, is clearly brought out by a comparison of the budget estimates for 1964-65 with those for 1965-66. In the current year the States' total revenue receipts have shown an increase of 21 per cent, from Rs 1,553 crores in 1964-65 to Rs 1,878 crores (Table 1). But expenditure has increased by 26.5 per cent from Rs 1,548 crores in 1964-65 to Rs 1,959 crores. Accordingly, whereas last year revenue receipts at the existing level of taxation more or less matched revenue expenditure and there was a marginal surplus of Rs 5 crores, receipts in the current year are estimated to fall short of expenditure by Rs 80.13 crores. Added to the revenue deficit is the deficit on capital account and other miscellaneous expenditure aggregating Rs 36.76 crores, bringing the total deficit of the States to Rs 116.89 crores.

Within this consolidated picture for all States, the performance of individual States varies considerably. On revenue account, only three States, namely, Assam, Bihar and Punjab have shown surpluses of Rs 0.38 crores, Rs 5.71 crores and Rs 2.32 crores, respectively, and in the other States, deficits range between Rs 0.73 crores in Madhya Pradesh and Rs 17.83 crores in West Bengal. On capital account, surpluses occur in the budgets of Jammu and Kashmir (Rs 1.33 crores), Kerala (Rs 1.38 crores), Rajasthan (Rs 4.34 crores) and West Bengal (Rs 10.78 crores); the rest of the States show deficits varying from Rs 1.60 crores in the case of Andhra Pradesh to Rs 26.34 crores in Maharashtra. The overall position of all the States is one of deficit which ranges between Rs 0.82 crores in the case of Kerala to Rs 35.69 crores for Maharashtra.

In certain States the deficits are actually larger than what the budget figures reveal — a lot of window-dressing has been resorted to. For instance, in Bihar though the overall deficit has been kept down to Rs 4.29 crores, the Finance Minister stated in his budget speech that it excluded certain inevitable expenditures such as those on revised pay scales and that provisions under certain heads were inadequate. The real deficit, he estimated, might be around Rs 9.18 crores.

Apart from Madhya Pradesh and Rajasthan which have proposed mild doses of taxation to the tune of Rs 1.71 crores and Rs 1.55 crores, none of the States has proposed any new taxation, though some States have promised to bring forth tax proposals during the year. The Uttar Pradesh Finance Minister, for instance, stated his intention to submit in due course tax proposals calculated to yield Rs 7.5 crores.

'Memoranda' to the Finance Commission

The Finance Ministers of some of the States used their budget speeches to appeal to the Finance Commission for a better deal for their respective States. The Madras Finance Minister, for example, desired that the Commission should evolve a formula under which financial assistance would become available for covering additional expenditure which the States are obliged to incur on upward revision of dearness allowance consequent on similar increase sanctioned by the Central Government. The dominant theme of the speech of the Maharashtra Finance Minister, too, was the need for the Centre to take a more liberal attitude towards a State like his which had done its utmost to mobilise resources by fresh taxation and open market loans and had tightened up fiscal administration. Similarly, the West Bengal Finance Minister pointed out that his State which occupied third place in 1957-58 in respect of per capita share in Central taxes had been reduced to ninth place in 1962-63. The budgets of these States were virtually additional memoranda to the Finance Commission.

The performance of some of the States in the matter of raising additional taxation has been depressing in earlier years of the Third Plan also (Table 2). Bihar shows the poorest performance as it is estimated that it will achieve only about 40 per cent of the target of additional taxation. In fact, Bihar has the distinction of taking no steps to raise additional resources by way of taxation during the last five years, with the exception of 1962-63 when additional tax of Rs 1 crore was imposed. It was against the background of this deplorable performance that the Bihar Finance Minister declared in his Budget speech that "the execution of the development plan is a problem of life and death for us and is the final purpose of all our efforts"! Next to Bihar are Uttar Pradesh and Madhya Pradesh which are expected to raise additional taxation only to the extent of two-thirds of their tagets for the Third Plan. Amongst others, Jammu and Kashmir, Andhra, Mysore, Assam and Rajasthan are expected to achieve their respective targets to the extent of 71, 87, 89, and 94 per cent.

Seven States have exceeded their targets of additional taxation for the Third Plan. Maharashtra shows the best performance, having exceeded the target by about 50 per cent — addi-

tional taxation during the Plan being about Rs 77.47 crores as against the target of Rs 52 crores. Gujarat and Orissa are expected to exceed their targets by about 40 per cent. Then follow Punjab, Kerala, Madras and West Bengal which are expected to exceed their targets by 21, 18, 17, and 1 per cent, respectively. The picture of additional taxation as it emerges is that the measures taken by the States during 1961-65 will yield about Rs 572.42 crores which is below the third Plan target of Rs 610 crores by Rs 37.58 crores. It will be seen from Table 2 that Madhya Pradesh and Rajasthan are the only States which have distributed additional taxation over the five years. Most of the other States concentrated their efforts in 1962-63 and 1963-64.

Central Assistance

What is as much cause for concern as the tax performance of the States is the sharp rise in the States' expenditure as a result of which even to cover their revenue deficits the States have to look to the Centre. The total resources transferred from the Centre to the States during the First Plan, it will be seen from Table 3, totalled Rs 1,413 crores, representing 42 per cent of the total expenditure of Rs 3,352 crores by States. This proportion increased to 49 per cent during the Second Plan period, as the amount transferred aggregated Rs 2,868 crores as against total expenditure of Rs 5,843 crores. In the current Plan the annual transfers from the Centre have risen from Rs 847 crores in 1961-62 to Rs 1,037 crores in the budget estimates for 1965-66. It has been estimated by the Planing Commission that the Centre would provide Rs 5,478 crores, or 54 per cent of the States' total expenditure of Rs 10,205 crores in the Third Plan period.

Of the total devolutions, loans from the Centre to the States which showed an increase of 75 per cent from Rs 799 crores in the First Plan to Rs 1,411 crores in the Second Plan are expected to be doubled in the Third Plan period to reach the figure of Rs 2,985 crores. In the Third Plan, loans account for about 55 per cent of the total transfers from the Centre to the States. Loans are followed by States' share of divisible taxes and duties and grants met from revenue which have increased about four-fold and five-fold, respectively, since the First Plan and today account for 22 per cent and 20 per cent of total devolutions.

In respect of Plan expenditure, the dependence of States on the Centre is almost complete, though in the Third Plan the percentage shows a little decline as compared with the Second Plan. Out of the States' total Plan expenditure of Rs 1,427 crores in the First Plan, the Centre provided Rs 982 crores or 69 per cent; this percentage is expected to reach 93 in the Third Plan as the Centre will provide as much as Rs 3,649 crores out of the States' total Plan outlay of nearly Rs 3,922 crores. In the Second Plan, the percentage of Central assistance was 97, the share of the Centre bring Rs 1,931 crores out of a total expenditure of Rs 1,981 crores. As data on the share of the Centre in Plan outlays in individual States is not yet available, only the total figure for all the States has been given in Table 1. It will be seen that the proposed Plan outlays range from Rs 23.30 crores in Jammu and Kashmir to Rs 141.00 crores in Uttar Pradesh; the other two States with big Plan outlays are Maharashtra and Andhra Pradesh which have fixed their figures at Rs 137.60 crores and Rs 100.33 crores, respectively.

Impact on Fourth Plan

The string of deficit State budgets has naturally had its impact on the preparation of the Fourth Plan. The calculations of the planners in regard to the internal resources for the Fourth Plan have been upset and consequently meetings of the sub-committees of the National Development Council have had to be postponed. The Planning Commission has expressed its concern at the inability of the States to effect economy and keep down non-essential expenditure. It has sought to impress upon the States the need to restrict expenditure on tax collection and general administration, etc, to 5 per cent per annum and non-Plan expenditure on revenue account to 3.5 per cent per annum. The Commission has suggested that representations from States to the Finance Commission should be based on this restricted level of expenditure so that resources for the Fourth Plan would not be unduly curtailed.

But all this notwithstanding it becomes clear that the increased expenditure of the States on revenue accounts is at variance with the assumptions of the planners and would cut into resources available for the Fourth Plan. The Fourth Plan memorandum, it will be remembered, had put the revenue gap to be met through increased taxation, better collection and pricing adjustments at nearly Rs 3,000 crores. On the basis of the 1965-66 State budgets as well as the Central Budget, however, the resources gap is now expected to be around Rs 4,500 crores. In fact, even at the time of earlier discussions, whereas the planners assumed the balance available from current revenues of the States at 1964-65 rates at Rs 870 crores, the States had maintained that this balance would be no more than Rs 335 crores. The Planning Commission was then of the view that the States were deliberately inflating their revenue expenditure, but in view of the 1965-66 State Budgets the Planning Commission's estimate seems to have been rather optimistic.

Table 1: States' Budgets, 1965-66

(Rs Crores)

	Revenue Receipts	Revenue Expenditure	Net Position on Revenue Account	Net Position Outside Revenue Account	Overall Position	Plan Outlay as Fixed by States
Andhra Pradesh	154.53	161.23	—6.70	—1.60	—8.30	100.33
Assam	70.78	70.40	+0.38	—4.63	—3.25	30.90
Bihar	119.34	113.63	+5.71	—10.00	—4.29	77.58
Gujarat	106.63	110.31	—3.68	—1.99	—5.67	58.45
Jammu and Kashmir	30.17	35.94	—5.77	+1.33	—4.44	23.30
Kerala	85.50	87.70	—2.20	+1.38	—0.82	41.60
Madhya Pradesh	120.46	121.19	—0.73	—4.21	—5.94	64.65
Madras	163.63	170.60	—6.97	—	—6.97	78.55
Maharashtra	215.47	224.82	—9.35	—26.34	—35.69	137.60
Mysore	121.52	125.43	—3.91	—	—3.91	56.16
Orissa	81.35	91.38	—10.03	—	—10.03	63.38
Punjab	129.65	127.33	+2.32	—5.82	—3.50	62.00
Rajasthan	79.68	86.14	—6.46	+4.34	—2.12	46.90
Uttar Pradesh	247.74	262.65	—14.91	—	—14.91	141.00
West Bengal	152.00	169.83	—17.83	+10.78	—7.05	75.28
Total	**1,878.45**	**1,958.58**	**—80.13**	**—36.76**	**—116.89**	**1,057.68***

* As some of the States have fixed Plan outlays at levels higher than those approved by the Planning Commission, the aggregate figure is higher than States' total approved outlay of Rs 1,027 crores in 1965-66.

This setback is likely to delay the finalisation of the Fourth Plan because, unless the resources sub-committee of the N D C meets and settles on the resources targets and allocations to different sectors, the other sub-committees would not be able to finalise their schemes. Presumably, a detailed review of the resources position by the resources sub-committee will be followed by some generalised recommendations to the States. Some vague suggestions about raising resources in the States are already in circulation. For instances, it has been suggested that the States might be asked to levy a surcharge on land revenue, ranging from 50 to 150 per cent to narrow the gap in resources. But the possibility of any really effective steps by the States is generally discounted. The States, it is felt, will not take the political risk of antagonising the peasantry.

Light Burden on Rural Sector

It was ten years ago that the Taxation Enquiry Committee recommended the introduction of the agricultural income tax but the response from the States has been most disappointing. The vast scope that exists for taxing agriculture is evident from the fact that of the total tax revenues of the country of Rs 2,400 crores in 1964-65, revenue from the rural sector was only Rs 700 crores. In other words, 80 per cent of the population of the country contributed only 29 per cent of total revenues. The rise in agricultural prices has raised incomes in the rural areas and this is, indeed, the opportune time to seek an upward adjustment in and rationalisation of rural taxation.

There has been almost no change in land tax for a long time and in most of the States land revenue settlements are as old as 30 to 40 years. Over these years, it is common knowledge, there has been a radical change in incomes from agriculture — per acre yields have risen and agricultural production has been boosted. But the land revenue and agricultural income tax taken together constitute hardly two per cent of the total value of agricultural production. Of the total tax revenue of the States during 1964-65 amounting to Rs 695.96 crores, land revenue accounted for Rs 118.55 crores and the agricultural income tax for Rs 10.76 crores. If an element of progression is introduced in the land revenue system the yield from this source can be multiplied since it is relatively difficult to evade. As regards agricultural income tax, only in Assam, Kerala and Madras is it reckoned as a source of income, though it is levied in nine States at present.

Finance Commission's Responsibility

The whole problem of State finances clearly needs careful review. While the States should have some freedom in allocating their own resources, so far as the Central assistance is concerned, there must be an assurance that a major portion of it is related to capital expenditure on projects which are part of the plan. The consequences of frittering away Central assistance on non-essential expenditure can be seen in the burgeoning debt servicing burden on the States against which few income-yielding assets have been created. Interest charges payable by the States have risen from Rs 84 crores in 1961-62 to Rs 219 crores in 1964-65!

As a postscript it may be added that the Rajamannar Commission which is now nearing the end of its labours should devise a system of financial devolutions that meets the genuine needs of the States but also insists on reasonable efforts by them. In particular, the Commission should take into account collection of arrears of taxes, additional taxation measures during the last five years and efforts to economise expenditure. The revenue gap and the budgetary needs to be met by financial devolution from the Centre should accordingly be based not entirely on the States' own estimates of revenue and expenditure for the coming years but on these esimates as adjudged by the Finance Commission on the basis of criteria of efficiency and responsibility. The Commission might measure budgetary gaps with reference to some sort of "optimum" taking into account the States' efforts in raising resources.

Indo-Pak Borders

THE fighting on the borders between India and East Pakistan in the Cooch-Behar district and elsewhere has served to remind us once again of the unsettled problem of India's relations with Pakistan. The problem is never really forgotten for long; almost every other month there is an incident along either the cease-fire line in Jammu-Kashmir or the borders between India and the two parts of Pakistan. Then there are the outbursts against India from Pakistan's politicians and Ayub Khan, which take place with a certain regularity and without any specific provocation from the Indian side. (Whatever India's other faults in her relations with Pakistan, her ruling politicians do refrain from similar cold war propaganda).

Providence, of course, could not possibly have been more unkind to the possibility of sustained happy relations between the two countries. One doubts if any other two religions have kept up a mutual animosity for as many centuries as have Hinduism and Islam. (Incidentally, this historical conflict also moulded certain persons into some of the world's greatest humanist philosophers; one thinks here of names like Kabir, Nanak and Akbar.) Then, when the Partition did come, there were the nettles of Hyderabad and Kashmir: Hyderabad got settled somehow; but Kashmir has continued to sting the sides of both countries. As if this was not enough, the principle of partition according to the majority community has left along the border, particularly in the East, a number of little islands of one country inside the other.

One such enclave is Dahagram. It is a little (Muslim-majority) Pakistan about 150 yards inside the Indian territory. The Muslims here naturally need to communicate with Pakistan mainland, just as the Hindus of a little Indian enclave inside Pakistan need to communicate with the Indian mainland. The rules, regulations and procedures for this movement of men—and to some extent materials—have not yet been settled between the two countries. The present trouble in Dahagram started when the West Bengal Government took some steps to prevent what Swaran Singh described as "smuggling and the illegal movement of Pakistani nationals". These steps were promptly condemned by the Pakistan press and radio as an economic blockade of Dahagram. Then the two sides started shooting about midnight of March 13. This led to the Hindus from Dahagram fleeing into India and the Muslims into Pakistan; large numbers of residents soon turned into evacuees.

When the trouble in Dahagram started, there was ready speculation in each country about the other country's hidden motives. According to Bhutto of Pakistan, India had started border trouble in order to "side-track world opinion from Kashmir" where there was a "good deal of trouble... and the people were trying to liberate themselves". On the Indian side there were suggestions in the Parliament and the press that the renewal of border fighting was in some way connected with Ayub Khan's recent visit to China. Though everything is connected with everything else in life—particularly perhaps in the Indo-Pakistan relations—one does not need to look beyond the character of the mutual borders to appreciate the causes of recurrent fighting.

Kashmir, of course, is itself a large disputed area between the two countries; but along their other borders too there are small disputed or undemarcated areas. There has recently been trouble in Kanjorkot along the Sind-Kutch border; and Kanjorkot is a disputed area. Then the recent fighting in Assam has been in Lathitilla-Dumabari, where the border has not been demarcated yet. So, disputed areas, undemarcated borders, and enclaves are the three categories of trouble spots. The Nehru-Noon agreement of 1958 had envisaged that the Pakistan enclaves in Cooch Behar (such as Dahagram) should be exchanged for certain Indian enclaves inside East Pakistan. A part of that agreement also laid down that Berubari—which at present wholly belongs to India—should be divided between the two countries. A stay order passed by the Indian Supreme Court regarding the division of Berubari has delayed the execution of that agreement. Now it is alleged that Pakistan has been recently trying to intrude into Southern Berubari.

Each of the recent border skirmishes, then, has been in an area where there are some physical reasons for disagreement. Of course, even with the presence of such reasons there need never be any fighting if the relations between the two countries were really cordial. Unfortunately that is not so. The heroic attempts of J P, culminating in the goodwill delegation he led to West Pakistan last year, have borne but little fruit. Similarly, the Shastri-Ayub meeting of three hours in Karachi on October 12 last year—though it resulted in a fairly hopeful joint statement—failed to ring in a detente between the two countries.

Be that as it may, for us there is no rational policy other than that of injecting as much goodwill as possible into our relations with Pakistan. No doubt it is a difficult policy: there are the flirtation of Pakistan with China and the rather grotesque misrepresentations by Pakistani spokesmen of our dispute with China. Nevertheless, we have to ignore Pakistan's lapses and be extraordinarily tolerant towards her. There are at least 50 million Muslims in India; the logical conclusion of prolonged hostility between India and Pakistan would be that these Muslims must all go to Pakistan, and all the Hindus in Pakistan must come to India. While Pakistan, given the principle on which it was created, can happily contemplate the later eventuality (and does not seem to be trying to bring it about) no sane Indian can feel happy about the former. There are some Hindus who would like that eventuality to occur sooner or later; but for us to give in to their persuasion would be as tragic as it was for Germany to listen to her Jew-haters. Moreover, since we need to devote so much of our strength to promoting our economic development, our aim ought to be to keep the friendliest possible relations with our neighbours and thus minimize expensive distractions.

There is the basic problem of Kashmir which no doubt defies any easy solution; however, our minimum aim in relations with Pakistan should be to settle permanently as many other mutual problems as possible—after the fashion of the settlement of the Indus Waters dispute: then, contrary to the commonly held view, the solution of the Kashmir problem itself is likely to become easier. Swaran Singh pointed out in the Rajya Sabha, "a major part of the Indo-Pakistani border has been settled through talks and actual demarcation has taken place". This gives us hope for the talks between the two countries on the 4-point plan for Dahagram, which began on 31st March. It will be in our interest to try to persuade Pakistan to broaden the scope of these talks and settle all the trouble spots along the borders once for all. Any generosity we display in such talks is bound to pay high dividends over the long run.

FROM THE CHAIR

The Syndicate Bank Limited

Statement by the Chairman, Dr T M A Pai

THE following is the Statement by the Chairman, Dr T M A Pai, circulated to the shareholders of The Syndicate Bank Limited, Manipal, with the Directors' Report and Accounts for the year ended December 31, 1964:

It gives me great pleasure to present to you the Profit & Loss Account of the Bank for the year ended 31st December, 1964 and the Balance Sheet as on that date. The Bank's progress during the year has been good. The Syndicate which was founded in the year 1925 has now stepped into its 40th year. Looking back on the years that have passed, we can be proud of our achievements not only from the standards of building up of our deposits and resources, but also from the point of view of the services that we have been able to render to the common man. As a Bank with deposits exceeding Rs 50 crores, the Syndicate is now one among the very big banking institutions of the country. I have no doubt that the great momentum and the dynamism that this institution has had the good fortune to have, will ensure a still faster growth in future years and the Syndicate can look forward to play its due role in the economic growth of our country. Our deposits have crossed the Rs 50 crores mark and have improved from Rs 45.49 crores in 1963 to Rs 51.46 crores as on 31st December, 1964. Advances have improved from Rs 27.83 crores in 1963 to Rs 33.48 crores as on 31st December, 1964. Our Reserves including Share Premium Account and other Reserves now stand at Rs 85 lakhs and are almost equal to our Paid-up Capital of Rs 87 lakhs. The net profits of the year amounted to Rs 48.50 lakhs against last year's Rs 39.92 lakhs. Thus from all respects the bank's working results are satisfactory. Our advances now constitute 63% of capital, reserves and deposits. The cash and bank balances and investments in Government and other securities amounted to Rs 22.99 crores as compared to Rs 21.43 crores for the year 1963. The bills for collection and acceptances portfolio of the bank have almost doubled from Rs 5.60 crores in 1963 to Rs 10.82 crores as on the 31st December, 1964. We have decided to maintain the last year's rate of dividends both for Preference as well as Equity Shares.

Agricultural Finance Department

In my Statement last year, I indicated to you that we were considering the question of agricultural finance so as to help owner-cultivators to increase their agricultural production. We opened up a new Department known as the Agricultural Finance Department in April 1964 and have done considerable field work in the matter and evolved new schemes for financing farmers. Under qualified technical staff, several experiments in the South Kanara District have been conducted in order to get first-hand data about the costs of cultivation, the application of fertilizers and the problems of financing agriculturists, both for short term as well as medium and long term requirements. The experiments that were conducted have been very successful and valuable statistics have been collected. The Bank's scheme of finance for the farmer for production of foodcrops was introduced in the South Kanara District as a pilot scheme and has received enthusiastic support from progressive farmers of the District. South Kanara was selected by us initially, as we have a net work of 46 branches in the Dist. and farmers in these areas are also personally known to the staff of our branches. At present short term loans are granted even without security to owner-cultivators for seasonal needs and minor improvements of the farm with repayments spread over to suit the farmer's convenience and repaying capacity from increased production. We have other schemes of medium and long term loans for land improvement, purchase of bullocks, agricultural machinery and dairy and poultry development. While these schemes have been initially extended to the South Kanara Dist. only, we are financing under another scheme, the purchase and installation of pumpsets for agricultural purposes at all places where we have our branches. The effective rate of interest on all these schemes of agricultural finance has been kept low at 7% p.a. A system of pre-advance inspection for the purpose of processing the proposals and also post advance inspections to ensure the proper utilisation of the finance granted by personnel specially trained for this work has also been evolved as part of the financing scheme. I am also happy to inform you that the Central Government have, after a study of the bank's programmes, written to the State Governments in the States of Mysore, Madras and Maharashtra to give help in all possible ways to the Syndicate Bank and any other commercial banks which may come forward to undertake similar activities and make available such technical advice as may be required. We are very thankful to the Central and State Governments for their assistance and we propose to avail of every facility we can get from whatever source.

It is imperative that banks of the country take keen interest in the financing of the agriculturist. Agriculture has suffered in this country for want of credit more than any other field of economic activity. It is a sad state of affairs that our country, so richly endowed by nature, should depend heavily upon imports from foreign countries for its food supply even after seventeen years of independence. While the country has made great progress in every other field of activity like industrial growth, public works etc, what we have done in the field of agricultural production has been indeed inadequate, particularly in view of the fast increasing population. It should be certainly possible to increase production more quickly in this field than any other field, and what could be achieved in the increase of agricultural production by scientific methods of cultivation, application of fertilizers and better irrigation is not properly appreciated. Increase in agricultural production is the key-note to the solution of a number of our problems including the present acute food problem, and banks of the country must have a revolutionary approach to this problem and give every possible financial assistance to the farmer. While one bank by itself can do little considering the vastness of problems before us, if all commercial banks give special attention to making available agricultural finance, at least progressive cultivators could be encourag-

ed to take up new schemes and increase production by extending to new areas, adopting better and more scientific methods of cultivation and using fertilizers. We propose to extend schemes of agricultural finance to certain other Districts in the States where we operate and intend to continue giving priority to tackling the problems of agricultural finance in the coming years also.

Taking Over of Smaller Branches

The bank took over five smaller banks during the course of the year, namely, 1. The Oriental Union Bank Ltd., Kaduthuruthy, 2. The Kotagiri Bank Ltd., Kotagiri, 3. Sri Ranga Raja Bank Ltd., Mettupalayam, 4. The Kothamangalam Namboodiri Bank Ltd., Quilandy and 5. The South Travancore Bank Ltd., Nayyoor. We have opened six branches as a result of taking over these banks, four of which did not have any office of scheduled banks.

With the merger of these banks, the Syndicate Bank has taken over altogether 20 small banking institutions during the last twelve years. We are deeply grateful to the Reserve Bank of India for the encouragement and guidance given to us in the taking over of these banks as well as other matters. Consequent on taking these over, the Syndicate has been able to provide better banking facilities to the customers of these smaller banking institutions and develop banking facilities at these places. The staff of all these institutions have been taken over on better scales of pay and emoluments of the Syndicate Bank. Every effort has also been made to train up these staff members so that the quality service provided by the Syndicate Bank might be maintained. Even in the case of banks taken over under Sec. 45 of the Banking Companies' Act, we have been able to make good collections on items of advances under collection and pay 100% of their deposits to all depositors. The last instalment due to the depositors of the Peoples Bank Ltd has been recently distributed. We have also been able to distribute the capital and surpluses in the case of two other banks. Steps to realise the money under litigation in the case of the Catholic Bank have been taken, and if litigation ends early, we shall be able to distribute the surplus to the shareholders of that Bank.

New Branches

In 1946, we opened 14 new branches bringing the total number of our branches to 203. The Bank has opened 2 branches in Delhi, one in New Delhi and the other in Old Delhi. One more branch of the bank has been opened at Bombay at Broach Street where we have five branches now. We are shortly opening a branch in Calcutta also. One of the branches opened in Delhi is a Ladies' Branch which is the first All-Women's Bank in Delhi. During the course of the year, we also opened branches for the first time in the Nilgiris District and the Kanyakumari District in the Madras State. I may state that out of the fourteen branches opened in the course of the year, at nine places the Syndicate is the only Scheduled Bank, and we have thus continued our traditions of giving preference to unbanked areas in our branch expansion programme. Our Branches in unbanked areas have been doing excellent work in spreading banking habits in new areas and a large number of them have been able to establish themselves and reach new heights.

All Women's Branches

With the opening of the All-Women's Branch at Delhi, the Syndicate have now 5 All-Women's Branches at Bangalore-Seshadripuram, Trivandrum-Puthenchenthai, Madras-Thyagarayanagar, Hyderabad-Chikkadpalli and Delhi-Karol Bagh. I am very happy that these branches have been able to develop very satisfactorily and the young ladies employed at these branches have earned the appreciation of the banking public by very satisfactory service, besides encouraging the opening of accounts by women and spreading the banking habit among them. At several of our other branches also savings bank counters are looked after by our lady staff and special facilities are provided for women to deal with the bank. I would like to make it clear that these All-Women's Branches handle not only the accounts of women, but of all customers. They are known as All-Women's Branches only because the entire staff of the branch consists of ladies.

Office Premises

The Head Office of the Bank was shifted from Udipi to Manipal last year. Our new building at Manipal was inaugurated on 19th April, 1964 by the Hon'ble Sri C. Subramaniam, Minister for Food & Agriculture. With the shifting of the Head Office to Manipal, all the Departments are now integrated in one building, and it has been possible for us to provide the staff with ideal conditions of working amidst the picturesque surroundings of Manipal. The Bank's building programme to provide better premises for its branch offices has also made very satisfactory progress. We have put up a very fine five storied building at Bangalore-Gandhinagar which is being inaugurated in April this year. Similarly, the Bank has also completed its new buildings at Cochin, Bellary and Hospet, and it has now taken up building construction for its offices at various other places like Thirthahalli, Guntur, Moodbidri, Cannanore, Bantwal, Aantapur and Chickmagalur. It is our desire to see that adequate space and every convenience is provided for the customers of the Bank and our staff at all our offices. Besides putting up our own buildings wherever convenient, we have been able to get suitable premises and to have buildings constructed to suit the bank's needs at several other places.

Modernisation Programmes

With the great increase in the quantum of work on account of the growth of the institution and in view of the large increase in its clientele, the Bank finds it necessary to switch on at a few offices to more modern mechanical systems of accounting. We propose to introduce the IBM at the Head Office at Manipal and we are also considering introducing modern mechanical methods of accounting at one of our branches this year. Our Organisation & Methods Division at the Head Office is continuing its efforts to find out better methods and it is our keen desire to see that our methods of working are improved with the growth of business so that efficiency may be maintained at high levels.

Foreign Exchange

The Foreign Exchange Department has had another very successful year. The Bank now transacts foreign exchange business from seven centres and we have established a good net work of correspondents all over the world. Several of the Directors and Officers of foreign correspondent Banks paid us a visit at Manipal during the year. Notable among these were the Deputy Chief General Manager Mr H W Norris and Mr R J Angus, Asst Manager (Overseas Branch) of the Westminister Bank, London and Mr V K Sondhi, Manager of the Bank of America.

Industrial Finance Department

With our increasing participation in industrial advances, both the number of units (small and large) financed by us in different fields of production as well as the quantum have risen. The Bank has continued to encourage advances to small industries and enterprising entrepreneurs in keeping with its policy of assisting the common man.

Staff Training

The Staff Training College at the Head Office has been able to improve its standards and to train up more than 700 young men and women so far in the clerical as well as officer's cadre. We have also continued to make use of the facilities given by the Staff Training College of the Reserve Bank of India, Administrative Staff College of India, the Small Industries Extension Training Institutes and other organisations so as to provide training for our officers not only in banking techniques, but also in management and administration to make them fit for the responsibilities a banker has to take up today.

Sri T A Pai

Our Managing Director, Sri T A Pai availed himself of an opportunity this year of going abroad, and paid visits to various countries both in the East and the West, establishing close connections with foreign correspondents. I am happy that during the course of his visits he made a special study of the organisations and the methods of working in foreign banks and we are effecting improvements in our own systems in the light of his studies and observations. I also had opportunity of going to the Continent and the United States of America this year and was very happy to find the great amount of goodwill and friendship that the people of these countries have towards our country as a growing democracy with great traditions. My contacts with several banking institutions overseas were very pleasant and useful.

Sri T A Pai was requested to take over the Chairmanship of the Food Corporation of India with effect from the 1st January, 1965. In view of the vital needs of the country and our conviction that he would be able to make a valuable contribution for the success of the Corporation by being its first Chairman, our Board decided to spare his services to the Food Corporation for a period of one year from the 1st January, 1965. His appointment as the first Chairman of the Corporation, when the problems facing the Corporation are of such great magnitude, is no small tribute to his dynamism, zeal, power of organisation and ability to solve problems and I am sure that with these qualities, he would be able to organise the Corporation and set it up on sure foundations. No doubt, the difficulties are many and the problems are baffling. I would request every person in this country to cooperate in this period of crisis and see that the Government and the Food Corporation are able to solve the problems of scarcity of food and high prices. The directors very much desire that Sri T A Pai comes back to the Syndicate as the Managing Director after the expiry of his term of appointment for one year in the Food Corporation. It is indeed an honour to the Syndicate that its Managing Director should have been called upon to be the first Chairman of such a great Corporation. We are fortunate that Sri T A Pai continues to be with us as the Vice-Chairman of the Bank, and the benefit of his all-round experience will be available to the Bank even during the current year. He has made a very great personal sacrifice by declining all remuneration from the Food Corporation as well as from the Bank.

I am also thankful to our friends who have showered on me their good wishes and greetings on the occasion of my having been awarded the "Padmashree" by the President of India. I greatly appreciate and value these good wishes and pray that it may be given to me to continue my work for public good, whether in banking, education or other fields.

Sri K K Pai, Chief Officer

The Directors have appointed Sri K K Pai, B Com, Deputy Chief Officer of this Bank as its Chief Officer, in the place of Sri T A Pai who resigned from the bank to take up appointment as Chairman of the Food Corporation of India. Sri K K Pai has had the benefit of a good collegiate career and wide experience not only in banking, but also in the social and educational fields and public administration. I am sure the bank will progress this year under his leadership. We are very keen that while the bank should grow even faster than in the past, it should not be at the sacrifice of efficiency, and that the Syndicate should continue to improve its services to the common man as effectively as it has been doing so far.

General

This year has been one full of significant events both at home and abroad. The country has lost Pandit Jawaharlal Nehru who had symbolised the country's hopes and aspirations and had guided our destinies since independence. With his passing away, a progressive era in the country's history has come to a close. We are fortunate in having as his successor another great son of India who has devoted his life for the cause of the country, Sri Lal Bahadur Shastri. Though politically the change over has been smooth and our new leaders have taken up their responsiblities enthusiastically, I am sorry the economic conditions have continued to deteriorate and the price level has been going up steeply, causing great suffering to the poor and middle classes. The cost of living index which was 137 in September, 1963 had increased to 159 in September, 1964 and in fact the real costs are higher because many of the essential commodities are not available at controlled or fair prices. It is necessary to take quickly drastic measures to restore the economic equilibrium, and stability in the price level and the cost of living, as otherwise with the spiralling price level and inflation and consequent suffering, the public confidence in the ability of the Government to meet the situation is bound to be lost. Any inducements which banks can offer by way of higher rates of interest on deposits can have little meaning to depositors unless stability in the price level can be assured over a period of time. If the value of the Rupee in terms of real goods continues to go down steeply, the savings of people are likely to seek other avenues of investment and investments in real goods and properties leading to further increase in prices rather than be kept in bank deposits or invested in Government loans or certificates.

There have been important events for the banking system by way of increase in the Bank rate twice during the period of 5 months from September, 1964 and by way of controls im-

posed by the Reserve Bank of India, firstly on deposit rates and secondly a ceiling on advances interest rates for all foreign banks and Indian scheduled banks with Demand & Time Liabilities in excess of Rs 50 crores. In September 1964, the Bank rate was put up by ½% from 4½% to 5% and again now on the 17th February 1965, the bank rate has been stepped upto 6%, an unprecedented level in India. The increase by 1½% in such a short time has been indeed startling and may have far-reaching effects on the country's economy and banking system. In September last year the Reserve Bank issued a directive to Banks regarding the maximum rates of interest to be allowed on short term deposits upto 90 days and on the 17th February, 1965 another directive has been issued, revising upwards not only the maximum rates of interest to be allowed on short term deposits upto 90 days, but also fixing the minimum rates of interest that may be offered by banks for long term deposits of above 90 days upto 2 years. For the first time, the central Bank of the country has fixed the rates of interest on deposits and the maximum rate for advances. Banks have been having their own agreement so far in respect of the maximum rates of interest to be allowed on deposits, but in order to bring up these rates to attractive levels to make long term savings worthwhile, as against short term deposits of less than 90 days, the minimum rate for deposits of over 90 days has been stepped up by 1% over existing levels under the directive. The new control measures of the Reserve Bank indicate that the banking system of the country must be prepared for greater amount of control all-round. As far as the rate of interest on advances is concerned, the Reserve Bank had fixed a ceiling of 9% for advances in respect of Indian scheduled banks having Demand & Time Liabilities of above Rs 50 crores and all foreign banks under their directive of the 25th September 1964, which has been now amended on the 17th February, 1965 to make the ceiling rate 10% for such banks. The liquidity ratio to be maintained by banks under the Banking Companies Act has gone up from 23% to 28% in 1964. New formula has been adopted for lending by the Reserve Bank of India to Scheduled Banks based on the liquidity ratio of the concerned banks. The minimum net liquidity ratio of scheduled banks for borrowings at the bank rate from the Reserve Bank on Government Securities has also been raised under the new formula of the 17th February, 1965 to 30% from the former 28%. This therefore puts up the cost of borrowing for scheduled banks from the Reserve Bank, even beyond the 1% increase consequent on the increase in bank rate to 6%. A bank with a liquidity ratio of 28% would have to pay 7% on borrowings from the Reserve Bank against 5% before 17th February, 1965. With the ceiling raised to 10% and the curbs on advances that will be necessary for commercial advances, funds will be more costly and difficult to get in future. The new directives reflect the continuing concern of the Reserve Bank over price situation and have the objectives of curbing of bank credit and development of deposits of banks by attracting fresh money to the banking system by higher deposit interest rates. It is however too early to say what the effect of these measures would be on the country's economy. As far as some of the old directives issued by the Reserve Bank of India are concerned, I feel that it is high time some of them particularly in connection with the advances on food-grains are reconsidered. The impression that bank advances have encouraged piling of food stocks or speculation in these commodities is, in my opinion, not borne by actual facts. Advances on food-grains (including paddy and rice, wheat, grams and other grains) have been going down steeply from year to year as can be seen from the fact that bank advances on foodgrains which were Rs 28.23 crores in October, 1962 declined to Rs 22.37 crores in October, 1963 and Rs 13.24 crores in October, 1964. Unless Banks can provide the finance to the merchant class to hold stocks to meet seasonal needs, the wide fluctuations in the prices of commodities from season to season cannot be avoided. In view of the fact that the Food Corporation has come into existence and banks in the country are interested in financing the food trade, I should think that the Reserve Bank directives in the matter of advances on foodgrains could be removed so that banks may be enabled to participate in the trade and help stable prices.

Lastly, I would like to convey my special thanks to all our valued customers for their continued patronage, to the Bank's Directors and shareholders for their enthusiastic support and to Sri T A Pai who as the Bank's Managing Director upto the end of 1964 spared no pains in building up this institution from year to year. I am also deeply appreciative of the services of our staff members and particularly of Sri K K Pai, Chief Officer. I am sure, with the continued enthusiasm and dedication of the members of the staff, the Bank will reach new heights during the year, and its 40th year will be one which will bring greater success and more avenues for service to it, so that the Syndicate might continue to be an institution working for public good and the economic prosperity of the Country.

Guest, Keen, Williams

WITH the final dividend raised by one per cent to seven per cent Guest, Keen, Williams is paying a total of 13 per cent for 1964 compared to 12 per cent paid a year before. But in view of the bonus shares issued last year the total distribution will cost the company nearly Rs 20 lakhs more than the amount disbursed a year ago. In spite of this it has been possible to transfer an almost equally higher amount to general reserve.

The preliminary profit figures for the 53-week period ended January 2, last, show advance in pre-tax profits of the order of 47 per cent from Rs 2.15 crores to Rs 3.16 crores. Out of this, Rs 6.66 lakhs have been taken away by debenture issue expenses on which account there was no expenditure last year. The smart rise in profits has invited a higher tax charge of Rs 165 lakhs against only Rs 136.59 lakhs, which also included Rs 26.34 lakhs being the tax on last year's bonus share issue. A sum of Rs 7 lakhs, against Rs 6.77 lakhs, is credited to taxation equalisation reserve but then Rs 13.64 lakhs have been withdrawn from excess tax provisions for previous years and additional taxation reserve from which the previous year's write-backs amounted to only Rs 2.12 lakhs. After these adjustments, the surplus is nearly a half crore more at Rs 124.06 lakhs against Rs 74.15 lakhs previously.

Allocation to debenture sinking fund is Rs 5 lakhs against Rs 5.05 lakhs but development rebate reserve claims Rs 13.75 lakhs against Rs 2.17 lakhs, which was the net appropriation after setting off Rs 4.77 lakhs being the development rebate reserve written back in respect of plant and machinery sold last year. The interim dividend already disbursed at 60 P absorbed Rs 37.93 lakhs (Rs 25.20 lakhs) and the proposed final should take away Rs 44.25 lakhs (Rs 37.93 lakhs).

United Bank of India Limited

Dr Dutt's views on Development Bank

Link Between Bank Rate and Deposits Rates Advocated
Budget Proposals Welcomed

THE following are excerpts from the speech delivered by Dr S B Dutt, Chairman United Bank of India Ltd, at the Annual General Meeting of the Shareholders of the Bank held on 29-3-65 at Calcutta.

Gentlemen,

It gives me great pleasure to welcome you all to this 15th Annual General Meeting of the Bank. The Directors' Report, Balance Sheet and Profit & Loss Account have been with you for quite some time and I am sure you have studied them with interest.

Since we last met the country has suffered a great loss in the death of Prime Minister Jawaharlal Nehru. Not only India but the world at large has deeply been feeling the void caused by his demise. The best and most lasting memorial that his grateful countrymen can erect to perpetuate his memory will be by ceaseless and rational endeavours to achieve the goal he had set for an integrated and economically prosperous India at peace, and on terms of friendly co-operation with the nations of the world.

Bank's Progress

It is satisfactory to note that the interim target for deposits for the year 1964 set by the Chairman in his statement to you last year at Rs 85 crores has been exceeded by over Rs 3 crores. We are confident that with the continued support from all quarters that we have been receiving, the target of Rs 100 crores of deposits set for the two-year period ending 1965 will also be fulfilled well before the year is out.

Operating Costs

Despite the growth of working fund exceeding Rs 97 crores achieved in 1964, the year has been one of strain, due to a sharp rise in operating costs. The establishment cost of the Bank has gone up by Rs 45 lakhs to Rs 2.36 crores, representing a rise of 23.5 per cent over the year. At the same time interest paid on deposits by the Bank during recent years has been rising steadily. There have been further upward revisions during the later part of last year and early this year.

New Head Office Building

I am happy to report that satisfactory progress has been made with the preliminary arrangements in connection with the construction of a multi-storeyed building on Old Court House Street at the site acquired last year. Demolition of the existing structure on the site was started during the year and the work is progressing satisfactorily. It is proposed to lay the foundation stone within the next few months and to start construction during the year.

Staff Training

In order to cope with the expanding business with the complexities that are developing every day, it becomes incumbent on the Bank to provide suitable training to its managerial and clerical staff at all levels. With this end in view, a Staff Training Centre has been established by the Bank at Calcutta last year. The Centre is making satisfactory progress.

Economic Situation

The economic situation prevailing in the country has for the past few years been characterised by the twin factors of sluggishness and rising price-level. The rate of growth of industrial production has slowed down and the situation as regards agricultural production is, if anything, less happy. The capital market is practically stagnant. Both the existing and the new enterprises are finding it difficult to raise resources from the capital market. The underwriters are heavily committed to the extent of straining their resources.

Whatever may be limitations of the stock exchanges and their importance in indicating the economy's mood in general, I believe that they have a very important place in the country's economy, more so when the rate of capital formation plays such a crucial role in achieving economic development. I would therefore urge on all concerned to take measures to reactivise the stock exchanges in the country.

Development Banks

I would like to make a few observations on the functioning of development banking in general in the country. As is well known, before taking a decision to assist an industrial project, development banks evaluate its potentialities from all possible aspects. It so happens that in a number of cases unforeseen difficulties of various kinds crop up in the implementation of such a project. It must be accepted that these unreckoned-with difficulties arise due to factors beyond the control of entrepreneurs, technicians or financiers. When such a situation develops, there is a feeling that the development banks get hesitant, particularly so when further financial help is required to overcome the unanticipated difficulties.

Such obstacles are perhaps inherent in the process of industrialisation which we have undertaken. It would therefore be unfortunate if development banks took a gloomy view of the entire project when faced with such unforeseen difficulties and hesitated to extend further assistance vitally required to overcome them successfully. While the attitude of development banks is understandable to a certain extent, it would appear to strike at the very root of the objectives of a development bank which should be to nurse a project and bring it to fruition at the earliest. It is hoped that such hesitation on the part of development banks will gradually wear out. One would further wish that this process were expedited. For until then — and in the context of the present dormant state of the capital market — new entrepreneurs with limited resources will be deterred from coming up with new ventures and the field will continue to remain with the established houses alone.

Term Loans

A word here about the role of commercial banks in providing term finance may not be out of place. We have always believed that the role of the commercial banks in extending long-term finance should be limited. For, besides the question of the short-term nature of their liabilities, the demand on the resources of commercial banks for meeting working capital requirements of industry and trade has been increasing at a faster rate than that of the growth of their resources.

Another significant development in industrial financing must be borne in mind. As I have already stated earlier, it has lately been noticed that for various reasons the gestation period of an industrial enterprise tends to be longer than that envisaged at the commencement on strict technological considerations. The original financial estimate thus gets upset and the enterprise is faced with the problem of finance to tide over the period, until eventually it is able to obtain adequate funds either from a development bank or through the capital market or both. It is at this stage that the role of commercial banks in providing temporary financial assistance becomes more important than that of providing term finance generally. It is, therefore, essential for the health of industrial financing that the role of commercial banks in normally extending term loans to industries be restricted.

Agricultural Finance—Role of Banks

Naturally, in view of the crisis on on the food front, thoughts have turned to the role of commercial banks in financing the agricultural sector. In this field besides financing the movements of agricultural commodities, banks also render assistance to plantation industries like tea, coffee, sugarcane, etc, but their assistance to the producers of foodgrains has remained limited. There are valid reasons for this. Primarily, agricultural activity has still not been able to shed its characteristics as a subsistence and unorganised activity, and coupled as it is with a high degree of dependence on weather, it remains a great financial risk. In addition, as a policy measure the co-operative credit structure is being evolved precisely for meeting the financial needs of this sector. In fact, financing of agricultural activity is believed, as it were, to be an exclusive field for the co-operative credit system.

It is not, therefore, that banks are unwilling to play their role, but the conditions to enable them to do so are non-existent. If like plantations, the entire agricultural sector could be placed on an organised and market-oriented basis, the pre-conditions for commercial banks' assistance would be created.

Monetary Policy

Among the more recent events, the one which interests and affects us greatly was the package announcement in February this year of a rise in the Bank Rate to 6%, increase in the liquidity ratio for the purpose of Reserve Bank's lending to commercial banks, a higher ceiling rate for loans and advances and prescription of interest rates for various categories of deposits. Not only has the availability of the resources from the Reserve Bank been restricted, but its cost has also been increased considerably.

The price situation which has been aggravated by a sharp rise in foodgrains prices is a resultant of a number of variables, important among which is the position of supply. It is admitted on all hands that inadequacy of supply, coupled with absence of rational pricing policy and proper distribution arrangement, caused the acute price situation in the natural course of events. Unlike other advanced countries, in the pattern of consumption discretionary spending is practically absent in the budget of the average person. Food still dominates the consumption pattern and therefore hardly allows for any adjustment. What appears, therefore, as an inflationary situation as reflected in the rising price level is not likely to have been generated by monetary developments. Under these circumstances, whether the monetary measures adopted are likely to help to any significant extent in controlling the price situation remains an open question.

Implications of High Rates of Interest

In the present situation a higher structure of interest rates will add to costs all round and will result in higher prices to that extent. It also affects the capital market adversely inasmuch as the expectations regarding return on capital also has gone up, to fulfil which the profitability of capital has to rise, perhaps more than proportionately. If in such a situation fresh capital has to be raised, the enterprise will have to ensure a higher dividend than that possible at present, — which seems uncertain — and the public response may not be any better than that currently experienced.

It may seem conceivable that economy in the use of capital resources could be induced by higher structure of interest rates. It may also be possible that such a structure of interest rates could lead to a more rational pattern of investment. However, in the context of a comprehensive system of control on the use of capital resources and a directed pattern of investment in accordance with the predetermined social and economic goals, the instrument of interest rates loses much of its allocative efficacy. It is therefore to be hoped that the Bank Rate may soon be revised downward from its present high level.

Deposit Rates

While these measures were adopted in the monetary spheres, an unusual step was taken in that minimum rates were specified in the matter of interest which the banks should offer for deposits of various periods, beginning with deposits for 91 days and over. Interest rate on Savings Bank Deposits was fixed at 4 per cent. It was only last September that the Reserve Bank had prescribed maximum rates of interest for various types of deposits not exceeding 90 days. The present measure is unprecedented inasmuch as (a) the rates prescribed cover both notice-money and term deposits, and (b) the term deposit rates prescribed are the minima.

Such a step will adversely affect bank-profitability. The need for strengthening the banking system by a greater plough-back of profit is today very important, particularly in view of the functional and geographical expansion of banking services. As a result of rising establishment costs, much of which are linked with the price level, the profitability of banks has already been adversely affected. The lower the profitability the lesser is the ability to plough back earnings. This development also limits the ability of banks to raise fresh capital funds.

The differential between the average rates of interest on advances and deposits is a very important factor to be borne in mind. This differential, low as it already was, has further been reduced by the impact of the present directive. It must be remembered that the structure of deposits has undergone a change during the past few years and that savings and time deposits are disproportionately high. Any upward revision of the rate of interest on such deposits is bound to have a much greater impact on the differential I have referred to than what would appear on the face of it.

Today, as the situation exists, the rate on one-year deposit is equivalent to the Bank Rate. It is rather a high level. I believe that there is a limit beyond which any increase in deposit rates will fail correspondingly to mobilise fresh deposits; on the other hand, it will cause a net adverse effect on banking operations. In other words, there is a range within which interest rates could be moved with some advantage. But when it exceeds the upper limit the advantage, if any, is negligible, while its impact on the costs of banking services becomes disproportionately high.

It is therefore that one feels the need for an early establishment of some orderly relationship between the Bank Rate and rates on bank deposits, so that it would not upset expectations and create uncertainty when lowering of the Bank rate causes a lowering of deposit rates. In the U K maximum deposit rate is 2 per cent below the Bank Rate. In India the rate on one-year deposits at least should bear a similar relationship and be kept at 1 per cent below the Bank Rate. Rates on deposits of other maturities could then be adjusted correspondingly.

Fiscal Policy

It gives me pleasure to say that the budget for 1965-66 presented to the Parliament is the first, in recent years, to have shown a small surplus. More than the amount of surplus, the significance lies in the fact that deficit financing, for the time being at least, has been avoided. At the same time disguised deficit financing, undertaken via subscription to Government loans by the Reserve Bank, will be restricted, if not eliminated altogether.

It is also significant that the contribution which indirect taxes have been making to the high level of costs and prices prevailing in the economy is recognised, and by reducing or repealing excise duties on a number of articles, it is sought to exert a downward pressure on prices. Similarly, the adverse impact of the very high level of personal taxes is also taken note of and steps have been taken to reduce the burden at all income levels. In the field of corporate taxes, recognition has been accorded to the role of tax reductions in increasing industrial investment, production and exports.

It may be that the budget as a whole has not come up to the expectations held by certain quarters. The principle of selectivity that has been adopted for providing incentives may appear to be unsatisfactory. However, one feels that perhaps it was not possible to do more than what has been done, particularly when action is required on several fronts simultaneously. On the part of business and industry, apart from the monetary value of the concessions and reductions, the budget should serve as a symbol of the Government's policies which will be geared towards achieving higher development all round. I earnestly hope that this recognition will be allowed to take its logical course in the form of further relaxations and modifications as and when time and circumstances permit.

Before I conclude my remarks this morning I would like to express my thanks to my colleagues on the Board for their co-operation; to the members of our Advisory Committees for their support; to the Managing Director, senior officers and all other staff members for their services which have resulted in a year of satisfactory progress. I also thank you all for coming to the meeting and giving me a patient hearing.

(NOTE : This does not purport to be a record of the proceedings of the Annual General Meeting).

Asian Cables Corporation Limited

Address of the Chairman Shri Girdharlal B Kotak

THE following is the Address of Shri Girdharlal B Kotak, Chairman, Asian Cables Corporation Limited, at the Fifth Annual General Meeting of the Shareholders of the Company held in Bombay on March 30, 1965 :

Friends:

Immediately after the conclusion of the last Annual General Meeting at which we met in April 1964, the country suddenly experienced a shock in the sudden and sad demise of our beloved late Prime Minister, Shri Jawaharlal Nehru. Our countrymen were never accustomed to the thought of being without Shri Nehru at the helm of our country's affairs. We felt so secure and safe with him, in our midst, that even when the Chinese horde suddenly rolled down the Himalayas, in surprising blitz-krieg advance on Assam, we never felt panicky.

The Country has shown remarkable sense of discipline and responsibility, immediately after Shri Nehru's sudden demise, in rallying round and electing Shri Lal Bahadur Shastri as our next Chief to guide the destinies of the Country, in such tumultous and troublesome times, as we have at present.

Although the Annual Report and the Statements of Accounts of the Company for the year ended 30th September 1964, try to show the final results of the working of the Company during the year under report, I maybe permitted to observe that they do not tell a complete story about the trials and tribulations an industry has to undergo during its working, especially at a time when the country's whole economy is working under every severe strain. Contrary to the expectations of the last year, the depression in the markets, which had shown itself consequent upon the large scale aggression on our frontiers, did not lift up completely. The sudden steep rise in the prices of raw materials and food stuffs due to inflationary pressures resulted in large scale unrest in the labour situation.

There was difficulty also on account of a further change-over from copper to aluminium in some more varieties of cables under the directive of the Central Government. Any such radical change adversely affects the efficiency and production. Now the third change-over, and let us hope the last of the changes from copper to aluminium in the small sizes of Rubber or PVC Insulated became effective on 1st January, 1965. With every change from copper to aluminium it is observed that while the reputed manufacturers abide by the change faithfully, still large stocks of cables with copper conductor are available in the market for a long time. With the normal customer's preference for cables with copper conductor, the production and sales of cables with aluminium conductor are slow.

Added to this is the tightness of the money market and the capacity of

the market to hold stocks and pay for the same on due dates. I am afraid the dearer money policy will have an adverse impact on production.

Unfortunately, there were two strikes during the year under report, one in January 1964 for 15 days and another at the end of our Financial Year in September. But for these strikes the result would have been different from what has been presented to you. During the first five months of the current year, we have been able to sell VIR and PVC cables worth Rs 52 lakhs as against 25 lakhs in the same period last year. We have on hand orders for about Rs 45 lakhs. We can therefore safely expect to sell over a crore worth of cables of Project I during the current year. At the same time I must confess that in the domestic markets so far as products Project I are concerned, there will always be much competition and very little margin; but I am quite confident about the products of Project II, which should handsomely supplement the meagre margins of Project I. We have already sold in advance power cables both PVC and PILC, the products of Project II, amounting to about a crore and thirty lakhs.

Project II—Power Cables

(a) One section for the manufacture of PVC Power Cables is ready and we hope to commission the Plant by the middle of April 1965. The first programme of manufacture will be Unarmoured PVC Cables. As soon as the operatives are trained, we shall go into manufacture of the armoured type Cables and also bigger sizes.

(b) The installation of all types of equipment for the Paper Insulated Power Cables upto 33 Kv is nearing completion. We expect that by June 1965, we shall be commencing trial runs on the manufacture of bigger types of cables.

(c) For both PVC and PILC Power Cable manufacture we have already got a team of 11 Indian Technicians, who were trained in our Collaborators' works in England. In addition our foreign collaborators will be sending their team of experts to assist the Company in starting up manufacture and training the operatives.

Magnet Wire

The main equipment for the Magnet Wire Plant consisting of the ovens have now been received and installed. This section will also be ready for commencement of trial production by July 1965 and production of marketable quality during August of this year.

Export

During the year under report we have started export of our cable products. We are working hard on it in order to earn the much needed foreign exchange for the country and, as far as one can see, larger turnover is expected during the current year. The great handicap to our export is the high cost of raw materials which goes into making the cable. For example Polyvinyl Chloride (PVC) costs to the foreign competitors Rs 2,200 per ton while the indigenous PVC costs Rs 7,300 per ton i e, 232 per cent higher to the Indian Cable manufacturer. I would urge on the Government that the raw materials required for export should be supplied to the manufacturers at the international prices; for this purpose, the indigenous manufacturers of raw materials may be given a subsidy wherever necessary. This will enable the manufacturer to cut down the cost of cables for export.

In order to regularly supply engineering industry with imported raw materials like copper, zinc, tin, lead, etc, I endorse a suggestion that there may be some Government agency—it may be the State Trading Corporation or a special bank for the purpose which may import such raw materials, stock them and supply to the industry according to their requirements. This will reduce the inventory carrying cost which comes to 6 tp 7 per cent; this is quite large as you will see from the increased amount of interest charges in the balance sheet. Such an arrangement will avoid shortages and surpluses in raw materials, both of which are not in the interest of the industry; and at the same time ensure a smooth flow of raw materials. It will greatly benefit the industry and the country.

You will see under column I of the table that production of VIR and PVC Cables is 172 million core yards within six months. Within 12 months the production may be expected to be about 400 million core yards. This is very much less than the plan production target of 600 million core yards. Even at this low production the market is full of stocks and the demand is not able to absorb even this below-the-target production. It would, obviously, appear that the planned targets were too optimistic. The Industrial Licences, unfortunately, have been issued on that basis and therefore, there is unused capacity in the industry for VIR and PVC Cables.

I have attempted here to give a picture of the cable industry in general and the working of our Company. I am fully conscious that the results have not been satisfactory; but I now feel that we have almost turned the corner and I hope that I may be able to give you more cheerful account at the next meeting.

Note: This does not purport to be a report of the proceedings of the Meeting.

Targets for Required Capacity and Production of Cables in the Third Five Year Plan

Particulars	VIR/PVC Cables *(in million core yards)*	Power Cables (PILC & PVC) *(Miles)*	Winding Wires *(Tons)*
(1) Capacity—Target for 1965-66	800	4,500	32,000
Licensed to November '64	1,123	5,746	28,529
(2) Production—Target for 1965-66	600	4,000	24,000
Actual half year April-September '64	172	1,408	4,600
(3) Estimated requirements 1970-71	1,531	15,625	55,000

Kamani Engineering Corporation Ltd

A Successful Year of Working

Chairman Shri R H Kamani Outlines Expansion Programme

STATEMENT of Shri R H Kamani, Chairman, Kamani Engineering Corporation Ltd at the 19th Annual General Meeting of the Shareholders held in Bombay on 30th March 1965.

I take great pleasure in welcoming you all here today to this 19th Annual General Meeting of the Company.

The past year has been a very critical one for the country. We lost our beloved Prime Minister Jawaharlal Nehru. Tributes to his memory from all over the world bore an eloquent testimony to his greatness. Shri Nehru was one of the principal architects of our Independence on whom fell the glorious task of piloting the nation through the formative years on the morrow of independence. The void created by his death will not be easy to fill. All of us must, therefore, exert ourselves to the utmost to extend and enrich the efforts for the improvement in the standard of living of the people. We can take some comfort from the orderly transition to the post-Nehru era which many had feared would be extremely difficult. We offer our heartiest congratulations to Prime Minister Lal Bahadur Shastri and his colleagues and wish them all success.

Agriculture and Industrialisation

The year was marked by a severe food crisis the like of which had never been seen before. We have just perhaps turned the corner of the critical situation. While on this topic of food problem, it is important to understand that any significant increase in agricultural productivity is now very much dependent on industrialization. The complementary character of industrialization to agricultural development needs to be fully realized. Rural electrification can play a very useful role in facilitating the use of modern technology by our agriculturists. By promoting the spread of electrification our company is not only assisting the efforts for industrialization but is also supporting in a very substantial manner the efforts of improving agricultural productivity and raising the standard of living of the people.

Rising Prices

Rising prices have become a source of constant worry to the nation. Commerce and industry are immediately affected by rising prices, which induce costs to go up generating friction between employers and workers, lowering productivity, affecting industries' competitive capacity and weakening export efforts. Our company has had to pay Rs 2,34,000/ more as a result of increased cost of living during the year under review. The Planning Commission and Government have often spoken of the need to keep prices under check. In practice, however, this objective has not been achieved. It is to be hoped that the Government will now give a more serious thought to this aspect of the economic problem. In our company we are doing everything possible to keep prices down, despite the rising costs of raw materials and labour. Between 1954 and 1964 the basic cost of steel alone went up by Rs 287 per tonne from Rs 433 to Rs 720. Yet the selling price of a tower increased only by Rs 100 during the same period. This was possible only by the success in our constant efforts to reduce costs through improved designs and better mode of working.

Working of the Company

The company did well during the year under review. The company earned a gross profit of Rs 35.04 lakhs during the year ended 30 September, 1964 against Rs 32.24 lakhs in the previous year.

The dividend was maintained at the preceding year's level at 12 per cent.

Allocations include Rs 2.27 lakhs for the Managing Agents' remuneration as against Rs 3.04 lakhs in the previous year, and Rs 7.49 lakhs for depreciation as against Rs 6.55 lakhs. The estimated tax liability will be Rs 16.60 lakhs against the provision of Rs 21.50 lakhs made in the previous year.

The development rebate absorbs Rs 36,000 against Rs 37,000 in the preceding year. The net allocation to the General Reserve has been raised from Rs 5.15 lakhs to Rs 6.15 lakhs. The company can confidently look forward to the future since the extension of the electrification programme will naturally result in an increased demand for the supply of transmission line towers. Transmission of high voltage electricity over long distances is a very difficult task and can be handled only by companies having adequate technical skill and manpower. The creation of the zonal power grids and the national power grid will increase the demand for such long distance transmission of high voltage electricity. The experience gained by the company in the field during the prevoius decades places the company in a particularly favourable position to handle such difficult jobs which are vital for the nation's progress.

Steel Structures and Erection

The production of galvanized and painted steel structures during the year under review was 18,248 tonnes which is almost the same as that of the previous year. Production could not be increased further as the company continued to encounter difficulties in getting tested steel of required sections.

Sales of factory products and erection work undertaken during the year amounted to Rs 3,95,13,965.

Orders on hand for towers and structures at the end of the year were 45,422 tonnes and for erection of transmission line, the pending orders were 3,597 kilometres.

Railway Electrification

The Indian Railways have spent about Rs 110 crores on electrification of tracks during the last 40 years, but still the programme is reported to be 20% behind the target. Our company has been entrusted with the work of railway electrification for 370 kilometres in Group 18 of the scheme of railway electrification from Igatpuri to Nand-

gaon. During the period of the fourth Five Year Plan 3,348 route kilometres (6,975 track kilometres) of railway are proposed to be electrified. With the achievement to its credit our company can confidently look forward to playing a very substantial role in railway electrification during the next plan period as well.

Ropeway

The company has also secured an order, in collaboration with the well-known German firm of M/s Pohlig-Hecle Bleichert Vereinigter Maschinenfabriken Ag for the installation of a ropeway from Chasnalla to Burnpur for the Indian Iron & Steel Co Ltd for a distance of 60 kilometres. The ropeway will have a carrying capacity of 450 tonnes per hour and will be the heaviest ropeway in the world for the distance covered.

Road Rollers

Due to the very considerable increased interest and demand for "Tractamount" Road Rollers, a separate Department was constituted in June 1964 to look after planning, production, and sales of road rollers.

The number sold in the six-month period ending 30 June, 1964 was the highest for any previous half year.

I am pleased to announce that the production during the half year ending December 31, 1964, left the previous record figure far behind.

Plans are now in hand for considerable expansion of the Tractamount road roller department with an annual production of 300 road rollers as the target.

Expansion Project

The company has decided to raise its annual production capacity from 24,000 tonnes to 60,000 tonnes. The expansion project consists of modernisation and expansion of the existing plant at Kurla, Bombay, so as to raise its production capacity from 24,000 tonnes to 30,000 tonnes per annum, and the installation of a new plant at Jaipur in Rajasthan with a capacity of 30,000 tonnes per annum. The total capital expediture for implementing the expansion programme in Jaipur and Bombay is estimated at Rs 170 lakhs. Applications for raising long-term loans to the extent of Rs 98 lakhs including the foreign exchange requirement are being made to the financing institutions and the balance will be arranged from the company's internal resources. The company has already purchased about 50 acres of land at Jaipur West Railway Station and the development on this is now in progress. A new office has been opened in Jaipur to look after the work of expansion.

Testing Tower

The tower testing site at Bombay was dismantled under terms of an agreement signed with the Central Government on 17 June, 1964. The company has already received from the Government Rs 4.50 lakhs by way of compensation and expects to receive a further sum of Rs 1.50 lakhs on the completion of the construction of the new tower testing station at Jaipur.

Exports

The value of exports of engineering goods from the country had gone up from Rs 13.47 crores in 1963 to Rs 16.86 crores in 1964.

Our company has played a creditable part in promoting the export of the non-traditional goods from India. The company executed orders from the Philippines which included designing, testing, manufacturing and shipping, in the record time of seven months. The Nigerian Government order for the supply of 132 KV Transmission Line Towers was also executed for the most part. Earlier, the company had exported its products to Canada, New Zealand, Thailand, Taiwan, West Indies and Tanganyika. The company's growing maturity in the export field is shown by the fact that these orders were secured by the company in face of stiff competition from suppliers from other countries.

In the field of export, however, the company has suffered from several handicaps. Only a limited range of steel sections is rolled in India as compared to a much larger range produced in other countries. As the Indian tower designer has thus to limit his designs to the available sttel sections, he is compelled to make use of heavier sections, unnecessarily adding to the weight of the towers. As towers are repetitive structures required in large numbers, any undue increase in weight will inflate the cost and reduce the competitive appeal of Indian-made structures.

Agency Activities

The working of this department has shown a tendency towards reduction in turnover. However, the commission earned during the year is Rs 10,53,559, only about Rs 50,000 less than the commission earned last year.

As you are aware, the company in its general meeting held on 28 December 1964, decided, subject to the approval of the Central Government, to subscribe to 25.5% of the paid up share capital of Rs 60 lakhs in a company to be jointly floated by Andhra Pradesh Industrial Development Corporation Ltd for the manufacture of porcelain insulators. The proposed investment would enable the company to increase its agency activities by selling the insulators which are likely to have an ever-increasing demand in the country. This will be in addition to the advantages and profit the company will be able to earn as shareholders.

Research and Development

Continuous importance has been attached to research for evolving lighter towers and structures and lower production cost. One of the designs is the 450 ft high All India Radio supporting mast using box type sections. The company has also made its humble contribution to the defence preparedness of the country.

Personnel

The growth of every organization is vitally dependent on the human element. The company continues to have excellent relations with workers and members of the staff.

The relations with workers were subjected to some strain as a result of the events following the company's appeal to the Supreme Court from Part II of the Tribunal's award and the closure of the Heavy Shop for want of orders. After this temporary set back, the relations between management and labour have steadily returned to normalcy and in fact, production during the last four months has reached new heights.

I should like to express my sincere appreciation of the loyalty of our workers, members of the staff, officers, and executives.

Thank you.

AROUND BOMBAY MARKETS

Dalal Street at New Low

Wednesday, Morning

DALAL STREET had a very uneasy time last week and it was forced to beat a fresh retreat which took it well below the lowest level recorded in the previous year. Earlier in the week, sellers dominated the scene most of the time and stockbrokers reported considerable distress selling. The market was in real panic on Saturday, March 27, when it made the week's low. Losses were heavy and widespread, with both forward and cash scrips faring equally badly. To mention a few shares, Century which had been quoted around Rs 552 a few days earlier were sold down to Rs 526 on Saturday and during the same period Kohinoor moved down from Rs 315 to Rs 300, Standard from Rs 484 to Rs 414, Indian Dyestuff from Rs 207.50 to Rs 175, Tata Locomotive from Rs 255.50 to Rs 246, Voltas from Rs 249 to Rs 240, Indian Iron from Rs 24.60 to Rs 23.84, Tata Steel from Rs 143.25 to Rs 140, Gwalior Rayon from Rs 40 to Rs 36.20 and SLM — Maneklal from Rs 127 to Rs 117. With the fall exceeding 10 per cent within one settlement, Standard and Indian Dyestuff came under interim margin. National Rayon which have been under strong bull manipulation since long — one operator is reported to have accumulated about 1 lakh shares, including 60,000/65,000 shares of which he has taken delivery — were also marked down from Rs 400 to Rs 387 but they staged a quick recovery later. The strong bull manipulation in National Rayon has been an important topic of discussion in market circles and it has received the attention of the authorities. The Stock Exchange President has been authorised to impose an additional margin on National Rayon if he considers it necessary in order to safeguard the solvency of the market.

The stock market's performance could have been much worse if the Life Insurance Corporation had not accepted large parcels of certain important shares offered to it during the week. Market reports suggest a large amount of dis-investment by some big holders for one reason or another. Apart from frequent disturbing reports about firing by Pakistani troops on the borders, trading sentiment last week was greatly unsettled by the disappointment over the meagre concessions announced by the Finance Minister at the end of the four-day debate on the Budget in the Lok Sabha. It appears that even though Shri B R Bhagat and Shri Krishnamachari had cautioned against optimism about tax relief the stock market had continued to hope that scared by the slump in equity values T T K would probably give in and modify the tax proposals which were particularly significant from the market's point of view. Official explanations that the Budget proposals provided additional incentives for the growth of the corporate sector failed to cheer the market.

The stock market is not unaware of the various concessions that the Budget provides for the development of the corporate sector. It is also fully aware that by and large the corporate sector is doing better than before. If equity prices have continued to decline despite all this it is mainly because the average yield on equities is still unattractive in the context of the prevailing interest rate structure, let alone the far more remunerative use of funds in other fields of activity. While there is a great deal to be said in favour of modifying the dividend tax and the capital gains tax on bonus shares for providing the badly needed psychological boost to the investment market, it would be too much to think that fiscal concessions alone can revive confidence in the capital market.

Near the week-end equity prices staged an all-round small recovery from Saturday's lowest levels due mainly to heavy short covering. Technical considerations apart, trading sentiment near the week-end was helped by encouraging corporate news from Century Mills and Mahendra Electricals. Reports suggesting an early cease-fire on the Cooch-Behar-Rangpur border had also a steadying effect on the market. In view of precipitous fall in prices over the past few weeks, it is quite possible that the market might pause here for necessary technical adjustments. But prospects of any sustained recovery from the current levels do not appear very promising.

COTTON

Futile Controversy

THERE seems to be no end to the controversy that has been raging for quite some time between the Indian Cotton Mills' Federation and the cotton trade over the purchase of Cambodia cotton. The controversy has arisen mainly because of the Federation's insistence that the offer for sale at 5 per cent below the appropriate ceiling should be made on a firm basis. But why not? If the traders feel that they can secure a better price than what they are likely to get from the Federation why need they make any offer to the Federation at all. The traders are quite free to market their product elsewhere. Growers and traders should, in fact, thank the Federation that it is willing to stand by its commitment, made on its own accord without any legal sanction behind it, to purchase all the cotton offered to it during the season at 5 per cent below the ceiling. The more so, when growers and traders cannot be said to have co-operated well with the Federation in making available to the mills cotton at ceiling prices when cotton could be easily sold (and it was being sold at huge premiums) above the ceilings even though it meant contravention of the Price Control Order.

It is reported that the East India Cotton Association is seeking the intervention of the Textile Commissioner to settle the dispute. It will be interesting to see how the Textile Commissioner who had miserably failed to check the rise in prices far beyond the ceilings will intervene when normal market forces have produced a normal decline in prices. Surely, the entire crop cannot be expected to be marketed at the ceiling.

Surprisingly enough, growers have begun to regard ceiling prices as virtual floor prices. Maybe, ceiling prices of cotton do not compare favourably with the prevailing prices of other agricultural commodities. But that is an entirely different issue and it calls for a different approach. Discussions at the Cotton Advisory Board's meeting in Bombay on March 30 indicated that cotton trade, textile industry and cotton growers — all would like to have the existing ceilings and floors scrapped and have only support prices fixed instead. Cotton growers' representatives are reported to have made the further suggestion that if the proposal for fixing only support prices is not found acceptable then the ceiling prices should be raised by 15 per cent and the floor prices brought up to the level of the existing

ceilings. The Textile Commissioner is stated to have rejected the plea for doing away with the existing ceiling and floor prices. But no decision is known to have been taken on the growers' plea for an upward revision of the ceiling and floor prices.

Prices and Production

In the absence of any reliable studies of costs of production of various related agricultural crops, it is difficult to say whether or not the present ceiling prices of cotton are sufficiently remunerative to the growers and how these prices compared with the prices of other agricultural crops. But it is now common knowledge that Indian cottons are no longer cheaper than the comparable foreign cottons — they are in fact much costlier. And there is also not enough evidence to show that higher cotton prices have been of any great help in boosting cotton production over the years. The average yield of cotton in India has continued to be disappointingly low — the lowest in the world.

Although the recent decline in cotton prices should be generally welcomed if only for the smooth marketing of the crop within the prescribed ceilings, considerable anxiety has been expressed in various quarters and it has even been suggested that unless something is done to prevent the further decline in prices, cotton production will be adversely affected during the coming 1965-66 season. In order to encourage off-take, the Indian Cotton Mills' Federation has raised cotton stock-holding limits for Bombay and Ahmedabad mills from two months to three months and for mills in all other regions from four months to five months. And with a view to giving sufficient protection to ISC-67, Cambodia A and B varieties of cotton, the Textile Commissioner has raised the stipulation of 7½ per cent compulsory purchases of these varieties to 10 per cent by mills who had used Cambodia A and B cotton in the previous three cotton years.

The situation obtaining in Bengal Deshi is in sharp contrast to that in other cottons. Bengal Deshi prices continue to soar due to sustained strong overseas demand. Japan has continued to be a keen buyer of Indian Deshi and it has paid up to 28 d a lb for choice quality. Sales registered since the beginning of the season have exceeded 1.90 lakh bales.

OILSEEDS

Prices Harden Further

OILSEEDS prices last week showed a further hardening tendency due mainly to persistent talks that the Government would soon permit free export of vanaspati and allow a limited quota for groundnut oil. Trading sentiment was also aided by the spurt in the maturing contract in castorseed which shot up to Rs 215 (per 250 kgs) — the highest rate for many years. Castor March has risen from Rs 206 to Rs 215 within a fortnight mainly due to strong bull manipulation which has forced bears to cover their sales at rising prices. Bears have been obliged to cover their sales as they could not manage to tender goods even though the spot material has been available at or below the ruling prices of the hedge contract. Castor June firmed up from Rs 76.25 to Rs 78 mainly in sympathy with the March contract but later the quotation eased to around Rs 77 (per 100 grams). Linseed June improved further from Rs 86 to Rs 88.90 (per 100 grams) but later it receded to Rs 88 on profit-taking and modest bear pressure. While the distant contract ruled firm, the maturing March contract was depressed by nervous bull liquidation due to the pressure of deliveries. Linseed arrivals are steadily picking up with the result that linseed oil has been fluctuating between Rs 18 and Rs 17.25 (per 10 kgs) for several weeks. Movements in linseed and linseed oil are being guided mainly by the fluctuations in mustardseed and mustard oil prices. Mustard oil has been moving between Rs 22.50 and Rs 24.50 per (10 kgs) for some weeks; it had fetched a price of Rs 49 some months ago. Groundnut oil has been remarkably steady

between Rs 21.50 and Rs 21.80 for the past few weeks on sustained buying by vanaspati manufacturers.

The price trend in coming weeks is likely to be guided mainly by conjectures about the Government's export policy for vegetable non-essential oils. Prices are unlikely to register any appreciable decline so long as the uncertainty continues about the export policy. Prices are expected to record a marked rise if the Government decides to allow a substantial quantity of groundnut oil for export; a great deal will of course depend on the export incentives. If the Government desires oil prices to come down to more reasonable levels before permitting exports, it would be well-advised to announce that it has no intention to permit exports so long as the price of groundnut oil keeps above a particular level. Fortunately, the overall supply position of edible oils this season is fairly satisfactory and it may be possible to release some groundnut oil for export if speculative tendencies can be kept under check. About 10,400 tons of soyabean oil have already reached India and another 13,000 tons are expected before the end of April. The entire quantity of 28,300 tons of soyabean oil and 1,700 tons of cottonseed oil will reach the country before the end of May. Purchase authorisation for the remaining 45,000 tons of soyabean oil is expected to be issued shortly and this oil will reach the country in October and November which will ensure satisfactory supply of edible oils near the fag-end of the current season.

Export activity in groundnut extraction has continued to be restricted recently. Exporters seem reluctant to put through fresh business in the absence of details about the tax credit certificates which are to be given to exporters of various commodities. Exporters reported fair business in cottonseed cakes last week.

BUSINESS NOTES

Atul Products

THE 1964 results of Atul Products are good for more than one reason. According to the preliminary profit figures, sales and other receipts have shot up by Rs 1.78 crores, or nearly 37 per cent, to Rs 6.61 crores. Gross profit has advanced at a faster pace to show a rise of about 50 per cent to Rs 1.32 crores, reflecting increase in the ratio of profit margin to sales from 18.21 per cent to 19.90 per cent. If despite such a happy position the dividend rate is only maintained at 12 per cent, it is because the necessary provisions have taken away a much bigger chunk of profits leaving behind actually a lower net profit compared to the previous year's.

The provision for depreciation at Rs 75.39 lakhs is more than double the last year's provision of Rs 34.25 lakhs and that for development rebate at Rs 20 lakhs is nearly three times the amount of Rs 6.90 lakhs set aside a year ago. Thus, virtually three-fourths of the gross profit has been syphoned off by these two provisions. Consequently, the tax charge is halved to Rs 8.50 lakhs, but even then the remaining profit is lower than last year's. Accordingly, the directors have withdrawn from reserves Rs 11 lakhs, Rs 8 lakhs more than in the last year. With the addition of Rs 0.37 lakh, being income-tax refund, as against Rs 3.54 lakhs being excess provision of income-tax for previous year written back, the total for disposal comes to Rs 39.05 lakhs compared to Rs 36.32 lakhs. Of this, the proposed unchanged dividend should absorb Rs 38.90 lakhs against Rs 36.74 lakhs. The increase in the total disbursement has resulted because of a higher payment now due on the partly-paid shares which have become entitled to a full year's proportionate dividend instead of only three months last year.

Larsen and Toubro

TO acquaint its shareholders with the expansion in its manufacturing facilities and the increase in its range of products, Larsen and Toubro invited some time ago some of its shareholders to its Powai estate, wherein are also situated the workshops of its subsidiaries, Alu Capsules and India Crown Cork Company and of its associate, Audco India. The company's chairman, H Holck-Larsen, told the shareholders that since their last visit in February 1962, an additional sum of Rs 1.12 crores had been invested by the company in its own workshops at Powai alone and that the estate produced engineering goods of the value of over Rs 5 crores per year.

Across the road from its present Powai estate, at a 36-acre site called "Powai East", the company will commence the building of additional manufacturing facilities for its own use and for that of its associate company, Tractor Engineers, which has been formed on a 50 : 50 partnership basis with Caterpillar Overseas S A, and in technical collaboration with the Caterpillar Tractor Company of U S A. Caterpillar is a leading manufacturer of earthmoving machinery with total sales last year of more than one billion dollars. Tractor Engineers, which has obtained a Cooley loan from the A I D, is manufacturing undercarriage parts for crawler tractors.

Commenting on the likely effect of the new Budget proposals, Holck-Larsen said that it would not have any marked effect on the company. He said that all the plants were working to full capacity. Output and sales and also profits were likely to be higher in the current financial year. A total turnover for Larsen and Toubro, its subsidiary and associate companies, of about Rs 18 crores had been forecast for 1965-66. The new debenture issue of Rs 1.75 crores would take care of the company's requirements for finance for its expansion plans during the next two years or so. The company might come out with a new rights issue in the future, he said.

Henley Cables

LOOKING to the keen competition and other difficulties experienced by the cable industry, Henley Cables India has shown a distinct improvement in its results for the year ended October 1964. The company's sales turnover has risen by 20 per cent to around Rs 75 lakhs on which it has earned a profit of Rs 3.20 lakhs compared to a loss of Rs 3.46 lakhs incured a year ago, without charging depreciation. After providing Rs 6.50 lakhs for depreciation for 1962-63, a loss of Rs 14.36 lakhs is carried to the balance sheet as against a loss of Rs 11.07 lakhs carried a year ago. No provision has been made for depreciation for the year 1963-64 which is estimated at Rs 6.74 lakhs.

Bank of Baroda

R D Birla has been unanimously appointed chairman of the Bank of Baroda. He succeeds Tulsidas Kilachand, who resigned earlier this year.

R D Birla is the managing director of Birla Brothers and chairman of Century Spg & Mfg Co and Hind Cycles. He was a director of the Bank of Baroda for many years.

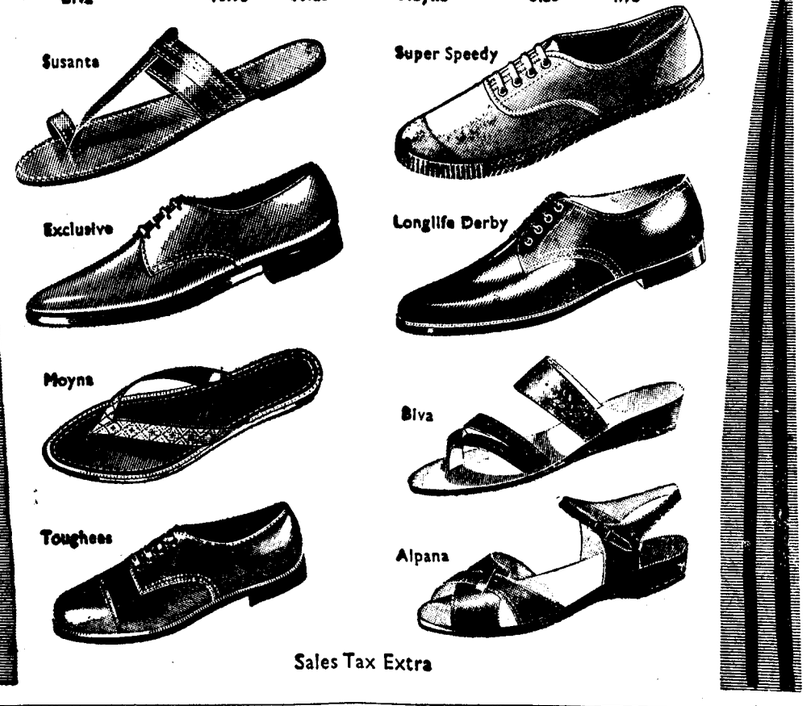
Bata

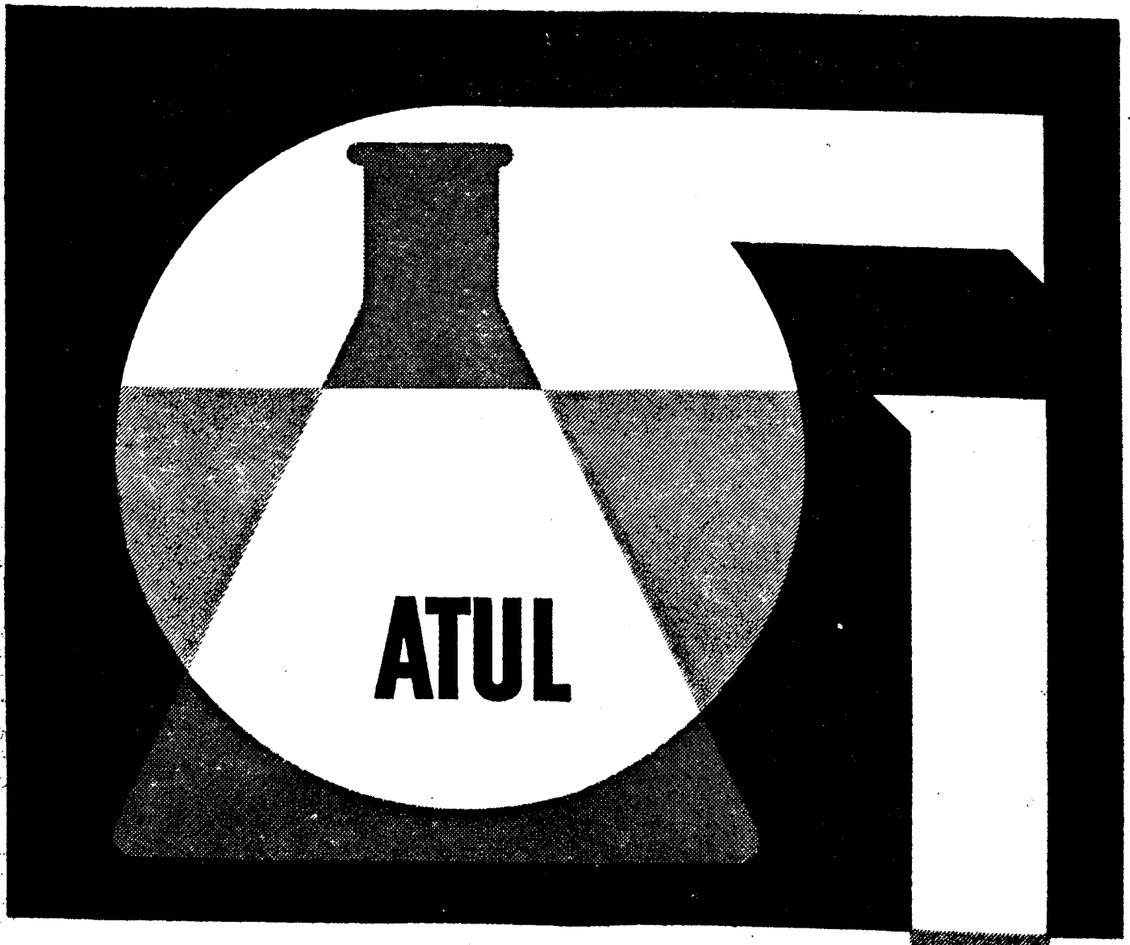


ANNOUNCE NEW EXCISE-FREE PRICES

In support of the Government's policy to reduce prices of consumer goods, Bata announce new excise-free prices on all footwear of their manufacture. The new prices take effect from Monday, March 29, 1965.

A visit to your favourite Bata Shop will be richly rewarding. You can take advantage of the substantial price reductions, even on footwear on which excise duty has already been paid.

EXAMPLES OF REDUCED PRICES



NAME	OLD PRICE	NEW PRICE	NAME	OLD PRICE	NEW PRICE

False Hope in Vietnam

IT is perhaps a measure of the universal despair over the tragic war in Vietnam that the U S President's speech at the Johns Hopkins University on Wednesday has been seized on as marking a decisive turn towards peace. If the situation in Vietnam were less hopeless or the plight of the people there less agonising there would be possibly greater willingness to examine it more critically.

All hope has been pinned on two points in President Johnson's statement. The first is the expression of America's willingness to engage in "unconditional discussions" and the second the proposal for a 1,000-million dollar American aid programme for South-East Asia after peace is achieved, a programme in which North Vietnam is invited to join. The idea of a kind of Asian Marshall Plan has occurred before in Johnson's statements, but the offer to start negotiations unconditionally is new. Hitherto the U S had explicitly insisted that negotiations could be started only when North Vietnam "is prepared to leave its neighbours alone" or when the Viet Cong "stop shooting". These expressions were used by the U S Secretary of State at a press conference earlier this month. Other American spokesmen have used tougher language: General Maxwell Taylor, the American Ambassador in South Vietnam, recently talked of the U S air attacks against North Vietnam stopping only "at the point where the enemy gives in".

Set against these statements, President Johnson's offer does appear to indicate a hopeful turn in U S policy. It is also possible to read into it implicit acceptance of the neutral nations' appeal which called on the parties involved in the Vietnam war to start negotiations "without posing any preconditions". This phraseological coincidence may, however, prove meaningless, for let it not be overlooked that while he talked of unconditional negotiations, Johnson also reaffirmed that the air attacks against North Vietnam were "a necessary part of the surest road to peace". These attacks started as specific reprisals against military targets in response to Viet Cong attacks against U S personnel, but were soon turned into a general air offensive to destroy North Vietnam's military capacity. And now, as the targets have changed from military installations to the country's transport system and American pilots have been ordered to seek out "targets of opportunity" and attack "at will", the attacks seem to have become part of a campaign of terror—in which some of the most barbaric methods of warfare have been used—to bring North Vietnam to its knees. As long as these attacks continue, therefore, it is meaningless for Johnson to talk of being ready to negotiate. And of a cessation of the attacks, there was no indication in his statement.

Even more important, the U S shows no signs of recognising that the war in South Vietnam is basically a civil war. American aid to the ruling cliques and North Vietnamese aid to the National Liberation Front have been superimposed on this basic situation. It is a measure of the relative strength of the forces in the civil war that in spite of open and large-scale U S intervention over years, the N L F today controls two-thirds of South Vietnam. This basic fact must find adequate recognition in any agreement to end the war in South Vietnam and in the subsequent political set-up there. The United States, on the other hand, has always refused to recognise the very existence of the N L F. In this aspect of U S policy, again, one sees no signs of change in Johnson's statement. While he was prepared to concede that "some" South Vietnamese were participating in the attack on their Government, he maintained that "the main reality" was that North Vietnam had attacked South Vietnam.

In sum, as long as the U S objective remains that of forcing North Vietnam by military terror to accept peace on American terms and the U S refuses to recognise that the basic cause of the present situation in South Vietnam is not "aggression" from the North, but the disaffection of the South Vietnamese with the successive ruling cliques, whom American military aid has barely managed to prop up, and the support that the N L F has among the people, nothing can be expected from Johnson's offer to negotiate "unconditionally". Talks begun on these premises will lead nowhere.

Labour's Budget

MAUDLING'S budget last year was considered well conceived in all respects but one; while the prospects of inflation called for a budget surplus of some £350 million, electoral considerations prevented the imposition of new taxes and the revenue surplus aimed at was only £88 million. In presenting an election budget with an inadequate surplus Maudling was only following the precedents set by Butler in 1955 and Macmillan in 1959. As then, the error proved costly: the balance of payments had a deficit of £745 million in 1964. Britain's unmortgaged exchange reserves are no more than £300 million, and the Pound can no longer be defended without foreign support.

So after the October election, Callaghan, the new Chancellor of the Exchequer, inherited a situation in which there was no alternative to deflation. There were the additional handicaps that holders of sterling were not so charitable to him as to his Conservative predecessors, and that there was the prospect of an early election. The difficult circumstances persist today; for in spite of the restrictive measures of October, the inflationary pressures in the British economy continue, sterling is still under pressure, and the Labour majority is still slender.

Whether because he has been assured that there will be no early election or because he keeps to Wilson's promise of an "honest" Government, Callaghan has budgeted for a surplus of £380 million, roughly equal to the inflationary gap expected over the next year. He has made big increases in taxes on mass consumer goods—cigarettes, alcoholic drinks and motor vehicles—which are expected to raise the cost of living index by 1.2 points. The deflationary impact of the budget will be less than the revenue surplus, for the capital budget deficit of £848 million will be financed out of borrowings and will cause some net increases in total demand; nevertheless the budget meets the economy's requirements much better than last year's. The Chancellor's refusal to specify the rate of corporation tax to be levied from next year might also increase company saving and restrain dividend distribution.

The corporation tax—a flat rate tax on company profits—is not very revolutionary; its main effect will be that while all profits will be liable to corporation tax, distributed profits will also be liable to income tax in the hands of the receivers and so will be taxed at a higher rate. This will probably stimulate company retention of profits and investment, but it is uncertain how much.

There are a number of innovations, most of them to plug loopholes in the taxation of high-income groups. Capital gains realised within a year are to be taxed as income while longer-term capital gains are to pay a tax of 30 per cent. Entertainment expenses of businesses are to be completely disallowed for tax purposes unless they are incurred on foreign buyers. The "spilling over" of overseas tax paid by British companies (i e, their deduction from the tax liability at nome) will be gradually abolished. However, the deduction of mortgage interest from taxable income, which makes it cheaper to buy a house on a mortgage loan than to rent it, is to continue.

There are changes in the taxation of income from abroad and in the system of exchange control which, it is hoped, will improve the balance of payments by £100 million. Buying of villas on the Mediterranean, which has been very popular in recent years, will be limited to the amount of the sale proceeds of similar property being sold. Investment outside the Sterling Area is to be limited to quick-yielding projects.

Some of the measures are likely to prove difficult to administer: the capital gains tax, for example, is so general that its collection can hardly be as comprehensive as is intended. The budget also leaves many problems unsolved. For instance, the Government is obviously perplexed about how to tax dividends on inter-company holdings without encouraging concentration. However, much thinking has gone into the framing of this budget, and it should make a substantial contribution to the solution of Britain's major economic problems.

Wasteful Collaboration

GATHERING suspicions that many of our foreign collaboration agreements have not only been of no advantage to us but have actually thwarted the growth of technical know-how in the country have received powerful confirmation from no less an authoritative source than the Council of Scientific and Industrial Research.

The rationale of the import of technical know-how into a developing country rests on the lack of such skill in the country or on the superior quality of the foreign skill. How many of the hundred or so collaboration agreements that are approved by the Government every year fulfil these conditions? Very few, feels the CSIR, which has enumerated many instances where the Technical Development Wing and the Licensing and Foreign Agreements Committees have by-passed available Indian talent and know-how and favoured the foreign expert. Further, the same technical know-how has been permitted to be imported repeatedly or from various countries simultaneously.

The private Indian entrepreneur plumps for foreign collaboration because he doesn't want to take chances with Indian know-how. There is, besides, the great advantage of being able to sport a well-known foreign brand name. Finally, a collaboration agreement makes things a great deal smoother, from grant of various official sanctions to availability of finance. But surely the Technical Development Wing and the Licensing and Foreign Agreements Committees cannot be guided by the same considerations as the private industrialist?

As the CSIR rightly points out, as long as the Development Wing and the Licensing and Foreign Agreements Committees do not have on them technical personnel capable of assessing and evaluating each collaboration proposal, haphazard and wasteful decisions would continue to be made. It is not denied, of course, that much needs to be done to link Indian technology with industry. The National Council for Research Development has admitted that a large number of our all-too-few patents and inventions have proved to be unsuitable for commercial use. The reasons for this have to be probed—one major reason may be the absence of facilities for design of plant and machinery to translate the results of laboratory research into commercial projects. We have also yet to draw on the technical staff in the various research agencies to provide consultancy services to industry, both in the public and private sector.

Granting all this, a rational policy for approving import of foreign know-how and technology with suitable provisions for a technological-economic evaluation of each proposal and for duplication in India of imported know-how and design of equipment as part of collaboration agreements to avoid repeated imports of the same kind, should be laid down without further delay.

Weekly Notes

Rationalising Export Subsidy

SO, it appears, the much-publicised differences between the Finance and Commerce Ministers will not hold up the tax credit scheme for exports after all. The Commerce Minister has announced the appointment of a committee of officials headed by the Commerce Secretary to work out the details of the scheme. Of course, there never was any suggestion of differences on export credits *per se*. It is the existing import entitlement scheme which is the bone of contention. The tax credits had been dragged into the controversy because it had to be decided to what extent they would replace import entitlements.

Import entitlements no less than tax credits are subsidies to exporters. Tax credits are a more overt measure but nobody need lose sleep over that. In his Budget speech the Finance Minister was quite frank about "the case for subsidising nascent exports". In any case subsidising exports has become so common that even GATT has stopped bothering except for making perfunctory disapproving noises.

Since the two schemes have the same purpose, the question why it is necessary to have both is indeed a relevant one. The Finance Ministry has for quite some time maintained that import entitlements have in practice proved rather expensive in terms of both foreign exchange and tax leakage. In any case, if we have to subsidise exports why not have an arrangement under which the extent of subsidy is known? Insofar as it is at all possible to regulate the amount of subsidy to exports according to the difference between domestic costs and international prices, it should be possible to do so under the tax credits scheme. Import entitlements, by contrast, leave the extent of subsidy indeterminate.

Import entitlements are attractive because they make available either necessary imports for the exporters' own use or imported articles which can be sold at a premium. Now, to the extent that the first category of imports are considered genuinely essential, they should be dissociated from exports and allowed in the normal course. Then the second, money-spinner, type of imports can be stopped altogether.

How much foreign exchange this will save it is difficult to say; very little the Commerce Ministry may claim. But at least the subsidy on exports would have been rationalised.

Poor Defence of Managing Agency

R K Hazari writes:

MILLOWNERS seem to be long on yarn and short on memory. Ten years back when a Bill, which ultimately became the Companies Act 1956, proposed about ninety sections to deal with managing agents, millowners and kinsmen gave one the impression that the existence of the corporate sector was at stake. Now in their memoranda to the Managing Agency Abolition Enquiry Committee, the Indian Cotton Mills' Federation and Bombay Millowners' Association have asserted that the managing agency is the sheet anchor of private enterprise and that the Companies Act has expurgated "the evils which had crept into it (the system) by efflux of time"!

The old vocabulary has not been forgotten; it has received a fresh coat of paint. The task ahead calls for the participation of all available entrepreneurial talent in greater measure than ever before. Only managing agents can mobilise savings for private investment, failing which public investment would lead to inflation. The rehabilitation of cotton mills would receive a setback and foreign collaborators would pack their bags and cause a foreign exchange crisis if the managing agency system is abolished. Banking, insurance and financial institutions find the system acceptable. The benefits of group management and common services are obvious. The ICMF goes a step further to say that "most of the managing agency houses are based on a system of sharing of responsibilities by families and this has a distinct advantage over management by professional men who cannot have the same degree of personal attachment to the fortunes of the companies managed by them." Encouragement to the system, it believes, would actually raise the clothing standards of the population!

It is a tribute to the efficiency and strength of the system that, in its dark hour, the defenders do not know what they are arguing for or about. After more than a century of its existence, the system still claims to rely upon family attachments for its proficiency and future industrial growth and its defenders unashamedly confess that they have failed to produce competent managerial cadres. And what is this talk of personal or family involvement and prestige when it has been established that increasingly the larger part of promoters' finance is coming from companies and not individuals. In 1962-63, the managing agents (and/or their associates?) of cotton mills advanced Rs 3 crores to managed companies but guaranteed loans worth Rs 48 crores to them. The question of guarantees by managing agents, among other things, was dealt with in my article "The Managing Agency System" in the Annual Number of February 1964. By way of a postscript, it may be added that a well known managing agency firm in Bombay recently refused to honour its guarantee and the creditor banks were left holding a few scraps of paper. That this default occurred more or less at the same time as the Enquiry Committee was set up is a coincidence, but it shows the way the managing agency system is going.

Fighting for a Lost Cause

THE memoranda of the ICMF and MOA are devoid of any documented facts on the relative efficiency of various types of managements. Apologies which serve for facts prove that, in this industry, at any rate, the managing agency system remains strong as ever, with the managing agents eloquently claiming the credit for the expansion of the share capital of managed companies. The Bombay millowners derive great consolation from the small size of their corporate groups as compared with American giants and, therefore, conclude that there is no danger of concentration of economic power. It should be a source of still greater consolation to them that the total assets of General Motors probably exceed those of the Government of India and that India, fortunately for them, has no anti-trust laws on the American lines which would mangle up the managing agency system straightaway. As for foreign collaborators packing their bags, where is this species in the cotton mill industry, except in a few managing agency firms in which also their share has been declining steadily since 1947?

Managing agents are fighting for a lost cause—for nothing. Their elimina-

tion as managing agents will not deprive them either of family control, exercised through pyramid holding of voting power, or of group management which exists elsewhere and even in India to a limited extent without the intervention of an archaic, irrational and expensive system of family management. The common overheads and services available within groups will continue to be on tap and their costs will, as at present, be debited to managed companies. The case for abolition of the managing agency system does not rest upon its much-repeated abuses (many of which could be found under all forms of corporate management) or its tendency to concentrate economic power (which can exist independently of it) but upon its inability to professionalise management and to delegate managerial powers and responsibilities. The remuneration of managing agents is high, not in absolute terms, but in relation to the managerial, financial and technical services (or the lack of them) which they provide.

Backward Classes

ONE does not ordinarily expect spectacular results from Government agencies and in any case to take to task the Department of Social Security would be less than fair since it was set up less than a year ago. The objective of creating this new department was to co-ordinate and integrate the various schemes of social welfare and social security till then distributed under various ministries. The quarrel is not with the performance of the Department but with the manner of presentation of its Annual Report.

Apart from a bland recital of a few figures of so many rupees spent, the report is severely non-committal. Even on a pressing social problem like the uplift of backward classes, all the larger issues and the glaring inadequacies are scrupulously ignored. Where do the backward classes stand with regard to employment, educational attainments, income levels, and social status? One looks in vain in the Report for information on these points.

The backward classes which constituted some 21 per cent of our population in 1961, lived almost entirely in the rural areas, on less than Rs 15 a month. Their educational attainments, after years of liberal concessions, scholarships and reservation of seats, were still very poor. While the literacy rate for the entire population was 22.4 per cent in 1961, it was just 9.95 per cent for the scheduled castes and 8.84 per cent for the scheduled tribes. Their employment in non-rural occupations had made little headway. Only 40 per cent of the reserved vacancies in jobs listed by the Employment Exchanges were filled. In the Government, out of 17.75 per cent seats reserved for them as many as 16 per cent were filled, but the sad truth is that 78.6 per cent of the vacancies filled were for sweepers and 20 per cent were class IV jobs and the share of the backward classes in class I jobs was a mere 1 per cent. In the technical and professional jobs 30 to 40 per cent of the vacancies reserved for the backward classes go unfilled due to non-availability of suitable personnel.

It is time that it is recognised that the backwardness of certain sections of the people cannot be overcome by legal action or "concessions" and reservations. More than anything else, the lack of enthusiasm shown by the backward classes themselves for measures intended to benefit them must be investigated. The backward classes, sociologists have argued, suffer from and perpetuate their "culture of inferiority" — practising untouchability among themselves (the Government has found it necessary in some places, at the insistence of the rural untouchables, to provide separate wells for the various sub-castes among them) and reluctant to utilise scholarship facilities for technical education, preferring instead general, liberal education.

But on all these complex issues the Annual Report of the Department of Social Security has nothing to say.

A Corporation Is Elected

A Correspondent writes:

PRE-ELECTION Calcutta looked calmer than usual and many took the mood as a bad omen. They said Kerala looked just the same before the recent election. This was the first Corporation election under adult franchise and so candidates tried to get people interested in a better future. But the voters have learned things the hard way—they are short of water, victims of adulterated food, sufferers in continuous epidemics. Craters gape at you on the face of streets while the public dustbins turn your stomach. During the monsoon one can actually get drenched inside the Corporation Building due to waterlogging on its terrace! The only time you hear and see the city fathers is when they claw and flay one another in noisy meetings and, of course, at election time.

There were three kinds of voters who started to stand in queues on Monday, March 29. The first kind were the legitimate voters, the second the 'false-voters', and the third the paid voters. A hundred seats were at stake. There was the Congress, the United Citizens' Committee (comprising seven Leftist parties, including the two wings of the CPI), the Progressive Peoples' Bloc (consisting of the SSP and the Forward Bloc), and the perennial Independents. According to official figures, only 60 per cent of the voters turned up (how many 'false-voters' made up that figure no one knows). The Congress lost its absolute majority and got 49 seats (the figure is a joke in itself), the UCC 35, the PCB 6 and the Independents 10. To add pep to the whole thing, the voters elected six detenus.

Great rejoicing there was in the city when voters learned of the defeat of some of the old bible-bangers. And the six detenus became the symbol of protest. It would be hard to hold meetings with elected candidates under continuous detention. And the less meetings our Corporation has the better.

Atulya Ghosh, who is Chairman of the Congress Municipal Association in addition to his other posts, has assured the public that the Congress would get the seats it needs for an absolute majority—one of the Independent members had already pledged to join the Congress bloc, he claimed. The new Corporation consists of 100 elected Councillors, five Aldermen (to be elected by the elected Councillors) and one ex-officio member, the Chairman of the Calcutta Improvement Trust. Atulya Babu hopes to get yet another supporter from the Independent bloc, and with 51 Councillors he is dreaming of bagging all the five Aldermen!

In spite of adult franchise and the Congress defeat, the Corporation Councillors are going to get paid as ever for conducting and adjourning endless meetings. The election farce was well played and the people enjoyed it while it lasted. But it is all over and the election queues have given place to the more permanent fish queues.

Bankers Differ

IF chairmen of companies were to adhere strictly to purpose, their addresses at annual general meetings would be no more than bald statements about the financial position of the companies. But they have firmly established the tradition of informing shareholders of other relevant—sometimes rather remotely relevant—matters such as the political and economic state of the nation and factors affecting industry, particularly Government policy. For this reason, these speeches are not infrequently of interest to a wider audience than just the shareholders. For instance, the speeches of bank chairmen could be a valuable indication to monetary authorities of the psychology prevailing in banking circles though, of course, it is impossible to know if this has much influence in the shaping of monetary policy.

The past year, with the dramatic and unprecedented developments in Reserve Bank policy, has provided the chairmen of banks with ample material for their annual addresses. But, as in all public utterances, the question arises as to the influences shaping the reactions voiced. It seems possible that the size and standing of a bank has some relation to the freedom and flamboyance of its chairman's address.

The Chairman of the United Bank of India (deposits Rs 85 crores), for instance, is sharply critical of the rise in the Bank Rate and hopes it will soon be revised downwards. On the other hand, the Chairman of the Indian Overseas Bank (deposits Rs 47 crores) considers this a "necessary corrective to a highly inflationary situation that threatened to get out of hand". The differences in the views on the altered deposits rate structure is concomitantly sharp. Even in previous years the United Bank Chairman has questioned the usefulness of hiking deposit rates and argued against the concept of interest elasticity of savings with a degree of sophistication somewhat unusual in this genre of analysis. In this year's address this point is repeated as also the argument that what is most important is the differential between deposits and advances rates. The new deposits rates, by raising establishment costs, have further cut this differential while they will fail to mobilise fresh deposits. The Overseas Bank Chairman's views are exactly the reverse; "The new pattern of deposit rates not only ensures a more appropriate spread between interest paid on short and long term deposits but is distinctly savings biased".

There are interesting differences, too, in the attitudes to credit operations. The Chairman of the Syndicate Bank (deposits Rs 51 crores) devotes a good portion of his speech to his bank's interest in providing finance for agriculture. The United Bank Chairman also touches on the role of banks in agricultural finance, his verdict being that this is "an exclusive field for the co-operative credit system". This conforms to the fact that agriculture now accounts for less than 1 per cent of total scheduled bank advances.

Rift in ICFTU

SPEAKING to newsmen in New Delhi on Saturday last, the Secretary General of the International Confederation of Free Trade Unions, Omer Becu, was at some pains to deny that there was any danger of a break-up of the ICFTU on account of internal differences involving its American affiliate and principal financier, the Federation of Labour-Congress of Industrial Organisations. But the signs of a split have been only too visible during the past one month or so. Even Becu's speech on the first day of the seventh conference of the ICFTU's Asian Regional Organisation created the same impression. Though he did not mention any names, Becu was obviously referring to George Meany, President of AFL-CIO, when he condemned the activities of "certain members" who, he thought, were subverting the ICFTU. Most of the criticism of the ICFTU, he claimed, was based on "untruths, half truths and a superficial view of its activities".

The ICFTU was set up in 1949 as a rival to the communist-organised World Federation of Trade Unions. It is financed from the International Solidarity Fund established in 1957, supposedly out of members' voluntary contributions, but in fact mainly out of the bounty of AFL-CIO. After 1960 particularly, AFL-CIO has poured large funds into the coffers of the ICFTU to enable it to expand its activities in the newly-independent countries of Africa.

The piper must play the tune called by the one who pays and Meany has been dragging the ICFTU over the coals because he believes that its activities in Africa have not been "effective". Specifically, he wants the ICFTU to take into its fold State-sponsored trade unions in certain African countries. The ICFTU Secretary General, on the other hand, is taking the apparently high-minded view that ICFTU would be betraying the principles of trade unionism if it accepted Government-sponsored unions.

Apart from issues of high policy, it has been rumoured that personal differences have played their part in bringing about the split. In any case, the AFL-CIO has left no one in doubt that it means business; last year it reduced its contribution to the ICFTU by about a million rupees and a total stoppage of the American dole would mean the loss of some five million rupees annually to the ICFTU which can be expected to bring it very near to disaster.

Is This Evil Necessary?

IT was to be expected that trade and industry would be upset at the Maharashtra Government's decision to enforce the octroi bill passed by the State Assembly in July 1964. The disappointment is heightened by the fact that earlier there was reason to hope that the scheme might be dropped. It had been officially stated that a bill to amend the Bombay Motor Tax Act and do away with the octroi duty was being drafted. In September 1964 the Minister for Urban Development, Rafiq Zakaria, had declared that the Government was considering accepting the recommendations of a committee to abolish the octroi duty and adding part of it to the sales tax. But finally the duty came into force from April 1, the event dramatised by the long hold up of trucks at check post along the major trade arteries of Greater Bombay.

A fact which does not seem to have been appreciated is that the octroi duty is not a new imposition. In fact, it replaces the so-called town duty which has been levied in Bombay since 1888. Of course, the octroi duty covers a larger number of items and the rates are also higher—the town duty was levied on 36 items whereas as many as 60 items will be subject to octroi.

Principal among the criticisms of the octroi duty has been that it is an antiquated levy. This is true, of course, but it needs to be mentioned that it exists in all States except five. And in Maharashtra itself the local bodies of all important cities levy octroi.

The defects of octroi as a tax are certainly not unknown to the State Government nor are the problems of granting refund of duty on goods re-exported which in this case would be truly formidable, Bombay having such a large *entrepot* trade. The experience of other municipalities and corporations levying octroi has also shown that this is one of the most expensive taxes to collect. In addition to all these, there are two objections against the octroi specifically in Bombay. First, it will make it relatively attractive

to locate godowns and industries within the municipal limits of Bombay which would defeat the efforts to disperse industry. Second, the under-utilisation of transport in Maharashtra which the Economic Development Council of the erstwhile Bombay State had found to exist in serious proportions would be aggravated. The hold-up of transport vehicles which was dramatically captured in newspaper photographs on the first day will become a regular feature.

Against all these criticisms the State Government can have only one answer—that the Bombay Corporation badly needs the money and there is no other source. But is there really no other source? What about taxation of urban property? It can hardly be disputed that the Bombay Corporation ought to get a far larger share of the gains which accrue in private hands as a result of the continuing upward spiral in real estate prices. Here the problem is one of devising effective tax measures to mop up the unearned increases in property values. This problem affects to a lesser or greater degree the local bodies of all towns. One suggestion which may be considered is that the rates of the discriminatory wealth tax on urban property introduced in this year's Union Budget may be raised and the additional proceeds made over to the local bodies.

West German Elections

THE approach of elections has led to some interesting developments in West Germany. Under German law, political parties get a subsidy for elections from the state budget, the idea being to reduce disparities in the financial resources of parties and lessen their dependence on vested interests. Thus the Social Democratic Party got DM 13 million last July. However, this was just what it did not want. It wanted its members to feel that they had a stake in the party and thought that the feeling might be weakened if it came to depend on outside funds. So it decided to spend the entire amount in a field where it felt the Christian Democratic Government was not doing enough, and offered 10,000 of the larger schools a Christmas present of books for civic education. Some efforts were made to avoid the suspicion that this was a propaganda move and the books offered were mostly school books and books of modern history.

The response to the offer was very warm. All but two schools accepted the offer, and asked for more books than could be given out of the state subsidy. The party, however, fulfilled all demands by drawing out of its own funds. Some books were out of print, so it had 90,000 new copies printed.

Another remarkable event is the signing of an agreement on election manners among the three major parties—the Christian Democrats, the Free Democrats and the Social Democrats. It is almost impossible for a middle-aged West German to have an electorally unobjectionable past. Work in the Nazi machine is an obvious disqualification, emigration during the War is considered a despicable escape from sharing the sufferings of the country, and having worked for Allied governments is treason. Hence personal attacks on most election candidates are easy to make and are frequently resorted to. The new agreement bans such attacks. It also prohibits appeal to national prejudices and racial hatred, places restrictions on advertisement and lays down ceilings on election expenses.

It is quite possible that the agreement will be ineffective. There is no institutional arrangement to supervise the working of the agreement, nor any sanctions against its breach. The forms of advertisement that are restricted are not very important in the campaign, and the ceilings on expenditure are comfortably high and do not apply to the local branches of parties. Nevertheless, the idea behind the agreement is capable of much development, and credit must be given to the West Germans for it.

LETTERS TO THE EDITOR

India's Invisible Men

I READ with interest the review in your issue of March 13 of the book "India's Ex-untouchables" by H R Isaacs. It seems to me—and I am sure this view is shared by many—that the problem of untouchability as such hardly exists at present in India. It is all a question of the haves and the have-nots.

I am surprised at the reviewer's comment that on the question of untouchability "the Indian Press has been stunningly silent". The fact is that there is at present no problem and all that needs to be done has been done and more.

Once the standard of living goes up, not only of those who are supposed to be from the "untouchable" castes, but also of the poorer sections of the other castes, the problem of 'untouchability' will be a thing of the past. The emphasis, however, is not on helping only those born in the "untouchable" castes, but on pushing forward to better standards all the have-nots, regardless of caste.

Isaacs has quoted the instance of a young man who had to indicate his caste as 'scheduled caste' on some forms. This is quite ununderstandable since in the Government (and presumably elsewhere) nobody has to state his caste under the present law. He need write only "Hindu", if he is a Hindu; he has to indicate that he belongs to the "scheduled caste" only when he wants to get an advantage reserved for persons belonging to the scheduled castes. If a person is poor and applies for a "scholarship", he can just declare himself as poor. In fact, several cases have come to notice where persons not belonging to the scheduled castes have declared themselves as belonging to a scheduled caste, to get from the Government certain pecuniary and other advantages.

It is the perpetuation of propaganda on behalf of "untouchables" in this country that serves as a constant reminder to those born in the "untouchable" castes that they are "untouchables". The sooner the propaganda is stopped, the better it will be for all concerned, and for the country.

Advertising and the Press

MAY I tell you how shocked I was to read your editorial "Thoughtless Move" (March 27), as I have never yet come across such an expression of naked self-interest in journalism, to the total exclusion of the merits of the case. It is astonishing to read it in a paper which commands the intellectual respect of your weekly.

Deliberately ignoring the various public issues raised by the Income-tax (Third Amendment) Rules, disdaining to go into such principles or criteria as may be followed in allowing legitimate advertising for genuine marketing needs, both in India and for exports, in different types of industry, and conveniently putting aside the controversy over whether advertising is a desirable influence on the press, an area of some public suspicion, this leading article of a thoughtful paper only thinks fit to consider the money which it gets from advertising.

It is almost laughable for advertisers to read in a serious paper on economic affairs that "advertisers generally follow the principle 'to him who hath shall be given'". Do you seriously think advertisers "generally" consider they dispense "dan" or pursue 'egalite' among the press with no thought of economic returns? Even a less than complete study will show that most advertising money is spent on papers which offer the widest circulation for the appropriate market for various products. The question of too much or too little is quite another one, and the Daniel who can come to precise rule-making judgments on this has yet to be born either in or outside a Finance Ministry or the press.

New Delhi A D MODDIE
April 2.

[It is perfectly legitimate to discuss the place of advertising in the economics of the press without bringing in any of the issues raised by A D Moddie in the second paragraph of his letter.

There was no suggestion in the editorial in question that advertisers dispense "dan". What was said, and this was said clearly enough, was that while the bigger circulation newspapers carry more advertising, the smaller newspapers derive proportionately more of their revenue from advertising.

— Ed]

CAPITAL VIEW

A State of Disarray

Romesh Thapar

WE seem to be running the affairs of this country like a bunch of teenagers. Granted that we are now so surrounded by aid-givers and foreign-advisers that we are fast losing the capacity to think out our policies and programmes. Granted that we feel inhibited about taking the positions we would because of the sorry complications in which we find ourselves. But, and this needs to be rubbed in, we do not have to present ourselves in the state of disarray which we have exhibited during the past week. This applies equally to the business of Abdullah's passport and the extradition proceedings connected with Sucha Singh in Nepal.

P M Ordered Passport Endorsements

Take Abdullah first. The fumbling explanations of the Foreign Minister were obviously designed to fob off critics determined to get at the truth about passport endorsements and foreign exchange permits. The truth never emerged, because the critics were too busy enjoying the embarrassment of the Foreign Minister. No one mentioned the fact that the Ministry of External Affairs had given orders to the Passport office — which, incidentally is under its direct control — to endorse the passports of Abdullah and party *only* for Saudi Arabia and the United Kingdom, that the endorsements for other countries came as a surprise even to the bureaucrats concerned with the case.

Apparently, the Prime Minister ordered the endorsements under the advice of the pro-Abdullah lobby in the Capital — and, what's more, he forgot to inform his Foreign Minister. This also explains the failure of the Ministry of External Affairs to brief its ambassadors in the Arab countries, and the visible shock when Abdullah and party started agit-propping in Cairo. What is inexplicable — at least, to those who still respect Swaran Singh's 'quiet diplomacy' — is the total silence of the Foreign Minister after Abdullah had revealed his intentions. When we did move, the damage had been done.

Armed with offers of free hospitality, husbanding the Rs 35,000 given to him by the suddenly generous Reserve Bank of India, Abdullah moved on to London and Paris. Anyone studying even the scrappy reports appearing in our newspapers could have detected a new opportunist note in the speeches of this ambitious man. He was leaning heavily on Pakistani organisers in Europe and his attitudes were becoming markedly anti-Indian. Quite clearly, the Ministry of External Affairs received no warning notes from its men in London and Paris — and was content to doze.

Abdullah's arrival in Algiers also failed to stir our lotus-eaters. In these circumstances, it was only natural that we had to learn from Peking Radio that Abdullah had met Chou En-lai and was planning a visit to China. The developments which followed are recent news, but few have bothered to analyse the sloppy behaviour of the Government of India. There is satisfaction that Abdullah has been asked to return by the end of the month or forfeit his right to return. Yet, it is a moot point whether it was necessary to push matters to a point where legalistic wrangles about passports and citizenship rights start and confuse the basic issue — Abdullah's activity against the territorial integrity of India.

Indian Unity, the Real Target

Our territorial integrity is seriously threatened. The catchy, superficial slogan of self-determination, so easily mouthed by every western neo-colonialist and communist adventurer, has been popularised for many months by an active lobby in the Capital which works for 'civilised' solutions to the problems of Kashmir and Nagaland. Now, these lobbyists have found new allies; Peking wishes to play host to both Abdullah and Phizo — and, perhaps, other self-determinists from the Himalayan Kingdoms may not be far behind.

If we merely enjoy the amusing spectacle of an authoritarian China chattering about self-determination and do nothing to counter this nonsense, we will again find ourselves forced on to the defence — even at Algiers, where only recently a special envoy sent by our foreign office, C S Jha, was more concerned about his trip to Europe than in the crucial ramifications of the Conference. Self-determination, in Maoist hands, can become the weapon with which to crack the unity of India, the unity which it is China's strategic aim somehow to destroy.

The government of Lal Bahadur is too obsessed with the notion that only territory is sought to be seized by our unfriendly neighbours. True a territory grab is on — but unless we are clear that the ultimate objective is to weaken the central power in India, to create dissension and discord, we will not be able effectively to break the conspiracy now jointly sponsored by China and Pakistan. The strengthening of the Centre's control over the affairs of the States, particu-

larly in the sphere of internal security and the crucial problem of building an adequate technical and administrative cadre through a more rigorous standardisation of education, is the only basis for building a socialist, democratic and secular society. To permit parochial ambitions to weaken the Centre is to invite disaster.

Rivalries in the Police

Over the last few weeks, we have not only witnessed extraordinary confusion over the implications for national unity of our language policies — including the hasty implementation of regional languages without a proper consideration of what should be done to strengthen inter-State communication during the transition — but we have been shocked by the rivalries of State police forces over the hunt for Kairon's assassins. Home Minister Nanda can no longer permit these petty rivalries to vitiate the business of maintaining law and order. He must move to re-establish firm control over these police forces which are being exploited by politicians and the like.

The hunt for Kairon's assassins has many lessons for us. It is common knowledge that there was utter lack of coordination among the four territories over which the hunt was launched — and only a very lucky break helped bring order to the chaos. Some 4,000 'bad characters' between Amritsar and Delhi were beaten up in an attempt to get information on the killings. All that emerged was a mass of evidence concerning a ramified network of crime in Delhi. This 'research' offended the Delhi police! The capture of one of the four suspects, who had apparently, become deranged and had talked, and the final location of the missing car and driver involved, made it possible to detail what happened and to surmise who was implicated. But the rivalries within the police set-up continued unabated.

The press reports of the alleged chase of Sucha Singh into Nepal, the highly dramatic account of the chase given to newspapermen by the senior police officer leading the chase, and the speedy disclosure by another source that this account was exaggerated, even false, together with the mess over the extradition proceedings in Nepal, have given a jolt to even normally placid citizens. There is much speculation as to what can be done to discipline these separate and divided police forces. It would be folly for Prime Minister Lal Bahadur and Home Minister Nanda not to seize this opportunity to re-open the question of a centrally-controlled police force.

If constitutional provisions prevent such a development, and the Congress Party chieftains in the States are too strong to be challenged, then the Centre must initiate moves to build auxiliary forces directly under its control and capable of being mobilised to assert the will of the Centre. The need for such a force is felt every time there is a crisis, whether communal or linguistic, but we do not seem to learn from our experience. With child-like simplicity, we place our faith in old imperialist gimmicks like emergency and defence regulations — and use them crudely only against political enemies.

When will Prime Minister Lal Bahadur realise that the whispering campaigns and the signature campaigns within the ruling party, the campaigns which he wants to squash, are a reflection of his reluctance to lead? Tinkering with issues is becoming a habit. We scratch at this or that problem, but never come to grips with it. We cannot continue for long in a state of disarray without seriously damaging the prospects of economic and political advance.

News Item: The Congress President has now been allotted an 'official residence' next to the AICC office on Jantar Mantar Road, through the energetic efforts of Housing Minister Khanna!

LETTER FROM SOUTH

New Postures in Andhra

THE Budget session of the Andhra Assembly, recently concluded, has revealed certain shifts in alignments and certain new postures of the different parties, which could work out to a significant trend in the near future.

With a sizeable chunk of the opposition in jail, including some of the more redoubtable debators like Sundarayya and Nagi Reddy, the Government had perhaps hoped for an easy time. But it was sorely disappointed and was compelled to stage a public retreat. This was on the issue of the allotment of houses in Sanjeeva Reddy Nagar—one of the Housing Board's middle-income group efforts in a suburb of Hyderabad.

No sooner had the Assembly session started than it was pointed out by the CPI spokesmen that six houses in this Nagar had been irregularly allotted at a time when the Housing Minister, Alapati Venkatramaiah, was in direct control of allotments through a committee of officials. Worse than the irregularity were the names of those who had gained by it. Among them were the wife of the Chief Minister, the wife of the Union Steel Minister and the son-in-law of the Housing Minister. Not satisfied with irregularity in allotment — most of the benefactors were not even in the middle income group—, the houses themselves began to be constructed in a lavish, right royal style. The estimated cost of construction of these favoured buildings came to Rs 80,000 when the ceiling on such costs had been fixed at Rs 30,000. These six villas stood out like an oasis in the general desert of ugly three-room tenements which make up the rest of Sanjeeva Reddy Nagar.

The Government was on the defensive throughout the session but on the concluding day the Chief Minister announced that the allottees were surrendering the houses. The opposition demand that these houses should be auctioned and the sum spent on the lowest income-group housing was not pressed. The demand for the resignation of the Housing Minister was not accepted. It was clear, however, that the Chief Minister was not over anxious to defend his colleague.

The significance of the surrender goes far beyond a matter of six houses. It revealed a cohesive tactic of attack by the opposition which was persisted in. It is evident that with still better planning this tactic can win better results. The point is to seize upon two or three issues only every session and doggedly pursue it. All too often the opposition, like the Indian mind, lacks stamina and is lured by the prospect of chaos. The issue also revealed that when a stir is created, the opposition is sufficiently well entrenched in the people outside the Assembly and the Congress is not particularly united under a strong man, some small concessions can be won which heighten the sense of confidence in being able to get ahead.

Another Minister who presented an extremely sorry spectacle was Balarami Reddy, the Food Minister. Sanjeeva Reddy is indebted to him for having given up his Assembly seat some years ago so that the Union Steel Minister could himself have an easy passage. He has thoroughly bungled his work. In this surplus State's capital on Telugu New Year's Day rice was not available. In West Godavari District, which is one of the richest in the State, signs of scarcity have already begun to appear. The situation can become extremely serious in the lean months, which commence from June. The big producers and the wholesale dealers' syndicates are trying to hold and corner the stock, not only with a view to profit but also to make a mockery of the Food Corporation. In this operation this whole combine of reaction is being actively helped by the entire Ministry, particularly the Food Minister.

Sympathy Among Congressmen

The barrage of opposition criticism found quite a few echoes in the Congress. Two prominent Congress MLAs called for the resignation of Balarami Reddy while the Chief Minister sat sphinx-like through the proceedings and refused to come to the aid of his colleague. This refusal to help was an indication of the desire of Brahmananda Reddy to project an image of independence from Sanjeeva Reddy. It was also motivated by the aim of bringing Thimma Reddy, the APCC President, into the Ministry. This latter gentleman is one of Andhra's conscious and cold-blooded reactionaries —the others often enough know not what they do. That the Food Minister was not sacked was in no small measure due to the frequent presence in Andhra of the Union Steel Minister, who still has to feel secure at the Centre. The pressure for his removal, however, is sure to mount and may become irresistible if the food situation deteriorates further.

As it is, the failure of the Congress as a whole to come to the rescue of the Food Minister tends to show that a degree of uneasiness has begun to project itself into its otherwise placid situation. The tensions of the 1967 elections have begun to operate. While Andhra is nowhere near the instability of a great number of other States, dissensions within the Congress have begun to increase. The trend is towards instability in the ruling party. Whether the opposition, particularly the two Communist Parties, will be able to make use of this and to strike harder cannot be foretold as of now. There are signs of hope, however. The two CPs are presenting an united front in the two byelections in Guntur and Warangal and their representatives have begun speaking from the same platform in several places on the issue of detenus and the imposition of President's Rule in Kerala. Efforts are going on to set up a Sangram Samiti in Andhra as well. So far the Communist-led AITUC has not been split and as the leading trade union force in the State has taken the lead in the matter. There is every chance of the SSP-led unions and the organisations of the bank, insurance and Road Transport Corporation employees coming into the action committee. If this effort at bringing about some massive and spectacular working class action is backed by some form of peasant action, like satyagraha or occupation of waste land, the present torpid atmosphere of Andhra can be radically changed.

Bid to Draw Centre's Attention

There is a section in the Congress leadership which, though not progressive in any coherent sense, would not take too unkindly to this change in tempo. This section feels that the comparative calm in this State, as compared to the more surcharged situation in Tamilnad, hampers its efforts to get more projects and funds from the Centre. If Andhra could also become something of a problem State the Planning Commission might be kinder! The militant anti-Centre speech made by Brahmananda Reddy while welcoming Lal Bahadur Shastri was a straw in the wind. Another indication was the open indictment of the Planning Commission and of T T Krishnamachari by A C Subba Reddy, the State's Power Minister. His complaint was that the Nagarjunasagar Project should have been taken over by the Centre long ago. In addition, the Centre had tagged on the Lower Sileru Project to Soviet aid, after making sure that this aid had already been exhausted in the current Plan period. There was also anger that the road-rail bridge across the Godavari was being deliberately held up by the Union Finance Minister. The opposition had raised all these problems both in the Assembly and through a memorandum presented to the Prime Minister. The Ministry, if anything, was even more vociferous. This attitude cannot be interpreted simply as an attempt to pass the buck or to divert mass attention in the State from urgent issues of poverty and distress. These factors do play an important part but not perhaps the most crucial one. Essentially, it is a desire for growth and for ending of regional imbalance.

The skilfully prepared Andhra Fourth Plan memorandum makes an unassailable case when it pleads that the most important reason why the gap between the Andhra per capita income and the all-India per capita income has widened over three Plans, is the refusal to locate Central sector projects in the State in anything like due proportion. The theory of comparative costs has been used to the detriment of Andhra. The remedy proposed by the State Government is paltry but the energy in fighting against this injustice displayed by the people as a whole could become the precursor to establishing the Andhra identity — paradoxically aiding the process of India's national emergence.

The Entente Becomes More Cordial

HAROLD Wilson's meeting with de Gaulle was an undeniable success and has brought to an end the two-year old estrangement between France and England, sparked off by the Conservative Government's failure to get into the Common Market.

From all reports the General and Wilson got on extremely well together, and the initial good impression that they made on each other when they met briefly at Sir Winston Churchill's funeral certainly survived the two-day meeting in Paris. The General went out of his way to be courteous to Wilson who received a most cordial reception, both from members of the Government and the Press.

The object, from Wilson's point of view, was to build a bridge between the two countries, and he had the wit to realise that little progress would be made if he concentrated on the central long-term problems of Britain's economic and political relationship with France and with the Continent of Europe. At the moment, there are many basic points on which differences between the two countries are too great to be bridged in a short two-day meeting. There are sharp differences on the attitude to America, the role of NATO, international monetary problems and the war in Vietnam, to name some of the more important issues. Bearing this in mind, Wilson concentrated on a number of secondary issues on which agreement is possible, and these will form the bridge for further co-operation.

Perhaps the most important result of the Anglo-French discussions was to end, beyond all doubt, rumours that sterling might be devalued. On the eve of Britain's budget it was certainly important to speak frankly and publicly in a key European financial centre like Paris, on the determination of the Government not to devalue sterling, and on Britain's plans for strengthening the economy. At his Press Conference in Paris, Harold Wilson gave the most unqualified assurance yet made that Britain would not devalue the pound, either before the Budget or at any time in the near future. He said: "We have left the French Government in no doubt about our determination to strengthen and modernise Britain's economy and maintain the value of sterling". He went even further and said referring to devaluation rumours, "Those who listen to these rumours are wasting their time, and those who try to take account of them are wasting their money".

U K and the Gold Standard

One of the long-term problems on which the French take a view diametrically opposed to that of Britain and America is that of the international financial system. The General's recent statement suggesting a return to the gold standard is certainly not popular in Britain, but it is understood that preliminary discussions on this subject were fairly cordial and it has been agreed that Callaghan, the Chancellor of the Exchequer, should go to Paris for talks with the French Finance Minister on improving the international monetary system, and easing pressure on sterling. Apparently the British Prime Minister referred to the scheme he had himself advocated two years ago about the creation by the International Monetary Fund of gold-backed certificates designed specially as a source of credit for developing countries. It is likely that the earlier French composite reserve unit proposal, put forward at Tokyo by Monsieur Giscard d'Estaing, will be discussed again, together with Wilson's own scheme. If these discussions have any effect on de Gaulle's ideas on a return to the gold standard, they could have a salutary effect on the world liquidity position.

Another important result of the Paris talks is that prospects have now been opened up for a considerable increase in industrial co-operation between Britain and France, especially in the technologically advanced fields of aircraft production and electronics. When Healey visited Paris a few weeks ago, two aircraft projects—one for a simple strike trainer and the other for a variable geometry craft—were under negotiation. The list may now be extended to include such items as an early warning aircraft and a heavy lift helicopter. In the field of civil aviation, the Concord project might well be followed up with co-operation on a large air-bus; Sud Aviation already have advanced plans in this respect. The Aviation Minister, Roy Jenkins, is going to Paris to discuss with his French opposite number, the whole question of such co-operation. The aircraft industry is, of course, a particularly appropriate one to illustrate the fact that the European Common Market, as it stands to-day, excluding Britain, is not of a size sufficient to compete with the United States in many fields of modern industrial technology. The fact that Frank Cousins, the Minister of Technology, is also to visit France adds point to co-operation in other advanced technologies such as electronics. It may well be that in this field co-operation will not be restricted to France alone and that Germany and Italy may also be invited to co-operate.

Although, at the moment, Wilson, no more than de Gaulle, is anxious for immediate British membership of the Common Market, these new proposals for close co-operation on aircraft and other projects are an attempt, as Harold Wilson described them, "to tunnel under the tariff wall of the European Common Market and the European Free Trade Association". Indeed, one of the main topics of discussion between Wilson and de Gaulle was a review of the present economic division of Western Europe and the relations between the European Free Trade Association of which Britain is a member, and the Common Market to which France belongs. "I do not think", said Wilson, "that any of us wants to leave the present situation where it is on the economic side".

Britain also indicated that she wanted to be included in any discussion of political developments in Europe, which might be held by the Six. He also expressed Britain's opposition to any form of supranationality.

In the field of economic co-operation between E F T A and the Common Market, it appears from the communique that the French are prepared to go no further than the recognition that a "successful conclusion of the Geneva tariff negotiations would contribute to more fruitful relations between the E E C and the E F T A countries". At the moment, of course, the Common Market refuses to recognise the existence of E F T A as a group, and insists on dealing with each of the seven E F T A countries individually.

Truth by Resolutions

Ashok Rudra

India: Economic Freedom versus Imperialism by V I Pavlov; Peoples Publishing House; 247 pp; Rs 15.

ONE of the pre-requisites of reviewing a book is that it has to be read; and that is what makes it so difficult to review a book that is unreadable. If all the same I have laboured through this particular unreadable book and have even sat down to review it, that is because I choose to treat it not as a book written by just another research worker, but as a specimen of the type of research that is carried out in the Soviet Union on subjects of political economy. The particular problem treated in this book makes it all the more interesting from the above point of view. The book is an apologia for the Soviet international policy with respect to underdeveloped countries in general and India in particular, formulated and put into practice by Khrushchev and carried on by his successors. The book deals extensively with two concepts that underlie this policy, namely "the non-capitalist path" and "national democracy".

Typical of Soviet Research

One is, of course, familiar with the particulars of the policy and the broad lines of the understanding of the world situation, and the political economic conditions in the underdeveloped countries that underlies the policy. However, most of the time one comes across only statements of the understanding as part of official pronouncements of leading personalities and organisations in the Communist world. One hardly ever comes across any material purporting to be analysis of facts and figures that might have led to the understanding or that might establish the reasonableness of the policies based on the understanding. It is from this angle that I have scrutinised the book. Does it represent a part, however small, of the research on which, one may presume, the understanding of the world situation by the Soviet policy makers is based? It is not necessary to read much of the book to find out that it is not a piece of research at all; it is a rehash and a purely verbal paraphrase of the statements found in official resolutions and pronouncements.

I submit that this book is a typical example, not an exception. I do not think that there are a great many books on the subject which are very much better than the present example. Considering the conditions under which books are published and published books are translated in the Soviet Union, it is to be presumed that the Soviet academic world will not have any objection to my treating the book as a representative sample of their research products.

Conclusions Come First

It is neither the volume nor even the quality of the research which I find most disturbing but something much more fundamental, namely the relation between research and the conclusions embodied in the official resolutions and pronouncements. One might have expected that the resolutions and pronouncements are based on appreciation of the results of voluminous and painstaking empirical research that is carried out by a whole army of competent research workers. The situation, however, seems to be the reverse. Whatever research is carried out seems to have the purpose not of helping the formation of judgment by the policy makers; instead it takes from the policy makers ready-made formulas and seeks illustrative evidence. (It is to be remembered that the correct scientific procedure is not to seek corroboration for hypotheses but to seek their contradiction: for an incorrect hypothesis may be corroborated by an indefinitely large body of empirical data, whereas a correct hypothesis will not be contradicted by any data whatsoever.)

If this indeed be the case then what is the basis on which hypotheses are formulated in the first instance? If it is not empirical research that gives rise to the understanding of the policy makers, then what does? The answer one receives from those who know is, the collective experience and wisdom of the leaders of the Communist movement. In practice it means that periodical gatherings of such leaders take place in which resolutions are put to the vote and passed and the contents of the resolutions so passed acquire the status, in the eyes of those subscribing to this particular epistemology, of Truth. It is, however, only a tentative Truth, or an approximation to the Truth, for the same problems are periodically reposed in similar gatherings where the experience of acting according to the earlier understanding is used as a criterion for re-examination and revision and thus arrive at a second approximation to the Truth.

Reliance on 'Collective Experience'

This method of approaching the Truth may be illustrated by considering a hypothetical application to the problem of deciding what is the result of adding 2 and 2. An opinion poll would be taken among the delegates to a congress and if the average of what the delegates think 2 plus 2 should work out to 4½ then a resolution would be passed declaring 4½ to be sum of 2 and 2. If an arithmetic system wherein 2 plus 2 makes 4½ is found unsatisfactory to work with, another congress would be called to reconsider the problem and this time the collective wisdom may settle upon the figure of 3¾ and arithmetic books would be revised accordingly. The assumption underlying this approach is that only "2 plus 2 equals 4" would be found satisfactory in practice and that, therefore, resolutions of the successive congresses would ultimately converge on this Truth.

The arithmetic example is provided for the purpose of elucidation; but it makes the method appear more ridiculous than it really is when applied to a field like political economy. The axiomatic approach is obviously inapplicable to the latter which calls for purely empirical research, and the experience of political activists is far from being insignificant as data to be taken into account. My objection is not to the use of this so called collective experience but to its *exclusive* use. Political economy is not a subject that does not lend itself to the scientific method.

Karl Marx was himself a passionate political activist, but he did not find his and others' political experience sufficient for his understanding of capitalism. He found it necessary to spend a large part of his life in the

British Museum, studying history, philosophy and political economy, and analysing facts according to the strictest academic standards of rigour of scientific objectivity. The analytical tools he developed may appear crude by present day standards, but represented great advances over the tools used by his contemporaries.

Decline of Empirical Research

The poverty of present day Marxism results largely from the fact that this tradition of empirical research has not been kept up, so that from a method of analysis Marxism has been steadily declining into a body of dogmas. Of course, one can find a very good excuse for the relative sterility of latter day Marxism in the capitalist countries: empirical research calls for official patronage which was and still is denied to workers professing a Marxian orientation of outlook. If despite all this Marxian political economists proved to be more successful in explaining certain phenomenon than their "bourgeois" contemporaries, that is because the latter persisted in refusing to take into account certain variables and certain relations between variables for extra-academic reasons.

What excuse can be thought of, however, for the poor research output of the political economists in the Soviet Union? A country that has reached the highest standard of scientific work in both theoretical and applied fields, as exemplified by the first rate contributions to mathematics on the one hand and to space navigation on the other, is lacking in neither talent nor resources available for research. I believe that a Marxist explanation is possible for this poor performance of Marxism in that country, but that would take us further afield.

I shall now substantiate the broadly generalised criticism hitherto made by emphasising two aspects of the grossly unscientific character of the book under review. Firstly, we shall look at the type of information made use of in the book. Not only is there no putting together of fresh statistical material or any original statistical analysis of existing data, the author has not even taken the trouble to get to the primary sources of statistics or find out who the economists of any standing in this country are. The argument is presented not in terms of any analysis of facts but mainly in terms of statements by various supposed authorities, who are quite often such entities as "the Indian Economist Kishori Lal". The most quoted sources are journals like the *AICC Economic Review* and the *New Age*. References to other monthly, weekly and daily journals abound, and most of the statistical tables are also taken from articles published in these rather than from their original sources. It is not sufficient to condemn the particular author as a journalist rather than a research worker: it is to be remembered that academic authorities in the Soviet Union judged the book worthy of publication and also of international circulation through translations!

What Do These Words Mean?

The second aspect is the utter lack of concern for *meaning* with which a large number of undefined or badly defined categories are introduced and made use of. The treatment of the problem is descriptive, the language style chosen literary and most of the sentences have as subjects such categories as "imperialism", "monopolists", "national bourgeoisie", "patriotic forces", "masses", "main ruling class", etc. I know that some of my Marxist friends will throw up their arms at my illiteracy with respect to marxist literature and refer me to various authorities who have already defined these terms. But I submit, firstly, that even if such definitions exist somewhere or other, it is the duty of a research worker to restate them with specific reference to the context of his field of work. I also submit that many of the authoritative definitions are much too vague and ambiguous and are unsuited for analytical purposes without considerable refinement. Thus, even though the phenomenon of "imperialism" was indeed defined and explained by Lenin, what should one understand when one reads such a sentence as "It is known that... imperialism employing the services of the local feudal and comprador elements attempted to impose on these states an outwardly independent but essentially semi-colonial state." (p 19) Known by whom? How? Is this imperialism "the last stage of capitalism" as understood by Lenin? How does a *stage* impose anything on anything else? Is one talking about a certain category of capitalists? How is that category defined and who are its members? How can we identify the "feudal and comprador elements?" Again, what are we to make of expression "(India's) main ruling class — the national bourgeoisie" (p 16). Now what is a ruling class? What is a main ruling class? Do we have a definition of "national bourgeoisie" such that given a capitalist individual or group we can uniquely decide whether it belongs to the above category or not? One often gets the impression that one ascribes two characteristics to the national bourgeoisie, namely it is non-monopoly capitalist and it is "nationalist" or "patriotic". But what basis have we got to assume that the two necessarily go together? Is it not possible to have an Indian monopoly group that would be "national" in the sense of being in competition with international monopoly groups? On the other hand, are we not having a large number of small firms that are under "imperialist" control in the sense of collaborating with foreign monopoly firms?

Brittle Edifices

It is not merely from an itch for semantic purity that I have raised the above objections. I have got the suspicion that many of the ideological edifices that have been built by contemporary Marxist theoreticians would collapse like houses of cards once one introduces precise, unambiguous, rigorous, definitions. I submit that once such an effort is undertaken, such statements as "National democracy is a form of Government in which the unification of all the sound forces of a nation can be most successfully achieved" (p 236), "an indispensable requisite for the formation of a national democracy is the leadership of the working class in the patriotic bloc" (p 236) "the non-capitalist road of development is ensured by the strength of the working class and the masses of the people" (p 235) will turn out to be completely vaccuous depending as they do on such empty phrases as "sound forces" "leadership in the patriotic bloc" and "masses of people".

The Asian Tragedy

Prabhakar Ghate

The Last Confucian by Denis Warner; Penguin Special; 327 pp; 5s.
South-East Asia in Turmoil by Brian Crozier; Penguin Special; 205 pp; 3s 6d.

THE last Confucian of Denis Warner's title is Ngo Dinh Diem, South Vietnam's late President. A good Confucian is imbued with a sense of duty, loyalty and service, and so was Diem, it appears, at least in his early years. Too unimaginative to come off as a tragic figure, Diem did have his virtues, not the least of them being patriotism. In 1931 he resigned from his post of Minister of the Interior (in effect Prime Minister) to the Emperor Bao Dai, when it became clear that the French were unwilling to enlarge the authority of the Imperial Court, or to introduce reforms. In 1946 even Ho Chi Minh asked Diem to join his government.

French Legacy

When called to power again in 1954 Diem's first problem was the bizarre politico-religious sects, each with its own private army. The French exercised only nominal control over them, but in the vacuum created by the French departure they became even more firmly entrenched. Diem was under pressure to form a government of national union, but he rightly decided that he must demonstrate his superiority over the sects once and for all, or forever remain subservient to them.

But as Warner points out, the very quality of dogged tenacity that enabled Diem to survive the early years also proved to be his undoing. For it had, as the reverse side of the coin, an inability to compromise or to accept or even consider advice and a belief in his own infallibility and righteousness. He finally managed to antogonise everyone: the intellectuals, the small westernised elite (with Madame Nhu's morality laws) and the peasants. Of these the peasants were the most important, since their support was essential if the Viet Cong were to be defeated. The regime increasingly became a family clique pitted against the rest of the country.

But the decisive blow was dealt by a political-religious crisis which Diem (and the Nhus) could hardly have provoked more effectively had they set out to do so deliberately. For the last time Diem let the defects in his make-up control his policy. He was no doubt influenced by his earlier success in crushing the sects, but he failed to see that whereas the sects were essentially bands of adventurers, Buddhist sentiment and apprehensions of discrimination were deep and genuine. The author makes the interesting point that the very passivity and non-violence of the Buddhists was their strength. Had they resorted to violence Diem would have had an excuse to crush them, but when he cracked down upon them without provocation he discredited himself finally with the generals who overthrew him.

Basic Weaknesses

The paternalistic and authoritarian streak in Diem and his brother Nhu, the tendency to think in terms of control and organisation, partly accounted for the most fundamental defect in the regime's strategy against the Viet Cong. The regime used the same methods as its adversary and as a result the choice for the peasant became "who is it safer to belong to?" The author brings this out in a first vivid chapter which describes an armed raid into Viet Cong territory, life in Diem's "strategic hamlets", and the machinery of administration. The object of the raid had been to harass and break up a Viet Cong company. In this it was successful, but on balance the Viet Cong won the day. The government troops tortured alleged Viet Cong guerillas, some of them captured on baseless suspicion. The result was to force them, in self-defence, to join the Viet Cong the next time they encountered Government troops. In a "strategic hamlet" villagers were watched, dossiered, and needed permits to leave the hamlet. They were required to contribute their time and labour to unpaid and unproductive government work, and to attend indoctrination sessions. The official ideology was Personalism, a concoction of Confucianism, Buddhism, Catholicism and Hinduism. It stood for freedom, though in practice there was precious little of it. As for the administration, the provinces and even the districts were headed by army officers and the province chiefs had arbitrary powers of life and death over their subjects.

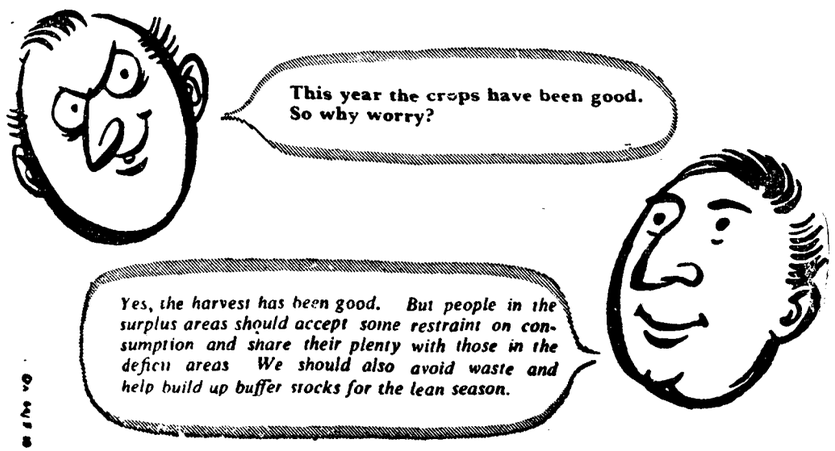
Warner's background as a war correspondent gives him a special insight into matters military. He describes how the Americans trained the wrong sort of army because they failed to understand, until 1959, the tactics and techniques of the Viet Cong. Diem to his credit did understand the Maoist formula of three-stage revolt: political subversion and military preparation, followed by guerilla warfare and mobile warfare. To answer the need for a grass-roots security organisation he formed the Self-Defence Corps, a home guard, units of which were set up in each village, but it remained ill-equipped and incompetent. The Americans would not aid it because they felt it would sooner or later get infiltrated by the communists. The Civil Guard was being trained by the Americans as a conventional police force, while Diem wanted a para-military force. When the second phase of the war started in 1959 the brunt of it fell on these groups. Today they are being properly trained but their usefulness is limited with the war now in the third phase.

Viet Cong Techniques

In a fascinating chapter Warner describes the first phase of Viet Cong operations, the preparation of political and military bases. The Viet Cong have been known to spend several years of patient political and social preparations before moving into the second phase. He uses, as a case study, a captured Viet Cong report titled "Experience in Turning XB Village in Kien Phong Province into a Combat Village". The hinge on which all their other efforts rested was the legitimate land hunger of the peasants and their exploitation under the present set-up. Gradually, after many reverses, the village was converted. The next step was to involve the villagers in the fighting and turn XB into a combat village. This attracted punitive reprisals by government troops, which led the villagers to further identify themselves with Viet Cong goals. The people learnt war through war.

The author devotes a chapter to Laos, but only a chapter, because he regards it as part of the battle for Vietnam. He appears to give it up for

lost from the U S point of view, largely because of a mismanaged American aid programme which lined the pockets of the Vientiane rich and antagonised just about everyone else, to the benefit of the Pathet Lao. The most the West can hope for, he suggests, is neutrality of the Austrian type in reverse, by which Laos will remain technically neutral but effectively within the Chinese sphere of influence. Men and materials still flow along the "Ho Chi Minh Trail" and north-eastern Thailand is as exposed to infiltration as ever. This is where Warner expects the next communist thrust in South-East Asia.



Warner discusses plans for the development of Thailand's long-neglected north-east, and is guardedly optimistic about meeting the communist challenge successfully there, largely by outdoing them in good works. (In some parts, it seems, the only medical aid the inhabitants have known has come from the communist underground). On the other hand, he points out that the communists have a head start, and in the racial and cultural affinities of the north-easterners with Laotians have ready-made separatist aspirations on which to work. Therefore he warns the West not to take Thailand's alignment for granted. The temptations to go neutralist like Cambodia are ever present if a posture of friendly neutrality towards China offers the only hope of avoiding subversion in the north-east.

A Broader View

Brian Crozier's book attempts something different. Instead of focussing on a particular country in depth, it takes a broader view of South-East Asia as a whole. It provides a pattern to what seems at first sight a haphazard and unrelated jumble of events, policies and personalities, and sets "issues" like Vietnam and Sukarnoism in their proper historical, ideological (and, therefore, world political) perspective. This is a useful task, but the result is a book likely to be of more interest to the student of international relations than to the general reader who is more interested in specific topical trouble spots. On these Crozier is forced to be brief in a small book, but he also tends to restrict himself to the 'political' level. For instance, in discussing South Vietnam Crozier spends most of his time establishing that the war is not a civil war but an insurrection directed by Hanoi. He describes the various front organisations in South Vietnam set up by the communists to that end. But these front organisations, as he implies himself, exist mostly on paper. Their influence on the course of the war must be slight. The outcome will be decided in the ricefields and up in the mountains, and this is where Crozier does not take us.

Nevertheless, Crozier's book is full of interesting comparisons. During the Second World War resistance movements sprung up in most of the countries under Japanese occupation. Broadly speaking, the communists did not lead the resistance groups; they were mostly hangers-on of nationalist or peasant movements. In Indo-China, however, at least at the outset, nationalism and communism merged into the strong stream of resistance to the French. When they separated the communists were the stronger of the two, and they carried the struggle to victory in the north. Whereas elsewhere in South-East Asia, Crozier believes, nationalism is an obstacle to the spread of communism, the North Vietnamese can use nationalism as an ally in their bid to complete the struggle they began in 1946.

Crozier's book contains useful suggestions for further reading.

Nationalism and Democracy in India

K R Narayanan

The strength and balance of a nationalist movement can be determined by the degree to which its economic and social aspects have been joined on to the political aspect. The moment a nationalist movement gets divorced from necessary social and economic reform it loses its vitality as well as its hold on the people and gives place, almost inexorably, to a more revolutionary movement. Kuomintang China is the classic example of such a development.

In India, as in most other countries of Asia and Africa, nationalism has thus to be understood in the sense of a constructive and liberating force. It is also a comprehensive concept transcending the boundaries of ordinary political usage in the West.

NATIONALISM is the background against which the drama of democratic development has been unfolding itself in India since Independence. Every aspect of development—social, economic, political and cultural—is informed by the spirit of nationalism, and moved by its emotional impetus. For a renaissant nation like India, awakening from centuries of political subjection and economic degradation, it is only natural that the nationalist spirit should be the presiding force in society.

Unlovely Forms

In the past nationalism has expressed itself in so many unlovely forms, both in Asia and Europe, that it is often regarded as a narrow and dangerous creed in the modern world. Colonial imperialism, Fascism, and the 'co-prosperity sphere' concept of the Japanese, were some of its most spectacular manifestations in recent history. Even the international creed of communism bears the imprint of the big-power nationalism of Soviet Russia and Peoples China. While these political ideologies are not merely expressions of nationalism, but something infinitely more complex and explosive, there is behind them a common irrational glorification of the nation, or the race, or of an ideology embodied in the concept of the nation. This kind of expansive and aggressive nationalism has played a black role in human history, and in our own atomic age it is, undoubtedly, a major anachronism. The touch of technology has made 'the whole world kind' in so real a sense that the other expression of nationalism, that of arrogant and brooding isolationism, has also become completely outmoded.

Nevertheless, nationalism seems to be a phase through which every nation has to go through, and it is not inevitable that it should always take a military or aggressive or isolationist form. On the contrary, it has often been a powerful defence against tyranny and oppression. Napoleon faced nationalism in this aspect in Europe, the British in their colonial empire, the Russians in Yugoslavia, Poland and Hungary, and the Chinese in Tibet. Indeed, many a battle of human liberty was fought under the nationalist banner, and even today over vast areas of the globe nationalism spells freedom and dignity for man. One must, therefore distinguish between the nationalism of a big industrial and military power projecting itself in the international arena, and of new underdeveloped nations struggling to become independent entities or establish their newly-won independence on firm foundations. Thus while the word conjures up many a fear and suspicion, it also summons from the depths aspirations of freedom, equality and prosperity for many millions of people.

In the Indian Context

In regard to India, and most other countries of Asia and Africa, nationalism has to be understood in the latter sense of a constructive and liberating force. It is also a comprehensive concept transcending the boundaries of ordinary political usage in the West. In origin it was, no doubt, a political movement born under the impact of foreign domination, with the central objective of attaining the political independence of India. At the same time it was not a purely political, but a renaissance, movement embracing almost every sphere of Indian life. One could describe Indian nationalism as a vast movement of a whole people towards national independence, national self-respect, national well-being and national enlightenment. Except for certain sporadic attempts at the apothesis of Mother India, the movement did not develop a mystique or myth of its own but remained mostly on a pragmatic plane, swept though it was by the winds of passionate ideas. In other words, nationalism in India was not the dream-child of a febrile collective-mind, but the manifestation of concrete forces and palpable psychological attitudes in society. This was largely due to the peaceful and rational approach of the leaders themselves who were constantly, even in the thick of the fray, examining and explaining the aims, methods and meaning of the movement. It is, therefore, easy to reduce Indian nationalism to its basic elements which are political, social, economic and cultural. When taken together these amount to an Indian Renaissance. One could even go further and say that it was as if the Renaissance and the Reformation have been taking place in India at the same period. There was the idea of the rebirth of the past glory of India, and also of the reformation of the existing social order. While the vision of the past greatness of India was conjured up, it was combined with the challenging of old ideas, beliefs, practices and institutions. Thus nationalism has been operating as a revolutionary force transforming, or more appropriately rough-hewing, the age-old Indian social order into a system more rational and modern. The rationality and the modernity were, in the main, the result of the impact of Western education and technology. A new spirit of reason, of enquiry, of scepticism and of criticism has been let loose in India for the first time since the spacious days of the Upanishads and of the Buddha. Though confined, in the beginning, to the educated upper and middle classes, this new spirit slowly percolated to the broad masses in thousand subtle ways and stung them with the desire for progress.

A Vehicle of Social Change

Therefore in India nationalism has not merely been an instrument of political change, but a vehicle of social and economic revolution. More than one stage of historical development is being pressed into one perfervid period of history. Struggle for

national independence, for political democracy, for economic freedom and social equality are all telescoped in a single period of change. The strength and inner balance of a nationalist movement could be determined by the degree to which these various aspects, particularly the economic and social aspects, have been joined on to the political aspect. In an underdeveloped country purely political nationalism is a hollow thing, and is replete with irrational potentialities. The moment a nationalist movement gets divorced from necessary social and economic reform it loses its vitality as well as hold on the people, and gives place, almost inexorably, to a more revolutionary kind of movement. Kuomintang China is the classic example of such a development. After independence from foreign domination has been achieved the main *raison d'etre* of a nationalist movement lies in its ability to engineer a socio-economic revolution. It may be that the purely political revolution can still fulfil a certain residual function in the way of preserving the independence of the country from outside pressures. The point, however, is that after independence this is at best a residual emotion which could, no doubt, be kept at a high pitch by propagandist ravings about foreign enemies, but, ultimately, must yield to social and economic considerations at home. The sanity and strength of Indian nationalism lies in the fact that even during the most fervid stage of its struggle against foreign rule it has developed within itself what might be called a socio-economic soul.

Struggle Against British

It was with the advent of Mahatma Gandhi as the exponent of large-scale mass action and of Pandit Nehru as the impassioned advocate of socialist ideas that the Indian National Congress acquired political dynamism as well as social and economic significance. The objective condition for the growth of social consciousness was inherent in the immense poverty of the people, and the many inequities of the social order in which they lived. In such a context it was natural that enlightened leadership should interpret the struggle against the British rule not only in terms of national freedom, but of economic, social and cultural betterment of the ordinary masses.

Since 1927 the idea of economic freedom became an increasingly important part of the thinking and programme of the Indian National Congress. "My outlook", wrote Pandit Nehru about this period, "was wider, and nationalism by itself seemed to me definitely a narrow and insufficient creed. Political freedom, independence were no doubt essential, but they were steps only in the right direction. Without social freedom and a socialist structure of society and the State, neither the country nor the individual could develop much". Nehru was very much ahead of the Indian National Congress at that time, but gradually the idea of social and economic freedom took possession of the movement until, as Nehru himself wrote: "The Congress represented not only the nationalist urge of India, which had grown with the growth of the new bourgeoisis, but also to a large extent proletarian urges for social change. In particular, it stood for revolutionary agrarian change". In this respect a resolution adopted by the All India Congress Committee in 1931, on Fundamental Rights and Economic policy, is of particular importance. It stated that "in order to end the exploitation of the masses, political freedom must include real economic freedom of the starving millions". In setting down the content of economic freedom the resolution enumerated a series of social and economic measures most of which, after independence, found a place in the Constitution and in the Five Year Plans.

Social and Economic Programmes

There was, thus, within the Congress, a good deal of thinking, discussions and programme-making in regard to the social and economic problems of the country long before the coming of independence. The climax of this process was the establishment in 1938 of the National Planning Committee of the Congress. It was, of course, a non-governmental body, without the supreme power of the State to back up its decisions, and the experience of this first attempt at planning brought home to the nationalist leaders the important lesson that no serious reform of the Indian social order could be undertaken in the absence of political independence. An examination of the work of the National Planning Committee would show the degree to which Indian nationalism nearly ten years before transfer of power, was permeated with the desire and the will for social and economic development of the country. There was a strong conservative element in the Congress who looked askance at this kind of Socialistic planning. It is a tribute to the progressive potentialities of the Congress and the brilliant Fabian strategy of Pandit Nehru that within a few years after independence the Congress Party and the country as a whole have been committed to an economic plan much more comprehensive and far-reaching, both in physical and social terms, than this first fragmentary and rather academic exercise in planning.

Acceptance of Planning

The composition and membership of this first planning body is worth noting. It consisted of widely differing, and sometimes, conflicting interests. Provincial Governments, industrialists, financiers, economists, scientists, trade unions and village industries, and even Princes were represented on the Committee. This heterogeneous body was, however, able to arrive at some common basis for planning, in very much the same way that India after Independence was able to find a common basis and a common set of objectives and methods for planning on a much larger scale. Pandit Nehru wrote about this early experiment: "Constituted as we were not only in our Committee but in the larger field of India, we could not then plan for Socialism as such. Yet it became clear to me that our plan, as it developed, inevitably led us towards establishing some of the fundamentals of the socialist structure. It was limiting the acquisitive factor in society, removing many of the barriers to growth, and releasing an enormous amount of talent and capacity. All this was attempted in the context of democratic freedom and with a large measure of co-operation of some at least of the groups who were normally opposed to Socialistic doctrine. That co-operation seemed to me worthwhile even if it involved toning down or weakening the plan in some respects". This passage expresses in a nutshell the broad strategy of Pandit Nehru, even after independence, in regard to the establishment of a democratic and socialist society in India. It was Nehru who popularised the ideas of planning and socialism within the nationalist movement. In doing so, he was merely bringing to the surface, boldly and clearly, what

was inherent in Indian nationalism and in the conditions of Indian society. He was in this respect ahead of the majority of his Congress colleagues, but his ideas, slowly and continually, flowed into the stream of nationalism until at last it became almost the main current. The Five Year Plan, with its objective of creating a Socialist pattern of society is the full-fledged post-independence expression of these earlier tendencies.

Britain's Historic Role

One cannot overlook the fact that the first practical foundations of this socio-economic revolutionary process were laid during the years of British rule. Indeed, the present restless desire for economic progress could have emerged only after the age-old rigidities of the Indian social order have been disturbed by the introduction of industrialisation and western education. The gates of modern scientific and technological knowledge were thrown open to the upper and middle classes and the seeds of industrial revolution sown in Indian society. The British contribution was neither deliberate nor planned, nor could it be described as having been adequate or impressive in comparison to the needs and resources of the country or the capacity of the administration to have undertaken had they set themselves to the task of raising living standards in India. Whatever industrialisation or economic development took place during the British period was primarily a by-product of their pursuit after military and commercial interests in India, but it was a by-product of immense and energising importance.

This historical role of England in India was recognised even by Karl Marx. It is worth quoting him on this point both to clinch the point of British contribution to Indian industrial revolution and the contribution now being made by free India: "All that the English bourgeoisie may be forced to do will neither emancipate nor materially mend the social condition of the mass of the people, depending not only on the development of the productive power, but of their appropriation by the people. But what they will not fail to do is lay down the material premises for both.... The Indians will not reap the fruits of the new elements of society scattered among them by the British bourgeoisie till in Great Britain itself the new ruling classes shall have been supplanted by the industrial proletariat, or till the Hindus themselves shall have gone strong enough to throw off the British yoke altogether. At all event, we may safely expect to see, at a more or less remote period, the regeneration of that great and interesting country". In assessing the British impact on India, Pandit Nehru expressed more or less the same view when he said that the British "represented a new historic force which was going to change the world and were thus unknown to themselves, the forerunners and representatives of change and revolution, and yet they deliberately tried to prevent change, except in so far as this was necessary to consolidate their position and help them in exploiting the country and its people to their own advantage".

Purposive Approach to Development

In the latter years of the British Raj, there was a much more purposive approach to economic development. Ultimately, the British left behind in India a system of railways, irrigation, and the various industries and above all, an educated middle class all of which constituted a foundation on which free India could build her future. But the fact remains that these did not go beyond laying the 'material premises' for the growth of production. What the nationalist movement, and later on the national government of India, have done was to gather up 'the new elements of society scattered among them by the British bourgeoisie', to organise the new productive powers and social forces released by the impact of the West, into a coherent, purposive and ambitious plan of national construction. This is a historic task that could have been done effectively only by a nationalist movement, and an independent Government. Gunnar Myrdal, in one of his books, has observed that a highly developed nationalist movement with a history of active struggle is an essential pre-requisite to the working out of a real economic plan in an under-developed country emerging from colonial status. He goes to the extent of saying that the ability to produce an economic plan of this sort is the hallmark of true nationhood for an under developed country. Viewed from this point of view, the Indian Five Year Plans could be interpreted as the finest expression of Indian nationalism. India is not doing this in a narrowly nationalistic or autarchic manner, but in fullblooded co-operation with other countries of the world. International co-operation, with all its political and financial implications, is one of the major assumptions on which the Indian Plans have been made.

While Indian nationalism derived its social and economic content from the objective conditions of Indian society, from the technological changes brought about by the contact with Britain, and from the consciously worked-out reform programme of the Indian National Congress, it was also to a certain extent the product of the particular character of the nationalist movement itself and of the unique method of struggle adopted by it. Had the nationalist movement remained an upper and middle class affair, social and economic ideas would not have invaded it so much, and after independence, nationalism would have, probably, degenerated into a conservative, if not a reactionary, force. Under Mahatma Gandhi, the masses, both urban and rural, were drawn into the national struggle and "political freedom took a new shape ... and acquired a new content". When the ordinary man became an active participant in the movement, it was inevitable that attention should be focussed on him and his problems. Thus national freedom came to be interpreted in plain bread-and-butter terms and from the stand point of social equality and economic opportunity. In a country so frightfully poor and illiterate as India, it was not only a matter of high morality but of superb political strategy to have interpreted national independence in this manner. This was the surest way of bringing into the thick of the struggle the ordinary masses without whom the politically conscious intelligentsia would have been but ineffectual angels beating their wings against the bars of the golden cage that was the British Raj.

The Social Democratic Twist

In identifying the Congress with the masses, and national freedom with the betterment of their condition, Gandhiji, in his own way, gave a social democratic twist to the nationalist movement. He did not talk the language of socialism as Pandit Nehru did, but set himself straightaway to the task of ameliorating poverty, disease and ignorance through self-help and self-discipline. He chalked out a programme of constructive action for Con-

gressmen which touched intimately the social and economic aspects of village life. Spinning, sanitation, clean housing, improved agriculture, removal of untouchability, emancipation of women, etc were some of the items that figured in the constructive programme. Despite the outmoded concept of village self-sufficiency and the semi-religious idea of simplicity and austerity, Gandhiji's constructive programme helped to sow in the peasant mind the desire and the will for a better life. One might say that the first tadpole wriggle of the modern kind of desire for progress was produced in village India, strangely enough, under the impact of the Gandhian programme. What he promised the masses were more clothes, more food, more housing, more sanitation, more freedom, and more equality than they possessed at the moment. This is clear from Gandhiji's own picture of an ideal Indian village. "An ideal Indian village", he wrote, "will be so constructed as to lend itself to perfect sanitation. It will have cottages with sufficient light and ventilation, and built of a material available within a radius of five miles of it. The cottages will have court-yards enabling households to plant vegetables for domestic use and to house their cattle. The village lanes and streets will be free from all avoidable dust. It will have wells according to its needs, and accessible to all. It will have houses for worship for all, and also a common meeting place, a village common for grazing its cattle, a co-operative dairy, primary and secondary schools in which industrial education will be the central fact, and it will have panchayats for settling disputes. It will produce its own grains, vegetables and fruits and its own khadi". From this, it is clear that Gandhiji visualised all round improvement of the economic and social condition of the masses, even though he did not think of it in modern materialistic terms. In fact India's ambitious Community Development Programme of today would not, in the near future, take the agrarian masses beyond the living standards envisaged by Gandhiji. Those who look upon his teachings as contrary to modern progress forget that in the context of Indian poverty what he was offering the masses was really progress and that, in fact, he aroused in them the desire for a better life and for the good things of life. Gandhiji did not, of course, approve of this desire growing into an enormous appetite, and his philosophy and programme had almost built into them both a spur and a bridle to this economic appetite. This was, in a peculiar way, a contribution to democracy.

The central problem of democracy in an underdeveloped country is how to persuade the people to go without some of the immediate necessities and delights of life until such time that long-term investment projects have begun to yield economic results. The problem is one of withholding from the people a goodly portion of the fruits of their labour so that it may be ploughed back into the process of development and of capital formation. Could this be done, democratically, in a country where living standards are sub-normal, where national independence has given rise to new demands and expectations, and where political democracy has bestowed on people freedom to agitate for the fulfilment of their aspirations to the point of changing the Government in power? It is in respect of this problem that the Gandhian philosophy of economic austerity and contentment could be of considerable service in preserving democracy. I do not say that Gandhi's philosophy should be used as a kind of non-violent opium of the people. But it certainly has the effect of taking the edge off the economic appetite and mollifying its revolutionary hunger. The actual impact of Gandhian ideas on the masses was one of opening up before them new vistas of social and economic well-being. To this extent Gandhi contributed to the social democratic content of Indian nationalism.

Impact of Non-Violence

It is possible to go a step further and argue that the method of non-violent struggle helped to emphasise the social and economic significance of nationalism. In one of his works Lenin advocated conflict as a method of political education of a backward people. If violent conflict arouses the consciousness of a people, non-violent conflict does it even more deeply, since it is a more prolonged process and is based on the utterly voluntary willingness of individuals to non-co-operate and make sacrifices. The long duration of the Indian struggle, its peacefulness and mass character helped to disseminate on a large scale the ideas inherent in nationalism, and made them gradually mature and gather strength until the whole movement, almost unknowingly, was pushed into an essentially revolutionary path.

From the very beginning Indian nationalism was also impregnated with the idea of political democracy. No one in India will deny the historical fact that it was the association with England that gave India the knowledge of and the desire for democratic institutions. Even though in her ancient villages India was familiar with some kind of local democracy, she had no conception of representative institutions of the modern type. Those institutions were, beyond doubt, imported from abroad and imposed from above. However, as a British writer has observed "The fact that Parliament is in origin a western institution is less significant than the fact that Parliament in India has become an Indian institution." The process of this transformation is the real story of political democracy in India. The impact of Britain created in India a bourgeoisie and an educated elite who provided the necessary context in which such a democratic transformation could take place. But the Indian soil had to be receptive to democracy and it was the nationalist movement that prepared the soil first, and also forced the hesitating pace of British constitution development directing it, irrevocably, towards the road to democracy.

Demand for Democracy

The demand of Indian nationalism was not merely for independence but for the establishment in India of a political system similar to the British Parliamentary system. In fact the earlier generations of educated Indians were enchanted by the Parliament at Westminister, and their faith in the British form of Government was profound, almost pathetic. Besides, the ideas of liberty and the rights of man expounded by the poets and philosophers of England crated a ferment in Indian middle-class society. In the early stages all that the Indian National Congress asked for was the extension of these British liberties and opportunities to the English educated Indians. Sir Surendra Nath Banerjee, one of the patriarchs of our nationalism, speaking to the Oxford Union in 1887, said "England is the home of representative institutions which have spread far and wide until the country has justly been called the august mother of free nations. The people of India are children of that mother, and they claim their birth-right, they claim to be admitted into the rights of British citizens and British fellow-subjects." Again, in 1906, we find the Calcutta session of the Indian National Congress asking for India the system of Government obtaining in the self-governing colonies. Later on the demand became for Dominion status, and at one time even Gandhiji would have been satisfied with it. The significant point in all this is that what India wanted from the very moment of the dawn of political consciousness was a parliamentary system of Government.

Constituent Assembly

When complete independence was declared as the goal of nationalism, this faith in democracy was re-affirmed even more emphatically. The Declaration of January 26, 1930—a day now hallowed as India's Republic Day—was a challenging assertion of not only the right of national self-determination, but also of the basic democratic right of a people to form or change their Government: "We believe that it is the right of the Indian people, as of any other people, to have freedom and enjoy the fruits of their toil and have necessities of life, so that they may have full opportunities of growth. We believe also that if any Government deprives a people of their rights and oppresses them the people will have a further right to alter it or to abolish it." This is, indeed, a revolutionary statement of India's democratic credo framed in such terms as to make it valid not only in the period of struggle against foreign rule, but after the attainment of independence.

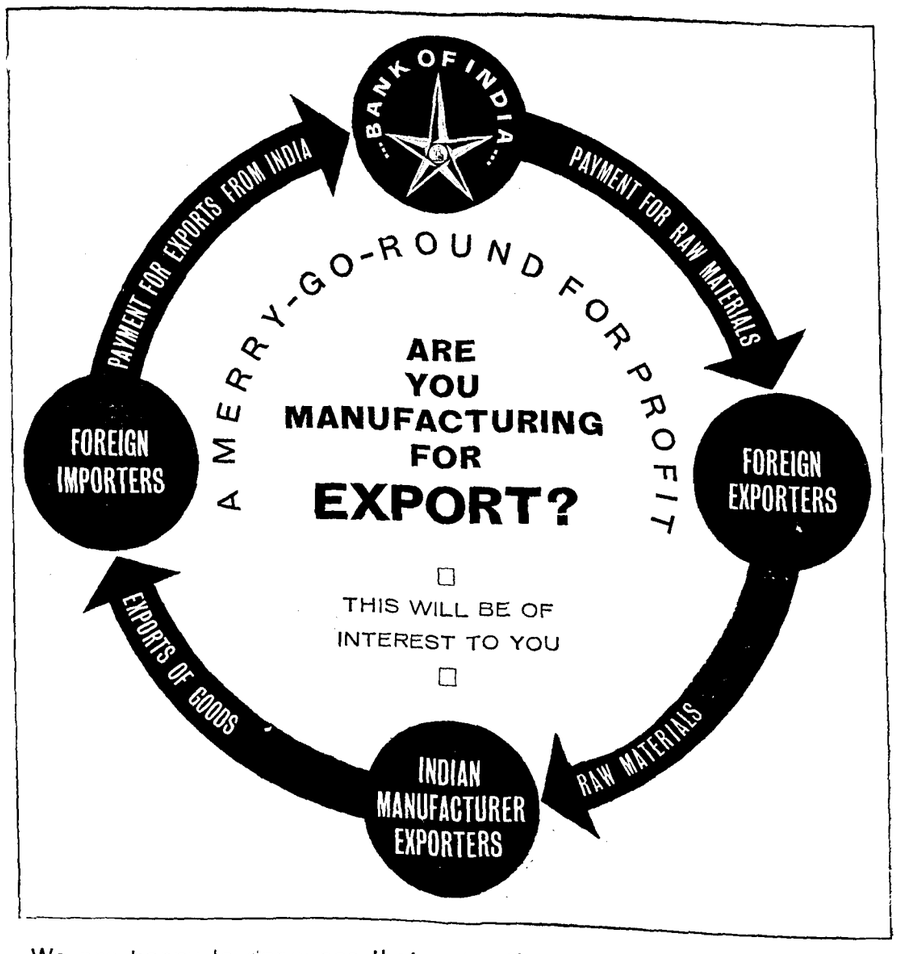
The Congress carried this concept further in the 1930's when it demanded a Constituent Assembly for India. Pandit Nehru was the exponent of this idea in India. He thought of it as a sovereign body elected on the basis of universal adult suffrage. The Constituent Assembly, strictly speaking, is not a British idea or institution, but one borrowed from the revolutionary politics of America and the European Continent. This is characteristic of the Indian approach to democracy. While modelling the political system after that of Britain, ideas from other sources, be they Western or Indian, were freely incorporated into the concept of democracy.

The nationalist movement had rejected the very idea of Britain giving India a Constitution. Gandhiji argued that "the Constituent Assembly alone can provide a Constitution indigenous to the country and truly representing the people." In 1936, the Congress adopted a Resolution which said: "The Congress stands for a genuine democratic state in India where power has been transferred to the people as a whole and the Government is under their effective control. Such a State can only come into existence through a Constituent Assembly having the power to determine finally the Constitution of the country." Again, in 1939, the Congress re-affirmed that "a Constituent Assembly is the only democratic method of determining the Constitution of a free country and no one who believes in democracy and freedom can possibly take exception to it." This demand was granted only in 1946 when Britain had already decided to quit India. The significant fact is that the Constitution of independent India was ultimately made in the democratic manner contemplated by the nationalist movement.

"Legalised Terrorism"

While fighting for national freedom and foreign domination, India was, at the same time, fighting against an autocratic form of Government. Today, there is a tendency abroad to look upon British rule in India as if it was nothing but a tender and considerate system of democratic tutelage. In fact, the entire fabric of British administration, from the Viceroy down to the village headman, was shot through with authoritarianism. Therefore, almost naturally, the nationalist movement grew into a struggle for liberal freedoms and civil liberties, and freedom for the individual, freedom of speech, freedom of press and freedom of association, became some of the major aspirations of nationalism.

These rights and freedoms derived their original inspiration from Europe and, no doubt, the British were responsible for their dissemination in the Indian Empire. Despite the individualism of the Indian and the long tradition of intellectual and religious freedom behind him, these ideas were new to the politics of India. They were, however, absorbed by the educated middle-classes with such avidity that very soon they were to be restated and reasserted by the nationalist movement in opposition to the administration. It is part of the fundamental contradiction of the British Raj that it was compelled, in the interests of Empire, to control, and on occasions, to suppress most of the liberal ideas that the British themselves had the historic privilege of introducing in India. The Vernacular Press Act (1786), The Arms Act (1876), the Criminal Law Amendment Act (1908), the Indian Press Act (1910), the Defence of India Act (1915), and the Rowlatt Act (1915) were some of the major undemocratic legislations by which freedom was severely curtailed for political purposes. The Rowlatt Act, which instituted a system of summary political trials, deserves special mention, even though it enjoyed only a short span of life. It was provoked by this Act that Gandhiji launched his first Civil Disobedience movement, making the issue of civil liberties a rallying point for the nation. To these laws must be added the Emergency Ordinances of the Second World War period. Sir Samuel Hoare, the Secretary of State for India, admitted in the House of Commons that these ordinances covered "almost every activity of Indian life." Gandhiji called them legalised Government terrorism. Many of the best sons and daughters of India spent the best years of their lives in British jails under one or other of these laws.



Battle for Individual Liberty

Within the larger struggle for national freedom there was, thus, in India a continuous battle for individual rights and civil liberties. This was reflected in the various resolutions and policy statements of the Indian National Congress. In 1918, the Congress proposed a Bill of Rights to be included in the new Constitution. One of the articles was to the effect "that no Indian subject of His Majesty's Government shall be liable to suffer in liberty, life, property, or in respect of free speech or writing or of the right of association, except under sentence of an ordinary Court of Justice, and as a result of lawful and open trial."

One of the great landmarks in the development of the idea of individual freedom in India was the Resolution on Fundamental Rights and Economic policy adopted by the All India Congress Committee in 1931. This Resolution, drafted largely by Pandit Nehru, enumerated with passion and clarity of thought, the following Fundamental Rights to be included in a Constitution of India:

"(1) Freedom of association and

combination; (2) Freedom of speech and of the press; (3) Freedom of commercial and free profession and practice of religion, subject to public order and morality; (4) protection of the culture, language and the scripts of the minorities; (5) Equal rights and obligations of all citizens without any bar on account of sex; (6) No disability to attach to any citizen by reason of his or her religion, caste or creed or sex in regard to public employment, office of power or honour, and in the exercise of any trade or calling; (7) Equal rights to all citizens in regard to public roads, wells, schools and other places of public resort; (8) Right to keep and bear arms in accordance with regulations and reservations made in that behalf; (9) No person shall be deprived of his liberty, nor shall his dwelling or property be entered, sequestrated or confiscated save in accordance with law." To these was ad-

We are happy to announce that under the scheme of Export Credit & Guarantee Corporation we have made arrangements to grant Foreign Exchange loans to **Manufacturer Exporters** for import of raw materials, components and spare-parts, etc. Loans to be repaid within 12/18 months from export proceeds. ■ For full details please call at our nearest Office.

ded religious neutrality on the part of the State, and adult suffrage, and a number of economic and social rights. It is a vindication of the democratic content of Indian nationalism that most of these freedoms were, after independence, enshrined in the Constitution as Fundamental Rights of the citizen.

Democratic Struggle

Political democracy was present in Indian nationalism not only in terms of ideas and aims. It was also inherent in the method of struggle adopted by the nationalist movement. There were, of course, periods of violence and terrorism in the history of the Indian struggle. But these were sporadic and short-lived, and not accepted by the main body of the movement. Until the advent of Gandhiji political agitation was conducted largely through constitutional means, and was confined to public meetings, petitionings, and speech-makings. Under Gandhiji's leadership, the Congress became a mass organisation and the idea of freedom assumed a revolutionary aspect. But even when direct action was advocated constitutional politics were not altogether discarded. While as a matter of basic policy the Congress boycotted the elections and the legislatures, there were also periods when they fought the elections and entered the legislatures and, for a time, assumed office in the Provinces. Whenever the Congress resorted to constitutional politics, it was to wreck the Constitution and not work it. "It was," wrote Nehru referring to the Congress experience of Provincial Autonomy, "the old Constitutional conflict between an autocratic king and parliament which had so often taken place elsewhere, leading to revolutions and oppression of the king. Here the king was in addition a foreign authority supported by foreign military and economic powers and the special interest and lap-dog breed it had created in the country." Therefore, in attempting to wreck from the inside a foreign made Constitution unrepresentative of the people the nationalist party was really moving towards constitutional Government in the full sense of the term.

The most unique thing about Indian nationalism was the acceptance by it of the non-violent means of struggle. This played a significant role in the development of the democratic method in India. No doubt, non-violent, non-cooperation was an extra-constitutional technique, and in the hands of Gandhi it was an instrument for the capture of political power, although peacefully. Some of the weapons of direct action like the deliberate defiance of laws, courting of arrests, boycotting of the organs of the State, no-tax campaigns, and fasting for political ends are revolutionary both in conception and execution. The tendency to resort to them has continued even after independence to the detriment of democratic procedures. But there is one great factor that is common to constitutional and non-violent politics — both are peaceful methods. Persuasion and conversion of the other party through peaceful means is the essence of both techniques. Only that non-violence is a more profound approach based not merely on rational persuasion, but also on change-of-heart, on moral conversion. The aim is not to humiliate or destroy your opponent but to win him over. A cause can, therefore, succeed only when it is overwhelmingly right and is pursued with intensity of faith, and without hatred or ill will of the heart. As a result means became all important, the end being the inevitable product. Gandhiji held that ends do not justify the means, and that wrong means do not lead to right ends. Political democracy is nothing if it is not a method of doing things and, therefore, the great emphasis on means must be reckoned as a unique Gandhian contribution to democracy.

One may go a step further and argue that the whole work and philosophy of Gandhi provided for democracy in India a moral and spiritual basis in somewhat the same way as Christianity did for European democracy. The Gandhian movement prepared the Indian soil, socially, morally and psychologically for the growth of democracy. In fact, this preparation was afoot even before the advent of Gandhi, from the time of the Brahma Samaj and other reform movements. What Gandhi did was to cap and carry forward this Reformation of Indian society. For the ordinary man in India the non-violent struggle was an uplifting experience. It showed that an individual, however small, could resist even an Empire with what Gandhi called "soul-force". In other words, it endowed the individual with a sense of dignity, power and challenge. In the Indian context of "pathetic contentment", and fatalistic helplessness this was a stirring idea comparable to the concept of the sovereignity of the individual conscience that Martin Luther preached in Europe on the eve of the Reformation. Thus, the Congress under Gandhi aroused the consciousness of the Indian and made him aware of his own importance and potentialities. For the masses the nationalist movement was a prolonged and collossal process of education. The democratic value of this can hardly be exaggerated even though it has not been fully appreciated either in India or abroad.

Part of Renaissance Movement

In the preceding paras, I have tried to bring out clearly the ideas of social and political democracy with which Indian nationalism was instinct. But nationalism in India was some thing more than a political, social and economic movement. It was part of a larger Renaissance and Reformation movement. There was a great revival of religions, cultures, languages, arts, etc combined with the spread of scientific knowledge and modern social ideas. This revival, incidentally, threw up a good deal of religious fanaticism and obscurantism that sought to preserve, in the name of religion, many an anti-democratic practice and institution. But the dominant tendency in society was not that of revivalism, but of change. The forces of social change were harnessed to the nationalist movement and, after independence they are, being harnessed to the legislative State that has come into being in India, perhaps for the first time in her history. To a large extent the success of democracy in India would depend on the ability of the State to act as the vehicle of this oncoming social revolution.

Another element of considerable democratic significance present in Indian nationalism was its deep sense of internationalism. From the very beginning India had intimations of belonging to the world community, and participation and cooperation in world affairs was one of her earliest dreams. She not only fought for her own democratic right of independence, but ranged herself on the side of democracy in the world. The Indian National Congress took an uncompromising stand against Fascism and Nazism, and also supported nationalist movements in the colonial territories. The despatch of an Indian Medical Mission to China during the Sino-Japanese war, and of medical and food supplies

to Spain during the Civil War were clear demonstration of the international democratic sympathies of the nationalist movement. Pandit Nehru was the prime mover of these measures. On the outbreak of the War, he drafted a resolution for the Congress Working Committee which said: "In this crisis the sympathies of the Working Committee are entirely with the people who stand for democracy and freedom, and the Congress has separately condemned Fascist aggression in Europe, Africa and the Far East as well as the betrayal of democracy by British imperialism in Czechoslovakia and Spain". During the War, India asked for immediate independence in order that she may mobilise her entire resources on the side of the democracies.

Growth of Internationalism

Pandit Nehru was the passionate and far-sighted advocate of this progressive internationalism. Poet Tagore and Gandhiji also played a predominant role in widening the nationalist horizon and arousing in India a certain world-consciousness. Nehru was, however, the internationalist par excellence. He was sensitive to his fingertips to developments in the outside world, and he had also an enlightened appreciation of the national significance of internationalism. In his "Discovery of India", while discussing the reign of Akbar the Great, Nehru observed that "Akbar might have laid the foundations of social change if his eager, inquisitive mind had turned in that direction and sought to find out what was happening in other parts of the world". Instead, Akbar was preoccupied with glory and internal consolidation. This inwardness, this lack of lively awareness of developments in the wide world outside, for example, of science and technology and commerce, was one of the reasons for the decline and fall of the Moghul Empire and of India in general. Nehru, therefore, realised that internationalism had an internal significance and the far-flung yet essentially India-based, foreign policy he developed after independence bears testimony to this. "Having attained our freedom", Nehru said at the Lahore Congress, "I have no doubt that India will welcome all attempts at world co-operation and federation and will even agree to give up part of her independence to a larger group of which she is an equal member". Mahatma Gandhi stated this internationalism in his own inimitable way when he wrote: "My service of India includes the service of humanity. Isolated independence is not the goal of the world States. It is voluntary inter-dependence. The better mind of the world desires today not absolutely independent states, but a federation of friendly inter-dependent states. The consummation of that event may be far off. I want to make no grand claim for our country. But I see nothing grand or impossible about our readiness for universal independence. I desire the ability to be totally independent without asserting the independence". Indian nationalism was, therefore, no narrow and outworn creed, but a movement that had at its very heart the objectives of political and social democracy, and was constantly stretching its arms towards the ideal of world cooperation and 'voluntary inter-dependence' of nations.

How Has the Indian Working Class Fared?

Subratesh Ghosh

The labour policies of a state with socialist aspirations have reduced the pains of industrialisation for the Indian working class.

Money-earnings have risen and there has been also some improvement in real earnings. Employment in the organised sector has expanded, though the unemployment problem remains unsolved. Some progress has been achieved in the field of social security, but not much in the field of industrial housing.

On the whole, there has been a moderate improvement in the level of living of industrial workers.

There has been a decline in spontaneous forms of labour protest. Organised protest in the form of strikes has not shown any pronounced upward trend. There are indications of a growth of positive labour response in the form of tripartite decision-making and collective bargaining.

THE impact of industrialisation on the labour-force and workers' response to it have been interesting themes for study to which many brilliant minds had been attracted in the past. Marx, Veblen, the Weffs, Commons, Perlman and Schumpeter are some of the great names who tried to study these subjects, each from his own angle of vision. A recent contribution in this field has been made by Kerr, Dunlop, Harbison and Myers, who in their joint work "Industrialism and Industrial man", have tried to present a complete theoretical structure to answer vital questions about the impact of industrialisation on the labour-force and workers' response.

No attempt will be made here to survey these theoretical contributions or to assess their relative merits. We will seek to study the problem in the context of Indian industrialization on a factual basis.

The Context

The experiment in industrialisation that is being made in India has some novel features which distinguish it from earlier cases of industrialisation in several respects. She has adopted economic planning as the instrument for achieving the "take-off" that was accomplished in the capitalist democracies within the framework of more or less "free" market economies. On the other hand, unlike the planned economies of the Soviet type, the market mechanism has not been completely subordinated to planning. In resource allocation, the market mechanism in India definitely plays a role, which, although basically regulated and modified by economic planning and social controls, is, nevertheless, much more important than in U S S R.

The elite that is guiding the industrialisation process in India also differs much from the elites who dominated the industrialisation process in other countries like Britain, U S A, Japan or U S S R. In a mixed economy under planning with a regulated market mechanism and a growing public sector, it is natural that the elite dominating the industrialisation process would be a mixed group coming from leaders of the Government and the ruling party and administrators and technocrats in the Government's economic agencies and public enterprises. Besides, there are the private interests guiding the large controlling groups in the industrial sector, who play very significant, although not always visible, roles in determining the market forces, prices of essential producers' and consumers' goods and also are suspected to influence political forces and even, to some extent, the course of state policy. The industrialising elite in India is thus a mixture of the nationalist-cum-middle class elite with some revolutionary-intellectual traits and the rising industrial magnets. The influence of the socialist forces in the country which tended to grow considerably since the 'thirties lent certain revolutionary-intellectual tendencies to the middle class elite. Adoption of the socialist objective for the country and economic planning as the instrument for economic development, selection of sectoral and industrial priorities and also the growth of the public sector are indications of the existence of this element in the industrialising elite of the country. But side by side with this element, there is a strong middle class element represented by the public administrators, technocrats and the leaders of the controlling groups in the private sector who play significant roles in influencing the implementation of economic policies. This type of heterogeneity in the composition of the industrialising elite was not visible in any of the four countries mentioned above which represent the four typical cases of successful "take-off" uptil now.

As regards the pace of economic development and the priorities, Indian aspirations are similar to those of U S S R in her early days of planning. She has adopted rapid industrialisation with primary emphasis on the development of a heavy industry base as a major objective of her economic planning. Naturally this meant considerable pressure on the economy revealed in the form of inflationary price-rise of essential products, growing foreign exchange-crisis as well as shortages and controls of essential products.

Naturally these features have tended to have an impact on India's developing work-force which is substantially different from the impact felt in other countries in the course of industrialisation. The responses also, similarly, show some peculiar traits. India, for these reasons, is a very interesting case study in the impact of industrialisation on the workers.

Three Criteria

For an empirical study of the impact of industrialisation certain objective indicators have to be selected and studied carefully. For this purpose we propose to select three major indicators, viz, impact on the level of living, on employment and on labour organisations and industrial relations.

For studying the impact on the level of living, the best procedure should be to study the changes in real wages and expenditures of workers and the benefits of social security and industrial housing received by them from 1951. (The year 1951 has been selected as the beginning of intensive industrial development in India, since it was in March, 1951, that the First Five Year Plan in India was launched. No doubt there was some industrial growth in India before the commencement of planning, but its rate was slow and its basis narrow.

But a higher rate of growth of the modern organised sectors relatively to agriculture and the subsistence sectors actually commenced with the beginning of planning).

As regards changes in employment, we shall mainly concentrate on how employment in the organised economic sectors increased since 1951. To get a full view of the impact of industrialisation it would also be necessary to take into account the unemployment situation. Thus it would be necessary for us to consider whether the economic development in the country has been able to make any dent on the unemployment problem.

Impact on Trade Unions

As regards the impact of industrialisation on trade union development, a study of the growth of trade union membership since 1951 will be helpful. In this connection the changes in organisation and methods of trade unionism, if any, also should be taken into consideration.

For studying the impact of industrialisation on industrial relations, the basic trends in the institutional set-up —the impact on labour-management co-operation and bargaining—as well as changes in the severity of industrial disputes ought to be the relevant points. Since a study of the severity of industrial disputes is also essential for measuring the extent of workers' response (in the form of protest) to industrialisation, we shall postpone its consideration till we take up the study of labour response.

Changes in the real wages of factory workers since 1951 are indicated in Table 1. The increasing trend of consumer prices, particularly pronounced since 1956, clearly indicates the heavy impact of inflationary pressures on the cost of living of the workers. Because of this persistent pressure, improvements in money-earnings have been considerably eroded away. Thus the gains in real wages have been much less substantial than what is indicated by the increases in money-earnings of workers.

It is interesting to note in this connection that on base: 1939=100, the index of real wages for factory workers in 1953 stood at 99.9.1 (On 1951 base, the corresponding index for 1953 was 106.6). Thus the pre-War real wage-level was reached only in 1953. However, since then real wages have remained in general above the pre-war level, the indices for real wages on 1951 base being almost always higher than 106.6 which was approximately equal to the 1939 level (with the only exception of 1959). Thus, the Indian workers, in the early phase of take-off, have been able to enjoy a real wage level slightly higher than the pre-take-off level. This means that unlike industrialisation carried through purely capitalist ways (e g in U K or U S A), the Indian workers have been spared the pains of continuous decline in real earnings during the 'take-off' phase.

At the same time, however, it should be clearly noted that the improvement in real wages has not been a continuous process. Thus although from 1953 to 1955 real wages were continuously rising, during 1956-1959 they revealed a consistent downward tendency, the index in each year being lower than the previous years'. Since 1960, however, real wages have again started rising. Moreover, real wages have not kept pace with the rise in the index of industrial production, which has been continuous since 1951, unlike the fluctuating real wages index. The disparity would be evident from the fact that whereas during the period 1951-1960, real wages increased by 10 per cent, the production index rose by 77.8 per cent. In fact, real wages also lagged behind improvements in productivity. B N Datar has estimated that the productivity-index of workers belonging to 29 industries covered by the C M I increased by 53 per cent between 1947 and 1958; real earnings during the same period registered a much smaller increase, being just 27 per cent over 1947 in 1958.[2]

Table 1 : Indices of Wages, Consumer Prices, and Industrial Production
(Base : 1951=100)

Year	Real Wages of Factory Workers	Industrial Production	Index of Money Wages of Factory Workers	Index of Working Class Consumer Price
1951	100	100	100	100
1952	109	103.6	107	98
1953	107	105.6	108	101
1954	112	112.9	108	96
1955	124	122.4	113	91
1956	115	132.6	115	100

Change in Levels of Living

Coming to another indicator of changes in level of living, i e, housing conditions, we find a situation which is far from satisfactory. Housing conditions for industrial workers were never satisfactory in the country. Thus R K Mukherji reported that in 1940 about 91.24 per cent of the families in the working class areas of Bombay occupied one-room tenements with 26.86 square feet available per person; in Ahmedabad 73.82 per cent, in the coal field areas of Bihar 85 per cent, and in Kanpur industrial area 96 per cent of the working class families lived in one-room tenements.[3] In most of these one-room tenements more than 3 adults—sometimes 6 or 7 adults-shared a small room. Actually most of these tenements had not even the facilities of latrines or kitchens attached to them.

Recognising the importance of reasonable standards of housing for health and efficiency of workers, the Government of India decided to take steps for improving the situation after Independence. In 1949 a scheme of industrial housing was undertaken by the Government, under which about 1,500 houses were constructed during 1951-52. The Planning Commission estimated that at the time of the commencement of the First Plan about 4.5 lakhs out of 17.1 lakhs of workers residing in 37 major industrial centres (i e, about 26.3 per cent) needed accommodation very urgently. It was further realised that with the growth of population, the problem will become more serious. The Government, therefore, adopted in 1952 a more ambitious programme known as the Subsidised Industrial Housing Scheme for liberal grant of long-term loans and subsidies by the Government of India to the State Government and through them to other approved agencies, e g, housing boards, local bodies, industrial employers, registered cooperative societies, etc. By the end of the First Plan the number of tenements completed under the scheme was about 40,000. By the end of 1961 the figure rose to about 1,13,223 tenements.[4] Although this indicated some progress over the 1955-56 figure of about 40,000, this was far short of the number of sanctioned houses which was 1,46,737 till the end of 1961.

As regards social security benefits, some definite progress has been recorded. The Employees' State Insurance Scheme which was started in 1952 only in 2 centres benefiting about 1.5 lakhs workers, covered about 17 lakhs workers in 121 centres by the end of March 1961.[5] By March 1963, it further extended its activities to cover about 23.35 lakhs workers in 151 centres.[6] By March 31, 1963, it arranged for 3,589 beds in hospitals and provided medical benefits to 82.55 lakh beneficiaries through 421 dispensaries and 2,307 panel doctors. In the financial year 1962-63 it disbursed a sum of Rs 409.77 lakhs by way of cash benefits to the insured workers and spent Rs 2.74 lakhs for grant of other benefits.

The Employees' Provident Fund Act, 1952, which was originally applicable to 6 industries only covered 61 industries by the end of 1961.

There are, of course, still many shortcomings of the Indian social security system. But, nonetheless, in view of the facts mentioned above no one can deny the progress that has been achieved since 1951.

From the brief survey of the major indicators of changes in the level of living, we find that the impact of the initial stage of industrialisation on the level of living has been uneven. Although the real wages have slightly improved as compared with pre-war and pre-plan levels, housing conditions are still deplorable. Besides, the inflationary price rise associated with the rising tempo of industrialisation is making continuous inroads into the real wages. Thus although, unlike earlier cases of industrialisation, they did not suffer allround, the gains derived by industrial workers have not been substantial. In one respect, however, the workers' condition has improved considerably since the beginning of the take-off and that is in the field of social security. Indian industrial workers now are insured against almost all the major risks of industrial society, excepting unemployment. In this respect they are much more fortunate than the agricultural workers or the white collared employees of commercial establishments.

Table 2 : Index of Employment in Organised Sector
(Base : 1950-51=100)

Changes in Employment

Changes in employment in the organised sectors since the beginning of planning is indicated in Taole 2. We find indications of almost continuous rise in employment in the organised sector, excepting in three years, viz, 1951-52, 1953-54 and 1958-59 when there were minor declines. However, there is little room for jubilation. In a developing economy, where large-scale public investments are being made for developmental purposes, increase in employment is natural. On the other hand, what is less expected is the rise in the volume of unemployment which increased from 5.3 million at the end of the First Plan to 9 million at the end of the Second Plan and is expected to rise to about 10 million by 1965-66 even on conservative estimates. Of course the population continued to increase throughout the period and is still increasing. But, even taking note of that, the fact remains that planned industrialisation of the country has failed to satisfactorily tackle one of her most formidable problems, viz, unemployment.

In this connection it is interesting to note that although employment increased in the organised sectors as a whole, the rate of increase has been uneven between the sectors. Table 3 indicates that although employment increased everywhere, the employment effect of development was more pronounced in the industrial sector than in the mines.

Economic development is not only greatly influenced by labour's response to industrialisation, but it is a major factor shaping the nature and course of the organised labour movement.[7] In India also, in the course of the decade of planned industrialisation there has been substantial progress of the trade union movement. The membership of the registered trade unions increased

Table 3 : Changes in Employment in Different Sectors

	Manufacturing Industries		Mines	
	Average Daily Employment *(thousands)*	Index	Average Daily Employment *(thousands)*	Index
1951	29,14	100	549	100
1952	30,21	104	559	102
1953	29,70	102	593	108

from about 18.8 lakhs in 1950-51 to about 40.13 lakhs in 1960-61. Thus in the course of ten years only trade union membership was more than doubled. However, this increase in membership has not been accompanied by qualitative improvement in all cases. Thus, the size of the individual union, indicated by its average membership, is not expanding. Whereas the average size was 781 members per union in 1951-52, this declined to 641 in 1953-54, 604 in 1958-59 and ultimately came down to 596 in 1960-61. The financial position also is not satisfactory. In 1951-52, the average income of a workers' union was Rs 2158, in 1953-54 that came down to Rs 1846 and then it registered some improvement in 1960-61, reaching the figure of Rs 2278. But in spite of this slight improvement, annual average income definitely remains at a pitiable level. There is, however, some sign of maturity in the labour movement reflected in the signing of the Code of Conduct for guiding inter-union relationship.

The organisational structure of trade unions as well as their methods have undergone some change in recent years. There is now a more general trend towards industrial workers grouping in the form of trade union federations, the number of federations having increased from 12 in 1947-48 to 64 in 1960-61; although industrial federations are no adequate substitutes for nation-wide industrial unions the federating tendency is welcome in a country full of "one-shop" unions operating at the factory level. Perhaps this federating tendency has been to some extent induced by growing concentration of industry as well as development of different forms of integration in the industries in the course of the industrial development. Another contributing factor has been the necessity of representing workers' interests in industrial committees, wage-boards, etc, sponsored by the Government as instruments for industrial rule-making.

Table 4 : Trend of Industrial Disputes in the Manufacturing Sector

Year	No of disputes	No of Man-days Lost	Severity Rate per 100,000 Workers	Index of Industrial Unrest (Base: 1951 = 100)
1951	1071	38,18928	424	100

Industrial Relations

In the realm of techniques of trade unionism also some improvement has to be noted. Trade Union methods, which in the pre-war period were mainly limited to periodic strikes and demonstrations, have now assumed greater sophistication. Thus there has been some increase in mutual benefit expenditures and educational activities by trade unions. They also make wide use of the methods of external regulation available to them (viz, industrial adjudication, placing of data and arguments in support of the labour point of view before wage-boards and other agencies of similar nature, and also activities for influencing the course of labour legislations). No doubt, this widening of the horizon has been greatly conditioned by the objective situation and circumstances which in turn were greatly conditioned by the industrialisation process.

As regards the impact of economic development on industrial relations, there has been a definitely welcome trend towards a change-over from unilateral decision-making by management towards industrial rule-making through tri-partite decisions. This is reflected in the Code of Industrial Discipline and numerous decisions reached in Indian Labour Conference and industrial committees which have vitally shaped the country's labour relations and conditions of work. There are some indications of growth of collective bargaining, although its pace is still rather slow. Of the total number of disputes in 1961 27.9 per cent and 25 per cent in 1962 were solved through negotiations without Government intervention. This does not indicate that the collective bargaining process has played an important role. But it is interesting to note that out of 487 cases of Government intervention in 1961 and 620 cases in 1962, only 7 and 12 cases, respectively, had to be settled through adjudication, the rest having been settled through conciliation. This decline in importance of adjudication itself indicates the scope for greater development of collective bargaining.

No definite uni-directional trend is obtained with respect to industrial unrest. However, in general, the index for industrial unrest has remained

below the 1951 level since 1956 (excepting only 1960).

Because of the Government's assumption of leadership of the development process, the necessity was felt for the development of a framework of industrial relations which would tend to avoid major industrial strikes and dislocations and would ensure conscious participation of labour and management in the endeavour for economic progress. This was greatly responsible for the evolution of regular machinery for consultation, negotiation and participation at different levels. It has also created an elaborate state—sponsored machinery for the settlement of industrial disputes in which Government intervention has been given sufficient scope for operation.

Workers' Response

Workers' responses to industrialisation may assume several forms depending on the degree of workers' commitment and other factors. More important measurable indicators are rates of absenteeism and turnover representing spontaneous or unorganised responses and strikes, demonstrations, etc, representing organised forms of protest. Organised response, under certain conditions, may also take the form of participative activities in the regular industrial relations system, if and when developed.

Although no all-India figures of absenteeism for the manufacturing industries sector as a whole is available, some details on the basis of available data on individual industries and centres are given in Table 5. From the table it appears that in almost all the centres of cotton-mill industry absenteeism is generally increasing since 1959. For engineering industry the general trend is downward in Bombay and upward in Mysore. For Indian coal-mines as a whole as well as engineering industry in West Bengal, no unidirectional trend is available. However, if we compare the average rate of absenteeism for the five years 1959-63 with the same figures for 1951-55 a better picture about the changes in the rate of absenteeism would emerge. For 1951-55, the average rates of absenteeism were for cotton mills at Bombay 11.4, Ahmedabad 8.4, Sholapur 19.0, Kanpur 12.2: for the engineering industry the rate was 14.3 at Bombay and 11.1 at West Bengal. For the coal-mines the All-India average for the period was 13.5. As compared with these, the 1959-63 average for cotton mills at Bombay was 10.5, for Ahmedabad 7.5 and for Sholapur 15.7. For the engineering industry at Bombay the 1959-63 average was 13.6 and that for West Bengal was 12.6. For coal-mines the average rate of absenteeism per year for the same period was 13.1. Thus, in almost all the important centres of the cotton mill industry and the engineering industry and also in the coal mines for India as a whole, the rate of absenteeism in 1959-1963 was somewhat lower than in the five years 1951-55. Engineering industry in Bengal, however, experienced some increase in the rate of absenteeism.

As regards labour turnover, no All-India picture is available. In fact, statistics on turnover are not regularly published in any State except Maharashtra and Gujarat (formerly Bombay). Thus no judgment can be passed on any changes in trend in recent years. However, from the reports of recent Urban Surveys conducted in different cities it appears that the number of permanently settled workers is increasing in almost all the major industrial centres. This indicates decrease in one aspect of labour turnover, i e, incessant inflow between towns and villages.

From both these indications it may be inferred that unorganised or spontaneous labour protest reflected in unwarranted absenteeism or excessive turnover is to some extent decreasing in the country. If this observation (which needs verification on a wider scale) is true, this must have been largely due to progress in social security measures as well as to increase in money earnings experienced by workers.

Organised Protest

With respect to organised forms of protest, however, some sort of a mixed picture emerges. The general trend of industrial disputes in the industrial sector has not been unfavourable. On average during 1957-62, only 1.208 days per year was lost per worker.[8] On a longer span, the severity-rate of industrial disputes in the manufacturing sector (i e, the rate of man-days lost to man-days available for work) on average was 442.7 per 100,000 workers per year in between 1951 to 1961. These figures cannot be considered as high. The number of man-days lost in the first three years of the Third Plan is also less than the corresponding figure for the last three years of the Second Plan. The average number of man-days lost per year during 1961-63 was 46,47,078—a figure much lower than the annual average of 66,55,750 during 1958-1960. Besides, as revealed in Table 4, the index for industrial unrest since the beginning of the Second Plan has consistently remained below the 1951 level (excepting only one year, 1960).

Thus, in spite of growing pains, necessarily felt in a developing economy, organised workers' response has not taken the shape of a continuously rising protest line. This is something quite different from what happened in the European countries during the 'take-off' phase. Differences in the pressures for domestic accumulation of capital, the growth in international labour standards, the historical setting as well as the influence of a sympathetic national labour policy appear to have played the main role for this difference.

However, it also cannot be denied that inspite of deliberate attempts at creating a machinery of advanced industrial relations to channelise the organised labour responses, the organised workers have not shown as much enthusiasm or participative spirit as was necessary for their success. Limited appreciation of the significance of work committees, joint productivity councils or joint management councils is definitely illustrative of the difficulties in the way of the development of participative responses of workers within a transplanted industrial relations system in an underdeveloped country. Actually only 2,918 works committees were in operation and the number of joint management councils was about 60 in 1962, out of which several were not functioning well. This of course, need not mean that the experiments in the field of industrial relations in India have failed. Actually, the suspicious trends in industrial relations, as reflected in the growth of tri-partite decision-making, growing importance of collective bargaining and collective agreements and decline in the emphasis on compulsory adjudication are definitely silver linings. But the horizon is not yet fully clear.

Conclusions

The most important conclusions of this study can be summarised as follows:

(1) Industrialisation in India has had a definite impact on the industrial workforce of the country. Inflationary

OF INTEREST TO SMALL SAVERS

EFFECTIVE 1st APRIL 1965

POST OFFICE SAVINGS BANK

Increase in rate of interest

- 4% Tax-free interest on lowest monthly balances
- Deposits and withdrawals without limits
- Cheque facilities available
- Can be operated by adults and children

CUMULATIVE TIME DEPOSIT ACCOUNTS

Tax-free Maturity bonus

- For deposit of Rs. 10 per month, in addition to the present maturity value
  Rs. 15 for a 5-year account
  Rs. 50 for a 10-year account
  Rs. 100 for a 15-year account
  for new accounts opened and for old accounts with outstanding terms of 5 years or 10 years to maturity
- Proportionate bonuses for other amounts of monthly deposits
- Deposits into these accounts will qualify for deduction from income for tax purposes

NATIONAL SAVINGS CERTIFICATES (FIRST ISSUE)

Interest subject to tax

- In denominations of Rs. 10, Rs. 100, and Rs. 1,000
- Maturing after 10 years at Rs. 18, Rs. 180 and Rs. 1,800 issued to individuals only.

These certificates will be on sale from 1st June 1965. But, purchasers of 12-year N.D.Cs. from 1st April 1965 will be entitled to convert them into the new certificates until 31st December 1965.

NATIONAL SAVINGS ORGANIZATION
MINISTRY OF FINANCE, GOVERNMENT OF INDIA

DA 64/739

price-rise, shortages of essential products and living facilities as well as the hastening of the tempo of work have been the main adverse symptoms of this impact.

(2) However, on account of the labour policy of a State with socialist aspirations, the pains of industrialisation have been much softened for the workers. There have been improvements in money-earnings (partly due to the national legislations and awards of tribunals and partly because of pressures from organised labour), and also some improvements in real earnings. Employment in the organised sectors expanded no doubt; but unemployment problem still remains vitally unsolved. Some progress has been achieved in the field of social security, but not much in the field of industrial housing. On the whole, there has been moderate improvement in the level of living of industrial workers in India, although much more is expected.

(3) There appears to be some decline in spontaneous forms of labour protest. Organised protest in the form of strike did not have any pronounced upward trend on the whole. To some extent, indications of the growth of positive response channelised through the developing framework of industrial relations have been noted because of a few favourable trends associated with the growth of tri-partite decision-making and collective bargaining. But the problems in the way of the development of a full-fledged and sound industrial relations system are also many. Some indications in this respect have been noted in the form of lack of proper participation of workers in the consultative and associative machineries developing within the industrial relations framework.

National Council's Strategy for Fourth Plan

A Reply

I Z Bhatty

In spite of T N Srinivasan's attempt to mislead readers (The Economic Weekly, January 23, 1965), *the fact remains that the National Council's strategy for the Fourth Plan is concerned principally with a new approach to attaining a minimum level of consumption for all. Since the attainment of this objective for all consumer expenditure is not considered feasible within a relatively short time, the Strategy selects food (and particularly cereals), the most essential need of the less fortunate sections of the population, for the Fourth Plan.*

A mode of operation is then specified within the framework of a plan which provides the mechanism for achieving this end.

Immediate concentration on food does not imply that other consumption expenditures stay stationary. These too increase, but the normative minimum is expected to be reached in the subsequent plan or plans depending on the order of priority and on feasibility.

PERMIT me as one who had some part in the preparation of the National Council's Strategy for the Fourth Plan to answer T N Srinivasan's critique. To start with let me draw attention to two points, academically peripheral, but significant in the light they cast on the tone and quality of the critique. First, the critic has chosen to draw from a preliminary draft to make open comparisons. This draft was strictly confidential (marked so) and was given to the Deputy Chairman of the Planning Commission for a restricted discussion. Whether it was proper on the part of the critic to have used this preliminary and confidential draft for open discussion in *The Economic Weekly* I leave to the readers to judge. Second, the critic starts with the sentence: Under the "direct supervision and guidance" of its Director-General, the National Council has...etc. The phrase "direct supervision and guidance" meant to be quoted from the Strategy occurs neither in the confidential draft nor in the published version. That the author should cite words which do not exist except in his imagination is in keeping with the spirit of the critique.

Srinivasan states that the Council has prepared a "plan" by making "back of the envelope" changes in the "numbers" provided by the P P D in its Notes on Perspective Development — a document which he describes as a "do it yourself planning kit"! I am sure the reader must have been surprised to find that the critique itself is devoted in most part to issues other than "numbers", viz, to the scheme for employment, redistribution and rationing advocated by the Council as a means for providing the minimum level of cereal consumption to all. Of this there is nothing in the famous kit. How is it that the envelope proved bigger than the kit? Surely not because of the "prejudices, biases and tastes" of the Council.

Let me now turn to the main burden of the critique. The author is peeved that, while the PPD was referred to in the draft version in respect of industrial and mineral targets for 1970-71 this reference was omitted in the final version. The reason of course is simple. There was no need for it.

Allow me to emphasise that the Council is quite capable of determining its own objectives and consistent targets without the help of any "do it yourself planning kit". The targets in the Strategy are based on available

data including a number of demand studies made by the Council. In some cases, as for example steel, the results of the Council's demand study were reviewed in the light of more recent developments and the target modified accordingly. Srinivasan may not be aware but the Council has made demand studies for a number of commodities and has developed its own technical coefficients in agricultural, industrial, mineral, energy and transport fields. In fact, even the PPD has made use of NCAER norms for a large number of important industries using rolled steel input.

The confidential draft was meant for discussion in a restricted group with a view to press for a new approach towards the objective of minimum food for all in the Fourth Plan based on increasing production, redistribution through creating employment in rural works and rationing. As at that stage detailed work on the targets for sectors other than agriculture was not completed it was not found necessary to draw attention to these except in respect of some of the major industrial and mineral targets which were significantly different from those given by the PPD. Later, when the paper was ready for publication the other targets were also incorporated. This will be clearly evident from the following facts.

(1) Only five industrial targets are specifically mentioned in the draft. Of these four are changed in the final version. Most of the draft targets for transport and power are changed in the final version. The mineral targets are unchanged, but for the more important products they differ significantly from those of the PPD. Some of these targets, as in the case of petroleum, are conjectural whether given by the Council or PPD.

(2) Of the number of capacity targets in industries and mining mentioned in the final version, nearly 85 per cent are radically different and by different degrees from those of the PPD.* These include all the important industrial and mining targets. As an illustration some of these are given in the Table. Further, in several cases the anticipated base output (1965-66) is different, so that, the growth varies to a greater extent than is indicated by the targets.

(3) The Council has made a specific point regarding reducing the existing gaps between capacity and production. These gaps are much narrower in the Council's than in the PPD's targets, thus incorporating productivity—a crucial factor of development—into the strategy of the Plan.

In the light of the above facts it is very clear that the targets in the draft and the final version of the Strategy are *not* the same. Therefore, the question of confirming or, for that matter, disputing the consistency of the PPD targets simply does not arise.

In spite of the critic's attempt to mislead the reader the fact remains that the Council's Strategy for the Fourth Plan is concerned principally with a new approach to attaining a minimum level of consumption for all. Since the attainment of this objective for all consumer expenditure is not considered feasible within a relatively short time, the Strategy selects food (and particularly cereals), the most essential need of the less fortunate sections of the population, for the Fourth Plan. A mode of operation is then specified within the frame-work of a plan which provides the mechanism for achieving this end. Immediate concentration on food does not imply that other consumption expenditures stay stationary. These too increase, but the normative minimum is expected to be reached in the subsequent plan or plans depending on the order of essentiality and feasibility. There is no suggestion for a "cloth plan", "house plan", etc, for each successive quinquennia despite the attempt of the critic to make it appear so with unwarranted quotation marks.

* Notes on Perspective of development India, 1969-61 to 1975-76.

* Targets published by the Perspective Planning Division in "Notes on Perspective of Development: India, 1960-61 to 1970-71", printed in April 1964. This document is marked 'preliminary for discussion'. I am forced to quote from it because of the open comparison made by Srinivasan.

Another argument of the critic is that, if the Lorenz concentration coefficient for cereals can be reduced by a ninth within five years it should be possible to reduce the coefficient of all commodities (which incidentally is more than twice as large) by the same proportion in ten years. Obviously the problem is not one of simple arithmetic. In the Strategy the coefficient for cereals is reduced through a specific operation for redistribution involving creation of employment in rural areas in capital forming rural works for which payment is made through a local transfer of cereals (in kind) from the rich to the poor farmers. The urban counter-part of the scheme is rationing based on procurement and building up of Government stocks. Without a comparable scheme of operation for the redistribution of all consumption expenditure mere arithmetical comparisons are quite meaningless. Would the critic like to construct such a scheme? As for a detailed scheme for rural works let me inform the critic that the Council is already engaged in this project and a reference to this is made on page 42 of the Strategy.

The computation of the burden of the levy on the rich farmers was purposely made illustrative using a hypothetical village and an assumed number of mandays of employment. A similar computation for 1970-71 would have involved many more assumptions than just a constancy of the number of villages and would have made the attempt at precision rather spurious. The purpose of the illustrative computation was to relate a level of levy with a quantum of employment in rural works and also to show the order of burden imposed on rich farmers. This object is fully served by the illustration.

It appears from the last paragraph of Srinivasan's article that all that is necessary for a "bolder" programme for basic industries is to suppress "deleterious consequences of a wage-good price inflation" through rationing. Does the critic mean that rationing of some food items is considered the answer to all supply questions for all consumer goods? Is he suggesting that given a 5 per cent rate of growth in agriculture and a scheme for cereal rationing and redistribution almost any programme for basic industries can be implemented? After all, how bold is "bolder"? If serious criticism is meant and not frivolous polemics, let him state how much "bolder" the programme for basic industries could be were it possible to implement a scheme for distribution and rationing of cereals as suggested by the Council.

A Rejoinder

T N Srinivasan

IN his reply, I Z Bhatty has accused me of (a) violating laws of academic ethics (b) of deliberately misleading the reader in comparing NCAER targets with PPD targets and (c) implying through the use of quotation marks that some phrases came from the NCAER document while in fact, they did not. He has devoted only a few sentences to some of the issues raised in my paper. Let me turn to these first.

Bhatty seems to imply that I treat the problem of reduction in concentration of the distribution of consumption expenditure as a mere problem in arithmetic. I thought I had said the contrary in footnote 2 of my paper. The point I was trying to make was that if we look at the distribution of per capita expenditure on an itemwise basis, wide disparities are found in items like health, education, housing etc. If, as is planned, the State is to take a dominant role in the provision of some of these services, these disparities should become far less than they are now. The problem will then be one of raising the requisite volume of resources (not merely financial) to provide these services in the public sector in a not-too-distant future.

Let me now turn to the scheme for rural works. I did notice the reference mentioned by Bhatty to the project of NCAER on a detailed scheme. However I did not refer to it in my paper only because, till the day when such a scheme is put forth for discussion, the feasibility of the NCAER strategy of rural works will have to remain an open question. I am still at a loss to understand how a calculation based on a hypothetical village with the average yield, area and revenue pattern of Madras or U P or M P can illustrate the burden of the levy on rich farmers. Does Bhatty imply that these patterns could be duplicated on an average for the country as a whole? If so, such an assumption will lead to no more or less spuriously precise results for one year than for another. To my mind, what is more important is to show how the levy could be related to consumption rather than income. If, in spite of the levy, the rich farmers do not substantially reduce their consumption of cereals, marketed surplus will fall and urban rationing scheme of the council will be jeopardised. Bhatty has not answered this point.

Bhatty claims that in my view all that is necessary for a bolder programme of development is to suppress wage-goods-price inflation. On the contrary, I thought I made it clear in my last paragraph that the most important task is to identify the real bottlenecks to rapid development, once fears such as the popular association of inflation with any attempt at accelerating the rate of growth are prevented from turning into bottlenecks.

Now a few words about Bhatty's charge-sheet. I am really sorry that my use of quotation marks may have led some readers to think that I am quoting from the paper. Since I did not associate any page reference from the paper to these phrases, I thought such an inference was unlikely. I should perhaps have used italics instead of quotation marks for emphasis. By using the words "direct supervision and guidance" I am sorry I had unwittingly reduced the importance of the Director General's contribution to the paper to mere supervision. I should have said that the paper was *prepared* by the Director General. Regarding what I thought was a humorous reference to "Cloth Plan" etc, let the reader judge from the following quotation from page 17 of the NCAER paper:

> "If the effort to ensure minimum consumption of food is successful in the Fourth Plan, the second most important need (or perhaps two or three) will be given a high priority and fully met in the following plan. This then will be a staggered process of achieving the

minimum level in all consumption needs instead of a simultaneous process".

Let me turn to the question of academic ethics. First, if as I had assumed and as Bhatty implicitly concedes, the NCAER first draft was an academic document, it is indeed strange that it was marked confidential and given only to policy makers. It is hard to see how an academic document with no secret data in it could claim the protection of the Official Secrets Act. This is not to say that a paper could not be marked preliminary. Such a procedure is adopted simply to protect the tentative character of the paper and to prevent the use of *views* or *results* contained in it before they have been given their final shape after discussion. I *did not* quote the *views* or *the results* of the first draft that were changed later. I merely drew attention to an omission of reference to PPD from the chapter on Minerals, etc. I carefully checked the statement in my paper. It is concerned with a comparison of NCAER figures in their draft and final version. It did not bring in PPD figures as such. I still find that almost all the figures in the Minerals chapter remain the same in the two versions. Under these circumstances, I may be excused if I do not understand the deletion of the reference to PPD in the final version.

Let me clear up one point. The purpose of my drawing attention to the omission of reference to PPD was not to accuse NCAER of bad faith. I did not intend to suggest that NCAER is incapable of drawing up an alternative set of figures. On the contrary my point is that since NCAER with its vast resources is in a position to make such an independent study, the public will be interested in knowing how far its figures are different from quasi-official figures such as those of PPD and the basis for the NCAER figures. I am sorry to say that NCAER does not indicate the source or the basis of its computations.

Regarding Bhatty's figures comparing PPD targets with NCAER's let me say this. First, Bhatty need not hesitate to quote from the PPD Document. I am told when the PPD marked it "for discussion" it meant exactly that: the figures are for discussion and amendment if necessary. Second, as I said earlier, I was comparing the figures in the two versions of NCAER paper, and not their figures with those of PPD. Be that as it may, let me say just a word about Bhatty's comparison of targets for capacity. As he himself admits, the NCAER plans for a higher rate of utilisation of capacity than has been prevalent. It means that though capacity targets may differ by a wide margin, output targets will not differ by as much. However until one knows the causes for under-utilisation and the NCAER's scheme for eliminating these, the feasibility of the assumed rate will remain an open question.

AROUND BOMBAY MARKETS

Brisk Rally in Shares

Wednesday, Morning

DALAL STREET presented quite a different look last week. Equity prices staged an all-round impressive recovery from the panicky lows recorded on March 27, with a few counters recovering nearly all the ground lost in the past few weeks. Tata Steel which had been sold down to Rs 140 on March 27 were bid up to Rs 145.50 on April 6. During the same period Standard recovered from Rs 414 to Rs 447, Indian Dyestuff from Rs 175 to Rs 194, Century from Rs 526 to Rs 552, Tata Locomotive from Rs 246 to Rs 255.50, Tata Chemicals from Rs 17.56 to 18.56, Scindia from Rs 12.44 to 13.28, Hindustan Motors from Rs 15.84 to Rs 16.40 and South India Viscose from Rs 101.50 to Rs 116.

The rise was due both to hectic short covering and renewed bull support. The turn in market sentiment which forced bears to rush for a cover was caused primarily by the massive support to the market from the Life Insurance Corporation. Technical considerations and good corporate news only accelerated the pace of recovery. The L I C purchases were not confined to the high yielding cash shares but they also included many of the speculators' favourites like Tata Steel, Indian Iron, Tata Locomotive, Hindustan Motors, Voltas and Kohinoor. Many market men are inclined to the view that the LIC buying is a part of the official strategy to boost the morale of the market. But if the Government were really concerned about the market, the Finance Minister could have at least modified the dividend tax and the capital gains tax on bonus shares which do not yield any significant revenue to the Government but are acting as a big drag on the market.

The recent recovery in equity prices cannot be regarded as anything more than a technical correction of the preceding perpendicular fall in prices since the presentation of the Central Budget. How far this recovery might go and how long the corrective phase might last, it is difficult to say. With conditions in the money market continuing to be very tight, interest rates high and political situation quite disturbing, prospects of the current rally developing into an important upward move are generally discounted.

COTTON

Prices Harden

COTTON prices which had been drifting lower for quite some time have once again developed a hardening tendency. Within a week or so, spot prices have risen by Rs 20 to Rs 30 per candy and the August hedge contract which had been marked down to Rs 751.25 (per 3 quintals) was up again at Rs 763.75 on April 6 which is a new high ever since this contract made its appearance on February 20. Improvement in cotton is not merely a part of the recent general upsurge in commodity markets—foodgrains, pulses and oilseeds have firmed up considerably—but it reflects, in no small measure, a reassessment of the demand and supply position of the commodity. While the latest estimates place the 1964-65 crop around 56 lakh bales, mill consumption is on the increase—the average of both Indian and foreign cottons for the first five months of the season (September to January) comes to 5.66 lakh bales as against 5.10 lakh bales in the same period last season. Consumption of Indian cotton amounts to 24.14 lakhs bales against 22.83 lakh bales and that of foreign cotton 3.19 lakh bales against 2.67 lakh bales. If this trend continues during the rest of the season—there is no reason why it should not—consumption of indigenous cotton might well exceed the season's output.

Prices of Cambodia cotton which had been making news for the past few weeks have also firmed up considerably because of increased spinner demand presumably because of the recent increase in the compulsory purchase quota for this variety. If the present trend continues, it is unlikely that the growers and traders will need to approach the Indian Cotton Mills' Federation for disposing of their cotton at 5 per cent below the appropriate ceilings. This will put an end to the long-drawn-out controversy that had been raging between the Federation and the trade over the purchase of Cambodia cotton.

The renewed firmness in cotton prices supports the view expressed in these columns that the concern over the recent decline in prices had been unwarranted; normal market forces had produced a normal decline. If general market expectations of an increase of about Rs 50 per candy in the ceiling prices for the 1965-66 season materialise, the industry might find it increasingly difficult to secure its supplies within the prescribed ceilings.

Cotton imports since the beginning of the current season on September 1 to March 27 total 5,09,687 bales as against 3,94,694 bales in the same period last season. The break-up figures are: American cotton 2,50,270 bales (1,99,205 bales), Egyptian 1,18,569 (1,06,127), East African 52,372 (14,415), Sudan 43,912 (68,072), Syrian 2,039 (nil), Pakistani 35,248 (4) and others 6,477 (6,871). The export performance has been encouraging due to keen Japanese buying of Bengal Deshi at rising prices. Sales registered have already exceeded 2 lakh bales. Actual shipments up to March 27, however, total 1,26,135 bales against 1,44,683 bales in the same period last season. Of these, Japan accounted for 94,256 bales (1,04,988 bales), Continent took 13,855 (15,541), U S A 9,720 (11,058), Hong Kong 5,550 (7,841), U K 2,455 (4,433) and others 299 (812). While overseas demand for Indian Deshi has continued to be encouraging, the domestic crop of Bengal Deshi is reported to be much smaller than in the previous season. According to the latest trade estimates, the production of Bengal Deshi might not exceed 4 lakh bales against 5.67 lakh bales in the previous season. It is because of the tight statistical position that Bengal Deshi prices have continued to display remarkable strength all the time.

OILSEEDS

Prices Rise Further

NEW DELHI has still to decide when and how to relax the existing ban on the export of vegetable non-essential oils. Details regarding the tax credit certificates for exporters and other export incentives have yet to be finalised. But speculators have already pushed up prices in the firm belief that the Government will sooner or later relax export curbs in order to earn the badly needed foreign exchange. Groundnut oil ready last week was bid up to Rs 22.10 (per 10 kgs)—the highest price for many weeks. Mustardseed oil which had been marked down to Rs 22.50 a few weeks ago is up again around Rs 27.75 (per 10 kgs). Linseed oil has firmed up from Rs 17.25 to Rs 17.75 in a matter of days. Only castor oil has been neglected around Rs 16 (commercial quality). In the futures market, linseed June which were quoted around Rs 87.20 earlier in the week were bid up to Rs 91.20 (per 50 kgs) in unofficial dealings on April 6—official trading came to a standstill when the contract rose above Rs 90.50—the maximum permissible rate for the week. After an early setback from Rs 77 to Rs 75.10, castor June recovered to Rs 77.50. Improvement in futures was due both to heavy short covering and fresh bull support. Apart from optimism about an early announcement of export of groundnut oil and vanaspati, sentiment last week was aided by reports of some damage to the standing mustardseed crop due to untimely rains.

Hopes that edible oil prices will come down with the increased flow of arrivals of the mustardseed and linseed crops have been belied. Nor has the arrival of soyabean oil produced any impact on the market. Increased consumption of soyabean oil by the vanaspati industry in coming months should reduce the pressure on the demand for groundnut oil. But prices are unlikely to decline to any appreciable extent if the Government permits export of groundnut oil. Unless the Government is very careful in devising the export incentive scheme for groundnut oil, it will be difficult to check the rising trend in prices, improved supply notwithstanding.

Exporters did not report any important fresh business last week. Export sales in groundnut extractions have shrunk to modest proportions. Indian extractions are quoted about 20 to 25 shillings higher than the U K prices and the Communist countries have been keeping off the market as they have already made substantial purchases. Activity in cottonseed cake also has been restricted since recently. Record crop of castorseed in Brazil has seriously undermined the prospects of selling Indian castor oil outside the Communist countries.

BUSINESS NOTES

Cable Industry

THE Third Plan will end in March next year with many industrial targets unfulfilled in both public and private sectors. But while there is some definite information about the reasons for the shortfalls in the public sector—of course, it has to be pieced together from pronouncements by Ministers in Parliament and outside, administrative reports of the Ministries, annual reports of public sector enterprises, etc—such information for the private sector is sometimes very difficult to come by. Take the cable industry, for instance.

The Third Plan contained targets of capacity and output for VIR/PVC cables, power cables and winding wires. On the basis of these targets licences were issued to prospective manufacturers fairly early in the Plan. In fact, by November last year the licensed capacity for both VIR/PVC cables and power cables had exceeded the Plan targets by substantial margins. In winding wires also the licensed capacity had approached within striking distance of the target.

And yet what do we find with regard to actual production? Production in the first half of 1964-65 was 29 per cent of the Plan target for 1965-66 in VIR/PVC cables, 35 per cent in power cables and only 19 per cent in winding wires.

These interesting facts were revealed

by Girdharlal B Kotak, Chairman of Asian Cables Corporation, in his statement at the annual general meeting of the company held recently in Bombay. Kotak's statement also threw some light on why production in the industry had lagged behind both Plan targets as well as licensed capacity. In the case of VIR/PVC cables, he said, the demand had been over-estimated in the Plan. As a result, even at the low level of production, stocks in the market were very large. What one would like to know is why the Plan estimate of demand has proved to be so wide off the mark.

In the case of power cables and winding wires it is unlikely that shortage of demand is to blame. Here the principal reason appears to be shortage of raw materials like copper, zinc, tin, lead, etc. This problem is serious enough to persuade Kotak to endorse the suggestion to have a Government agency—the State Trading Corporation or "a special bank" through which these imports could be channelled. Of course, the basic problem is shortage of foreign exchange, but one would like to have more precise information on how much more foreign exchange would be needed to import sufficient materials to ensure fuller utilisation of established capacity. Comparison of this figure with that of foreign exchange now spent on import of cables will show whether the restrictive policy followed in regard to import of raw materials for the cable industry is indeed saving any foreign exchange for the country.

Kamani Engineering

ENGINEERING goods constitute a growing segment of world trade, but also one where competition is the keenest. Competition takes many forms besides price-cutting, one of them being the grant of credits to the buyer. In this respect, as indeed in most others, the developing countries are at a disadvantage. Desparately short of foreign exchange, these countries need everything they can earn from exports here and now. Indeed, taking a very short view, to grant export credits would be for them to defeat the very purpose of exports.

But should a country like India, for instance, always take such a short view? Or, should some immediate foreign exchange earnings be at times foregone if that helps to create a market for the country's products? Clearly, more attention needs to be paid to this problem than has been done so far.

Referring to his own line of exports, transmission line towers, R H Kamani, Chairman of Kamani Engineering Corporation, stated in his statement at the company's annual general meeting recently: "Developing countries which import transmission line towers from India are often found to be short of funds and need extension of credit facilities equivalent to those offered by others, importing countries may ultimately turn to other suppliers who would be in a position to offer those facilities." Kamani suggested that the Export Credit and Guarantee Corporation could play an important role in this field. But that will depend on a careful consideration of the implications of the grant of credits to foreign buyers at the Government level and a general policy decision with regard to such credits. Whatever the decision, the issue is an important one and deserves the Government's immediate attention.

The other factor responsible for hindering Kamani Engineering's export effort, according to the Chairman, was that only a limited range of steel sections was rolled in India and since manufacturers of transmission towers had to limit their designs to available steel sections, they were compelled to make use of heavier sections which in turn affected the marketability of the towers abroad.

Kamani's suggestion to overcome this problem was that a portion of the capacity of one of the steel plants should be earmarked for rolling sections in the sizes required for export orders. Alternatively, the standard manufacturers should be allowed to import these sections for use in export items.

Canara Bank

SATISFACTORY progress has been reported by Canara Bank in 1964, when at the year-end its deposits increased by well over 21 per cent from Rs 72.48 crores to Rs 88.24 crores and advances from Rs 42.27 crores to Rs 58.59 crores. The Bank's investments were up from Rs 20.63 crores to Rs 22.28 crores.

During the year, the Bank's total revenue expanded from Rs 3.46 crores to Rs 4.96 crores, of which interest and discount brought in Rs 3.94 crores and commission, exchange and brokerage Rs 78.77 lakhs against Rs 2.70 crores and Rs 55.88 lakhs respectively. On the expenditure side, interest paid on deposits and borrowings rose from Rs 1.49 crores to Rs 2.06 crores, and salaries, allowances and provident fund claimed Rs 1.75 crores against Rs 1.13 crores. After providing for taxation and making the usual and necessary provisions, the Bank's net profit amounted to Rs 34.66 lakhs against Rs 24.12 lakhs in the previous year. Of this, the directors have transferred Rs 13.55 lakhs to special reserve for payment of dividends on preference and equity shares. Dividends are unchanged at the previous levels of 5.56 per cent and 15 per cent, respectively. A sum of Rs 14.10 lakhs (Rs 6.25 lakhs) is earmarked for payment of bonus to staff. The remaining surplus of Rs 7 lakhs, together with another amount of Rs 1.5 lakhs transferred back from contingency account, is set aside for reserve fund to raise it to Rs 108.50 lakhs.

The Bank opened during 1964 new branches at Tiruvottiyur and St Thomas Mount (Madras) and Vishakapatnam. It also took over the assets and liabilities of the Pollachi Union Bank. It is intended to further increase the Bank's capital later in the year in order to improve the capital base in keeping with fast-growing deposits.

German Business Machines

AN exhibition of German business machines was inaugurated this week by Y A Fazalbhoy in Bombay. Organised by Blue Star Engineering Co, Bombay, and Bueromaschinen-Export GmbH, Berlin, a foreign trade organisation of the German Democratic Republic, this exhibition has for display and demonstration machines for accounting, invoicing, adding, calculating and other mathematical purposes.

Speaking to the guests the Chairman of Blue Star Engineering, M T Advani, emphasised the importance of modern mechanical means of accurate and speedy mathematical calculations and computations in the context of the rapid growth of industry and commerce.

NON-RECEIPT OF COPIES

Subscribers are requested to inform us regarding non-receipt of their copies within a fortnight of the date of publication. It will not be possible to replace a missing issue, free of cost, unless timely intimation is given.

Complaints can be attended to promptly if subscribers kindly remember to mention their subscription number.

Talks Again

IN Indo-Pak relations everything is connected to everything else. The intrusion of Pakistani forces into Indian territory in Cachar has been described, probably correctly, as a ruse to divert attention from the two posts set up by them in Kutch and Pakistan's generally provocative attitude all along the border in recent months can be linked in turn to President Ayub Khan's forthcoming visit to the United States where he will try to convince the Johnson Administration that American military assistance to India creates a serious threat to Pakistan. It is possible from here to go back step by step, taking in every manifestation of Indo-Pak antipathy including Pakistan's blossoming friendship with China, till we come to Kashmir which is what the Indo-Pak problem is basically.

Given this connected pattern it is really pointless to get worked up about border infringements and skirmishes or to expect any lasting improvement in Indo-Pak relations from their settlement. It is of very little importance whether the proposed talks on the Kutch-Sind border begin after Pakistan has removed her posts from Indian territory or before or even if they begin at all. Of course, formally India has conceded that this part of the border is not demarcated and Pakistan has claimed some 3,500 square miles of what is now Indian territory. So it is a border dispute, but only technically; basically, the trouble is not about the border at all. Magnanimity here is, therefore, wasted. Pakistan's friendship, let us face it, cannot be won with the present of a few square miles here or there. Of this Pakistan has not left anyone in doubt.

This is not, let it be understood, a plea for the 'tough-line' towards Pakistan. But we have been through the border incident-cease fire-talks cycle so many times that it is well to admit that they make little difference to Indo-Pak relations and that if we seriously seek improved relations with Pakistan we have to be prepared to tackle the problem of Kashmir which has been the dominant influence in shaping these relations so far.

But can the Government of India do anything about Kashmir? Basing itself on the formal accession of the State to India, it has always claimed Kashmir as a part of India and has been committed to keeping it such. This policy was developed under Pandit Nehru but the Shastri Government has identified itself with it completely. The formal process of Kashmir's integration with the rest of the country has been in fact accelerated recently. The Congress party has extended its operations to the State by taking into its fold the ruling faction of the National Conference and, even more recently, the titles of Sadar-i-Riyasat and Prime Minister have been replaced by those of Governor and Chief Minister as in the other States. These may be formal changes but they mean only one thing — that the Government will not countenance any change in the status of Kashmir. As for popular opinion in the country, if not in Kashmir itself, it will permit any change even less. Those who do not regard a reopening of the Kashmir question too high a price for the possibility of friendly relations with Pakistan are definitely in a minority.

But, while on the question of the status of Kashmir itself the Government's stand has been clear, it has not always appeared to realise that the implication of this is permanent unfriendly relations with Pakistan. The result is the recurring spectacle of injured innocence whenever there is a border 'incident' created by Pakistan. After much fire-breathing, this is inevitably followed in due course by futile talks and minor compromises which achieve nothing in the long-run. Talks between governments may at times be diplomatic ends in themselves, but surely not when they are repeated with monotonous regularity over fifteen years? Keeping to this pattern there are now to be talks on the Kutch-Sind border, first at the level of officials and later at a "higher level".

Here we go round the mulberry bush once again!

Where Vultures Fly

THE latest American move on Vietnam has shown their hand. Last year all agreed (including some Americans) that the cause of the United States was hopeless — victory could not, in the nature of the thing, be won, yet there was no graceful escape from disaster. Johnson was trapped between Goldwater and the cost of a hopeless war until the election cleared one out of the way. Once this was done, Johnson has set about trying to make the best of a disaster by expanding the military effort in order to be able to negotiate 'from strength'. First, he expanded the hardware and American manpower in the South (to the extent of sending in a marine invasion force), strengthened the command, and ran the American navy along the coast. This did nothing to stabilise the Saigon regime or cow the Viet Cong, but it was a prelude to the second stage. This consisted in seizing upon North Vietnam's aid to the Viet Cong (trivial in comparison to American aid to the Saigon regime) as the real secret of Viet Cong strength, and undertaking reprisals.

This cynical tactic diverted attention entirely from the war in the South and pinned it upon the scapegoat in the North. It is a tragic commentary upon the state of the world's conscience that it took, not the deliberate brutality from the air rained upon an almost defenceless North, but the use of gas to awaken sustained protest. It is not necessary to pursue the idiocies of the apologists of the use of gas ('a splendid technological breakthrough to the era of non-lethal warfare') in order to marvel that some people mind not that children may be shattered for more than ten years by shell-blast, but that they are suffocated by gas.

President Johnson's strategy was a shrewed gamble: to divert attention to the North and to punish the North so much that the Soviet Union would be forced to intervene to protect its ally and moderate the impetuous advance of the Viet Cong. The punishment came, as heavy as any inflicted by a great power upon a small and defenceless one, but the Soviet Union did not. With much prevarication, Russia complained sadly that China was preventing Russian arms aid to Hanoi going through China — a useful defence, but one suggesting how seriously the Russians wanted to help in the first place. As for China, it is to be believed that the petty wrangles of the Sino-Soviet dispute and the aim of keeping Russian influence out of South-east Asia were important enough to sacrifice North Vietnamese lives. Peking boasted, talked of its volunteers, and did nothing.

Since the first element worked but not the second, Johnson has been forced to make a third. He has, by his policy of pure brutality against the North, won a temporary initiative, but the basic problem remains: he cannot indefinitely hold the South, and he cannot indefinitely bomb the North, particularly now that MIGs and artillery in the North, both pathetic by the standards of their opponents, are beginning to pull a few American planes out of the sky. So, in his magnanimity, he has offered 'unconditional' talks, baited with a billion dollar loan to South-east Asia.

But what exactly does he think is possible by this face-saver? The South has voted for the Viet Cong, a genuine popular and indigenous nationalist movement in exactly the same sense as were the revolutionary leaders of Yugoslavia, China, Algeria and Cuba. They cannot be ruled out by some deal between other countries, nor, ultimately, can they be restrained from the victory which is rightfully theirs. The only sort of worthwhile negotiated agreement possible is the one that the Americans has so far shown no inclination to swallow—which concedes victory to the Viet Cong.

The struggle remains as it was: about victory, not a stagnant peace such as there is in Laos. The talks therefore can only be useful if they achieve this victory and the evacuation of American forces from Viet Nam—summed up in the demand for a referendum in the South, the results of which will be binding upon all participants and all foreign powers concerned. The right of national self-determination has been denied the Viet Namese so for — and the Geneva agreements rejected as a result. It is this right, its firm and binding affirmation, that alone can prevent any talks that ensue being merely a breathing space for both armies to polish their weapons or a camouflage to hide America's disastrous failure.

Weekly Notes

Foreign Companies' Assets

IN 1962-63, foreign controlled rupee companies and branches of foreign companies made a gross fixed investment of Rs 37 crores and Rs 19 crores, respectively, against Rs 45 crores and Rs 13 crores, respectively, in 1961-62. The increased investment by branches was accompanied by a considerable improvement in profits before and after tax. Branches of American companies particularly improved their profitability in substantial measure. Not merely did the branches step up their fixed investment, but they also increased their inventory accumulation (mainly in finished goods) from Rs 3 crores in 1961-62 to Rs 18 crores in 1962-63 and also increased their receivables substantially. The total asset formation of Rs 48 crores in 1962-63 (Rs 18 crores only in the previous year) was financed largely from borrowing (Rs 38 crores) mainly the category "others" (Rs 29 crores) and also from banks (Rs 10 crores).

This sudden spurt of asset formation in branches is difficult to explain. All that one can see from the Reserve Bank study published in the March issue of the *Bulletin* is that U K trading branches were largely responsible for this spurt. U K branches added Rs 41 crores to their total assets, U S branches Rs 8 crores, while other branches shed Rs 1 crore. A high jump of this order in total assets and 'other borrowings' could have been performed by only one U K trading branch and that is Burmah Shell Storage and Distribution. It must have added substantially to its fixed investment inventory and receivables in 1962-63 and financed it largely from other borrowings. Since there is a reduction of Rs 11 crores in the trade dues of U K companies and a rise of Rs 29 crores in 'other borrowings' it would be justifiable to presume that Burmah Shell changed the classification of a large part of its payables and borrowed more from some associated company—not its holding company for that would come under 'liability to head office'. Something interesting must have happened at Burmah Shell in 1962-63.

Long Term Trade Plans

REPORTS have been appearing for some time about the eagerness of U S S R and Czechoslovakia to coordinate some of their production programmes with industrial development in India. This is a welcome development since these countries were rather cool to this idea three years back when the Poles and Hungarians first made proposals on these lines. At that time New Delhi also did not respond too favourably because it was believed that (a) the scheme might inhibit the production of certain items (b) it might reduce the earnings of free foreign exchange and (c) it would involve long term commitments which the government may not be able to underwrite. There was also a fear that this tie-up with communist countries may not be received too favourably by Western government.

Attitudes seem to have changed over the years. They had to, because India's trade with the Soviet bloc is expanding rapidly. This expansion involves the import of more machinery as well as more intermediate goods from the centrally planned economies, and the export of processed and more sophisticated goods, including tropicalized components. The import of steel mills and power stations and the export of traditional goods like iron-ore is upto a point, a simple affair. The diversification which is taking place now implies that the annual trade plans, which lay down either the values or quantities of goods to be exchanged for the next years, are no longer sufficient. The export of more finished goods to the communist bloc requires considerable advanced planning for capacity and materials. Similarly, at the other end, the wide variety of goods demanded by us has to be fitted into the development plans of individual countries.

The U S S R is now agreeable to setting aside capacity for the export of goods like special steels, pig iron, caustic soda, fertilizers, newsprint, non-ferrous metal, etc. The non-traditional goods required from India would consist largely of shoes, hides and skins, garments, hosiery, processed goods, radios, electric fans, and plastic cloth, etc. The volume of trade, both existing and potential, in these commodities is large enough to justify constant effort over a period of time to lay down targets and means for their implementation.

The problems of trade with East Europe are somewhat different. As smaller countries, they do not have the same capacity to provide goods or absorb them, nor is a large part of their export of machinery, etc, covered by credits for large specific projects. Some of them have been eager to enter into deals with India for planned division of labour and for export of finished goods to third countries. This exercise in international planning would be unique in many ways. It would also involve a considerable tightening up of Plan implementation in India.

A Second South Africa?

NOW that Ian Smith has called for general elections on May 7, a unilateral declaration of Rhodesian independence seems inevitable within the next six months (by when this season's

tobacco crop will have been safely disposed of). Smith's purpose in calling for elections is to increase his majority in parliament to the necessary two-thirds required by the 1961 constitution for constitutional amendment. Since constitutional amendment also requires British assent, which is bound to be withheld for the changes Smith has in mind, a unilateral declaration of independence must be the obvious sequel.

Smith, when he gets his majority, plans to reduce the number of elected Africans and replace them with chiefs. He also wants to increase the number of higher roll seats normally held by Europeans. Together with new security measures these changes will take Southern Rhodesia further in the direction of becoming a second South Africa. Smith's Rhodesian Front is believed to be already working on schemes which will keep the races apart.

Smith is widely expected to secure the necessary majority. The leaders of the nationalist African opposition are under restriction and European opinion is rallying to his banner so as to strengthen his hand as much as possible for the crisis which lies ahead. The white members of the moderate opposition Rhodesian Party are expected to be obliterated in the new parliament.

In view of this situation, Harold Wilson's government should make it quite clear that rebellion will be met with vigorous economic sanctions. Unfortunately the threat of sanctions may not deter Smith. Salisbury appears to be confident that it will be able to sell more of its important tobacco crop to non-Commonwealth countries, particularly France and Japan, in the event of a Commonwealth boycott. Secondly, Salisbury is actively discussing with Portugal and South Africa, ways and means of beating an economic ban. Thirdly, Smith knows that if Zambia participates in collective Commonwealth action, she is less likely to be able to withstand a breaking off of economic relations than is Rhodesia. But despite these difficulties, and given emergency measures to aid Zambia, there is good reason to belive that sanctions would badly dent the Rhodesian economy if they are enforced for long enough. The only alternatives are military intervention which Wilson's government might not survive at home, and abandoning Rhodesia to a white minority which seems determined to thwart the politicial, social, economic and cultural development of the African majority for as long as it can.

Agricultural Finance and Banks

SOME surprisingly contradictory views have been expressed by the chairmen of the leading banks in their statements to shareholders this year. There have been sharp differences, for instance, on the role of banks in agricultural finance. The chairman of the United Bank, S B Dutt, is convinced that the preconditions for bank financing of agriculture just do not exist at present. For one thing, 'agricultural activity has still not been able to shed its characteristics as a subsistence and unorganised activity" and, for another, its dependence on weather makes it "a great financial risk". Dutt would, therefore, wait till "the entire agricultural sector could be placed on an organised and market-oriented basis" before stepping into agricultural finance, ignoring that provision of agricultural credit is a precondition to such a transformation of agriculture.

The chairman of the Syndicate Bank, T M A Pai, however, sees things in a different light. His bank, though it has only just joined the class of big banks with deposits over Rs 50 crores, has been distinguished by its pioneering efforts in the field of agricultural finance. Of course, in quantitative terms agricultural finance is a negligible proportion of even the Syndicate Bank's advances, but during the last year it has taken certain steps which indicate that this bank at least is not going to wait till the opportunity to finance agriculture is presented to it on a platter. It is prepared to go out on the farms and partly adjust itself to existing conditions and partly change them.

It is true, as T M A Pai is realistic enough to admit, that "one bank by itself can do little" considering agriculture's vast need for finance. What one hopes is that the Syndicate Bank's role in agricultural finance may prove to be that of the Schumpeterian entrepreneur. If it can establish the possibility of profitable operation in this field it is bound to draw in others. The State Bank at least may be spurred to work harder and show better results in agricultural finance.

The PM's Approval

AN institution, even if it be one for private profit, is entitled to attention when it completes a long period of successful existence. If in the opinion of the Government the institution has served some public interest, official approbation may also be bestowed upon it. The Prime Minister himself may publicly applaud the institution's services to the country. All this is permissible and has been done before.

But in the process is it necessary for the Prime Minister to seem to extend his congratulatory approval, even though by a thoughtless word or act, from the institution concerned to individuals who have fallen foul of the laws of the land? Is it necessary, for instance, for him to get himself photographed with someone about whom the following facts are well known?

(i) that he is on bail after being arrested on a criminal plaint;

(ii) that he is charged by the Government with various malpractices before a semi-judicial body;

(iii) that a number of companies under his control are under investigation by statutory authorities; and

(iv) that only a few years ago he was removed from the Board of the very institution whose achievement is being lauded, as a result of a specific directive from an official authority which gave him every opportunity of clearing himself.

Whether the charges against the individual concerned are ultimately proved or not, should not the Prime Minister have considered carefully the consequences of his consorting with such a person for the morale of the Government officers and others who are charged with the investigation and prosecution of the charges against the individual concerned and for public confidence that the Government will apply the country's laws equally to all wrong-doers, however rich or influential some of them may be.

Second Thoughts on Coal

A correspondent writes :

LAST September the Ministry of Steel and Mines published a tentative Fourth Plan target of 47 million tons of coking coal, which was to yield 24 million tons of clean coal. The target has since appeared increasingly unrealistic. The NCDC, which is supposed to contribute 21 million tons, has said that 17 million tons is the utmost it can manage. The private sector's response has been hardly more

enthusiastic. This is what the Chairman of the Indian Mining Association had to say on the subject at the Association's annual meeting in March:

> "In regard to coking coals, the private sector is expected to raise its output from the current level of 14 million tonnes to nearly 28 million. This poses a formidable challenge, since a substantial portion of this sector's contribution must come from depillarising with stowing, and from vertical development in depth. It will require a fresh input of capital on an impressive scale. Again, as stowing must play a significant part, sufficiency of sand supplies will have to be ensured. The bulk of coking coal production moreover will have to be washed and if washing capacity, and the expansion in steel, do not keep pace with increased production of coking coals, the industry's investments might be rendered largely sterile".

Apart from the problems of material balances and investment, sizable reserves of coking coal lie in small mines whose amalgamation is necessary if they are to be exploited. The progress made so far in bringing about such vitally-needed amalgamation can be hardly said to have been encouraging.

The main lesson of the Third Plan is that in respect of coal, reliance on past input-output coefficients can lead to an average error of the order of 30 per cent in consumption forecasts. As against a target of 96 million tons of coal in 1965-66, the actual demand is likely to be no more than 73 million tons, a good part of the shortfall is due to a fall in the input of coal rather than shortfalls in the output of coal-consuming industries.

The big problem with coking coal is its ash content: inspite of all the scrubbing it undergoes, it retains over 16 per cent of ash, and the ash content has been going up in recent years. The use of such ash-laden coal in steelmaking is unknown elsewhere in the world, and our steel industry has been faced with a technical problem that it must solve on its own. There has been enough experimentation to suggest the directions in which its solution will be found: oil injection is used by the Tatas, while Bhilai has been varying the composition of fluxes to see which can take a larger proportion of non-coking coal. The effect of both these techniques will be to reduce coking coal requirements. Thus, the demand for coking coal is likely to be less than present forecasts. With some imagination and innovation — e g blast furnaces and steel plants in Goa and Neyveli relying on naphtha from refineries in Bombay and Madras along with some coking coal — it might be possible to reduce it still further.

Even if a large increase in coking coal consumption is expected, one wants to consider the question whether it should be met out of home production. Coal washing doubles the cost of coal; the process costs something and greatly reduces the weight of coal. At Rs 70 or so a ton, washed coal is more expensive than Australian coking coal. And even this price is probably too low to bring forth the required increase in supply; during the Third Plan the private sector has shown much reluctance to raise more coking coal. Much of the coal it has supplied has, moreover, come from pillars removed from existing mines and little from new deep mines which require fresh investment. A rise in the price of coking coal is being considered, and it would not be surprising if the rise were substantial in the next five years. Talk of importing coal must raise eyebrows in the present plight of our payments, but exporting more to Australia might well be a more economical way of getting coking coal than making it ourselves.

Incomes Policy for U K

WITH the formation of the Board for Prices and Incomes, headed by Aubrey Jones, the stage is now set for the introduction of an incomes and prices policy in Great Britain. The intention to formulate a kind of incomes policy was, it may be recalled, announced by the Conservatives in 1961. The announcement was followed by the setting up of two institutions, the National Economic Development Council and the National Incomes Commission. The final purpose was the creation of a machinery to keep a continuous watch on the general movement of prices and money incomes so that increase in prices may be controlled directly as well as by restraining rise in wages in relation to the growth of real national output.

The Labour Government issued in December last a "statement of intent" declaring the objectives of its incomes and prices policy. It called upon the employers' organisations and the trade unions to pledge themselves to pursue industrial efficiency, higher productivity and stable prices and to make sure that wages, prices and profits were kept in line with the growth of output. The necessity of such a policy is as much realised by labour leaders as by the Government and the employers. Speaking at a regional meeting of the Trade Unions' Congress last year, the secretary general of the Congress, George Woodcock, observed that it would not be possible to maintain economic growth without an incomes policy. He feared that if such a policy was not deliberately formulated it would be imposed on the country by economic circumstances. The alternative, he said, was to modify or even abandon the objectives of full employment and fast economic development.

It is not, therefore, surprising that an agreement on the guiding principles of a prices and incomes policy was reached last week between the Government, employers and the trade unions. According to the White Paper released in London, while the NEDC will keep under review the general movement of prices and of money incomes of all kinds, the NBPI will investigate particular cases. The latter's prices division will examine any particular increase in or failure to reduce prices referred to it by the Government while its incomes division will examine claims and settlements involving changes in wages, hours of work and working conditions. The Board will not have any statutory powers and the settlements would be arrived at by mutual consent. But the Government has already made it clear that if the "voluntary method" failed it would resort to "other methods".

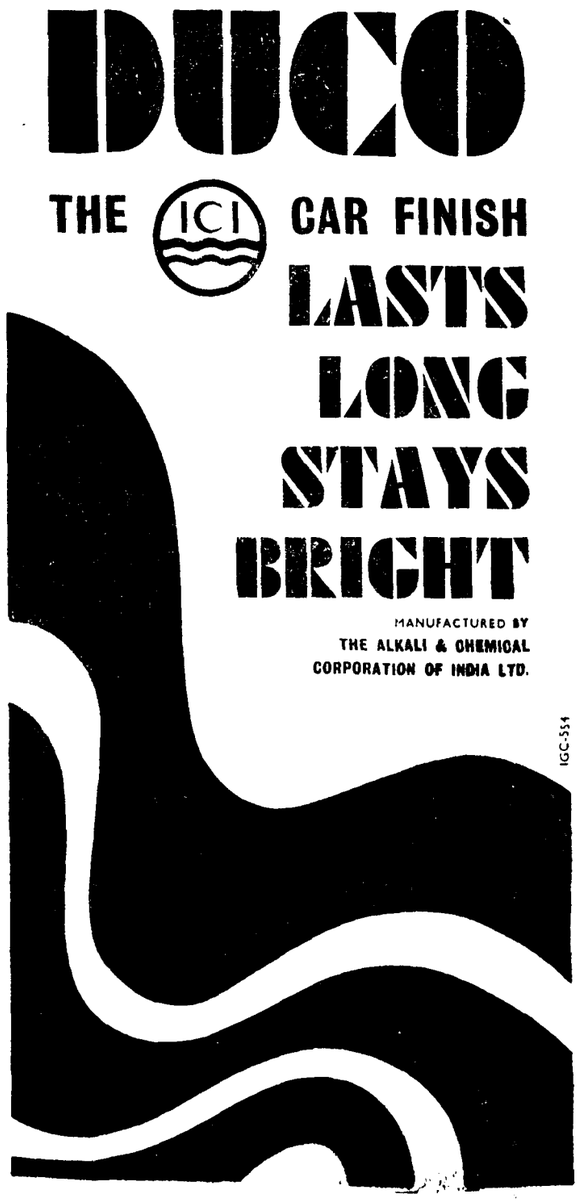
The Labour Government is of the view that in the present circumstances the "norm" for the annual average increase in money incomes is 3 to 3.5 per cent as this is in line with the assumed annual rate of growth of output per head; but the figure may be re-examined by the Government in the light of NEDC's views. The implementation of the incomes and prices policy in Britain, apart from proving a precursor to such policies in other West European countries faced with similar economic problems, will as George Brown, Secretary of State for Economic Affairs, observed in the House of Commons last week, make "possible a more rapid rise in real, as opposed to money, incomes".

LETTER TO EDITOR

Export Finance

IN the note "Dear Money and Export Finance" in your issue of April 3, 1965 there is a reference to what I said at the Seminar on Engineering Goods Exports in Bombay. As the reference does not adequately represent what I stated, I should be greatly obliged if you would kindly publish this letter, so that the position may be correctly known to your readers.

What I said in effect was as follows:



(1) As a general principle, one should remember that capital is a scarce resource in the economy. Trying to provide it at a cheap rate only encourages its use in an indiscriminate manner and leads to inflation, which in turn affects exports. The best assistance to exports that a central bank can give is to try and maintain a reasonable degree of stability in the economy. This I said was the primary responsibility of the Bank.

(2) I did not rule out cheaper credit facilities for exports and also central bank assistance for such purpose. In fact, I drew attention to the facilities which the Reserve Bank and the Industrial Development Bank have provided (a) through the Rupee Export Bills Scheme, and (b) through the medium-term export refinancing scheme. It is to be noted in particular that the latter scheme which provides concessional finance continues to do so at the same rate as before, although rates in other sectors have gone up. I thought that this was of particular interest to the engineering goods exporters. I also added that there were various technical aspects to the other suggestions in respect of pre-shipment finance and post-shipment finance where the export bills are drawn in other currencies which needed examination and that this was being done.

In view of this, the comment in your note "But instead of accepting these suggestions, the authorities seem to have done the opposite" does not appear to be correct.

The point made in the note that "economic and efficient use of money would certainly call for its employment in export finance" is certainly a very valid one. It is one which has to be constantly borne in mind not only by the Reserve Bank but all the credit providing institutions of whom the banks form a major sector. As I stated at the Seminar, the Reserve Bank has always urged the banks to regard exports as a priority sector in their credit operations in view of the importance of exports to the economy. One important way in which the banks could assist exporters is by making a distinction between the rates charged for loans to production for the home and production for the export market as is done in other countries. However, as was pointed out in the Chablani Committee's Report, under the 'Inter-Bank Agreement' no such distinction is made and the minimum lending rate is fixed at 2 per cent above the Bank rate irrespective of whether the finance is required for domestic needs or whether it is pre-shipment export finance. As I mentioned at the Seminar, apparently there has been no move so far in regard to this matter.

CAPITAL VIEW

And Now, Pakistan . . .

Romesh Thapar

MAKE no mistake about it, the present border skirmishes cum attacks by Pakistan will take on the dimensions of a major confrontation unless we are able in a few precise moves to make clear to our detractors and their influential friends, particularly in the West, that the repercussions of such a confrontation will be deep and widespread. A certain co-ordination is noticeable in the attacks on our border posts in the east and in the west. Concentrations of Pakistani army formations are heavier than usual and the desire to engage in regular battles is more pronounced. The feeling is widespread in the highest quarters that this change in Pakistani tactics is the result of collusion with China's leaders who at this moment would rather that their new found ally exploited the disarray noticeable in India's political life.

Tell the People the Facts

Prime Minister Lal Bahadur and his colleagues at the Centre are for once making the effort to get two steps ahead of the developing situation. Not only have moves at UN level been initiated, but friendly nations are being briefed. There is, however, a reluctance to make people at home more aware of the threat because it is feared that this might provide communal groups with the kind of inflammable material upon which they flourish. This is a mistake, for only an informed public can isolate the 'Hindu' incendiaries who masquerade as defenders of the nation. Home Minister Nanda must link the external threat with the internal in such a way that our defensive strength is not frittered away in law and order problems.

The entire propaganda machine of the GOI should be geared to this task. As with China, so with Pakistan, the attempt is to weaken the unifying the elements in this country, to break their resolution and their confidence, to create those economic and political tensions which would make the ruling party hopelessly dependent on foreign support. India in such a state, it is believed, would not be able to retain its federal cohesion. In this respect, the national interests of China and Pakistan coincide to a critically dangerous degree.

Pakistan pretends to be obsessed by the fear of being crushed by 'the bully that is Bharat'. The reality is very different. Her military Junta, preening itself on U S equipment and training, has for long been confident that an armed collision between India and Pakistan would yield dividends. This confidence was further strengthened by India's poor showing in NEFA during 1962. The Pakistani argument, according to reliable informants, runs something like this: it is no longer true that India's army is superior to ours: we have shorter lines of supply, a stable and united population dedicated to the greater glory of Pakistan; our armed forces, thanks to US aid, are better equipped and we have had some ten years of training with equipment which India's forces are only beginning to get used to; and, now, we have them in a fix — strung out thinly behind the longest and most difficult border in the world, a border which over large stretches is not internationally recognised and which does not provide much scope for the quick and rapid deployment of forces.

Rethinking on Defence

This theorising cannot be easily dismissed. Our earlier reliance on massive Soviet assistance in the event of an attack has been much eroded by a short-sighted leadership; indeed, during the past year, as on the question of Soviet naval aid, we have acted as if we put little value on it. Defence Minister Chavan, in spite of his better judgment, has permitted the growth of sentiment in army circles which encourages the thought that India's salvation lies in a firmer military commitment to the West; with Pakistan on the rampage, he must be wondering why on earth he permitted himself the comforting thought that only China was the enemy, for the West is most unlikely in the present confrontation with Pakistan to assist India's interests.

Once again, we have been sharply reminded that India's defence cannot be assured by a fully worked-out commitment to one of the two major nuclear powers. Once again, we have learned that our only course is to build our internal strength to the maximum and through skilfull diplomacy to negotiate the critical military hardware which we cannot as yet manufacture. The extent of the disorganisation in our thinking is brought home by the fact that only a few days ago Parliament was listening to supposedly profound perorations about the need for full commitment to the West (even to South Vietnam!) and the GOI was fumbling over the question of contradicting the distorted and tendentious reports spread, with the connivance of U S officials and diplomats, about Jawaharlal Nehru's ambivalence on these matters.

Pakistan's Tactics

Pakistan is probing at several widely separate points. At the moment of writing, it looks as if the main blows are to be directed in the swampy and supposedly oil-rich Rann of Kutch which from our side is more difficult to get at. It is here that skirmishes have become attacks. In fact, militarily speaking, the only way of punishing Pakistan is to break the back of the attacking force even if it means a counter attack from the coast northward towards the Pakistani line of supply. This would, of course, lay the basis for a major operation. But, then, how else are we to put a stop to continuous skirmishing which develops into a serious violation of our border positions? Pakistan's military junta calculates that India will never push matters to the level of a major operation — or, at least, not until compelled to do so. Like China, she waits to catch us unawares.

The initiative, in other words, remains with Pakistan. It has been suggested that President Ayub is only preparing the background for his visit to Washington where he hopes to limit the supply of U S military aid to India. But this could only be a minor objective. For, whatever be the convictions of those who would have us commit to the West, the fact remains that Washington remains firmly opposed to any move which might offend Pakistani opinion — even in the matter of supplying rather out-dated aircraft which Pakistan already possesses in adequate number. The U S A, it is said, knows that Pakistan is quick to anger. As for India, the greater the neglect the more pliable her pre-

sent leadership becomes. Why worry? Therefore the fear that there is a more sinister plan in Pakistan's latest attempt to hot up the border.

It is being argued by many in the Capital that moves at U N level, and also among friendly nations, will sooner or later have to be followed up by retaliatory diplomatic action, *a la Nasser*, against those who would exploit our present predicament to blackmail us. Whether it is Pakistani skirmishing, or support to an Abdullah or a Phizo, or military involvement with an aggressive neighbour, or more indirect hostility, we shall have to adopt tougher attitudes. Our carefully civilised postures are apparently misunderstood. Moves are tolerated which increase our isolation. We fail to discern who are genuine friends and who are false. We have no reliable yardsticks. And, in the process, crucial national interests are being sacrificed.

These same circles, however, although incensed by the treatment India receives, fail to stress the paramount need for building a spirit of self-reliance. This spirit cannot grow spontaneously, as they seem to imagine. It has to be cultivated, canalised and directed into a carefully devised programme of mobilisation and development. A certain degree of what is called regimentation is a necessary part of such a programme, and there is no reason why we should weaken ourselves merely because we are unable to find the 'perfect' solution to our problems. The defence of our sovereignty, as also the democratic State structure which holds our people together, demands that we free ourselves to a large extent from the many inhibiting influences generated by our dependence on others.

Within a fortnight, Parliament will be preparing for the summer recess. Prime Minister Lal Bahadur will be in the throes of readying himself for a three-week tour of foreign capitals. Various ministers and deputy ministers will be organising visits abroad. The less fortunate of the ruling elite will be content with seminars and conferences at various hill-stations. It is to be hoped that a nucleus of effective leadership will be left behind to 'hold the fort'.

FROM THE LONDON END

The Budget and Overseas Investment

CALLAGHAN'S Budget was obviously framed with the foreign banker in view. The main object of the Budget was to try and convince foreign bankers of Britain's determination to tackle her balance of payments difficulties without devaluing the pound so that, impressed by the stern internal measures taken in the Budget to restrict home demand, there would be less opposition to the renewal of the $ 3,000 million loan in May. On the other hand, too stern a dose of deflation had to be avoided if the old "stop-go" policy so fervently attacked by Labour in opposition was not to be repeated. Generally speaking, the comments which have appeared in the press appear to endorse the view that this Budget has found a nice balance between the two objectives.

Again, as a socialist Chancellor, Callaghan had to give some impression that social justice was also one of the aims of the Budget. In order to compensate for increased taxes on beer, spirits and tobacco, the Chancellor has introduced the capital gains tax and the new restriction on all forms of business entertaining. These are quite obviously small sops in order to ensure the success of the incomes policy which will bear heavily on wages and salaries.

The general reactions overseas have been favourable and rumours on devaluation have been now finally scotched. In the event, the City is somewhat relieved as the corporation tax — the new tax on Company profits — is not going to be levelled at a penal rate; it is not going to exceed 40 per cent. The companies which will really suffer from the new corporation tax are those which earn a large part of their income abroad. Thus, companies will be allowed relief on foreign tax, only to the extent of their corporation tax liability. With the exception of overseas companies, the immediate effect on industry of the corporation tax should not be too adverse.

Departure from Tradition

Perhaps the most interesting feature of Callaghan's Budget is the direct attack it makes on overseas investment. This is a major departure from the traditional British attitude to foreign investment which has hitherto always been accorded specialised treatment and, in the days of colonial superprofits, brought in more than adequate returns.

The outflow of long-term capital from the U K accounted for half of last year's £745 million deficit on the balance of payments, and the decision to take direct action to improve this balance was certainly justified by the size of the present deficit. The present tax system puts a premium on overseas investment as it tends to favour those who invest abroad, and the Chancellor is now aiming "to change the direction" and "to channel home some of the accumulation of assets held in private and abroad". The various steps which the Budget proposes on top of the switch to a corporation tax to discourage companies investing abroad, will bear heavily on companies whose major interests are abroad, and will hit particularly overseas trading corporations—mainly rubber, tin and tea-planting companies who have hitherto paid no profits tax. Overseas trading corporations are companies registered in Britain which operate exclusively abroad. All O T Cs pay tax at the local rate in the countries in which they operate, and have so far been given relief for that reason in the U K. Under the new Budget, their special status will be abolished from April 1966, and the only relief that they can obtain will be if the taxation rates in the countries in which they are operating are higher than the proposed corporation tax rate of 40 per cent.

Since O T Cs will now have to pay dividends gross, many will have to cut their payments drastically. This may well mean that companies will be sold and British capital will be withdrawn from areas in which it is now established. For example, these new measures may make it of interest for British tea plantations, for example, to sell out to local entrepreneurs in India.

For some years now, it has become fairly obvious that Britain, like the United States, simply cannot afford to invest on the scale of the past ten years. Britain which has gold reserves which are half the size of Germany's, is certainly overstretching its resources when it tries to police a major part of the world, to run a world currency and invest on a considerable scale. While Britain's reserves altered very little between 1952 and 1964, private and Government investment overseas amounted to no less than £4,000 million over the same period. As a result, of course, Britain now possesses long-term assets whose value is nearly £11,000 million. This is a very large sum of money to be invested overseas. It is true that these investments bring in profits and dividends, but the fact remains that if money is going out at a quicker rate than income is coming in, this certainly does not help the present balance of payments difficulties. It is for this reason that the Government is readjusting the tax structure to make it worth while to invest at home. It is also imposing more rigid exchange control regulations to make sure that future investments are worth the price that is paid, and it is attempting to get a contribution to the gold reserves from any future sales of foreign assets. These are part of the measures which the Government is taking to preserve the existing parity of the pound. The table gives some information on Britain's stake abroad.

What effect the new restrictions on overseas investment will have on the flow of private capital to the developing world remains to be seen. Dealing with the direct measures taken to make overseas investment less attractive, the *Financial Times* says: "For example, a company thinking of operating in India will have to see a profit rate 70 per cent above that of the stay-at-home counterpart to make the game worth the candle. This is perhaps fair enough, but what if all that happens is that official aid from the U K has to fill the gap?" Indeed, in recent years much of the argument with regard to the development plans in the emergent world have referred to the fact that Governments of these countries have come to realise that since official Government aid to the developing world is not nearly large enough to cover their development needs, private capital has also an important role to play.

While it was a right decision to take direct action to improve the balance of payments, one of the major omissions in the Budget is that no attempt has been made to lessen Britain's overseas military expenditure. In 1959, Government spending abroad was £175 million; it is now over £300 million. Even the *Times* said: "Yet the Government itself is making no economies on its overseas spending...There is only one solution—a reduction of military commitments in Germany, the Middle East or the Far East. Without a reduction of commitments, no major spending cuts can be forthcoming." Thus, the present Budget leaves untouched military expenditure abroad, one of the root causes of the balance of payments problem.

No Help for Exports

Another omission in the Budget is that very little has been done directly, either to promote Britain's exports or to modernise British economy to meet the challenge of the day. Indeed, planning for economic expansion is singularly absent from the provisions of the Budget. No tax allowance, for example, is being granted to encourage the type of science-based automated industries on which the future of Britain depends. But perhaps the basic reason for this is that under the present system, where economic responsibilities have been divided between the Treasury and Brown's Ministry of Economic Affairs, we must regard the Budget as one half of the plan providing the basic structure for future developments of the economy which will be initiated by Brown.

Again, nothing very much has been done to assist the Regions, and the unequal economic advance in the various regions of Britain is one of the most crucial problems facing the country today. However, Regional Development is to get some encouragement through the new facilities for loans and borrowing.

There is no doubt at all that the Budget has been a great personal triumph for Callaghan, and by and large it has been a moderately successful Budget gearing its priorities to reduce home demand by £250 million so as to reassure the foreigner about the pound and impress overseas bankers, on whose credit Britain still depends, without at the same time imposing too great a degree of deflation at home. What is interesting, however, is that the one point on which both the Government and the Opposition seem to agree is that if the Budget has any dangers, they are deflationary. While it is true that the measures taken will still permit the British economy to keep on the move at home, it will also mean a slowing down in the rate of growth for the earlier part of the Government's long-term economic programme.

Introduction to Africa

Indira Nath

Which Way Africa by Basil Davidson; Penguin Books, London, 1964; 215 pp, 4s.

MOST people in the West still believe in the myth of colonial rule rescuing the African from savagery, civilising and educating him, giving him democratic institutions, and leaving him economically much better off than it found him It is refreshing, therefore to find a book about Africa written by a European who is without any illusions about the 'colonial heritage'. In contrast to the general self-congratulation of the colonial powers, the author sums up the position in most countries on achieving independence as one of "acute and worsening poverty"; he holds the colonial powers largely responsible for it. The destruction of the old ways of life, together with the introduction of the terrible system of migrant labour, redued the villages to starvation level by depriving them of their labour force; it also produced large insanitary slums in the continually expanding cities. Poverty, famine, disease, illiteracy, a general lowering of the standard of living were the true colonial heritage in Africa. As late as 1951, 51 per cent of the children in Nigeria's Northern Region (a relatively prosperous area) died before the age of six. In 1959, after 40 years of colonial rule, among the 24 million inhabitants of British East Africa there were only 2,000 who would qualify for a school certificate.

None of these appalling conditions could be ascribed to a lack of resources, for the colonial powers thoroughly exploited the continent's wealth, particularly its mineral wealth, while denying the African any share in the benefits. The author bears out this contention by quoting figures, gathered by U N in 1958, comparing the actual benefits with those which had been promised from the formation of the Federation of the two Rhodesias and Nyasaland. In 1945 gross mining profits were £ 5,500,000 and African wages were £ 1,400,000 (about 25 per cent of the profits); in 1956 gross profits amounted to £ 80,000,000 while African wages accounted for £6,400,000 (about 8 per cent of the profits). "Federation was evidently rather more beneficial to mining shareholders than to the African miners themselves."

In Africa, then, as in India in 1947, the challenges to be faced on achieving independence were social and economic. Poverty and disease were rampant and not enough food was grown. The author's view is that the colonial powers — in addition to exploiting the mineral resources of Africa — did further harm by enforcing on the African farmer cash crops such as wine, cotton and cocoa for export to the mother country in place of subsistence farming. In Algeria, for instance, the French increased the vineyard acreage from 4,000 acres in 1830 to 750,000 acres in 1953. The production of cereals there remained stationary after 1880 while population almost trebled, so that although in 1871 the average Algerian had 5 quintals of grain a year by 1940 he had only 2½. Similar instances can be found al over the continent: in Southern Rhodesia much good land went into tobacco farming.

Independence and After

Along with the neglect of food production for the African went the system of cheap African labour. In 1954 a Committee on African Wages in Kenya reported that "approximately one half of the urban workers in private industry, and approximately one quarter of those in the public services, are in receipt of wages insufficient to provide for their basic, essential needs of health, decency and working efficiency". In South Africa, miners received roughly 100s per month in 1951, compared with 63s per month in 1890. Given the fall in the purchasing power of the pound since 1890, "it is obvious that the real wages earned by these hundreds of thousands of men fell steeply during the period".

Besides the massive economic problems, there were other serious problems too. Since the colonial powers had generally worked on the principle of divide and rule, when it came to granting independence some federal system usually had to be devised to satisfy the ambitions of the various factions — usually divided on tribal lines — which had been carefully nurtured by the foreign ruler. In consequence, a country like Kenya with heavy unemployment and poor resources had to bear the cost of maintaining eight parliaments and governments along with all their inevitable paraphernalia. In Dahomey 60 per cent of the total budget receipts are spent on civil service salaries. The author comes down firmly on the side of a unitary constitution and cites Ghana as an example to be emulated. When Ghana achieved independence in 1957 her constitution permitted the formation of strong regional governments similar to India's state governments. The author feels that it is to Nkrumah's great credit that he crushed the power of the chiefs who wanted regional autonomy. There is no doubt in the author's mind that had Ghana been allowed to lapse into regionalism, as happened in the Congo, no meaningful economic and social progress could have occurred.

After mentioning some of the main ideas in modern African political thought, including nationalism, neocolonialism, neutralism and pan-Africanism, the author gives due prominence to the two most important of these, pan-Africanism and neutralism. Far from being a creation of Nkrumah the idea of pan-Africanism originated in America at the turn of the century. The first pan-African Congress was held in 1900; the sixth was held in 1945 in England, attended by many then unknown young Africans, including Kenyatta and Nkrumah. Yet the ideal of Pan-Africanism seemed to have been forgotten by the fifties. It was then revived by Nkrumah and greeted with scepticism by most other leaders. In 1963 the first African Unity Conference was held in Addis Ababa, attended by 32 independent nations who agreed to co-operate politically, economically and socially and to endeavour to secure greater African representation in the various United Nations bodies including the Security Council.

Davidson does not claim that the ideal of pan-Africanism, with its concept of continental integration, has been accepted all over Africa. Many African countries have formed themselves into "blocs" — the notable division being between the ex-French colonies and the ex-British colonies. Yet there is a growing awareness of the benefits of co-operation. One thing at least unites all the 32 countries, and that is determined opposition to South Africa and Portugal and their practice of *apartheid*. Most of them also follow non-alignment to a greater or lesser degree. The non-alignment was inspired by India. If India could, why not Africa? It is a tribute to India that so many African States have openly acknowledged their debt to the Indian example. Now it is India's turn; if so many 'un-committed' African countries can practise non-alignment with success, cannot also India? Or have our circumstances changed so fundamentally?

To many people, including Indians (if they think about Africa), the general swing to one-party states in Africa is alarming. The author is sympathetic to it, but his arguments remain unconvincing. He says that in each country there was a single political party demanding independence; since no opposition party existed, there was, therefore, no need for one after independence. Julius Nyerere has summed up the justification for one-party rule thus, "There is no remaining division between 'rulers' and 'ruled', no monopoly of political power by any sectional group, which could give rise to conflicting parties. A multi-party system would, at best, lead to the trivial manoeuvrings of 'opposing' groups whose time is spent in the inflation of artificial differences into some semblance of reality, 'for the sake of preserving democracy'". It may be that the only opposition now is merely a reactionary, secessionist minority in Africa and that *at present* all governments command the full support of all their people, but the denial of the right to form opposition parties can lead eventually only to some kind of totalitarianism. To say "... while Ghana has political prisoners today, she has yet to have her first political execution" hardly provides reasonable support for the author's view that the one-party State in Africa is a democratic institution.

This book is not for those who seek to know anything of the impact of communist powers on Africa. There is scant reference to communism as such and no mention of the involvement of communist powers in the affairs of any African country. It is a fact that no African country had a strong communist party before independence; but it does not follow that there is no communist interest now in the continent. By barely mentioning the communist powers, the author implies that only America and the ex-colonial powers are in any way interested in what happens in the continent which is certainly not the case.

What is there for Indians to learn from this book? In both India and Africa, there was a failure to realise that political independence was far from being an end in itself, resulting in the lack of a widely shared sense of mission regarding social and economic problems. Some kind of a political elite had emerged under colonial rule, but under the heady influence of freedom, far too many members of this elite — in Africa as in India — sought to take the white man's place and enjoy his privileges. One author wrote in 1963 of "the appalling mismanagement of our public affairs, the lack of sense of direction on the national level, the moral depravity of our society...". This could have been an Indian writing about India; in fact it is a Nigerian (Gabriel Faqbure) writing about Nigeria. Equally relevant is the eloquent comment of another Nigerian (Tai Solarin) about his country: "One thing is clear in the minds of the young elements in our country — Nigeria is not being effectively governed. Our government is a hydra-headed octopus that veers and backs, depending on the prevailing planetary and political winds, and that oscillates and flounders and hopes, whatever happens, for the best. It is not purposive; it is not disciplined."

Davidson wisely remains content with predicting very little for the future, the title of his book notwithstanding. He is certain that Africa will play an increasingly important role in world affairs — a conclusion that is unexceptionable. This is a well-written little book. Unfortunately its usefulness is somewhat reduced by the absence of a reading list.

The Psychiatry of War

Prabhakar Ghate

Psychiatric Aspects of the Prevention of Nuclear War Report No 57, Group for the Advancement of Psychiatry; New York; 94 pp.

IT is possible to classify, as Kenneth Waltz in his "Man, the State and War" did, the seminal thinkers on the problem of war into three main groups. There were those, like Thomas Hobbes, who regarded war as arising inevitably out of the nature of man. Others attributed war to the intrinsic nature of particular types of state, such as Karl Marx's capitalist-industrial state which had to expand overseas in search of markets, raw materials and investment opportunities, or, to take a more recent example, C Wright Mills' state dominated by the militaristic 'power elite'. A third group regarded war as an inexorable consequence of the nature of 'international society', a society which lacked a common authority with a monopoly of force superior to its constituent units. These diagnoses of the causes of war led to three corresponding sets of solutions. Until fairly recently a book by a psychiatrist would more likely than not have seen the solution to the problem of war as lying exclusively in the rectification of human nature.

The "Psychiatric Aspects of the Prevention of Nuclear War", one of a series of booklets published by the Group for the Advancement of Psychiatry and prepared by its Committee on Social Issues, does not fall into this error. It recognizes that the problem of war is multi-faceted. It regards conflict between groups as inevitable, while recognizing that conflict is not synonymous with war. If conflict is to be prevented from taking the shape of war, what is needed instead is a continuing process of non-violent resolution of conflict. This, the report points out, rejecting the uni-dimensional fallacy, will entail profound developments in diplomacy, law, politics, technology, and ideology, *as well as* the modification "of many entrenched complexities of human nature and behaviour at both individual and societal levels".

Having recognized the limitations imposed on psychiatry's contribution by the very nature of the subject and "the need to stay within the limits of psychiatry when seeking to apply its insights and methodologies to broad problem areas", the report goes on to staunchly defend the value of that contribution on these grounds: "the complex nature of these issues requires a pooling of knowledge, collaborative effort, and better communication at various levels between psychiatrists and other behavioural scientists, between behavioural and natural scientists...

One of the many advantages of such joint endeavours is that they tend to counteract one-sidedness, blind spots, and bias in any participating group or individual". To this end the report seeks to make available to colleagues in various disciplines the results obtained by subjecting a mass of material derived from other sources (the Committee has not conducted its own research, except bibliographical) "to the processes of psychiatric 'filtration', assimilation, integration and deliberation." It hopes thereby to stimulate further research into the emotional, irrational, and individual human factors involved in specific issues of peace-keeping.

In discussing the relationship of war and human nature the report takes the view that war is not rooted in human nature. It has never been simply a collective expression of individual hostility and aggressiveness, merely the sum total of countless individual aggressions. On the contrary, war is a social institution, and like all social institutions it must potentially be capable of change and eradication. Cannibalism, slavery and ritual human-sacrifice must have all seemed deeply rooted in human nature when they were prevalent.

The report admits that war has traditionally provided an outlet for the release of destructive (and cohesive) impulses. In this sense it has found sustenance in them. But progressive changes in the character of warfare have rendered it an increasingly unsatisfactory outlet. The distance between the individual soldier and his enemy has increased, making war more and more impersonal and mechanical. The best soldier is no longer a hero, but an automaton.

In discussing some of the psychological responses of individuals and groups that contribute to the continuance of the arms race and render a non-violent solution of the current East-West struggle (or any struggle for that matter) difficult, the report deals in particular detail with the phenomenon of 'dehumanization'. This, it points out, is a serious and fundamental problem of our time, to which the forces of industrialization, specialisation, bureaucratization, and automation are increasingly contributing. Dehumanization is the tendency to denude other individuals and groups of human qualities in order to protect a person from feelings of guilt and shame about the way he feels about or acts towards them. It is a defence mechanism which enables one to write off other people's suffering or death as something that neither concerns nor moves one personally, and with which no identification takes place. While dehumanization makes statistics out of other people, it has a similar effect on the self. It leads to an image of oneself as powerless, a mere cog in the wheel, passively following orders. It stifles one's capacity to feel and act like a human being. It results in a diminished sense of personal responsibility for the consequences of one's actions, and prevents people from taking steps essential to the maintenance of the well-being of society and the prevention of mass destruction. The report underlines the need "to investigate what innovations in modes of thinking are needed, and how they may be brought about, to counteract the intensified callousness toward human worth and suffering resulting from the advances in modern technology and the push-button aspects of nuclear warfare."

The Dangers of Deterrence

The report discusses the policy of deterrence in some detail, because as it rightly points out, it is the relationship of mutual deterrence between the two super-powers that is responsible for having prevented the outbreak of nuclear war so far. But, it adds, though the nuclear stalemate, or the balance of terror, has proved a useful temporary expedient, long-term reliance on it as a permanent arrangement is fraught with dangers. Deterrence can fail, partly because some of the psychological assumptions on which it rests are dubious. Firstly, it assumes that there will be rational and responsible control on both sides of the decision to use nuclear weapons. But behaviour under stress of extreme fear tends to become more impulsive and less rational. The spread of nuclear weapons to other powers will increase the chances of nuclear weapons falling into the hands of those with limited tolerance for emotional strain. Secondly, there are people with suicidal tendencies, who in destroying themselves have no compunction about destroying others. Thirdly, deterrence suffers from the drawback that it deters the other side by the threat of punishment. It does not use the promise of reward. Punishment, or the threat of it, may inhibit acts undesired by the 'deterrer', but it leaves the underlying motivation unchanged and, if anything, acerbates hostility towards the 'deterrer'. Reward on the other hand creates a favourable attittude towards the rewarder, thereby reducing the incentive towards undesired behaviour.

Confronted as we are with these (and other non-'psychological') deficiencies in the present system of mutual deterrence, the search for more satisfactory arrangements for the maintenance of international security must continue. But under any system there will remain the need for some means by which conflict can be conducted and resolved without resort to violence. (It is interesting to note that under a system of world government, or a centralised authority with a preponderance of coercive power, though that need will still be great, it will no longer be vital, since conflict, if it does lead to violence, will be containable within safe limits by the preponderant force of the central authority, and will be resolved according to the will and law of the world community.)

The report examines some non-violent methods of conducting conflict, involving action by one, both and third parties. As an example of action involving one party to a conflict the report contains an interesting discussion of non-cooperative non-violent action on Gandhian lines. It is enthusiastic about the advantages and prospects of this means of conflict in the domestic sphere, but points out that its applicability to international conflict seems limited, because its effectiveness depends on making an ally of the opponent's conscience, on appealing to a set of shared values and exemplifying the opponent's ideals. This can only happen when there is continuous personal contact between members of opposing groups — a condition which is not met in conflicts between nations. Examples of action taken by both parties to a conflict are negotiations, and competitive co-existence, in which the opposing parties mutually undertake to desist from active efforts at destroying each other. Action taken by third parties may be informal, or may involve formal procedures such as arbitration or negotiation. Moreover, supranational organisations also play 'third party' roles. The discussion of the psychological aspects of all these alternatives to violence in the condut of conflict makes fascinating reading. What is more, the report shows that they hold out hope of reducing tension between national adversaries.

Implications of Curb on Advertising

Subrata Banerjee

The rules prescribing restrictions on advertising expenditure by companies have been withdrawn. It is proposed to re-issue fresh rules after considering representations from industry, the advertising trade and other concerned interests.

However, the thoughtless manner in which the rules were first promulgated creates serious doubt whether the Central Board of Direct Taxes will be able to come to a correct decision on the question of legitimate advertising expenses.

In the circumstances, there is a strong case for appointing an expert committee to examine the issue objectively. The committee could consist of Government officials, representatives of industry, the press and the advertising trade and an independent economist. Only such a committee will be able to consider all aspects of the problem and judge whether advertising expenditure should be restricted or not and, if so, how.

THERE seems to be an implicit assumption by those who frame income tax regulations that no marketing organisation which realises the necessity to advertise will be inhibited by any tax regulations, however prohibitive. It will continue to advertise, may be on a somewhat restricted scale, and the income tax authorities will happily harvest the revenue. This seems to be the view of S L Rao too ("Tax on Advertising" *The Economic Weekly*, March 27, 1965). He ends his analysis of the implications of tax limitations on advertising on this note. The matter, however, is not as simple as all that.

Advertising, because it is seen by the public all the time, creates the illusion that it is a separate entity, complete in itself. It is often felt that advertising by itself sells goods or services. This is not true. It has to be understood that advertising is only one factor in the total complex of marketing operations. It is just one cog in the machinery of selling. No intelligent business management considers advertising apart from the total selling and distribution arrangements.

Costs May Go Up

It is in this context that the proposed income tax limitations on advertising expenditure should be considered. The real implication of such a measure is a tax on the entire selling and distribution expenditure of a marketing organisation. Advertising really forms only a part, and a very small part of this expenditure.

As advertising is just one of the tools of selling, it will be wrong to think that it is not irreplaceable. Its importance lies in the fact that it is the least expensive and most effective method of selling. If advertising is taxed many marketing organisations would find it more attractive and more economical to spend more money on the other methods of selling than pay taxes. S L Rao, in his article, has indicated some of the other possible methods available.

It is true that the case of consumer goods industries is somewhat different. Their ratio of advertising to sales turnover is relatively high. They cannot do without advertising. Just in order to survive they will have to advertise beyond the minimum limits that may be prescribed and pay the tax. They too will, however, reduce their current expenditure considerably.

Obstacle to Competition

Every organisation will naturally revise their advertising expenses to reduce the tax liability. The rest of the money will be diverted to other and more expensive, and in many cases relatively less efficient, methods of sales promotion. Such a step can have two effects. Rise in the cost of selling will lead to a rise in prices. This in turn will soon mean reduction in sales and hence lower production. Non-utilisation of full production capacity will adversely affect the economics of large scale production. As it is, there is considerable under-utilisation of capacity in many consumer goods industries. This is partly due to scarcity of raw materials and partly due to lack of demand. This situation will further deteriorate if limitations are imposed on advertising at this stage in our economy.

It is the declared policy of the Government to operate a mixed economy and prevent the development of monopolistic tendencies. A sufficient number of units has been licensed in each area of production for this purpose. This means competition. How can competition be effective without adequate advertising? The smaller and new units, competing with well established manufacturers can get their products known to the consumer effectively and economically only through heavy advertising. With restrictions on advertising expenditure they will be at a disadvantage and monopolies are bound to emerge in many industries. Already in many consumer products industries a single manufacturer commands the major share of the market. Sometimes this share is larger than that of all the other units put together.

We are all anxious to save foreign exchange and develop indigenous production of many goods now imported. Quite a few such industries have already come up. Greater achievements are called for in this direction. How can such industries and those producing import substitutes get their products accepted by consumers without adequate advertising?

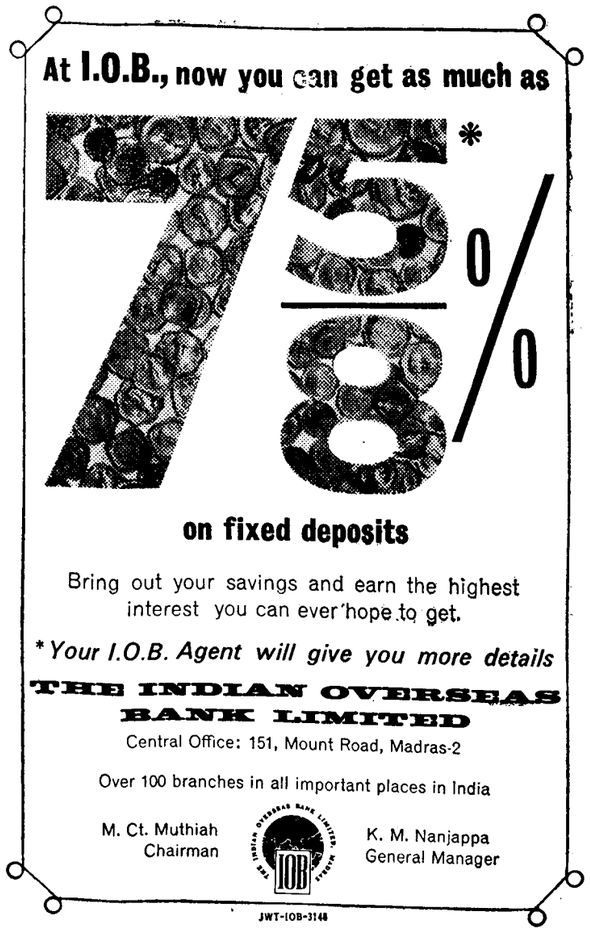
Restrictions on advertising expenditure will encourage inferior and adulterated products. With higher selling costs leading to higher prices and lower production, branded goods will naturally be ousted from the market. Consumers will have to make do with inferior substitutes. It should be remembered that a manufacturer who advertises his products mentions certain product qualities. He thus makes himself publicly accountable to the consumer for the quality of his product. This is why there is greater confidence among consumers in branded goods. The manufacturer of non-branded goods is not accountable at all.

Impact on Foreign Capital

The Government has had occasion in the past to complain that capital is shy in this country. Various incentives have been offered to offset some of the obstacles to investment of capital, both Indian and foreign. It is surprising that a new deterrent should now be contemplated. Obviously if an investor is faced with higher selling and distribution costs at the very initial stages of marketing, he will have second thoughts. This is especially true of the foreign investor, who has never operated in circumstances where limitations are imposed on selling efforts. He can expect a favourable return on his investment

from large-scale production and the maintenance and expansion of mass markets. Otherwise he would have to raise prices and lose the benefits of mass production and mass markets.

What about Export Promotion?



Export promotion efforts will also be hampered in such a situation. Restrictions on advertising, leading to under-utilisation of plant capacity because of a restricted home market, will raise the unit cost of production. This will reduce our competitive strength in export markets. Sufficient funds will also not be available for advertising abroad on an adequate scale. As it is, our export promotion drive is being hampered in many product areas precisely because of higher prices and inadequate advertising and sales promotion efforts. Restrictions on advertising expenditure will merely make the situation worse.

It is vital for our economy to modernise our farming methods. This means inducing the farmers to use modern agricultural tools, fertilisers, improved and scientific cattle feed and so on. This is an area where quick results are essential. And yet restrictions on advertising expenditure will mean that a large number of manufacturers of agricultural implements and allied products will be compelled to reduce their sales promotion efforts. We shall, of course, happily go on spending more and more valuable foreign exchange to feed the people.

In recent years a small section of farmers has begun to have a disposable surplus income. To some extent this is being used to raise their own standards of living. A large percentage of this goes into the manipulation of foodgrains prices. Advertising can help to divert more of this money towards the purchase of a wide range of consumer products and consumer durables, to ensure a higher standard of living. Here is an area where consumption needs to be encouraged in the interest of our developing economy.

In the countryside advertising can thus provide an incentive to higher productivity. This was the experience of the United States economy in the "developing" stage some 70 years ago. W W Rostow, the American economist, advanced this idea some time ago. He suggested a Sears-Roebuck type of catalogue for the Indian farmer to spread the take-off stage from the cities to the countryside. Seventy years ago, the American farmer saw in the attractive catalogues put out by the Sears-Roeback mail order company illustrations of inexpensive tools, fertilisers, etc, and also of a wide range of consumer durables that make for better living, such as sewing machines and electric lights. The dream of possessing these luxuries acted as a spur to higher production in agriculture. Rotow suggests that Indian farmers could be more strongly prompted to adopt modern farming methods, if given a picture of "incentive goods" such as table fans, radios or bicycles which they could buy if they raised a higher yield. Such a possibility will be, of course, impossible with restrictions on advertising expenditure.

It is obvious that sufficient thought was not given to the implications of a restriction on advertising by the income tax officials far removed from the day to day operations of selling and distribution. Having seen the initial efforts of these officials, it is difficult to feel assured that representations from advertising and allied trades will help them come to a correct decision on the question of legitimate advertising expenses. The only way seems to be to appoint an Experts Committee which can go into the whole question objectively. Such a Committee could comprise Government officials, representatives of industry, the press, advertising and allied trades and an independent economist. Only such a Committee can really decide whether advertising expense should be restricted or not, and if so, how.

Caste and the Kerala Elections

Robert L Hardgrave Jr

The mid-term election in Kerala was fought by the Congress and the Communists to secure the support of the Ezhava community.

The failure of any party to secure a majority, however, only emphasises the fact that while the politics of Kerala may be caste-bound, no party can rule with the support of one community alone.

The erosion of the political solidarity of the Ezhava community by the Congress may reflect the initial stages of differentiation within that community. Under the impact of economic change, as each community becomes increasingly heterogeneous, political interests within it will get differentiated and as this happens the polarity between the communities in terms of party support may be expected to decline.

PERPETUATING the political *immobilisme* which has incapacitated the state since its creation, the people of Kerala went again to the polls on March 4, to scatter their votes among fifteen parties and more than five hundred candidates. The campaign for the fifth major election since independence was lackluster, and the people responded with a bored indifference, but on election day, more than 60 per cent turned out to register their political literacy by distinguishing between the Congress and the dissident Kerala Congress and between the Left and the Right Communist parties. While no party secured a majority, the largest slice of the votes was taken by the Left Communists. With 29 of their winning candidates imprisoned under the Defence of India Act, the Left CPI won 40 of the Assembly's 133 seats. The Moscow-backed Communist Party of India, ideological opponent of the allegedly pro-China Leftists, secured only 3 seats. The Congress Party won 36 seats, and the rebels, who had toppled the Congress Ministry only six months before, took 23. The elections, however, reflect not so much the strength of communism in India, much less support for China, as the peculiar pattern of communal rivalries which cut to the quick of Kerala society.

Kerala is a land of contradictions in a nation of contrasts. As India's smallest state, Keala has the highest birthrate and the greatest pressure on the land, it abounds in agricultural wealth, yet imports half its food supply. Its international exports bring 25 per cent of India's dollar earnings, yet Kerala's per capita income is the lowest in India. It has the highest literacy rate and the highest rate of unemployment. With the largest community of Christians, it has the highest Communist vote too. It is at once a bastion of orthodox Hinduism with the most elaborate system of caste ranking in India and a region deeply affected by the process of social mobilization and change. With many of the prerequisites of political modernization, Kerala is confronted with the omnipresent reality of caste in politics, a spectre of tradition decried by Nehru as a reversion to "tribalism".[1]

Caste Ranking

Traditionally the elaboration of the ritual hierarchy reflected the economic position of the constituent castes, with each caste associated with a particular occupation and sharing a common economic status. The caste system historically, however, was not rigid, for as a caste gained economic power, a commensurate ritual rank usually followed. Caste ranking in Kerala reflects such a process, but in the development of its linear elaboration, a rigidity stifled the movement of castes in the hierarchy, freezing the lower castes in their positions of subservience. Only the Muslims and Christians, both being outside the hierarchy, were able to exploit new economic opportunities and in so doing to raise themselves in social status. The process of pauperization initiated by population growth and the divisions of lands accentuated the economic disparity between castes. Thus, in the high correlation between caste ranking and economic position, the socio-economic structure of Kerala came to reflect the highly elaborate hierarchy of ritual purity.

Caste ranking places the Namboodiri Brahmins at the peak of the hierarchy. Numbering only 8 per cent of the Hindu population, it remains primarily a landowning community. Despite the number of political leaders from the caste, such as the Left Communists' E M S Namboodiripad, the community has little political power. A far more potent political force is the Nair community, the traditional warriors of Kerala. As a landowning and mercantile community today, the Nairs, numbering 25 per cent of the Hindu population, are the pivotal force of Kerala politics. They have traditionally held the balance, making or breaking a Government with the shifts of its power. Economically subservient to the Nairs are the Ezhava, or Tiyyar as they are called in Malabar. Traditional toddy-tappers, the community is considered the highest of the polluting castes. With nearly 45 per cent of the Hindu population, however, the economically depressed Ezhavas are perhaps the single most powerful community in Kerala.

In addition to the mutually antagonistic Nairs and Ezhavas, the Christian community ranks as a major political power in Kerala. Although the Christians, 24 per cent of the population, are divided among the Syrians (of whom there are two sects), the Protestants, and the Roman Catholics, it is the Catholic community which numerically dominates and which holds the locus of political power through the organization of the Church. Through the Muslim League, the Muslims, 16 per cent of the population, are a major factor politically, particularly in the Malabar region of northern Kerala where they are the dominant community.

As the Muslims are concentrated in certain areas of Malabar, so each of the other communities dominates in particular regions of Kerala. The Christians are concentrated primarily in Ernakulam and Kottayam districts. The Nairs form the dominant community in the areas of Trivandrum District, and the Ezhavas are particularly strong in Palghat. Each political party must thus seriously consider the dominant community, or as the Communists prefer, "the social base", in the selection of its candidate. That each party tends to choose its candidates from the dominant community, however, does not cancel out community as a factor. Although there are elements of each community in all parties (except for the Muslim League), the parties in Kerala have come to be associated with particular communities, and within each party, factionalism expresses the divisions of religion and caste. Indeed, it is the politics of caste which forms the fundamental reality of political life in Kerala.

Kerala, as a linguistic state, was formed in 1956, combining the former princely states of Travancore and Cochin with the Malabar portion of Madras. Following independence, Travancore and Cochin, then separate, held their first elections in 1948. The Congress, at the height of its prestige, captured all the seats of the Travancore Assembly, save one Independent who later joined the Congress. Congress President Pattom Thanu Pillai, a leader of the Nair community, became the Chief Minister and was joined by two Congress leaders of the Christian and Ezhava communities T M Verghese and C Kesavan, in the formation of the first Travancore ministry. The Muslims, however, were dissatisfied by what they saw as their exclusion from the cabinet, and Pillai attempted to expand the Ministry to include a more communal representative body. In so doing, he only fortified Nair strength within the Government, and both Verghese and Kesavan threatened to resign if a new Nair minister was not dropped immediately from the cabinet. Pillai acceded to their demands only to be challenged again by the Christians, backing another Nair, T K Narayana Pillai, in opposition to the Chief Minister.

In October 1948, only a few months after the formation of the Government, P T Pillai resigned as Chief Minister and crossed the Assembly to join the ranks of the Socialist Party (later the Praja Socialist and now split into the Praja Socialist and the Samyuktha Socialist Parties). T K Narayana Pillai was elected party leader and became the Chief Minister of the new Government, but the greater portion of the Nair community followed P T Pillai into the opposition Socialists. With the new Chief Minister, the weight shifted in favour of the Christians, and although Kesavan remained within the Congress, the Ezhavas — threatened by Christian dominance — increasingly shifted their support from the Congress to the Communist Party. The Muslims, totally alienated from the Congress, rallied around a reactivated Muslim League. Thus, in the first year of independence the pattern of political instability in Kerala was set. Shifting coalitions of caste and community, both within and among the various parties, have defeated each successive Government.

In 1949, Cochin was merged with Travancore to form the State of Travancore-Cochin. Narayana Pillai retained control of the new Assembly, but Cogress strength was reduced to 44 of 108 seats. With charges of corruption and pressure from the Hindu and Muslim factions within the Congress, Narayana Pillai was forced to step down in 1950. A new "caretaker" Government was formed by C Kesavan, continuing in office until the 1951-52 General Elections. If the elections gave the Congress a weak victory, securing again only 44 seats, they strengthened the position of the Christian community within the party. With the support of the dissident Travancore Tamil Nad Congress (which in 1956 won its demand for the inclusion of the southern district of Travancore in Tamil-speaking Madras State), the Congress secured the necessary majority to form a Government, and in March 1952, A J John became Chief Minister. The Ministry, while now commanding a narrow majority, lived by the grace of the Tamil community; and in September 1953, the TTNC withdrew its support from the John Ministry, and a vote of no-confidence brought the Government down, The Assembly was dissolved, and the Ministry continued as "caretaker" until new elections could be held in February 1954.

Role of Tamil Nadars

The 1954 elections in Travancore-Cochin brought a political polarization which was to severely test the prestige of the ruling Congress Party. The Praja Socialist Party, supported almost entirely by the Nair community and led by P T Pillai, allied itself with the Communist-backed United Front of Leftists, predominantly Ezhava. The electoral arrangement consisted of an agreement among the parties not to contest against each other, thus allowing for straight contests between the Congress on one hand and the UFL or PSP on the other. With the Nairs and Ezhavas joining together in opposition to the Christians, the campaign centred primarily on the communal relationship between the Catholic Church and the Congress Party. A K Gopalan Nair, leader of the CPI in Parliament, together with a colleague, wrote an open letter to Nehru complaining about the role of the Church in the elections. "Almost all churches in Travancore-Cochin", they wrote, "have been turned into election offices for the Congress Party." [2]

Congress won 45 of the Assembly's 118 seats, returning victorious candidates from the Christian constituencies of Kottayam, Ernakulam, and Trichur districts. The PSP secured 19 seats, mainly in the Nair-dominant constituencies of Trivandrum and southern Quilon. The United Front of Leftists won a total of 40 seats, 23 of which went to the communists. The greatest concentration of their support rested in the heavily Ezhava regions of Quilon and central Travancore-Cochin.

Without the support of the Tamils, the Congress was unable to form a Government, and the PSP, emphasizing that the electoral arrangement with the UFL in no way bound them, began to put out feelers for a possible coalition Ministry with either the Congress or the UFL. P T Pillai expressed support for a Leftist coalition, but the National Executive of the PSP was wholely opposed to cooperation with the Communists. Further, the Nairs themselves were fearful of political dependence upon the Ezhava. When the UFL offered to form a Government, the Congress immediately responded with support from the outside for a PSP Ministry. Pillai agreed to form a Government, and in March 1954, the PSP, with only 19 members in the Assembly, took control of Travancore-Cochin.

The PSP Government, however, was to last only nine months, defeated in a vote of no-confidence moved by the TTNC. The Tamil's antagonism toward the Government reflected more the traditional enmity between the economically depressed Tamil Nadars and the landowning Nairs than it did the Tamil's aspiration for union with Madras State. Indeed, it was the support of the TTNC which enabled the creation of another short-lived Congress Ministry. Charges of corruption and nepotism were soon levelled at the new Ministry, however, and, with the defection of a "rebel" contingent from the Congress, the Government fell after one year. Last minute efforts were made by Pillai to form another PSP Ministry with Congress support but political instability had reached such a crisis that the Governor was forced to advise the President of the conditions in Kerala. In March 1956, the President, under Article 256 of the Constitution, assumed the powers and functions of the Government of Travancore-Cochin, abolishing the Assembly until the General Elections of 1957 would give it a new lease on life.

States Reorganisation Helped Communists

Before the elections, however, in 1956, the States of India were reorganized on a linguistic basis. The Malayalam district of Malabar in Madras was added to the State of Travancore-Cochin to form the new State of Kerala, and the Tamil-speaking regions of southern Travancore were merged with Madras. With the heavy concentrations of Muslims in northern Malabar and the Ezhava strength in the southern portions of the district, particularly in Palghat, the acquisition of Malabar deeply affected the communal balance in Kerala, with grave consequences for the emerging pattern of political power.

In the campaign for the 1957 elections, the All-Kerala Catholic Christian Convention called on all Catholics to oppose Communist candidates and to support the Congress. Kottayam District went heavily for the Congress, as did the predominantly Christian constituencies of Ernakulam, but the force of the Church brought victory to only 43 candidates for the Assembly's 125 seats. The position of the Christian community within the party, however, was seen in that of the 43 Congress victors, 23 were Christian. The Nair-supported PSP fared even worse, securing only 9 seats. The strength of the Communist Party rested with the Ezhavas and the Scheduled Castes, and to a lesser extent, with the Muslim labourers of Kozhikode and Palghat. The addition of the Malabar constituencies tipped the scales toward the CPI. Securing 60 seats, the Communist Party, together with 5 Communist-supported independents, held a clear majority and was called upon to form a Government. Party chief E M S Namboodiripad became the Chief Minister.

Legislation under the new Government soon heightened old communal rivalries. The agrarian reform bills were attacked bitterly by the landowning elements of the Christian and Nair communities, but mass agitation against the Government was aroused by the Education Bill. The Act sought to attain greater Government control over the 7,000 private schools receiving State assistance. Most of the schools lay in the hands of the Christians who saw the bill as an attempt to take over their schools and to dictate the content of the teaching programme. Particularly at issue was Clause 11, which stipulated that teachers be appointed from approved lists and that in the appointment of teachers, communal representation would be observed. The provision would reserve 50 per cent of teaching positions to "backward" classes, that is, the Ezhavas — the Communists' major supporters.

The Communists appealed to the poverty-striken Muslims of Kozhikode District, the Muslim League Stronghold, emphasizing that the Muslim community would benefit through the reserved seats. The League, however, feared Communist encroachments among its community members and joined hands with the Christians against the Government. The Nairs resentful of the Christians' virtual monopoly of education and fearful of their ascendency in the Congress Party, realized nevertheless that the Christians' loss at the hands of the Education Bill would be of no gain to the Nairs, for their community association, the Nair Service Society, too maintained private schools.

"Liberation" Struggle

Many members of the so-called "backward" communities, having had the benefits of special reservation in government for more than 60 years, were often far more prosperous than some of their "advanced" neighbours. To remedy this anomaly and placate the growing opposition to the Education Bill, the Administrative Reforms Committee of the Communist Ministry suggested that a new definition of "backwardness" be determined on an economic rather than a caste basis. Under pressure from the Ezhavas, however, the recommendation was withdrawn. This action so antagonized the Christians, Nairs, and Muslims that they announced "direct action" against the Government. Mannath Padmanabhan, leader of the Nair Service Society, and leaders of the Catholic clergy, together with the Muslims, joined in the formation of the Vimochana Samara Samiti for the "Liberation Struggle" to free Kerala from Communist rule.

In the six-week agitation by the Samiti and the allied Anti-Communist Front of Father Vadakkan, more than 80,000 arrests were made, some 10,000 were jailed, and 15 people were shot dead in police firings. On July 31, 1959, the President of India, on the advice of the Cabinet, intervened in Kerala and imposed President's Rule after twenty-eight months of Communist control.

The united front which had ousted the CPI from power now provided the base for an electoral alliance and the establishment of a coalition Ministry of the Congress, the PSP, and the Muslim League. In the elections of 1960, following five months of President's Rule, the Alliance secured 94 of the 125 seats. The Communists won 26. With victory, however, the Congress would have nothing to do with the "communal" Muslim League, and the PSP, which had been in alliance with the League since 1954, refused to be party to a coalition which excluded the Muslims. The impasse was resolved through the intervention of the General Secretary of the League, who urged the PSP to form a coalition with the Congress, assuring "the fullest co-operation and support of the Muslim League to a cabinet that might thus be formed". So it was that another Government in Kerala was formed, with P T Pillai as Chief Minister for the third time. The Speakership went to the League.

Within the Congress Party itself communal dissension was crystalizing around the Christian Home Minister, P T Chacko, and the Ezhava Deputy Chief Minister, R Sankar. Sankar aimed the guns of the Congress organization at the open communalism of the PSP and the Muslim League. Chacko, as the leader of the Legislative party, stood by the Alliance. Under pressures from the All-India Congress Committee in New Delhi, Chacko gave away, and the Muslim League was pushed out of the Alliance. New Delhi then reached down to "promote" P T Pillai out of Kerala politics and into the Governorship of Punjab. Sankar stepped in as the Chief Minister of an all Congress Ministry.

The Split in Congress

With the departure of Pillai from the arena of politics in Kerala, the Nair community felt its interests threatened by the ascendency of the Ezhavas in the Cogress. Chacko himself was none too happy about the prospects of the Ezhavas supplanting Christian influence in the Congress and became increasingly antagonistic toward the Chief Minister. With the Government's attempt to evict Catholic peasants from certain temple lands, Chacko threw his support to the peasants in opposition to the Govern-

ment of which he was Home Minister. With the backing of the AICC in New Delhi, Sankar forced Chacko's resignation.

From within the Congress, Chacko attacked the privileged position of the Ezhavas as a "backward" class and accused Sankar of persecuting the Church. Chacko found a ready ally in the leader of the Nair Service Society, Mannath Padmanabhan. The Muslim League, long on the firing line of Sankar, could hardly be considered unsympathetic. Thus, in opposition to the Sankar Ministry, there again emerged the same communal contingent which had brought the collapse of the Communist Ministry four years before. It represented an alignment of the Nairs, Christians, and Muslims, against the Ezhavas. This time, however, the Ezhavas were in the Congress.

With the death of Chacko, Sankar purged the Kerala Congress Committee of the Chacko supporters, for the most part Christians. The issue was forced, and under the leadership of K M George, 15 Congress Assembly members withdrew their support from the Government. Under charges of corruption, totally discredited in the eyes of the people, in September 1964, the Sankar Government fell. Governor's Rule was for the third time imposed, perhaps this time to the relief of a politically weary population.

Kamaraj's Miscalculation

On the defeat of the Ministry, the Congress rebels formed the Kerala Congress as an opposition party. The Church, however, was reluctant to oppose the Congress. Many Christians continued to support the Congress, and the dissidents informally put out feelers for negotiations. The price for their support to Congress would be the ouster of Sankar from party leadership. Although the people had lost confidence in the Sankar Government, the President of the All-India Congress Committee, K Kamaraj, backed the former Chief Minister and said that no "deal" would be made with the Nair and Christian communalists who had brought the Congress Government down.

Kamaraj's unwillingness to compromise with the rebels only strengthened the fears that the Congress President was attempting to engineer a shift in the social base of the Congress Party in Kerala from the Christians to the numerically more powerful Ezhava community. Kamaraj was in an awkward position, for if he compromised with the rebels, he would immediately loose the Ezhava support to the Communists. His refusal to compromise, however, would inevitably mean the loss of support from sections of the Christians and Nair communities which had traditionally supported the Congress. Kamaraj, in a major political defeat was caught on both horns of the dilemma, for he underestimated the strength of the rebels and overcalculated the power of Sankar in the Ezhava community.

Congress Defeat

The stronghold of the rebel Kerala Congress was in the districts of Kottayam, Ernakulam, and Alleppey — the areas which had formerly been the bastion of Congress strength. Kamaraj's attempt to salvage support of the Christian community by setting up Chacko's brother as a Congress candidate ended in defeat at the hands of the rebels. The Church, while remaining officially neutral and only calling upon its members to support democratic forces, had given informal sanction to the Kerala Congress dissidents. The Christian constituencies which had before always gone Congress now voted solidly for the rebels. In Kottayam District itself, of 14 seats the Congress secured only 1. The defeat of the Congress came at the hand of two inter-locking, but mutually antagonistic, alliances. Mannath Padmanabhan solidly supported the Kerala Congress, drawing a large portion of the Nair community into the rebel fold. The Kerala Congress had also entered into an electoral understanding with the Nair-backed SSP and the Muslim League, both of which had separately made arragements with the Left Communists.

While the ideological and personality dispute within the Communist Party of India had ended in a formal split into the right and left factions, the Moscow-recognized CPI or Right Communists in Kerala remained but a handfull of leaders without followers. E M S Namboodiripad, the former Chief Minister of Kerala, was the leader of the Left faction and commanded the support of the people. Despite the rise of Sankar in the Congress, the greater portion of the Ezhava community, as before, remained solidly united behind Communist Party. Indeed, in the very constituency Sankar had cultivated, Attingal, the Congress leader was defeated by his Left Communist opponent. Although imprisoned throughout the campaign, Sankar's opponent, an Ezhava himself, commanded the support of the dominant Ezhava community.

Thus, in the elections as the communities polarized, Congress was squeezed out. It was not so much a debacle as a gross miscalculation. Had the two parties, the Congress and the Kerala Congress, been able to unite, it would have received approximately 45% of the vote — more than in any previous election since 1954. Further, the combined vote of the Left and Right CPI was less than 28 per cent — a decline of nearly 10 per cent since 1960. Per centages must be taken cautiously as they must be matched with the number of seats contested. In any case, however, an actual decline in support for the Communists was recorded — a decline represented perhaps in the Congress' partial success in weaning away sections of the Ezhava community from the Communists.

The campaign was in large part fought by the Congress and the Communists to secure the affections of the low caste Ezhavas. The failure of any party to secure a majority, however, only emphasizes the fact that while the politics of Kerala may be caste-bound, no party can rule with the support of one community alone. That the Congress' has eroded the political solidarity of the Ezhavas may reflect the initial stages of differentiation within the community. Under the impact of economic change, as each community becomes increasingly heterogeneous, so their political interests will begin to differentiate, and as they do so, the polarity between communities in terms of party support may be expected to decline. Until then, perhaps the only alternative to prolonged chaos was expressed on the anonymous posters seen near Trivandrum's secretariat buildings: "We want President's Rule".

A Trade Theory for Developing Countries

Staffan Burenstan Linder

The trade policies of developing countries and the thinking which has inspired these policies differ greatly from conventional trade theory and policy. Although the explanation of this phenomenon may simply be that the policies actually pursued are misguided, this paper will instead suggest a reformulation of trade theory.

On the basis of this alternative theory it could be concluded that conventional theory is inapplicable and that present policies, although probably sub-optimal in many respects cannot be evaluated on the basis of conventional theory.

For an Indian reader, critical as he is likely to have been for a long time of conventional trade theory, this approach will probably not appear startling. However, what does not seem to have been sufficiently well done is a replacement of the conventional theory with a coherent alternative demonstrating clearly why and how conventional doctrines are not applicable.

The present paper will be directed towards this task of reconstruction.

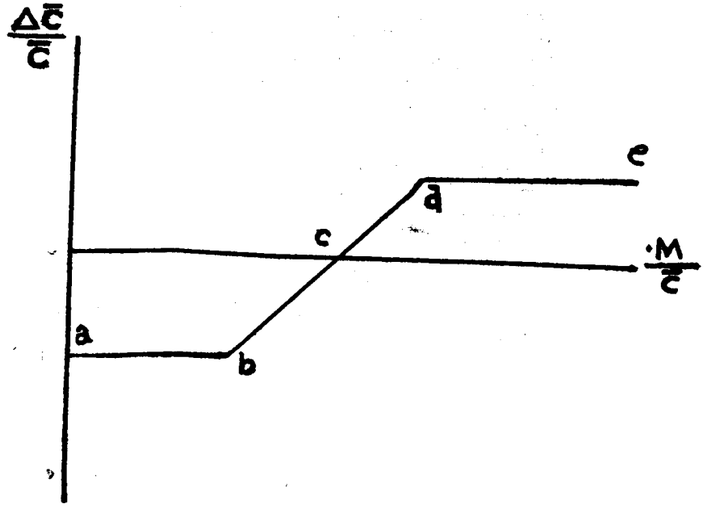
[This paper contains ideas put forward in a book soon to be published under the title "Trade and Trade Policy for Development." The approach also formed the analytical background to a report written for UNCTAD under the title "The Significance of GATT for Underdeveloped Countries".]

FIRST of all, it must be observed that the group of underdeveloped countries is so heterogenous that no single theory can be formulated which offers adequate insights into the problems of all these countries. The particular theory to be advanced here is aimed at the situation of developing countries or regions, i e, areas which have entered into a development phase holding out real promise of propelling them into a process of self-sustained growth. For these countries or regions a distinction must first be made between trade with advanced countries and with other developing countries.

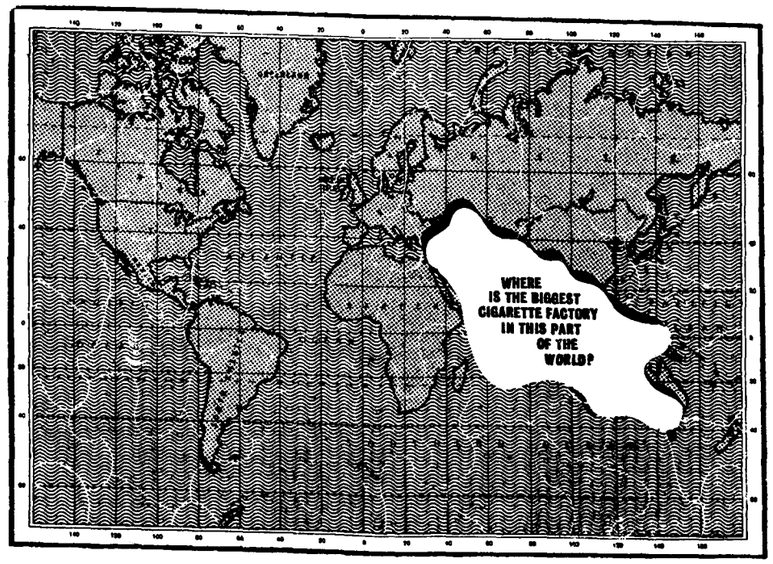
Trade with Advanced Countries

The Import Minimum

As to the trade with advanced countries our starting-point will be the observation that certain imports into the developing countries fulfil a special function. They are what will be called "input imports" which cannot be produced domestically and which are required by the developing country in order to utilize the existing productive capacity and the growth potential. The input imports consist of *operation imports*, i e, raw materials not existing at home and spare parts to imported machinery; of *reinvestment imports*, i e, various capital goods needed to replace the third kind of input imports, or *expansion imports*, i e, imports of various investment goods. To the extent that a sufficient amount of operation imports cannot be secured the existing productive capacity cannot be fully utilized. To the extent that enough reinvestment and expansion imports (which we can lump together into *investment imports)* cannot be obtained, there will be a frustration of the growth potential. This frustration will be manifested in a failure to realize the savings which would be forthcoming if there were opportunities to import investment imports. If there is even a lack of reinvestment imports, the absolute stock of capital goods will decline.



The relationships between input imports and domestic production and capacity can perhaps best be set out in terms of a simple diagram. In Figure 1 the rate of growth of capacity $\frac{\Delta \bar{C}}{\bar{C}}$ is measured on the vertical axis.



Input imports as a fraction of total capacity $\frac{M}{\bar{C}}$ are measured along the horizontal axis. In this diagram a function can be drawn to express the role of input imports.

If there are input imports just enough to operate the existing capacity and to maintain its size, i e, if there are input imports just enough to cover the operation and reinvestment purposes, the rate of growth will be zero. To the extent that additional amounts of input imports can be obtained for expansion purposes, there will be a positive rate of growth. When the amount of expansion imports is so big that all planned savings in the economy can be realized, the function will level off. From here on the rate of growth can increase only by ordinary capital imports which serve the function of adding to domestic factors, rather than complementing them. Whether or not the maximum rate of growth in capacity that can be achieved in a particular country or region reaches the rate which could be referred to as the "minimum socially acceptable rate of growth" is uncertain. Our diagram has, of course, nothing to say on this point.

If, on the other hand, the actual amount of input imports is so small that the full need of reinvestment imports cannot be secured, there will be

Figure 1

IN INDIA ...AND IT'S VAZIR SULTAN'S

The biggest cigarette factory in South-East Asia. Owned by The Vazir Sultan Tobacco Company Limited. In Hyderabad, Andhra Pradesh, India. One of the world's finest, with high-speed automatic machines, the most skilled experts and quality control scientists. Backed by modern cigarette-making research. Which famous cigarette does this factory produce? Charminar.

Charminar's rich flavour and unique taste make it India's most popular cigarette. One out of every four cigarettes smoked is a Charminar. It works out to nearly 900 million Charminars smoked every month! To meet this demand requires a fantastic rate of production...over 20,000 cigarettes a minute. Only a world-size company could do it. In India, The Vazir Sultan Tobacco Company Limited does it every day!

There's nothing like Charminar—India's greatest cigarette!

CAS/VS-5

a negative rate of growth. This negative rate will reach its maximum level when there are no reinvestment imports at all. Further reductions in input imports would mean a curtailment of operation imports and would affect capacity use rather than capacity size.

On the basis of this reasoning the function a b c d e in Figure 1 can be drawn. It should be noted that on the horizontal axis input imports have been measured as a fraction of total capacity so that any change in capacity would not immediately mean a shift in the function. It is, of course, obvious, however, that even a function of the type in Figure 1 may change through time. It will be affected by such things as changes in the propensity to save, changes in the relative need for input imports, and changes in the capacity to produce domestically goods which in former periods have qualified as input imports. Changes of this latter kind are of particular interest because they are necessary for the country in order to change the role of trade as depicted in the Figure over to a role which would more resemble what it, on the basis of conventional theory, is thought to be in advanced countries.

However, it is obvious, though not underlined in conventional theory, that the imports of advanced countries, too, consist to some extent of what could very well be referred to as input imports. The gains from trade for countries such as the U K and Japan are regularly said to be "extraordinarily great". This is only because their imports are made up to an unusual extent of goods which, if they could not be imported, would lead to difficulties in maintaining production.

Nevertheless, the neoclassical theory is applicable to the conditions of countries such as the U K and Japan. Thus, the fact itself that the developing countries need certain imports, which we have called input imports, is not of any definite importance for the relevance of neoclassical trade theory. However, if the import minimum were combined with an *export maximum* and the export maximum were, in fact smaller than the import minimum, the consequences would be far-reaching. Then it would be impossible to transform domestic factors into certain strategic inputs not only through domestic production but also through trade.

The Export Maximum and the Foreign Exchange Gap

According to the conventional theory the existence of an export maximum is an impossibility. A simple application of the comparative cost doctrine tells us that a country can always export goods in the production of which it is *relatively* efficient in order to import products in the production of which it is relatively inefficient, i e, in this case the input imports. However, in this doctrine although it has almost achieved the status of a truism there is a serious flaw. The comparative cost theory is based on the implicit assumption that in the production of the goods in which it has a comparative advantage a country is sufficiently efficient to be able to pay the factors of production involved in the export activities a minimum reward, i e, a reward above subsistence incomes. In advanced countries this assumption can very well be made; but it should of course be specified. As long as appropriate expenditure policies are being pursued, an advanced country can certainly export goods in the production of which it has a comparative advantage. Thus, in spite of the failure to specify the assumptions of the comparative cost doctrine, it remains applicable to advanced countries; and the import minimum which for countries like the U K and Japan is conspicuous, does not, since it can be covered, call for any reformulation of the theory. However, in the case of developing countries the assumption concerning minimum factor rewards must not only be made explicit; it must also be recognized that it might very well not be fulfilled in their trade with advanced countries.

The reason why the developing countries may encounter an export maximum is that they may be sufficiently efficient only in the production of various primary commodities, the foreign demand for which is too small and too inelastic to allow an expansion of exports beyond the need for imports. As regards manufactures, there are great differences in demand and production structures between the advanced and the developing countries. Those manufactures which are currently produced in the developing countries, and in the production of which the developing countries thus must be sufficiently efficient to pay more than minimum factor rewards, *are not demanded in advanced countries*. As to the manufactures that *are* demanded in advanced countries, they are not currently produced in the developing countries. And due to the difficulties the developing countries have in meeting the high requirements, technically and commercially, production of such goods cannot be taken up at an efficiency sufficient to cover minimum factor rewards.

If the export maximum is smaller than the import minimum, a developing country can be said to face an acute foreign exchange gap. This gap, it should be noted, exists in spite of optimum expenditure policies. This should be emphasized, at the same time as it must be stressed that the foreign exchange difficulties of a developing country may self-evidently be much worse than they have to be, i e, if the country pursues inept expenditure policies.

The foreign exchange gap need not be reflected in an actual balance of payments deficit. It will be reflected in such a deficit only if the developing country can find means of financing the deficit. Otherwise, and this is the interesting feature of the trade situation of developing countries, an *internal disequilibrium will be substituted for the external imbalance.* The only third alternative would be that the developing country finds ways of closing the foreign exchange gap through recourse to trade policy measures of a kind which, on the basis of conventional trade theory, would be considered highly unorthodox.

Trade with Other Developing Areas

However, as has already been indicated, the foreign exchange gap analysis is intended to cover only the trade with advanced countries. What concerns trade with other developing countries, it seems as if it could be appropriate to make use of conventional trade theory. In this trade there are no particular import minima or export maxima. Instead, trade serves the role of permitting a more efficient allocation of resources and of enabling the utilization of economies of scale. However, the application of conventional theory will lead to certain unexpected results when juxtaposed with the theory of trade with advanced countries. This is so since, in order to make use of the advantages of trade with other developing countries, a developing country must pursue discriminatory policies against the advanced countries. If the unorthodox policies at which has been hinted already as recommendable to

direct trade with advanced countries have to be applied against other developing countries also, trade with those countries would probably be reduced to a trickle.

The discriminatory policies mean that developing countries should, in an optimum solution, pursue their trade within a single large customs union. Interestingly enough, it is not only trade creation within such a union which is to be welcomed. This we should expect on the basis of the neo-classical trade theory use of which is presently made. But also trade diversion away from advanced countries would be beneficial since it would permit a greater concentration of the actual imports from advanced countries to the particular input import category.

CONCLUSIONS

At this stage the theoretical implications of the foreign exchange gap analysis might be summarized as follows.

(i) *The gains from trade are of a different nature.* A developing country trades to exert a multiplicative effect on its capacity use and growth, rather than to improve the allocation of the existing, fully employed resources in the marginalist sense. For this reason, trade could be characterized as a *super-engine* of growth, rather than as a mere engine of growth as it has often been described. However, to the extent that a developing country does not succeed in meeting its import requirements and thus faces an acute foreign exchange gap, the extremely attractive gains from trade tend to become exasperating since they cannot be fully realized. Trade is then a *potential* super-engine of growth. Trade with other developing countries takes place, however, to improve allocation.

(ii) The possibility of an export maximum in relation to an import minimum means that the *comparative cost doctrine has limited validity.* A developing country need not be able to export the goods in which it is most competitive, since there might be no demand for these products in advanced countries. And, as regards products for which there is a foreign demand, the country need not be able to export enough of those goods in the production of which it has what the conventional theory would refer to as a comparative advantage, since productivity is not high enough to support the factors involved in their production.

(iii) *The existing balance of payments theory cannot be applied* if there is a foreign exchange gap. Contrary to the situation in conventional analysis, internal and external equilibrium cannot be established simultaneously. Whatever the expenditure policies, imports cannot be reduced below a certain limit without causing internal instead of external disequilibrium, and exports cannot be stimulated as in advanced countries. Thus, a foreign exchange gap reflected in an actual balance of payments deficit does not imply over-absorption of goods and services in the ordinary sense. No matter how much absorption is reduced, the deficit could not be removed without substituting internal disequilibrium for external.

Conventional balance of payments adjustment measures are applicable, however, in the sense that suboptimal expenditure policies would worsen the situation.

(iv) *The usual kind of savings-investment equation in Keynesian models and in growth models must be modified.* As long as there is an acute foreign exchange gap, it is inappropriate to put $I = S = sY$, even though this is an *ex-post* identity. Instead, one should work with an equality stating that investments are limited by the availability of investment imports.

(v) In countries with an acute foreign exchange gap *capital imports are of an unconventional nature* since they do not supplement scarce domestic resources. Instead, they have the effect of increasing input imports so that the investment constraint can be lifted. Capital imports beyond the closing of the foreign exchange gap serve the usual function.

(vi) If external and internal equilibrium cannot be achieved simultaneously, *the basic postulate of the pure theory of international trade is not fulfilled.* The usual division of trade theory into balance of payments theory and pure theory cannot be made. Balance of payments considerations must be brought into the analysis of structure and welfare. This means that *the whole edifice of commercial policy conclusions built within pure theory is inapplicable* to trade relationships with advanced countries. Also, the trade policy towards other developing countries will, though based on conventional theory, show distinctive differences from the recommendations usually deduced from that theory.

British Books for the World

THE Book Development Council, an independent organization to promote the export of books, was launched in London on April 9. Its chairman is Patrick Gordon Walker, former British Foreign Secretary. Part of the Council's work would be research into the developing book needs of selected areas of the world. The Council would assist at least one bookshop in every major city in the world to carry a representative selection of current and standard British books. It would also carry out curriculum research in consultation with authorities on the spot.

"In the present drive for exports, there can be no item more important than that of books", according to Gordon Walker. "They provide an essential contribution to international understanding which cannot be overestimated."

Nearly every British publisher of note has joined the Council, which has been described as a "British enterprise for international co-operation". It will try to make available overseas the skills of British publishing wherever they can be used — particularly in the developing countries.

Exhibitions, trade fairs and special displays of books will be arranged in co-operation with the British Council and the Publishers Association. Among the short-term objectives of the Book Development Council are coupon schemes, correspondence courses, low-priced book schemes, co-operative mailing facilities, and improved bibliographical services for overseas. Booksellers from overseas will be invited to Britain for training, and British booksellers will go abroad to study the needs of other countries.

The Marketable Surplus Function for a Subsistence Crop

Comments

I—C H Hanumantha Rao

IN his study of marketable surplus for a single subsistence crop ("The Marketable Surplus Function for a Subsistence Crop", *The Economic Weekly*, Annual Number, February 1965), Raj Krishna found the marketable surplus function to be linear in the case of majority of the samples analysed. These results would imply that "the marginal propensity to sell out of the output of a subsistence crop is constant over the wide range of output above the minimum subsistence output". From these findings relating to a single subsistence crop, Raj Krishna proceeds to question some of the widely held beliefs regarding the consumption behavious of poor farmers as well as the affect of farm size structure on the marketable surplus. He says :

> "These findings should weaken the widely held belief that output increases on relatively small farms are always likely to be swallowed up in consumption whereas those on large farms are likely to flow into the market. The truth seems to be that in many areas the small as well as the large producers producing more than a minimum output sell (consume) the same additional quantity out of every additional unit of output . . . it follows that the usual discussions about changes in the farm size structure having a favourable or unfavourable effect on the marketable surplus of a subsistence crop have a lean empirical basis . . . The overall policy implication of the analysis is that it is best for Governments to concentrate on inducing increases in farm output without any special discrimination in favour of small or large farms."

The study of a single subsistence crop does not warrant the above inferences regarding the consumption behaviour of the farmers and the policy implications regarding the influence of farm size structure on the marketable surplus. These conclusions can be justified only if the nature of the marketable surplus function for total output of the farmer consisting of all crops can be shown to be similar to that for a single subsistence crop. That these two many turn out to be dissimilar is supported by a number of considerations.

If the small farmers allocate a relatively larger proportion of farm area to food crops other than the crop under study and (or) if a larger proportion of output of these crops is consumed by the small farmers as compared to the large farmers, then the marketable surplus function for subsistence crops would exhibit a non-linear relationship as the amount sold would increase with every unit increase in the output of food crops. This is quite conceivable as small farmers are known to grow and consume relatively more of inferior cereals whereas Raj Krishna's study relates only to a single superior cereal, viz, wheat or rice.

Marketable surplus of small farmers is a function not merely of output on the farm but also of other kind receipts. Many small farmers supplement their incomes in a substantial way through kind receipts by working on large farms. Since such kind receipts as a proportion to total output decline with the increase in income, the marginal propensity to sell would show an increase with the increase in output, if such kind payments are included in their total output. Incidentally, by treating kind payments by the large farmers (which are in fact the kind receipts of the small farmers) as marketable surplus, Raj Krishna has overestimated the elasticities of marketable surplus because the number of hired labourers and consequently the amount of kind payments increase steeply with the increase in farm size. These elasticities may represent the behaviour of 'potential' surpluses when the wages will have been completely monetized. They do not reveal the marketed supply behaviour for a partially monetized Stage.

The usual hypotheses regarding the consumption behaviour of small versus large farmers concern the per capita changes in consumption in response to the changes in per capita income. Raj Krishna could not hold the family size factor constant. According to him "in the economics of subsistence farming, the peasants determine the size of output of the subsistence crop itself keeping their family needs in view. The output variable itself reflects family size." This explains why in most of his functions, family size when included as another independent variable turned out to be non-significant. The problem of inter-collinearity between independent variables signifies only the limitation of the particular method followed. Since this method fails to eliminate the effect of the changes in family size, these findings can not disprove the usual hypotheses relating to the behaviour of marketable surplus with the changing per capita output.

If the proportion of farm area allocated to food crops declines with the increase in farm size or farm income, that for non-food crops increasing correspondingly, as is often found, then the total marketable surplus function (food as well as non-food crops) would show a distinct non-linear relationship because non-food crops are almost entirely marketed. It does not follow, therefore, that the changes in the size structure of holdings cannot have any effect on the marketable surplus.

A more equitable structure of land holdings may, other things remaining the same, lead to a larger allocation of area for subsistence crops for the purposes of consumption and to a corresponding decline in the overall marketable surplus. Of course, this does not necessarily imply that equitable distribution is either desirable or undesirable or that the marketable surplus cannot be increased through any other method, e g, by increasing productivity, whatever be the structure of holdings. What is suggested here is that the usual hypothesis regarding the effect of size structure of holdings on the marketable surplus is not disproved by Raj Krishna's findings from the study of a single subsistence crop.

In the case of certain samples Raj Krishna found marketable surplus be-

having in a non-linear way. These, according to him, belong either to extremely poor or extremely wealthy villages. One wonders whether in the case of such samples the subsistence crop under study is not a predominant crop or whether some of these samples are not characterized by mono-culture. In cases where the above suspicion turns out to be true the output of the subsistence crop under study would be a proxy for total output and the non-linear behaviour can be explained in terms of the usual income hypothesis. Raj Krishna suggests that "after a certain level of income has been reached the cultivation of the subsistence crop becomes highly commercial and the marginal propensity to sell rises with output." *A priori* there is no reason to believe that the subsistence crop under study should alone become highly commercial after a certain level of income has been reached. Any other crop could become commercial, depending on the relative profitability of crops. The fact that the subsistence crop under study is found to be commercial indicates that it may be a predominant crop owing presumably to its high profitability and the non-linear behaviour of marketable surplus can be explained by the variations in income without bringing in the mean income levels of samples.

For the so-called "linear zone", the hypothesis of constant marginal propensity to consume (or sell) would be meaningful only if it can be shown that the crop under study is the only crop grown in these areas or is at least the predominant crop. Alternatively, it has to be shown that the crops other than the one under study exhibit a similar behaviour in regard to their marketable surplus. In the absence of such evidence the hypothesis of "constant marginal propensity to consume (sell) over a wide range of income for a single subsistence crop" cannot have any analytical or policy significance. In any case, one must justify such a hypothesis on theoretical grounds as well, if one is serious about its implications. Conclusions drawn from empirical findings having a lean theoretical basis could be as meaningless as those flowing from *a priori* notions lacking in factual evidence.

II—I N Krishnaji

RAJ Krishna's assertion that "the truth seems to be that in many areas the small as well as the large producers producing more than a minimum output sell the same additional quantity out of every additional unit of output" and "thus in an important sense the market supply behaviour of small and large farmers is similar in these areas" is based on the formulation of the relationship

(A) $M = a + b\,Q$,

where 'a' and 'b' are constants independent of the size of output Q, and M denotes the marketed surplus.

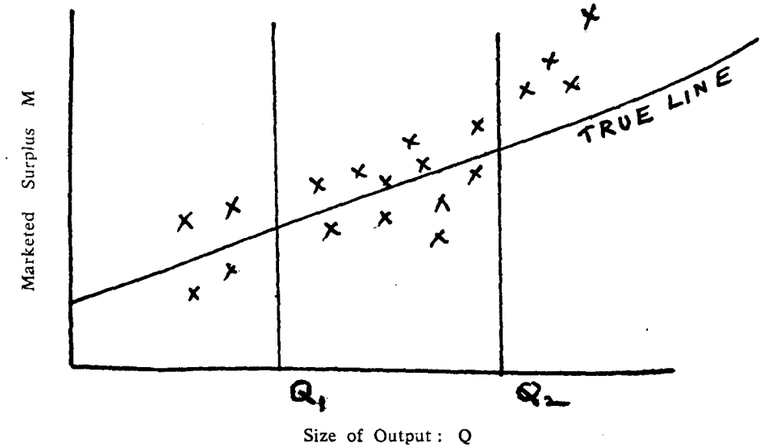
Tests for departure from linearity in certain samples are conducted to substantiate this assertion.

[I] The specification of the above relationship corresponding to a sample of (say) n farms is

(B) $M_i = a + b\,Q_i + e_i$, $i = 1, 2 \ldots n$

with the usual assumptions about the residuals e_i. While one could always obtain a least squares estimate of 'b' whatever the nature of sampling might be, the above specification will lead to a valid estimate of the error variance and hence valid tests of significance only if the sample is random and not purposive. This is because, in a purposive sample the assumptions about e_i are grossly violated. In fact, given the truth of the relationship (A) and given a sample of observations it is possible to so construct purposive sub samples that the residuals are systematically positive or negative with a reasonable degree of certainty. This is true irrespective of whether the sample is stratified according to the size of output or not. The figure illustrates this point.

Since a purposive sample is merely a subset of the points shown in the scatter, it is obvious that some choices introduce a bias. If, for example, one wants to include large farmers, largeness being defined by the line at Q_2, the only points available are those above the true regression and such an inclusion will overestimate 'b'. Thus it is difficult even to say in which direction the bias in estimation would lie, if sampling is purposive. Again, a purposive sample might exclude certain classes of output altogether.



It would, of course, be different, if the entire population of M's is stratified by the size of output Q, and samples are drawn *at random* within the strata. The assumptions of the specification (B) would then hold, but it would, then, be proper to call it a stratified sample rather than a purposive sample. Since it is not clear from Raj Krishna's paper whether his purposive samples are stratified random samples or as the name connotes merely a collection of observations chosen at will from a previously chosen sample or a post-stratified sub-sample, it is very difficult to interpret his results satisfactorily. So much for estimates based on purposive samples, when linearity is assumed.

[II] The objection to the use of purposive samples in testing departure from linearity is more serious because it is possible to choose the purposive samples to substantiate the linearity hypothesis.

In conclusion, Raj Krishna's results would be more meaningful if the following two questions are answered more clearly.

(a) How are the 'big', 'medium' and 'small' farmers defined?

(b) What is the precise procedure of sampling?

The New Village—I

V Nath

During the last few years attention has begun to be directed towards differential progress in agriculture in different parts of the country. It is becoming increasingly clear that while in some areas agriculture has begun to display considerable dynamism, its progress in other areas is still very slow. Identification of the factors — physical, economic and social — which contribute to these differences in progress is important for understanding the dynamics of agricultural progress.

Case studies of villages of especially rapid or slow progress is a fruitful method of identifying these factors because the sharp contrasts between the two situations bring out these factors prominently. Moreover the case study method by describing change in different aspects of the economy and social life of the selected village makes it possible to bring out the inter-relationship between these.

This study of a village in Central Punjab, an area which has experienced rapid technological change in agriculture and economic progress, has been undertaken with these objects in view.

It describes the various changes in agriculture experienced by the village, the inter-action between these, the shape of the agricultural enterprise and of the village after the improved practices advocated by extension workers have been largely adopted and, finally, the problems which agricultural progress and relative prosperity created.

Although the study is focussed on change in agriculture, progress in other directions — health, education, transport and communications and levels of living — has also been described.

A major conclusion emerging from the study is that change in agriculture is part of a larger process of social and economic change, as a result of which the complexion of the village and the character of village life are changing rapidly and a new village is emerging. Hence the main heading.

It is hoped that this study will be followed by case studies of slow progress in agriculture in north India and studies of both slow and rapid progress in other parts of the country so that the dynamics of agricultural progress are more adequately understood.

[This study will be completed in three other instalments to appear consecutively which will deal with "technological change in agriculture", "the impact of change" and "factors behind technological change".

The views expressed are the author's and he alone is responsible for them.]

THIS study is based on a three-weeks' stay in 1963 in village Jitpur[1] of Ludhiana district of Central Punjab. This is a comparatively large, multi-caste, village with a population of about 1850. A village of this size was selected in order to observe the effects of change in agriculture and of economic progress on cultivators as well as non-cultivators and especially to see how far the latter had contributed to these changes and had benefited from them.

A major part of the study consisted of discussions with individuals and groups of cultivators about agricultural techniques and seeing the improved practices and devices at work. Several group discussions, in which anybody from the village could participate were held. In addition individual interviews were held with the Sarpanch of the village panchayat, the Chairman and the Secretary of the service co-operative, the Manager of the seed and fertiliser depot, the Village Level Worker, the Patwari, a few progressive farmers (on their farms), some Harijan leaders, one of the two fabricators of agricultural implements, and one young man who does electrical installation work in the village.

Data on demographic characteristics, land-holdings and economic activity were collected for all households in the village through a household census. More detailed data on agricultural operations of medium-sized cultivators (those having holdings between 8 and 14 acres) and on employment and earnings of the Harijans were collected on a sample basis. Ten families of medium-sized cultivators and ten of Harijans were included in the sample. The object of the survey of the cultivators was to obtain a closer acquaintance with their farm operations and to obtain an approximate idea of their levels of production and income. It was also useful in seeing how far improvements like use of chemical fertilizers for which data on consumption for the block and the village were given by the block staff, were being followed by these cultivators. The sample survey of the Harijans was intended to obtain a more precise idea of their level of income.

Besides work in this village, several other villages in the Block were visited in order to see other noteworthy developments. One of these villages had a successful co-operative milk producers' society supplying milk to the Government dairy at the State capital. Another had a number of progressive farmers settled in a garden colony which is one of several such colonies established in the Punjab in the post-Partition years. Detailed discussions about agricultural progress and extension activities were held with the Block Development Officer and other members of the Block extension staff, and later with the Pilot Project Officer of the Package Programme, and a few specialists at the Punjab Agricultural University, Ludhiana. I am indebted to all these people, and especially to the B D O and his staff who had to spend considerable time with me, for their assistance in this study.

The Area And The Period

Ludhiana is one of the more progressive agricultural districts of Punjab. Since 1960, it has been selected for the Intensive Agricultural Development (Package) Programme of the Ministry of Food and Agriculture. Accordingly, the intensity of agricultural extension effort in it is greater and the resources being made available for agricultural development are much larger than in an average district of the State. However, this more intensive effort began only in 1961; the district had not received any special attention earlier. The changes described in this study are the results mainly of developments which had taken place before inception of the

Package Programme, and, as the discussion brings out, are related to the social and economic changes which have occurred all over Central Punjab in the post-Partition years and to development activities undertaken in all parts of the State. But it is well to keep in view the fact that the very selection of Ludhiana as the Package Programme district indicates a relatively high standard of agricultural development and a potential for attaining rapid increases in agricultural production as a result of the programme.

Secondly, Ludhiana and a number of smaller towns of Central Punjab have seen rapid growth of small scale industry in recent years. The centre of this development is the town of Ludhiana itself, in which there has been a phenomenal growth of machine tool and light engineering industries. Lately, this development has overflowed to the larger villages, especially those which have certain advantages like location along the Delhi Amritsar (Grand Trunk) road. This growth of small-scale industries has important effects on the rural economy and agricultural techniques, which are discussed below. Moreover, the agricultural changes described in this study and growth of small scale industry in towns are both part of a larger process of socio-economic change. However, for the purposes of this study, I took care not to select an industrial village. Such villages are still few in number and selection of one of these would have interfered with analysis of agricultural change which is the main theme of this study. The influence of industrial growth described in this study is the regional effect which has been felt by all villages in this area.

The selected village is well served with road transport, has electricity and has attained a high level of agricultural productivity. But, it is not exceptional in any of these respects in this area. The majority of the villages in this C D block are within two miles of an allweather motorable road and the motor transport facilities available to them are almost as good as those available to this village. Electric supply has been extended to 88 out of 107 villages of the block. As regards agricultural productivity, the average yields of crops reported for this village are comparable to yields reported for the block. Similarly, in the level of fertiliser use, which is a good index of acceptance of agricultural improvements, the village is not exceptional. The average figure of 34.0 kg of chemical fertilizers used per acre under crops reported for this village, has been attained or exceeded by a number of other villages in this block and by several blocks in this district.

II

The Village and the People

The Village

Jitpur is a medium-sized, multi-caste village, having 299 households and a population of about 1,850. It is located at a distance of two miles from a small tehsil and block headquarters town, which itself has a population of only about 6,000 and is not much more than a large village. Jitpur is situated on an all-weather motorable road which links it with this town on one side, and with a market town (population about 25,000) on the other. There is a regular bus service with 12 buses plying each way on this road. In addition, four three-wheeler Tempos are plying continuously. As a result, a motor transport vehicle is available on this road every ten minutes throughout the day. The village is not suburban in character: Ludhiana, the nearest large city (population over 5 lakhs) is about 25 miles from it. But these details about frequency of road transport have been given in order to indicate how quickly and easily the villager can move out of the village. This fact was brought home to me during the first visit to the village. When I reached the village, I was told that a prominent village leader whom I had expected to meet, had left for the State capital that very morning. I was disappointed at the prospect of not being able to see him. But before I left the village four hours later, the man had returned. The entire trip to the State capital, located about 40 miles away, including his making certain enquiries about his work in the capital had taken just six hours. This rapidity of travel by road, in which this village or the villages of this block are by no means exceptional, is a very powerful factor in the travel of new ideas to the village and in lessening of the distance — in time, in ways of thinking and in levels of living — between the people of the villages and those of the towns, which in turn is an important factor in technological progress in the villages.

Another first impression may be recorded also, in order to give a perspective of the technological level to which the village has access now. The village has two shops of fabricators of agricultural implements. These are owned by two extended families of Ramgarhiya Lohars (smiths), resident of the village. One of these shops is on the approved list of fabricators of agricultural implements for the State Department of Agriculture. It manufactures *rahats* (iron persian wheels), iron ploughs, buckets, steel trunks and similar articles of sheet steel, besides doing repair work. This shop with its electric motors, a power press, lathes and other power-driven machines is comparable in equipment and technical skill of its workmen to any small manufacturing unit in the neighbouring tehsil town or even in Ludhiana. Several young men from Lohar families of Jitpur are working in Ludhiana as skilled workers in small engineering units and the men working in the village have stayed behind, not because they are inferior in skill or capacity to work to those who have gone out, but only because they feel that they can make as much or more money by running the family shops in the village. These men understand machines — electric motors, tractors, trucks, flour mills, almost any machine that is likely to be used in the village—and their presence in the village is a major factor in technological progress. It means that if an electric motor or other power driven agricultural implement like a chaff cutter or sugarcane press goes out of order, it will be repaired quickly and efficiently, and if the repair cannot be done locally or a part needs to be replaced, the cultivator will be suitably advised to get this done from the block headquarters town or Ludhiana. He need not be afraid of being left helpless in case of a breakdown or of long expensive delays or heavy repair costs. It means further that the cultivator or his young son has a high standard of technical competence to look up to. The fact that this standard already exists in the village gives an impetus to him and to his young son to handle machines and to correct small defects himself. During subsequent discussions in the village, many cultivators explained that they seldom have any problem with their electric motors; that they could correct small defects themselves and went to the tehsil town only in case of a major trouble like a burnt armature. One elderly cultivator went so far as to say that the longer they worked their motors the fewer breakdowns these had.

This level of competence in handling machines is in striking contrast to that found in an average village in parts of the country, where the village smith or carpenter confines himself to making and repairing the traditional agricultural implements and is either incapable of, or does not care to handle, even such non-power-driven improved implements as iron ploughs or sugarcane crushers.[2]

The People

The distribution of households by caste is given in Table 1. Detailed data on land ownership, cultivation and other economic activities, distribution of population by age and sex, literacy and standard of education are given, caste-wise, in the Appendix Table.

The Bazigars are not permanent residents of the village. They live in semi-permanent huts in one corner of the village and are dependent mainly upon casual agricultural or non-agricultural labour. They also rear buffaloes or cattle for sale of milk or animals. They are a semi-nomadic people who stay at the outskirts of large villages and small towns for months at a time. In recent years, they have been trying to settle down as cultivators or cultivators-cum-labourers and are being assisted in this process by the State Government with allotment of land for cultivation and with financial assistance.

There are sharp differences in land-ownership and occupation among the different castes as will be seen from Table 2. The Jats are the principal land-owner-cultivators: they own and cultivate practically all the land of the village. Among the other castes, Mahajans, Mistris and 'other artisans' are essentially non-cultivators. The Harijans have agricultural labour as an important source of income; but they have no rights in land. Of the 104 land-owning families in the village, 96 are of Jats, and of the 82 families of cultivators, 76 are of Jats. These cultivate 96 per cent of the land of the village. The concentration of land-ownership and cultivation in the hands of a single caste could hardly be greater.

Further, as the data of the Appendix Table bring out, the participation of Jats in non-agricultural occupations is relatively small. A number of Jats have gone out of the village in the Army and elsewhere; but among those living in the village, more than 90 per cent are engaged in cultivation.

Mistris, Mahajans and the other artisans' depend upon occupations other than cultivation. In the case of Mistris, the principal occupations are those of mason, carpenter and smith, the latter including skilled work in machine shops in the village and outside. Out of 56 workers living in the village, as many as 43 are classified as engaged in skilled work. Fourteen of these masons, 12 are carpenters, and 11 are smiths. The principal occupations of Mahajans are petty shop-keeping and white collar services. Four families take up cultivation of their small holdings. Agricultural and non-agricultural labour is also reported by a few persons, obviously those who are uneducated or are too poor to do anything else. A number of persons among the Mahajans are not doing any work. These are old people, who depend upon their pensions and/or remittances from sons in service outside the village.

The 'other artisans' follow their traditional occupations, supplementing earnings from these by labour, agricultural and non-agricultural. Their numbers are sufficiently small (1 to 3 households each) to enable them to make a meagre living in this way.

The Harijans are the big landless-group. A few families have their traditional occupations — scavenging for six families of Balmikis, weaving for six families of Julahas — as important sources of income. But the great majority (75 families), who are called Ramdasias or Ravidasias[3], depend almost exclusively upon agricultural and/or non-agricultural labour. These people gave up their traditional Chamar's work i e flying of carcasses of dead cattle and making of leather goods, about 40 years ago. But even when they practised it, it contributed only a small proportion of their incomes, and their main reliance was on labour. Out of 110 Harijan workers living in the village, as many as 91 were reported to be engaged in agricultural and/or non-agricultural labour. Fifteen among these are *sanjhees* (attached agricultural labourers) working for cultivators for an annual payment, given in most cases as a share of produce; 13 are non-agricultural labourers, while the remainder take up casual agricultural or non-agricultural work as one or the other becomes available.

Since the *sanjhees* get a share of the produce, it may be thought that they are share croppers and not labourers. The impression is strengthened by the fact that some *sanjhees* besides contributing labour, pay proportionate share of the land revenue and cost of seed, fertilizer, etc. The annual contract (usually verbal) between the cultivator and the *sanjhee* specifies the items to be contributed by the latter and the crops of which he is to receive a share. (Usually the *sanjhee* gets a share of the grain and cash crops; but is not given any share in fodders or by-products like chaff, cotton sticks, etc.) But the cultivators were emphatic in maintaining that the *sanjhees* were agricultural labourers,

Table 1: Distribution of Households by Caste

Caste	No of Households	Population
(1) Jat	105	780
(2) Ramgarhiya Mistri (smith, mason, carpenter)	37	205
(3) Mahajan* (Brahmin, Khatri and Arora)	46	289
(4) Harijan (Ramdasia, Balmiki, Julaha)	87	517
(5) Other artisans: Darzi (tailor), Kumhar (potter); Nai (barber); Jhiur (water-carrier); Teli (oil-presser); Gujar (grazier)	15	92
(6) Bazigar	9	48
Total	299	1831

* The term Mahajan is used by the villagers for all these three castes of traders-cum-white collar workers. It has been retained here for the sake of convenience even though I realise that quite different castes, like Brahmin and Khatri are included in the group. The number of households by individual caste is as follows: Brahmin, 27; Khatri, 17; Arora 2.

that they had no part in decision making, in cultivation and that giving them a share of the produce was only another method of paying for their labour. The Harijans themselves did not contest these claims nor did they make any reference to their having had rights in land at any time in the past.

The remarkable adherence of castes to their traditional occupations and roles in the village may be noted. Ownership and cultivation of land is concentrated in the hands of the Jats. The only other participants in cultivation are Harijans; but their role is confined entirely to furnishing labour. The Mahajans and the Mistris, the two other major castes of the village, have confined themselves to their traditional roles of traders-cum-white collar workers and skilled artisans respectively. This adherence to traditional occupations and roles is in striking contrast to the technological and economic progress which the village has made in recent years. It shows that economic progress need not involve basic changes from the traditional roles and patterns of economic activity of the different castes. On the other hand, as the following discussion will bring out, this very adherence, *voluntary or forced*, has provided a major incentive to economic and social progress. The fact that castes like the Mahajans and the Mistris did not have an opportunity for participation in land-ownership and cultivation within the village, meant that as population increased and aspirations rose with spread of education and increasing contacts with the outside world, these castes sought an escape from the limitation of local economic opportunity in emigration. Each caste chose the occupation(s), for which it was best suited because of its traditional occupation and role in the village. Among the Jat cultivators also, young men from families with small holdings sought an escape from declining incomes at home in emigration. As a result, the area acquired an active tradition of emigration which has been a major influence in economic and social progress. The alternate response of traditionally non-cultivating castes participating in land-ownership and cultivation with varying degrees of combination between cultivation and the traditional occupation of the caste, which is found in villages in many parts of the country, was not made here. Both the social situation and the laws were responsible for this. The land-owning cultivating Jats were too powerful and too deeply attached to the land to allow non-cultivators to acquire rights in it. Secondly, acquisition of land by non-cultivators was prohibited under the well-known Punjab Land Alienation Act of 1901.

Emigrants

The figures of Appendix Table include data on those emigrants from the village who are unmarried and those who are married but keep their families in the village. These persons have been included for two reasons. Firstly, since emigration is an important factor in technological and social change in the village, some data on numbers who have gone out of the village are of interest for this study. Secondly, people of these two categories, even though living outside the village are part of the social, and to an extent the economic, situation of the village. The men with families living in the village send remittances and themselves visit the village as frequently as possible. Most of those from cultivating families continue their interest in land. The unmarried ones have equally strong links and interests. Their parents, uncles and other relations in the village are the only family they have. They look to them for assistance in getting married and in setting up their own homes in future. These two categories of emigrants are best thought of as constituents of village families, who are living outside it. Many of them will come back; others will remain 'men of the village', until they establish themselves sufficiently to take their wives and children with them.

The emigrants included in this Table total 89. Most of them are Jats, Mahajans and Mistris; the number of Harijans and other artisans is very small. Emigration from this village (and this area generally) has been mainly from castes which are socially and economically the most advanced, and the least from groups like the Harijans which were poor and depressed. The largest number of emigrants (42) are in the Army. More than half of these (23) are Jats; the remainder being Mahajans (10) and Harijans (7). The other occupations of the emigrants are skilled work (22), and white collar services and professions (32). The Mahajans are either in white collar services and professions or in military service. The Mistris are mostly skilled workers though a few are in white collar services and professions also. They are conspicuous by their absence from the Army. The eleven Jats listed under skilled work are mostly drivers of buses and trucks. They are about the only people in the village who take up this form of skilled work: the Mistris avoid it. This was explained by the villagers with the remark that the Jats alone have the physical strength and stamina required for this exhausting work.

The area has a long tradition of military service. The Jats and, to a lesser extent, the Brahmins were the first to join such service. The first recruits to the British Indian Army went in the last quarter of the 19th Century and there are many men in the village today, who have served in the first or the second World War. On the other hand the recruitment of Harijans to the Army is a very recent phenomenon. Six of the 7 young men reported as being in military service, joined the service only after the declaration of the Emergency.

Migration to take up white collar services and professions and skilled work also began several decades ago. The Mahajans were prominent in the former and the Mistris in the latter. Masons of this village have been going out for work on public works and private house construction for several decades. Before the Partition, they used to go for work on the Canals in West Punjab, and to towns like Lahore, Lyallpur and Rawalpindi. This tradition continues and several of them are now working in Delhi and towns of the Punjab.

This tradition of emigration has had very important economic and social consequences some of which are related to the main theme of this study. Emigration with its inflow of money, and new ideas especially from persons who came back to live in the village, brought rise in economic level of the families of the emigrants and rising aspirations and widening mental horizons for the whole village. The village people saw that there was opportunity outside, and that it was possible to avail of it instead of enduring a low and declining income at home. In case of cultivators, emigration meant also that the process of sub-division and fragmentation of holdings was less rapid than it would have been otherwise. The relatively comfortable size of holdings, which we note below as a major reason for successful technological change, is the result partly of emigration.

Two aspects of emigration which deserve special mention are going to canal colonies of West Punjab and to foreign countries. The canal colonies were a major avenue of emigration for cultivators of this area in the early years of this century, and the area is now full of cultivators who have come back to their ancestral villages after the partition of the Punjab. This return migration has, as explained in Section VI, been a significant factor in agricultural progress. But this particular village did not participate in migration to canal colonies. The explanation given for this was interesting. It was explained that the then Zaildar[4] of the village when asked by Government whether he or any person from his village, would like to take land in the canal colonies, had refused

Table 2: Land Ownership and Cultivation

(in acres)

	Land Ownership		Cultivation	
	Families	Area Owned	Families	Area Owned

the offer. His grandson, a prominent leader of the village, was mildly proud of this attitude of his ancestor, though many others were of the view that this had retarded the progress of the village.

Emigration to foreign countries from villages of this area has been mainly to Malaya, Thailand and East Africa. From this particular village, several Brahmin families have settled in East Africa. But the latest phase of such emigration is migration of young men to the U K for taking up jobs as unskilled or semi-skilled workers. Large number of young men from Ludhiana and other districts of Central Punjab have been going to the U K during the last few years and during the course of this study I had occasion to experience the ferment which news of employment in U K on "good wages" was causing in the area. Employment vouchers, wage rates, cost of living and living conditions in U K and the possibility of saving money and sending it home, were the talk of the small block headquarters town. Information on these points obtained from all possible sources—letters and remittances from the young men who had gone to the U K, news picked up at Ludhiana, Delhi and other towns—was pooled and discussed at length by the young men from the villages who gathered at restaurants and other shops in the town. The concensus of opinion was that wages were "good"; but cost of living was high, and one could save money only by living in overcrowded tenements and enduring physical hardship. Since the average young man of this area is quite prepared for these, there was considerable enthusiasm for going abroad, especially among young men with some education who did not want to engage in farming or other ancestral occupations.[5]

Notes

[1] The name of the village is ficticious.

[2] I know of villages in another State where cultivators who grow sugarcane and make gur do not own the cane presses, but hire these from smiths in towns, who look after the repairs also; because the local smiths cannot repair these presses.

[3] The correct word appears to be Ravidasias, i e, followers of Ravidas, the celebrated Chamar Saint; but the word Ramdasias is more commonly used.

[4] Headman of a group of villages. The post was abolished after Independence.

[5] No young man from Jitpur had gone for such work to the U K till the time of this study. But two young men explained to me that they were thinking of going and had sent the necessary applications for employment vouchers, passports, etc.

(To be continued)

AROUND BOMBAY MARKETS

Dalal Street Digesting Gains

Wednesday, Morning

DALAL STREET did not make any new high mark last week. With anxious bear covering nearly over and fresh institutional support very much restricted, the market preferred to digest the gains already made and consolidate its position before pushing its way further up. And in the process of adjustment, the market beat a modest retreat. While odds are that last week's setback is a correction of the sharp recovery from the panicky low registered on March 27, it could well be argued that the rally has started petering out.

Apart from continued anxiety about the political situation arising from developments in Vietnam and frequent skirmishes on the Indo-Pakistani borders, trading sentiment last week was affected to some extent by the restrictions imposed on the outflow of capital in the British Budget. But this only induced tired bulls to reduce their commitments and discouraged fresh support. Sellers, however, were never really aggressive during the week. Except for substantial bull liquidation in National Rayon near the week-end which had a slightly unsteadying influence on the general trading sentiment, equities prices last week drifted lower mainly due to lack of support.

If sellers were not aggressive it was partly because of the highly encouraging corporate news during the week and partly because of the considerable shrinkage in floating stocks of several scrips on account of massive purchases by the Life Insurance Corporation. New India Industries, Amar Dye Chem, Modi Industries, Ahmedabad Jupiter and Victoria Mills, to mention a few names, reported impressive results. Reports indicating a possible removal of the statutory control over the price and distribution of steel had also a steadying effect on the trading sentiment.

While there has been a noticeable improvement in the general market sentiment and the recent recovery holds out the promise of being extended further, any undue optimism about the outlook for equities needs to be avoided if only because of the continuing political uncertainties and monetary stringency. Apart from technical considerations, even the recent rally from the March 27 low point has been made possible mainly by massive institutional support. Outside public interest in the market continues to be negligible. Institutional support alone cannot bring about the revival of investors' confidence.

COTTON

Cotton Curbs Go

THE Indian Cotton Mills' Federation has removed all restrictions on cotton purchases by the mills and on the stocks that they can hold. The Federation's decision to give up its 8-point scheme aimed at securing cotton at or below the appropriate ceilings through self-restraint could not have been prompted by any reassessment of the supply position of cotton. For, excepting a few varieties like Cambodia and L 147, most varieties of cotton are again quoted at around the ceilings, indicating a none-too-satisfactory supply. According to informed sources, the Federation had been under considerable pressure from the State Government to do away with the restrictions on the purchases of cotton by mills and on the stocks that the mills could hold in order to meet cotton growers' demand for better prices. Since the scheme of self-discipline had never been much of a success due to lack of cooperation from various quarters, the Federation has decided to remove the restrictions thereby putting an end to the mounting criticism of cotton growers and also to the futile controversy regarding purchase of Cambodia cotton at 5 per cent below the appropriate ceilings. It is now left to the Textile Commissioner to enforce the price control order should prices pierce the statutory ceilings.

Cotton prices have firmed up considerably over the past fortnight or so and if this trend persists, which seems quite likely, it will not perhaps be long before unofficial premiums emerge in respect of several varieties. Prices have firmed up even when mills are reluctant to enter into large fresh commitments because of the accumulation of large stocks of cloth with them at a time when credit is both difficult and costly. An improvement in the off-take of cloth is likely to give a big boost to the cotton market.

While the Indian Cotton Mills' Federation has given up its scheme of self-restraint designed to keep prices within appropriate ceilings, ready cotton merchants in Bombay have decided on a code of self-discipline aimed primarily to ensure that no cotton is sold to mills on credit. Under the scheme, no member or trader will buy or sell cotton or kapas above the appropriate ceilings and every trader will insist on delivery to be taken by mills and payment made strictly in accordance with the by-laws of the East India Cotton Association. Rules regarding time-limit for weighment of cotton are being tightened. Though mills are at present supposed to weigh cotton within four days after the contract, the actual position is quite different. The time limit is proposed to be extended to 11 days but mills failing to weigh goods within the extended time-limit will be required to pay carrying charges. Further, the sellers will henceforth disallow any "fancy stone allowance" to mills. The proposed code of self-discipline has been characterised as a desperate move on the part of cotton muccadums and merchants to ensure their survival in the context of the extremely stringent monetary conditions obtaining at present. It is extremely doubtful whether the trade will be able to observe the code of self-discipline and sell cotton to mills on its own terms.

Even though most varieties of cotton are at present quoted at around the ceilings, market reports indicate accumulation of stocks with growers and traders. This is rather intriguing. High prices and accumulation of stocks can go together only when prices are expected to rise still higher. If growers and traders continue to sit tight on their stocks even when prices are at or very near the statutory ceilings, it can only mean that they hope to be able to sell their product at well above the ceilings. In sympathy with the increasing firmness in the spot material, cotton futures recorded a further rise last week; the August contract was bid up to a new high of Rs 768 (per 3 quintals).

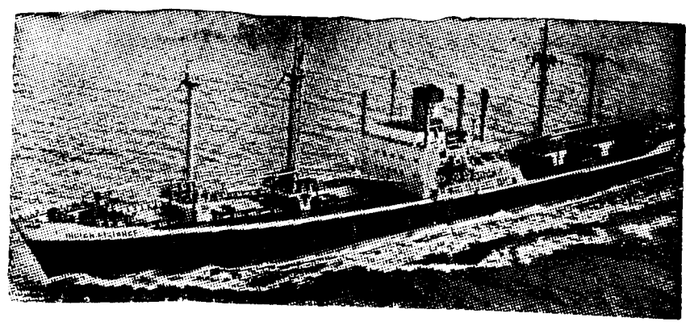
OILSEEDS

Prices Continue to Rise

THE oilseeds market displayed further remarkable strength last week, with prices rising to the highest levels for a few months. The strength was particularly marked in linseed and linseed oil. The quotation for spot linseed rose from Rs 45 to Rs 47.50 (per 50 kgs) and linseed oil improved from Rs 17.75 to Rs 19 (per 10 kgs). Linseed further were quoted well above the maximum price permitted during the week — the hedge contract is not allowed to rise (officially of course) by more than Rs 2 (per 100 kgs) during any week. While official trading remained suspended most of the time, in kerb dealings the June contract was bid up to Rs 95; correc-

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.



Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

tive profit-taking brought down the rate to around Rs 93.70 near the week-end. The rise in prices was due more to scarcity of offerings than to any sudden increase in off-take though traders reported fairly satisfactory demand from paint manufacturers. Despite a fairly good harvest, the supply of linseed oil is said to be poor for this time of the season. The movement of goods is said to have been affected by the recent rains in Uttar Pradesh, Madhya Pradesh and Rajasthan. Apart from the restricted flow of supplies, sentiment in linseed was also aided by rumours that Pakistan was interested in purchasing Indian linseed oil. Linseed prices have been merely following the trend in mustardseed prices which have been moving up and up despite a record harvest. In Delhi, mustardseed oil was bid up to Rs 29 (per 10 kgs) last week; the quotation has been appreciably lower around Rs 23 some weeks ago.

The strength in linseed and mustardseed has had a profound impact on the general market psychology. Groundnut oil ready has been marked up from Rs 22 to Rs 23.10 (per 10 kgs) and what is more, centres which are the traditional suppliers of groundnut oil to Bombay have been making purchases of oil in the Bombay market recently. Castor futures have risen from Rs 77.40 to Rs 79.10. Bullish psychology seems to have firmly seized the market. Goods are no longer moving out from the producing centres in desired quantities. Growers and traders are reluctant to part with their stocks at the current prices, which, though quite high from the consumer angle, look low compared to the fantastic rates obtaining near the fag-end of the last season. Stockists are in no mood to ponder over the marked improvement in the supply position of edible oils this season, partly due to record harvests and partly due to the import of 75,000 tonnes of soyabean oil for the vanaspati industry and 50,000 tonnes of mutton tallow for soap manufacturers. Unless the authorities take firm action to discourage holding and hoarding of stocks at various levels and inter-State movement of goods is freely allowed, it might become difficult to check the rise in oilseeds prices, improved supply notwithstanding. The way prices are surging forward at a time when the movement of mustardseed and linseed crops is expected to be in full swing is quite disturbing. Any relaxation of export curbs at this juncture is likely to complicate the situation further.

Export houses did not mention any important fresh business during the week. The further rise in groundnut oilcake prices has made fresh export business difficult, particularly with the U K. The buying by Communist countries too has been restricted of late. Cottonseed cake also did not evoke much interest. Export business in oils remains at a standstill. With the decline in overseas prices and a rise in domestic prices, the disparity between Indian and world prices has increased further.

BUSINESS NOTES

Madras Rubber

UNTIL a few months ago, the new tyre units were experiencing keen competition from well-established brands as a result of over-capacity in the industry, and had to keep their production much below installed capacity. But conditions have since changed for the better not only on account of improvement in demand, but also because concession and reliefs in the 1965-66 Budget have brought some benefits for the industry. Besides, there are indications of increased purchases of tyres from the new companies by the Government and semi-Government undertakings. In view of the unfavourable conditions then prevailing, Madras Rubber Factory worked at only 35 per cent of installed capacity during its financial year ended September 1964. Production has been stepped up gradually in the current year; towards the middle of March it ran at around 600 tyres per day and is expected to reach 75 per cent of the capacity by September. Some of the well-known automobile manufacturers now use the company's tyres as original equipment. The company is also steadily increasing its exports of types; the current year's exports are expected to be substantially higher than those of the past year when goods worth Rs 8 lakhs were exported.

In the meanwhile, the company has reported a set-back in its results for the year 1963-64. While sales turnover has nearly doubled to exceed Rs 5 crores, the gross profit has shrunk by more than a third to Rs 21.60 lakhs. After providing Rs. 18.92 lakhs (Rs 11.86 lakhs) for depreciation and nil for managing agents' commission and development rebate, which received Rs. 1.07 lakhs and Rs 18.40 lakhs, respectively, last year, the accounts show a profit of Rs 2.68 lakhs against Rs 3.12 lakhs a years ago. The dividend is skipped, and the profit together with the previous year's surplus of Rs 1.02 lakhs is carried forward.

Phillips Carbon Black

A SUBSTANTIAL improvement in its results has been recorded by Phillips Carbon Black in the second year of operation ended November 1964, when its sales expanded from Rs 91.08 lakhs to Rs 197.24 lakhs, and after providing Rs 24.23 lakhs (Rs 38.32 lakhs) for depreciation, the company earned a profit of Rs 24.16 lakhs compared to a loss of Rs 39.64 lakhs incurred in the previous year. After adjusting the profit against the previous losses, there still remains a debit balance of Rs 23.51 lakhs to be carried forward.

Considering trend of earnings, however, it seems the company will not take long to wipe off this deficit. Production was increased to nearly 70 per cent of the installed capacity during the year, and is likely to be increased further. Interruptions in power supply have been greatly reduced following the installation of a new distribution system, and a much higher production rate has been recorded for the past few months. What is more encouraging is that the company's product has been in good demand, and all production is readily taken up by the market. The expansion of ten million pounds of capacity is expected to be completed by the beginning of next year.

From June 1964, the company raised its prices by about 5 per cent in order to counter the steadily rising costs of raw materials. The recent ten per cent duty on all imported materials will substantially increase costs, and a further revision of selling prices may become necessary, though the management says it shall make every effort to avoid this.

Dunlop Rubber

THE year 1964 was another successful one in the history of Dunlop Rubber Co (India). Despite the problems arising out of keen competition and uneven flow of raw material supplies, the company established new peaks in production and sales. The years to follow are expected to bring not only fresh problems, but also greater opportunities; and with a view to meeting the challenge of future, the company has already set before it the aim of "further expansion through increased productivity, additional capacity, improved quality and service second to none". Meanwhile, the major expansions of both the factories at Sahaganj and Ambattur have already made considerable progress, and outlets for further diversification are constantly being explored.

With the growing demand for its products both in the home and export markets, sales during the year jumped by Rs 4.60 crores to Rs 45.34 crores, and gross profit expanded by Rs 73.71 lakhs to Rs 4.63 crores. After charging depreciation of Rs 65.67 lakhs (Rs 59.83 lakhs) and providing for tax liability Rs 194.77 lakhs (Rs 158.82 lakhs), the after-tax profit was Rs 202.79 lakhs as compared to Rs 168.87 lakhs for the previous year. Development rebate reserve claimed Rs 21 lakhs (Rs 10.25 lakhs), preferential dividends Rs 4.60 lakhs (same) and ordinary dividend Rs 109.37 lakhs (Rs 78.75 lakhs). The dividend rate is kept unchanged at 17.5 per cent, and of this the half payment proposed as final is payable on the capital as enlarged by the issue of rights and bonus shares. The remaining surplus of Rs 67.81 lakhs is to be transferred to general reserve which last year received Rs 106.15 lakhs, but then that was possible after taking credit for the preceding year's surplus of Rs 25.88 lakhs and for Rs 5 lakhs being the provision for retiring gratuities written back.

Associated Bearing

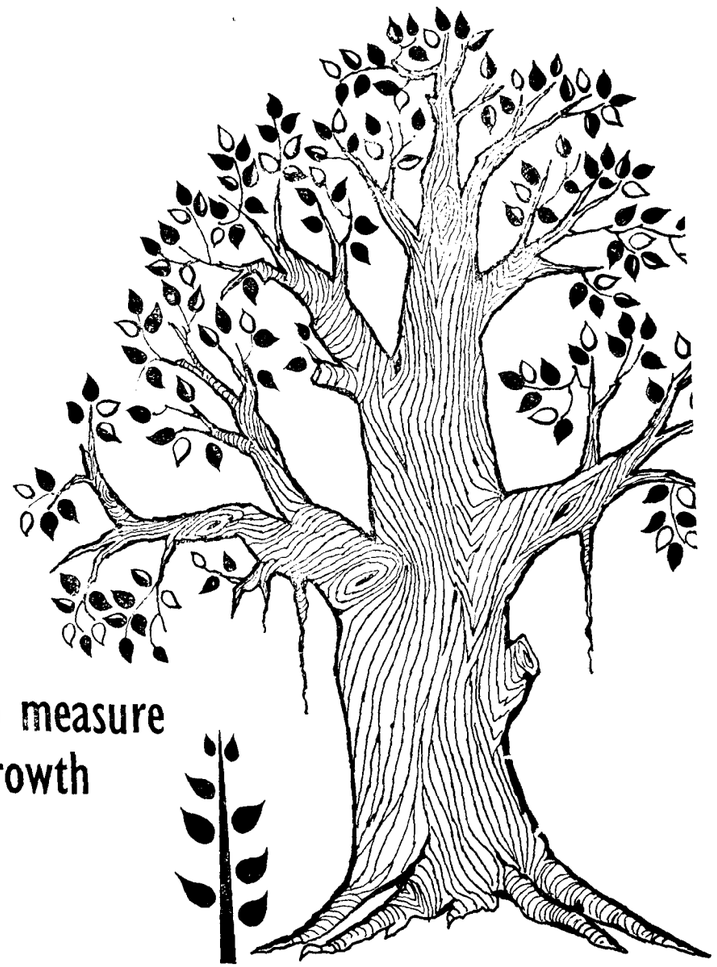
DURING the year to December 31 1964, Associated Bearing Company incurred a loss of Rs 16.49 lakhs, as against a profit of Rs 0.78 lakh earned in the previous year, even though sales of textile products were almost double at Rs 48.08 lakhs. After transferring Rs 5,000 (Rs 39,000) to development rebate reserve and providing Rs 14,143 (Rs 35,000) for tax liability, the year's net loss aggregated Rs 16.69 lakhs which together with the previous loss makes a total loss of Rs 22.99 lakhs to be carried forward. There is good reason to expect better results in the current year, as production of bearings started early this year and is progressing at a good tempo, and increasing quantities of ball bearings have already been sold. The 10 per cent regulatory customs duty will, however, affect the company's working because it will increase the duty on machinery and tools and raw materials to be imported. This will force the company to raise prices of its products.

The company proposes to issue debentures of Rs 1 crore carrying interest at eight per cent per annum. A public issue is proposed to be made for this purpose after getting it fully underwritten by well-known financial institutions. During 1964, the company raised loan capital of Rs 1.65 crores by way of debentures from ICICI.

Killick Industries

AS in the previous year, Killick Industries' results have been again affected by a set-back in the earnings of John Baker and Sons. A year before, its margins had diminished and the last results are poor because of the go-slow policy of labour at its steel files factory, culminating in a strike that continued for three months. Despite the end of the strike, the current year's prospects for this division are not rated high, as the recent increase in import duty on steel is expected to affect profitability. Practically all the steel used in the manufacture of files is at present imported from abroad.

In welcome contrast to the poor showing by John Baker, however, the various managed and subsidiary companies of Killick have generally produced good results. The company's income by way of commission and office allowance from the managed companies has gone up by Rs 5 lakhs but this improvement has been nullified by an almost equal contraction in the company's sales of products. The total income is slightly up from Rs 101.26 lakhs to Rs 103.03 lakhs but, with expenses rising at a faster pace, the outcome is a lower gross profit of Rs 17.37 lakhs compared to Rs 19.66 lakhs a year ago. The directors have provided Rs 2.78 lakhs (Rs 2.60 lakhs) for depreciation, Rs 4.95 lakhs (Rs 7.20 lakhs) for the tax liability and Rs 0.10 lakh (Rs 0.15 lakh) for development rebate. Together with the sum of Rs 0.85 lakh (Rs 0.28 lakh) being refund of previous year's taxes, the disposable profit is slightly higher at Rs 10.39 lakhs compared to Rs 9.99 lakhs last year. The equity dividend is increased by 50P to Rs 8 a share, and should absorb Rs 10 lakhs against Rs 9.37 lakhs previously.



Hindustan Lever

HINDUSTAN Lever's preliminary results for the year 1964 showed that despite an impressive jump in sales the company had earned lower profits, because vanaspati had a very difficult year due to the shortage of edible oils. Now the directors' report shows that during the year the company recorded satisfactory progress in most of its other lines of manufacture.

Sales of soap recorded a small increase, while those of the non-soapy detergent, Surf, continued to expand steadily. Toilet preparations experienced a further substantial increase in demand, sales of feeds and concentrates for poultry expanded rapidly in Western and Northern India, and those of cattle food remained steady. But the milk products plant at Etah, which came into operation from mid-1964, experienced shortage of milk.

The modernisation of the company's soap plants both at the Bombay and Garden Reach factories is proceeding on schedule, and the major works are expected to be completed by the end of this year. Also, the new Surf plant, under construction at Calcutta, should be ready by that time. The company has begun work on the installation of a nickel catalyst plant in its Bombay factory, and this should come into operation in early 1966. It will help save a good deal of foreign exchange required for imports of the catalyst.

A small scale unit for animal feeding stuffs was started at Ghaziabad, where the company has its dehydration plant. Besides, the company has started there a poultry development unit to investigate efficient poultry rations for stock kept under Indian conditions. It is also proposed to take up marketing of quality razor blades, and for this purpose the company is entering into a partnership with a razor blade manufacturer of New Delhi.

How to measure Growth

All things grow in age—but only *some* grow in size and stature. A young sapling shoots up—sprouts new leaves and branches. But how does one measure the growth of a bank? Take the Bank of Baroda, for instance.

One way would be to compare figures. The Bank of Baroda began in 1908 with a single office in Baroda. Now it has as many as 235 branches in India and abroad. And deposits exceed Rs. 170 crores.

A strong and progressive institution with over 55 years of experience, the Bank of Baroda has had a successful programme of branch expansion. It has also aimed at an ever-widening pattern of service. Indeed the Bank's chief goal has been to widen the range and scope of its banking services for the convenience of its customers.

THE BANK OF BARODA LTD.

(Estd. 1908) Head Office: Baroda

now has over 235 branches all over India and abroad with deposits totalling over Rs. 170 crores

Write in for our free booklet entitled **'May We Help You?'** which gives details of all our services.

JWT-BB.1643

FROM THE CHAIR

The United Commercial Bank Limited

Address by the Chairman Shri I P Goenka

THE following is the Address by the Chairman, Shri I P Goenka, to the Members of the United Commercial Bank Limited at the Twenty-second Annual Meeting held on Wednesday, the 7th April 1965:

I extend to you all a very hearty welcome to the new headquarters of the Bank, which was formally opened by Shri G D Birla on the 29th August 1964. The blueprints of our architects have, as you can see, been transformed into an aesthetically beautiful building which now serves to provide Calcutta with a unique landmark. The ample space and the efficiently planned lay-out for staff will both ensure that we shall be able to tender more efficient service to our customers and in brighter surroundings.

As a prelude to the business of today's meeting, we should pay respectful homage to the memory of Pandit Jawaharlal Nehru. His services as a fighter for freedom and as a builder of modern India after independence will forever be remembered. Not only did he secure for India a position of high respect among the comity of nations; not only did he provide India with a driving force of political unity and economic development; his contribution has been of value to the world at large, serving as he did as a beaconlight for peace in our times. That Pandit Jawaharlal Nehru's legacy has been meaningful is attested to by the fact that, despite apprehensions to the contrary, we have had the unanimous election of Shri Lal Bahadur Shastri as his worthy successor. There is no doubt that, under the able guidance of Shri Lal Bahadur Shastri, India will be in a position to build up a solid edifice on the strong foundation laid by Pandit Jawaharlal Nehru.

Today, all of us miss the august presence of Shri G D Birla at this meeting. Shri Birla had made no secret of his growing desire, in recent years, to retire so as to make room for the emerging generation. Accordingly, he laid down office as Chairman even as he formally opened the new building on the 29th August 1964. With his wealth of experience in financial, industrial and other fields, Shri Birla ensured that the progress of the United Commercial Bank would be swift and sound. I am certain that all of us, Shareholders, Directors, management and staff, would wish to place on record our high appreciation of Shri Birla's outstanding contribution to the Bank during his twentyone memorable years of leadership and to convey to him our deep and continuing personal regards. I am moreover obliged to him because, even after his retirement, he continues to take a keen interest in the affairs of the Bank and makes his wise counsel readily available to us.

Shri M L Dahanukar, who has been a Director since the inception of the Bank, retires today from the Board on grounds of health. The Bank has greatly benefited from his long association and I wish to acknowledge on your behalf the very valuable guidance and counsel given by him during the period of his office and wish him speedy recovery and a long life.

I now present to you for your consideration and adoption the Balance Sheet as at and Profit and Loss Account for the year ended 31st December 1964, which have already been in your hands; and I shall touch briefly on the working of the Bank during the past year.

Branch Expansion

With a view to widening the scope of the Bank's service to the public, as many as 26 new branches were opened during 1964 in various parts of the country as against 18 branches in the previous year. Out of these 26 branches 9 were at unbanked centres. The total number of branches at the end of 1964 stood at 202. We shall be opening 21 new branches by 31st July 1965 under a programme approved by the Reserve Bank of India. With more branches in bigger cities like Calcutta, Bombay, Madras and Delhi we hope to be able to provide our customers with better and speedier service. It will also be our endeavour to open more branches in unbanked centres and spread the banking habit in the rural areas, despite the fact that such branches are not remunerative for the first few years of their working.

Staff

Our Management and staff are being kept at full pressure in dealing with the increased volume of business. Expansion of business calls for continuous recruitment of new staff and training and promotion to higher cadres of the existing staff. It has always been the endeavour of the Management to give full scope to the members of the staff to expand their knowledge by training so that they may give better and more courteous service to customers. Introduction of machine accounting would have certainly helped in providing quicker service, but non-availability of the right type of machines on account of import restrictions has not made it possible to make much headway in this direction. I would like to take this opportunity of expressing on behalf of the Shareholders and Directors of the Bank our gratitude to the General Manager and to all other members of the staff for their excellent work during the year, without which the favourable results that we are able to place before you could not have been achieved.

It would be seen from the Balance Sheet that the Deposits of the Bank show further rise during the year of nearly Rs 13 crores—the percentage of increase being 10.7. The increase of Rs 4.08 crores in Savings Bank Deposits as against Rs 1.89 crores last year is worth noting.

Liquid Assets

The total of our liquid assets of Rs 17.43 crores consisting of Cash on hand, Balances with banks and Money at Call and Short Notice represents 13.01 per cent of our Deposit habilities. This compares favourably with 9.7 per cent *at* the end of last year. The proportion of the Bank's investments in Government Securities continues to be high. Out of the total investments of Rs 38.18 crores, investments in Shares and Debentures amount to only Rs 79 lakhs. The investments of the Bank are shown at a figure which is below the market value and give a ratio of 28.5 per cent to Deposits.

We hold no undated Government Securities and the majority of our holdings matures within 10 years.

Our quick assets consisting Cash and Bank balances, Money at Call and

Short Notice and unencumbered Government Securities total Rs 54.81 crores as against Rs 48.91 crores at the end of 1963 and form 40.9 per cent of Deposits which I trust you will consider as a highly satisfactory position.

Advances and Bills

Our Advances and Bills stand at Rs 93.44 crores which represent 69.8 per cent of our Deposits. The corresponding figures at 31st December 1963 were Rs 85.95 crores and 71.0 per cent. In keeping with the policy of the Reserve Bank of India, the Bank continues to provide credit facilities for exports and other productive purposes and to Small Scale Industries as well. We have also made a beginning in the extension of credit to the agricultural sector by the grant of loans for the purchase of fertilizers, production of improved seeds, etc. The medium term finance to industries stands at Rs 2.57 crores as against Rs 1.75 crores at the end of last year.

Profit and Loss Account

The working results of 1964 have further improved with gross earnings recording an increase of over Rs 1 crore. For the best part of the year the interest rates on advances remained the same as in the previous year. The income from Commission, Exchange and Brokerage was a shade lower than in the previous year mainly due to the fact that the business of our branches in the Far East was considerably affected on account of political conditions there. The average yield from investments in Government and other securities was more or less the same as last year. On the expenditure side the interest paid on Deposits and Borrowings showed almost the same rise as in the previous year. The rise in Salaries and Allowances and Provident Fund was nearly Rs 41 lakhs as against Rs 27 lakhs last year. This, in a large measure, was on account of the increase in the staff and the grant of *ad-hoc* increments to subordinate staff and Dearness Allowance to the members of the subordinate, clerical and supervisory staff consequent on the abnormal rise in prices. The increase in other expenses was due to the opening of a larger number of new branches during the year. Together with the amount brought forward, the balance for disposal totals Rs 83.94 lakhs. The allocation of Rs 17 lakhs to Reserve Fund is the same as that for the previous year. The Gratuity Trust Fund receives Rs 1 lakh more than the previous year while allocation to Bonus to staff is higher by Rs 5 lakhs. The Shareholders would be happy to note that it has been possible to recommend an increase in the rate of dividend from 12 per cent to 13 per cent *less* tax on the increased share capital.

Food Situation

Let me now turn to a survey of the economic situation in the country. While the choice of a successor to Pandit Jawaharlal Nehru was effected with smoothness and unanimity, the problems which confronted the new cabinet soon after its formation were of a formidable nature. I refer to the difficult food situation that developed suddenly all over the country. The seeming shortfall of supplies aggravated the price situation which, at the time, was already most disquieting. At that stage, had it not been immediately and effectively tackled and remedial measures promptly taken, a serious crisis might have set in. For thus having been able to control a most abnormal situation, we all owe a considerable debt to the readiness of the U S Government to proffer further gigantic assistance under P L 480. The fact remains that the general index of wholesale prices rose from 139.0 at the end of 1963-64 to 155.0 on 20th February 1965; and during this period the index for food articles went up from 141.0 to 160.2. The last year has thus been one during which the country has as its most immediate and compelling problem the need to control the price situation and reverse its trend. I am not here going to suggest what ultimately any country has to do to repel inflationary tendencies. But I think we should take note of the measures that, in the monetary sphere, were instituted by the Government with a view to regaining control of the price situation.

Monetary Measure to Control Prices

The approach of the Government in this regard appears to have been guided by the traditional and conventional solutions for checking inflationary pressures. The central banking institution used its powers of selective credit control whereunder the banking system was from time to time guided as to the margins that were required or the limits that were to be imposed in respect of advances against specified foodgrains and commodities. When it became patent that selective credit control by itself was inadequate to arrest the upward trend in prices, Government resorted to the most basic of its monetary weapons, the Bank Rate. When on September 25, the Bank Rate was raised by the Reserve Bank to 5 per cent from the 4½ per cent at which it had stood from the 3rd January 1963, there was for the first time implicit recognition by Government of the possibility that the trend in foodgrain prices might, if unchecked, lead to a general rise in the level of prices. I am however happy to note that the upward trend in prices has not only been effectively checked but also reversed and the indices of wholesale and foodgrain prices have registered a decline over a period of two months by 8 and 13 points respectively by 6th March. With the new stipulations and restrictions on access to central bank credit, monetary policy in India has taken on the aspect of quantitative rather than merely qualitative control. Since the close of the year, apparently with a view to lending greater strength to its own orthodox measures, the Reserve Bank again raised the Bank Rate to 6 per cent and, at the same time, central bank credit was made almost prohibitively costly for the banking system. I am not myself in disagreement with the successive raising of the Bank Rate since it is intended to bring in a more realistic structure of interest rates. That the cost of money should alone have tended to remain low in India does not accord with the general increase in the price level that is to be anticipated in a developing economy. Furthermore, as has happened consistently since the raising of the Bank Rate in May 1957, I think it is not altogether incorrect to say that changes in the Bank Rate follow rather than precede changes in interest rates in the money market. I think we may be confident that the higher interest that we shall pay on deposits will succeed in mobilising new resources for the banking system—resources which are sorely needed if we are effectively to extend sufficient finance not merely for the growth of industrial production but also for the distribution of the products manufactured.

Credit Squeeze

While on the subject of interest rates I wish to add my comments on some aspects of monetary management. The linking of the cost of central bank credit to liquidity is certainly more equitable than the other

formulae that have been tried out in the past inasmuch as it is a recognition of the basic canon that banks should not lend beyond their means and thereby overextend themselves. But at the same time I am afraid that any multiple-tier system of Bank Rate has little merit to commend it since it might, in effect, result in the denial of credit to worthwhile productive endeavour. I may point out that it is normally during the busy season that the banking system needs to have recourse to central banking credit. This is because during this period a considerable element of a seasonal demand for money gets superimposed upon the normal needs of industry and trade. If simultaneously, the industrial demand for funds also increases, then the banks are confronted with a problem of substantial dimensions. Obviously, credit to industry for production cannot be stopped; equally obviously, the seasonal demand for funds must be met, since in large part this relates to raw materials used by industry. But in the present circumstances with a lowering of liquidity causing increases in the rates of interest paid on the total of borrowings from the Reserve Bank, not a few institutions become reluctant or unable to lend even against essential needs. If, therefore, the Government desires that the extension of bank accommodation for productive purposes should continue smoothly, then there is need, I suggest, for the evolving of a special formula in respect of busy season financing. I think that up to half of proven credit for the busy season should be refinanced by the Reserve Bank at Bank Rate; and borrowings in this regard should be left out of the reckoning when the liquidity ratio is determined. Otherwise, I fear, I repeat, an emerging situation in which bank credit for productive purposes will not be readily forthcoming.

Spread Between Deposit and Lending Rates

Again, I cannot quite appreciate the central banking institution's need to fix minima for deposit rates and maxima for advance rates. It ought, I suggest, to be the other way about. The strengthening of the banking system requires that its earnings should not get eroded by the payment of unnecessarily high rates of interest on deposits; and such strengthening also requires that, where and to the extent necessary, earnings are enlarged not merely for the twin purposes of adding to reserve and of at least maintaining the dividend distribution to the shareholders so that right issues can be successfully undertaken, but also for making provision to cover the inherent risks of loss involved in the financing of new kinds of endeavour.

Inducement for Production

If the raising of Bank Rate was intended to prevent the use of available funds for non-productive purposes or output of lower priority, what is necessary to keep in mind is that ultimately the only answer to inflation is adequate supply of goods, whether by higher production or through the medium of imports. In the light of our current foreign exchange situation, the dissipation of our scarce resources for imports, particularly of consumer goods, must be ruled out. I am heartened to find that the Finance Minister, in his budget for 1965-66, has taken due note of the need to encourage production in every possible way. There is a wide range of inducements available to industry to increase output and to plough back profits. Tax Credit Certificates, themselves of a tax-free nature, are to be available, subject to certain conditions, on additional production and in respect of additional excise duties that might become payable and also with regard to additional tax burdens that a company itself might be liable for. What is more, for the first time in years, the budget underscores reliefs, concessions and inducements rather than innovations, impositions and additional burdens. Especially do I welcome the relief that has been offered in personal income-tax, since, as my predecessor remarked last year, there is no meaning in offering incentive to industry "unless there is incentive for individuals". With the introduction of Tax Credit Certificates to investors in regard to their holding of new equity shares up to specified maxima, there is the beginning of official policy intended to foster and encourage the channelling of the savings of individuals into worthwhile corporate endeavour. The restoration of the exemption from Wealth Tax of specified investments can be said to be further inducement for the investor in this behalf. The fact that new companies will be exempted from the liability to dividend tax up to 10 per cent distribution for 5 years is further reason why the investor would be emboldened to support such issues.

Revival of Capital Market

When all is said and done, the magnitude of response to new issues in the capital market depends upon the state of the Stock Exchanges. I am sorry to have to say that the reaction of the Stock Exchanges to the Finance Minister's budget proposals for 1965-66 has been less than enthusiastic. Perhaps one reason lay in the high expectations that had obtained before the budget. In particular, it had been hoped that the Dividend Tax would be abolished and that the assessment to capital gains of bonus shares in the hands of the shareholders would be repealed. It was the psychological shock of finding neither of these reliefs which, I dare say, accounts for such pessimism as holds sway in Lyons Range or Dalal Street today, more particularly in the background of slackness in capital formation during the last year. The liability of shareholders to capital gains tax on bonus shares is particularly indefensible, since, in the event of capitalisation of Reserves, the undistributed profits of a company bear taxes at three points—first, when profits are transferred to Reserves; second, when Reserves are capitalised; and third, yet again, when the bonus shares are taxed in the hands of the shareholder. Possibly, partially in recognition of these facts, the Finance Minister has given notional credit of 10 per cent of the tax on the capitalisation of Reserves as far as affecting the individual's liability to Capital Gains Tax that he has to pay on the bonus shares received by him. I wish the Finance Minister will find it possible to do more in this regard. But I would emphasize that there is, in line with Government's monetary policy, a very strong case for the abolition of the dividend tax. The revenue from this source is comparatively negligible. But psychologically it has an adverse effect on investors. It needs to be realised that, at a time when Bank Rate is 6 per cent, when a one-year deposit in banks also earns 6 per cent, the investor's anticipation of a fair and reasonable yield on his holdings will also be correspondingly high. If then, perchance, the distributable surplus with a company gets reduced by such a charge as dividend tax, the automatic reaction of the Stock Exchanges is to depress the prices so that the yields thereon conform to the new structure of interest rates—based on a Bank Rate of 6 per cent. Thus, while Shri T T Krishnamachari's budget contains

many favourable features. I would enter here a strong plea for the repeal of the dividend tax.

However, the tax and other incentives in themselves are not likely to enable increased production. Capacity to a not inconsiderable extent is lying idle for lack of imported raw materials and components. We are finding it hard to pay for the so called maintenance imports despite the success that has attended our effort to augment export earnings, which rose during April-December 1964 by Rs 40 crores as compared with the relative figure for April-December 1963. Idle capacity represents idle investments both of which the country can ill afford today.

Foreign Investments

The improvement in exports notwithstanding, realism requires us to recognise the fact that the scope for enlarged earnings is limited. The incentives given by the Finance Minister can be of limited avail. What, then, is necessary is that there should be a more vigorous endeavour tt import substitution. I dare say that the inducements available in this regard should be sufficient to foster the growth of particular industries manufacturing components. But a prerequisite is that research is undertaken with a view to pinpointing the industrial areas wherein such exchange savings would be possible. We have also to realise that beyond a point foreign aid on a government basis is not feasible; moreover, the cost of servicing such debt as well as the liabilities for repayment will to a corresponding degree be reflected in our foreign exchange reserves. Indeed, it would seem that the Finance Minister has come to the conclusion that private foreign investment touches less heavily on our foreign exchange resources; the repatriation either of dividends—or of capital at times—does not involve the country in any considerable drain of foreign exchange. It is thus that we have to appreciate the steps taken by Government to encourage the inflow of private foreign investments—steps comprised in what the Finance Minister described as "hospitable and fair treatment" for private foreign enterprise. Some weeks before the budget, the Finance Minister announced that conditions for private foreign capital to enter the country had been liberalised; it is now possible for a foreign enterprise to get a letter of intent in its favour. Again, the concession has been offered to the foreign investor of re-investing the proceeds of any sale within India; any capital gains arising therefrom will not be liable to tax, provided the re-investment is made in priority industries.

On the subject of foreign assistance, I would suggest that aid for maintenance imports is essential for the success of the plans themselves. For, it is only then, that we shall be able to make use of idle capacity, increase production and enlarge exports. Such higher export earnings are necessary, in turn, not only so that we ourselves can import more industrial raw materials, but also in order to make payments of accruing interest on foreign loans as they fall due and repayment of loans as instalments become liable to be paid. Interest on foreign debt of a normal nature has been rising in geometric progression; from no more than Rs 3.49 crores in 1954-55, the cost of interest on foreign debt has gone up to Rs 84.68 crores for 1965-66. Even so, repayments have risen impressively from Rs 47.59 crores in 1962-63 to Rs 97.28 crores in 1965-66. While I will not minimise the liabilities in foreign exchange that India is now burdened with, I would like to draw the attention of our friends to our exemplary conduct in meeting our obligations. Thus, as against foreign loans outstanding, at the end of 1965-66, of Rs 2,764 crores, we shall have already paid out interest amounting to Rs 355 crores; and repayments of instalments of principal as at the end of 1965-66 will have added up to Rs 407 crores. That, in the midst of our foreign exchange difficulties, we should have met such commitments bespeaks highly if I may say so, of India's creditworthiness. I urge our foreign friends, then, to extend untied credits to us, so that the beneficial cycle of utilisation of idle capacity, augmented production and enlarged exports can be set in train.

Revolving Foreign Exchange Credits

Aside from the generosity of our foreign friends, I venture to suggest that the commercial banking system in this country can raise foreign exchange for maintenance imports. The Export Credit and Guarantee Corporation, it is true, has evolved a scheme for revolving foreign exchange credits for exporters; but for reasons I am unable to fathom, the scheme has not been availed of to any significant extent. I should think that the commercial banks in India could muster considerable foreign exchange resources by way of loans from their correspondents and associates in other parts of the world for precisely this kind of financing. The banking system in this country can help in fuller utilisation of idle industrial capacity; and it should be given the opportunity so to contribute. It is time that the various Export Promotion Councils and the Chambers of Commerce gave wide publicity to the scheme of revolving foreign exchange credits. If there are any procedural difficulties in the utilisation of such credits, they should be expeditiously removed.

Although the last year has been a hard one, we must be grateful that signs of a turn for the better have begun to be in evidence. It is for us to seize the opportunities as they offer themselves, so that we can now proceed with our great task of industrialisation.

Note: This does not purport to be a record of the proceedings at the Annual General Meeting.

Anil Starch

A SHARP contraction in margins has more than nullified Anil Starch Products' impressive expansion in sales. The company's preliminary profit figures for the year to December 1964 show sales nearly 22 per cent higher at Rs 4.18 crores but gross profit more than 6.5 per cent lower at Rs 47.14 lakhs. Depreciation charge has absorbed about Rs 9 lakhs more at Rs 26.94 lakhs and development rebate reserve has claimed Rs 2.60 lakhs more at Rs 4.30 lakhs. There is a sizable saving in the tax charge, which at Rs 10.41 lakhs is less than a half of the last year's. But inspite of this and the addition of Rs 0.22 lakh being refund of income-tax, the disposable profit amounts to only Rs 5.71 lakhs compared to Rs 8.63 lakhs previously.

The directors have not taken any decision in regard to the dividends at their meeting held on March 25. It is expected to be decided at their next meeting. Last year, the company paid a total dividend of Rs 25 per ordinary share, inclusive of Rs 5 as bonus, which absorbed Rs 9.95 lakhs. The preferential dividend claimed Rs 0.35 lakh.

Whatever the welding requirement—general constructional engineering, ship building or structural work—we can offer you the type you are looking for from our range of mild steel electrodes—**Radian, Ferrospeed, Vortic, Vordian, Ferron 5, Pressure Vessel.** The main features of our electrodes are easy slag detachability, reduced spatter loss, fast deposition rate and absence of pungent fumes. Manufactured under meticulous quality control, our electrodes conform to IS & BS specifications and are approved by the Lloyd's Register of Shipping. Our new cardboard packing is designed for convenient handling and easy storage.

Let us help you choose the right electrode for the right job.

That Bandung and This

DISTANCE and warped reporting have not successfully concealed our debacle at Jakarta. But the predominant reaction, even outside the Government unfortunately, has been either to ruefully blame it on the machinations of Pakistan and China or to play down the Anniversary celebrations as inconsequential and to take the attitude that India couldn't care less what went on. There is no inclination to ponder over the developments since 1955 which have made this Bandung so different from that. It is hard to believe that it was barely ten years ago that the Bandung Conference was held. The metamorphosis of our role in the Afro-Asian world and among the non-aligned could not have been more dramatically emphasised than by the contrast between our part at the first meeting in 1955 and the almost embarrassed appearance we put in at the Tenth Anniversary celebrations.

Consider our 1955 role : We were in the euphoric stage of our friendship with China; the conclusion in 1954 of the Pancha Sheel agreement with China led us to assume the responsibility of introducing her into the comity of nations—first among the Emerging Forces as a prelude to her eventual entry into the U N. So successful was Pandit Nehru's role that, by all accounts, Chou en-lai emerged as the leading figure of the Conference. Our ties with President Sukarno and his country also were particularly close. There was a Delhi-Jakarta *entente* with emotional and nostalgic references to the close cultural ties and similarities in contemporary economic and political postures. 'Bung Nehru' was as much a father figure in Indonesia as 'Bung Karno' himself and in India affectionate references were made to the basic rationalist and secularist approaches of the Indonesian leader, a Muslim but part Balinese and one steeped in the writings of Tagore and Gandhi. The odd man out at Bandung was Pakistan's Mohammed Ali Bogra and to a smaller extent Ceylon's Sir John Kotelawalla. Pakistan had just tied herself to the Western bloc through the Baghdad Pact and the SEATO, and Indian despatches at that time said that Pakistan's presence was at best a concession to her geographical Asianness and at worst a calculated plan of the Americans to put up Asian opposition at the meeting to what seemed to be a promising Delhi-Peking-Jakarta friendship. Pakistan and Turkey were indeed embarrassed participants while the irrepressible Sir John Kotelawalla drew many unfriendly comments for his presumption to speak against China.

If all this is repeated at length, it is only to draw the contrast with the Tenth Anniversary meeting. This time it is India who has been the odd man out. Far from playing a leading role, we are reduced to feeling gratified that we are not considered 'un-Asian'. Of the five original sponsors (at Bogor) of Bandung, Ceylon and Burma have lost interest. Pakistan and Indonesia have teamed up and we are left wondering why and how it all happened. It is childish to blame Pakistan as opportunistic or Sukarno as behaving like an ungrateful upstart as some of us seem to be doing. Pakistan is going through the same heady phase of a non-aligned and independent stance in foreign affairs as we did in the early fifties. She has mended her fences with the radicals of Asia—China and Indonesia—while being unremitting in her opposition to us. There is certainly more consistency in her policy than is conceded here if we interpret it as always being guided by the lodestar of opposition to India. Indonesia's change in attitude is the amalgam of disillusionment with our virtual abandonment of non-alignment, of envy at the aid which we seem to get, and of the Indonesian President's personal anger with some of our attitudes and personalities. Our support to Malaysia must have been the proverbial last straw but the parting of the ways was clear enough even at Belgrade.

It is unfortunate but a fact that we are now out of step in Asia. Our growing dependence on aid—for everything from food to military hardware —has rightly made us cut a sorry figure; our refusal to speak out on important issues out of fear of offending either Washington or Moscow or

which any increase in deposit rates will fail correspondingly to mobilise fresh deposits", he fears that the only result of the high rates now prescribed will be to reduce bank profitability.

Other bankers have taken less unambiguous positions. The chairman of the United Commercial Bank is a model of circumspection when he says that he is "not in disagreement with" the successive raising of the Bank Rate since it is intended to bring in more realistic rates of interest. He also concedes that the linking of the cost of central bank credit to bank's liquidity is equitable since it recognises that banks should not lend beyond their means and thereby over-extend themselves. Finally, he is cautiously hopeful that the higher deposit rates will bring more deposits to the banks.

But his approval of all these measures is severaly qualified. On the central question itself, he is apprehensive that the raising of the cost of credit might result in denial of credit to "worthwhile productive endeavours", particularly during the busy season. This argument does not, however, come out quite clearly. For one thing, it ascribes an importance to the Bank Rate inconsistent with his statement a little earlier that the Bank Rate follows rather than leads interest rates in the money market. That apart, it is not clear whether what is meant is that at the higher rates of central bank lending, total bank credit will be insufficient to meet the demands of "worthwhile productive endeavours" or that particular banks, which are overextended, will find themselves at the end of their tether. If it is the latter possibility that the chairman had in mind, is that not exactly what linking of the cost of central bank credit to the banks' liquidity is expected to achieve? Inevitably there will be a redistribution of advances among the banks as has happened in the last few months, in favour of the State Bank.

It is also interesting how, when the monetary authorities themselves seem to be giving up the pretence of being able to direct bank credit into different activities according to some order of priorities, bankers continue to argue as if their dispensation of advances strictly conforms to national purposes. The Deputy Chairman of the Indian Banks' Association has drawn attention to the fact that bank advances to industry had increased to 59 per cent in March 1964 from 34 per cent nine years earlier while their commercial and financial advances had declined to 31 per cent from 50 per cent. It is, however, difficult to draw any inference from these figures about the impulses which cause banks to distribute their advances among different sectors. To a large extent the changed percentages reflect the growth of industrial production in the period in question and the increase in the proportion of national income originating in industry. Besides, the break-down of bank advances is by borrower category, not purpose, and as such the higher percentage of advances to industry may indicate to an extent larger inventory-holding by industry and perhaps vertical integration of manufacture and trade in certain sectors.

With the shortage-of-credit-for-essential-uses argument based on rather faltering foundations, the bankers' case against the higher cost of central bank credit comes to depend very much on the profitability argument, which is sharpened by the prescription of minimum deposit rates and of a ceiling on advance rates by the Reserve Bank. The Deputy Chairman of the Banks' Association claims that on the basis of the prescribed rate of 6 per cent on one-year deposits, banks will "break even" after meeting overheads only if they can earn an average of 10 per cent on their advances. These are startling statistics, considering that roughly a third of total bank deposits earn no interest at all and that a considerable proportion of the rest earns interest well below 6 per cent. However, even if we accept the Bankers' Association's figures what they indicate is that there will now be greater pressure on every bank to raise the preferential rates that it charges on advances to favourite borrowers and bring then nearer the rates charged from the rest. If this happens it will be no bad thing—unless, of course, bankers can convince us that their advance rates, too, are graded according to the rating of the purpose of the advance in the scale of Plan priorities!

A Rebuff or An Affront?

WHEN is a rebuff a rebuff and not a snub, and when does it become an affront and an insult? Is a request for the postponement of an official visit by the host country any of these? President Johnson's postponement of Lal Bahadur Shastri's visit has been variously interpreted in this country. In Parliament it has been taken very seriously indeed. One member went so far as to describe the postponement as "unprecedented in diplomatic history". What seemed to irk members particularly was the fact that Shastri had been bracketed with President Ayub Khan. But this should have caused less surprise; it has long been U S policy to treat the two countries on a basis of parity. After all, Pakistan does still belong to CENTO and SEATO. Moreover, her diplomatic star is rising. It must be equally galling to Pakistan to feel "equated" with India.

Given Parliament's predictably strong reaction, Shastri must have decided that a suitably strong response to the US action was called for. On balance his decision to cancel his visit seems appropriate. It takes some of the steam out of increasing criticism in the country of growing subservience to the U S. Besides, Shastri's and India's views on Vietnam have already been conveyed to President Johnson via Harriman and will no doubt be conveyed to him again via Cabot Lodge, who is due to pass through Delhi soon. Indo-U S relations hardly suffer on account of unsatisfactory lines of communication. Shastri is not likely to have persuaded Johnson to stop bombing North Vietnam during his brief sojourn in Washington. Indeed the U S President would not have asked for a postponement, were he somewhat more amenable to other people's views on Vietnam. This appears to be the real cause of concern: the calling off of Shastri's visit is only another indication of the U S President's increasing irritation with, and disinclination to consult, adverse international opinion on Vietnam.

Too Much Useless Research

IF the impact of modern science on our agriculture appears nominal, it is not for want of enthusiasm for research but because much of the research is misdirected. Worse, the results of this research hardly ever reach the man at the plough. This is what one reads in the Estimates Committee's report on the working of the Indian Council of Agricultural Research.

The I C A R is charged with promoting and aiding research in agriculture—with providing the needed "leadership". For this purpose, it makes grants to schemes of research undertaken by various recognised institutions, private and public. In this the ICAR has not escaped the common administrative failings. The Estimates Committee notes that the long and cumbersome procedure laid down for sanctioning schemes leads to the lapse of more than a year between the receipt of a scheme and the communication of its financial sanction and of

yet another year or two before the scheme is actually activised. In the selection of personnel there is further delay.

But the most serious criticism the Committee has to make is with regard to the co-ordinating functions of the Council. Unnecessary duplication and much waste of resources are the result of the helpless attitude assumed by the ICAR. One of its spokesmen admitted to the Committee: "It is a fact that excepting for research which is carried on under the grants given by the ICAR, we have no knowledge of the research programmes of State Governments. They do not come to us and so we do not know... It is doubtful whether the State Governments themselves know what is being done at various institutions. There must be a fair amount of duplication going on". The Agricultural Research Review Team (1964) had earlier reported similarly: "On several occasions we saw research along parallel lines being done at stations situated only a few miles apart but under different authorities and found no co-ordination between the programmes".

Such examples of misdirected energy were found elsewhere too. The Council spends nine to ten lakhs of rupees out of its research funds on administrative staff when the Government could be asked to shoulder this burden. In 1964 it brought out 39 publications, 32 of which were in English, 7 in Hindi and none at all in the regional languages. The Estimates Committee is very sceptical about the need for so many publications—none of them meant for the cultivator. Indeed, it has ample reason to be. On March 31, 1964 the value of the Council's publications that remained unsold was close to three and a half lakhs of rupees.

On the promotion of agricultural education, the vigilance and assistance of ICAR have been less than adequate. A host of agricultural universities, ill-planned and ill-equipped, often with less than thirty acres of land for experiments have freely mushroomed in several parts of the country, creating problems of deterioration in standards, lack of uniformity in courses and in the number of years of training and regional imbalances between the supply of and demand for agricultural graduates. Little planning has gone into agricultural education as is obvious from the fact that no proper scheme of incentives to attract the right talent has been worked out. The administrative services and medicine and engineering remain the prized professions and the poorest quality students take up agriculture. This is hardly surprising when the scales of pay, conditions of work, chances for promotion are all such as to discourage the entry of the better students.

Research is meaningless if the cultivator does not benefit from the increased knowledge and yet the weakest part of the ICAR is its extension programme. Contact with the cultivator is minimal and the successful graduates prefer administrative posts to farm work. The Estimates Committee suggests the opening of more vocational schools teaching agriculture to middle school boys in the villages. One may go further and say that what is needed is an overhaul of the assumptions and objectives of the present education system in the rural areas which is at best a poor copy of its urban counterpart, unrelated and irrelevant to the needs of the villages. Agricultural education is not a mere matter of turning out agricultural graduates and introducing agriculture in the schools. It implies a change in values and attitudes. This is the objective that education in the rural areas ought to be tailored to achieve, but isn't.

Saving and Investment

THE Reserve Bank's estimates of saving and investment in the Indian economy have been brought upto 1962-63. The latest estimates, the third in the series, are published in the March issue of the Bank's *Bulletin*. Though "basically" the method of estimation has remained the same as before, there have been some "refinements". These relate mainly to (i) saving of State governments; (ii) blowing up of saving figures for the corporate sector on the basis of the paid-up capital of enumerated companies; and (iii) household sector's saving in the form of gold and in physical assets in agriculture, corporate shares and securities. Inventories in (non-corporate) trade and agriculture have been included for the first time.

According to this study, at 1948-49 prices, total gross saving amounted to 5.7 per cent of national income in 1950-51; over the next three years the percentage fell to 5.4 in 1953-54. In 1954-55 it jumped to 8.0; then it rose further to 9.7 in the following year. There was a slight decline to 9.5 in 1956-57, followed by a sharp fall to 7.0 in 1957-58. The figure recovered only slowly over the next five years, so that in 1962-63 it had only reached 9.7 (which is the level it had already reached seven years before). Of course, as the study points out, since the necessary information is not available for all the individual years, the estimates of year-to-year variations in saving are rendered "less reliable". Still the decline in the percentage of saving in 1957-58 was so marked that it merits detailed analysis. The study refers only to proximate causes: "a running down of inventories in agriculture and trade and a sharp drop in investment in urban housing."

There is some analysis of the estimates which reveal significant results. For example, it is shown that average saving-income ratio for the government sector declined from 11.9 in the First Plan period to 11.2 in the Second. The ratio for the domestic corporate sector showed a major decline from 42.8 to 35.8. The saving-income ratio has been rising only for urban households. Another interesting result is that "within the household sector, in most years covered by this study, the share of rural saving is much less than that of urban, considered in relation to total saving, or in proportion to national income or income of the respective sectors".

Aggregate marginal saving-income ratio during the Second Plan with reference to the First Plan is estimated at 18.9 per cent; the corresponding ratio during the first two years of the Third Plan with reference to the last two years of the Second Plan is estimated at 14.6 per cent. As contributors to total saving, both government and the domestic corporate sector have done badly. The percentage share of government in total saving declined from 17.6 in the First Plan period to 17.3 in the Second; (government's saving as a percentage of national income rose from 1.2 to only 1.5 over the same period). The percentage share of the domestic corporate sector in total saving over the same period also fell from 6.2 to 5.1; (its saving as a percentage of national income stayed put at 0.4). But the household sector increased its share from 76.2 to 77.6 and its saving as a percentage of national income rose from 5.0 in the First Plan period to 6.6 in the Second.

The study also contains much useful information on the behaviour of domestic investment and the inflow of capital from abroad. Investment as a percentage of national income (at 1948-49 prices) was 7.2 in the First Plan period, 11.7 in the Second, and 12.3 during the first two years of the Third.

The Ideal Contraceptive

A Correspondent writes :

THE Union Government's green signal to the States to promote the use of intra-uterine devices (IUD) as an effective method of birth control promises to prove a landmark for the family planning movement in the country. The search for an inexpensive, effective and simple contraceptive has brought forth what seems to be a satisfactory answer with the added advantage that, once adopted, it requires a couple to do something to restore an otherwise inhibited fertility.

The origin of IUD can be traced back to the use of rings of silkworm gut and gold or silver wire by a German gynaecologist, E Grafenberg, around 1928-30. These devices continued to be used by individual doctors but there was little interest in them in medical literature between 1934-59. In 1959, the research publications of two doctors from Israel and Japan revived interest in IUD. Experiments by two American doctors, Dr L C Margulies of the Mt Sinai Hospital of New York and Dr Jack Lippes of the School of Medicine of the University of Buffalo, with 'coils' and 'loops' respectively, removed the difficulties of the earlier devices and opened up new vistas in the technology of family limitation.

An international conference sponsored by the Population Council in New York in the spring of 1962 and attended by medical representatives from 11 countries, including India, held IUD as extremely promising and recommended expediting of further work. In the same year, the Government of India entrusted to the Indian Council of Medical Research the task of evaluating intra-uterine contraception and some 48 studies covering over 2,000 women were undertaken. While the results of these studies are yet to be published, the decision to recommend IUD to the States indicates that the results have been encouraging.

Both the Margulies coil or spiral and the Lippes loop, now in world-wide use, are made of polythelene which is chemically inert and flexible enough to permit their insertion through a strand-like tube with a plunger without any dilation of the cervix. The technique of insertion is simple enough and trained midwives can do the job so that the organizational problem in promoting family limitation becomes manageable. Both the coil (shaped roughly like a shepherd's crook) and the loop (shaped like a double 's') are available in two sizes—large and small —and for both the large size has been found more stable and effective. While the mechanism of the conception-inhibitory effect of IUD is yet a subject of research, the failure rates—the number of unintended pregnancies per 100 insertions at 12 months after insertion—of the loop and the coil are significantly lower than those for condom or diaphragm as used by a sample of 1,165 metropolitan couples in the U S A in 1957. The cost of a coil or loop is about 15 to 20 paise and it can remain in the uterus as long as desired without any carcinomatous effect. Also, unlike sterlization, whose reversibility is as yet under experimentation and discussion, IUD can be removed without any adverse effect on fecundity or the child-bearing capacity of the female.

A central question about IUD has been the rate of their expulsion, with or without notice by the wearer, and the rate of removal due to complaints of excessive or persistent bleeding during or after menstruation, pain or the development or reactivation of pelvic inflammatory disease. However, women using IUD can be trained to verify, say, every week whether the IUD is in position. Besides, these problems appear mostly in the first few months after insertion and it seems possible to remedy them through anticipatory administration of vitamins and minerals and the use of antibiotics. While women with any infection may not be given IUD, advance assurance about the transitory nature of side effects also promises to improve the acceptability of IUD.

IUD are being used in many countries including the U S A. The Lippes loop has been found more effective than, and preferable to, the coil. A factory for the manufacture of IUD is being set up by the Government at Etawa in Uttar Pardesh. Pending the adequacy of indigenous supply, the Government has arranged to secure about 6 million devices from the Population Council, New York, to be distributed to various States.

While the recently accelerated medical research on the physiology of reproduction can legitimately be expected to come up with even more effective and simpler contraceptives in the future, at the moment IUD appear to be the ideal contraceptives to meet the need of the masses in a country like India. While it cannot eliminate the need for sufficient motivation for family limitation, it will certainly facilitate the generation of such motivation. And since once inserted, IUD do not require couples to take precautions at every coitus, the need for a steady level of motivation for family limitation will be minimized.

Capital Export and Balance of Payments

BALANCE of payments problems have recently forced the world's two most important capital exporting countries, the U S A and the U K, to take steps to discourage the flow of private capital abroad. In this context the quotation given below from the statement of the Chairman of British Petroleum to the company's shareholders is of interest. British Petroleum, incidentally, operates almost wholly outside the U K. Nearly 100 per cent of its producing activities are located overseas and so are nearly 90 per cent of its sales. Says the BP Chairman :

"During the past year a good deal of attention has been given to the subject of overseas investment by British companies. When considering our (BP's) contribution to the U K balance of payments, I think it best to distinguish between two quite different aspects of our operations. The first part is our overseas trading in oil which does not enter this country. From the results of this overseas trade the contribution amounted to £ 42 million in 1964 after allowing for new investment abroad... The second contribution consists of the saving on our oil imports into this country to meet the energy requirements of the home market. The cost of these imports in balance of payments terms was £ 36 million, but if this oil had had to be purchased from a foreign-based oil company the overseas payments might well have been at least £ 25 million more.

"It appears true to say, therefore, that your company's contribution to the U K balance of payments totalled at least £ 67 million, being the overseas earnings of £ 42 million plus the £ 25 million saving on imported oil, and these figures are arrived at after deducting in full all remittances for new investment overseas. Nor should we forget that considerable exports from this country such as plant, machinery and general stores are generated by our operations abroad.

"... Our net assets outside this country at the end of last year were about £ 450 million, so that in terms of a contribution to this country's balance of payments the return on this investment was about 15 per cent."

CAPITAL VIEW

A 'Coup' in the Foreign Office

Romesh Thapar

IN knowledgeable circles, our quiet, self-effacing Prime Minister is considered one of the most remarkable political in-fighters of the sprawling Congress Party machine. Admittedly, he has not been endowed with the kind of equipment which we have come to associate with leadership, yet he has managed to present himself to the country as the only possible candidate for leadership. Today, for example, when his public image is anything but what it should be, the truth is that he is more firmly in the saddle than ever before — and this is so despite the repercussions of the Abdullah visit, despite the successful Pakistani attack in Kutch and despite the crude and brusque manner in which his visit to the USA has been 'postponed' by President Johnson.

Calculations Upset

It is somewhat difficult to cut through the whys and wherefores of the situation which prevails, but, nevertheless, it is important to record that Prime Minister Lal Bahadur has for some weeks been rather concerned by the way in which various trends in foreign affairs are compelling him to assume postures not relished by him. True, these postures are inhibited, belated, disjointed, without a determination born out of conviction. In totality, however, they have confused the careful calculations of those influential circles who until yesterday firmly believed that a few sharp proddings would make post-Nehru India a vassal of the West. President Johnson's computers, human and mechanical, seem to have indicated that the GOI will be more easily tackled after the buffeting it receives at the Afro-Asian Algiers Conference!

That India has been equated with Pakistan, and that Lal Bahadur has been made to look rather ridiculous before the world, will not be lost upon the GOI. There is anger in normally placid quarters. But will it find expression in a more frank assessment of critical international issues? Will the lazy leadership of this country be roused from its long sleep? Or will we continue to phrase our declarations in such a way that we influence no body and only irritate our friends? The pointers are ominous.

The other day, U S Ambassador Chester Bowles thought fit to visit our Foreign Office to lecture a senior secretary on the failings of India's foreign policy. Bowles used the most intemperate language in describing his reactions to the GOI's stand on the escalation of the war in Vietnam, the use of gas and the inadvertant description (by Foreign Minister Swaran Singh) of the U S President as a 'U S spokesman'. The GOI was told that it was ungrateful for the assistance given by the U S A since the Chinese attack in NEFA and Ladakh, that it lacked understanding of the implications of the Vietnamese conflict as part of the war against communism, and that it was unable to distinguish between its friends and enemies. Some such insinuations were made earlier by Averell Harriman. Bowles also opened fire, as it were, on the GOI's attitude to the twisted aircraft carrier story.

Juniors at the Foreign Office expected that Bowles would be ticked off as soon as the note prepared by the senior secretary had been studied. Minor slips of this kind by self-important Ambassadors had earned them a pointed rebuke in the past. There was no reaction. And, towards the end of last week, came another blow. Unknown to the Foreign Minister, a press statement was issued announcing the constitution of a Committee of Secretaries to help formulate foreign policy. It was in the nature of a 'coup' at the Foreign Office, and has been so interpreted in the Capital. Indeed, the assessment is even more provocative. It is maintained that in future the possibility of obtaining western aid and assistance will be an over-riding consideration in the formulation of foreign policy, that this is the real objective designed for the new Committee of Secretaries.

Reduced to a Rubber Stamp

It is still unclear as to how this concept of a Committee of Secretaries came to be projected. Foreign Minister Swaran Singh knew nothing about this move which, in fact, reduces him to a rubber stamp. True, the Prime Minister has been widely criticised as a result of his Foreign Minister's inept handling of issues. But it passes comprehension how this new Committee is going to fare any better. These gentlemen of the ICS — described by K M Panikkar as 'the unlettered service'! — are already so involved in dabbling in all manner of subjects that their tentacles need to be drastically confined. If, however, their job is to make foreign policy dependent on the *diktats* of western aid and western capital, then it is time to investigate what goes on in the Foreign Office.

On the surface, the story is that Swaran Singh has protested against the attempt to make him an obedient mouthpiece of such a committee. Some say that this is Lal Bahadur's subtle way of easing him out of the Foreign Office, and wonder who will succeed him to this degraded post. It is argued that only if Lal Bahadur took over the reins could the Committee be made to look innocuous, but this too is out of the question. As for the demoralising effect this move to 'streamline' foreign policy planning has had on the permanent cadre of the ministry, the less said the better; a serious revolt is developing against the 'coup'.

Conspiracy Against Foreign Service

Even casual observers of the scene have been startled by the almost deliberate attempt to give the most incompetent men the most responsible positions in the Foreign Office. If the present process continues unchecked, we will be at the mercy of men who have no understanding of the vital interests of this country and little desire to project them. Of course, the usual seniority arguments are used to justify the process. The attempt is to smear the entire foreign service with the charge of incompetence, although it is well-known that the service has many able officers who could be used to strengthen policy planning. In this way it is intended ultimately to so infiltrate the foreign service that power passes to men committed to a Westward orientation.

The conspiracy against the solid core of the foreign service, which continues to work for a sovereign policy, has been developing for several months. It was speeded by the waffling of the Foreign Minister and the heavy reliance the Prime Minister places on the advice of those bureaucrats closest to him. Members of the I C S Establish-

ment (active and retired) who were frustrated in their attempt to push through the VOA deal, and senior military personnel, who imagine that a military alliance with the West is the only answer to China and Pakistan, had also been lobbying for a drastic overhaul of the Foreign Office. The 'Coup' has been most carefully planned for the public has been influenced to believe that a salvage operation is overdue.

The poor calibre of the seniors who control the Foreign Office, their refusal to coordinate their activities or to establish a policy planning cell which would activise their more able juniors, the conscious effort to keep the more perceptive men of the service engaged in unimportant diplomatic assignments which could well be done by the moronic seniors posted in Delhi, the deliberate failure to plan international moves in perspective or to engage the talent of experts in researching trends in strategic areas of the world, and the apathy shown in projecting India's case abroad, has been exploited to create the sanctions for the constitution of a Committee of Secretaries to formulate foreign policy. The implication is that we only need the brains-trust of a few non-experts to give us expertise. How fatuous!

Shake-Up Imperative

The dreams of the 'coup' leaders have fortunately been shattered by President Johnson's rude 'postponement' of the Prime Minister's visit to the U S A and the subsequent 'cancellation' of the trip by Lal Bahadur himself. Incensed by the treatment given, the Congress parliamentary party is boiling with rage — and the rage increases every time an attempt is made to explain away the rudeness with a sly anti-Pakistani interpretation of the incident, for it is known that other visits by lesser persons have not been postponed. The Prime Minister himself has spoken with a new-found sharpness on the Vietnam situation — and at a meeting of the Indo-Soviet Cultural Society in the Capital! This new emphasis is likely to be underlined in the coming weeks, as also the stress on India's close friendship with the Soviet Union.

But the Prime Minister requires to do more than this if he desires to block the developing 'coup' in the Foreign Office. The situation of paralysis which has been deliberately created under the aegis of Swaran Singh by a present bureaucratic apparatus at the Centre can only be broken by a real shake-up in the Foreign Office, a shake-up which brings the most able and dedicated officers of the foreign service into control irrespective of seniority and other such absurd considerations. Preferably, this shake-up should follow the appointment of a new Foreign Minister.

Lal Bahadur cannot afford to procrastinate. Too many challenges are developing. It is imperative that an active, alive Foreign Office start functioning without delay. Only then can we be reassured that the projected 'coup' has been squashed.

LETTER FROM SOUTH

Dissidents in the Congress

IT is still not clear as to when exactly the gathering of Congress dissidents is going to take place in Bangalore. There are possibilities that it will be postponed for some time because of certain new developments in Kerala. But there is little reason to doubt that such a convention will take place some time this year to prepare for the pre-election tussle for constituencies.

The convenors of the proposed convention are the anti-Nijalingappa group of Congressmen in Mysore State. They allege that the present Ministry is corrupt, factional and isolated from the people. A great many memoranda have been prepared by the Congress opposition against the Ministry to this effect and publicly circulated as well as sent on to the High Command. The complaint now is that the High Command has also turned callous and hence an appeal has to be made directly to the supreme arbiter—the people.

The motivating forces seem to be caste rivalry—the Lingayat-Vokkaliga conflict is at the root of a great deal of the political strife in Mysore State —and the conflict between Congressmen belonging to the old Mysore State and those who came in when all the Kannada-speaking areas were amalgamated. Though linguistic reorganisation was never opposed, the movement for a united Karnataka had not gained the tempo or the depth that similar movements acquired in Andhra and Kerala.

No Coherent Programme

The dissidents in Mysore State have not yet put forward any very coherent programme or a well thought out platform of action. Corruption seems to be the rallying point. Where they have displayed a certain novelty is the invitation they have extended to other dissidents in other States and the energy with which they are attempting to bring in the Kerala Congress rebels. They seem to feel that they can give a lead to the rest of the country and form dissident Congress parties in one State after another till a parallel Congress is ready throughout the country by the time of the 1967 General Elections.

It has now been disclosed that the first thoughts about forming an all-India dissident Congress matured during the Guntur AICC session last autumn. The brain behind the move is said to be Morarji Desai or, at any rate, the coterie close to him. The strategy is based on the calculation that with the death of Pandit Nehru the possibility of balancing, manoeuvring and yet remaining together has considerably diminished. At the same time, the discontent of the people was sure to mount without Nehru there to act as a safety value. But no opposition party would be able to garner the harvest of this discontent as the Congress was still identified in the minds of millions with India itself. Hence, the failure of the Swatantra to make any significant headway since the last elections. Logically, therefore, the dissidents should put forward the claim that they were the "true" Congress.

The first move in the new game was the formation of the rebel Congress in Kerala. Kamaraj attempted to boldly face the challenge but the results demonstrated that quite a sizeable chunk of the traditional Congress vote had shifted its allegiance, undoubtedly on the basis of caste and religious appeals. It was significant, also, that the official Congress, though still well-off financially, did not have quite the plethora of funds that normally is made available to it. Possibly, the hope was that some heads would roll! The hope was very nearly realised since the effective campaigning in the State for the official Congress was confined to Kamaraj and Krishna Menon.

The full impact of this new factor in southern politics could not be felt because of the hesitations of the Nair Communalists and the Catholic hierarchy. The rebel Congress leaders were quite prepared to form a coalition ministry with the Muslim League and based on the benevolent neutrality of the Left Communists. The latter, however, did not agree to any blanket promise in the matter. Worse still, Mannath Padmanabhan suddenly declared that President's Rule was the best solution in the given circumstances and that his grouse against the official Congress was that they had not 'shot' both varieties of Communists! This was followed up by some Catholic bishops coming out with the pious warning that all good Christians should remember that they must do nothing to further the ambitions of the atheists. Both these influential forces are hesitating as to whether the present juncture is the most propitious for staging an open rebellion. Their caution is likely to prejudice the chances of the proposed Bangalore convention as well.

A great deal will depend on the extent to which the Shastri-Kamaraj *entente* is able to consolidate itself and intervene firmly but imaginatively not only in the internal strife of the Congress but in the larger policy conflicts that are looming ahead. There are no significant signs yet that either of these two leaders will demonstrate imaginative firmness.

Growing Polarisation

The real significance of dissidence, however, lies in the belief that the Congress name has still a magic appeal to the vast majority who are expected to favour the concept of progress with stability. The corollary of this belief is that no viable alternative to the Congress, i e, openly anti-Congress, can be built in the near future. It cannot be denied that the Congress hold on the people is still very extensive and that as capitalist development proceeds the tendency to play it safe by sticking to old labels will increase in strength among the smaller proprietors. But this very development itself produces its own polarity, not between increasing wealth and increasing poverty but between concentration of power and rising expectations. Already, the operation of this polarity can be seen in the greater stridency of Big Business on the one hand and attempts at militant consolidation as in the Sangram Samiti of the workers or, locally, in the Mahagujarat Janata Parishad. It is this latter trend that has all the potentiality of rapid growth, if the various Left parties do not pursue their sectarian paths. Once this trend gathers momentum a real choice opens before the people and the large mass of democrats who still hold to the Congress.

The possibilities of some sort of open split in the Congress can and should be utilised by the adherents of this trend to push ahead. It would be fatal, however, either to rely on the dissidents for an alliance to move Left or to rally to the official Congress in the name of defence against the Right. The first task of the Left is to establish its identity through a platform and through joint actions. This in itself would produce a sizeable mutation in the political scene, not the least of which would be the inducing of relevent separations in the Congress. Then alone would true dissidence in India acquire coherent mass dimensions.

Dharmapuri Victory

Another setback to the dissident plans came with the Congress victory at Dharmapuri in Tamilnad. The election contest took place in the aftermath of the recent massive anti-Hindi upheaval. The DMK had mustered its entire strength, Rajaji had actively campaigned and the Congress seemed rather demoralised, especially as the seat had been won by an Independent in 1962. The 11,000 majority, therefore, represented a thumping success for the Congress, somewhat belying facile hopes that the mass base of the Congress had substantially melted away. Many a Congressman, attracted by the dissident idea, must have wondered whether the chances for personal uplift were still not better within the official fold.

These reverses, however, are not likely to completely kill the new move. The Mysore dissidents seem to be firm on keeping to their original resolve. The objective situation appears also favourable to the possibilities of split. Even when Nehru was alive the factional squabbles were mounting in the last year. It is not altogether fanciful to postulate that these quantitative conflicts are approaching the point of a qualitative leap to open dissidence.

FROM THE LONDON END

Convincing the Americans

EASTER is traditionally a time for hope, and Harold Wilson's sketch to his American audience provided a most convincing Labour blueprint for the real economic renaissance of Britain. In a really inspired speech at the New York Economic Club, the British Prime Minister's main object was to scotch finally any rumours that remained of the possible devaluation of the pound, to restore foreign confidence in Britain's economic ability to deal with her balance of payments problems, and to raise, once again, the vital question of international liquidity and the need for a more positive approach to this problem.

In his speech, Wilson strongly reaffirmed the Government's "unalterable determination to maintain the value of the pound". Hard-headed New York businessmen must have seen the logic of Wilson's confession that shortly after he had formed a Government, he had discussed with Brown and Callaghan the serious difficulties of the balance of payments position they had inherited from the Conservatives, and had discussed the possibility of devaluation, but had reached the firm conclusion that this, though providing an easy way out, was not the solution for Britain's problems. The situation was quite different from 1949 when the exchange rate had been held at an unreal level at the end of the war, and the time had come to make terms with reality. The situation to-day was different. Moreover, it would disrupt established and trusted values in world trade and have a particularly unfortunate impact on the Sterling Area and international trade generally. Surely the Americans must have got the message that if

Labour had intended to devalue the pound, it would have done so immediately after taking office, so that the blame could have been squarely laid on the Conservatives.

The British Prime Minister dealt at some length with the measures now being adopted by the Government to tackle the balance of payments deficit which he hoped would be reduced by half, to $350 millon in 1965. He hoped that it would be completely eliminated in 1966.

Overseas Investment

Justifying the Chancellor's curbs to restrain new overseas investment, he pointed out that it was economic nonsense to feel that Britain should keep on adding to capital investment abroad for the sake of future returns, at a time when she was still in the red on her current payments. While Wilson was making his speech in America, the oil companies in Britain, particularly British Petroleum and Shell, were starting to mount a campaign against the restrictions on overseas investment introduced in the Budget.

Many commentators on the Budget have pointed out that one of the main drains which keep Britain in the red in her balance of payments account, is the vast sums that are spent annually on overseas military expenditure. This is running currently at the rate of some £300 million. It was, therefore, somewhat reassuring to hear the categorical statement from the Prime Minister that Britain's military expenditure abroad would be cut by one-third if the Defence Department met in full a new economic target which had been set for them. The aim is to save between £50m and £100m in overseas military expenditure.

How this saving will be made is not yet clear. The most likely possibility is a cut in the money spent in Germany on maintaining the British Army of the Rhine. It is understood that while in Bonn, Harold Wilson discussed this matter with the German Government, and if agreement were reached, as much as £50 million could be economised under this head. Of course, there is also the possibility of reductions in Malaysia and Aden, but given the Government's attitude to policy "East of Suez" and Britain's traditional role there, it does not seem very possible that many economies can be made there.

Giving a clear warning that those who speculated on a devaluation of sterling would burn their fingers badly, Wilson went on to point out that Britain's gold and convertible currency reserves were only a small fraction of its real reserves which it could bring forward to defend the present parity of the pound. These included Britain's overseas assets currently estimated at £11,000 million. Of these, £4,000 million were portfolio securities, and £6,000 million direct investment. The Government itself had an additional portfolio of foreign securities worth about $1,250 million "which we regard as our second line reserve and are easily mobilizable".

No Impact on Exchange Market

In making this statement, he was reiterating what the Chancellor of the Exchequer had said earlier in the week, when he stated that the Government would be prepared to throw the whole of the country's £4,000 million odd stock of private portfolio investment abroad into the battle to save the $2.80 parity if its existing supplies of ammunition were likely to prove inadequate. It should be noted that Callaghan's speech did not have much effect in bringing about a transformation in the exchange market in favour of sterling, and there was no rush for holders of short-term funds abroad to start transferring their money to London. Indeed, they still seemed to prefer the expense of covering themselves against exchange risks. The main reason why, despite a vigorous official declaration that the parity of the pound should stay put, the foreign exchange market still remains unconvinced, is that there is a widespread tendency these days to believe that even when Governments are contemplating devaluation, they are more or less duty bound to say that they will defend the official parity. Hence, there is a certain cynicism about these declarations.

However, the fact that the present Labour Government is determined to defend the parity of the pound with all the means at its disposal, has now been made evident to the world, and interest will, therefore, be focused on the more long-term proposals that the Government is taking to restore the economic balance of the country. In this connection, Wilson outlined the ten-point programme which the country was undertaking. These involved "tough measures" which would lead to "a new drive and a new sense of urgency, a new ruggedness and competitiveness" and technological advance and invention throughout British industry. These involved an all-out attack on restrictive practices, the redeployment of resources, and the launching of an incomes policy. To ward off inflation, they had imposed, both in the November and in the April Budgets, net increases in taxation and associated changes of nearly £600 million.

International Liquidity

Another major theme in Wilson's speech was the urgent need to supplement the world's existing liquidity arrangements. The burden of Wilson's remarks on this subject was that the world was in danger of drifting into deflation unless agreement could be reached on increasing the volume of world monetary liquidity, to keep pace with the demands upon it which expanding trade would involve. Under the present system, there was no means of matching the volume of liquidity to the needs of world trade without the continuous export of crisis and deflation from one currency area to another. Perhaps with memories of his recent visit to Paris, he said that too much was at stake for the payments problem to become part of any undeclared conflict for leadership and power within the Western alliance. Obviously, Wilson is no believer in a return to the gold standard. He said this was "effectively repudiated 35 years ago" by Keynes, and that there had been no change since then. He believed that an international credit revolution was essential now just as a revolution in national credit had been a prerequisite of the spectacular 19th century industrial development.

Certainly there is no doubt that a dangerous situation lies ahead if the present views of Continental bankers that the world's liquidity resources are sufficient is allowed to carry the day. Without some more efficient means of credit creation, plans of developing countries will grind to a halt for lack of foreign exchange induced by balance of payments difficulties which inhibit the main lending countries.

Excess Imports of Capital and Technology in the Private Sector

Michael Kidron

Many of the collaboration agreements between Indian industrialists and foreigners have not only been of no advantage to us but have actually thwarted the growth of technical know-how in the country. This fact was recently confirmed by no less an authority than the Council of Scientific and Industrial Research.

In this article the author shows that under collaboration agreements much capital and technology have been imported into India, unnecessarily and at great cost to the country. He also probes some of the reasons for such excess imports.

Important among these is the care taken by foreign collaborators to see that the importing of a technology is divorced as far as is practicable from the imparting of that technology. Patents are used to this end as are licensing arrangements and the many restrictive clauses written into collaboration agreements. Partial technologies are supplied and fundamental research and development confined to the foreign partners' home firms.

[Much of the material for this paper was gathered on a tour of India in February 1965, made possible by the British Council, Bombay University and the University Grants Commission.]

ELSEWHERE I have argued that India can expect little in the way of foreign private investment—as distinct from an increase in foreign claims on local resources — however permissive a policy the Government adopts[1]. The reasons lie in the bias of the typical foreign investor today towards technologically-intensive manufacturing and in the institutional nature of his inducement to invest. It is further argued, against the general view, that large flows of private capital are neither always necessary for, nor necessarily beneficial to, economic development.

This paper carries the argument further by showing that capital and technology have been imported unnecessarily, that is, wastefully and at great cost to the country. This is true in both the public and private sectors, although illustrations will be drawn from the latter only.

'Excess imports' like 'love' or 'sand dunes', is not readily amenable to quantitative description. Like the one, it contains a large normative element. Like the other, it deals with shapes rather than sizes. Like both, it is not, therefore, less real a concept. In an interesting article, John Knapp defined 'excess borrowing' as "imports of capital which arise otherwise than in connection with a need to finance such supplies of goods and services from abroad as are, in a given state of tastes, techniques and available resources, and of a given amount and composition of output and growth, both indispensable and unequitable."[2]

We can do worse than accept his definition and pass on to the more worthwhile matter of adducing current examples, probing some of the reasons for them and questioning the relevance of the 'rules of the game' which harbour them to India's problems.

In almost every plant visited, and in which the foreign collaborator had a significant equity stake, new equipment could be seen standing idle. In some it was fork-lift trucks, at Rs 30,000-40,000 apiece in foreign currency, replaced by one-ton pedal lifts made locally and selling at between Rs 300 and Rs 400. In others it was automatic lathes, replaced by very much cheaper capstans.

The Reasons

Asked for the reason, management spoke readily of short runs not justifying the use of the most productive equipment available; less readily of why and how the equipment was ordered in the first place. In one case, it was thought — only *half*-facetiously — that fork-lifts, idle or not, symbolized the seriousness and importance of the undertaking. In others it was admitted by the Indian partners that they had started with little idea of the equipment required for production and little experience of the technological approach likely to be adopted by the foreign partner: that where they had had an inkling of the extent of the gap between requirements and recommendations, they were unwilling to debate every last detail before concluding the collaboration agreement or even during the first few months of its operation, since they had more to lose than their collaborators from its termination or from the retarded growth of easy working arrangements and mutual understanding. As the outlay on such equipment was normally the foreigners' concern, the Indian partners did not pay a direct penalty and could afford, therefore, to be liberal.

Underemployment of too-specialized plant has its counterpart in underemployment of much of the technological knowhow which, having recommended its use, accompanies the equipment. One large firm, with three foreign technicians on its payroll, is typical. The three are highly skilled, two of them within a very narrow range as is normal within the mammoth organization which seconded them. Their particular specialisms are required for between two and four days a month on average. For the rest, they operate on a level they themselves consider inferior to that of their immediate Indian subordinates. There is more here than an overimport of expensive knowhow. The fact that these foreign technicians receive between seven and fourteen times their immediate, and frequently more-skilled, Indian subordinates, breeds frustration and irresponsibility within the firm, which affect directly the degree of waste, the amount of machine breakdowns, etc. After all, "they (the foreigners) are responsible, let them clear up the mess".

In this case management admitted that two at least of the three could be repatriated without damage to their operations, but pleaded unwillingness to enter lengthy negotiations with their collaborators and — a unique argument, this — thought the money well spent as an insurance against restive Indian shareholders: such is the strength of Indian xenophilia that the presence of foreign technicians would, they thought, give body to a plea of *force majeure* should anything go wrong in production.

Further examples deriving, like these, from ignorance — the Indian partners' ignorance of what is required; the foreigners' ignorance of conditions in India, coupled with his frequent use of technological (efficiency) criteria rather than economic (cost) criteria in selecting plant — could be

Age is not all... nor the mere fact of survival on the frayed ends of tradition. Among the earliest promoters of a concept — that of self-sufficiency for our country through extensive industrialization, we have known no ingenious ways to overcome obstacles apart from flexibility in decision making, and regard for ordinary principles of management wedded to probity. If we are today a rational complement of industrial units, that is because of our reluctance to sit on the fence of the status quo — waiting for an overwhelming consumer demand to develop before being able to set our sights. And if we have a modest reputation of worthiness, we intend to live up to it through an optimum use of talents, available resources and initiative.

AGE IS NOT ALL...

AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON AND STEEL CO. LTD.: With an enviable record of production efficiency the million ton integrated steel plant at Burnpur is ready with another two-phase expansion programme to double its production capacity by the end of the Fourth Plan period. The largest foundry in the Commonwealth at Kulti is being steadily modernized and expanded.

A subsidiary, The IISCO-Stanton Pipe and Foundry Company Limited, recently inaugurated, has its brand new factory coming up at Ujjain for the manufacture of spun iron pipes and ancillaries directly for the benefit of consumers in developing areas.

BURN & COMPANY LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive springs and components.

THE HOOGHLY DOCKING & ENGINEERING CO. LTD. Established in 1819, the Company with its shipbuilding yard, dry dock and extensive workshops is geared to meet defence and civilian requirements, and to produce dredges to keep our new harbours and channels of inland navigation open.

ROBERT HUDSON (INDIA) LTD.: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES: Some of the first feeder railways in India, with six systems in four states, still a great aid to suburban travel.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India serving a wide area in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester...Hand operated and electric overhead travelling cranes and chain pulley blocks.

REYROLLE BURN LTD.: A collaboration with A. Reyrolle & Co. Ltd., Hebburn, England—for the manufacture of specialized types of electrical switchgear of worldwide repute.

multiplied. They embrace cases of plant design and layout that had had to be drastically altered — by Indians — before production could commence; cases of unsuitably-frozen technology; others of unnecessary and frequent changes in product or process specifications; and much else. In aggregate, however, they are probably less important than those that derive more directly from accepted institutional arrangements or the 'rules of the game'.

An extreme example is to be found within one group whose managerial efficiency can stand comparison with anyone's. Two of the group's companies, standing side by side within a single complex of plants, manufacture very similar products, use very similar techniques and equipment and sell to an almost identical body of customers. Yet they are involved in two sets of collaboration agreements, two sets of imported equipment, two bodies of foreign technicians, of managers, sales staffs and overheads. The waste is obvious; and the explanation unanswerable within the accepted 'rules': the first foreign collaborator proved unwilling to expand his commitments when a market developed for the second line of products, and both foreign collaborators — competitors on a world scale — proved unwilling to join with the Indian group in a single consortium.

Pull of Brand Names

Such patent duplication of costs and effort within a single group and on one site is rare. But duplication is nonetheless the norm. On two occasions met with, important, well-entrenched Indian firms were forced into unwanted, technologically-superfluous foreign collaborations in order to secure the use of foreign brand-names. Without them they would almost certainly have lost out in competition with new entrants to the industry who had that foreign distinction. On almost every other occasion, collaboration agreements were found to have been concluded in industries and for products already covered in their essentials by similar agreements.

There are a number of reasons for this general duplication. One is the strong xenophile prejudice that suffuses Indian society. Almost invariably, an imported article is *ipso facto* preferable to one made in India and commands a higher price; a foreign brand manufactured locally by a foreign firm is better than one made by an Indian firm; and so down the line with decreasing value accompanying receding foreign-ness. This alone is a strong inducement for Indian firms to seek foreign links whatever the cost to the country as a whole.

Another, related reason is the care taken by many foreign collaborators to see that the importing of a technology is divorced as far as is practicable from the imparting of that technology. Patents are used to this end, as are licensing arrangements and the many restrictive clauses written into collaboration agreements; partial technologies are supplied; and fundamental research and development confined to the foreign partners' home firms. Often there are overwhelming economic arguments for such behaviour; equally, there are convincing arguments from interest, particularly for technologically-progressive firms whose strength lies in their control of the most productive techniques and in whose revenue the sale of knowhow looms large. Unfortunately for India, the presence of such firms guarantees that output in the industries in which they operate can expand beyond their own targets only by recourse to further collaboration agreements and further imports of capital and technology. Unfortunately, too, such firms are increasingly typical of new foreign investment.

Underlying both reasons is the Government of India's unquestioning compliance with one of the most fundamental — and, at this stage of development, one of the most crippling — of the 'rules of the game', viz, that technology remain overwhelmingly in the private realm.

To anyone aware of Japanese or Russian practice at a parallel stage of development, it seems incredible that the Government has voluntarily retained the British law on patents; that is, has voluntarily elected to remain one of the most expensive countries in the world for drugs,[3] where richer countries like Germany, France, Italy or Switzerland, that make no pretence of 'socialistic patterns', have abrogated patents in the industry and benefit from cheaper medicines.[4] It is almost as incredible that — at least until recently —' the Government has ignored such restrictive provisions in collaboration agreements as enjoin Indian firms not to use information supplied beyond the currency of the agreement, not to collaborate with other parties in related fields, or not to manufacture certain key components of a product. Equally surprising is the Government's complacency at the universal absence of research and development clauses in agreements.

Probably most incredible of all — reflecting something of the low priority given economic development in practice — is that the Government of India has refrained from conscripting Indian technologists and setting them to work and to train others on the job, whether in other private units or in public-sector pilot plants; has never, it appears, even considered such a move.

By one set of rules, proposals such as are implicit here are foul in every sense; by another — those relevant to economic development without dependence — they are an essential part of the game. And while it is true that the realities with which the Government of India has to deal are more complex than those of the playing field, and that private control over technology is not entirely undisputed at present; and while it is also true, given the organization of the world market in technology, that no government would be able to impress all its requirements into public service, it holds nonetheless that there is a choice to be made between technology (and much of the plant in which it is embodied) as a private commodity and technology as a public service. It is on this choice that the reality of excess imports hinges.

Peeping into the Future

Taya Zinkin

RECENTLY a very interesting conference was held in Paris under the auspices of "Futuribles", that serious body of crystal gazers headed by the distinguished French political philosopher, Bertrand de Jouvenel. There were some hundred delegates at the Futuribles conference which was summoned to try to forecast the relationship between power and the people in times to come. There were delegates from almost everywhere: two Indians, one of them a very senior civil servant indeed, there was a Pole from Warsaw, two Yugoslavs from Titoland, an Israeli, a Turk from Turkey and a Turkey from California, a galaxy of American scholars, French scholars, politicians and civil servants, many Britons, a few Germans and Swiss, a very amusing Belgian, some Scandinavians, a Senegalese. The Nigerian could not come because he was being sworn in as Minister, the Vietnamese because he was under house arrest, the Rumanian from Rumania, as distinct from the Rumanian from the London School of Economics had flue, and take-off Rostow was prevented from attending because of the developments in Vietnam. All in all there were close to a hundred delegates. Some of them very distinguished indeed; professionally they ranged from economists, jurists, sociologists, psychologists, politilogists which is a new word for political scientists, administrators, businessmen, historians, journalists, philosophers and politicians. For three whole days, from morning till evening these wise men gazed into their crystal balls in an attempt to predict the future of what Bertrand de Jouvenel calls the Active Power.

Decline of the King

There was astonishing agreement. The good old days when the Prime Minister or the King could say, *"l'etat c'est moi"* have gone, whether the country is democratically run or not. For this there are many reasons.

First and foremost there has been what Professor Shils called the *moral revolution,* the realisation even by the dumbest, the most feudal or the most authoritarian that power is not by divine right but by the will of the people. Next, and equally important, there is the competition with the state from all sorts of busybodies who know as much or more than the government and who do get ways of expressing their criticisms be they defence correspondents, economics dons and journalists, city editors, market researchers, gallup polsters, heads of special bodies like Neddy or the Planning Commission or the Atomic Energy Commission or simply private firms of computer programmes analysis.

Another reason is that power is becoming more and more complex technically speaking so that the politicians have to consult more and more experts and technocrats and naturally power shifts to some extent to the technocrats and the academically qualified. Moreover audio-visual and technical methods are superceding the straight forward old-fashioned ways of courting power. Thus television replaces parliament to a large extent, while gallup polls replace byelections.

People Given Their Head

Finally, and perhaps the most important factor is that everywhere, be it in America or in Russia, the efficiency of government is being measured in the growth of the national income instead of, as it used to be in the pre-second world war days, in terms of military conquest and the size of the pink on the map. Once the measure of the efficiency of the government is in percentages of the national income, or in function of the value added, the people have been given their head; only if they cooperate can government be efficient as the constant failure of the Soviet agricultural policy proves. Indeed, planning makes it possible for the ordinary citizen to voice his protest in a way *laissez-faire* economics did not. This explains why there has been a politisation and a proliferation of interest groups who make themselves felt, like farmers, trade unions, engineers, etc. The multiplication of the functions of the state provide a multiplication of means of protest. This is somewhat paradoxical, but seemed to be accepted by all the delegates; the Professor from Warsaw insisted that there are already pressure groups emerging in his own country. Indeed, there was agreement that the Active Power of tomorrow will be of similar nature everywhere with more authoritarian concentration in the democracies, where power will be more with technocrats and less open to question by lay politicians and voters because of ignorance, while there will be decentralisation of power in the dictatorships thanks to the creation of all the new pressure groups. As the professor from Belgrade put it eloquently "the right to disagree is the most fundamental of all human rights."

The only exception to the rule of diminishing political power seemed to come from the Senegalese delegate, D'arboussier who has just been appointed number two to U Thant at the UNO. According to him independence has put undreamed of political power in the hands of the governments of the newly emerging states. As he put it: "African states have for the first time discovered the importance of political power. In Europe there was time for transitional experience from political to economic power, but in Africa where we have to catch up we have to do everything at once and this means exercising a great deal of political power which, by virtue of the small size of our elite, must be concentrated in very few hands and must lead to the one party state."

Seat of Power

Next to the future of power the Futuribles scholars devoted their attention to the seat of power or what would be left of it. The delegates from the the socialist countries were not very interested in what must still be for them a very academic discussion. The dialogue, therefore, was largely confined to the rest, be they white, black or brown.

Whereas for the African States the seat of power is in the handful of its elite, in Turkey it is quite distinctly with the Armed forces which as the lady delegate from Ankara pointed out is the only possible escalator to power and social mobility because Turkey is still in transition from being a backward to an industrial country and does not have a large enough middle class for the technocrat to assert himself. In India, where there is a large enough middle class, there seems no doubt that power is with Parliament and the Planning Commission and that slowly the people will assert themselves—as indeed they seem to have done, if I read my papers correctly, when the city of Ahmedabad, the fount of Congress and the home-ground of Gandhiji, defeated Congress over the non-teaching of English.

The French, obsessed as they are by the recent developments of their

history, kept insisting that power must be strong and that it must be with the civil servants and the technocrats; they would have been quite happy to see the politician wither away in favour of the administrator and the expert. The British remained benignly amused: after all when one's muddling democracy goes back to Magna Carta there is little point in bothering about the seat of power. The Americans by contrast were most allergic to the suggestion that anybody, be it the President, Dr Strangelove, the Harvard Faculty or the Congress, might have power. They proposed, quite seriously, that the agencies which will be created to collect information and which may, therefore, contain the seed of that power which comes from advanced knowledge and understanding between cause and effect, be multiplied *ad infinitum*. The Germans, obviously unwilling to trust themselves to be good for all times, seemed to favour the seat of power residing in ultra-territorial bodies like the special agencies which will be set up to reinforce the Common Market and the One Europe and for which Gatt, Nato, or the Strasbourg Parliament already provide a guidance.

Experts and Politicians

But what fascinated me above all, listening to the experts as they went on conjecturing about the future of Bertrand de Jouvenel's imaginative "Active Power", the power which has to do with the conscious *wanting* or *willing* of the future of the nation, was that experts are vastly different from politicians. Politicians the world over have one thing in common: politics, which runs thicker than party loyalty. Thus, there is more in common between a Tory MP and a Congress MP, or between a member of the Presidium and the Cabinet in say Paris or even London, than between French democrats and British democrats and Indian democrats. This is because politics is its own idiom, it creates bonds such as there are between say doctors wherever they come from.

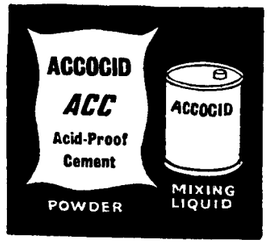
But with experts of the social sciences the primary bond is not between themselves but between them and their own compatriots. They are Frenchmen, Britons, Americans first and experts only second. This was most visible not only through the attitudes to power of the various delegates but also through the way they approached the problems of the Futuribles exercise of gazing into crystal balls. The French do it with Cartesian logic, they must have a theory, the theory must be admirably and lucidly expressed in classical French of the highest literary quality. Words have a fascination of their own for the French who are artists at choosing them. The Germans are somewhat pedestrian and very long winded. They are more concerned with the substance of treaties and checks than with effects of oratory. The British are generalists with a profound sense of the ridiculous and an equally profound distaste for theories. They muddle through from one pragmatic notion to the other, they play politics and power by ear. The Italians are above all profoundly cynical and very funny. They like to laugh at everything. As one of them explained privately, without a sense of humour we would be overcrushed by the Colyseum and the Vatican. The Americans are unbelievably earnest, they have a touching faith in statistical data and on the spot investigation. They are ready to investigate anything, then they are ready to feed their results into computers which should give them, adequately programmed, the answers to varying questions which they believe must be correct if the data and the programming was accurate. One can laugh at the American passion for collecting data; I remember a colleague of mine in the days when I was doing biochemical research at the University of Wisconsin who was assaying everything under the sun for its pantothenic acid content. One day, having run out of things to assay, she asked me to let her have a piece of my shoe laces and found, that, as the prefix pan indicated, there were traces of the acid in my shoe laces.

No Substitute for Information

One can laugh, but one should not. There is no substitute for information. What may at times be deplored is that the information is misused or misinterpreted. Nevertheless information is always valuable. Thus as one computer expert explained to me, had there been sufficient data in the computers, Martin Luther King might have been informed that it was the right time to embark on his march to Selma, and that the march would have certain results. As it was, there was a prolonged and quite agonising appraisal of what to do, where to do it, how to do it, and when to do it. All of which could have been solved by a run of a fully programmed and heavily informed computer. The ultimate decision to do right or wrong must, of course, still rest with the politician. Thus the same scientist said that if Truman and the Allies had known the after effects of Hiroshima they would still have dropped the bomb. The decision had been taken although it was known that an unprecedented number of people would die; this was deemed in the interest of ending the war; the radiations were only a side issue as far as decision making was concerned and would have been irrelevant.

Cause and Effect

The Americans insisted that it is important to know the relations between cause and effect. Their arch example was that when Henri VIII divorced Katherine of Aragon he did not plan the Reformation. The French argument seemed to be that he would still have divorced her and that any prognostic made by those who are actively engaged in assessing the relations between cause and effect are bound to be vitiated because they *are* the Active Power. A French diplomat quoted in support of his thesis the prognostics of Lord Curzon and an Australian by the name of Pierson who were both taking a Futuribles guess at the balance of power in Asia. Thus at the turn of the century Curzon wrote that India is the pivot of Asia and holds the secret of world domination and the British Empire while China will always remain static and never present any danger to Asia. Pierson said the exact opposite. Why was Lord Curzon wrong and Pierson right? The answer seems to have been that Curzon was a high official consulted by his own government and that he rationalised events while Pierson was an academic outsider.



It is this need for detached outside prognostic and interpretation which makes the exercise of Futuribles worthwhile, indeed there is a great deal in the theory that the Active Power is the least qualified to take long term views and therefore decisions. This need for detachment does go a long way to explain why the two most impressive Futurible scholars have so far been Karl Marx and, even more impressive and accurate in his prognostics, de Tocqueville. If science and the Americans have their way, both will be replaced in the not so distant future by electronic computers of immense complexity.

ACC

QUALITY PRODUCTS TO HELP INDIA'S INDUSTRIES

ACCOCID

...a special acid-resisting cement, proof against both acids and chemicals. For setting acid-resistant bricks in acid towers, fume stacks, acid storage and pickling tanks...wherever protection from acids is needed.

ACCOSET-50

...air-setting refractory cement which can withstand temperatures up to 1710° C., and has firm bonding strength. For jointing, bonding, monolithic and rammed linings, for protective wash of furnace-walls and floors etc.

FIREBRICKS

...manufactured to your specifications of shapes, sizes and alumina content. ACC Firebricks resist abrasion and spalling. They possess all the properties required for long service under severe operating conditions in high temperature zones.

The New Village-II

Technological Change in Agriculture

V Nath

This study of a village in Central Punjab aims at identifying the growth factors in agriculture.

The first part of the study, which appeared last week, presented the basic data on demographic characteristics, land-holdings and economic activity. In this, the second part, the different facets of the technological change in agriculture in the village are examined.

The picture that emerges is that of an agricultural community in which there have been notable advances in methods of utilisation of resources and a process of rapid adoption of improved agricultural practices is well under way.

This process began with consolidation of holdings which was followed by a rapid increase in the number of irrigation wells and electrification of most of these wells. These three developments made possible a more intensive cropping pattern, more adequate irrigation and care of all the crops grown, and increasing attention to adoption of recommended improvements, notably use of chemical fertilisers.

A stage has now been reached when adoption of improved practices has become part of the agricultural enterprise of the average farmer. Further, beginnings of highly specialised types of commercial farming or livestock enterprises, like commercial poultry production, have already been made.

The area is now ready for larger changes, which would bring about major transformations in farming techniques and make farming significantly more specialised and commercial.

Pattern of Land Holdings

IT has been noted in Table 2 (p 682, *The Economic Weekly*, April 17, 1965) that the 82 cultivating families of the village cultivate a total of 1103 acres. This gives a crude average of 13.45 acres per cultivating family. The distribution of families by sizes of cultivated holdings is given in Table 3.

The largest number of families (70 out of 82) cultivate between 5 and 20 acres. Femilies cultivating less than 5 acres are very small in number and have only a part-time interest in cultivation. Familes cultivating above 20 acres are also very few. Several of them are undivided joint families.

On further classification by one acre divisions, it is found that the largest number of families (21) cultivated between 10 and 11 acres, and that the median cultivated holding is 10.5 acres. The villagers consider those cultivating between 8 and 14 acres as medium-sized cultivators. Such cultivators number 38, somewhat less than half of the total. Data on farm operations of the ten sample cultivators of this group are presented in Table 4.

It will be seen that the net disposable income of these cultivating families ranged from about Rs 1,200 to over Rs 5,500 per year; the variation being dependent upon the number of workers in the family, the area cultivated, whether irrigation was being done by bullocks or by electric motor and the level of fertilizer use. This income remained with the family after meeting all its needs of food, providing for fodder for livestock including milch animals, and paying all the cultivation expenses (e g for seed, manures and fertilizers, labour etc). The value of the foodgrains and other produce (*gur*, *khandsari* sugar and cotton) retained by the families for domestic use varied from Rs 1,275 to Rs 2,360. Each family was keeping besides bullocks, two or more milk-yielding buffaloes and since the milk yields are fairly high (8 kg per baffalo per day or higher) the milk was sufficient for meeting all the milk and *ghee* requirements of the family. Further, all families grew some vegetables and had kept a few poultry birds also. Accordingly, the food needs of the families were met almost fully, and at a fairly satisfactory level of nutrition; and the disposable income was available for expenditure on clothing, repair or extension of the house, education, travel and miscellaneous expenses.

The calculation is not very refined, but it is adequate for the purpose of obtaining an approximate idea of the economic level of the middle cultivator. It is clear from it that this cultivator is considerably above the subsistence level; that he has a small surplus for education, travel and other needs after meeting his elementary needs for food, clothing, housing etc. Data on the character of housing, facility of electricity and water supply in the house, and possession of durable goods given later and general observations in the village also point to a similar conclusion. The main significance of this conclusion is that since the cultivator is not constantly pre-occupied with meeting his barest minimum needs, he can afford to bring a business approach to his cultivation, to take some risks and to make experiments with new practices. The extension staff emphasised that this latter had been one major result of the economic changes of the last fifteen years. As the VLW put it, "Earlier the sole aim of the cultivator was to feed his family and that of the Harijan who worked for him. Now however, several of them aim at making more money and are looking for changes in practices which would enable them to do so".

Land Use and the Cropping Pattern

Data on distribution of the cropped area among principal crops in 1951-52, 1956-57 and 1961-62, as obtained from the records of the Revenue Department, are given in Table 5.

These figures do not show any noteworthy change either in the net area sown or in the gross cropped area during this period. But there is an increase of about 200 acres in the irrigated area. In 1961-62, 85.6 per cent of the cropped area of the village re-

Table 3: Distribution of Families by Sizes of Cultivated Holdings

20 to 30 acres	4
30 acres and above	5

ceived irrigation. Irrigation was almost entirely from wells. Out of 951 acres irrigated in 1961-62, 940 acres were irrigated by wells. The increase in irrigation during this period has been due to increase in number of wells (from 30 to 51) and electrification of a large number (36) of these. The area under canal irrigation is very small, only 11 acres. The distributary of a canal passes through the village; but very few cultivators take water from it. The main reason given for not taking water from the canal is that there is sufficient water in the wells, and cost of lifting it is not too high. The fear of water-logging, which is a major problem in some of the canal-irrigated areas of Central Punjab, also discourages use of canal water.

The figures of Table 5 show significant changes in the cropping pattern, with increases in areas under more remunerative and higher-yielding crops like cotton, maize and the winter fodder *berseem*, and decreases in those under lower-yielding crops like gram, rabi grain mixtures (wheat-gram, gram-barley) and the summer fodder *chari*. The area under maize has doubled during this period; cotton which was not grown in 1951-52, has become an important crop and acreage under *berseem* has also increased. All these crops yield much more than the crops they have replaced. Maize and cotton are higher yielding or are more remunerative than gram or wheat-gram or barley-gram mixtures. *Berseem* similarly yields much more than *chari*. It gives 5, 6 or more cuttings in one season, compared to one cutting of *chari*. The value of fodder from an acre under berseem is estimated at about three times that from an acre under *chari*.

This change in the cropping pattern has become possible because of increased availability of irrigation, and especially because the cultivator has a much larger quantity of water entirely under his control. He can follow an intensive cropping pattern and ensure adequate attention to each of the crops grown by him. During discussions in the village, the cultivators repeatedly referred to the latter fact.

Consolidation and Electrification

All cultivators were agreed that the present phase of rapid improvement in agriculture, started after consolidation of holdings which was completed in the village during 1951-52. The advantages of consolidation of holdings for more efficient and intensive cultivation are so well known that it is not necessary to explain these here. However, the case of the Sarpanch may be mentioned to illustrate the point. He said, "Before consolidation my family had share in lands falling under 13 wells; but after consolidation all our lands came under one well, though we constructed another well later." Consolidation of holdings was followed by a spurt of development activity, the most important feature of which was extension of well irrigation. The village had 30 wells in 1951-52. By 1961-62 the number had increased to 45. In addition, there were 6 kutcha-bore tubewells in the latter year, bringing the total number of irrigation units to 51. The village received electricity in 1954; it was among the first villages in the block to receive it. Electrification was followed by a wave of installation of electric motors on the wells. Eleven motors were installed within one month in 1955 when a large *taccavi* loan was sanctioned for this purpose by the State Government. At the time of this study, 29 out of 45 wells had electric motors and one had a diesel engine. In addition, the 6 *kutcha*-bore tubewells mentioned above were also fitted with electric motors. This *kutcha*-bore is an interesting innovation because it enables a cultivator to

start irrigating his land without constructing a *pucca* well. A tube is inserted in the ground by digging a *kutcha* hole, a pumping set and electric motor are installed on it and irrigation is started immediately but the pucca well is constructed after two, three or more years when the cultivator can spare the capital. It was also reported that some farmers in neighbouring villages had two or three such bores in different parts of their farms and used portable motors which they took from one hole to the other. This latest innovation which saves time and investment is an indication of the facility which the cultivators have acquired in the technique of irrigation with the help of electric motors.

Installation of electric motors was helped by liberal grants of *taccavi* loans by the State Government. Loans for 8 electric motors totalling Rs 13,000 were sanctioned during 1955, when the first set of motors was installed and till the time of this study, loans totalling Rs 26,300 had been sanctioned for 15 electric motors. Thus, taccavi loans have financed electrification of half the wells in the village.

Electrification makes possible lifting of water at a markedly lower cost, besides allowing a saving of time in irrigation. The estimate given in Table 6 of the comparative cost of irrigation of one acre of wheat by electric pumping and by lifting water with the help of bullocks was given by one cultivator and is generally accepted. Irrigation with an electric pumping set besides being much cheaper is also much more intensive and adequate. It was explained that with an electric pumping set four waterings for the wheat crop were adequate; but with bullocks 6 to 7 waterings were required.

The effect of electrification of wells has not been so much increase in area under irrigation, as more adequate and intensive watering of the irrigated land. The saving of labour of man and beast, which electrification has brought about, has been utilised by cultivators mainly in this form of more adequate and intensive irrigation of their crops, which along with increased use of fertilizers and other improved practices, has resulted in increased yields. Improvement in the quality of livestock has been another striking benefit. This has resulted both from reduced strain on bullocks—lifting water for irrigation is considered extremely strenuous for the bullocks—and better feeding, which has become possible as a result of larger area under green fodders. Explaining this point, one cultivator said, "Now we have green fodder the year round, with the result that we feed our animals better and also make a saving on the grains which we used to feed them earlier".

More Intensive Manuring

This is probably the second most important aspect of technological change in agriculture. It consists both in better use of farm-yard manure and greatly increased use of chemical fertilisers. The latter which began only during the early 50s, has shown a rapid increase especially during the last five years as the figures in Table 7 bring out.

This village is not exceptional in the progress of fertiliser use or in the average quantity of fertilizer used per acre. The total fertilizer consumption in the block itself has increased from 295 tons in 1956-57 to 2,141 tons in 1961-62 and is expected to reach 4,000 tons in 1963-64. The average figure per cultivated acre in the village was 344.0 kg per acre as compared with 25.3 kg for the block. The highest average of almost 100 kg per cultivated acre was reported from the garden colony village mentioned later.

Use of chemical fertilizers has become an integral part of the agricultural pattern of the village. The VLW mentioned that practically every cultivator in the village was using chemical fertilizers, and that a large number were following the dosages recommended by him. One reason for the popularity of chemical fertilizers is that the average cultivator realises that the increasingly intensive cropping pattern which he is now adopting, cannot be sustained without their use. He understands that he just does not have adequate farm-yard manure for all his crops and most use chemical fertilizers in addition. There is good awareness also of the relative cost and returns from fertilizer use. In one of the discussions, a cultivator mentioned that in case of the wheat crop, the cost of the chemical fertilizer was recovered from the additional chaff which they got as a result of the higher yield, and the additional grain was their profit. There was general agreement with this view. Another indication of the cultivators' understanding of chemical fertilizers may be had from the speed with which the new fertilizer CAN (calcium ammonium nitrate) has spread. In the early years of the C D block, the extension staff popularised the use of ammonium sulphate but during the last three years, when there has been a shortage of ammonium sulphate, and CAN from the Nangal Fertilizer Factory has been

freely available, they have been propagating use of the latter.

The B D O explained that while ammonium sulphate was still demanded by cultivators for certain crops — it was considered particularly good for groundnut — the majority of the cultivators had already switched over to the use of CAN. They had understood that their crops needed nitrogen, and that CAN supplied it just as efficiently as did amonium sulphate They might not know the English word 'nitrogen'; but they had grasped the basic idea that ammonium sulphate, CAN and other manures (like farm-yard manure) supplied the same essential element to the soil.

Use of superphosphate for the wheat and groundnut crops is also increasing rapidly. The latest introduction is potash. Its use is being propagated by the extension staff for the wheat crop from this year (1963-64) only, and 8 tons of potash have been distributed in the block area. As the results are considered to be promising, the block staff feel that the quantity could be increased to about 100 tons next year. The main advantage of potash is that gives a polished appearance to the grain, which fetches a higher price in the market. The yield is also reported to be somewhat higher with its use.

Better Use of Farm-Yard Manure

This is linked with consolidation of holdings on the one hand, and use of chemical fertilizers on the other. Consolidation gave a fillip to use of farm-yard manure, because as a result of it all cultivators and most non-cultivators who had livestock were alloted sites for compost pits on the outskirts of the village. This allotment removed the difficulty of land for pits which many cultivators and non-cultivators like Harijans who kept cattle, faced. All these pits are well utilised. In addition many cultivators have pits in their holdings also. Experience with use of chemical fertilisers has aided use of farm-yard manure because it has made the cultivators conscious of the value of their own farm-yard manure. So long as the cultivators did not buy fertilizers they were not acutely conscious of the monetary value of the farm-yard manure which they produced themselves or which they obtained from Harijans and others in the village. But, when they began to buy fertilizers they began to be aware of the value of farm-yard manure also, because they began to compare what a cartload of farm-yard manure could do for their crops in comparison with what a bag of chemical fertilisers did. Moreover, as a larger number of Harians and other non-cultivators began to have manure from their newly allotted pits buying and selling of manure (for cash or in exchange for fodder) became more common. In 1963, the price of one cartload of manure during the kharif sowing season (May-June) when most of the farmyard manure is applied to the fields, was more than Rs 6 per cart, and many cultivators were commenting that this was an all-time high.

However, even though there is greater awareness of the value of farm-yard manure, and its use has increased, the practice of burning cow-dung has not stopped. The Compost Inspector of the block explained that the cultivators realised that the practice caused a serious loss to agriculture and that the more progressive and prosperous ones would be quite willing to stop it if an alternate fuel was available easily and cheaply, and the problem of heating milk for making *ghee* could be solved. As regards the latter, he explained that cow dung cakes were essential for heating milk for *ghee* making, because of the slow heat and the particular flavour which they imparted to the ghee and which was especially fancied by the village people. This preference may result in some cow-dung continuing to be burnt for heating milk, even after the households switch over to other fuels. But the main problem is obviously that of providing an alternate fuel.

The Problem of Fuel

The present fuel consumption pattern of the village is somewhat as follows:

(i) The cultivators and the Harijans depend upon home produced fuel — cow dung and agricultural wastes like cotton sticks.

(ii) Most Mahajan and Mistri families, who do not keep milch animals, buy fuel. They buy cow-dung cakes, agricultural wastes, fire-wood charcoal or kerosene, depending upon availability and price of different fuels, and the income and level of living of the family.

Cow-dung cakes are sold mostly by the Harijans and "other artisans". Fire-wood and charcoal are sold in three fuel shops located in the village.

Table 6: Comparative Cost of Irrigation with an Electric Pumping Set and Bullocks

Rauni irrigation (fiirst irrigation after preparing the land) of one acre of wheat

With Electric Pumping Set	(Rs)	With Bullocks	(Rs)
Cansumption of electricity for 6 hours (approx)	2.00	Wages of 2 men for 2½ days @ Rs 2.50 per man per day	12.50
Wages of 1 man for three-quarters of a day @ Rs 2.50 per day	1.87	Expenses of two bullocks for 2½ days @ Rs 5 per day	12.50
Total	3.87	Total	25.00
Or say, 4.00

Phosphate : Superphosphate	2.00	3.05	2.00	7.04	10.01
Total	22.00	26.05	26.00	38.04	46.06

* Sale of fertilizer between April and November 1963 was about 75 tons and it was estimated by the VLW and the BDO that the total for 1963-64 would be between 90 to 100 tons because top dressing of *rabi* crops had yet to be done.

As many as ten families have kerosene stoves, which they use for a part of their cooking.

The chief requisite for reducing consumption of cow-dung as a fuel is making available alternate fuels at a cheap price. The families which are already buying fuel will buy any fuel which is cheap and easily available. They will gladly use soft coke or firewood or even electricity if it is cheap. The cultivators and Harijans will have greater resistance to buying fuel. But even they will buy fuel, if it is cheap and conveniently available. The value of cow-dung for agriculture is realised by the cultivators and it is not considered free. But it is used, because it is there and is cheap. The *gobar* gas plant and more efficient *chulhas*, especially those which can use agricultural wastes like cotton stocks also have good possibilities of being adopted.

Use of Improved Implements

The third notable aspect of technological change is use of improved implements. Use of improved iron ploughs, chaff cutters and iron sugarcane presses which began to be used in the Punjab villages 30-40 years has become universal, and newer improvements like furrow-turning and soilstirring ploughs, bullock carts with pneumatic tyres, chaff cutters and sugarcane crushers driven by electric motors have also been introduced in considerable numbers. The number of implements, including improved implements, at the time of the study is given in Table 8.

It will be seen from the above that the stage of acceptance of small improvements, e g iron ploughs or chaff cutters is long past. Even the bullock cart with pneumatic tyres which involves considerable investment, is in general use. The cultivator is now at a stage when he is prepared to adopt any improved implement which is distinctly superior to the one he is using already and which he can afford to buy or hire. Secondly, he is prepared to accept any innovation or modification in existing practice, which results in a clear saving of time, labour or money, This last is very well illustrated by the recent change in the practices regarding threshing of wheat and shelling of maize.

Wheat has been threshed in Indian villages from time immemorial by bullocks going over piles of harvested wheat placed on the ground. This process involves back-breaking labour by men and bullocks for two or three weeks in April and May. Winnowing is done by throwing the wheat and chaff against the breeze. Both these processes have been replaced in the West by the combined harvesters. These machines are beyond the reach of the Indian cultivator; but during the last few years a number of small mechanical threshers costing between Rs 2,000 and 3,000 have appeared in the markets of the Punjab. Some of these have begun to be used by cultivators in this area also and it was reported that some cultivators of this village had got their wheat threshed by one such machine the previous year. However, more significant than use of this machine is the new practice of using the chaff cutter (which most cultivators possess) for threshing wheat. In this new process, whole stocks of wheat are fed through the chaff cutter which cuts the chaff into smaller pieces and separates the ears of grain. The mixture is then gone over lightly by bullocks for a few hours and the grain is separated. Another method is to put the ears of grain through the maize-sheller described below. It was reported that nearly 40 per cent of the wheat crop of the village had been threshed in this way during the previous year.

The advantages of the new process are obvious. It results in considerable saving of time and labour during April and May which are among the busiest months of the year. This is the time when cotton and early summer fodders have to be sown and weeding of sugarcane has to be attended to. The cultivator does not have to do back-breaking labour in the hot sun as he had to do in the past, and can devote himself to more fruitful work. The practice has two other advantages also. It reduces risk of loss of grain and chaff from dust-storms and thunderstorms which are quite common at this time of the year and yields better, cleaner grain and chaff because these do not get mixed with the dust. Secondly it does not involve use of any special, expensive equipment, but depends upon use of tools which the cultivator possesses already. But the most significant point about it, from the point of view of this study, is that it has become popular mainly through the initiative of the cultivators themselves. An extension worker might have evolved the practice and extension staff might have had some part in popularising it. But it was obviously not evolved at a research station and was not propagated by the extension staff as an important recommended practice.

The mechanical maize-sheller is a simple device which consists of nothing more than an old mobiloil barrel, fitted with wooden pedals, mounted on a horizontal wooden shaft. It operates with mechanical or bullock power. There are three such machines in the village, one of which is owned by an agricultural implement fabricator and the other two are owned by the two flour mill owners. These people undertake shelling of maize for cultivators at a higher charge of one seer, per maund (1 kg per 40kg) of grain shelled. It was reported that about half of the maize crop of the village was being handled by these machines and that five machines would be adequate to handle the entire crop. Here again is an instance of a simple machine evolved through local ingenuity which gives substantial benefits — saving of time, labour and a much better product.

One result of these technological advances is that the extension workers and the engineers working on improved implements have acquired a new hope and confidence. I had occasion to visit the agricultural implements workshop attached to the Agricultural University and to see the work being done on evolving improved implements like improved ploughs, a combined seed-cum-fertiliser drill and an improved hoe. Many of the improved ploughs and other implements devised at the workshop are improvements on the implements used by the cultivators earlier and have proved to be very popular. From discussions with these people it was clear that they had acquired the confidence that any imple-

ment which was distinctly superior to the one used by the cultivator and met all his requirements would be accepted. This confidence is a very important fact.

At this workshop experiments were also being made with small tractors. The main objective of these experiments is to evolve a tractor which meets all the needs of a medium cultivator with a holding of 10 to 15 acres and which sells at a price which this cultivator can afford to pay. The engineers and some of the other specialists at the University were very confident about the success of these experiments. They felt that among the models available abroad there were some which could meet all these conditions and could with suitable modifications be successfully placed in the Punjab market.

Use of Improved Seed

The Punjab cultivator has long been familiar with the use of improved seed of some crops. Improved varieties of wheat like C-591 and of sugarcane like CO-312 were accepted several decades ago and have been in general use since. The most important change in this area during the last ten years has been introduction of longer staple 'American' varieties of cotton. The practice of growing American cotton was brought to the area by refugee cultivators returning from the canal colonies. It spread very quickly in the early 50s when it nearly replaced the shorter staple *desi* varieties. However, it received a set-back later, because the price differential in favour of the American variety was reduced and it was found that the American variety was more susceptible to disease. As a result both American and Desi varieties are now grown in the area. In this village, most of the cotton grown is of the American variety but as the figures in Table 5 show, the area under cotton has declined after 1956-57, partly because of damage from disease.

In case of wheat also the older C-591 variety has been largely replaced by a new variety, C-273 which is more resistent to disease, has bolder grain and consequently fetches a better price. The experience with the spread of this new variety is interesting, because it brings out the speed with which a new, distinctly superior variety can replace an older one. This variety was introduced by the Department of Agriculture about seven years ago and it is claimed by the extension staff that it almost replaced the C-591 variety in this block within a period of about four years. When one considers that one season must elapse before the first demonstrations on cultivators' fields can give results, this time span of four years is quite small and shows a high degree of receptivity of cultivators to improvements like improved seed with which they have long been familiar.

Another noteworthy development is that some of the more progressive cultivators are themselves looking for new varieties. One such cultivator had obtained from a cultivator in another block, seed of a new variety of wheat which was supposed to give very high yields with intensive application of chemical fertilizers. This new variety has not yet been released by the Department of Agriculture because experiments on it are still in progress. But this cultivator had obtained it on his own and during my interview with him, gave quite a sophisticated analysis of the economics of high yields with heavy doses of fertilizer. Another cultivator was experimenting with a new kharif fodder evolved by crossing bajra with napier grass which gives very high yields and is also very nutritious.

Use of Pesticides

Use of pesticides is the latest among the improvements advocated by the extension staff, and is not as widespread as use of improved seed or of chemical fertilisers. This is due partly to the fact that the chemicals and equipment like power sprayers needed for spraying the crops are expensive and partly to the fact that chemical pesticides are ineffective in case of some important plant diseases of the area. Thus, there is as yet no chemical cure for the Gurdaspur borer which attacks sugarcane and causes heavy damage to the crop in some years. But, wherever the cultivators can use pesticides cheaply and effectively they are doing so. This is illustrated by the use of pesticides against storage pests. The practice of using BHC on grain kept in storage has been advocated by the extension staff during the last three years and the VLW claimed that it has already been adopted by the majority of cultivators in this village. Some of them mix BHC with the grain in the storage bin while others spray it by hand on the bags.

Livestock Husbandry

The standard of livestock husbandry in the Punjab has always been comparatively high. Some of the best breeds in the country like the Hariana bullocks and Murrah buffaloes come from the Hariana (south-east Punjab) area which is not far from this district. Moreover, recent technological changes in agriculture and rise in agricultural productivity have also contributed to improvement in the quality of livestock. Mention has been made above of improvement in feeding resulting from larger areas under green fodders, and of less strain on the working animals as a result of introduction of electric motors for lifting water. The bullocks and buffaloes now seen in the village would rank among the best in the country.

The villagers are also keenly aware of the value of good breeding. Two pure-bred bulls, a Hariana cow bull and a Murrah buffalo bull, are maintained by the panchayat through the traditional practice of being allowed to roam freely in the fields. Castration is universally done and early, in order to avoid indiscriminate breeding. However, artificial insemination has not become popular, even though this facility, which is available at the veterinary hospital in the block headquarters town can be availed of without difficulty. Certain other attitudes, e g, towards treatment of disease and taking up commercial production of livestock products, also indicate that considerable progress has yet to be made before scientific attitude towards livestock husbandry and a commercial outlook towards production and sale of livestock products become widely established.

Treatment of Disease

The block headquarters town has a well equipped veterinary hospital. Similar hospitals are located in other towns at distances of 5 to 10 miles. Besides there are sub-centres in the larger villages. With this net-work of hospitals and sub-centres, facilities for treatment of sick animals and of breeding with animals of pure breeds are within easy reach of most villages. The veterinary doctor in-charge of the hospital explained that the hospital and sub-centres were quite popular with the villagers; that large numbers of animals were brought to these daily; that he and his assistants were called frequently in cases of serious sickness

of animals and that programmes of control of epidemic diseases like H S and foot-and-mouth disease were effectively organised from time to time.

While all this would be correct, another experience which I had, gives a revealing insight into the present attitudes towards treatment of livestock disease. During my first visit to the village, I was told that the village was going through an out-break of foot-and-mouth disease, and that a special ceremony, a *jag* (from Sanskrit *yajna* or sacrifice) would be organised the next day to bring it under control. It was explained that a special messenger had been sent to a neighbouring town to obtain a charm *(taweez)* from a wellknown practitioner of Chamars and that the ceremony would consist in collecting in the morning all the cattle of the village at its various gates, passing them through the gates, and sprinkling on them while they passed, water in which the charm and leaves and fruit of the neem tree had been dipped. They added that a large quantity of rice would be cooked at one place and distributed to all the house-holds in the village, and that no fire would burn, i e, no cooking would be done in any individual house, and that no person would be either allowed to come into the village from outside or to leave it, on that day.

The *jag* was duly held the next day; but I was not able to witness it because of the ban on entry of outsiders. The Sarpanch, an educated wide-awake man with extensive urban contacts, was a leading figure in organising the *jag*, and the other village leaders, most of whom are equally educated and wide-awake, took a prominent part in it. Even the young VLW, an excellent extension worker who was otherwise quite progressive in his outlook, appeared to share the villagers' belief in the *jag*. When I mentioned celebration of the *jag* to the veterinary doctor, he admitted that celebration of such *jags* at the time of outbreaks of foot-and-mouth disease was common in the area. He mentioned also that villagers frequently resorted to treatments of this kind when their animals were sick, and that these treatments were often done simultaneously with the veterinary treatment obtained from hospitals.

Dairying and Poultry Farming

The attitudes towards commercial dairying and poultry production also show that the traditional prejudices against these are being overcome only slowly. There is widespread prejudice against sale of milk by cultivators in Punjab and adjoining states of Northern India. This prejudice has been weakening in recent years when, with the growth of urban demand for milk, sale of milk has become very profitable. In this area, the city of Ludhiana and other towns obtain most of their milk supply from villages, through vendors who collect milk in the villages and bring it to the towns on bicycles. The block headquarters town obtains its milk supply in this way. In addition, there is a large and growing demand for milk from the government dairy at the State capital. The dairy obtains its milk supply from milk producers' cooperative societies, several of which are located in villages of this block.

This village sends milk to the block headquarters town, the quantity being estimated at between 120 and 150 kg daily. Besides, there is considerable sale of milk within the village itself. Most Mahajans and Mistris and many Harijans do not keep milch animals and buy milk, the quantity varying with the size and income of the family. Many jats also buy milk when their animals are dry. But commercial milk production is much less than it could be, and the prejudice against production of milk for sale among cultivators is partly responsible for this. It is significant that sale of milk was reported by only 5 people and three of these were non-Jat, one Brahmin and two Harijans. Some village leaders mentioned that the number of milk sellers was in fact higher and that many cultivators, who were actually selling milk had not reported the sale, because of the stigma attached to it.

A milk producers' co-operative society for supplying milk to the government dairy at the State capital had been formed in the village two years earlier; had worked for some time, and had then failed. Its failure was attributed by the village leaders to dishonesty and inefficiency of the staff attached to the milk collection centre located in the village. But later, when I discussed this subject again with them after having seen the successful operation of such a centre in a neighbouring village, they agreed that the main reason for the failure of the scheme was lack of interest in commercial dairying among the cultivators.

The same attitude prevails towards production of eggs for sale. The cultivators have no prejudice against consumption of eggs or other poultry products or against keeping some birds for meeting their domestic requirements of these. In fact, the practice of keeping birds for meeting domestic requirements has increased greatly in recent years, as the cultivators have become more prosperous. The U L W estimated that as many as 75 families (mostly of Jat cultivators) were keeping poultry. But only one person had started commercial production in a small way, by keeping a flock of about 50 birds.

However, both successful dairying and commercial poultry farming were seen elsewhere in the block. Dairying was seen in adjoining village which had a co-operative milk producers' society supplying milk to the Government dairy at the State capital. The society has 20 members from the village, and in addition collects milk from non-members in other villages. The supplies range between 400 and 600 kg of milk daily. The members of the society were very satisfied with its working and explained that they received good income from sale of milk. Many of them had steadily increased milk production during the one year's working of the society. It was an experience also to see delicate instruments like the Babcock butterfat tester being operated by an old illiterate member. The Chairman of the society, a young man, educated and very progressive dairy farmer, was exfremely enthusiastic about its working. He mentioned that the members of his society had recently bought 60 quality buffaloes from an adjoining district to increase their production of milk. His own herd of about 15 buffaloes was among the best in the block and two of his buffaloes had received prizes for high milk production. He explained that the average milk yield of a buffalo among the members of the society was 8 kgs per day (some of the buffaloes in his own herd yielded 16 to 18 kgs per day, at the peak of the lactation period), that one buffalo could yield a net profit of Rs 75 to 100 per month to its owner and that several members of the society with only 2 or 3 buffaloes were having incomes of between Rs 150 to 200 per month.

Commercial production of poultry was also seen in this village and elsewhere in the block. This is one of the blocks selected for intensive development of poultry in the State. As part

One of the world's outstanding cigarettes

Player's
GOLD LEAF
FILTER TIPPED

Now available to you also in the handy 10's pack, Player's Gold Leaf Filter Tipped is one of the world's outstanding cigarettes. An instant success on its introduction, Player's Gold Leaf Filter Tipped is a cigarette rich in tobacco, rich in taste and with a reputation that matches its good looks. Quite the most satisfying filter cigarette you have ever smoked—try it and you'll agree.

of the poultry development programme a poultry extension centre and a marketing society were established at the block headquarters about a year ago. These provide all the assistance and facilities—one day old chicks to start a new flock, balanced feed, medical assistance, especially inoculation against disease like Ranikhet, incubators for hatching of eggs and arrangements for marketing of eggs and birds—which a farmer needs to start and run a poultry farm. The block has about a dozen poultry farms with flocks of 100 to 500 birds each, and the number is increasing.

The poultry farmer in this village was an educated young man, the son of a government officer, who had turned to poultry keeping about a year earlier when he was unable to get a suitable white collar job. He explained that he had obtained one day old chicks from the government poultry farm at Ludhiana and got technical assistance from the extension staff at the poultry extension centre. He was a member of the poultry marketing society, bought his feed and marketed his eggs through it. During the previous winter he had made good money by selling eggs for hatching to the I A D P people at Ludhiana. He mentioned that he could get a net income of Re 1 per bird and that he was making more money by keeping poultry than he would have made in any white collar job. He had started with about 300 birds in his own residential house, but was so satisfied with one year's working of his enterprise that at the time of my visit he was building a new, scientifically designed poultry-house outside the village, and was planning to increase his flock to 1,000 birds.

Later, I had occasion to see several other poultry farms, including one located at the block headquarters town, which was being managed by the wife of a white collar worker. This woman was keeping about 400 birds in the yard of her home. She had started keeping poultry about 3 years earlier, and her initial success had so encouraged her that she had bought her own incubator and had set herself up as a supplier of chicks to new poultry farmers.

Poultry farming is making rapid progress in the block and in the district. The number of poultry farms has increased during the last three years and will increase even more rapidly now, since it has caught the attention of the people. The main attraction is the high price of eggs in the markets of Delhi and the Punjab towns. The staff of the poultry extension centre and several of the poultry farmers themselves explained that the new, scientific method of keeping poultry, which had eliminated the risk of heavy mortality from disease, had made poultry farming quite profitable. Indeed, it has transformed poultry keeping which was a neglected branch of animal husbandry, to which attention was given only by the poor scheduled castes or the Muslims into a profitable enterprise.

But it is interesting to note that this new development of poultry is mainly in the hands of educated people. Some of them are cultivators; but others like the wife of the white collar worker mentioned above are non-cultivators. The enterprise requires a certain amount of capital and what is more, strict adherence to certain recommended practices, e g, inoculation of birds at stated periods, balanced feeding, culling etc, which the average farmer still finds too tedious; but which the educated person can adopt easily.

The speed with which commercial poultry farming is spreading leads me to think that commercial dairying can also make similar progress, if there are comparable advances in technique and similar facilities for marketing etc are made available. The main requirements for development of dairying are improving the milk yields of animals and more efficient organisation of milk collection. As regards the former, one specialist at the Agricultural University was of the view that through systematic breeding and improvement in feeding practices the milk yields of buffaloes in this area could be increased by 50 to 75 per cent within a few years.

The Problem of Excessive Numbers

In any discussion on animal husbandry in India, the problem of numbers asumes prominence, because the number of cattle is much in excess of the requirements of agriculture and their low quality is considered to be due mainly to this fact. The prevailing practice in many parts of the country is that animals, especially cows and young stock, are turned loose on village pastures and other common lands and fallows, and subsist on whatever grazing is available in these. The situation in this respect is strikingly different in this village today. The numbers of cattle is not too large and the practice of grazing on common lands and fallows, never very important, has almost disappeared. The number of livestock at the time of this survey were reported to be as shown in Table 9.

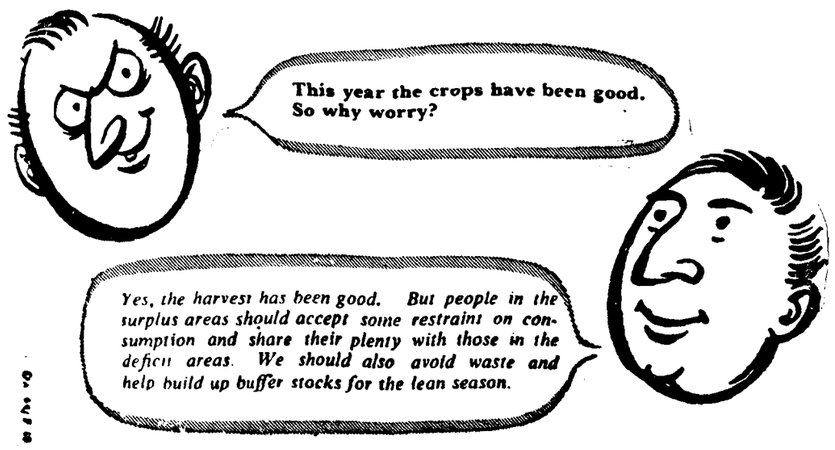
Thus there were only 131 pairs of bullocks for over 1,100 acres of intensively cultivated, well irrigated land, which has a high intensity of double cropping. This number is not only not excessive; but appears to be barely sufficient for meeting the requirements of agriculture. The only other animals kept in appreciable numbers are milch buffaloes, which are the primary source of milk supply. On the other hand, the number of cows and young stock, which form such a large proportion of cattle in several other parts of the country, is comparatively small. One reason for this is that the cultivators do not attempt to be self-sufficient in their requirements of bullocks by breeding cows and raising young stock. They do not find this practice economical. The prevailing practice is to buy either mature bullocks or young calves of between 1 and 4 years of age, and to bring them up until they are old enough for work. Buying of young calves is preferred to buying of mature bullocks, because these are cheaper. These bullocks and calves are bought mainly in the *mandis* of the Hariana area, which are not far from here. Most cultivators do not rear buffaloes either. These are reared by Harijans or other castes like Bazigars, for whom it is an important source of income. Even buffaloes which have gone dry are often given by cultivators to Harijans to keep through their dry periods and are taken back, when they are in milk.

It is clear from this that the cultivator has a very practical attitude towards livestock husbandry. He keeps only those animals which are most useful to him, and keeps feeding of unproductive animals or even of productive animals through their unproductive periods at a minimum. But the animals which he does keep, he feeds well. Unlike farmers in many parts of the country, he does not have the attitude of keeping large numbers of animals (and allowing them to starve) just because it does not cost him anything to do so.

Table 9: Number of Livestock

Bullocks	262
Cows	89
Youngstock	123
She-buffaloes	261
Youngstock of buffaloes	197
Goats	109

This attitude is related to the fact that the practice of allowing the cattle to graze in pastures, etc, has been stopped and there is now almost exclusive reliance on stall feeding. Growing of fodder crops and stall feeding of cattle have been prominent features of the farm enterprise in Punjab for a long time: but in villages of this area, these have received further emphasis after consolidation of holdings and electrification of wells. First, with consolidation even the small areas of pastures which had been available earlier, were eliminated. Secondly, with the growing intensity of cropping, hardly any areas of fallow lands are available for grazing of animals. Thirdly, as explained earlier, with increase in irrigation and in agricultural productivity, cultivators now grow much larger quantities of green fodders.



Therefore, if the present phase of mechanization, i e. electrification of wells, is followed by the further step of introduction of small tractors, the presence of a large number of surplus cattle will not prove an intractable problem. The introduction of tractors will be accompanied by progressive reduction in the number of cattle through the simple process of cultivators selling their existing bullocks and not buying new ones. Buffaloes will continue to be kept however for their milk and their numbers may even increase, if commercial dairy-farming makes progress. The need for farmyard manure will then be met increasingly from the buffaloes. These developments will be similar to those in U S A and Western Europe, where the farm-work animal, the horse, has disappeared after introduction of tractors, and there has been a sharp increase in the number of cows of specialised dairy breeds.

On The Eve Of A Technological Revolution

The picture which emerges from the above description is that of an agricultural community in which there has been notable advance in methods of utilisation of resources and a process of rapid adoption of improved agricultural practices is well under way. This process began with consolidation of holdings, which was followed by a rapid increase in the number of irrigation wells and electrification of most of these. These three developments made possible a more intensive cropping pattern, more adequate irrigation and care of all the crops grown, and increasing attention to adoption of recommended improvements notably use of chemical fertilisers. Much progress still remains to be made in intensifying agriculture and extending adoption of improved practices to all the farmers. The use of chemical fertilisers for instance, could be increased ten-fold before the levels considered adequate by the agricultural scientists are reached. But a stage has now been reached when adoption of improved practices has become part of the agricultural enterprise of the average farmer; when proved improvements like improved seeds of several crops, and nitrogenous fertilisers are adopted by the majority of the farmers, and a new seed variety or a new fertiliser takes only a few years (3 to 5) to get widely accepted. There are farmers in these villages who are not only ready to adopt recommended improvements: but are themselves looking for these in an effort to increase their production and incomes. Their number is small; but their presence has an influence which is far greater than their numbers. Further, beginnings of highly specialised types of commercial farming or livestock enterprises, like commercial poultry production, have already been made.

The area is now ready for larger changes, which would bring about major changes in farming techniques and make farming significantly more specialised and commercial. Expansion of poultry farming and of commercial dairying; much larger and more scientific use of commercial fertilisers and pesticides; large scale introduction of the small tractor and mechanisation of a variety of agricultural operations will be some of these changes. The successful experience with technological change has put the farmers in a mood in which a large number will be ready to adopt these larger and more fundamental changes. The economic level of the upper half of the farmers (those with holdings above 10 acres) makes it possible for them to be receptive to these changes, and there are no problems like that of a large number of unproductive cattle, which would present insuperable obstacles in the adoption of these.

(To be Continued)

Capital Formation through Consumption

Vinay Bharat-Ram

It is suggested here that greater reliance ought to be placed on the production of consumer goods as a means of capital formation.

While, generally speaking, it is true that capital is an important element in productivity, the role of motivation and the desire to live a better life should not be under-rated. In those sectors, particularly, where a low capital output ratio under-scores the importance of human ingenuity in putting simpler forms of capital to use, a confrontation with mass-produced consumer goods may achieve significant results.

IN a large part of the Indian rural setting there is reason to believe that,

(A) The very concept of a better standard of life associated with greater and more diversified consumption is outside the mental horizon of the farmer;

(B) The relative rise in the price of agricultural commodities has been a maior setback to the raising of productivity. To the extent farm incomes have risen without a corresponding rise in productivity, the farmer has been enabled to maintain his current standard of living by exerting even less than before.

Factors (A) and (B) warrant two somewhat opposite approaches:

(i) to tax the farmer almost to the point of subsistence so that in order to merely exist he has to enhance productivity: or

(ii) to stimulate his consumption propensity to a point where he would be willing to exert himself in spite of windfalls in the form of relative price rises of food over manufactures.

The first approach is clearly likely to cause political complications in a democratic-cum-predominantly agricultural society. The second, though less-publicised than the first, seems deserving of special consideration.

Inducement to Raise Production

My argument is that mass-produced consumer goods made available in the rural areas can bring about some changes in the attitude towards productivity through a two-way process. First, the farmer will tend to exert more within the broad limits of the existing technology. Secondly, he will be induced to use more ingenious methods through acquiring new knowledge and by withholding consumption just enough to move a step in the direction of a more favourable capital-labour complement. For example, he might forego the purchase of a used bicycle in the present to buy more fertiliser in the hope that he will be able to possess a new bicycle in the future when his farm output has increased as a result of an increment of capital. Of course, this presumes a transformation in attitudes which may at best come about very gradually. However, the experience of Japan in the early stages of development suggests that this kind of a change is not impossible.

Basic Problem

This approach detracts a little from the Ricardian prescription of direct means of enhancing productivity. It runs closer to the Malthusian point of view where consumption and saving are not necessarily regarded as mutually exclusive. The relevance of this theme to economic development seems considerable.[1] Rostow uses it up to a point when he argues in favour of transferring idle resources from those who tend to hoard to those who tend to invest in productive enterprises.[2] Such a transfer can take place either through making available loanable funds to the urban sector or through enhanced rural consumption. An enhanced marginal propensity to consume inflates the total income generated by a given new investment. This places in the hands of the entrepreneurs greater investible funds. Consequently — provided new investment is a positive function of the availability of funds— greater initial consumption will have actually led to greater saving and investment.

The basic problem is how to bring consumer goods within the reach of rural society. There is, first, a general shortage of consumer goods in relation even to urban demand. Second, an expansion in the output of consumer goods will divert scarce resources, including foreign exchange, from the capital goods industries.

There can be two ways of looking at this problem. First, what would happen if the economic forces are left to work themselves out? Second, what would be most desirable from the point of view of economic development?

If the economy is left to move in the present manner the two societies —urban and rural—might yet find a meeting point even if in the quite distant future. Industrial estates will spring up in various parts of the country; there will be long periods of under-utilisation of capacity on account of a shortage of, mainly, foreign exchange and agricultural raw materials. The development efforts of the Government in the rural areas will gradually take root because the greater the shortfalls in achievement the greater will be the political pressures on the Government to find short term solutions Rising employment opportunities around the major industrial estates will attract larger numbers of the under-employed from the relatively low income rural sector and will hopefully ease some of the pressure of population on land. This will inevitably force the farmer to use more labour saving and perhaps more efficient methods of production. Consumer goods will gradually trickle into rural areas and begin to provide some of the necessary incentives. Hence the two societies may ultimately merge.

Bringing the Two Societies Closer

This is an optimistic view of a generally pessimistic situation. The pessimistic view might well foresee the economy gradually becoming static. The lag in agricultural productivity might add to the already severe foreign exchange shortage by making inevitable the imports of food and the imports of agricultural raw materials necessary to feed existing capacity. This will become a drag on industrial activity which cannot sustain itself indefinitely without the support of a healthy agricultural sector. Meanwhile the growth of population will be increasingly wiping out the marginal gains in productivity.

1 Arthur Smithies has developed this idea in his article, "Rising Expectations and Economic Development", *The Economic Journal*, June 1961, pp 255-72.

2 Rostow, W W: "The Stages of Economic Growth", p 64.

The question to ask then is what would be most desirable from the point of view of economic development? It seems clear that the two societies should be brought closer together and their growth should proceed in an integrated fashion. This has been recognised in a general way by the planners. Even so there is a case for drawing attention to certain specific areas where greater emphasis may prove worthwhile:

(1) The plans have recognised the importance of a network of roads in the rural areas. These should receive considerably greater attention as a means of bringing urban and rural societies closer together.

(2) The key role of the personnel associated with the Community Development Project is undisputed. The success of these projects depends heavily on the quality of these persons, their training and the dedication with which they work. Greater thought, therefore, might be given to their selection, training and morale. This training apart from imparting knowledge about details of the programmes might also include an exposure to the social sciences. This would help in their being able to understand the problems of the peasant in some depth.

(3) The lack of confidence in the minds of the farmer in regard to his own ability to use new methods is a definite bottleneck. It is associated with a basic fear of the adverse consequences of new technique failing to pay off. A change in this outlook, it could be argued, will come about in any event because science inevitably tends to extend itself. This, however, is not the point. The problem is to accelerate the adaptation to new techniques and in this matter a two-pronged approach could be of help. First, some form of insurance against the risks of using new approaches might be provided to the farmer. (Crop insurance of the kind that operates in Japan is one possibility.) Second, a more concerted effort might be made at demonstrating the potentiality of new techniques in selected areas where the absence of water or fertiliser are not insurmountable bottlenecks.

(4) There are then certain lessons that can be drawn from the operation of the "demonstration effect" in the developing countries. The demonstration effect has primarily touched the urban centres. It is responsible for an "achievement orientation" which seems basic to the objective of raising the standards of living. It might be possible to select some of the healthier aspects of the demonstration effect and project them into rural society. The need to do this has already been accepted in the case of family planning, education and medical care. These are certainly excellent importations from the industrial societies and their need cannot be over-emphasised. They are nonetheless long term variables and do not possess the direct appeal of some of the other stimulants to achievement found in the urban cultures. Typical examples of such stimulants are consumer durables like bicycles and radios. It is not inconceivable that their vigorous extension in the rural areas will provide an exposure to symbols of achievement. It is of some relevance in this connection to explore possibilities like the provision of tax concessions to those who will be willing to locate consumer goods industries in the more remote parts of the rural sector or the granting of sales tax concessions on certain consumer articles sold in the agricultural regions.

To sum up, it is suggested here that greater reliance be placed on the production of consumer goods as a means of capital formation. While generally speaking it is true that capital is an important element in productivity the role of motivation and the desire to live a better life should not be underrated. In those sectors, particularly, where a low capital-output ratio highlights the importance of human ingenuity in putting simpler forms of capital to use, a confrontation with mass-produced consumer goods can achieve significant results.

The desire for higher standards of living must be related to direct efforts and must not be allowed to result in short-sighted consumption of capital. To ensure this, the part that education and the Community Development Programme can play is crucial. Nevertheless, the mainsprings leading to faster economic development will have to be founded on a deeper understanding of the forces that restrain the individual from finding self-expression in new ways rather than on a hope that modern techniques and methods will be automatically adopted.

R. B. SHAH
GENERAL MANAGER

AROUND BOMBAY MARKETS

Dalal Street Inclined Upward

Wednesday, Morning

DALAL STREET displayed remarkable steadiness last week. It not merely recovered the ground it had lost in the preceeding week but it was also able to make a new high mark in the recovery phase which has been in progress since the panicky sell-off on March 27. Gains were widespread and quite pronounced in certain cases. Tata Steel, T Maneklal, Tata Chemicals and Tata Locomotive were the outstanding bright spots. Scarcity of offerings, short covering and fresh bull support—all these contributed in varying degree to the recovery in prices. The market's performance could have been still better but for the disturbing news from across the Indo-Pakistani border, particularly in the Kutch-Sind area.

The almost uninterrupted flow of encouraging corporate news undoubtedly aided market sentiment. But the buying that pushed up equity prices last week was inspired mainly by fresh institutional support to the market. The Life Insurance Corporation was reported to have purchased a huge parcel—about 25,000 shares—of Tata Steel shares and in a matter of days the quotation for the generally slow-moving Tata Steel shot up from Rs 144.50 to Rs 150—the sharpest rise for a single week for several months; corrective profit-taking caused a modest setback near the week-end. Apart from the L I C buying, the professional support for Tata Steel was also based on expectations of a higher dividend as the company is believed to have fared much better during 1964-65 than in the preceding year. Tata Locomotive and Tata Chemicals are being fancied for a similar reason. T Maneklal have soared from Rs 405 to Rs 450 following the announcement of one-for-three rights issue.

Sustained institutional support for many of the popular counters in the forward list in recent weeks has had a significant impact on the 'budla' charges at the turn of the settlement. Notwithstanding the high interest rates, carry-forward charges have declined considerably because of the scarcity of floating stocks as a result of institutional buying. Technical position of the market has also aided recovery—the decline in equity prices between February 28 and March 27 had been very steep indeed. Technical correction had been overdue; the process of technical adjustment is well underway. It is difficult to say how the current recovery phase will progress in face of the uncertain political situation.

COTTON

Prices Harden Further

COTTON prices showed a further hardening tendency last week. The turnover, however, was very much restricted. This is scarcely surprising. Faced with the accumulation of large stocks of both cloth and yarn and the consequent financial strain on their resources, mills have been in no mood to purchase cotton in quantity. Only the needy mills have figured as buyers recently and their inquiries have been mostly confined to good quality cottons. Digvijay is about the only variety which is eagerly sought after and its price has risen by Rs 40 to Rs 50 per candy within a week or so; it is now quoted almost at the ceiling. Another variety which has been in the news recently is L 147. The Indian Cotton Mills' Federation is reported to have made some purchases of this variety mainly under pressure from the State authorities which have been over-anxious to woo the farmers. Reports indicate accumulation of L 147 stocks in upcountry centres which is generally attributed to the fact that this cotton has been mixed up with other inferior cottons with the result that mills have been reluctant to purchase this popular variety at prices demanded by the growers and traders in upcountry centres.

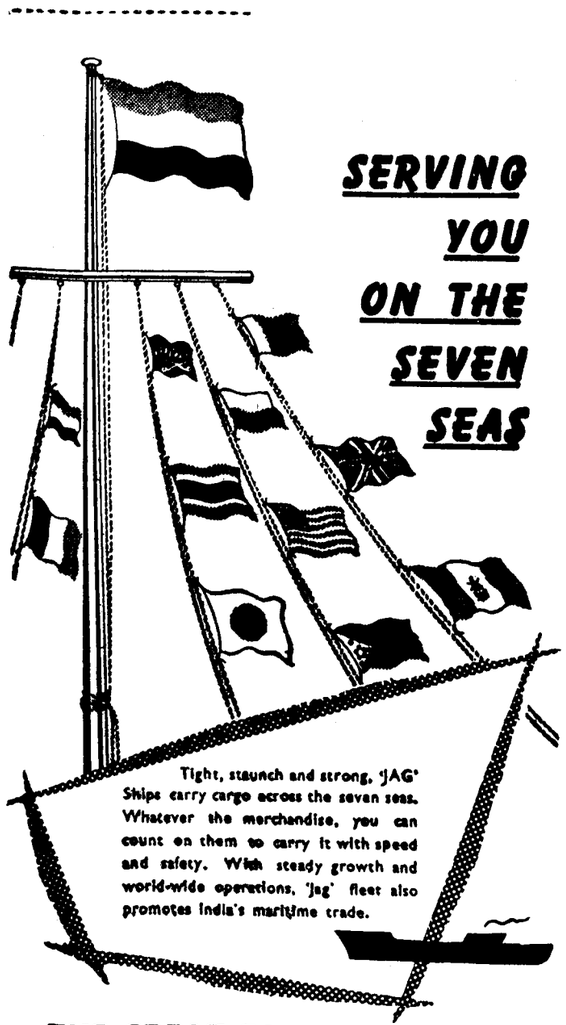
The way the growers are being wooed by the State authorities gives one the impression that there has been an extraordinary fall in cotton prices which calls for remedial action. Nothing could be farther from the truth than this. Excepting a few varieties which also include CO2, most of the varieties are quoted very near the ceilings. With the 1964-65 cotton crop estimated at between 55 lakh and 57 lakh bales, the supply position cannot be said to be very comfortable. But for the acute financial stringency and the accumulation of cloth and yarn stocks with the mills, cotton prices might have pierced the ceilings again; prices have been ruling above the ceilings most of the time this season.

The decline which occured during the latter part of March and continued into early April seems to be a temporary phenomenon. Prices have already registered a sizeable recovery recently. In the circumstances, the Textile Commissioner's reminder to mills that they should complete purchases of entire quantity of their quotas of Indian cotton by the end of July seems hardly necessary. The Textile Commissioner has also warned the mills that if they fail to fulfil their obligation in regard to the compulsory purchase of Combodia A and B and ICS-67, they would render themselves ineligible for the issue of allotments for the import of global cotton.

OILSEEDS

Disturbing Trends

ALL the available reports indicate that the total availability of vegetable oils in the current season is likely to be 20 to 25 per cent larger than in the 1963-64 season. Groundnut and mustard and rapeseed crops are an all-time record; production of other oilseeds is also better. The domestic supply has been augmented by the import of 75,000 tonnes of soyabean oil of which about 30,000 tonnes will have reached the country by the end of May. The import of 50,000 tonnes of tallow for the soap industry will also ease the demand for vegetable oils which this industry had been using in the past. Moreover, there has been no export of groundnut oil this season and the export of linessed oil has also been negligible whereas considerable quantities of groundnut oil had been exported last season by this time.



In spite of all this, vegetable oil prices at present are quoted considerably higher than the prices prevailing at this time last year; mustard oil is the only exception and this is because the price of this oil had been pushed up to a fantastic level last season because of the partial failure of the mustard and rapeseed crop. Both groundnut oil and linseed oil around their current levels of Rs 23.20 and Rs 19.25 (per 10 kgs) respectively are

costlier by about Rs 3 to Rs 4 compared to the prices prevailing a year ago. Despite good harvests, the visible stocks of linseed and mustardseed are reported to be very poor even though the movement of these crops is normally in full swing at this time of the year. Since the marketing of these crops has commenced only recently, the poor flow of arrivals clearly indicates that the stocks are being held at the producers' end. The supplies of groundnut are also relatively small. With the total supplies of oilseeds limited for one reason or another, the crushing industry in Bombay is having a very difficult time; the industry has been hit particularly hard by the continued ban on the export of groundnut from Saurashtra—the chief source of supply.

Last week's strength in the oilseeds market was in no small measure due to the feeling that the Government's decision retaining the present wheat zones will encourage the State authorities to impose fresh curbs on the movement of other commodities, particularly oils and oilseeds. The States had relaxed restrictions on the movement of oilseeds only recently. It would be unfortunate if the free movement of goods were again to be restricted. This will lead to wide inequalities in prices of edible oils in different States causing considerable avoidable hardship.

After an early rise to a new high of Rs 79.70 castor June receded to Rs 77.50 on corrective profit-taking but it again recovered to around Rs 78.50 at the week-end. Official trading in linseed June remained suspended throughout the week as the contract was all the time quoted above Rs 94.50—the maximum permissible rate for the week. In unofficial dealings, however, the June contract was bid up to Rs 96.50 (per 100 kgs). The strength was even more marked in the spot materials. Groundnut oil ready was marked up to Rs 23.20 and linseed oil rose to Rs 19.25 (per 10 kgs). Castor Oil Commercial was also steadier around Rs 16.30.

Export activity was extremely restricted. The rise in domestic prices of groundnut extractions has rendered fresh business with the U K unremunerative and the East European countries have been reluctant to follow the rise because they have already covered the bulk of their requirements from India. With groundnut expellers quoted about Rs 100 per tonne higher than groundnut extraction, the manufacture of de-piled meal has been rendered unremunerative. Fresh business in cottonseed cake has also been very poor. As for oils, business has been at a complete standstill and prospects of reviving exports have been rendered more difficult because of the widening disparity between Indian and world prices.

THE GREAT EASTERN SHIPPING COMPANY LTD.

BUSINESS NOTES

Bank of Baroda

A LOOK back at Bank of Baroda's progress over the past ten years reveals, an impressive record of all-round achievement. It shows that the Bank's deposits shot up from Rs 34.85 crores at the end of 1954 to Rs 169.64 crores at end-1964. In this period, advances rose from Rs 25.50 crores to Rs 120.45 crores, investments from Rs 11.84 crores to Rs 42.95 crores, total resources from Rs 46.66 crores to Rs 212.89 crores and capital funds from Rs 2.28 crores to Rs 4.48 crores. Similarly, the number of deposit accounts increased from 1,25,574 to 6,49,447, that of employees from 1,797 to 6,512 and that of branches from 57 to 235. The financial results of the decade were also equally encouraging, with the operating income rising from Rs 1.53 crores to Rs 9.46 crores and with a corresponding rise in operating expenses from Rs 1.24 crores to Rs 8.61 crores, the net operating earnings after taxes expanded from Rs 20.02 lakhs to Rs 85.53 lakhs. The dividend rate was stepped up from 12 per cent (tax-free) to 18 per cent (taxable), and accordingly dividend disbursement increased from Rs 12 lakhs to Rs 36 lakhs.

Equally encouraging has been the progress of the Bank in 1964 which was the 56th year of its existence. In this year, the Bank's deposits increased by Rs 29.48 crores to Rs 169.64 crores, advances by Rs 14.64 crores to Rs 120.45 crores and investments by Rs 12.36 crores to Rs 42.95 crores. The year's total income jumped from Rs 7.48 crores to Rs 9.46 crores, of which interest and discount accounted for Rs 7.98 crores against Rs 6.12 crores and commission, exchange and brokerage brought in Rs 1.43 crores against Rs 1.30 crores. But, at the same time, expenses also increased in all directions: interest on deposits and borrowings consumed Rs 4.63 crores against Rs 3.47 crores, salaries, allowances and provident fund absorbed Rs 2.65 crores against Rs 2.16 crores, rent, taxes, etc, claimed Rs 40.26 lakhs against Rs 34.83 lakhs. Even then the balance of profit is usefully higher at Rs 85.53 lakhs compared to Rs 75 lakhs a year ago. An amount of Rs 17.25 lakhs (Rs 15.50 lakhs) has been transferred to reserve fund and Rs 34 lakhs (Rs 24 lakhs) earmarked for payment of bonus to staff. The interim dividend at the rate of eight per cent absorbed Rs 16 lakhs as before, and the proposed final dividend at 10 per cent should require Rs 20 lakhs (same).

During the year the Bank opened 30 new branches, making a total of 219 branch offices in India and 15 in foreign countries. The banking business of the Tamil Nad Central Bank, Tiruchirapalli, was taken over from May 16, 1964.

With effect from the beginning of February this year the Chairman, Tulsidas Kilachand, who has been associated with the institution for over 31 years resigned from the Board in order to avoid a controversy with the central banking authority over certain advances made to Synthetics and Chemicals of which Tulsidas Kilachand was also the Chairman. It is stated that an unsecured advance of Rs 12 lakhs was made by the Bank to Synthetics and Chemicals prior to the amendment to the Banking Companies Act, 1949 which came into force from February 1, 1964 and Rs 30 lakhs were advanced after the amendment against surety of Kilachand Devchand and Co Private Ltd. According to the authorities, these transactions came within the restrictions on loans and advances under the amended Section 20 of the Banking Companies Act.

Central Bank

THE results of Central Bank of India, the biggest banking institution in the private sector in India, shows that it continued its stately progress in 1964. As at the year-end, the Bank's deposits jumped to Rs 278.02 crores from Rs 251.28 crores a year ago, advances to Rs 205.70 crores from Rs 190.33 crores and working funds to Rs 306.21 crores from Rs 271.92 crores. The expansion in activity also lifted investments from Rs 66.65 crores to Rs 81.17 crores and reserves and other funds from Rs 5.53 crores to Rs 6.35 crores, whereas the capital got increased from Rs 3.16 crores to Rs 4.72 crores.

The year's total revenue rose from Rs 15.13 crores to Rs 17.46 crores, of which interest and discount accounted for Rs 14.35 crores (Rs 12.48 crores) and commission, exchange and brokerage for Rs 2.98 crores (Rs 2.54 crores). The expenditure also rose in almost all directions. For instance, interest paid on deposits and borrowings claimed Rs 7.48 crores (Rs 6.67 crores) and salaries allowances and provident fund Rs 6.23 crores (Rs 5.18 crores). But even then the directors are left with a higher disposable profit of Rs 215.69 lakhs, compared to Rs 189.26 lakhs a year ago. As a result, employees' bonus is increased from Rs 75 lakhs to Rs 87 lakhs, allocation to reserve fund is raised from Rs 40 lakhs to Rs 43 lakhs and that to special reserve stepped up from Rs 34 lakhs to Rs 40 lakhs. As in the last year, staff gratuity fund again gets Rs 10 lakhs. The interim dividend already paid at Rs 2.40 a share absorbed Rs 35.4 lakhs (Rs 30.28 lakhs) and the final proposed at Rs 2.60 should take away Rs 49.46 lakhs (Rs 33 lakhs). The final dividend as also an amount of Rs 0.25 lakh (being the interim dividends for 1963 and 1964 and final dividends for 1962 and 1963 to the former shareholders of Jodhpur Commercial Bank) are to be paid out of the special reserve.

During 1964, the Bank opened two new branches, 14 sub-branches and five pay offices; and one branch and one pay office were closed down. The total number of branches at the end of the year thus increased from 366 to 385.

Goodyear India

FOR Goodyear India 1964 proved a distinctly better year. Its sales jumped to Rs 13 crores from Rs 10.68 crores and the operations resulted in a net profit of Rs 52.78 lakhs compared to a net loss of Rs 43.43 lakhs in 1963, after providing Rs 32.96 lakhs (Rs 32.48 lakhs) for depreciation and Rs 21.78 lakhs (Rs 19.98 lakhs) for interest charges. Out of the profit, Rs 40 lakhs have been transferred to general reserve and the remaining amount carried forward, lifting the reserves and surplus to Rs 1.59 crores to stand against a capital of Rs 2 crores. If no dividend has been recommended in spite of this happy position, it is because the Board has been influenced by two considerations. First, the limitation of dividends imposed in the Rs 2.25 crore loan agreement with the Export-Import Bank requires the company to accelerate loan repayment if any dividend distribution is made at this time. Acceleration of repayments would deplete necessary working capital needed for the company's current operations. Secondly, the current major expansions programme requires working capital over and above existing funds in order to service the enlarged operations as evidenced by the rights issue made in December last. Consideration of the proposal to issue bonus shares has also been deferred to a later date.

Modi Industries

ALTHOUGH Modi Industries, formerly known as Modi Sugar Mills, is still better known for its interest in the sugar industry, the company is in fact more broad-based. Its other interests range through vanaspati, soap, oil, paint and varnish, lantern, torch, gases and chemicals, distillery, electrodes, and even steels. Such a wide spread of interests is naturally beneficial to a group, for should a few fields of activity be adversely affected in a particular year, the stability of the group as a whole can be maintained in other fields. This is amply proved by Modi Industries' results for the year ended October last when, though the average recovery of the sugar factory fell from over 9 per cent to 8.81 per cent due to damage to the cane by frost and failure of winter rains, and the electrode factory's margins were reduced due to "cut-throat competition" in the market, the company showed a healthy rate of growth in overall sales and profits. The future prospects, too, appear good, as most of the machinery of the steel project is in the last stage of erection. The electric furnace was commissioned in January this year, and the rolling and wire drawing plants are expected to go into production in a couple of months.

The 1963-64 results show that rise in sales from Rs 7.90 crores to Rs 10.25 crores led to a slightly higher proportionate increase in gross profit from Rs 53.11 lakhs to Rs 69.40 lakhs, reflecting a small improvement in margins. Even after making higher necessary provisions, the net profit is more than last year's. Depreciation has taken away Rs 12.78 lakhs (Rs 9.55 lakhs) and taxation Rs 32 lakhs (Rs 24 lakhs). After writing off debenture issue expenses Rs 3.13 lakhs (nil) and after transferring Rs 2.25 lakhs (Rs 50 lakhs) to development rebate reserve, there is left a disposable profit of Rs 19.24 lakhs compared to Rs 17.06 lakhs a year ago. The unchanged dividend of 12 per cent claims a little more at Rs 9.40 lakhs (Rs 8.81 lakhs) since a larger capital is now to participate in the disbursement. Allocation to dividend equalisation reserve is lowered from Rs 11 lakhs to Rs 3 lakhs; last year's allocation was higher because the dividend was to be paid out of it. Price fluctuation reserve gets the same amount of Rs 3 lakhs and general reserve Rs 3 lakhs (Rs 3.44 lakhs).

Larsen and Toubro

LARSEN and Toubro has acquired a controlling interest in Willcox Buckwell India, Delhi, the authorised dealer in Northern India and Rajasthan for Caterpillar Overseas S A, British Crane Corporation, U K, Priestman Brothers, U K, and other well-known foreign manufacturing companies.

The current working results of Willcox Buckwell India Limited are reported to be satisfactory and the sales turnover is expected to exceed Rs 2 crores. For the financial year 1964-65, the Board of Directors have declared an interim dividend of 20 per cent.

Dusk falls... lamps are lit

After a hard day's work, it's time for villagers to enjoy their well-earned relaxation.

The programme of rural electrification under the Five-Year Plans goes on apace. But Kerosene will remain as ever, a vital commodity for the villager. INDIANOIL ensures a continuous supply of this essential product through its wide marketing network.

INDIANOIL, proud to serve the people of India, now refines and markets the entire range of petroleum products so essential to Industry, Agriculture and Transport, among others.

What every engineer should insist on–in Switchboard Design

In evaluating a switchboard some features are of greater importance than others, depending on the environment in which it has to function. What are these features? Can you recognise them?

Totally enclosed design: In almost any industry, dust, like corrosion, is a very serious problem. To keep dust out, every unit has to be made to seal like an oyster-shell. Research has revealed that only a carefully machined, rigid, cast-iron clad enclosure, lined with rubber gasket, effectively resists dust, vermin and moisture.

Interchangeability: All components should have standard flange openings and machined surfaces; only then can they be inter-changed.

Flexibility: It should be easy to extend the switchboard at site, when you want to. This is possible only if the busbar chamber has standard end openings.

Maintenance: Must be judged largely by your ready access to busbars and easy examination of contacts.

Safety: A dented cover of a unit not only fails to keep dust, vermin and moisture out but could become a source of great danger without your knowing it. So value every safety feature in the design, the rigid sturdy shell, inter-locking system and insulated handles.

Carefully examine all these features listed here against your own specific needs.

LT-LK switchboards, like LT-LK motor starters, have secured in so short a time, the highest sales in the country. Take another look at the features and you will know just why!

Pakistan's Tactics

MANY similarities have been noticed between the Chinese aggression against India three years ago and the recent Pakistani attack in Kutch. However, here attention may be drawn to one dissimilarity. It is that in Ladakh China was in occupation of a large part of the 'disputed' territory; in Kutch very little of the 'disputed' area was in Pakistan's possession before the outbreak of hostilities. Following from this, Pakistan in Kutch, as India in Ladakh, will negotiate on the basis of a withdrawal by both parties. India, on the other hand, wants restoration of the *status quo ante* existing before the Pakistani attack. If the two countries stick to their respective terms, as they are likely to since they are so obviously intended to protect their respective interests, the history of the two and half years of bargaining over the pre-conditions for talks between India and China is likely to repeat itself. This does not mean war, of course, but an uneasy cease-fire which should be possible once Pakistan is satisfied that she has gained a tactical position by occupying a substantial part of the 'disputed' area. Having gained her purpose, Pakistan can have no further interest in escalating the conflict.

This is, however, small cause for comfort to India, for what Pakistan has been able to do in Kutch she should be able to repeat elsewhere where for one reason or another she is at a tactical advantage. If India restricts her response to these specific areas, she will invariably come out the loser. After the initial brave talk of throwing out the enemy, the Government of India seems to be beginning to realise this. In his statement in the Lok Sabha on Wednesday the Prime Minister admitted frankly that "on the Kutch border Pakistan has many advantages" and that even if the Pakistani attack didn't advance fast enough the Indian army would have to withdraw since the areas now occupied by it will soon be submerged under water. The most significant part of the Prime Minister's statement was where he said that "if Pakistan continues to discard reason and persists in its aggressive activities, our army will defend the country and it will decide its own strategy and the employment of its manpower and equipment in the manner in which it deems best". The hint is plain enough. If Pakistan starts operations in areas where she has some advantage India will not consider herself obliged to restrict her response to those areas; she will take counter-measures where it suits her best.

It was argued in these columns when fighting first broke out in Kutch last month that the Pakistani attack on our positions was not by itself the important thing, but that it was part of Pakistan's long-term strategy of keeping Indo-Pak relations in a state of tension which would sooner or later compel India to re-open the Kashmir question. To this strategy there can be two answers from India. India can accept the challenge of an over-all settlement with Pakistan which would include Kashmir. Alternatively, she can try to foil the strategy of building up tensions by making it as difficult and as costly as possible. This can be done only through a policy of 'free response'. Of course, such a policy will exact its own price. Principally it will keep alive the constant threat of a major conflict between the two countries. The risk is very real, but not one which is incalculable for Pakistan can hope to gain very little from such a conflict and so her leaders will not be averse to considering all possible alternatives. Further, such a hard-headed policy will mark a departure from the international postures which we have assumed so far and there is bound to be much criticism and not a little pressure, even from friends. Finally, this policy is hardly calculated to infuse amity into Indo-Pak relations. But, considering the current state of these relations, this may be no great loss.

The choice between a determined policy of combating Pakistani tactics to pressurise us into reopening the Kashmir question and one of taking the initiative and making the first moves towards an over-all settlement with Pakistan is admittedly a difficult one and cannot be made

without reference to all its implications for our internal and foreign policies. But the other choice, between either of the two alternatives and a policy of disconnected, *ad hoc* response to Pakistani tactics, which is what we have seen so far, should not be so difficult.

Waste of Vegetable Oils

THE decision to permit vanaspati manufacturers to use soyabean oil up to 50 per cent instead of 20 per cent as hitherto has been dressed up to look like a deliberate step to bring down groundnut oil prices. True, in spite of an all-time record groundnut crop, groundnut oil is today at least 15 per cent dearer than at this time last year. True also that the import of 65,000 tonnes of soyabean oil from the U S under P L 480 and the prospects of its substitution for groundnut oil on a bigger scale as a result of the raising of the ceiling on its use by the vanaspati industry should have some impact on groundnut oil prices. Those who are holding on to stocks even at the current high prices in the hope of still higher prices later may be persuaded to think again.

And yet the decision to raise the limit on use of soyabean oil seems to have been taken by the Government not for its likely effect on groundnut oil prices. It is well known that the first shipments of P L 480 soyabean oil were to arrive here much earlier than they will now and the supplies were to be more evenly spread out. But the dock workers' strike in the U S intervened and upset the time-schedule. As a result, there is now the problem of clearing the supplies as they arrive. To this end, besides permitting the vanaspati industry to use more soyabean oil, it has also been decided to exempt from the minimum margin requirement bank advances to vanaspati manufacturers against stocks of soyabean oil. Prices of soyabean oil in the U S have risen considerably since the time when the imports were first mooted and at current prices the landed cost in India would not have been very much lower than groundnut oil prices but for the waiving of the 10 per cent regulatory import duty. With all these concessions vanaspati manufacturers should have incentive enough to use soyabean oil.

The important issue raised by the decision to allow vanaspati manufacturers to use more soyabean oil relates to the Government's attitude to solvent extraction oils. The Ministry of Health has held solvent extraction oils as non-edible and injurious to health and has on that ground prohibited their use in vanaspati. But it has been difficult to accept this when vanaspati manufacturers had been permitted to use up to 20 per cent U S soyabean oil which is also produced by the solvent extraction process. Now that the percentage has been raised to 50 it needs to be asked what basis remains for the prohibition of use of indigenous solvent extraction oil in vanaspati making. Obviously, the decision to allow vanaspati manufacturers to use 50 per cent soyabean oil instead of 20 per cent was taken quite readily with only the problem of quickly using up the P L 480 supply in mind and without any reassessment of its edible qualities. It is difficult to be convinced, therefore, that the earlier limit of 20 per cent had anything to do with a scientifically calculated "tolerance limit".

The Health Ministry's classification of indigenous solvent extraction oils as non-edible and the ban on their use in vanaspati assume much significance in the context of the perpetual shortage of edible oils in this country. From January this year the Government has prohibited use of edible oils (defined to mean oils obtained by extraction) for the manufacture of industrial hard oils. This is intended primarily to prevent their use in soap-making. But the declaration of solvent extraction oils as non-edible reserved an alternate source of vegetable oil for the soap industry. To that extent the move failed to divert the soap industry entirely from vegetable oils and compel it to turn to animal fat—which should be the objective of any policy of conserving scarce vegetable oils. Some 42,000 tonnes of mutton tallow are to be imported this year, also from the United States, but the misuse of vegetable oils continues as a result of the irrational persistence in regarding solvent extraction oils as non-edible.

It is true, of course, that not all solvent extraction processes are equally efficient in the sense of effectively separating the petroleum-based solvent from the oil so as to render the latter edible. But a part of the extraction done in this country is as efficient as in the case of U S soyabean oil which the Government sees no harm in allowing the vanaspati industry to use. In any case, the objective should not be to condemn solvent extraction oils to non-edible status permanently but to encourage expellers to switch over to modern processes which produce oils fit for human consumption. Only such a policy accompanied by efforts to persuade industrial users, like soapmakers, through restrictions and inducements to give up use of vegetable oils and turn to animal fat will solve the problem of chronic shortage of vegetable oils.

Bourguiba's Initiative

PRESIDENT Bourguiba's remarks on a possible Arab-Israeli settlement to an audience of Tunisian students last week have raised a storm in the Arab world. Contrary to the general impression however, he did not propose that the Arabs should recognise the present frontiers of Israel, but only those drawn for it by the U N. The London *Times* quotes President Bourguiba as having said in his address: "What I have suggested is that all the resolutions of the U N should be applied, including that concerning partition—which would mean the restoration of an important bit of territory to the Arab State of Palestine—and that concerning the return of the refugees. This would mean that the Israelis occupied a reduced area, but they would have the great compensation of peace and an end to a state of veiled war". Thus his proposals entail a return to the frontiers of Israel proposed by the U N in 1947 before they were enlarged by the throwing back of the Arab attack and the return of Arab refugees proposed by the U N in 1948.

The significance of his proposals lies not in their actual terms, which are anathema to the Arabs and unacceptable to Israel, but in the fact that they represent the first public admission by an Arab leader that the Israeli problem cannot be solved by war. Whatever their private reservations and doubts the Arab leaders have always stood united in their proclaimed determination to push Israel into the sea. Nothing less than the extinction of Israel has been the object. Now one of them has said that this is not possible because the great powers will intervene to stop the fighting, after a few hours and that it is not really necessary anyway because Israel and her Arab neighbours can live in harmony. In fact, President Bourguiba is trying to convert his fellow Arabs to the concept of co-existence; he is trying to do for the Arab-Israeli conflict what Khrushchev did for the East-West conflict.

The wrath which President Bourguiba's remarks have caused in many Arab capitals was only to be expected. Bourguiba himself referred to the "chimerical hopes and sterile hatreds" which have been aroused among Palestinian refugees by repeated but so far unfulfilled promises of an eventual restoration to them of their lands and homes (hopes which Bourguiba would satisfy by a negotiated compromise rather than war). The mental adjustment in the popular mind involved in the jump from extermination to co-existence is a big one. President Nasser, the Arab world's most realistic leader, has himself gone on record, in an interview with a French magazine, as saying that Arab honour would be satisfied if the refugees were allowed to return to their former homes and those that did not return were compensated. But his public response to President Bourguiba's proposal must necessarily be cautious. The Arab leaders are in a sense prisoners of their own promises, and cannot afford yet to risk the appearance of suffering a diminution of fervour. But if the result of President Bourguiba's initiative will be to set the ball of public discussion rolling, and start some much needed rethinking at the policy-making level in both Israel and the Arab countries, it will have served a vital purpose.

Weekly Notes

National Planning Council

WHEN the Prime Minister announced some months ago the decision to set up a National Planning Council to advise the Planning Commission on different aspects of plan formulation, there were misgivings about the utility of the new body. The proceedings at the first meeting of the Council appear to confirm these misgivings.

At its meeting on April 21, the Planning Council divided itself into some 12 groups, each in charge of a member of the Planning Commission. The groups will study special problems like irrigation and power, management, agriculture and land reforms, family planning, education, manpower planning, internal trade, etc. By and large, these groups will be concerned with subjects which are already engaging the attention of working groups and steering groups constituted by the Planning Commission as well as of the respective divisions of the Planning Commission and, of course, the respective Ministries. It is to be expected, therefore, that there will be much duplication of work. One would have expected that the groups set up by the Planning Council would replace the older working groups. But no; the two are apparently to co-exist. The argument is that the complexity and multiplicity of the development problems necessitate a close and continuing liaison between the bodies of experts and the Planning Commission.

Attention may be drawn to one of the inevitable consequences of such duplication of work. If the Planning Council studies the same problems as the Working Groups, there will often be conflicting views and voices within the Commission itself, which might necessitate arbitration by some other body. It is not as if we have been spared such conflicts hitherto. It is common knowledge that the Ministry of Commerce and the Foreign Trade Division of the Planning Commission squabbled over the export targets for the Fourth Plan; also the Ministry of Food and Agriculture and the Planning Commission. With the prospect of such conflicts increasing in number it is hardly to be expected that the planning process will be speeded up or made more effective.

Another feature of the groups set up by the Planning Council deserves comment. The Planning Council had been advertised as "a small body of specialists". Every one of its members, one would expect then, would function as a specialist giving the Planning Commission the benefit of his advice on matters relating to his particular field of specialisation. Yet what do we find? Among the 12 groups now set up the same person, for instance, is the chairman of no less than four, in charge of subjects as diverse as international trade and manpower planning and agriculture and land reforms and education. This, it may be explained, was inevitable once it was decided to have members of the Planning Commission as chairmen of the groups since there aren't enough members to go around. In any case, no one has claimed that members of the Planning Commission are specialists and so the Planning Council's pretensions to being a body of specialists refers only to its non-official members. But is even this true? To take the composition of the groups once again, one finds that one non-official member is in the groups on management, industry and minerals and family planning; another in the groups on education, family planning and international trade: and so on. The conclusion is obvious: either the specialists who have been nominated to the Planning Council are gifted with amazing versatility or the Council isn't going to *function* as a body of specialists even if it was *constituted* to be one such.

A Time for Deficit Financing

THE Finance Minister is reported to have told a meeting of the informal consultative committee of the Parliamentary Congress Party last week that the Government's restrictive credit policy would continue during the Fourth Plan period. The circulation of money *(sic)*, he said, would not be permitted to go beyond the levels of the expected growth of production. Controlled credit expansion was imperative since the Fourth Plan strategy would have to be chalked out without any scope for deficit financing.

On the face of it, the Finance Minister's statement contained nothing startling. Both in the Third Plan as also in the Fourth Plan Memorandum the approach of the Planning Commission towards monetary policy is based on the Reserve Bank's norm of "non-inflationary" level of deficit financing. This norm is derived from the estimated rise in real national income, expected changes in the income velocity of money and the probable level of price. But this gives only the broad framework within which monetary policy has to operate; it says nothing whatever about fluctuations in output and prices in the short run with which monetary policy is intimately concerned. To identify the long-term norm with monetary policy is, therefore, a mistake.

The Finance Minister seems to equate the rise in prices in the last few years with the Government's recourse to deficit financing and the credit expansion by banks to the private sector. But haven't there been years, e g, 1952-53 and 1953-54, when a substantial amount of deficit financing coincided with a sharp fall in general prices? The predominant factor which governs the movement of prices in a country like India is the level of food output. If, therefore, we stick dogmatically to a quantity theory approach we might end up by sacrificing growth when availability of food increases. This is what we did in 1952-53 and 1953-54.

In his enthusiasm to pin the blame on deficit financing the Finance Minister has slurred over the real causes of the price rise in the last two years. As much as four-fifths of the rise in real national income during 1962-63 and 1963-64 was absorbed by the rise in investment expenditure and defence outlay. Considering that during this period population also increased by about 5 per cent, it is not difficult to see why prices rose so sharply. But defence expenditure may now be stabilised at around the present level and agricultural production looks like picking up. In these changed circumstances there is no reason why deficit financing must remain the dirty words that they are now.

Prescription for Cooperatives

WHEN representatives of the Reserve Bank, the State Bank, the Ministries of Food and Agriculture and Community Development and Co-operation and the Planning Commission sit on a Committee to study the arrangements for agricultural credit, it was not too much to expect that they would bring to bear on the question their experience and awareness of the weaknesses plaguing the rural credit set-up. But, in fact, the Committee's recommendations turn out to be largely administrative and financial, probably because of the continuing assumption that the imposing edifice of co-operative credit needs only further stretching to be strengthened.

The emphasis of the Committee is throughout on augmenting the financial resources of the co-operative structure, especially at the top level. To this end, the State Bank and the State Governments have been asked to increase their financial assistance. Some acquaintance with the growth of the co-operative movement in this country is enough to prove that what ails the co-operatives is not lack of funds. The working capital of all the societies put together ran close to Rs 1,800 crores in 1962-63 and the average working capital per society rose from Rs 4,190 in 1951-52 to Rs 17,526 in 1962-63. The figure of average loan per member is now Rs 246 while in 1955-56 it was just Rs 64. But all this has been achieved through massive doses of governmental help—hardly 20 per cent of the working capital of the societies is owned by the societies themselves, the rest being externally financed. No wonder that in many villages, no distinction is made between "sahkari" and "sarkari" credit. The deposit effort of co-operatives has been poor—it has never gone above Rs 9 per member in the primary societies in the last fourteen years — reflecting the financial standing of the members. And the percentage of overdues is no less than 25 per cent for the primary societies.

With all the resources available, the co-operatives have made but little dent on the rural credit problem. Rural debt has never been higher, and more than half of this is used for financing current expenditure. The co-operatives by their very structure cannot pose an effective challenge to the competitive power of the trader-moneylender nexus. Where the co-operatives have made an impressive showing, their success is for the wrong reasons. Daniel Thorner's field reports of agricultural credit societies in different parts of the country give grim details of the power and influence of the village oligarchy. Again and again he found that the leadership of the co-operatives rested with the biggest village landlord, the most powerful trader or moneylender or the influential village official, all of whom cleverly diverted co-operative funds for their own uses—often for their own informal money-lending!

In the past attempts to link credit to production have failed. Loans are used for unproductive purposes and where there is no effective supervision it is difficult to prevent this. Where enforcement is effective, the peasant turns to the moneylender for his unfulfilled needs. The integration of credit and marketing has failed for the same reason—it cannot work where the cultivator has little surplus to sell and where the cultivator uses the co-operative marketing agency only to obtain the minimum credit, marketing the rest of his produce through the trader. Availability of cheaper credit has not thus provided the answer. Some means have to be found to reach credit to the poor and the most needy and to prevent the domination of the societies by the influential sections of the village. The dilemma is that where the co-operatives genuinely represent the interests of the weak, they are themselves weak. So much so, they are overwhelmed by overdues and bad debts and are steadily pushed towards final liquidation—last year more than 22,000 societies were awaiting liquidation.

Under these conditions, to repeat well known remedies (excellent in principle, ineffective in practice) of "crop-loans", "integrated credit and marketing", etc, will not help. What is needed is a sober reassessment of the impact of co-operatives on the rural sector and the realisation that without a modicum of economic and social wellbeing of *all* participants, the co-operatives cannot take roots and "de-officialisation" will be impossible.

Japan-Korea Crisis

RECENT attempts to normalise relations between Japan and Korea, which have not had diplomatic ties since World War II, have erupted into a series of violent student demonstrations in Korea and threaten to touch off anti-government rioting in Japan as well. Ostensibly a much needed forward step, the treaty between Japan and South Korea has aroused serious opposition among leftist and nationalist elements in South Korea, and among leftists in Japan. The reasons for the opposition are not difficult to find, though official communiques from both sides have been obscure. In Seoul, one student has already been killed, and hundreds arrested, and reliable reports indicate that the agitation is just beginning, since the labour movement and the secondary school students are becoming actively involved in the struggle.

In Japan, the Socialist Party and the left-wing student organisations are opposing the treaty, which the ruling Liberal Democratic government has rammed through the Diet. The Zengakuren, Japan's largest student organisation, is planning demonstrations for the coming weeks in collaboration with Korean students, and the Socialists and their union movement will be sponsoring meetings and protest rallies. Though the government cannot be shaken in Japan by the treaty issue because of its large majority and the fact that the issue has not aroused national concern as yet, it is entirely possible that General Park's government in South Korea may be toppled by the students, just as President Rhee lost power more than a year ago as a result of student demonstrations.

The roots of the disaffection go deep in Japanese and Korean history, and are related to Japan's economic offensive in East and South-east Asia. For almost a century prior to World War II, Korea was a colony of Japan and was exploited by the Japanese, both economically and politically. With the defeat of the "Greater East Asia Co-prosperity Sphere" and Japan's other imperialist designs, Korea gained her independence along with a strong hatred of Japan. As a result, diplomatic relations were never established between the two countries, and Korea has been engaged in a long-standing dispute over fishing rights with Japan, and has refused to allow Japanese fishing vessels within 100 miles of Korea, much to the distress of the Japanese.

Another cause of fear for the Koreans is the fact that Korea has made many concessions to Japan in matters of trade, and has withdrawn its objections on fishing boundaries. These concessions, which were made mainly to protect the large Korean minority living in Japan, may open the door to economic penetration by Japan into Korea, thereby raising the bogey of Japanese "neo-colonialism". It is true that Japan's economy must expand in order to survive, and the country is now in the throes of a recession due primarily to domestic over-expansion. Given new markets in South Korea, the Japanese economy would have more leeway. Thus, of some advantage to Korea, which could obtain goods cheaply in Japan, economic penetration by Japan could bring other types of domination, with which the Koreans have had adequate experience.

Behind the scenes, the United States has pushed hard to cement Japanese-South Korean relations, and is particularly anxious to have two of its major allies in the Far East on friendly terms. The Americans are, in the long run, anxious to bring Japan into its security system in Asia, and see the present treaty as a first step in this direction.

The situation in Korea has reached crisis proportions, and it is doubtful whether the government of General Park can withstand the combined opposition of the students and the nationalists. Though it is likely that the treaty will be ratified as scheduled, the issue is an important one in Korea's internal politics, and has implications for the Japanese economy and for Asian development generally.

Credit and Capital

A non-economist reader writes:

IN his letter published in the issue of April 17, 1965 V G Pendharkar of the Reserve Bank writes: "As a general principle, one should remember that capital is a scarce resource in the economy. Trying to provide it at a cheap rate only encourages its use in an indiscriminate manner and leads to inflation which in turn affects exports".

To this non-economist reader it appears that this statement needs some examination. To begin with, what is capital? Is it loan finance or physical capital goods? When the central bank acts to raise interest rates in the economy, it raises not the price of capital goods but of loan finance. The higher price will reduce the demand for loan finance and the demand for the goods—capital goods, inventories, labour as also consumption goods—on which it is spent. This will lower the prices of these goods. The impact on prices is here produced by reducing aggregate demand.

Where does, scarcity of capital, understood to mean capital goods, enter the picture? It does not, in fact. But Pendharkar's reference to indiscriminate use of scarce capital gives the impression that it does somewhere. The expression "indiscriminate use" has meaning only with reference to some notion of socially optimal use. Indiscriminate use of capital will arise when the market price of capital is lower than the social cost or when the market price of substitutable factors is higher than their social cost. Isn't this what economists call the problem of choice of techniques? If capital (in the sense of machinery and equipment) is scarce and it is considered desirable to reduce its use in any industry or enterprise, the thing to do then is to either raise its cost or reduce the cost of substitutable factors particularly labour, or both. This could be done by a fiscal impost on capital goods or a subsidy to wages or both—and, directly at any rate, not by raising the cost of credit.

Taking any industry or enterprise, greater economy in the use of capital goods is to be expected with a rise in aggregate investment demand in the economy since, given the elasticities of supply of capital and labour likely to prevail in a developing country, a rise in investment will raise the price of capital relatively to the price of labour.

LETTER TO EDITOR

Fertilisers and Irrigation

I AGREE with your correspondent (*The Economic Weekly*, March 20 p 508) when he says that the ICAR's suggestion that irrigation projects should not be undertaken unless a simultaneous increase in fertilizer supply is ensured was bound to provoke controversy. However, there is nothing controversial about the Council's suggestion itself; what is questionable are the reasons the Council has put forth in support of its suggestion.

The point at issue is the relationship between water input and fertility of the soil. Is it correct to maintain, as the Council does, that applying increased water inputs by itself leads to a rise in the nutrient intake rate of plants, thereby depleting the soil and producing low yields?

On the question of water input I would like to draw attention to what Colin Clark has to say in his "Economics of Irrigation in Dry Climates". On the basis of Penman's theorem on the subject, Clark maintains that water requirements of all crops must be more or less the same, if they are grown on the same type of soil and for the same growing season. Surplus water fed into the soil in the belief that some crops require more water than others is probably just lost through evaporation or is drained into the sub-soil on lighter soils.

The ICAR's suggestion would be valid in broadly two situations — first, where the increase in water input is the direct result of growing crops such as sugarcane having a longer growing period and requiring comparatively large dosages of plant nutrients, and second, where the relationship between water input and plant nutrients is such that indiscriminate irrigation washes away the plant nutrients through erosion or drains them into the deep sub-soil.

A War Situation Develops

Romesh Thapar

THERE has been so much self-congratulatory talk about the friendships supposedly forged against Chinese aggression during the anxious days of October 1962 that the temptation is great to dwell on the attitudes of these friends in the present confrontation with Pakistan. Of course, extollers of these friendships, local and foreign, are silent about friendship and such things at the moment. Indeed, there is an unspoken fear that if the clash in the Rann of Kutch continues to escalate, as it has done during the last few days, there is every likelihood that India will revise many of the assumptions which have motivated her policies over the past two years.

U S Must Have Known

Already, at the level of the Congress leadership, the uncomfortable thought recurs that President Johnson was made aware of the preparations under way in Pakistan for full-blooded attacks in the Kutch sector and elsewhere — and the decision was taken abruptly to call off the visits of Ayub and Lal Bahadur. After all, no military preparation in Pakistan is possible without the knowledge of the considerable U S military staff attached to the Pakistani army at almost every level. Actually, we ourselves are now experienced in the ways of foreign military advisers and understand how much of our own military control and operation is known to them.

The attempt in the West to treat Pakistan's aggression against India as another one of those 'confused' situations in which it is 'not possible to take sides' was generally expected even by men accustomed to fawning upon aid-givers. But there is demoralisation, and even anger, that 'our friends' are not prepared to do or say anything which might place them in a position critical of Pakistani blackmail or which might appear to favour India in a developing war situation. In fact, once again, India is being advised to do 'something' about demarcating her borders — which very often means that she should surrender territory to her neighbours. 'Useless tracts', they say, forgetting that the argument applies either way.

Prime Minister Lal Bahadur, purged of much of his wishful thinking since the rude treatment received at the hands of President Johnson, returned from a trip to Nepal to preside over a series of secret Cabinet confabulations to determine India's next step. The military situation in the Rann of Kutch, and more specially in the area which would soon be cut off for several months during the annual flooding, was not very reassuring. The Pakistanis obviously hoped that the pressure of an uninformed, excitable public opinion would force the GOI to push military reinforcements into a wasteful and indefensible position — a trap very similar to the one created by the Chinese movement into Thag-La in NEFA in 1962. The effort to stage-manage a 'victory' was only too apparent.

From what can be gathered, a firm decision has been taken to prepare for the possibility of war being forced upon us. Should Pakistan refuse to withdraw from the territory occupied by her, then the skirmishes taking place at widely separate points in the west and east will be treated as part of a general attack. The consequences are clear and do not have to be spelt out. Unless Ayub and his lieutenants are curbed, major battles are in the offing. The realisation is now widespread in political circles that to keep an army on the defensive in the face of continuous attacks is to invite disaster.

We are not without our more cautious strategists. The Prime Minister is being warned of the dangers of a war on two fronts and more, for the Indonesian capacity to make mischief in the Nicobars is not under-rated. And there is a fatalistic feeling that 'enemy agents' will disturb law and order. But these cautious elements are unable to present a coherent alternative plan to punish the aggressor, and they also recognise the serious demoralisation which would grip the armed forces if they are prevented from expelling the intruder.

Take People Into Confidence

Naturally, there is a marked degree of impatience at what appears to be our slow response to the Pakistani intrusion into Kutch. Everywhere people are recalling that Defence Minister Chavan and the General Staff have been assuring us that the armed forces are ready to face China's military machine, and the inevitable question forms: what prevents them from 'bashing' the Pakistani intruders? This is the kind of questioning which the GOI has invited upon itself as a result of the loose talk of ministers and officials. Until the people are taken into confidence, this sort of criticism will mount.

Rawalpindi's near-ultimatum that there will be no cease-fire and no negotiations until half the Rann of Kutch — the Pakistan claim is based on the theory that the Rann is an inland sea! — is surrendered means in fact that the two countries are moving towards war. India cannot afford to wait until the floods in the Rann of Kutch force her to withdraw from forward border positions on the other side of the flood. Pakistan can maintain the pressure, hoping to take over her claim — some 3,500 square miles — after the floods make defence of the area impossible for India. Delhi has, therefore, to face the fact that her territory has been entered and consider that aggression has been perpetrated. This means the activisation of the entire Indo-Pakistan border. A war situation may prevail between the two countries by the time these lines appear in print.

The urgent need to make known the facts pertaining to the borders of the two countries in the Rann of Kutch has not penetrated the bureaucratic apparatus of the GOI. Diplomatic missions in the Capital have still to be informed of the fact and this applies to the foreign correspondents, too. Maybe, our missions abroad are also inactive, without proper briefing. It is also necessary to explain the clear merits of India's case through every media of communication. We are again guilty of taking too much for granted, particularly when it is known that the Pakistani propaganda machine is most active.

In the opinion of many, the Home Ministry also seems to be dragging its feet. True, Gulzarilal Nanda has warned 'the enemies of the nation' that they will be dealt with ruthlessly, but there has been little action to mobilise the people against the communal incendiary, the rabble-rouser who makes it his revanchist profession to locate so-called fifth columnists. And there has been no action against men and organisations known to exist only for communal vendettas. The Home Minister cannot afford to await developments.

The ramifications of even a limited war between India and Pakistan would be wide and deep. It is also within the realms of possibility that a limited war could take on the character of a sustained and unending war of attrition, aided and abetted by interested groups of various description. All the more reason, then, that even as we move to thwart the Pakistani attempt to blackmail us, renewed efforts should be made to work out a rational approach to find a solution to the problem of the undemarcated sections of the borders of our country. Effective, realistic thinking of this kind would certainly help to isolate the blackmailers in Rawalpindi and Peking.

But those in this country and outside who are urging talks even as the Pakistani army sits in the Rann of Kutch are in fact sowing the seed of political instability and chaos which the Peking-Pindi-Jakarta coalition would like to see flourish in this subcontinent. We must constantly remind ourselves of this strategic objective of our detractors, or else we will be persuaded to make *ad hoc* unconnected moves which create demoralisation and disarray. In the speeches of government leaders, there is a surprising lack of understanding of what our enemies seek to achieve. The peripheral territory grabbing is only a minor part of the over-all design to sap the political-economic strength of India and in this way to destroy her unity.

Public opinion, made insensitive by the moronic stressing over the past two years of 'threats' and 'build-ups' on our borders with China and Pakistan, has only just begun to realise that the affair in the Rann of Kutch could spark a war. And the debate in the Parliament has yet to reflect a meaningful emphasis. It is time to galvanise the people for that extra effort which we will require if we are successfully to pull through the present crisis and others that may be spawned by it.

FROM THE LONDON END

Labour's European Policy

THE week-end conference held by Harold Wilson at Chequers with a number of European socialist leaders on a visit to the U K as members of the Socialist International, provides evidence to support the view that the Labour Government is planning a break-through to closer links between the European Common Market and the European Free Trade Area. At a speech made in Margate after the conclusion of the Chequers meeting, Wilson said: "We are now poised to take a new initiative in European economic co-operation".

Wilson Anxious to Close Gap

It is well known that although the Labour Government has, at present, no plans for renewing Britain's application for membership of the Common Market, Wilson is most anxious to bridge the gap between the two trading blocs in Europe. The first step in this policy was taken during his recent visit to De Gaulle, where a foundation was laid for technical co-operation on joint projects between France and Britain which Wilson himself described as an attempt "to tunnel under the tariff wall of the European Common Market and E F T A.".

The actual situation is that by next year both E F T A and the E E C will be free trade areas, with no internal barriers but with high tariffs between them. This is a position that could, in the future, give rise to friction. Members of the visiting European countries, were, apparently, very struck by the fact that Britain, under a Labour Government, was at last beginning to talk like a European country. Many of the leaders of the Socialist International were impressed by the marked contrast in Wilson's attitude to European problems and his apparent new warmth towards the Continent as compared with the rather chilly atmosphere which prevailed during Gaitskell's visit to Brussels in 1962. It will be recalled that in 1962 differences between European socialists were particularly marked on the question of British membership of the Common Market, and the differences came to a head in the sharp clash in 1962 between Gaitskell and Spaak over the conditions of British membership.

Possible Areas of Cooperation

Socialist parties in Europe, unlike the Labour Party, have always regarded planning as something that should be done on a European scale. The Labour Party, on the other hand, has always believed that economic planning must be a national affair, and this is a view that is still held to-day. When Labour first came to power. European socialists felt that with the imposition of the import surcharge, Britain had once more administered a slap in the face as far as Europe was concerned. The excitement over this particular issue has now cooled down and Wilson has certainly won his reputation as "a good European" by his recent statement at Chequers.

Visiting European socialist leaders were particularly struck by the fact that although there were a number of items on the agenda for discussion at Chequers, including Vietnam, international liquidity, Africa, etc, the item which took pride of place was relations between Britain and the Common Market. The following lines of co-operation between E F T A and E E C were discussed:

(a) Intensification of the Kennedy Round of tariff negotiations. If these succeeded, there should be a series of tariff negotiations on commodities of particular concern to E F T A and Common Market countries. An arrangement under which the Six could be treated as one economic unit which might enter into relations with E F T A to give a wider free trade group is also to be explored.

(b) Greater collaboration through O E C D.

(c) Further direct co-operation on specific issues such as that between Britain and France in aircraft development.

(d) Extension of the kind of monetary co-operation that provided financial support for Britain from Central Banks in Europe.

Proposals on these lines are now to be made at the E F T A Ministerial Conference in Vienna at the end of May. Discussions with Common Market countries may well be held after this, either directly or through the Organisation for European Economic Co-operation and Development.

Assurance to Commonwealth

Socialist representatives from E F T A countries were particularly enthusiastic about these proposals, and they feel it has now given the lie to the belief that Britain has no interest in

defending the EFTA set-up — a feeling which was intensified by the import surcharges. They now believe that EFTA has a long and rosy future ahead. It was, therefore, not surprising that EFTA representatives at Chequers should be enthusiastic about this new move, but what was particularly interesting was that the representatives from the Common Market also made no criticism.

One thing, of course, is perfectly clear and that is that at the present moment there is no question at all of Britain joining the Common Market as such. The moves towards closer co-operation are rather on the lines of an enlarged free trade area, similar to the proposal made by Macmillan before EFTA was formed or before Britain had taken the plunge in applying for membership of the EEC.

The Commonwealth point of view was also not overlooked and was indeed very strongly put by the leader of the Canadian New Democratic Party, TC Douglas. He raised most of the points that were made during the Commonwealth Prime Ministers' Conference in London held before Britain's application for membership of the Common Market was finally rejected. Wilson reiterated the assurance that in no circumstances would Britain be prepared to join a European trade bloc which pursued the type of policy that the Common Market was at present pursuing with reference to its agricultural policy. This was obviously said with particular reference to Canadian interests, but Wilson also made it clear that Britain would still insist upon the conditions which they had laid down previously before any attempt was made to join the Common Market.

Of course, there is no knowing how the Common Market will react officially to this initiative for closer economic co-operation. Wilson who is, above all, a realist, knows that no amount of tact and charm is going to make General De Gaulle change his mind about the terms under which Britain can become a full member. If, of course, a socialist government were returned in the forthcoming elections in Western Germany, or if Herr Brandt managed to find a place on a coalition government, it might be possible to ease British entry on terms considered suitable by the Labour Party. Again, with a socialist government in Germany, it would be much easier for Britain to enter into joint arrangements in public enterprises such as in the field of electronics with Germany rather on the lines at present proposed to the French on the aircraft industry.

The Chequers meeting is a culmination of comments and references which Wilson has recently made on the need of improving relations between the two main European trading groups. The British Prime Minister has always been careful to say that no action on these lines would be taken without consultation with Britain's EFTA partners. This was obviously a lesson that was learnt after the violent reactions to the imposition of the import surcharge without prior consultation with the EFTA countries. The Chequers meeting was another personal triumph for Wilson who has now completely placated Britain's EFTA allies, convinced Europe that Britain is not turning her back on the Continent and persuaded General De Gaulle during his Paris meeting that there is great scope for Franco-British co-operation while at the same time succeeding in reassuring Johnson that Britain remains one of America's staunchest allies.

BOOK REVIEW

India: Secular or Jurisdictionalist?

S K Nath

The Concept of the Secular State in India by Ved Prakash Luthera; Oxford, 1964; ix+187 pp; Rs 12.50.

NEARLY everybody thinks that India is a secular State; yet the word "secular" does not occur in the *Constitution. Two attempts* by a member of the Constituent Assembly to have the word included were defeated due to opposition from Dr B R Ambedkar himself. Again, one of the basic principles of a secular State is that its Constitution lays down a tight division between religious and non-religious affairs: church (or something *like it) is free to conduct what* are strictly its own affairs; but in India *the various religions* have not been granted this internal autonomy. The other basic principle of secularism is that the State is completely impartial as *between the* followers of different religions. The Indian Constitution embodies this principle, and, therefore, *to this extent* is secular. *But a constitution* which embodies this latter principle but not the former (of a *tight division* between *the "church" and* the State) is more properly described, according to Luthera, as *jurisdictionalist.*

Apart from strict impartiality as between different religions, the other common characteristics *of secular and* jurisdictionalist states are *complete* freedom for the individual to choose any faith for himself and qualified freedom to perform any external acts of his chosen faith—the qualification *being* that the external religious observances should be in conformity with the laws of the State. Our Constitution adds this restriction even to the former freedom; but such a condition on the freedom of *conscience* can have very little meaning in practice. The author puts it down to bad drafting.

It seems that there is only one country where the Constitution embodies strict division between secular and religious matters (and the consequent internal freedom for religious bodies). That country is the USA—though even there, in practice, the division is not always maintained: some religious bodies have formed strong pressure groups in order to influence government policy, and there are references to God and Christ in official utterances. There is, besides, the institution of State chaplains. In any case, the age-old injustice of untouchability, carefully wrapped in the folds of Hinduism, made it inevitable that the founding fathers of the Indian Constitution would want to give the State the power to embark upon social reform legislation that "does not stop at the non-religious sphere but extends even to the religious sphere". They could touch almost all parts of untouchability without breaking *the wall* between religion and State (which characterises the legally *perfect* concept of secularity), but they could not throw open "Hindu religious institutions of a public character to all classes and sections of Hindus" without discarding strict, legal secularity. No one need regret this; *Luthera does* not either. A jurisdictionalist Constitution (which is what we have) suits Indian social conditions *better than* a secular one.

However, though our Constitution should remain jurisdictionalist, there is room for improvement in its interpretation by the Parliament. Luthera correctly argues that in its legislation for social reform the Parliament has been unduly timid, confining such legislation to the majority community; this has vitiated the whole spirit of the Constitution—which was to ignore religious differences in civil matters. While Article 44 of the Directive Principles of State Policy laid it down that the "State shall endeavour to secure for all citizens a uniform Civil Code throughout the territory of India", within five years of the enactment of the Constitution the Hindu Marriages Act was passed. In a sense, legislation of this kind is not impartial between the religious sects and hence not jurisdictionalist: if the Hindus' marriage laws should become modern, just and rational, why not *also those of* the Muslims, etc?

The Articles of the Indian Constitution which embody the principle of religious non-discrimination have a most *curious feature.* While other constitutions simply lay down that the State shall not discriminate on grounds of religion and caste, etc, the Indian Constitution specifies that the State shall not do so on grounds *only* of religion, caste, etc. It seems that this peculiar word was included to enable the government to give extra privileges to members of the backward classes—people who belonged to certain *castes* and were *also* poor and deprived. However, the Constituent Assembly later went on to add specific parts to the Constitution explicitly enabling government to grant these humane privileges. Various State governments have been trying to take advantage of the word "only" to reserve seats for different castes *in educational* institutions; they have not always been above the temptation to show extra favour to the politically important castes. Fortunately, each time such a case has been brought to any court the decision has been against the sectarian reservation of seats.

A similar reform is needed in the provisions about the Scheduled Castes and Scheduled Tribes. A great many of the members of these groups are trying to escape from the stigma of their caste names by discarding Hinduism and turning to other religions, *particularly Buddhism.* For every Buddhist in India in 1951, there were 1,671 in 1961. But once a member of a Scheduled Caste or Tribe discards Hinduism, he no longer qualifies for the extra help the Constitution had provided for *him. This is* thoroughly unjust. If the special provisions were designed to help the most unfortunate Indians es*cape from their social* and economic handicaps (rather than to preserve them in their Hinduism), then it is high time *that all* caste criteria were replaced by economic criteria.

But perhaps the most anomalous article of the Constitution is that relating to cow protection (embodied in the Directives): it seems to justify prohibition of cow slaughter on economic grounds! In a *country* where one-third to one-half of the members of the cow family have been estimated to be *economically useless,* the adoption of the Directive on economic grounds is an arresting example of double think.

Though it needs some improvement, our Constitution is no doubt very enlightened in matters relating to religion. Yet the hold of irrational religious *traditions continues* to be strong in the country. Perhaps important improvement will come with widespread education. However, our Constitution permits denominational educational institutions; *it permits religious instruction* even in institutions which are partly state aided. One can argue for the abolition of these permissions; but their abolition is not likely to be enough by itself. Starting from 1926, Turkey attempted increasingly to secularise the state and to weaken the hold of the

traditional Islamic practices on her society. Even oaths by the officers of the state were to be taken not in the name of Allah but on a man's honour. Government policies matched the constitutional changes: religious colleges, tribunals and monasteries were abolished; even the wearing of religious garments outside the places of worship was forbidden in 1934. But in 1947 a number of these measures began to be withdrawn. It would have been interesting and useful if Luthera had given a detailed analysis of why that experiment failed.

Luthera is very good at reporting the facts relevant to his theme, but he fails to develop it strongly and coherently at any one place. Therefore, while this is an interesting and useful book, it could have been much more so — with the same basic research but a better development of the main arguments.

A CALCUTTA DIARY

A Hundred More or Less

WITH a moral insouciance perhaps unparalleled elsewhere in the country, the Ministers of the Government of West Bengal have decided to forgo Rs 100 a month of their meagre salary of Rs 1,000 a month, already reduced, it is said, by 10 per cent because of the contribution to the National Defence Fund. The scheme awaits several clarifications: is the reduction going to be on the original Rs 1,000 or on the emaciated Rs 900? Last week the Finance Department did not know the answers, with no harm done. More important than it all was the reason given for the voluntary cut. "Austerity", we were told. The people laughed luxuriously. The one healthy feature of the Bengali political scene today is that, at least in the urban areas, political gimmicks now evoke only cynical guffaws. This reporter has yet to meet anyone who believes that, because of the cut of Rs 100, some Ministers, are going to skip a meal or stop buying that twenty-fourth punjabi in the finest khadi.

What all this exercise was in aid of remains a matter of speculation. It may be that, after its mock fight with Big Business, represented by none lesser than G D Birla, aided and abetted by Gulzarilal Nanda, S K Patil and Satyanarayan Sinha, the State needed a telling gesture; and the hundred-rupee cut was considered just it.

* * *

One of these days, however, we will have to get down to the job of fixing price tabs on politicians. The reference here is not to the price at which a politician can be bought; every business man knows that, as do party leaders. (Heard the lovely American definition of an honest politician? — The one that *stays* bought.) The question here is how much the people owe a politician elected to a legislature and how much more one that is doubly lucky to be in office, this in terms of his service to — or work for — the people, as distinct from his services to particular groups.

Quite frankly, there is no knowing, no possible cost accounting. A politician goes to the legislature because he has been able to fool, or persuade, a requisite number of voters that he is going to do something for his electors' interests and, at a second remove, for the good of the world. No questions asked about personal qualifications, academic or otherwise. The classic example is Churchill's when he went into the Admiralty and thought that his main qualification was that he was at sea. The civil service, it was taken for granted, would provide what has since illiterately come to be known as "expertise", although in French it has nothing to do with the perfectly good English word, meaning the right thing, expertness—and the Minister the popular opinion. Neither assumption holds good today, for the civil service in the democratic countries frequently knows nothing of quasars or quantum and Ministers' common sense is frequently no more common than sense.

* * *

As it happens, few of these general principles are involved in the West Bengal decision. It is by no means certain that anybody in the West Bengal Cabinet cared to evaluate, in terms of rupee and paise, his worth to the State. They do not work, for which there may be rates; they serve, for which the rewards are to be collected in the next world. Even this Hindu view of life maintained the Hindu social structure, until the additional proposition came along, convincingly, that there were prizes to be collected here and now. If Three Coins in the Fountain could work magic, so could a hundred rupees out of the pay packet; West Bengal Ministers may well be on to a good thing. It may well be a sign of India's economic take-off that Ministers can sign away Rs 100 just like that; many had never seen thirty together, except in other people's hands.

Few can know how much our Ministers and officials, to say nothing of such ornaments as the President and the Governors, are costing the country. The whole picture has been distorted by accounting and auditing manipulations through "sacrifices" here and benefits there; accountants and auditors, be it remembered, are as readily at the service of the Government as they are of private business. We may never know just how much today's President costs the country against yesterday's Viceroy; and the successor is supposed to be mainly decorative. An honest audit might go down to the level of Grade IV and prove the same thing.

* * *

The question of salary, a hundred more or less, has lost all meaning because the distinction between personal and public charges has ceased to exist. This writer knew a member of the Viceroy's Executive Council whose son had used his official car; promptly on his return the father wanted to sign the log book. "How many miles?", asked the father. "Twelve miles, more or less", said the son. Father was indignant, "What do you mean by this nonsensical 'more or less'? I have to pay for this mileage; this was not official; and I want to know whether this was 11 or 12 or 13 or 12½. I will not let you cheat the Government of one yard".

Those familiar with Bengali lore will already have cried, "Ah! another Heramba Maitra. In any event, all this seems very remote from West Bengal ministerial salaries". That, I submit, is the whole point; and we have come to regard Rs 100 as a relative quantity, not as an absolute in terms of morality. The argument is as old as Bankim and Babi Babu; but never old enough to be forgotten, at least in Bengal. It is; hence the hundred-rupee sacrifice to the bitch goddess of success. It may be too late to embark on the thesis that in India today sacrifice may be the most seductive of sirens, the Lorelei of libertarians the world over, India included. But there you are, West Bengal Ministers are a hundred rupees poorer, which does not necessarily mean that hospitality will be poorer; that's another matter.

Relative Rates of Growth

Agriculture and Industry

A V Ramsunder

A Rudra has presented in his article ("Relative Rates of Growth: Agriculture and Industry," The Economic Weekly, November 7, 1964) certain rates of growth of industry which are in balance with specified rates of growth of agriculture. One of his important conclusions was that a 12 per cent annual rate of growth of 'industry' over the decade 1960-61—1970-71 is in balance not with 5 per cent growth of 'agriculture' as is believed but with a 6.9 per cent growth. He also works out the pressures on prices that will be generated in the economy by the imbalanced growth.

In view of its importance it is worthwhile to re-examine the problem keeping in mind two important aspects which did not directly enter Rudra's discussion.

First, we shall relate consumption, savings, taxes, etc, directly to the levels of income generated under alternative assumptions about the rate of growth of 'agriculture'.

Second, we shall explicitly make some assumptions about tax-rates, savings ratios, commodity composition of consumption, etc. We have retained most of Rudra's other assumptions.

The present paper concerns itself only with deriving the rates of growth of 'industry' in balance with alternative rates of growth assumed for 'agriculture'. We have also worked out the changes in the overall direct tax-rate that will have to be made in order to make a 5 per cent growth rate of 'agriculture' balance a 12 per cent growth of 'industry'. Finally we have examined the implications of an alternative value for the savings to disposable income ratio.

[The writer is thankful to A Rudra and T N Srinivasan for their guidance and help in the preparation of this paper.]

BRIEFLY stated the following conclusions emerge from our analysis:

(1) We find that a 12 per cent rate of growth per annum of 'industry' is in balance with a rate of growth of 'agriculture' in the range 5.7 per cent —5.9 per cent. The term balance is used in this context to mean that there is balance between total supply (including imports) and total demand (including exports) at base year prices. In interpreting this result a number of qualifications need to be kept in mind: (a) The model is defined in terms of broad aggregates. One can argue that the rates of growth of 5 per cent and 12 per cent widely discussed are not necessarily related to the sectors 'agriculture' and 'industry' as we have defined for this study. It can further be argued that the particular scheme of aggregation adopted may have concealed the extent of imbalances that may be revealed by a more disaggregated study. In this connection it may be mentioned that our sector 'agriculture' includes industries based on agricultural raw materials. Thus if we had treated these industries as a separate sector the results could conceivably have been different. (b) The limitations of the input-output framework with constant coefficients in the context of an economy undergoing rapid structural change are well known and need not be repeated here. In particular supply response to changes in prices are ignored. (c) A number of simplifying assumptions have been made (see section 3) in arriving at our results.

(2) Direct tax-rate as a proportion of Net National Product will have to be raised from 5 per cent to a value in the range 7.4 per cent—7.9 per cent.

(3) If the ratio of savings to disposable income is raised from 8 per

1 total value added
2 total household consumption at market prices.

cent to 12 per cent it is seen that the rate of growth of 'agriculture' that is in balance with a 12 per cent of growth of 'industry' is in the range 4.6 per cent—4.8 per cent.

(4) The rates of growth of 'industry' which are in balance with given rates of growth of agriculture are generally seen to be *higher* than those obtained by Rudra (compare our Table 3 with Rudra's Table 3). In particular, the rate of growth of 'agriculture' which is in balance with a 12 per cent growth of industry is in the range 5.7 per cent—5.9 per cent as against Rudra's 6.9 per cent. Again the magnitude of foreign exchange deficits generated by an imbalanced growth is roughly half of what Rudra has obtained, though the gross capital formation is somewhat lower in our case (compare our Table 4 with Rudra's Table 4). However, in analysing these differences one must keep in mind the differences in the set of assumption made by us and Rudra.

II
The Model

We have used the inter-industrial set up to study the dependence of agriculture on industry. The economy has been divided into four sectors.

(1) Agriculture and industries based on agriculture.
(2) Mining (excluding coal) and industries based on mining.
(3) Coal, electricity, railways and motor transport.
(4) Residual sector, including commerce and services.

Table 1 gives the inter-industrial transactions for the base year 1960-61, drawn up at 1959-60 producer's prices and Table 2 gives the matrix of coefficients, including the coefficients of value added for the three sectors.

The model consists of the following feasibility condition to be satisfied by the output levels x_{it} (i=1, 2, 3) of the three sectors. The equations may be written as follows:

$$(1)\quad x_{1t} - a_{11}x_{1t} - a_{12}x_{2t} - a_{13}x_{3t} = h_{1t} + g_{1t} + s_{1t} + o_{1t} + e_{1t} - m_{1t}$$

$$(2)\quad x_{2t} - a_{21}x_{1t} - a_{22}x_{2t} - a_{23}x_{3t} = h_{2t} + g_{2t} + s_{2t} + o_{2t} + e_{2t} - m_{2t} + k_t$$

$$(3)\quad x_{3t} - a_{31}x_{1t} - a_{32}x_{2t} - a_{33}x_{3t} = h_{3t} + g_{3t} + s_{3t} + o_{3t}$$

where a_{ij} are the input coefficients, h_{it} is the household consumption of commodity i in year t, g_{it} government consumption, e_{it} its export, m_{it} the import, s_{it} the addition to stocks and o_{it} is the intermediate consumption of the residual sector. k_t stands for capital formation consisting of two parts k_{dt} financed by domestic savings and k_{ft} financed by external assistance. The sectors are so defined that all the fixed capital formation takes place in the second sector and the third sector has neither imports nor exports. In addition to the above three conditions we make use of the following identity:

(4) $y_t = v_{1t}x_{1t} + v_{2t}x_{2t} + v_{3t}x_{3t} + y_{4t}$

where y_t is the gross national product measured in producer's prices of 1959-60, v_{it} is the value added per unit of output in sector i and y_{it} is the total value added in the residual sector.

In order to study the mutual relations between the rates of growth of the output x_{it} and available supply for net exports of agriculture ($e_{1t} - m_{1t}$) we eliminate g_{it}, s_{it} and o_{it} by making suitable assumptions about them and k_t and h_{it} by relating them to the gross national product y_t.

III
The Assumptions

(1) The coefficients a_{ij} and v_{it} are taken from the 1960-61 inter-industry table and are assumed to remain constant over the decade. Rudra, however, has assumed a zero value for some of the coefficients, where the corresponding flow constitutes less than 5 per cent of the total flow. Again, he has raised the input of industrial raw materials into agriculture "to take care of likely technological changes in the latter".

(2) Government consumption is treated as exogenously given, taking the following numerical values (for t = 1970-71) (same as Rudra's).

g_{1t} = Rs 250 crores, g_{2t} = Rs 560 crores g_{3t} = 10 crores.

(3) We treat $s_{it} + o_{it}$ as proportional to the level of outputs x_{it}.

$s_{it} + o_{it} = b_{it}x_{it}$ where b_{it} are assumed to have the following base year values:

$b_{1t} = b_{10} = 0.04$; $b_{2t} = b_{20} = 0.05$; $b_{3t} = b_{30} = 0.27$

(4) The household consumption h_{it} and the domestic capital formation k_{dt} are related to y_t in the following manner.

Depreciation is assumed to be 6 per cent of the G.N.P. This gives the net national product:

$y_{nt} = 0.94\,y_t$.

Direct taxes and surplus of public enterprises are each assumed to be 5 per cent of the N.N.P. Subtracting these two from the N.N.P. we get the disposable income.

$y_{dt} = 0.94\,y_t - 2(0.05 \times 0.94\,y_t) = 0.846\,y_t$.

The total private savings (personal + corporate) are assumed to be 8 per cent of the disposable income. So that we get total private savings at 0.06768 y_t and total household consumption at market prices $C_t = 0.77832\,y$.

It is assumed that the domestic consumption at producer's prices of the output of the three sectors retains to C_t the same proportion in the terminal year as in the base year. In the base year this ratio is seen to be 0.6635. Further it is assumed that 85 per cent of this consumption at producer's prices is from the output of the first sector, 10 per cent from the second and 5 per cent from the third. In contrast to the consumption vector used by Rudra, which he has derived by a modified application of the Linear Expenditure System, our vector has fixed proportions in the three sectors.

To arrive at total domestic savings used for financing fixed investment we have to add government savings to private savings and subtract the net increase in inventories during the final year.

For evaluating total Government savings the receipts are assumed to be 18.8 per cent of the G N P (direct taxes 4.7 per cent, government current surplus 4.7 per cent and indirect taxes 9.4 per cent of the GNP). We have assumed the total Government expenditure to be Rs 2800 crores, in 1970-71. Thus the total savings is $0.188y_t$ - 2800. The net increase in inventories in the final year is assumed to be 1.5 per cent of the G N P. Thus the total gross domestic savings devoted to fixed investment in the final year is $0.06y_t + 0.06768y_t + 0.188y_t - 0.015y - 2800 = 0.30068y_t - 2800$. There are two sources of financing

Table 2: Coefficient Matrix

Input Sectors / Output sectors	(1)	(2)	(3)
(1)	0.204	0.052	0.020
(2)	0.017	0.310	0.149
(3)	0.020	0.064	0.129
Value added	0.736	0.407	0.698
Gross output	1.000	1.000	1.000

total investment. The first is through domestic savings. The second source is through foreign trade deficit covered by external assistance. The figures we use for this second component are already in producer's prices. We need the counterpart of gross domestic savings in terms of output of the second sector in producer's prices. It would have been nice if we had a deflator for this domestic savings component. What we have is a deflator 1.43 (source: Central Statistical Organisation) for equipment part of investment and 1.00 for construction. We, therefore, made the following two alternative assumptions to arrive at an overall deflator for domestic savings component of fixed investment.

A: 80 per cent of gross domestic savings used for fixed investment is devoted to financing construction. The overall deflator in this case is

$$\frac{1}{\left\{\frac{0.8}{1.00} + \frac{0.2}{1.43}\right\}} = 1.064$$

B: 70 per cent of gross domestic savings is devoted to construction. The overall deflator in this case is

$$\frac{1}{\left\{\frac{0.7}{1.00} + \frac{0.3}{1.43}\right\}} = 1.099.$$

The part of capital formation financed by external assistance is treated as equal to the surplus of imports over export earnings.

Thus $k_{ft} = m_{it} + m_{2t} - e_{1t} - e_{2t} - e_{ot}$ where e_{ot} is the net invisible earnings plus domestic trade and transport margin on exports.

For m_{1t} we have assumed that the non-competitive import is 0.01 x_{1t} and the competitive import vanishes for balanced growth. As to m_{2t} the non-competitive part is assumed to equal 0.085 x_{2t} and the competitive import is assumed to be zero.

For e_{1t}, the exports of 'agriculture' sector, we have assumed a given projection of Rs 570 crores and for e_{ot} a value of Rs 220 crores. The way the sectors have been defined with all the investment goods producing industries put in sector 2 and with only the sectors, 1 and 2 engaging in foreign trade no assumption about the export of the second sector is relevant to the calculation.

IV

Results

Dropping the subscript t the relations (1) to (4) can be written under assumption A, as follows:

(5) $0.796x_1 - 0.052x_2 - 0.020x_3 = 0.43896y + 0.04x_1 + e_1 - m_1 + 250$

(6) $-0.017x_1 + 0.690x_2 - 0.149x_3 = 0.051647y + \frac{0.30068y - 2800}{1.064} - 220 + 0.05x_2 + 360 - (e_1 - m_1)$

(7) $-0.020x_1 - 0.064x_2 + 0.871x_3 = 0.02582y + 0.27x_3 + 10$

(8) $y = 0.7357x_1 + 0.4071x_2 + 0.6984x_3 + y_0$

To arrive at the rates of growth of 'industry' which are in balance with specified rates of growth of agriculture, we have to express x_2 and x_3 as functions of x_1. This is achieved by substituting 570 for e_1, and $0.01x_1$ for m_1 in the above and eliminating y between equations (5), (6) and (7). This leads to the following sets of equations under the two assumptions:

Assumption A:

(9) $x_2 = 0.9379x_1 - 5246.5$
(10) $x_3 = 0.2030x_1 - 594.4$
(11) $y_1 = 0.3654x_1 + 1331.5$
(12) $y = 1.6247x_1 - 1219.5$

Assumption B:

(13) $x_2 = 0.9159x_1 - 5103.9$
(14) $x_3 = 0.2007x_1 - 580.0$
(15) $y_1 = 0.3786x_1 + 1261.4$
(16) $y = 1.6274x_1 - 1237.0$

Substituting the values for x_1 for 2 per cent, 3 per cent, 4 per cent and 5 per cent growth of 'agriculture' the rates of growth of x_2, x_3, y_1 and y are worked out. These are presented in Table 3. Again the rate of growth of 'agriculture' which is in balance with 12 per cent rate of growth of x_2 has also been worked out by making use of relations (9) and (13).

Now to work the foreign exchange deficit engendered by unbalanced growth, equations (5) and (6) have been solved for $e_1 - m_1$ and y. These give

A: (17) $y_1 - m_1 = 0.3365x_1 - 0.3858x_2 + 0.0759x_3 - 1409.0$

(18) $y = 0.9558x_1 + 0.7605x_2 - 0.2186x_3 + 2640.4$

B: (19) $e_1 - m_1 = 0.3315x_1 - 0.3898x_2 + 0.0771x_3 - 1394.6$

(20) $y = 0.9670x_1 + 0.7694x_2 - 0.2211x_3 + 2561.9$

By substituting 570 for e_1 and putting $m_1 = m_1^* + 0.01x_1$, where m_1^* stands for competitive agricultural imports, equations (17) and (19) are used to evaluate m_1^* for given rates of growth of 'agriculture' and 'industry'.

The values of m_1^* and the corresponding foreign exchange deficits,

$D = m_1^* + 0.01x_1 + 0.085x_2 - 990$

are presented in Table 4, for 2 per cent, 3 per cent, 4 per cent and 5 per cent annual growth rates of 'agriculture' and 10 per cent growth of 'industry'. The results for combination of 5 per cent growth of 'agriculture' and 12 per cent of 'industry' as well as the balanced rates with 'industry' growing at 12 per cent are also presented.

The table also gives the gross investment calculated as follows:

gross fixed investment $= 0.30068y - 2800 + 1.43 (m_1 + m_2 - e_1 - e_2 - e_0)$

As we have seen above 'agriculture' must grow at 5.7 per cent (under assumption A) to be in balance with a 12 per cent growth rate of 'industry'. If, however, agriculture grows only at 5 per cent the demand at base year prices for agricultural products will exceed their supply. The supply demand balance can be restored through a rise in relative prices of agricultural products, leaving money incomes unchanged. Balance can also be restored without change in relative prices by a reduction in total consumption, expenditure. We now examine the extent to which direct taxes will have to be raised to bring down consumption expenditure to the appropriate level[1].

Denoting the proportion of direct taxes to the Net National Product by 'd' and retaining the assumption about government current surplus and indirect taxes as before, we get:

Private savings $= (0.0714 - 0.0752d)y$
Gross Domestic Savings $= (0.2574 + 0.8648d)y - 2800$

Consumption at producer's prices of the output of the three sectors $= (0.5451 - 0.5738d)y$.

The first two equations of our system (under assumption A) can now be written as:

$0.766x_1 - 0.052x_2 - 0.020x_3 = (0.4634 - 0.4877d)y + 820$

$- 0.027x_1 + 0.640x_2 - 0.149x_3 = (0.0545 - 0.0574d)y + \frac{(0.2574 + 0.8648d)y - 2800}{1.064}$

Substituting the values for x_1 x_2 x_3 obtained by assuming the annual growth rates of 5 per cent of agriculture and 12 per cent of industry for the decade 1960-61 to 1970-71, the first equation gives

$$y = \frac{11112.102}{0.4634 - 0.4877d}$$

Substituting this value of y and the values of x_1, x_2 and x_3 as before in the second equation we get the value of d. Under the two assumptions A and B the values of d are 0.074 and 0.079, respectively. The implications of this increased tax rate on the Gross National Product and on the volume of direct taxes and total government revenue are presented in Table 5.

We have worked out and presented in Table 6 the balanced relative rates of growth obtained under an alternative assumption about the savings ratio. We have assumed the total private savings (personal + corporate) to be 12 per cent of the disposable income. This rate is nearer the rate of savings implicit in the PPD's notes on Perspective of Development[2] than our earlier assumption of 8 per cent. The increased savings results in a lowering of consumption and consequently a growth rate of 4.6 per cent of 'agriculture' is seen to be adequate to balance a 12 per cent growth rate of 'industry'.

Notes

1 In computing this we are ignoring the effects changes in direct taxes may have on the savings ratio as well as on the commodity composition of consumption.

2 "Notes on Perspective of Development, India 1960-61 — 1975-76", Perspective Planning Division, Planning Commission.

Sankey Wheels

SATISFACTORY progress has been made by Sankey Wheels in the second year of its existence. Having completed the construction of factory buildings and installation of the truck wheel plant, the company began trial production runs in the latter half of 1964 and initial sales of truck wheels were also recorded before the year ended. The car wheel plant continued to be operated by Guest, Keen, Williams but from the beginning of the current year this plant was transferred to Durgapur where production of wheels for car, jeep and slow-moving vehicles is now in full swing. During the 53-week period ended January 2, last, the company incurred a loss of Rs 18.76 lakhs, after providing Rs 12.47 lakhs for depreciation. Together with the brought-forward loss, the total loss of Rs 23.45 lakhs is carried to the balance sheet.

The New Village—III

Impact of Change

V Nath

This study of a village in Central Punjab aims at identifying the growth factors in agriculture.

The different facets of technological change in agriculture in the village were examined in the first two parts of the study. The picture that emerged was that of an agricultural community in which there have been notable advances in methods of utilisation of resources and in which a process of rapid adoption of improved agricultural practices is well under way.

The impact of this rapid technological change in agriculture and of the economic progress in the village on castes other than cultivators is analysed here.

The Mahajans

THE non-cultivator castes in the village are the Mahajans, the Artisans and the Harijans. The Mahajans need not detain us long. It has been explained earlier that for several decades they have sought their economic destiny outside the village, through joining services and professions after getting education. The economic changes of recent years have not altered this trend significantly.

The majority of the Mahajan families of Jitpur are dependent to a greater or lesser extent upon income originating outside the village. Some depend upon pensions; others receive remittances from sons, nephews etc, working outside the village. Among the 83 workers listed in the Appendix Table as many as 30 are 'emigrants' with active links with village families. Even among the remaining 53 workers, who live in the village, as many as 13 are in service outside it. Within the village, the principal occupation of the Mahajans is petty shop-keeping. A few have recently taken to mechanical trades like repair of bicycles and flour milling. But the scope for such petty commerce is rather limited. The village is not a commercial centre and is not likely to become one in the future, because it is located so close to the block headquarters town. The aspiration of the Mahajans has for several decades been to seek employment outside the village after education, and most remain so.

The Artisans

As mentioned earlier, the village has two main groups of artisans: the Ramgarhia Mistries — smiths, masons, carpenters — having 37 households, and 'other artisans' — potters, oil pressers, etc — represented by 15 households. The impact of the changes on these two groups has been markedly different. Most of the Mistry families have done well; but the majority of the families of 'other artisans' have benefitted little and continue to be among the poorest people in the village.

The families of smiths are among the most progressive and prosperous in the village. The two families of agricultural implements fabricators are doing a flourishing business in fabrication of agricultural implements and in repair work. Two other families have gone into business — owning brick kilns and trucks and taking up small government contracts. They are among the most prosperous people in the village. A large number of young men from families of smiths have got remunerative employment outside the village, in the machine shops in the block headquarters town and in Ludhiana. The masons are also doing well. As explained earlier, they are very good craftsmen, and as a result of increase in house-building activity, they have managed to get remunerative employment in the village, in the block headquarters town and in neighbouring villages. The wages of a mason range between Rs 4 and Rs 5 per day plus food, so that an average worker can make about Rs 150 per month. The carpenters have not displayed the same enterprise as the smiths or the masons have. They remain closely connected with agriculture and have repairs of ploughs and other agricultural implements as their major source of income. But even they have benefitted from increase in demand for wood-work, resulting from increased construction activity.

In contrast, the 'other artisans' have benefitted very little. The potters and the oil pressers continue their traditional occupations and follow the traditional techniques. But since these do not give them full-time employment, they supplement their earnings from these with agricultural and non-agricultural labour. The potters also haul earth for house construction. The traditional craft of the weavers (6 Harijan families) has been steadily declining as mill-made fabrics have replaced the cloth woven by them, and the recent economic changes have only hastened the decline. The only cloth now produced by them is coarse, heavy *khadi* and *khes* (bed-spreads). Weaving of these two types of cloth survives only because these fulfil some of the more specific needs of rural life. The *khes* for instance, is useful not only as a bed-spread, but serves also as a cheap and durable cotton shawl, which can be used as much for protection against rain and cold as for bringing straw or green fodder from the fields.

In case of all these crafts, there is neither any marked increase in demand for the products nor any technological improvement. Nor does continuation of the current change of processes hold any prospects of revival in the foreseeable future. The economic redemption of the artisans practising these crafts lies in change of occupation — taking up white collar service after education or entering other skilled occupations after learning new skills.

The Harijans

As explained above, the Harijans of Jitpur are primarily a labouring group. The 75 families of Ramdasias depend mainly upon labour, agricultural and/or non-agricultural. The six families of Julahas (weavers) and six of Balmikis (scavengers) have their traditional occupations as supplementary sources of income. The labourers can be divided into two groups:

(i) *sanjhees* or attached agricultural labourers with cultivators; and
(ii) casual unattached labourers who take up labour, agricultural or non-agricultural, according as it becomes available.

Among the latter, 18 men work with trucks, loading and unloading bricks. They could also be regarded as attached labourers, more or less, because they do this work for about ten months in the year and take up other work only during the rainy season when this work is not available.

The other economic activities of the

Harijans are; service (8 workers) and shop-keeping (3 workers). Service is mainly of the unskilled work type, though two young men are skilled workers and one is a white collar worker. Eleven Harijan young men of the village are included among the emigrants in the Appendix Table. Seven of these are in military service and the other four are in other services. The families of shop-keepers and service-men living in the village, and of the young men who have gone out for service are the most progressive and prosperous Harijan families in the village. And, with spread of education and rise in aspirations there is a growing tendency among the young people to look up to these occupations as the means to a higher income and better life.

Wages and Employment

The wages of casual agricultural labourers are Rs 2 per day plus food or, less frequently, Rs 2.50 per day without food. Wages for certain agricultural operations like harvesting of wheat or maize, and making of *gur* which are paid in kind, are considerably higher. But such work is available only for a few days in the appropriate seasons. The Harijan casual labourers figuring in the sample survey reported having done such work for 15 to 25 days in the year.

The wages of casual non-agricultural labourers are Rs 2 per day without food, though workers who load and unload bricks from trucks make much more, upto Rs 4 per day. These workers have also greater security of employment, because this work is available for about ten months in the year.

From the data of the sample households and from discussions with Harijans in the village, it appears that a casual agricultural / non - agricultural labourer can get employment for about 25 days in a month in most months of the year, and that the only slack period when he is unemployed for any length of time is the rainy season (July-August). Assuming a total work year of 250 to 300 days, taking into account the fact that when he does agricultural work he gets food in addition to money wages, and that in specified agricultural operations like harvesting of wheat or making gur, he makes much more than Rs 2 per day, the average annual earnings of a casual agricultural-cum-non-agricultural labourer come to about Rs 600 per year. There was general agreement among the villagers on this point.

The women do not take up wage labour, agricultural or non-agricultural. The only work for which they get wages (in kind) is picking cotton. The women of the sample households had obtained 15 to 25 kg of cotton in the previous year, and all of it was retained for household consumption. The main contribution of the women to the income of the household is made through the livestock enterprise. This income comes through increment in the value of the animals kept, less frequently from the sale of milk, and is reported to range between Rs 200 and Rs 300 per year. Including this income, an average Harijan household with one male earner working as casual agricultural/non-agricultural labourer makes between Rs 800 to 1,000 per year. The *sanjhees* and those working with trucks are better off. The latter get higher wages. The *sanjhees* have assurance of obtaining all their needs of food and other agricultural produce fairly comfortably, and have also greater financial security, because they can depend upon financial assistance from their employers in time of need.

Most *sanjhees* are given a share of the produce, the proportion varying with the size of holding, especially depending on whether one or more pairs of bullocks are kept, on the productivity of the farm and the need of the owner for labour. In a holding with one pair of bullocks, the share varies from one-fourth to one-sixth of the produce, and in one with two pairs of bullocks, it varies between one-eighth and one-eleventh. If more than two pairs of bullocks are kept, the proportion is correspondingly smaller. Until about 20 years ago, the *sanjhee's* share in the produce was decided as follows: If a cultivator had a pair of bullocks and two workers of his own family, the *sanjhee* got one-fifth of the produce, bullocks and men being counted equally for this purpose. Now-a-days however, this principle is not always adhered to, mainly because the cultivators feel that productivity of land has increased with intensive irrigation, use of chemical fertilisers and other improved practices, and the *sanjhee*, who does not contribute to the cost of these, is not entitled to the same share which he was getting earlier. Therefore, progressive cultivators with high level of productivity generally give the *sanjhee* a smaller share of the produce. Some of them prefer to pay their *sanjhee* in cash. In such cases the payment to the *sanjhee* varies between Rs 500 and Rs 600 per year plus food. On the other hand, a *sanjhee* working with a farmer who has not enough workers of his own, or whose cultivation is not efficient, may get a larger share. There was one case in the sample in which the *sanjhee* was getting one-fourth of the gross produce from a cultivator having one pair of bullocks. But as the man was not an efficient cultivator, and production on his farm was low, the *sanjhee* was no better off than the other *sanjhees* included in the sample.

The *sanjhee* gets a share only in foodgrains and other products like *gur* and cotton, but not in fodder crops, agricultural wastes or by-products like cotton sticks. Most Harijans do keep some milch animals, for sale or for meeting the milk needs of their families, and do need fodder. They obtain it in two ways — in exchange for farmyard manure which they have from their animals, and by their women cutting grass growing along field boundaries or as weeds in the fields with standing crops. The cultivators do not object to Harijan women, especially of the families of *sanjhees* and others with whom they have relations, cutting grass in their fields; and the facility of obtaining grass from the employer's fields is one attraction for a *sanjhee* and even for a casual agricultural labourer.

During the interviews with them, the cultivators complained that because of greatly increased availability of agricultural and non-agricultural employment in recent years, they were experiencing difficulty in obtaining labour for agriculture, especially in the months of April-May and September-October, when agricultural work was the heaviest. They also complained that the labourers preferred non-agricultural work to agricultural work in spite of higher wages in the latter, because agricultural work was harder and involved longer hours of work. The Harijans agreed that more employment was now available, but explained that there were still some periods in the year like the rainy season, when they had to remain unemployed for some time. They also admitted that they preferred non-agricultural to agricultural work, and for the reasons given by the cultivators. Their main complaint was that increase in agricultural production in recent years had not benefitted them much. They stated that the wages for casual labour had not risen in proportion to the rise in prices and that in case of *sanjhees* rise in agricultural productivity had been neutralised by reduction in share of the produce.

We now come to the question : how far have the economic changes of recent years benefitted the Harijans and what attitudes do they have to these? The answer may be given somewhat as follows :

(i) The casual agricultural-cum-non-agricultural labourers are still essentially at the subsistence level.

(ii) The *sanjhees* and the workers with trucks are better off. The *sanjhees* have participated directly in the increase in agricultural productivity, though their participation would have been larger if their share had not been reduced. The workers with trucks have a new remunerative source of employment.

(iii) The best-off families among Harijans are those in which one or more members are engaged in occupations like shopkeeping or service.

The Harijans are keenly aware of the fact that economic progress in the village has so far failed to lift most of them above the subsistence level and has only increased the economic disparity between themselves and the cultivating-owners. This creates a certain dissatisfaction among them, especially among the young men.

The largest gains to the Harijans have come through changes in social attitudes and improvement of social services. Untouchability, never as rigorous in this area as in other parts of the country (partly because of the influence of Sikh religion) has almost disappeared. Improvement in health services, construction of works like pavements of streets and pucca wells in the Harijan quarter, and loans for housing have also benefitted them. But the main benefit is coming through education. It has been explained earlier that the most prosperous and progressive Harijan families in the village are those of shopkeepers and men in service, or families from which boys have gone out for service. All these people have been able to enter these more remunerative occupations because of education. It appears that spread of education will be the main instrument for economic and social progress of the Harijans and such progress will come mainly through the social process — education, wider outlook, higher aspirations, striving for and getting better paid jobs, mainly outside the village. The recent extension of compulsory primary education, which has brought a large proportion of the Harijan boys into the schools is a major step in this direction.

Other Aspects of Change

EDUCATION

The tradition of modern type school education is quite well established in this area, especially among groups like Mahajans and Ramgarhia Mistries from which large numbers have been going out in services, professions and skilled work. Among the Jats too, education has been widespread because of the tradition of emigration and military service. But in recent years education has been spreading rapidly among all groups including the Harijans. The village has two primary schools now, one for boys and the other for girls, which have 285 students. In addition 83 boys and girls go to the three high schools in the block headquarter town and three boys attend the college located in the *mandi* town. Thus, the total number of students in the village is 371. Their distribution by sex, caste and type of school attended is given in Table 10.

Compulsory primary education was introduced in the village three years ago. It has been effectively enforced in case of boys and with the exception of a stray case here and there, every boy of school going age now goes to school. In case of girls, however, enforcement is not equally strict and there are many girls especially among the Harijans, who do not attend school. The figures in Table 10 bring out clearly the effect of enforcement of compulsory education on school going. The sharp increase in the number of Harijan boys in the first three classes is particularly noteworthy. The number of Harijan girls going to school has also shown a marked increase though it is still small. Among the Jats also the number of girls going to school is much less than the number of boys but the effect of introduction of compulsory primary education is clearly seen in the increase in number of girls in the first three classes as compared with that in the higher classes. Among the Ramgarhia Mistries and Mahajans on the other hand, the number of girls going to school including high school is comparable to or higher than that of boys. In both these groups, education of girls has become an accepted social practice.

The number of boys and girls in classes I to 9 is estimated to be about 66 per cent of those in the age group 6-15. The percentage of boys and girls of the age group 6-11 going to school would be higher still because the numbers in primary classes are much higher than those in the post-primary classes. But the village is still far from universal literacy. The percentage of literates among adults (above 15 years) was found to be only 23.8 in this survey. The position of universal literacy will be reached only after a generation when the boys and girls who are now going to school become adults. But a situation has already been reached, in which because of the large number of boys and girls in schools, presence in the village of a number of educated men, and of growing awareness and knowledge of things even among the illiterates *ignorance has ceased to be a relevant fact in village life. This is a most significant fact for the educational and cultural progress of village India, because it means that the point at which ignorance ceases to be important can be reached considerably before univer-*

Table 10 : Distribution of School Students by Sex, Caste and Type of School Attended

sal literacy has been attained. Literacy and education are important as ends in themselves. But they are equally important as means of banishing ignorance and superstition, and changing the mental outlook from a basically tradition-oriented one to a change-oriented one. Experience here shows that the water-shed between ignorance on one side and knowledge on the other can be crossed and a change oriented outlook produced even before the entire population becomes literate.

HEALTH

By far the most significant recent development in the field of health in this area, as in most others in India, has been eradication of malaria. This has meant elimination of the greatest killer and debilitator of man. Moreover, since other diseases like cholera and dysentery, which are prevalent in most other parts of India, have always been less important in the Punjab, eradication of malaria has meant elimination of epidemic disease as a major problem in village life. Campaigns for eradication of small-pox and trachoma, are now being carried out as part of country-wide campaigns, and it is expected that these two diseases will also be eliminated in a few years' time.

I had occasion to discuss the availability of medical facilities and attitudes towards treatment of disease, with the village leaders and with the lady doctor in charge of the hospital at the block headquarters town. The hospital, which has 24 beds, has one doctor, besides nurses and other auxiliary staff. Similar hospitals are located at distances of 5 to 15 miles along all the roads going out from the town. In addition, there are sub-centres located in the larger villages, which provide maternity aid and guidance in child care. Three such sub-centres are located in this block, and this village is included in the area of one of these.

The doctor explained that as part of the work of the sub-centres, house-to-house surveys of all pregnant women were conducted from time to time, that the women were persuaded to come to the sub-centres for ante-natal consultation and were given advice and necessary medicines. Cases in which any complication was likely at the time of delivery, were detected at this stage, and deliveries of such women were attended to either by the nurse-midwife in their homes, or if necessary, at the hospital. At the time of this survey, about a dozen women from this village, were visiting the sub-centre for ante-natal or family planning consultation. All the three *dais* of the village had received the training prescribed by the Health Department and were associated with the programme of the sub-centre. The maternity and child guidance service now available to this village is comparable to that available to any protected section of the population of the middle or lower income group, e g, participants in the Employees State Insurance Scheme, and is very much better than that available to any ordinary urban group.

ATTITUDE TOWARDS TREATMENT OF DISEASE

Treatment of disease, especially serious disease or injury by modern medicine has become accepted. All cases of serious sickness or of injury are taken normally to the hospital at the block headquarter and more serious ones are taken to the hospital at the district headquarter town. But, for treatment of common diseases, there is considerable resort to private practitioners, a *vaidya* in the village and two *vaidyas* and two medical practitioners in the block headquarters town. One reason for the popularity of the private practitioners is that the hospital cannot provide all the medical facilities that a villager may need or desire. Thus, a villager may go to a private practitioner because he is not able to get all the medicines at the hospital — medicines are frequently in short supply —, or because he feels that he will get better medical attention with a private practitioner. But since even the *vaidyas* have begun to use sulpha-drugs and anti-biotics, use of modern medicines is extensive, and the knowledge that a penicillin injection is an effective cure for many a disease, has become part of the culture of the village.

FAMILY PLANNING

A beginning has been made with this programme also. Facilities for consultation and free contraceptives are provided to the women at the sub-centres, and to both men and women at the hospital. The hospital provides facilities for vasectomy also and six of these were reported to have been done during the two years preceding this survey. The doctor, the BDO, the VLW, some workers of the Family Planning Programme and the village leaders with whom I had occasion to discuss the subject, summed up the present practice and attitudes towards family planning as follows:

(i) The number of people using family planing practices is still quite small. The Mahajans and the Mistries use these practices more than people of the other castes.

(ii) But knowledge of family planning practices is spreading rapidly, and the number of people who have begun to be aware of the need for these practices is growing. The cultivators in this area have always been acutely conscious of the limitation of land in supporting an increasing population—the tradition of migration among the Jats is one indicator of this awareness—and the threat to size of holding, and level of income posed by a large number of births is being increasingly realised by them.

(iii) Many cultivators, especially the young ones, are only watching the experience of those who have begun following family planning practices and especially those who have undergone vasectomies, before adopting these practices themselves. Use of family planning practices will spread very rapidly in the next few years as the experience of the small number who are practising these now becomes widely known.

SANITATION

There has been enormous improvement in sanitation and water supply in the village during the last 15 years. Most of the village streets have been paved and provided with *pucca* side-drains with financial assistance from the Community Development Block. Several wells have been made sanitary by provision of well-designed platforms, parapet walls and pullies. But the biggest improvement in water supply has come through installation of hand-pumps in a large number of houses. Sanitary water supply now remains a problem only for the Harijans and 'other artisans', who continue to draw water from the wells.

The main sanitation problems of the village now relate to use of latrines and provision of drainage. The drainage problem has been aggravated in recent years, with installation of hand-pumps in the houses and construction of drains because much larger quantities of waste water now flow into the village pond. No way of draining the pond has been found yet. The Sarpanch mentioned that he had sent a proposal to the State Government for draining the pond through a long drainage channel into a nullah, and was expecting that a survey of the scheme would be taken up by the State Drainage Department in the

[The Appendix Table which appeared with part one of this article on page 683 in the issue of April 17, 1965 was incomplete. The complete Table is as printed below. *Ed*]

Appendix Table: Selected Economic Data for Households, Caste-wise

		Jats	Ramgarhia Mistris	Mahajans	Harijans	Other artisans	Bajigars	Total
Number of households		105	37	46	87	15	9	299
Population:	Male	472	110	154	281	57	25	1099

Sewing machines		30	23	23	2	5	—	83

near future. However, from the discussion with him and other people in the village it was clear that there was not enough concern about this problem among the village people and progress on it would not be rapid. Similarly, no progress has been made in use of latrines and none can be made unless flush-type latrines, which an average farmer can afford to instal in his own house, are introduced. Dry latrines are impractical for the simple reason, that nobody would be prepared to clean them. The sweepers of the village already confine themselves to sweeping of only cow dung and other litter and in the prevailing social climate, it will be impossible to get them to clean latrines.

Levels of Living

Some limited data on character of housing and possession of certain durable consumer goods was collected as part of the household survey. The main object was to get some indication of the advance towards modernisation and of improvement in levels of living. The items were selected with this end in view. Another consideration was to select those items which would show significant differences in economic status within the village. Thus possession of a radio set was considered far more significant than possession of several other modern type consumer goods like a torch, a hurricane lantern or even a wrist watch. These latter have become common place in the villages, but the number of radios is still small enough to indicate significant differences in level of living. Similarly, possession of a sewing machine, a kerosene stove or an electric iron indicates not only a certain economic level but even more a definite urban orientation in the household. The items selected for the survey were: type of house—*kutcha, pucca,* or semi-*pucca;* whether having electricity and hand-pump or not; possession of bicycle, sewing machine, radio, kerosene stove and other electric appliances like a fan and electric iron. The data are presented caste-wise in Table 11.

It will be seen that about 45 per cent of the households are living in *pucca* or semi-*pucca* houses; about 35 per cent are in houses fitted with electricity; but as many as 55 per cent are in houses having hand-pumps. Over 45 per cent of the house holds have bicycles and over a quarter have sewing machines. But the number of radios, kerosene stoves and electric irons is rather small.

Table 11: Levels of Living

	Village	Jat	Ramgarhia	Mahajan	Harijan	Other Artisans	Bazigar
Total No of Households	299	*105*	*37*	*46*	*87*	*15*	*9*
No of households living in houses							
Kutcha	163	41	18	21	62	12	9
Semi-pucca	58	18	7	14	12	2	—
Pucca	83	46	12	11	13	1	—
With electricity	108	45	24	31	3	5	—
With hand-pump	168	83	25	35	17	7	1
No of households possessing							
Bicycle	130	55	33	28	7	6	1
Sewing machine	83	30	23	23	2	5	—
No of households possessing other appliances	radio 20; electric iron: 16; Kerosene stove:10						

It may be noted also that living in *pucca* or semi-*pucca* houses with facility of electricity or hand-pump and possession of these durable consumer goods, is confined mainly to the three upper groups, the jats, the Ramgarhia Mistries and the Mahajans. The Mahajans are visibly lower than the other two groups. This may appear surprising at first; but is readily understood when we consider the fact that a large number of Mahajans are old people or widows living on pensions or remittances from sons and other relatives.

On the other hand the Harijans, the other artisans and the Bazigars have these benefits of modernisation to a very limited extent. As compared with nearly 40 per cent of Jat families living in electrified houses, only three Harijan families (4 per cent of the total) are living in such houses. Harijans come out very poorly even in possession of the bicycle which has come to be accepted as a necessity over large parts of rural India. This contrast in level of living between the three upper groups and the Harijans reinforces the observations about the failure of the Harijans to rise above the subsistence level and the growing disparity between them and the Jats made earlier. It focuses attention on what is perhaps the biggest problem of the village for the future, namely, taking the fruits of higher productivity and income to this large section of the population.

Assistance from the Aid-India Consortium

A Review

D C Vohra

THOUGH India has received the largest amount of aid from the West in Asia, with half the population of Asian aid-receiving countries, its share in the aid has been only one-third. Per capita aid received by India is $2, as compared with $61 by Israel, $40 by Jordan and $5 by Pakistan. Average western aid received by African countries has ranged between $6 to $7 per head.

That there has been a progressive decline in the pledges by the Aid-India Consortium to this country may be seen from Table 1. From Rs 616.67 crores in 1961-62, the total commitment came down to Rs 509.5 crores in 1962-63, Rs 501 crores in 1963-64, Rs 489.52 crores in 1964-65 and further to Rs 488 crores in 1965-66. Within this broad picture, it will be seen that of all the countries West Germany has progressively reduced its commitment for the past four years from Rs 107 crores in 1961-62 to Rs 41 crores in 1965-66. Considering that the international liquidity position of West Germany is extremely comfortable and also that India continues to have a heavy payments deficit with her, the reduction in West German aid is not easily explained. For 1965-66 most of the countries have maintained their contributions at the 1964-65 level. Belgium did not contribute last year because an earlier contribution of Rs 9.5 crores had remained unutilised; this year it has pledged an amount of Rs 1.90 crores. Austria has contributed Rs 2.38 crores as against Rs 0.48 crores in 1964-65. Last year's low figure of aid from this country was attributable to the fact that the contribution of Rs 5.6 crores in the two previous years was meant to be spread over three years.

Total Consortium pledges during the Third Plan thus aggregate Rs 2,604.52 crores, as against the original estimate of total external assistance requirements of Rs 2,593.50 crores. Since the formulation of the Third Plan, however, the foreign exchange requirements both on account of project and non-project imports have perceptibly gone up. The rise in project imports is partly because of rise in prices which have raised costs in most of the fields and partly because of the enlargement of the scope of some Plan programmes and the inclusion of new projects in the Plan. The requirements of non-project imports have also increased substantially. For one thing, production of a number of commodities having a bearing on the country's import needs has been lower than originally envisaged. Besides, the demand in the economy for a number of commodities has been higher than expected. The quantum of aid pledged, therefore, falls short of the estimated needs and the enhanced imports have had their natural effect on the balance of payments. This is reflected in an unprecedented depletion of foreign exchange reserves. That this has happened despite a better performance on the export front indicates the extent of the divergence between actual imports and Plan estimates.

Balance of Payments

The balance of payments position seriously deteriorated in 1964-65, wiping out all the improvement recorded in 1963-64. It will be seen from Table 2 that imports which have been rising at a rapid rate since 1961-62 gained momentum during the first half of 1964-65 due mainly to the larger intake of food, fertilisers and defence equipment. As compared with Rs 582 crores in the first half of 1963-64, imports during the corresponding period of the last fiscal year increased by Rs 92 crores, reaching an all-time high half-yearly figure of Rs 674 crores. Exports increased by Rs 35 crores, from Rs 371 crores to Rs 406 crores and the balance of trade deteriorated by Rs 56 crores, the deficit rising to Rs 268 crores. Moreover, despite increasing exports during 1964-65 foreign exchange proceeds from exports have not shown a commensurate increase. This partly reflects the fact that about 50 per cent of the increase in exports went to the countries in the rupee payment area and was paid for by a reduction in the rupee balances held by these countries in India. The Economic Survey for 1964-65 also points out that foreign exchange receipts have been actually lower than those shown by the Reserve Bank because the Bank's figures are on a shipment basis and not on foreign exchange accrual basis. This lag is natural, however, in a period of rising exports. The discrepancy for the last year is reflected in a rather large figure under "errors and omissions" which, if taken into account, will take the trade deficit deterioration to Rs 86 crores.

Thus whereas during 1961-62 and 1962-63 the country lost foreign exchange only to the tune of Rs 6.3 crores and Rs 2.3 crores respectively, and in fact gained reserves aggregating Rs 10.8 crores during 1963-64, in the first half of 1964-65 an amount of Rs 55.4 crores was lost from the reserves. The first half of the fiscal year is normally the lean season for exports and some fall in reserves is to be expected but the decline in reserves during April-September was much larger than the figure of Rs 27.9 crores during the first half of 1963-64. What is really disturbing is that the decline in reserves has persisted even during October 1964-January 1965, bringing the total fall to Rs 88 crores which necessitated the transfer of some amounts

Table: 1 Consortium Pledges during Third Plan

(Rs crores)

Total	**616.67**	**509.52**	**500.95**	**489.52**	**487.86**	**2,604.52**

of gold from Government stocks to the Reserve Bank. This decline is to be contrasted with an accretion to reserves during 1963-64. The improvement in 1963-64 was in fact even more impressive because India had repaid an amount of Rs 23.8 crores to the International Monetary Fund.

A great deal of pressure has been put on the balance of payment by servicing of external debt. Capital repayments and interest payments involving foreign exchange cost the country Rs 50 crores in 1960-61; they almost doubled to over Rs 95 crores in 1963-64 and are estimated to be as high as Rs 140 crores in the last year and Rs 160-165 crores in 1965-66. The fiugure would be greater if repayments to IMF are also included.

The situation is the graver in the context of the Fourth Plan. The planners have estimated total export earnings during the next Plan at Rs 5,100 crores. The requirements of imports (exclusive of PL 480) have been tentatively fixed at Rs 7,200 crores. Subject to the sectoral allocations and estimates of indigenous production, particularly of metals, machinery and chemicals, the estimated trade deficit during the Fourth Plan is Rs 2,100 crores. This, together with obligations on account of payment of interest and repayment of principal in respect of foreign debt amounting to Rs 1,100 crores (Rs 500 crores by way of repayment of debt and Rs 600 crores by way of interest) will result in a gap of Rs 3,200 crores between total payments and total receipts of foreign exchange. This figure indicates the volume of external assistance that will be needed during the Fourth Plan in the form of aid from foreign governments and international agencies and as private capital both in the public and private sectors. Latest estimates, however, place the aid requirements of the Fourth Plan at Rs 500 crores more than Rs 3,200 crores. The main reason for the revision is that the Fourth Plan memorandum assumed a much higher level of capital goods and components manufacture in India than is justified by the progress of the Third Plan.

Against these formidable figures have to be set certain redeeming trends in foreign assistance. First, there is now a general recognition on the part of aid-giving countries of the need for softer loans. India has been able to obtain a number of loans and credits during the current Plan with larger maturities and lower interest rates. The average rate of interest on external assistance has come down from 4.3 per cent in the Second Plan to 3.2 per cent in 1961-62 and further to 2.6 per cent in 1963-64. The share of loans with interest rates of 5 per cent and above in our outstanding external debt has been reduced from 63 per cent in 1960-61 to 50 per cent in 1963-64. The maturity pattern, too, has changed considerably. Whereas 50 per cent of the loans authorised during the Second Plan period were for periods of less than 15 years, the corresponding figure for the Third Plan is only 16 per cent. Further, while only 5 per cent of the total loans obtained during the Second Plan was for over 24 years, the corresponding figure in the Third Plan is as high as 54 per cent. These improvements are largely the result of the changed terms of aid from the US Agency for International Development whose loans are of 40 years' duration and are interest-free. Loans from the International Development Association and Canada are also on

Total	**381.80**	**201.70**	**2539.95**	**1435.29**	**2043.90**	**1715.56**	**4965.65**	**3352.55**	**1597.01**

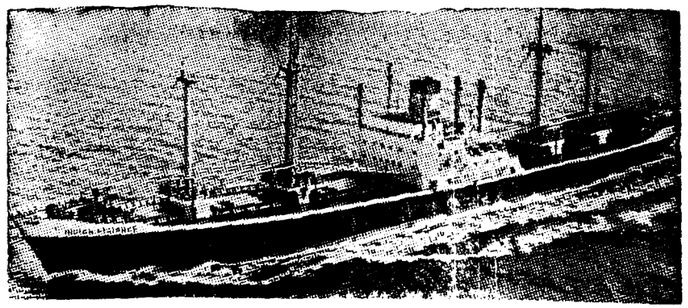
similar soft terms. Recent loans from the UK and West Germany carry more favourable terms than the ones sanctioned earlier. This trend has been maintained by the ten countries of the Aid-India Consortium in their latest pledges. It has been stated by the World Bank spokesman that about two-thirds of the aid pledged for 1965-66 will be in the form of grants and low-interest loans for periods of 25 years or more. Of the World Bank-IDA pledge, Rs 50 crores will be from the World Bank carrying the usual high rate and Rs 66.5 crores from the IDA on soft terms.

Apart from the better terms of aid, a notable development in recent years has been a greater appreciation of the needs of this country for non-project assistance. This is a welcome development because the Government of India had maintained that the rate of utilisation of foreign assistance in the past was slow mainly because substantial part of the loans granted by different countries were tied to particular projects which took time to execute. A major argument in favour of non-project assistance has been that India has now reached a stage of technological development when imports of components are needed for its developing industries. The Aid-India Consortium has agreed that a substantial part of the aid extended to India during the coming years should be in the form of non-project aid which could be utilised to finance imports required for the maintenance of the economy. The percentage of non-project assistance is expected to be slightly better in 1965-66 than in the last year; it may be more than 50 per cent of the total assistance. While the USA, the UK, Canada, Germany and Japan have been relatively liberal with regard to non-project assistance, Italy has gone a step further in promising to give two-thirds of its pledge in non-project form.

As for utilisation of aid, while there has been a slight improvement in the rate recently, it cannot be considered satisfactory as a large amount of Rs 1,597 crores, about one-third of total foreign aid received so far aggregating Rs 4,965 crores, was lying unutilised at the end of September 1964 (Table 3). Seen in retrospect, this country relied mainly on internal resources during the First Plan as the external assistance authorised was just Rs 381.80 crores, of which Rs 201.70 crores was utilised leaving a spill-over of Rs 181.10 crores. In the Second Plan the total external assistance authorised was Rs 2,540 crores, the utilisation being somewhat more than half at Rs 1,435 crores. Taking the spill-over from the Second Plan and the fresh authorisations up to September 30, 1964 total aid available for use in the Third Plan was Rs 3,313 crores, of which utilisation aggregated Rs 1,716 crores.

According to the latest official indications, the aid utilisation rate may increase substantially in the coming years. Greater attention is now being paid to the detailed and accurate preparation of project reports for which aid is sought in order to draw quickly upon tied loans. The Planning Commission and the Central Government are believed to be engaged in streamlining administrative procedures on the lines recommended by the Rao Committee on the utilisation of foreign aid.

On towards progress . . .



India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Dalal Street Unsettled Again

Wednesday, Morning

DALAL STREET received a severe jolt on Monday, April 26, which was reminiscent of the panicky sell-off on March 27. In jsut two hours, the market shed nearly all the gains it had accumulated over a fortnight or so. Monday's sharp decline was caused by nervous bull liquidation and renewed bear pressure. Quite a few shares like Voltas, Tata Locomotive, SLM — Maneklal, Associated Bearings and Synthetics and Chemicals were down again to around the lowest levels for the year recorded a month earlier. The market's position could easily have been much worse but for the substantial support from the Life Insurance Corporation which has been in the market making news for the past few weeks.

The sudden change in the mood of the market came about because of the marked deterioration in the Indo-Pakistani relations due to intensified border attacks by Pakistan. Market sentiment in the near future is likely to be moulded almost entirely by developments in the political situation; trouble seems to be brewing up almost everywhere and it is difficult to say how the situation will shape itself in coming weeks. If the political situation deteriorates, no amount of institutional buying will be able to generate a recovery on the stock market; only the pace of the decline could be slowed down. And even that might not be easily possible.

Speaking at a meeting with the Committee of the Indian Merchants' Chamber in Bombay on April 26, the Union Minister for Planning, Shri B R Bhagat, expressed the view that the economic prospects of country did not hold out any reason for the stock markets to remain depressed. One would have expected the Union Minister for Planning who is also the Minister of State for Finance, to have a better understanding of the factors influencing the stock market. Economic prospects might not be unpromising — they are certainly not as promising as the official spokesmen are inclined to make out. But it does not follow that equity prices should also be rising. The Government's present fiscal and monetary policies are not conducive to any sustained recovery in the stock market. The average yield on equities is far from being attractive in the context of the existing interest rate structure and what is more, funds can be employed more remuneratively in fields of activity other than the stock exchange. This aspect of the problem has not been receiving the attention that it deserves.

COTTON

Unexciting Affair

IT was quite an unexciting week for the cotton market. Though spinner inquiry was reported to be fairly satisfactory, with CO2, L 147 and 197/3 receiving good attention, spot cotton prices held steady around the previous week-end levels. Prices might have hardened further but for the uneasiness caused by the mounting tension on the Kutch border which is fairly close to the cotton growing tracts in Gujarat and Maharashtra. Trading in cotton futures was also devoid of any outstanding feature. After being marked up to a new high of Rs 769.50, the August contract receded to Rs 765 on adverse political news but it steadied again and at its Tuesday's closing of Rs 767.75, the contract showed a net gain of Rs 3 per 3 quintals over the week.

Spot cotton prices are at present less than 5 per cent below the statutory ceilings. But for the accumulation of large stocks of both cloth and yarn with the mills and the acute financial stringency, cotton prices could have easily pierced the ceilings again. How the political situation will develop and how it might affect the tendency to hold and hoard stocks, it is difficult to say. This makes the outlook for cotton prices rather uncertain. But the overall supply position being far from being comfortable, there seems little chance of any important decline in prices in the near future. The statistical position of Bengal Deshi is exceptionally tight. The total availability of Deshi cotton, including the previous season's carry-over of 75,000 bales, is not expected to exceed 4.25 lakh to 4.50 lakh bales. Export sales have already reached 2.10 lakh bales and domestic consumption can be conservatively estimated at 2 lakh bales. This means that the current season will end with a very poor carry-over. Bengal Deshi prices therefore can be expected to remain firm for many months to come.

New Cotton Policy

Considerable interest centres on the cotton policy for the 1965-66 season which is expected to be announced by about the middle of May. New Delhi is awaiting the interim report of the Agricultural Prices Commission before taking a final decision on this issue. But since the Commission has not yet had sufficient time to go into the question of costs of production of cotton and other related crops, the Commission's recommendations in regard to cotton prices will at best be based on an assessment of views expressed by various cotton interests and the Government's policy of partial statutory control over cloth production and prices.

All the available reports indicate that the general view is in favour of abolition of price control over cotton. The reasons vary. Growers see no reason why cotton should be singled out for control; no such control exists over the prices of other agricultural commodities. The trade favours de-control because controls restrict its freedom of operations. The industry is in favour of the abolition of control because the Government has never been able to ensure supplies at controlled prices whenever there has been a shortage. While advocating decontrol, the industry wants that controlled prices of cloth should be revised from time to time in line with the changes in cotton prices. The Indian Central Cotton Committee has already expressed itself in favour of decontrol on the (doubtful) plea that this would encourage increased production of cotton. Press reports indicate that since the Government is determined to retain partial control over cloth production and prices, it is unlikely to remove control over cotton prices. But in order to please the farmers, it will probably raise the ceiling prices by about 10 per cent. If cotton ceilings are to be further raised to such an extent, it would perhaps be much wiser to give up all pretentions to price control over cotton, which would at least save the Government from being accused of inefficiency and corruption: cotton control has been reduced to a complete farce.

OILSEEDS

Prices Continue to Rise

THE oilseeds market displayed further remarkable strength last week. Spot groundnut oil touched a high of Rs 24.50, linseed oil rose to Rs 20.25 and castor oil Commercial was marked up to Rs 17.30 — all per 10 kgs.

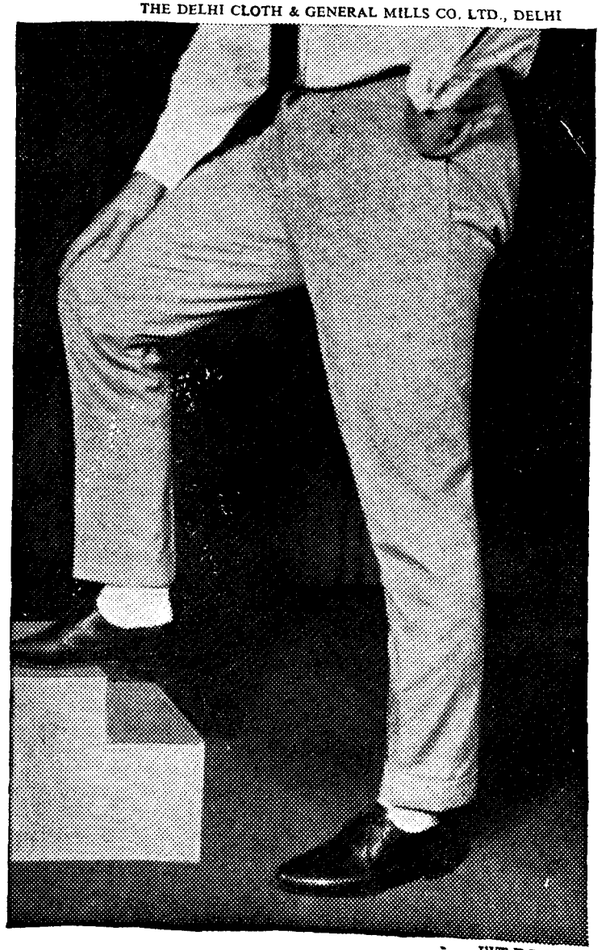
Tuesday's closing prices were only a little lower than the highest levels reached in the week. In futures, official activity was extremely restricted. Linseed June contract was quoted all the time higher than the maximum limit prescribed for the week; castor June also was quoted above the weekly limit most of the time. In kerb dealings, linseed June touched a high of Rs 99.10 and castor June was bid up to Rs 81.50 (per 100 kgs).

After three-day long deliberations, the board of the Bombay Oilseeds and Oils Exchange decided on April 27 to impose heavy margins on castor and linseed futures in order to contain the volume of speculative activity and check the rising trend in prices. The margin is to be payable by bulls on all outstanding bull positions. In the case of castorseed, the rate of margin will be Rs 8 per 100 kgs when the hedge contract rises above Rs 80 (per 100 kgs); the margin will rise to Rs 16 at above Rs 82 and further to Rs 24 when the contract moves beyond Rs 84. In the case of linseed, the margin will be levied at the rate of Rs 20 (per 100 kgs) when the contract rises above Rs 96; the margin will be raised to Rs 25 at above Rs 98 and still further to Rs 30 when the contract moves higher than Rs 100 (per 100 kgs).

That the rising trend in oilseeds prices needs to be viewed with considerable concern will be readily conceded. Prices have been rising even though the overall supply position of edible oils this season is appreciably better than in the previous season. While every possible action needs to be taken to check the rising trend in prices, the Association's decision to impose heavy margins on castor and linseed futures seems to have been influenced more by the heavy 'bear' interest of the members of the board than by the anxiety to contain the volume of speculative activity and to arrest the rising trend in prices. The market authorities will have only themselves to blame if official activity in the futures market comes to a virtual stop as a result of the proposed margins.

Futures have been simply following the trend in the spot material. In such a situation, restrictions on futures trading will only widen the spread between the spot and futures prices, with the spot material enjoying a big premium. Speculation must be contained within limits. But what is really needed in the present situation is strong action to discourage holding and hoarding of stocks. New Delhi would do well to ponder over the disturbing price situation.

Soyabean Oil



The Government has done well in permitting the vanaspati manufacturers to use 50 per cent of soyabean oil for the manufacture of vegetable oil products against 20 per cent at present. This step had become necessary because of the delay in the arrival of soyabean oil with the result that the entire quantity of 65,000 tonnes that India will be getting from the U S under P L 480 will have to be consumed within a much shorter period of time. Equally welcome is the Government's decision to exempt the import of soyabean oil from the 10 per cent regulatory customs duty and also from the countervailing excise duty. These concessions will bring down the price of soyabean oil by nearly Rs 250 per ton; now the

landed cost of this oil is likely to work out at between Rs 1,750 and Rs 1,800. This will considerably encourage the use of imported soyabean oil which in turn will release a large quantity of groundnut oil for internal consumption. The use of about 42,000 tonnes of mutton tallow by soap manufacturers will also ease the pressure on vegetable oils.

All this should help impart easiness to the oilseeds market. But vegetable oil prices cannot be expected to come down to any noticeable extent when coconut oil is quoted around Rs 4,400 per tonne. The price of coconut oil is greatly inflated by the enormous profit made by the State Trading Corporation on the sale of copra imported by it.

BUSINESS NOTES

Syndicate Bank

IT is a sad state of affairs when our country, so richly endowed by nature, should depend heavily upon imports from foreign countries for its food supply. While we have made good progress in other fields such as industrial development, public works etc, what we have done in the field of agricultural production has been indeed inadequate, particularly in view of the fast increasing population. Increase in agricultural production is the key-note to the solution of a number of our problems including the present acute food shortage. The problem of raising agricultural production has evaded solution, although it has been engaging the attention of Government right from the inception of the First Plan. In this connection, the diagnosis and the remedy prescribed by Dr T M A Pai, Chairman, Syndicate Bank, has come as a breath of fresh air.

In his annual statement circulated with the Bank's report for the year 1964, Dr Pai says that agriculture has suffered in this country for want of credit more than any other field of economic activity. He has suggested that the country's banks must have a revolutionary approach to this problem and give every possible assistance to the farmer. It should be certainly possible to increase production more quickly in this field, and what could be achieved in the increase of agricultural production by scientific methods of cultivation, application of fertilisers and better irrigation is not properly appreciated. If all commercial banks give special attention to making available agricultural finance, at least progressive cultivators could be encouraged to take up new schemes and increase production by adopting better and more scientific methods of cultivation and using fertilisers.

In fact, Syndicate Bank has already given a lead in this direction, and its example is worthy of emulation by other banks. A year ago, the Bank established an agricultural finance department to help the farmer grow more food crops. A series of experiments are being conducted in modern farming and, with the help of qualified technical staff, valuable first-hand data have already been collected about costs of cultivation, application of fertilisers and problems of financing agriculturists, both for short term as well as medium and long term requirements. As a pilot scheme, the Bank introduced its scheme of finance for the farmer for production of food crops in the South Kanara district where the Bank has a net work of 46 branches. At present short term loans are granted even without security to owner-cultivators for seasonal needs and minor improvements of the farm with repayments spread over to suit the farmer's convenience and repaying capacity from increased production. The Bank has other schemes of medium and long term loans for land improvement, purchase of bullocks, agricultural machinery and dairy and poultry development. Besides, under another scheme, the Bank finances the purchase and installation of pumpsets for agricultural purposes at all places where it has branches. The effective rate of interest on all these schemes has been kept low at seven per cent per annum.

The Bank has also recorded further all-round progress in its financial results during the year to December 1964. Its deposits have risen from Rs 45.49 crores in 1963 to Rs 51.46 crores as at end of 1964 and reserves from Rs 75.25 lakhs to Rs 85 lakhs against the paid-up capital of Rs 87 lakhs. The net profits of year amounted to Rs 48.50 lakhs, against last year's Rs 39.92 lakhs. The advances now constitute 63 per cent of capital, reserves and deposits. The cash and bank balances and investments in government and other securities amounted to Rs 22.99 crores for 1963. The bills for collection and acceptances portfolio of the Bank has almost doubled from Rs 5.60 crores to Rs 10.82 crores. The dividend is maintained at 20 per cent on equity shares.

The Bank opened 14 new branches in 1964, bringing the total number of branches to 203. Of these, five are all-women's branches where the entire staff consists of women.

Shivrajpur Syndicate

IN recent months there has been a definite improvement in the international demand for manganese ore as a result of the record levels at which steel production has been maintained in the importing countries. This has led to a revival of interest in Indian ores and some improvement in the prices offered. But on account of the acute inflationary pressures on costs, prices of Indian ores have remained well above the prevailing international prices, and exports continue to depend almost entirely upon barter business. From the beginning of this year, government policy relating to barters has been modified and barter business will in future be permitted only through the Minerals and Metals Trading Corporation, and not through private exporters as in the past. Shivrajpur Syndicate, one of the old companies engaged in the mining of manganese ore for over sixty years, had suspended production from June 1964 due to the unfavourable market conditions. The company has now entered into negotiations with the M M T C for supply of ore on a long-term basis, and the question of its resuming production is dependent on the outcome of these negotiations which should be known in the near future.

With the suspension of production, the company had to retrench more than 400 staff and labour. During the year to November last, the company's output fell from 25,826 tonnes to 9,753 tonnes but shipments shot up from 36,267 tonnes to 72,612 tonnes as a result of the intense activity in the local market during the last quarter of the year, following the decision that outstanding private barters would lapse if not completed by the end of 1964. This enabled the company to dispose of practically all the accumulated stocks of ore, and sales realisation increased to Rs 67.36 lakhs compared to Rs 37.18 lakhs in the previous year. After charging Rs 3.42 lakhs against Rs 4.45 lakhs for depreciation, the company earned a profit of Rs 8.84 lakhs as compared to a loss of Rs 3.40 lakhs incurred a year ago. Together with Rs 14 lakhs withdrawn from reserves and write-back of Rs 0.81 lakh, there is a total of Rs 23.65 lakhs against which is adjusted the loss of Rs 23.64 lakhs brought forward from the previous year. In view of the improved results, the directors have recommended payment of a dividend at a rupee per share which should require Rs 2.10 lakhs to be paid out of reserves. The company has returned to the dividend list after a lapse of three years.

Jessop and Co

THE financial results of Jessop and Co for the year to October 1964 reflect a healthy growth in output, sales and profits, and this has enabled the management to step up the dividend by 2.5 per cent to 12.5 per cent. Having regard to the imbalance in the supply of steel, scarcity of other raw materials and the limitations of the company's present location, the 1964 achievement is indeed creditable. Sales have jumped nearly Rs 2 crores to Rs 16.71 crores and gross profit about Rs 33 lakhs to Rs 225.33 lakhs. The necessary provisions have taken away more: depreciation has absorbed Rs 37.15 lakhs (Rs 36.25 lakhs), taxation Rs 94 lakhs (Rs 75.40 lakhs), Sur Tax Rs 14 lakhs (Rs 10 lakhs) and development rebate reserve Rs 3.88 lakhs (Rs 8.82 lakhs). But there is still left behind a higher disposable profit of Rs 76.30 lakhs, against Rs 62.11 lakhs a year ago. As before, the dividend on preference shares absorbs Rs 1.30 lakhs but that on ordinary shares requires Rs 25.50 lakhs (Rs 20.40 lakhs). General reserve has been strengthened by a transfer of Rs 51 lakhs (Rs 46.17 lakhs).

The rebuilding of the wagon works could not be completed till the year-end due to difficulties in obtaining steel and corrugated sheets. Production of box wagons was, however, begun in the rebuilt unit. The commissioning of the two new 80 bays in the structural works, the transfer of the production of box wagons to the new works and the steady improvement in the supply of matching steel have enabled the company to progressively increase its contribution to meeting the growing demand for fabricated structural steel. Although the company fell short of the target of 450 road rollers in 1963-64, the management is confident of achieving this target in the current year. A small expansion is now in hand for the manufacture of small road rollers in the 4/6 ton range.

The scheduled rate of production of electric multiple unit coaches and fully furnished passenger coaches was well maintained. The expansion and modernisation of the wagon and structural works have been completed. The company has made a small beginning by exporting pressed steel tanks to Burma. It has also submitted tenders against items of overseas demands. Active steps are being taken to increase productivity by introducing newer and more efficient techniques of production, reducing thereby the man-hours employed and the cost of production.

Kohinoor Mills

AFTER recording an impressive rise in profits in each of the preceding five years, Kohinoor Mills has suffered a set-back in its financial results for the year to December 1964 when, though sales were well maintained at the previous level, profit showed a significant contraction. This outcome is attributed to adverse trading conditions experienced by the textile industry as a whole, particularly on account of rising raw cotton prices and higher wages coupled with unremunerative prices for cloth. With a final dividend of Rs 14, the company has, however, maintained the total dividend rate of Rs 21 a share which was raised by Rs 3 last year.

The year's accounts show that net sales edged up from Rs 8.55 crores to Rs 8.56 crores, and income by way of processing of cloth and yarn increased from Rs 3.52 lakhs to Rs 5.62 lakhs. But the gross profit is lower at Rs 85.72 lakhs, compared to Rs 93.60 lakhs a year ago. The gap is further widened, with the depreciation charge claiming a considerably higher amount of Rs 33.96 lakhs (Rs 21.57 lakhs) and the tax liability also demanding a little more at Rs 24.26 lakhs (Rs 23.20 lakhs). Development rebate requires a lower amount of Rs 4.12 lakhs (Rs 6.11 lakhs), but a substantial saving in the employees' bonus for prior years, which has taken up only Rs 4.53 lakhs against as much as Rs 23.02 lakhs last year, has helped to restore the position. The disposable profit is Rs 18.85 lakhs compared to Rs 20.80 lakhs (which also included Rs 1.11 lakhs written back). The interim payment absorbed Rs 7 lakhs, and the final dividend requires Rs 14 lakhs. This is to be paid out of general reserves after crediting to it the year's surplus of Rs 11.50 lakhs.

Bombay Dyeing

DESPITE a steep rise in raw cotton prices, Bombay Dyeing has turned out satisfactory results for the year 1964. Its net sales have expanded by Rs 2.52 crores to Rs 18.34 crores, and gross profit has improved by Rs 30.58 lakhs to Rs 204.42 lakhs which, however, includes a non-recurring item of Rs 14.60 lakhs being the profit realised on sale of land. With provision for depreciation and taxation taking away higher amounts of Rs 108.26 lakhs and Rs 33 lakhs, against Rs 105.77 lakhs and Rs 27 lakhs, respectively, and development rebate absorbing a lower amount of Rs 13.60 lakhs (Rs 16.80 lakhs), the net profit for disposal has more than doubled to Rs 49.56 lakhs (Rs 24.27 lakhs). The total dividend as raised by 50P to Rs 4 a share requires Rs 40.15 lakhs (Rs 35.14 lakhs) and is well covered by earnings, whereas the last year's distribution was 'short-earned'. Besides, an unexpected gain of Rs 21.60 lakhs has been taken to reserves. This amount was received by the company as earnest money for sale of land at its dye works, and has since been forfeited because the purchasers defaulted in meeting their commitment.

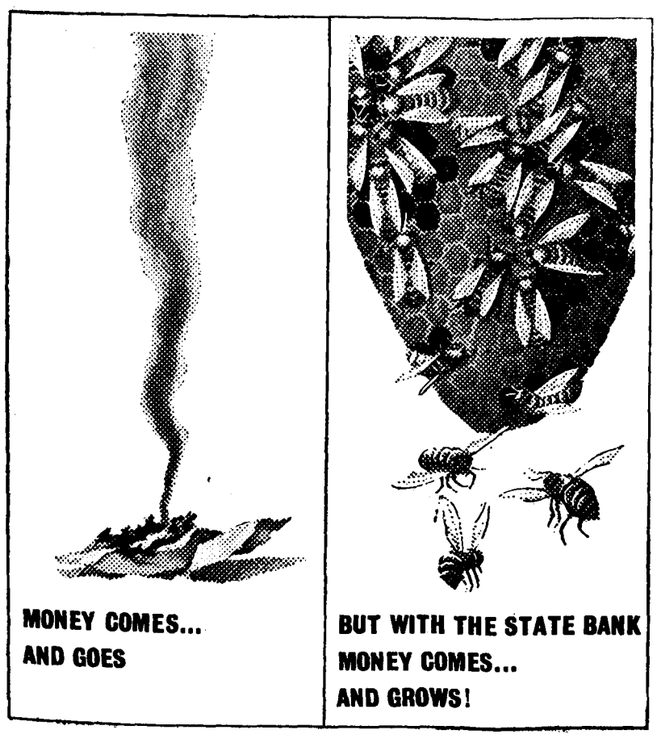
Notwithstanding a difficult situation on the export front, the company has once again maintained its position as the largest exporter of cloth—a tradition kept up for over 20 years. Its 1964 exports accounted for 10.5 per cent of the country's total shipments for the year. The Government's new scheme of tax-credit certificates should benefit the company considerably this year. The organisation for overseas sales has been streamlined, and production for export is already running at a considerably higher level than the average for 1964.

Madura Mills

APART from the common handicap of rising costs experienced in 1964 by the cotton textile industry as a whole, Madura Mills' profit position was also affected by a 100 per cent power cut that continued for 18 days during the year. Besides, the 15 per cent levy on imports into the U K affected exports in the last quarter. Considering these factors, the company's performance has been satisfactory. Sales and processing charges are up Rs 1.39 crores at Rs 19.64 crores and gross profit is Rs 11.18 lakhs higher at Rs 2.07 crores. But the position is completely reversed at the after-tax stage; profit after tax at Rs 55.98 lakhs reflects a decline of over Rs 24 lakhs, because depreciation has taken away over Rs 26.5 lakhs more and tax

charge about Rs 9 lakhs more. With a sizable saving in the development rebate which at Rs 9.39 lakhs is about a third of the last year's allocation, the gap is considerably narrowed. Allocations to reserves for redemption of debentures and an NIDC loan together are Rs 15.82 lakhs against Rs 17.50 lakhs, but no amount has been set aside for general reserve which last year received Rs 14.92 lakhs. The remaining surplus is just sufficient to pay the unchanged dividend of 17.5 per cent costing Rs 30.62 lakhs.

Both the additional 500 looms and the bleaching plant, which are expected to be fully installed during 1965, should add to the profitability but the ten per cent customs duty on imports will not only prove a heavy burden on the company but will also make the fulfilment of its export obligation more onerous. Both depreciation charge and development rebate will require higher amounts in the current year, but relying on the company's strong reserve position the directors hope to maintain the dividend rate.



Borax Morarji

BORAX Morarji, incorporated in August 1963, has reported encouraging progress in the implementation of its project. The construction of the essential buildings and ancillary facilities having been substantially completed, trial runs of the borax plant are being taken and erection of the boric acid plant is expected to be completed soon. The company is well set to begin production and sales at an early date. Its products will be marketed under the well known trade mark "20 Mule Team" by I C I (India) as sole selling agent.

These good results have been achieved despite an acute shortage of alcohol that restricted production of polythene. Rubber chemical output was also at around half the capacity as the rubber industry had imported stocks. These adverse factors, however, were more than offset by the increased production of paints, pretreatment chemicals, hydrochloric acid, 'Alfloc' formulations and liquid insecticides. The current year's results should reflect increased output of an extended range of paint products as the new resin plant is nearly complete. Modernisation of the hydrochloric acid plant is also expected to be completed shortly. A determined effort is being made to further expand exports, which have already shown an appreciable rise over the previous year's level.

Associated Cement Cos

IN terms of an agreement entered into between Associated Companies and the Government of West Pakistan on March 13, the company's undertakings comprising the cement works at Wah and Rohri together with the movable and all other assets in Pakistan were transfered to the West Pakistan Government for a total consideration of approximately Rs 3.5 crores which includes interest on diminishing balances. Payment of this amount is to be made by the Government of West Pakistan in minimum annual instalments of Rs 50 lakhs each. This may be made up of deliveries of cement and clinker from Pakistan to India. Any shortfall at the end of a year will be payable to the company in cash in Bombay.

STATE BANK OF INDIA

INDIA'S BIGGEST BANK

Aiyars SB. 2051 D

FROM THE CHAIR

The Central Bank of India Limited.

Speech of the Chairman, Sir Homi Mody

THE following is the speech delivered by the Chairman, Sir Homi Mody, at the Annual General Meeting of the Shareholders on Wednesday, 28th April 1965:

LADIES AND GENTLEMEN,

It gives me much pleasure to welcome you to this Annual General Meeting. Before asking you to consider the Directors' Report and the Audited Statement of Accounts, I shall, as usual, take a few minutes of your time to make some general observations.

Since we last met, the nation's leader, Jawaharlal Nehru, passed away, to the profound sorrow of millions of our people. For well over a generation, he had dominated every aspect of our national life and, as was natural, his death created a deep void. The time has not yet come for an objective assessment of Nehru's personality and achievements, but whatever be the verdict of history, his dauntless fight for the freedom of India must ensure for him a permanent place in the hearts of his countrymen.

The year under review was full of stresses and strains in the economy. On the agricultural front, acute shortages and spiralling prices prevailed in many parts of the country in the closing months of the year. The situation led to violence in certain areas, and the failure of Government to perform one of its most elementary duties, namely feeding the people, was vehemently criticised. While the worst seems to have been over, the food problem is far from solution. Government cannot resolve it by larger and still larger imports of foodgrains, by refusing to recognise its errors and trying instead to make a scape-goat of the wholesale trade, by disputes between the Centre and the States on questions of policy and by the creation of a Food Corporation. Apart from the traditional measures of assistance to the agriculturist, what is required, in place of an elaborate and imposing organisational set-up, is a trained body of rural workers who would establish themselves in groups of villages and teach the peasant how to increase production and improve his standard of life.

Our performance was better in regard to industrial production, which showed an increase of about 8.5 per cent over the previous year. This still fell short of the anticipated annual growth of 11 per cent during the Third Plan period. Shortages of raw materials, machinery components and other necessary maintenance imports stood in the way of a fuller utilisation of the installed capacity of industry. The latest figures show a further falling off, and the tightness of the foreign exchange position does not warrant any hope of a better performance during the current year.

Although there was an increase in the volume of exports during the year, since a large part of it was in respect of exports to Rupee Payment countries, our foreign exchange resources did not derive commensurate benefit from this improvement. Our increasing dependence on imports of foodgrains resulted in augmenting the pressure on our Balance of Payments. In fact, the position became so critical that we had to seek a large standby credit of 200 million dollars from the International Monetary Fund. In view of the enormous debt service charges that are piling up, the need for vigorous and sustained efforts to promote exports has acquired greater urgency than ever.

The Budget

At this stage, a few words about the recent Budget of the Government of India will not be out of place. It is a matter of satisfaction that for the first time, in many years, a balanced Budget has been presented. The criticism has been voiced that this balancing is artificial, in the sense that it has been made possible only by the imposition of a regulatory duty of 10 per cent on all imports just a few days prior to the presentation of the Finance Minister's proposals to Parliament. Even so, the change is to be welcomed. More heartening is the fact that the Budget provides refreshing evidence of a new approach. The Finance Minister has sought to simplify the tax structure and has offered a certain measure of relief in personal taxation. He has also proposed issuing tax credit certificates with a view to accelerating the tempo of industrial production and rewarding export performance. While these measures are to be welcomed, it is a matter of considerable disappointment that the Corporate Sector has not received any tax relief worth the name. Until that is done, the capital market which remained extremely sluggish throughout the year can have no hope of recovery. It is well-known that most of the recent issues of capital, even when sponsored by business houses of repute, have fallen completely flat, compelling the underwriters to shoulder the major part of the burden. While the establishment of new financial institutions like the Unit Trust of India and the Industrial Development Bank is a move in the right direction, it must be recognised that neither they nor the Life Insurance Corporation nor the Industrial Finance Corporation can by themselves improve the general climate, or impart the strength and stimulus to investment activity which a vigorous and healthy capital market alone can provide. The one way to remedy the present situation and revive the capital market is to provide incentives to the community to build up real savings and direct them along proper channels.

We are now in the final year of the Third Five-Year Plan. During this period, our achievements have lagged far behind the assurances and expectations held out by the spokesmen of Government. In the words of the Finance Minister's economic survey: "It is now clear that despite larger outlays on the Plan in money terms, many of the physical targets initially envisaged will not be reached till the first or second year of the Fourth Plan." In such a context, one would reasonably expect the Planning Commission to display a greater sense of realism in drawing the outline of the Fourth Plan. Its motto, however, seems to be: "the greater the failure of the present Plan, the greater the size of the next Plan." The draft of the Fourth Plan accordingly provides for an outlay of Rs 21,500 crores, which is almost double the outlay on the Third Plan. This only goes to show that the authors of our Plans have no use for the lessons which their own experience should have taught them. They seem to be anxious only to jump from one gamble to another.

In this situation, I would once again urge the importance of a closer understanding between the Government and the leaders of commerce and industry. Such consultations as take

place between the two sides prove somewhat hollow and unreal, since an atmosphere of distrust of the business community vitiates the proceedings from the start. While the private sector has much to answer for, its record of achievement, by and large, and the nationalist outlook of many of its leaders ought not to be forgotten. A little more of confidence reposed in it will, I am certain, pay rich dividends. It must be remembered, however, that for any such contacts to be fruitful, there must be a two-way traffic. While businessmen must stand solidly behind the basic policies of Government, Government must recognise the legitimacy of their claim to some relief from oppressive controls and taxation, which not only cripple existing enterprises but must end ultimately in the complete stagnation of the economy.

In this connection, it is necessary to remind ourselves that foreign aid is not a perennial spring from which we can go on drawing indefinitely. The aid-giving countries have their own difficulties. The economy of the United Kingdom, for instance, has been encountering rough weather during the past year. Sterling has been under severe pressure and the British Government have been forced, not only to raise the Bank Rate steeply from 5 per cent to 7 per cent, but to resort to other drastic remedies like the imposition of a surcharge on all imports and the negotiation of a huge temporary credit line of 3,000 million dollars from the central banking system of other countries. The USA is also not free from Balance of Payments difficulties, and President Johnson may not find it easy to persuade Congress to vote larger sums for overseas aid to developing countries. Prudence, therefore, demands that in preparing the groundwork for the next Plan, the pitfalls of the previous Plans be avoided, and targets and priorities so fixed as to be in line with the human, physical and financial resources which can be mobilised within our own country.

During the year under review, money supply with the public registered an increase of a little over 10 per cent rising from Rs 3,541 crores to Rs 3,901 crores. This increase being less than the expansion which took place in 1963, it is reasonable to infer that the steep rise in the general price level was due, not so much to monetary inflation, as to a decline in physical output. Scheduled Banks' deposits increased by Rs 272 crores, reaching the figure of Rs 2,525 crores at the end of 1964. As in the previous year, demand deposits contributed a major share of this increase. The improvement of 12.06 per cent in deposits has, however, been surpassed by an increase of 14.64 per cent in Scheduled Bank credit which, at Rs 1,812 crores, showed an expansion of Rs 231 crores over the year.

Credit Control

This takes me on to an examination of certain aspects of the comprehensive credit control measures which have been set in motion by the Reserve Bank during the past few months. Apprehending a repetition of the large credit expansion which had occurred in the 1963—64 busy season, the Reserve Bank took time by the forelock and raised the Bank Rate from 4½ per cent to 5 per cent September last, to be followed by a further increase of 1 per cent in February 1965. Thus, practically for the first time, the Bank Rate has been sought to be used as an effective monetary weapon. A more far-reaching development has been the abolition of the quota-cum-slab system governing the Reserve Bank's advances to commercial banks and its substitution by a more sophisticated system, under which the Bank's effective lending rate would be determined by the net liquidity position of the borrowing bank, the object being to render recourse to the Reserve Bank more difficult and unremunerative. The statutory liquidity ratio had already been raised September last, and now on the top of it, a new concept of net liquidity has been created and put into operation as a further measure of monetary discipline. This net liquidity formula is onerous in many respects. Firstly, for determining net liquidity, all amounts borrowed, in whatever shape or form, and whether from the Reserve Bank or from the Industrial Development Bank, are required to be deducted from the borrowing bank's eligible assets. Thus, even the amounts obtained by a Scheduled Bank by way of re-finance from the Reserve Bank or the Industrial Development Bank for discharging those very obligations which the Government had been repeatedly exhorting the commercial banks to undertake, such as granting of medium-term loans to industry for expansion or rehabilitation, the financing of small-scale industries and the extension of export credits, have come within the mischief of the formula. Secondly, the penal rate of interest, which would become operative the moment a bank's net liquidity ratio drops below the prescribed minimum, is made applicable, not to the residual excess—which would be fair and reasonable—but to the totality of the bank's borrowings from the Reserve Bank. Another provision lays down that even if the decline in the net liquidity position is just a fraction of 1 per cent, the borrowing bank would be compelled to pay penal interest, calculated at the full rate of ½ per cent over the Bank Rate for every drop of 1 per cent or a fraction thereof. Finally, the Reserve Bank has recently further raised the net liquidity ratio from 28 per cent to 30 per cent. I have made these points in order to remove any superficial impression that may be formed that, in the absence of quotas, banks are now free to borrow any amount from the Reserve Bank. In effect, these stringent provisions severely limit the capacity of banks to avail of accommodation from the central banking authority to meet the legitimate credit requirements of their customers.

During the past few months, there has been a definite slackening in the pace of growth of bank deposits. At the same time, owing to an all-round increase in inventory costs, demand for bank credit for genuine productive purposes has become more keen. The result is an unprecedented tightness in the money market, as evidenced by the fact that the inter-bank call money rate has touched an all-time record of 8½ per cent. Besides these curbs on credit expansion, the Reserve Bank has laid down minimum and maximum rates of interest payable on certain categories of deposits with a view to achieving mobilisation of deposits in general. I have no doubt the Bank has acted with the best of intentions, but I am not sure these measures will succeed in bringing down the general price level. As a necessary corollary to the increase in the Bank Rate and in the total cost of money borrowed from the Reserve Bank, all commercial banks have had to step up their own lending rates. This must inflate manufacturing costs all along the line, which is bound to be reflected in the price of any product. In such a situation, the general price curve would tend to slope upward. So for as foreign trade is concerned, it is well known that on account of their high prices, our exports are already at a disadvantage. If an increase in interest charges results in adding to the over-all cost of our export commodities, we are likely to be gradually priced out of the world market. As regards the internal price level, so long as there is a large non-monetised sector, which is willing

and able to lend money to those in need of it, it is wishful thinking to assume that curbs on bank credit are sufficiently powerful to drive out consumer goods from their hidden hoards into the open market and thereby bring down their prices. As a matter of fact, bank advances against foodgrains have been steadily diminishing during the past few years without making any tangible impact on food prices. To quote the Reserve Bank itself: "The impact of credit policy on the price line is conditioned by the availability and cost of alternative sources of finance for hoarding operations."

As regards the growth of deposits, this has to depend ultimately on improving the saving capacity of the people. With taxation remaining at the existing high levels and the cost of living soaring higher, money savings are rapidly dwindling and it would be an over-simplification of the problem to believe that there are large surplus funds which are so interest-elastic as to be readily attracted into the banking system by the mere process of offering higher interest rates. The only way to add to the total deposit resources is to generate fresh savings. Such savings cannot be generated unless, simultaneously with enforcing monetary discipline, the Government's fiscal policies are suitably remodelled. I would just like to add that in the present stage of our economy, the sovereign remedy for our ills is increased production, which alone can prevent a rise in prices and stimulate the country's development.

I would now refer you to the Balance Sheet and Audited Statement of Accounts.

As you are aware, in pursuance of the decision arrived at in the Extraordinary General Meeting held in December 1963, Right Shares were issued by the Bank during the year under review, as a result of which our capital structure has been strengthened to the extent of over Rs 1.5 crores. A sum of about Rs 30 lacs recovered by way of share premium has also augmented our Reserves. Thus, at the close of the year, our Paid-up Capital and Reserves stood at a total of over Rs 10 crores, providing another testimony to the strength of our position in the Indian banking system.

During the year, the Bank was able to add nearly Rs 27 crores to its total deposits, which now stand at about Rs 277 crores, representing an improvement of 10.6 per cent over the previous year. But we have no reason to be complacent in regard to the pace of growth of our deposits, and redoubled efforts will be made during the current year to accelerate the pace. It is only through deposit mobilisation on a larger scale that a bank of our size and status can gather the necessary resources for playing its part worthily in the country's economic development. In this connection, I would refer to a conference recently held by us of the Chief Agents of our branches. It served a very useful purpose and provided an opportunity for the Head Office Management and the Branch Agents to share their thoughts on a variety of subjects, discuss common problems and chalk out future course of action for the healthy development of the Bank's business.

The Bank's advances have moved up by Rs 18 crores, to reach the total of Rs 206 crores. Here again, as in the case of deposits, we account for about 11 per cent of the total Scheduled Bank credit in the country. In regard to the break-up of our advances, I may mention that the share of the industrial sector has gone up from 42 per cent to 47 per cent of the total. This is not as good a percentage as that shown by some of the other big banks, and needs to be improved, but I think you should know our policy always has been to meet, to as large an extent as possible the genuine credit needs of ordinary trade and commerce. I may also draw your attention to the increase of about Rs 10 crores in the balance under Bills Purchased and Discounted. This is a gratifying feature, because it shows a satisfactory velocity and a healthy turnover in our business.

During the year, we increased the size of our Investment portfolio substantially by as much as Rs 14 crores. The net yield on Government Securities is definitely unattractive in the context of present money conditions and, normally, our Bank would have turned to more remunerative outlets for the employment of funds, but the demand of the higher statutory liquidity ratio, which became effective from September last, necessitated diversion of a larger share of our total resources to investment.

The ever-growing demand for additional credit limits from our customers all over the country during the busy season compelled us to draw up to the hilt on our borrowing quota at the Reserve Bank, even though it involved payment of a stiff price by way of interest charges.

Our gross earnings showed a striking improvement over those of the previous year, due largely to an all-round increase in our lending rates, in conformity with the acute tightness of the money market. It is not my purpose today to undertake an analysis of the various factors affecting earnings, profits and disbursements. I only wish to emphasise that we shall need to earn larger and still larger amounts to meet our growing liabilities. It may interest you to know that during the span of three years, between the end of 1961 and the end of 1964, staff salaries and allowances have gone up by as much as Rs 2.2 crores, representing a rise of 55 per cent. It is obvious that our earnings cannot go on bearing such a steeply increasing burden, unless something is done to improve the quantum and quality of the work performed by our staff. Every effort is being made to bring about an improved relationship between the Management and the Staff, and I would like to think that an increasing recognition of the close identity of interests between the two is slowly coming about. To all those who are in the service of our Bank, I would like to say that nothing will please the Board of Directors more than to be in a position to give tangible recognition to their claims for a share in the growing prosperity of the Institution which would flow from better work and better human relations.

It remains for me to place on record our sincere appreciation of the zeal and ability with which our General Manager, Mr F C Cooper, has sought to advance the interests of the Bank. Our thanks are also due to our Deputy General Manager, Mr Vithalbhai Patel, who has been so capably assisting Mr Cooper and sharing his heavy burden. Our appreciation is also due to the managerial and other members of the staff of all ranks at the Head Office and Branches for their valuable services as well as to the various Local Advisory Committees for their guidance and counsel. I must make particular mention of the deep debt of gratitude which we owe to our Vice-Chairman, Mr C H Bhabha, for the competence and devotion with which he has been serving the Bank and contributing to its success.

Year after year, our banking system will be called upon to face greater challenges and shoulder greater responsibilities. I shall end by hoping that the Central will always be in the van of progress and continue to contribute to the prosperity and well-being of the nation.

Note: This does not purport to be a record of the proceedings at the Annual General Meeting.

Managing Director's Speech

THE DUNLOP RUBBER CO. (INDIA) LTD.

The following is the speech delivered by Mr. M.L. Bexon, M.C., Managing Director of The Dunlop Rubber Co. (India) Ltd., at the 39th Annual General Meeting of the Company held in Calcutta on the 28th April, 1965.

I HAVE much pleasure in welcoming you to the 39th Annual General Meeting of the Company. The Director's Report and Accounts have been in your hands for some time, and with your permission I should like to take them as read. This year we have added two new features to the published accounts, namely a brief review of the company's activities and a ten year summary of results. I hope you will have found these useful and informative.

The Year's Trading

Turnover for the Tyre Division in 1964 was once again a record and our two factories at Sahaganj and Ambattur worked to capacity to meet orders. The truck tyre potential did not grow as anticipated in 1964 and the situation was further complicated by the sudden cancellation of substantial orders due to a cut back in Government expenditure. In spite of the highly competitive market conditions, we achieved our planned sales by obtaining a higher share of certain markets. This was due to the good name we have established as manufacturers and suppliers of high quality products and also to the continued loyal support of our dealer friends and the efforts of our sales organisation in giving first class after-sales service.

Our two premium nylon truck tyres — the Plus Bar and GK 56—have been very well received and are proving most popular, particularly with long distance transport operators.

The Gold Seal car tyre has also established an excellent reputation and during the year there was a marked increase in supplies to car manufacturers.

Although cycle tyre production increased last year, we were still unable to meet the demand and further expansion is being implemented. There has been a gratifying response to our request to dealers to maintain the recommended retail prices.

Sales of earthmover tyres continue at a high level and we will very shortly introduce two new extra large sizes. Each of these tyres weighs nearly half a ton and measures just over six feet in diameter. We are the first company to undertake the manufacture of such large sizes in India and the technical achievement is considerable. A brisk demand for these tyres is foreseen and their production locally will result in a substantial saving in foreign exchange.

In view of the increasing importance of the Company's non-tyre business and our future plans for the introduction of new products and expansion of existing lines, we have set up an Industrial Products Division to handle all aspects of this business. The products which are at present handled by this Division are conveyor and transmission belting, hose, Vee belts, Dunlopillo and Adhesives.

Our turnover of industrial products increased substantially over the previous year. Conveyor belting made a significant contribution resulting from an increased share of the growing potential, and there were also increases in the sales of the other items in the range. The demand for our products continues to exceed our production capacity, and we have therefore paid particular attention to obtaining increased productivity from our plant. I am pleased to say that our efforts have been particularly successful in the case of conveyor belting.

With the assistance of our U K associates, we have stepped up the technological development programme of these products and the expansion of the existing range in order to meet the demands resulting from the rapid industrialisation of the country. During the year, after extensive development and field trials, we extended our range of high tenacity conveyor belting and this is now being marketed under the trade name "Starlon". This range has been extremely well accepted by public and private sector undertakings.

The plant and machinery for the manufacture of P V C fire resistant conveyor belting has been installed and production has already commenced. The use of this belting will enable the safety regulations for the prevention of fires in coal mines to be fully implemented and will result in savings of foreign exchange otherwise spent in importing this product. This is yet another Dunlop first in the country.

We are now also implementing our expansion scheme for Fan and Vee belts and this will be completed in 1965. During the year we introduced our new range of "Maxrate" Vee belts which have a 40% higher horsepower capacity and hence meet the revised standard specification.

Our range of braided noses has been further expanded with the addition of Paint Spray, Steam and Chemical hoses, and sales were higher in 1964 due to increased productivity.

Exports

Our export achievement registered a new peak in 1964. Each month a steady stream of our products is sent out to markets overseas and Dunlop tyres made in India are now in use in many parts of the world: cycle tyres have been sent to North and South America, earthmover tyres to Malaysia and Australia, truck tyres to Eastern Europe and Thailand, to mention only a few products and markets.

Every effort is being made to improve further on this performance, but I must mention here that the continual increases in cost of raw materials that have taken place over the last twelve months inhibit our efforts to develop our export business. Unfortunately this trend is continuing and in spite of the benefits of the export promotion schemes organised by the Government of India, it is difficult to be very optimistic unless some scheme can be evolved whereby raw materials for export products can be supplied to us at world prices. Well over 60% of the cost of a tyre is represented by raw materials and it is difficult to remain competitive in world markets, despite manufacturing efficiencies, when the difference between our raw material costs and world prices is continually growing larger.

Raw Materials

The supply position of raw materials throughout 1964 was extremely delicate and considerable problems were raised by the delay in issue of import licences. It is not always realised that when licences are not issued promptly, apart from the danger of running short of essential materials, it also leaves us little time to negotiate prices and we are often compelled to pay higher prices in order to obtain prompt shipment. In particular, this is the case where natural rubber is concerned. A further effect is that we obtain less material for our money with a consequent wastage of foreign exchange. It is important from all points of view that import licences for raw materials are issued in time for them to be utilised in the best possible manner.

Some indigenous raw materials were also in short supply because, due to import restrictions, suppliers were unable to import their requirements of basic materials as required. In such times of scarcity some suppliers do not give proper attention to quality and our technical department was put under considerable strain to ensure that substandard materials were not used in production and that product quality did not suffer.

Where quality meets our standards, we continue to obtain the maximum amount of both raw material and capital goods indigenously. A continuing effort is made to develop these sources to the full in order to save foreign exchange, and we are in close touch with suppliers to guide them and encourage them to manufacture our requirements in India.

I have already made reference to the cost of raw materials, but I must again stress the impact on our manufacturing costs that the higher prices of indigenous raw materials make. A period of price stability for these materials would enable us to endeavour to absorb the extra cost through increased efficiency and productivity, but what successes we have had in these areas, and they have been considerable, have been more than offset by price increases for existing indigenously produced goods. As more materials become available from local sources, so a further addition to costs is involved as each import substitution results in a considerably higher price.

Production

There was again a considerable increase in output at both factories during the year. Our targets were very nearly achieved in each case, despite continued power cuts throughout the year at the Sahaganj factory and an electricity shutdown at Ambattur which lasted for over ten days.

Expansion & Modernisation

The expansion schemes which I mentioned last year are well in hand and to schedule. Those at the Ambattur factory are nearing completion and in fact we produced 30% more truck covers and 11% more cycle covers than in the previous year.

At Sahaganj a new Vee belt shop has been erected and is now in full operation, while, as I mentioned earlier, the P V C belting project has started producing despite delays in the receipt of both imported and indigenous equipment.

In all our expansion plans, the opportunity is being taken to equip your company with the most modern and efficient plant available. Considerable thought is also being given to the replacement of the older equipment, particularly at Sahaganj, with the more modern and efficient plant which is required to enable us to continue to produce competitively, not only in India, but also in the export market.

Training Programmes

Modernisation of equipment is of little value unless more modern management techniques are applied at the same time. Training courses are in operation in India to this end, and I must also record the assistance we receive from our U K associates both in training our staff in Europe and in making available their skilled personnel to visit us in India.

As you will have seen from the Review of the Company's activities, we are installing an IBM 1401 Computer at Sahaganj towards the end of this year. Our staff who have been selected to operate this new department are now under training in the U K at the Dunlop computer centre at Birmingham, and courses are being run in India to ensure that all levels of management will be able to make the fullest use of this new facility.

Profit and Loss Account

As you have already seen from the Directors' Report, the profits before tax have improved by approximately Rs 70,00,000. This was achieved mainly through the increased volume of sales, the price increase implemented at the beginning of 1964 not being sufficient to offset fully the very substantial cost increases which took place during the year.

The net profit for disposal after tax is Rs 2,02,78,676. Out of this amount the statutory transfer to Development Rebate Reserve is Rs 21,00,000 and the provision for Preference Share dividend is Rs 4,60,000, leaving a balance of Rs 1,77,18,676.

The Directors propose to transfer to General Reserve a sum of Rs 67,81,176. An interim dividend on the Ordinary Share Capital of 8¾%, subject to income-tax, was declared and paid during November, 1964, which absorbed Rs 39,37,500, and the Directors recommend a final dividend at the rate of 8¾%, subject to income-tax, on the capital as increased by the issue of Rights Shares and the issue of Bonus Shares and which now totals Rs 8,00,00,000 as explained in the Director's Report. This will absorb Rs 70,00,000.

The Directors are indeed pleased that the result of the year's trading has enabled them to increase the distribution to Shareholders and at the same time plough back sufficient funds towards the future growth and diversification of the Company.

Balance Sheet

The Fixed Assets show a substantial increase representing the expenditure on buildings, plant and machinery in connection with the expansion of both the Company's factories.

Inventories remain much the same as the previous year despite the increased volume of business, reflecting our continued efforts to maintain stocks, particularly of raw materials, at an economic level.

Debtors are substantially higher. This is due to the higher volume of business and the seasonal trend which invariably results in heavy sales during the latter two months of the year.

Cash and Bank balances show a substantial increase but this is entirely accounted for by the sterling balance lying with National and Grindlays Bank Limited, London, and which represents the balance of the sterling paid by Dunlop Rubber Company Limited, U K, in connection with their contribution towards the recent Rights Issue.

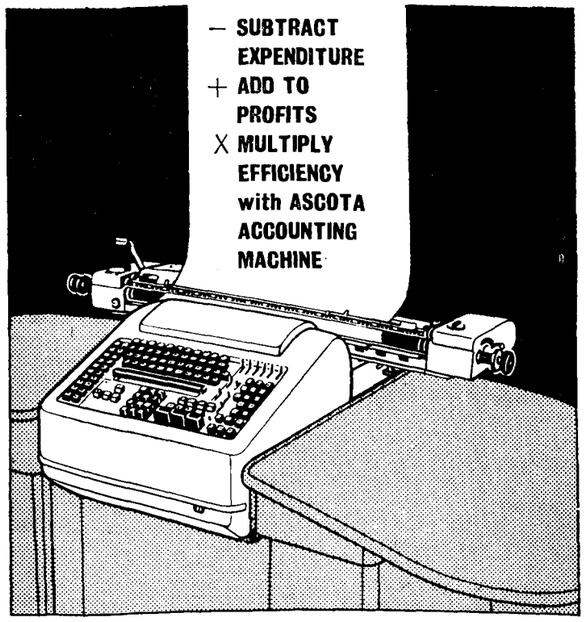
This amount will be fully utilised in the purchase of the remaining plant required for our expansions.

Bank borrowings are substantially lower as a direct result of the moneys received from the Rights Issue in December.

The movements in Share Capital and Reserves are fully dealt with in the Directors' Report and I need only mention here that by the capitalisation of Rs 2,00,00,000 out of Share Premium Account, the Issued and Subscribed Share Capital as it stands today is Rs 8,70,00,000 and the Reserves total Rs 6,61,82,292.

Future Prospects

As mentioned in my opening remarks, the Directors' thoughts are now on a further expansion and diversification of the Company and negotiations are in progress in an effort to secure further foreign exchange for this purpose. As you will appreciate, such negotiations are time-consuming and it would be premature at this stage to endeavour to present you any details or to forecast the success or magnitude of the final outcome.



I have dwelt at some length on many of the problems and difficulties we are facing, but I would not like to end only on this note. Even higher targets have been set for 1965 and I am confident that with the continued cooperation, loyalty and effort of all our employees, we can look forward to another satisfactory year.

One hears a lot of talk these days about the difficulties of industry. They exist, and there is no point in trying to minimise them, but opportunities there are in plenty. Our efforts are directed to searching out these opportunities, ensuring that your Company is equipped to seize them, and then making the best use of them to the advantage of the Company and the nation.

Personal

If I may, I would like to conclude on a personal note. This is the last Annual General Meeting over which I shall have the privilege of presiding. I shall be leaving India in June to take up an appointment with Dunlop Rubber Company Limited in London, while Mr Cecil Stack, who is no stranger to most of you, will be returning to India to take over from me. I should like to thank you for the support you have invariably given me and the courtesy with which you have received my addresses on these occasions. As usual, I am sure that you would like me to add your thanks to those of the Directors to all our employees, whose loyalty and hard work have contributed so much to another successful year's operations.

NOTE: This does not purport to be a record of the proceedings of the annual general meeting.

Let this modern, versatile machine take over the various accounting functions of your business. It makes possible accurate, speedy calculations and helps effect a substantial saving in time and manpower

☐ Especially suitable for banks and industrial establishments. ☐ Automatic handling of complete accounting procedures, invoices, sales/purchase journals, ledger accounts, payrolls, statements, etc. ☐ Foolproof system of "Control Number" ensures correct posting of every entry ☐ Interchangeable control panels enable quick change for different bookings ☐ Many models available to suit all requirements

A NEW DIMENSION TO INVESTMENT

As on March 1, 1965, nearly 1,33,000 applications had been received for investment in 'Units' of the Unit Trust of India for an aggregate sum of Rs. 19 crores.

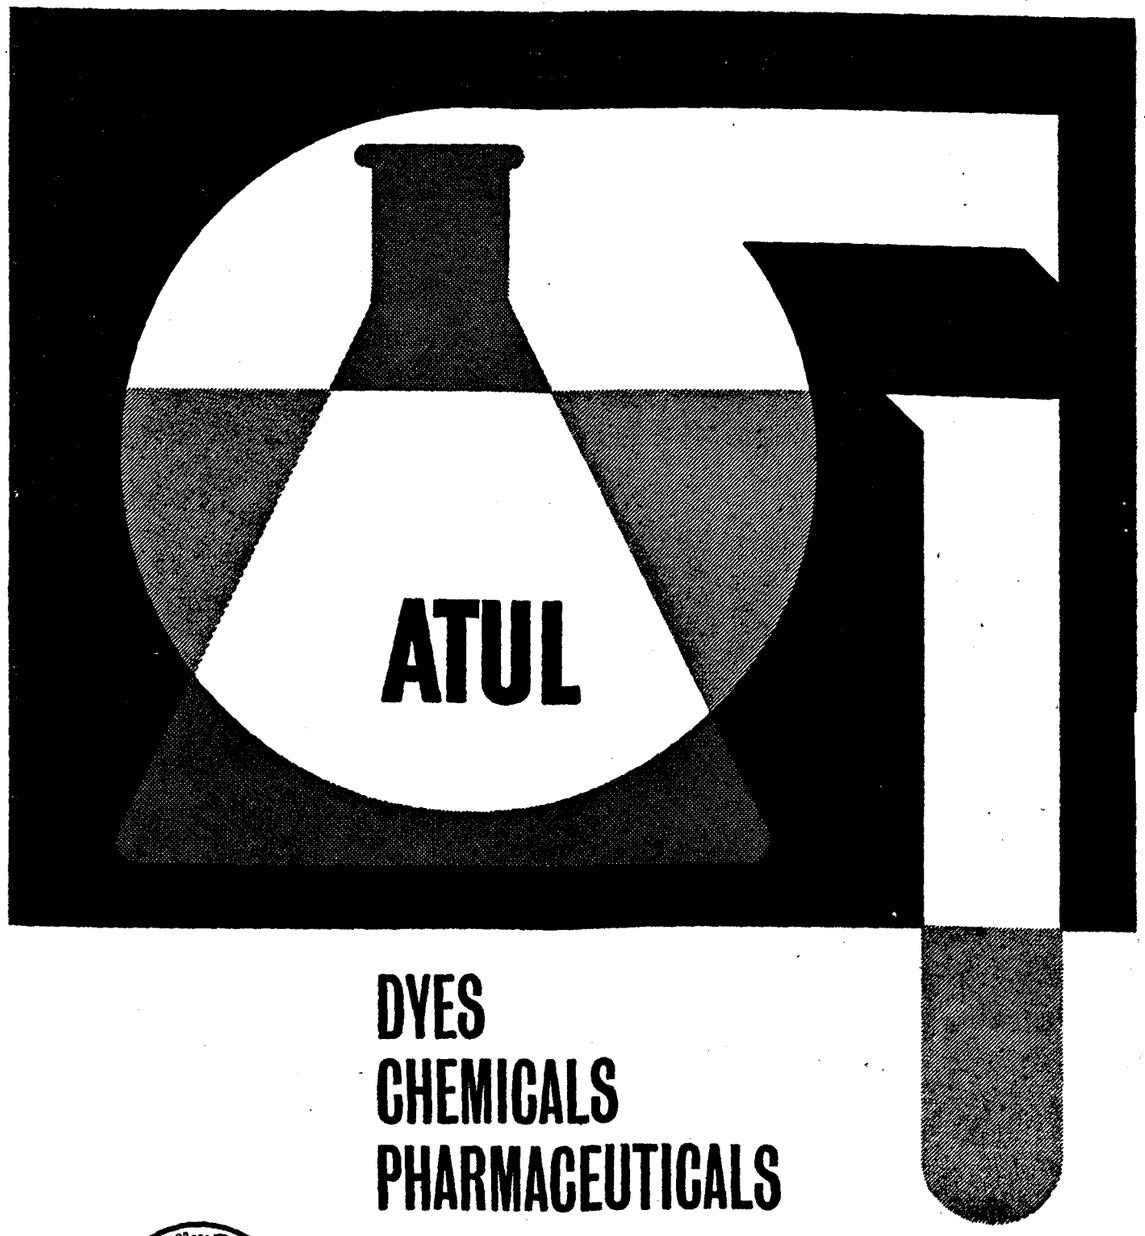
Units offer safety of capital and other importans advantages...

* Units offer safety of capital because the investment policy of the Trust is guided by principles of sound and prudent investment.

* The Unit Trust operates on the principle of investing its funds in a balanced and well-distributed portfolio of investments. A holder of even 10 units participates in the entire portfolio consisting of Government Securities, industrial debentures, preference shares and equities. Thus, the risk of investment is minimised and units offer security of capital, combined with a reasonable return and prospect of capital appreciation.

* Units are a unique form of investment, that has important advantages. They give a steady income...They entitle holders to significant tax concessions...They can be cashed whenever money is needed.

UNITS ARE AVAILABLE AT ALL BRANCHES OF THE LEADING BANKS THROUGHOUT THE COUNTRY



BUY UNITS
They are good investments for your savings

After Kutch

THE disengagement on the Kutch border has taken on all the appearances of a *de facto* cease-fire. Both India and Pakistan ordered general mobilisation of the armed forces and threatened preparedness for full hostilities, knowing well that a massive escalation of the conflict would be *mutually ruinous*; both now seem to have come to an understanding with Britain not to cause any provocation to the other. British mediation seeks to provide, initially, for a cease-fire and, later, reference of the matter to an impartial body like the International Court of Justice. The U S keeps mum while the Pakistan Chief of Staff boasts of a momentum adequate to carry him through Punjab, but sends its officers to check on alleged Indian use of U S arms. Traditionally friendly British journals ooze sympathy for India's awkward tactical position and advise acceptance of what to them appears as no more than cartographic pollution. How do we now seize the diplomatic, if not military, initiative and, besides, negotiate on the terms suggested by Britain?

Whether the immediate cause of friction is Kashmir, canal waters, Dahagram, Rann of Kutch, or any other, we must settle down with the full implications of Pakistan as a running sore. Against China, we can count on a limited degree of support from U S and U K but in matters relating to Pakistan, these two countries will at best remain on the sidelines. Our pathetic cries of distress against the use of U S aid arms by Pakistan ignore the obvious fact that Pakistan has after all been (and still is) a U S ally in SEATO (like recalcitrant France in NATO) and that India gets military aid from U S only on sufferance. Attempts to influence Washington may be good propaganda: they are no substitute for a policy because Washington will refuse to be bothered with anything less than a conflagration. Pakistan has safeguarded its backdoor by making friends with China and felt this the proper time to administer pinpricks, for New Delhi has been in disarray and the picking up of economic growth has still to make an impact on public discontent. Defence and development have not been going too well together but now that good crops could make a substantial difference, was the time for Pakistan to strike. We must now do something more than assert the historical and ethical sanctity of our maps.

Though, in the ultimate analysis, we have to depend on our own economic and military strength, as at present and in the interregnum there is need for understandings and arrangements which would restore the balance of power in our favour. Whatever official spokesmen might say, we are isolated diplomatically, while Pakistan is friendly with both U S and China and through the latter with Indonesia. Our interest lies in moving closer to USSR and developing relations with France. That France is trying to put a foot in a slit in the Chinese door need not disconcert us for USSR is more valuable to France than China (or US for that matter). If Pakistan can enter into an open liaison with China and other anti-American countries without disturbing the massive inflow of aid (at least till the Johnson Doctrine is given a new turn), India can take the safer risk of leaning more heavily upon USSR, particularly for naval and air force equipment and facilities for their production

The increased frequency of border skirmishes in the East and continued infiltration of Pakistanis into Assam need to be dealt with firmly, the firmer the better. A US foreign policy adviser was once heard to remark in New Delhi that it was inhuman on India's part to drive back Pakistani Muslims from their historical immigration grounds in Assam. How many Mexicans, one would like to know, are allowed to infiltrate and settle down in US? For reasons of security, it is necessary to clear the Eastern border of subversive elements. In north-west Gujarat, too, events in Kutch have confirmed the existence of a network which involves espionage besides smuggling of gold.

Evacuation of some posts, cease-fire and arbitration are, though immediate, relatively minor issues. The army has done well not to be caught, under

political pressure as in NEFA, in an indefensible position. The aggressor in a border skirmish of its own choosing has an inevitable advantage. If this offers the Pakistan army some consolation for what it considers as its humiliating inactivity when India was alleged to be committing aggression on Junagadh, Kashmir, Hyderabad and Goa, we need not grudge them the momentary satisfaction.

An official cease-fire which does not involve Pakistani withdrawal to positions at the end of 1964 will not be acceptable to India. If Pakistan does not come round, we will be free to seek other remedies, defined to exclude reminders to Washington of its promises and recalling of British memories of the border between Sind and the princely State of Kutch. We cannot afford to rely once again (though we have much better reason to) on maps, past correspondence, and other legal technicalities. Shastri, unlike Ayub and much more than Nehru, is responsible to a freely elected Parliament and to autonomous States. Mild though he is on the surface and hedged in by lobbies, he cannot be pressurised beyond public and army patience.

As for juridical arbitration, it is unexceptionable in principle, once Pakistan withdraws its troops out of the Rann. We have a case strong enough to stand international legal scrutiny but it must be quite clear that the issue at stake is demarcation of the border, not disposition of territory. There can be no objection to a give or take in drawing the boundary line to make it viable but the whole territory cannot be the subject of reference.

Pre-Shrunk Monetary Base

MONEY, according to people who should know, has never been so tight in recent years as it is now. The blame is put on bank credit restrictions and practical stoppage of *hundi* business. Unaccounted money is said to have almost disappeared though the Finance Minister disclaims the receipt of any large hoards. Cotton mills are burdened with accumulations of cloth and yarn which traders are unwilling to stock as before. None of the affected parties, all of whom are on record as being opposed to public deficit financing, has so far cared to point out that the cure for inflation which they had been prescribing all along has now been accepted with a slight modification, namely, that the same medicine is being administered to the private sector also. The cries of anguish will not die away in the near future. Painful days lie ahead. Borrowers will have to ease their stringency by quicker turnover of goods at lower prices and narrower margins and by cutting down bloated inventories, all of which is hard exercise after the cozy times left behind. Some relief was expected with the onset of the slack season but the Reserve Bank has clamped down again.

In a discussion with bankers, which is reported to have left them overawed, the Governor advised that the entire anticipated gross inflow of Rs 400 crores during the slack season (Rs 200 crores of fresh deposits and Rs 200 crores of seasonal repayments) should be sterilised: Rs 120 crores to be repaid to the Reserve Bank, Rs 80 crores absorbed in government securities, and the remaining Rs 200 crores should be put away in special fixed interest Treasury Bills. In other words aggregate bank credit shall be frozen at last year's level. Any readjustments are to be made within this ceiling. Loans to industry will no longer be a holy cow; borrowers must be compelled to improve their inventory management and economise the use of bank credit. Public sector enterprises are not to be spared in this process; their inventories, in fact, need special attention.

Assuming that this policy succeeds (bankers being dedicated to inventory values rather than turnround makes one rather skeptical), the pre-shrunk monetary base will have to be counteracted by a higher velocity of money. By strict economic calculation, this should help offset the reduced availability of money but higher money velocity also implies a quicker turnover of goods and correspondingly less hoarding.

The situation has its dangers. Monetary stringency has always claimed its first victim in the Punjab wheat farmer who is confronted with a steep decline in prices and a Government dragging its feet on open market purchases. Small industry and trade are in a tight corner for, pious advice notwithstanding, bankers are apt when hard pressed to favour the large borrowers. Leaving aside these and other sectoral problems, the fact is that, in both 1963-64 and 1964-65, the growth of national income has picked up impressively. Something like a 7 per cent increase in two consecutive years and the fiscal and monetary taps turned off can lead to a price disinflation out of proportion to requirements and have a traditionally greater impact on agricultural prices. Monetary policy will need careful watching in the next few months. Slimming down has its side effects.

Marine Diplomacy

HISPANIOLA is a 29,000 square mile island in the Central Carribean. A narrow forty mile stretch of sea water separates it from Cuba. The island is divided between Haiti and the Dominican Republic; the latter occupies the eastern portion of the island. On April 28, 556 Marines from the appropriately named aircraft carrier *Boxer* landed on the outskirts of Santo Domingo, capital of the Dominican Republic, ostensibly to protect American lives, though none was lost before or has been since. With the landing of 2,500 more troops in the early hours of April 30, it became clear that the United States was determined to prevent a sovereign nation from becoming another Cuba and was, paradoxically, pushing it towards Cuba at the same time.

The sequence of events started with the assassination of Trujillo in May 1961. El Jeffe, as he liked to be called, had ruled the country unperturbed since 1930 through a startlingly efficient and callous system of blood-letting, bribes and family oligarchy. His son was soon overthrown by a combination of liberal and progressive parties. In December 1962, the first free elections for 38 years were held. The Partido Revolucionario Dominicana (P R D) gained sixty per cent of the votes, a convincing majority considering that the rest of the vote was divided between six parties. Juan Bosch, poet-leader of P R D became President, and set out to remedy the typical Latin American problems of feudal land tenure, a self-serving business oligarchy, a politically inclined and privileged army elite and over-dependence on foreign, namely, American, capital. Inevitably, he came into conflict with these powerful groups. In September 1963, Bosch was overthrown by a bloodless military coup. Had Bosch been politically more astute and alert, he might possibly have lasted longer. Since his overthrow, there have been several governments, coups and counter-coups, the armed forces as usual holding the balance of power.

The catalytic event last month was a revolt, which found the army violently divided, seeking to restore Bosch. President Johnson smelled a nascent Cuba and decided to nip it in time. Latest reports indicate that the Marines have taken over street fighting in the name of protecting American lives. Casualties have been heavy: 1,000 dead and 12,000 injured. The Organisation of American States which ordinarily acts under U S pressure has refused to succumb this time; it is unable to fit this intervention in the Alliance for Progress. The leader of the revolt, Colonel Deno, who has been sworn in as provisional President in spite of American intervention, is reported to have said that American troops had better leave before Dominican nationalism turns anti-American. This is an under-statement. The Johnson Doctrine is claiming its victims in more than one continent.

Weekly Notes

More Priority Labels

THE marginal concessions announced by the Finance Minister run true to his earlier statement that there would be no going back on his Budget proposals but he would be prepared to make some relaxations for promotion of 'compulsory' savings and for investment in selected directions. As he indicated earlier, the straight deduction of one-half of the eligible life insurance and provident fund contribution from taxable personal income has been raised to 60 per cent for the first Rs 5,000 of such savings. The tax credits for subscription to new equity issues of public companies will be extended to purchase from underwriters instead of being restricted to direct absorption of first public issues.

Some degree of uniformity is sought to be effected in the lists of industries which qualify for a 10 per cent rebate in corporation tax, 20 per cent rebate in surtax and 25 per cent development rebate (instead of the new standard rate of 15 per cent after March 1967). The high priority rate of development rebate will now also apply to mining other than coal, mineral oil, machine tool attachments, agricultural implements, trucks and buses and automatic ancillaries, refractories, soda ash, pesticides, seamless tubes, gears, bearings and cottonseed oil. It has been clarified that the scheme of excise duty concessions will exclude the effect of changes in the rates of duty, and that the tax saved can be utilised for financing expansion besides repayment of loans. The Minister has also announced that this incentive to increase production will be granted to priority industries in which substantial expansion of capacity is envisaged and which do not rely heavily on imports of raw materials and components.

The stock exchanges may refuse to be impressed but the fact is that the Budget is loaded for growth. True, it requires a fair lot of home work to assess its impact on individual companies and projects and takes some effort to move in the directions favoured by the new fiscal policy. While personal taxation has been greatly simplified and also considerably reduced, the new schemes of company taxation, complicated as they are, do represent some fresh and original thinking in North Block for the first time and that, too, without the benefit of British and American precedents. The export performance tax credit of 15 per cent maximum. excise duty concession on additional production of 25 per cent maximum, and 10 per cent maximum relief against company tax and surtax, together with the higher development rebate of 25 per cent for priority industries, all add up to very substantial incentives for investment, production, *lower costs* and exports. The incentives reward performance and enterprise; they do not promise a straight and easy increase in take-home profits. It is a legitimate complaint, however, that these concessions have still to be spelt out, in the absence of which their precise implications cannot be appraised. One also hopes that the priority lists would not be enlarged further to such an extent as to render them futile.

Responsive Non-Co-operation

A Correspondent writes:

EVER since Manubhai Shah mooted it, the question of producing a small car has become a subject of heated controversy and considerable business manoeuvering. Its ghost refuses to be exorcised, such is the inexorable logic of the question.

The Jha Committee examined the question in detail, but failed to work out the only logical solution, namely a co-operative pooling of the resources of existing manufacturers to produce the small car, mainly because of their refusal to co-operate. Later, the attempt to produce a small car in the public sector in collaboration with Renaults, as negotiated by another Government-appointed Committee, was successfully torpedoed by the vested interests.

Now the lengthening of the delivery periods—and the reported chicanery in the allocations—has again brought the car in the orbit of a feasibility study, and a reluctant minister, who as a planner had opposed the idea earlier, makes a public show of examining the position dispassionately. In the meanwhile, the existing producers, as shown by the address of Keshub Mahindra to the Association of Indian Automobile Manufacturers, remain wedded to the theory of responsive non-co-operation to the project.

The small car episode illustrates most of the ills of the Indian economy. As has been asserted in this journal (April 30, 1960, pp 680-684), the Government was initially wrong in accepting the need for manufacture of passenger cars, and, what is more, even then, failed to obtain the adherence of the producers to that policy. Only a couple of years back, Subramaniam insisted on automobile producers achieving 90 per cent indigenous content; so far, only one producer claims to have reached that figure.

Private enterprise refuses to look beyond its nose. The present scarcity so suits its purpose that it has not taken any steps to remove it. It was left to Manubhai Shah to initiate the move for raising automobile production. Moreover, the existing producers have failed to develop any design facilities to be able to become independent of their collaborators in any foreseeable time, or to be able to co-operate in meeting the increasing demand for cars. And it is left to a foreign-owned company, Gabriel, to make the most effective case for road transport through its advertisements.

Resources for Small Car

ONE fails to recognise the logic of price control in a semi-luxury industry with long waiting periods for delivery. It deprives the manufacturer and the Government of much-needed revenues. At the same time, it gives an undeserved gain to the consumer who is able to sell his old (or the newly allotted) car at high premium. The case for a swingling excise duty, till such time as supply catches up with demand, remains to be answered.

Besides the normal Governmental red tape, the small car has also got enmeshed in a wrangle about priorities under the plans, in which, in addition to Indian puritans, true believers in free enterprise like ambassadors and international civil servants have freely participated. Two of the major deficiencies of Indian planning are a lack of desire to meet the known demands and endless delays in arriving at decisions. The small car illustrates these most effectively.

In the meanwhile, Government servants have managed to insulate themselves from the consequences of their policies by having a fixed quota for car allocations and by arrangements with STC for allocation of diplomats' cars to public sector undertakings. And, if they manage to get themselves a foreign assignment, they can always bring back a car, to facilitate which the rate of import duty was specially brought down last year from 150 per cent to 60 per cent.

Clearly, there is need for urgent decision and action on the small car project. On the basis of past record, Telco or Mahindra and Mahindra in the private sector is most suited to carry out the project, unless all automobile producers combine to take up the job. If not, for no virtue of its own, the project should go to the public sector. In any case, the project must start with the maximum indigenous content.

An incidental problem is the raising of rupee resources for the project. In view of the long waiting lists, why should not a person placing an order be required to deposit the full price of the car on the basis of a fixed delivery schedule? This would make available all the local currency resources required for the project. This technique, first used by the late Kidwai, could also be revived for telephones and other public utility services in short supply, whose development is hindered by lack of budgetary resources. Further, to keep the distribution cost low, initial sales should be made on the basis of non-exclusive franchises given to existing distributors. This will at once make available to the project at a low margin, the large network of distribution already in existence.

British Credit Squeeze

THE latest credit controls introduced by the Bank of England have taken economic commentators as well as British industry and trade by surprise. English clearing banks have been asked to deposit one per cent of their deposits with the Bank of England while Scottish clearing banks are let off with ½ per cent. The time limit stipulated for compliance with the new directive is short: half the amount is to be deposited on or before May 19 and the remainder by June 19. Contrary to expectations, bank rate has not been lowered simultaneously. A moderate reduction was believed imminent after Wilson's eloquent intention, expressed in the United States, to give "a bloody nose" to speculators against sterling and Callaghan's fiscal prescription for relieving distension in the British economy.

The ostensible reason for the impounding is that the advance-deposit ratio (the definition is not the same as in India) of banks has reached the disturbing level of 55 per cent. But the question that needs to be answered is whether this move was necessary after a severely anti-inflationary budget. When the Labour Government came to power, it was determined to undo the 'stop and go' policies of its predecessors, since it attributed the crawling pace of the economy in the last thirteen years to those policies. Its own performance since the confrontation with the sudden and frightening run on sterling, however, appears different only in the sense that the 'go' signal has yet to be uncovered. A stiff budget and some respite on what is described here as the foreign exchange front would have justified, if not a slightly liberalised credit policy, at least the leaving alone of bank reserves. As the fiscal reins continue tight, a somewhat easier monetary policy could rescue the economy from stagnation. This is a prescription which Japan has successfully followed in the last few years.

It could be argued that the latest credit squeeze is being experimented with as an alternative to bank rate. If this be so, one should expect, in the not too distant future, some token reduction in the bank rate, now that the speculative onslaught on sterling has moderated of late.

Higher Rate of Growth

THE provisional estimates of national income for 1963-64 put out by the Central Statistical Organisation present a somewhat refreshing picture of the economy. After the hesitant and sluggish pace of growth during the first two years of the Third Plan, an advance of nearly 11.7 per cent (at current prices) over the year is quite encouraging. According to the provisional estimates, net national output at factor cost rose to Rs 17,200 crores in 1963-64 from Rs 15,400 crores in 1962-63, both at current prices. Even

in terms of constant 1948-49 prices, there is a noticeable stepping up of the pace of growth. The index number of net output (1948-49=100) moved up from 151 in 1961-62 and 154 in 1962-63 to 161 in 1963-64. The per capita net output at current prices was Rs 371 in 1963-64 against Rs 339 in the previous year.

The breakdown of national income by industrial origin presents certain interesting features. Contrary to what was anticipated, agriculture, animal husbandry and other ancillary activities have contributed in fair measure to the higher rate of growth; income originating in the sector rose to Rs 8,100 crores from Rs 7,000 crores in 1962-63 and Rs 6,960 crores in 1961-62. However, the performance of agriculture in terms of total farm output produced was not any better than in 1960-61. The sudden increase in agricultural prices seems to have been responsible for the inflated contribution of the sector. This is also evident when the income originating in the sector is reckoned in terms of constant prices. Even though the income originating in this sector (at constant prices) in prices) in 1963-64 shows a considerable improvement over the previous year, increasing from Rs 5,790 crores to 5,900 crores, it is slightly below that observed in 1960-61.

National Income By Industrial Origin (in Rs abja)

	1950-51	1955-56	1960-61	1961-62	1962-63	1963-64*
1 Agriculture, animal husbandry and ancillary activities

(b) At 1948-49 prices	88.5 *(100.0)*	104.8 *(100.0)*	127.3 *(100.0)*	130.6 *(100.0)*	133.1 *(100.0)*	139.1 *(100.0)*

* Provisional.
Figures in brackets indicate the percentage distribution of national income by industrial origin.

The impact of relative price movements as between the different industrial sectors is brought out also by the differences in the percentage distribution of national income by industrial origin, when the two types of price weights, constant and current prices, are adopted. The percentage share of income originating in the sector rose from 45.4 in 1962-63 to 47.1 per cent in 1963-64 when computed in terms of current prices but fell from 43.5 to 42.4 per cent when constant prices were used.

Mining, manufacturing and small enterprises also indicated a slightly higher rate of growth over the previous year than was observed in 1962-63. The contribution of this sector to national income at current prices has moved downwards. In terms of constant prices, however, the share improved, again bringing out the impact of relative price changes. There are reasons to suspect that the income from small enterprises is understimated; deficiency of coverage and inadequacy of operational statistics defeat efforts to improve the estimation of their income; the estimates of income originating in commerce, transport, communication and other services are built up, in most part, from indirect and secondary sources and rough rules of thumb are generally used; one need not be surprised, therefore, at the smooth and consistent trends in the estimates over time.

Shifting Sands of Methodology

A FEW changes in methodology have been adopted in the estimates for 1963-64. The estimates of value of

agricultural output have been considered on all India level instead of at the State level as hitherto. The all India average rise observed in the wholesale prices of certain individual crops during the peak marketing period, over the year, was used as a basis for projecting the 1963-64 prices from 1962-63 prices. The ratio between value of net output to that of gross output observed in 1962-63 was assumed to prevail also in 1963-64. In the case of the animal husbandry sector, estimates were worked out on the basis of all India level rather than at the State level. The 1962-63 prices of individual livestock products were projected to 1963-64 on the basis of the Economic Adviser's Index of Wholesale Prices instead of State-wise prices obtained from the Directorate of Marketing and Inspection. In the case of forestry, the estimates for 1963-64 were obtained by projecting the 1962-63 gross and net output figures on the basis of the trend of Government receipts from forests as recorded in their budget documents.

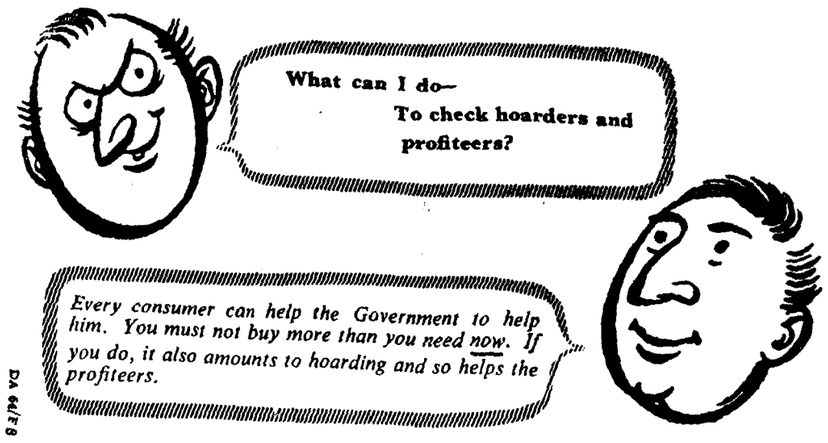
It is not possible to detect the extent to which these changes in methodology affect the estimates. Though, not an argument against improving the methodological base, this is a handicap since frequent changes in methodology vitiate intertemporal comparability of estimates. Unless one has at least a broad idea of the range of variations arising due to methodological changes alone, any comparison of statistics over time becomes very shaky. The C S O would do well to give parallel estimates — based on the old as well as new methodology — whenever important changes are involved.

LETTER TO EDITOR

A Minister's Statistics

MY attention has been drawn to the Weekly Notes of your issue dated the 20th March, 1965, under the caption 'A Minister's Statistics'. I have been accused of misquoting statistics in my last month's speech on the Central Budget in the Rajya Sabha to show that the targetted increase in national income during the Third Plan would be almost reached and that additional tax revenues had gone to finance investment in industry and elsewhere. The fact, however, is that the fault lies at your end because your comments are based on wrong reporting of my speech.

As for the first point I would do no better than to quote from my speech as published on page 316 of the official proceedings of the Rajya Sabha on March 15, 1965:



> "At one time, a year ago we thought that the picture was darker. Today the picture is not that much dark. I think we will end up with anything between 23 and 24 per cent growth over the Third Plan period....On the basis of the physical inputs in agriculture I think the 5 per cent average rate of growth that we expect in the Fourth Plan will be realised together with self-reliance in the economy as a result of diversifying and improvement of the industrial sector..."

Even you have accepted that aggregate increase can go upto 22 per cent, nowhere did I mention that the targetted increase in the Third Plan was 25 per cent.

With regard to your second point about additional tax revenue having gone to finance investment in industry and elsewhere I wish to point out that never did I deny what you have said "that a good part of the proceeds of additional taxation has been diverted into current non-investment expenditure". What I said was that Government was trying its utmost to bring down the expenditure on non-developmental activities year after year, but at the same time there were certain inescapable items like defence, rehabilitation, servicing of public debts, subsidising foodgrains distribution, etc, which pushed up such expenditure.

In fairness, therefore, you will agree that it was not my so-called 'careless statistics' that is to blame but unfortunately the inaccurate publicity that it got in certain newspapers.

New Delhi,
April 28. B R BHAGAT

CAPITAL VIEW

Ugly, Quiet and Frustrated

Romesh Thapar

THIS place smells of ugly Americans, quiet Englishmen and frustrated Indians. The local Punjabis, with a penchant for earthy comment, have stopped joking about the Pakistani infatuation with the 'Rann' of Kutch and 'Kanjar' kot.* There is anger in the air. Anger that we have permitted the Pakistanis to get away with what they can tom-tom as a victory. Anger that we tolerate the Americans who are reluctant to curb the Pakistani army which they have equipped and trained. Anger that we are so considerate of the British who are for ever justifying Pakistani blackmail. What political brew this mass of anger will create is anybody's guess.

Frankly, I think it's about time that we stopped expending all our energy on being angry — unless, of course, the anger clears the muck that fogs our vision. So far, only Indira Gandhi has spoken her mind. She has flogged U S. policy in this region, called on the people to learn the bitter lesson of dependence on so-called 'friendly' powers and foreign aid, and urged self-reliance. Others will no doubt follow this lead, but it will take time to shed illusions. But for how long will the people have to wait for action?

Soviet Alliance

With ugly Americans insisting on a visit to the Kutch front to see that no U S equipment is being employed by the Indian army, although they have shown no such anxiety on the Pakistan side, and with quiet Englishmen trying their damned best to persuade the 'bloody Indians' to agree to a compromising compromise, despite the detailed knowledge they possess of the actual border in Kutch, there is little surprise these days when psychopathic anti-communists call for a full commitment to a Soviet alliance. Indeed with western diplomacy sowing the seed of deep antagonisms in the sub-continent Prime Minister Lal Bahadur may well decide to become the instrument for a full fledged alignment with the Soviet Union.

It is known in inner circles that the Prime Minister has been ruminating on some such plans. And with every new pontification by well-known British commentators on the subject of the clash in Kutch, these thoughts on a Soviet alliance are becoming fairly general. It's a pity that we are so fuddled that only a kick in the pants (or pyjamas!) shakes us out of our confusions and delusions. But, judging from what has been happening over the past week, we will not need many more kicks to be roused. Then, God help our ugly and quiet friends. They'll have to keep out of reach.

These are strange emotions for a proverbially placid Capital, but it would be a mistake to ignore them. They might well be the fertilising force of a militant nationalism with all its dangerous propensities. They might also be the corrective to years of 'turning the other cheek', that is, if the leadership is strong enough to discipline these new emotions. I say 'new', because we have lost touch with them for some eighteen years. And for this reason, too, they will emerge many times stronger than before, sharpened by the failure to win respect through civilised postures.

War or Peace

I can see the ugly and the quiet smiling as they scan these comments and other similar statements. Their counter-parts did likewise in not-so-different situations. These political morons, who despatch their troops, their navies and their war planes to any part of the world where their miserable interests are threatened, imagine that India's leadership can always be pummelled into accepting a blackmail peace. So confidently do they go about this degrading job that they have managed to convey the same impression to short-sighted Arab, African and Asian Opinion—that India is about to go to sleep again. Only the really perceptive can cut through the present stalemate to realise that, war or peace, the repercussions of the confrontation in Kutch will be deep, very deep.

I say war or peace, because even though we are again becoming the victims of indecision, with pro-western elements urging caution against Pakistan in the interests of consolidation against China, the sentiment is general that we will have to do some solid thinking about the dangers of relying too heavily on western sources of military hardware and economic aid. This reliance has weakened our resolve to defend our vital interests and is now sapping the strength of our polity. It has also created markedly pro-western factions in the apparatus of government, factions which use all manner of dubious argument to splinter our will to act in our interest.

Anyone who has witnessed the play of politics in the Capital during the past week, and been buffetted by a veritable avalanche of rumours about the condition of our army, the dissensions within the Cabinet, the weaknesses of our commanders and the opportunism of leading elements in our public life, cannot help but conclude that only a massive purge of political, military and administrative personnel can restore the health of this nation. Excellent material is available at every level to stop the rot, but it is being suppressed, side tracked and made impotent.

The *de facto* cease-fire in the Rann of Kutch, and the continued presence of Pakistan soldiery on Indian soil, has brought this septic focus to a head. Prime Minister Lal Bahadur cannot pretend that he is unaware of this condition. It is common talk that we are at the mercy of fairly active bureaucratic elements who, given the chance, would be prepared to make this country an appendage of the USA because they believe this is the only way in which to preserve their present system of privilege and profit. Only a surgical operation can rid us of the septic focus. This realisation will grow whatever the outcome of the present confabulations on Pakistan's aggression in Kutch.

Pro-Western Lobbyists

In passing, it is interesting to compare the kind of reactions which were generated by the Chinese attack in 1962 as against those visible today with Pakistan on the rampage. Either we have become surprisingly mature, and are now able to view these crises as persistent and something to live with, or much of the commotion in 1962 was deliberately sparked by interested, western-oriented lobbyists against the controversial V K Krishna Menon and his supposed influence on Jawaharlal Nehru. Defence Minister

* In colloquial Punjabi, 'Rann' means wife and 'Kanjar' a courtesan.—*Ed.*

Chavan seems to be secure in his silence, although it must be admitted that there is widespread regret that his dynamic predecessor's undoubted talents continue to be neglected.

Obviously, the organised lobbyists in the Capital are almost entirely western-oriented. At the moment, they are making polite noises about Pakistan very similar to those made by demented, sectarian communists at the time of the Chinese attack. There has so far been no hysterical reaction even from Jan Sanghi elements; perhaps, the hysterical among them are aware that any escalation of the conflict might wreck their dreams of a military commitment to the USA. All these lobbyists must be putting in extra time somehow to again deflect national attention to the Chinese threat.

Whatever finally emerges from the debate joined in the Cabinet, in Parliament and in the Congress Party, the fact remains that those who would attempt to conciliate Pakistan will see that they have no audience to preach to. Indeed, militancy shows signs of rapid growth in India. Many an old slogan is likely to be revived, including the demand for a nuclear programme. Opinion which makes political policy is now oppressed by what looks like a continuing threat from China and Pakistan — and feels that it must free itself by striking new precise and militant postures.

Who will lead this opinion? Who will discipline it? Who will plan its perspectives? These are some of the questions which will recur again and again during the coming months.

LETTER FROM SOUTH

Communists: Impasse and Unity

AFTER the election frenzy and the rush with which President's Rule was imposed have spent themselves, Kerala has reverted back to shapelessness. There is no sense of relaxation, of ease after strenuous accomplishment, but rather a fetid dropping down after an exercise in futility. The protest meetings against the imposition of President's rule, jointly called by all the Left Opposition parties, proved to be a very poor show, indeed. In towns where lakhs had voted for these parties, only a few hundreds turned up to hear the speeches of the Left leaders and hoist a few black flags. From this one could draw the conclusion that democracy has lost its attraction in Kerala.

It would be more correct, however, to attribute this apathy to a mood of defeat, an acceptance of the inevitable since there is no viable, invigorating alternative. If this alternative takes too long in coming then, certainly, the sense of defeat would convert itself into a basic quarrel with the concept of the utility of democracy. And, in the present situation, two years would be too long. The alternative has to take shape within the next few months. There are, fortunately, some indications that this may fructify, and in time.

Contrary to what many observers expected, the results of the elections have helped to bring the two Communist Parties in Kerala closer. At any rate, the gulf has not widened and the relations have not been further embittered. The recent demonstrations against President's rule may have flopped but one useful result was the fact that the leaders of the two CPs spoke from the same platform. Nor was this a mere flash in the pan. The statements of E M S Namboodiripad indicate that he has a perspective of united action on a number of issues. His condemnation of the Pakistani push and sharp criticism of the Chinese connivance at this latest anti-India manoeuvre has certainly helped the process of moving towards joint action.

Similarly, the C P I leaders have sharpened the edge of their attack against Government policies, and signalled a warning about the very real danger of their turn to the Right all along the line. They have taken greater pains to explain that the C P I stands for the replacement of the present Congress regime by a democratic alternative, in which democratic Congressmen would also find a place. They emphasise that to realise such an objective the unity of the democratic opposition, particularly of the two CPs, is essential not only for electoral purposes but even more for sweeping mass movements.

Defending Democracy

At present the point of unity is greatest on the question of the release of the Left C P detenus and the abrogation of the DIR. A very commendable initiative was taken by the convention for the defence of democracy in Hyderabad in which the two CPs, the SSP and other leading personalities of the city participated. This initiative was a follow-up of the talks for united action between the two CPs begun at Calcutta. It is quite evident that such a campaign for the defence of democracy has no possibility of gathering any kind of momentum unless the two CPs unite in a spirit of earnestness.

It is equally evident that both in Kerala and in Andhra any prospect of presenting a Left challenge to the Congress also depends on such unity.

The split in the C P I has led to the formation of two clearly-defined sets of Party cadres with widely varying degrees of personal influence and worth. Two trends of Communist political thought in the country have crystallised, which will have very far-reaching consequences in the coming decade. But by and large the traditional following of the C P I, or what can be broadly called the Communist movement, has not split. It may go in the direction of a particular leader who may happen to belong to one of the CPs but it would far rather prefer to move in the direction of unity. In Andhra and Kerala this traditional Communist base is, on a conservative reckoning, about one-third of the electorate and far more in terms of the striking power of mass movements for certain concrete demands. This is a powerful lever for building democratic unity if singly applied.

While any advance, since it needs independent strength, depends on such unity, the prospect of moving out of the impasse depends on a broader system of alliances and adjustments. And it is precisely here that the maximum discord prevails—who are to be approached for alliance and for what?

Take Kerala. There is now a good chance of the consolidation of the alliance between the rebel Kerala Congress and the Muslim League. The S S P may well incline towards this alliance or, at the least, maintain extremely cordial relations with it. Kamaraj's plan for the Congress in the State would give it a different type of mass base—among the more oppressed Ezhava community—and open the possibility of a different type of orientation. Yet this would be a Congress fully integrated with all the ramified power structure in the country as a whole.

It can be facilely argued that the proper attitude for the two CPs would be to proclaim a plague on both the houses and go ahead on their own. In reality this will not be possible either in the sphere of electoral activity or on the question of specific mass demands. It would be possible to attempt to unite impartially with either, depending on location and issue, only for a very restricted period of time and on very few issues. At the same time, it would be wrong to ally with the rebel Congress-Muslim League alliance in the name of pulling down the Congress, since this alliance represents a concentration of reaction. It would also be wrong to ally with the official Congress in the name of a united front against reaction, since the corrupt and the guilty and the Right are also within it.

Take Andhra. In some of the districts of this State, especially in the delta region and in Rayalaseema, it is quite likely that the Swatantra will emerge as a formidable contender for seats against both the Congress as well as the two CPs, even if the latter united. It is difficult to estimate who would suffer or gain the most from triangular contests. And when it comes to mass movements among the peasants, the social base of the mass following of both the Congress and the Swatantra is essential to impart sweep and strength to them. Congress factions have not reached the stage of open quarrels and splits in this State on any significant scale, but there is every likelihood of their accentuation as the General Elections draw nearer. Once again the complex problem of choice would be complicated still further.

It would appear that the way out of the impasse is the projection of a minimum platform of action. As against customary Communist practice, it would be essential for this platform to be made up of a very few selected items chosen for their practicality, i e, the possibility of their implementation through determined mass action over a definite period of time. The stress would have to be placed on economic demands and the appeal made along class lines, especially in the rural areas. Despite the heavy pressure of caste, it remains true that economic issues and class alignments around them are meaningful factors in the Indian village and far more so, of course, in the towns and cities. The fact is that this approach has not been given a sufficient chance to prove itself, thanks to the short-term outlook of the Left parties since Independence. Where it has been tried consistently, as in the trade union field, it has paid good dividends. A determined offensive along these lines alone would induce a measure of polarisation among the various other parties and factions. Only when such polarisation proceeds to a certain point will the complexity of choice be reduced to the level of rational alternatives. And only then will the core of Left unity find it possible to build up a significant system of alliances.

CALCUTTA 1

A Non-Capital View

INTROSPECTION is not Delhi's strongest point. With all those ruins of Delhi's dead all over the place, Delhi does contemplate history after its fashion. Bombay or Calcutta has not a hundredth of that muck called history; but New Delhi has too many conferences to address and too many cocktail parties to dress for and there is simply not the time for quiet thought. Calcutta, on the other hand, is all the time looking inward, with a combination of impotent indignation and intense self-pity which is almost pathetic. (Not tragic, as Nirad C Chaudhuri has resumed reminding us in a continuing series of lashing articles in an odd variety of unlike journals.) It can, therefore, be argued that New Delhi is in somewhat greater need of the as-others-see-us view from time to time than a withering city like Calcutta; and of recent weeks Calcutta has had several looks at Delhi and not liked the sight.

Perhaps it is a pity that most of the seeing is done through the dark glasses of Atulya Ghosh; but he is a man who matters in West Bengal today, for good or ill; and his view may have considerable relevance also in the national context. New Delhi had better be told right at the outset that what Calcutta now thinks of New Delhi is well summed up in two words: Not much. The recent attempts by Gulzarilal Nanda, S K Patil and Satya Narain Sinha to fraternise with big business were not well received, and even the severest critics of Atulya Ghosh were moved to praise him when he openly criticised the effort. To Prafulla Sen was attributed the sentiment that Lal Bahadur Shastri would be wise to remember that he was no Jawaharlal Nehru.

Needless Reminder

Calcutta, of course, did not need to be reminded that Atulya Ghosh was no Subhas Bose any more than Prafulla Sen was Dr B C Roy. But it is another key, another scale, all over the country; and in that changed context West Bengal's current mood of limited revolt certainly has enough ephemeral significance to make an impression on the capital. Stripped of polite verbiage, the West Bengal view seems to be that Delhi today is not much of a capital. Delhi has critics enough; Romesh Thapar has been writing so often about Delhi Drift that in the next edition of Materia Medica it may find itself listed like Bengal Rot, an identifiable disease. But when the same notion percolates through the various State capitals, some unpleasant political processes may already be in incubation.

To name these processes and spell them out is to invite that which one is most anxious to avert: the ancient dilemma of the commentator. There ought, however, to be some, never many, people in Delhi who can read, with aid from astrologers, not only what the stars foretell for individual careers, but also what the States tell for the career of the nation. Through Atulya Ghosh and Prafulla Sen West Bengal has said several things since the "Little A I C C" at Ranchi; there is less evidence that Delhi has heard them or digested their possible meaning. What is here referred to is not an event but a tendency.

The Two Borders

Not everyone in the country may be aware that, eighteen years after Partition and intermittent hostility of considerable military proportions, to say nothing of the ceaseless "backlash" of everything India and Pakistan have done, there is no demarcated boundary in many places. Nor is there, in India, a unified force to guard the border; nor even two forces, police or para-military, to safeguard the two borders, east and west. When the Army was ordered to move into the Rann of Kutch, obviously because existing agencies had proved inadequate, not a few Bengali breasts registered a rise of several centimetres at the thought that comparable trouble in Cooch Behar had been more than adequately taken care of by the State's own border police force. The contrast made an impression on a city and a State not easily impressed, without improving the "image" of Delhi.

Not long after came the report of a "rift" in the Central Cabinet over cease-fire proposals in the Rann of Kutch, with the British and the Americans as very audible prompters in the wings. Shastri and T T K, it was said, favoured a soft line; Chavan and Nanda a less soft. The truth may never be known. (Everyone knew when to put the subsequent denials). It has to be recorded still that the report did not enhance West Bengal's respect for the Centre, whose peaceableness seems weakness and whose strong words seem petulance; there is published comment on the two views. One writer reprimanded official spokesmen for taking talk of war blandly; another summoned his best Churchillian prose to exhort the civilian population to come to the aid of the armed forces which may be called upon to meet a challenge from Pakistan with which there might before long be "a major clash". The latter added, "This I know is war talk".

Red Herrings

It may not be true of Pakistan alone that it engineers crises abroad to divert popular attention from internal embarrassments or crises. Where the reputation of the Government of India has slumped the most is in the direction of leadership; this perhaps for the reason that the people know that Shastri is not Nehru but want another Nehru and feel that Shastri can neither fill the bill nor cut it. The countdown in Indian politics is thus painfully slow and seldom painless. A plentitude of aspirins, from Sadachar to Handloom Week, makes the scene bearable only up to a point.

Nine hundred and twelve railway miles away from Delhi, we in Calcutta are perhaps insufficiently appreciative of the political strains and pressures that go into every administrative decision now emanating from Delhi, although some of these pressures may well be West Bengal's. The time may yet be approaching when Delhi must regain its realisation that its primacy is administrative—not political; politics in India are worked out in the quasi-religious ashrams at Sabarmati, Wardha or Sodepur; a modern equivalent may be the India Exchange. New Delhi cannot altogether escape the influences of all these agencies of God and Mammon; but until administrative decisions from the capital are firm and clear again, the States will go their wayward ways and India will never look like one country. West Bengal's recent waywardness was only a straw in the wind, others may be making bricks without straw. Bricks hurt and mortar may follow.

The New Village—IV

Factors Behind Technological Change

V Nath

This paper has been concerned primarily with describing technological change in agriculture. Certain other aspects of change, e g in levels of living, education, health and attitudes of people, have also been described briefly, mainly with a view to seeing the relation between them and changes in agriculture.

Perhaps the most significant conclusion is that change in agricultural techniques is part of a larger change process which affects many aspects of the life of the villager. Change in agriculture is but one aspect of the process of economic growth in Central Punjab.

Further, what has been described here is the beginning of a process of technological change. It should gather momentum in the future and produce larger and more important changes — intensive use of chemical fertilisers and pesticides, use of small tractors, increasing emphasis on specialised farming, change in attitudes towards the role of agriculture. These changes can be seen already among the more progressive farmers.

This descriptive paper throws up many questions relating to analysis of change, e g, the role of innovators, channels of communication within the village, reasons for the acceptance or rejection of specific practices, the contribution of Sikh religion, better nutrition or health to enterprise and vigour.

These and other questions are being investigated currently by a number of investigators working in different parts of India. It is hoped that similar studies will be made of villages in other regions so that we can have a better understanding of the process described in this paper.

The Man

THE Jat generally, and the Sikh Jat particularly, is known to be a good cultivator, combining hard work with intelligent use of resources. This fact has been repeatedly stressed by administrators, agricultural officers and others who have had occasion to work with Jat cultivators. In the canal colonies of West Punjab, Sikh Jats proved to be particularly adept at intelligent use of irrigation waters, and some of the highest standards of farm husbandry, yields per acre and agricultural incomes to be found anywhere in the country were reached on their farms. The refugee cultivators from the canal colonies are among the most progressive cultivators in this area, and their presence has made a major contribution to Jitpur's agricultural progress, as explained below. Already the standard of farm husbandry in this area was fairly good in pre-Independence years. Cultivation was intensive and crop yields were moderately high. The average yield of sugarcane in 1951-52, just before the opening of the C D block, was 40 to 45 kg (of *gur)* per acre, as compared with 55 kg per acre today. The standard of livestock husbandry was also high, as evidenced by the fairly high yields of milch animals.

Agricultural extension work was well organised in pre-Partition Punjab, its Department of Agriculture being among the best in the country. Several important improved practices such as use of C-591 wheat, and CO-312 sugarcane, growing of *berseem* as green fodder and use of improved implements like iron ploughs, iron persian wheels, chaff cutters and improved sugarcane presses, had become universally accepted in this area by the time of Independence. The people of Jitpur mentioned in particular the work of a Deputy Director of Agriculture who had in the 1930's, taught them the improved method of making *khandsari* sugar which they are following to this day.

But, rapid advance in techniques and agricultural productivity, with which we are concerned in this study, has occurred only after Independence, and the explanation for it must be sought in the factors operating in this period. A number of factors have been operating simultaneously, and we shall content ourselves with listing the most important among them.

The Influence of the Refugee Cultivators

After the partition of the Punjab, large numbers of cultivators from the canal colonies came to East Punjab to their ancestral villages from which they had emigrated 30 or 40 years earlier, or to other villages in which they had been allotted lands. The canal colonists, as stated earlier, had attained high standards of farm husbandry and agricultural incomes in West Punjab and were used to improved methods of farming advocated by the Department of Agriculture. When they came to East Punjab and were given holdings which were much smaller than those they had left behind, their first endeavour was to re-attain the standard of agricultural income which they had enjoyed earlier. They started building up their new holdings through methods which had given good results in the canal colonies — use of improved seed, use of iron ploughs and other implements, thorough preparation of land, and last, but most important, intensive irrigation. From these practices they soon went on to new practices which were necessary for obtaining higher per acre yields from their smaller holdings. Thus, they were in the fore-front of the movement for irrigation by pumping sets, because they realised that irrigation was the key to intensive farming and that the only way to increase water supplies in this area was through the use of mechanical power for lifting water from wells.

Besides generally stimulating the movement towards more progressive, intensive agriculture the refugee cultivators were responsible for popularising several specific improvements. The rapid spread of American cotton in East Punjab in the early 1950s was due mainly to their influence. They started growing American cotton which they used to grow in the canal colonies, and the local cultivators followed their example. The large price difference between American and *desi* cotton in the early 1950s aided this movement and growing of American cotton became universal in several districts of the Punjab within a few years.* The rapid increase in popula-

* The Programme Evaluation Organisation of the Planning Commission made a study of the spread of American cotton in certain community development blocks of PEPSU in 1954. It was found in this study that 70 to 90 per cent of the cultivators were growing American cotton and that the example of the refugee cultivators who had brought American cotton with them was a major factor in its spread — "Cotton Extension in PEPSU," 1955, P E O, Planning Commission.

rity of the fodder crop, *berseem*, was also because they preferred *berseem* to other fodder crops. Some of the prosperous refugee cultivators, who had owned citrus orchards in the canal colonies, started planting orchards. The Punjab government encouraged the practice by establishing planned garden colonies, in which besides specialised advice, liberal *taccavi* loans and other facilities were also given to the planters.

Of course, the refugee cultivators were not successful in everything they introduced. Citrus orchards were not successful, because the climate and soils of the Central Punjab districts are different from those of the West Punjab canal colonies. We saw an instance of failure of citrus plantation in the garden colony, located in this block, at a distance of about ten miles from Jitpur. The colonists had all planted citrus orchards in the early 1950s; but they had to give up later when they found that the trees did not survive after two or three years, partly because of the presence of a "hard pan" in the sub-soil. The American cotton was also not without its defects. It was more susceptible to diseases like jessids and boll-worm. As a result, after the first wave of spread of American cotton, the *desi* variety staged a come-back. Many agricultural officers now feel that the area is more suitable for *desi* than American cotton.

But the idea of intensive agriculture, use of improved methods and following the advice of extension workers received a definite stimulus from the example of the refugee cultivators. We have described earlier about the leadership provided by a refugee cultivator in the village with the co-operative milk producers' society. The garden colony people, though unsuccessful at planting orchards, have nevertheless attained a high standard of cultivation. They are acknowledged to be the best cultivators in the block and are frequently held up by the extension workers as models for other cultivators. In all our discussions, with the extension staff at the block and the district level, and even with specialists at the Ludhiana Agricultural University, the role of refugee cultivators in providing a stimulus to the movement towards improved agriculture was emphasised.

Ex-Servicemen and Educated Cultivators

Two other groups whose presence has had a significant influence on technological and economic progress in the area are ex-servicemen and educated cultivators. The major contribution of the ex-servicemen has been in spreading the idea of better living — better and cleaner homes, cleaner villages, use of modern medicine, modern-type consumer goods, etc. The block staff and the village leaders said that ex-servicemen were particularly enthusiastic about building *pucca* or semi-*pucca* houses and installing electricity and handpumps in houses. They also took active interest in village sanitation programmes. The spread of the tea-drinking habit after World War II was also attributed to them. Several ex-servicemen were also active in popular institutions like the co-operatives and the panchayats and rose to positions of leadership in them. The extension staff thought that they were good at working the co-operatives because they understood the 'co-operative principle' and were more honest; but they were not particularly successful in the panchayats. Several ex-servicemen, when elected to panchayats, proved unpopular and lost in the subsequent elections. The explanation given for this was that 'they were too strict in the observance of principles'.

But the role of ex-servicemen in the improvement of agriculture was somewhat limited. They undoubtedly influenced technological change, because they were familiar with modern technology and were anxious to adopt labour saving devices. They were among the first to install electric motors on wells, and to adopt innovations like power or bullock-driven chaff-cutters, sugarcane crushers, in this and the neighbouring villages. But their influence in adoption of other improvements has not been much, because the average cultivator feels that they are not willing to do hard labour and are not particularly good cultivators. This impression is based on the fact that many ex-servicemen were not really interested in agriculture. They drifted to non-agricultural jobs after a period of stay on the farms, and those who did stay back were not happy at doing hard manual labour.

As for educated people, few persons with education above the middle standard stay in agriculture. They are after non-agricultural employment, and leave cultivation as soon as they get suitable jobs. But to the extent that they do stay in agriculture, they are an influence for progress. Some of them, like the garden colonists and the chairman of the milk producers' society, are good cultivators. Moreover, like the ex-servicemen, they are anxious to adopt new techniques, especially new implements and other labour-saving devices; and for the same reasons. They have also shown a noteworthy aptitude for taking up new, remunerative types of farm production. The new commercial poultry production is entirely in the hands of educated men. They do not have the prejudice against keeping poultry which the average cultivator still has. They also have the added advantage of understanding and following the rigorous routine which commercial poultry production requires.

The Environment of Progress

But the most significant influence of the post-Independence years has been the environment of progress. A number of factors, ranging from steady and high prices of agricultural produce and interest shown by government in improvement of agriculture, to the growing inter-action between the town and the village, have gone into the making of this environment. Since prices of agricultural produce have remained high, and the government has been making propaganda and giving various incentives and facilities for increasing production, the cultivators feel that increasing agricultural production is profitable and is likely to remain so for a long time. The various steps taken by the government to increase production have also had their direct effects. It has been explained that in this village, consolidation, digging of new wells and electrification laid the basis of a more progressive agriculture. The work of the extension organisation has also been a constant influence for progress. Currently, the propaganda for use of chemical fertilisers, backed by readily available *taccavi* loans, is a major factor in rapid increase in the use of chemical fertilisers.

Increasingly, these influences have operated on a peasantry which was rising above the subsistence level, was becoming less subject to tradition, and was, therefore, more responsive and better able to benefit from them. The size of holdings in the area is such

that with the improved methods of resource use — possible after consolidation and electrification of wells — the average cultivator could raise himself substantially above the subsistence level. As this happened, he acquired not only a desire for a higher standard of living, but also a confidence in his ability to attain it. Eradication of malaria removed a major impediment to economic efficiency — a cause of chronic lassitude and lack of ambition. Spread of education meant penetration of new ideas, decline in influence of tradition and growth of new aspirations, especially among the young who form a steadily more influential section of the population. Even though large numbers of educated young men have gone out after receiving education, the ones who have stayed behind have been on the look-out for improvements which lighten the burden of work or increase incomes. And as they succeed in their efforts, their influence increases.

Town and Village Brought Nearer

Finally, rapid growth of transport and communications has effectively linked the villages with the towns, and made the village people an integral part of contemporary culture and aspirations. Reference was made in the beginning to the ease and rapidity with which the people of Jitpur can travel to the neighbouring town and other places. The material advantages of this which have a direct influence on agricultural improvement are, facility and low expense of taking produce to the market, buying implements, equipment and consumer goods at lower prices and getting repairs and replacement of parts done quickly and cheaply. But the non-material advantages are of equal, if not greater, importance. The average resident of Jitpur today is a full participant in the news, ideas and social currents of contemporary society. Any news or new idea can reach him just as quickly as it reaches a person in the neighbouring town. To an extent he is better informed than the latter, because the channels of informal communication and discussion are much better preserved in the village. Moreover, with his present income and the network of social services available to him, he has a standard of living which is comparable, if not superior in many respects, to that of the resident of the town. All this means that the villager and the town-dweller are part of the same culture and share its values and aspirations. This constant inter-action between town and village and the establishment of a cultural continuum extending from the large city to the village is a most important influence for economic progress. The distinction between the town and the village—in food, dress, housing conditions, modes of economic activity, patterns of social relation and values — which is still pronounced in many parts of India has almost disappeared in the Punjab.

Simultaneous development of small-scale industry in the towns and technological change in agriculture in the villages is only another aspect of this cultural continuity. The two developments are related in many ways, starting from a common dependence on cheap electricity and mechanical aptitude and skills of the Punjab artisans. Within the village, the relationship between them is expressed in two ways: facility in adoption of new agricultural implements by cultivators because of existence of facilities for repair and manufacture of these in the neighbouring towns; and opportunities for young men of the village for employment in small-scale industry in the towns. An investigation of the relations between the two developments is a fascinating subject for further research.

Emotional Identification

One result of establishment of this cultural continuum is seen in the mental make-up of the extension workers. The extension agency has here, as in other States, its problems of administrative co-ordination, supplies, credit, etc. But what impresses one here is the *lack of distance* — social, economic and psychological — between the agricultural extension workers and the cultivators. The Village Level Workers and even the block and district level Extension Officers speak the language of the cultivators. They have an understanding of their problems and an emotional identification with their interests, which is not found among extension workers in many parts of the country. One reason for this is that most of them come from cultivators' families. But an even more important reason is the fact that levels of living, awareness and income of the average cultivator are comparable to those of the average extension worker. As a result, the extension worker considers the cultivators to be his social and economic equals: he does not think that by joining government service he has become superior to them. Moreover, most extension workers realise that they will have to settle down and work on farms after retiring from service. And since cultivation is profitable, they look forward to it. It may be of interest to mention that many highly paid government officers, especially of the Department of Agriculture, have settled down after retirement, on 15-20 acre farms, and are quite happy with the income and living conditions which these farms provide. This aspiration to return to agriculture, even more than the farm background, is responsible for ready and sympathetic appreciation of the problems of the cultivators. When both the cultivator and the extension worker feel that they have not merely a common past but also a common future, mental reservations disappear and a community of interest is established, which is rarely established otherwise.

The Role of Emigration

It has been explained earlier that the area has a tradition of emigration. The effect of the recent economic and social changes, has been to accelerate the rate at which aspirations for non-agricultural employment and emigration grow. It is true that two reasons for emigration of educated young men from the village in the past — low productivity in agriculture and unattractiveness of village life — no longer operate. A 10-acre holding now offers a similar or higher income than clerical or skilled jobs in town. Secondly, life in the village after coming of electricity, hand-pumps, roads and bus transport is not unattractive. But these changes cannot check growth of off-farm employment and emigration, because continued advances in agriculture and levels of living are themselves dependent upon a continuing exodus of workers from the village.

Let us analyse this separately for each of the principal castes. Among the Jat cultivating owners, continued agricultural progress and prosperity are dependent upon the size of holding not falling much below the present level. This means that a certain proportion of young men must continuously go out. The Mahajans already have a limited economic role in the village. They depend mainly upon income originating from outside and their position cannot change significantly unless some manufacturing industry or

urban-oriented commercial activity, in which a large number can get employment, is established in the village. As for the Mistries, technological change has undoubtedly opened opportunities for work within and near the village. But as explained above, even they have found employment outside the village more attractive. Increasing numbers of Mistri young men are either going out of the village or are working outside while living in the village. Emigration and work outside the village have been the least among the Harijans and 'other artisans', who are the poorest and most backward people in the village.

The much repeated argument that emigration of its educated and most intelligent people robs the village of its best talent and slows down economic and social progress has no relevance in this situation. As stated earlier the major role of emigration has been to provide opportunities for gainful employment to people who had only a limited role in the economic system of the village and to bring into the village money, new ideas, new techniques and higher aspirations. This contribution of emigration has been far more significant than any loss caused to the village by migration of its educated young men.

Gains of Progress and the Weaker Sections

It has been explained above that the gains of recent economic progress have not been shared eqally by all sections of the village community and that the Harijans and other artisans in particular have not benefited adequately from such progress. These groups have made some economic gains undoubtedly, but they are much smaller than those made by the Jat cultivators and the Mistris. The different levels of living of the different castes and groups in the village is much larger today than it was a generation ago, simply because conveniences like electricity and hand-pumps in the homes or durable consumer goods like bicycles and sewing machines which the Jats and the Mistris have in considerable numbers and which the Harijans do not have, were not available earlier. Moreover, from the (limited) data on earnings of Harijans given earlier, it would appear that increase in agricultural productivity has not been accompanied by a proportionate increase in earnings of agricultural labourers. The result is that the difference between owners of land and their labourers has increased.

But the Harijans cannot obtain a significantly higher income within the economic framework of the village. (Revitalisation of their traditional crafts offers no solution to their economic problem, because the economic changes of recent years have accelerated the decline of these crafts.) They can achieve it only through greater participation in the economy of the area, the State and the country. In other words they must do what the Mahajans and the Mistris (and to a lesser extent the Jats) have done before them. They must take up white collar and skilled labour jobs in increasing numbers. The process has begun already — recent increase in the number of Harijan young men going into the armed forces is an indicator — and will gather momentum as education spreads among the Harijans. Already, the more advanced and prosperous families among Harijans are those in which skilled work or white collar service, or other non-agricultural pursuits, is an important source of contribution. As the number of such families increases, the economic and social levels of the group will rise.

Conclusion

This paper has been concerned primarily with *describing* technological change in agriculture. Certain other aspects of change, e g in levels of living, education, health and attitudes of people, have also been described briefly, primarily with a view to seeing the relation between them and change in agriculture. Perhaps the most significant conclusion emerging from the paper is that change in agricultural techniques is part of a larger change process, which affects many aspects of the life of the villager, and also the entire region. Change in agriculture is but one aspect of the process of economic growth in Central Punjab. Further, it is necessary to mention that what we have described here is the *beginning* of a process of technological change. It should gather momentum in future and produce larger and more important changes — intensive use of chemical fertilisers and pesticides, use of small tractors, increasing emphasis on specialised farming (poultry keeping, dairying, horticulture), and change in attitudes towards the role of agriculture. These changes can be seen already among the more progressive farmers like the dairy farmer and the garden colonists.

This descriptive paper throws up many questions relating to the analysis of change, e g the role of innovators, channels of communication within the village, reasons for acceptance or rejection of specific practices, and the contribution of Sikh religion, better nutrition or health to the enterprise and vigour. These and other questions are being investigated currently by a number of investigators working in different parts of India. We hope that before long similar studies will be made in villages of these areas so that we can have a better understanding of the process described in this paper.

(Concluded)

Fertiliser Corporation

WITH the completion of four fertilizer projects, which are at present under implementation, the Fertilizer Corporation of India is likely to develop in another three years an overall production capacity of 637,000 tonnes of nitrogen and 153,500 tonnes of phosphate. The Corporation has now under it two operating units, namely, the Sindri fertilizer factory in Bihar and the Nangal fertilizer factory in the Punjab. The four fertilizer projects under implementation are at Trombay in Maharashtra, Namrup in Assam, Gorakhpur in Uttar Pradesh and Durgapur in West Bengal.

The production of the Sindri fertilizer factory is to be stepped up by installation of additional lean gas generators for which orders have been placed and by procurement of better grade gypsum. The total production of ammonium sulphate of this factory during April-December, 1964 was 223,960 tonnes. The expansion plants produced during April-December, 1964, 33,593 tonnes of double salt and 12,682 tonnes of urea.

During the period April to December, 1964, the Nangal factory produced 282,319 tonnes of calcium ammonium nitrate against 280,435 tonnes during the corresponding period in the previous year. The production of heavy water in the factory was 8,421 kg during the period. For the fourth year in succession, this factory is expected to exceed its production target.

India's External Debt

The Repayment Problem Examined

G C da Costa

An attempt is made here to examine the composition of India's external debt with regard to amortisation period and interest rate with a view to determining the debt-service burden.

The burden of servicing external debt has a short-term as well as a long-term aspect. In the short-term the burden may be measured by the proportion of export earnings absorbed by service payments.In the long-run of a decade or longer it has to be considered in the context of growth of income, savings and external receipts.

India's debt-service burden is here considered from both these viewpoints.

THE last decade has witnessed a substantial flow of foreign aid to the developing countries. The extent to which India has benefited from this flow can be seen from the data in Table 1. During the First Plan we received authorisations for a total of Rs 381.80 crores of foreign aid. For the Second Plan, the total size of the foreign aid authorisation was Rs 2,539.95 crores. It will be seen that while the ratio of loans to total borrowings to be repaid in foreign currencies registered a fair decline, in the case of loans to be repaid in rupees the ratio rose from 3.83 to 9.07 per cent; in respect of grants there was a steep fall in the ratio from the rather impressive level of 36.13 per cent to a meagre 4.77 per cent. However, if we add the grant of Rs 375.33 crores included in P L 480 aid, the ratio rises to 19.54 per cent, mitigating to some extent the degree of the fall. In the aid authorised for the two and a half years of the Third Plan, loans repayable in foreign currencies have registered a very steep increase to 82.43 per cent; loans repayable in rupees a further decline to 2.43 per cent; and grants a further fall.

Wide Gap in Balance of Payments

The Planning Commission had estimated a gap in the balance of payments during the Third Plan period of Rs 2,600 crores. Inclusive of P L 480 imports the net requirement of foreign assistance works out to Rs 3,200 crores. The authorisations to date already exceed that figure.[1] It would thus seem that our foreign assistance requirements have been met. However, as the gap is likely to be much larger due, on the one hand, to underestimation of the capital costs of our projects, and, on the other, to the increase in maintenance imports our requirements of foreign assistance will be much higher.

We have seen that a part of India's external debt is repayable in rupees. There certainly is an advantage in this form of repayment especially in the short period when exchange earnings are inelastic. Unfortunately, the proportion of loans that are repayable in rupees has decreased between the Second and the Third Plan periods. However, it is essential to remember that even in respect of loans that are repayable in rupees the fundamental nature of the repayment problem, viz the transfer of resources, remains. The main merit of this form of repayment is that no scarce foreign exchange reserves need be surrendered.

Average Ratio

External debt servicing has both a short-term as well as a long-term aspect. In the short-term we measure the burden by the percentage share of external earnings absorbed by service payments.[2] In the long run of a decade or more, however, we would have to consider "the rate of growth of income, savings and external receipts remaining available after service payments has proceeded *pari passu* with a strengthening of the long-run economic position of debtor countries".[3] We shall consider the debt-service burden from both these aspects.

The Planning Commission had estimated foreign exchange needs over the Third Plan period on account of interest on and repayment of loans, which had been contracted during the two earlier plans, to be of the order of Rs 500 crores, giving an annual average of Rs 100 crores. In fact, the figure works out higher at Rs 584.5 crores. Capital repayments account for Rs 338.2 crores and interest payments for the balance of Rs 246.3 crores. Assuming that the export target of Rs 3,800 crores for the Third Plan is reached, the annual average ratio of service charges to export earnings works out to about 15.38 per cent. Details of the ratios of service charges to export earnings and the magnitude and composition of annual payments for the Third Plan period are given in Table 2.

The ratio is affected by two variables: one, the size of export earnings; and two, the size of the foreign loans and their composition. It is the former that is causing us a great deal of anxiety. Export earnings must rise not only to finance service payments and make possible the purchase of essen-

Table 1: Foreign Aid Authorisation

(*Rs crores*)

	First Plan		Second Plan		Third Plan (upto 30-9-1964)	
	Total	Percentage	Total	Percentage	Total	Percentage
(a) Loans and credits to be repaid in foreign currency	212.29	*55.61*	1057.69	*41.64*	1684.83	*82.43*
(b) Loans and credits to be repaid in rupees	14.63	*3.83*	230.42	*9.07*	49.59	*2.43*
(c) Grants (excluding those under U S Public Laws)	137.96	*36.13*	121.11	*4.77*	49.56	*2.42*
(d) U S Assistance under PL 480 and PL 665	16.92	*4.43*	1130.73	*44.52*	259.92	*12.72*
Total	381.80	*100.00*	2539.95	*100.00*	2043.90	*100.00*

Source: "Economic Survey," 1964-65, Government of India.

tial import requirements, but also to enable us to replenish our depleted foreign exchange reserves. The share of our exports in world markets has steadily declined, the figures for 1948, 1956 and 1962 being 2.5 per cent, 1.4 per cent and 1.1 per cent respectively. Again, the ratio of exports to the national income has declined from 7.3 per cent in 1951-52 to 4.7 per cent in 1963-64. The ratio of export earnings to imports fell from 88 per cent in 1953-55 to 64.4 in 1962-63. This decline has taken place in the face of stringent control over imports. However, in view of the high import content of the Plan projects imports in the future will certainly rise and unless exports are sufficiently buoyant the trade gap will widen. It is encouraging, however, to note that the export sector is displaying increasing dynamism at present.

It will be of interest to recollect that during the inter-war period despite much lower export earnings we were able to maintain a fairly steady outward payment of more than Rs 50 crores per annum exclusive of repayments of capital and the 'home' charges. The magnitude of that burden can well be imagined when we recall the level of prices that prevailed during that period. There were, however, two redeeming features: (1) service charges absorbed only about 15 per cent of the export earnings of the period; and (2) we enjoyed a four-sized trade surplus during that period. Between the inter-war years while the aggregate service charges were about Rs 905 crores, the trade balance was of the order of Rs 1489.05 crores—i.e., service charges accounted for about 60.78 per cent of the trade balance.[4] It is this trade surplus that enabled us to service our external debt comfortably despite the large outflows by way of service payments. What has created our present problem is not the level of the ratio of service charges to export earnings, which cannot be considered as unduly high, but of the large deficits in our trade balance. It is plausible to argue that had our exports performed more satisfactorily the ratio of service charges to export earnings would have appeared more favourable. As things are at the moment, we have to depend almost entirely on new external assistance to service our foreign obligations. We may, however, derive some consolation from the fact that other developed countries, had similar experiences during their period of development. For instance, between 1874 and 1897 the magnitude of foreign borrowing by the United States was so large that the current trade surpluses were inadequate to service the debt and she had to rely on the new loans to service the old ones. Canada too found herself in a similar position from 1900 to 1913 and again from 1920 to 1929—the two phases of her rapid industrial growth.[5] In both these cases, the continuity of foreign assistance enabled the two countries to maintain a steady rate of industrial growth.

Total		2692.06	*100.00*

'high' interest categories while loans repayable only in rupees are concentrated in the 'medium' and 'high' interest category. Had we included the PL 480 loans which are repayable in rupees and belong to the 'medium' interest category the position would have been somewhat different. In Table 4A we have the composition of loans repayable in both rupees and foreign currencies, on the basis of amortization period while Tables 4B and 4C include only those loans that are repayable in foreign currencies and rupees respectively. In all cases we have a fair concentration of medium and long-term loans.

Liberalisation of Terms

We would certainly benefit both from a lowering of the interest rate structure and from an extension of the maturity period. It is indeed encouraging to note that there is to-day a definite trend towards the liberalization of aid on both these counts. The necessity for such liberalisation is reinforced by the consideration that grants now form a relatively smaller proportion of the international assistance we are receiving. Several instances of the improved terms on which aid is being given may be cited: loans from A I D are repayable over a period of 30 years with a 10 year grace period. No interest is charged except a credit fee of ¾ of 1 per cent on the outstanding amount. Loans from the I D A are repayable over a period of 40 years with a ten-year grace period. Again, there is no interest levied except a service charge of ¾ of 1 per cent per annum to meet the administrative expenses. Assistance from the Soviet Union although for a twelve year period, carries a relatively low rate of interest of 2½ per cent. Loans on conventional terms come from the Western European countries. But even here we find evidence of the desire of these countries to liberalise both the cost as well as the period of repayment of loans to India. Even financially conservative West Germany has decided to toe the line of liberalisation: whereas formerly her loans carried an interest rate of 6 per cent, the bulk of the loan assistance authorised in 1962-63 carries a rate of interest of 3 per cent with the repayment of principal spread over 20 years. The U K has waived interest during the first seven years in her loans from 1963-64. Despite the fact that grants continue to dominate Canadian assistance to us, her loans in recent years are on softer terms.

In the long run a country's ability to service its external debt depends on the state of the economy. Both savings and national income should show a satisfactory rising trend, for the service charges have to come out of the savings of the community and the volume of savings depends on the level of national income. Savings are a function of the price level. Where inflationary pressures exist they exert a downward pressure on aggregate savings and reduce a country's ability to service foreign debt. Finally, the conversion of domestic savings into foreign exchange implies that exports should grow fast enough to provide the external earnings necessary for meeting payments obligations. All these factors are inter-related and represent different facets of the same problem. As D Avramovic points out: "Growth in income and savings and growth in transfer capacity are interdependent in the long-run and represent only different aspects of the process of economic growth although the degree of interdependence will not be the same in all cases".[7]

Pattern of Repayment

Increases in the per capita income of a country is one of the primary requisites for the successful servicing of its external debt. Where the per capita income fails to respond sufficiently, the conflicting objectives of savings and consumption will hinder the process of transfer. While this is true of any country it is more so of an underdeveloped country because of the extremely low per capita income. The rate of growth of our national income in the last decade was around 3.3 per cent and the per capita income increased by about 1.3 per cent per annum. These figures are even lower for the Third Plan period. This is very disappointing even by standards of under-

developed countries. Nor is the situation better in respect of prices (wholesale) which registered an increase of 9.1 per cent in 1963-64 and 14 per cent for the first 10 months of 1964-65. It is to be hoped that these are short-term difficulties and that the success in resource mobilisation and in export performance will continue and be extended to the other departments.

Before we conclude, it would be worthwhile to have a brief idea of the repayment pattern during the Fourth and Fifth Plans of loans received upto the end of 1963. The details are found in Table 5. The repayment problem will not be as acute in the years ahead. For loans outstanding on Dec 31, '63 the repayments decrease not only absolutely but also relatively to our export earnings. This implies that we are in a position to absorb more external assistance with long maturities and low interest rates.

Conclusion

From our study several conclusions emerge. First, that both from the short-term as well as the long-term point of view, the trends in the key variables of our economy have not particularly enhanced our capacity to meet our service commitments. Increase in the capacity to repay is possible only when national income, savings and export earnings all exhibit a healthy buoyancy. To ensure this it is essential that economic development be promoted under conditions of price stability and that investment should be export-oriented and to the extent

possible import competing. This is not to say that our ratios of service charges to export earnings are unduly high. Many countries have had large ratios during their process of growth. For example, for the two periods of rapid economic expansion (1900-13 and 1920-29) Canada had average ratios of 19.1 and 17 per cent respectively. The United States has had one of the lowest ratios, the maximum being 14.2 per cent in 1869.[8] The experience of the developed countries shows that in each of them the ratio was fairly large in the initial stages of development and that it eventually declined to insignificant levels. Moreover, as against our experience, the case of certain Latin American countries may be mentioned. Colombia had a ratio of 29 and 26 per cent in 1958 and 1959 respectively. Chile had a ratio of 12 per cent in 1950-56, 17 per cent in 1957, 22 per cent in 1958, 36 per cent in 1959, 43 per cent in 1961 and 50 per cent in 1963.[9] Such ratios are extremely high for a developing country to bear for any extended period of time.

Secondly, it is necessary that the external assistance coming into the country should maintain its continuity. This is essential in view of our heavy reliance on external finance to meet our service commitments. The prevailing mood in the developed countries and the establishment of the Aid-India Consortium seem to ensure this at least for the foreseable future. At the same time excessive reliance on external assistance to finance economic development should be eschewed; foreign aid must remain what it essentially is—a complement and not a substitute to domestic efforts.

Finally, while recognising the importance of external aid steps should be taken to divert part of the stream of private international capital to India. True, between 1948 and 1963 private international investment in India increased from Rs 255.8 crores to Rs 668.77 crores—an increase of 160 per cent. And yet, in aggregate terms, the record is quite unsatisfactory. Much more needs to be done in this field.

Employees' State Insurance Scheme

A Critique of the Utilisation of Reserves

V Jagannadham

K S R N Sarma

This article reviews some aspects of the utilisation of reserves under the ESI Scheme in the context of the implicit objectives of a social security scheme.

The scheme is at present administered with extreme caution in financing and conservatism in implementation. It lacks the imagination necessary to attract the workers.

A shift in emphasis from calculated conservatism to liberal humanism need not necessarily spell disaster to the financial soundness of the scheme.

It is suggested here that the policy regarding accumulation of reserves should be changed and the excess incomes should be spent on additional social benefits.

THE Employees' State Insurance Scheme that came into operation in 1951-52 under an Act of the Parliament in 1948, is intended to provide a sense of security to certain classes of workers. The Scheme at present is confined to the workers in factories using power and employing 20 persons or more and whose monthly remuneration is Rs 400 or below. The benefits provided include, medical care and treatment, cash benefit for sickness, maternity, disablement and for the surviving dependants in case the insured dies of employment injury. The Act also provides for extending, in due course of time, the coverage under the scheme to workers in other organised sectors such as mines, plantations and shops and establishment.

The 'Contribution' Approach

The building up of reserves against the liability undertaken in the case of future benefits and the investment of these reserves is a characteristic problem in social security schemes based on 'contribution approach', as under the Employees' State Insurance Scheme. Under the 'contributions' or 'insurance' approach, the premium is determined in respect of each risk in such a manner that it is sufficient to cover the estimated expenditure on that risk irrespective of whether the risk is of short term or of long term duration. This practice gives rise to the phenomenon of accumulation of reserves as under the E S I and E P F Schemes. Here the contributions made by the insured are allowed to accumulate before he could finally begin to realise the benefits. Another possibility under the contributory system is, for funds called "excess incomes" to get accumulated when the expenditure in any year on a particular benefit is less than that was provided in the calculation of its premium. In a social security scheme based on taxation or 'pay as you go' approach, large funds are not accumulated. Only relatively small reserves are kept to provide for variations in expenditure from year to year. This is because government would guarantee the payment of future benefits as it does in the case of public debt. The controversy as to the building up of reserves or otherwise as between the tax and contributory systems need not detain us here. We are interested in the ways in which the reserves accumulated in a social insurance programme can be best utilised. This problem is of considerable importance in countries like India which wish to develop the social security schemes acceptable to people from out of scarce and competing resources.

Three Basic Requirements

Different types of reserves funds lend themselves to different forms of utilisation. Some need short term planning and some long-term planning depending upon the benefits with which they are associated. The I L O publication entitled "The Investment of the Funds of Social Insurance Institutions" made a detailed study of this problem. According to this publication, whatever may be the type of reserve fund, the securities in which it is invested should satisfy the following conditions viz.

(1) *Safety:* Safety is the primary consideration to be satisfied by the securities chosen for investment of social security funds. Safety implies not only the guarantee as regards the repayment of capital and the interest at the agreed rate but also the provision for the maintenance of the purchasing value of the returns thus planned against possible devaluation etc.

(2) *Yield:* Investment of social security funds need not generally fulfil any special conditions as regards the yield except in the case of reserves built up against the future liabilities wherein the yield should not be less than the rate assumed in the actuarial calculations. It is sufficient if the average yield from all the investment is not less than that is generally obtained by similarly placed funds. However, a lower rate could be justified in the case of investments which procure some advantages for the insured persons.

(3) *Liquidity:* Liquidity of an investment may be taken to mean its potentiality to get realised in money terms at any moment or at a particular date fixed in advance. The first kind of liquidity is of capital importance to the contingency reserve funds. The second kind of liquidity is the one that is sought in the case of actuarial reserves for the provision of future benefits.

The Adarkar Report

Among the securities that satisfy these three basic requirements of safety, yield and liquidity, preference should be given to those which have an economic and social purpose to serve the community at large.

Under the E S I Scheme the benefits that necessitate the building up of reserves are only the permanent disablement benefit and the dependants benefit. The expenditure on the other benefits namely, medical, sickness, maternity and temporary disablement benefits, is of current nature and has to be provided for during the statutory benefit period.[3] There is no future liability in the case of these benefits, and as such there is no need to build up reserves.

The Adarkar Report which[4] formed a prelude to the E S I Act, recommended the establishment of two more reserve funds under the scheme viz, a contingency reserve fund to meet any sudden and excess rise in the claims, and an epidemic reserve fund to meet epidemics in particular areas or years.

Adarkar's view was not shared by the I L O experts Rao and Stack[5] who reviewed the above mentioned Report at the request of the Government of India for the following reasons:

(1) There will be a time gap of about six months between the payment of contributions and the payment of cash benefits in the case of sickness and maternity; and

(2) the contemplated provision of medical care to the families of the insured takes some time to materialise.

The experts therefore, believed that there would be a large possibility of getting sufficient excess incomes under the scheme and consequently there is no need to set aside a portion of the reserves specially for the purpose of accumulation of the two reserves advocated by the Adarkar Report. Further they said that if unexpected increases occur in the incidence rates of sickness or employment injuries in a particular area or year, they can be met through "subsidiary levies" by the State governments concerned.

More Benefits for the Insured

However, both reports agreed that if a substantial amount of excess income becomes a regular feature under the scheme, they should be utilised for an improvement in the benefits for the insured under the scheme.[6] This suggestion was incorporated in Sec 99 of the E S I Act. It says that "At any time when its funds so permit, the (E S I) Corporation may enhance the scale of any benefit admissible under this Act and the period for which such benefit may be given and provide or contribute towards the cost of medical care for the families of the insured persons." The Act does not, however, spell out in detail the pattern of investment to be adopted with regard to both, namely, excess incomes and "other reserves". Attention however, may be drawn to Section 29 of the Act in which it is stated that the details of the policy in the above matters would be prescribed from time to time by the Central Government. Clause (1) of Rule 27, for example, mentions the various items for investment.[7] According to this clause "All moneys belonging to the (E S I) Fund which are not immediately required for expenses properly defrayable under the Act, may, subject to the approval of the Standing Committee, be invested by the Director-General (i) in Government securities including Treasury Deposit Receipts or (ii) in securities mentioned or referred to in clauses (a) to (b) of sec 20 of the Indian Trusts Act 1882 (ii of 1882); or (iii) as fixed deposit in the Reserve Bank or the Imperial (State) Bank of India."

E S I Corporation

An idea of the build-up of reserves during the past twelve years under various heads of the scheme could be obtained from an observation of the balance sheet of the E S I Corporation. This shows that annual additions to assets under E S I Scheme are broadly under two categories, viz (i) those which have a corresponding account in the same name on the liability side of the balance sheet and (ii) those which do not have such liability item attached. The former category includes (a) Permanent Disablement Reserve Fund, (b) Dependents' Benefit Reserve Fund, (c) Depreciation Reserve Fund of buildings for the offices of the Corporation, (d) Repairs and Maintenance Reserve Fund of buildings for the offices of the Corporation, (e) Employees' State Insurance Corporation Provident Fund, (f) Depreciation Reserve Fund for equipment in Hospitals and Examination Centres, (g) Depreciation Reserve Fund for Hospitals and (h) Depreciation Reserve Fund for Staff Cars. The second category of additions to assets include (a) Investment in the construction of hospitals etc or advances for that purpose to the State Governments, (b) Advances or loans etc to the staff of the E S I Corporation and working cash balances and (c) Funds in the account of "general cash balances". The data regarding this second category of assets (investments) and the 'excess incomes' from which these are mostly met, are given in the Table on page 788.

In every organisation the provision for items mentioned in category 2(b) namely advances or loans to the staff and the general working cash balances is an administrative necessity and therefore cannot be dispensed with. However, as can be observed from the data given in the Table, the amounts that may be required annually for these purposes are very small when compared with the funds available under the E S I Scheme. It was therefore rightly decided in October 1954[8] to give priority in the utilisation of the 'excess incomes' under the E S I Scheme to construct hospitals etc, under category 2(a). But because of some administrative difficulties such as the difficulties of the State Governments to procure land for the E S I Corporation to construct hospitals etc, much progress could not be made in that direction. Meanwhile large funds from the annual excess incomes were allowed to accumulate, under the account "general cash balances" (category 2(c) of investments). Since 1960, however, the construction of hospitals has gathered momentum. In order to finance the commitments made under the programme of construction of hospitals etc, some withdrawals have been made in each succeeding year (since 1962) from the reserves under "general cash balances" account in addition to the utilisation of annual excess incomes. The reserve funds built up under the General Cash Balances account, as on March, 1964 are still substantially very high.

Choice of Investment Restricted

As regards the problem of utlisation of investible funds with the E S I Scheme, the Corporation has freedom of choice in the selection of securities except in the case of the working balances and advances to the staff (which are an administrative necessity and are of small proportion to the total) and except as regards the commitments already made such as investment in the construction of hospitals etc. But by clause (i) of the rule 27 (see footnote 7) this freedom is restricted as these investments are to be made in the securities of the government or its banks. This operates as a limitation on the autonomy of the Corporation in the choice of the fields of investment. However clause (2) of the same rule provides for alternative channels of investment with the prior approval of the Central Government. This concession was not utilised and so far no investments have been made any where else than in those mentioned in clause 1 of the above rule. We are of the opinion that the Corporation should obtain the necessary freedom to invest under clause 2.

When such freedom is obtained, the Corporation has a two-fold choice: either to invest in commercial securities which yield more profit but have an element of risk in them, or to invest in channels that promote the social and economic objectives of the scheme. The first method is not generally favoured and therefore, the Corporation should search for channels of investment that promote the second objective. We suggest that some portion of the funds under the E S I may be used for the promotion of house construction for the insured employees

on easy terms of mortgage loans. The need for a proper housing programme to secure better results under the E S I Scheme was emphasised by the Mudaliar Committee in its report in 1960. Another possibility which would be worth exploring is to use the funds under the scheme through appropriate grants or loans to the State Governments for the specific purpose of getting the required number of medical personnel trained exclusively for the use of the E S I Scheme. The shortage of medical personnel is the Achilles heel in the speedy implementation of the scheme. The E S I Corporation has, in our view, the necessary power under Sections 28, 58 and 59 of the Act[9] to take steps to meet the above shortage. The experience during the last 11 or 12 years, resulting in slow implementation and not so high standard of medical service, dictates the necessity to adopt a dynamic approach in securing the medical and paramedical personnel for effective and rapid extension under the scheme.

Better Medical Services

Further, the choice of investment by the Corporation must be exercised with considerable imagination so as to promote the "social objectives" of the scheme. These objectives may be furthered by (a) giving better satisfaction under the present benefits, (b) by enhancing the scale and period of the existing benefits (c) by the adoption of new measures permissible under law and (d) by the introduction of new benefits. A few illustrations are given below.

The area studies[10] and special review reports have brought to light many shortcomings in the administration of medical service and cash benefits. The Mudaliar Committee Report suggested many improvements in the provision of medical services under the Panel and Service systems which await action.[11] Their suggestion about the establishment of polyclinics and cottage type dispensaries is worth implementation. The employment of sick visitors under Regulation 101 still remains ineffective.[12] Though not connected with investment, the simplification of existing procedures add to a greater satisfaction of the present benefits. Some of the amendments suggested by the Corporation are helpful in this direction.[13] These suggestions may mean an effective reorganisation of the way the medical benefit is administered. The dual responsibility for medical benefit, under which the Corporation provides the bulk of the finances and the States provide the services is a statutory impediment for any effective reorganisation of medical benefit. This subject of elimination or minimisation of the impediments arising out of dual responsibility deserves a thorough review by a competent Committee and quick action by Parliament. These changes, both in the content of services and in procedures in administration may involve additional administrative costs which are worth incurring for providing better satisfaction under the present Scheme.

The scale and period of benefits as fixed under the Act no longer serve the initially conceived purpose owing to the spiral rise in prices. Extended sickness benefit rates have been revised periodically but the other benefits have not received the same attention. The amendments proposed by the Corporation contain some suggestions on these aspects. These deserve implementation. The relationship between wages, contributions and benefits do not in any way affect the validity of this suggestion because of the very conservative approach in the initial fixation of benefit rates.

The law permits the adoption of preventive measures against accidents, sickness etc. As a result of a decade of experience in the provision of medical benefit, considerable data on morbidity and sickness has been collected and classified by the Corporation. A more detailed analysis of this data may provide clues regarding the appropriate preventive measures for the improvement of the health and welfare of the insured as contemplated under sub section XI of section 28.[14] Without amending the Act it may also be possible to provide loans, on appropriate guarantees, for higher educational purposes for the children of the insured persons. Such measures as these cumulatively enhance satisfaction with the Scheme and help to promote a feeling of security in other areas than mere cash benefit.

Table: Particulars of Investments of Category 2 under the ESI Scheme

(Rs Lakhs

	Excess of Income over Expenditure (From the Revenue Ac)	(a) Investments in buildings, etc		(b) Investments Which are of an Administrative nature	(c) Investment (at cost) under Ac "General cash balances"	
		(i) Net Additions to Buildings, etc in the Year	(ii) Suspense Account (Advance to the State Govt for Construction of Hospitals, etc)		(i) Total Reserves as on March 31 of the Accounting Year	(ii) Net Addition during the Year to Column 6.

New Benefits

The Corporation has recommended the introduction of funeral benefit not exceeding Rs 100 by amending the Act. We suggest a benefit which is similar but slightly different. Our suggestion is as follows: To grant, on the death of an insured person, whatever are the reasons for the death, for the insured person's family a lump-sum of Rs 100 to tide over the immediate liabilities. This suggestion is the same as that of the Corporation's but not necessarily tagged on to funeral expenses. In addition, we also suggest the children of such deceased persons should be declared eligible for financial assistance for continuing their education on the same conditions as are available under the dependants benefit scheme on account of death due to employment injury. The condition as to the insured status of the deceased person applies in this as in other case. We suggest this educational benefit for two reasons. The investment on education is in the national interests. It is part of an overall national social policy. Secondly, the educational benefit to the dependent children only of workers whose death is caused by the technical phrase "employment injury" is unfair because it acts more as a penalty upon the children than a drain upon the resources of the Corporation. If funds permit, the amount of hundred rupees may be raised gradually so as to enable quick rehabilitation of the family to the circumstances after the death of the breadwinner.

All these would no doubt involve some additional expenditure. Fears might be expressed about using either the 'excess incomes' or the 'excess income reserve funds' for the following reasons: (1) The commitment to construct separate hospitals for providing better medical service as well as the liabilities arising out of the extension of medical care to the families of the insured are likely to create unforeseen financial burdens on the present reserves. (ii) The rate of growth in reserves may not be enough to meet these mounting liabilities.

These fears find expression in the Report of the Study Team in 1958 and also in the First and Second quinquinnial Valuation reports. These fears are genuine but they have to be considered in the whole context of the objectives of an overall social security scheme. The following points deserve consideration here:

(1) The full rate of contribution from the employers is yet to be realised.

(2) The motivation to opt voluntarily for the scheme on account of satisfaction derived from the old and new benefits, could not be calculated in financial terms but contributes to a smooth functioning of the scheme and its expansion.

(3) The rates of contribution initially fixed are high enough to ensure financial solvency when it is extended to the workers in all organised industries.

(4) The table 25 of the Second Quinquenial Report indicates the possibility of surpluses of income over expenditure on benefits when the full rates are collected.

The proposals made here for improvement in the existing benefits or the creation of new benefits, would, in our view, not be such as to lead to a financial breakdown of the Corporation. The details, however, have to be worked out.

The social insurance scheme is at present administered with extreme caution in financing and conservatism in implementation. It lacks the necessary imagination to attract the workers wholeheartedly into the scheme because of the absence of a heavy dose of "social" spirit in the whole scheme. The shift in emphasis from the present bias of calculated conservatism to liberal humanism need not necessarily spell disaster to the financial soundness of the scheme. We, therefore, suggest a revision in the accumulation policy of reserves and an imaginative expenditure of excess incomes upon additional social or fringe benefits. These suggestions are made with a view to render the scheme attractive to the workers, beneficial to the employers and ideologically satisfactory for the nation committed to the development of a social order based on concepts of social justice and welfare state.

14 Sub-section XI, of Section 28 says: The E S I Fund may be expended for "defraying expenditure within the limits prescribed, on measures for the improvement of the health and welfare of insured persons and for the rehabilitation of and re-employment of insured persons who have been disabled or injured".

FROM THE LONDON END

Renationalisation of Steel

THE publication of the Steel Nationalisation White Paper (which will be fiercely debated in Parliament) is a clear indication that despite its slender majority of four, the Labour Government has the courage and determination to push ahead with one of the most controversial items in the Labour manifesto. Ever since his election, Wilson has held that the Government had been a mandate to govern which they proposed to exercise. Accordingly, with great political courage, no important issue has been baulked despite the fact that it might have been electorally less dangerous to compromise on controversial issues. The determination to proceed with the Bill inspite of the hesitations within the Labour Party where two members — Woodrow Wyatt and Desmond Donnelly may register their discontent by either voting against the Government's Steel White Paper or abstaining in the debate and thereby reducing the already slender majority, are certainly creditable. Indeed, they give evidence of what Britain has been most in need of, particularly during the last years of the Conservative regime—a firm Government.

In contrast with the 1949 Steel Nationalisation Act, where the take over was to cover a large range of firms, the present White Paper proposes to restrict itself to the main firms in the industry. In 1949 all companies with production over a given tonnage of pig iron, ingot steel, or hot rolled steel, were nationalised, together with their subsidiaries, regardless of activity. Thus, the Act transferred nearly 250 companies to the Iron and Steel Corporation.

The present White Paper merely proposes to take over 14 large companies, i e those that produced more than 475,000 tons of crude steel in the twelve months from July 1963 to June 1964. The securities of these companies, or in some instances the securities of the relevant holding companies will be vested in a new National Steel Corporation. Remembering the speed with which the Tories denationalised steel when they were returned to power, the present Bill proposes a public steel corporation which would have its own single marketing organisation and powers equivalent to those of the Electricity Board, which in effect, would make it very difficult to unscramble the steel firms and return them to private ownership. Acordingly, no loopholes or ambiguities are being left in this field. The National Steel Corporation will have considerably wider and more unitary powers than those of the Iron and Steel Corporation set up by Strauss in 1950. At that time the commercial and managerial functions of the separate steel companies were left to men who were relying on the fact that they would be denationalised once the Tories took power: the Iron and Steel Corporation's main function was to act as a holding company. The National Steel Corporation, on the other hand, while permitting the individual companies in the first phase to retain their names and separate identities, will see to it that these will gradually be merged in the process of rationalisation which will make any future unscreambling very difficult indeed.

Control of "Commanding Heights"

The 14 companies that are to be taken over—Colvilles Ltd., Consett Iron Co Ltd., Dorman, Long and Co Ltd., English Steel Corporation Ltd., G K N Steel Co Ltd., John Summers and Sons Ltd, The Lancashire Steel Corporation Limited, The Park Gate Iron and Steel Co Ltd, South Durham Steel and Iron Co Ltd., Steel Company of Wales Ltd., Stewarts and Lloyds Ltd., United Steel Companies Ltd., and Richard Thomas and Baldwins Ltd., which is already nationalised, account for the lion's share of the industry, producing 90 per cent of British steel. They own or control all the 22 integrated iron and steel works in the United Kingdom, and 42 other iron and steel works; they control about 60 per cent of known reserves of iron ore in the U K and they employ about 70 per cent of the total manpower of the iron and steel industry. The private sector will consist of about 210 companies with an annual output valued at about £200 million, employing nearly 100,000 people. The private sector will still have an important role to play, particularly in specialised finishing operations on the borderline between steel and engineering industries. In introducing the White Paper at a press conference, the Minister Lee said: "We want to see a viable and thrusting private sector"

There is no doubt that in taking over so large and important an industry as steel, the Labour Party has now achieved control over the "commanding heights" of the economy, and the fact that the National Steel Corporation, through taking over, for example, Dorman Long, will engage itself in important engineering interests, makes this even more significant, particularly, as under the Bill it will be free to diversify its activities outside the field of steel with the consent of the Government.

The Government's case for nationalisation rests on the basic argument that the British steel industry is split into too many units to be efficient. Existing private steel firms are just not big enough to compete with overseas rivals. The new Government proposal will create a single unit of more than 30 million tons capacity a year—comparable in size to the mammoth concerns in the Continent and the U S.

Further support is given to the case for nationalisation as a considerable degree of public control and finance already exists, and it would, therefore, be only sensible to go all the way and take the industry into public ownership. This would allow a more positive rationalisation policy to be carried out: obsolescent units could be cut out and the most modern computer techniques for plant management and process control could be introduced. Other arguments include the inadequacy of the powers exercised by the Iron and Steel Board, the difficulties in financing expansion projects, and the absence of price competition.

One of the aspects of the White Paper which has caused the greatest surprise is the generous compensation terms that have been offered. The plan will cost a total of £660 million—£550 million worth of Government stock to be exchanged for the holdings of shareholders plus £110 million compensation for stock which has no market price. The Government has thus wrested the initiative from the Opposition who cannot now assert that the industry is being expropriated by ruthless socialists. Everyone has admitted that the basis chosen for compensating shareholders is very fair. By choosing a long period of market prices as the basis of valuation—either the 61 months from October 1959 to October 1964 which reflects all degrees of political and trading conditions, or the period from May to October 1964 whichever is the higher, the Government has been extremely generous.

Fierce Batle Ahead

The steel White Paper will be fiercely opposed in Parliament both by the Conservatives and by the Liberals. The main arguments which are being used are that in Britain's present position, nationalisation is completely irrelevant. No proof has been provided, according to Mr Macleod, that nationalisation is more efficient than private enterprise. The Liberal Party spokesman on steel said: "This is an old-fashioned takeover bid giving the blankest of blank cheques to the new National Steel Corporation and compensation that will cost more than £600 million which is the equivalent in capital provision of 200,000 new houses or 1,200 new schools at £500,000 each".

Some critics claim that Wilson has pushed ahead with the Steel Bill in order to placate the Left Wing elements in his Party who are incensed at the Government's attitude towards the fighting in Vietnam. Many anti-nationalisation critics hope and believe that by pushing through steel nationalisation, Mr Wilson will be in a position to forget about Clause 4 completely and that no more nationalisation will appear on the Party's programme.

Bitter battles lie ahead for Parliament and the Tories believe that with the steel White Paper and the Finance Bill they can really begin to act as an effective Opposition. No holds will be barred to try and defeat the Government. As for the Steel Bill itself, the changes contemplated cannot take effect until about mid-1966 at the earliest since vesting date cannot be until 36 weeks after royal assent. The Tories are gambling on the hope that even if there is no election this year, there is a strong chance that a General Election will be held before all the stages of steel nationalisation are complete.

AROUND BOMBAY MARKETS

Political Uncertainty Tells

Wednesday, Morning

IT was an altogether unexciting week for the stock market. The turnover was almost at its lowest and even the popular speculative counters drifted idly in a narrow range. Though the market managed to keep a little over the previous week's low registered on April 26, the general tone continued to be subdued. The corporate news was excellent but it brought little cheer to the market, oppressed all the time by political uncertainties. And tax concessions announced by Finance Minister Krishnamachari actually caused some disappointment. The extension of the higher development rebate at 25 per cent to 21 more industries, the five-year exemption from wealth tax on investments in equities of new companies with retrospective effect from March 31, 1964, the increase in the rate of deduction against life insurance from 50 to 60 per cent on the first Rs 5,000 paid in premiums annually, the extension of tax rebate on profits to more industries—all these concessions, welcome as they were, had no significant impact on the state of the capital market. Hopes that the Finance Minister might modify the provisions relating to the dividend tax and the capital gains tax on bonus shares have been frustrated. T T K's promise to simplify the corporate tax structure in the next Budget has failed to impress.

If the recent massive support by the Life Insurance Corporation and the almost uninterrupted flow of encouraging corporate news have failed to impart any strength to the stock market, it is mainly because the market is very much worried over the deteriorating political situation as a result of the mounting tension on the borders. Investors' confidence which had been at an extremely low ebb since long has been further undermined by the disturbing political developments. Prospects of a recovery in equity prices which had never appeared to be promising in view of the upward revision of the interest rate structure have receded further on account of the adverse political situation.

In an otherwise extremely uncertain situation, investors could, however, draw some comfort from the improved performance of the corporate sector. According to the *Economic Times* study based on the published accounts of 106 large and medium-sized units, industrial profits showed a substantial improvement in 1964-65 over the previous year's level. The increase in profits was more than the increase in owned funds and total employed funds indicating improved profitability. Dividend rates also showed some improvement though they were not commensurate with the rise in profits. The pre-tax profits of 106 companies recorded an increase of about 19 per cent from Rs 50.8 crores to Rs 60.4 crores. As tax provision absorbed a somewhat lower proportion of pre-tax profits in 1964-65, the net profits increased substantially from Rs 23.3 crores to Rs 29.7 crores. Distribution by way of equity dividends by these companies amounted to Rs 17.6 crores against Rs 15.9 crores in 1963-64 and retained profits rose sharply from Rs 6.6 crores to Rs 11.2 crores

OILSEEDS

Firm Tendency

OILSEED prices did not strike any new highs last week. But this

hardly indicated any change in the market's assessment of the near-term prospects for oil prices following the move for tightening of margin rules against bull speculators and the Government's permission to the vanaspati industry to use up to 50 per cent of soyabean oil in the manufacture of vegetable oil products. The market, it appears, merely chose to mark time before pushing its way further up since oilseed prices had been moving higher and higher, week after week for a long while. After registering a small setback earlier in the week, the market turned firm again near the week-end and made good nearly all the earlier losses. Groundnut oil ready which had receded from Rs 24 to Rs 23.40 (per 10 kg) recovered to Rs 24.20. After easing from Rs 20 to Rs 19.50, linseed oil ready was up again around Rs 20 at the week-end. Castor oil Commercial held steady around Rs 17.25 throughout the week.

Activity in futures was somewhat restricted as linseed June was quoted above the weekly prescribed limit most of the time. After receding from Rs 98.10 to Rs 96.50, linseed June firmed up to be quoted around Rs 99 on May 4. Castor June which had been marked down from Rs 82 to Rs 79.50 rallied to around Rs 80.80 (per 100 kg). The Bombay Oilseeds and Oils Exchange is still awaiting the Forward Markets Commission's approval of its proposals for tightening the margin rules against bulls. Could it be that the Commission has sensed that the margins are being tightened to protect the bearish interests of the governing body rather than to hold prices in check?

The rising trend in oilseed prices despite substantially improved supply is attributable, partly, to the general inflationary psychology in commodity markets and, partly, to the growing internal consumption of vegetable oils in the country of which no statistics are available. At a time when the Exchange itself is feeling uneasy over the price trends and has thought it necessary to tighten the margin rules, it seems rather odd that Shri Ramdas Kilachand, president of the Exchange, should be pleading for resumption of futures dealings in groundnut, groundnut oilcake and cottonseed. No less intriguing is the Forward Markets Commission's own attitude towards forward trading. How can one rationally explain why hedge trading is banned in mustard and rapeseed when it is permitted in castorseed and linseed?

COTTON

Dull But Steady

THROUGHOUT last week, the August hedge contract fluctuated between Rs 768.75 and Rs 766 per 3 quintals which depicted quite vividly not only the conditions prevailing in the futures market but also the situation obtaining in the spot market. Spot activity was restricted partly due to holidays. Spinner inquiry was virtually confined to 197/3, Digvijay and L 147, Spot prices were more or less steady around the previous week-end levels. It is quite normal for activity to shrink appreciably at the time of the year when the cotton season is 8 months through.

Thanks to the accumulation of fairly large stocks of both cloth and yarn with mills and continuing financial stringency which appears to have been aggravated by the partial withdrawal of unaccounted money, spot cotton prices have continued to remain a little below the ceilings for quite some time. Market sentiment recently seems to have been influenced by the upward revision of crop estimates. On the basis of the latest pressing figures, the 1964-65 cotton crop is now estimated around 59 lakhs instead of 56/57 lakh bales.

With the current season already 8 months through, interest has naturally shifted to the cotton policy for the new season which is due to be announced any time. The general feeling is that though the price caontrol over cotton is nothing but a farce, the Government is unlikely to abolish it but it would probably step up the ceilings which would minimise the need for enforcing price control. Since the Government has never really been able to administer price control over cotton, the control had better be abolished if only to expose the popular plea that controls have been hampering cotton production.

BUSINESS NOTES

Century Spinning

THERE was a reduction of five to eight per cent in prices of most of the controlled varieties of cloth following the imposition of statutory control from October 20 last year. Besides the off-take of rayon yarn was extremely poor almost throughout the year and consequently prices had to be lowered. Considering these circumstances the 1964 results of Century Spinning and Manufacturing Company look excellent indeed, more so because there was a continuous increase in the cost of production. What helped the company achieve impressive results were, first, improved efficiency and maintenance of the general level of production in all its units; and, second, the benefit of the tyre-cord plant's working throughout the year at full capacity. What is more important is that the company is now selling the product to all leading tyre manufacturers in the country, and the quality is highly appreciated by them. Earlier in the year, there was accumulation of stock but, with restricted imports, the company has been able to sell its production and stocks have come to normal.

The company has also reported encouraging progress in its programme of expansion and development of all its units. A new completely modernised weaving shed containing 240 Cimmco Sakamoto autolooms was started during 1964. The company holds permission to instal 14,578 spindles and 362 looms, and a scheme is being prepared for their installation. In the rayon unit, 18 spinning machines are under erection which are expected to go into production in about two months. The company has been assured of the necessary foreign exchange for import of machinery for expanding the production capacity of the rayon tyre-cord plant from five million to 15 million lbs a year. The scheme will be implemented in two stages: the first stage is expected to go into production after about a couple of years, and the second within about three years. The entire scheme is estimated to cost Rs 9 crores. The caustic soda plant started production in August last year, but the plant could not be worked at its full capacity due to shortage of power supply. The company is in touch with the authorities concerned, and it is expected that it would get its full requirements of power towards the middle of this year. Efforts are also being made by the management to secure import licence for mercury, which is one of the essential requirements for the manufacture of caustic soda and is in short supply.

The present working of the plant indicates that there will be no difficulty in achieving full rated production subject to the availability of power and mercury.

During the year to December 1964, the company's sales advanced about 15 per cent from Rs 22.25 crores to Rs 25.50 crores, and gross profit, too, rose in the same proportion from Rs 4.35 crores to Rs 5 crores. The advance has, however, been considerably reduced at the after-tax level, since both depreciation and taxation have syphoned off higher amounts: the former taking up Rs 208.38 lakhs (Rs 177.24 lakhs) and the latter Rs 137 lakhs (Rs 112 lakhs). Development rebate reserve is allocated a lower amount of Rs 35.17 lakhs (Rs 57.85 lakhs). After providing Rs 11.61 lakhs for preferential dividend, there remains a higher surplus of Rs 107.80 lakhs compared to Rs 77.37 lakhs a year ago. Of this, the total dividend, as stepped up by Rs 5 to Rs 35 a share, requires Rs 89.22 lakhs against Rs 76.47 lakhs, indicating that the cover for the increased dividend distribution has been strengthened.

Union Carbide

DURING the year to December 25, 1964, Union Carbide recorded an increase of 11 per cent in sales at Rs 15.95 crores and of 12 per cent in net profit before tax at Rs 3.01 crores. These improved results were achieved by the company due to the expanding demand for its plastic and chemical products as well as increased sales of batteries and zinc products. Sales by the consumer products division were again higher than for 1963, although some major adjustments in product mix were necessary to suit market requirements. The demand for batteries for transistor radios increased substantially at the expense of those for valve-type sets. A further rise was recorded in the sales of organic chemicals and polyethylene resins during the year. Defence and agricultural application were among the vital uses of the company's polyethylene film. Zinc products sales to customers increased slightly, although not to the full extent of production capabilities. The company's sales of zinc plate were held down, because substantial imports of photoengraving plate were permitted in 1964. Curtailment of the import of zinc plate is, however, likely in the future. Continuing emphasis upon export sales resulted in a further increase in this business during 1964, when the company extended activities into several new markets.

During 1964, total capital expenditure amounted to Rs 3.06 crores as compared with Rs 27.80 lakhs in the previous year. A major share of the 1964 expenditure was incurred in expanding chemicals and plastic capacities at Trombay, plus the installation of naphtha cracking facilities. The latter will reduce dependence upon industrial alcohol as a raw material. The construction of a cinema arc carbon and midget electrode plant was virtually completed during 1964.

Paint Industry

ALTHOUGH the paint industry maintained the upward trend of production in 1964, this was done in spite of significant difficulties which it had to face continuously for many previous years. Among these may be mentioned the severe shortage of imported raw materials which impedes a healthy development pattern, and often deprives other industries of the surface coatings they need to proceed with their own plans. In spite of what has been done so far to make available indigenous products, we have not yet reached the point where all currently imported materials are available in India. The reasons are in many cases economic in that the industry's offtake of certain materials, which to them are essential, is so small that there is not yet scope for establishing an indigenous industry for their manufacture or processing.

One unfortunate result of the lack of adequate actual users licences to paint manufacturers is the necessity forced upon them to purchase such materials in the open market where prices that were paid previously for those enjoyed by normal import. Also, the prices of many of the raw materials now manufactured in the country are very much higher than the prices that were paid previously for their imported counterparts. As a result, the cost structure of the industry has been affected adversely and, coupled with the high incidence of excise on paint products, prices have had to rise.

R A Godwin, President of the Indian Paint Association, in his speech at the fourth annual general meeting of the Association held some time ago, stated that one of the most serious repercussions of the increase in price structure is the effect this has upon the ability of the industry to export its goods to those countries where price increases have been much lower. He warned that unless some positive and immediate steps were taken by the Government to arrest the raw material shortage, the high indigenous price and the heavy incidence of not only direct excise on paints but also excise on intermediates, it would be increasingly difficult to fulfil the export targets required of the industry.

Hukamchand Mills

THE half-a-century old Hukamchand Mills has been pursuing a renovation programme for some time past. As part of this programme, the company installed and commissioned additional 4,872 spindles during 1964 In the current year, 2,088 spindles were erected, and 5,568 more spindles are under erection. With the installation of all these spindles, the total installed capacity of the mill will be nearly 56,000 spindles. The renovation scheme has already stood the company in good stead in offsetting the pressure on margins the textile industry as a whole had to experience during 1964.

The company's financial results for the year to December 1964 show that though sales and processing charges brought in a lower amount of Rs 3.63 crores compared to Rs 3.83 crores a year ago, the gross profit was sizably higher at Rs 40.17 lakhs against Rs 28.55 lakhs. The advance has, however, been more than negatived at the net-profit level, partly because of higher provision of Rs 19 lakhs (Rs 15.44 lakhs) for depreciation and Rs 8.55 lakhs (nil) for the tax charge. Development rebate claims a lower amount of Rs 3.83 lakhs (Rs 5.07 lakhs), with the result that the equity profit of Rs 8.87 lakhs is a little more than last year's Rs 8.44 lakhs. Of this, the dividend raised by 2.5 per cent to 12.5 per cent demands Rs 7.56 lakhs (Rs 6.05 lakhs). The surplus sum of Rs 6.68 lakhs is carried forward, after bringing in Rs 5.36 lakhs from the previous year's account.

As a measure to meet the power shortage, the company has staggered the weekly holidays to workers with effect from February 21, 1965. The power shortage, which is expected to continue upto July-August this year, is likely to have an adverse effect on production and working results. The company is completing its 50th year of existence in the middle of May this year. The management has decided to celebrate the golden jubilee in a fitting manner.

WIMCO

THE demand for matches is on the rise, and the mechanised sector of the match industry has made representations to the government to allow it to expand its manufacturing capacity. But there has been no response from the authorities so far, according to the directors of Western India Match Company. They add that during the wet season last year there was a severe shortage of matches which the cottage industry could not make good despite the incentive of lower excise duties enjoyed by it. Wimco's output is now running at its peak, but its profits have contracted for the second year in succession, because it cannot increase its output while costs of raw materials (particularly timber) and labour charges have continued to rise.

The company's 1964 results show that whereas sales were only a shade lower at Rs 19.52 crores than last year's Rs 19.75 crores, gross profits declined to Rs 1.14 crores from Rs 1.41 crores. Profit margins have thus shrunk from 7.14 per cent to 5.86 per cent. The directors have provided Rs 23.72 lakhs (Rs 22.51 lakhs) for depreciation, Rs 50.30 lakhs (Rs 65.75 lakhs) for taxation and Rs 1.53 lakhs (Rs 1.99 lakhs) for development rebate. For purposes of paying the unchanged dividend of 16 per cent, a sum of Rs 5.04 lakhs is to be transferred back from super profits tax reserve.

For more than a year the salt project has been in operation on a pilot basis, and during 1964 considerable quantities of salt were formed in the pans. But the major portion of this harvest was washed away by unexpected rains. The company has added the manufacture of sodium chlorate and pottassium perchlorate to its existing potassium chlorate production. The paper mill, which continues to work on imported pulp, suffered some stoppages in 1965 because of inadequate and untimely import licensing. The company has now made firm arrangements with a pulp manufacturing concern to be established in Gujarat for the supply of most of its requirements indigenously in three or four years' time.

Shreeniwas Cotton

CONSIDERING the various difficulties the cotton textile industry had to contend with during 1964, Shreeniwas Cotton Mills' results are indeed good. Though net sales declined perceptibly from Rs 5.14 crores to Rs 4.73 crores, gross profits increased from Rs 82 lakhs to a new high mark of Rs 85.44 lakhs reflecting a two-point rise in gross margins in relation to sales. The provision for depreciation has taken away Rs 41.12 lakhs (Rs 26.72 lakhs), that for tax Rs 18 lakhs (Rs 24.34 lakhs) and development rebate reserve Rs 5.50 lakhs (same). But last year Rs 6.23 lakhs were required for earlier years' bonus for which no provision is necessary now. After providing Rs 0.25 lakh (same) for preferential dividend, the disposable profit is moderately higher at Rs 20.57 lakhs compared to Rs 18.96 lakhs previously. Of this, the dividend as raised by one per cent to 17 per cent requires Rs 17 lakhs (Rs 16 lakhs).

During the year, the company continued its expansion and modernisation programme, and incurred an expenditure of Rs 37 lakhs on this account. Among the items added were 40 additional automatic looms and a compressing shrinking machine. Besides, a screen printing machine and two sets of automatic winding and warping machines have been ordered. The benefits of modernisation and expansion apart, the current year holds promise of good results also because the company is "favourably covered" for its requirements of long-staple cotton which has been in scarce supply and its prices have recorded sizable rises. Shree Madhusudan Mills and Shree Gopal Industries, the two subsidiaries of the company, are also faring well and their expansion programmes are progressing as scheduled.

Central Bank

THE comprehensive credit control measures set in motion during the past few months have severely restricted the capacity of banks to borrow from the Reserve Bank in order to meet the legitimate credit requirements of their customers, according to Sir Homi Mody, Chairman of the Central Bank of India. The net liquidity formula, he says, is onerous in many respects. For determining net liquidity, all amounts borrowed in whatever shape or form, and whether from Reserve Bank or from I D B, are required to be deducted from the borrowing bank's eligible assets. Thus, even the amounts obtained by a scheduled bank by way of re-finance from the Reserve Bank or I D B for discharging those very obligations which the government had been repeatedly exhorting commercial banks to undertake, such as granting of medium-term loans to industry for expansion or rehabilitation, the financing of small-scale industries and the extension of export credits, come within the mischief of the formula. Secondly, the penal rate of interest, which becomes operative the moment a bank's net liquidity ratio drops below the prescribed minimum, is applicable not to the residual excess but to the totality of the bank's borrowings from the Reserve Bank. Another provision laid down is that even when the decline in the net liquidity position is just a fraction of one per cent, the borrowing bank is compelled to pay the penal interest, calculated at the full rate of ½ per cent over the Bank Rate for every drop of one per cent or fraction thereof. Finally, the Reserve Bank has recently further raised the net liquidity ratio from 28 per cent to 30 per cent.

Referring to the slackening in the pace of growth of bank deposits in the past few months, Sir Homi says that owing to an all-round increase in inventory costs, demand for bank credit for genuine productive purposes had become more keen, with the result that there is an unprecedented tightness in the money market, as evidenced by the fact that inter-bank call money rate has touched an all-time record of 8½ per cent.

Jaya Shree Textiles

THE combined effect of increased wages, higher interest charges and enhanced prices of raw materials, stores etc, is reflected in the financial results of Jaya Shree Textiles for the year 1964. Although during the year sales rose by Rs 65 lakhs to Rs 3.62 crores, gross profits could advance by only Rs 7.36 lakhs to Rs 60.81 lakhs. Depreciation charge has taken away more at Rs 13.79 lakhs (9.49 lakhs) but the tax liability is substantially lower at Rs 10.90 lakhs (20 lakhs), after taking credit of Rs 3.50 lakhs (0.75 lakh) being excess provision of previous years, and the directors are left with a disposable surplus of Rs 32.62 lakhs (23,22 lakhs). Out of this, development rebate reserve gets Rs 6.60 lakhs (2.69 lakhs) and general reserve Rs 16 lakhs (13.25 lakhs). Equity dividend raised by 25 P to Rs 1.25 per share requires Rs 9.22 lakhs (7.38 lakhs) and preference dividend Rs 0.12 lakh (nil). A part of the dividend is expected to be exempt from tax.

The flax unit is proposed to be modernised. In the weaving section 16 new cotton looms have been installed. The construction of buildings for the insulator project is making satisfactory progress, but the scheme will not be implemented before early 1966.

FROM THE CHAIR

Mahindra & Mahindra Limited

Speech of the Chairman, Shri Keshub Mahindra

THE following is the Speech delivered by the Chairman, Mr Keshub Mahindra, at the 19th Annual General Meeting of the Shareholders of Mahindra & Mahindra Ltd, held in Bombay on 30th April, 1965.

LADIES AND GENTLEMEN,

This is the first time we are meeting after the sad and untimely death of our late beloved Prime Minister. Pandit Jawaharlal Nehru's loss came as a personal shock to us all and I am afraid no words of mine could possibly do justice to his greatness. I shall, therefore, request you to join me in standing in silence to honour his memory.

Higher Turnover

It is my privilege to welcome you to the 19th Annual General Meeting of the Company. The balance sheet incorporating the Report of your Directors has been in your hands for some time. As compared to the year before, there was an increase in the turnover by approximately 30%. The effect of this increase is reflected in the profit for the year. In spite of the higher provision for depreciation, development rebate and an appreciable increase in the provision for taxation, the total available for disposal was considerably greater than that of last year. These results have enabled your Directors to recommend a little higher dividend and enabled them to plough back a larger amount by way of general reserve.

During the year under review, the Management of your Company has been able to improve the extent of control over the operations by utilising more sophisticated and scientific techniques. This process is really evolutionary. As an organisation gathers more experience it is better able to know which areas require closer control. There is a genuine awareness at all levels of our Management of the importance and need for system and methods, and the role these play as indicators of our efficiency. The never ending problem of rising costs has been to some extent off-set by greater efficiency of operations but it should be obvious, that unless basic costs of materials and wages are kept under control, it will be extremely difficult to maintain this delicate balance.

In pursuance of our growth policy, the Management of your Company has been engaged in exploring ways to bring about rational expansion. In December of last year, a public issue was made by the International Tractor Co of India Ltd. At the time of this public issue, a private offer was made to the shareholders and employees of your Company. Although the response from the public was not unsatisfactory, the applications received from the shareholders and employees were discouraging. It is still however the intention of your Directors to continue following this policy — as long as circumstances and the Government permit it.

While attempting to combine consolidation of existing operations with future expansion, it sometimes happens that particular endeavours fall short of expectations. One such example is the Indian National Diesel Engine Co Ltd. Your Directors have explained at some length the reasons why this Company is showing considerable losses. I am, however, happy to report that the results for the first six months of the current year show a satisfactory improvement and in fact, we have every reason to expect that this Company will make a profit for the first time. Additional steps are being taken to increase the production of air-cooled engines which have found ready acceptance in the market.

Union Budget

It is usually expected that some observations should be made by me on the provisions of the recent Union Budget and the effect that it might have on our future operations. I have no quarrel with the Government in their attempt to mobilise the resources they require — but the provision in respect of reducing the development rebate to 15% in April 1967 will affect us, particularly, as we are on the threshold of large expenditure on capital account. It is to be hoped that the Government will accept the plea of the automobile industry for inclusion in the list of basic industries specified eligible for tax concessions. This will be of considerable benefit to your Company.

The fact of planning in our national life has assumed a certain significance. The debate is no longer on the wisdom of planning; there is wide acceptance that the broad rationale of the country's development programme makes good sense. Rather, the issue is sometimes joined on the programming technique, and the matching of needs and resources.

From time to time, I have looked hard at our national accounting as revealed in the Union Budgets every year. It strikes me that both in the matter of revenue and expenditure, certain rigidities have crept in, thereby causing inelasticity in certain resource areas.

The expenditure on Defence and Civil Administration is roughly 11-12% of our Gross National Product. While one could question the validity of a rigid pattern on civil expenditure, no one can question that the expenditure on defence must not only remain, but may even go higher.

On the investment front, a minimum of 15% of our Gross National Product is necessary, if we are to ensure an annual growth rate of 5% — (Assuming a 3 : 1 capital/output ratio) which is the very soul of our Plan! Altogether about 25-27% are required by the State, if it is to meet the cost of current administration, satisfy defence requirements, and pursue our growth targets.

The latest Union Budget shows that approximately 24% of our Gross National Product is being made available to the Government. In spite of these resources, experience over the last three years shows, that we have not achieved a 5% rate of growth. I have heard it said that our assumptions regarding the efficiency of our investments are faulty. If this is so, then the implication is that the volume of investments will have to be increased in order to obtain the above growth, But as I have observed earlier, most of the areas from where further resources can be mobilised will remain fairly inelastic for many years to come, thereby making it difficult to increase our investments. To me, the answer to our present problems lies in productivity, with the objective of immediate improvement in the efficiency of our capital investments.

Productivity is not merely increasing production, it is an attitude of mind and a way of life. In the context of our difficult resource position, the narrower definition of productivity assumes great significance in our industrial operations. While the mathematical definition of productivity would be the ratio of output to input, productivity in industry means obtaining maximum results from available resources by reduction or elimination of wastage in all forms. Higher productivity would mean usage of less resources, like money, material, machinery, man-power and management for a given production or using the same resources for a greater production. It implies the fullest exploitation of all available resources efficiently and economically.

Scientific Management

Production is never an individual effort. It is the combined effort of management and workers; in our society, the Government has also a most important role to play.

The importance of technology, and the need for managers and workers to be professionally trained needs to be emphasised over and over again. Budgetary techniques used for controls, analysis and forward planning are basic essentials in the running of an industrial enterprise. Scientific methods of detection, analysis and feed-back information of a product in process, commends the use of the Total Quality Control approach to operations. The use of control charts based on statistical probabilities in process control helps to navigate production and forecast sufficiently ahead, possible deviations and defects. Industrial engineering analyzes, measures and improves the methods of performing tasks and is a continuous process of study and evaluation of results. Through its work-study techniques, it gets to the root of the problem of productivity. Standardisation and variety reduction, bring about larger production runs, save time on machine settings and improve plant utilisation. An efficient plant maintenance, built-in training programmes for workers, use of Operational Research and PERT are all tools available to Management for obtaining higher productivity.

One of the major factors which contributes to higher productivity is the attitude of the workers. An organised wage structure, grievance procedure with easy communication methods, joint consultations, welfare facilities, training, selections and opportunities for promotions, job evaluations and specifications etc all help to give stability to labour — which is of prime importance in our country. Perhaps of equal value to Labour Productivity is the imparting of a feeling of fair play and justice.

An increase in Labour Productivity does not mean "harder work", at the best it means "more effective work". Work is a group activity and a healthy co-existence between workers, supervisors and all levels of management is essential if one is to aim at higher productivity.

In our planned economy where the share of the State in the capital investment is on the increase, there is the need to recognise that resources can only be put to best use by trained men. Ownership of capital does not necessarily imply that it also possesses management skills. While the recent announcement of the setting up of the Planning Council is to be welcomed, I venture to say that greater emphasis should be placed on implementation. It is my plea that while planning of our economy is very much the duty of the Government, industrial enterprises should be entrusted to men who have the knowledge and experience to operate them — the professional managers and technicians.

I crave your indulgence for embarking on a subject which might appear to have no relationship with the affairs of your Company. But this is not so. Your Management believes in the philosophy of higher productivity and is constantly receptive to new ideas and techniques.

New Companies

Your Directors have generally reported to you the expansion plans before them. The largest expansion envisaged is in the automobile division, increasing capacity from the present level of 10,000 units to 25,000 vehicles per annum. In addition there will be diversification in the form of new product lines. Large funds are necessary for this expansion. Our application for a loan of Rs 5 crores has been filed with the Government for transmission to A I D. This will cover the foreign exchange requirements for the expansion programme. Your Directors are presently studying the estimates of rupee finances required. As soon as these are finalised they will be made public.

In addition to expansions of existing Companies, we have concluded negotiations for which three new Companies are being formed. The first one is in association with Vickers-Sperry Rand Incorporated, U S A for the manufacture of Hydraulic Control Gears with a wide application, raising from machine tools to aircraft. The second one is in collaboration with Van Wijk & Visser of Holland for the production of Current Limiters, Automatic and Voltage Regulators, Manually Operated Circuit Breakers and Starters. Arrangements have also been concluded with Natvar Corporation of U S A for the manufacture of High Temperature Synthetic Flexible Electrical Insulations. It is anticipated that an offer will be made to the public for subscription in these three new Companies, sometime at the end of this year or early next year.

In conclusion, I am sure you would like me to thank all the employees of your Company for their loyalty and devotion to work.

Note: This does not purport to be the record of the proceedings of the 19th Annual General Meeting.

The 5-year Interest-free Prize Bonds you bought in 1960 matured on April 1, 1965.

How do you propose to use them? You would certainly not like to fritter away your savings !

A TIP FOR YOU...!

Better, you invest them in 12-Year National Defence Certificates or 10-Year Defence Deposit Certificates or Post Office Savings Bank and earn handsome tax-free interest.

You can invest these Bonds in National Defence Certificates and Defence Deposit Certificates any time up to 31st December, 1965 and get interest with retrospective effect from April 1, 1965.

National Defence Certificates so purchased up to 30th Sept., 1965 can be converted into the new National Savings Certificates (First Issue) up to 31st December, 1965.

INVEST YOUR PRIZE BONDS IN SAVINGS SECURITIES

The Season That Was

THE 1964-65 busy season came to a close (in the Reserve Bank's reckoning) on April 30, with a total credit expansion of Rs 413 crores, which is a record. This is somewhat larger in absolute terms than the previous record of Rs 377 crores set last year, though in terms of the rate of increase this season was perhaps no busier than the last. What is surprising at first sight, however, is that the credit expansion in the season just ended should have taken place against the background of a credit policy which had a marked restrictionist bias. Does it mean that the credit squeeze was phoney or that, though intended to be effective, it failed?

The stringency in the inter-bank call market should set at rest any doubt about the reality of the squeeze. The market is acutely aware of the difficulty of raising funds and complaints have poured in from business interests of the dearth of adequate finance. Further, the absolute figure of credit expansion cannot be taken to indicate that the Reserve Bank's policy has failed; the monetary authorities had all along emphasised that it was their aim to raise the cost of credit and quicken its turnover to promote more efficient use of finance rather than to restrict availability of credit to the point of hurting genuine seasonal needs. It is known, for instance, that sugar production this season bids fair to be perhaps the highest on record and the credit needs of a highly seasonal industry like this tend to be concentrated in a short period. Less defensible is the locking up of bank finance in stocks of cotton textiles which are becoming embarrassingly large; if credit curbs induce their unloading, the effect cannot be regarded as other than salutary. There are also the needs for food procurement which the banking system has been asked to finance.

If these special factors are taken into account, on top of the substantially higher production both on the farms and in the factories and the higher value of inventories due to price increases, the seemingly large seasonal expansion of credit gets into clearer focus. Indeed, one must be thankful that the authorities did not panic into a further dose of restriction; the February measures were tough enough and a further tightening of the monetary screw to please the IMF and its like would have done more harm than good. As was argued on an earlier occasion in these columns, to starve the genuine monetary requirements of this year is no answer to the excessive monetary expansion of last year. This is the pitfall of a purist monetarist approach; the Reserve Bank has not fallen into it.

It is significant in this context that credit expansion this season has been financed to a greater degree by borrowing from the Reserve Bank. In fact, many accusing fingers have been pointed at the level of the Reserve Bank's advances to banks. These advances, it is true, were generally much higher than last year but it is equally significant that the variations in the amounts were quite sizable over the period, indicating the quickening of turnover. The penal rates paid by many banks in combination with the ceiling on advance rates could hardly be expected to have had any different result.

Not only has the total figure of Central Bank credit been assailed but the large share of the State Bank in this has been invested by critics with the sinister implication that the credit policy has been worked to the advantage of a public sector institution. The State Bank's figures are published weekly; those of the other banks are not, but it would be interesting to know how the other banks fared in this respect. The net liquidity ratio principle favours banks with conservative investment portfolios and has no relevance to whether a bank is in the private or public sector. That this is a more scientific formula is apparently now recognised; then why this pother? Or is any stick good enough to beat the public sector with?

The busy season has ended but bankers' worries do not seem to have. It is reported that the Governor of the Reserve Bank has advised banks not to utilise the funds accruing to them from credit contraction and increase

in deposits to keep up the high credit levels but instead to put them in Special Treasury Bills. It is not known what the Special Treasury Bills are or at what rates they are to be issued. Various guesses have been made but the authorities have been in no hurry to show their hand, though, if reports are to be believed, the Governor seems to have coupled his 'advice' with an 'or else' threat!

It is not clear what the intentions of the authorities are. Immediately the objective may be to dampen pressures arising out of credit extension to the private sector, but investment in Treasury Bills will add to bank credit to the public sector (unless one assumes that this will replace Reserve Bank credit to Government in the same period). Banks have apparently been advised that this will stand them in good stead during the next busy season, but will it matter very much even otherwise, for under the present system if banks continue to be overextended, they will have to pay penal rates much earlier in the busy season next year than they had to this year? Whatever the next busy season may have in store for them, bankers are promised a tight slack season.

New Turn in Kashmir

SHEIKH ABDULLAH's internment in Ooty on return from his foreign travels caused little surprise in New Delhi, according to newspaper reports. It is not likely to have come as a total surprise to Abdullah himself either. The angry, almost frenzied, reaction of the Government and Parliament to his alleged activities when abroad must have been known to him and should have warned him that he could hardly expect red carpet treatment when he landed at Palam on May 8. Indeed he must have had a good idea of what was in store for him. The fact that in spite of this he chose to come back within the time-limit set by the Government of India is significant. Some of the wilder charges which were levelled against him when the storm broke in Parliament over his meeting with Chou en-lai (one member of the Lok Sabha actually claimed to have intelligence of a diabolic scheme of Sheikh's to set up an emigre government in Sinkiang!) were really baseless, it is now clear.

The Sheikh did meet the leaders of the countries he visited. In Algiers he also met Chou en-lai though, according to him, only to discuss the implications of Pakistan's border agreement with China which covers parts of Kashmir. He has claimed that in his meetings with leaders and at his press conferences he said nothing that he had not said earlier in this country. It is unnecessary to disbelieve this claim, for the simple reason that Abdullah has stated his position on Kashmir—rejecting the State's accession to India and asserting the right of self-determination of the people of the State—unequivocally enough on numerous occasions since the right of free speech was restored to him last year. It is unlikely that he needed to add anything to this in his talks abroad. Naturally he sought to enlist sympathy and support for his case, but what else did the Government of India expect him to do when it gave him permission to go abroad?

The official press note issued in New Delhi on Saturday explaining the Sheikh's internment tries to maintain the fiction that the Government's permission was only for a pilgrimage though the passport on which the Sheikh went abroad had been endorsed for Saudi Arabia, Iran, Iraq, Jordan, the UAR, Aden, Lebanon, Afghanistan, Algeria and all countries of Europe including the U K, Turkey and the USSR and excluding only Portugal. It is clear enough, therefore, that the question of the Sheikh having abused the purpose of his journey abroad does not arise since this purpose was evidently never stated as being only the pilgrimage to Mecca.

But the merits of the grounds for Abdullah's internment are of little consequence since the country seems prepared to accept the Government's action without question. Indeed the only criticism one heard in Parliament was that he had been merely interned, and that too in some comfort, and not put behind bars straightaway. Given the mood of Parliament, the Home Minister had no difficulty in brushing aside the stray voices of protest like that of Jaya Prakash Narayan who felt that nothing that had so far been said by the Government against Sheikh Abdullah's activities abroad justified the action against him and pleaded that an opportunity should be given to the Sheikh to answer the charges against him. And as for non-observance of democratic proprieties in connection with the internment, it was too much to expect Parliament to protest. Apart from the fact that Parliament is, if anything, more convinced than the Government of the Sheikh's crimes, with about a thousand left communists and scores of others in prison indefinitely without trial, this country has got rather used to such things. Only in Kashmir have there been outbursts of protest but these have been subdued for the time being with sundry loss of life and another hundred or so arrests under the DIR.

Kashmir politics have thus moved a full circle since April last year when Abdullah was released after ten years in prison. His release made sense only on one of two assumptions—either the Government was confident of check-mating Abdullah on the political plane or, alternatively, Abdullah was henceforth to be closely associated with the Government's Kashmir policy. Such association, it was clear enough, would have had to be largely on his terms and, therefore, with a policy different in essentials from the one pursued during the years of his imprisonment. In the first heady months after his release which saw the rapprochement between him and Pandit Nehru and culminated in his visit to Pakistan with Nehru's blessings in search of Indo-Pak unity, there were hopes that an important role for Abdullah in Kashmir was intended. But these hopes died with Pandit Nehru and the Sheikh's estrangement with the Shastri Government grew and the emphasis of official policy shifted to meeting the Sheikh's challenge politically..

In this there has been conspicuously little success, and not surprisingly. A strong movement opposed to the accession of Kashmir to India has emerged. Though formally Sheikh Abdullah is associated with only a part of this movement, the Plebiscite Front, he remains its tallest leader. In these circumstances the formal administrative measures aimed at closer integration of the State with India by extension of Articles 356 and 357 of the Constitution and further erosion of the provisions of Article 370 which confers a special status on the State have had the effect of strengthening rather than weakening the anti-accession movement.

Thus neither of the two bases of official policy which dictated Sheikh Abdullah's release last year has endured. No rapprochement between him and the Government of India has been possible; at the same time, the opposition movement in Kashmir inspired by him has gained in strength. These facts rather than his alleged misdemeanours while abroad are at the bottom of the new turn in the Government of India's Kashmir policy marked by Abdullah's internment far away from Kashmir, the arrest of a large number of his political sympathisers and the banning of that section of the press in the State which has supported him. Unmistakably, Kashmir is moving back to the days of the Bakshi Government which took over after Sheikh Abdullah's fall from grace and ruled the State for a decade—how and with what consequences it is well known.

Weekly Notes

More Indo-Soviet 'Traid'

ONE of the more fruitful areas of Indo-Soviet co-operation in recent years has been economic relations and the current negotiations in Moscow between Asoka Mehta's team and its Soviet counterpart on Soviet assistance for the Fourth Plan will be watched with much interest. It is perhaps more than a coincidence that these discussions are proceeding against the background of a broader review of Indo-Soviet relations by Lal Bahadur Shastri and the Russian leadership.

Soviet assistance to India in the recent past has primarily been in the sphere of basic industry, mining and power; some 'maintenance' help in the form of oil imports has also been made available. The assistance has come in crucial sectors which are important for the realisation of the objective of a self-reliant economy. It is to be expected that Soviet assistance for the Fourth Plan will also be largely confined to the basic and heavy sectors. Apart from Bokaro for which Soviet assistance has been committed in principle, the Indian request is in respect of over 40 projects totalling Rs 400 crores and for non-project assistance of Rs 200 crores. This last item must be regarded as the new feature in the Indian request to the USSR though it fits in with our general preference for non-project aid in our dealings with the Aid-India Consortium.

One of the features that have marked Soviet aid in the past is the slow rate of disbursement, largely because of its project-tied character and technical limitations delaying the completion of projects, apart from bureaucratic delays at both ends. It is to be hoped that in the discussions in Moscow means would be explored for reducing these dalays.

Soviet assistance to India is fruitful not only in terms of its immediate contribution to our development but in the manner in which provision is made for the debt liability to be extinguished. Soviet aid has been generally In the form of 12-year loans—a relatively short period as development aid goes—but the fact that an export expansion is built into the agreement must be regarded as easing the debt service burden. Thus Indian exports to the Soviet Union have risen substantially in the past few years and a wide range of consumer and light engineering goods have been reaching the Russian market at a time when the market itself is being opened up to these goods. Indian tea and jute exports to the USSR are largely additional to what was exported to the traditional markets and the numerous non-traditional exports to the USSR have contributed to a healthy broadening of the commodity composition of our exports.

It is here that the existence of bilateral payments agreements have proved advantageous, irrespective of the canonical objections which the IMF theologians may have to these arrangements. The Western countries who dominate the IMF are quick to condemn these arrangements but do not realise that their own "aid" which is often project-tied and now invariably country-tied also breaches the multilateral principle. It is only when developing countries wish to tie trade expansion to aid receipts that cries are raised in holy horror against denting the multilateral principle. India's export expansion to the Soviet Union is a healthy example of how aid can be both self-respecting and economically meaningful to both the giver and the taker. It is, to use the currently fashionable phrase, a fine example of "traid".

Blackmarket in College Seats

AS the month of May progresses and the results of various University examinations are announced, there will start a frantic struggle on the part of young men and women for admission to educational institutions. The struggle will be the severest for those who aim to be doctors and engineers, despite the substantial increase in the number of medical and engineering colleges (and of annual admissions to each) during the past decade and a half.

The demand for seats in medical and engineering colleges far outstrips the supply and, inevitably, these seats command a premium. The well-to-do are only too willing to pay this premium in the form of capitation fees to make good the deficiency of their wards in terms of academic merit. Speaking in the Rajya Sabha in September 1964 the Union Education Minister had condemned the levy of capitation fees in "certain technical institutions" as "the most scandalous blackmarketing". But the institutions depending on capitation fees continue to thrive, particularly in the field of medical education.

At the last session of the Maharashtra Assembly, the State Health Minister reported a proposal from the Chhatrapati Shivaji Co-operative Education Society of Kolhapur to start a medical college with 100 seats to be financed by a capitation fee of Rs 7,000 per student. Similarly, a medical college is being started in June 1965 in Davanagere, a town of about 78,000 in the Chitradurga district of Mysore, which will charge a capitation fee of Rs 3,000 for local students and Rs 6,000 for others. Last year a medical college in Sholapur financed itself by charging capitation fees at the rate of Rs 8,000 per student—and there was actually a rush for admissions!

Ingenious promoters of institutions levying capitation fees take full advantage of the situation. This is illustrated by a medical college in the South Kanara district of Mysore, associated with the name of Kasturba Gandhi, which charges a capitation fee of Rs 3,000 and annual tuition and special fees of Rs 1,250 and Rs 270, respectively. (The tuition fees in medical colleges in Bombay city are around Rs 350 per year, with special fees amounting to between 15 and 100 rupees). What is more interesting, the payment of the capitation fee in 1964 makes possible reservation *(sic !)* of a seat only for the year 1972; and a waiting list fee of Rs 100 per year, adding up to Rs 800, is collected with the application. But if an

applicant, unable to secure admission in 1964 and placed in the waiting list, subsequently cancels his reservation for a 1972 seat, he forfeits nearly Rs 1,100 from a total of Rs 5,050 paid with the application. Of course, an offer, made in good time, of a 'donation' of Rs 10 or 11 thousands is reported to ensure immediate admission to the college.

The prospectus of this medical college in South Kanara reports, with due quotations, the blessings of the ex-Chairman of the UGC and of a former Union Health Minister. Further, while the present Education Minister last year expressed his determination not to let "even one anna of Government revenue" go to institutions levying capitation fees, the Union Government has in fact reserved 15 seats in the college by making three *ad hoc* grants of Rs 5 lakhs each. Of course, medical colleges are under the jurisdiction of the Health Ministry, but it is surprising to say the least that grants to such institutions go unnoticed by the Members of Parliament or the Public Accounts Committee.

Thanks probably to the initiative of the Education Minister, the Central Advisory Board of Education recommended last year that in future all medical and technical colleges should be started only by the Government. Only two States—interestingly enough, Mysore and Maharashtra—had some reservations about this. But there have been vociferous protests from the vested interests—including the All-India Conference of Headmasters of Schools early this year. One hopes that the Union Education Minister will stick to his stand and ensure that the principle of equality of opportunity in education is not made a mockery of by permitting educational institutions to discriminate in favour of those born with silver spoons in their mouths. Energetic action in this direction should not be held up because of the specious arguments of vested interests that capitation fees are a way of making costly medical or technical education "self-financing", or that the self-relying private colleges lighten the burden on the public exchequer. After all, the quality of education in colleges depending on capitation fees is, generally speaking, sub-standard; and some at least of these colleges will need to be taken over by the Government after a few years. The levy of capitation fees should be made a criminal offence and Universities should be directed to withhold or cancel recognition to institutions charging such fees.

Uninformed Criticism of IFC

THE 36th Report of the Estimates Committee had made some damaging remarks on the operations of the Industrial Finance Corporation, particularly its underwriting activities. Now the Finance Ministry in its explanation to the Public Undertakings Committee of the Parliament has sought to re-affirm the validity of the IFC practices.

This perhaps is inadequate, for, in their origin, the remarks of the Estimates Committee, to say the least, were misconceived. Underwriting, being a riskier form of operation, is also lucrative, as the operations of ICICI, which has always considered this to be one of its primary functions, show. Unfortunately for IFC, it entered this business in the downward phase of the capital market when the public got disenchanted with ordinary shares. The consequences of this slump for IFC as for other underwriters have been terrible. However, given the state of the capital market an underwriter did not need any special expertise or lack of it to be landed with a large percentage of the shares underwritten—or, to use the pompous phrase of the Estimates Committee, to find that a large proportion of the shares it had underwritten had "devolved upon it" (committee reports in India would provide excellent research material for Sir Ernest Gowers!).

However, what is the function of an underwriter but to be available to bear the risk in difficult capital market conditions? And would not promoters seek their services more readily in such times? It would have been surprising to see an underwriter who always managed to pocket the underwriting commission without being called upon to take up any shares. What is responsible for the underwriters having to take up almost the whole amount underwritten is, of course, the general depression on the capital market. The setting up of the Industrial Development Bank is recognition by the Government of this fact as also of the inadequacy of underwriting facilities on the Indian capital market.

The remedy for the present situation is not for IFC to withdraw from the underwriting field as is implied in the Finance Ministry explanation but to remove the special disability which prevents IFC (and also SFCs) from holding shares for more than seven years; after all, IDB, which is Government-owned at only one remove, is not subject to this limitation. Because of its late entry in the underwriting field, IFC missed the 1960-62 boom and the profits available in that period; the consequences are most clearly seen in the relatively unprosperous accounts of IFC.

The Estimates Committee also had something to say about the geographical distribution of IFC's assistance. Here again a finance institution like IFC operates within a given framework —the choice of location is that of the entrepreneur, subject in India to the Government's approval under licensing procedures. IFC's portfolio does show a comparative weightage in favour of underdeveloped States. If further weightage is to be given—though one is not sure of its desirability—a beginning would need to be made with Government's licensing policies.

The Committee's Report raises one more question: the limits of its own competence. While it is a watchdog for the Parliament and the demands for grants sanctioned by it, the Estimates Committee often tends to go into policy issues, and blithely makes criticisms and suggests policies, a task which had better be left to expert committees. Some of these criticisms, as in the case of IFC, are wholly unjustified, but the damage done to the institution sticks. Restraint in recognising the true limits of its functions would earn the reports of the Estimates Committee more attention.

Japan and Viet Nam

A Correspondent writes from Tokyo:

AMERICAN prestige and popularity in Japan are just now at their lowest ebb since the riots against the US-Japan Security Treaty in 1960. Japanese reaction against US Viet Nam policy has been sharp. Even leading Liberal-Democratic (conservative) politicians have been urging the United States in private to stop the bombing raids on North Vietnam. The entire intellectual community, almost without exception, is against American policy, and the Socialist Party and its affiliated trade union federation have been particularly vociferous in opposition.

There have been a spate of demonstrations against the US. The largest of these demonstrations, which included a massive rally and a march to the American Embassy, brought more than 60,000 people into the streets under the leadership of the Japan Socialist Party. The militant Zengakuren (National Federation of Students) participated in these demonstrations. The students have been aiming their attacks both at the United States and at the Japanese government of Prime Minister Sato, which Zengakuren accuses of being servile to the Americans.

In addition to the organisations which can usually be counted on to participate in anti-American demonstrations, the Vietnam issue has involved many independent intellectuals. In a public meeting addressed by several respected writers and the Saigon correspondent of the *Ashai Shimbun*, Japan's leading newspaper, several intellectuals called for a peaceful solution of the Vietnamese issue. One official of the American Embassy in Tokyo afterwards admitted privately that US popularity seemed to have dropped very low in Japan.

In Japan there seems to be some racial feeling connected with the Vietnamese issue, since many Japanese recall that the atomic bombs which were used against Japan were aimed at Asians, and that similarly the chemicals now being used in Vietnam are aimed at Asians. Primarily, however, the Japanese are against the war in Vietnam and generally fear further escalation. They are less concerned about the exact political solution of the problem. The demonstrations, and most of the discussion of the problem as well, have a strong emotional strain.

The Japanese Government, in the meanwhile, has continued to tacitly support the American policy, though with scarcely veiled discontent. It is unlikely that the ruling conservative Government will make any sharp break with the United States, particularly at a time of negotiations with the United States over fishing rights. Nevertheless, it is clear that politically aware Japanese of almost every colour are very much against United States policy in Vietnam, and that the Americans have lost much of the goodwill built up in Japan so carefully since the political crisis of 1960.

Tourism: Costs and Benefits

INCREASING affluence and easier travel have helped to send larger numbers of North American and European pleasure travellers to the Orient, and India has had a share in this expanding tourist traffic, though this share is just under half per cent. A lakh and half foreign visitors came to this country in 1964, a year when world tourist trade touched its highest level. There has been an upward trend in our tourist traffic — in the last seven years it has increased by more than 300 per cent and stands today as our fifth most important foreign exchange earner. It is natural, therefore, that the potential for growth in this sector should have received much attention. The Jha Committee made a detailed study of the problem and made many useful recommendations — most of which have been accepted and are being implemented.

The Indian Travel Congress which held a four-day session at Srinagar last month focussed attention once again on the problem, but its recommendations and suggestions added very little to what is common knowledge. Voicing the private sector's apprehensions over the encroachment of the public sector in the commercial activities connected with development of tourism, the Congress predictably enough opposed the two proposed new Corporations — the Indian Tourism Hotel Corporation and the Indian Tourism Transport Undertaking. It also came out against the proposal to invite foreign collaboration in the hotel-trade. Instead, it pleaded for liberalising imports and asked for the establishment of a high powered body to lay down policies.

Is the problem mainly one of inadequate implementation and lack of coordinated effort as the deliberations of the Travel Congress and discussions in the press seem to imply? The achievements of the Department of Tourism, while not spectacular, are not insignificant. The Centre and the States have assumed greater responsibility for increasing the availability of accommodation, and much has been done by the Tourist Development Council to lessen irksome formalities. The coupon scheme introduced in 1960 which enables a tourist to buy films, tobacco, alcoholic drinks, etc; the endorsement of visas for liquor by our foreign consular offices; the opening of duty-free shops at important airports for tourists; the relaxation and simplification of customs formalities; the proposed creation of a special customs officers' pool to deal with tourists; and the curbs proposed to be put on the activities of unrecognised travel agencies — all these are steps in the right direction. There has been some activity on the publicity side too. True, not all the Third Plan targets relating to the development of tourism are likely to be fulfilled and there will be a large shortfall in outlay, but still a beginning has been made. The existing agencies, viz, the Tourism Development Council and its zonal committees, the Standing Committee and the Coordination Committee can well handle the problem. The need for another super body as proposed by the Travel Congress does not appear to be urgent. Similarly, the public sector's entry into the hotel trade is unavoidable; the private sector has been unable to reach its targets and the extent of the effort needed can be judged from the estimate that by 1968 we would need an additional 9,000 beds to keep up with the growth in tourist traffic.

More Information Needed

AS an important foreign exchange earner, development of tourism should receive high priority but it can be hardly considered in isolation from the development of the economy as a whole. It is pertinent to consider, for instance, how the development of tourism would affect domestic priorities. Building materials and transport equipment may be urgently needed elsewhere. The opening of duty-free shops, imports of articles like films, cigarettes and air-conditioned coaches and promotional activities abroad involve expenditure of scarce foreign exchange and the question naturally arises; what is the benefit? Is it likely that in the short-run these expenditures will yield spectacular gains, as is often claimed? In other words, it is necessary to lay down a rational plan for the development of tourism on a cost-benefit basis. The Department of Tourism did undertake such a survey in 1962 but the results have not been published and many important questions remain unanswered. Take the current controversy over the luxury-hotels scheme. Much of the talk is based on casual impressions and none of the relevant data needed for a decision are available. If indeed it were true that a large proportion of our tourists belong to the high spending category, there would be a case for wooing them by providing for their needs at the level they expect. Yet it is often mentioned (with how much truth we don't know) that the luxury-hotels cater mainly to the wealthy among the indigenous population. Do we have any information to indicate the type of accommodation preferred by the majority of the tourists? If what most of the visitors ask for is only reasonable efficiency and general cleanliness, it is certainly a waste of resources to give them luxury, unasked for.

There are other problems too. Even assuming that visitors are pleased by our ostentatious display of luxury, these islands of cleanliness and of

high standards of comfort can have little impact for the growth of tourism in surroundings of general squalor and poverty. We come back to the problem that the process of developing tourism must inevitably be a part of general economic and social development. There is some truth in the sceptical remark that more hotels, more roads and extraordinary courtesy can act only negatively: in not discouraging the prospective visitor. What matters is whether the visitor thinks the country is worth a visit.

That some thinking has been done on tourism cannot be denied. Some efforts have also been made to maximise returns from use of scarce resources as is evident from one or two instances. The decision to select a few centres of tourist attraction and concentrate on their intensive development is one such. The Indo-Japan agreement to exchange publicity and to form travel deals on a package basis are other examples. What we need is an integrated overall plan along these lines, keeping in view the inevitable limits of an economy like ours.

LETTER TO EDITOR

Foreigners, the Only Experts

PLEASE transmit to Romesh Thapar belated congratulations from one so-called "foreign expert" on his satirical "Foreigners, the Only Experts" (*The Economic Weekly*, March 20).

An autobiographical anecdote will illustrate my, and also his, point. Negotiations were commenced to bring me to India as a visiting economist a few years ago. I visited India to look the situation over. I found literally dozens of brilliant young Indian economists, who were my equals or superiors in economic and statistical expertise, who could be employed far more cheaply than I, and who in addition knew something about India.

The funds involved in hiring me would have been 95 per cent wasted. The talents of my younger Indian colleagues would likewise have been 95 per cent wasted—waiting for their seniors to retire, I'm afraid.

And yet, when I broke off negotiations and suggested employment of Indians in my stead, my motives were apparently interpreted (from the Indian side, mind you!) as expressions of anti-Indian prejudice. I didn't appreciate India, and so I wouldn't come.

Incidentally, what is said here of India is true of many other countries. Neither in India nor elsewhere, in my view, is it entirely the foreigners who spread the view that they are "the only experts."

Why We Did Not Hit Back in Kutch

Romesh Thapar

A RATHER tense and anxious Lal Bahadur left for the Soviet Union. All kinds of ill-founded statements are circulating about his role at the height of the Kutch crisis, statements which suggest that he alone is responsible for the GOI's failure to act in the face of Pakistani aggression. Certain well-known 'get-tough' elements in the ruling party are also playing with the idea of a possible change in the leadership in the coming months. Intelligence reports point to a sharp decline in the prestige of the Centre throughout the country, more serious than in 1962. Indeed, it looks as if powerful influences are at work somehow to pillory the political leadership for the failures of the past few weeks.

Who Was Curbing Whom?

All this needs honest and careful study. Actually, when not muddled and confused by the very selective and angled briefing of his Secretary, L K Jha, who is now tempted to play a role beyond the once-strict limits prescribed for a bureaucrat, Prime Minister Lal Bahadur has measured up to the crisis. From what I can gather, the inaction was dictated by an army staff which sought to rationalise its lack of preparedness by a continuous harping on the dangerous side-effects of a confrontation. In fact, ballots of a kind were conducted at Army Headquarters to locate the 'hawks' and to persuade them to become 'doves'!

The first indication received of something amiss in the calculations of observers was when it was learned that there had been separate briefings by Army Headquarters for foreign and Indian correspondents. In private, the foreigners were told that the army was curbing the politicians. The Indians came away with the 'news' that the politicians were curbing the army. The provocative nature of the briefings gave birth to the story that army resignations were in the offing, including that of the still passive Defence Minister.

Next, we were given what sounded like a very logical army point of view —that there should be no political pressure to compel the army to fight in the Kutch 'trap', that the army be free to choose its point of counter-attack. This, too, seemed reasonable; although some of the more knowledgeable did argue that the army should punish the Pakistanis only on the Kutch front and then withdraw during the monsoon months to a proper defensive line, for to hit the enemy elsewhere would mean a general conflagration. Yes, there's no denying that there was ample time to do the punishing before the Rann of Kutch became impassable.

It was at this stage that the Prime Minister took the decision to permit the army the freedom to decide its course of action. Once this was made known in Parliament, the U S military mission in India got to work. The 'considered view' was expressed that the Indian army would be 'licked' if it sought battle with the Pakistanis, that it was wrong of the politicians to push the army into such a situation. There was, moreover, complete silence on the use of U S equipment by the Pakistanis. It was made apparent to our army staff that western sympathies were willy nilly with Pakistan and that the consequences of an Indian counter-attack would be far-reaching.

Paralysis at Army Headquarters

The growing paralysis at Army Headquarters—heightened by an inexplicable interest in the transfer and retirement of senior officers—was reflected on the Kutch front. A group of correspondents visiting the area were told by the local commander that air cover was being denied, that tanks were withheld from the front and that forward strikes had been prohibited. A defensive strategy was being adopted on the plea that the topography of the Rann of Kutch favoured the Pakistanis, although the local command refused to accept this very limited view. This part of the story was published piecemeal, both here and abroad. But, and here's the rub, the responsibility for inaction was placed on the politicians at the Centre!

Time was running out for a punishing counter-attack in Kutch. At this point, the army staff, sensing the angry mood within Parliament and the defence services, began to ask the loaded question whether the country was for 'total' war or not. The projection of a choice of this kind was obviously intended to reinforce the *status quo* even at India's expense. The country had demanded earlier that the armed forces punish the Pakistanis on the Kutch front, for such punishment was *least likely* to lead to an escalation of the conflict. The army staff demanded freedom to hit elsewhere. This freedom was granted. Now the army staff warned against a 'total' war and its consequences. The implications were clear—and now there is little to stop the gossip in the living rooms of Delhi.

The timing of this complicated tactical and strategic chatter in the Capital became most significant when British Prime Minister Harold Wilson launched his peace moves. The political leadership knew that it had been cornered by the cautious argumentation of the army staff. There seemed no alternative except to work out the details of an honourable disengagement irrespective of criticism from within the ruling party and without. But again, the GOI showed firmness in resisting a blackmail peace so persistently urged upon it by certain civil and military careerists who reflect the thinking of various active Western-oriented lobbies in the Capital.

PM Must Correct Wrong Impression

It is comparatively easy to smear the political leadership of the country with the failures of the services, civil or military, and it has become a popular pastime in certain circles. For this same reason, the Prime Minister needs to correct the false impression so assiduously publicised that he prevented the punishment of Pakistan. This would have an important bearing on the morale of the nation and its armed forces. Once again, we find ourselves urging that the lessons of this unhappy experience be digested. But on this occasion, as against 1962, we must go beyond mere urging and demand action to cure the sickness which saps our strength.

The sickness is our lack of self-reliance, our increasing dependence on nations who in moments of crisis are always found wanting. Once the attack is launched on this sickness, we will find that it is of paramount importance to purge our ministerial and administrative set-up of all those elements who stand in the way of a full mobilisation of our resources and manpower and the full assertion of our sovereign rights. The story of these last few weeks—or 'Operation Poppycock' as it could be dubbed—should

unite wide sections of our people for a hard-hitting programme of national revival. To be satisfied with anything less is to invite the destruction of our political institutions and perspectives, even the unity of this sub-continent.

There may be a great deal in the argument that the politicians have failed to apply their energies to the business of demarcating and guaranteeing our borders, that great strains have been placed on the civil and military services in the course of these last few years, but the fact remains that the temper and fibre of these services no longer reflect the aspirations of our people. Over the years, a new, insensitive caste of civil and military bureaucrats has grown up, interested only in its self-preservation and unmindful of national interests. We have tolerated these elements, for until recently no real threat developed to challenge the future of this country. This is no longer true. We need men of a different mould to shoulder the grave tasks of the critical period which is now unfolding and to inspire the people.

The present political leadership is not unable to perceive the need for a drastic overhaul of the present system of running the State, an archaic system left behind by the British with a heap of irrelevant rules and regulations which destroy dynamism at every level, but there is confusion as to how this system has to be reorganised. Confusion will persist, so long as efforts are not made to initiate changes. It is possible to move from one level to another to show the incongruity of it all. It is for the ruling party to constitute a body which will begin this reorganisation, which will modernise the rules and regulations governing administration, which will open the way for the recruitment of experts for specific jobs, which will free the initiative and spirit of the administrator who has become over the years an unthinking, mechanical robot.

A people cannot be galvanised by talk alone. They must be able to get a glimpse of what the future holds and be inspired by the firm belief that nothing will be permitted to dim that future. If 'Operation Poppycock' does not open our eyes, possibly nothing will. But maybe, Lal Bhahadur's eyes have been opened. Maybe, on his return from the Soviet Union, he will launch this long-awaited quiet revolution—a revolution which will convince us that it is better to die on our feet than to live on our knees.

How Not to Set up and Run a Project

Arthagnani

THE Sixth Report of the Committee on Public Undertakings on the Fertiliser Corporation of India is an interesting treatise on the methods of working of a public corporation, and, for any protagonist of socialism through public sector undertakings, makes sorry reading. For here are collected, in the short space of 100 pages (the rest are annexures and summary of findings and recommendations), perhaps all the follies that can be committed in setting up and running an industrial enterprise—wrong location (Namrup), underestimation of capital cost (all the individual projects under FCI), delays (Nangal and Trombay), lack of inventory control (Sindri, Nangal); the list can be continued *ad infinitum*. This is particularly distressing as Sindri Fertilisers, which provided the nucleus for the subsequently formed Fertiliser Corporation of India, is the oldest modern industrial undertaking set up by the Government.

The Fertiliser Corporation has under control six undertakings: Sindri and Nangal (in operation), Trombay (almost completed) and Namrup, Gorakhpur and Korba (under planning). It is interesting to examine the performance of FCI in respect of these projects under the following heads:

Land: Evidently, all the projects have been lavish with the use of land (p 85). At Sindri there is one house constructed per acre of land, the argument being that land is cheap. Even at Trombay, FCI thinks it necessary to provide housing to 96.9 per cent of its workers. The cost of township formed 12.6 per cent of the total cost of project at Sindri, and 12 per cent at Nangal. Surely this must be a civil contractors' paradise.

Construction Period: From the conception stage to completion, Sindri and Nangal took considerable time. The periods envisaged for Trombay, Namrup and Gorakhpur are about 5½ years (p 46). The Committee cites the estimate of the UN Fertiliser Team that a fertiliser project in India should take 35-47 months to complete. It does not cite the fact that in advanced economies the actual time is much smaller, less than two-thirds of this. Apparently, almost each decision in India gets bogged down by delays in administrative procedures and sanctions.

Capital Cost: The capital cost of all the projects has been high, higher than original estimates (pp 44, 45) and higher than the recent estimates submitted by Bechtel Corporation. The costs have been inflated by the large element of township costs and by administrative delays and consequent rise in overheads.

Staffing and Inventories: This waste of capital is most clearly noticeable in staffing and in inventory holding practices. The number of personnel employed at Sindri was 8,103 and at Nangal 3,429; even Trombay which is still to go into production has already on its roll 1,543 persons against a total strength of 1,803. In this, of course, FCI is not unique. Visiting the Heavy Engineering Corporation, one can see people sitting idle or loafing about. This not only increases the running cost of the projects, but, when one relates it to the housing policy of FCI, also the capital cost—and the real resources which go to constitute this capital cost.

Inventory control is apparently something which a civil servant does not understand. There are instances given in the report of stocks not being properly accounted for (p 12). And inventory norms are not maintained so that there is unnecessary accumulation of stores and spares much of it imported. The Committee cites an instance where for fear of the generator at Sindri giving way, huge supplies of spares were ordered—and continue to be held (p 16). To a civil servant, evidently safety of maintaining huge stores is more important than economy.

Other Matters: There are a host of other instances of what in business parlance would be called pure and simple mismanagement. There are references to supplies being obtained without contracts being finalised for gypsum for Sindri; rise in electricity rates at Namrup and Trombay from those envisaged at negotiation stage; and the inter-ministry squabble over the transfer of Rourkela fertiliser to FCI. Civil servants apparently are more adept at standing on their rights and dignity than in managing an industrial enterprise.

Wider Issues

The Report also throws up issues which are of wider significance, relating to the role of public sector in economic development. These relate to (a) production planning and designing facilities, (b) management of public sector enterprises, and (c) their contribution to plan financing.

(a) Sindri is the oldest of the modern public sector units, and with an experience of almost fifteen years, could have been expected to act as a nucleus for the country's fertiliser programme. FCI has a Planning and Development Division under a general manager (that is, at the same level as the general managers of the production units), and spends annually Rs 37 lacs on this Division (p 62). However, apparently so far there has been little return from this Division, considering the fact that Trombay was wholly foreign designed and financed. And it was left to a foreign consulting firm to suggest a large fertiliser programme and to undertake its designing. This lack of initiative is also evidenced by the fact that the development of indigenous manufacturing capacity for fertiliser plants has been small (in contrast, one can refer to the fact that sulphuric acid and super-phosphate plants are almost wholly fabricated in India.)

(b) After almost 15 years of planning, we do not seem to have solved the problem of a proper management pattern for public sector undertakings. The Committee refers to the fact that the present managing director of FCI was given extension as no suitable replacement was available (p 52) and that the general manager of Gorakhpur reverted to civil service where his prospects improved with the extension of the retiring age (p 66).

The only systematic study of management staffing of public sector undertakings done is that of H K Paranjape —apart from forays by civil servants like Khera into the field, which have little value. It is unfortunate that Paranjape recommended the disbandment of Industrial Management Pool. Evidently, we still seem to believe that civil servants are omniscient and can do any job. In contrary evidence, the Report on FCI provides enough material. Civil servants like to play safe (example: huge inventories), lack initiative (example: the state of the fertiliser programme) and show little responsibility (examples: all the explanations offered for the shortcomings found out).

Apart from this, the practice of inter-change between civil servants and managers of public undertakings also sets up certain inherent counter-pulls which make for inefficient and stagnant management. A civil servant in a managerial position is constantly watching over his prospects in the civil service, and he, therefore, becomes a convenient tool in the hands of superior civil servants whose hold on the management of the undertakings is considerably increased. It is, therefore, necessary that a complete division be enforced between the two, and that a manager in a public sector undertaking should look for prospects only in the management field (either in the public or the private sector). It would then be possible to judge his ability by management criteria and not subservience to departmental fiat.

So also there is need to re-examine the constitution of Boards of Directors of these undertakings. Despite the recommendation of the Krishna Menon Committee, secretaries manage to get themselves placed on these Boards, and, being wholly innocent of management standards and busy with departmental functions, fail to do the job well.

(c) Given the lack of financial management, it is not surprising to note that the planners had failed to consult the managing director of FCI before setting up a target for FCI's contribution for plan financing through public enterprise surplus. After all, this has to be taken as a norm (though one would certainly like to know how the planners went about setting it). FCI claims that against the planned Rs 33 crores, the actual surplus would be Rs 41.32 crores for the Third Plan period.

Conclusion

However, the point is not that the norm was exceeded but that in fact there have been considerable waste of capital (townships), delays and increases in construction costs and additional drawal of funds for financing expansion. One has only to examine the case of Hindustan Aluminium, an initial Rs 20-crore project, which is able to double its capacity by taking an additional outside loan of US $11 million.

If public sector enterprise is to be run efficiently it would be necessary to set various norms—capital cost, inventory control, production cost, personnel policy—to which its managers should be made subject. After all, excluding management staffing, none of the problems of FCI, mentioned in the Report, are specific to public sector; private sector faces these problems—delays in sanctions, rise in costs—with equal intensity, and without the direct lines to Government machinery which administrative camaraderie makes possible for managers of public sector enterprises. What these managers lack is commitment to the job. However, having been so inefficient in the jobs entrusted to it, does not prevent FCI from wanting to take up distribution itself; evidently this sort of bureaucratic empire-building is what our civil servants are very good at.

The Report, while it brings out the deficiencies in FCI, is itself not well-organised, loses itself in petty details, lacks perspective, and does not provide a constructive base for proper management. Its suggestions, to say the least, are puerile, and it abounds in platitudes.

Two further points naturally suggest themselves from a perusal of the Report: First, at present, with quantitative restrictions providing a natural protection to industry and price decontrol making price-fixation unnecessary, the Tariff Commission has not many rational jobs to do. It would be good to bring all public sector enterprises under the Tariff Commission's scrutiny; it has excellent costing staff and procedures, which would help to make a thorough analysis of the efficiency of these units. This could help to establish the norms for the units examined and for the units to be established. Second, it is necessary that the Reports of the Committee be studied, say, in the Planning Commission so that a list of common deficiencies be established, and action taken to remove them.

How to Remember Tagore

PERHAPS it says something for Bengal that, 104 years after his birth and 24 after his death, Rabindranath Tagore should be elaborately remembered in every centre in the State with any pretension to culture. In Calcutta last week there were special numbers of weeklies and supplements to dailies; all about Tagore. The ritual has come to wear a routine appearance, admittedly; but those who care for Tagore music — and, very important, can follow the words — the 25th of *Vaisakh* is never like any other day. Amatory, hortatory, religious, now specific and then gossamer-like, Tagore's songs to Bengalis have for years now been aphrodysiacs, tranquilisers and temporary excitants, all rolled into one. On Saturday last week, Calcutta's most cosmopolitan part, with the Bengalis in a minority, heard a fair number of these songs which they could not follow; and there was a reason for it.

It had been decided that the Tagore birth centenary year would produce a Tagore theatre in every State capital. With customary efficiency in the administration, the project was delayed just about everywhere. In West Bengal, Tagore's home state, Rabindra Smarani was not ready full four years after the centenary year. The Government, therefore, decided that the auditorium could not be used for celebrations this year. The engineers were probably right in not letting the stage under construction being used. The protestors, who included Satyajit Ray and others of considerable local fame, were perhaps equally right to hold their celebrations on a lorry parked on Cathedral Road. The presence of a few female film stars helped the show.

Above Politics

There is no question about it that some people wanted to make political capital out of the row over the Tagore theatre. The parties, one suspects, included the Congress and its Government. The thesis of this piece is that Tagore was not above politics, never. Nobody could be, in those days; and it is quite unnecessary to refer to Tagore's renunciation of the knighthood. That was the least of his political acts. Where he was culpably political, from the British point of view, was when he questioned the very basis of Western civilisation, when he rejected the need for English as a medium for education in this country. (Little did he know what seeds he was sowing.) His rejection of an urban, industrial civilisation was as sentimental, although we are only now beginning to discover the primacy of agriculture in the Indian economy. It is of a piece that he was the first to see a Mahatma through the rustic exterior of Gandhi and yet ruthlessly to criticise the anti-art, anti-life aspects of Gandhism.

In "The Crisis of Civilisation", Tagore's last testament, there remains the severest indictment of British rule in India; yet the two phenomena, ruling and being ruled, are seen in the world perspective. Africa is brought in. Then there is that prophetic reference to the debris that imperialism would leave behind; for the former rulers and the lately emancipated, it was a crisis in civilisation; for the ruled and lately freed, it was going to be a crisis of character.

The Controversialist

The story is told of two relatively young disciples of Tagore who were once found walking slowly with a stoop much like the ageing Poet's. Tagore sent for them and admonished them for imitating the postures age had inflicted on him against his will and native character. This may well be symbolic of all that has been seen in Bengal in its recent decades of decadence. Albeit in his measured, elegant and sophisticated manner, Tagore participated in every major debate in his lifetime; Mrs Eleanor Rathbone's sole title to immortality may be that Tagore found the time to reply to her denigration of India. As a young and ardent Brahmo, and a secretary of the Samaj, Tagore was tireless in arguing the toss with neo-Hindu obscurantists, not excluding Bankim Chandra Chatterji. To have turned this rebel into a saint, aloof and apart from the living world, interested only in ethereal poesy, may well have been the worst disservice at once to Bengal and to Tagore.

Against this background it was good to see last week some of Bengal's foremost writers, directors and actors and actresses come out into the open in protest against a senseless bureaucratic measure affecting the arts. Satyajit Ray's politics have never been easy to identify; Premendra Mitra was never known as a leftist, though Utpal Dutt is; Manmatha Ray was for years a Government servant. Yet they all joined the demonstration on Cathedral Road; and the unity made one think of an artistic I N A against the insensitive Establishment we have today.

Banner of Revolt

Tagore never went to gaol, except once or twice to administer orange juice to a fasting Gandhi; nor were there any arrests on Saturday by the police, who only wanted to stop the procession going to the unfinished Rabindra Smarani. Yet a confrontation there was, between a fading and distorted memory of greatness and a growing and increasingly more arrogant distortion of what freedom was meant to be. The hot May sun did not prevent the artistes from gathering on the maidan; the trees provided the shade. This combination of grace and strength was perhaps the essence of Tagore's life; and it was good to be reminded on Saturday morning that the two could happily co-exist in a single man. Indeed, perhaps the two could not exist in separation.

It may seem idle to some to hear of the strength of Tagore, who never lived to see India free. Free he was because of his inner strength which no extraneous force could daunt or dim. It was this very personal self-confidence and self-respect which Tagore wanted each of us to cultivate in preference to collective assertiveness. Thence also came the grace, for collective assertiveness is frequently a coarse display, besides being often an indication of individual inadequacy. On Saturday the writers and others collected all right on the *maidan;* their separateness remained obvious. Ironically, as the police were preventing the artistes from entering Rabindra Smarani, Sinha the Education Minister and Atulya Ghosh the party boss were speaking at functions celebrating Tagore's birth anniversary. It is not true that the Organisation Men's do's were more successful.

—Flibbertigibbet

What to Do with Sheikh Abdullah

Balraj Puri

This article was written before Sheikh Abdullah was interned at Ooty, but the internment does not answer the question: what are we going to do with Sheikh Abdullah and with the forces represented by him?

The Sheikh has evidently grown less amenable and manageable since his release from jail a year ago. At the same time, let it not be forgotten that the gap between him and the rest of the country was not always so wide. Nor was his political position in the Valley always so well consolidated.

This is, in fact, an occasion to look back over the years to discover which of the lost opportunities are not irretrievable.

ONLY in May last year Sheikh Abdullah had expressed the conviction that a basis existed in India for the kind of settlement of the Kashmir problem that he was working for. There was, he had said publicly, no basic difference between him and Prime Minister Nehru—"the differences existed only in the imagination of some people". The formula that he took to Pakistan had obviously the blessing of Nehru.

Nehru-Abdullah Entente

It is not difficult to surmise the possible basis of settlement that Abdullah had discovered in New Delhi. On May 11, 1964 he had declared that in spite of 11 years of incarceration, he stood by every commitment and agreement made by him until the evening before his arrest, viz, August 9, 1953. Taking note of this offer, Nehru, in the last Press Conference of his life, reminded his listeners that "before his arrest, accession of Kashmir to India had been more or less completed". At the ideological level also Nehru found common ground with Sheikh Abdullah when he acknowledged, while addressing the AICC session in Bombay, that the Sheikh "is wedded to the principles of secularism and does not wish anything to be done to vitiate these in any way. He does not believe in the two-nation theory which was the basis for formation of Pakistan".

On their attitude towards Pakistan the two leaders seemed to have a broad measure of agreement. Abdullah had endorsed Nehru's plea for a coming closer of India and Pakistan "even constitutionally". "If Sheikh Abdullah", Nehru had said in his AICC speech, "can help in bringing this about, he will have done a great service to both the countries. We will have to help him in this attempt". Apart from agreement—however broad—on the "basis of settlement", on ideology and approach to Pakistan, the warm emotional rapport that the two leaders had re-established was of crucial importance.

All this seemed—more so in retrospect now—too good to be true. The difficulties in the way of a final settlement were indeed formidable. But there was reason to hope that tensions would be further reduced and the area of agreement would be gradually enlarged, and would remain in any case larger than what Kashmiri leaders could discover across the border.

Within a month of the death of Nehru, Abdullah declared at a public meeting in Srinagar that "India has dug its own grave in Kashmir". Though after another round of talks in New Delhi he felt that the "climate for the Indo-Pak amity mission was good" and was happy "that things are going satisfactorily", frustration was not long in coming. "It was futile", he soon said in Srinagar, "to expect anything from the rulers of Delhi or to appeal to them on the grounds of justice, humanity or morality. Time for such things has passed".

Why Liberalisation Failed

Politically and ideologically Sheikh Abdullah now moved away from India. On the plea that only those countries were friends of Kashmir that supported its right of self-determination, he moved closer to Pakistan and eventually to China. When he started addressing his political appeals exclusively to Kashmiri Muslims, he also made a significant departure from his earlier secular stand.

Is it just that Abdullah has finally come out in his true colours? If so, why had he assumed "false" colours in the first place? Or has he cut his nose to spite India?

There may still be some in India who regret that Sheikh Abdullah has not been tackled properly. Others, far more numerous and vocal, feel that appeasement has gone too far. Yet the two viewpoints need not be exactly contradictory, for appeasement is hardly the best way to tackle an honourable man. The fact remains that Abdullah is still a problem. He has neither been won over nor rendered politically ineffective. And the fate of the last one year's experiment in what has been called the policy of liberalisation has damaged the prospects for a third course besides appeasement and suppression. But was this policy really foredoomed to failure? And can it not still be rescued?

The year 1964 does mark the freest year of Kashmiri politics. But if it could be said during the Bakshi regime that people were not to be satisfied "by bread alone", it can be said now that they are not to be satisfied "by freedom alone" either. Why did freedom fail to satisfy and what supplementary measures are needed to make it satisfying?

If the people did not feel obliged to be grateful to the new regime in Kashmir, it was because it could hardly dispel their impression that they had earned their freedom through the grace of the holy relic (the loss of which had occasioned a massive upheaval in the valley) and as a result of demonstration of their strength and the exigencies of the international situation. The party in power, in fact, did not get an opportunity to claim credit for the liberalisation policy, for the opportunities offered by greater freedom of the press and speech were almost entirely monopolised by Abdullah and other opposition elements. Abdullah was released at a time when the only political force that had been allowed to exist during his absence under the command of Bakshi Ghulam Mohammed had been disarmed. The political machinery at Sadiq's disposal was either paralysed or owed allegiance to its creator, the Bakshi.

Abdullah's Problems

The situation, however, had its own compulsions for the Sheikh also. He had to lead the crowds which, after being embittered by the masterly mishandling of the relic agitation in the preceding months, had been told to believe that India was fast retreating. Having fitted into their mood, he could neither meet their demands nor keep them at the high pitch of excitement. For a while illusions of some progress were kept up. Afzal Beg confidently predicted plebiscite within a year. Soon disillusionment started. The same

DUNLOP

INDIA'S
FIRST
EXTRA LARGE
OFF-THE-ROAD
TYRES

In the race against time to complete various projects on schedule, giant earthmoving vehicles are being used in increasing numbers throughout the country. The extra large size tyres required for these vehicles were hitherto imported, costing the country valuable foreign currency.

Dunlop have now undertaken for the first time in India the manufacture of Extra Large Off-The-Road tyres in sizes 24.00-25 and 26.5-29 for these massive earthmoving vehicles. Weighing nearly half a ton each and standing over six feet high, these tyres are made to the highest international standards.

DOTIC-2

YET ANOTHER DUNLOP FIRST

speeches with the same arguments by the same persons could not hold popular interest at the same level. Controversy also started about the objectives of the movement. Those who did not want to completely antagonise India became lukewarm. A more serious challenge to Abdullah's supremacy was, however, posed by Maulvi Farooq, who wanted the options at a plebiscite to be confined to accession to India or Pakistan, ruling out independence that is supposed to be Abdullah's objective. Violent clashes between the two factions exhausted some of their energy and provided an opportunity to G M Sadiq's Government to assert itself. Abdullah made a desperate bid to steal the thunder of Farooq. In his assured and confident moments he is an excellent exponent of secularism and Gandhian ideals. But when in a tight corner, he does not hesitate to fall back upon Kashmiri chauvinism, religion and sectarianism.

Further, through the understanding and friendship that he was able to revive with Nehru, during the latter's last days Abdullah could, for a while, aspire to a wider role for himself and his people. He failed to set up a similar rapport with the new rulers in New Delhi. The only role he got outside the valley was membership of the 100-man Nehru Memorial Committee, which was arranged by some of his friends. But he was not given any assignment on any of its numerous subcommittees. He then exclusively concentrated on the valley to regain his political importance. When he found challenges to his position in the Valley also, he did not hesitate to manoeuvre —politically and ideologically—to conquer his opponents. The nature of the manoeuvres was determined by the direction from which he received the most serious challenge and there was as yet no political challenge or even noticeable political activity by the ruling party in the Valley.

Part of the Sheikh's difficulties were due to his peculiar political position. Broadly speaking, he seemed to rule out an exclusive relationship for Kashmir with either India or Pakistan. But he led a much wider and precarious coalition of forces whose cohesion is seriously strained whenever loyalties to India and Pakistan tend to divide the politics of the State.

Two factors enabled Abdullah to weather the storm. First, Pakistan could not afford to disown a leader of such stature and to disrupt the united front against India. Second, some steps by India unintentionally helped to cement the front that was visibly cracking. The series of measures, avowedly meant to integrate the State with the Union, provoked a fresh upsurge of popular resentment. For the people saw in them a threat to the separate existence of Kashmir. Beg described them as a prelude to the eventual merger of the State with the neighbouring, exclusively Hindu, State of Himachal Pradesh (for which a demand had already been made in Jammu). The "new danger" made an important contribution in forcing a unity on the warring leaders and reviving the flaggnig tempo of the movement.

Dissatisfaction in Kashmir Not Abdullah's Creation

It should be recognised that the reactions of Kashmir—after allowing for the element of exaggeration by politicians—are in no way dissimilar to those of any other State when some of its powers are taken over by the Centre. Even if the so-called integration were good for Kashmir and the rest of India, the citizens of every State have the right to hold a different view and strive for any other relationship between their State and the Union. Views on the degree of central control over Kashmir—or any other State—should not be the sole measure of the patriotism of its people.

Those who who are piqued that the people and leaders of Kashmir have not appreciated the Government's gesture in restoring their liberties should not forget that to-make people free when they are angry and to make them angry when they are free is the surest way to alienate them. Liberties were not restored in Kashmir till the relic agitation had been forced to take an angry turn. Integration measures waited till repression had been completely withdrawn. When steps are taken in utter disregard of the freely expresed opinion of the people and in the teeth of opposition, the only use to which freedom can appropriately be put is to oppose the regime more openly and effectively.

Another danger of posing the integration debate as being between pro-Indians and anti-Indians is that it disguises and inflates the actual strength of the Pakistani sentiment while isolating and shrinking the potential loyalty to India in Kashmir. What sustains Abdullah apart from his personal halo is thus not merely the support of Pakistan but also a sense of Kashmiri pride, Muslim fears and administrative grievances. Recently the Action Committee, which owes allegiance to him, observed an antiprice rise day also.

By simplifying all causes of dissatisfaction (regional, communal, administrative and economic) in Kasnmir into one represented by Sheikh Abdullah, much thinking effort is avoided but the problem is not faced. Abdullah does not create all the dissatisfaction. He only symbolises or articulates most of them. All discordant voices that had been stilled—by means far from fair —all these years now add the most vocal notes to the orchestra we call Abdullah. The only sensible course is to discern the notes that are intolerable, tolerable and pleasant. But who is to decide and on what criteria?

The interests of the ruling party—or faction—has always determined the Government's attitude towards the opposition in the State. The present regime, which is otherwise far more liberal than its predecessor, has been extremely reluctant to associate opposition elements with any of the official activities, as is often done in the rest of the country. The only opposition party that has any representation on official committees is the Jana Sangh which is hardly likely to satisfy the Muslim majority of the State. Even in purely religious conferences abroad, the delegations do not include anybody —political or non-political—from outside the ruling faction.

The Kashmir Government can certainly count upon the goodwill and support of the whole nation in its defence of national interests. The ruling party has also a right to fight against its political and ideological opponents. But the fight should not be waged by the Government nor on behalf of the rest of the nation.

The challenge in Kashmir cannot be met by administrative and economic measures alone, though they are admittedly useful—first, because there is yet no fool-proof administrative and economic system which causes no dissatisfaction and, second, because regional and religious aspirations, as we should know from experience in other parts of the country, often have a more powerful appeal. Regional and religious aspirations—not to speak of administrative and economic ones—are by no means more aggressive in Kashmir than elsewhere in the country. But elsewhere non-secessionist avenues

of protest are available (even the Muslim League and the D M K have opted for them). In Kashmir where all avenues were suppressed as a matter of "national policy", now Abdullah is unwilling to be merely such an avenue nor does his charismatic umbrella leave much room for other avenues. So long as it is not possible (either due to official policy or other reasons or due to Abdullah's spell) to provide in Kashmir avenues of expression of protest that the rest of the country can tolerate and appreciate, a discriminating attitude to the powerful opposition movement and its leader is called for. This requires much more firmness and clarity in New Delhi than shown so far.

It is not sufficiently realised either in New Delhi or Srinagar that the current tension is far in excess of what objective conditions should permit. It should certainly be possible for India, consistent with her self-interest, to go a longer way to meet the demands of Kashmir and its leaders. Likewise, Abdullah can hardly afford to completely antagonise India if he has any ambition left of making Kashmir a bridge between India and Pakistan.

The current moods on either side do not permit bridging the entire gap between the demands of Kashmir and the rest of India. But it should be possible to shift the debate from the level of abstract and provocative slogans to concrete proposals. Thus delimited, the differences could then be set in the perspective of two facts. First, Kashmir shares the common and precious heritage of political values evolved under the leadership of Gandhi and Nehru, which it can throw away only at its own peril. Second, the gap between the interests of Pakistan and Kashmir, clouded by negative common demands against India, has always been and will remain very large. It was this perspective in which the Nehru-Abdullah talks were held last year.

There are obvious difficulties in picking up the threads at this stage. But the difficulties are not all due to political differences which, too, can be kept within limits. The limits of national interest may not as such bind Sheikh Abdullah, but the Kashmir leader may be compelled to take up positions far more extreme than those necessary to safeguard the interests of his people by the incompetence, confusion and panick of those who claim to be his opponents. While it will need statesmanship of a very high order (which is not visible on either side at the moment) to revive the dialogue between Abdullah and the Indian leaders and while the decision to write him off is likely to harden in India, it is not yet too late to prevent the authorities from writing off all the forces he represents.

Women in the New Village

Kamla Nath

In the last four issues were serialised a study of change in Jitpur, a village in Central Punjab. This paper describes how the changes—technological and economic—described therein are affecting the women.

It describes the pattern of work, practices relating to home making, treatment of disease, maternity and child care and attitudes towards education of girls among women of Jat cultivator households of a small village about 3 miles from Jitpur.

THE agricultural economy and techniques in this village are very similar to those described for Jitpur. It received electricity at about the same time: the bulk of the cropped area is irrigated, and the majority of irrigation wells are fitted with electric motors. The cropping pattern and use of improved practices (chemical fertilisers, improved seeds, improved implements) are also similar to Jitpur. I selected this village in preference to Jitpur, because it is a small village of Jat cultivators, and it was much easier for me to know the women. Besides, the extremely co-operative attitude of women of the family of the Sarpanch (father) and the President of the dairy co-operative (son) enabled me to know the women of the village. The educated young wife of the President is much respected in the village for her family background—she comes from a well known Jat family of the district—education and competence in managing the home. She introduced me to the village women, helped explain the object of my work, and was always available for any assistance that I might need. I found discussions with her and the older women of the family, an interesting supplement to data collected through the sample survey. The *dai* of the village, a Chamar woman, assisted me as a companion and interpreter, and also gave useful information on local customs and practices. I am grateful to these women for their assistance.

The village has a total of 104 households and a population of 626 (1961). There are 76 households of Jats, but only 36 of them are cultivators. In the remaining households, the small holding is given out for cultivation on *batai* (crop sharing), and work outside the village, army pensions or remittances from sons or nephews working outside are the principal sources of income. This study was confined to the Jat cultivators. A sample survey of 18 households (50 per cent of the total) was undertaken, with a view primarily to meeting and knowing a sufficiently large number of women. Emigration and dependence upon outside income is rather more in this village than in Jitpur. The Jats of the village have been prominent in military service. Several men received awards for valour in World Wars I and II. A *pucca* well, situated at the entrance to the village, was built by the District Board in 1937 in recognition of the services rendered by men of the village in World War I.

The 18 households have 123 persons, an average of 6.8 persons per household. The comparatively large size of households is due to the strength of the institution of joint family. As many as 10 households consist of joint families—7 are two-unit families, while the remaining 3 are three-unit families. The number of males is much larger than that of females (68 males and 55 females). The excess of males creates a serious problem of finding wives for men, which is discussed at the end.

Pattern of Work

The women's pattern of work has been described first, because of its influence on home-making, child care, personal hygiene and even attitude towards education of girls. Most women of the sample households reported that they did not do any work in the fields. One of them, to emphasise her point said, "We do not go out even to pick *sag* (green leaves of mustard, turnips etc, used as a vegetable)". Only two women said that they went to the fields to pick cotton or to supervise the work of hired labourers, during peak periods of agricultural work.

Women in the villages of this area probably never worked in the fields in the way in which women of some other cultivating groups in North India do. [1] But the trend towards women not doing any work in the fields is recent. The change has occurred only during the last 15-20 years and is related to agricultural prosperity, increase in education and in urban influence. The older women in several households said that earlier they used to go to the fields to pick cotton, bring fuel and vegetables for the home and fodder for the livestock. One woman regretting the change said, "The young women do not do hard work now. They do not work in the fields, and they do not have to grind corn on the *chakki* (hand mill) or to fetch water from the wells, as we had to do. This is why they cannot deliver their babies easily." Domestic work for the women has also become much lighter. Since hand pumps have been installed in most homes, the women do not need to bring water from the village wells. Grinding corn on the *chakki* is no longer necessary, because there is a flour mill in the village. This work, which was generally entrusted to the young daughter-in-law, was often the cause of quarrels in the joint family. Its elimination has been welcomed particularly by the younger women.

The main work of the women now, besides looking after the home, is care of the livestock. This takes a lot of their time, because the animals are kept within the houses at night and also for part of the day. Indeed, they go out to the fields mainly for exercise. The women feed and look after the animals and milk the buffaloes and cows. But they will not clean the cattle shed. Cleaning the cattle shed and carrying refuse to the compost pit are the jobs of the sweeper women. The women do not mind looking after the animals—indeed they are proud of it, because presence of milch animals in the house has always been considered a sign of prosperity in Punjab villages. Even the educated wife of the President of the dairy co-operative spent a lot of time attending to her milch animals and disposing of the milk.

Poultry farming is now becoming popular in this area. In this village, one young man is keeping about 400 birds in a part of his house. His mother and wife do all the work—feeding the birds, collecting the eggs, cleaning the bird house periodically. Two other men have also started keeping a few birds each. One of them is thinking of setting up a big, modern poultry farm. But the attitude of women towards this work is not favourable. In some of my group interviews, the women jeered at the mother of the young poultry farmer

and showed pity for the young wife. "Chicken are dirty", they said, "and looking after them is the job of the sweeper women. Besides, what is the use of keeping poultry, when we can get the same income from one buffalo as from a hundred chicken". These attitudes may change, if poultry farming continues to be as profitable as it has been during the last few years, and the movement towards establishing poultry farms continues among the educated farmers.

Elimination of farm work and lighter domestic work have given the women lot of time, which they are devoting to cooking, better care of the homes, the children and themselves, practising traditional crafts such as *durry* making, and learning new ones such as knitting and sewing.

The women devote much more time to cooking than do women who work in the fields. Two full meals (sometimes three) are cooked daily[2] and the food is substantial and adequate.[3] They are also becoming increasingly conscious of personal hygiene and their own appearance. They bathe much more frequently than they did in the past. A daily bath is now the rule in the summer; but in the winter, they bathe only once in two or three days. Presence of hand pumps in the houses encourages frequent bathing. A number of women use cheap face cream or talcum powder. The wife of the President of the dairy co-operative was using face cream, face powder and lipstick of well known brands. All the younger women said that they used toilet soap and applied oil to the hair. But some of the older women continue the old practice of applying *ghee* to the hair. None of the women, young or old, had ever used mud for washing their hair, which the Meena women of Sawai Madhopur use. The children too were clean and well clothed. Most women possess quite a few changes of clothes. Every time the family goes to town, new clothes and some times new shoes, are bought for one or the other member. Silk or rayon clothes are bought for festive occasions, woollens are bought for winter. All men, women and children were wearing some woollen garments at the time of this study which was conducted during December. Some men possess western style woollen suits, and the women have woollen *salwar-kameez* suits. These are worn on special occasions—visiting the town to see a 'high officer', or visiting a prosperous relative. A large proportion of the cash income of the families is spent on clothing. It is interesting to note that with somewhat higher incomes, the trend among the Meenas of Sawai Madhopur is to spend more on silver ornaments; but in this group the emphasis is *now* on clothing. That they have gone through the stage of spending more on ornaments, was clear from the remarks of the 90-year old mother of the Sarpanch. She said, "I have seen three ages *(zamana)* in my life. First, there was the 'silver age' when all of us wore silver ornaments. Then there was the 'gold age'; now it is the 'cloth age'." The women do have gold and silver ornaments; but they were not wearing any ornaments at all. This is a significant trend, for it shows that in course of time possession of ornaments may not remain what value it is today with villagers in most parts of India.

Washing of clothes is almost a daily routine. Frequent washing of clothes is necessary because of the preference for higher shades of colours in clothes, in contrast to the dark colours worn in Rajasthan. Ordinary washing soap, Surf and even Lux flakes are used.

Houses and Household Goods

Most of the houses (16 out of 18 among the sample households) are *pucca*. All houses have hand pumps, nearly two-thirds are fitted with electricity. Electricity is used mainly for lighting: only 5 households possess radios and 5 have electric fans. However, 13 households possess bicycles, 11 own sewing machines and 9 have kerosene stoves or electric heaters. In the house of the President of the dairy co-operative, the drawing room was furnished with a cane sofa set (without cushions), chairs, a dressing table, a bedstead and curtains. There was some modern furniture in his father's house also. But this family is clearly an exception. The other households cannot set apart a room, in their small, crowded homes as a drawing room. The only 'modern' furniture seen in their homes were a few chairs. However, old style bedsteads (called *palangs)* of good workmanship were seen in a number of homes.

There is a definite trend towards modernising the home and buying new, durable consumer goods. Several women showed me their radios, sewing machines and other possessions with obvious pride. In most cases, the articles had been brought by the daughter-in-law married to the educated son (employed in the town) in her dowry.

But most of the houses are congested and are not very clean. This is due partly to the large size of families and partly to the practice of keeping animals within the houses. Moreover, installation of hand pumps has made the houses damp—a portion of the courtyard always remains wet. It has also made the lanes outside the houses wet and dirty, and given the village pond a permanent existence. Most of the women did not show any concern about the insanitary conditions of the streets of the congestion and damp within the houses. This lack of concern may be due partly to the feeling that nothing can be done about these things. Tightly clustered houses, narrow, dirty lanes, lack of drainage and presence of stagnant water at various places are common features of villages (and most towns) in North India, and are accepted. But some of the younger men and women are thinking of getting away from it all, by building their new houses in the fields.

The need for additional space felt by these families has been met (in the recent past), by construction of one or more rooms on the first floor. These rooms are well-lighted and are of relatively modern design. They are generally used either by the young educated daughter-in-law (if she is staying with the family) or are reserved for guests, such as the son-in-law.[4] But addition of rooms on the first floor has cut off sunlight from the ground floor rooms and has made the principal living quarters of the people darker and more dingy.

Women in the two households having *kutcha* houses said that they had not made their houses *pucca* because they were thinking of building new houses outside the village. But the movement towards living outside the village has not yet started. So far, only the Sarpanch, a refugee from the West Punjab canal colonies, has built a house on the outskirts of the village. His house, with its enormous courtyard *(ahata)*, cattle sheds and feeding stalls, well separated from the living rooms, is patterned after houses in the canal colonies. It presented a pleasant contrast to the other houses. But no other family has followed his example so far.

Health

Modern facilities for treatment of disease, maternity and child care are within easy reach of the village, and are being used by the people. There is a good hospital at the block headquarters town, Samrala. Besides, there are three sub-centres each under the charge of a trained nurse-midwife, which provide assistance for maternity and family planning. The village is in the area of the sub-centre located in the next village, a mile away. The village *dai* is undergoing training at the sub-centre. She assists the nurse-midwife in conducting delivery cases, and will be 'authorised' to handle these cases on her own, after she has completed the one-year training course. According to an order of the Punjab Health Department, no untrained *dai* can handle delivery cases on her own. I did not have the opportunity to investigate how strictly this order was actually being followed.

All the women reported that for all ailments, major or minor, they consulted a doctor, the qualified private medical practitioner at Samrala. He lives in the next village and can make the rounds of this village on his way to and from the town. They said that they went to the Government hospital only when this doctor was not available. Cases of serious sickness or serious injury are taken to one of the hospitals at Ludhiana. The city has a number of good hospitals including one attached to the Medical College. In half of the sample households, the women reported that they kept medicines such as Anacin, tincture iodine, Amritdhara and brandy at home, and used them for minor ailments. Women in the other households also knew about these medicines, but they were not keeping them. Resort to the doctor is so common that one woman said, "We go to the doctor, even when a thorn pricks us."

All pregnant women are expected to be registered with the sub-centre and visit it regularly for getting ante-natal advice. The nurse-midwife is also expected to conduct house-to-house surveys periodically, in order to make sure that all pregnant women are contacted. But she is confronted with an interesting problem arising from the practice (in this area, as in many others in India) of women going to their parents' homes for childbirth. She explained that a number of women for whom she starts maintaining ante-natal records go away for their deliveries to their parents' homes, while she has to conduct delivery cases of many women for whom she has no records!

The sub-centre also provides advice and assistance on family planning. Of the 32 women in the sample households, 3, all below age 35, were using family planning devices. Two more showed interest, but were not using any device. One woman, who complained about having a large number of children, was hesitant about using any family planning devices. Most women knew about family planning practices but were not unwilling to talk about them; some expressed a desire for a birth control pill. The lady doctor at Samrala hospital mentioned that some men of the village had had vasectomies done. But no such case was mentioned among the sample households.

Education

All the girls of primary school age, i e, 6-11 years, are going to the village school. Half a dozen of the older girls go to higher secondary schools in Samrala. I used to meet these girls, going to school or returning, on their bicycles, on my way to or from the village. They all rode gents' bicycles: the families could not perhaps afford to buy separate ladies' bicycles. This phenomenon—young girls going out on bicycles—would have been unthinkable a generation earlier, when a girl was not allowed to go out of the village unescorted. Girls from some of the more prosperous and progressive families are receiving education in colleges (or other training institutions) in towns. They stay in hostels. Two daughters of the President of the dairy co-operative are studying outside the village—one is in a college at Ludhiana, while the other is in the higher secondary school at Samrala. The daughter in another household is receiving the Physical Training Instructors' training at Patiala. In another household, the daughter is receiving the basic teacher's training. Another girl (not in one of the sample households) is studying for the B T diploma. A sister of this girl had recently flown to Canada to get married to a man (of the caste) settled in Canada. The village women were referring to this as an example of the 'forwardness' of the family. There was no hint of disapproval, or of embarrassment that such a thing should have happened in their village.

Education of girls has become a thing of value with the group. All families are sending their girls to school, and the more progressive ones are sending them to institutions of training which will equip them for careers. Some young women from the village have already taken up jobs. The Deputy Inspectress of Schools at Samrala is the daughter-in-law in one of the sample households. Both the women teachers in the village school are women of the village. This preference for 'career training' to getting a university degree, is significant. Some of the women said that they would like to see their daughters equipped for a career in time of need.

But education of girls is a recent phenomenon. This is brought out very well by data on the number of educated females of different age groups presented in the table. It will be seen that all the 14 women above age 35 are illiterate: among those below 35 more than half are educated, but all the girls of school-going age are going to school. It may be noted also that all the daughters-in-law living outside the village are educated. These women, married to educated men—their husbands are all in white collar or military service—had to be educated to get married to educated men. This shows a pattern of selectivity in emigration, and also provides a clue to the motivation for education of girls. Girls are being educated because educated men, who are in service and who are the prized grooms, want educated wives. The changed work pattern of the women—their being at home all the time and having adequate time for household work and child care—also helps education of girls. Older girls are not needed in the house to look after younger brothers and sisters or to help the mothers with household tasks.

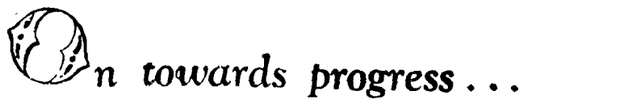
But this trend towards education of girls, with a view to marrying them to educated young men in service, is creating an interesting situation within

Table: Number of Educated Women of Different Age Groups

No of households			18
	Total	*Educated*	*Illiterate*
No of women above age 35	14	—	14
No of women below age 35	22	12	10
Daughters-in-law of households living outside the village	10	10	—
	Going to School		*Not going to School*
No of girls of school age (6-14 years)	18	18	—

the group. On the one hand, the problems of finding suitable grooms for educated girls and giving an adequate dowry—problems characteristic of the urban middle class—are appearing. The recent journey of a girl to Canada shows how far the families are prepared to go to meet these problems. At the same time, it is becoming increasingly difficult for illiterate, or barely literate, young men who remain in the village and work on the farm to get married. This difficulty, caused by the absolute shortage of women referred to earlier, has always been there; but it is accentuated by the tendency to educate girls and marry them to educated young men in service. The gravity of the problem will be appreciated from the fact that among the 43 males, above age 18, in the sample households, as many as 15 are unmarried. Reference was made to this problem by the women in 3 households. In one household, that of a small farmer with a holding of only 6 acres, four unmarried young sons were living with their aged father and mother. They had no hope of getting married because their holding is so small. In another household, only one of the three sons was married. Their father said, "The Jats will not give their daughters to us, because our holding is small, and we are not prepared to buy women from outside. It is a lucky father, who can marry all his sons!"

The difficulty of finding wives is met to some extent by buying women from outside the State. These women, usually from poor families of low castes are brought from U P, West Bengal or the South. There were no such women among the sample households; but there were three in the village. I could meet all these women and listen to their interesting life histories. I met some of them in the neighbouring village, of the sub-centre, also. The men of that village are well known in the area for bringing women from outside, and there were about a dozen such women in that village.



Notes

1 The Meena women of Sawai Madhopur district of Rajasthan, among whom I had conducted a similar study earlier, do all agricultural work except ploughing. In fact, from an analysis of farm work in this area, I came to the conclusion that they do more work than their men.

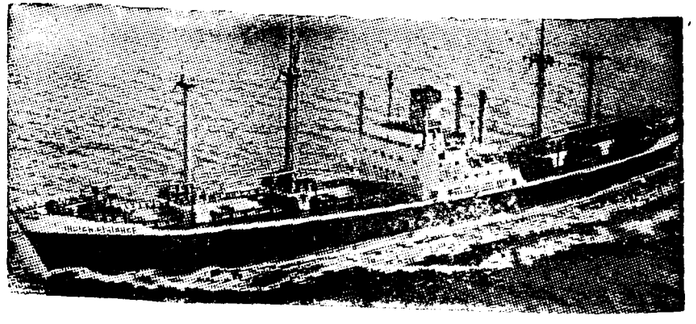
2 The Meena women of Sawai Madhopur would finish most of their cooking for the day in the morning, before leaving for the fields, and would cook only hot *chapatties* in the evening.

I did not collect any data on food consumption. But use of plenty of milk and ghee and vegetables (especially green leafy *'sag'*) was so evident.

The women used the Punjabi word for guest *(paraohna)* also for son-in-law. Obviously, sons-in-law are the most frequent or the most honoured guests.

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.



Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Case for Curb on Advertising

I S Gulati

What is the rationale of fiscal curbs on advertising?

This is a question well worth asking at this juncture, when, on the one hand, the Government of India proposes to put a curb on advertising expenditure and, on the other hand, strong and vocal opinions are determined to thwart any attempt on the part of the Government to restrict the freedom of businesses to spend as much as they like on advertising.

IS not the basic objective of advertising to inform? Information is no doubt the main purpose with which a businessman advertises. He wants people to know what he produces, how and from where his products can be obtained, and at what price. The wider the area covered by one's advertising, the more extensive ordinarily is the market for one's product. If advertising pushes leftwards the cost curve, it is supposed to be more than compensated by the rightward shift of the demand curve, i e, the rightward shift in the demand curve is relatively larger, such that the quantity sold is greater in spite of the increase in price. To put it in still more sophisticated terminology, the advertising expense is incurred with a view to gaining additional demand for one's product and rational calculation would suggest that a businessman would call a stop to advertising at the point where the last unit spent on advertising is just about offset by the excess of the price charged over the cost incurred on the production of the additional unit of output.

The question arises: If this is how a businessman ought to be behaving if he wants to maximise his profits, why at all should the Government contemplate a curb on the businessman? It is to the advantage of the Government, insofar as it claims a proportion of business profits as tax, to permit, indeed to encourage, the businessmen to maximise their profits. And if advertising helps towards this objective, why at all put a curb on it? Is not all advertising, therefore, a legitimate charge on the gross receipts of a business before calculating its taxable profits?

Creation of Synthetic Demands

Before we attempt to answer these questions regarding the rationale of Government curb on advertising, let us be clear about the purposes other than to inform, for which advertising might be used. As against genuine information, for which advertising might be used, advertising might be resorted to for deliberate mis-information. This should not be taken to suggest that advertising that does not inform belongs entirely to the other extreme and necessarily mis-informs. The truth in most cases may be somewhere in between.[1]

The point is that in actual practice, most advertising does not content itself with informing. In fact, as is well known, the most advanced techniques of advertising are directed less at supply of information or, for that matter, even mis-information, than towards the creation of new demands. Techniques have been evolved whereby the consumers' minds are constantly trained to make particular demands. Readers of John Kenneth Galbraith's "The Affluent Society" will recall how he bemoans the fact that in America it is the chief preoccupation of advertising to create 'synthetic demands'.[2] And massive advertisement outlay every year is defended on the ground that it sustains total demand at or near the full-employment level.

Economics of Advertising

Whether advertising informs or mis-informs, whether it subserves genuinely felt or synthetic demands, the economics of advertising, it might well be argued, remains as before — a business man will still equate his costs and gains at the margin and decide where to stop in his advertising campaign. Thus, it might be argued, there is still no rationale in economics at least for a Government curb on advertising, even though on social grounds a case could be made for regulation of advertising.

The logic of the above argument is not unassailable, however. Even on economic grounds, one could argue for regulation of advertising. First, in aggregate or macroterms, the case for unregulated or unrestricted advertising becomes very weak if we accept Galbraith's argument that outlays on 'public'[3] projects are remunerative, economically as well as socially. Thus, a crore of rupees gained in aggregate demand through advertising and consequential increase in total demand is to be compared with the same amount gained in aggregate demand through outlay on 'public' projects. For a developing economy, more than for highly developed economy, the calculation of economic gains secured through these alternative methods of raising aggregate demand, is very important because, if Galbraith is right, spending on advertisement rather than on 'public' projects should retard the pace of economic growth.

Second, the presumption of profit maximising behaviour is, as even undergraduate students of economics know, subject to several qualifications. Moreover, whatever else one might say regarding high rates of income and profit taxation (and personally I have always expressed myself against very high rates of taxation), it will be difficult to dismiss the argument that when a businessman pays in tax as much as two-thirds to three-fourths of additional income or profit, the urge to economise (and thereby to maximise profit) cannot be anything but weak. And the urge might be in the opposite direction when avenues are open whereby a part of taxable profits can be shown as expense incurred for the purposes of business. Let it be added at once that this applies to all expense, be it on advertising, entertainment or even on items supposedly much more essential to the very process of production, involved in the generation of any income. It is interesting that the Government notification laying down limits and conditions for allowance of expenditure dealt with expenditure not only on advertisement but also on guest houses and travelling, including maintenance and running of motor cars for the purposes of business.

Impact of Curb

Also, when a Government levies high rates of tax on income and profit the stake of revenue in the profit of business is also correspondingly high and it is only natural for the Government to be anxious that only genuinely necessary expense is charged against gross receipts of business. No doubt, the income tax law already provides that expenses wholly and exclusively incurred for the purpose of business

are deductible, but this has been very narrowly interpreted by the courts. The tax authority is precluded from disallowing an item because it is unreasonably high. Strict government check and even regulation of business expenses are necessary concomitants of high rates of profit taxation.

Advertising is an important item of expenditure. As a recent study by *The Economic Times* shows, in the case of some important companies advertising expense may be as high as 20 to 30 per cent.[4] Even if the company profits are taxed at the rate of 50 per cent, the stake of the Government in advertising expense is evidently high in the case of such companies.

From the point of view of revenue, if the estimate of *The Economic Times* based on the study of 111 companies is correct, the corporate sector will have to cut down under the proposed rates advertising expenditure by more than Rs 30 crores. This should mean that the net gain to revenue, assuming of course, that taxable profits would go up by the full amount of saving effected in advertising expenditure, should amount to at least Rs 15 crores a year. But *The Economic Times* estimate is most probably on the high side. If one applies the same ratio of advertising expenditure to turnover as obtains for 111 companies (i e, 0.7 per cent) to the entire corporate sector, the total advertising expenditure for the year 1962-63 could not be above Rs 35 crores. Therefore, the reduction in advertising expenditure even at the estimated rate of 63 per cent[5] would work out to Rs 22 crores. My suspicion, however, is that the advertising expenditure of the entire corporate sector might have been even lower than Rs 35 crores. The ratio of advertising expenditure to turnover for the entire corporate sector is unlikely to be 0.7 per cent. Assuming that the corporate sector's advertising expenditure is around Rs 30 crores, the maximum reduction that could have been secured under the proposed rules would be Rs 19 crores.

Advertising and Sales

It might be objected that the very assumption that the taxable profits of the corporate sector will go up by the full amount of the savings effected in advertising expenditure is not correct. Will not curtailment of advertising cause a reduction in sales and therefore in profits? This, no doubt, is an important question. If sales went down, not only will there be a fall in profits, there will also follow accumulation of unsold stocks, excess capacity and unemployment.

In fact, the question posed above is basically a question of aggregate demand which among other things advertising is supposed to maintain. But the basic principles of Indian economy, unlike those of the Western economic systems, especially the American economy, stem not from a tendency of aggregate demand to lag behind the total supply but from the difficulties of matching total supply to the aggregate demand. To put it very simply, deficiency of demand is not the problem we face in India. Our problem is of raising adequate output to meet demand. In such an economy, advertising does not have to raise the level of total demand. In fact, too much of advertising might be harmful in an economy of this time. It exercises an inflationary influence in an already extended economy. There is, to say the least, little weight in the question posed above, insofar as the Indian economy is concerned. In all likelihood, the reduction in advertising expenditure should be reflected, more or less, fully in the increase in taxable profits and consequently in Government revenue.

The Press

Let us at this point take note of another argument against curbs on advertising, viz, its indirect financing of the newspaper industry. In point of fact, this seems to have been the weightiest of argument that possibly prevailed upon the Government to rescind the part of the Notification prescribing limits on advertising expenditure.[6]

There is no denying the fact that advertisement revenue is the most important source of income for our newspapers and magazines. If therefore business advertising were curtailed, it will certainly hit the newspapers and magazines. Further, while the major portion of advertising revenue is bagged by a few newspaper and magazines with very large circulations, the worst sufferers in consequence of any curtailment in advertising will be the smaller newspapers and magazines. Advertisements to these small newspapers and magazine will most likely be slashed first and far more drastically than those to bigger newspaper and magazines.[7] No wonder then that the whole press, big and small has most vociferously backed the advertising industry's case against any curb.

But let these small papers and their sympathisers and supporters (I am one of them) ask themselves the question: do they want these papers to subsist on the crumbs previously doled out to them through business advertisements or would they rather that they subsist on the strength of their quality? If quality papers and magazines have to be sustained by society, let us devise more honourable ways of supporting and subsidizing them instead of throwing them to the uncertain mercies of business advertising.

It will be worthwhile noting also that advertising involves foreign exchange. A glance at an Indian daily in which anything up to 50 or sometimes even more of the space is taken up by advertisements will convince anyone that of the current annual import of newsprint to the tune of Rs 8 crores a major portion can be set against advertising.

Conclusion

In conclusion, it must be added that while there is a good case for the tax authorities to exercise some sort of check on the advertising expenditures of businesses (as also on other items of expenditure not wholly and exclusively incurred *for the generation of income*), there might still be considerable room for argument regarding the manner and extent of curbs to be imposed. In principle, the idea of (a) relating admissible advertising expense to the value of turnover and (b) progressively reducing the proportion admissible as the value of turnover increases, as embodied in the Government Notification, is sound. Maybe the proportion allowed by way of advertising expense is rather small for all slabs of turnover. Maybe, the progressive declines in the proportion allowed is too sharp. These questions cannot be definitely answered, at this stage at least.[8] But the basic idea ought not to be given up

Notes

1 It is not generally realised how much of advertising, especially with regard to consumer items is mis-leading. Take the case of common analgesics which are advertised under various names but are no better than pure aspirin. And how much more does one have to pay for a branded product compared to aspirin? I am afraid Subrata Banerji over-emphasises the virtues of branded articles (*The Economic Weekly*, April 17, 1965).

2 See pages 121 and 123 (British edition published by Hamish Hamilton, London, 1958).

3 I am deliberately using quotes to signify that the term is employed after Galbraith's usage.

4 In 1963 Hindustan Lever made a taxable profit of Rs 447 lakhs after providing for advertising expenditure of Rs 120 lakhs. From its pre-tax profit, the company provided 64 per cent for taxation. See *The Economic Times* of March 28, 1965.

5 The rate of 63 per cent is worked out for 111 companies. It might well be objected that this rate will not apply to the entire corporate sector, if the advertising expenditure incurred by other companies is, as a proportion of value of their respective turnover, closer, or equal to or also lower than the prescribed limit.

6 It is a sad commentary on the political courage of our Central Government, and especially of the Finance Minister, that a measure like this was withdrawn the moment the Press raised a howl. Why at all was it introduced if the Minister was so uncertain of its merits?

7 For the purely economic reason that the contribution of these small papers to the furtherance of the objectives of advertising will be minimal.

8 I must add here that in its pre-occupation with the rules regarding advertising, the Press has completely overlooked the rules regarding other expenses laid down in the same Government Notification. For instance, the rule regarding foreign travel on business appears to me to be unduly restricted. Why must the admissible expense on foreign travel be confined to that proportion of the total expense abroad (i e the foreign exchange allowed) as the number of days of travel required by reasonably direct routes bears to the total number of days spent abroad? One is not detailed abroad on business to go and touch a place and get back. In any case is the rule intended to suggest that the Government can in the matter of business trips abroad afford to be more generous in sanctioning foreign exchange than in allowing deduction of the connected expenses for income tax purposes?

Pay your annuity deposits the easy way!

OPEN AN A.D. SAVINGS ACCOUNT WITH THE STATE BANK

It may not be easy to pay Annuity Deposits in a lump sum. That's why we started our Annuity Deposit Special Facility Scheme for the convenience of individual assessees. Take advantage of it. Open an A.D. Savings Bank Account at any of the over 1800 offices of the State Bank and its Subsidiaries. You can put money in this account periodically so that, when due, you have the full amount ready to pay your Annuity Deposit.

SPECIAL FACILITIES

1. We can transfer, under your instructions, money from yourCurrent or Savings Bank Account regularly to your A.D. Savings Account free of charge. The two accounts need not be at the same office.
2. You will earn 4% interest on the balance in this account.
3. This amount in your A.D. Savings Account is not reckoned for the ceilings fixed on Savings Accounts.

Marketable Surplus Function for a Subsistence Crop

Further Comments

I Manoranjan Majumdar

Raj Krishna (The Economic Weekly, Annual Number, February 1965) finds that in the case of most of the sample data he studied the amount of marketable surplus is a linear function of farm output.

Such being the nature of the marketable surplus function, Raj Krishna concludes, the usual arguments for discrimination in favour of large farms to increase the marketable surplus do not hold. Even with farm size structure remaining what it is, output increase will lead to more than proportionate increase in marketable surplus without any discriminatory or coercive Government policy.

The object of this note is to set out some consequences of the linearity hypothesis in the present context — consequences which seem to be at variance with some of our common beliefs as to the nature of marketable surplus.

IN his article Raj Krishna examines the nature of the marketable surplus function for rice and wheat on the basis of some Indian cross-section data. On the simplifying assumption that the amount of farm output which is not retained for consumption is 'marketable', he proceeds to examine three hypotheses :

(i) The marketable surplus (M) is linearly related to the level of farm output (Q), i.e.

$$M = a + bQ \qquad (1)$$

(ii) The relationship is quadratic, i.e.

$$M = a + bQ + cQ^2 \qquad (2)$$

(iii) M is a joint linear function of income (Y) of the farm or the total acreage cultivated (A) by the farm and the family size (F) — all in the logarithmic scale.

Raj Krishna finds that in the case of most of the sample data he studied the amount of marketable surplus is a linear function of farm output (his first hypothesis). 'In very poor, and the very rich, areas it is likely to be non-linear' (the second hypothesis); while the third hypothesis — especially with the acreage cultivated as one of the explanatory variables — gives 'unsatisfactory' results in all the samples. The obvious policy implication of this law of linearity is, therefore: "It is best for Governments to concentrate on inducing increase in farm output without any special discrimination in favour of small or large farms. The nature of the marketable surplus function is such, in most areas, that the usual arguments for discrimination in favour of large farms do not hold. Even with the farm size structure remaining what it is, output increases will lead to more than proportionate increases in marketable surplus without a discriminatory or coercive policy".

The object of this note is to set out some consequences of the linearity hypothesis in the present context — consequences which seem to be at variance with some of our common beliefs as to the nature of marketable surplus.

Viewed from cross-sectional analysis, the most unsatisfactory feature of a straight line is the constancy of its slope, which in the present context gives the measure of what Raj Krishna calls the "marginal propensity to sell" on the part of the farm. If the straight line is accepted as a description of the farm's behaviour as regards its marketable surplus, then assuming, for example, that $b = 0.75$ in (1) above, this will mean that as the farm's output increases by an additional kilogram (say), it will always bring in 750 grams of marketable surplus whatever may be the size of the farm as measured by the level of total production. For instance, consider two farms A and B — A with an average annual output of 100 kg of wheat and B with 1,000 kg. Suppose in a particular year the production of A increases by 10 kg but that of B decreases by the same 10 kg, so that the total production of the two farms taken together remains the same, then in the frame-work of the linearity hypothesis, the resulting increase in marketable surplus by 7.50 kg in the case of the low-output farm A will be exactly equal to the decrease of marketable surplus due to the fall in production in the high-output farm B. Thus a relative change in the level of output in between the farms will not affect the volume of marketable surplus. In other words, the only factor which will determine the volume of marketable surplus is total production of the agricultural sector. The relative position of the different farms in the output-scale will not come into the picture.

This is clearly an incredible state of affairs at least over a wide range of output. On the contrary, there is every reason to think that as the level of output increases, the "marginal propensity to sell" out of the farm's produce also increases, so that even when the production of a high output farm increases by the same amount as that of a low-output farm, the increase in the marketable surplus of the former will be greater rather than be equal to that of the latter.

It should be noted that in principle, at least, Raj Krishna accepts this fact. This he does when he comes to consider the nature of a "general marketable surplus function" (p 313). In fact, his brief outline of this "general function" is based on the postulate that "after a certain level of income is reached the cultivation of the subsistence crop becomes highly commercial and the marginal propensity to sell rises with output" (pp 311-313). However, he does not take up the implication of this postulate in the empirical part of his analysis. Instead he places the weight of his judgement in favour of a linear marketable surplus function and makes policy recommendations entirely on this basis.

It is significant that in all the samples examined by him the elasticity of marketable surplus with respect to output is greater than unity and decreases towards unity as output increases (see his Table 2, p 313). This is a direct consequence of the negative value of the intercept, a, in his estimated linear functions. It is a well-known property of the linear function that whenever the intercept is negative, the resulting elasticity expression decreases from a high value towards unity as the value of the explanatory variable increases (which, in the present case, is the level of farm output). Now, writing E_{MQ} for the output elasticity of marketable surplus and E_{CQ} for the elasticity of consumption with respect to output, one gets, from his definition of the marketable surplus,

$$\frac{M}{Q} E_{MQ} = 1 - \frac{C}{Q} E_{CQ} \qquad (3)$$

Expressed otherwise, this means that the weighted sum of the output elasticity of marketable surplus and the output elasticity of consumption equals unity — the weights being the proportion of output 'marketable' and that 'retained for consumption', respectively.[2]

Thus, if the output elasticity of marketable surplus is decreasing as the linearity hypothesis would have us believe, then it follows that the output elasticity of consumption increases from a low level to a high level as the level of output increases. But since, farm income is an increasing function of farm output, this is the same as saying that the income elasticity of consumption increases with a rise in income. I think few will be ready to accept this result. On the contrary, there is every presumption to argue and the evidence of all consumption studies shows, that the income elasticity of consumption which measures the proportionate increase in consumption due to a proportionate increase in income, actually declines as the level of income increases. Thus the linearity hypothesis in marketable surplus analysis comes upon a result which is just opposite to what is generally held to be true. The Table below is a reproduction of Raj Krishna's Table 2 (p 313) for the first set of his samples — except for columns (3′) and (5′) where we present the estimates of output elasticity of consumption, E_{CQ}, along with those of the output elasticity marketable surplus, E_{MQ}, both at low and high level of output. These estimates of E_{CQ} are computed by using the relation (4) above directly from Raj Krishna's fitted functions (his Table 1, p 310). Columns (3′) and (5′) of the table presented here clearly show how as a result of the linearity hypothesis we are led to an unreasonable situation where the elasticity of consumption increases as the farm passes from a low to a high level of output.

In this connection it may be mentioned that unlike that of the linearity postulate, the output elasticity of marketable surplus which follows from his second postulate of a quadratic function is indeed a rising function of output. This is because with both b and c positive — as is evident from his table 4 (p 315) — the "marginal propensity to sell" in the case of a quadratic function always increases with the level of output. [This can also be seen from his Table 6 (p 316) where he presents the numerical values of the "marginal propensity to sell" estimated from his fitted quadratic function.] In an increasing range of the "marginal propensity to sell", the "average sales ratio" (M/Q) also increases, but still remains below the former. As a result, the output elasticity of marketable surplus defined as the ratio between these two increases with the level of output. However, while presenting the estimates of the increasing "marginal propensity to sell" from the quadratic function, Raj Krishna does not examine its implication for the nature of the elasticity of marketable surplus. But it is rather easy to see that the elasticity estimates obtained in this way are more in line with common experience than what is suggested by the linearity hypothesis.

All this, however, does not mean that we are putting up a case in favour of his second hypothesis. The quadratic function it may be noted is not meaningful as a marketable surplus function for a wide range of output. Instead, it may be worthwhile to follow up the implication of the "general marketable surplus function" outlined by him and tentatively suggest an alegebraic form of this function along the line of our above reasoning.

For this purpose we may begin with the postulate that the marketable surplus is a function of farm output such that the slope of the function increases as the level of output increases. As we have seen, this implies an increasing elasticity of marketable surplus with respect to the level of output. Let us specify that this elasticity expression varies proportionately with output. Thus we write

$$E_{MQ} = bQ \qquad (4)$$

where, as earlier, E_{MQ} stands for the output elasticity of marketable surplus, Q, the level of output and b, the proportionate factor. Remembering the definition of elasticity, (4) is then seen to be contained in the following differential equation:

$$\frac{dM}{M} = b\, dQ \qquad (5)$$

with the obvious interpretation that a small relative increase in marketable surplus is proportionate to a small increase in the level of output. Solving (5) we, therefore, get the following relation:

$$\log M = a + bQ \qquad (6)$$

where a is the constant of integration. Expresed otherwise, (6) means that at a given level of farm output the amount of marketable surplus tends to increase in geometric progression as the level of output increases in arithmetic progression.

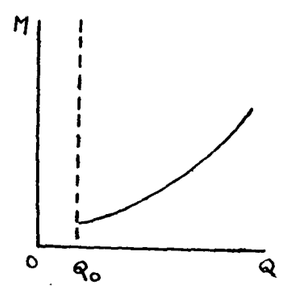
Now it is obvious that a farm will be able to produce marketable surplus only when its scale of production reaches a critical level of output, say, Qo. Below Qo the output of the farm will be barely sufficient for its consumption needs, though it may not be unreasonable to think that such a low output farm may still bring some portion of its produce to the market to meet its cash requirements. In any case, it will be more realistic to say that the relationship (6) will hold only when the output is above Qo. We may, therefore, require (6) as

$$\log M = a + b\,(Q - Qo) \qquad (7)$$

where, $Q \geq Qo$. When plotted in terms of Q and M, the function (7) will have the form shown in the diagram on p 822.

It may be seen that for this function the value of marketable surplus is non-negative. In particular, when the farm is at the "critical" output level, Qo, it will bring ea amount to the market where e is the base of na-

Table: Output of Elasticity of Marketable Surplus (E_{MQ}) and of Consumption (E_{CQ})



Equation Symbol	Low Output (mds)	E_{MQ}	E_{CQ}	High Output	E_{MQ}	E_{CQ}
(1)	(2)	(3)	(3′)	(4)	(5)	(5′
PB-51	25	4.47	0.18	200	1.11	0.21
PB-53	25	8.58	0.10	200	1.12	0.47
PB-55	25	3.01	0.16	200	1.09	0.62
PB-57	60	1.70	0.09	200	1.14	0.25
PB-59	25	4.84	0.16	200	1.11	0.60

tural logarithm. In all probability a will be negative when fitted to the cross-section data on marketable surplus, so that the numerical value of e^a will be very small. The slope of the function will vary proportionately with M such that in the neighbourhood of Qo, the increase in the "marginal propensity to sell" will be slow. But to the extent output moves away from Qo, increase in the "marginal propensity to sell" will become rapid.

It is not proposed here to give an empirical application of this marketable surplus function. But experience shows that empirical performance of (7) is likely to be satisfactory when compared to that of the straight line model (1). In that event the policy implication derived from (1) will also change — in particular, an increase in aggregate output will then not be the only determinant of an additional quantity of marketable surplus, the latter will also depend on the existing size distribution of the farms. As for statistical estimation of the function, the obvious procedure will be as follows:

Given a set of cross-section data one can tentatively choose several alternative values of Qo equi-distant from each other from graphical plotting and obtain the corresponding estimates of the parameters, a and b by least square regression. Then the final choice will be that value of Qo and the associated estimates of a and b which will give the minimum value of the sum of squares of deviation of the estimated M from the observed M.

However, the pertinent question is whether it is realistic to analyse marketable surplus in a single-equation model like the above one where the output of the farm is treated as an exogeneous variable. In a truly general model, both the production function and the marketable surplus function will enter as the essential elements of a complete system, so that, given the relevant technological ratios and the necessary inputs, the output and the marketable surplus will be simultaneously determined within the system. An analysis of this kind is overdue in this country.

Notes

1 As he works with cross-section data related to a single period of time, variation in prices does not, in principle, affect his analysis.

2 This can be derived as follows:

We have, $M = Q - C$

Where, as before, M stands for marketable surplus, Q, for farm output, and C for consumption. Now differentiating with respect to Q, we get

$$\frac{dM}{dQ} = 1 - \frac{dc}{dQ}$$

$$\text{or } \frac{Q}{M}\frac{dM}{dQ} = \frac{Q}{M} - \frac{C}{M}\frac{Q}{c}\frac{dc}{dQ}$$

$$\text{or } E_{MQ} = \frac{Q}{M} - \frac{C}{M}E_{CQ}$$

$$\text{Hence, } \frac{M}{Q}E_{MQ} = 1 - \frac{C}{Q}E_{CQ}$$

II Brahmanand Prasad

THE findings of Raj Krishna's study are that in general the elasticity of sales with respect to output, above the subsistence output, is greater than unity. Therefore, his policy pronouncement is that there is no case for adopting a discriminatory policy in favour of larger farms for increasing the marketable surplus of foodgrains.

Apart from methodological error in selecting his samples, the reader is left with the feeling that the arguments advanced by the author suffer from constant failure to clarify assumptions, and a tendency to treat assumption as having demonstrated relevance, which frequently they do not have. These defects in his analysis are examined here.

The Sample

(1) A sample which could have an all-India relevance must satisfy the following norms:

(a) the samples must be selected without bias or prejudice;

(b) there should be no underlying differences between areas from which data are selected; and,

(c) conditions must be the same for all items in the sample.

In the study under reference the method adopted for selecting the samples is arbitrary and far from scientific. Out of 23 samples selected, 9 are purposive samples, 12 are census samples and the remaining 2 are random samples. By any statistical norm, they can hardly be described as samples. Moreover the samples give weightage to surplus food producing areas like Punjab and western U P. Out of the 23 samples, as many as 12 are from these zones. Samples of other areas suffer from underweightage. There are only 2 samples from Madras, 3 from Madhya Pradesh, 1 from Delhi, 1 from Orissa, 2 from Maharashtra and 2 from Andhra Pradesh. Raj Krishna has avoided selecting samples from subsistence regions and states like Eastern UP, Bihar, Orissa, parts of MP, Rajasthan and West Bengal. It is, therefore, no accident that deviation from linearity is found in random or census samples.

Raj Krishna further points out that four out of the 10 non-linear village samples are characterised by very low mean income or mean holdings or mean output of the subsistence crop. I wonder if he is suggesting that it is far from the general characteristic of Indian farming units. According to current estimates about 75 percent of the holdings are small in size and a majority of them have marginal or no economic viability.

(2) In choosing purposive samples, Raj Krishna selects four villages which include "big" as well as "medium" and "small" farms. It is not clear why such a procedure should have been adopted when his preoccupation is with analysing the marketable surplus function of subsistence farms. These samples would certainly inflate the mean and would give a distorted picture of the subsistence farms. Or, does he mean to suggest that these four samples are sufficient to draw any conclusion about the marketable surplus function of medium and large farms. Either way, the method is of questionable validity.

What Is the Subsistence Level?

(3) Raj Krishna says that, "in the areas covered by these samples the marginal *propensity to sell* out of the output of a subsistence crop is constant over a wide range of output above the *minimum subsistence output*". This inocuous statement has a big catch in the words "above the minimum subsistence output". According to his own admission, the proportion of farmers producing less than the minimum subsistence output varied widely from 5 to 46 per cent in the various samples. If the samples had covered the heavily populated deficit or subsistence States of the country, these proportions would have certainly gone up. Moreover, when the vast majority of the rural population is underfed, the subsistence level of food intake is likely to fluctuate with the growth of income of the farmers. In another study on an identical subject, it has rightly been pointed out that small farmers are forced to make "distress" sales of their output to meet their money needs like rent, servicing of debt, and to purchase other necessaries of life as salt, kerosene and clothing and are forced to live on less than subsistence diet. In a period of relatively high prices, the producers' real burden is reduced and the favourable circumstances enable them to retain all they need. When prices rise, they are able to increase their cereal intake,[1] as has been the case since 1943. In other words, windfall gains in income through higher produce prices increase the reservation demand of the producers, reducing the marketable supply of foodgrains.

According to the study by Dharm Narain referred to above 26 per cent of the marketable surplus is accounted for by holdings of the sizes below 5 acres. Holdings of sizes between 5 to 10 acres account for another 20.5 per cent of the total marketable surplus.[2] That is, holdings of sizes upto 10 acres are responsible for contributing the major portion (46.5 per cent) of the marketable surplus and are operationally more significant. Historically also, the findings of the latter study have been vindicated. During the Great Depression the Indian cultivator actually fed the people at ridiculously low prices, starving himself and his family.[3] Even in the contemporary situation most of the indebted cultivators, who account for 60 to 80 per cent of all cultivators, are forced to sell their produce to the moneylender-cum-trader at less than the market price. The pre-determined low price of their produce forces them to sell the output they actually need for their own consumption. Under the circumstances, it does not appeal to commonsense that farmers who are forced to part with a major part of their produce under "money" pressure would continue to sell the same proportion of the additional output and continue to subsist on below normal food intake.

Price Changes Ignored

(4) Raj Krishna does not take into consideration changes in foodgrains prices because time series data are not available. It needs a stout heart to make a general policy pronouncement without taking into consideration the effects of such an important variable on which the quantum of marketable surplus has been observed recently to depend. Inflationary rise in prices on the one hand raises the real income of the farmers because they can meet their money need by selling a small part of their produce and on the other encourages them to hold back a greater part of the produce from the market in the expectation of getting a more favourable price in the future.

Under the circumstances the applicability of the findings of Raj Krishna's study for the country as a whole is questionable and the policy prescription advanced by him is of doubtful validity.

Incidently, those who favour consolidation of holdings rather than fragmentation through ceiling on land holdings base their conviction on the following grounds. The small size of the holdings and very low real income of farmers are impediments to the introduction of tractor-farming, technological innovations, or other methods of improving agricultural production. Small and fragmentary holdings are also responsible for waste in human energy and material resources. Due to the small size of the holdings, the cost of making improvements like wells, terracing or improving the drainage system become prohibitive in terms of per unit of produce.

Worst of all, much land is wasted in establishing boundaries and paths between the fields of different proprietors. Scattered plots of land over a large area also involve considerable waste of time, energy and manure. Some plots are too small to cultivate. The low productivity of land, due to the small size of holdings and the absence of any improvement in the technique of production, makes cultivation in such cases uneconomic. Many people continue to be agriculturists partly due to their love of land and partly due to the absence of alternative occupations in the villages. The implicit assumption underlying these arguments is that when small farm units are consolidated, the chances of introducing technological innovations are increased. And unless changes are brought about, output cannot be increased, be it on small or big farm units.

Wednesday, Morning

THE corporate news was certainly encouraging. Dharamsi Chemical, Texmaco, Digvijay Cement, Dalmia Cement and Hindustan Aluminium — to mention a few important names — reported considerably improved results for 1964 and dividends have also been stepped up in some cases. And though India and Pakistan have yet to agree to a negotiated settlement of the border dispute, there has been a lull for quite some time in fighting on the Kutch border. No major border clashes were reported last week from other places. But all this brought little relief to the market which continued to have a very uneasy time. In extremely restricted dealings—activity appeared to be almost at a standstill quite often — equity prices gradually drifted lower and moved very near to the year's low point recorded on March 26. A few counters like Tata Locomotive, Voltas and Standard Mills made new lows for the year.

Apart from the frustration caused by the tax concessions allowed by the Finance Minister, the market sentiment last week was affected in no small measure by the rise in the call money rate to a record high of 9 per cent and by the prospect of continuing financial stringency even during the slack season following the Reserve Bank's advice to the member banks to divert their 'surplus' resources into short-term treasury bills. While the interest rate structure has brought about a significant change in the basic outlook for equities, mounting tension on borders has further undermined investors' confidence which had already been at an extremely low ebb.

That equity prices should continue to seek lower levels despite the recent massive support from the Life Insurance Corporation underlines the serious nature of the 'crisis of confidence' in the capital market. With financial institutions unable to dispose of the shares, underwritten by them, the situation in the capital market is likely to become still worse if the growth of investible funds with the financial institutions does not keep pace with the demand for underwriting facilities. The Industrial Finance Corporation has already let it be known that it will be restricting its underwriting activity as it cannot afford to have its funds locked up for too long and there seems no prospect of the shares, underwritten by it, being disposed of at a profit.

The volume of business put through on the stock market has declined to such proportions that not many stockbrokers are able to meet their normal office expenses. The market authorities are naturally very much exercised over the situation. With a view to stimulating activity on the stock exchanges, the standing committee of the presidents of recognised stock exchanges, which recently met in Madras, has suggested that at least 10 per cent of the investible resources of provident funds should be allowed to be invested in industrial securities listed on the stock exchanges and that the Indian Trust Act and the Employees Provident Fund Act should be suitably amended for this purpose. The committee is also reported to have suggested that the brokers should be asked to step up the rates of brokerage. But with brokers competing for a share in the declining turnover, it is doubtful whether they will find it easy to raise the rates which are known to be much below the prescribed rates.

COTTON

Dull Trading

IT has been yet another week of agonising dullness for the cotton market. Business was restricted both in ready and futures. The August hedge contract moved between Rs 767.25 and Rs 765 throughout the week. Against a normal turnover of 10,000 to 15,000 bales, the daily turnover in cotton futures in Bombay has shrunk barely to 1,000/2,000 bales. Considering the very low commission that is charged for speculative transactions in cotton, one wonders how cotton brokers manage to stay in business at all.

According to the Forward Markets' Commission, the monthly volume of business in cotton futures in India which was around 36 lakhs bales in October 1964 declined to merely 3.67 lakh bales in March. The decline in turnover has been attributed to late commencement of forward trading, tight money conditions and strict survey results. But this can be only a part of the explanation. The main reason is that with spot prices quoted near the ceiling most of the time, speculation has lost most of its charm, particularly when there exists a lower arbitrary ceiling for the hedge contract during the pre-delivery period. Yet another important reason why speculators are reluctant to take a very active interest in cotton futures, as also in other commodity futures, is the unpredictable attitude of the Forward Markets' Commission. Strange as it might appear, illegal trading has increased very considerably whereas there has been a marked decline in speculative business in the recognised forward markets. Neither the Government of India nor the Forward Markets' Commission is unaware of this. And, in a way, it is the Commission which has been responsible for this situation. Activity on recognised exchange has shrunk due to the arbitrary manner in which the Commission has been acting from time to time to regulate trading in the name of safeguarding the general public interest.

Of course, nobody need really regret the decline in the volume of speculative activity because the utility of hedge trading in a planned economy predominated by chronic shortages can be seriously exaggerated. No one can seriously say that the decline in the volume of hedge trading has in any way affected the marketing of crops or the return to growers. When arbitrary ceilings, unjudicious margins and the peculiar structure of the hedge contract tend to perpetuate the disparity between ready and forward prices, hedge trading becomes a pure gamble and renders no useful economic purpose.

OILSEEDS

Prices Recede

OILSEEDS prices suffered an all-round setback last week. Castor June receded from Rs 80.70 to Rs 78.80 and linseed June from Rs 98.50 to Rs 96.50 (per 100 kgs). In ready, linseed oil eased from Rs 19.75 to Rs 19.30, castor oil from Rs 17.25 to Rs 16.85 and groundnut oil from Rs 24.35 to Rs 25 (all per 10 kgs). In futures, upcountry was reported an important seller, presumably because mustardseed and mustard oil prices have been reluctant to move up for quite some time. It is tempting to explain, as some have tried to do, the setback in linseed futures as due to the tightening of the margin rules by the Forward Markets' Commission even though the margin will become operative only when the hedge contract rises beyond Rs 100 (per 100 kgs) — the plea made by the Bombay Oilseeds and Oils Exchange for making margin operative at Rs 96 has been turned down by the Commission. But the setback is not such as to call for any special explanation. It is quite normal for a rising market to pause and even react from time to time for necessary technical adjustments.

The decline in prices is really welcome because prices had been rising almost continuously for a long time. That oilseeds prices should be quoted substantially higher than prices prevailing at this time last year has intrigued many observers because the overall supply position is considerably better this season. The rising trend in prices of oilseeds, as also so many other commodities, cannot be adequately explained in terms of physical shortages, though offerings have continued to be rather poor in relation to the size of the harvests. Bullish psychology in commodity market has received considerable impetus from the rise in bullion prices which have been making new highs month after month. Many factors seem to have contributed to the rising trend in bullion prices and weakening confidence in the currency is by no means a small factor.

Despite the arrival of a fairly large quantity of soyabean oil and the Government's permission allowing vanaspati manufacturers to use up to 50 per cent of soyabean oil in the manufacture of vegetable oil products, there has been no noticeable decline in the demand for groundnut oil which has continued to hold relatively steady as compared with other oils. Besides, offerings of groundnut oil have not been such as to cause any pressure on the market. Since there is no real shortage of edible oils this season, it is quite likely that prices will not rise to anywhere near the fantastically high levels reached towards the end of last season, particularly if the monsoon is timely and its progress is satisfactory.

Philips India

INTEGRATION is a practical idea for Philips India. For more than a quarter of a century the management has been striving to make the company an integral part of the Indian industrial and economic scene. Several aspects of this philosophy of integration are manifest in the company's operation. There has been, for instance, a progressive and continuing integration of manufacturing; today Philips India is the leader in the race towards the manufacture of the first all-Indian radio. And at the new plant at Kalwa, near Bombay, the company will soon make almost every component for incandescent and fluorescent lamps. The company helps small independent manufacturers with designs, production techniques, supervision and quality control. They make many essential components for Philips products, and every single component is of a high enough standard to carry the Philips name and guarantee. By imparting information on the one hand and insisting on quality standards on the other, Philips India is helping to develop a host of ancillary industries. Endeavours made in the past years towards accelerating the programme of vertical integration and developing local sources of supplies have resulted in steadily decreasing the requirements of maintenance imports for each unit manufactured by the company. In this regard the company has been receiving valuable assistance from the parent company, N V Philips' Gloeilampenfabrieken of Holland.

The company has reported good progress during the past year. The production of tungsten and molybdenum wire and tungsten coils was begun at the Bombay factory. These are vital components for electric lamps and were hitherto imported. The volume of manufacture of fluorescent lamp starters and burners for gaseous discharge lamps in this unit was larger in 1964 than in the previous year. A similar trend was recorded in respect of production of fluorescent lamp fittings and various accessories thereto by the Calcutta factory. A satisfactory level of production of G L S lamps was maintained in the Bombay factory. The construction work at the Kalwa showed rapid progress, and the building for starting the first phase of manufacturing activity, namely, bulb blowing, is expected to be ready in the course of this year.

There was a notable rise in the production of radio components at the factory at Loni where construction of additional buildings was undertaken to facilitate further expansion of component activities. Production of radio sets in the Loni and Calcutta factories developed satisfactorily. The new unit started in Bombay for the production of electronic servicing and industrial process control instruments was able to increase production during the year. There are plans to expand its manufacturing capacity as also to set up a development laboratory. Steps were taken to implement by early 1965 the phased manufacture of fully transistorised portable wireless communication sets at the factory in Calcutta for defence purposes.

The financial results for the year to December last show rise in sales from Rs 10.63 crores to Rs 11.39 crores. The increase would have been higher but for the stocks destroyed by fire in the company's stores in Bombay. Taking into account the insurance claim in respect of the stocks lost in fire amounting to Rs 53.08 lakhs, the company earned a pre-tax profit of Rs 2.24 crores against Rs 1.66 crores previously, after providing Rs 33.07 lakhs (Rs 25.22 lakhs) for depreciation. The tax liability demands Rs 1.60 crores (Rs 1.17 crores). General reserve gets Rs 20 lakhs (Rs 11.04 lakhs) and development rebate reserve Rs 11.20 lakhs (Rs 5.50 lakhs). The proposed dividend of 18 per cent should absorb Rs 39.60 lakhs (Rs 33 lakhs). After bringing in the excess provision for previous year's liabilities amounting to Rs 8.26 lakhs, the surplus of Rs 2.15 lakhs is carried forward.

Amar Dye—Chem

SATISFACTORY progress has been reported by Amar Dye-Chem in implementing its expansion programme. The expansion of reactive dyes plant has been undertaken, as the demand is rising and the company is the only producer in the country. The Controller of Patents has granted five patents to the company. Extension of the optical whiteners plant has also been undertaken to meet the increased home demand and export requirements. The reduction unit for manufacturing toludines and anisidines is only partly completed, as the company has still not received the necessary import licence for which it had applied in 1962. The building for the TPM second phase expansion is complete, and equipments for most of the projects are on site. It is expected to be in production in the second half of this year. During 1964, the company added quite a few items to its selling range, like an expanded range of reactive dyes, an almost full range of basic dyes and a couple of items in the range of pigment colours.

The results for the year show marked improvement, with sales at Rs 2 crores against Rs 1.50 crores and pretax profit at Rs 13.82 lakhs against Rs 8.67 lakhs, after providing for depreciation Rs 39.03 lakhs (Rs 23.11 lakhs). A sum of Rs 10.96 lakhs (Rs 6.62 lakhs) is transferred to development rebate reserve. The equity dividend is raised to Rs 10 per share for payment of dividends requiring Rs 13.71 lakhs (Rs 8.91 lakhs) Rs 10.80 lakhs are withdrawn from general reserve, while last year Rs 6.60 lakhs were withdrawn from development reserve. The results would have been better but for a labour strike that lasted for about three weeks and boiler failure for about a month; both these factors affected production during the year.

Escorts

ESCORTS is acquiring management and control of a running concern of Bombay known as Bahri Automobile which owns a specialised factory for the manufacture of transmission gears of all types for passenger cars, trucks and heavy earth moving equipment. It also manufactures axle shafts, crown wheel and pinion king pins, rear king pins, etc. These items are needed by Escorts for the manufacture of its agricultural tractors. In fact, Escorts had planned to establish a factory of its own for the manufacture of transmission parts for its tractors similar to those being produced by Bahri Automobile. By acquiring controlling interest of this firm, Escorts will be able to advance its plans for the manufacture of parts for tractors by at least two years by saving the time required in obtaining import licences for machinery and raw materials and for getting the machinery installed and buildings completed. Besides, it will reduce its requirements of investments which otherwise would be required for putting up a completely new workshop.

It is proposed to make Bahri Automobile a subsidiary of Escorts by owning majority share capital of this firm. Shares of the value of Rs three lakhs out of the total paid-up capital of Rs 30.21 lakhs have already been purchased by Escorts from the existing shareholders. The directors of Bahri Automobiles have decided to issue further equity capital of Rs 25 lakhs and to allot these shares to Escorts. The proposed fresh investment will be made by Escorts after obtaining sanction of shareholders. Meanwhile, it has been appointed sole selling agent for the entire range of production. There is already a good market for these products and, if necessary, Escorts will arrange technical know how from foreign countries with a view to enabling this unit to further improve its quality.

Escorts also proposes to appoint Commercial and Industrial Exports, a Tata group organisation, as sole exporter to export products manufactured or supplied by it to all countries except Iran and Afghanistan where it has already appointed distributors for agricultural equipment.

Ultramarine and Pigments

DURING the past several months, demand for indigenous ultramarine blue has been rising as is evident from the latest annual report of Ultramarine and Pigments. The company was able to sell its entire production during the year to December 1964. From the beginning of this year, demand has been more buoyant, with orders coming in faster than the company can execute and both production and sales have been to the full capacity. With a view to raising the production capacity, the company has already taken in hand the work of expansion. For this purpose additional land has been purchased, and new machinery and equipment are being installed. It is proposed to double the manufacturing capacity to 1,200 tons per year by the end of this year.

The company has produced pleasing results for the year 1964, with sales rising more than four times to Rs 33.86 lakhs and gross profits at Rs 12 lakhs nearly seven times the 1963 level. After providing Rs 5.48 lakhs (Rs 3.38 lakhs) for depreciation, Rs 0.89 lakh (Rs 2.53 lakh) for development rebate and Rs 0.35 lakh (nil) for taxation, there is a net profit of Rs 5.28 lakhs compared to a deficit of Rs 4.10 lakhs a year ago which has now been wiped off. The directors have proposed payment of a maiden dividend of seven per cent, free of tax.

With the improvement in the company's financial position, borrowings have been reduced considerably. As at the end of December 1964, the company owed to ICICI only Rs 6.25 lakhs against Rs 11.30 lakhs a year before, and a further sum of Rs 2.69 lakhs was repaid this year.

Investa Machine

INVESTA Machine Tools and Engineering Company has achieved a steady improvement in the rate of production and is engaged in extending the range of its products. It has planned to have a regular production of four models of PD-25 drill in the second half of this year. Steps are being taken to develop a bigger model of PD-40 drill and LEA type heavy lathes and SM type shapers. The last two items are to be manufactured with the help of Japanese technicians. The formalities connected with the import of a few machines have been completed, and a technical collaboration agreement is being finalised with Okuma Machinery Works of Japan. The company's chairman, K C Bakhle, is hopeful of better prospects for the current year, with a turnover of about Rs one crore compared to Rs 77.26 lakhs in 1964 and Rs 63.40 lakhs in 1963.

During the year to December last, the company sold 513 machines as against 431 machines sold a year before. Despite a higher provision for depreciation and a much bigger interest charge, the results showed a net profit of Rs 6,775 against a loss of Rs 1.25 lakhs incurred previously. The dividends are once again skipped. The liability for the accumulated preference dividend now amounts to Rs 9.36 lakhs.

Mahindra and Mahindra

WITH a view to further widening the field of its activities, Mahindra and Mahindra proposes to form three new companies in collaboration with foreign concerns for undertaking the manufacture of several new products. Addressing the shareholders at their annual general meeting held in Bombay some days ago, Keshub Mahindra, Chairman, stated that one of these companies would manufacture, in collaboration with Vickers-Sperry Rand of the US, hydraulic control gears which have wide applications ranging from machine tools to aircraft. Another company will specialise in the manufacture of current limiters, automatic and voltage regulators, manually-operated circuit breakers and starters in collaboration with Van Wijk and Visser of Holland. In collaboration with Natvar Corporation of the US, another company will undertake the manufacture of high temperature synthetic flexible electrical insulations. The public would be invited to participate in the capital of these three new companies.

Mahindra also told shareholders that the company's scheme of expansion aimed at raising the production from 10,000 to 25,000 vehicles per year would involve an estimated outlay of Rs 10 crores, half of which would be in foreign exchange. The company had already applied to the Government for permission for negotiating a loan of Rs 5 crores from AID for this expansion.

FROM THE CHAIR

Mahindra Ugine Steel Company Limited

Speech of the Chairman, Shri Harish Mahindra

THE following is the speech delivered by the Chairman, Mr. Harish Mahindra at the Second Annual General Meeting of the Share-holders of Mahindra Ugine Steel Company Limited held in Bombay on Eleventh May, 1965.

Ladies and Gentlemen,

I deem it a privilege to extend to you all a warm welcome to the Second Annual General Meeting of the Company.

It is sad to recall that last year, on this occasion, we had paid silent homage to our beloved leader, Pandit Jawaharlal Nehru. The first anniversary of his death falls on the 27th of this month. I am sure I am echoing your thoughts if I say that time has not diminished our deep sense of this loss.

The Directors' Report and the audited Balance Sheet are with you for some time, and with your permission, I will take them as read. In the year under review, your Company earned interest on short-term deposits. We have, however, been advised to make a provision of Rs 1,00,750 for meeting our tax liability. This has resulted in a loss of Rs 3,586.

The Directors have reported to you in detail the progress registered on the Project. The construction activity is proceeding satisfactorily at the site despite certain hindrances of which I shall speak presently.

All of you are aware that the establishment of Alloy Steel Plants has been accorded the highest priority by the Government. Accordingly, our steel requirements for construction of shop buildings have been planned on producers on a 'first priority' basis. Nevertheless, procurement of matching steel has posed serious problems with the result that the fabrication programme as originally scheduled could not be implemented. I am glad to say that most of the critical items have since been received and the fabrication of steelwork for Roling Mill and Shipping Shops has now commenced. Unfortunately, however, in the case of cement, Steel Industry has been assigned a lower place in the order of priorities. As a consequence, we are experiencing difficulty in maintaining the construction activity in full swing, but, it is hoped that our recent representation to the sponsoring authorities, i. e. the Ministry of Steel, for expediting physical deliveries of cement for our project, will yield satisfactory results.

The site today presents an interesting panorama of about 600 labourers working under the supervision of foreign and Indian engineers. The existing tempo will unfortunately slow down during the rains and civil work may have to be suspended during the peak monsoon period. The erection of fabricated structures at site is expected to commence immediately after the monsoon

Contracts Finalised

I would like to make a reference to the contracts concluded with the suppliers of major items of capital plant and equipment. We have been able to finalise the contracts in respect of both technical and commercial conditions, on terms satisfactory to your Company. Shipments of most of the major items of plant will be completed by last quarter of 1965, and subject to any unforeseen circumstances, we expect that trial runs of some of the units will begin during the latter half of 1966.

You are aware that in terms of the Industrial Licence granted to this Company, it was originally intended to produce 18,000 tonnes of finished steel per year during the first phase of its manufacturing programme. In the context of a rapidly increasing demand for alloy steels and the long gestation period involved in the establishment of alloy steel plants, Government welcomed proposals from those units in the private sector, which had made tangible progress in the implementation of their manufacturing programmes and were ready to expand their capacities to cope with the demand during the Fourth Plan period. I am happy to advise that we have since received the Letter of Intent from Government, permitting us to expand the rated installed capacity of our plant to 31,000 tonnes of finished alloy steel per year. The plant is now being designed for an initial output of 24,000 tonnes of finished alloy steel per year, with suitable provisions in the works lay-out and plant and equipment for eventual expansion to 50,000 ingot tonnes per year at a minimum cost. To take care of the substantial increase in the rated capacity of the plant, the additional outlay is estimated at Rs 200 lacs, out of which Rs 150 lacs will be required by 1966 and the balance Rs 50 lacs, by 1967-68. Negotiations are already under-way with the Financial Institutions and we have received encouraging response to our request for additional long-term loans. Provisions made in the plans for built-in facilities to increase the output per annum will improve the earning potentials of your Company.

The making of alloy steel involves a very complex technique and know-how, proper assimilation of which by our Operating Personnel is essential for the successful operation of the plant. In recognition of this fact, an intensive training programme for the Operating and Maintenance Personnel has been formulated in conjunction with Ugine. We have plans for immediate deputation abroad of 5 technical personnel, who will be followed by another batch of 30 engineers towards the end of this year. One of the noteworthy features of our collaboration agreements with Ugine is that these personnel will be allowed to assume complete responsibility—though for a brief period—for operations in their respective fields at Ugine's plant, prior to their return. In this connection, I wish to acknowledge the co-operation extended by the French Trade Commissioners in New Delhi and Bombay and the Department of Economic Affairs in agreeing to include some of our personnel in the Indo-French Technical Assistance Programme. The benefit to be derived from the participation of our personnel in this scheme is expected to be substantial, as they will have the opportunity of undergoing an induction course in French language before they commence their training at Ugine.

Research Facilities

In order to assess the quantum of annual consumption for alloy steel by 1966-67 as well as by 1970-71, a comprehensive market survey, on our request, has been undertaken by our

Selling Agents Messrs Mahindra and Mahindra Limited. The basic objective of this study is to assess the pattern of future consumption of alloy steel—gradewise, sizewise and categorywise—to enable the Company to formulate its production programme in a manner which will reflect the basic needs of the market.

Commendable efforts are being made in this country to study the relationship between industry and technology. These studies are being carried out with the objective of attaining a proper comprehension of the role which can be played by technological innovations in accelerating the process of economic growth. The need for providing adequate research facilities in industrial units is being increasingly recognised by the Industry and in acknowledgment of our obligations in this respect, your Company proposes to have in due course built-in research facilities in its Laboratory.

Regulatory Customs Duty

The 10 per cent regulatory duty on all imports which preceded this year's budget was an unpleasant surprise. The impact of this regulatory duty on the financial resources of your Company has been very severe as it means that an additional sum of Rs 20 lacs will have to be expended on the import of capital plant and equipment. It is not my intention to question the necessity of an impost of this nature from the point of view of the economy as a whole, but, I feel that new manufacturing units engaged in key industries with high import-saving potentials should have been spared by the Government from the rigours of this impost. No such exemption has yet been granted, but, it is hoped that the frustrating effect of this duty on new capital intensive units, like alloy steel, fertiliser, etc, will be realised and the authorities will decide, before long, to exempt these new industries from the purview of this duty.

Compared with the other progressive countries of the world, our per capita consumption of steel remains at a lamentably low level. While it is acceptable that the country's immediate need is increased agricultural production, and a balanced growth of consumer goods, attention must be paid simultaneously to the progress of a well-co-ordinated Iron and Steel Industry. Only the development of the basic industries on predetermined lines can bring the nation to the take-off stage—any shift on emphasis is fraught with the possibility of a grave danger to the economy. The most heartening official pronouncement in this respect has come from the Finance Minister. After a comprehensive assessment of the nation's outlook since the 1963 Budget he has warned that it would be disastrous for India at this stage to slow down the development pace, and alter the present pattern of planning—either due to political pressure, or due to a misinterpretation of the present inflationary situation. He made out a strong case for ambitious investment planning aimed at rapid industrialisation. I have no doubt that rapid industrialisation necessarily includes establishment of heavy industries on proper foundations. Your Company expects to be a worthy unit of this phase in the economic development of the country.

I wish to express our gratitude to the Central and the Maharashtra State Governments and the Financial Institutions for their continued interest in our Project. I would like to commend the Maharashtra Government for drawing up the Master Plan for Khopoli, where a large industrial complex is growing up. I fervently hope that the Town Planning Scheme will be implemented with all speed. Khopoli is suffering from acute shortage of residential accommodation and I would once again revive the appeal I made to the Maharashtra Government to provide industrial housing at Khopoli on a priority basis.

I also wish to place on record our deep appreciation of the co-operation which is being extended to us by our French collaborators. The progress so far registered on your Project is also, in no small measure, due to the untiring efforts of the French and Indian Technical Consultants, viz. CETIG and KULJIANS. I am as always indebted to my colleagues on the Board for their continued counsel and guidance in managing the affairs of your Company. I would also like to thank Members of the Staff who have worked so well and whose loyalty and allegiance will contribute to the success and prosperity of your Company.

Thank you.

Note: This does not purport to be the record of the proceedings of the Second Annual General Meeting of the Company.

ECONOMIC AND SCIENTIFIC RESEARCH FOUNDATION

Federation House, New Delhi-1.

The Foundation invites applications for Senior and Junior Research Staff for work in the fields of Industrial Planning and Taxation.

1. *Senior Staff (3):*

Candidates should have a basic qualification, preferably a post-graduate degree with high rank, in economics, statistics, commerce, engineering or science with special interest and/or substantial research experience in any of the following fields: industrial finance, cost accounting, taxation, industrial and economic surveys, agricultural economics, techno-economic analysis for industrial projects, demand forecasts. They should have proven capacity for research work and be able to write clearly and succinctly. Experience of work in industry would be an advantage. Salary in the range of Rs. 900-1200 p m consolidated.

2. *Junior Staff (3):*

Candidates should have a post-graduate degree in economics, statistics or commerce and appropriate research or teaching experience. Salary in the range of Rs. 300-900 p m consolidated.

Candidates called for interview will be paid second-class return train fare to and from their place. Applications with detailed particulars of qualifications and experience together with copies of published papers and reports should reach the Deputy Director not later than 30th May 1965.

A Successful Visit

LAL Bahadur Shastri's first visit to the Soviet Union has taken place in circumstances very different from those in which Pandit Nehru went to that country for the last time in September 1961. Pandit Nehru went there after attending the neutral nations' conference at Belgrade, disappointed and dejected at the Soviet Union's action in breaking the moratorium on nuclear tests with a blast on the eve of the Belgrade conference. And if Nehru was shocked by the Soviet Union's action, his hosts in Moscow too had reason to be angry with him, for it was he who had taken the lead in bringing the subject of the Soviet nuclear test before the Belgrade conference and having it discussed there—in the course of which discussion almost every leader present condemned the Soviet action.

By contrast Prime Minister Shastri could not have gone to the Soviet Union in circumstances more propitious for the success of his visit. The developments which made this possible were all fortuitous and could not have been foreseen at the time when the invitation to Shastri was extended and accepted. The Soviet Union has been India's traditional "ally" against Pakistan. With the recent heightening of Indo-Pak hostility following the incidents on the eastern border and the major armed action in Kutch it was natural that India should turn to her "ally". The clear evidence of the use of U S arms by Pakistan in Kutch and the American Government's unwillingness to condemn this breach of the understanding on which the U S had supplied arms to Pakistan increased the pro-Soviet sentiment in this country. The other factor which helped was relatively trivial and passing in its impact. This was the brusque postponement by President Johnson of Shastri's visit to the U S. From the reaction of the Government and the Parliament as well as of other sections of Indian opinion, it was clear that the U S action had been taken very seriously indeed here. Along with these developments, the stepping up of the tempo of the bombing attacks on North Vietnam and the despatch of U S marines to suppress the popular uprising in the Dominican Republic produced sharply adverse reactions in India, even though the voice of the Government of India was all but muted.

In any but such specially favourable circumstances the fact that the Soviet Union has refused to support, even mildly, the Indian stand in Kutch and that the issue does not even find a mention in the joint communique issued at the end of Shastri's visit should have caused considerable disappointment. The disappointment would have been irrational, of course, since only the very naive could have seriously expected that the Soviet Union would want to take sides against Pakistan just when she is engaged in the exceedingly delicate double manoeuvre of weaning away that country from US-sponsored military alliances and preventing her from getting too entangled with China. It would have been even more silly to canvass support in Moscow for the Indian case in the border dispute with China. The Soviet Union has already gone as far as she can by not permitting the Sino-Indian conflict to influence her friendship with India or affect the flow of economic aid to this country. She has in addition given us just enough defence assistance to prevent our catapulting into an American arms embrace. It would have been wholly inconsistent with the current Soviet approach to the Sino-Soviet ideological conflict to have said anything on the Sino-Indian border dispute which might further offend China.

The genuine criteria by which Shastri's success in Moscow will be judged are different, foremost among these being the strengthening of Indo-Soviet relations and the expansion of economic co-operation between the two countries. The joint communique issued on Wednesday acclaims Shastri's visit as an important milestone in the development of friendly relations between India and the Soviet Union and lists the many areas of agreement between the two countries. It will be apparent that this is something more than an instance of the kind of euphoric expressions customary in such communi-

ques if it is considered that there are practically no conflicts of interests between the Soviet Union and India. In the economic field the Soviet Union will no doubt continue its assistance to India in the Fourth Plan. As in the Third Plan, the quantum of assistance for the entire Plan period may be announced in advance once agreement is reached on the major projects to be aided. No figures have been mentioned, of course, but the current expectation seems to be that Soviet assistance would be around Rs 600 crores, or more than her total aid for the Second and Third Plans. Consistent with aid of this magnitude, trade between the two countries will expand rapidly and the joint communique mentions the target of doubling the 1964 turnover of goods by 1970.

No less important are the consequences of Shastri's visit for the continuance and strengthening of India's policy of non-alignment. It is certain that his direct contacts with the Soviet leaders has led the Indian Prime Minister to a better appreciation of the rationale of non-alignment while at the same time they must have strengthened the Soviet Government's confidence in India's ability and determination to pursue this policy. This is a matter of some significance since as Shastri said in one of his first speeches in Moscow: "It is no exaggeration for me to say that our ability to pursue this policy (of non-alignment) has to a large measure been due to the understanding and support with which your Government has regarded this policy."

But non-alignment was never conceived of as a policy of equi-distance between the Soviet Union and the US. Now particularly, with the once-tight alliances of the cold war fast loosening, such a conception has lost all relevance. The joint communique itself mentions some of the areas of international conflict or disagreement where ultimate settlement may follow upon initiatives from the non-aligned. Immediately, of course, there is the war in Vietnam. In the joint communique India joins with the Soviet Union in demanding that the bombing of North Vietnam should stop immediately and in asserting that the solution of the problem of Vietnam can be found only within the framework of the Geneva Agreements of 1954. This is no doubt the right position for India to take but with articulating it alone her responsibility in the matter cannot be considered to have been discharged. Apart from her commitment to and interest in preventing an escalation of conflict in Asia, she is—though it seems to be forgotten almost—a chairman of the International Commission for the Supervision and Control of the Implementation of the Geneva agreement. In Vietnam, therefore, India has a double responsibility to act.

Bokaro over Again

WHATEVER the Steel Minister and his officials might say, the Ministry did not put up any kind of fight to secure for Indian engineers a worthwhile role in the preparation of the project report for the Bokaro steel plant. On the contrary, it was only too willing to hand over the task to the Russians lock, stock and barrel. The motive behind this apparently strange behaviour is also no secret: it was to facilitate the acceptance of an offer from an Anglo-US consortium to build the fifth steel plant on a turn-key basis, covering every stage from selection of the site to erection of the plant. The question of the extent of association of Indian engineers with the plant's operation when it is ready has not arisen yet, but judging from the attitude of the US consortium which was to build Bokaro originally, it is certain that the foreign collaborators in the fifth steel plant would expect to have controlling powers; equally likely they would be given them.

Commenting on the dissociation of Dasturco from Bokaro it was pointed out in an editorial some months ago ("Engineering for Bokaro", December 5 1964), that what was at stake was more than the future of one consultancy firm—important though even that was considering the care with which Dasturco had been built up and the quality of talent it had brought together. What was at stake was the development of Indian designing and engineering. Indian consultancy and designing, it was emphasised, "have to be built up and any backsliding, from this firm resolve would be too high a price to pay for aid, however attractive the latter might be otherwise". The apprehension was that Bokaro would set a pattern of backsliding and Indian designing and engineering would be cast aside for other projects too. Since that editorial was written the expected developments have taken place in relation to the fifth steel plant. The agreement with the Anglo-American consortium was signed on January 27 covering, to begin with, selection of two alternative sites for the plant and preparation of the project report. The other steps are expected to follow in due course. Within six months of the submission of the project report the consortium is to prepare the plan for financing the project after which the deal for building the plant would be concluded.

This abject dependence on the consortium for tasks which it is well within the competence of indigenous technical skill to perform the Steel Ministry defended on the ground that "the negotiations for the financing of the foreign exchange costs of the fifth steel plant.... can be brought to a speedier conclusion if the advice of the consortium is available on the merits and demerits of the respective sites". The specious argument was also advanced that the consortium had agreed to do the project report for Rs 46 lakhs while Dasturco had charged Rs 60 lakhs for the report on Bokaro, completely ignoring the fact that such comparison was meaningless since the consortium is obviously expecting to bag the steel plant project and is, therefore, looking to the returns to it from the deal as a whole. In any case, the additional expenditure of Rs 14 lakhs could hardly offset the case for encouraging Indian consultancy. The fact is that the consortium laid down the terms and the Steel Ministry bend over backwards to please —which was just what it had been preparing the ground for.

The rot has gone much deeper, however; it has affected the expansion of the existing steel plants at Durgapur and Rourkela. The expansion of both plants is to be completed in two stages—Rourkela from 1 mm tonnes to 1.8 mn tonnes first and then to 3/3.5 mn tonnes; Durgapur from 1 mn tonnes to 1.6 mn tonnes and then to 2.5 mn tonnes. The project reports for the first stage of expansion of the two plants were prepared by Hindustan Steel's Central Engineering and Design Bureau which has also been supervising the implementation of the expansion programmes. But now suddenly it has been discovered that the CEDB's handling of the first stage of expansion has not been satisfactory and on that ground the German and British consortiums which helped put up the Rourkela and Durgapur plants respectively are known to be pressing the Government of India to hand over the second stage of expansion to them on a turn-key basis, leaving out the CEDB altogether. Inspired reports have simultaneously appeared in the press suggesting the disbandment of the CEDB since, according to the reports, it has turned out to be a big liability which Hindustan Steel can ill afford!

To demand that these pressures must be firmly resisted is not to claim infallibility for the CEDB or to deny that it may have made mistakes—after all, the record of the German engineers at Rourkela is nothing much to write home about. But while the alleged failures must be investigated and corrected and steps should be taken to prevent their repetition, it must be made clear to our foreign collaborators that the CEDB is a vital link in our steel programme and that its functions and responsibilities must increase steadily as it gains in experience and as the technical resources at its command grow. Any other attitude on the part of the Government to the demands for more turn-key contracts will complete the elimination of Indian designing and consultancy begun by the present Steel Minister with the decision to leave Dasturco out of Bokaro. It is known that Dasturco's team of hand-picked engineers and experts had been substantially expanded for undertaking the massive task of drawing up the project report for Bokaro and in preparation for the designing, engineering and supervision of construction of the project itself, an agreement in respect of which had been initialled between it and the Government when C Subramaniam was the Steel Minister. But when the Steel Ministry under Sanjiva Reddy went back on its word, this team perforce broke up and some of its men drifted away, damaging the most outstanding achievement so far in designing and consultancy services in this country. Is a similar fate in store for Hindustan Steel's Engineering and Design Bureau which, according to the latest Steel Ministry report, has now been built up to a strength of 434, including 146 engineers?

Weekly Notes

The Rationale of 'Confrontasi'

PRESIDENT Sukarno's confrontation policy against Malaysia has been analysed from various angles; the largest common denominator of the explanations is that he needs an external adventure or at least a state of tension to divert his peoples' attention from the economic disarray in which his country finds itself. Until Irian Barat was ceded to Indonesia this issue was sufficient to whip up national hysteria. USDEK has now been succeeded by NASAKON as the struggle for Irian Barat has been followed by 'Confrontasi'. But is this sufficient explanation? How real is President Sukarno's fear that Malaysia represents an imperialist plot aimed at Indonesia. Observers have laughed away President Sukarno's fear of a nation of 10 million posing a threat to a country of 100 million. Enough attention has not been paid to the reality of the threat. It is not the British bases in Malaysia that present the threat to Indonesia. There are American bases in Philippines—as near a neighbour of Indonesia as Malaysia and in any event Australia, a strong western bastion, is another neighbour.

The reality of the threat of Malaysia to Indonesia is the result of the complex internal situation in Indonesia. Indonesia's unity is indeed kept together by the "Indonesian identity" which a charismatic leader has been striving to emphasise. The diversity of the peoples of the Republic has been suppressed through the institution of a unitary State (after a brief period of federalism), a common language, a common legacy of fighting the Dutch and emotional appeals to the heritage of Sri Vijaya and Madjapalit. The brave experiment of unifying the diverse peoples has not met with full success — the Javanese who form the vast majority of the nation's population are distrusted and suspect in Sumatra, Kalimantan and Sulawesi. The people of the Outer Islands have on more than one occasion rebelled against central, i e, Javanese, domination. It is not sufficiently realised that the only serious challenge to Sukarno's regime — the 1957-58 revolt—was more than a mere colonels' revolt. It is true that Colonels Simbolon and Lubis had an anti-Sukarno record but the intellectual and political leadership of the rebels was provided by Dr Shaifuddin Prawaranegara, the Governor of the Bank Indonesie and Dr Sumitro, perhaps the ablest finance minister Indonesia has had. It was a Sumatran-based revolt against Java, and reading the 1957 Annual Report of the Bank Indonesie one can see the depth of feeling against Java. Sumatra with its oil fields and religious and communal forces has never pulled together. It is more conservative and more Muslim-minded than Java, where Islam sits lightly on the people and communism has both an intellectual and economic appeal. The army leadership personified by Gen Nasution is Sumatran while the Communist cadres are strong in Java.

President Sukarno's exit from the scene, it is now recognised, will be the signal for a struggle for succession with the ambitious Dr Subandrio backed by the Communists and possibly Dr Saleh backed by the Army. It would be in the best traditions of Wayang Urang—the Indonesian shadow play—for the Army and Dr Aidit to remain in the background. The struggle for succession could lead to a civil war which soon would lead to a break up of the Republic. It is as unlikely for Java (apart from some area in the West) to come under a Muslim revivalist movement as it would be for Sumatra to vote for the communists. The more likely outcome would be for Sumatra to break loose and vote to join Malaysia with whom it has close ties of language, religion and race.

It is here that Malaysia presents a threat. The concept of Malaysia extending beyond the Malayan peninsula is thus a threat to the existence of Indonesia. If the old Dutch possessions of Sumatra and Kalimantan could join Java to form Indonesia, there is no reason why the former British territories of North Kalimantan could not join a British Malaya to form Malaysia. The peoples of North Kalimantan have as much (or as little) in common with Malayans as South Kalimantanese have with Javanese. In fact, they have more in common with each other. "Indo-

nesian identity" is thus in danger of subversion and the strong Malaysia for Malays streak in the ruling circles at Kuala Lumpur cannot but have appeal for the Sumatrans and other Outer Islanders, especially resentful of Java's hegemony.

The existence of Malaysia is thus seen to be a strong potential threat to the future unity of Indonesia, especially when in the grip of civil strife with regional and ideological undertones. It is perhaps this that explains the fury of President Sukarno and his desire to nip Malaysia in the bud for he perhaps knows that his successors will find it difficult to maintain the Archipelago Republic's unity in the turbulent times of the struggle for succession and the inevitable civil war.

Another Fund Mission

NEW DELHI's summer somnolence has been somewhat disturbed this year by the arrival of the IMF mission. The last IMF mission was here only in November 1963. The critical foreign exchange position then had driven the Government to the Fund for an emergency standby credit. It was granted, of course, and of the $200 million, a sum of $100 million has already been availed of. However, the help was not without conditions. The Fund theologians were mollified by the raising of the Bank Rate and the tightening of the credit screw.

The position since then has improved somewhat, the most heartening feature of the improvement being the marked expansion in agricultural output and, because of it, in national income. There is hope now that if the Government could make a successful assault on the psychology of the hoarders through skilful manipulation of what stocks it has, food price may come down during the slack season. All this points to the need to be chary of the Fund's unvarying advice on monetary and fiscal matters. When there is unmistakable proof of growth of output, credit restriction can be overdone and may have unpalatable consequences for the long-term rise of the investment rate.

This apart, internal inflationary pressures are only remotely connected with the balance of payments problem. Exports have actually risen beyond expectations and though there is some lag in receipt of export proceeds it is no more than temporary. What is really material from the point of view of the balance of payments in future is the growing dead-weight of repayment liabilities. Expansion of exports at this rate, at a rate fast enough to meet these liabilities, is unlikely without a basic change in the attitudes and policies of developed countries to exports from developing countries. This is an issue which the Government of India should boldly place before the IMF mission.

Multiple Exchange Rate Bogey

IMPORT entitlements are by no means the ideal export promotion device. Professor I S Gulati's close examination of the scheme elsewhere in this issue shows how in practice it may yield results exactly the opposite of those intended. But the IMF is reported to have objected to import entitlements on quite different grounds—that insofar as the entitlements are transferable they imply practice of multiple exchange rates. On this basis the IMF, according to newspaper reports, has persuaded the Government of India that raw materials which do not go into the manufacture of a particular export item should not be allowed to be imported under the incentive scheme.

Where import entitlements are saleable they do amount to a straight monetary subsidy to the exporter. But, then, it has been accepted by GATT as also by the developed countries that some subsidy is unavoidable if manufactured goods from a developing country like India are to find a market. In fact, the IMF itself has sometimes encouraged, overtly or covertly, the introduction of multiple exchange rates in this sense. The Export Bonus Scheme in Pakistan is an instance. The Fund has gone to the extent of even commending the Pakistan Government on the skill with which the scheme has been operated. Why, then, this lofty attitude when it comes to India? If the use of import entitlement for import of goods other than those used in the export item is taken exception to, the same objection would be valid against all export incentive schemes.

This raises another fundamental issue. Almost all the developing countries other than the oil-producing ones have an import surplus. Those who are schooled in monetary orthodoxy such as the Fund's might see in this conclusive proof of the over-valuation of the currencies of these countries. But in fact the currencies of these countries can be said to be over-valued only in terms of the cost of manufactured goods produced by them. Since export of primary commodities is not governed by cost considerations so much as by the demand for them, the Fund's standard prescription of revaluation suffers for being indiscriminating. Devices to increase the exchange earnings of developed countries from exports of manufactures have to be discriminating and if such devices amount in terms of a certain interpretation to a system of multiple exchange rates, certainly they cannot be dispensed with for that reason.

U S Education after Inter Science

A Correspondent writes:

A CURIOUS development of the past few years has been the marked increase in the number of students from Maharashtra going to the USA to study engineering after completing the Inter Science examination. The Reserve Bank grants foreign exchange to engineering students without much hesitation and therefore perhaps such increase could be a result of the rising enrolment in the science courses. But in fact like the capitation fees, this development seems to be a bye-product of the difficulties of getting admission in engineering colleges in the country.

Most of the students who go to the US after Inter Science are not the best in the academic sense. A large majority of them fail to get admission to an engineering college in this country and they seek the prestige-giving foreign education solely on the strength of the financial resources of their parents. Also, some lesser-known second or third class American colleges or universities are willing to admit students from abroad as an evidence of their interest in promoting international co-operation and goodwill, even on the strength of the SSC examination, not to speak of the Inter Science examination.

The desire to go abroad to study engineering immediately after Inter Science has received an added impetus by two recent changes in Maharashtra. First, from the next academic year the duration of the course for a Bachelor's degree in engineering has been extended by one year to four years. Secondly, the Government of Maharashtra has prescribed a two-year post-degree period of compulsory government service for graduates of engineering colleges in the State. Thus a student will be free to take up a job of his own choice as an engineer only after a minimum of eight years after passing the SSC examination. If, on the other hand, he goes to the USA after passing Inter Science, he can normally get an MS (Master of Science) degree in engineering in less than four years. Further, if, he stays for two or three more years in that country, an easily-available well-paid job would permit him recover, more than fully, his investment in foreign education. In the process, he can escape the obligation to serve the Government.

The situation deserves the most careful consideration by the authorities because it inevitably creates frustration among those students, who, though brilliant, are not fortunate enough to be rich. The policy of granting foreign exchange to those who can afford to pay for foreign education, without regard to their academic merit, urgently demands a change. Ideally, if the country can spare a certain amount of foreign exchange for foreign education of its youth, should it not arrange for its equitable distribution among the most promising, on the sole criterion of merit, judged by special competitive examinations? Under such a scheme, those unable to pay from their present resources can be given loan scholorships. Or, at the very last, cannot the allocation of foreign exchange be restricted to those taking advantage of the available educational facilities and with a proof of their ability in their academic performance?

Also, if the inadequate supply of locally-trained engineers is to be corrected, the top students would prove better educators and researchers after their education abroad and could be called upon to man the new engineering colleges. The Government of Maharashtra also should consider whether its understandable and socially-justifiable prescription of compulsory government service is to desriminate, in effect, against those who cannot or would not escape it by going abroad or to other States in the country for engineering education. Without a well-co-ordinated approach by all the States and the Centre, the objectives of the policy adopted by Maharashtra are unlikely to be realised satisfactorily.

South Rhodesia: Deepening Crisis

THE result of the May 7 election in South Rhodesia was as expected; Ian Smith's Rhodesian Front won all 50 white seats, thus securing the necessary two-thirds majority to amend the 1961 constitution. The amendments envisaged are to remove African votes from the "A" poll in order to increase the number of European held seats, and to reduce the number of elected Africans, replacing them with chiefs who will toe the "white supremacy" line. Since the British Government (whose consent is necessary to amend the constitution) will not agree, Smith will then be forced into an illegal unilateral declaration of independence (UDI). If he gets away with it, it would be a tragic example of successful blackmail by a fascist-like white minority in Africa. Although constitutionally Smith's UDI would be illegal in the *ultimate* analysis, a constitutional provision can be only backed by physical force; would Britain be able to use physical force?

Britain in the recent past has not shown undue hesitation at armed intervention when she felt her interests were at stake. In the case of South Rhodesia, her *material* self-interest is less compelling; but justice demands that after 40 years of legal responsibility (however indifferently performed), she does not abandon the Africans of Rhodesia to as wretched a fate as that of their fellows in South Africa. And it must be said at once to Britain's credit that there must be plenty of people — in the present government, in the opposition party and among the public — who do not consider that what is at stake in South Rhodesia is any less important than the kind of interests for which Britain has militarily intervened abroad in the past. But the big question this time is, will a British Government that decides to intervene obtain the amount of support from its public which is essential for its survival? If in the attempt to intervene militarily, the Labour Government topples, then a new government may take measures against the Smith Government which are even weaker than those which the Labour Government can now take short of military intervention.

What are these measures? So far Britain has confined herself to some energetic sabre-rattling about economic sanctions against South Rhodesia in the event of UDI. Both within Rhodesia and outside opinion is divided on the possible effects on the economy of a boycott by Britain, Commonwealth and other Afro-Asian countries. Immediately prior to the May 7 election, the South Rhodesian Government issued a White Paper purporting to show that the threatened economic boycott would not cause undue harm. This view was vigorously refuted in a report issued by the Rhodesian Association of Industries and the Associated Chambers of Commerce. According to the report, after a year of independence coupled with economic sanction, the national income would drop 10 per cent, and 8,000 Europeans would be rendered jobless; moreover 25,000 of Rhodesians, 217,000 Europeans would be forced to leave. These estimates, described as "conservative" by the report, are dismissed as "the worst that could happen" by Smith.

Much emphasis has been placed on the harm that South Rhodesia could inflict on Malawi and particularly Zambia, in the event of an economic boycott. Since their exports have to be shipped via Beira in Mozambique (which as Portuguese territory is friendly to Smith's government) a new route will have to be forged through Tanzania (fortunately a sympathetic neighbour) to the port of Dar-es-Salaam. Further, three-fifths of Zambia's imports originate in South Africa and South Rhodesia from secondary industries, which will have to be built up in Zambia itself. On the credit side, Zambia has a surplus of roughly £25 million in the coming years. During Federation while Zambia banks were under-lent, their surplus funds went to Rhodesian banks which were over-lent. After June there will be restrictions on the free flow of money from Zambia to Rhodesia and Rhodesian tobacco farmers will be left without the easy bank loans they were used to for financing their crops. Furthermore, Rhodesia is hopeful of non-Commonwealth markets in France and Japan for her tobacco crop. It will make nonsense of economic sanctions if Britain cannot persuade them and America to participate in a boycott. If Britain decides only on an economic boycott, she will also have to give sufficient help to Zambia and Malawi to tide them over the effects of reprisals from Rhodesia.

Testing the Indo-Soviet Link

Romesh Thapar

AT a comic level Health Minister Sushila Nayyar (Gandhi's disciple!) and a veritable regiment of flunkeys (officials, to be precise!) might take time off to 'inaugurate' the Capital's first electric crematorium. Or Foreign Minister Swaran Singh (in distant Moscow) might startle his hosts by showing his total ignorance of Krupskaya (Lenin's wife). Or Home Minister Nanda might release that snooper Stacey (a correspondent!) early enough on Saturday to give him the opportunity to file 'his story' (of his arrest in Ooty) for his Sunday paper. But at least we are now beginning to realise, largely as a result of what's been going on during the past few weeks, that the basic domestic and foreign policies evolved over some seventeen years under Jawaharlal Nehru's stewardship were not the result of momentary hunches, personal whimsy and psychological maladjustment. This awakening to our national interests — for that is what it is — is assisted by several factors and forces now at play, but primarily by the extraordinary relevance which the Indo-Soviet link has come to assume in these days of our travail.

PM Forms His Own Views

I am not suggesting that some great change is about to take place within the next few days or weeks. Nor should one run away with the idea that India and the Soviet Union are again in full accord on the common problems which face them. Indeed, only the short-sighted could view Lal Bahadur's visit to the USSR as comparable to that triumphant journey which Jawaharlal Nehru made. However, a certain qualitative change has occurred.

Lal Bahadur is no longer luke-warm about the importance and value of Soviet friendship. He is also able to see through the confusions which his psychopathic, anti-communist advisers had sought to create. In order words, he has developed his own very definite opinions on the subject of the Indo-Soviet link—and these will most certainly influence the formulation of Indian policy in the coming months.

The more one probes these rather swift developments, the more one is convinced that Planning Chief Asoka Mehta, whether by design or otherwise, made the major contribution to clearing the suspicions which have inhibited Indo-Soviet friendship since the death of Jawaharlal Nehru. Asoka Mehta's bold initiative to establish a working relationship between Indian and Soviet planning, and the skill with which his negotiations in Moscow were conducted, obviously did much to re-establish the old *rapport* with regard to the fundamentally progressive and enlightened objectives guiding the policies of India.

Time to End Drift

Asoka Mehta's cautious posture on his return to India, despite the rather significant achievements of his mission, suggests that he too realises that although goodwill and cooperation has been restored much detailed work has yet to be done to implement and to extend substantially the collaboration projected in the economic field. And, what's more, several vital political moves, closely connected with the explosive situation in South-East Asia, will have to be carefully unfolded to restore India's much smeared image. This is not easy, for powerful groups exist within the GOI to urge that India became a faceless, amorphous thing in foreign affairs.

The Prime Minister will now have to assert himself in these matters. After all, he is only too conscious of the attempts that were made either to postpone or curtain his trip to the Soviet Union on the grounds that (in the absence of arrangements to visit the USA) it would appear as if India were again becoming 'aligned'. It was suggested that Indo-Pak tension could be used as an excuse. Only a Cabinet decision prevented another Himalayan blunder. Lal Bahadur's advisers know that he has a long memory.

There is no denying that of late in the maze of present day international diplomacy we have adopted the mannerisms of the bewildered orphan seeking the support of all passers-by. We like to describe this state as one of drift, of indecision, of amorphousness. In fact, it is nothing less than a crisis of character. We have been corrupted, made soft and easy-going. To emerge self-reliant, we will consciously have to take steps to break the vicious equation of aid and subservience, and to rekindle the spirit of former days.

The economic talks in Moscow seemed to have been motivated by some such desire. The emphasis on trade rather than aid is healthy, and there is no reason why we cannot devise the organisational measures to implement this programme. It would be a pointer to the seriousness with which we approach the problems of our independent development. If we are successful in this collaboration with the Soviet Union, it would be possible to follow up with similar collaboration in some other countries of Asia and Africa.

It is common knowledge that the USSR is reluctant to commit to projects on an *ad hoc* basis, because the suspicion persists that India tends to use these commitments only to extract more favourable terms from the West. This economic opportunism was tolerated in the fifties, but now it merely causes irritation. The sooner we abandon this approach, the better. On the other hand it would be politically puerile for us to neglect the task of developing independent economic relations with countries like Japan which has no desire to influence the internal or external direction of our policies. Such diversification must be attempted in a systematic way.

The greater India's self-reliance, the more we defend our sovereignty in matters economic and political, the surer will be the revival of national morale. The assets built up during these past eighteen years are not to be lightly dismissed. They can provide the basis for solid achievement in the course of the Fourth and Fifth Plans. But it is sheer opportunism to imagine, as do many economists and sociologists, that these results can be achieved without political mobilisation and sanctions. The failure on the political front lies at the root of our sent state of disarray.

From Moscow to Algiers

In many ways this is a testing time for India. Soon, the Prime Minister will be preparing for the Afro-Asian Conference at Algiers. His talks in the Soviet Union, to be summarised in a joint communique which will be released after these comments have been posted, together with the results achieved by the Asoka Mehta mission, will have far-reaching repercussions at Algiers. But we must not rest content with repercussions. We must move to carry forward those policies which reinforce and strengthen the initiatives for peace and development of the non-aligned against sectarian forces wherever they express themselves. Only in this broad movement can the adventurism of China and Pakistan finally be curbed and broken.

Maybe, by May 27, the first death anniversary of Jawaharlal Nehru, we will know broadly what is intended to be done to restore the direction of State policies. Maybe, we might even begin to discern the outlines of the perspectives we have been lacking these so many months. I say, 'may be', because a great deal of hard work has to be done to clear the way. Hard work—and a resolute will to pull this country out of its despair.

Policing the West Bengal Border

(Contributed)

THE recent border clashes between India and Pakistan have caused considerable rethinking on our method of policing the border and if and how we should reorganise it. This is natural enough, for the nature, the organisation and the armament of forces on a country's border merely reflect that country's relations with its neighbours. Between friendly countries a few customs men should be enough — and in the modern "Zollvereins" like the ECM even they can be done without. There are exceptions: USA needs border guards against a friendly Mexico merely to prevent the numerous friendly Mexicans from immigrating illegally. If Britain had with India and Pakistan a common border she would certainly have needed police patrols to keep out the infiltrating seekers of jobs. But she probably would not have needed what East Germany has on her non-Communist frontiers — helmetted guards with automatic weapons, alsatian dogs, barbed wire and flood lights. This is precisely the reason why there is so much talk about the need for a para military force on Indo-Pakistan border, for the relationship between the countries is far from friendly.

Improvement Unlikely

It is unlikely to improve either. Pakistan was born out of hatred and fear of India and Hindu domination. Communal carnage in either country has driven millions of refugees in the opposite directions and the memory lingers. And then there is Kashmir. There are many who believe that a solution of the Kashmir problem, if indeed it can be solved, will improve Indo-Pak relations and may even lead to friendship. But it is unlikely that the dispute over Kashmir will be resolved, for as a diehard Muslim Leaguer in East Pakistan recently said: "If Kashmir problem is solved, what remains between India and Pakistan?" China has failed to unite the two parts of the sub-continent, for to Ayub China is not now a common threat. It is at least Pakistan's calculation that Indo-Pak relations will for years to come continue to be unfriendly — and if Pakistan thinks so, India has to accept it. This will explain why Pakistan has put para military forces on her borders with India — Sind Rangers and West Punjab Rangers in the West and from 1958 East Pakistan Rifles in the East — in the same manner as Tochi and Chitral Scouts police in the North-west the turbulent tribals and as the Assam Rifles were used in the past for police action in North-East India.

II

Substituting the District Civil Police on East Pak border by the EPR was a major step in escalation, a step which India cannot ignore. It will be dangerous for India to have on the Eastern Borders any force to face the EPR without full parity with it. It will be equally dangerous for Pakistan. The argument is clear. If any inferior force is roughly handled by the Pak para military force the Indian army is bound to be called in, leading to a confrontation with the Pakistan Army, an eventuality which the Border Police Forces should strive to avoid. What is wanted on the border is an equilibrium based on equal strength. One does wish that Pakistan had struck to its pre-1958 border defence by the District Police. But the EPR had to be expanded in East Pakistan for political reasons—to assist the army in seeing to it that East Pakistan did not secede. And while not engaged in putting popular movements down the EPR had to do something. The Indo-Pakistan border which was too quiet for the politics at home had to be hotted up and hence the setting up of the EPR wings and sectors on the border, a huge organisation based in Dacca.

India's reaction was slow. In the west, the Rajasthan Armed Constabulary and the Punjab armed police were organised early. But Delhi has looked oftener to the threat from the west, traditionally and historically, until the Chinese invasion, and the East Pakistan border was taken little notice of. Yet in 1959 plans were made perhaps incompetently for a reorganised centralised police force for the border. The role and organisation of the EPR was not properly appreciated and in armament and organisation, the so-called armed police battalions were hardly superior to the civil armed police of West Bengal. In fact until 1962 these battalions of West Bengal were merely used as the law and order reserve. Even these inadequate plans remained long on paper. To the discredit of the Central Government of India and the State of West Bengal no steps were taken to implement even these half-hearted schemes until 1962. And in 1962 in trying stretch out along the 1,349 miles of the border, the arithmetic of the plans broke down and the battalions soon ran out of man power. Painfully and haltingly two more battalions were raised in the next couple of years time and so mumerically the organisation is now barely adequate to man the border. The gaps for infiltrating Pakistanis are wide. In the Punjab the strength of the Border police is 13 men per linear mile; in Rajasthan 7.5 men. And except in small pockets of Rajasthan these areas are absolutely clear of Muslims, marking Pakistani infiltration unlikely. In West Bengal where the numerical predominance of Muslim in the basda areas makes Pakistani infiltration easy, the strength of the Border police per linear mile is 3.6 men.

Civil Character Persists

The civil character of the organisation persists, the officers of middle ranks are promoted men of inadequate education, training and experience for the role they have to fill. The commandants are usually Superintendents of police—the entire cadre trained by tradition and regulation to avoid vio-

lence rather than face it—and facing a para military body like the EPR it is not easy to run away from occasional clashes. The force is poorly armed owing to the tardiness of military help and owing to lack of facilities. The police forces on the Gujarat and Assam borders are probably worse, a fact which need not cheer the West Bengal State.

There is no doubt that the unfriendly relations with Pakistan will continue making the need for a reorganised Border Force imperative. The model exists. The Assam Rifles are officered by the Army, the NCOs and JCOs rise from the ranks of riflemen forming a formidable para military body of troops of high tradition. It functions under the Civil Government, in the NEFA under the Governor through his special advisers, and elsewhere through the ordinary civil agencies. Some have argued for a centralised control of the Border Police Forces. That will be fatal. The Government of India is now crushed by a deadweight of bureaucracy and a day to day governance by it of anything, not to speak of the distant marches, would be impossible. The brain in the country often fails, but the limbs should be able to react locally to knocks and blows. The extraordinary suggestion that a strip of 10 miles should be carved out of border states is novel but unworkable. Unless a civil administration can be fashioned for these many thousands of square miles thus sliced off from the states. It will be adequate for the Centre to assist the border States with finance to remould into para military bodies the fat and flaccid civil police battalions now responsible for the security on the border. The State must control the force thus fashioned but the Centre through the Army may retain the right to inspect these battalions to ensure that the petty state bureaucrats do not retard or hamper their growth and efficiency—nor do the petty jealousies of the Civil Police who are frequently ignorant of para military problems can obstruct them. The Centre is paying and can call the tune; the State may well play it.

FROM THE LONDON END

The Lessons of the Local Elections

THE results of the local elections have come as a salutary shock for the Labour Government. While it had generally been expected that the unpopular measures which the Labour Government had been forced to take in its first six months in office were bound to be reflected in a swing away from Labour — particularly in local elections — the extent of the swing is a cause for grave concern.

As a result of these elections, the Conservatives gained 562 seats and obtained power in 20 more cities and towns, giving them complete control of 16. The table below sets out the gains and losses of the main Parties in the local elections:

	Gains	Loss	New Seats
Conservatives	562	10	13
Labour	45	419	19
Liberal	39	213	Nil
Independent	70	73	Nil
Communist	Nil	1	Nil

The Labour Party is naturally seeking to gain what comfort it can from the fact that swings of this type are more than natural, and that local elections are not necessarily a reliable guide to the movement of public opinion. It is, of course, also true that the general rise in rates has caused deep resentment, and this is naturally reflected in the local boroughs. Moreover, the decision on TSR2, which has led to a large number of retrenchments of workers in the aircraft industry who have not yet been resettled, has naturally caused disillusionment and concern.

According to George Brown, the real reason for Labour's setback in the local elections was that people have forgotten the mess the Tories left behind them. It is also true that Labour Ministers have been so busy getting on with the job, that little time has been spent on explaining to the electorate that if they are to proceed with the reforms they have in mind a difficult period lies ahead, and that long-term measures take time to show results.

Decline in Labour Popularity

While it is true that Labour inherited a very difficult situation from the Conservatives, it is difficult to attribute all of Labour's failures to the mess it inherited from the Conservatives, and even after all allowances are made, there is no doubt that there has been a swing away from Labour. This is particularly evident in the low poll at the local elections.

In general, many Labour supporters who were fed up and dissatisfied stayed away from the polls. This is very similar to what had happened in the 1962 elections when Labour gained over 200 additional seats because the electorate was dissatisfied with the Conservatives.

The swing revealed in the elections is approximately an average of 10 per cent compared with last May, or 7 per cent since the General Election. If local elections were representative of the national mood, this would mean a Conservative majority of about 230 seats but of course, local elections are not a reliable guide. Indeed, what is interesting is that they reveal a very different trend from that shown in the National Opinion Polls. The *Daily Mail* National Opinion Poll of May 13, gave Labour a 5 per cent lead indicating a Labour majority of 80, and the Gallup Poll on May 14 put the Conservatives only one point ahead, suggesting a parliamentary majority of 30. However, these same Opinion Polls also show that there has been a steady increase in the number of people dissatisfied with the way in which the Government is running the country.

According to the Gallup Poll of May 16, fewer people are satisfied with Wilson as Prime Minister than at any time since the General Election. Now, 56 per cent are satisfied, against 63 per cent last month. The Government's record is now approved by only 39 per cent and 45 per cent disapprove. This is the first time since the election that the disapprovers have outnumbered the approvers.

For the third month in succession, Gallup shows a fall in the number of people who expect their incomes to increase in the next twelve months. Pessimism about prices is expressed by 76 per cent and more people fear unemployment than before. Many people are dissatisfied with the line that the Labour Government has taken in backing American policy in Vietnam and

the Dominican Republic. Many Labour supporters also find it difficult to see much difference between Tory and Labour credit squeezes, high Bank Rate, increased prices and "stop-go" economic policies. Potential middle-class voters have been put off by rising rates, mortgage difficulties and shortages of houses. All this has built up a feeling of resentment, and the Labour Party is now placed in a rather more difficult position.

One thing is now abundantly clear, Wilson will not be seeking an early General Election. With the climate of the country as it is, it has become evident that an early election would not necessarily result in a much larger Government majority, and for the first time since the General Election, there is a chance that should such an electoin be held, the Conservatives could win. What is particularly ironic is that the Conservatives themselves have done nothing to gain this popularity; it has been caused entirely by dissatisfaction with Labour. Indeed, one of the amazing facts which are likely to get overlooked is the consummate parliamentary skill with which Harold Wilson has proceeded so far with his wafer-thin majority of four. In the circumstances it is hard to believe that with such a slender majority, he has had the courage to proceed with tough and unpopular items of legislation, despite the electoral risks involved. Now, however, he may well have to proceed more cautiously, and this places him in a dilemma, for if he is now seen to compromise for electoral reasons, the credit the Party has obtained for providing a firm Government in a difficult situation will disappear.

In the period that lies ahead, the Government will run the risk of defeat only on those few occasions when the Liberals choose to vote with the Conservatives on major confidence issues. These could well include the Finance Bill, where Grimmond recently announced his decision to vote against it, and of course, the Steel Bill.

Hitherto, the Conservatives have refrained from an all-out attack on the Labour Party because they feared that any early election would have brought Labour home with a much larger majority, and still divided over their own leadership problem, they felt this was something they were unprepared to tackle. Greatly heartened by the local election results, it can be expected that they will now attempt to be a really active Opposition, and the Bills that lie ahead, provide ample munition — the mammoth Finance Bill, which will be fought clause by clause, the Steel Bill and the Land Reform Bill.

From the Labour side, elections will mean that much more effort will now has to be directed to publicising and explaining the action that the Government is taking among the average voters. The likelihood of a June election has now definitely receded. As things stand, the earliest date for a General Election looks like October this year, but so many political considerations have to be taken into account before an election is held, that forecasts of a definite date are always risky.

OFFICIAL PAPER

Another Report on Urban Land Policy

IT does not require great imagination to appreciate the enormous social cost involved in the unplanned growth of towns. One has only to take a look at our metropolitan cities like Bombay or Calcutta, seventy-one per cent of whose houses have no more than a room; where nearly one-third live in "bustees" or slums and lakhs have no home other than the pavements. Apart from over-crowding, basic amenities of civilized existence are nowhere adequate—about a quarter of the population in our great urban centres have learned to live without them. If town planning has at last been recognised as an essential component of a national plan, the realisation has not come too early. In the coming years, with the present trends in population growth and rate of urbanisation, the urban sprawl will easily get out of control if planned action is not taken in time. If we remember that the rise in urban population is three times as fast as in the rural areas, it should be clear how soon the problem will reach unmanageable proportions.

The Town and Country Planning Organisation set up by the Central Government at New Delhi has done much useful work in offering technical assistance and training facilities to promote the town planning effort of the States. It has formulated some 'model' plans, and 'model' town-planning Acts which the States could use as guideposts. Yet the scheme has not gathered any momentum in the States, with the exception of a few like Maharashtra which has considerable experience of town-planning. The State Ministers' Conference every year meets dutifully, passes resolutions and returns again next year to note that little has been done. In the Fourth Plan all important towns in each State are expected to have comprehensive Master Plans and initiate suitable legislative amendments to implement them.

Central to the whole issue of town-planning is the extent of public responsibility for achieving a socially optimal use of urban land through public control over ownership and use of urban land. Hence the need for a clearly enunciated urban land policy has been felt for quite some time. The Central Town and Country Planning Organisation had presented a "Note on Urban Land Policy" and in September 1963, at the State Ministers' Conference a Committee on Urban Land Policy was set up to examine the problem and make recommendations in the light of this note. The report of this committee is now available. But if one opens the report hoping to find specific practical proposals one is certain to be disappointed. After lengthy pronouncements on the social objectives to be pursued the report skirts the fundamental issue of land-acquisition and speculative rise in land values and while admitting the total inadequacy of existing laws and tax measures, resigns itself helplessly to the observation that under the present political set up, no far-reaching measure like nationalisation of urban land or a right of pre-emption on the part of the State can be adopted. The Committee's emphasis on the fact that land policy is more than mere acquisition and that little attention has hitherto

been given to the need for proper land-disposal and land-use plans is unexceptionable, but surely, the pre-occupation with acquisition rights is only rational when without unified ownership no planning is possible and where widespread evasion of taxes makes curbs on speculation inoperative?

The existing Land Acquisition Acts are clearly dated, drawing their inspiration mainly from the Act of 1894. Of the 11 Central Acts and 21 States Acts only 4 were enacted afresh after 1954 and incorporate some of the town planning objectives. Even the restricted scope there is under the old Acts for compulsory acquisition of land has been never exploited, so shackled are these Acts with procedural formalities and compensation clauses favourable to the private owner and burdensome to the public authority. Compensation was fixed at the market value on the date of the preliminary notification by the public authority and thus included a large part of the unearned increment in land values.

To make matters worse, in all cases of acquisition a 15 per cent solatiun was legally necessary and whenever disputes over compensation awards arose, the courts generally favoured the retention of solatium. Even the Law Commission argued recently that the private owner's benefit from rising land values was more than offset by the rise in general price level and therefore payment of solatium was necessary to compensate this hardship. Rejecting this specious argument, the Committee pleads for the abolition of the unnecessarily generous provision. The rise in land values are not parallel to the rise in the price level — far from it; it is exhorbitant and speculative — land prices increased by about 127 per cent in 1950-60 in suburban Gauhati; in Delhi the price of suburban land increased over 145 per cent between 1955-58; in other bigger cities the increase was over 350 per cent in 4 to 5 years. The Committee recognises that pegging land values at the levels prevailing at an earlier date could minimise the financial burden of compensation. But actually it favours advance acquisition of land rather than ante-dating land values.

This does not solve the problem of evolving a policy, politically feasible and socially justifiable. The surplus value generated by rising land prices should rightfully accrue to the community insofar as a good deal of it arises from development activity, for which the individual owner is in no way responsible. The 'compensation' clause continues to be a major hurdle. Apart from the direct acquisition of land, means have to be found for mopping up the unearned increments in income that private owners of land (not intended to be taken over by the public authority) enjoy. The "Note on Urban Land Policy" had earlier recommended the levying of an annual tax on increments in urban property value, the basis being the capital value of the property. It is difficult to understand why this suggestion has been dropped and instead "suitable amendments" to the existing tax measures are advocated. None of the existing land taxes have even a marginal impact on mopping this surplus. An enhanced surcharge on Stamp Duty on the Transfers of Properties theoretically could be a useful device but with land mobility as low as it is and the temptation on the part of the owner to under-assess his property value, it cannot collect much. The Municipal Property Taxes, again, operate only where the augmented values are actually reflected in income and rent control can effectively conceal the increase.

By and large, the public authorities should not, the Committee feels, undertake development themselves in the underdeveloped areas. These should be given on lease to bonafide builders, preferably co-operatives. This policy has in fact been usually employed and co-operative housing in urban areas has been remarkably successful. The advantages of disposal on leasehold basis is that public control can be retained by stipulating the terms of the leasehold to conform to the social objectives.

So far, the local bodies have not demonstrated their capacity to undertake development schemes and the Committee's fears that town planning is more than what the local bodies can chew are justified. It recommends the setting up of a high-powered body capable of instituting and implementing planned development. Neither the Planning Commission nor the State Governments are likely to agree to this — they have been talking with undiminished faith about community participation through "plan-cells" and "citizens' councils".

In conclusion one may say the report presents much useful information on the problem but little by way of solution. Its recommendations are general and its observations are a repetition of the comments made by the "Note on Urban Land Policy", two years earlier.

LETTER FROM SOUTH

Kamaraj's Home Track

KAMARAJ has been stuck in his home State for some weeks now, undertaking a strenuous and intensive tour; neither the battle of the Rann nor the tussel for posts in the Congress Parliamentary party's executive impelled him Delhiwards. He kept going from one small town to another and trekking through a few villages as well. The crowds were up to the standard size and the general atmosphere was one of welcome to a local boy who had made good.

The main reason for this long stay is the run of troubles that the Tamilnad Congress is currently confronting. Four Congress MLAs have left the party to form the Toilers' Welfare Party. Actually this is not a new party but a revival of the Toilers' Party which had been formed prior to the first General Elections and won quite a few seats. At that time to ward off the possibility of a non-Congress Ministry being formed in the then composite Madras State, Rajaji had won them over with a few Ministerships and finally absorbed them in the Congress.

It is an unabashedly communal-caste party of the Vanniyas. This is a non-Brahmin caste which claims that it was far more oppressed and dominated by the Brahmins than the Mudaliars, whose cause Kamaraj espoused. The complaints of their leaders is that being anti-Brahmin is far from enough. They feel that this slogan has been used solely to push forward the claims of the advanced non-Brahmin castes. These castes are quite as bad as, if not worse than the Brahmins and have now to be displaced if the "toilers" (the Vanniyas are mainly agricultural labourers) are to make any substantial progress. Thus these leaders hope to hoist Kamaraj with his own petard, since the strategy of the Congress President has been to project his party as the representative of the oppressed castes. It is almost a consistent theory, i e, that in India the economic categories of haves and have-nots run along the frontiers of caste.

The desertion of prominent Vanniya leaders can have a considerable adverse effect on the position of the Congress. They are said to constitute the majority of the electorate in the districts of Arcot, Salem, Coimbatore and Trichy. It is also quite likely that the bulk of the caste will tend to follow their traditional leaders rather than retain their allegiance to the Congress.

In addition to this breakaway has come the critical statement of Periyar, the leader of the Dravida Kazhagam, who had been a pillar of support to the Congress when faced with the challenge from the DMK. It should not be forgotten that, despite all his eccentricity, Periyar had raised the banner of revolt against the Congress from an egalitarian angle. He was one of the first Indians to visit the Soviet Union in the late 1920s and returned with a burning enthusiasm for social justice. His hatred for the Brahmins, however, distorted itself into turning to the British for protection against the possibility of their caste domination. But he has remained committed, rather oddly it is true, to the cause of the uplift of the downtrodden and has believed for some years that the ascendance of Kamaraj to the position of the undisputed leader of the Congress in Tamilnad signified a revolution in the party. It could now become the instrument for social uplift on a mass scale.

Periyar is now, however, making rather gloomy forecasts about Congress prospects. He feels that the failure to implement its socialist slogans is certain to bring the ruling party to a disastrous end. At the same time, he feels that even a dozen Kamarajs cannot salvage the Congress nor even prevent it from becoming indistinguishable from the Swatantra. He feels perplexed and wonders what he should advise the people to do.

A serious situation is thus developing. A wide and heterogeneous anti-Congress coalition is quite on the cards in Tamilnad. The DMK is already powerful and there is little reason to believe that there has been any decline in its strength. It is already allied to the Swatantra and Muslim League, at least, for electoral purposes. The Left Communists are quite close to it, in the belief that it represents an essentially radical force, despite some unfortunate separatist overtones. It should not be very difficult for it to come to a working agreement with the Vanniya leaders as well as to utilise to the full the sense of disenchantment which now sits heavily upon Periyar. This formidable coalition could not only skilfully utilise all the discontent against the Congress but also project itself as a realistic alternative, as a possible ruling group, which would greatly enhance its chances.

It is against this background that Kamaraj's tour assumes some deeper meaning; it is certainly more than the expression of the desire of a home-spun man to go once again among his own people. The present leadership of the Congress in Tamilnad, particularly the Chief Minister, certainly cannot be entrusted with the task of projecting a radical image of the Congress. All the leaders are far too staid, far too caught up in the toils of routine administration to emerge as more than utter mediocrities and as committed to the maintenance of the *status quo*. And they have bungled badly in dealing both with the food problem as well as the anti-Hindi agitation, relying only on the bureaucracy and failing to take the people into confidence.

The Congress President is trying to redress the balance. The very fact of his political tour is a novelty. Congress leaders, as a general rule, never bother to take the trouble to launch any kind of political campaign except at the time of the General Elections. At best they might utter a few platitudes while opening hospitals or laying some foundation stone or the other. These are completely official affairs in which the general people feel quite out of place, though they are forced to attend so as to provide an audience. Kamaraj, following the Nehru tradition, is making an effort to take politics to the people, to make them aware of national issues. His speeches have dealt with a wide range of topics and have, on the whole, tended to emphasise the more progressive aspects of Congress policy.

He has spoken out rather sharply against the tendency to rely on outside help to defend India against aggression. In particular, he has assailed the pro-Americanism of what he has called the capitalist class of India. He has pointed out that recent events have shown how unreliable the US can be and the discourtesy it can display to persons who might disagree with it on one and another issue. He has had high praise for the way in which the Soviet Union has stood by India at moments of crisis, even when another Communist country was involved. At the same time, he has made it clear that he was not advocating any alignment with the Soviet Union. Nevertheless, it was quite a novel experience for the people who attend Congress meetings to hear a prominent leader with the courage to openly criticise the U S.

Another interesting feature of the speeches has been the sharp criticism of Congress policies which have failed to bridge the gulf between the rich and the poor. He quite agreed that the poor had ample reason to feel dissatisfied with the Congress but, at the same time, they should display initiative in correcting it and not despair by leaving it. He instructed Congressmen to take the lead in expressing the discontent of the people and organising them for a removal of their grievances. This should not become the monopoly of the opposition, most of whom had no real desire to serve the people. The tactic is the obvious one of outbidding the opposition and of creating the impression that the Congress has the capacity for self-correction. Some of the opposition parties, at any rate, should take the Congress President at his word and begin asking Congressmen to join demonstrations and strikes.

Kamaraj has combined this appeal to the poor to look upon the Congress as their own party with advice to the capitalists to do the same. In Trichy he said that the capitalists know very well that no other party has done or can do as much for them as the Congress. They should beware of what their fate would be if the Congress were really to go down. He added, of course, that the capitalists would have to adjust themselves to the fact that socialism was an inevitable destination for India. There could be no room for monopolies and glaring inequalities. These had to go and the capitalists must reconcile themselves to this fact.

It is too early to say what exactly this turn towards radical consistency denotes. It is not too early to know, however, what the radicals should do. They must work out a concrete, immediate programme on the basis of the general statements of Kamaraj and confront the Congress with it, compelling it to choose, and pulling into the orbit of struggle the huge mass who still cling to it.

Case for Foreign Collaboration in Advertising

(From a Correspondent)

THE Government was assailed in Parliament earlier this month for allowing foreign collaboration between Indian advertising agencies and foreign agencies. Members indignantly enquired whether Indian advertising agencies were not competent to handle advertising by themselves. One Member asked why foreign collaboration was necessary at all when Indian agencies were doing a competent job. It was pointed out in support of this claim that India had won prizes in several international advertising exhibitions. The Minister for Industry and Supply, T N Singh, agreed that the Indian advertising agencies were functioning quite satisfactorily, but he defended the decision to allow foreign collaboration on two grounds. First, he said, a few wholly foreign-owned advertising agencies were at present holding a dominant position in the advertising business in India by reason of their organisation. The proposed collaboration would strengthen the position of the two Indian companies concerned and enable them to compete successfully with the foreign companies. Second, it might be possible to effect some reduction in the foreign exchange expenditure on advertising charges as a result of the collaboration.

One would have expected the matter to end with the Minister's plausible explanation. But some Members did not seem to be satisfied with the link-up and they wanted time to discuss the matter further. It will be recalled in this connection that the consent for collaboration has been granted to one agency on the basis of 49 per cent foreign participation. In the second case, the Government has given preliminary clearance and the draft agreement was under consideration of the Government when the matter was raised in Parliament. Later reports indicate that the second link-up has been sanctioned on the basis of a 25 per cent foreign participation. But this may not be the end of the matter since all Indian advertisers have submitted a document to the Government protesting against the encouragement given to foreign agencies. The Minister did assure the House that the Government would ensure that Indian companies were not affected by collaboration and that there would be a check on the outflow of foreign exchange on this account.

A full appreciation of the case for and against collaboration in advertising calls for an understanding of the structure of the advertising industry and its development. Of the estimated Rs 30 crores spent on advertising, approximately 33⅓ per cent (Rs 10 crores) is handled by the Government, mainly through the Directorate of Audio Visual Publicity. Rs 12 crores or 40 per cent is controlled by the wholly foreign-owned agencies. The two companies which have been granted collaboration facilities handle about 8⅓ per cent (Rs 260 lakhs). About 18 per cent (Rs 540 lakhs) is handled by 200 and odd other Indian agencies of all sizes and description. The dominance of foreign agencies is mainly due to the patronage of foreign firms, though it cannot be denied that the high level of their technical skill and knowledge of the latest techniques also help. They have been able to attract business from Indian firms. The handling of Air India's account by a foreign agency is an outstanding case in point.

Twenty Years Behind the Times

Faced with this challenge, Indian agencies, many of them founded in the early forties, have found the going rather rough. Some of them had the backing of business groups and they managed to lead a sheltered life, without much regard to quality and diversification of service to meet changing marketing needs. Others managed to secure and retain clients by means not always above board, such as rebating of commission. There was hardly any compulsion to improve quality. As a result, Indian advertising is 20-30 years behind times. The backwardness is particularly glaring in the field of market and product research, media survey, motivational research and so on. With the idea of export publicity catching up rapidly, it was very clear that Indian agencies were hopelessly ill-equipped to offer competitive service against foreign-owned agencies.

It is under these compulsions that some of the agencies have sought foreign collaboration. To compete effectively with the foreign-owned agencies, it was felt, one had to have comparable technical know-how. The two main ways of getting this is by training Indians abroad and by exchange of latest technical know-how in the industry. (Curiously, some of those who have protested against collaboration had reportedly sought, and failed to get, collaboration themselves. One or two major agencies have refused to join in the protest for this reason.) Viewed in this context, the reference to international awards to Indian advertisers is a trifle besides the point. They are indicative of the standards of only a section of the Indian advertising trade. Besides, layout and copy do not constitute all of advertising service. As to foreign exchange lost through link-ups, it is to be remembered that a large amount of it is now being spent by entrusting business directly to foreign-owned Indian agencies. The export bodies spend much on market surveys by agencies like the Economist Intelligence Unit. Not long ago the Government of India itself had sought the services of the London Press Exchange (one of the two foreign companies who have been given permission to collaborate with an Indian company) for a survey of demand for Indian products like carpets in Europe at a cost of several thousand pounds.

Indian agencies claim that they are in a position to provide service in the overseas markets without any foreign collaboration. It seems that a few of them have some *ad hoc* arrangements with agencies abroad, from whom they get the required services by sharing the commission earned on the specific business. However, this does not always work to the advantage of Indian clients. The returns to the foreign company are too low for it to provide service at its usual standards. Besides, such *ad hoc* arrangements take a long time to put through and in many cases the purpose of the whole project is lost by loss of time. Finally, in export advertising unlike in domestic advertising there are no substitutes for proper professional standards.

If there is a case for protecting the Indian agencies it is against the foreign-owned agencies. They repatriate all the profits that they earn, whereas the foreign collaborator's share of profits is only to the extent of its financial involvement. If collaborations work to the detriment of the Indian partners or the national interests, they can be terminated without much ado. As matters stand, collaborations are expected to facilitate the training of Indian personnel abroad and the foreign parties will also press their international clients to shift their Indian business from foreign-owned agencies to their collaboration partners.

Among Practical Idealists: A Sarvodaya Meet

(From One Who Attended as an Outsider)

THE Sarvodaya movement meets at periodic conference through its organised body, the Sarva Seva Sangh. The latest of these was held at Gopuri near Wardha on May 7, 8 and 9. It was attended by over 500 workers from all over the country. Most of them were active members of the Gandhian movement before Independence who gravitated to Vinobha's fold after Gandhiji's death. Others entered politics when the political and socio-reformist parts of the Gandhian movement separated after Independence, only to get disillusioned and join the Sarvodaya movement. Among these at the conference there were at least five ex-ministers and one ex-chief minister. Several workers had been university teachers and there was a sprinkling of foreigners. Spiritually, the overwhelming majority of the workers could be described as Hindus of liberal and humanitarian leanings. Of mysticism or obscurantism there was no evidence. (The movement boasts of at least one prominent atheist).

The formal function in these gatherings is to lay down, collectively, Sarva Seva Sangh policy, although in practice resolutions tend to be formulated before the conference by the executive body, the Prabandh Samiti, which consists of leaders of the movement. (It would be misleading to emphasise the distinction between leaders and the rest. It would be truer to say there is a continuous gradation from the more to the less prominent workers. The most prominent belong to the Prabandh Samiti. After Vinoba, they do most of the thinking of the movement, though some of them have earned their reputations and their place on the Samiti through hard, practical and effective work in the villages). But since their speeches usually prepare the ground for the resolutions that will follow and since their views carry the weight of greater personal authority, the resolutions presented at the end do in fact represent the consensus of the conference. Where they do not, amendments are proposed and incorporated in the draft resolutions.

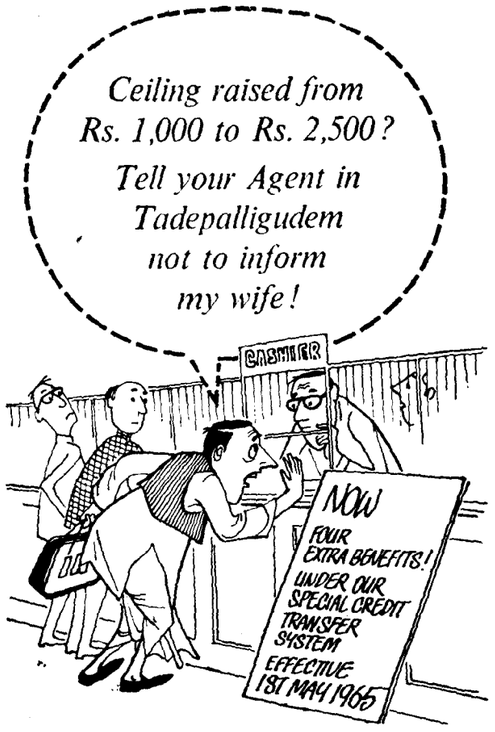
The real value of the attendance of the majority of delegates lies elsewhere. The movement gains in ideological coherence through discussion of its social and political philosophy. New trends in thinking emerge, and old principles are applied to new situations. Secondly, old friendships are renewed and the movement gains in coherence through greater personal contact. Thirdly, Vinoba's talks (he spoke every morning for an hour-and a-half) have a salutary effect on morale. He speaks gently, persuasively, with flashes of humour, referring often to points raised in the previous day's discussion to lay aside doubts or to answer criticism concerning, say, the direction of the movement or its order of priorities. His steady faith in the value of the work of the movement never fails to infect his audience. "Nothing spurs me on to further action than despair" he said recently. And "if our movement has failed I would be the first to say so". Apart from the mental stimulation of listening to Baba (as he is affectionately known) the workers satisfy their *darshan lalsa*, or craving for *darshan*. Finally, many of the workers are members of specialised committees to do with such activities as the Sarvodaya weeklies or basic education. It is convenient for these committees to coincide their meetings with conferences when they take important practical decisions.

Movement Needs Spectacular Success

So much for who was there and why. The conference discussed at some length means of settling the situation on the Sind-Kutch border and the wider question of India's relation with Pakistan generally. Several speakers spoke of the total breakdown of communication between the two countries. Vinoba pointed out that the newspapers of both countries dealt selectively with the facts of the situation though he seemed to partly justify this one-sidedness in a later talk when he explained it in terms of the need to keep morale high. As a counter balance, therefore, he had tried to get hold of one of the more moderate Pakistani newspapers. In the same connection, but in relation to China, another speaker criticised the government's policy of proscribing books about the border dispute which did not fully accord with India's official stand. Several speakers suggested that in situations like Kutch it was the duty of workers to try to form as objective an assessment of the facts as possible, if necessary by visiting the affected border himself. Greater personal contact between the people of both countries was urged.

As regards the Kutch dispute, Jaya Prakash Narayan proposed its submission to the International Court of Justice for adjudication. He felt that an insistence on a return to the *status quo ante* was justified in the case of bilateral negotiation, because then neither side would stand to gain by the use of force if negotiations failed. But if the dispute was referred to a third party for adjudication (ICJ) or arbitration, both parties could commit themselves in advance to regard the verdict as binding. In order to prevent future border disputes, he proposed the setting up of a joint commission to demarcate the boundary, and a resort to arbitration for those sections of the boundary the commission could not agree upon. Failing this he suggested the establishment of some sort of permanent machinery or procedure to deal with future disputes of this kind.

Perhaps the most significant outcome of the conference for the Sarvodaya movement itself was Vinoba's announcement on the last day that he was willing to accept Bihar's invitation to go there for six months, on the condition that the Bihar workers promised to 'raise a storm' and collect 10,000 gramdans in six months. With Vinoba's presence in Bihar it is just possible that this ambitious target will be approached if not attained. He is not well enough yet after his recent attack of typhoid to walk again; *padyatra* the most important ingredient of his appeal, will have to give way to some other form of *yatra*. But this need not turn out to be a handicap in Bihar where Vinoba is best known and loved.



It is just this sort of spectacular success that the movement needs if it is to regain its momentum and recapture the popular imagination, as it did in the early and middle fifties. On the other hand as JP pointed out when he welcomed Vinoba's challenge to Bihar, the movement must learn to be less dependent on Vinoba's personal appeal if it is to grow. But if the new Bihar thrust proves successful it may infect workers with a new enthusiasm, and the two needs will to that extent be reconciled.

The variety of subjects discussed at the conference revealed how much more diversified the movement is than the outsider realizes. The several as-

pects of the movement cover the whole gamut of social and political issues, more often than not striking at the roots of a problem with radical solutions. It is this combination of radical solutions coupled with a refusal to use force or political power to implement them that makes the movement seem so Utopian. But most workers feel confident that their programme of fundamental change will follow upon the creation of the right atmosphere, which they see as their first task. The movement has been criticised for lacking a policy towards large-scale mechanized industry (apart from what Gandhiji said about trusteeship), and indeed for not even having accepted it as something which has come to stay, but this lack is being remedied by new thinking on the subject. Fields of interest tend to vary and not every worker would agree that bhoodan-gramdan is the most important aspect of the movement. Many would see it as fighting chauvinism or working for communal harmony, or genuine democratic socialism. That fields of interest may even conflict was demonstrated when a gramdan worker complained that the movement's internationalism proved embarrassing to him in his village work.

One of the reasons for this heterogeneity is partly to be found in Vinoba's own attitude to his leadership. He said at the conference that revolutions are never made by following anybody. "I do not follow anyone, nor should you follow me". He said he had done everything he could to counteract the cult of leadership. His aim had always been *shoonyata* or nothingness. Another reason is the general mistrust of strong centralised organisation and of policy lines expressed in resolutions of the Sarva Seva Sangh when almost complete unanimity is lacking. The example of the response which met a proposal at the conference to pass a resolution to send *shanti sainiks* to the Kutch border is illustrative. J P took the line that this was a question for each worker (most workers have taken the vow of the *shanti sainiks*) to decide for himself according to his *antrik prerna* or inner inspiration. He personally did not feel he had to go, but if others did they should certainly go. The outcome was that a group of workers, mostly from Gujarat, met informally that evening, and the next day announced their intention of visiting the border. Thus questions such as these tend to remain open.

What struck one so strongly at the conference was that this was primarily an assembly of doers, not talkers, of idealists, but intensely active and practical idealists. They work for their ideals, often at great personal risk as when *shanti sainiks* tried to quell the latest outbreak of communal riots. Today some of them are engaged in restoring mutual confidence in Jamshedpur and Rourkela. They seemed to share a keen sense of personal responsibility for, and involvement in, whatever happens in our midst. They seemed determined to tell the people the truth, particularly about ourselves, even if it hurts. Above all they are working courageously and constructively, to draw attention to and help solve at least three of our basic problems: the threat to democracy from what someone at the conference called "aggressive, narrow-minded nationalism" (as opposed to liberal nationalism which shows a healthy regard for other people's interests as well as one's own), communalism and the problem of our land-hungry, rural poor.

FOUR EXTRA BENEFITS !
under our special credit transfer system

EFFECTIVE 1ST MAY 1965

1. The ceiling on any one remittance is now Rs. 2,500.
2. The system will now cover your other personal Accounts, such as Fixed Deposits, Short Term Deposits, Demand Loans and Safe Deposits.
3. You need not call yourself at the Bank's Office. Your representative can make the remittance!
4. Transfers between two Accounts are also covered, as long as both are personal Accounts of the same person, or, in the case of joint Accounts at least one Account holder is common to both.

A personal account with the State Bank will thus enable you to take advantage of the additional benefits now made available under the special Credit Transfer System at any of the offices of the Bank throughout the country.

Three Bye-Elections

Introduction

Rajni Kothari

THE articles in this series deal with the three parliamentary bye-elections held in 1963 in Amroha, Farrukabad and Rajkot,[1] in each of which the Congress was badly defeated. Although they were not the only bye-elections in which the Congress was defeated, they evoked great interest among the politically conscious sections of the Indian public, because of the circumstances in which they were held, and the importance that was attached to them by the contesting parties. The elections were held at a time when the prestige of the government was at a low ebb. The Chinese attack on the country's northern borders was primarily responsible for this. The atmosphere was full of political controversy.

Although the bye-elections took place a few months after the actual Chinese attack, the political climate was still charged with suspicion and dissatisfaction. In fact, fresh grounds for discontent were added by rising prices, and the new policies of Gold Control and Compulsory Deposits Scheme announced by the then Finance Minister, Morarji Desai, in his budget speech in April 1963. The return of peace also took away the sense of the emergency under which the people had rallied round the Government. The Opposition took advantage of the elections to challenge and ridicule the policies of the Government. The Congress leadership, on its part, took the challenge seriously and called upon the people to vote for the Congress and show that they stand behind the Government. Such declarations created a tempo not normally found in bye-elections.

Dramatis Personae

The *dramatis personae* behind the elections added to this tempo. Three of the leading lights of the Opposition were put up as candidates, Acharya J B Kripalani in Amroha, Ram Manohar Lohia in Farrukhabad, and M R Masani in Rajkot. The Congress also took considerable risks. In Amroha the name of Hafiz Mohamad Ibrahim, Union Minister of Irrigation and Power and a sitting member of the Rajya Sabha, was announced at the last minute. In putting up Hafizji, a leading role was played by Krishna Menon who had himself defeated Acharya Kripalani in the famous North Bombay contest in 1962, and his close associate, K D Malaviya. In Farrukhabad, Keskar, formerly Union Minister of Information and Broadcasting, who had been defeated in 1962, was sought to be brought back. His contestant from the Socialist Party, Lohia, had fought against Prime Minister Nehru himself in 1962 from Phulpur. In Rajkot, another sitting member of the Rajya Sabha, Jethalal Joshi, was put up as the Congress candidate against Masani. All the three opposition leaders were known to be bitter critics of the Government and especially of Nehru.

The results of the three elections in each of which the Congress was defeated by a sweeping majority, created a sensation in the country. While the extent of the defeat[2] surprised everyone, it nearly stupefied the Congress, and raised great jubilation in the ranks of the Opposition. The latter lost no time in declaring the results as a clear "verdict" of the people against the Government, and, in fact, called for a general election in the country. The Congress, however, was in no mood to oblige the Opposition like that and declared that the election results had nothing to do with the policies pursued by the Government, adding that it had achieved significant victories in other bye-elections.[3] and that the public response to the Chinese attack had shown beyond doubt that the people stood behind the Government. Nevertheless, the results of the bye-elections had greatly perplexed the leadership in the Government and added to the soul-searching that had been going on for some time. The Congress called for an enquiry into the factors that had led to its defeat, and appointed a committeee for this purpose. The studies on the basis of which these three articles on the bye-elections are written, were conducted independently of the enquiry undertaken by the Bye-Election Committee,[4] although the AICC provided all the necessary assistance for the conduct of the three studies, and in fact, stimulated them in every possible way. Both the AICC office in New Delhi and the DCC offices in the respective districts were found to be co-operative and I should like to record our gratitude to them for this. We are also thankful to a number of other public organisations, office bearers of political parties, a large number of local leaders, and members of the public for giving their valuable time and the benefit of their experience to the respective scholars who undertook the field work. Neither the office-bearers of the Congress nor anyone else, however, are responsible for the conclusions of these studies.

Factors Behind Congress Defeat

The results of three studies are interesting for an understanding of the factors which bring about a defeat of the ruling party in India. Although the opposition and certain sections of the press interpreted the outcome of the elections as a "verdict" against the policies of the Congress, and although the Congress utterances before the elections provided support for such an interpretation, a striking revelation of the three studies is the relative unimportance of issues and policies in the elections. The Amroha study takes this as the chief focus of its attention but the point is equally brought out in Farrukhabad and Rajkot.

Secondly, all the three studies show the great importance of the state of the Congress organisation in the determination of election results. Farrukhabad and Rajkot provide direct evidence on this point; Amroha does it in an indirect manner.

Thirdly, and this follows from the state of organisation of the Congress party, all the three studies bring out the considerable importance of the struggle for power within the Congress in its ability to deal with the opposition. The Amroha study vividly brings out this factor by contrasting the conditions in Amroha with the conditions in Jaunpur (1963) and Moradabad (1962) Parliamentary constituencies, in both of which the Congress has staged

a come-back following the conciliation of diverse groups within the party. In Amroha the Congress failed to bring about such a conciliation. The articles on Rajkot and Farrukhabad also show how the alienation of important social groups from the Congress resulted in a high rate of dissidence – and "sabotage" – from within the Congress in the elections.

Fourthly, as against such fragmentation of the Congress, the opposition consolidated its forces in each of the three bye-elections. Such a consolidation proved too much for the Congress, especially when its own house was in bad shape. The point is of general importance. In both Amroha and Farrukhabad, the Congress had all along been in a minority position but had won because of its plurality over a fragmented position. On the other hand, as shown clearly in Amroha, even the organisation of the opposition parties and the support received by them considerably depends on the pressures operating upon the Congress and the desire by various groups to acquire a dominant position within it. The support given to an opposition candidate often represents an attempt by an important group or faction to press its way to power within the Congress. Again, this is a point of general relevance and underlies the dominant position of the Congress in the organisation of Indian politics.[5]

Not Issues, but Organisation

Each of the three studies shows the importance of long-range factors in determining the outcome of the bye-elections, thus further modifying the impression that immediate issues dominate voters' preferences. On the other hand, the short-range factors that weighed with the electorate differed between the three constituencies. On the side of the Congress, there are such factors as the importance of Panchayati Raj in Rajkot, public dissatisfaction with the administration in Amroha, the poor impression created by the Congress candidate in Farrukhabad. The accentuation of the 'communal problem' in Amroha, largely as a result of Central interference, proved decisive. There was, however, no slackening of effort in Amroha as was the case in Farrukhabad and Rajkot, both victims of acute party factionalism, internal sabotage, and a low state of morale.

Caste, communal and demographic factors played their usual role everywhere, but appeared in different ways in U P on the one hand, and Gujarat on the other. In U P they took the traditional pattern of communal voting, whereas in Gujarat it was in terms of the powerful *Kshatriya Sabha*, a caste federation of great political importance in the region since 1962.

The studies serve to modify the forebodings and excitement usually generated by the results of such elections. They show the exceptional circumstances under which the opposition was able to consolidate its forces against the Congress, a tendency that has been lately growing somewhat, but has not yet taken any definite and institutional form. They also show beyond any doubt the critical importance in Indian politics of the internal group structure of the Congress party and its ability to accommodate diverse

conclusion that emerges is that it is not issues but the organisational competence of a political party in mobilising a wide range of support that is the critical factor in electoral behaviour. In India, the conclusion is important for both the Congress and the Opposition.

Notes

1 Amroha: 19 May, 1963; Farrukhabad: 19 May 1963; Rajkot: 26 May '63.

2 The lead of the Opposition candidates over the Congress: 50,454 in Amroha; 57,588 in Farrukhabad; 14,151 in Rajkot.

3 Of the 10 bye-elections held to the Lok Sabha since the third general elections upto July, 1963, the Congress won in 4 as against 8 in the general elections. Of 49 bye-elections to the Legislative Assemblies, the Congress won in 28 as against 26 in the general elections.

4 See the "Bye-Elections Committee Report", All-India Congress Committee, New Delhi.

5 For a theoretical interpretation of the Congress dominance system, which was also used as a point of departure for the bye-election studies, see Rajni Kothari, The Party System, "The Economic Weekly, June 3, 1961; and "The Congress 'System' in India," Asian Survey, December 1964.

THREE BYE-ELECTIONS—I

Congress Defeat in Amroha

A Case Study in One Party Dominance

Bashir Ahmed

Considering the various factors that operated during the Amroha bye-election, Acharya Kripalani's victory hardly appears to have been a verdict for or against the policies or record of the Congress. For, not only did an issue like the Chinese aggression fail to evoke much interest among the majority of voters but even those policies and actions of the Congress Government that adversely affected the interests of the people failed to have a bearing on the way they finally voted.

Even communalism with all its psychological and emotional overtones played no more than an accentuating role in the elections inasmuch as it merely reinforced the existing opposition to the Congress. For the Congress itself, however, it did bring in more votes from the Muslims but this accretion of electoral support was not of material importance to the outcome of the election.

The outcome was decided, if anything, by the opposition the Congress had been facing over the years from the influential elements in the social structure whom it has failed to accommodate in the organisation. The vote against the Congress in the bye-election was, therefore, no more than another expression of the struggle against the incumbent leadership in the Congress that these influential elements have been waging at successive elections in the district.

The Congress continues to be the focal point of political power in the district and its reverse in Amroha underlines precisely this dominant position in district politics.

[The study of the Farrukhabad bye-election by Ramashray Roy will appear next week and that of the Rajkot bye-election by Rushikesh Maru the week after.]

THE selection of the Congress candidate and the struggle for positions within the Congress party dominated the bye-election in Amroha, one of the two parliamentary constituencies in the Moradabad District of Uttar Pradesh. The election was held in May 1963 following the death of the sitting Congress M P Maulana Hifzur Rehman. One of the first to announce his candidature for the election was Acharya J B Kripalani who defeated in the 1962 General Elections' by V K Krishna Menon in the well-known North Bombay contest, was in search of a seat in Parliament. Though contesting the election as an independent, Acharya Kripalani had the support of all the opposition parties except the Communist party. The Republican party, which had earlier entered the contest, retired from it in favour of Acharya Kripalani after the last date for withdrawals was over, as did three of the five other Independents who had also filed their nominations from Amroha. The Congress party, however, took a long time choosing its own nominee.

Finally on April 7, the Central Parliamentary Board of the Congress picked Ram Saran, a local leader, whose name had been recommended by both the DCC and the PCC as its candidate. But it changed its mind on the day the nominations were to close and replaced him with Hafiz Mohammed Ibrahim, a member of the Union Cabinet and the Central Parliamentary Board. Lest delay or irregularity be committed in the filing of the papers leading to their possible rejection, the responsibility for completing this formality was taken upon themselves by Krishna Menon and K D Malaviya both of whom personally went from Delhi to Moradabad for this purpose. The last minute choice of such a senior leader and the keenness shown by Menon and his close ideological associate Malaviya, Union Minister for Mines and Fuel, who after Menon's departure from the Government had become a major target of opposition attack, gave a new significance to the Amroha bye-election and turned it into a prestige contest for the Congress.

Apparently the Congress chose Amroha for a major trial of strength because Acharya Kripalani, one of the most prominent of its critics, had decided to contest the seat. It was probably believed that his defeat, at a time when the opposition was subjecting the Government to the most severe kind of criticism, would silence such criticism or at least make it less effective. Conversely, the Congress victory against Acharya Kripalani would virtually amount to a popular vindication

of their stand and policies. At least, this was how Mrs Indira Gandhi posed the matter before the electors. Addressing a public meeting on the eve of elections in Moradabad, she said the Congress believes that Hafiz Mohammed Ibrahim's success was necessary for India's political future, its domestic and foreign policies and for democracy, while Acharya Kripalani's victory would mean upsetting of everything for which the nation and Congress had stood and striven for so far.

The opposition also formulated the issue in similar terms. Two of its spokesmen issued a statement in which they argued that the "enthusiasm shown by Mr Krishna Menon and Mr K D Malaviya in sponsoring the candidature of Hafiz Mohammed Ibrahim is proof that it is not really the Congress that is contesting the election but Mr Menon and his group . . . Our retreat during the Chinese invasion was the result of the policies of Mr Menon. Every vote for Hafiz Mohammed Ibrahim will, therefore, be a vote for Mr Krishna Menon's policies". By approaching the Amroha election in this manner both the Congress and the Opposition, therefore, chose to fight it on the basis of the Government's record and national policies.

Consistent with such an approach towards the election, Acharya Kripalani's impressive victory over Hafiz Mohammed Ibrahim by a margin of 50,454 votes, in what was virtually a straight fight (see Table 1), came to be interpreted by the Opposition as an expression of the peoples lack of confidence in Nehru's Government and led to the demand on their part that fresh elections be held throughout the country. Even some of the newspapers saw in the Congress defeat in Amroha an expression of popular disapproval of the Government's policies and performance, particularly of its "failures on the food and planning fronts and laxity in the maintenance of standards of public life . . . (Editorial, *Hindustan Times*, May 23, 1963; also see Editorial, *Indian Express*, Delhi, May 22, 1963.)

Was such an interpretation of the election warranted? Was the Amroha bye-election a verdict of the people on the policies, programme and performance of the Congress Party? With a view to answering these questions, our study in Amroha began with an inquiry into the extent to which policy issues and the record of the party in power figured in the voting decision of the adult citizens in the Constituency. For this purpose we selected some of the major planks of Congress policy and record that had constituted the main focus of attack from the Opposition both inside and outside Parliament immediately preceding the election, and had been brought before the electorate in Amroha during the course of the election campaign. We then interviewed voters in towns and the rural areas to see how and to what extent policy issues and the record of the Government became part of the frame of reference within which they made up their mind to vote the way they did. We present below the evidence we collected as also an analysis of the factors that influenced the outcome of the elections.

II

Issues Affecting the People

Considering the severity of criticism that Nehru Government's failure to secure the country's frontiers against the Chinese had provoked from the Opposition and Menon's association with the policy leading to it, we assumed that much of the vote against the Congress would reflect the peoples reaction in this regard, particularly since Menon had also chosen to identify himself so closely with the Congress candidate in Amroha. But we found that only the educated in the Constituency were agitated about the military debacle on our North Eastern borders in 1962 while the event failed to figure as one of the important considerations in the voting decision of the other voters.

Similarly the Gold Control policy of the Government of India which had provoked one of the major controversies of the period hardly evoked much concern among the voters. In the rural areas the issues failed to have an impact on a majority of the voters for reasons which were best summed up by a voter in Deeppur village when he said: "How does it matter to us whether there is gold control or not. In the first place we could never buy gold even when it was available in 'pure' form. But when in the past some of us could and did buy it, we were always cheated by the goldsmith. Now at least with 'impure' gold in the market none of us will be tempted to buy it and will be saved from being cheated." In the urban areas again neither the reaction nor the reasons for it were very different. Deep resentment over the Gold Control Policy was found only among the goldsmiths concentrated in some of the towns but forming on the whole an infinitesimal part of the electorate in Amroha.

The rise in prices and the shortage of food and other commodities, however, had a more widespread impact particularly since its consequences were felt directly by the people in their day to day existence. Most adversely affected were the people in towns who form 21.5 per cent of the population in the Constituency, while for the 78.5 per cent of the population in rural areas the ill effects were somewhat mitigated by their ability to produce part of what they required. The consumption

* Identifies candidates who retired from the election. Of the two Independents who remained in the contest Ali Bahadur was new to the constituency having come recently from Delhi. Zabar Singh also is little known in the constituency his influence being confined primarily to the Hassanpur North and South Constituencies.

pattern of village Dhakia[1] (See Tables 2-A and 2-B), which is more or less the pattern in other villages in this constituency, shows that 54.8 per cent of the food was produced by the households, where they had to buy the remaining 45.2 per cent of their total food requirement spending Rs 1202 for the purpose. In contrast to the quantity of food they purchased from outside, their purchases of non-food articles was only 40.60 per cent of their total requirements. Interestingly however, the money spent on non-food items was only slightly more than half the amount they had spent on the purchase of food items. Thus the tables show that the villages were far from self-sufficient either in the matter of food or non-food articles. Their position, though better than that of the urban population, did not really remain unaffected by the rise in prices and the shortage of food and other commodities.

Factors Affecting an Election

Perhaps the greatest concern and agitation among the people was over matters that were primarily administrative in nature. For instance there was widespread complaint against the manner in which the National Defence Fund was collected in the District. While no one ever questioned the need for such a contribution being collected from the people, they all objected to its being taken at several points and through several agencies. Likewise they resented the pressure and the force that was sometimes used in the process. In Amroha and part of the Hasanpur Tehsil there were additional complaints relating to the extortion of bribes by officers in charge of the land consolidation proceedings that were under way in these areas during the period immediately before the election. More localised and specific were the complaints in some of the villages we visited. In the Sambhal Assembly Constituency which forms part of the Amroha Parliamentary Constituency, we found voters in Madala Fatehpur and Nagla villages exercised over the non-fulfilment of the promise made by leaders and officers alike to complete the work started in 1957 on the Sambhal-Amroha road that passes very close to their villages. Similar grievances were voiced in the other villages we visited in the Constituency. Very often these were mentioned along with complaints about corrupt, unjust and high-handed behaviour of government officials and politicians in the past. As a consequence of such a linking of these two kinds of complaints, the resentment among the people was fairly strong even when the specific and immediate complaints were in themselves negligible.

Do these grievances among the people ever find an expression in their votes? Did they find such an expression in Amroha? The electoral record of Madala Fatehpur and Nagla, the villages referred to above, shows that at least in their case the vote did not reflect such a relationship. Forming between the two of them the polling booth No 35 in the Sambhal Assembly Constituency, Madala Fatehpur and Nagla gave the Congress a majority in both the 1962 election and the 1963 bye-elections to the Parliament, notwithstanding the grievances the villagers had against the Government and the Congress.

Taking the Constituency as a whole, the position does not seem to be any different in this regard. An analysis of votes polled by the Congress and the Opposition at the Third General Elections and the 1963 bye-elections shows that in towns where the people were adversely affected by the rise in prices and shortage of food and other commodities, Congress actually polled 15,067 votes more in 1963 than it had polled in 1962. In the rural areas where too the people did not escape the adverse affects of increasing prices and shortages and had in addition a host of specific grievances against the government Congress only lost a negligible 802 votes from what it had polled in 1962. On the other hand, the Opposition, to which should have logically gone the advantages of rising prices, food shortages and all the other grievances among the people, actually lost 9,763 votes in towns and 1,517 in the rural areas. In terms of the overall position also, the Congress fared much better this time than it had done in 1962. For while the Congress added 14,265 votes to its 1962 figure, the Opposition actually dropped 11,280 votes from its previous total.

The assumption, therefore, seems well warranted that the way people vote is determined by factors other than the policies and performance of the Government. Additional support for such an assumption comes from Congress victory in a bye-election in Jaunpur, a parliamentary constituency in U P where elections were held at the same time as the bye-elections in Amroha. The Party's position in terms of policies and record here was no different from what we had noticed it to be in Amroha. A *Hindustan Times* Correspondent visiting the rural areas in Jaunpur found, for instance, that the people were unhappy about the emergency surcharge on land revenue and other rural imports as they were about the rising prices and shortage of kerosene and sugar. He also reported that the Jan Sangh which was opposing the Congress here in a straight fight was fully exploiting the situation. *(Hindustan Times, May 4, 1963).* In several respects in fact the situation here was much less favourable to the Congress than it was in Amroha.

For one thing, the Congress was contesting here for a seat it had lost in 1962. For another, its candidate was a local leader while his rival was no less a person than the General Secretary of the Bharatiya Jan Sangh, which has its major base in U P. Organisationally also while twenty Central and State Ministers camped in Amroha for the election and ample funds were poured into the campaign there, in Jaunpur the campaign machinery lacked adequate resources. On the other hand, the Jan Sangh had an elaborate set up with a fleet of cars,

cycle squads, host of speakers and canvassers to conduct the campaign since Jaunpur was a prestige contest for it just as Amroha was for the Congress. But despite what were by all standards considerable odds against it, the Congress won by a handsome margin of 8,000 votes, thus regaining the seat it had lost to the Jan Sangh in 1962.

What caused the Congress victory in Jaunpur? Our inquiry shows that the most important factor was the latter-day patching up of differences in the ranks of the influential Thakurs who control the D C C. Considering the otherwise unfavourable situation for the Party, this development proved of critical importance to the successful outcome of the bye-election. For the Thakurs, forming a numerically large group and possessing considerable economic power and high social status, have virtually controlled the political life of the District through their influence in the rural areas. Although they are not the only element of the district population represented in the DCC, agreements and disagreements among them have always proved to be crucial to the performance of the Party in the elections. The Congress defeat in the Third General Elections in Jaunpur had followed differences among the influential Thakurs in the Constituency. Likewise a rapproachment between them had enabled it to win nine of the ten positions of Block Pramukhs in the Jaunpur Parliamentary area in the elections held just prior to the 1963 parliamentary contest. Seen in this context, therefore, the Congress victory in Jaunpur appears to have been less a function of popular policies or a satisfactory record of the Congress Government, and more of organisational cohesion resulting from the accommodation of the most influential individuals in the district and the resulting aggregation of the most vital elements of the electorate in the area within the Party fold. And it is precisely in this respect that the Congress in Moradabad District, of which the Amroha Parliamentary Constituency forms a part,[2] appears to have been particularly defecient.

III

The Support Base of the Congress in Moradabad District

The total population of Moradabad district according to the 1961 Census is 19,73,530, 23,58 per cent of which lives in the 14 towns in the district, while the remaining 76.42 per cent is spread over the rural parts of the district.[3] Among the numerically important communities[4] living in the rural areas are the Scheduled Castes, the Chauhans, Jats, Ahirs and Kahars, while between 60 to 65 per cent of the large Muslim community and about the same proportion of Vaishyas and Brahmans live in towns. Besides these numerically large communities, there are the other agricultural castes of Thakurs, Bishnois and Tiyagis, which though small in number are important elements in the area because of the high degree of social and political articulation they possess.

Of all these elements it was the urban-middle class individuals belonging to the Vaishya, Brahmin and Muslim communities who originally established and ran the Congress in Moradabad till 1938. The organisation did, however, manage to gain, by the early thirties, the support of influential individuals from among the Chauhans, a numerically large, ritually high and economically powerful caste, and from the less prosperous and small but high caste of Tiyagis. From the big and perhaps economically the most well-off caste of Jats in the district as from the equally rich but small caste of the Thakur, no one of significance could ever be attracted into its ranks. This was probably because both the Jats and the Thakurs who held most of the "Zamindaris" in the area regarded causes espoused by the Congress in this period as opposed to their interests. Rather than join the Congress, almost all the Jat and Thakur notables joined the Agriculturist Party that was formed in the thirties to represent the interests of the Zamindars and the rich peasants in UP. Even after independence the relations between them and the Congress did not change. On the contrary, they became, if anything, a little more hostile in their attitude towards the Congress, particularly since measures like the Zamindari Abolition Act sponsored by it affected their interests adversely.

Although the Congress failed with the Jats and the Thakurs, it was able to attract a few leaders from among the Ahirs and from some of the Scheduled Castes into its ranks. In fact, by 1938 the rural element in the Congress was so large that it was possible for Shiv Swarup Singh, a Chauhan, and Muni Dev, a Tiyagi, to become the President and General Secretary of the DCC, respectively. They remained in virtually complete control of the organisation till 1949 when differences between them, arising mainly out of personal ambitions, allowed others like Ram Saran, Dau Dayal Khanna and Jagdish Prasad, who belonged to the group of urban-middle class individuals that ran the Congress originally to stage a come back. By 1951 the

*The Non-Congress votes for 1962 include votes polled by the candidates of the Socialist Party, the Jan Sangh, the PSP and four Independents. Non-Congress votes for 1963 include the votes for the Republican Party nominee, who later withdrew from the contest and of six Independent candidates including Acharya Kripalani.

leadership passed into their hands. That year Ram Saran was elected President of the DCC while Jagdish Prasad became its General Secretary. In the factional struggle that led to their success and in the steps they subsequently took to consolidate their position, a large number of influential rural leaders belonging to different castes were pushed out of important positions in the party and in some cases sent out of the organization itself. In a few instances individuals even left the Party on their own.

As a consequence of these developments, the Congress in Moradabad once again reached very nearly the position from which it had originally started. Today almost all the important offices and positions in the DCC are held by Vaishyas while the representation of other communities in the organisation seems at best to have become merely nominal in character. Of the nine office-bearers, for instance, 5, including the President and the General Secretary, are Vaishya, while 2 are Chauhans, 1 a Brahmin and 1 a Muslim. Again, in the 20-man Executive, there are 9 Vaishyas, 2 Chauhans and one each from among the Jat, Ahir, Thakur, Tiyagi, Bishnoi, Brahmin, Jatav, Sunnar and Muslim communities. Similarly of the 73 others in the General Body of the DCC, besides those already mentioned, 20 are Vaishyas, while seven of the fifteen PCC members from the District also belong to this caste.

This failure of the Party in Moradabad to accommodate effectively the other communities is particularly prejudicial to the interests of the Congress party, in view of the political influence some of these appear to wield in the rural areas. Some idea of the extent of this influence is provided by an analysis of the caste affiliations of the 19 Pramukhs and 19 Representatives that each Block Samithi sent to the Zila Parishad in 1961.

As Table 4 shows, while only 3 of the 38 of the Pramukhs and Representatives from the Block Samithis were Vaishya, 23 of them came from the three economically powerful castes of Jats, Chauhans and Thakurs in the District, while 7 belonged to the less rich but landowning Ahir and Tiyagi Castes. By alienating over the years the sympathies of leading individuals from some of the politically important castes like the Chauhans, Ahirs and Tiyagis, the present leadership of the DCC has, therefore, only augmented the opposition the party was already facing from the Jats and the Thakurs. The consequences of this development for the Party have been most inopportune, as is clearly noticeable in the increasing losses the Congress has suffered at successive elections in both the Assembly and Parliamentary Constituencies in the District.

IV

Congress Position Till 1962

Moradabad district has two Parliamentary and eleven Assembly Constituencies. Moradabad Parliamentary Constituency, known after the district itself, covers the six Assembly Constituencies of Moradabad (City), Moradabad (Rural), Thakurdwara, Chandausi, Bhaijoi and Bellary, while the Amroha Parliamentary Constituency is made up of the remaining five Assembly Constituencies of Hasanpur North, Hasanpur South, Amroha, Kanth and Sambhal. In the First General Elections the Congress was able to cap-

ture both the Parliamentary and all the eleven Assembly seats in the District. At the Second General Elections it retained both the Parliamentary seats but lost four of the Assembly seats in the Moradabad Parliamentary Constituency and two in the Amroha Parliamentary Constituency. In the 1962 General Elections, however, it lost the contest in the Moradabad Parliamentary Constituency where it also dropped another Assembly seat while its position remained unchanged in Amroha. Therefore by 1962 the Congress was left in the District with only one Assembly seat in the Moradabad Parliamentary Constituency and three Assembly seats and the Lok Sabha seat in the Amroha Parliamentary area.

But even in Amroha, the Congress was not able to draw adequate support from the 4,18,384 voters, 78.5 per cent of whom are in rural areas while the remaining 21.5 per cent are in the seven towns in the Constituency. In the 1962 elections to the Parliament, the Congress polled 63,975 or only 15.32 per cent of these votes. Between urban and rural parts of the constituency, its percentage share of votes polled was higher in the former than in the latter (see Table 5). In the urban areas the bulk of the Muslims, who constitute between 35 to 37 per cent of the electorate, are concentrated. As Table 6 shows, Muslims constitute from 60 to 70 per cent of the population in the three large towns of Hassanpur, Amroha and Sambhal and the two small towns of Bachraon and Naugaon. In the two other small towns of Kanth and Dhanaura, they constitute half the population in the former and 35 per cent in the latter.

The larger share of the urban votes that the Congress got in the 1962 elections was, we suspect, due to the Muslim support for it in the towns. And it is also from the Muslims that a substantial part of the Congress support was probably drawn even in the rural part of the constituency.

Although it is not possible to establish this fact satisfactorily due to the nature of data available, a booth-wise analysis of votes polled by the Congress candidate for the Assembly, Sri Sukhanlal, and the Congress candidate for Parliament, Maulana Hifzur Rehman, in the Hassanpur South (Reserve) Assembly Constituency in 1962 provides us with some empirical basis for making such an assumption.

Hassanpur South is a completely rural constituency with a Hindu majority and a fairly large Scheduled Caste population. Muslims spread all over the constituency have a majority only at six of the seventyseven of the polling booths while at 39 others their minimum number is at least 100. An analysis of the poll at the 77 polling booths in the constituency reveals a close relationship between Congress votes and the number of Muslim voters (see Table 7). The Table shows that Congress vote increases, both in the case of Sukhanlal, a Hindu, and Maulana Hifzur Rehman, a Muslim, as the number of Muslim voters at the polling booths goes up, although the percentage of votes polled by the two is not always the same. There is a variation of approximately 4½ to 5½ per cent in the votes polled by them in the first two categories of polling booths, while in the three that follow, it ranges from 1 per cent to nearly 2½ per cent (see the Table) One of the main reasons for these variations could have been the inability of Maulana Hifzur Rehman to attract Hindu votes, for we notice that the differences between his votes and those polled by Shri Sukhanlal increase as the Muslim vote falls. Even so a substantial part of the Congress support in both the Assembly and the Parliamentary constituencies could only have come from the Muslims since the Congress share of the vote falls as the percentage of non-Muslim voters and of total voters in the constituency increases. Thus by 1962 the Congress support was not only confined to a rather restricted geographical area but also to a narrow social base in the district.

The foregoing analysis of the Congress position prior to the 1963 bye-election should not, however, lead us to the conclusion that the Party is on its way out in the district. To do so, we believe, will be to ignore one very important factor in the situation, namely the position and role of the Congress Party in local, state and national politics. Holding immense patronage and vast resources through its control of Government in the State and the country as a whole, the Congress has become the focus of all political activities in the district. Those out of it wish to come into its fold, while those within it but not in positions of leadership want to attain these positions. It is in this context, therefore, that the opposition to the Congress, both from outside and from within its own ranks, should be viewed. That at any rate is the position in Amroha and in Moradabad. Many of the locally influential individuals who have contested against the Congress candidates in Moradabad, sometimes as independents and sometimes under the label of one or the other of the opposition parties, seem to have done so more out of a desire to pressurise the local leadership into taking them into the Congress fold than with the desire of ousting the Party out of power. And very often they seem to have succeeded in the realisation of this aim. In 1962, for instance, Haith Ram and Bishan Singh of the PSP and Kunwar Narendarsingh, a locally influential former zamindar, and a non-party man, were taken into the Congress. Their admission, however, followed their success at the Third General Elections against Congress candidates in the Assembly Constituencies of Bellary, Bhaijoi and Chandausi, respectively. The D C C leaders were obviously compelled to bring them in since the election of these individuals had the effect of wiping out the Congress from the Moradabad Parliamentary area. This move of the Party, not only tilted, the balance in its favour but also as a corollary rendered the opposition's success a temporary achievement. In the long run, the overall effect of the Congress policy to absorb influential opponents when really pressed to the wall has been to prevent the crystallisation and institutionalisation of op-

position in the district. Even the PSP (now SSP) which had been the most successful of the opposition parties in the area with two electoral victories in 1957 and three in 1962 to its credit for instance has failed to acquire a permanent support base and establish a regular organisation in Moradabad.

There is a corollary to what is said above. Individuals from within the Congress, particularly those belonging to the 'out-group' in the DCC have also contributed to the rather impressive though ephemeral strength the Opposition has exhibited at the successive elections in the area. Chaudhury Shiv Swarup Singh and Muni Deo pushed out of positions of power in the Congress, for instance, have supported in the past both independents and opposition party candidates contesting against the nominees of their own party. Their main idea in doing so has apparently been to secure the defeat of as many Congress candidates as possible so that the dominant group in the district organisation is discredited and the Congress leaders in the State are forced to acknowledge their influence, placing the control of the DCC once more into their hands.

Buy Units

They are good investment for your savings

- The Annual Accounts of the Unit Trust of India will be closed on 30th June, 1965.
- The First Dividend will be declared thereafter as soon as possible.

* Income received by individual unit holders by way of dividend up to Rs. 1,000 is free from income-tax.
* Units offer to investors steady return on their investments besides other benefits.
* Unit holders get a steady income because income distribution by the Trust to Unit holders is based on the *average* income of a well-balanced portfolio consisting of Government securities, debentures, preference shares and equities of corporate enterprises.
* Units are a unique form of investment which has important advantages. They offer safety of capital...They yield assured income...They can be cashed whenever money is needed.

UNITS ARE ON SALE AT ALL BRANCHES OF LEADING SCHEDULED BANKS THROUGHOUT THE COUNTRY

V

The Significance of the Bye-Election

All of this provides the overall context against which the Amroha bye-election has to be seen. The bye-election provided Chaudhury Shiv Swarup and all the others in the district organisation who were opposed to the present DCC leadership with an excellent opportunity to pursue the strategy they had been following in the past and possibly invite intervention this time from the highest quarters in their favour. The importance the Prime Minister himself appeared to attach to the outcome of what had become a prestige contest for the Congress seemed to indicate the seriousness with which the Congress High Command could be expected to view the defeat of its nominee on this occasion. Regarding this as a rare chance, what could be called the 'out-group' in Moradabad Congress, did all it could to secure the defeat of Hafiz Mohammed Ibrahim. It was greatly helped in its efforts in this direction by the attitude the 'dominant-group' adopted towards the outcome of the elections. Piqued at the last minute replacement of its own man, Ram Saran, the 'dominant-group', which was entrusted with the task of organising the campaign, showed little interest in working for Hafiz Mohammed Ibrahim. Both, the dominant-group's indifference and the out-group's work against their own Party's nominee, could not but have favoured Acharya Kripalani. Looked at in this background, the vote against Congress in Amroha, therefore, appears not as an expression of opposition to the Party as such but a reflection of the struggle of different elements in the district to get access to positions of control in the Party.

Communalism as an Issue

It was perhaps such an awareness of internal struggle and of a generally weak support base of the Congress in the district which impelled the Congress High Command to choose Hafiz Mohammed Ibrahim, a Muslim, rather than a senior Congress leader belonging to some other community when it decided to make Amroha into a prestige contest. But what the Congress leaders apparently did not take into consideration was the latent feeling, particularly in the articulate sections of the Hindu community that the Muslims have a disproportionately large representation from the District than their numbers warranted. This feeling was based on the fact that unlike in the past when a Hindu and a Muslim were returned from the two parliamentary constituencies in Moradabad District, both the successful candidates at the 1962 elections were Muslims, although one was returned on Congress ticket and the other on that of the Republican Party. Ram Saran's replacement by Hafiz Mohammed Ibrahim, therefore, instantly produced resentment in certain sections of the Hindu community against the Congress and made communalism into a major election issue in Amroha.

No party can in reality ignore the ethnic and caste composition of a constituency in making its choices at the time of elections. In deciding on election strategy, however, great care is needed in the handling of prevailing sentiments and climate of opinion. By choosing in such a crude and transparent fashion a Muslim as its candidate in an area where communalism was lying, as it were, near the surface, the Congress, wittingly or unwittingly, turned it into an active element in the constituency. If it was the expectation of the Congress that Acharya Kripalani will ignore the resentment that its own action produced in the majority community then it must have been disappointed. For Acharya Kripalani, as keen on winning the election as the Congress itself, not only took cognizance of the sentiments of the majority community but also fully exploited them.

Throughout his campaign great stress was placed on the motives of the

Congress leadership in replacing Saran by Hafiz Mohammed Ibrahim. To the more sophisticated audiences in towns the change was represented as a kind of challenge to the Hindu community. It was argued that if 37 per cent of the Muslim voters in the Constituency can be expected to elect a Muslim candidate, then surely 63 per cent Hindus can also return one of their own number to the Parliament! In the rural areas the matter was posed more directly though perhaps a little crudely by Acharya Kripalani's workers who had gone and settled down in the villages several days before the poll was held. The choice before them, the villagers were told, was whether they will vote for 'Choti' or for 'Boti'.[5] All kinds of deep prejudices against the Muslims were activated and references were made to real or imaginary instances in which Muslims supposed to have been with the Congress had in reality joined hands with other members of their community and had by acting secretly as a group, brought about the defeat of Congress Hindu candidates in the past.

Such arguments and stories received greater credence among the people due

to the way Hafiz Mohammed Ibrahim's campaign was conducted. With it were associated local Muslims who had always opposed the Congress in the past. A man like Nawab Yusuf Ali Khan who had opposed the Congress candidate Jaydish Prasad in the Hassanpur North Assembly contest at the Third General Election was now, for instance, playing an important role in organising support for Hafizji. Then there were the Muslim divines from the shrines of Ajmer and other religious places who virtually turned the campaign into holy crusade by the kind of speeches they delivered. Wherever they spoke they referred to the past greatness of the Muslims, their present 'plight' and the need to defend their religious, cultural and political rights which, the Muslims were informed, were in jeopardy due to the rise of Hindu communalism that Acharya Kripalani's campaign represented.

How important in fact was the impact of this 'communalism' on the distribution of the vote? In its total effect the communal atmosphere produced by the two sides appears to have only reinforced the Opposition to the Congress that had been growing over the years with the alienation of influential leaders from the organisation, for the non-Congress vote in the Constituency did not either increase or decrease substantially. Although the non-Congress vote did fall from 1,71,396 in 1962 to 1,60,116 in 1963 the loss of vote in terms of percentage was too small to signify any major alteration in its size.[6] It is, therefore, arguable that even if the communal factor had not operated in the bye-election in the manner it did, the vote against the Congress would have perhaps remained the same. It is doubtful, though, if the same could be said of the support received by the Congress. For at this election the way the campaigns of both the candidates were conducted created in the minority community of Muslims which is peculiarly sensitive and self-conscious, a frame of mind in which Acharya Kripalani's election came to symbolise a threat to its vital interests in the District. With this kind of perception, the Muslim community which had remained divided due to sectional, personal and political differences in the past, closed its ranks, turned out in great numbers and polled heavily for Hafiz Mohammed Ibrahim, thus enabling Congress to register an increase of 22 per cent over the votes it had polled at the 1962 General Elections. All the additional 14,265 votes the Congress received this time came, as Table 5 shows, entirely from the towns where Muslims are in a majority. In both Amroha and Sambhai its urban vote increased by 6,000 each. In Hassanpur North it increased by a little over 2,300 while in Kanth it went up by 300 votes only. In terms of percentage, the Congress urban vote, not surprisingly, rose from 37.6 per cent in 1962 to 59 per cent in 1963 (see Table 3).

But even the 14,265 extra votes it polled were not enough to enable the Congress to win this time. For the continuous decline in its vote at successive elections had made Amroha into a marginal constituency for the Congress. Its percentage share of the votes polled which was 47.60 in 1952 went down to 39.17 in 1957 and fell even further in 1962 to a mere 27 per cent. All through, its successes were possible due to the multiplicity of candidates opposing it. At the First General Election the 52.40 per cent non-Congress vote was, for instance, shared by the candidates of the Socialist, Jan Sangh and Kisan Mazdoor Praja Parties. In 1957 over 60 per cent of the votes polled were shared by the candidates of two opposition parties, namely, the Jan Sangh and the Praja Socialist and one Independent, while in 1962, 73 per cent of the votes polled were distributed among four candidates of the opposition parties (S P, Jan Sangh, PSP, Republican) and four independents (see Table 8). The decision of all the opposition parties which had candidates in the previous election, to back Acharya Kripalani in the bye-election, therefore, proved decisive. Though two of the five independents who had entered the contest remained in the field while the others withdrew, they never really were in the picture because of the limited influence they had in the area. Consequently, the election virtually turned into a straight fight between the Congress and the opposition with the former losing for the first time in the Constituency.

In light of the foregoing analysis of long-term trends, it is not difficult to

Table 8: Distribution of Votes in Four Parliamentary Elections in Amroha

* In Col 6 the votes in the top are those polled by the Socialist Party before it transformed itself into the PSP. For 1957 the votes are PSP votes. In the split that occured after the Second General Elections Lohia and his followers left the PSP and formed their own party called the Socialist Party. For 1962 General Elections, therefore, the first figure indicates the votes polled by the PSP (after the split) while the second indicates the votes polled by the new Socialist Party.

† In Col 7 the votes for 1952 were polled by the Kisan Mazdoor Praja Party. Vote for the Third General Elections and by the Bye-election in this Col were polled by the Republican Party.

** There was one Independent candidate in 1957, four in 1962 and six in 1963. Of the 1,59,041 votes polled by the Independents in the bye-election, 1,28,694 were secured by Acharya Kripalani and the remaining 30,347 vote were shared by five other Independents.

see why the Congress leadership was so nervous about the Amroha bye-election. To retrieve itself from such a difficult situation, however, the party had to fulfil three conditions:

(1) It should have won back into its camp those sections of leadership that it had alienated during the past few years;

(2) It should have widened its social base; and

(3) It should have widened its geographical base, especially adding substantial rural support to the already available urban support.

It is now clear that the Congress failed to fulfil any of these conditions, and thus lost the bye-election.

However, there is no reason to believe that the Constituency is lost to the Congress forever. So long as those opposing it remain primarily interested in gaining positions of importance within its organisation so as to be able to share the benefits of power and patronage that it alone seems to offer, any reverse for the Congress is likely to be temporary, and hence possible to arrest. The only thing that could stop the position from changing favourably for the Congress in the future would be the refusal of the incumbent leadership in the DCC to recognise the realities of the situation and let in the elements who were responsible for Congress defeat in Amroha. But past experience shows that the leadership may not adopt such an obdurate attitude but instead accommodate within the Party its most influential rivals as it had done in the case of the Moradabad Parliamentary Constituency.

VI

Conclusions

Considering all the factors that have operated during the Amroha bye-election, Acharya Kripalani's victory appears hardly to have been a verdict for or against the policies or record of the Congress. For not only did an issue like the Chinese aggression fail to evoke much interest among the majority of voters but even these policies and actions of the Congress government that adversely affected the interests of the people failed to have a bearing on the way they finally voted. Even communalism with all its psychological and emotional overtones played no more than an accentuating role in the election in as much as it merely reinforced the existing opposition to the Congress. For the Congress itself, however, it did bring in more votes from the Muslims but even this accretion of electoral support for it was not of material importance to the outcome of election.

The outcome was determined if anything by the opposition the Congress has been facing over the years from the influential elements in the social structure that it has failed to accommodate in the organisation. The vote against the Congress in the bye-elections, therefore, was no more than another expression of the struggle against the incumbent leadership in the Congress, that these elements have been waging at successive elections in the district as a whole. The Congress continues to be the focal point of political power in the district and its reverse in Amroha underlines precisely this dominant position of the Congress in district politics.

Notes

[1] Village Dhakia forms part of polling station No 41 in the Kanth Assembly Constituency which is one of the five Constituencies forming the Amroha Parliamentary Constuency.

[2] In the following section we discuss the social basis of the Congress support in Moradabad district. What is said there in respect of Moradabad applies equally to the Amroha Constituency.

[3] Census of India, Paper No 1, 1962.

[4] Community-wise break-up of the population is not available for 1962 except for the Scheduled Castes. According to the District Election Office the latest figure is 3,17,730. Some idea of the size of the other communities is available from the 1961 Census. The total population of the District in 1961 was 1, 28, 4,108, of these 7, 45, 669 were Hindus and 4, 78, 847 were Muslims. The numerically large Hindu Caste in the district were Chamar 1,73,907; Chauhan — 47,312; Brahmin — 39,751; Kahar — 33,887; Ahir — 33,235; Jat — 30,204 and Vaishya — 27,574.

[5] The expression 'Choti' refers to the tuft of hair worn by orthodox Hindus at the back of their head. 'Boti' is a colloquial expression for beef and refers here to the Muslims who are beef-eaters. The expression 'boti' also has an emotive significance for the Hindus who revere the cow and have been successful in securing a ban on cow slaughter in some of the States, including U P.

[6] The 11,280 votes dropped by Opposition amount to only 6.58 per cent of its vote in 1962.

Irrigation Target for 1965-66

THE Ministry of Irrigation and Power has set up a Reviewing Committee of officials to examine the progress of works on certain irrigation projects which are in an advanced stage of construction and to remove, as far as possible, the difficulties experienced in their execution. Irrigation and multi-purpose projects taken up during the First, Second and Third Plans are expected to create an irrigation potential of 19.4 million acres by March 1966. The potential attained by March last year is about 16 million across. The remaining potential has to be achieved during the current year, the last year of the Third Plan.

The average rate of creation of irrigation potential has so far been of the order of one million acres a year. The current year's target is three times the yearly average. The setting up of the Committee is one of the steps being taken by the Ministry of Irrigation and Power for close liaison with State Governments in achieving this target. The Committee will review the progress of works in the following nine States: Andhra Pradesh, Bihar, Gujarat, Madhya Pradesh, Maharashtra, Orissa, Rajasthan, Uttar Pradesh and West Bengal.

The Reviewing Committee is presided over by the Chairman of the Central Water and Power Commission, M R Chopra. The Members of the Committee are D B Anand and A R Venkataraman, both Members of the Central Water and Power Commission, and G R Iyer, Joint Secretary and K S S Murthy, Deputy Secretary, Ministry of Irrigation and Power. K V Krishnamurthy, a Director in the Central Water and Power Commission, is the Committee Member-Secretary.

Export Promotion through Import Entitlement

I S Gulati

The objective of this paper is two-fold:

(i) to appraise the scheme of export promotion through import entitlement as it obtains to-day; and,

(ii) to examine the present criterion on the basis of which import entitlements are fixed for various export products and to attempt an answer to the question: Does the criterion lead to optimum export promotion?

[I must acknowledge my debt to N B Amin of Jyoti Limited, Baroda, one of the small band of forward-looking businessmen in this country. He first made me aware of the existence of the problem. My subsequent discussions with him on the subject have been of immense help. But I would not like to commit him in any way to the views expressed and conclusions drawn by me in this paper.]

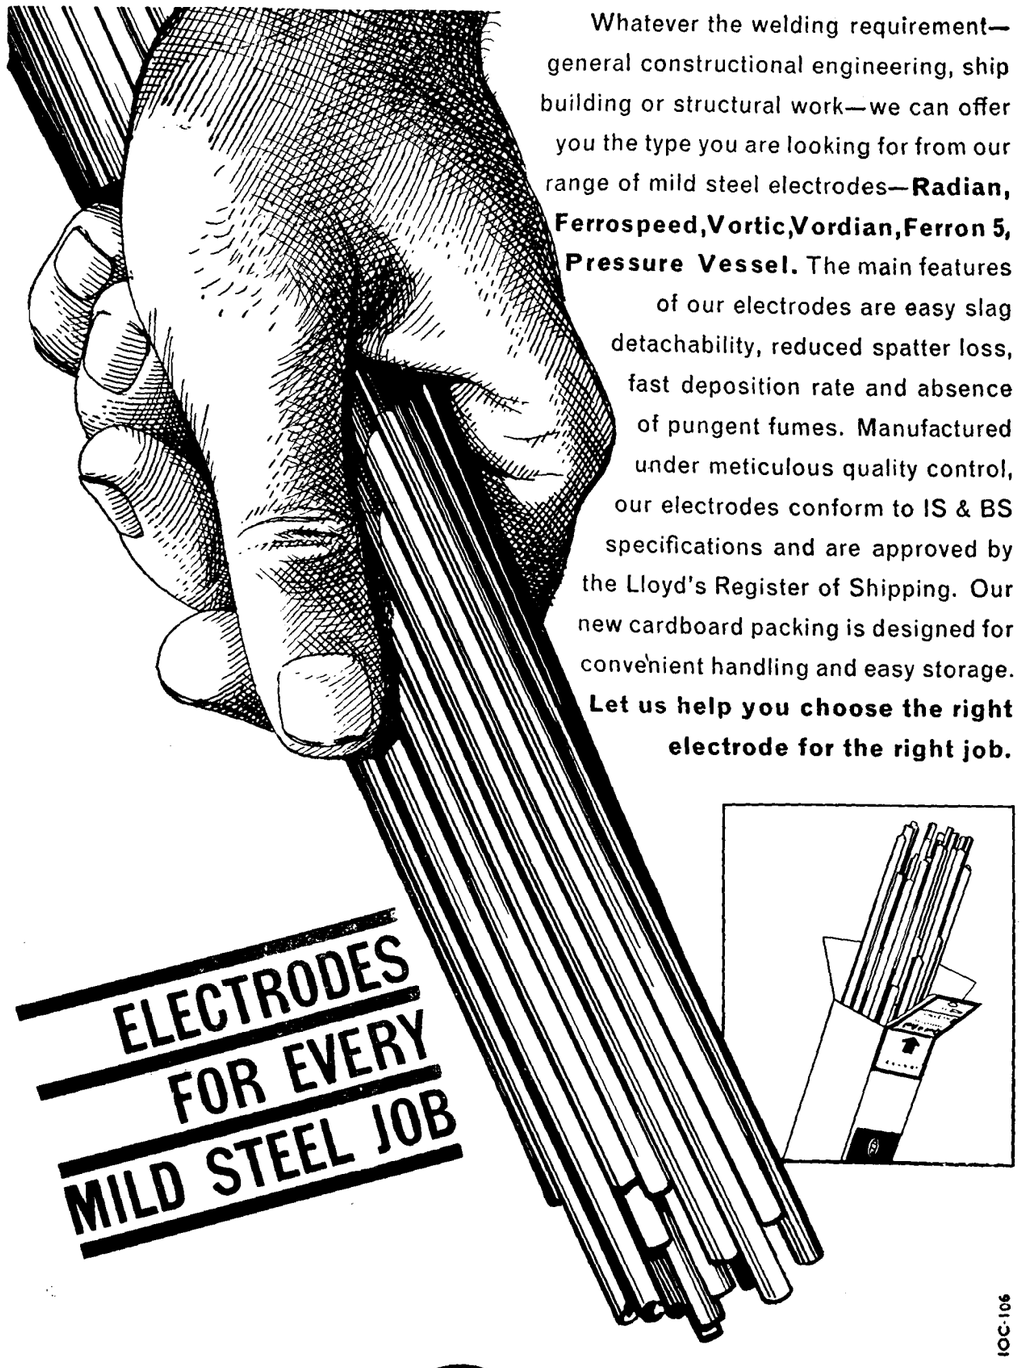
AS a measure of promoting the export of manufactured products from India, the Government issues import licences against exports of specified items. Against each export product covered by this scheme of export promotion, a specified percentage of the FOB value of the export is allowed as import entitlement.

The import entitlement under this scheme may be used for the import of raw materials required in the manufacture of export products and also for the import of machinery and parts. These import entitlements may be availed of by the exporter himself or transferred or sold to another manufacturer who (a) manufactures products covered by the scheme and (b) exports (or sells for export) a part of his product.

The objective of the Government in giving the import entitlements is, to put it in the words of the 1964-65 Report of Ministry of Commerce, "to keep the (export) industries modernized and to asssit them with imported essential raw materials, components, etc., which are not indigenously available." In this manner, the Report argues, the manufacturers|exporters are provided with "a dependable source of availability of these raw materials and components as compared to the manufacturers and producers who are too much attracted by the sheltered internal markets and internal higher prices and, therefore, do not desire to export."

This import assistance is supposed to enable manufacturers|exporters to produce more not only for export but also for internal markets. It helps them "to partly compensate for the loss in exports and partly to be competitive with the non-exporting manufacturers in the country." The element of help can be said to enter the scheme in two ways: (a) in the almost automatic entitlement to import the inputs which are not locally available, and (b) in the entitlement to import *over and above* the actual import-content of the export product. It is this second part of entitlement which contains a clear element of subsidy or bonus, the extent of subsidy, of course, depending on the premium the import licence for the import of the particular machinery or raw material commands. It is again this bonus element of import entitlement which really differentiates between production for export and production for the internal market because even the latter would be given a licence to import the inputs not locally available, even though less expeditiously.

II



From the same Report we learn that out of the total annual exports of Rs 835 crores in 1964, exports valued at Rs 193 crores (ie, less than 23 per cent) were eligible for import entitlements under the above scheme. The rest of exports belong mostly to the category of traditional items which, the Report says, "do not require any major assistance for promoting their exports because in most cases their internal prices are more or less at par with the international prices of these products."

Between 1962 and 1964, total export earnings have gone up by Rs 150 crores. The report compares to this increase in total export earnings the increase in the value of import licences to the tune of Rs 15 to Rs 20 crores under the import entitlement scheme during the same period. The total value of import licences issued under the scheme is estimated at Rs 50 to Rs 55 crores in 1964.

The above comparison, to say the least, is not valid. How can credit for the expansion of the total export earnings be claimed for the import entitlement scheme when only 23 per cent of the export products are eligible for the import assistance under this scheme? It is the increase in export earnings of the products covered by the scheme which is relevant. Even then, the question remains: In orders to appraise the scheme, should the increase in export earnings of the products covered be compared with the increase in the value of licences issued under the

Table 1 : Net Foreign Exchange Earnings under the Existing Scheme

scheme or with the total value of the licences thus issued or further, with the total value of only bonus entitlement claimed during the period? It is enough, at this stage, to have posed this question. We shall take it up later in the course of this paper when other issues are cleared up.

III

The general principle on the basis of which import entitlement is determined at present is to allow by way of import twice the import-content of an export product subject to a ceiling of 75 per cent of the FOB value of export. In actual practice, however, there are items in whose case import entitlement has been fixed at even 100 per cent. Among the group, Engineering Goods, as many as 29 items are listed for 100 per cent import entitlement. For engineering goods, the import entitlement ranges from 20 per cent for items like wooden furniture, gramophone, records and bicycle components to 100 per cent for non-ferrous semis, alloys and fully processed manufactures and stainless steel products.

Let us first examine the general principle of giving an import licence twice in value the import-content of an export product. Half of the import licence thus acquired may be said to compensate the manufacturer/exporter for the foreign exchange that he gave up in making the export[1]. The other half represents the bonus intended to offer the necessary incentive to exports.

In Table 1, we have classified export products into seven categories[2] and calculated net foreign exchange earnings from the export of each of the seven categories of export products. The categories are arranged in the ascending order of import entitlement. In this Table a distinction is drawn between 'Net Export Earning', and 'Net Foreign Exchange Earning' in the following manner:

Export Earning = FOB value of Export *minus* CIF Value of Import Content

Net Foreign Exchange Earning = FOB value of Export *minus* Import Entitlement

Since *by definition:*

Import Entitlement = Entitlement against Import Content *plus* Bonus Entitlement

Therefore,

Net Foreign Exchange Earning = Net Export Earning *minus* Bonus Bonus Entitlement

The distinction drawn above is, as will be observed, very useful. It helps bring out the incidence of the bonus element in import entitlement on export earnings. While for product A, export earnings are reduced from Rs 90 to Rs 80, for product G, export earnings decline from Rs 50 to Zero. But more important, by making this distinction it is possible to see clearly that under the present scheme the *bonus entitlement increases with decreases in net export earnings.* For product A, whose net export earning is Rs 90 the bonus entitlement is Rs 10, whereas for product G whose net export earning is Rs 50, the bonus entitlement is as high as Rs 50. Thus, the lower the net export earnings of an export product, the greater is the bonus entitlement it earns under the existing scheme. That is, a higher bonus is offered to an export product yielding a smaller export earning. It is incredible but true that a scheme designed to promote exports with a view to augmenting the country's export earnings should, in effect, have a bias operating in the opposite direction.

Table 2: Bonus Entitlement under the Existing Scheme

Export Product	FOB Value	CIF Value of Import Content	Export Earnings	Import Entitlement		Bonus Entitlement as Percentage of Export Earning
				Against Import-Content	Towards Bonus	
A	100	10	90	10	10	11
B	100	15	85	15	15	17
C	100	20	80	20	20	25
D	100	25	75	25	25	33
E	100	30	70	30	30	43
F	100	37.5	62.5	37.5	37.5	60
G	100	50	50	50	50	100
H	100	60	40	60	40	100
I	100	70	30	70	30	100
J	100	80	20	80	20	100
K	100	90	10	90	10	100
L	100	100	0	100	0	100

The second drawback of the existing system of import entitlement is that it has to stop short at the point where net export earnings comprise 5 per cent of the FOB value of export because at this point the bonus entitlement will work out to 50 per cent and thus the entire export earnings are wiped off. That is why net foreign exchange earning at this point is Zero. Thus it creates the anamolous situation in which an export product whose net export earning works out to, say 40 per cent of FOB value (i e CIF value of import content is 60 per cent) contributes as much to foreign exchange earnings of the country whereas an export product with 50 per cent export earning contributes nothing to the country's foreign exchange earnings.

Now we can easily anticipate the answer that even as things stand to-day it is not that the export product with 60 per cent import content is not entitled to any bonus entitlement but with the effective ceiling of total import entitlement at 100 per cent, the bonus entitlement could not exceed 40 per cent. Hence, the type of anamolous situation feared by us will not, it can be argued, arise.

Be it as claimed in the above argument, we shall be very happy that at least this drawback of the existing scheme is being taken care of.

Assuming that export products with

E.I.D.-PARRY IN THE NURSERY

Any child will tell you that "Parrys" makes "Sweets", for the name "Parrys" has become synonymous with quality confectionery. Parry's confectionery is so popular that children-and adults-consume over 5,000 tonnes every year-more than 13½ tonnes a day.

The E.I.D.-Parry Group became interested in sugar making during the life time of Thomas Parry and the factory at Nellikuppam was established in 1845. In the early years of the 20th Century, Parrys entered the confectionery field and about the same time became Managing Agents of The Deccan Sugar & Abkhari Co. Ltd. and later of The Travancore Sugars and Chemicals Ltd.

The E.I.D.-Parry Group not only leads in the confectionery and sugar business but also in the manufacture and sale of fertilisers, fungicides, pesticides, pottery, sanitaryware and a large number of other products.

Today, the E.I.D.-Parry Group, fondly known as "Parrys", is one of the larger companies in India, consisting of 9 subsidiary and associated concerns providing employment for more than 10,000 people.

import content exceeding 50 per cent do get covered by the scheme under review, but subject to an effective ceiling of 100 per cent import entitlement, the position with regard to bonus entitlement for various categories of export products would be as is worked out in Table 2. It can be observed that the *bonus entitlement increases as the export earnings decline* until we reach the export product 'G'. From there onwards, bonus entitlement as a proportion of net export earnings remains constant at 100 per cent.

IV

At this point in our discussion, let us make a slight digression and raise the question: What is the gain to the economy in allowing 100 per cent import entitlement? Obviously, the gain in foreign exchange earning in such cases is nil. The only defence that one can put up for giving 100 per cent import entitlement is in terms of its being a purely temporary measure intended to help manufacturers/exporters in these particular lines to establish their foot-hold abroad. Once they are established, the quantum of import entitlement might be reduced.

V

But the much more important questions remain: Is it appropriate that bonus entitlement should be tied with the import content of an export product? Since the purpose of giving the bonus is to stimulate net export earning, will it not be much more beneficial to the economy to relate the bonus to net export earning of an export product rather than relate it to the import content of the export product? If bonus entitlement is linked to the import-content of an export product, the tendency on the part of the exporter will naturally be to go in for the export of products with higher import-content. Also, there will be an urge to overstate the import-content[3]. If on the other hand, bonus entitlement is linked to net export earning, the natural tendency on the part of the exporters should be to go in for exports with lower import content and, if anything, the urge will be to overstate the local content of the export product.

Clearly, the right thing to do is to relate bonus entitlement to the net export earning of an export product instead of to its import-content. In Table 3 (A) and 3 (B), it is indicated how this can be done and what the change would imply in terms of net foreign exchange earning for each of the export products.

In constructing Table 3(A) two considerations have been kept in mind: (i) it is taken as a given restraint that the total outlay of foreign exchange in the form of bonus entitlement must not exceed what is given away at present (i e Rs 187.5 in our illustrative exercise as against total net export earning of Rs 512.5) and (ii) bonus entitlement has to be related to net export earning from an export product instead of to its import content. As a proportion of total net export earnings from products A to G, the present total outlay on bonus entitlement works out to 36.5 per cent. Therefore, in our calculations bonus entitlement is distributed among these export products at the rate of 36.5 per cent of their respective export earning. This yields an interesting result. Unlike under the existing scheme, bonus entitlement as a proportion of the FOB value progressively increases as the net export earning rises.

In Table 3 (B) bonus entitlement is separately worked out for products H to L. If these products were included in Table 3 (A), the outlay available for bonus entitlement would have added up to Rs 287.5 against total net export earning of Rs 612.5 and therefore, the proportion of export earnings which could be given away in bonus entitlement within the limit set by our restraint would be as high as 47 per cent.

It is important to note that with the proposed modification in the fixation of bonus entitlement, products G to K which now yield Zero net foreign exchange earnings would be making some contribution to the country's foreign reserves. Only product L would not. But then it would not be *ordinarily* exported.

VI

This brings us to the question of appraising the achievement so far

Table 3A: Bonus Entitlement on a Modified Basis

				Bonus Entitlement		Net foreign exchange with bonus earning	
	FOB Value	Value of Import Content	Net export earning	@100% import-content	@36.5% of export earning	@100% import-content	@36.5% export earning
A	100	10	90	10	33	80	57

	700	187.5	512.5	187.5	187	325	325.5

Table 3B: Import Entitlement on a Modified Basis

				Bonus Entitlement		Net foreign exchange with bonus earning	
	FOB Value	Value of Import Content	Net ex-Port earning	@100% import-content	@36.5% of export earning	@100% import-content	@36.5% export earning
H	100	60	40	40	15	0	25
I	100	70	30	30	11	0	19
J	100	80	20	20	7	0	13
K	100	90	10	10	4	0	6
L	100	100	0	0	0	0	0
	500	400	100	100	37	0	63

under the existing scheme whereby bonus entitlement accrues on the basis of the import-content of an export product. In appraising this scheme, the relevant data would be (a) *the increase in net export earnings* of the country from the export products covered by the scheme and (b) *the total outlay on bonus entitlement* during the period under review. It is the bonus part of the import entitlement which, as we observed at the very outset, can make a material difference to the exporter and is, therefore, the relevant part to be taken into account in making the appraisal. Also the *total outlay* and *not the increase in outlay* on bonus entitlement should be taken into account because it is the entire bonus entitlement which is supposed to be directed to securing an increase in export earnings.

Let us now apply this criterion to the performance between 1962 and 1964. On the assumption that half of the value of import entitlement licences issued during the period represented bonus entitlement the bonus part in the year 1964 would be around Rs 25 to 27 crores. If, however, one allows for the fact that for certain export products (like products H to K) bonus will work out to less than 50 per cent of import entitlement, bonus entitlement for the year 1964 may be put at Rs 22 to 24 crores. As against this, the *increase in the FOB value* of export products covered by the scheme in 1964 may be put at Rs 40 crores (See Table 4 for principal items covered by the scheme) and our rough calculations yield a figure of Rs 30 to 32 crores for the increase in net export earnings of the same products.[4]

As it is, therefore, the gain in net export earnings from the present scheme, no doubt, exceeds the bonus entitlement but by just about Rs 8 crores. In other words, credit can be claimed by the present scheme of import entitlement for contributing to the increase in the country's net foreign exchange earnings to the extent of *only Rs 8 crores and not Rs 150 crores*. If, however, the scheme is modified on the lines suggested in this paper, it should be possible to achieve much better results, because a clear incentive will then have been introduced to increase *net* export earnings—an incentive which does not exist at present. Bonus entitlement, when related to net export earnings should stimulate efforts on the part of manufacturers|exporters to increase their net export earnings and that is precisely what the scheme is supposed to promote.

Table 4: Performance of Principal Export Products Covered by Import Entitlement Scheme, 1962-64

Item[1] No.	Commodity	Exports in 1961-62	Exports in 1963-64	Increase or Decrease

1 As in the 1964-65 Report cited below.

Source: Appendix IX, "Export Estimates for Fourth Plan" in 1964-65 Report of Ministry of Commerce

Notes

[1] We put it in this way deliberately. Under the import-entitlement scheme, one is not obliged to export one's produce on utilization of import entitlement. Having once made an export of the product eligible for import-entitlement, one becomes eligible for an import licence regardless of whether one partakes the subsequent export-cum-entitlement round or rounds.

[2] This follows more or less the classification of Engineering Goods under the existing scheme of Import Entitlement.

[3] It must be conceded that if the import-content is independently determined on the advice of export advice available to the Government, and the bonus admissible thereon does not vary from transaction to transaction, the scope for overstatement of import-content or of under-statement of local content does not exist except through pressure at the very stage when experts are engaged in fixing the import-content.

[4] According to the 1964-65 Report of Ministry of Commerce, the *increase* in the value of import entitlements was of the order of Rs 15 to 20 crores. Assuming, that at least half of it represented the value of import-content we get the figure given in the text. If the import-content was somewhat higher, the net export earnings ought to be smaller by that amount.

Dalal Street at New Low

Wednesday, Morning

IT is about the same story every week. Oppressed by political uncertainties and continuing monetary stringency, the stock market continues to beat a gradual retreat even though the corporate news remains fairly encouraging. On May 18, Dalal Street slipped through its March 27 low, thereby making a new low point for the year—the lowest for over two years. With the inter-bank call money rate reaching a new high of 9½ per cent and Pakistan continuing to evade a negotiated settlement of the Kutch border dispute, Dalal Street's performance could scarcely have been different. Perhaps the only redeeming feature of the market was that bears were never really aggressive; the sagging tendency was due more to lack of support than to any important selling. Bears seemed to have been discouraged mainly by the fairly consistent support from the Life Insurance Corporation. Recently, there has hardly been a week when the LIC has not been reported as an important buyer of one scrip or another. Trading throughout last week was characterised by extremely poor turnover and narrow fluctuations. Several shares, both on the forward and cash list, were marked down to new low levels —the lowest for several years—and these included some of the growth shares like Telco and Voltas.

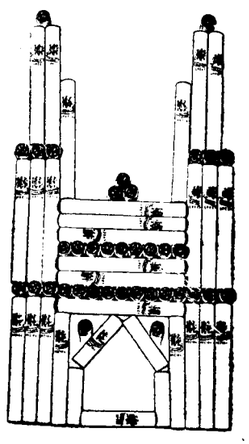
The feeling of despondency is growing with time. The fall in equity prices provides little indication of the mood of frustration pervading the stock market which has long been living on a starvation diet. Dalal Street has lived through many bear cycles and seen several crises which even necessitated its closure for a time. But stock brokers cannot recall any occasion when the turnover shrank so low as it is at present. Fall in equity prices is inevitable when the interest rates are being pushed up as matter of official policy. And it is also a fairly common experience for activity to shrink with the decline in prices. While monetary policy and also fiscal policy, to some extent, can explain the declining trend in equity prices, these cannot fully explain the phenomenal fall in stock exchange activity. The slump in stock exchange business needs to be properly distinguished from the slump in equity prices. Strange as it might appear, activity on the stock market has been steadily declining over the years—including bull cycles—in spite of the phenomenal growth of the corporate sector over the past 15 years or so. Factors which are affecting the course of equity prices are different from those which have been influencing the volume of business. In the past, the stock markets in India have thrived mainly on speculation but speculative activity has been steadily declining over the years for good many reasons.

COTTON

Dull But Firm

THE cotton market last week displayed a firmer tendency though the turnover continued to be extremely restricted. The futures market appears to be as good as closed as the daily turnover has dwindled to a trickle and conditions are not much better in the spot market where only the needy mills figure as buyers now and then. Because of the none-too-encouraging off-take of cloth and the acute financial stringency, mills are making their purchases of cotton only on a hand-to-mouth basis. Laxmi, Jayadhar, C02, L 147, Digvijay and Kalyan—these are the varieties which are being more actively traded at present.

The improved sentiment in cotton which took the August hedge contract to a new high of Rs 770.25 on May 18 was attributed generally to rumours suggesting an all-round increase of about 10 per cent in the ceiling prices for the 1965-66 season. An increase of this order would please the growers, paccify the opponents of decontrol and also relieve the authorities of the responsibility of administering price control because rarely have cotton prices been known to be quoted 10 per cent above the existing ceiling rates. But if the authorities are willing to concede such a big rise in ceiling prices, it would perhaps be better to abolish the control altogether if only to expose the oft-repeated complaint that price control has been hampering production. Whether decontrol will help production is a moot point but it will certainly help minimise the evil of mixing of different varieties of cotton which has often been resorted to in order to secure higher prices for inferior types.



Arrivals of foreign cotton into India during the first eight months of the current season—September 1 to April 30—are placed at 5.86 lakh bales as against 4.62 lakh bales in the same period last season. Of this American cotton accounted for 2.72 lakh bales (2.25 lakh bales), Egyptian 1.31 lakh bales (1.28 lakh bales), East African 69,151 (21,452), Sudanese 51,970 (78,923), Syrian 4,611 (nil), Pakistani 49,939 (4) and other 8,039 (8,159). Export sales of Bengal Deshi up to May 13 are placed at 2.14 lakh bales. Actual shipments up to May 1 total 1,45,492 bales against 1,70,271 bales in the corresponding period last season. Out of this Japan's share is 108,411 bales (121,783 bales) to be followed by the Continent with 15,780 (20,262), USA 12,213 (14,234), Hong Kong 6,234 (8,036), UK 2555 (4,994) and others 299 bales (862 bales).

OILSEEDS

Prices Firm Again

THE oilseeds market last week showed remarkable strength with groundnut oil striking a new high for the season. The spurt in groundnut oil from Rs 24 to Rs 25.10 (per 10 kgs) in a matter of days had a profound effect on the general market psychology. Linseed oil ready rose from Rs 19 to Rs 20 in sympathy with groundnut oil and castor oil Commercial hardened from Rs 16.80 to Rs 17.10. Oilseeds futures also recorded sizable gains, with linseed June improving from Rs 96 to Rs 99.70 (per 100 kgs)—a new high for the season—and castor June recovering from Rs 78.25 to Rs 79.65. The latest quotations were only a little below the week's best.

Business in new contracts was permitted from May 13 without any changes in the terms and conditions of trading except for the increase in the weekly permissible range of fluctuations from Rs 2 to Rs 3 (per 100 kgs). While the new September contract in castor has been commading a modest premium on the June delivery, in linseed the September contract is quoted slightly lower than the June contract. The Forward Markets Commission has permitted trading in the July contract in groundnut with a ceiling of Rs 105 (per 100 kgs) which makes little sense because even the

Really something to look up to...
VAZIR SULTAN's symbol of fine cigarette-making

This sign belongs to The Vazir Sultan Tobacco Co. Ltd., who make Charminar in a huge modern cigarette factory in Hyderabad. Charminar is the cigarette with an unvarying rich flavour, a unique taste. Meeting the tremendous demand for Charminar is a feat within reach of only a world leader in cigarette-making...the Company with this symbol. So its factory is the largest in South-East Asia. And also one of the most modern...

Rotary mixers blend the finest tobaccos thoroughly. Cutting machines shred the leaves at high speed. Spinning cylinders process the tobaccos. Then the cigarette-making machine performs many intricate operations...to produce over 20,000 Charminars every minute of the day, nearly 900 million Charminars every month of the year. This is how modern high-speed machines have helped Charminar become India's favourite cigarette, and also one of the world's top selling cigarettes. Now that's really something to look up to...

There's nothing like Charminar—India's greatest cigarette!

THE VAZIR SULTAN TOBACCO COMPANY LIMITED

MAKERS OF INDIA'S GREATEST CIGARETTE

CAS/VS. 6 R

inferior most groundnut Karad Bold ready is quoted about Rs 14/15 higher than the permissible ceiling for futures. The Commission cannot be unaware that no transaction had been recorded in the April hedge contract as the spot material was all the time enjoying a huge premium over the prescribed ceiling. It is one thing not to permit hedge trading—opinions on the utility of hedge trading can differ sharply—but there is no sense in allowing forward trading on terms and conditions which make business impossible. The only justification for permitting hedge trading in groundnut July with a ceiling of Rs 105 can be that prices might decline below this level some day in course of time and thereby make forward dealings feasible.

May be, the Commission feels, as many other observers do, that there is no sound reason why groundnut and groundnut oil prices should be quoted around the prevailing high levels. But it is not easily possible to assess the demand and supply position of oilseeds in India. Estimates of supply are quite often very wide of the mark and no reliable estimates are at all available about demand. Little wonder therefore that many observers have been intrigued by high prices of edible oils this season when the overall availability of oils is believed to be appreciably larger than in the previous season.

And what is more, last week's spurt in groundnut oil ready from Rs 24 to Rs 25.10 (per 10 kgs) occurred when it could have been the least expected. The Union Commerce Minister told the Rajya Sabha on May 13 that the Government had no proposal at present for exporting groundnut oil. The Government has also issued the authorisation for the purchase of the remaining 35,000 tonnes (or more depending on prices of soyabean oil) of soyabean oil under PL 480. There has also been a sizable decline in soyabean oil prices in the US over the past few weeks — about $30 per tonne, which will not only enable India to secure a larger quantity of oil with the same funds but it will also make the use of this oil more remunerative for vanaspati manufacturers. This in turn could be expected to have a softening effect on groundnut oil prices.

Export houses reported fairly large business in groundnut extractions last week. Communist countries were the chief buyers and they took substantial quantities. Apart from groundnut extractions, the other main item of export is cottonseed cake. Exporters are eagerly awaiting the details of the tax credit certificate scheme for exports. The Government will do well to announce the details of the scheme soon to enable exporters to make a fresh assessment of the export possibilities.

BUSINESS NOTES

Atul Products

THE preliminary profit figures of Atul Products for the year ended December 1964 were discussed in these columns in the issue of April 3. The directors' report now released says that higher sales were due mainly to a better working of all the dyes and the caustic soda plant. The difficulty regarding procurement of raw materials continued in 1964 also, and whatever materials were secured were purchased at a higher cost. The situation was partly relieved because the company itself manufactured some of the intermediates.

The company has made satisfactory progress in implementing its various projects. The project of extension of sulphuric acid plant and establishment of chlorosulphonic acid plant is completed; the latter plant started working in February. The caustic soda plant worked throughout the year, but it could not achieve full capacity due to the non-availability of power. Since March last, however, the plant is running to full capacity. The dicalcium plant is expected to begin production shortly. Originally, it was intended to secure foreign know-how for chlorinated products but the management has now decided that the company itself should develop them. Some more time will, therefore, be needed to complete this project. The naphthalene intermediates plant is expected to go into production in the third quarter of this year, nearly three-fourths of the equipment for the plant having been already installed. The company has ordered almost all the equipment for the fast colour bases plant, and the construction of the building is in hand.

The Cibatul's projects will cost approximately Rs 3.5 crores, and the company will have to raise additional funds. The original estimate was for the total sum of Rs 3 crores. Almost all the machinery for the plastics project has arrived on site and is in the course of being installed. The plant is expected to be ready for commissioning in the third quarter of this year. So far as the Sulpha project is concerned, the progress has not been so satisfactory. Only 50 per cent of the machinery has been received on site. But the greater delay is in respect of the structural steel required for the plant building. The fabricators have not been able to keep their delivery dates. It, therefore, appears that the plant may not be ready for commissioning before the middle of 1967.

Shree Digvijay Cement

THE management of Shree Digvijay Cement has decided to undertake a further expansion of the cement capacity with a view to raising it by two lakh tonnes to 8.30 lakh tonnes per annum. Plans are also under way for raising the capacity of asbestos cement products.

During the year to December 1964, the company's production of cement increased from 5,02,995 tonnes to 5,90,407 tonnes but the output of asbestos products was lower at 21,531 tonnes against 23,300 tonnes last year. The total turnover was up by 24 per cent from Rs 6.18 crores to Rs 7.64 crores, and even though cement prices continued to be "unremunerative" the company earned a considerably higher gross profit of Rs 159.67 lakhs against Rs 123.12 lakhs a year ago. This outcome was possible mainly on account of the higher output and increased efficiency. The directors have raised the dividend to Rs 15 per share from Rs 13 paid for 1963 and Rs 10 for 1962. The proposed dividend is payable in full on the additional capital raised in 1963, which in the preceding year ranked for only a proportionate payment.

The provision for depreciation has taken up Rs 34.78 lakhs against Rs 32.63 lakhs, development rebate reserve Rs 5.14 lakhs against Rs 16.20 lakhs and the tax liability Rs 47 lakhs against Rs 29 lakhs. The rehabilitation and development reserve gets Rs 5.59 lakhs against Rs 4.73 lakhs and the transfer to general reserve Rs 32 lakhs against Rs 19 lakhs. The proposed ordinary dividend should take away Rs 29.92

lakhs against Rs 22.63 lakhs and preferential dividend Rs 5.20 lakhs as before.

Herdillia Chemicals

HERDILLIA Chemicals is soon entering the capital market with a capital issue of Rs 1.70 crores for its big petro-chemical project. One of the first ventures falling within the private sector to undertake the manufacture of phenol, acetone and phthalic anhydride from petro-chemical raw materials, the project is estimated to involve a total capital outlay of Rs 10.59 crores. Speaking to the Press recently in Bombay, H V R Ienger, Chairman, said that the petro-chemical industry would make rapid strides in the coming few years and that Herdillia's project, when completed, would open a fascinating chapter in the industrial development of the country. He said that the company was expected to go into production in the third quarter of 1967 and that when in full production, its turnover would be around Rs seven crores per year.

The company is promoted by E I D-Parry in collaboration with Distillers Co of U K and Hercules Powder Co of U S A. The factory will be located in the trans-Thana creek industrial area on the Thana-Belapur Road in Maharashtra. Of the present capital issue of Rs 4.02 crores, Rs 2.32 crores are to be subscribed by the promoters, collaborators, directors, the Commonwealth Development Finance Co of U K and the National and Grindlays Finance and Development Corporation of U K. The remaining capital of Rs 1.70 crores will be offered to the public for subscription at par. The entire public issue will be underwritten.

Ceat Tyres

DEMAND for tyres was slack for the major part of last year, mainly as a result of over-production. With another unit entering production, there are now seven producers in the country in the field of tyres and tubes. Happily, there has been some improvement in demand from the beginning of this year and this has relieved the situation to some extent, but market conditions are such that manufacturers have to depend largely on their ability to sell their products in a competitive market. Anticipating this situation, the management of Ceat Tyres of India has been devoting a good deal of attention on expansion of their selling organisation throughout India. This policy is expected to help this new company in meeting competition in the market.

Poor demand apart, last year the company's employees in certain sections resorted to go-slow methods which lasted for three months and culminated in a strike of six days. The output was, therefore, some 14 per cent lower than that of the previous year. Sales at Rs 5.95 crores were about 3¾ per cent lower, and the year's operations resulted in a loss of Rs 2.09 lakhs, as against a profit of Rs eight lakhs, after providing Rs 25.68 lakhs (Rs 24.09 lakhs) for depreciation. From the beginning of last year, prices of tyres and tubes were raised by six per cent but the benefit was almost neuralised by larger consumption of more expensive indigenous raw materials, particularly synthetic rubber, carbon black and fabrics. The company's expansion programme could not be completed in time, and is expected to be completed in the current year. The production of retreading material will begin shortly. Besides, proposals for further diversification are being considered by the management.

Mahindra Ugine

PER capita consumption of steel in India is lamentably low compared with that in other progressive countries. While it is acceptable that the country's immediate need is increased agricultural production, and a balanced growth of consumer goods, attention must be paid simultaneously to the development of a well co-ordinated iron and steel industry. This view was expressed by Harish Mahindra, Chairman, Mahindra Ugine, at the company's annual general meeting held in Bombay. He added that only the development of the basic industries on pre-determined lines could bring the nation to the take-off stage and that any shift in emphasis was fraught with the possibility of a grave danger to the economy.

Official thinking also seems to be on similar lines. In view of the rapidly rising demand for alloy steels and the long gestation period involved in the establishment of the alloy steel plants, the Government some time ago welcomed proposals from those units in the private sector which had made tangible progress in the implementation of their manufacturing programmes and were ready to expand their capacities to cope with the demand during the Fourth Plan period. Mahindra Ugine has recently received a letter of intent from Government permitting the company to expand the rated capacity of its plant from 18,000 tonnes to 31,000 tonnes of finished alloy steel per year. According, the company's plant is now being designed for an initial output of 24,000 tonnes, with suitable provisions in the works layout and plant and equipment for eventual expansion to 50,000 ingot tonnes per year at a minimum cost. The substantial increase in the rated capacity of the plant is estimated to involve additional outlay of Rs two crores, of which Rs 1.5 crores will be required by the company by 1966 and the balance by 1967-68.

Guest, Keen, Williams, Limited

Statement by the Chairman, Sir Raghavan Pillai, KCIE., CBE

THE following is the text of the statement by Sir Raghavan Pillai, KCIE, CBE, Chairman, Guest, Keen, Williams Limited, on the occasion of the Thirty-fifth Annual General Meeting held in Calcutta on May 21, 1965 :

It gives me great pleasure to welcome you to this, the thirty-fifth Annual General Meeting of your Company. The Directors' Report and the Statement of Accounts have been in your possession for some time, and I propose, with your permission, that they be taken as read.

When we met a year ago I took the opportunity to review the history of the Company and drew attention to the several important recent developments which marked the opening of a new chapter of progress. I am glad to be able to tell you today that the impetus gained in recent years in the raising of productivity and in the rate of modernisation and expansion has been fully maintained in 1964, and we can be satisfied that in this context achievement during the year has wholly matched expectation. Much benefit is being gained by the merger of the Company's former subsidiary, Sankey Electrical Stampings Ltd., which now operates as Sankey Division. The process of administrative and managerial integration will necessarily take time, and indeed this is desirable; advances have been, and will continue to be made towards the objectives of economy and improved administrative efficiency, and these will progressively be reflected in the Company's results.

Operations

In all divisions a substantial increase in production and sales was recorded in 1964 representing a further improvement in the utilisation of new plant. In certain lines competition has intensified noticeably, but the Company is generally maintaining its share of the expanding market.

As in the past few years a curb was imposed on the rate of activity in the Steel Division by the continued shortage of raw materials. This lack of steel billets is becoming a problem of serious proportions, and during the year raw material stocks were further reduced. While the immediate outlook is thus far from satisfactory, we can look forward to some measure of relief when the expansion of the Company's own steelmaking capacity has been completed. and I shall refer to this again; it is clear that in the future greater emphasis must be given to this area of development to ensure a regular supply of good quality steel for the mills and for the fabricating departments.

In the Sankey Division, too, the raw material position caused difficulty, and the considerable increase in the production of electrical stampings and precision presswork that was required of all three Works of the Division was not matched by supplies of indigenous electrical steel sheets. It has not yet been found possible to increase indigenous production of electrical sheets since this was started a few years ago, and it is still necessary to import from abroad the major part of India's requirement. It appears unlikely that indigenous supplies will be appreciably increased before 1967 or 1968, and in the meantime the needs of the consuming electrical industries grow day by day.

A rise in the output of railway track items and forgings in the Engineering Division was recorded. The manufacture of certain simple items is being progressively reduced however in favour of more complex products.

In the Bolt and Nut Division at Calcutta and the Screw Division at Bhandup production of all types of fasteners showed a satisfactory advance although output of high tensile products is still limited by shortages of raw material and imported parts for the plant.

Labour relations during the year were generally satisfactory and employees throughout the Company are responding well to the changing conditions arising from expansion. Several important issues, including Annual Bonus for earlier years affecting a large proportion of the Company's workmen, were settled in 1964.

In response to the Government's call, Consumer Co-operative Stores have been set up at the Works at Howrah and at Bhandup.

A year ago I told you of the Court of Inquiry that had been constituted by the Government of Maharashtra to inquire into the most deplorable strike which occured at the Bhandup Works of the Company's then subsidiary. Today the lengthy proceedings of the Inquiry still continue, and until the outcome is known I must refrain from further comment.

Exports

Never before has the need to develop India's exports been so acutely felt as at the present time, and it is with great personal satisfaction that I am able to tell you of the efforts that your Company is making in this direction.

During the past few years valuable and comparatively regular trade has been established with the U K and with Middle and Far Eastern countries mainly for the export of fasteners but also for other engineering products. Representatives of the Company have travelled to a number of countries to seek out potential export markets and to establish trade channels which are now being developed. In 1964 the Company shipped its products to the United Kingdom and New Zealand, to Iraq, South Vietnam and to the U S A as well as to closer neighbours, and you will be glad to know that the value of exports during the year, at almost Rs 28 lacs, was higher than ever before. Opportunities have now been presented to enter the U S A market on a larger scale than hitherto, and we can take pride in the fact that the quality of the G K W product offered has been very well received, as in other countries, when judged by the highest international standards. This new avenue of trade is being actively explored.

Such direct exports, however, form only part of the Company's contribution to India's overseas trade since its products, particularly fasteners, are used in the production of an endless range of engineering goods which are

increasingly exported by other manufacturers in India to all parts of the world. Whilst it is impracticable to assess with accuracy the value of such indirect exports we can be certain that our goods are to be found in ever increasing quantities in all foreign markets for India's engineering industry.

Trading Results aid Dividends

The accounts for the year under review incorporate the operations of Sankey Division whereas in the previous year they did not, since the Division was operating as a subsidiary company. In my ensuing remarks the comparative figures for the previous year have been adjusted to include the operations of the then subsidiary so as to illustrate more clearly the progress that has been made.

Turnover rose satisfactorily to Rs 26,91,66,841 from Rs 22,53,80,677 for the previous year. Profit before taxation, Rs 3,09,72,190, compares favourably with the figure for 1963, Rs 2,60,80,071, in spite of raw material shortages and the unusual inflationary conditions prevalent in the country throughout the year which were reflected in higher operating costs.

The charge for taxation amounting to Rs 1,65,00,000 is determined after allowing for tax relief estimated at Rs 12,00,000 in respect of your Company's new industrial units. In the absence, however, of any agreed assessment it has been considered prudent to make provision for this amount in the accounts as an Additional Taxation Reserve.

The available profit for disposal after all required transfers and appropriations is Rs 1,05,33,204. Your Directors have recommended a Final Dividend of 70 paise per share which together with the Interim Dividend of 60 paise per share already paid makes a total distribution for the year under review of Re 1.30 paise per share compared with Re 1.20 paise per share distributed in the previous year. You will recall that the paid up capital of the Company was increased during 1963, after declaration of the Interim dividend for that year, and on the increased capital the total distribution for 1964 amounts to Rs 82,18,436 compared with Rs 63,21,874 in 1963. Rs 23,14,768 is taken to General Reserve and shareholders will appreciate the need to conserve as far as possible the Company's own resources to finance its expansion programme.

As regards prospects for the immediate future, the results for the first few months of 1965 have been encouraging though it would be imprudent to assume that the pattern has been set for the full year since results are highly sensitive to supplies of raw materials. Experience shows that steel supplies cannot be realistically predicted with confidence, but, if adequate supplies materialise, there are reasonable prospects of a further improvement in the Company's results for 1965.

Expansion

Much progress has been made in the Sankey Division in the development of new products and in the overall expansion of capacity for electrical stampings production. By improved productivity and by the installation of new and sophisticated plant, productive capacity was raised by some 20%. Plant for the manufacture of brake components for the automobile industry was fully installed at the Bhandup Works during 1964 and is in production, and a start has been made on developing the die casting of rotors. This will help to conserve India's meagre supplies of copper and, together with the introduction of steam blueing, will constitute an additional and useful service to the electrical industry.

Another major project which is now being implemented is the modernisation of the forge which forms part of the Engineering Division and its expansion to the extent of 4,400 tonnes of forgings per year. The Government of India has issued a letter of intent indicating approval for these proposals, and plant procurement is now in hand. This project will enable the Company to increase the quantity, the range and the quality of the forgings it supplies to the railways and to the automotive and other industries.

Much of the modern replacement plant planned for the Bolt and Nut Division has been ordered. In the Screw Division the expansion of self tapping screw capacity has been largely completed and the remaining plant will be installed in the third quarter of this year. The process of further diversification of the Company's extensive range of fasteners continues and new products are being added to the range.

In the Steel Division is the largest project currently in hand, the expansion of steelmaking capacity. The construction of the new melting shop buildings is approaching the final stages, despite shortage of structural steel, and installation of plant for the first phase of the project which will increase capacity to about 30,000 tonnes of ingots per year is scheduled for completion later this year. The second phase is coupled with the installation of a new merchant bar mill, and the building of the mill equipment is proceeding in the U K.

I mentioned earlier the need to direct future development to the field of steelmaking. Today, we are witnesses of further substantial expansion in India's iron and steel industry, but this expansion has been mainly focused on the large scale production of mild steels in the integrated steel works. For some time now the urgent need has been recognised for developing also the production of special steels in relatively small quantities, steels which are at present a drain on India's foreign exchange resources, and this task is being undertaken by both Public and Private sectors of industry.

Backed by the technical and financial resources of Guest, Keen & Nettlefolds Ltd., to whom I should like to take this opportunity to express our thanks for the help rendered by them, your Company is well equipped to take part in this specialised field of development, and during the past year a study has been made of possible further expansion. This expansion will be of immense benefit to the Company, not only in safeguarding its vital needs of raw material but also in strengthening its present ties with the industries, particularly the transport industries, which consume these steels.

To all the staff and employees, on whose diligence and loyalty so much depends, you will, I am sure, wish to join me in expressing our thanks for their work and enthusiasm. The tasks before us are challenging but exhilarating, and I am sure we can rely on every man to devote himself to his share of the burden with energy and with the determination to give of his best.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

Leaders in Instrumentation

Now Pioneers in Automatic Process Controls

WE LIVE ON THE PAST: Four years ago, we ventured into the manufacture of a wide range of industrial measuring instruments in collaboration with Electroflo Meters Co. Ltd. of U.K. a member of the Elliott Automation Group. ■ WE LIVE IN THE PRESENT: Our present range of measuring instruments has been fully accepted by users as conforming to the rigid specifications required of precision instruments. Some users have done us honour of specifying the brand name 'Mahindra-Electroflo' against their requirement. ■ WE LIVE FOR THE FUTURE: And now we look ahead, with plans under way for the manufacture of a further range of sophisticated pneumatic, electronic, hydraulic process control equipment in collaboration with the same British Group. These instruments will find wide application in industries like... steel, paper, power generation, chemicals, fertilisers etc. where precise measurement and accurate control of Flow, Level, Pressure and Temperature is required.

The Right Lead

FOR the first time the Congress Working Committee struck the right note on the language problem when at its meeting in New Delhi this week it did not content itself with arbitrating between English and Hindi and concentrated instead on marking out for the regional languages their rightful place in the future language scheme for the country. To allay the immediate apprehensions of non-Hindi regions, it has suggested that the purpose for which use of English, in addition to Hindi, will be compulsory at the Centre and in inter-State dealings should be specifically laid down in the proposed amendment to the Official Language Act. Bilingualism of this sort is presumably to continue without any particular time-limit till such time as the change to exclusive use of Hindi can be made by common consent.

More important are the Working Committee's recommendations relating to regional languages. It is made "obligatory" for all States to introduce the three-language formula in their educational curriculum, extend it to the university stage and apply it strictly. The regional language of each State will become the medium of administration as well as of instruction, including at the university stage, as early as possible. Efforts are to be made simultaneously to improve the standard of teaching of Hindi in the schools and colleges while English would continue to be taught "as a language which has to play an important role". Along with their adoption as medium of instruction in schools and colleges, all UPSC examinations will be conducted, besides in English and Hindi, in the 14 regional languages specified in the Eighth Schedule of the Constitution.

These recommendations at last impart some internal consistency to the Government's language policy. At present, while the changeover to the regional language as the medium of instruction in schools has been substantially completed all over the country, instruction in colleges continues to be in English in all the States, with one or two partial exceptions. Fresh entrants to colleges thus come up against a veritable language barrier, a circumstance which must be reckoned as among the main causes of the deterioration of college education. This inconsistency is itself in a way the result of the other glaringly illogical aspect of the language policy which, while directing that students be taught in the regional languages in schools and colleges, expects them to take examinations in English only for entry into Government service. The belief that English education offers better economic opportunities, therefore, has continued and with justification. Inevitably, in colleges which offer students a choice of instruction in either English or the regional language, the majority opt for English. In Madras, which was a pioneer in introducing instruction in the regional language at the university level, Tamil medium colleges are actually starved for students. In Gujarat, another State which has introduced the regional language medium in colleges, the situation is somewhat different but equally unhappy. Here the changeover to the regional language has been almost entirely achieved through administrative fiat, but complaints are getting steadily more insistent that students from the State have been faring poorly at UPSC examinations and the pressure for reinstating English is getting stronger.

The experience so far makes it clear that however much one may decry the craze for English education, so long as better job opportunities, real or fancied, are offered by it, it will not be successfully snuffed out. Here the substitution of Hindi for English as the medium for public service examinations would have left the position unchanged for the majority of the country's college educated who receive instruction in languages other than Hindi. If proficiency in Hindi becomes a precondition for success as that in English has been hitherto, it will not be enough to study Hindi as just one of many subjects, which is what the three-language formula requires, and the tendency will be to opt for institutions which teach in Hindi, whatever one's mother tongue may be.

The suggestion to conduct UPSC examinations in the regional languages, besides in Hindi and English, therefore, cannot be questioned without rejecting the three-language formula. This journal has repeatedly pressed the viewpoint that if the purpose of education is to enable students to develop mentally, to teach them to use their minds, then education at all stages has to be through the mother tongue. Not that other languages should not be taught. A knowledge of Hindi as the link language and the official language of the Union will be essential as will be that of English for those who aspire to higher education and specialisation at the university stage. These requirements the three-language formula meets satisfactorily. But both Hindi fanatics and those who would cling on to the economic and social advantages which knowledge of English has given them can be expected to resist the clevation of regional languages. Both will raise the spectre of national disintegration as a result of the undermining of the two supposed props of the present unity — English as link language and the steel frame of the all-India civil service.

It need not be denied that initially at any rate communication among linguistic regions will be clogged and the character of the administrative services may also be altered—for, the problems of ensuring uniform assessment arising from the use of 16 languages in examinations cannot but lead to some sort of quota system, open or tacit. But must the nation perish in the process? The prophets of gloom unwittingly or otherwise overplay the centrifugal tendencies and understate the centripetal ones. The judgment that the English language and the civil service are the only, or even the main, bonds of Indian unity comes from a partial view of history. The national movement was underpinned by neither. And if today the possibility of holding the nation together once again through a common political purpose is not even mentioned, that is a reflection on the state of our political morale.

Odd Man Out Again

IF at the Bandung anniversary celebrations India was the 'odd man out', out of step with the rest of Asia, the spectacle at Algiers will be even more odd for us. The figure we shall cut will be more ridiculous and pathetic if the way we propose to overcome our isolation is to team up with Russia and Japan. It is extraordinary that during the past few days press reports and comments have harped triumphantly on India's successful diplomatic deals with Russia and Japan. We seem to be about to present Chinese diplomacy with a resounding victory on a platter.

The most probable hypothesis about Chinese motives in regard to India is that she would like to make India appear a perfidious partner of American imperialism, shrewdly and opportunistically playing the game of non-alignment—one who is not to be depended upon as a true Asian nation and not to be trusted in any anti-imperialist front. What can please the Chinese more than seeing India line up with the most non-Asian and the most "imperialistic" of all Asian countries, namely Japan? And championing of Soviet participation in the conference will hardly serve to restore the Indian image: Russia is indeed *not* an Asian country, whatever the facts of geography. Russia was one of the power poles, alignment with which was to be avoided according to the philosophy of non-alignment as it was originally formulated and adopted. True, non-alignment for India has undergone a transformation and has actually become equi-alignment: from a position of fearlessly defying both the power blocs, if need be, we have been reduced to fearfully pleasing both of them. All the same, by canvassing support for Russian participation and at the same time seeking Japanese backing, India has discarded the mantle of assumed moral superiority and overtly entered the arena of real politics in the same spirit as China and Pakistan.

This is no criticism: the mantle has been proving inconvenient for quite some time. But one must judge the Indian politicking in terms of its efficacy as a match for Peking-Pindi diplomacy. What exactly are we gaining by backing Russia and seeking Japanese support? The Chinese and Pakistanis are trying to isolate us; so we refuse to be isolated by seeking friends. It is a counter-move to a move. But what do we do next? Do we know what the Chinese will be up to? We are assured of Japanese backing. But for what? Against whom?

This brings us to the essentially unreal, phantom character of the proposed conference at Algiers. The excitement is all about who is against whose participation and about who is teaming up with whom. Nobody discusses the agenda. It is a play about actors going to act in a play: the conflicts between the actors are the elements of the drama, the stage setting is that of the green room, the play to be presented within the play quite unimportant and incidental. This is to be an Afro-Asian conference, the second one. It is not a non-aligned nations' conference, nor an anti-imperialist conference, given the participation of Russia and China on the one hand and of countries like Japan and Pakistan on the other. Is it then going to herald the establishment of an Afro-Asian United Nations inspired by Indonesia? But that is too flighty a proposal to be taken seriously.

Nobody has as yet declared that the conference is meant to celebrate the close of an era that was opened up by the Bandung conference ten years back, yet if at all the Algiers conference has any impact of any sort it could only be in that funeral role. The world has changed since the days of Bandung: the Sino-Soviet split, the India-China dispute, the phenomenon of de Gaulle and the varying rates and patterns with which economic development has taken place in the Afro-Asian countries have together put an end to the situation in which it was possible for Afro-Asian nations to keep out of the two blocs *as a bloc*. Divergences in interests among Afro-Asian nations have become increasingly important and have reached a stage when they cannot be regarded as negligible in comparison with the identity of interest among this group of under-developed and ex-colonial countries. These nations have been, as a matter of fact, individually and in groups, not acting according to any principle of non-alignment but groping for multiple alignments with and against each other. One country that is not groping but following a premeditated path is, of course, China that has long been ideologically convinced about the necessity of putting an end to what it considers the hoax of non-alignment. It would be a signal victory for it if the Algiers conference in a pandemonium of multiple conflicts explodes the assumption of common Afro-Asian interests.

Weekly Notes

Tariff Preference

AUSTRALIA'S decision to give tariff preference to exports of manufactures and semi-manufactures from developing countries has been hailed by India's Minister of Commerce as "bold and imaginative". Without detracting from the merits of the Australian move the context in which it has been made needs to be mentioned. Australia recently refused to approve the new Article 37 of the General Agreement on Tariffs and Trade which requires members to give high priority to reducing non-tariff barriers and to refrain from increasing tariff barriers on imports of interest to the developing countries. The new Article embodies, if only imperfectly, the conclusions of the UN Conference on Trade and Development. Australia's reasons for rejecting it have to do partly with her distrust of the GATT as an arrangement favouring only industrial exports and partly with the anxiety not to commit herself to not raising tariffs in any circumstance. Australian official spokesmen have further explained that in their view across-the-board tariff cuts as required under Article 37 would benefit the developed countries more than the developing ones. By offering to give tariff preference to specific exports from the developing countries, the Australian Government has thus retained its control over tariffs and at the same time appeared to be not insensitive to the problems of the developing countries.

Under the preference system adopted by Australia, tariff rates will be reduced by between 7½ per cent and 20 per cent on imports of selected commodities from developing countries. The commodities covered include soaps, leather, carpets, coir goods, electric fans, sewing machines, machine tools, furniture and sports goods. Two features of the preference system make it less attractive to the developing countries than it might have been. First, the Australian Government reserves the right to withdraw the preferential tariff on imports of a particular commodity from a developing country if in its view the country is "competitive" in the manufacture of that commodity. Thus, for instance, matt-woven fabrics of certain specifications of Indian and Pakistani origin have been considered ineligible for preferential tariffs. Second, along with the preferential tariffs, Australia has fixed quotas for imports from developing countries of each item. In some cases at least the quotas fixed are very small. A further criticism could be that the list of goods entitled to preferential tariffs should have been longer.

Neither these criticisms nor the fact of Australia's refusal to accept Article 37, however, negatives the fact that the tariff preference for developing countries is an important step towards the modification of international trade practice to meet the problems of development. Preferential treatment for developing countries is the most important part of the decisions of the UNCTAD and Australia deserves to be congratulated for taking the initiative in offering such preference.

Tariff reduction by developed countries does not, however, automatically open up their markets to the exports of developing countries. These exports have to be able to compete with identical goods produced in the preference-giving country. In the case of manufactured goods at least this will not be easy since it requires a growth of productivity in manufacturing industry in preference-recipient countries which is higher than that in the preference-granting developed country.

The benefits of tariff preference will be reduced also if the preference-granting countries consider the preferences as a substitute for aid. The developing countries would then lose on the swing in the form of aid what they gain on the roundabout in the form of trade. The developing countries themselves do not appear to be adequately aware of this possibility.

Too Much Money or Too Little?

WITH the end of the busy season the monetary authorities have now to face the problems of the slack season. The Governor of the Reserve Bank has already given notice to bankers that they would have to cut back credit sharply. And now it has been reported in the press that the authorities intend to keep the screw tight not during the slack season only but the entire last year of the Third Plan. The Reserve Bank is credited with the intention of keeping expansion of money supply down to five per cent during the year on the ground that a faster growth would give a fillip to inflationary trends.

If the reports correctly portray the monetary authorities' intentions, then the influence of orthodox quantity theorists is plain enough. But even from the quantity theory viewpoint, the permissible rate of expansion of 5 per cent chosen is intriguing. In a year when national income at constant prices is expected to grow at a rate between 6 and 7 per cent, what exactly is the rationale of a 5 per cent expansion in money supply? Or is the Reserve Bank hoping to induce a price deflation in the coming months?

A deflation we may well get, but one not marked by a price fall. The investment of the last few years has created new capacity in almost all sectors of industry which has to be utilised while the import restrictions recently clamped are bound to affect production. Where will that leave costs and prices? Besides, what about bank credit to the Government, for monetary expansion is not all the result of credit extension to the private sector. If with the slack season contraction of bank credit, there occurs a simultaneous rise in bank subscription to Government loans, banking statistics may show a gratifying fall in the figure of bank credit without, of course, reducing money supply. Has this possibility been fully considered while setting the 5 per cent growth ceiling for money supply?

No Bounty For Cement-Makers

THE cement industry has been in bad shape for the last four years. Consumers have suffered. Penny-wise price fixation and concern with what was described as concentration of economic power put the industry in a strait jacket. The cement industry is no more (or no less) inefficient than other industries but thanks to the prices set in 1961, its profitability has been consistently and significantly lower than average, and retention of profits has been wholly on account of development rebate, which is not available for distribution. Till recently, Associated Cement was not given any licences for largescale expansion because it contributes about 40 per cent (against two-thirds before the war) of total output, while the Dalmia-Sahu-Jains have been denied expansion since the publication of the Vivian Bose Commission Report. It is hardly surprising then that inspite of two public sector plants, a shortage of about two million tonnes has emerged — and manufacturers of cement machinery are waiting for orders.

Some belated recognition of the need for positive action is noticeable now. Government has set up a Cement Corporation but it will take time to deliver the goods. The development rebate has been raised from 20 per cent to 25 per cent which is equivalent, in event of expansion of fixed assets, to an increase of about Rs 6 per tonne of cement. Now, with effect from June 1, the ex-works price allowed to producers will be raised by Rs 4 per tonne and the selling price by Rs 8.35 per tonne. The price increase is meant to offset rise in costs, as laid down by the Tariff Commission formula. Previous increases were sanctioned in June 1963 and June 1964, aggregating Rs 4 per tonne against a cost increase of Rs 5.91 in 1961, claimed by the industry. The industry now claims that the cost increase between May 1964 and March 1965 has been Rs 2.17 per tonne, exclusive of higher railway freights since April 1965 and the rise in interest rates on borrowings. Since the latest increase of Rs 4 per tonne, like the earlier one, has no retrospective effect, the industry is not terrible enthusiastic about it.

A comparable situation was allowed to develop in the steel industry in the early fifties and had to be set right at great cost later. Spokesman of the cement industry have been demanding an expansion allowance in the price on the basis allowed to steel companies. The Tariff Commission is slated to make a fresh inquiry into the industry next year, but there is a case for not waiting that long. A number of steps can be suggested. Retention prices can be increased at the expense of the margin allowed to the State Trading Corporation and a large part of this increase segregated in a special development reserve. Or, following the Raj Committee scheme and on the analogy of sugar, Government and high priority users should get a specified percentage of the output of each producer and the balance of production should be decontrolled.

From Port to Consumer

THE shortage of middle distillates, kerosene and high speed diesel, threatens to upset the precarious stability of prices which had been established in the last few months in vulnerable areas. The reason for the shortage is two-fold: delays at Barauni which was expected to supply a large part of the eastern and northern markets, and the denial of foreign exchange to the Western oil companies for the import of these deficit products during April-September 1965. Unless Cochin and Koyali are commissioned on schedule —which is unlikely to happen—the shortage will continue into 1966. As the foreign exchange position got tighter and the demand for kerosene and HSD increased rapidly, Government had two alternatives. One was to ask the oil companies to import deficit products against rupees. This the companies would not, partly in view of possible repercussions in other importing countries. The companies offered a sop in the form of a moratorium on their remittances of profits but this rightly failed to satisfy Government because, among other reasons, there was no offer to reduce prices. The other and immediate alternative which the Government adopted was to step up rupee payment imports from USSR and Rumania under existing arrangements and to negotiate with Kuwait and France for cheaper or easier imports. Meanwhile, areas like Calcutta which are supplied mainly from imports are facing a difficult situation.

Indian Oil Corporation which handles all petroleum imports on Government account has nearly doubled its imports from USSR and Rumania and will, in the bargain, effect a net saving of foreign exchange because these imports are cheaper. IOC's problem, however, is not of import but storage and distribution. Its ability to relieve shortages on an emergency basis is not doubted but arrangements have to be put on a permanent basis if only because it has to handle the capacity production of Barauni by the end of the year and later the increasing flow of supplies from Koyali and Cochin. IOC has little storage facility and its distribution organisation is still rudimentary compared to those of Western oil companies. The companies continue to have the products of the Bombay and Visakhapatnam refineries besides imported lubricants which are still relatively unrestricted. They will not handle oil (crude or refined) from the communist countries through their own network nor will they place indents upon IOC. At most, they might agree to temporary leasing of storage facilities; they can be compelled to do so under emergency powers. Their dealers are all captive and cannot walk over to IOC except at great loss. While much has been heard about IOC's import programme, one would, therefore, like to know a little more about its arrangements for storage and distribution, apart from bulk sales to large consumers.

Coal Folly

THERE is only one bona fide reason we can think of for the appointment of a committee to study the prospects of coal exports—that the government is abysmally ignorant of the conditions in the world fuel market. At the present prices, mineral oil is a cheaper fuel in almost all uses; the only assured uses for coal are in the making of coal-based chemicals and of coke for blast furnaces. Where it is particularly cheap, it is barely competitive with oil in thermal power generation.

If coal continues to be widely used in spite of being uncompetitive, it is partly for historical reasons and partly due to deliberate government policy. Many of the world's older industrial plants use coal as a fuel, and railways have large fleets of steam engines; coal continues to be used where the conversion to oil is expensive or impossible. Britain, France and Germany levy discriminatory taxes on fuel oil in order to prevent precipitate unemployment among coal miners, and many countries, including India, protect coal mining for balance of payments reasons. The reasons behind India's present coal exports are largely historical —the bulk of them goes to East Pakistani jute mills.

In these circumstances there are three principal ways of stimulating coal exports. First, we might give a whacking subsidy on coal exports to make them competitive with oil and promise to continue the subsidy over a long period. However, since the relative price of coal to oil is lower at home than in the international market owing to the oil duty, it would be more sensible to save foreign exchange on oil by subsidising home consumption of coal. Second, we might take payment for coal from imports abroad in their own currency; some scope for doing so exists perhaps in South-East Asia, Ceylon and East Africa. Then, however, we would require to enter into trade agreements with the coal importing countries and to shop around to see what we could buy from them. The idea of Afro-Asian trade co-operation or payments union is worth pursuing,

Capital View

Romesh Thapar is away from Delhi. Capital View will be resumed on his return.

— Ed.

but it is hard to visualise the Indian Government taking an initiative in the matter. Third, we might manufacture coal-fired thermal power stations and sell them in Asia and Africa; coal exports may then follow the power stations. The conversion of power stations from coal to oil is none too difficult, however; so either the exported coal will have to be much cheaper or the conversion co-efficient of coal into electricity will have to be greatly improved. The possibilities of technical advances in the latter direction are enormous, but we are not even manufacturing much thermal power equipment, let alone improving its performance. And the appointed "team of experts" is quite irrelevant to the problem.

No Sympathy From India

A Correspondent writes:

COMMON courtesy becomes the first victim of national animosities. April and May have been months during which Indians and Pakistanis were busy denigrating each other. The Rann of Kutch has excited emotions, and those emotions which have a primal base — anger, hate, fear, desire for vengeance, and so on. Old issues of conflict have been revived, new issues have been discovered; whether here or in Pakistan, the general spirit is one of uncompromising non-accommodation. Iron has entered the soul. In either country, goodwill for the other is at the lowest point.

It is not necessary to go into the relative merits of the various issues in the Indo-Pakistani dispute. In the context we want to refer to here, it should not be necessary to rake them up. More than thirteen thousand men and women died in East Pakistan as a result of last month's devastating cyclone. All these people must have been poor, simple folk, mostly peasants; some perhaps had belonged to the artisan class; for all one knows, some were members of the fishing community. Communication lines too have been destroyed, property damaged extensively, school buildings washed away. All told, it has been a grim human tragedy.

As human beings, we on this side of the border ought to have felt deeply about these deaths and devastations, and should have been moved to express our sorrow and sympathy to the stricken inhabitants of East Pakistan. In different circumstances, perhaps the President or the Prime Minister would have sent a telegram of sympathy to the Government of Pakistan and might even have made a token offer of relief. The Rann of Kutch has taken care of all that. There has been no report of any telegram from our leaders and by and large no commiseration on the part of the Indian press. Our conscience would not apparently allow us to accord any sympathy to human beings in distress across the border because we have concluded that the people who have now been stricken — or at least their Government — have done us wrong. Similarly, it is possible that there would be no message of sympathy from Pakistan for the mining disaster at Dhori.

Must the logic of conscience be so cold-blooded? Must human sentiments be of such acute divisibility that we should be prevented from expressing our sorrow on a tragedy which obliterates populations, devastates schools, destroys standing crops and wipes out transport networks, in case all these take place in a country which we consider to be hostile? Are we scared that any such expression of sympathy will weaken our political cause? Or has some sage in the South Block reached the conclusion that a telegram of sympathy to the Pakistan Government would affect adversely the morale of our troops along the border?

These questions are being raised here more in sorrow than in annoyance. In the long run, a nation will grow as strong as its moral fibre will allow it to. In our struggle for survival, we are not supposed to abdicate the elementary decencies. This, one assumes, was the teaching of Tagore and Gandhi — and of Nehru, whose first death anniversary we were observing last week. But perhaps we are going to other temples of learning these days, so that each time there is a drought in China, there is no end of gloating in our newspapers, and each time a cyclone hits East Pakistan, we decide to do a foxtrot.

World Bank's Smile

WHILE the Industrial Finance Corporation had to rest content with a loan of 10 mn dollars from the US Agency for International Development last month (which raised its aggregate borrowing from that agency to 40 mn dollars), ICICI has walked away with 50 mn dollars from the World Bank. This sixth loan has raised the Bank's total credit to ICICI to 140 mn dollars; it is also the largest single loan yet given by the Bank to any development finance agency. The fifth line of credit of 30 mn dollars obtained by the ICICI in 1963 was fully committed in 1964. As a matter of fact, in anticipation of the present credit ICICI had committed 91 mn dollars through 1964 against the then available total of 90 mn dollars. The amount credited by the Bank to ICICI Loan Account was 71 mn dollars (Rs 34 crores), of which 49 mn dollars (Rs 23 crores) or 68 per cent was disbursed to sub-borrowers. Repayments by ICICI through December 1964 aggregated Rs 4.96 crores, all of which had not been recovered from sub-borrowers till then. The ICICI's annual report for 1964 indicated an amount of Rs 1 crore overdue from sub-borrowers, most of whom have run into project delays and overruns of cost. This difficulty has arisen because the first three loan agreements signed in 1955, 1959 and 1960, provided for a fixed repayment schedule. Thanks to the efficient management of its resources, ICICI has been able to withstand this strain. The fourth and fifth credits, finalised in 1962 and 1963, provided for flexible repayment schedules consistent with the repayment of sub-loans. The latest credit also has the same terms of repayment but unlike the variable interest rates chargeable on the earlier loans it has been extended at 5¼ per cent. The credit is expected to meet the bulk of ICICI's foreign exchange requirements (the rest are met from West German loans) till mid-1967.

From 1955 to 1964, ICICI has approved assistance of Rs 102 crores to 374 projects. Foreign exchange loans account for about one-half of total assistance, rupee loans for a fourth, and underwriting and direct subscriptions for the rest. The ICICI has concentrated on new industries like chemicals, machinery and machine tools (unlike IFC which has taken great interest in textiles and sugar). About a third of the 125 assisted projects which have gone into production have been sponsored by entrepreneurs who are new to industry. The ICICI's main problem now is not foreign exchange but rupee funds. IBRD had agreed in the past to a 4 : 1 instead of 3 : 1 debt equity ratio, the first government loan of Rs 7.5 crores also ranking as equity, but the sixth credit and the tapering off of government rupee loans (Rs 1 crore only has been provided for ICICI in the 1965-66 budget) have made it necessary to increase the share capital in the immediate future. How capital is to be raised under present capital

market conditions is a problem that has agitated ICICI for a considerable time. Nearly 30 per cent of the present share capital is held abroad but a rights issue for the balance of 70 per cent would have to be underwritten. Who except the LIC and the Industrial Development Bank would bear the brunt of the burden? Some changes in ownership may be produced this way.

LETTER TO EDITOR

PL-480 Transactions

I AM writing this letter to question the purpose of the article by M Z Mogri on P L 480 transactions, which appeared in your issue of May 29, 1965. According to the author, the article is intented to be a sort of supplement to the official statement on the subject issued by the Finance Minister. The official analysis, he says, considers the impact of PL 480 transactions with reference to Government Accounts only, whereas he considers the banking system as a whole.

It is, however, not a fact that the official statement is incomplete. The official statement, though Mogri does not mention it, is based on a study prepared by the Reserve Bank about two years ago. This study dealt with the problem of the impact of PL 480 transactions very comprehensively. The subsequent controversy between the authors of that study and B R Shenoy in the *Economic Times* clarified the issue still further. In fact Mogri's article merely paraphrases the main conclusions of the RBI study. True, he disaggregates the transactions involved in accumulation and disbursal of the PL 480 counterpart funds; but is most of this disaggregation necessary? To understand the basic issue only the basic transactions need be analysed. At this rate, someone else can come up with still more transactions without arriving at any different conclusions. Mogri's conclusions, not surprisingly, are exactly the same as those of the RBI study.

Finally, a word about Mogri's concern over the long-term implications of the accumulation of PL 480 funds. Though the counterpart funds are made over to the Government of India both as loans and grants, it is the latter element that is predominant. Further, even the loans are not repayable in foreign exchange nor would their repayment involve export of goods from India. The problem of creating an export surplus at a future date to liquidate the liability does not, therefore, arise. And even if the export surplus had to be created, the problem would not be peculiar to PL 480 assistance.

FROM THE LONDON END

More Debate on International Liquidity

THE fundamental differences of approach on the question of international liquidity permit agreement only on one point — viz, the present system, based on the international gold exchange standard, is far from adequate. The Anglo-Saxon view is that there is an overall shortage of international liquidity, and unless something is done to remedy this defect, world trade will grind to a halt. The Continental view, on the other hand, claims that there is no shortage of liquidity as such, but that the present system under which the pound and the dollar act as reserve currencies, leads to slack discipline in monetary matters both in Britain and America, and forces third countries to import inflation from these countries. What, according to Continental bankers — principally French — is needed is stricter monetary control, even at the cost of deflation and unemployment. In February, General De Gaulle made it quite clear that what he hankered after was a return to the disciplines of the automatic gold standard which would inhibit the inflationary excesses of Britain and America.

In Britain itself, the burden of supporting a reserve currency has meant a constant conflict between internal growth and external balance. As long as the present system continues and new methods of increasing international liquidity are not available, Britain seems inevitably doomed to a "stop-go" policy which, apart from inhibiting growth in Britain itself, will have a serious effect on the developing countries since it will restrict the foreign exchange resources that are available to these countries. With balance of payments difficulties facing both Britain and America, assistance to developing countries is in jeopardy. Indeed, the British Budget is very much a case in point. The Budget is designed principally to correct Britain's balance of payments. The brake it put on overseas investment is a threat to developing countries, and unless some last minute revisions are introduced in the working of the Corporation Tax, and special concessions are made so as not to restrict overseas investment in the developing world, these countries, so urgently in need both of development finance and technical know-how, will find themselves in a very difficult situation.

Solution of the problem of international liquidity has thus assumed great importance. Last week in London, the whole problem was discussed once more under the auspices of the Federal Trust for Education and Research, which organised a two-day Conference on international monetary problems. The gathering was graced by many experts who have made their contribution to this problem, chief among them being Professor Triffin who is one of the main proponents of increasing international reserves through an international credit-creating authority, preferably the International Monetary Fund, and Monsieur Jacques Rueff, a firm disciple of the gold standard. Midway between the two, and also attending the Conference, was Reginald Maudling who, in 1962, at the Annual Meeting of the International Monetary Fund, produced his own particular scheme for adding to international liquidity. Shortly before the Conference was held, Roy Harrod's new book "Reforming the World's Money" was published, adding its quota to the general discussion.

The Theories

It may be useful perhaps to summarise the debate as it now stands, still split by Anglo-Saxon and Continental differences of approach. Edward Bernstein the author of the now well known Bernstein Plan was absent from the London Conference, but he spoke last week on the dollar and the international monetary system before an audience invited by the New York firm of Model Roland and Company. The essence of the Bernstein Plan is that new reserve assets should be created among the rich Continental countries in the Group of Ten, plus Switzerland: each one of these countries should agree to hold the currencies of others in prearranged proportions in its reserves which would be used, with gold, in the settlement of debts. These new reserve assets would be Composite Reserve Units. Under the Bernstein Plan gold would remain as the basis of the international monetary system and nothing would be done to undermine the position or the important role played by the dollar and sterling; the CRU would, however, acknowledge the mounting importance of European currencies which could also be used to finance international trade.

The French CRU proposal is a doctored version of the Bernstein Plan, but does not permit the holding of sterling and dollars as a reserve currency. Another recent addition to the Bernstein Plan to take in the needs of the developing countries — which were ignored in the original draft — is that 25 per cent of the reserve units should be handed over each year to the International Monetary Fund to be channelled to the developing world.

The Triffin Plan is based mainly on making an international institution the main creator of international reserves which at present rely so largely on the two reserve currencies, sterling and dollars. He points out that the situation has now become urgent, with both Britain and America surrounding themselves by exchange controls of one form or another in order to protect themselves and their currencies. According to Professor Triffin, neither God nor gold will save the international monetary system from its approaching crisis. Professor Triffin is a champion of a new and more ambitious world monetary structure which involves a massive increase in the powers of the International Monetary Fund. His plan proposes the conversion of underlying national reserves into deposits with the I M F, backed by a massive increase in the Fund's deposits and its investment activity. The Fund could then operate an international contra-cyclical credit policy, at the same time offering creditors guarantees on deposits and a nominal rate of interest as an added incentive against holding gold. Deposits could be used to invest for profit and could also be channelled to the World Bank for the use of less developed countries.

During the discussions, Maudling recalled his own plan for a mutual currency account, the basis of which is that when a country bought another's currency in a support operation, it could, with the agreement of the country supported, pay it into a gold-guaranteed "mutual currency account" in the I M F. Dealing with the so-called "privileged position" of the two reserve currencies, he pointed out that as far as Britain was concerned, it would be happy to share this role with countries other than the U S A, but he pointed out that under the present system, in order to have a reserve currency, a country must owe the rest of the world a very great deal of money (i e the balances held by other coun-

tries) and it must also owe this in a form in which other countries are willing to hold their balances. One of the difficulties in the situations today is that more and more countries are reluctant to hold either dollars or sterling.

The case for gold was put forward by Monsieur Jacques Rueff who emphasised the virtures of the two-way equilibrating mechanism and discipline that used to be wielded by the gold standard. Of course, he realised that a return to such a gold standard would only be possible if there was a substantial increase in the price of gold. His argument seemed to be that the solution of the problem of international liquidity could be found if the world price of gold was doubled and there was a ban on the use of national currencies as exchange reserves.

Perhaps one of the most interesting schemes to increase international liquidity is that put forward by Stamp. *The Stamp Plan*, in essence, envisages the I M F increasing liquidity by a fixed amount each year by investing in developing countries, either through the International Development Association or directly in their capital markets. The developing countries would then use the certificates they obtain from the I M F to buy from the industrialised countries which would treat these certificates in the same way as gold additions to their reserve assets. This would not only increase international liquidity, but provide it to those areas which are most in need of it.

However, it must be admitted that no real agreement was reached at the Conference. The only thing on which politicians, bankers and economists could agree was that the gold exchange standard is no longer working properly. The second point on which they agreed was that some action is urgently required, but what this action should be is still no nearer solution.

A CALCUTTA DIARY

The Darjeeling Exodus

INDIANS old enough to know that history did not begin, although a part of it ended, on August 15, 1947, will not need to be reminded what a hardy annual the Simla exodus used to be. Long before a derelict village called Delhi was chosen as India's capital, the Viceroy and his chosen bureaucrats used to travel all the way from Calcutta to Simla for a part of the year when Calcutta, the seat of government, was more unpleasant than usually. The bureaucracy was then largely British; we have been told by Graham Greene of "the involuntary injustices of tired men" in exile in a hostile climate. Somehow, the "natives", together with most newspapers, some owned by Englishmen, never saw a diminution of injustice following the exodus and commented only on the colossal cost. Loudest in protest was the Indian National Congress.

Quite apart from the physical effects of heat, to say nothing of the worse adversary called humidity, on the children of a very different kind of weather, there was the philosophy, brilliantly analysed recently by Nirad C Chaudhuri, that ever since the Mutiny it was the conscious policy of the British Government to be aloof and apart from the people of India. The annual exodus to Simla—followed by Darjeelings, Nainitals, Panchmaris and lesser summer capitals—was part of this ritual: the heat of Calcutta might be all right for the natives but not for the superior bureaucracy. The Government those days never pretended to identify itself with the people; distance was then the essence of deference. The Congress was for the people, with the people, of the people.

Things then stood on their heads; the critics of yesteryear became the rulers. The hill stations languished. The Exodus shed all the tragic associations of the Old Testament and became a journey of hope. For a fortnight or so the West Bengal Cabinet and the higher echelons of the bureaucracy with their wives go to Darjeeling every year, accompanied by numberless underlings; and all this is for the welfare of the hills people. An imperialistic luxury has been neatly converted into a nationalistic necessity. Poor Prafulla! He has to go to Darjeeling at the height of Calcutta's brilliant summer only to preach and practise national integration to the sometimes contrary people of Darjeeling.

Sheershasana

A rather naive reporter has meanwhile spilled the beans. In his story from Darjeeling he recently said that some film actresses were leaving the place but others were on the way; Suchitra Sen had indeed left but Prafulla Sen was here! The equation became a little more disturbing when the correspondent informed his readers that Prafulla Sen, the Chief Minister, was spending most of his evenings playing cards with his friends and colleagues. A card, indeed.

Basically, there is nothing wrong whatever with a Chief Minister going on holiday and playing cards with friends in the evening. The fantastic idea that Ministers could live on Rs 500 and fresh air and a fruit cocktail of love and *ahimsa* did not make sense even in the late 'thirties when some Congressmen saw, for the first time in their lives, carpeted rooms and liveried chaprassis. Apart from the myth of Congress austerity, is there one reason why a Minister should not enjoy at least the same amenities as a Secretary? But no Congressman born of Mother India will enunciate so simple a proposition; hypocrisy holds a higher place. Holiday is high duty. And the bill goes to the Government, which, of course, means the tax-payer, you and me.

What makes the current scene a little touching is that we are seeing chaps enjoying themselves for the first time. They had spent a lot of their time in prison and knew no comfort, let alone luxury. To the consumption of new things, sometimes lovely and young, they bring a certain vulgar avidity which would be understood and condoned by an old surviving member of the Viceroy's executive council with a mistress somewhere in the background—had not the Congress Minister's pleasures been publicised so as patriotic sacrifices. "The pursuit of happiness" is a part of the U S Constitution; the Indian Constitution forbids it.

What makes the Indian scene today so endlessly interesting is its obvious transience. Lal Bahadur Shastri constitutes a dyke of weaknesses between two forces that I dare not identify. Prafulla Sen, likewise, represents a pliant body of feeling, not opinion, that he may not be up to much harm. Which assessment is probably correct. Playing cards with friends in the evening seems so much more a human act than playing poli-

tical chess with Atulya Ghosh, although one is not sure that the latter game is not being played too. Yet it remains a fact that the Sen-Ghosh compact has so far spared West Bengal the kind of sordid wrangle almost every other State Congress Party has painfully known and not yet recovered from. Even in Kurseong and Darjeeling Sen and Ghosh met; and they seemed the best of buddies.

The criticism against summer sorties today is that while foreigners born in another clime might in retrospect be forgiven for running away to the hills at the cost of a subject people, the native administrators of today should be used to the weather and stay put. This is the place to make the point that nobody ever gets used to his weather, hot or cold. With their usual contrariness, the British bellyache when it is perishing cold and they utter the most unprintable swear words when it is 80° in the shade. Prafulla Sen's Darjeeling holiday need not be grudged at all; he fully deserved his holiday, even if he was under no obligation to call it work. But everybody is wise to remember that nobody gets used to his political weather either. Everyone bellyaches; and a bellyache is almost always the beginning of bust-ups that are sometimes, if successful, called revolutions. In short, the Darjeeling junket needs what the Americans call "validation".

—Flibbertigibbet

AN AMERICAN LETTER

The Economy at Midyear

WHEN President Kennedy proposed, almost two years ago, that a substantial tax cut be instituted to deal with economic stagnation, many American economists were sceptical. Although the tax cut proposal was in keeping with Keynsian economics, many conservative analysts opposed the cut, and expressed fears that the government would be forced into substantial deficit spending. In mid-1965, almost a year after the cut was instituted by the Johnson Administration, it has proved a complete success, and the U S government is at present considering massive reductions in excise and sales taxes to go along with the earlier cuts, which were mainly in corporate and income taxes,

The purpose of the Kennedy proposal was to stimulate corporate investment and individual spending at a time when economic growth had slowed down. This goal was achieved beyond the expectations of the Council of Economic Advisors which was mainly responsible for the specific legislation which was finally carried through Congress under the guidance of President Johnson.

One of the results of this rather unexpected economic boom was to produce a surplus of tax revenue, since gross corporate earnings, as well as individual incomes, were up substantially. In an attempt to keep consumer spending at a high level the Johnson Administration has proposed further substantial cuts in excise and sales taxes imposed by the federal government on many items. The Administration has, for instance, suggested that the present 10 per cent tax on automobiles be completely lifted in a series of measures. Similarly, taxes ranging up to 15 per cent on entertainment, luxury goods such as fur coats and jewellery, airplane tickets, and other items will also be lifted. Though the federal excise taxes were originally instituted to pay for the Korean war in the early 1950's and were conceived as an emergency measure, the giving up by the Government of such a large segment of tax revenue at one time is an unprecedented step.

The rationale behind the proposed cut in taxes is not difficult to understand, however. The Administration is able to make the concessions because government economists are convinced that the growth rate of the economy will make up for the loss in revenue. Rising incomes and corporate profits have boosted government revenues in recent months. Besides, federal authorities have been concerned at the rising rates of local and state taxation. In many parts of the United States, municipal authorities, as well as some of the fifty States levy various taxes to raise necessary revenues. As a result, the tax burden on Americans, particularly those living in cities and suburban areas, has risen in spite of the cuts in federal taxes. Tax relief by the federal government will give State and municipal governments more room and will ease the tax burden.

Though tax cuts, both those already effected and those proposed, have been the most important economic news of the year, other even more important issues are in the background. The much heralded "War on Poverty" inaugurated by President Johnson late in 1964 has run into difficulties, while the trend toward automation in industry has continued at an unprecedented rate. The "War" has got bogged down in internal battles in a number of cities, such as New York and Boston, where groups have been fighting for control over the millions of dollars being spent by the federal government on various rehabilitation projects. As a result, the success of the "War" has been limited, and in many areas, the effort has been totally unsuccessful. Yet the government *has* attempted measures of reform and rehabilitation. The problem it faces is of vast dimensions and, of course, needs more drastic solutions.

Some valuable work can be done; workers can be trained, educational levels in some areas can be raised, and crises in some industries can be avoided by adequate planning. But the trend toward a smaller industrial work force is irreversible, and the Administration's current efforts are not adequately dealing with the problems. Even in areas like the coal mining districts of western Pennsylvania, where the "War on Poverty" has been concentrated the situation has not substantially changed.

The summer will see two conflicting trends in the United States. The economic boom will continue at its present rate and the government's growth projections will almost certainly be proved correct. The tax cut will probably pass the Congress without much difficulty within the next few months, much as President Johnson suggested it. On the other hand, the summer will also probably see further violence in the predominantly Negro areas of the large cities. Racial violence, which has become an integral part of the hot summer months when many people are on the streets and tempers become short in the cities, is directly connected to the economic situation. Certain sections of the population, including of course the Negroes, have not been a part of the booming economy. Poor educational levels, lack of training, and latent prejudice among employers has meant that Negroes have a difficult time obtaining jobs, and at a time of a shrinking job market for unskilled labourers, they are in a particularly difficult situation. Thus, despite efforts to the contrary, the United States is faced with pockets of poverty in the midst of general abundance. And it does not seem that with the present governmental plans will substantially alter this situation in the near future.

BOOK REVIEW

Growth of a Bureaucracy

Arthagnani

The Planning Commission : A Descriptive Account by H K Paranjape; The Indian Institute of Public Administration, New Delhi: pp *ix* : 216; price Rs 5.

NORTHCOTE Parkinson's well known equation shows the rate at which an organisation inevitably grows. The equation is $x = 100\ (2k^m + 1)\%$, where k is the number of staff seeking promotion through the appointment of subordinates; 1 is the difference between the ages of appointment and retirement; m is the number of man-hours devoted to answering minutes within the department; n is the number of effective units being administered; y is the total staff; and x is the percentage increase of staff per year. This rate, Parkinson is sure, "would invariably prove to be between 5.17 per cent and 6.56 per cent, irrespective of any variation in the amount of work (if any) to be done". Applying this formula to the Planning Commission which had a staff of 584 persons (186 higher categories plus 398 lower categories) in 1955-56, the figure for staff, calculated at Parkinson's higher rate of growth, should have been 970 (310 plus 660) for 1963-64; actually, the Planning Commission had a staff of 1,025 (297 plus 728) towards the end of 1963!

Chapter IV of the book under review provides an interesting account of the biology of organisational growth of an official body. The Planning Commission was originally conceived as a compact expert body which would provide the driving force for India's economic growth (p 162). However, it could not withstand the urge, natural in India, to share in executive powers and, in the process, lost both its independence and it expertise. The beginnings of this process can be traced almost to the very first stages after the formation of the Planning Commission.

The first stage in the process was the inclusion of Ministers as members of the Commission, starting with C D Deshmukh, "not so much" as the author says, "because of any preconceived thinking about the necessary pattern of membership as because of *ad hoc* considerations" (p 15). There were three "minister-members" from 1951 to 1956, four since then, and the number has increased to five recently. As a *quid pro quo* perhaps, the author reports, the Deputy Chairman of the Planning Commission attends all meetings of the Economic Committee of the Cabinet (pp 32-33).

The second stage in this process was the common manning of secretarial personnel, beginning with the Cabinet Secretary who felt himself versatile (or idle) enough to double as Secretary to the Planning Commission, ostensibly because "the Secretary of the Commission being also the Cabinet Secretary was able to get the views of the Ministries and in his dual capacity could do things by way of discussion on difficult questions at official level at the meetings of Secretaries, etc," and, as if this was not enough, because "there was also some difficulty in getting a person who would make a good Secretary" (p 33). Evidently, the theory of the indispensability of civil servants is becoming more pervasive today, the way superannuated civil servants manage to hang on to all kinds of official positions. When this dual position was questioned by the Estimates Committee, the Government blandly replied that it accepted the principle underlying the Estimates Committee's views—but, of course, in India, principles are intended to be enunciated, not acted upon.

This concept of common personnel was carried from administrative matters to policy-thinking and policy-making through having the Chief Economic Adviser of the Ministry of Finance as also the Economic Adviser of the Commission—a decision which must be considered to have been disastrous. According to Paranjape, "this development seems to have been partly fortuitous" (p 34) in the C D Deshmukh decided to carry the Chief of the Economics Division of the Commission to the Finance Ministry. This effectively stifled all debate on the relevance of Government's economic policy to problems of economic growth under planning, and helped to establish the Planning Commission as an arm of the executive machinery. Moreover, the Panel of Economists, set up in March 1955 (pp 75, 82-83), because of its composition and the vague nature of its working relationship with the Planning Commission, failed to provide the necessary correctives for economic policy and, thus, proved a flop.

The third stage in the process was the increasing association of the Planning Commission with executive decisions. The author refers to the growth of a convention to refer important proposals in the economic field to the Commission and adds; "As a result of these developments, from the point of view of the Planning Commission and that of the executive organs both at the Union and the State levels, close understanding and co-ordination between them are required if they have to carry out their functions efficiently" (p 31). Earlier, the author justifies this on the ground that "it has been thought that in the Indian context, planning must have the closest connection with the administration if it is not to risk becoming a more (mere ?) academic exercise" (p 21).

In fact, this association has been, as it can only be, at the periphery of power—the Commission could never hope to influence decisions except by acquiescing in them. However, in India people love power, particulaly if it can be had without responsibility. This was how the Development Wing (now the Department of Technical Development), originally intended to provide technical expertise, ended up as a dispenser of industrial licences. It was not unnatural for the Planning Commission to lose its prime function in the hope of obtaining illusive powers in executive decisions.

This was inherent also in the manning of the Commission and the division of functions among the members. Very few members brought a scientific approach to their work; the author, after describing the evolution of some portfolios, states: "This indicates that the distribution of subjects and Divisions among Members has not always been the result so much of a logical pattern as of historical developments and the special interests of Members" (p 29). Later (p 30) the author mentions a case where a portfolio was transferred in four months and another where this was done in three days.

An organisation chart, appended to the book, shows the Planning Commission as having 13 members (including the Chairman) and 17 division heads (all with esoteric designations). The description of the organisation of the Commission, given by the author in Chapter IV shows how bureaucratic considerations came to swamp the functional aspects of the Commission's work. The author states, "It was recognised that if officers of the status of

Under Secretaries are placed in charge of different Divisions or Sections, it will not be possible to get in each Branch the quality required, and it was therefore, decided that the Divisions of the Commission should be placed each under a Chief of Division supported by an Assistant Chief" (p 60). Later, the author refers to how, with increasing personnel, it became necessary to increase staff at the top "owing to limitation regarding span of control". "Gradually in this manner a system came to be built up under which a hierarchical level between the Heads of Divisions and the Members was created . . ." (p 66).

The book is intended only to be a descriptive account of the Planning Commission. It has been produced at the suggestion, and with the co-operation, of the Planning Commission. The author sympathetically takes us through a lot of official jargon: members are referred to mostly not by name but by designation, and the author seriously discusses the factors governing the hierarchical status: "A question was raised whether officers put at this new level—group leaders and programme advisers—in the hierarchy should be called Joint Secretaries or should be given some other designation. It was pointed out that the term 'Joint Secretary' would give a correct description of the officers whose primary function would be to assist the Secretary of the Commission in managing his charge" (pp 66-67). He does not even refer to the criticism of Pandit Nehru on the attempt of the Planning Commission to duplicate the ministries and the designations in them. The author concludes: "It (the Commission) has evolved organisational devices and working processes whose object is to ensure that the different operating agencies are in various ways involved in the planning process. Because of its composition, especially the fact that the Prime Minister and some other senior Ministers have been its members, and also because of the approach, the expertise and the working methods developed by it, the Commission has acquired prestige and has built up for itself a position of influence in the machinery of State" (p 162). The consequences of this, however, for on the content and efficiency of planning have been wholly negative, and ultimately this is the standpoint from which the role of the Planning Commission must be judged.

Even this descriptive account indicates clearly the seeds which were to show up later in the failure of the Planning Commission. Behind all the divisions and sections and so on, there was no clear vision of the functions the Planning Commission was to perform. And the setting up of panels—for example, the Economists' Panel and now the further confusion created by the Planning Council—is no substitute for solid groundwork by staff. It is easy to find people who are eager to tag on memberships of committees and panels to their names, but the results achieved have still to provide justification for their formation. In addition, the Planning Commission has been used to park some useless ministry officials and has, in its turn, been used as the jumping board for executive positions.

To-day the Planning Commission has become a body in search of its identity. The author's is a studious, painstaking study of the formation and growth of this body; except for a few laudatory remarks, the book provides mainly factual material. It provides an interesting inside view of the evolution of planning organisation in India and of how the plans are framed.

Has the Farmer Benefited from High Prices?

A Comparison of Trends in Harvest and Annual Prices

N. K. Thingalaya

The behaviour of agricultural prices during the last decade reveals in retrospect the many imponderables inherent in our economic life and also perhaps the limitations of planning in a mixed economy.

Agricultural prices have shown large fluctuations during many of these years. They moved down during the First Plan, leading to the depression of 1955-56. The Second Plan, which began with agricultural prices still ruling at relatively low levels, saw considerable rise in them towards the end. The price rise has been accelerated during the Third Plan with prices of most agricultural commodities reaching all-time high levels during the third year of the Plan.

It is argued sometimes that rise in agricultural prices measured by annual average prices does not represent the price situation faced by the farmers in the country. Most of the farmers, their ability to hold stocks being poor, dispose off their produce immediately after the harvest when the rush of supplies to the market results in low prices. And once the produce leaves the farm, whatever rise in price occurs does not benefit the farmer.

The price that really matters to the farmers is thus the harvest price. Therefore, it is pertinent to examine whether the level of harvest prices has risen along with the rising trend of agricultural prices during the last few years.

[The author is grateful to M L Dantwala and C H Shah for their valuable comments on an earlier version of this paper.].

A STATISTICAL analysis of the trends in harvest prices and average annual prices is of considerable practical importance. It will enable us to judge whether the inflationary trend prevailing in the economy, as indicated by the rise in the annual average of wholesale prices, has any impact on the level of harvest prices. If the former has not exerted any influence on the latter, it may be said that the rising prices have not favoured the producer. And this may make those small farmers who sell their produce immediately after the harvest (at relatively low prices) and buy later (at high market prices) really worse off. On the other hand, if the level of harvest prices indicates a rising trend along with the annual wholesale prices of agricultural commodities, the farmers' price position would be determined by the relative rates of rise of the two sets of price.

A comparative analysis of the trends in the annual average prices and the harvest prices during the last 13 years 1951-52 to 1963-64 is made here by fitting linear trend equations using the Least Squares Method. Only one commodity — rice is selected for this purpose.

The annual price indices of rice are obtained from the Index Numbers of Wholesale Prices (revised series) compiled by the Office of the Economic Adviser to the Government of India. As for harvest prices, there are two types of price series, both published by the Directorate of Economics and Statistics of the Ministry of Food and Agriculture. Of the two, the farm (harvest) prices broadly represent the prices received by the farmers as they are defined as "the average wholesale price at which the commodity is disposed off by the producer to the trader at the village site during the specified harvest period"[1] These price data which are available in the form of State averages cover only a short period. And the inadequacy arising out of their non-comparability over time and space lessens their usefulness considerably.

The index numbers of harvest prices are the other set of price data available. They are based on the wholesale price quotations collected by the branches of the State Bank of India from about 104 market centres relating to a few principal crops during the harvesting season. The harvest period of the agricultural year 1938-39 is the base for this series. In a recent publication,[2] the Directorate has presented this price data, converting the base into the harvest period of 1952-53. The long-term trends in harvest prices are analysed in this study by fitting linear trend equations to the 3-year moving averages of the harvest price indices for the period 1953-54 to 1961-62. The trend equation obtained by them for the harvest price of rice is: $Y = 864.5 + 4.4x$. The value of the coefficient 'b' indicates that the harvest prices of rice have been rising at an annual rate of 4.4 per cent during the period studied.[3]

To compare this trend with the trend in the annual average wholesale price of rice, we have fitted a linear trend equation to the 3-year moving averages of the annual price indices of rice for the same period. The regression equation works out to be

$$Y = 85.93 + 3.957x \quad (0.816)$$

A comparison of the two trend lines reveals that during the nine years considered, the harvest prices of rice have been rising at a faster rate (4.4 or 4.95 per cent per annum) than the average annual prices (3.957 per cent per annum). The remarkable inference that may be deduced from this comparison is that the harvest prices of rice have been rising faster than the rate of rise in annual average prices! This certainly casts some doubts regarding the efficacy of the statistical measures employed. However, it is not strictly the statistical measures that are at fault, but the non-comparability of the two sets of prices. The differences in the methods of compilation and the number and nature of markets from which price quotations are collected are too important to be ignored. Hence the differential rates of rise recorded by these two sets of prices cannot be accepted, *prima facie*, as an indicator of the relative rise in harvest price of rice.

Alternative Analysis

An alternative method has been adopted, therefore, to make a comparative analysis of the trends in harvest and annual wholesale prices of rice. Instead of the harvest price indices, we may use the averages of the monthly wholesale price indices pertaining to the harvest period. Rice in India is grown under different soil-climate complexes and thus has different harvesting periods in different parts of the country. And again as it

is grown more than once in a year in many of the rice growing regions, there is more than one harvesting period in a year. But of the three crops grown, only the autumn and winter crops are important and broadly their harvest periods fall within the five months from September to January.[4] This has been substantiated by a study of the seasonality of rice prices.[5] However, a period of five months is a long period compared with the harvest period considered in the compilation of the harvest price indices, which is only six to eight weeks. In between these two extremes, we have selected, somewhat arbitrarily, the three months December, January and February, to represent the harvest period for rice. By a close observation of the monthly indices of wholesale prices of rice during the last 14 years (see table 1), it was found that generally prices remain low during these three months compared to the other months in the year. Therefore, a simple arithmetic average of the three monthly price indices is calculated to represent the "harvest period price" of rice in each year. These prices are obviously lower than the annual average prices during all the years.

The differences between these "harvest period price" indices and the harvest prices of the Directorate may be noted. Apart from the differences in the base period and the length of the harvest period, there is one major difference. The harvest price index is calculated as a weighted geometric average of the price relatives of rice from different States, the weights being the current year's production in different States. Our "harvest period price" index is a simple arithmetic mean of 43 price quotations drawn from 43 markets in all of the rice growing States.

Comparison of the Two Indices

The similarities between the "harvest period price" indices and the annual price indices may also be noted before we proceed with the comparative analysis. Both have the same base, same price quotations from the same markets and the same method of compilation. The comparability of these two price indices may enable us to obtain better results than that obtained by the earlier comparison.

Table 2 provides the annual price indices and the "harvest period price" indices of rice from 1951-52 to 1963-64. Linear trend lines are fitted to the 3-year moving averages of the annual and "harvest periods prices" to estimate the rates of increase of the respective price series. The trend equations obtained are :

Annual Average Prices ... Y=100.09 +2.11 X (0.67)

"Harvest Period Prices" ...Y=95.18 +2.22 X (0.54)

It is interesting to note that the "harvest period prices" have been rising at a rate equal to that of the annual average prices of rice during 1951-52 to 1963-64. The earlier comparison had given the impression of harvest prices outstripping the rise in annual prices. This would lead one to the erroneous conclusion that during the last 13 years the margin between harvest prices and annual average prices has tended to be narrowed down considerably. The present comparison, on the other hand, yields a result which is more moderate in its implications and perhaps nearer to reality than the former. It indicates that the rise in the "harvest period prices" of rice has kept pace with the rising trend in its annual average prices. A simpler inference readily acceptable would be that the price situation of the producer *has not* deteriorated during the last decade when almost all agricultural prices were moving in the upward direction. We may hasten to add that this is only an inference, deduced from the observation of only one agricultural commodity and is too far from a generalization.

It is not difficult to show that the relationship between the "harvest period price" and the annual average price has not deteriorated during the period studied. This can be examined

Table 1 : Monthly Index Numbers of Wholesale Prices of Rice

(Base: 1952-53 —100)

by expressing the "harvest period price" as a percentage of the annual average price for each year. If the two prices are equal then the ratio between them will be 100. Any figure lower than this indicates the differences between the two prices. This difference, or the differential margin in prices, if we may call it so, has not risen during the last 13 years as can be seen in Table 3.

The average price ratio for the whole period works out to be 95.2 and during 9 out of 13 years, the ratio has remained above this level. Only during three years has it declined below 90.0. And these three years represent the years of low annual average prices. It may be noted from this observation that during the years of low annual prices the harvest prices remain still lower, resulting in a differential price margin of over 10 per cent. Logically the causal relationship may run the other way—annual prices may tend to be low due to the low harvest prices. This may be explained as follows: During a year of bumper crop, the traders who feel the pulse of the market more intelligently than the farmers, and who expect a fall in the annual prices, offer lower prices to the farmers to safeguard their margin[6].

During the years of price rise (due to poor crops), the differential margin is roughly maintained at 5 per cent or so. The harvest prices also rise with the annual prices. A plausible explanation would be that in view of the shortage of crops the traders tend to offer a little higher price inducing the farmer to part with more of his produce during the harvest period. This course of action is likely to be taken by them in order to procure large amount of supplies, which they are certain to sell at higher prices during the rest of the year. As a result harvest prices roughly keep pace with the rise in the annual average prices.

However, the simple inference deduced from our analysis is subject to modification due to the limitations of the price data used. The price quotations used for compilation of the price indices are drawn from primary, secondary and terminal markets.[8] Though the "harvest period price" index is based on price quotations prevailing during the three months considered to be the harvest period, the price quotations may not necessary pertain to rice coming to the market after the current year's harvest The price quotations in the secondary and terminal markets are more likely to be the prices relating to the previous year's crop. And usually the prices in the secondary and terminal markets are higher than those in the primary markets. A simple average of these prices thus does not realistically represent the "harvest period price" which is what really matters to the producer.

The "harvest period price" index merely represents the average price of rice prevailing in the country during a particular harvest period. Therefore, the rise in the levels of this price over a period does not mean that the level of prices received by the producer has risen with the rise in the commodity price level. At the same time it would not be unrealistic to conclude that the level of the "harvest period price" or better the level of the lowest price in each year has risen along with the rise in the annual average price of rice.

Table 2: Annual and "Harvest Period Price" Indices of Rice

Base 1952-53=100

Year	Annual Prices	3-Year Moving Averages	"Harvest Period Prices"	3-Year Moving Averages
1	2	3	4	5

The Bechtel Plan for Fertilisers

Ajoy Gupta

IT has been shown by many experiments and the experience of difference countries that, of all the input factors in agriculture, the one which gives the quickest and most lasting results is fertiliser. The aggregate requirement of fertilisers in the Fourth Plan on the basis of the estimates of the different States has been put at 6.5 million tonnes of plant nutrient per year 1970-71. However, considering the many limitations which make production of this order impractical the Planning Commission has proposed a target of 3.35 million tonnes for 1970-71, consisting of 2 million tonnes of nitrogen, 1 million tonne of phosphorus and 0.35 million tonne of potassium. How modest this target is can be seen from the fact that if we are to reach the level of fertiliser consumption in developed countries like UK, Japan and West Germany, (ie, about 100 lbs of plant nutrient per acre), the total output of fertilisers would have to be at least 6 times the proposed Fourth Plan target. Against this all the plants which are now under production as well as those which are under construction will not yield more than 0.77 million tonnes of nitrogen by the end of 1968. There will thus remain a wide gap which will have to be filled if the Planning Commission's very modest target is to be achieved.

A consortium of Western private industries styled as the Bechtel Corporation has shown interest in a massive fertiliser production programme by establishing five plants of standardised design which will produce approximately 3.5 million tonnes of chemical fertiliser per year containing 1.79 million tonnes of plant nutrient in collaboration with the Government of India. The consortium had submitted a feasibility plan to the Union Government early this year and discussions on it have been going on between the Bechtel Corporation and the Government.

In its report the Bechtel Corporation has suggested that the proposed output of 1.79 million tonnes of plant nutrient should consist of 1 million tonnes of nitrogen (N_2) and the rest of phosphorus (P_2O_5) and potash (K_2O). The individual capacity per plant has been suggested at 200,000 tonnes of nitrogen per year. Plants of this size have satisfactory operation characteristics and favourable economics. Besides, building a series of large plants of standardised design and operating characteristics will yield saving in capital, operating costs and engineering and will reduce substantially the construction time. There will also be advantages from the point of view of purchase of raw material and spare parts and establishment of operator training facilities.

The Bechtel Plan has selected urea as the most satisfactory compound for supply of nitrogen to the soils. Urea has been preferred by the Fertiliser Corporation of India also as the most suitable nitrogenous fertiliser for our soil, especially for paddy crops. It contains about 46 per cent nitrogen and can be used straight or mixed with other fertilisers.

Raw Materials

Diammonium phosphate is recommended as the phosphatic blending constituent or for direct use. It is a more recent type of mixed fertiliser and has a very high phosphorus content, i e, 46 per cent of P_2O_5 and 18 per cent of nitrogen, yielding a total of 64 per cent plant nutrients. The manufacturing technology based on ammonia and phosphoric acid has been well established. The advantage of diammonium phosphate over other fertilisers is that besides having a high concentration of plant nutrients it can be blended with other fertilisers according to the requirement of the soil and can be easily handled, being solid.

The principal processing units proposed by the Bechtel Plan will perform the following functions: The 760 ton per day ammonia plant will produce nitrogen as ammonia and carbon dioxide as a separate co-product. Both of these materials will be required as feedstock to the urea plant. Ammonia will also be supplied for the diammonia phosphate production. The urea plant will combine ammonia and carbon dioxide under high pressure to produce 1,070 tons of urea per day. The sulphuric acid plant will provide 840 tons per day of 100 per cent sulphuric acid which, in treatment with rock phosphates, will produce phosphoric acid. The production of phosphoric acid will be 310 tons per day of equivalent P_2O_5. In the granulation plant, phosphoric acid will chemically combine with ammonia to form diammonium phosphate. Urea and potassium chloride will be mixed and granulated with the diammonium phosphate to produce a 20:20:10 grade complex fertiliser or other formulations as desired. This urea-diammonium phosphate product when coated has good storage life and can be applied easily by the cultivator.

The main raw materials required for the production programme are: (a) surplus naphtha from refineries and other petroleum feedstock for the production of ammonia; (b) sulphur for the production of sulphuric acid, and (c) rock phosphate for the production of phosphoric acid. According to the tentative programme for the Fourth Plan, total refinery throughput of 11 existing and proposed refineries will be about 29,260,000 tonnes by 1970-71. This will involve an approximate foreign exchange outlay on imports of about Rs 144 crores or some 10.6 per cent of our total imports. By 1971 estimated production of gasoline will be about 4,780,000 tonnes, while the demand for motor spirits and aviation gasoline will be 1,458,000 tonnes. Naphtha for the petrochemical projects will account for 100,000 tonnes, for blast furnace injections 200,000 tonnes and for export and J P 1,427,000 tonnes. This will give a surplus of 1,595,000 tonnes for fertiliser production. This quantity along with available refinery gases will be more than sufficient to produce nitrogenous fertilisers equivalent to 1 million tonnes of nitrogen. No further import of crude, therefore, will be necessary.

The demand for sulphuric acid in 1965-66 is estimated at 1,195,000 tonnes and in 1970-71 at 1,980,000 tonnes. The major part of this will come from the fertiliser industry. All production today is based on imported sulphur. Imports of sulphur are expected to amount to more than Rs 175 million by 1970-71. Production of sulphuric acid by the pyrites process is well known in the West. In India we have been contemplating on adopting this process for a long time. We have

large deposits of iron pyrites at Amjore in the Shahabad district of Bihar State. The recent estimate of the Geological Survey of India indicates a total reserve of 1,000 million tonnes spread over an area of 48 sq miles. A sulphuric acid plant based on iron pyrites is already in operation in the Sindri fertiliser factory. To save foreign exchange production of sulphur from pyrites must be expanded. At least two of the five units proposed by the Bechtel Corporation could be based on iron pyrites as raw material for sulphuric acid.

Cost Estimates

Almost all the rock phosphates needed for production of phosphatic fertilisers are at present imported. Total import in 1965-66 is estimated at 1,410,000 tonnes valued at Rs 136 million. Estimated demand in 1970-71 will be 4,260,000 tonnes valued at Rs 375 million. Phosphatic rocks are known to exist in the Singbhum district of Bihar and in Tiruchirapally in South India. Rocks from these sources could be used after a certain amount of beneficiation. Prospecting for phosphatic deposits has been going on in the sea-coast of Andhra and on the Arabian sea coast. Sea muds containing phosphatic rocks could be used after beneficiation as raw material for phosphoric acid production.

Bechtel Corporation has estimated the total cost of its massive fertiliser programme at Rs 202 crores which amount is distributed under different heads as shown in the Table. Considering present availabilities of supplies in India, the Bechtel Corporation expects that some 54 per cent of the total expenditure would be in foreign currencies as indicated below:

	Rupee expenditure (per cent)	Foreign Currency Expenditure (per cent)
(1) Facility construction	48	52
(2) Initial materials and services for operation	35	65
(3) Total	46	54

The above proportions appear to have been changed to some extent in recent negotiations. From press reports it seems that the Ministry of Petroleum and Chemicals is of the opinion that the Bechtel Corporation's cost estimates are on the high side compared to the estimated cost of Rs 35 crores of the Durgapur plant designed to produce 125,000 tons of nitrogenous and 108,000 tons of phosphatic fertiliser annually. The fixed capital cost could perhaps be reduced to some extent by utilising more of indigenous production of heavy machineries as has been done by F A C T and the Fertiliser Corporation of India which has designed and constructed the new fertiliser plants at Namrup and Korba. The working capital costs could also be reduced by rationalising the price of surplus naphtha and using more indigenous raw materials, the possibilities of doing which have been discussed above. In this connection it is worthwhile mentioning that the price of surplus naphtha at the refinery was calculated at Rs 70 per ton by the Kane Committee Report on Petro-Chemicals; this was increased to Rs 80 per ton in the Henny Report and the latest estimate of the Petro-Chemical Committee of the Planning Commission is Rs 90 per ton. The price of naphtha is directly based on the price of petroleum crude. In spite of the high cost estimates, however, the Bechtel Corporation expects that their plants will work economically at the present level of fertiliser prices.

The Bechtel Corporation report lays great emphasis on the marketing and distribution of fertilisers. It suggests a vigorous sales and marketing organisation employing 3,000 qualified agricultural personnel to demonstrate the usefulness of chemical fertilisers to cultivators. Credit is an import element in the marketing programme. The report estimates the credit needs of the proposed fertiliser programme at between Rs 80 crores and Rs 140 crores, depending upon the availability and utilisation of present credit sources. In addition, about 17 crores will be required for initial market development.

Table: Distribution of Cost of the Five Fertiliser Plants

Head	
(1) Processing units including ammonia plant, urea plant, acid plants and granulator facility	97,82,00,000
(2) Non-processing facilities including raw material receiving, handling and storage facilities, power generation, water supply and recovery, steam supply, site development, fencing and general plant facilities, administration, building, shop, maintenance warehouse laboratory, cafeteria and the like	59,33,00,000
(3) Housing facilities for plant staff	9,51,00,000
(4) Special facilities as required at specific plant sites, mainly wharves and ship unloading systems	4,21,00,000
(5) Cost of land	1,35,00,000
Sub-total Fixed capital	172,22,00,000
(6) Pre-production costs including start-up and training costs and initial charges of catalyst, etc, and owner's cost during construction	9,36,00,000
(7) Working capital including allowance for spare parts, 30-day storage of raw materials, interest during construction, insurance during construction, etc.	20,72,00,000
Total estimated capital requirement	202,30,00,000

Larsen and Toubro

LARSEN AND TOUBRO has added two more activities to its already vast repertoire. It has been appointed all-India selling agents for the products of the Traco Cables Company. It has also been awarded the contract to contruct, on a turn-key basis, the Atomic Energy Establishment's Radiological Laboratory at Trombay.

Traco Cables, which is a Kerala Government project, started production early this year and is estimated to produce goods worth Rs 60 lakhs during its first year. This would be doubled in the second year. Among the company's products are all sizes of low tension PVC insulated cables and wires and heavy duty cables rated at 1100 volts. Larsen and Toubro is confident that the new company's products will be well received in the market.

Atomic Energy Establishment's Radiological Laboratory, which will be constructed by Larsen and Toubro with the aid of a Danish engineering firm, is estimated to cost about Rs 3 crores. The laboratory will include 'hot cell' facilities and when complete will be the largest of its kind in Asia. Larsen and Toubro's contract covers civil works and fabrication, supply and erection of piping, air conditioning, electrical and other mechanical equipment.

Distribution of Public Health and Education Services

N Bhattacharya
B Dey

In any discussion on inequalities in level of living, it is necessary to consider the distribution of consumption outside the domestic sector, especially the consumption of free health and educational services rendered by government and other public bodies. It is necessary to know, in a rough way, at least, in what way the benefits of such free public services are being shared by people in different levels of the society.

No such information seems to be available in India at present.

The Planning Division of the Indian Statisical Institute has started a random sample survey for a broad study of the position in rural and urban sectors of West Bengal. The present paper is a preliminary analysis of the data collected in the pilot enquiry during October 1963 to May 1964 in MADHYAMGRAM, an urbanised village in the district of 24 Parganas, West Bengal, only 18 kilometers away from Calcutta.

[The authors are indebted to M Mukherjee, Head of the Planning Division, for suggesting the problem, and to S Nandi, S Dhar, P Mazumdar and A Mondal for conputational assistance.].

THE village with 468 households was subjected to complete enumeration. For each household in the village, a schedule was filled in by the interview method. The following items of information were collected in this schedule :

(a) household size and composition;

(b) average monthly consumer expenditure on all items during the last year;

(c) educational particulars of different members with details of receipt of public education services during the last year in the form of fees exempted, scholarships/stipends, and in other forms; and

(d) receipt of free public health services during the last quarter by different members of the household.

By last year and last month will be meant last 365 days and last 30 days, respectively, preceding the date of survey.

Two investigators carried out the field work and the households were divided between them at random. This gave two interpenetrating subsamples of the sample households. We do not present the sub-sample estimates but they were used at the stage of drawing conclusions.

A preliminary analysis of the data has been reported here. The objective is to show how the benefits of (free) public health and educational services are being shared by different sections of the population in this particular village. It is obviously unsafe to generalise from one village which has more than one hospital within its boundary and a number of primary and secondary schools.

Attempts were made in this pilot enquiry to collect cost data from medical and educational institutions. It may be possible to present in a subsequent note the estimated money values of benefits received by different groups of people. But this line of work is extremely laborious and the results may not be worth the trouble. In any case, for a large scale enquiry collection of cost data would be practically impossible.

Material and Analysis

As already stated, the investigators collected figures for the average monthly value of domestic consumpconsumer expenditure) by each housetion of all items (usually called total hold, averaged over the last year, i e, 365 days preceding the date of survey. Only a rough figure was obtained through a few minutes' enquiry*. The households were then ranked in an ascending order of levels of living as measured by per capita total consumer expenditure per month; ten decile groups were then formed by grouping households contiguous in the ranking. The bottom decile comprised households having the lowest values of per capita consumer expenditure; the second decile from bottom, the households having the next lowest values of per capita expenditure; and so on. The limits of per capita expenditure were so determined that each group contained nearly 10 per cent of the total population in the 468 households surveyed (see Mahalanobis [3]).

Table 1 shows the formation of the decile groups. The average household

Table 1: Total Consumer Expenditure and Share of Total Consumer Expenditure by Decile Groups—Average Month of Last Year

Decile Group (Per cent)	Number of		Average Household Size	Consumer Expenditure (Rs) Per Person Per Month		Per Cent Share of Consumer Expenditure
	Households	Persons		Upper Limit	Average	
(1)	(2)	(3)	(4)	(5)	(6)	(7)
0—10	45	310	6.89	14.28*	12.04	4.21
10—20	47	313	6.66	18.18	16.42	5.80
20—30	50	310	6.20	20.00	19.50	6.82
30—40	39	308	7.90	22.72	22.45	7.80
40—50	46	313	6.80	25.00	24.73	8.73
50—60	43	314	7.30	29.16	28.42	10.07
60—70	56	313	5.59	33.33	31.80	11.23
70—80	40	306	7.65	36.36	35.70	12.33
80—90	47	313	6.65	41.66	39.06	13.79
90—100	55	317	5.76	400.00	53.75	19.22
Total	468	3117	6.66	400.00	28.44	100.00

* The lowest observed value of per capita total consumer expenditure was Rs 8.57 per month.

size is 6.66 for the entire population and shows very little trend over the decile groups. The lowest observed value of per capita monthly consumer expenditure was Rs 8.57, and the overall average is Rs 28.44. These figures show that Madhyamgram is not a typical village. Column (7) of the Table shows the inequality in the distribution of domestic consumer expenditure. Whereas the bottom decile gets a share of only 4.21 per cent, the top decile has 19.22 per cent of the aggregate consumer expenditure of the entire Madhyamgram population. This column is repeated in the subsequent tables.

Table 2 shows the distribution of all students by decile groups. The different columns are self-explanatory. 'Students' include all boys and girls continuing their studies in public educational institutions like schools and colleges, universities and other institutions which impart training to the students and are financed and/or governed partially or wholly by public bodies. So, this excludes those institutions which are run with a motive of making and appropriating profit by individuals or groups of individuals. As for example, tutorial schools and colleges, some of the commercial colleges, K G schools etc, run under proprietorship are excluded from our scope. Students are classified under three heads: (i) primary (infant class to class IV), (ii) secondary (class V to X or XI) and (iii) others (colleges and other institutions conducting degree or diploma course).

Table 3 shows the distribution of free students by decile groups. The purposes of this table, two half-free-studentships were together taken as equivalent to one free-studentship.

Table 4 shows the distribution of patient-visits to outdoor departments of medical institutions and patient-free-bed days in indoor departments by decile groups of the population. Medical institutions include hospitals, charitable dispensaries and health centres run by government and also by local bodies. It should be appreciated that only the curative side of public health services has been considered here, and the preventive side has been left out.

The money value of a free-studentship is not the same for all students. Also, all students, including free students, may really be enjoying some subsidies. Similarly, outdoor services include services of physicians, distribution of medicine, operations, X-rays and pathological tests. In the indoor department, in addition to medical treatment, the patient receives food, accommodation and nursing care. The money value of services etc, will vary from patient to patient and from visit to visit. The indicators chosen in this study, viz, the number of free students, the number of patient-visits to outdoor departments and the number of free-bed days stayed in indoor department, are only first approximations to the money values of benefits.

* Previous type studies [1] have shown that such quick methods give estimates consistently lower but highly correlated with the usual estimates of total consumer expenditure obtained through detailed family budget schedules. Quick estimates are sufficient for the present purposes of ranking the households by per capita total consumer expenditure: There is no point in spending 3 hours per household for estimating total consumer expenditure, when the main enquiry on consumption of public services required only half an hour per average household.

Statistical Finding

Number of students: There is a clear tendency of the number of all students increasing over the decile groups from about 70 in the bottom decile to about 105 in the top decile. Average is 90 per decile. In terms of percentage of population, the rise is from 22 or 23 per cent to 33 or 34 per cent roughly. Average is 28 per cent. Hence the percentage share of the ten deciles in the total number of students rises from about 8 to 12. Figures for some deciles seem to be erratic; in general, one should smooth the figures before drawing inferences.

No such trend is found in the number of primary students which constitute about 50 per cent of all students. All deciles have about 44 students (i e, 15 per cent of population). Only the top decile shows a lower figure, viz, 28 (9 per cent of population). So each decile gets about 10 per cent of all primary students.

There is a clear tendency of the number of secondary students increasing over the decile groups, at a steeper rate than the number of all students, from about 25 in the bottom decile to 55 in the top decile, the average being 41. In terms of percentage of population these figures are 8, 18 and 13 roughly. Hence the percentage share of all secondary students rises from 6 per cent to 14 per cent over the ten deciles.

Regarding students under the 'others' category, the trend is steeper, because the number rises from 0 in the two lowest decidles to 15 in the topmost, the average being only 5. In terms of percentages of population these figures are 0, 5 and 2 roughly. Hence the percentage share of 'other' students rises from about 0 per cent to about 30 per cent over the ten deciles.

To sum up, then, the percentage share of the ten decile groups in the total number of students is more of less the same in the primary stage, while in the secondary stage, there is a rising trend from bottom to top decilies and such a trend is steepest for the category of 'other' students. A rising trend is also evident, though the rate of increase is moderate, when all students are taken together.

Number of Free Students: No definite trend over the deciles is evident when all students are considered. Each decile shows around 65 free students which means just over 20 per cent of population. So each decile had about 10 per cent of all free students. If we consider percentage of all students who are free, the percentage, however, falls from about 90 in the bottom deciles to 50 or 60 in the top deciles, the average being about 70 or 75. Free students in the primary stage form about two-thirds of all free students, and this is more prominent in bottom deciles as percentage of primary students (mostly free all over the state) to all students here is overwhelmingly large.

No definite trend is observed in the number of free primary students. Each decile shows around 40 such students which means about 13 per cent of population. So each decile has around 10 per cent of all such students. If we consider the percentage of all primary students who are free, the percentage remains very near 100 or even reaches 100 over the seven deciles from bottom, but thereafter shows signs of some decline reaching about 80 in the top deciles. The overall percentage is 95.

The number of free secondary students shows an increasing trend, rising from about 15 or 18 in the bottom deciles to 27 or 28 in the top deciles. Considered as percentage of population the rise is from 5 to 9 roughly, the average being 7. So the share of all free secondary students rises from 7 per cent to 12 per cent, roughly, over the ten decile groups. As regards the percentage of secondary students who are free, the overall percentage is nearly 55, but there seems to be a slight declining trend the figures are too erratic for any definite statement — from about 65 in bottom deciles to 50 near the top.

Very negligible number of free students were observed under the 'others' category, so little can be said except that since such students are rare in the lower deciles, free cases are also rare in the lower deciles.

Number of visits to outdoor departments of hospitals etc: The number of visits shows a clear decline from nearly 200 in the three lowest deciles to about 160 in the fourth decile from the bottom and then to around 60 or 80 in the six remaining deciles. There seems to be little trend over the top six deciles. So clearly richer people avoid visits to outdoor departments of hospitals etc. So per 100 persons per quarter (the reference period was last quarter i e, 90 days preceding the date of survey), the number of such visits decreases from about 64 in the three bottom decile groups to 50 in the fourth and then to 20 or 25 in the six top deciles. So far as percentage of all such visits is concerned, the three bottom deciles have a share of about 17 per cent each, the fourth of about 13 per cent and the top six of about 6 per cent.

Number of free-bed days stayed in hospitals etc.: The figures are too erratic in this case. A quarter seems to be too short a period to give reliable estimates. The numbers may be taken as fluctuating widely around an average of 57 per decile, and the figures per 100 of persons fluctuate around 19 per quarter which comes to about 75 free-bed days annually. So far as percentage share of the decile groups is concerned, very little can be said; for instance, the share is 0 for the eighth and 33 per cent in the ninth decile. Cummulative percentage shares are more stable; and they hardly show any inequality, as the bottom 50 per cent have a share of only a little over 50 per cent.

Table 2: Distribution of Students by Decile Groups—Last Year

Decile Group (Percent)	Percentage of persons	Share of Consumer Expenditure	Percentages of Students				Students as Percentage of Population

Free-studentship is more or less equitably distributed in proportion to population, if all categories of students are considered together. The same seems to be true for primary students also. In the secondary stage, the bottom deciles send fewer free students than the top deciles, the shares rising from 7 to 12 per cent. Little can be said about the 'others' category; but the few free students generally fall in the upper deciles. On the whole, therefore, the higher deciles get a somewhat larger share of free educational services than the lower deciles.

Free primary education being available, almost all children seem to attend free primary schools. (Primary students form about 15 per cent of the population in all the ten decile groups.) This is why free-studentship in the primary stage shows an egalitarian distribution. The higher deciles have a larger share of free students of 'secondary' and 'others' categories; but the bottom deciles send relatively few secondary students and very few students of the 'others' category. As a matter of fact, number of free secondary students seem to be roughly proportional to the number of secondary students in the ten deciles. The two considerations — (i) economic conditions of parents and (ii) merit of the students, — may have counterbalanced each other in the award of free studentship.

So far as free medical services are concerned, it is evident that the four bottom decile groups 'get' — it is more appropriate to say 'take' — a much larger share (above 15 per cent) than the top six decile groups (6 or 7 per cent), in the service rendered by outdoor departments of hospitals etc. This is apparently because the rich people try to avoid the trouble of attending hospital outdoors, while the poorer people are compelled to do so because of their economic condition. The distribution of services rendered by indoor departments of hospitals etc, may be more or less equitable, but the picture is not at all clear from this small scale study. It is possible that acute cases, where hospital services are essential, arise equally often among all classes of population and even the rich cannot avoid hospitals in such cases.

So far we have considered how far the distribution of these benefits is egalitarian, that is, proportional to population in the ten deciles. Perhaps it is more important to consider how far the distribution of these benefits is more egalitarian than the distribution of domestic consumer expenditure. The distribution of domestic consumer expenditure is far from egalitarian, the bottom decile getting nearly 4.3 per cent and the top decile 19 per cent. (For all-India, rural or urban, the corresponding figures show even greater inequality, *vide* Mahalanobis [2]) Judged against this background, the distribution of free health and education services seems to be favouring the poorer sections considerably. In medical services rendered by outdoor departments of hospitals, the bottom deciles get more than their due share even on the population basis. In free-studentship in the primary stage, the bottom deciles get their due share on population basis and hence more than their due share on the basis of domestic consumer expenditure. The same may be said, very roughly, about services of indoor departments of hospitals. In free-studentship in secondary and 'other' stages, the bottom deciles get less than 10 per cent share, but even here their share is larger than their share in domestic consumer expenditure. Hence, it is clear that the distribution of free health and education services in *Madhyamgram* was effectively reducing the inequality in level of living.

Table 4: Distribution of Outdoor Patient-visits and Indoor Patient-Free-Bed Days by Decile Groups—Last Quarter

Decile Groups (Per cent)	Per Cent of Persons	Share of Consumer Expenditure (Percent)	Percentage of		Per 100 of Population Per Quarter	
			Visits to Outdoor Departments of Hospitals	Days Stayed In Free Bed	Visits to Outdoor Departments of Hospitals	Days Stayed in Free Bed

The Rally Continues

Wednesday, Morning

DALAL STREET presented a distinctly steadier appearance last week and its overall performance held out the hope that the market might be able to put up a still better showing for quite sometime unless, of course, the political situation deteriorates all too suddenly. Equities have staged an all-round moderate recovery from the previous week's lows and the rise has been quite impressive in certain counters. For instance, National Rayon have moved up from Rs 348 to Rs 373, Standard Mills from Rs 385 to Rs 408, Century from Rs 505 to Rs 525, Telco from Rs 221 to Rs 233.50, Voltas from Rs 224 to 234.50, Indian Dyestuff from Rs 170 to Rs 188, A C C from Rs 147 to Rs 150.25, Scindia from Rs 12.80 to Rs 13.40, Tata Steel from Rs 147 to Rs 152.25 and SLM—Maneklal from Rs 102 to Rs 125. While Tata Steel were back again at the year's highest, Amar Dye-Chem made a new high mark last week.

Heavy short covering, scarcity of fresh offerings and renewed selective bull support—all these contributed to the recovery in prices. Turnover also showed a noticeable improvement though activity continued to be entirely professional. There was nothing particularly stimulating in the week's news to bring about a turn in market sentiment. The corporate news was of a mixed nature. The industry's reactions to the Ordinance on bonus and the increase in cement prices were not such as would enthuse the stock market bull.

But one need hardly be surprised by the recent recovery in prices, which, in fact, had been overdue. With equity prices drifting lower and lower week after week despite the progressive decline in floating stocks of several scrips as a result of sustained institutional buying, the market's technical position had become vulnerable. It was necessary that the market should take a pause to allow technical forces have their full play. This is exactly what has happened now. It is difficult to say how long the process of technical adjustment which is well underway will continue. Nor is it easy to tell how far the recovery might go. Much will probably depend on the developments in the political situation. Apart from political uncertainties, the market's behaviour has become very unpredictable because of the lack of outside public interest. Being extremely thin, the market responds sharply to small buying and selling.

COTTON

Dull Affair

TRADING in the cotton market throughout last week, particularly in futures, was an extremely dull affair. The August hedge contract hovered around Rs 773—Rs 2 below the ceiling rate—most of the time and it was only near the week-end that it eased a little to Rs 770.50 (per 3 quintals). Total turnover during the week did not exceed a few thousand bales. One really wonders how cotton brokers manage to pass their time. Conditions in the spot cotton market were a little better, though it is only the needy mills which figured as buyers from time to time. Because of the accumulation of stocks of both cloth and yarn and acute financial stringency, mills are restricting their purchases to the minimum. Uncertainty about the global import quota has led to increased demand for foreign cottons; mills are picking up available lots of foreign cotton and a fair turnover has been reported in Upland and Supima cottons. Among the indigenous varieties, C02, L 147, Laxmi and Kalayan have been receiving fair attention.

The cotton trade seems satisfied with the Indian Cotton Mills' Federation's decision to purchase ISC 67 cotton from Gujarat which had been the subject of controversy for some time. The Federation has already agreed to take up 4,125 bales from the Sabarkantha Ginners, Oilmills and Cotton Merchant's Association and it is willing to purchase another 6,000 bales provided a firm offer is made on or before June 12. The agreement stipulates that the ISC 67 cotton will not be inferior to Cambodia A. If the cotton offered is above 1-3/32" staple, the price would be the ceiling prescribed for Cambodia A 1-3/32" and if the staple length is 1-3/32" and below, the price will be 5 per cent less within the approximate ceiling price for Cambodia A.

New Delhi had still to make up its mind on the cotton price policy for the next season. If prices are to have any bearing on production then the price policy should be announced before the commencement of the sowing season. Sowings have already started in the Punjab which is one of the important cotton growing States in the country. May be, New Delhi thinks that it does not have to bother much about cotton growers in the Punjab as Bengal Deshi has been fetching quite fancy prices throughout the current season.

OILSEEDS

Hesitant Tendency

THE oilseeds market had a rather dull time last week. The turnover in futures was restricted because of the margin considerations and the bulk of business was in the nature of switching over of positions from the nearby June to the distant September contract. There was a considerable increase in the spread between the June and September contracts, the distant position being quoted at a discount. After being marked down to Rs 78.10 castor June moved irregularly higher to Rs 80.60 by the week-end and showed a net gain of Rs 1.40 per quintal over the week. The September contract was virtually unchanged over the week at Rs 78.90 against Rs 78.80. The relative strength in the spot material induced short covering in the maturing contract. Linseed futures showed a small decline over the week, with the June contract receding from Rs 101.20 to Rs 99.80 and the September contract down from Rs 100 to Rs 98.40. No tenders were issued either in castor or linseed on the first notice day. Cottonseed September in which trading was permitted last week eased from Rs 52.25 to Rs 51.75 without much activity.

The spot market also displayed a subdued tendency due to improved supplies of groundnut oil from the upcountry centres. Groundnut oil was sold down to Rs 24 but later it recovered to around Rs 24.40 (per 10 kgs). Linseed oil eased from Rs 20 to Rs 19.40 but castor oil was steadier, with the quotation for Commercial grade marked up from Rs 16.65 to Rs 16.90 on some export house buying. Prominent spot dealers do not antici-

pate any significant changes in prices—up or down—in the immediate future While the general market psychology continues to remain bullish, the overall supply position is considered as reasonably comfortable. There was a scramble for edible oils towards the end of the previous season and prices were pushed to fantastically high levels. Nobody expects that experience to be repeated this time. Oil prices are unlikely to register any important rise from the highest levels recorded recently, provided, of course, the monsoon is timely and its progress is satisfactory. With the supply of edible oils reasonably comfortable and groundnut oil prices fluctuating between Rs 24 and Rs 25 for a long while, the recent increase in vanaspati prices by the industry has evoked considerable comment in market circles. The increase in prices is said to be quite unwarranted particularly when the industry has been able to acquire a fairly large quantity of soyabean oil which is considerably cheaper than groundnut oil.

Export houses reported fairly good business in groundnut extractions though the prices realised were lower than in the preceding week. Poland, East Germany and the U K were mentioned as the main buyers. There has been an appreciable decline in internal prices of extractions, the spot quotation having come down by about Rs 30 per tonne over the past month or so. The decline in prices is attributed to increased offerings by the manufacturers. Export business in cottonseed cake also continues to be good though here again overseas prices have registered a moderate decline in recent weeks. The delay in the issue of import licences against exports of cottonseed cake has pushed up the premium on copra licences from Rs 700 to about Rs 1000 per tonne.

Money and Banking

Thursday Morning

THE Bombay short-term money market held steady during the week. Demand seemed to have slackened somewhat even as the supply position became a little easier. The call rate now stands at between 7.75 and 7.50 per cent as against 7.75 per cent quoted at closing on Saturday, May 29.

Net deposits of scheduled banks showed in increase of Rs 9.37 crores at Rs 2,653.53 crores during the week ending May 21. Investments in government securities increased by Rs 3.07 crores at Rs 721.22 crores. Bank credit dipped by Rs 13.07 crores to Rs 2,105.94 crores. Borrowings from the Reserve Bank were lower by Rs 39.84 crores at Rs 126.45 crores. Money at call and short notice rose by Rs 5.89 crores to Rs 51.92 crores.

A further contraction in notes in circulation by Rs 31.34 crores at Rs 2,698.43 crores is revealed by the Reserve Bank's statement for the week to May 28. Notes held with the banking department increased by Rs 32.58 crores to Rs 52.66 crores. Total notes issued showed a nominal increase of Rs 1.24 crores at Rs 2,751.09 crores. Central Government deposits were marked down by Rs 3.26 crores and stood at Rs 64.12 crores. State Government deposits were lower as well by Rs 2.05 crores at Rs 15.93 crores. Deposits of scheduled banks were higher by Rs 10.51 crores at Rs 104.62 crores while their borrowings decreased by Rs 21.92 crores to Rs 102.84 crores.

BUSINESS NOTES

Svadeshi Mills

IN pursuance of its objective of diversifying activities, Svadeshi Mills has obtained a licence for the manufacture of laminated plastics which will enable it to produce water and acid proof packing material for textile and other goods. Besides, steps are being taken to effect economy in operation, improve the quality of cloth and expand the weaving and processing sections. A completely new modern weaving department is now nearly complete to house about 300 automatic looms. During 1964, 3,520 additional spindles were installed, increasing the installed capacity to 91,228 spindles and thereby nearly achieving the required balance between spinning and weaving. Also, 32 automatic looms were added. Further 244 automatic looms are expected to be installed by the end of 1965 when the automatic weaving capacity would be about 38 per cent of the total weaving capacity.

The management has formulated a seven-year plan of renovation, modernisation and expansion. Estimated to cost Rs 2.70 crores, the plan envisages replacement of worn out and obsolete plant, equipment and other related facilities with modern up-to-date plant and equipment. For financing this plan, Rs one crores have already been raised by the issue of debentures, and the balance amount of finance will be met from internal resources to be generated in the course of the next seven years.

The company during the past year produced satisfactory results despite adverse trading conditions in the latter part of the year. Gross profit was higher by more than Rs twelve lakhs at Rs 89.99 lakhs, though sales and other income improved only by less than Rs five lakhs to Rs 6.93 crores. With depreciation taking away about Rs nine lakhs more at Rs 32.21 lakhs, taxation Rs eight lakhs more at Rs 31 lakhs and development rebate a lakh more at Rs six lakhs, there is left for disposal a lower amount of Rs 20.79 lakhs compared to Rs 26.63 lakhs a year ago. Of this, the unchanged equity dividend requires Rs 19 lakhs and preference dividend Rs 1.07 lakhs.

The company was able to better its export performance in spite of the difficult conditions obtaining in world markets. There was increased competition from Pakistan, Hongkong and Korea, which were making a concerted drive to expand their exports. Indian cloth was being outpriced owing to the high cost of cotton, labour, stores and plant and equipment. The company is making efforts to find new markets, and a start has been made by exporting cloth to some of the Eastern European countries.

Jyoti

BETTER utilisation of manpower and newer and better substitutes for costlier raw materials have helped Jyoti considerably in holding the production cost despite rising prices of raw materials, higher wages and taxation. The company's modern research and development centre started working last year, beginning with the hydraulic section. This year the electrical rotating machine and switchgear sections have also commenced functioning. Equipment for the metallurgical section has been ordered, and is likely to be received by the end of the year. Various laboratories of the centre are usefully utilised for extensive tests on all critical raw materials and for type tests and endurance tests on finished products. With these facilities at its disposal, the company is now in a happy position to study the problem of substituting the imported raw materials with indigenous materials and components.

In view of the expanding market for electric motors, switchgear and switchboards, the management has

decided to expand the manufacturing facilities of these products. The possibility of expanding the manufacture of small and medium motors and switchgear and instrument transformers on a considerably larger scale is being examined. A separate electrical machines testing shop equipped to test generators upto 500 kW rating is being set up. This will help in consolidating and stepping up the manufacture of generators. A collaboration agreement has been concluded with a French firm for the manufacture of power relays and allied products, and a concessionaire agreement has been entered into with a U K firm specialising in the production of large pumps and both hydraulic and electric naval auxiliary equipment.

The company during 1964 introduced some new products such as sand and cement slurry pumps, rubber lined chemical pumps to handle abrasive and corrosive liquors and other difficult chemicals, large turbines and generators, 11 kV potential transformers, 33 kV circuit breakers and switchboard panels. The company's sales promotion efforts in overseas markets have started showing results as evidenced by the rise in export business. The 1964 export performance has exceeded the records of the past years.

The financial results for the year to December 1964 show sales higher by 22 per cent at Rs 3.14 crores and profit before taxation nearly a half more at Rs 21.26 lakhs. Of this, the tax liability has taken up Rs 12.30 lakhs (7.71 lakhs), gratuity reserve Rs 0.50 lakh (same) and reserve for doubtful debts Rs 0.10 lakh (same). The allocation to general reserve has been raised from Rs 1.20 lakhs to Rs 2.50 lakhs and the dividend stepped up by two per cent to 12 per cent claims Rs six lakhs against Rs five lakhs a year ago.

Synthetics on Chemicals

THE synthetic rubber industry is in a difficult situation owing to poor offtake and high cost of production. This is reflected in the working of Synthetics and Chemicals, the only unit in the country. Though imports of synthetic rubbers manufactured by the company are banned and imports of natural rubber restricted, the company's plant remained closed for a third of the year in 1964 and produced only 11,808 tons of synaprene rubbers against the rated capacity of 30,000 tons. On the company's representations, for the first time last year the government started making specific allocation of company's synthetic rubber to individual units of industry borne on the list of Development Wing, but the total allocation for twelve months to end-March 1965 was about 15,000 tons only. The company has made representations that there is scope for the increased usage of synthetic rubber, and has submitted detailed break-up for each product and each unit of industry in support of its contention. It has urged the government to help in utilising its idle capacity when providing for any imports of natural rubber.

The company's cost of production continues to be high, mainly on account of high cost of raw materials like benzene and high import duties on imported raw materials and chemicals. It has made many representations to the government that the cost of production of synthetic rubber can not be brought down unless reasonable reliefs are given on these counts and the company is assured of the fullest utilisation of the rated capacity of the plant. Meanwhile, in deference to the wishes of the government, the company had further reduced the price from August last even when the earlier price schedule was adopted with the apporval of the government.

During the year 1964, the company sold 10,982 tons of synaprene rubber compared to 2,246 tons in the previous year. The turnover increased from Rs 93.72 lakhs to Rs 4.37 crores, and the company earned a gross profit of Rs 16.49 lakhs as against a loss of Rs 29.26 lakhs incurred a year ago. After adjusting the profit against the previous accumulated loss and making some other adjustments, the balance loss of Rs 23.06 lakhs is carried to the balance sheet. As in the previous year, no amount has been provided for depreciation. Total arrears of depreciation amount to Rs 2.10 crores. Besides, there are preliminary expense amounting to Rs 23.26 lakhs which too have not been provided for.

Indian Copper

THE year 1964 has proved a profitable one for Indian Copper Corporation. Net sales during the year rose from £4,246,511 to £4,341,905 and the company earned thereon a higher profit before taxation of £1,304,591 compared to £1,193,181 in the previous year, after providing £172,105 (170,000) for depreciation. Of the higher profit, taxation demands £880,160 (821,855), leaving a balance of £424,431 (371,326). To this is added £465 being the balance from the previous year and £12,406 being other adjustments relating thereto. A sum of £47,813 (28,125) is allocated to development rebate reserve, £57,375 (nil) to capital development reserve and £332,000 (98,000) to general reserve out of which the unchanged dividend of 12 per cent is proposed to be paid. No amount has been earmarked for transfer to reserve for gratuities which had last year received £67,500.

The company produced 9,475 tonnes of refined copper in 1964 compared to 9,582 tonnes in 1963. The overall recovery from ore to refined copper was 92.162 per cent, as against 92.403 per cent for the previous year. The loss in production is attributed to the high ash content of the coal, coupled with a breakdown to the reverberatory furnace. Sales were lower at 11,418 tonnes, including 1,015 tonnes of refined copper ingots compared with 14,029 tonnes, including 3,057 tonnes of refined copper ingots during the previous year. The average per tonne selling prices were considerably higher over those of the previous year: copper ingots were up from £241.08 to £268.17, rolled brass from £283.55 to £356.56, Y M circles from £301.45 to £345.74 and rolled copper from £353.38 to £404.61. But at the same time, the overall operating cost of production of refined copper rose from £179.11.4d to £214.5.8d.

The construction of the new electrolytic refinery suffered further delays due largely to poor quality of locally manufactured equipment and the failure of manufacturers to adhere to delivery schedules. With the completion of cast housing section, however, work commenced on the production of anode moulds. The manufacture of electrolytic wire is expected to begin soon.

New India Industries

THE year to December 1964 has proved a good deal better for New India Industries, manufacturers of cameras, photographic paper, etc. The financial results show all-round progress in production, sales, and profits. During the year, sales expanded from Rs 1.50 crores to Rs 2.14 crores and gross profit from Rs 36.77 lakhs to Rs 48.53 lakhs. Of this,

depreciation has claimed Rs 14.51 lakhs against Rs 14.98 lakhs, taxation Rs 20.80 lakhs against Rs 6.85 lakhs and development rebate reserve Rs 0.06 lakh against Rs 9.26 lakhs, leaving a net profit of Rs 13.16 lakhs compared to the previous year's Rs 5.68 lakhs. The proposed ordinary dividend at Rs 15 per share requires Rs 6.60 lakhs and preferential dividend Rs 1.29 lakhs. The directors have also recommended capitalisation of a sum of Rs 11 lakhs from share premium account and distributing the same by way of bonus shares in proportion of one new ordinary share for every four ordinary shares held subject to the approval of the Controller of Capital Issues.

Madras Motor and General Insurance

ALL-ROUND progress has been recorded by Madras Motor and General Insurance Company in 1964. The gross premium underwritten by the company has risen by Rs 27.47 lakhs to Rs 129.08 lakhs. The fire underwriting results have been fairly satisfactory, notwithstanding the adverse claims experienced in the U K which affected the treaty results of the company. The fire revenue account has shown a net profit of Rs 4.74 lakhs. The company has expanded its activities in the miscellaneous department and is granting various types of cover in addition to motor insurance. The net premium has gone upto Rs 84.91 lakhs from Rs 68.30 lakhs, but due mainly to an increase in reserve strain the net profit in this account is slightly lower at Rs 15.62 lakhs. For the first time since the commencement of marine business in 1960, the marine revenue account has recorded a small profit of Rs 0.18 lakh. The net income of the company by way of interest, dividends and rents has gone up by Rs 1.59 lakhs to Rs 7.10 lakhs. But due to the fall in the market rates of stocks, shares and other securities, the company's investments have suffered a depreciation of Rs 1.51 lakhs.

After providing Rs 12.95 lakhs (13.85 lakhs) for the tax liability, the company has earned during 1964 a profit of Rs 13.40 lakhs compared to Rs 11.46 lakhs a year ago. Of this, Rs 96,500 (78,600) are taken up by donations, Rs five lakhs (Rs 4.50 lakhs) have been earmarked for augmenting general reserve and Rs 7.48 lakhs (Rs 6.43 lakhs) for payment of dividend is lowered by 2.5 per cent to 18 per cent but payable on an enlarged capital. The total assets as at the end of the year stood at Rs 210.17 lakhs as against Rs 176.26 lakhs, reserves at Rs 30.57 lakhs against Rs 25.62 lakhs and insurance funds at Rs 56.21 lakhs against Rs 43.77 lakhs.

Age is not all... nor the mere fact of survival on the frayed ends of tradition. Among the earliest promoters of a *concept* — that of self-sufficiency for our country through extensive industrialization, we have known no ingenious ways to overcome obstacles apart from flexibility in decision making, and regard for ordinary principles of management wedded to probity. If we are today a rational complement of industrial units, that is because of our reluctance to sit on the fence of the status quo — waiting for an overwhelming consumer demand to develop before being able to set our sights. And if we have a modest reputation of worthiness, we intend to live up to it through an optimum use of talents, available resources and initiative.

AGE IS NOT ALL...

AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON AND STEEL CO. LTD.: With an enviable record of production efficiency the million ton integrated steel plant at Burnpur is ready with another two-phase expansion programme to double its production capacity by the end of the Fourth Plan period. The largest foundry in the Commonwealth at Kulti is being steadily modernized and expanded.

A subsidiary, The IISCO-Stanton Pipe and Foundry Company Limited, recently inaugurated, has its brand new factory coming up at Ujjain for the manufacture of spun iron pipes and ancillaries directly for the benefit of consumers in developing areas.

BURN & COMPANY LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive springs and components.

THE HOOGHLY DOCKING & ENGINEERING CO. LTD. Established in 1819, the Company with its shipbuilding yard, dry dock and extensive workshops is geared to meet defence and civilian requirements, and to produce dredges to keep our new harbours and channels of inland navigation open.

ROBERT HUDSON (INDIA) LTD.: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES: Some of the first feeder railways in India, with six systems in four states, still a great aid to suburban travel.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India serving a wide area in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester...Hand operated and electric overhead travelling cranes and chain pulley blocks.

REYROLLE BURN LTD.: A collaboration with A. Reyrolle & Co. Ltd., Hebburn, England—for the manufacture of specialized types of electrical switchgear of worldwide repute.

WE LOOK BEYOND TODAY

Forward planning has always been a part of management thinking at IISCO. This made it possible for us to complete by 1960 a two-phase expansion programme to take production to 1 million tonnes of ingot steel well ahead of schedule

With the challenge there again to provide more steel for the nation produced efficiently, we are on the edge of another two-phase expansion programme to reach a target of 2 million tonnes. Research and the constant application of new techniques will win better iron, more steel and more diversified end products from Burnpur's existing installations which new plant and equipment should ideally balance and supplement—at an investment cost *considerably less* than that required for an entirely new plant of the same tonnage.

A Time for Introspection

IN recent weeks India has launched an all-out self-salvaging operation in Asia and Africa. The Minister for External Affairs himself has toured several African countries; simultaneously, the Minister of State crossed over to West Africa, and the Deputy Minister has been pleading the country's cause in the capitals of South Asia and the Far East. Even the Vice-President, presumably because he is a Muslim, was requested to visit the Middle East. Topping this series of manoeuvres, Lal Bahadur Shastri, on his way to Canada last week, stopped in Cairo to propitiate President Nasser.

All this is supposed to contribute to India's ground strategy to thwart China at the Afro-Asian Conference to be held later in the month in Algiers. It might be argued that our present policy of directly canvassing for Afro-Asian support is nothing out of the ordinary, since Prime Minister Chou en-Lai is also doing precisely the same thing. Even President Ayub Khan has been going out on a series of foreign tours to propagate the point of view of Pakistan. And who has not heard of the flamboyant trips of President Soekarno every twelve months or so?

A caveat nonetheless has to be entered with respect to the nature of the diplomatic offensive which our policy-makers have mounted. It is possible to propagate a foreign policy if a country has one. Do we really have one? What have our Ministers been trying to sell abroad? Are they seeking to convince the Afro-Asians that, despite all that has happened since Pandit Nehru's death, we still believe in non-alignment, anti-colonialism and Afro- Asian brotherhood? What concrete steps are we prepared to take to provide evidence of this continuity?

There was a time during the closing half of 1964 when it was becoming obvious that our foreign policy experts were slipping into an anti-non-aligned frame of mind, despite Afro-Asia and despite the aid that was being received from the East European countries. The zeal of the general run of civil servants who have come to the fore since Krishna Menon's exit apart, the Government was being pushed by a number of internal developments. Partly this was on account of the demoralisation which followed last year's debacle in food. In the ensuing panic, the United States was thought to be the only saviour. Intense pressure was immediately mounted on the Ministry of External Affairs to muffle all criticism of that country. A strong Minister of External Affairs could have resisted this encroachment on independent decision-making. But, to all intents and purposes, the initiative for the making of foreign policy had by then shifted from the Ministry of External Affairs to the Secretariat of the Prime Minister. It is well known that, leading up to the time of the April disenchantment with President Johnson, the permanent officials of the Ministry of External Affairs were under a cloud and policy-making was gradually being usurped by Shastri's personal advisers. There is of course not much of a qualitative difference in the general attitude of the civil servants who man the Ministry of External Affairs and those who constitute Shastri's Secretariat. But at least the former would be knowing a little bit more of the history and background of a particular situation and, therefore, in their advice on policy formulation they would be likely to be somewhat more circumspect. In contrast, the Prime Minister's Secretariat, not being inhibited by either memory or history, would feel tempted to shoot from the hip. Most of these officials in any case have pronounced pro-American inclinations; besides, they are men in a hurry. Having reached the judgment that the country's long-run interests lie in alignment with the U S A, they would like to hustle the decision-making process accordingly.

Till only a few weeks ago, these people were succeeding very demonstrably. They have now stumbled only because they had little idea regarding the volatile nature of Indian public opinion. They have also been somewhat naive in their assessment of the American Administration's general attitude to India. For this essential truth needs to be stressed over and over

again: we may willingly agree to be a vassal State of the U S, but that does not mean that the latter country would be equally willing to enlarge the volume of aid to us, or to support us down the line on all issues. With the old Cold War mould all but broken, the U S Administration does not consider it enough of an attractive bargain to alienate our Asian neighbours merely to placate us. At the more mundane level, it is not easy for even the affluent Americans to subsidise for years on end a population of five hundred million, and one which is growing annually at the rate of 2.5 per cent. Also, the Americans could hardly be blamed if they are a little wary of the fickle Indian mind; just as our short-term emotions have today arrayed us against the Chinese and the Indonesians and the Pakistanis, another series of incidents could easily turn our minds to an altogether different direction.

President Johnson's lack of enthusiasm has again forced us into a journey of re-exploring the roots of our foreign policy as it was conceived by Pandit Nehru and fashioned by Krishna Menon. But, after our recent bouts of opportunism, will it be easy to convince our Afro-Asian neighbours that we are permanently deviating back into fidelity? In our obsession with American military aid and economic succour, we have, in the recent period, tended to ignore Afro-Asia. Today the Afro Asian countries have much less need for India than we have for them. We have alienated the other three major populations in Asia. Having realised only subsequently that the direct support of the Western powers is not adequate for survival, we are now desperately searching for friends among the African and Asian countries. While no nation will chafe at being called a friend of India, certainly the Afro-Asian powers by and large would not like to make enemies of Prime Minister Chou en Lai, President Ayub Khan and President Soekarno just in order to gladden our heart. It is not only the mericans who are growing wise.

After all, while we demand sympathy and understanding from the Afro-Asian nations, we have little to offer them in exchange. China has currently a surplus in its external accounts running near to one million dollars annually. It happily provides arms to countries which are in need of them in Asia and Africa; occasionally it offers economic aid. Pakistan has a viable economy, and has just entered into a number of collaboration agreements with several Middle East countries. President Soekarno's Indonesia is not so well off, but at least it has a positive ideology and a cohesive national movement.

We have none of these. We can offer no ideology to Asia and Africa, because anyone who has studied our foreign policy of the last few years, would only be impressed by its latent opportunism. As a bankrupt nation, we are unable to offer any aid. And militarily, we exposed ourselves in 1962; and the reputation has not been enhanced by the episode of the Rann of Kutch.

Afro-Asian conference or no Afro-Asian conference, a reconstruction of the country's foreign policy is necessary for survival. And here the greatest lesson that we can learn is that of humility. If we want to contain China, we shall have to begin by admitting the fact that, compared to her, we are a weaker and smaller nation as of now. We must be able to extricate ourselves soon from the China syndrome. In the process of re-evaluation, the first task is the development of a self-reliant economy. It is only inherent strength which evokes emotion from outsiders, whether it be fear or admiration. The second, but hardly less important, task is to thwart the sabotage of our foreign policy by civil servants whose reading of history is imperfect and whose ideologies are distorted. The politicians must have the courage to tell their advisers that the country is not for sale.

Disciplining the States

AS this issue goes to the press, another series of meetings begins in New Delhi between the Planning Commission and the State Finance Ministers, individually. The issue is the States' contribution to Fourth Plan resources. The Planning Commission wants the States to produce a surplus of Rs 825 crores in their current accounts (compared to Rs 960 crores recommended by the Working Group on Resources and the figure mentioned in the Memorandum, Rs 870 crores). The States' own estimates, however, add up to no more than Rs 335 crores. No surprises are expected from the current meetings. The Planning Commission, it is safe to predict, will stick to its estimate with some concessions perhaps here and there to certain States. The figure that is finally agreed upon will be, almost certainly, around Rs 800 crores.

These figures as such do not call for any comment. The dispute is between two sets of calculations and not of policies and is more than likely that neither is based on sound scientific methods. Though some amount of comodity balancing has begun to make the physical targets more closely inter related than they used to be in the earlier years of planning, no such streamlined methods underly our financial calculations. The growth rates assumed in the financial calculations reflect, by and large, the wishes and aspirations of the authorities making them. The Planning Commission it suits to assume high rates of growth for the States' resources; the opposite suits the States. Each party wants to pass on to the other as much of the burden of raising resources as it can.

States' estimates are, of course, usually very much more irresponsible than those of the Planning Commission and the series of meetings may turn out to be the usual disciplining sessions for the States. But what is worthy of notice is that this relationship between the States and the Planning Commission has not been sufficiently criticised in the country for its terrible inefficiency. Fifteen years of planning have produced not much change in the organisational framework of Plan formulation and implementation. In a vast country with a federal government structure, the framework has to make possible effective participation by the States or other regional agencies in the process of planning. There are various ways, more or less efficient, of allowing this participation, involving different degrees and types of decentralisation within a framework of centralised calculations. Some original developments in the methodology of planning — both in organisational and computational aspects — might have been expected in this country. French planners have some valuable contributions in this sphere to their credit; they have widely experimented with operational techniques of collaboration between the Planning Bureau and associations of entrepreneurs representing particular industrial sectors and there has been a parallel development in the mathematical theory of decentralised decision-making closely wedded to actual practice. In India, however, there has been no original thinking, no experimentation in how to make the States

participate effectively in the planning process. The relationship has remined that of the controller and the controlled. The current talks are in effect bargains across the counter, with the Centre holding the purse strings and the States exploiting to the hilt their capacity to blackmail. The technique is not one of co-operation and collaboration — neither among the States, nor between the States and the Centre — but one of getting the better of each other. The game played is certain not a game-theoretic one; it does not lead to any optimality.

The fact is no action has yet been taken on the generally accepted contention that for efficient planning at the grassroots level there has to be a considerable degree of decentralisation. The facts and figures necessary for formulating efficient State level plans can only be known or fully understood by experts with local knowledge. Planners in the Yojana Bhavan and the other Bhavans in New Delhi cannot but be handicapped by ignorance and distance. What is necessary are expert bodies of planners at the State and district levels — say State level Planning Commissions with horizontal co-ordinating role with respect to the State departments and vertically dual relationship with the State Ministry and the Central Planning Commission. And yet in all these years nothing has been done to set up such State level planning bodies. In discussions between the Centre and the States the former is represented by the Planning Commission which is supposedly an expert body, and the latter by Ministers and Secretaries incapable of taking a unified, technical view of the problems of their State. The discussions thus take place between two parties neither of whom is competent to appreciate the problem in its fullness — the Central planners because of their lack of local knowledge, and the State representatives because of their lack of understanding of the problems either of their State or of the country as a whole. State planning continues, therefore, to be a most inefficient process, reflecting a compromise between the parochial selfishness of the States and the highhanded, but un-understanding, arbitration of the Centre.

Weekly Notes

Signs of Revival

THERE are signs of revival on the stock exchanges. But the little improvement that has taken place over the last two or three weeks is mainly in prices, not in the volume of business transacted. The *Economic Times* all-India index of equity prices stands nearly 2 percentage points above the lowest level reached this year, though it is still 7 percentage points below the pre-Budget high. The revival has taken place mainly in Bombay, Ahmedabad and Delhi, not in Calcutta, and is confined largely to cotton textiles, steel, engineering, sugar and electricity. Part of the returning confidence is, of course, attributable to the fact that the dividends of a large number of companies are expected shortly, since they close their accounts in March, and the dividends should be higher in keeping with the higher structure of interest rates. Tata Steel, particularly, is expected to give a better deal to shareholders this year.

Moreover, L I C has been an unusually heavy buyer of leading scrips in recent weeks and there is a well-founded belief that LIC has decided to invest a higher proportion of its funds in private securities, in order to earn a larger over-all return. In spite of the much advertised monetary stringency, at least one operator in Bombay and two (one of whom is Haridas Mundhra) in Calcutta are consistent buyers of certain scrips and have not disappointed themselves or their followers in the process. Carry-forward charges for transactions in forward shares have stabilised at relatively low levels and the current yield of over 7 per cent average on ordinary shares is attractive.

These — as they are described in market jargon — technical factors apart, there are good reasons for revival. The entry of the Industrial Development Bank in a massive way in the field of underwriting, especially for large projects requiring assistance of more than Rs 2 crores, has made a good impression, all the more because IDB is giving share brokers a slice of the underwriting commission, in addition to the usual brokerage. Most companies have reported satisfactory it not better results over the last year. The floatations of around 1960, which have been a deadweight for a long time, are going into production and some are approaching the dividend paying stage; consequently, there is some interest in cash shares also. While the foreign exchange position remains or grows more critical, there is a silver lining or two: the utilisation of the latest Consortium aid should begin soon and, at the same time, depleted stocks of some competitive imports have helped enterprises like Synthetics and Chemicals to at last sell at a profit. It is also hoped that relatively stable food prices this year would keep down wage costs and that higher costs of materials would be passed on to consumers, of which there are some indications already. There is greater confidence in the stability of the Shastri Cabinet, too.

The dust raised over the non-abolition of dividends tax and capital gains tax is tending to settle down. The dividends tax is after all a flea-bite, less than Rs 10 crores out of a total revenue of more than Rs 340 crores from companies, and the concession allowed in capital gains tax taken off much of edge. The market and tax experts have taken some time to realise that the continuation of these taxes has been offset to a large extent by the very liberalised treatment of so-called narrowly owned (i e, section 104, formerly 23A) companies. Foreign controlled public companies, all those public companies which have assets of more than Rs 50 lakhs and all companies with profits up to Rs 10 lakhs have benefited considerably from the Budget. After the traditional lag in understanding novel measures, businessmen, even share brokers, have come to appreciate that the Budget has left them very much better off. For the first time in a decade and half of planning, the tax pattern has been settled on a long-term basis and that basis is that the more you invest and sell and keep down your cost, the lower the rate of tax you pay.

Three factors, foreign exchange, tight money and border troubles, prevent the recovery from becoming a boom, and all three are inter-related. Border troubles will entail larger defence expenditure which, in the absence of significant Western military aid, will involve consistent pressure on free foreign exchange resources for the next five years or so. Industrial production grew last year at a disappointing rate, largely due to shortage of maintenance imports. Monetary stringency of present dimensions might by comparison be a passing phase but notice has been served that the reins would be kept

tight over the Fourth Plan too — if only to make sure of stand-by assistance from IMF. These are also other adverse developments like the power cut in the Bombay-Poona region. Nevertheless, for the market the worst seems to be over, though blood-curdling rumours pop up every now and then, as they will — this week, for instance, of devaluation and de-monetisation!

Unsafe Mines

ON June 1, 236 coal-miners died in one of the worst mine disasters in Japanese history at the Yamano coalmine in Kyushu, Japan's main southern island. This was just four days after the Dhori colliery explosion, the worst ever in India, which killed 270 miners according to official estimates and almost twice that number according to estimates by miners' unions. In Japan the Minister of International Trade and Industry promptly tendered his resignation assuming responsibility for the disaster. In India the Minister concerned has taken the mishap as part of the day's work and is still undecided whether even to institute a judicial enquiry or not. So much for concern for human life!

It is not the magnitude of the Dhori disaster alone which calls for a thorough enquiry into it — nothing, after all, will bring back the dead men to their hapless widows and children. Some very serious allegations have been made about its possible causes, to establish the truth or falsehood of which is absolutely necessary considering the publicity they have received. Understandably, the owners of the mine have been anxious to allay doubts that the accident might have been caused by some negligence on their part; towards this end they have raised the possibility of sabotage by workers on the basis that there had been a strike in the mines and the workers had been compelled to resume work by a government order less than a week before the explosion. However, the sabotage theory has been discounted by the Chief Inspector of Mines, G S Jabbi, after some preliminary investigations. On the other hand, some of the facts which have come to light hardly do credit to the management of the mines. The Chief Minister of Bihar, K B Sahay, who made an on-the-spot investigation, discovered that no qualified engineer had cared to check pit conditions after the strike and before work was resumed. In fact, the last time the Dhori colliery had been inspected by the Department of Mines was in July 1964.

Safety laws prescribe regular testing of air inside mines, mechanical ventilation to dilute and remove explosive gases and stone dusting of walls to render harmless coal dust. Since the Dhori mine was closed for a long time on account of the strike, it is pertinent to ask if these minimum precautions were taken. This may well prove to be crucial in view of the fact that has come to light that at Dhori miners rarely used safety lamps, using instead 'dhibris' (kerosene wick lamps giving out naked flames). Since 'dhibris' are far cheaper than proper safety lamps the managements' anxiety to make do with them is not difficult to understand but it would be interesting to know on what grounds the government's inspecting staff permitted their use.

It is, of course, no news that basic safety precautions are ignored in our mines. Compliance with them means some expenditure by comparison with which human life is cheaper — each one of the miners killed at Dhori has cost the owners of the mine a mere Rs 100 in the form of *ex gratia* (sic!) payment. And the mine inspecting staff does not seem to be averse to obliging mine managements. Only last month the Minister had read out a detailed statement in Parliament giving details of how for years many mine owners had evaded their responsibility to supply proper mining boots to their workers, preferring to expose them to serious injury so as to save themselves a few thousand rupees.

The enquiry into the Chinakuri disaster of 1958 which killed almost 200 miners revealed grave lapses in the observance of safety precautions. The same findings have been repeated by numerous courts of enquiry appointed to enquire into other accidents. The principal purpose of these enquiries is that their findings make it possible to take action to prevent accidents from similar causes. This purpose does not seem to be achieved very often. Nor do the statistics of casualties in mine accidents seem to make any great impact on the Department of Mines. The public needs a disaster of the proportions of the one at Dhori to make it aware of the problem of miners' safety. But the Department of Mines does not: it knows that, to take the latest figures available, on average there occur 7 fatal and serious accidents in coal mines on every day of the year. In a whole year in these accidents some 200 persons or more are killed and almost 15 times that number seriously injured and disabled for life.

The New Cold War

THE events of the past three months have amply illustrated a new phase in post-war international affairs, the precise significance of which is still obscure. It is almost as if we were back in the nineteen thirties and the League of Nations was gently fading away to reveal the actual scale of conflict no longer soluble through the polite institutions founded with such goodwill in the early twenties: all is commotion, excitement, gloom, but no one sees the coming cataclysm.

Then the enemy was clear — or seemed so retrospectively. Now it is not. The American response to its profound dilemma in Viet Nam has been to escalate the conflict with increasing speed through 1964 (despite protestations to the contrary), culminating in February last with the beginning of the wanton bombardment of North Viet Nam. Since then escalation has continued. U S troops in Viet Nam have risen from 16,000 'advisers' last August to (and this is a guess, owing to American censorship) about 70,000, not counting those deployed on the 126 ships of the Seventh Fleet which patrols the whole coast and supplies half the American strike force for bombing purposes. Some 25,000 men are currently landing in South Viet Nam, and the immediate prospect is that the number of U S troops would swell to 100,000, including three combat divisions. The cost has soared again, a guess that leaves out the cost of U S forces in Viet Nam paid under separate heads) to about 1,800 million dollars per year, or nearly double the sum offered by President Johnson as economic aid to South East Asia in his John Hopkins University speech. The bombing sorties on the North, begun as limited 'retaliation' for Viet Cong attacks in the South, have risen to regular missions, part of the ordinary peace-time policy of an American Government! From regular missions, they have become round-the-clock blitzkriegs on targets initially 100 miles or more from Hanoi to ones only 45 miles away. The transition to openly bombing civilians is already in sight. Now McNamara has put it on record that at no time has any responsible official of the U S Administration ever said that nuclear weapons would not be used in Viet Nam if it was felt to be in the interests of the United States.

The escalation must continue if evacuation is to be avoided, if the Viet Cong victory is to be evaded. It must continue also because a section of Washington policy-makers aim not at the soul of the South, not even at the soul of the North — the real target, for which the Vietnamese war is merely an incidental tragedy, is China. China has inherited the place left vacant by the Soviet Union on the see-saw of the Cold War — with a difference. The stability of the Cold War turned upon the equality of the contenders, the balance of terror between two nuclear giants. Yet today China can oppose the United States only from under the Soviet nuclear umbrella; the Chinese can fight the United States only with words when there is a risk of American nuclear retaliation. The East Wind blew strong only with Peking-Moscow amity. In Korea, Soviet power stood behind China; no one knows whether it does at the moment. And in Viet Nam, China must play safe, for it knows that the 'warhawk' faction in Washington argues, cogently, that Russia will no longer shield China, and that therefore now is the time, while Chinese nuclear capability is still very weak, to strike at China's industry once and for all. China's weakness without Russia is an open incitement to American ambitions.

The key change is then the extinction of the Soviet Union as the balancing factor to the United States. American power, expressed in openly lawless brutality in Viet Nam and the Dominican Republic, is predicated on the assumption of Soviet acceptance of whatever America does in the interests of preserving the Soviet-American *detente* — so far a successful assumption, since Russia did not even summon the U N Security Council when the bombing of the North began. Indeed, America could argue that its activity in Viet Nam helps Russia. If it forces Soviet intervention to stabilise the *status quo* (to the loss of the Viet Cong), together Russia and America will undercut the appeal of the Chinese position, demonstrating that peaceful co-existence is all and wars of liberation evil.

The policy has dramatically demonstrated the lack of any new post-war world order: all is as before, whether it be the gunboat diplomacy of classical imperialism or the lawless aggression of the Axis powers before the last war. The rule of law, the sanctity of negotiated settlements (the Geneva Agreements), of national sovereignty, just as the United Nations and the Organisation of American States, all have suddenly appeared to be purely contingent fictions adorning the fact of American hegemony. Even little SEATO has been left high and dry, squeaking to be so naked in public gaze. And in all the discussions, the cry of sorrow from the ordinary Vietnamese, speared on the 'balance of power' is drowned.

Will Labour Last?

Our London Correspondent writes:

THE Labour Government's hair-breath escape from defeat during the debate on the Finance Bill—it was saved, ironically, by an Opposition Chairman's vote—has raised questions about how long Labour will survive in office. If one were to believe the anti-Labour press, it is only a matter of time, and short time at that, before the Conservatives are back in office. Is the situation really as bad as that for Labour?

But despite the premature jubilation of the Tories, who already see themselves back in power, the issue is far from settled yet. The Opinion Polls still give Labour a lead greater than they had at the time of the Election and, what is more important, it is beginning to look as if Labour is at least turning the corner.

The first sign of this was the much-publicised get-together of a formidable array of Ministers last week-end at Chequers. The object of the meeting was to speed up publication of the National Plans for Economic Development to reassure the public and British industry that Labour is not content with defending its slender majority in Parliament but is taking very seriously the task of putting Britain's resources to the best use. Although it is certain that there will now be no early election, it is just possible that Harold Wilson may be contemplating an appeal to the electorate in October to ask for a mandate to implement the National Plan which aims at a 25 per cent increase in the overall rate of growth by 1970 and which will combine full employment and monetary stability. It is understood that far-reaching proposals for stimulating industrial investment and modernisation and for expanding exports were discussed at the Chequers meeting. Other key questions discussed included regional planning, optimum redeployment of manpower (particularly in view of the fact that there is likely to be a shortfall of 300,000 men if the 25 per cent growth target is to be achieved) speed up of the introduction of automated techniques and rationalisation of Britain's dock system. The Ministers and experts concerned believe that they have made good progress towards producing a first draft of what has been described as a "vigorous and viable plan". The first version of the plan is expected to be ready in September.

The scaling down of the Bank Rate from the crisis level of 7 per cent to 6 per cent was also a shot in the arm for Labour since it has been taken as indicating that the basic economic situation is improving. The move has been justified by the marked improvement in the balance of payments and the substantial strengthening of Britain's gold and dollar reserves. At the same time, the fact that the cut in the Bank Rate was linked to a tightening of hire purchase terms will reassure foreign opinion that there is to be no relaxation of the credit squeeze.

From every point of view the lowering of the Bank Rate—maintained at a crisis level for the unusually long period of six months—is to be welcomed. In the first place, a high rate maintained for so long is in itself self-defeating. Far from reassuring foreigners about the security of their sterling funds, the raising of the Bank Rate to 7 per cent in November last year so heightened their nervousness that it was accompanied by a massive flight from sterling. In recent weeks it was beginning to look as if continuance of the Bank Rate at 7 per cent would be taken by foreigners as a sign that the UK authorities were again worried about the prospects of sterling. Surely, it is high time that the Labour Government stopped attaching so much importance to such a clumsy instrument of economic control?

Passivity on Vital Fronts

THE Annual Report of the Union Ministry of Health evokes rather mixed reactions. In keeping with developments since Independence, the institutional structure of medical and professional education and research has been further strengthened during the year. The remarkable progress in the field of control and eradication of major diseases continues to be reflected, for example, in the marked reduction in the incidence of smallpox,

malaria, etc, and the emphasis progressively shifts from the attack phase to consolidation and maintenance of the gains.

However, measures taken so far to improve health have continued to be *mainly in the form of the introduction* of modern medical technology and its shot-gun spectral drugs. There are many who feel that the foundation of better health in the form of proper sanitation and hygienic environment is as yet generally absent. This is confirmed by a recent report that according to surveys the population living in filarious areas of the country is estimated to number 122 million today as against 25 million in 1953. One does not know whether and how much of this increase is due to better and/or more extensive surveys, but since proper disposal of sullage and improvement in sanitary conditions are vital for controlling filariasis, the very slow progress on these fronts in the face of growing slums in urban areas constitutes important evidence which cannot be dismissed casually. True, proper drainage in urban areas demands heavy investment of resources, but even the educational activities related to health and hygiene seem to be totally unimpressive. The Health Education Bureaus at the Centre and in the States are clearly not up to the task.

In the vital area of promoting family planning in the country, the creation of an administrative structure for the "re-organised" family planning programme in the States appears to have received the highest priority during the year. As for other matters, one is told once again, the Government has approved the proposal to *manufacture* condoms in the public sector — an approval that was first reported in the Press as early as in 1962. Three years have passed without any tangible progress on this important scheme. One hopes that the approved proposal to *manufacture* intra-uterine devices in the public sector will not meet with the same fate. The much-talked-about programme to improve the distribution of contraceptives "in every part of the country" still remains ineffective as can be judged from the fact that even in Greater Bombay condoms imported at a maximum price of about Rs 15 or Rs 16 per gross are sold at Rs 36 to Rs 48 per gross.

Incidentally, against the Ministry's proposal for a Fourth Plan allocation of Rs 396.90 crores for "Hospitals, Dispensaries, Primary Health Centres and Medical Care", the Planning Commission has tentatively allocated only Rs 250 crores. The Ministry's Report asserts that "under this reduced allocation no appreciable increase in the present scale of medical care is possible" (p 134). Of course, what is "appreciable" is impossible to appreciate; and the statement may be merely a bargaining stand vis-a-vis the Planning Commission. But if only the Health Ministry could bring itself to be a little more imaginative and the bureaucratic labyrinth of health departments at various levels can be straightened out, a better rural-urban distribution of medical personnel and proper motivation on the part of persons in the field could substantially improve on present standards of available medical care.

BOOK REVIEWS

Reality of Economic Growth in India

D S

Indian Economic Growth: Perfomance and Prospects by K N Raj, Allied Publishers 1965; pp 28, Rs 1.50.

ECONOMIC discussion in India is, like Indian agriculture; both *succumb to the* prevailing climatic 'mood'. When the going is good, as was the case during the First Five Year Plan, the votaries of planning extolled economic progress as resulting solely from adoption of planning as the instrument of *growth. Dogmatic* assertions and extravagant hopes were the order of the day. But when the economy began to run *into* heavy weather, the pendulum of economic discussion swing dramatically to the other extreme. Planning is now proclaimed as the villain of the piece. Blame for all ills—be they the foreign exchange crisis, the domestic inflationary pressures or the all-round shortages—is laid at the doors of planning and the planners. A corollary of this muddle-headedness was that a lot of energy and time of politicians and so-called economists was wasted on futile controversies—public sector versus private sector, heavy industry versus light industry and so on—without realising the real nature of the difficulties facing India or of the remedies necessary to remove them. True, *value* judgments are a *sine qua non* of scientific discussion, as Gunnar Myrdal has very persuasively argued, but what we perceive in the economic debate in India is not the use of value judgments as a basis for logical building up of argument but mistaking them for logically derived conclusions.

Problems in Perspective

At a time when one despaired of a scientific approach to current economic and political problems, this book by K N Raj came as a whiff of refreshing breeze. The book consists of two lectures delivered by the author at the invitation of the Nalanda College. The lectures are not merely a commentary on contemporary economic and political problems, they treat of the rationale and philosophy of Indian economic development in the last 14 years. Though he starts with the economic situation which has developed in the last three years, since the Chinese aggression, he analyses with relentless logic, analytical vigour and a fervour which can come only from deep convictions the whole process of Indian economic growth. In the scheme of thinking of Raj there is no room for the 'wafflers' who know nothing beyond the quantitative theory of money, who tend to ascribe all economic malaise to excessive credit creation or, put differently, excessive investment, whose mental horizon is narrow enough to confine new investment to available saving. Nor does he give any quarter to those who applaud planning with an enthusiasm and a lack of economic expertise which can do credit only to a village level politician. It is for this reason that the book commends itself as the first serious attempt by an Indian economist to study the problems of Indian economic development.

A conspicuous feature of the book is its inter-disciplinary approach. It does not treat economic problems in isolation from their political implications either in the domestic sphere

or in India's foreign policy. It shows with rare perceptiveness that both the political and the economic difficulties which multiplied in the last years of Nehru and the consequent crisis of confidence have to be seen as interlinked. If the economy falters for some reason, it has its natural and predictable impact on the political strategy. Raj argues, 'if ... the inter-relation between problems—more particularly between the economic and the political—is lost sight of, the insight gained is likely to be of a very partial character and of limited value from an operational point of view". This approach is seen at its best when Raj discusses India's growing reliance on foreign aid and private foreign investment as a way out of the foreign exchange shortage. He has exposed the myth of the shrivelling of India's international stature because of the attack by China and the subsequent explosion by China of the nuclear bomb and rightly attributed China's growing stature in world affairs to "China's show of discipline and self-confidence and the progress it has apparently made in a short period relying almost entirely on its own resources". "Correspondingly", he adds "it is the collapse of morale in India and the growing attitude of dependence on others which has been bringing down its prestige and standing in recent years". How true! Those who are dismayed by India's pathetic attempts to seek friends alternately among the Western and the communist countries could not agree more with Raj.

Answer to the Cassandras

The meat of the book is largely in the first lecture which explains the logic of the inflationary situation as it developed in the years 1962-64 against the background of Indian growth in the last decade. Raj is not apologetic about the mistakes of Indian planning. He has shown that between 1950-51 and 1962-63 the rate of growth of income in India worked out to about 3.5 per cent (compound) as against a targeted rate of 4 per cent. Even this, according to Raj, is an underestimate because of the possible understatement of growth of income from small enterprises. If the Indian achievement is seen against the growth achieved in the 50-year period prior to Independence or against Japan's rate of growth in the later part of 19th century and the early part of the 20th century, the Cassandras among our economists would not be listened to so attentively.

Why, then, all this noise about the slothful progress of the Indian economy? It is here that Raj's analysis is seen at its best. True, the Indian economy has just had its worst experience of inflationary pressures, but can we say that this was all due to the faulty strategy of planning or the rise in money supply and deficit financing? It is known that defence expenditure had sharply risen between 1960-61 and 1963-64. This, together with a normal rise in investment expenditure, accounted during this period for as much as two-thirds of the rise in national income. Considering that population in the meanwhile also increased, no wonder that prices rose as they did.

Food Stocks Wasted

The question, however, remains why the growth in national income during this period was slow. Raj rightly pins down the reasons on some of the thoughtless policies the Government has followed. He has shown with full force of facts that the food policy, as also the use of imported foodgrains under Public Law 480, were misconceived and mis-directed. The massive import of foodgrains by way of commodity assistance was not utilised for building up stocks for a rainy day out was dissipated through sale during a period (1960-62) when the internal food situation was comfortable. This led naturally to a fall in food prices, particularly wheat prices in relation to the prices of manufactured goods resulting in a change in the terms of trade against agriculture. The comparative stagnation in agriculture is thus explained by the disincentive effect of this change in terms of trade.

And yet this does not provide a full explanation for the sharp rise in food prices and the accentuation of inflationary pressures during 1962-64. The internal gap between aggregate supply of food and aggregate demand was, as Raj rightly emphasises, made the more formidable by the peculiar characteristics of Indian agriculture where small producers predominate. Their reaction to the price situation is not the same as that of the capitalist farmer so that a rise in prices of agricultural output leads actually to a shrinkage of marketed surplus which in its turn helps to fan the tinders of inflation. Even large farmers are infected with this psychosis in a period of rising food prices and they in consequence try to build up inventories through holding back new output from the market. Though most of this analysis is on the lines made known through the work of Ezekiel, Mathur, Dharm Narain, Khatkhate, etc, the ingenuity of Raj lies in the fact that he, through a skilful comparison of experience in the years 1960-62 and in 1962-64, demonstrates the total bankruptcy of the Government's buffer stock policy. We have talked, times without number, about the need for a flexible buffer stock operation but it has remained only talk all these years. Apparently, the lesson of history is that it teaches no lesson at least to the Indian bureaucrats!

Institutions and Technology

If Raj's analysis of Indian economic growth is perceptive, penetrating and persuasive, his policy prescription is far-reaching in its implications. He rightly points out that the real problem in India is to raise agricultural yield per acre. But that problem cannot be solved merely through application of technical inputs, however urgent it may seem. He shows that rent on land has shot up in areas where technical inputs are applied more intensively and that it has acted as a major disincentive to the tenant-cultivators on whose response agricultural production greatly depends. This means that if the technological innovations are to reap a rich harvest in irrigated acres, they have to be accompanied by institutional reforms — a great desideratum in Indian agricultural development.

The second of the two lectures comes as a sort of anti-climax. It begins well with a much-needed distinction between the rates of growth of new industries and old industries. It is demonstrated that the rate of growth of new industries is accelerating, which has wide implications for future growth. Raj has also given a fitting reply to the doubting Thomases of Indian planning, pointing out that between 1951-52 and 1960-61 the marginal rate of savings achieved in India was between 20 to 25 per cent, and that too not as a consequence of the rise in prices. All this needed to be said and it is said here very effectively. This discussion in the latter part of this lecture, however, goes off at a tangent into the relative merits of private foreign investment and foreign aid and grants. Not that what Raj says about private foreign investment is not acceptable and not sufficiently documented. What is disappointing is its hackneyed nature and the fact that he should have given so much attention to something which is

irrelevant to the main theme he is developing. One would have in fact expected from him a deeper analysis of the problems which Indian planners have either unsuccessfully solved or failed to tackle at all. Some of these issues may be indicated here.

One of the paradoxical features of Indian planning is the ambivalance about financial and physical planning. The planners are not tired of saying that their plan is a physical plan but when it comes to implementation, all that the planners do is to calculate in a conventional way what resources they will raise by way of taxation, borrowing, etc. This is indeed surprising considering that planning has gone far beyond the chrysalis stage in this country. It is this dichotomy which prompted I M D Little to say that the confusion between physical planning and financial planning "means that the physical plan must be regarded as a very loose jointed affair and that there is little reason to suppose that any subsequent enlargement of the plan need or should be towards a fulfilment of the physical plan". *(Oxford Economic Papers*, February 1964). Raj comes very near to saying something on this aspect when he discusses the marginal rate of saving achieved in India. It is a major issue in the context of Indian planning and should, therefore, receive greater attention from academicians in the country.

Size and Growth

An even more significant aspect is the problem of planning in a country of India's size. Whatever rate of growth India might have achieved in the last few years, it does not stand favourable comparison with what has been achieved in smaller countries like Thailand, Philippines, Malaysia, etc. Can we, therefore, say that India has suffered due to bad planning or faulty policies? This is an important question since the relationship of the size of the country to the rate of growth has not been given due weightage in discussions on economic development. Planning for growth in a small country is not on all fours with that in a big country. In the latter the problem is made the more difficult due to shortage of perhaps the most important agent of growth, viz, managerial and entrepreneurial skill. In a way, the growth of a country's economy is analogous to the operations of a firm; when the firm expands beyond the stage where available entrepreneurial ability fails to cope with the task, diminishing returns set in, as Kaldor showed in his classic article on equilibrium of the firm. So is the case with a country's economy. When the size is large, the existing managerial skill cannot tackle the problem in an efficient manner — at any rate in the initial stages of growth. It, therefore, follows that in any scheme of planning, due allowance should be made for this most vital factor.

All said and done, this little book of Raj's is conspicuous for its constructive approach to and rare insight into Indian economic development. It is refreshingly free from the tub-thumping variety of pronouncements of the economist panjandrums of the Planning Commission as well as from the sterile negativism of some academicians whose judgments spring from hunches and intuition.

A Summary and a Proposal

Ashok V Desai

International Currency Plans and Expansion of World Trade by K Venkatagiri Gowda, Asia Publishing House, 1964, Rs 18.00.

Commonwealth Common Market — Proposal by K Venkatagin Gowda, Asia Publishing House, 1964, Rs 16.75.

VENKATAGIRI Gowda is to be congratulated for extending his interests beyond the problems of import substitution, export promotion and foreign aid which, for so many Indian economists, exhaust the field of international economics. International monetary arrangements are of close relevance to us in India since they determine what role deflation should play in the correction of payments disequilibria in industrial countries, and thereby affect their rates of growth and their offtake of goods we export to them. Similarly, the change in our pattern of production is changing the potentialities of our foreign trade, and their is much scope for trading arrangements that would facilitate the export of goods we have begun producing and the import of goods we find ourselves in need of.

In "International Currency Plans" Gowda reviews various proposals for international monetary arrangements. The summary is competent, and faithful even down to the allocation of space — Triffin, who has written two books on currency problems, gets nearly half the space. The treatment is enumerative, and analysis suffers as a result. One cannot get Gowda's judgment on anything. It is nice, for example to know that Vanek thought the Triffin plan was inflationary and Bernstein thought it was deflationary, but it might have been more useful if we had been told why Vanek and Bernstein differed. Similarly, I found nothing new on other important problems in this field: the difficulty of getting countries with payments surpluses to accept any discipline, the post-war restrictions placed on countries, freedom to frame their trade policy, imposed by the IMF and the GATT, and the consequent reversion towards gold-standard conditions when the entire burden of adjustment of payments used to fall on domestic policies, the legitimacy of the distinction, rigidly made by the Fund, between short-period and long-period payments disequilibria, etc.

"Commonwealth Common Market" is a proposal — and amounts to little more. All it has to do with the Commonwealth is the recurrence of names such as the U K, India and Canada; for the rest, there is so little discussion of the specific trade patterns and needs of the constituent countries that the proposal might equally well have been one for a Polynesian Common Market. It is even difficult to know if Gowda means a Common Market when he proposes one, for while he favours a customs union arrangement as against a free trade area (p 50), he accepts arguments for tariffs and import restrictions within the area to protect infant industries and correct balances of payments (p 59). Such vagueness persists throughout the book. I feel there is little difference between Gowda's proposal and the present Commonwealth Preference and Sterling Area arrangements, but Gowda's argument is not sufficiently clear to permit such an extreme conclusion. Which is perhaps just as well, for I would have been very annoyed to read this book and find it didn't really need to be written.

OFFICIAL PAPER

Credit Control Incomplete

Trend and Progress of Banking in India 1964, Reserve Bank of India, May 1965; pp 68.

CHANGES in the Reserve Bank's credit control policy appear to follow a time-pattern, with each phase lasting about four years. Selective credit control was introduced in 1956 to combat alleged speculative build up in sensitive sectors. In 1960 the Reserve Bank realised that selective control could be successful only if it was accompanied by general restraint on availability of credit and introduced the quota system of lending to banks. Borrowings from the Reserve Bank were in this case related to the level of a bank's deposits from the public and not to that of its advances. The Bank had the discretionary power to refuse to lend more to a bank if its borrowing exceeded the limit.

The quota system was criticised on the ground that by linking the Reserve Bank's accommodation to the level of a banks' deposits, the principal purpose of credit control — the controlling of banks' advances — was lost sight of. Banks require such accommodation to replenish funds lent out and not those invested. Further, quantitative restraints do not allow the cost element to exert its influence as a restraining factor on demand for credit. The inflexibility of the system, it was pointed out, could be modified if the cost factor were allowed wider scope to check demand for Reserve Bank accommodation.

Accent on Cost

In 1964 the Reserve Bank was finally convinced that there was need for the cost of credit "to reflect more closely the relative scarcity of capital in the country so as to ensure a more meaningful employment of the factor endowments in the economy and also to induce a larger formation of savings". Emphasis then shifted from controlling the quantum of Reserve Bank's accommodation to raising the cost of such accommodation. On September 25 when the Bank Rate was raised from 4 to 5 per cent borrowing by banks from the Reserve Bank was related to the banks' liquidity position which was expressed as the ratio of their liquid assets to their aggregate deposits. Banks were allowed to borrow from the Reserve Bank at the Bank Rate as long as their liquidity ratio was 28 per cent or above; for every percentage fall in the ratio below 28 per cent, the rate of interest on the banks' total borrowings from the Reserve Bank increased by ½ per cent. Banks could reduce the liquidity ratio below 28 per cent provided they were prepared to pay the higher interest rate.

The Reserve Bank knows, of course, that the cost is obviously a weak factor in restraining credit in an economy insulated by import and other controls. The prevailing levels of profitability are such as to be able to easily sustain an increase in the cost of bank credit. The Reserve Bank, therefore, introduced a ceiling of 9 per cent on interest chargeable by banks on their lendings. This ensured that banks could not pass on to their clients the higher cost of borrowings from the Reserve Bank when their liquidity ratio sank below 28 per cent. Simultaneously, the Reserve Bank also required banks to increase the rates of interest on fixed and savings deposits to encourage saving.

Between October 1964 and January 1965 bank advances increased by Rs 130 crores and aggregate deposits by Rs 28 crores as against Rs 175 crores and Rs 44 crores, respectively, in the same period a year ago. Borrowings from the Reserve Bank increased during this period by Rs 56 crores compared to Rs 34 crores a year ago. Although the quantum of credit expansion was lower than in the previous busy season, increase in borrowings from the Reserve Bank was much higher. This indicated a strong inflationary build up in the economy.

New Purpose

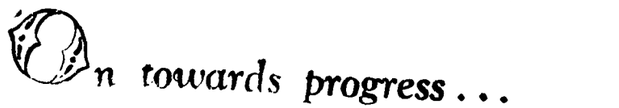
The rise in the Bank Rate in U K in November 1964 had an adverse effect on realisation of export earnings. In spite of increase in the quantum of exports, the difference between the local interest rates and the rates abroad caused delay in receipt of earnings. This happened at a time when increased exports were expected to reduce the pressure on external resources. Normally, in the advanced countries a rise in central bank rates is expected to either stop flow of funds abroad or bring in 'hot' money. In India a rise in Bank Rate became imperative in order to bring in export receipts held abroad to take advantage of interest differentials — and that too in spite of exchange control regulations which require export earnings to be brought into the country within a maximum period of six months unless the Reserve Bank permits otherwise. This was perhaps the first instance of use of the Bank Rate mechanism to bring in export earnings speedily.

The September 1964 measures had little effect on the price front, though, as already pointed out, it kept the increase in bank advances a little lower than in the last busy season. Further deterioration in the price situation and the sharp decline in foreign exchange reserves finally forced the Reserve Bank to raise the Bank Rate to 6 per cent on February 17, 1965. The effect of this increase in the cost of Reserve Bank lending was reinforced by a rise of 2 per cent in the minimum liquidity ratio. Banks could now obtain Reserve Bank accommodation at the Bank Rate only if their liquidity ratio was 30 per cent or above instead of 28 per cent as fixed in September 1964. Every one per cent fall below this level raised the cost of accommodation by ½ per cent. The emphasis on the cost element in the control mechanism introduced in September last year thus remained and was further strengthened in February.

No Impact on Bank Credit

To reduce reliance on Reserve Bank accommodation banks were expected to increase their deposits and interest rates on deposits were therefore, raised. The Reserve Bank also raised the ceiling on bank advances from 9 per cent to 10 per cent in view of the 1 per cent rise in the Bank Rate and to cover banks against the rise in deposit rates.

Between February 19 and May 14 bank deposits increased by Rs 74 crores whereas advances increased by Rs 120 crores. To finance such a steep rise in advances, banks increased their borrowings from the R B I by Rs 52 crores as compared to Rs 15



crores in the same period in the previous busy season. These figures do not indicate that the February measure had a restrictive effect on bank advances. They would even appear to emphasise the failure of the new control policy based on the cost of credit. But market reports show that the credit squeeze did take effect in spite of the increase in bank advances. This was due, first, to the dislocation of *hundi* business which was the pipeline through which undisclosed income used to operate and, second, to the brake applied on the deficit financing which effected the money flow.

Textile mills have already raised alarm over accumulation of stocks with them as a result of the trade's reluctance to lift stocks. To some extent trade used to finance its stocks with bank borrowing, but bank advances to trade have been rapidly declining over a number of years and there is no evidence that this decline has been accentuated in recent months because of the credit squeeze. The shortage of funds experienced by the textile trade was due more to the decline in *hundi* business than to contraction of bank advances to this sector. The monetary scarcity felt in the market can scarcely be attributed to the actions of the Reserve Bank in raising the cost of credit.

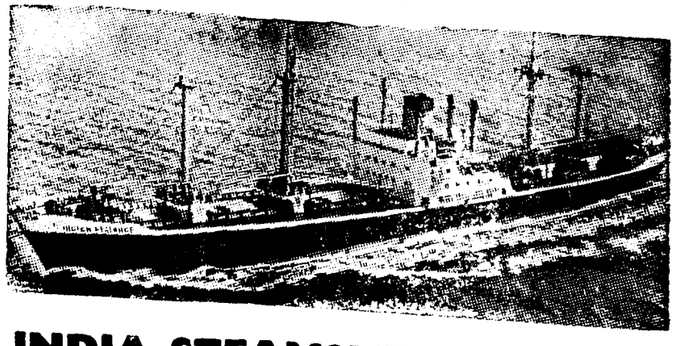
A justification offered by the Reserve Bank for the raising the cost of credit is that cheap credit works against economic management of inventories in industry. But is costly credit the answer to the problem? Supply of imported raw materials being increasingly restricted and local supply unable to meet increasing demand, there is inevitably a scramble to build up stocks. Counsels of economic management of inventories in such circumstances are likely to go unheeded. An increase in cost of credit cannot be expected to significantly affect demand for funds for financing stocks since prospects of profitability generally outweigh cost of credit.

Banks may be able to satisfy the Governor of the Reserve Bank by reducing advances by Rs 200 crores during the slack season as they have done in the past in 1957 and 1959. But this will not ensure that in the next busy season rise in bank advances will not behave in much the same way as it did in the busy season ended. If the sharp rise in cost of credit could not check demand in the 1964-65 busy season, there is no guarantee that it will be able to achieve the objective in the next busy season. Quantitative restrictions on bank credit must be more organically integrated with the concept of cost of credit to evolve a more dynamic credit control policy than the present one has proved to be.

C S

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.



Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Development Of Tribal Areas

A Aiyappan

An attempt is made here to show that the slow, piece-meal effort now made to develop tribal areas will not be effective in bridging the gap in progress between tribal and non-tribal communities.

Instead of frittering away scarce resources on fragmentary and ill-planned programmes, concentrated use of funds for large-scale agro-industrial projects, as suggested over fifteen years ago by the Malayappan Committee in Madras and recently for Orissa tribal areas by the National Council of Applied Economic Research may be more useful and productive of good for the tribes and the nation as a whole. Comparative data from other parts of the world show that the arguments of those who suggest that our tribals may not be able to participate in large-scale projects are baseless.

INDIA has a tribal population of about three crores. In other words, out of every 100 Indians, 6.8 are Adibasis. Few other countries of the world have such a large population of tribesmen. The USSR, China and USA have tribal communities, economically and educationally backward in comparison with the rest of their peoples and speaking languages and practising customs different from those of the majority communities, but in none of these countries are the tribal groups so numerous as in India. There are over two hundred major tribes and more than twice this number of minor tribes distributed in the most inaccessible and wild hill and forest tracts of India. On account of their distinctive ways of life, their general isolation from the currents of our national life and their economic and educational backwardness, these tribes are to be regarded as the weakest of our minorities. While other minorities are nationally organised, vocal and led by effective leaders, the tribal minorities are generally without pressure groups and leaders. (Exception should, of course, be made of tribes that have come under the influence of Christian missions). For this reason, the Adibasis are extremely dependent on the goodwill and sympathy of the majority communities, the Central and State Governments and the welfare agencies. Their future depends very largely on the understanding with which the people at large and the administration approach the tribal question.

In the Political Melting Pot

Some people regard the problem of the Adibasis as one of the many new post-Indepence problems. While it is true that far more attention is now being paid to the Adibasis and the Government is now more concerned about their welfare, the British Indian Government were also interested in giving some measure of special protection to the tribal people. In areas where there is a large concentration of tribal population, there were simplified types of administration and there were special laws to protect the tribesmen from exploitation. This policy of the British was one of insulation; it was also a half-hearted policy which was first discussed in the open at the time of the Round Table Conference (1934). There are now no special areas and no question of simplified administration except in NEFA. Politically all the tribes have been brought under the general administration to sink or swim with the rest. Except reservation of a few seats in the legislatures and reservation of a certain percentage of Government jobs, and scholarships for students there are no special privileges given to them. Politically and administratively, the tribes are now little insulated; they have been more or less thrown into the melting pot of national politics.

The Government of India, however, has been keenly aware of the need to protect the tribes from exploitation and of the need for giving special grants for the development of tribal areas. Briefly we might say the present Government's policy is one of gradual integration without radically altering their traditional ways.

In furtherance of the Government's policy of bringing the tribal areas from their present backwardness to the general level of development reached by the progressive areas there is the programme of intensive development in the Tribal Development Blocks for which the Government of India is committed to give special grants.

Widening Gap

The objective of bridging the gap between the tribes and the rest of the population is not possible of achievement at the present slow rate of development. The gap, instead of closing, tends to grow wider and in the handicap race the tribes will be left further behind. My suggestion, therefore, is that we have to anticipate the Fourth or Fifth Five Year Plan developments in agriculture and rural industrialization, and make an earlier beginning of these developments in the tribal areas and thus give them an earlier start.

The National Council of Applied Economic Research has made a suggestion in its Techno-Economic Survey of Orissa that agricultural estates should be started in the predominantly tribal areas of that State where land is available in sufficiently large blocks. The Andhra Government also have their plan for a Rs 10 crore coffee plantation in the Aruku Valley Mechanised farms of the type started with Russian aid in Rajasthan are also worth considering.

I have had informal discussions with the Additional Development Commissioner, Orissa, on the practicability of Agricultural Estates in Koraput district. Since climate, etc, there are not different from those of the Aruku valley where coffee growing experiments have been successful, coffee estates are agriculturally feasible. The Additional Development Commissioner suggested that cash crops such as cashew and potato, rice, and tobacco at the lower levels of the hill slopes and valley can be tried in addition, so that instead of coffee alone we may plan multi-crop agricultural estates. Ways will have to be devised to involve the tribal communities in these large-scale agricultural schemes not merely as labourers, but as partners who, in due course, will run the whole business themselves.

The tribesmen of the western and southern districts of Orissa now grow a number of commercial crops. But they suffer because of exploitation by middle-men, lack of capital, and lack

of knowledge of modern ways of increasing output. They have neither credit nor marketing organisations. The middle men advance credit and buy or rather capture the produce at prices fixed by them.

Both the Elwin Committee on tribal blocks and the Dhebar Commission have made recommendations about the urgent need for credit and marketing corporations to help the tribals. With their primitive methods of production the proposed credit facilities and marketing organizations by themselves will be of little use. Will they get enough from their little holdings to meet the needs of a fuller life? Hence it is essential that plans for modernised agricultural development, that is, agriculture as an industry should be considered for the tribals areas, and this should be done earlier than elsewhere for the reasons already stated.

Unfavourable Stereotypes

When I first made this suggestion in the course of a brief personal discussion with U N Dhebar, he told me that in the new steel towns and in Tatanagar, the Adibasis are engaged only for the most unskilled types of works as they are not considered fit to handle more complicated jobs. This is a case of giving the unwanted underdog a bad name and hanging it. The recruiting agencies in all these places have not given the Adibasis a chance. I am told there is a Santhal who is now working as a University Professor. That means he was given a chance to prepare himself for such a career. Adibasis work in the Accountant General's Office in Orissa. There are Adivasis in the Indian Administrative Services who are as good as any other government employees. Is not the translation of a tribal youth from his rural home to offices in the State capitals a sudden change? Are they not adapting themselves to the new situation? If the Government were not generous to them and if they had not been given the chance, unsympathetic critics would have continued to say that the Adibasis are unfit for high Government jobs. Several Konds are employed as skilled workers in the Rayagada Sugar Factory, Oraons and Mundas as machine men in the Bonai iron ore quarries and in the Cement Factory at Rajgangpur in Sundergarh district. The Adibasis in Tatanagar, etc have not been given a chance under fair and sympathetic conditions.

In other parts of the world, aboriginal peoples have in recent years undergone rapid transformation from very primitive conditions. Backward Papuans in New Guinea area, far more backward, primitive and isolated than any of our tribes have, during the last two decades made tremendous progress. Prof Firth of the London School of Economics mentions of a particular Papuan Co-operative society which owns a small ship to import and export goods. Then are Polynesian tribal estate owners and ship owners. If these primitive populations can make good progress, our Adibasis, too, can do likewise, but they should be given the chance, inital help and encouragement.

The old belief that simpler folk cannot make rapid adjustments to change is found to be only partially correct. Many are the cases we know of tribes whom contacts and changes ruined but the circumstances of each case would show that it was not change as such that created disorganisation but the failure to re-organise. In her restudy of the Manus people (north of New Guinea) Margaret Mead* has shown how under the dynamic leadership of Paliau, a community of about 4,000 people who lived a generation back at the stone age level gave up its old ways of life and modernised itself on the western patterns acquired by contact with American forces stationed in the area during World War II. Their housing pattern, family pattern, sex relationship and local government were all changed radically in the course of 25 years.

In India itself, the transformation by Christian missionaries of the ways of life of minority communities such as the Khasis, Garos and Nagas did not take long. The changes have been quick and since the cultural traits taken over included English language, Christianity and several western values, the transformation meant also modernization. Individuals as well as groups can and do change without deleterious effects. Both psychological and sociological theories have been veering to this point of view.

In the course of a dozen years, a serf population of Peruvian Indians, living under miserable condition were transformed to a modern community, so progressive as to serve as a model for the whole of Peru. These Vicosinos were able to change and make adjustments because the programmes were goal-directed and guided, deliberately choosen and planned. The scientific resources of Professor Allan Holmberg and his team, and the co-operative spirit of the Peruvian and American technicians and careful organisation did the job in spite of initial doubts and suspicions.

Contribution of Agriculture to Industrialisation

A Study of the USSR and Japan

K Sarwar Lateef

Many Western economists are of the opinion that the Japanese experience "clearly offsets the commonly held view that not much can be done to increase agricultural productivity without vast institutional changes in the countryside". On the other hand, they see the Soviet experiment in collectivization as a failure both in terms of the high human costs and in the slow increase in agricultural productivity in the early years of collectivization. They therefore argue that if countries like India are to achieve their economic aspirations, they will be "well advised to reject the Soviet model, instead atlast giving the alternative Japanese model the attention it deserves".

What is very often forgotten in such discussions is the crucial historical and institutional factors that made possible the success of agriculture in Meiji Japan. The institutional and historical factors in the USSR after the 1917 revolution were not conducive to increased agricultural productivity without institutional change, and when the Soviets collectivized, it was because they had little choice if they were to secure the marketable surplus for development.

The writer believes that only a similar detailed comparative study of the institutional factors prevailing in Meiji Japan and in present day India would reveal whether in fact the Japanese experience has any relevance to India.

[The author is grateful to C H Feinstein of Clare College, Cambridge, for his invaluables comments.]

THE main purpose of comparing the role of agriculture in the economic development of two countries as different as Soviet Russia and Japan is the hope that by doing so we manage to shed some light on the peculiar features in each country's development. More specifically, in this paper, I intend to bring out the reasons why Soviet Russia had to reorganize agriculture drastically in order that it could play a significant role in the USSR's industrialization, while Japan was able to achieve vast increases in agricultural produce in the early Meiji years without any major structural changes in its agriculture.

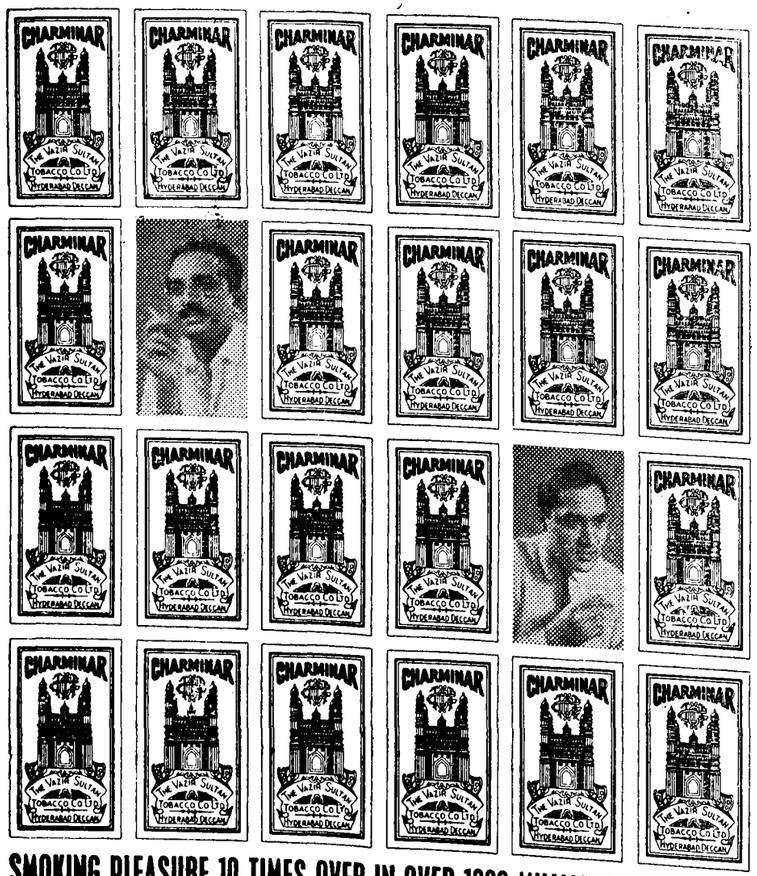
The paper is divided into two sections. In the first, I will examine separately the contribution of Japanese agriculture to that country's industrialization in the period 1868 to 1914, and that of Russian agriculture to the industrialization of the USSR in the period 1917 to 1952. In the second section, I propose to bring out some of the crucial factors that were responsible for the success of Japanese agriculture and examine to what extent these factors were present in Soviet Russia in the years before collectivization, and whether their absence made collectivization inevitable.

I

Japan 1868-1914

Meiji Land Reform made all land freely cultivable in 1871 and freely transferable in 1872. Land titles were issued to all occupants. Thus began an era of small scale predominantly tenant farming (though there existed some peasant farming as well). Its contribution to economic development can be measured in two ways:

(i) Product Contribution



Net output increased steadily between 1878 and 1917 at 2.3 per cent per annum. Most of the increase in output was due to increased productivity. Land productivity, according to calculations made by Rosovsky and Ohkawa [1] increased by 80 per cent, labour productivity by 2 per cent per annum and area under cultivation by 35 per cent. This increase in output was large enough to meet the growing urban demand, as also the demand arising from increasing real incomes. Demand for food, it is calculated, was then increasing by about 2 per cent per annum. This equation of demand and supply was reflected in the steady terms of trade between industry and agriculture during this period. Thus the advance in agriculture permitted industrialization without significant inflationary pressures (though Japan suffered inflationary bouts due to heavy defence spending). The increased output and improved quality of commercial products also provided the foreign exchange to import capital goods.

(ii) *Factor contribution*

(a) LABOUR: In the early phases of industrialization a substantial portion of urban work force was of rural origin. In 1878-82, 76 per cent of the labour force was engaged in agriculture. In 1913-17, only 59 per cent were so engaged. But this transfer was made possible because of the rapidly rising population (44 per cent between 1881-90 and 1911-20) which enabled the increase in rural population to be shifted from agriculture to urban areas. Hence there was only a very slight decline in the rural population in this period.

(b) CAPITAL. Perhaps this was agriculture's most important contribution. Rosovsky and Ohkawa point out that since between 1887 and 1913, the economy was growing at 3.5 per cent per annum, and since they work out the capital output ratio to be 3 or 4, the rate of savings must have been about 10 — 14 per cent of the National Income. Agriculture during this period was showing an output increase of 2.3 per cent per annum. Given the low capital output ratio for Japanese agriculture, savings in agriculture (10.3 per cent) exceeded the investment required. Only 25-30 per cent of agricultural savings were invested in agriculture. The surplus was siphoned off to the non-agricultural sector. With rising agricultural productivity, the landlords were able to maintain high rents in kind. They in turn were forced to pay the new Meiji land tax (3 per cent of land value or 1/3rd produce) in cash. This was as severe as the old Tokugawa tithes. Agriculture contributed 86 per cent of total government revenues in 1888-92. Table 1 illustrates the revenue contribution of agriculture.

Until 1913-17, land tax was the most important source of revenue in both absolute and relative terms. Agriculture continued to be the most heavily taxed sector though the relative decline in its share of the rapidly rising National Income reduced its

SMOKING PLEASURE 10 TIMES OVER IN OVER 1000 MILLION PACKS A YEAR

Or, nearly 900 million Charminars are smoked every month! Or, one in every four cigarettes sold is a Charminar! Certainly, Charminar is India's most popular cigarette. What's Charminar got that others haven't? *Rich* flavour, *unique* taste...that comes from special ingredients and processes at The Vazir Sultan Tobacco Company Limited.

Experts start with the finest tobaccos—developed exclusively for Charminar. These are specially cured, *triple-matured* and skilfully blended. Next, an *extra process*, special to Charminar. Then automatic machines take over, produce millions of Charminar cigarettes at South-East Asia's largest cigarette factory. What does it all add up to? Why, the finest smoking pleasure for you ...in over 1000 million packs a year!

There's nothing like Charminar—India's greatest cigarette!

absolute contribution. Table 2 shows the heavy burden on agriculture.

Thus agriculture contributed heavily to the State's revenues, which were then used to finance social overhead capital, industry and defence. While defence expenditure was important, in the period 1892-1901 (which seems fairly representative), the government's share in gross domestic fixed capital formation was about 55.9 per cent and if you exclude defence investments, the government's share was 42.7 per cent.

(c) ENTREPRENEURS: Landlords invested in village and urban industry, and their sons were an important source of entrepreneurial talent, in Japanese industry.

The year 1918 proved the turning point in Japanese agriculture. The industrial spurt of World War I meant rapidly rising productivity in industry, and so the fast increasing population could no longer be absorbed in the non-agricultural sector, worsening the Man/Land ratio. Agricultural productivity declined as more resources were attracted to industry, and it was proving difficult to make further gains within the existing production function. Imports from Japanese colonies to meet rising demand for food adversely affected agricultural prices in bumper crop years. The share of agriculture in National Income declined sharply from 64 per cent in 1878-82 to 36 per cent in 1913-17, to a mere 17 per cent in 1938-42. Agriculture had played its crucial role and now found itself relegated to the position of a subsidised sector.

USSR 1917-1952

The land reforms of 1903-06 proposed to abolish land redemption payments and replace the traditional communal village ("mir") by a system of consolidated individually owned farms. This policy was inadequately implemented, and when put through it benefitted the richer areas, and meant small uneconomic farming in the overpopulated areas. The Russian government tried to subsidize migration from the poorer areas to Siberia ...but all this was too little, too late. The peasants supported the Bolshevik revolution in 1917. The Bolsheviks nationalized all land and broke up the big estates. In the period of chaos that followed, the peasants not awaiting official action seized the big estates and divided it between themselves. Workers migrated from urban areas, and soldiers left the army in the mad scramble for land. The proportion of peasant holdings in total cultivated land rose from about 70 per cent to 96 per cent. At first it meant a vast increase in the number of small uneconomic holdings. A bad harvest, the famine of 1921-22, the abolition of a free market and compulsory requisitioning all but dried up marketed surplus, and reduced acreage under cultivation. The regime retreated to the New Economic Policy—a free market and a not too severe grain tax. The government started State farms and collectives but on the eve of the First Plan, they supplied less than 2 per cent of the total grain crop, and covered less than 1 per cent of the cultivated area. Government policies to encourage better farming were half-hearted and not successful (we shall see why in Section II). By 1925-26 total agricultural area was about 95 per cent of the pre-war level, while marketed surplus was only about 70 per cent of the pre-war level. Only about 13 per cent of food-grains yield was being sent to the market. Grain exports fell drastically in order that industrial workers be fed. Industrialisation on the other hand was seriously handicapped by the fall in capital imports. In 1927-28, inspite of a good harvest, marketed surplus was negligible. Hasty government action to restore it (State trading, punishment for speculation) led to a further fall in supply, 12 million poods had to be imported. The main reason was the worsening of the terms of trade against agriculture as a result of the Scissors Crises of 1923-24, which had left its scars...and the shortage of industrial goods in 1928 brought the situation to a head. The original first plan aims of collectivising of 18 per cent of the cultivable land were thrown overboard, and full scale collectivisation was pursued.

Thus between 1917 and 1929, Russian agriculture was more a hinderance than a help to the industrialisation of the USSR. It consistently failed to supply a marketed surplus, and marketed output varied with the weather, kulak speculation and the terms of trade. Collectivisation was designed explicitly for the collection of marketable surplus amidst contracting output, an appalling shortage of consumer's goods and mass starvation. Following our treatment of Japanese agriculture, we will again assess the product contribution and factor contribution of Soviet agriculture to the USSR's industrialisation in the years of socialised agriculture.

Product Contribution

In order to understand the relationship between reorganisation of Soviet agriculture and the increased marketed surplus as a result of it, we must first examine the collective farm. Each kolkhoz's* goal was to maximise a particular product mix of the marketed output. The output of each kolkhoz was distributed according to the following priority:

(1) Government: (a) Compulsory deductions in money and kind.
(b) Fees for Machine Tractor Stations**
(c) Direct, indirect taxes.

(2) Kolkhoz's: (a) Compulsory funds, (reinvestment, staff payments etc.)
(b) Reserves.

(3) Kolkhoz-niki's: Residual after (1) and (2) have been met. Plus an individual plot of land for each family.

* Bumper year

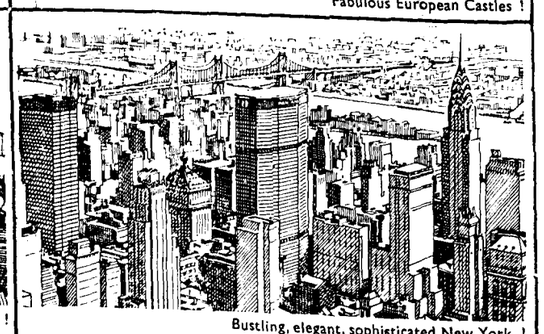
Don't say a 'ROUND THE WORLD TRIP is only for "somebody else"



Charming San Francisco !

Fabulous European Castles !

See historic London !

Bustling, elegant, sophisticated New York !

Most people think a 'Round-the-World trip costs a king's ransom. On Pan Am it doesn't.

A 'Round-the-World trip need not be just a dream ! A Pan Am 'Round-the-World economy class ticket costs *less* than the return first class fare from Bombay to New York

What does a Pan Am 'Round-the-World trip include ? Up to 20 U.S. cities...major cities in Europe...the Middle East...the Orient. You enjoy stopovers almost anywhere. You'll find more places to see, more things to do. And everywhere you travel, you enjoy the good feeling knowing you're flying with the very best there is.

For reservations, call your Pan Am Travel Agent or Pan Am in :

Bombay : Taj Mahal Hotel, Tel : 211063-64

Thus marketed surplus was collected *independent* of the terms of trade between industry and agriculture, (these being determined by the price paid by the State for produce). The size of delivery quotas was determined independently of output so a fall in output was borne by a cut in farmer's home consumption, as Table 3 shows clearly. Inspite of a drop of 20 million tons in output between 1937 and 1938, deliveries to the State dropped by a mere 2.4 m tons, and in 1939 when output rose over 1938's by a bare quarter of a million tons, marketed output increased to a mere .7 m tons less than the bumper '37 deliveries to the State. Thus the State's grain procurement was unaffected by the level of output, while peasant consumption suffered as a consequence. Collectivisation was enforced rapidly, and by mid-1936 only 1.8 per cent of peasants were not collectivised.

Marketable output of grain increased threefold between 1928 and 1961. But marketable output of livestock did not show impressive results. As a result of collectivisation, kulaks slaughtered their livestock, and this was a severe setback. [See Appendix Table (i)]. Urban per capita consumption declined in the early years as Table 4 shows.

Since newly recruited industrial workers formed a significant proportion of total industrial workers in 1937, their consumption in the urban areas was not much lower than their previous rural consumption levels. Also, it is wrong to judge collectivization solely in terms of livestock output. It is reasonable to believe that the increase in marketed grain output was sufficient to maintain urban living standards and finance vast capital imports for the first two plans.

As for gross agricultural output, it did not rise above the precollectivization year of 1928 for all years (except 1937) between 1929 and 1953. But we must remember that this was very largely due to the poor performance of livestock. Crop output seems to have increased steadily, though not spectacularly. Table (ii) shows a comparison of official statistics with those computed by Johnson for the years 1913-1940.[2]

Factor Contribution

(a) LABOUR: Collectivization made possible more organized forms of rural recruitment; the ORGANIZOVANNYI NABOR which organized rural recruitment recruited 28.7 million peasants between 1931 and 1940. Individual factories made their requirements known to this body, and it directed suitable people which wished to migrate to these factories. In order to ensure that supply did not exceed demand, the Tsarist passport system was restored to prevent peasants from leaving collectives, and a system of contracts was devised between the organized recruitment set up and the kolkhoz. Thus the release of labour was no longer solely dependant on the relative income levels in the two sectors. Between 1926 and 1939 migration from rural areas was 18.7m and 24.6m between 1939 and 1959. Thus out of a *net* increase of 73 million in urban population (taking into account war losses) 43.3 million had migrated from the rural areas. With a declining birth rate in rural areas, the natural population increase was absorbed into the towns.

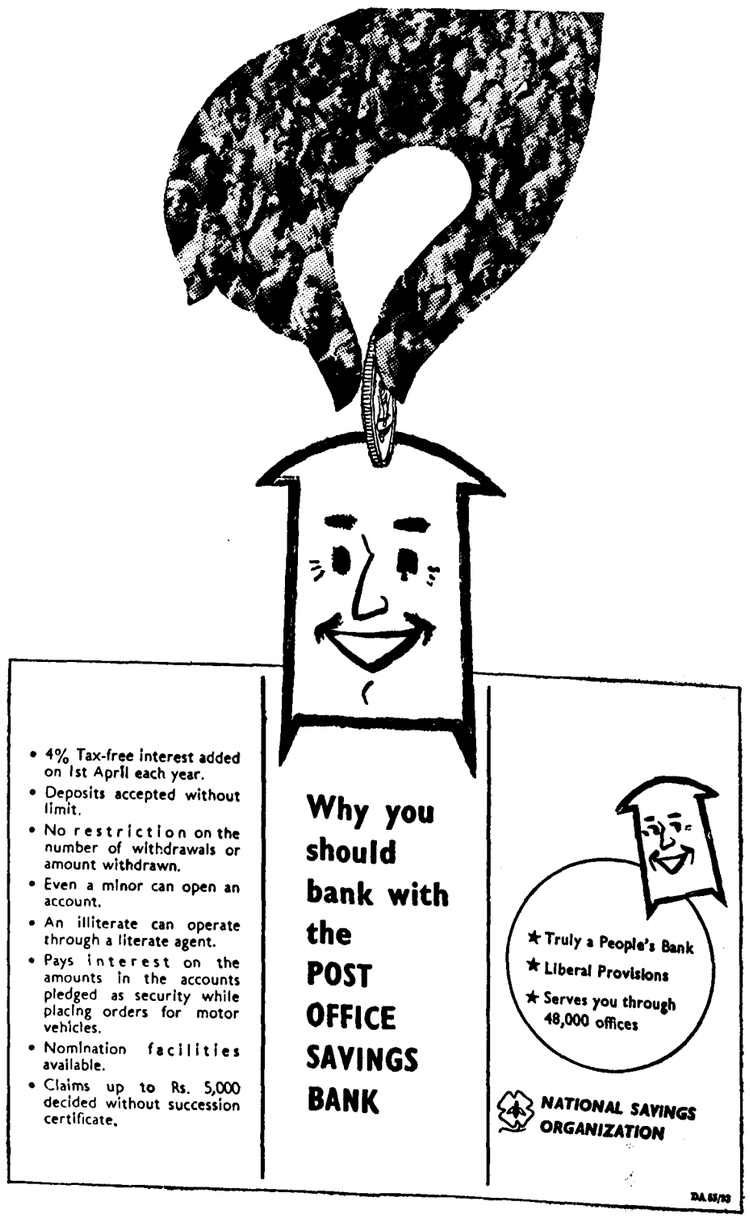
An equally important contribution of labour was the training of rural workers for the handling of tractors. Some 3 million were trained between 1930 and 1939, but only 1 million remained in agriculture. Those who stayed helped substitute mechanical for animal power and thus the diversion of grain from animal to human consumption and for exports. Collective farm workers also contributed to the construction of social overhead capital, building roads, railways, as well as irrigation schemes like the Fergana irrigation canal in Uzbekistan where 165,000 kolkhozniki were mobilized.

(b) SAVINGS: Agriculture was taxed in three ways. Firstly, by setting high delivery quotas independent of output, hence reducing consumption by kolkhozniki. Secondly, by paying low prices for agricultural procurements. And finally, by setting high prices for industrial goods supplied to agriculture. Thus the demand for manufactured goods by the agriculture sector fell heavily, enabling (1) a cut in consumption goods investment, and a concentration of resources on capital goods; and (2) a diversion of consumer goods to urban areas to compensate partly for the decrease in per capita food consumption.

(c) ENTREPRENEURS : Agriculture does not seem to have provided entrepreneurial talent for industry in the Soviet Union. In fact there is evidence of the opposite trend. With the dearth of rural communists and/or trusted leaders, and the difficulty in persuading any kolkhozniki to accept responsibility, the government imported 250,000 industrial workers between 1928-38 to man kolkhoz as Chairman and senior staff. These people were completely alien to village life, and were mainly interested in meeting the State quota requirements. In the early '40s the situation had improved and 76 per cent of the chairmen had been reared in the kolkhozy.

It is often argued that the results of collectivization were (are) unimpressive, that the increase in grain output was brought about by increased acreage (some 46m hectares between 1928 and 1952), the substitution of mechanical for animal power enabling a diversion of grain for human consumption (the reduction in feed for power animals amounted to 40m tons between 1928 and 1959), the sharp drop in milk, meat and egg production during the early years also diverted grain from livestock feed to human consumption and finally that with the exception of cotton, crop yields increased only modernately between 1925-29 and 1950-54. [See Table (iii) in Appendix.] However it is clear that collectivization performed effectively its first and most important function : it provided the needed marketed surplus for industrialization.

II



What were the factors that made it possible for Japan to expand her agricultural output without embarking on any structural reorganization of agriculture? There may be many factors which we as economists are not competent to take into account: climate, soil conditions, terrain. We know from Jasny that in the USSR collectivization was initially uneven. In mountainous South Caucasia with its non-Slavic population, by 1934 only 44.7 per cent of the peasant households were collectivized, while in the level areas of European Russia, 80 per cent of peasant households had been collectivized by that date. Maybe the terraced cultivations of Japan did not lend themselves to any reorganization. But to a people

Table 2 : Ratio of Direct Tax to Income Produced

(Percentage)

Year	Agricultural Sector	Non-Agricultural Sector
1883-87	*22.1*	*37.0*
1913-17	*12.9*	*4.5*
1933-37	*7.8*	*4.2*

Source : Rosovsky and Okhawa.

as pragmatic as the Japanese, reorganization would appear wholly unnecessary if the "existing set up" was delivering the goods. Maybe even in the USSR, collectivization might have been delayed had the "smytchka", peasant worker alliance, not broken down so completely. Why did Japanese agriculture deliver the goods in the early Meiji era while Soviet agriculture failed in the years preceding collectivization? There seem to me four main institutional factors:

Sense of Community

It is wrong to think of Japanese agriculture suddenly waking up in the 1860's. The Tokugawa period saw significant changes. Firstly there was a shift from cooperative to individual farming. Though all land belonged to the village lord, there existed peasant proprietors who gave him 50 per cent of the rice yield plus labour services, and tenant farmers. Secondly, the growth of markets in castle towns induced technical change: use of fertilizers, triple crops, new planting methods. With stagnant population, and high labour requirements, labour wages were high, discouraging large scale farming, and resulting in intricate garden like plots. The Meiji Restoration removed some of the disincentives to farming but attempted to increase production and productivity within the traditional pattern of rural organization.

Russian agriculture before 1917 shows few signs of the kind of *steady* progress made in Japan. There is evidence of considerable peasant discontent. Any sense of continuity that might have been was broken by the chaos that followed the revolution. Peasants seized the big estates and divided them up between themselves. Animals and equipment was destroyed. There was no material or political incentive to produce more and little guidance from the State. For a long time no one knew how permanent the revolution was, and this did not encourage stability in the rural areas. Thus the instability and uncertainty caused by the Revolution itself prevented the Soviets from trying to increase agricultural output within the 'traditional pattern'. There is some doubt as to whether any 'traditional pattern' existed in 1918.

Landlords

Landlords in Meiji Japan were a force for progress. This was partly because peasants lived in small, tightly packed hamlets with a great deal of community solidarity, collective legal responsibility for tax payments etc. Such communities were traditionally inclined to accept paternalistic leadership. In 1881, there was a Congress of Old Farmers in Tokyo, where the village leaders (mostly landlords) met to set up a National Agricultural Association which they would represent in their villages. The model village resembled closely a modern Chinese commune, with a communal hospital and a restaurant in the busy seasons, and many cooperative activities run by the village leaders. The landlords introduced better methods, inspected crops, made social distinctions between efficient and inefficient tenants. Most landlords were themselves cultivators. They were as much concerned with raising the standards of their own tenants as fulfilling a "paternalistic duty towards their fellow villagers". In bad harvests rents were always lowered. Rents in kind helped landlord's own incentives.

Meiji land reforms meant that the smaller peasants, unable to bear the burden of the extremely heavy cash tax payments, sold out to landlords and became tenants. Ex-samurai who were given unreclaimed land to cultivate, tried and gave up large scale capitalist farming because of high wage costs, and the relative efficiency of family labour, and turned to landlordism, renting out the land, and introducing a new dynamism into the countryside. Thus there was virtually no rural proletariat.

The USSR, on the other hand, provides a story of centuries of exploitation of the peasants by the nobles and landlords. "There were no good landlords" said one villager, and they seized all the lands. Yet they were *insecure in their new holdings* because they feared the return of the landlords in flesh (with the white armies) and in spirit. Maynard talks of: "a certain Count Stroganov who had had a terrible reputation in his lifetime for his treatment of offenders against his rights. The local peasants left all the land on one side of the river untouched, lest the Count should return from the grave and flay the trespassers".[3]

The Roman tradition of the rich helping the poor and the poor loving the rich was not highly developed in Russia. When the land was being redistributed, the big landowners bribed the surveyors and managed to get most of the land. And the saying in Russian goes: "Do not fight with the strong, nor go to law with the rich" This was still true in the early days of Bolshevik Russia. The kulaks (rich peasant) soon replaced the landlords as rural dictators. The Soviets were faced with the dilemma of having to give incentives to the kulaks in order to persuade them to release the marketable surplus and yet having to retain the support of the poor peasantry for the eventual socialization of agriculture. Unlike Japan, the Soviets could not rely on the kulaks to spread better methods. The better methods were identified with mechanization and large scale farming, and so the very poor peasants, like in Japan sold out to the rich, but unlike Japan, joined the growing rural proletariat.

In Japan, the call for nationalism found a response in the landlords, and through them the peasantry. The rich Russian peasants having derived all the benefits they could from their own social revolution, had no clear conscious or practical link with the proletarian revolution. This basic alienation was also felt by the poor peasantry.

City-Village Conflict

This brings us to yet another phenomena in Japan: the absence of any conflict between rural and urban areas. Japanese society in the Tokugawa period was highly centralized. The

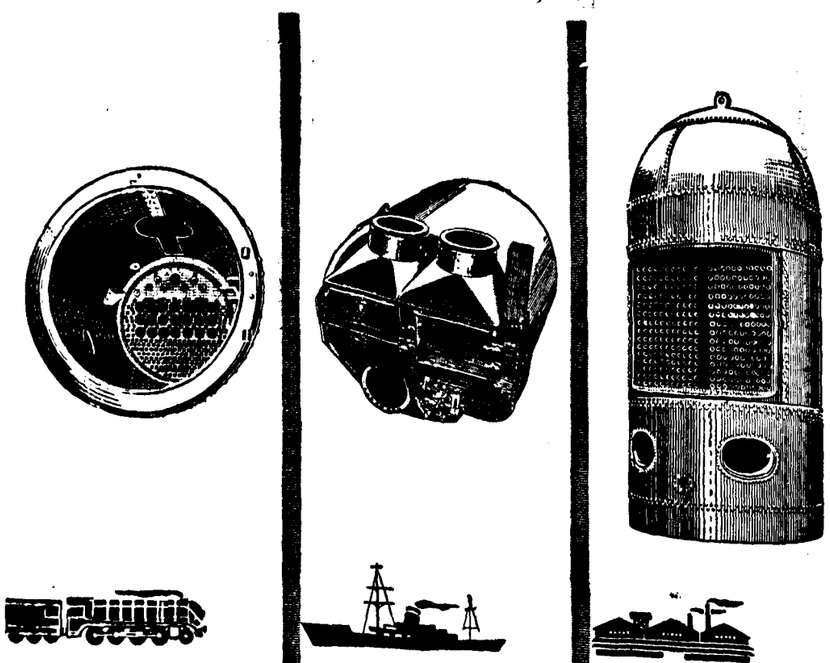


Table 3: Distribution of Collective Farm Grain Crops 1937-39

Item	1937	1938	1939
(1) Total Output (m tons)	87.02	67.09	67.35

E.R.W. BOILER TUBES

For trouble-free steam raising in all applications calling for rigid specifications, Electric Resistance Weld tubes are in every respect equal to corresponding seamless tubes. High frequency current ensures efficient welding, and normalising is carried out in controlled atmosphere furnaces to produce a ductile tube with a smooth, blue finish.

LOCO

We supply E.R.W. loco boiler and superheater tubes from our Jamshedpur Works to meet the bulk of the Indian Railway's demand. These tubes meet all the technical requirements of Indian Railways.

MARINE

Our E.R.W. tubes meet all the tests specified by Lloyd's Register of Shipping. Indian Tube is on Lloyd's Register of Shipping's list of approved manufacturers.

LAND

Our E.R.W. tubes for land boilers are accepted by the D. G. S. & D. and comply with the Indian Boiler Regulations. We also carry ready stocks of this category at our Warehouses.

INDIAN TUBE THE INDIAN TUBE COMPANY LIMITED

cities with highly advanced administrations were centres of fiscal and social administration and market towns for the surrounding countryside. They therefore became excellent intermediaries between rural areas and central policy. So technical change taking place in different parts of the country was communicated through Tokyo to the cities, and to their surrounding rural areas. So taxation was made easier. Because of the absence of significant industrialization, the conflict between towns and villages was negligible.

The Soviet Union is a very large country, and so does not lend itself easily to centralization. Thus communications between many villages and the cities were weak, and a large part of the USSR was, (and some still is[4]) remote. Thus under the existing system there was no quick way of spreading better farming. Collective farming got over many of these problems, because by definition it was a highly centralized operation with each kolkhoz chairman intimately connected with the Party and State organs. The proletarian revolution had also accentuated the city-village conflict. There was little understanding of village problems, and the peasant was considered as if he belonged to another species. Hence Stalin argued :

> "The great importance of collective farms lies in the fact that they are the basis for introducing machinery and tractors, for transforming the peasant, for transforming his psychology in the spirit of proletarian Socialism".[5].

A consequence of this Japanese phenomena of an absence of city-village conflict and also the long period of isolation as a result of Tokugawa policy, was the growth of village crafts in Japan to such a high stage of perfection that when manufactured consumer goods came on the market, they made little inroads into the traditional consumption patterns. This traditional labour using consumption continued to rise and absorbed increases in real income in the Meiji era.[6] Thus manufactured consumer goods were not required to compete with capital goods for scarce capital. Hence the tasks of industrialization were easier.

In Russia, on the other hand, most of the peasantry came under a subsistence economy. The rising real incomes in the period 1917-28 were felt mainly by the kulaks who had already developed an appetite for manufactured consumer goods. The demonstration effect had eroded its way into the countryside. Thus in 1928, the shortage of industrial goods on the peasant market when peasant earnings had increased resulted in the peasants cutting grain deliveries. If the peasant was to be lured into increasing marketed output, consumer goods production would have to rise, at the expense of capital goods. Collectivization by making the peasant "sell without purchasing" enabled cut in consumption goods industries investment and a concentration on capital goods. Thus while the USSR cut rural consumption of manufactured goods and agricultural goods to tap savings for investment, the Japanese did not need to cut manufactured goods consumption, and with rising productivity in agriculture, they only needed to prevent an increase in food consumption.

Role of State

The State played a dynamic role in the development of Japanese agriculture in the Meiji era. It set up a new Ministry of Agriculture and Commerce. It taxed agriculture for economic development, pursued land reclamation, export promotion and improvement of agricultural production. It sent students to the West, tried and rejected Western methods, and in the process evolved new methods, suited to Japanese conditions. It used exhibitions, national prize shows and experimental stations to diffuse widely best practices of particular regions. It set up agricultural schools and colleges, and the graduates went into local village and district governments. It set up credit societies, published bulletins for farmers, and set up local agricultural associations. Yet in 1890, total expenditure of the Ministry of Agriculture was only 1m yen (1/30th of the Ministry of Finances total outlay, and 5/8ths of this was for the Administration of the National Forests). Success at so little expenses was due to several factors.

(a) it speaks volumes for the efficiency of the Ministry;

(b) it was partly due to key intermediate role of district governments which adapted national plants to local conditions, redistributed tools, livestock, etc;

(c) there was no distrust of government as in Russia. According to Japanese tradition, "the official is noble, the people base";

(d) it was possible to appeal to nationalism, but sometimes compulsory regulations were issued to improve productivity. For instance during the Russo-Japanese war, farmers were told that rice seedbeds should be oblong in shape and 4′ wide and penal provisions were prescribed for infringement.

Thus the quality of the Japanese response to the State's plans more than ensured their success.

In the Soviet Union, immediately after the Revolution, the main purpose of Lenin's policy was to neutralize the peasants, and prevent them from going over to the counter-revolution. As Lenin said :

> "Ten to twenty years of proper relations with the peasantry, and victory on a world wide scale is assured, otherwise twenty to forty years of torture, of white guard torture."

Alas, this policy meant a tightrope walk between avoiding peasant opposition and securing peasant produce. The peasants were allowed to seize the estates and divide it up between them. At the time it suited the Revolution :

> Let them do it," said Lenin "if the lands are seized the banks will be ruined, (loss of mortgage money) if stock is taken over, the power of capital will be broken. With the control of the proletariat at the centre, the rest will follow of itself. The point is the transfer of political power to the proletariat.".

Did the Bolsheviks have a ready agrarian programme to fit this peasant

revolution? Some say yes. Some kind of master plan is seen which ensured that the leadership of the revolution should rest with the proletariat, and that the revolution should be carried into the countryside in two stages: Stage One, where peasants are detached from the upper class and urban bourgeoisie, and given enough rope to divide the land between them and reduce the mass of the peasantry into a state of helpless independence; at which point Stage Two comes into operation whereby the mass of peasants are pitted against the rural petty bourgeoisie, and collectivization becomes inevitable. We cannot entirely discard this view. We cannot deny the Revolution's ideological commitments to collectivization, and this view helps us contrast the absence of any ideology in the Japanese picture. But there is considerable evidence that Stalin and others had decided on the slower course: "riding towards socialism on a peasant nag". Hence Stalin's frequent declarations about the "predominant role of individual farming for many years" and his condemnation of "dekulakization." The bulk of reorganization was to take place *after* and not simultaneously with the cycle of intensive industrial expansion. Hence the campaign for "smytchka through metal" rather than "smytchka through textiles". What caused the volte face:

(1) The state's tightrope walk involved a love-hate relationship with the peasantry which caused considerable fluctuations in marketed output, and once the Bolsheviks felt threatened by war from the "imperialist interventionists", this uncertainty had to be eliminated.

(2) There was a basic contradiction between a state relying on capitalist farming to deliver the goods, and the proletarian dictatorship opposed to any form of capitalism. This meant, firstly, that the Japanese solution of intensification of inputs in order to increase agricultural productivity was not open to the Soviet because of the absence of a close working relationship with the peasantry which would permit such a course. Increasing marketable surplus therefore meant large scale farming through some kind of enclosure movement. As Kondratiev pointed out: "If you want a higher rate of accumulation-then the stronger elements of the village must be allowed to exploit (the weaker)" — landless labourers. This was not only objectionable on ideological grounds, but was rejected because it might upset the political balance in favour of the kulaks. Secondly, to accept indefinitely a policy of gradualism would have seriously demoralized the party and poured cold water on its revolutionary fervour, thus weakening the regime.

(3) Finally, in 1928, with marketed surplus down to near zero ("the sabotage of grain collections by the kulaks" — Stalin) as a result of the famine of industrial goods. The choice had to be made between the two mutually inconsistent targets of the 1st Plan: doubling fixed capital and increasing consumer goods by 40 per cent. The Soviets had *either* to postpone collectivization, thus reducing the pressure on capital goods industry, and achieving the consumer goods target, thus persuading the peasants to sell more; *or* to push through full scale collectivization abandoning the consumer goods target, and imposing the required volume of savings to achieve the planned capital goods target. Under the circumstances, and despite kulak resistance, they chose collectivization. They thus succeeded in pulling the plan over the hump, and meeting party demands for socialization of agriculture. Success was made possible largely by stretching the use of decrepit equipment in agriculture, so that the capital goods industry could achieve target production without having to supply the kolkhozes with capital corresponding to their size.

Conclusion

In the years 1917 to 1928, Soviet agriculture failed to provide the marketed surplus required for industrialization. Among other reasons, this was largely due to the absence of the favourable institutional factors that explain Japanese success: the lack of continuity and gradual change essential for success in a small scale peasant farming set up; the absence of progressive elements in the rich peasantry, and the conflict between the rich peasants and the State; the failure of the proletarian revolution to understand the peasantry; the erosion of rural savings via the demonstration effect operating through the rich peasants' demand for manufactured consumer goods; and lastly, the incapacity of the State to increase productivity by co-operating with the peasantry because of the internal inconsistencies, the threat to party unity and the external danger of war. If we superimpose on this the ideological

U S Export Control

THE U S House of Representatives approved a four year extension of the Export Control Act of 1949 on June 8 along with a policy declaration against restrictive trade practices or boycotts imposed by foreign governments against other nations friendly to the U S. The measure now goes to the Senate for consideration and vote. The debate in the House centred on the efforts of the 12-nation Arab League to involve American business firms and their personal in the League's boycott of Israel.

In addition, the House adopted a further statement of policy, the sense of which requests and encourages U S firms to refuse to furnish information to any foreign government to further restrictive trade boycotts. American firms have been asked in questionnaires by Arab countries whether they deal with Israel and when they answer in the affirmative they become subject to Arab blacklisting. House debate brought out the allegation that certain Arab countries sometimes ask prospective American suppliers whether they trade with Israel, use products from that country, employ Jews or have Jews among their stockholders or managers.

The Law gives the President wide discretion to limit, restrict or prohibit entirely exports to any person or to any nation of any or all commodities, including information, to whatever extent they are of military, industrial, or economic significance, if such limitation , restriction or prohibition is found to be in the interest of national security or foreign policy.

Breakthrough in Andhra

IN contrast to what appears to be happening in many other States the Congress at the moment is consolidating its position in Andhra. It has retained all the three seats which were contested in the recent by-elections by very confortable majorities. It has its factional squabbles but they are under control and have not assumed anything like the dimensions elsewhere. It has made what looks like a breakthrough in its relation with the Centre which is perhaps the most important gain of all.

In the past Andhra could quite legitimately complain that the regional imbalance, of which it was a victim, was being aggravated. Central sector projects seemed to have developed an allergy for this State and the consequent pace of industrialisation was pitiful. Even the Nagarjunasagar project continued to cripple the State's budgetary resources, despite repeated representations that the Centre should take over responsibility for it. Now there has been a sudden turn of the wheel.

In a single week Brahmanand Reddy, the amiable Chief Minister, was able to announce that the road-cum-rail bridge across the Godavari at Rajahmundry would be coming through, that a zinc smelter plant would be located at Visakapatnam and that an electronics factory would be coming up at Seconderabad. He could also point to the Ramchandrapuram Heavy Electrical Plant, the synthetic drugs project and part of the MIG plant as acquisitions for Andhra. In the meantime, various forces are gearing themselves to launch a powerful agitation for the location of the fifth steel plant at Visakapatnam — to make things somewhat easier for Steel Minister, Sanjeeva Reddy.

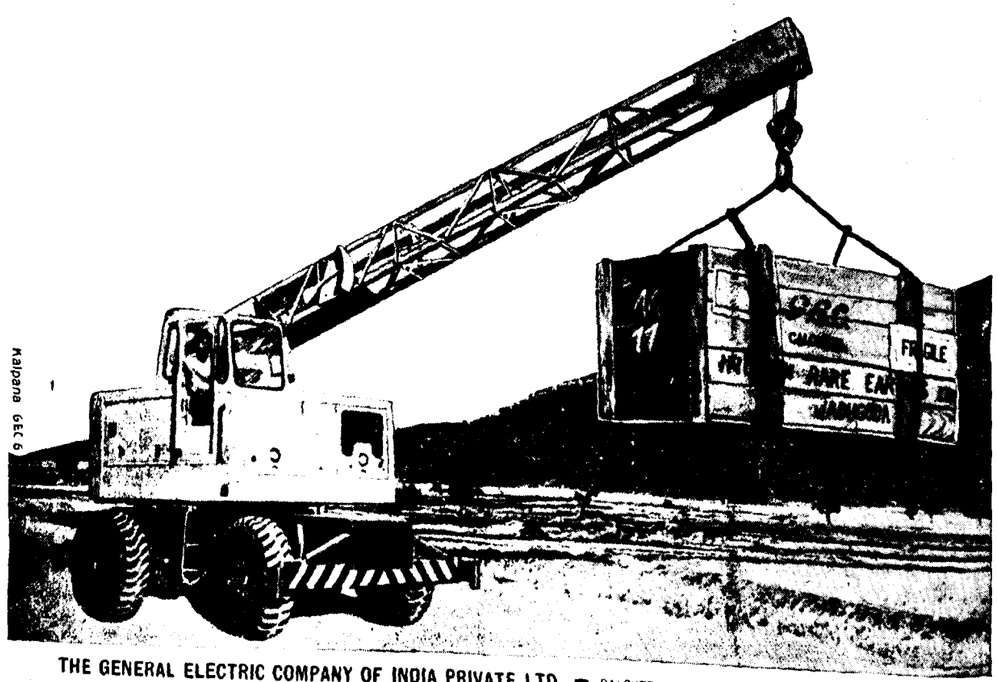
It would be wrong to look at this sudden increase in industrial potential as a mere windfall. It comes as the culmination of a process. Capitalism in Andhra had, some years ago, reached the point where it could jump the barrier of petty production, where it could shake off its rural sloth. It is undoubtedly true that capital in Andhra is still rather petty — in the size of resources it commands and, consequently, in its vision and capacities. It is also true that it is still largely stuck in rural mud, that it would prefer to go in for crops, land buying and rice-cum-sugar mills. But the size of capital accumulation, scattered though it might be, has now reached a point where some minimum leadership can provoke it to change its assets-preference to industry.

It is interesting that just when the Centre appears to have woken up to the potentiality for capitalist growth in Andhra. Dharma Teja of Jayanti Shipping fame has also decided to invest in a fairly big way in his home State. He had made this decision a few years ago with his Republic Forge Company but its actual fructification takes place only now. Dr Teja is a scientist, a modernist and a man of some vision. He seems to be amply provided with funds, including precious foreign exchange, as well as with powerful connections at Delhi. Even after Pandit Nehru's death his connections are profitably strong. He has not yet evinced any desire to go in for politics — otherwise, he might have developed like Biju Patnaik of the earlier years — but he will certainly exert a powerful influence on the politics of the State, especially on the Congress.

Role of the Opposition

An indication of the increase in the development tempo is provided by the attitude of the opposition parties. They certainly take up all kinds of issues against the Government, lead various types of movements and try different methods to demarcate themselves from the ruling party. Yet a considerable part of their energy and time is taken up by the very same issues of Andhra's backwardness, the unfair deal it is receiving and its need for factories, bridges, roads and power projects. At a lower level, in the various Zilla Parishads and panchayat samitis, the situation is not very different. Corruption, of course, is a recurring theme but the jostling and jockeying that goes on has the common denominator that Andhra needs to grow. No radically different alternative is projected by any party — the contest is often a matter of personal integrity or efficiency or village-feud link-ups.

There is no doubt that the overwhelming majority in Andhra at the moment want development *per se*. They might grumble at the fact that Congress Ministers and their relatives are taking too many of the plums, that inequality is growing and that the administration is too corrupt and inefficient. But there is little evidence of any widespread desire for any basic social change. Petty property growing into medium capitalist property seems to offer an avenue for development to such vast numbers that the very atmosphere reeks with the desire for gain, for personal enrichment. And those who have medium incomes have acquired a craze for property acquisition — house, a small shop, vineyards and the like — which will soon enough put them in the race for climbing to the next rung of the ladder. i e, medium capitalism. Without property nobody seems to have any status and it seems to be fairly easy for a very large number to acquire this status. If he, why not I? — that is the prevailing mood.



This may be good enough for capitalist development. It is also helpful at the present stage as a countervailing force to the various types of monopolists who have sprouted in different centres throughout India. At the present moment there may be no obvious clash of interests between the two groups of capitalists but conflict is inherent in the situation. The burgeoning of the newly-emerging capitalists has as its *sine qua non* the growth of the public sector, collaboration agreements with the socialist countries or government help to secure partners in the capitalist world. It is also likely to prefer the hurly-burly of parliamentary democracy to the authoritatian consistency of a Rightist dictatorship.

Yet its proliferation very seriously blunts the edge of any desire for sweeping, radical social change. Their meagre dimensions unit-wise and enormous size in the aggregate will create serious obstacles for any movement which wants India to develop along socialist lines. It is essential that powerful anti-capitalist social forces are organised which might find temporary allies in this broad stratum but which will not be engulfed by it. In Andhra these forces can only be the workers and the agricultural labourers. But they are at the moment very weakly organised and at an extraordinarily low level of consciousness. And ideas of historical initiative are very remote from the thinking of the overwhelming majority. At best ideas of resistance, of securing more of the growing cake are slowly seeping through. But these are the points of concentration for all who desire that India should avoid becoming a Mexico. There are some signs in Andhra that this idea is seizing the minds of many who hitherto had confined themselves to the middle class politics of the urban *nouveaux riche* and the *kulaks*.

Getting there fast is only half the story. Getting there with the goods, the experience, and the know-how—that's G.E.C. ■ When Indian Rare Earths Ltd. entrusted M. N. Dastur & Co. as consulting engineers for the design, engineering and supervision of construction of India's first Uranium Milling Plant at Jadugoda, in Bihar, G.E.C. were called in on the basis of global tenders to provide a wide range of services. G.E.C. engineered the Ore Crushing and Grinding Plant at its Fraser & Chalmers Works. AROUND BOMBAY MARKETS

Dalal Street Moves Further Up

Wednesday, Morning

DALAL STREET was in fairly good form last week. Equities recorded further sizable gains and, what is more, the gains were widespread. Improvement was no longer confined to the speculative counters; several cash scrips participated in the rise and these included shares like Synthetics and Chemicals which had for long been one of the weakest spots. While Tata Steel continued to provide the lead, the performance of many other shares was no less impressive. The long-neglected Engineering shares once again received good attention. Rayons were particularly firm and sentiment here was aided by the marked strength in the rayon yarn market. Automobiles, Shipping and Textiles — all had their quota of bright spots.

Fairly encouraging corporate news, absence of any fresh adverse development in the political situation, the reduction in the British Bank Rate, scarcity of floating stocks and the generally low carry-forward charges at the end of the settlement and, last, but not perhaps the least important, the large volume of option business — all these factors contributed in varying degree to the further rise in equity prices. The substantial recovery in prices over the past fortnight has had a considerable influence on the general trading sentiment and this is being reflected in increased turnover.

While there has been a considerable improvement in turnover along with the rise in prices, activity continues to be predominantly professional. There is very little evidence of outside public participation and it is doubtful whether the small fry would be attracted to the stock market in face of the prevailing political and economic uncertainties and the deteriorating foreign exchange situation. The current recovery is essentially technical — an overdue correction of the post-Budget steep decline. Optimism about this recovery development into an important upward trend needs to be tempered with utmost caution.

COTTON

New Policy—When

YET another week has gone by and New Delhi has still to announce the cotton policy for the 1965-66 season. The authorities cannot be unaware that sowing operations are nearing completion in the Punjab, which, apart from being one of the leading cotton growing States in the country, is the main producer of Deshi cotton, a valuable foreign exchange earner for the country. Of course, the price policy is not of any relevance from the view-point of export in that there is no control over the price of cotton meant for export. When will the Government understand that if prices are to have any bearing on production, then the price policy must be announced before the commencement of sowing operations? Can it be that the authorities share the widely-held view that agricultural production is not very responsive to prices and that in any case on the basis of current cotton ceilings — and prices are generally near or above the statutory ceilings — Indian cottons are quoted about Rs 200 to Rs 250 per candy higher than comparable foreign cottons.

If the ceiling prices of cotton have been revised upward in recent years it has not really been for stimulating cotton production but simply to facilitate the marketing of cotton. Price control loses much of its economic meaning when the ceilings are revised upward to accommodate the unofficial premiums obtaining in the preceding season. The rising trend in cotton prices reflects the continuing imbalance between demand and supply and the gap is likely to widen with the expansion in spindleage unless a determined effort is made to increase output through improved yields. Indian cotton prices are already so very high that there is not perhaps much risk in abolishing price control altogether if only to bring about a better price relationship between different qualities of cotton.

There is very little to report about last week's developments in the cotton market which continued to present a dull appearance. The August hedge contract fluctuated between Rs 771.50 and Rs 773.75 and most of the time it was sticky around Rs 773. Activity in the trading ring was virtually at a standstill throughout the week. The turnover in the spot market was also extremely restricted, both in indigenous and imported varieties. Prices held distinctly firm.

OILSEEDS

Futures Hit New Highs

THE oilseeds market displayed amazing strength last week under the lead of linseed, which, in fact, have simply been following mustardseed where, futures trading, through banned, has assumed menacing proportions. During the week, linseed June shot up from Rs 99.85 to Rs 103.60 and the September contract moved up in sympathy from Rs 98.55 to Rs 101.50 (per quintal). Castor June advanced from Rs 80.50 to Rs 82.30 and the September contract rose from Rs 78.90 to Rs 80.30. Cottonseed September were marked up from Rs 51.75 to Rs 54. In ready, linseed oil advanced from Rs 19.40 to Rs 20.85 (per 10 kgs) and groundnut oil firmed up from Rs 24.60 to Rs 25. Castor oil Commercial was also steadier at Rs 17.

The spurt in prices was not due to any sudden deterioration in the supply position of edible oils. Nor could it be attributed to apprehensions about a possible delay in the start of the unpredictable monsoon. Prices have flared up mainly due to strong bull manipulation. Completely unmindful of the penal margins, bulls have pushed both linseed and castor beyond the second marginal lines; margin at the rate of Rs 2,500 per 10 tonnes becomes payable in linseed when the rate goes above Rs 102 and in castor bulls have to pay margin at the rate of Rs 1,600 per 10 tonnes when the contract rises beyond Rs 82. The determination on the part of bulls to pay margin has scared bears and they have been frantically covering their sales in the June contract and/or switching over to the distant September contract. Mustard oil prices have shot up by about Rs 150 to Rs 200 per tonne in a matter of days. Inquiries with the trade indicate that large amounts of unaccounted money are being utilised for speculation and speculative holding of linseed and mustardseed. The tendency to hold commodities has been steadily growing, which, among other things, is due to lack of faith in the stability of the rupee. Since the supply position of edible oils is never really comfortable — production is not keeping pace with growing requirements for internal consumption, let alone exports — holding of stocks

pays. The financial stringency does not matter much because of the large-scale employment of unaccounted money for this purpose.

Except for the normal routine business in groundnut extractions and cottonseed cake, export houses did not report any important fresh development. Locally, prices of groundnut extractions firmed up from Rs 385 to Rs 400 per tonne in sympathy with the general strength in the oilseeds market.

Money and Banking

Thursday, Morning:

DEMAND for funds in the Bombay short-term market during the past week showed a dwindling trend with the busy season almost coming to a close. Supply position was better as outstation money came into the market. The call rate ruled steady around 7½ per cent throughout the week but stray lots were done lower at 7½ per cent. The call rate in Calcutta was higher at around 8 per cent.

Bank credit during the week to May 28 was lower by Rs 8.76 crores at Rs 2,097.18. However, borrowings from the Reserve Bank of India were still high even though a fall of Rs 22.44 crores occurred during the week. Deposits advanced further by Rs 13.81 crores to Rs 2,667.34 crores. While demand deposits recorded a steep rise of Rs 11.86 crores, time deposits were higher by only Rs 1.95 crores at Rs 1,411.71 crores. Cash and balances with the Reserve Bank moved up by Rs 6.23 crores to Rs 169.62 crores. A small rise of Rs 23 lakhs was registered in investments in Governments in Government Securities. Money at call and short notice declined by Rs 3.22 crores to Rs 48.70 crores.

Foreign Securities with the Reserve Bank of India were unchanged during the week to June 4. Balance held abroad however moved down steeply by Rs 3.81 crores at Rs 3.54 crores. Active notes increased by Rs 20.94 crores to Rs 2,719.37 crores but notes with the Banking Department were lower by Rs 23.58 to Rs 29.08 crores. Total notes issued registered a nominal fall of Rs 2.64 crores to Rs 2,748.45 crores. Scheduled Bank borrowings advanced by Rs 4.97 crores to Rs 107.81 crores. Advances to the State Bank were higher by Rs 9.30 crores to Rs 121.50 crores. State Bank deposits were lower as well by Rs 2.83 crores at Rs 13.10 crores. Union Government deposits increased from Rs 64.12 crores to Rs 73.27.

BUSINESS NOTES

Electric Meter Industry

A CRISIS is in the making in the electric meter industry. Over the past few years, demand of meters has been lagging far behind production resulting in a glut in the market and fierce competition among producers. Recent reports suggest that as against the average cost of single phase house-service-electricity meter ranging between Rs 32 and Rs 37 (depending on design, features, etc.) producers have been bidding against tenders as low as Rs 24 to Rs 25 per meter. Faced with this situation, some units have had to curtail production considerably, but even then they are left with large unsold stocks.

This is indeed a disturbing situation; and if allowed to continue may result in retarding growth of new units particularly those depending entirely on meter manufacture. At stake is a fair amount of valuable foreign exchange and the savings of hundreds of small investors and employment of a large number of workers engaged therein.

It is worth while tracing the origin of this critical situation. The manufacture of electricity meters was started in India in 1952, and production has registered a remarkable increase during the past 13 years. Starting with a low figure of 34,356 meters produced in 1952, the country produced around 18,00,000 meters in 1964. This, however, is still much below the total licensed capacity, since a number of new units licensed have yet to start production.

The Planning Commission had envisaged the demand at over two million pieces per annum, and as against this, actual offtake was less than 1.1 million in 1964. The continuously widening gap between production and offtake has left large accumulated floating stocks in the market. Obviously, this situation has developed because the various power generation schemes and rural electrification programmes of the government have not been fully implemented. Demand of meters is unlikely to expand to the expected level unless these schemes come into fruition.

The electric meter industry has made several representations to the government to help it out of its sad plight. Recently, the Government of India called a meeting of the representatives of meter manufacturers in New Delhi with a view to finding ways and means of helping the industry. The government is reported to have suggested two remedies: first, the industry should fix floor prices for sale of meters in India to check unhealthy competition among producers; and secondly, to create with its own resources a pool of funds to subsidise exports to which the government would contribute an equal share. A suggestion was made at the meeting that the S T C should take from the industry all its output at cost plus a reasonable margin and sell in the home market as well as abroad. But the S T C is said to have expressed its unwillingness to accept this responsibility.

The manufacturers are considering the suggestions of the government. How far these suggestions will help the industry in over coming difficulties is to be seen. In the meanwhile, it is learnt that on quite a few occasions in the past members of the Meter Manufacturers Association of India had fixed floor prices for sale of meters but these have been violated by elements within the industry and the 'floor' has been sinking and lower. All the meter manufacturers are not members of the Association, and those outside its orbit have been free to quote lower prices in their anxiety and get aid of their stock.

Exports of meters look to be difficult unless the government offers liberal incentives to the industry, as stiff competition prevaild in the export markets.

Elphinstone Spinning

ELPHINSTONE Spinning and Weaving Mills has received a raw deal from Bombay Municipal Corporation and National Industrial Development Corporation in the matter of rehabilitation of its Moon Mills unit. The Municipal Corporation has informed the company that it will not be possible to allow it to work at the existing site under the Development Control Rules, whereas both the Government of India and the Municipal Corporation had earlier given their permission, after consultation with the Maharashtra Government, to restart theMoon Mills unit at the existing site.

In spite of the recommendations made by the Cotton Textile Loan Advisory Committee for an additional loan of Rs 37 lakhs to be given to the Company by N I D C for the rehabilitation of the said unit, the loan has yet to be sanctioned. The additional loan was recommended by the Committee after it had satisfied itself on various counts and had got the rehabilitation scheme pruned substantially. Besides, the company had agreed to finance a required portion of the scheme from its own resources and to give personal guarantees of its directors by way of additional security.

Meanwhile, the company has produced poor results for the year to December, last. Apart from the various adverse factors experienced by it as well as the cotton textile industry as a whole, the working of its leather cloth division was affected by shortage of raw materials. Owing to restricted imports, indigenous raw materials had to be used in increased quantities which cost the company more than twice the price of the imported material. Sales of cloth, yarn, waste and leather cloth decreased from Rs 3.43 crores to Rs 3.40 crores and gross profit was lower from Rs 25.19 lakhs to Rs 22.40 lakhs. After providing Rs 13.89 lakhs (12.35 lakhs) for depreciation, Rs 3.75 lakhs (5.60 lakhs) for taxation and Rs 1.60 lakhs (2.22 lakhs) for development rebate reserve, there remains a net profit of Rs 3.23 lakhs (5.03 lakhs) which is insufficient for payment of the unchanged dividends on equity and preference shares requiring Rs 7.15 lakhs. Besides, Rs 0.53 lakh (0.74 lakh) are to be allocated to development reserve. The shortfall is to be made up by drawing from general reserve. The credit of development rebate reserve at the end of 1963 has been utilised for the purchase of new machinery during 1964.

Imperial Chemical Industries

IMPERIAL Chemical Industries and its subsidiaries in U K spent about £22.3 million during 1964 on research, development and technical service. A considerable expenditure was also incurred by its associated companies and overseas subsidiaries on the same account. There has been, as a result, a steady flow of new or improved processes therefrom. The ICI's 1964 report lists some of the processes. For instance, the development of a novel process for the manufacture of vinyl acetate directly from ethylene has led to the establishment of a plant for making 30,000 tons a year. Vinyl acetate is used in a wide variety of industries such as emulsion paints, adhesives, paper and plastics. The basic process shows promise as a method of manufacture of a number of other important chemicals which have hitherto been too costly for exploitation.

A new process has been developed to the pilot stage, in which propylene is oxidised directly to propylene oxide. Hitherto, this chemical, which is of growing importance as an intermediate in the production of polyurethane foams, has usually been made by a multi-stage route whereas the closely related ethylene oxide is now normally manufactured by direct oxidation of ethylene.

I C I has devised an improved and continuous process for making aniline, based on hydrogenation of nitrobenzene. Aniline is an important chemical not only for dyestuffs but in many other fields. In addition to the continuing work in the agricultural division, two new processes for making granular fertilisers have been announced by a subsidiary company, Scottish Agricultural Industries Ltd. In one a mixed fertiliser is obtained directly from primary raw materials phosphoric, nitric and sulphuric acids, ammonia and potassium chloride, as hard spherical granules. The other process produces monammonium phosphate ('PhoSAI') in a new form. With its high plant food content, this is increasingly replacing superphosphate. In the field of olefine polymers and copolymers, a process for producing high density polythene at low pressures, using a novel catalyst system, has been developed to the plant scale, and the product is expected to become available this year. High density polythene is mainly complementary to the original ICI low density polythene made at high pressures, and ICI's product is likely to be used initially for blow moulding application and later for several other products in which the mechanical properties of this class of polymer, especially stiffness, are of advantage.

A new mechanical — rather than chemical — process resulted in the introduction of a bulked 'Terylene' yarn of particular interest to the weaving industry. This product, called type 500 'Terylene', is nearly twice as bulky as normal filament yarns of the same weight. In consequence, lighter weight woven fabrics than hitherto can be made with similar 'cover' for various types of garments such as overalls, blouses, shirts, suitings and raincoats.

Systems research has led to the greatly increased use of computers in many new applications. Arising from silicones research, a new device known as 'Flexel', which consists of an inert substrate such as glass-cloth coated with a conducting silicone rubber, is in an advanced stage of development. When electric current is passed through it, the whole sheet warms up to a steady uniform temperature. This material has many potential applications in domestic appliances such as electric blankets and in heater panels and other forms of central heating.

Kothari Textiles

IN his annual speech circulated with Kothari Textiles' 1964 report, D C Kothari, Chairman, has urged the government to remove all controls, statutory or otherwise, on prices of cloth and yarn and allow the normal economic laws of demand and supply to operate. Kothari feels that control on cloth was imposed by the government more under political pressure than to fulfil a real need of country's economy, considering that more than two-third of the total supply of cloth is available freely without any price control. He wonders how the control on prices of one-third production would hold the price line, as far as the clothing needs of the people are concerned. The cloth markets in the country for the past few months have remained in the doldrums and in spite of statutory control on prices, cloth is sold freely at prices considerably below the ceiling rates.

The Chairman adds that decontrolled cloth is sold faster than the controlled varieties, for obvious reasons. The margin of 18 per cent between the ex-mill and retail prices, according to the trade, is not sufficient to cover working expenses and yield reasonable profit for the parties constituting the distribution chain. The merchants, therefore, prefer to take decontrolled cloth where there is no such fixed margin, he says.

During the year to December, last, Kothari Textiles' performance has been excellent, with gross profit expanding by nearly a half from Rs 22.30 lakhs to Rs 32.95 lakhs, though sales turnover could rise only moderately from Rs. 2.11 crores to Rs 2.34 crores and there was a 100 per cent cut enforced on the mills for 18 days during June-July 1964. Besides, there has been rise in costs of cotton, wages, power and stores.

Good results are attributed to the large scale renovation carried out in the spinning department and economy effected in several directions. Of the profit, depreciation and tax charges have syphoned off more at Rs 19.96 lakhs and Rs 7.35 lakhs against Rs

15.10 lakhs and Rs four lakhs, respectively. Development rebate reserve has taken up slightly less at Rs 1.41 lakhs (1.57 lakhs), and there is left a higher net profit of Rs 4.23 lakhs (1.62 lakhs). For payment of the proposed unchanged dividends on preference and equity shares which require Rs 5.44 lakhs, a sum of Rs one lakh has to be withdrawn from reserves, as against Rs four lakhs transferred back in the previous year.

Raymond Woollen

WITH the tapering off of defence orders and the availability of imported raw materials considerably restricted, the woollen mills division of Raymond Woollen Mills could work only 57 per cent of its full installed capacity on three-shift basis during 1964. Of the capacity worked, a little over a fourth was run on export orders, and the balance on orders for the home market. Efforts are being made to expand exports. The management has emphasized on the government the importance of improving the quality of indigenous wool with a view to supplement at least to some extent the requirements of the woollen industry for raw materials for clothing purposes. So far, however, little effort, has been done in this direction.

Meanwhile, in 1964 the company's export sales increased from Rs 26.77 lakhs to Rs 35.10 lakhs. Export orders for the current years are expected to be to the tune of Rs 50 lakhs. Further progress has been made in developing business in other lines such as socks, jerseys, cardigans, ready-made garments etc. The company's schemes of modernisation in the wool combing division and spinning and weaving section are proceeding apace.

The accounts show that in 1964 despatches against defence orders were nearly a fourth at Rs 60.24 lakhs, and these too were made against orders placed in the previous year. The total sales turnover decreased over 21 per cent to Rs 4.01 crores from Rs 5.11 crores a year ago. After providing a little more for depreciation at Rs10.50 lakhs (9.70 lakhs), the pre-tax profit is down by nearly a third at Rs 40.79 lakhs (60.86 lakhs). But the gap is considerably narrowed at the after-tax level, since the tax liability is more than halved to Rs 17 lakhs (34.50 lakhs) mainly on account of a larger development rebate of Rs 5.26 lakhs (1.80 lakhs) allowable on new plant and machinery added during the year. The dividend maintained at twelve per cent requires, Rs nine lakhs, same as the previous year, and is covered 1.9 times as against over two-and-a half times cover in the previous year.

India Reinsurance

THE gross premium income of the India Reinsurance Corporation for the year ending December 31, 1964 for all departments was Rs 7.83 crores as against Rs 6.99 crores in the previous year. After processing this premium and after fulfilling the statutory and other retrocession obligation to companies, the Corporation wrote a total net premium of Rs 4.52 crores against Rs 3.89 crores in 1963. The total departmental reserves in respect of fire, marine and miscellaneous business totalled Rs 2.80 crores as against Rs 2.37 crores in the previous year, showing an increase of Rs 42.34 lakhs. The total funds as at end of December 1964 stood at Rs 4.04 crores as against Rs 3.53 crores a year before.

The year's trading resulted in a net profit of Rs 16.74 lakhs compared to Rs 12.21 lakhs in the previous year. Of this, Rs seven lakhs have been appropriated to general reserve and the balance to the dividend reserve out of which the proposed dividend as raised by two per cent to ten per cent is to be paid.

The Corporation is now well organised to give full reinsurance service to the Indian market. It is in a position to give large facultative covers and full technical help on rating and other matters in all branches of insurance, including specialised branches like contractors' all risks, erection, machinery breakdown, marine-cum-erection, bankers' blanket, professional indemnities, performance and other solvency bonds, deferred payment guarantees and hire purchase guarantees.

Sandoz (India)

THERE is vast scope in India for agro-chemicals. According to Government estimates, the consumption of plant protection chemicals is likely to be around Rs 100 crores by 1971 as against the present level of about Rs 13 crores. With a view to availing the opportunity that this field offers, Sandoz (India) Ltd has set up formulation facilities at Thana and is actively considering the basic manufacture of some products with the help of the parent company, Sandoz Ltd, Switzerland. Meanwhile, the company has recorded fair progress in the existing lines. The pharmaceutical department derived good benefits arising from the rationalisation of manufacturing and introduction of four new products. Extensive market research helped to highlight the needs of the Indian market, and products were developed to cater to these needs. The turnover of both the dyes and chemical departments was highly satisfactory, rising by a third in the case of former and by a sixth in the case of the latter.

During the year 1964, the company's expanded by 31 per cent from Rs 2.87 crores to Rs 3.64 crores but gross profit soared nearly three times from Rs 16.95 lakhs to Rs 48.38 lakhs, reflecting a substantial rise in margins. After providing for depreciation Rs 16.26 lakhs (12.56 lakhs), for development rebate reserve Rs 2.24 lakhs (0.37 lakh) and for taxation 19.23 lakhs (1.17 lakhs), a sum of Rs five lakhs is allocated to general reserve to which no amount could be credited last year. The provision for tax in respect of previous years accounts for Rs 1.75 lakhs, and the dividend raised by three points to nine per cent requires Rs 6.75 lakhs compared to Rs 4.50 lakhs a year ago.

Andhra Bank

SATISFACTORY progress has been recorded by Andhra Bank during 1964 when its deposits expanded from Rs 20.57 crores to Rs 26.44 crores, advances from Rs 12.32 crores to Rs 15.63 crores and investments from Rs 7.90 crores to Rs 10.19 crores. During the year, the bank took over Bharatha Lakshmi Bank, and thus 16 new branches were added though four of them were subsequently closed down. Besides, the bank opened ten more branches, some of them in big cities like Calcutta, Madurai, Cuttack and Hyderabad.

The bank's total income advanced from Rs 143.52 lakhs to Rs 167.55 lakhs of which interest and discount accounted for Rs 139.99 lakhs against Rs 18.93 lakhs and commission, exchange and brokerage Rs 22.30 lakhs against Rs 17.98 lakhs. Simultaneously, the expenditure also rose. For instance, interest paid on deposits claimed Rs 78.04 lakhs against Rs 69.13 lakhs, and salaries and allowances, bonus and provident fund Rs 59 lakhs against Rs 48.23 lakhs. But even then the bank earned a higher profit of Rs 9.40 lakhs compared to Rs 8.70 lakhs a year ago.

The Shame of Viet Nam

IT is such a pity moral indignation is about the only weapon a journal of opinion possesses. What the Americans are demonstrating in Viet Nam is nothing short of lunacy. There has been another coup last week in Saigon, and the pretence of a civilian regime has once more been laid to rest by the assumption of power by the army generals. It hardly matters though, for these generals have only a nuisance value. They represent not one segment of even the population of Saigon. It cannot even be said that they represent American wishes. If the US administration could have its way, it would have tried to foist a better lot in Saigon. But in the present exigency the Americans cannot afford to be choosy. They have to persist in the make-believe of being present there on the invitation of the local authorities. There are, however, no local authorities: what takes place every now and then is a shuffling of the sorry lot of mercenaries and imposters who are with the Americans because they are hopeful of making a quick pile while the chaos still lasts. Whoever amongst them comes on top, the Americans will have to placate him; it is a true manifestation of the cliche: the drowning man clutches at a straw.

For there is no question that the US is on the brink of a major disaster in Viet Nam. The National Liberation Front has taken over the offensive. The rains have come, the monsoon clouds are impeding the freedom of the air which the American planes had been enjoying so long, and the guerrilla elements have re-grouped themselves to deliver crippling blows on the foreign intruders. Despite the purposive black-out of news, reports indicate that casualties on the American side have been extremely severe, amounting in many areas to a total annihilation. Desertion from the so-called South Viet Nam contingents has reached runaway proportions. The Viet Cong forces are apparently ready to swoop down on American military installations, the entrenched areas around the ports and air bases, and on Saigon. When they do so, it is likely that the local populace in each area would offer them the maximum co-operation.

This would perhaps explain China's disinterestedness in getting directly involved in Viet Nam. The NLF and Ho Chi Minh must have assured the Chinese that intervention is not really necessary at this stage; time is on their side. Given the existing constellation of factors, it should be possible to complete the mopping-up operations by the end of August. That is, unless the Americans lose their heads completely and decide to turn the Viet Nam war into a nuclear confrontation.

Desperate people will go to any lengths, which is why it is not possible to rule out straightaway such a possibility. Over the next two months, the Americans could attempt to retrieve the situation by doing either of two relatively less desperate things. They could intensify the aerial attacks on North Viet Nam, hitting Hanoi and the industrial establishments up to the border of China. Messrs Bundy, McNamara and Rusk might still hope and advise President Johnson that saturation bombing would bring Ho Chi Minh to his heels. After all, all that the US administration is praying for is some token gesture from Ho Chi Minh and Chou en-Lai that they are willing to sit at the negotiating table and give the Americans a quasi-honourable 'out'. The present phase of the war has nothing to do with the saving of 'democracy' and the ensuring of 'freedom'; it is wholly and exclusively intended for the salvaging of American *amour propre*.

If blasting North Viet Nam with napalm will not do the trick, the Americans could try to carry the strategy one step further and start dropping bombs on China itself. This would however lead to the collapse of the entire edifice of peaceful co-existence, for, irrespective of ideological differences, the Soviet Union, for dear life, will have to declare all-out support for China. But there is another alternative, and one which, if recent indications mean anything, the Americans are likely to pursue. This will be the gradual elimination of the demoralised and desertion-prone South Viet Namese regiments and the

regular deployment of American troops instead. Already seventy-five thousand troops have been landed in South Viet Nam, and President Johnson has thrown hints that he would be prepared to commit up to a limit of twenty-five thousand American regulars.

This could amount to succumbing to the temptation of an invitation to a mass beheading. American troops have only limited experience of fighting in marshy, tropical tracts. The hinterland would be hostile, communications would be uncertain, and air support would be liable to continual disruption. In these circumstances, the Americans would not be much of a match for the wily Viet Namese, and the story might well turn out to be one of encirclements and annihilations. The consequences for the Johnson administration of such an unmitigated disaster can be perilous: it was Korea more than anything else which sealed the fate of the Democratic Party in the 1952 elections.

What is happening in Viet Nam is sickening, and is bound to make the U S A a deeply hated nation in Asia for decades to come. It is rarely in history that one can find a parallel to the cussedness of current American foreign policy. The only silver-lining is the fact that conscience and sense of decency are not yet quite dead even in that country, as the 'teach-ins' have shown. Fortunately for the world and humanity, there are other values beyond what the American official line represents, even if such formidable 'socialists' as Harold Wilson have not heard about them.

Joint Planning ?

IN this country one has a weakness for high-sounding words, nice shining phrases. One of the ways people make compromises with the harsh realities of life is by first creating and then becoming fascinated by words and symbols with a wealth not so much of meaning, as of vague significance. This national weakness has played not an unimportant part in our planning. Up till now in the discussions on the Fourth Plan there have not been many attempts to indulge in irresponsible slogan-mongering to captivate public imagination. One, therefore, views with concern the sudden coming into vogue of the phrase "joint planning".

The pretext for the use of the phrase is that there has been during recent weeks a few welcome trade agreements between India and some European countries. The aluminium plant at Korba is to expand its capacity from 60,000 tonnes to 100,000 tonnes with Soviet assistance on the understanding that the Soviet Union will import the additional 40,000 tonnes. There is also the agreement, recently announced by Baliram Bhagat, between Hungary and Yugoslavia on the one hand and India on the other for the assembly in Yugoslavia of Indian railway wagons. These agreements have been described officially and welcomed in certain quarters as reflecting a qualitative change in the method of planning. Nothing can, however, be farther from the truth.

To equate long-term agreements for trade and collaboration to inter-locking planning between countries involves serious misunderstanding of planning as a process. After all, any time anybody sets a target for domestic production, he implicitly sets targets also for imports and exports of the same commodity. For, what commodity balancing is meant to achieve is a correspondence between domestic requirements and total supply. Long-term trade agreements make the task of planning easier and more scientific insofar as they give sound basis for making projections for exports and imports. In the absence of such long-term agreements, one has to be prepared for all calculations being upset by the projections for exports and imports proving wrong. As is known from elementary inter-industrial analysis, the entire domestic production structure is a function of the projections made for exports and imports. Long-term trade agreements, therefore, are logically called for by any planning whatsoever.

Joint or inter-locking planning is, however, a very different thing. It ought to mean, to use technical language, over-all optimisation for a number of countries with decentralised sub-optimisation for each member country. In every day language, it should mean a painstaking joint effort to quantify comparative costs for a whole range of goods produced and exchanged by the different countries concerned based on their resource-endowment and to work out import substitution patterns best suited to each economy. It goes without saying that nothing like that is being visualised between India and any one of the countries — Soviet Union, Yugoslavia, Hungary, France, etc — with whom the recent trade agreements have been arrived at. It is also to be emphasised that there is absolutely no realistic possibility of joint planning in this sense taking place in the near future. India has not as yet got the organisation for planning capable of participating in such a venture. Also, genuine joint planning can take place between countries which have got some basic identity of interests. Whatever might be the political facts underlying the friendly relations existing between India and these other countries, that kind of basic identity of interests just does not exist.

Aid for Uganda

THE first concrete manifestation of Indian technical and economic aid to African countries is the setting up of the India-Uganda Development Agency, a new Government company with the participation of five leading Indian sugar and sugar machinery manufacturers. Earlier, in September last year, a memorandum of agreement was signed between the Governments of India and Uganda for the development of the sugar industry in Uganda. The project involves the setting up of four new sugar mills with a capacity of 25,000 tons each, with attached sugarcane estates of 20-25,000 acres. The total cost of the project is £ 10-12 mn. India will provide the sugar machinery, materials for factory buildings, etc, in consideration of which I-UDA will receive 45 per cent of the share capital of the Uganda Sugar Development Corporation. The Uganda Government will hold 45 per cent of the share capital and private investors in Uganda the remaining 10 per cent; they will jointly bear the entire expenditure outside India. I-UDA will be responsible, subject to arrangements with its Uganda counterpart, for placing orders for machinery, equipment and stores in India, for purchasing and forwarding them to Uganda, for recruiting and training staff and for arranging technical advice and facilities. India will appoint the general manager of the Uganda corporation for the initial six years of production. About 90 per cent of the employees would be Ugandans who will ultimately take over the entire management.

This is the ideal form of aid which India can extend to more underdeveloped countries. In two earlier comments on the subject (October 24 and October 31, 1964) it was pointed out that such assistance should preferably be extended by or through the public sector and that managerial, financial and technical control over the enterprises concerned should pass into local hands over a specified period of time. This is the only arrangement which would be consistent with our own attitude to foreign aid and would also assure export of indigenously manufactured machinery on a long-term basis. Indian private enterprise which is going into Ethiopia, Nigeria and other African countries is, on the other hand, motivated entirely by profits without any serious intention of repatriating them home or placing orders for local machinery — the Birla cotton mill in Ethiopia purchased its equipment from Switzerland and others are also hunting for foreign exchange under the guise of exporting a handful of machinery — or training the Africans to finally take over. Profits in Africa are large but we cannot afford to lose what little goodwill there is for Indian business by the export of, among other things, sharp practices which are already creating a bad impression over and above the traditional antipathy which Africans have towards domiciled Indians.

Since this is the first organised attempt to export Indian machinery and technical and managerial know-how, a conscious effort would be required to make an exemplary success of it. Both machinery and men would have to be the best that can be offered and maintained. Public relations, as the Russians demonstrated in Bhilai, are a key factor. The Indian personnel sent to Uganda must be carefully selected and put through an orientation course to avoid mishaps in human relations. The African may be innocent and backward but he is sensitive and eager to be accepted as an equal — just as we are in dealing with westerners. Any impression that we are out to exploit African backwardness must be avoided.

Weekly Notes

TTK and Bankruptcy

PEOPLE often say things which, on sober reflection, they wish they had not said. With Ministers this is an occupational hazard, but our Ministers have struck upon (and have overworked) a device to get themselves out of trouble — they just say they were misreported. One sincerely hopes that the Finance Minister was indeed misreported when he made the amazing assertion — amazing even to those familiar with a Minister's idea of his own importance — that as long as he was Finance Minister the country would not go bankrupt! "After me, the deluge" — shades of the Bourbons!

Presumably, the Minister was referring to external solvency. We are not bankrupt in the sense that our international cheques have not bounced — yet. We have been spared this ignominy directly through a refunding of our obligations by institutions like the I M F and by some countries and indirectly by the provision of non-project aid. The Minister possibly wishes to take credit for arranging this refunding in view of his willing acquiescence in the stern measures of internal monetary discipline which our foreign creditors are prescribing for us. But how long can we travel on that road? What happens when we use up the remainder of the stand-by credit (a mere $ 75 million now) and do not get adequate cash aid in time? The time for financial brinkmanship would then be over; we would have gone over the brink and a regular stabilisation programme would be insisted on. The Finance Minister may stay (for the nation's good, of course) but only as an agent for carrying out policies indicated in the programme.

There seems to be a queer coincidence — if it is only that — between the tenure of office of TTK in Finance and our parlous financial straits. In 1957-58 we were running through our reserves and, after starting with a comfortable reserve cushion in 1956 on the eve of his assuming office, we were forced to draw on the Fund for a sum of $ 200 million. By 1958 we had begun to pass the hat around. Internal deficit financing was also highest in 1957-58. Now, once again, his holding of the office has coincided with a severe exchange crisis. The bottom of the barrel has been scraped but we have a seemingly cheerful Finance Minister assuring us that we will not go bankrupt. That is a tribute to the resilience of the economy more than anything else. A cynic might say that we will not go bankrupt—despite the Finance Minister.

Snail's Progress

THE Ranchi snail is nowhere near the end of its long and arduous journey. Its new chairman, T R Gupta, former chief executive of Jay Engineering, appears to have brought some drive and much more optimism, but the goods are a long way off from delivery.

Four major projects come under the Heavy Engineering Corporation: the machine building project, the foundry forge and the heavy machine tools project at Ranchi and the coal-mining machinery plant at Durgapur. Of these, only the first has really gone into production; its entire construction, erection and commissioning is expected to be completed some time next year. Out of 44,000 tonnes of materials and equipment including structurals required for the plant, about 36,000 tonnes have been shipped from USSR; of the 838 standard machine tools to be installed, 690 have been received at site and 561 have been installed. The plant needs advance orders, much more than those for 40,000 tonnes of machinery and equipment which include the orders for Bhilai and Durgapur expansion, booked already. It is negotiating for further orders, of 58,000 tonnes for Bokaro and other steel plants. Gupta is confident of turning out a completely *swadeshi* steel plant by 1972-73, though less well-informed persons would like to know what precisely complete self-sufficiency in the manufacture of large plants means. For the time being, even the heavy machine building plant is bedevilled by lack of firm orders, made worse by the continuing handicap of both H E C and potential customers in designing and by the unfortunate prolonged delay in the foundry forge project.

The foundry forge plant is way behind schedule. Civil work on it is in the preliminary stages; civil construction of the main production buildings are still at 5 to 18 per cent completion stage. Out of 41,500 ton-

nes of steel structurals required, 7,000 tonnes have been received at site and 2,100 tonnes erected. Of 53,000 tonnes of equipment including refractories to be imported from Czechoslovakia, nearly 49,000 tonnes have been received. However, only 13 per cent of the grey iron foundry installation is complete. Total production during 1963-64 was 300 tonnes. Delays in completion apart, the plant is caught in a vicious circle. It does not get adequate orders and is unable to secure enough materials, particularly non-ferrous metals, to fulfil the orders received.

The heavy machine tools project, also being put up with Czech collaboration, is the farthest behind. Rough levelling and grading of plant site was completed in May 1964. Civil work has been taken up recently and about one-half of the materials and equipment to be imported from Czechoslovakia has been received. Production is expected to commence next year.

The coal-mining-machinery project with Russian collaboration at Durgapur commenced production of conveyor belts and pumping sets in November 1963. It will also design and produce coal-washery equipment. Civil work has been completed and the greater part of equipment to be imported has arrived and has been installed.

The number of foreign experts is 180 at the foundry forge, 167 at the heavy machine building project, 6 at the heavy machine tools plant and 138 at the coal-mining machinery project. The Russian and Czech credits for these plants were extended in 1958 and enlarged further in 1960, when it was decided that their capacities should be substantially larger and when it was also found that their foreign exchange component was bigger than the credits, especially in the case of the Czech-aided plants. The main causes of the delay, however, have been three: indecision about the precise pattern of production, administrative bungling, and inadequate development of designing facilities. The completion of these projects on schedule would have substantially eased the pressure on foreign exchange resources, besides inspiring confidence in the attempt to achieve technological self-sufficiency.

Don't Axe Export Credit

THE provocation to return in these columns to the harmful effects of bad foreign exchange budgeting and reporting is provided by reports appearing in the financial press of moves to insist on prompt realisation of export proceeds. At present exporters are allowed six months to bring in the proceeds to India. Recent delays in receiving export receipts could be ascribed to various causes: the possibility of profitable investment abroad and—does one dare mention it?—speculative action against the possibility of a rupee devaluation. Apart from such special factors, the lengthening of the date of payment is a feature which has marked international trade with a reversion to buyers' market conditions.

It is in the light of this development that we in India have been taking steps, especially in the new markets and for the new products, to enable our exporters to match the attractive credit terms offered by competitors. Several committees and working groups have stressed the importance of offering competitive credit terms as a factor in international trade and the need for us to do more in this direction. The E C G C's recently expanded role is a step in this direction. That is also why the R B I's eligibility rules permit an 180-day bill being offered as collateral. It is interesting to note that even as newspaper reports indicate so much concern in New Delhi over the consequences of allowing credit facilities to Indian exporters for the pace of repatriation of export proceeds, the Industrial Development Bank has relaxed the provisions of its scheme for refinancing of medium-term export credits. A press note just received from the IDB says:

> "With a view to extending the benefits of the scheme for refinancing of medium-term export credits to exporters who ship goods against contracts for amounts less than Rs 1 lakh, the Industrial Development Bank of India has decided to remove the present restriction in the scheme that such export contracts should be for a minimum amount of Rs 1 lakh. This relaxation, it is hoped, would help small exporters to offer competitive terms to their customers abroad...".

Clearly, there is a case for larger and cheaper export finance which would enable the exporter in turn to offer better credit terms. Panicky action to curb such credit extension taken to meet a short-term crisis can only upset the good work done to broaden the credit facilities our exporters can offer foreign buyers.

EEC and Developing Countries

ATTENTION has been focussed on the European Comon Market's relations with developing countries by certain events of the last few days. The EEC Council of Ministers has decided to permit its Executive Commission to re-open negotiations with N i g e r i a on new and more hopeful terms. The Commission has also begun a specific study of India's trading problems with the ECM; the recently-published annual report of the ECM for the first time makes more than a passing reference to India.

The ECM is the largest single customer for the developing countries as a group. Its imports are 10 times as large as those of the Soviet Union, twice as large as those of the U K, and considerably larger than those of the U S A. Though the developing countries are not satisfied with the record of the ECM, yet its imports from that group increased from $6,800 million in 1958 to $9,800 million in 1963. The ECM has in fact been running an increasing trade deficit with the group of developing countries.

Hitherto France has exhibited a relative lack of concern for the trading problems of developing countries, excepting the former French colonies. She has not yet signed the new chapter of the GATT which lays down that the developed countries should no longer insist on reciprocity in their trade relations with the under-developed countries. Since last year Nigeria has been negotiating with the EEC for associate-member status. Almost a month ago the negotiations reached a deadlock because the French demanded greater reciprocity from Nigeria than the latter thought was justified in the light of the new chapter of the GATT. Perhaps the real reason for the French opposition was the desire to have the former French territories of Morocco and Tunisia admitted before Nigeria. However, the other EEC countries seem seriously concerned about the criticism that they might be helping to perpetuate the old colonial divisions of Africa. Though the EEC Excutive Commission has been given a new mandate, the final success of the negotiations with Nigeria is not certain yet, especially because so far official talks with Morocco and Tunisia have not been authorised.

It is believed that Kenya, Uganda and Tunisia are also eager to obtain a special trade or an associate-member relationship with the ECM. If Nigeria and these countries do succeed in their efforts, India's trade with them will suffer. This possibility adds further urgency to India's own negotiations with the ECM. Since the collapse of Britain's EEC entry negotiations, India has submitted five notes requesting the EEC to consider her specific problems. Now at last there is some hope that such attention may be forthcoming. However, though the EEC Commission seems to have been impressed by India's problems and the proposals India has made to tackle them, there are indications that it would like to delay action till some global solution for the developing countries as a group can be devised.

Dastur Restored?

A Correspondent writes:

THE Union Cabinet, on the recommendation of the Cabinet Secretary who was asked to look into the matter, has decided that Dastur and Co will be "associated" with the construction of the Bokaro steel plant as far as possible and that it would remain a private firm without Government participation. The precise extent and terms of association have not been spelt out but Dastur might be offered such of the engineering and designing work as would not require Soviet expertise. This, *if* interpreted in the right spirit, is what should have been made explicit at the time of signing the agreement with USSR. There was no question ever of Dastur designing the equipment to be supplied from abroad because it is always the supplier who undertakes the design and supply of equipment and the responsibility for its performance. The buyer chooses his own consultants to advise him and coordinate the project which in the case of Bokaro involves a fairly large amount of work since 35 per cent of the equipment, apart from civil construction and procurement, would be domestic. Surely, it was not the Steel Minister's intention that the domestic part of the construction should also be handled by Soviet experts? What is required now is not just a vague association of Dastur with Bokaro but a clear spelling out of its responsibilities as Government consultants.

Part of the damage has already been done since Dastur has retrenched about 400 of its 900 engineers—and many of the rest have accepted cuts of up to 75 per cent in their emoluments which is a tribute to the team spirit that has been built up in this firm. But it has the Durgapur alloy and steel plant to its credit and also a contract for a steel mill in Pakistan. The dangers to which Dastur has been exposed bring out the difficulties of a single major consultancy firm which has to maintain a large staff on its payroll. In other countries, consultancy firms enjoy the advantage of division of labour through farming out sub-contracts and casual employment of specialised personnel. This activity has hardly developed here, largely because foreign collaborators are given or take turn-key jobs, not all of which have turned out to be satisfactory, to put it in mild terms. Dastur and the Designs Organisation of Hindustan Steel are the swallows which definitely do not make the summer. Now that Dastur has been restored to its rightful place (so one hopes), Government and private entrepreneurs must look about to encourage promising consultancy and design teams in other industries.

New Thinking on Corruption

SOME recent developments, if pursued, hold out hope that something may yet be done to fight corruption both at the political and administrative levels. The current *impasse*, especially with regard to political corruption, cannot be allowed to continue. A variety of **ad hoc** expedients have been devised in the past to look into cases of corruption at the ministerial level. This was unavoidable in the absence of an independent high-powered machinery to look into them. It was, therefore, gratifying to hear the Home Minister tell the last session of Parliament that the Government's experience of handling the corruption charges against the Orissa leaders, Biju Patnaik and Biren Mitra, "called for rethinking" about the procedure for enquiring into allegations of corruption against political leaders. While Nanda maintained that in the Orissa affair no independent body could have come to a conclusion different from that of the Cabinet Sub-Committee, he conceded that the Sub-Committee could not be considered an independent agency. Hence, according to him, the Prime Minister was thinking in terms of a new approach.

The Home Minister's statement gave a fillip to the demand for an ombudsman which has found support among leading jurists and men in public life. The Chief Justice of the Supreme Court has generally welcomed the idea as has the former Attorney-General, M C Setalvad. The Committee on Administrative Reforms appointed by the Rajasthan Government has recommended an ombudsman for the State. The subject has also come up in Parliament more than once. During the last session, the Minister of State for Home Affairs, Jaisukhlal Hathi, announced that a consultative group of Members of Parliament drawn from all parties would consider the setting up of a suitable machinery for redressal of public grievances. This was in the course of the debate on a non-official resolution calling for the setting up of an ombudsman. Hathi reverted to this subject on Wednesday this week to disclose that the report of the Parliamentary study group on ombudsman would be ready in about two months.

With regard to corruption at the administrative level, the Central Vigilance Commission and its counterparts in many States have completed a year of quiet existence. Nittoor Srinivas Rau, the Central Vigilance Commissioner, revealed at the end of a three-day Conference of Vigilance Commissioners at Bangalore last week that neither at the Centre nor in the States had theire been a single case where the advice of the Vigilance Commission had been rejected by the Governments. All the same, he pressed for an independent and statutory basis for the Commissions. As he put it: "To assist the Government in the maintenance of discipline of services, it is essential to establish proper coventions and traditions which, while enabling the commissions to function with independence and detatchment, will ensure harmony and understanding between the Commissions and the administrative machinery and also help strengthen public confidence in the vigilance organisation all over the country". This advice, based on a year's experience of handling corruption cases, cannot be lightly brushed aside. If it is conceded, a very important step will have been taken in the fight against corruption.

Local Finances

IN a developing economy with decentralisation of power, local bodies must necessarily shoulder more and more responsibility. On how adequately such bodies in India are equipped to perform their functions, we have had hitherto very little in-

formation. The Reserve Bank's study of local finances (summarised in the Bank's **Bulletin** of May 1965) covering selected ports, city corporations and municipalities over a period of ten years is, therefore, a useful contribution to the study of this significant segment of our public sector.

A general expansion of the activities of local bodies is only to be expected; what is of interest is their approach mobilisation of resources and the extent to which their expenditure is development-oriented. Among the three categories of local bodies studied in the Reserve Bank survey, city corporations predominate and their finances are, therefore, of special interest. While the total income of all the three categories increased from Rs 67.9 crores in 1951-52 to Rs 230.1 crores, that of city corporations jumped from Rs 35.7 crores to Rs 148.4 crores. Likewise, city corporations' expenditure rose to Rs 180.0 crores in 1962-63 from Rs 34.8 crores in 1951-52. From the comparison of revenue from various sources given in the Table one can see that city corporations have certainly stepped up their tax efforts and that profits from remunerative enterprises have also gone up and contribute significantly to revenues.

Taking all local bodies together there has been a more than fifteen-fold increase in expenditure on public health, public works and public instruction between 1951-52 and 1962-63. The shift in expenditure towards welfare and developmental activity is even more pronounced in the case of city corporations. For the 17 corporations considered, while general administration accounted for only 3 1/3 per cent of total expenditure, public health and convenience, public works and public instruction together accounted for 45 per cent. Expenditure on new construction of roads, buildings, machinery, equipment, vehicles and general repairs, which may be taken as an approximate index of capital formation, came to 18.5 per cent in 1962-63 for all local bodies.

Concurrently with the expansion of their activities, the corporations have come to depend more on governments for their finances. In 1960 borrowings from governments was just about half of market loans; in 1962, on the other hand, it was twice as much.

Share of Different Sources as Per Cent of Total Revenue of City Corporations

	'61-62	'62-63
Taxes	20	40
Rates	10	7
Profits from remunerative enterprises	7	14
Receipts from property	2	2
Grants from Government	6	7
Loan Receipts	10	18

LETTER TO EDITOR

Export Promotion through Import Entitlement

I HAVE read with great interest I S Gulati's article, "Export Promotion through Import Entitlement", in your issue of May 22, 1965. He has certainly brought a certain amount of clear thinking on the problem which is of vital interest to the country. Broadly speaking, the modified basis suggested by him for import entitlement substitutes bonus entitlement at 36.5 per cent of the export earning against the present scheme which gives import entitlement by way of twice the import content of an export product, subject to a ceiling of 75 per cent of the F O B value of export, with certain specific modifications on either side. It may be mentioned that the present scheme of import entitlement is based on the actual requirements of the export trade as analysed and examined by the Ministry of Commerce. With varying degrees of competition of various products exported, and with varying values of the import content of the same, some kind of *ad hoc* arrangement has been arrived at. A product by product examination to know the value of net foreign exchange earned in each case would, therefore, be of great value so as to focus attention on those items where a variation in the import entitlement is likely to achieve greater results. Also, unnecessary detailed work may be avoided in the case of minor items where gains in foreign exchange may be negligible. This may be an empirical approach, but it is likely to yield results.

Regarding Gulati's suggestion of fixing bonus entitlement at 36.5 per cent (with a view to ensuring that it is within the limit set by our present restraint), I would like to make a reference to Table 3A of his article. Under the modified scheme, exports of items falling under E, F and G are likely to be severely handicapped, as the bonus entitlement at 36.5 per cent of the export earning is less than the value of the import content of the exported articles. Even in regard to the other items, say item D, practically the whole of the value of the bonus entitlement would be taken up in the value of the import content of the article with the result that there would be no incentive to the producer to export this product if the internal price is higher. We need not discuss at this stage why the internal price is higher. Would not Gulati's scheme, therefore, have a retrograde effect on the total volume of exports under the entitlement scheme?

There is another point which has not been touched upon in the article under consideration. This is the question of the importance to be attached to imports which are allowed to the exporters under the existing bonus entitlement scheme which can be sold by the exporters in the internal market. It should be appreciated that these articles are not imported for fun. There is a genuine shortage of a large number of goods in India which have to be imported as a necessity and not as a luxury. If they are not allowed to be imported under the Export Promotion Scheme, they would have to be imported in any case. It is, therefore, not quite correct to say that the total outlay and not the increase in outlay on bonus entitlement should be taken into account in making the appraisal of the outgoings against bonus entitlement. If this factor is taken into account, the value of the entitlement schemes will be found to be much higher than made out in the article.

Finally, I do not see why a bonus voucher scheme on the lines of Pakistan should not be tried. Pakistan gets away with it although she is a member of the International Monetary Fund. If such bonus vouchers are allowed on all exports except those which move on their own merits without assistance, and are freely saleable in the market, a good deal of administrative drudgery could be avoided and exporters would know exactly where they stand. The use of these bonus vouchers could also be restricted to the import of raw materials, components and other goods considered essential for the life of the nation. Perhaps Gulati would like to study the Pakistani Bonus Voucher Scheme and express his views on it.

FROM THE LONDON END

Issues for the Commonwealth Conference

THE Nehru Memorial Exhibition which was opened officially by Harold Wilson on June 10 served as a useful curtain raiser to the Commonwealth Prime Ministers' Conference beginning in London on June 17. For, as the British Press never tires of telling its readers, Nehru was indeed the founder of the new Commonwealth. Wilson in his speech said, "...and next week when the leaders of Commonwealth countries assemble round the conference table...unspoken perhaps but not unrealised, will be the recognition that the Commonwealth...owes more than any of us could ever say to the work of free India's first Prime Minister". The same theme was echoed in Lord Mountbatten's speech, "The form in which the Commonwealth exists form an empire of many races and religions into a Commonwealth of free nations. It was his idea to give the Queen the new title of 'Head of the Commonwealth'."

While the Agenda for the Conference has not been issued, it is easy to guess the issues that will be discussed. Chief among them, of course, will be Rhodesia. This was an explosive issue at the last Conference presided over by Alec Douglas-Home and certainly the African members of the Commonwealth are extremely concerned about what they consider a general softening of the Labour Government's attitude to the Rhodesian question. All the African Commonwealth members are determined to resist any policy that will transfer power to the present Rhodesian Government, irrespective of what guarantees might be included in an agreement between the British Government and the Rhodesian Prime Minister, Ian Smith. The criticism of British policy may indeed be sharper this year as most African countries had hoped for a more favourable attitude from the Labour Government. Apparently there has been a great deal of concern in African Governments over a statement made by Wilson in the House of Commons on June 1 in which he said, "There is no difference between the two sides of the House over Rhodesia". Even a moderate African statesman like Albert Margai, Prime Minister of Sierra Leone, reflected the attitude of most African states to this issue when he said on his arrival in London, that if British policy forces African leaders in Rhodesia to set up a "Government in exile" the African members of the Commonwealth "may well be compelled to support it". Unless Britain takes steps to ensure majority rule in Rhodesia, he made it perfectly clear, Sierra Leone was prepared to take the initiative in demanding that "Britain intervene directly by suspending the Rhodesian Constitution".

The British Government will be left in no doubt about feelings on this subject. Kenneth Kaunda of Zambia has predicted that the Rhodesian issue will be a "bit of a hot cake" at the conference. "To us Rhodesia is a matter of great concern", he said, "not only because 4 million people are oppressed today, but from our own selfish angle, we are directly concerned. I believe all of us are bent on seeing that we find a peaceful solution. That to me means majority rule." In view of the sentiments that have been expressed there can be no doubt that the Commonwealth would be strengthened or weakened according to the outcome of this issue.

Commonwealth immigration will be another live issue at the Conference. Much to the disappointment of many of the developing countries in the Commonwealth, it looks now as if the Labour Government is going back on its immigration policy, sticking instead to the policy initiated by the Conservatives which in essence means imposing control over all coloured Commonwealth immigration. It is hoped that the Mountbatten report, prepared after visits to a number of Commonwealth countries to discuss with their Governments the possibility of controlling immigration at their end, will be ready before the Conference and will provide the basis for discussion of this difficult issue. Rumours are, however, circulating that the Labour Government is likely to put a virtual ban on further coloured immigrants though it is unlikely that an announcement to this effect will be made until after the Commonwealth Prime Ministers have met.

While there is no doubt at all that the Labour Government, and particularly Harold Wilson himself, are strongly attached to the idea of closer Commonwealth relations, particularly as they believe that the first Labour Government was the initiator of the modern Commonwealth, it remains to be seen what concrete steps can be taken in this direction. Wilson was not slow to taunt Alec Home and the Tories about their readiness to sell the Commonwealth down the river to join the Common Market, but recent moves by Wilson himself at Vienna to build a bridge between E F T A and the Common Market have raised doubts in the minds of Commonwealth leaders as to where, in practice, this policy will lead and whether it means that the Labour Government is also beginning to turn its back on the Commonwealth and move towards a closer integration with Europe. It will be recalled that in the Labour Government's Manifesto it was declared that "though we shall seek to achieve closer links with our European neighbours, the Labour Party is convinced that the first responsibility of a British Government is still to the Commonwealth".

Another key question that will be discussed at the Commonwealth Prime Ministers' meeting, therefore, will be that of Commonwealth trade and aid. Here again, a number of thorny issues arise. It is well known that Wilson is anxious to increase intra-Commonwealth trade. But when in his speech during the Commonwealth debate in the Commons he talked of the need to reverse the decline in Commonwealth trade, it was British exports to the Commonwealth he was thinking of, not Commonwealth exports to Britain! Wilson has indicated to the Commonwealth Relations Office that during the customary discussions on trade and economic matters he will have an important speech to make, but as yet there is no indication of the initiative that he may be planning. Whatever it is, Wilson cannot ignore the fact that Britain's trade with the Commonwealth is slumping sadly even though Commonwealth trade as a whole is growing.

In the autumn of last year the Labour Manifesto said: "We shall build a formal basis for extending trade by introducing long-term contracts and commodity agreements providing guaranteed markets for Commonwealth primary products at stable prices." Yet the stringent controls imposed by the Labour Government to protect Britain's balance and payments have hit the developing countries in the Commonwealth quite severely. To begin with, the surcharges which the Labour Government was forced to impose has affected export of manufactured goods to Britain and since many developing countries in the Commonwealth rely on manufactured goods to increase their

foreign exchange earnings, this has created a severe problem for them. Again, there is this business of quota restrictions on imports of textiles from developing countries in Asia. More concessions on this point will be sought but the attitude of the textile lobby here is certainly far from helpful.

The impact of the budget, particularly of the clauses in the Finance Bill relating to overseas investment, is bound to be dampening on exports of British capital to developing areas in the Commonwealth. The restrictions come at a particularly difficult time for these countries since balance of payment difficulties of both Britain and America are already impinging on Government-to-Government aid. Discussions will certainly centre on means of increasing such aid. Many developing countries in the Commonwealth expect a great deal from the new Ministry of Overseas Development though it is not known what new proposals Barbara Castle will make to increase the flow of assistance to Commonwealth countries. There is some talk of more assistance being channelled through the Commonwealth Development Corporation.

The move to set up a Commonwealth Secretariat was initiated at the last Commonwealth Conference at the request of the African members of the Commonwealth. Not much progress has been made and even the Secretary-General has not yet been appointed. The names that have been mentioned at different times for this post include those of Robert Jackson, an Australian official now with the UN Special Fund, George Ivan Smith, another Australian also with the U N, Alistair McIntosh, a New Zealand civil servant, Arnold Smith of Canada and Malcolm MacDonald. Interestingly, all the candidates are white, a fact which will not go unnoticed. At one time is was hoped that this appointment would be made before the Conference but this has not been possible. However, it is now expected that the Secretariat will be created and the first Secretary General appointed at the Conference. No details have been worked out about the role of the new body, except that it will be responsible for convening and servicing future Prime Ministerial conferences and will also act as a clearing house for information.

Britain's role in Vietnam is likely to come up for serious criticism at the Conference. There is much disappointment that the Labour Government is giving such unqualified and uncritical support to the US in Vietnam. Nearly all independent African States have expressed their opposition of American action in Vietnam and so have the three Asian states as well as Cyprus. It is likely that Wilson may be considering the possibility of using the Conference to launch a fresh appeal for the ending of the war in Vietnam and for unconditional negotiations. The appeal of the 17 non-allied countries provide a basis, and what better opportunity would there be for Britain to initiate some constructive moves than the Conference where 7 of the countries which signed the appeal will be present.

A CALCUTTA DIARY

Another Freedom Gone ?

IT would not make news in most other parts of the world; in Calcutta it does. And so, for the last few days, most people have been discussing the Government of West Bengal's proposed ban on travelling on the footboards of buses and trams. There was recently a more than usually nasty road accident, involving a State bus and killing six. Not content with issuing an order, of which no true Bengali would normally take the slightest notice, the Government is said to have asked the police to enforce the order. As if the travelling public did not already know, advertisements have been appearing in the Press that such travel is dangerous. From June 15, therefore, each bus and tram car will be required to carry only so many passengers sitting and so many standing, none on the footboards. Should this come about, which few consider probable, public transport in Calcutta will be very different from what it has been for at least a quarter of a century. And, of course, a city's public transport and manners on the road reflect certain objective conditions and certain general attitudes. Will these change too?

Unlikely. The State Transport Authority has promised no increase in its number of buses. In advance its spokesman has let it be known that it cannot promise even to put on the road a larger proportion of its existing fleet; a large percentage is idle, for spares cannot be bought without the foreign exchange the Centre will not release. Expansion of the tramway service has been virtually unknown in recent years: the idea of three-coach trams instead of the present two was successfully resisted by the Calcutta Police on the valid plea that such three-car monsters would further slow down traffic in Calcutta, slow enough already. The city thus has all the old problems — and only a new order.

Especially in the current extreme heat, nobody — not even mad dogs, let alone Englishman — in Calcutta travels by tram or bus unless he must. At least during the peak hours, therefore, there is unlikely to be a sudden decrease in demand to correspond with the decreed decrease in transport's carrying capacity. What then is going to happen? Elementary, Watson. Even under the pressure of World War II it was found impossible to work out a scheme of staggering office hours; the rush hours will thus remain as "rush". For the first three or four days at least, the police will make an effort to make the public feel that there is a new order, accepted elsewhere as part of life. But most bus and tram users being in the middle or lower middle brackets of employment in the Government or the commercial houses, it very much remains to be seen whether the dread of the traffic cop will triumph over the traditional trauma administered by the departmental head's grim, smiling remark, "Babu, unless my watch is all wrong, you do manage to get to work early, don't you?" The babu washes his face with an unclean end of his dhoti and mutters, "Sorry, sir.".

This is where we come to more general things, applicable perhaps more to Calcutta than to other parts of India. The administration in Calcutta, even after the capital was transferred to Delhi, was represented by the policeman, whose identification with British commerce was complete. The two were one and equally feared and respected or despised. This neat little unwritten co-ordination came to an end around 1947. The Bengali today does not know whom to fear and whom to disregard, the cop or the commercial employer.

To the whole Calcutta traffic scene, never a homage to geometry as in Moscow or to aggressive abandon as in Paris or to homicidal madness as in Tokyo, has been added an element of imbecile officiousness which excels in making things worse for all around. The other day some bright traffic cop thought up the idea of having "lanes" all along Chowringhee, now Jawaharlal Nehru Road. Empty oil drums were installed outside the arcade of a big hotel; and all was chaos. The traffic was not regulated or accelerated but just inefficiently ordered about to the inconvenience of all concerned. A squeal from the Press; and the drums went.

There is reason to believe that the latest order on footboard travelling will also go the way of all flesh. Those who believe in the superstition of going to work on time will do so, on footboards if necessary — come what may. Some policemen will pretend to enforce the order; and then there will be clashes between police and public. In Calcutta the police never wins; the public always loses. Unpleasantness is the permanent factor, constantly inviting intensification.

There then, in miniature, is the whole problem of West Bengal today, which in varying degrees may be applicable to the rest of the country. Not enough room nor resources; not enough self-discipline; not enough will power (which comes of that old-fashioned thing, moral force) in the administration to enforce what it believes to be right. The fourth factor to be taken into account is the modern Bengali's weird notion of freedom and right; the freedom to travel, suicidally, on footboards of buses and trams will strike many Bengalis as a fundamental right which the Government — always "agin' it" — is seeking to stifle. Down with it all! Few in Calcutta will be surprised if in the next few days there are fewer buses and trams, both being easily perishable by fire.

About half a century ago Tagore wrote of trams, not minds (because of the language barrier, English), connecting Bengalis and their schools. To thinking Bengalis, therefore, the odd English phrase "transports of joy" has always seemed ironical or insulting. The recent ban on dangerous footboard travelling, apparently to avert fatalities, symbolises the basic, tragic, heartbreaking contradiction of all planning in India — a pathetic attempt to save life in face of an embarrassing over-abundance of it fast overwhelming the country's stagnant or dwindling resources. Many years ago Andre Malraux asked a Communist gathering about the fate of the man run over by a tram car and was given the chilling answer that in a perfect socialist society there could be no traffic accidents. In India's very imperfect socialistic society, the ban on footboard travel may only lead to more accidents.

BOOK REVIEW

Pathetic Women

Ashok Rudra

Indian Women through the Ages by P Thomas; Asia Publishing House, 1964; pp x + 392, price Rs 25.00.

DENIAL of life that has been the basic value principle underlying most of the customs, conventions and morals of Hindu society down the ages, has meant for man inhibition of self-expression, non-realisations of potentialities, crippling of faculties, extinction of any joy in the fact of living; it did not, however, mean the total extinction of his personality. The Hindu man did acquire a personality and a character, the object of awe as well as of abhorrence of those of other more humanistic civilisations. But did the Hindu woman ever acquire a personality, a character? A corollary to the question is, have the so-called emancipated women of modern India got any personality, any character? The second question does express a doubt, but the first is more rhetorical. In the case of the woman, the world view of life denial was indeed carried by traditional Hinduism to the extreme point of total extinction of her personality, nay, to the point of making a supreme value of suicide, physical annihilation of self in the literal sense.

Mass Brain Washing

There is something breath-takingly impressive in the sight of a person taking his or her life, not out of desperation, not to get relief from any unbearable mental torture, but for a cause. Socrates drinking hemlock, Joan of Arc burning at the stake, Gandhi facing the assassin's bullets—these are edifying spectacles of spirit triumphing over matter, of life cheating death. But very much more staggering and not at all edifying is the spectacle of men and women taking their lives, not for any cause, but as a matter of principle, according to to the dictates of some code of conduct. The Japanese soldier of a suicide brigade, holding on to a torpedo and directing it to the bottom of an enemy boat and himself to a death worthy of an insect, is one of the rare examples from outside India of the practice of suicide as a supreme value. But the largest body of evidence of this value in practice is provided by the history of Indian women.

The spectacle of the Hindu widow mounting the funeral pyre of her deceased husband is, of course, the most effective if gruesome symbol of her role in Indian history, but it is not just the symbol. The *sati* is very much a real part of Indian history, an essential aspect of traditional Hindu culture and we shall not understand our history and culture so long as we treat the phenomenon as peripheral. It symbolises the ultimate and supreme triumph of matter over spirit, for it involves intelligent living beings acting as automatons in response to suggestions to the point of acting contrary to the very life-principle, the very basic and primal will of all living beings, namely, the will to live. It represents the supreme victory of that subtle, non-violent technique of persuasion practised by the Hindu law-givers which elsewhere I have characterised as a form of "brain-washing" on a mass scale. * This technique succeeded so thoroughly well in the case of women that men did not have to impose their domination over them. The women of India have prided themselves in their total subjugation to men; by making chastity and fidelity the most important, if not the only, virtue to be strived for, they have joyfully denied

* "Myth of Tolerance", *Seminar*, March 1965. C Rajagopalachari has taken objection to this characterisation (See *Seminar*, April 1965). But can we explain rational beings being persuaded by rational arguments to overcome the will-to-live?

themselves any personality. The task of monitoring and disciplining, to the meagre extent that it was ever necessary, was left to women themselves: the husband had often to protect the wife from tyranny of the mother-in-law. The role of handling down the lesson from one generation to another was also left to women; it is the Indian mother who groomed the daughter to become what she became; mother, daughter and daughter-in-law all agreed to accept as true the law-giver's view that women are basically wicked, vile and lustful.

The State of the Emancipated

Can there be any understanding of the mind of modern Indians except in the light of a social history of India that could be written from the point of this technique of brain-washing? How can we have any appreciation of the problems of the "emancipated" Indian woman unless we connect her up with her ancestors who climbed into the funeral pyre of their husbands or who, in the case of *Kulin* Brahmins, saved their womanhood by marrying men whose profession it was to "save" hundreds of women by marrying them and who spent their days travelling from one wife's place to another, returning to the same wife only at intervals of years and only for a few days? No such social history has been written and consequently no understanding has been acquired about the behaviour pattern of modern Indians. That has not, of course, stopped us from talking glibly about Indian socialism and the socialist pattern of society as if the transformation of a society and change-over from one value system to another can be effected without any change in the minds of men but merely by setting up steel plants and playing about with capital output ratios.

The essential feature of the behaviour pattern of modern Indians is, of course, that *there is no pattern*. This is true of both men and women, but more so of women to the extent that in the past they were subjected to very much more severe restrictions than men ever were. Let us take the case of the emancipated women. Until the days of her grand-mother there were definite and precise laws governing the lives of women. There were elaborate systems of do's and don'ts based on certain fundamental premises that had remained invariant ever since the days of the epics: Women were not to have any social and professional life; their place was in the kitchen and the bed-room; their duty, to serve their menfolk; their ethics, to be totally loyal to their husbands, but not to expect the same in return. The emancipated woman does not accept any of the above premises. She goes out to work, has dealings with men other than her husband and has accepted in theory the idea of divorce and remarriage. The old system of do's and don'ts that sufficed to guide the life of her grand-mother has no more any relevance, but no new system has taken its place. There are no "rules of the game" to follow and in this respect she is at a great disadvantage compared to her Western sisters, who even when being extremely bohemain have got definite rules to fall back upon.

The emancipated Indian woman lives in a world haunted by ghosts of ancient moral ideas and codes of conduct, anachronistic and inconsistent, echoing back to different periods of history, some with significance for primitive and tribal times, some for the changed social conditions brought about by the Muslim invasion, and some for 19th century England, but many more for the world in which she moves and lives. The inadequacy of the ancient codes of conduct, the contradiction between them and modern values, not indigenously developed but borrowed from Europe, bedevils her life at every step and gives rise to fatal misunderstandings and dire tragedies. In this sense the lives of modern Indian women are much more *lawless* than those of even the most shockingly enterprising of European women. The only philosophy that can be practised by them under the conditions is, of course, existentialism, each individual making her own rules and creating her own morals. What actually happens, however, is that each individual, not having the character to live existentially, makes for herself a bundle of do's and don'ts from among the welter of moral ideas that surround her, some of them harking back to mediaeval and ancient India, some fresh from post-war Europe! The bundles differ from individual to individual, from family to family, and thus do not give rise to any social behaviour pattern, to any moral laws valid in general.

The social history of India that will trace back the ghosts of moral ideas haunting modern Indians to their origins and thus lay bare the fantastically lawless character of their lives, has not yet been written. There are, of course, social histories written by scholars, but they are more of learned chronologies than anything else; the authors themselves are too much a part of the situation discussed above to be able to make their histories bear upon the predicament of modern Indian men and women. Even less satisfactory are the inspired accounts of India's past written by such of our modern thinkers who have taken upon themselves the task of inspiring fellow-Indians with pride and self-confidence. Their zeal to salvage the image of India from the slanders cast by unsympathetic foreigners have made them indulge in considerable white-washing. Quoting isolated examples of a Maitreyee discussing high philosophy with Yagnavalkya or a Tara Bai leading soldiers on horse back, they would have us believe that Indian women have after all enjoyed a high status in society and played an important part in Indian history. A particular variant of this line of argument takes the position that the subjugation of Hindu women dates to and resulted from the Muslim invasion.

Modern Outlook

Thomas's book is also not the social history that we need to have. In particular he fails completely to take any view of the position of Indian women during the post-British period which he has called the age of emancipation. His last chapters are the most uninteresting in the whole book, being records of social reforms and enactments for the benefit of women. But what makes the book exceptionally fresh is a remarkable, I would say rare, detachment and a truly modern outlook on women, sex, marriage, and associated questions. He sets out to "give the reader a connected account of the gradual subjugation of women in India, which started from very early times and continued right down to the eighteenth century . . .", and does not hesitate to give the badge of "age of subjection", to this entire period. Thomas is indeed a courageous writer, for he has run the risk of being accused of not only lacking in patriotism but, far worse, of being un-understanding or intolerant of Hindu values, being a Christian. This placidity is impressive: there is nowhere any sign that he has been inspired by any frustration or bitterness so common among middle class Indians or by any shallow runaway enthusiasm for Western history and values. Thomas writes the most unkindest things about Hindu values all through this book but nowhere does he give the impression of being a Christian zealot or a petty snob. He has a mild style of writing, straight-forward and descriptive lit up with a pleasant sense of humour, completely free of any ideological or educative zeal, but with a very consistent point of view — that of the modern man who regards freedom as the supreme value. The book is full of interesting quotations from scriptures and delightful anecdotes about the sexual adventures and curiosities of the holy law-givers of ancient India. It is these qualities which make the book eminently readable and worthy of note. Otherwise, of course, it is no more than a bed-side social history, a book written by an amateur for the benefit of lay readers.

As one goes down the dismal record of the progressive subjugation of Indian women, one is struck by an irresistible, staggering thought. If the general body of women in India present a sorry spectacle, bereft of any dignity, a pathetic procession of crushed souls marching on their way to the funeral pyre, there was at all points of history an alternative spectacle — that of the gay, accomplished, artful and artistic courtesans. It would indeed be extremely galling for any virtuous Indian woman to admit that if there ever was any social class of women who have left an imprint on Indian civilisation that was that of the courtesans. The virtuous women of Indian history have left nothing for posterity. Their contribution was strictly limited to the continuation of the race. But India, nay the whole world, owes a great debt to the Indian courtesans. It is they who have cherished and preserved the arts of music and dance. It is they who could provide civilised feminine company — so necessary for creative activity — to poets and artists, for the virtuous women were all steeped in ignorance. But much more important than the services rendered to the Muse was the fact that they, among all women of Indian history, could and did deal with men on equal terms. They might sell their favours in bits and pieces, but they did not sell their souls for all time as their virtuous sisters did. Moreover, being fallen women without any hope of redemption, they alone could snap themselves free of the noxious influence of pernicious moral values. They alone could acquire personality and character; they alone could afford to be truthful in their lives.

OFFICIAL PAPERS

Science and Technology for Development

Pravin Visaria

Science and Technology for Development: Report on the United Nations Conference on Application of Science and Technology for Benefit of Less Developed Areas; United Nations.
Vol I — **The World of Opportunity,** pp viii + 267, $2.40 (paper bound).
Vol IV — **Industry,** pp. viii + 265, $7.50 (cloth bound).

THE UN conference on the application of science and technology for the benefit of the less developed areas which met in Geneva for 12 days beginning February 4, 1963, was probably the largest such conference and certainly unique in many ways. The Conference, presided over by Professor M S Thacker, had brought together 1,665 participants from all scientific disciplines and the number of papers submitted for its deliberation exceeded 2,000. Since the publication and perusal of such a large number of essentially technical and scientific papers would be an immense task, it is commendable indeed that the highlights of contributed papers as well as of the Conference discussions have now been summarised in a comprehensive eight-volume official report of the Secretary General of the U N. The Report, prepared with the advice of an Editorial Advisory Committee, is non-technical in style and is very "readable", which is what it was intended to be.

The breadth of coverage of the Conference is evident from the titles of the six volumes of the Report not under review here: natural resources (vol II), agriculture (vol III), people and living (vol V), education and training (vol VI), science and planning (vol VII) and plenary proceedings, list of reports and papers and index (vol VIII). In fact, the scope of the conference was even broader than indicated by these titles. To illustrate, the volume on industry covers the main issues in industrialisation, the pattern of particular main groups of industries, transport and communications. And on every subject, the potentialities as well as the unsolved difficulties of the application of the most recent scientific and technological progress are outlined, with numerous illustrations from the actual experience of some countries.

Excellent Summary

The first volume of the Report is general and introductory and is divided into three parts. The first part introduces the Conference and the Report with a terse discussion of the natural features of the earth and the effects on them of human interference through irrigation, burning of fuel for energy, hunting of animals, water-pollution, etc. A most interesting though brief reference is made to the non-conventional sources of energy and their promise for the future. The revolution of rising expectations is presented in the context of the gap in income-levels of countries, the scientific and technological revolution, and the role of the conference as a gathering to take stock of the potentialities of science and technology and to focus attention of the scientific world on the urgent need "to combat poverty, chronic disease, illiteracy, and to raise more than two-thirds of the world's population to a condition compatible with human dignity".

Part II of the first volume is its core, consisting of a 149-page summary of the proceedings of the entire Conference. It is sub-divided into 12 sections corresponding to the broad areas under which the papers and deliberations were grouped. While this summary is excellent, the fourth volume on industry can better illustrate the nature of the Conference discussions and the Report.

Diversity of Views

As mentioned above, the volume on industry covers, *inter alia*, a discussion of major issues involved in industrialisation as well as in developing specific industries. Among the issues discussed here are the need to integrate an industrialisation programme with a

general plan of economic development, decision on priorities, choice of techniques and the role of small industry, industrial location, training of managerial and executive personnel and operational efficiency in production. On every aspect, there was a wide diversity of views and, not unexpectedly, the lines were drawn according to the nationality of the contributor of the paper or the discussant. Thus while a paper from the USA cautioned against viewing "heavy industry as the key to affluence" on the basis of the experience of the Soviet Union and other developed countries, a paper from USSR criticised the priority given in some countries to consumer goods industries. The latter were said to slow down "the achievement of the economic independence" and to aggravate "the balance-of-payment deficit". Another Rumanian paper emphasised the role of the engineering industry as "the most dynamic and productive industrial branch" in establishing a base for industry. Experience of various other countries naturally suggest gradual stage-by-stage progress in industrialisation associated with shifts in emphasis. Similar differences are evident on the subject of small scale vs large scale production, the role of the State, etc. It is an impressive achievement of the report in keeping with the policy of the UN, that differences of opinion have been recorded faithfully. While this may confuse a layman, it will certainly stimulate further enquiry and study in the intellectually curious.

A remark by Soviet contributor, noted in volume IV, is worth mentioning here. He criticised the Indian government "for allowing imports to rise more rapidly than production, and for producing a situation in which the bulk of industry is working below capacity" and attributed this to the "failure to give sufficient initial priority to the key machine-building sector" (p 17). Presumably the reference is to the priorities in the First Five Year Plan; but in a summary report the perspective of the argument naturally tends to be blurred. Also a reader who is not closely familiar with the Indian developments may tend to accept this remark as essentially correct despite the fact that in 1951-52, the first plan appeared quite a monumental undertaking. Further, can one argue that an earlier emphasis on the machine building industry would have avoided a more rapid rise of imports than of production? Would it not have merely hastened the appearance of the foreign exchange crisis — except probably for its possible contribution towards ensuring the use of the then available sterling balances for capital goods imports? These questions are raised here not so much to criticise the Soviet contributor as to point out that illustrative material based on case histories cannot, in a report of this nature, do full justice to the complex processes and problems involved in applications of scientific or technical knowledge and in development planning. One should not even expect this. Only the broad outlines of the particular case histories can be taken as valid.

Relevance for Development

This is not to suggest that the reporting is uncritical. In fact there is a remarkable candour and in the discussion of "food industries" it is clearly stated that "the conference papers on food preservation and processing were concerned with techniques, rather than with their transference, and barely touched the crucial question of how to introduce technological change" (p 99). Besides this, the report is valuable not for its contribution towards enlarging the competence of a specialist in his own field but for informing him of developments in other fields and their relevance to economic development. Thus, for example, an economist will find it interesting to learn of the latest techniques in transporting and handling cargoes such as the use of pipelines to move coal (pp 178-9) or the basic principles underlying teleprinters and television (p 187) and the possibilities and problems of using earth satellites for a world wide communications network (pp 210-15).

One might naturally ask at this stage what the value of this conference for the actual progress of developing countries in the next few years is. This is briefly discussed in Part III of Volume I. While the conference had no power to adopt resolutions, it informally forwarded a proposal to the UN Secretary General for "the creation of a new specialised agency of the United Nations to service the less developed areas in the field of science and technology". The UN Secretary General, however, recommended to the Economic and Social Council not a new agency but only a further development of and stronger co-ordination among the existing agencies. The heads of various agencies accepted in May 1963 continuing responsibility for follow-up action. They decided to establish and to continue in existence "for such time as may be necessary", a sub-committee on science and technology. The role of the UN, however, is to stimulate action. The support for projects involving financial resources for implementation must come chiefly from governments, either on a bilateral basis or in the form of regional co-operation.

Role of Entrepreneurs

Industrialists of various countries can also contribute a good deal if they recognise and attempt to seize the numerous challenging opportunities outlined at the Conference and mentioned in this Report. (For example, to satisfy the UNESCO's estimate of a minimum requirement of five radio receivers per 100 inhabitants in a country, about 400 million radio receivers would be required for Africa, Asia, excluding Japan, and Latin America. The UNESCO has also drawn up the specifications of a low cost transistor radio set priced at from $5 to $10 and powered by ordinary torch batteries. The aim is to at least assemble the radios in countries where they will be used.) Thus the ultimate achievement of the objectives of this conference seems to depend on whether the natural as well as social scientists and entrepreneurs, administrators and planners, both in developed and developing countries will show sufficient imagination, enthusiasm, initiative and spirit of co-operative endeavour to harness the mighty forces of science and technology for the benefit of that segment of mankind which has so far been denied the fruits of scientific progress.

To conclude, a perusal of the two volumes under review convinces a reader that at a time when it is extremely difficult to keep abreast of developments even in one field and when the malaise of "two cultures" is present almost everywhere, this eight-volume Report promises to provide an excellent comprehensive outline, simple and readable, of the relevance of the scientific and technological revolution to the problems of development in underdeveloped countries. The Report deserves wide distribution, publicity and perusal because many of the applications of science and technology described here to be at an experimental and preliminary stage will make an important contribution to the development of several underdeveloped countries.

Use of Rural Manpower for Development

V S Vyas

For formulating a practical programme of using rural manpower for development it is necessary to take a dis-aggregated view of the unemployment and underemployment situation in the rural areas. The charcteristics of the problem and consequently the solutions relevant will differ depending on whether we are considering one section of the rural population or another.

The broad approach suggested below is to encourage cultivators to take to more intensive cultivation and to supplement it with dairying and similar activities.

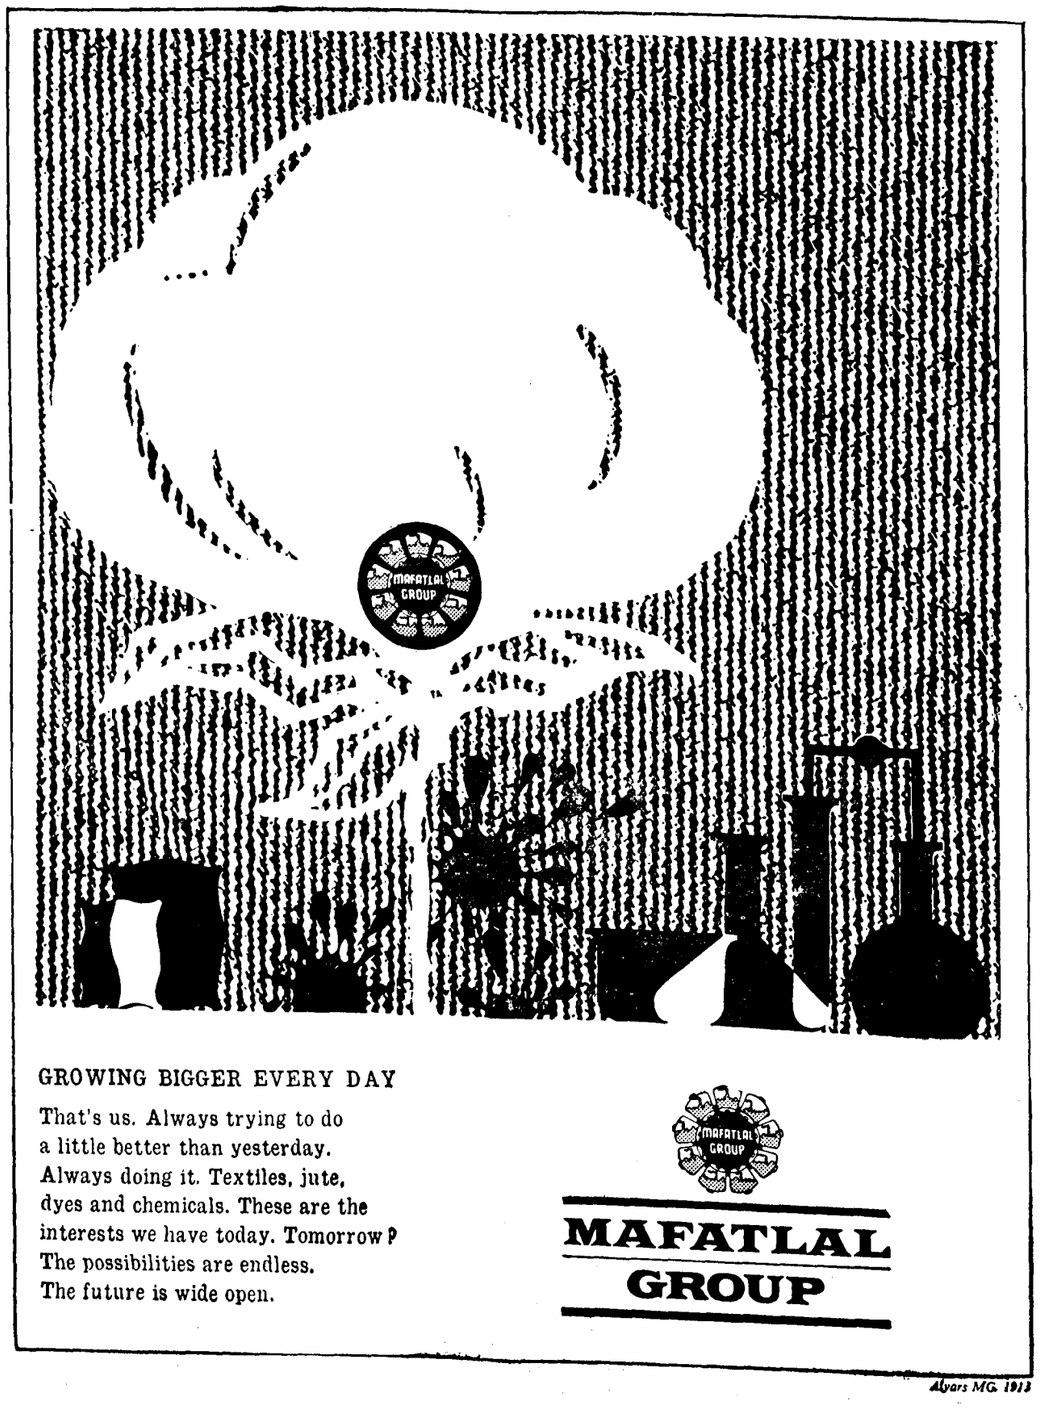
For agricultural labourers a programme on the lines of the rural works programme included in the Third Plan, with a portfolio of quick-maturing projects which will also make intensive agriculture possible, is proposed. The programme will have to provide for training to form elementary skills and develop organisational abilities.

The artisan classes should be covered by a programme of rural industries which will take into account their existing skills and will aim at developing and diversifying them with remunerative employment throughout the year.

A MAJOR concern of planning in this country has been, and must remain, the proper utilisation of manpower for economic growth and for providing gainful employment to the population in the working age-group. While setting the objective of fuller employment the consideration of economic welfare has also been kept in mind since, because of the very size of the work-force in our country, it will never be possible to provide workers an adequate living except by giving them gainful jobs to do. In spite of all the concern with the problem, this is precisely the field in which planning has made the least impact. The fact of mounting unemployment is too well-known to need any elaborate statistical evidence. Yet to suggest the broad dimensions of the problem, one may mention that the Second Plan began with a backlog of 5.3 million unemployed. At the beginning of the Third Plan, unemployment, rural and urban, was reckoned at 8 million. There has been an addition of 17 million to the country's labour-force during the Third Plan period. But employment opportunities created do not seem to have exceeded 13 million or so. Thus 4 million more unemployed have been added to the backlog of 8 million with which the Third Plan started, making a total of 12 million. Nor is there in the draft of the Fourth Plan any evidence to suggest that a significant dent will be made on the backlog of unemployment. According to its framers, the Plan would be considered a success if it could provide jobs to the new entrants to labour-force, numbering about 23 million.

The lack of gainful opportunities for employment is common both to the urban as well as rural areas, though the nature and characteristics of the employment problem differ in the two areas. The acuteness of unemployment in urban areas becomes obvious because a large part of the unemployment is overt. The problem is not less serious in the rural areas where most of the unemployment is in the guise of under-employment coupled with meagre purchasing power.

Of the total rural work-force, numbering nearly 162 million workers (in 1961), about 79 per cent were engaged in agricultural activities. Of these, nearly 60 per cent were cultivators and 19 per cent agricultural labourers. Of the rest about 6 per cent got employment in household and cottage industries, and the remaining 15 per cent were engaged in construction, trade, commerce and service, etc. To provide adequate employment to this labour-force needs very careful planning. There are economic as well as social factors which have to be given due recognition in any attempt at rural manpower utilisation. The unemployment or under-employment situation among different categories of rural workers differs as it does from one industrial category to another. The problem, therefore, has to be disaggregated.



Cultivators Should Stick to Farming

From data collected during the Farm Management Surveys in eight States, Maharashtra, Madras, Punjab, U P, West Bengal, Andhra Pradesh, Orissa and Bihar, it seems that on an average effective work on the farm ranges from 100 to 250 standard days (of 8 hours). The number of days in a year when the farm family worker is unemloyed ranges from 100 to 150 standard days. It will be wrong to conclude from this data that most farm family labourers will be available for off-farm jobs for all these days. This is because the days of unemployment are arrived at after totalling the hours of employment each day and converting them into standard days of eight hours To these are added hours (converted in to standard days) spent on social activities and hours (again converted in to standard days) when the respondent was not available for work due to sickness, etc. The residual figure is considered as the unemployment during the year. Thus, hours of unemployment are spread practically through-out the working days of the year though with differing intensity. It is not as if a continuous period of 100 to 150 days is available for off-the-farm jobs.

Even if it were possible to have a continuous period of 100 to 150 days of unemployment it is doubtful if the cultivators would opt for off-the-farm employment if they could help it. Several studies by the different Agro-Economic Research Centres, other institutions and scholars clearly show that from the social point of view cultivators above the rank of marginal farmers, the latter being strictly agricultural labourers rather than cultivators, consider it "beneath them" to offer themselves for non-farm employment, specially in construction type of activities.

Even if they accept employment in the cottage industries during the intermittents periods of unemployment, it is doubtful if it would be of much avail. Even in these traditional industries it is desirable to aim at skill-formation which comes with continuous work on a job for a long period of time. Off-and on employment in a traditional industry will not be of much help to farmers economically nor will it expand the pool of skills in the industry. What is worse, it may affect the efficiency of agricultural operations adversely.

Economically more justifiable would be a programme for intensifying agriculture by the introduction of irrigation, intensive use of inputs and better care of land. Coupled with the intensification of agriculture stress will have to be laid on encouraging supplementary occupations like dairying and animal husbandry. In the Farm Management Surveys it has been clearly shown

that differences in the number of days employed on irrigated and unirrigated farming is quite considerable. For instance, in case of wheat, gram, jowar, cotton, cholam and ragi, man-hour employment on irrigated crops is easily 2 to 3 times that on unirrigated crops.

Two conclusions emerges from this. In the first place, distribution of attention and time among various occupations which are not integrally related with each other is not very helpful. Second, the most important measure to give fuller employment to cultivators is the spread of irrigation and intensive use of inputs. As supplementary vocations, the cultivators should be encouraged to take to dairying, animal husbandry, pisciculture and poultry.

The next important group of rural workers, agricultural labourers, faces the problem of unemployment and low income in a more acute form. According to the 1961 census, agricultural labourers numbered more than 305 lakhs. By now their number must have increased at least by 10 per cent. This is undoubtedly the most disadvantaged section of the rural population. Several studies in this field suggest that employment of agricultural labourers is no higher than that of the cultivators; in fact it is lower. And per capita income of agricultural labourers is much lower than that of cultivators which itself is meagre.

There are two or three characteristics of agricultural labourers which should be kept in view while devising any programme of rural manpower utilisation affecting this section of the labour-force. In the first place, this is not only economically the weakest section but is socially on the lowest rungs of the rural society. It is in fact a floating mass not particularly attached to any vocation and can be, with some persuation, mobilised for any type of unskilled labour. Because of the low aspiration level, this section is supposed to be characterised what has come to be known as "the backward-sloping supply-curve of labour"—it responds inversely to rise in employment opportunities and higher wages once the minimum needs are satisfied. This characteristic, however, is fast disappearing with the impact of urbanisation and modernisation to which even agricultural labourers have not been immune. Therefore, they should be considered as available for any type of un-skilled work. For the present, however, the employment opportunities as well as wage-levels of these workers are directly related to the profitability of agriculture in the particular area.

Agricultural labour faces a continuous period of unemployment which more or less, coincides with the slack season in agriculture. The duration of the slack season in various parts of the country ranges from two to eight months depending largely upon irrigation and the crop pattern. For the larger part of the country, the latter figure is more relevant; it also indicates, broadly, the period of unemployment faced by agricultural labourers. The continuous period of unemployment spread practically through the slack season facilitates mobilisation of this work-force for gainful employment.

The above characteristics of agricultural labour provide certain guidelines for a programme of utilisation of this section of rural manpower. The programme devised has to be, perforce, highly labour intensive. It should be dispersed in such a way that it is within walking distance of the population it seeks to cover. This condition is particularly necessary to overcome inertia and apathy. It should be a programme which can be completed within the duration of the slack season in the particular region and should strengthen agriculture. It will have an indirect impact on under-employment of cultivators and will promise fuller employment to labour in agriculture. Of course, in the choice of programmes a degree of flexibility will have to be maintained, depending largely on the population and the area to be covered.

Failure of Rural Works

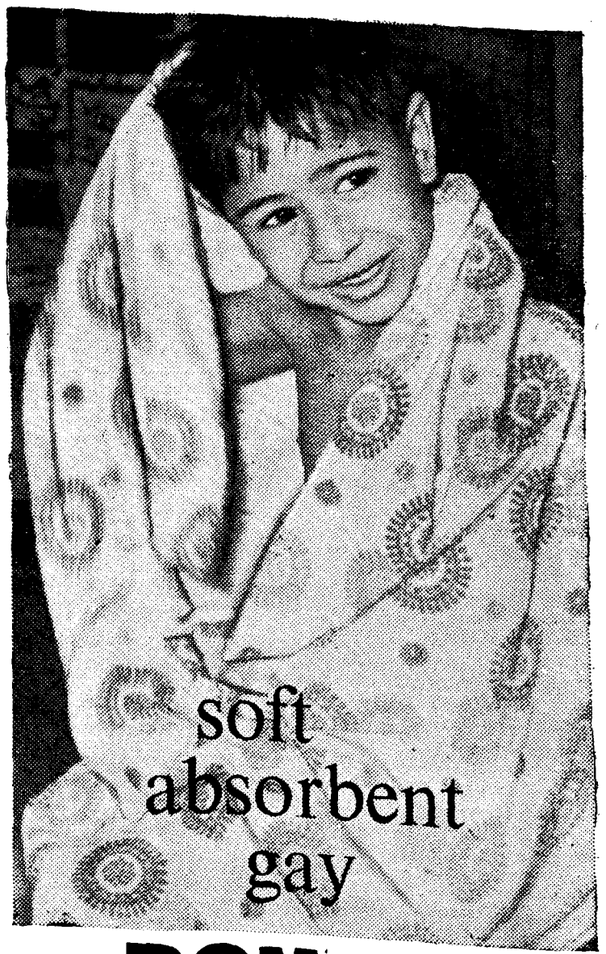
Since 1960-61 a Rural Works programme has been in operation with more or less the same objectives as I have mentioned above. This programme unfortunately has not met with any perceptible success. As against the target of providing employment for 100 days to 2.5 million workers in the Third Plan, total employment generated till 1964-65 is not more than 3.5 lakhs. It is envisaged that during the fourth Plan, the programme will receive high priority. More than 1,500 blocks are likely to be covered and something like Rs 250 crores will be spent on it. The target is to provide 5 million rural workers employment for 100 days by the end of the Plan. This target in itself seems quite impressive, but in view of the dimensions of the problem of unemployment and under-employment even if it is fulfilled it will bring only modest relief. It is all the more necessary, therefore, that rigorous standard should be set in coverage of population, selection of areas and choice of projects.

It follows from what has been said above that agricultural labourers qualify for this type of programme more that any other section of rural population. Therefore, the existance of a large number of agricultural labourers should be the most important criterion for the selection of areas. Similarly, the projects selected should be such as create the potential for future development of the region and fuller employment of labour so that the programme does not remain merely a relief programme but becomes an economic programme in the true sense of the term. The selection of the projects will be conditioned by several consideration, viz, they should be labour-intensive, quick maturing, and, preferably, conducive to development of more intensive agriculture in the area.

There is another aspect which also should be kept in mind, namely the objective of skill-formation. The programme should be so devised that at least the elimentary skills, e g those of masons, brick-layers, ordinary surveyors, etc, should be imparted to the workers on the site, so that the programme will be helpful in transforming the outlook of the participants and in enhancing their capacities. Development of organisational skills and leadership should also find a suitable place in the programme. As the programme is phased over five years, it should be the aim that at least in the later years the skilled or semi-skilled workers needed are recruited and trained from among the workers who came to work in the earlier years.

In this connection it will be worthwhile to experiment with a labour crop employed all the year round in the construction of works of quick-maturing nature This crop should be organised in those areas where the problem of surplus agricultural labour is particularly acute. In such areas it may happen that the prospects for intensive agriculture and consequent increase in agricultural labour requirement may not be there and so structural changes in the economy have to be initiated. This will be facilitated by a labour crop working all through the year in construction projects and attracting to their ranks even the small and marginal farmers who may, if assured year-round employment, dispose of their tiny bits of land. In this way the programme can indirectly help in initiating radical structural changes. There is no desire to deprive

agriculture of its normal labour requirements.



Artisan Classes

Another important group whose labour-time can be utilised for development is that of the artisans and craftsmen. They constitute about 6.1 per cent of the total rural labour-force. They pursue a number of crafts, most of which have not received any direct aid or support from government or quasi-government agencies. It is for this group that the programme of cottage and rural industries should be specially oriented.

The artisans have the tradition of such activity behind them. The identification of occupation with caste is still a real phenomenon in the rural areas. It will be difficult to interest any major group in the rural areas in rural industries with as much ease as the artisan castes. Further, they can pursue these activities exclusively and round the year which, again, no other group in the rural areas will be able to do. The advantage of the year-round pursuit of one particular activity as against division of interest has already been pointed out. Third, the artisans have the elementary skills for the type of industries which can be developed with little effort and attention. Wherever small scale or cottage industries have developed rapidly the artisan castes have been the first to take the advantage of them. In Punjab and in parts of Gujarat where such industries are becomming important the artisan castes have taken the lead. Finally, a class of people fully devoted to and specialising in small industries in the villages will also help, indirectly, in encouraging farmers to use ordinary mechanical appliances which can supplement human and bullock labour more fully since the servicing and minor repair of these appliances will no longer be a deterrant.

Conclusion

For formulating any practical programme of utilisation of rural manpower for development, it is necessary to take a dis-aggregated view of the rural unemployment and under-employment situation. The characteristics of the problem and consequently the solutions offered differ from one class to another and have to be viewed in the specific context of the locality and the region. The broad policy approach suggested is to encourage the cultivators to go for more intensive cultivation and supplement it by dairying and similar activities. For agricultural labourers a programme on the lines of the rural works programme uncluded in the Third Plan with a portfolio of quick maturing projects, which also help make intensive agricultural possible, for each locality, is proposed. The programme must provide for training which may lead to formation of elimentary skills and development of organisational abilities. For the artisan class it is proposed that they should be covered by a programme of rural industries which takes into account their existing skills and develops them further while providing them remunerative employment round the year.

THERE BYE-ELECTIONS III

Fall of a Traditional Congress Stronghold

Rushikesh Maru

The Rajkot by-election to the Lok Sabha in 1963 underscored the great importance of the organisational factor in the outcome of elections.

Where the Congress party is dominated by one leader for a long time, the result is a highly personalised support structure and lack of institutional expression of political loyalties. Once the original condition of efficiency —the domination of the particular leader—is removed, or weakened, the Congress is suddenly found without depth or energy, greatly divided and lacking in drive and resources.

This state of internal organisation reflects the large gaps in the social base of the Congress party's support —gaps between the masses and the ordinary leadership which had relied all the time on the "great leader's" appeal and the failure to accommodate certain important segments of the social structure.

For the opposition to take advantage of such a situation, it is necessary for it:

(a) to close its ranks and present a united front;

(b) to isolate the sections alienated by the Congress party and secure their support; and,

(c) to sustain such a support by imaginative field organisation, with the help of influential key men and continuous pressure on voters either individually or in groups.

In organising such an effort, it is vital to put into effect existing influence-networks based on kinship, caste and caste associations, traditional loyalties and economic relationships.

It is this inter-twining between organisational factors on the one hand and a sharply differentiated social structure on the other, which provides the context in which a traditional Congress stronghold like Rajkot votes an opposition party to power.

THE defeat of the Congress candidate in Rajkot came as a shock to both the local and the national leadership of the Congress, which had considered Rajkot as a stronghold of the party. The Congress had won this parliamentary constituency in all three elections. Its vote rose from 61.44 per cent in 1952 to 71.65 per cent in 1957. It held all of the seven legislative assembly seats that form part of the parliamentary constituency in the first two elections. However, in the 1962 election, although the parliamentary seat was retained, the Congress lost in two assembly constituencies and its strength diminished in four other constituencies. As shown in Table 3, the anti-Congress vote in Rajkot city constituency was more than double that of the Congress and although the opposition was divided, one of the opposition candidates succeeded in dislodging the Congress. The Congress was also dislodged in the Paddhari Assembly Constituency, while the opposition secured a sizeable votes in Jasadan, Dhoraji and Uplita constituencies. The domination of the Congress was thus already on the decline by the time of the third General Election; the decline turned into defeat in 1963. The Congress vote fell from 71.65 per cent 1957 to 55.24 per cent in 1962 and 44.4 per cent in 1963.

However, a closer look shows that while the Congress position was no doubt weakened in 1962, it was still substantial in the parliamentary constituency and district as a whole. The Congress was still the only organised political party, a position it had acquired through a long period of domination. The State People's Movement for popular government was directed against the ex-ruler of Rajkot as long back as 1921. The association of Gandhi himself with this movement and the fact that Gandhi was born in Saurashtra gave an advantage to the Congress in Saurashtra. This identification was made more concrete by a net-work of constructive programmes initiated in the early 1920's. This tradition of constructive work was carried over even in the post-Independence period. U N Dhebar, who has been the leading spirit behind these activities, came to power as the first Chief Minister of Saurashtra State in 1948. He emphasised the importance of constructive work in providing a network support to the Congress. Such a structure of support was further reinforced by a very successful governmental performance during his regime. The opposition failed to gain any strength in this situation. Inspite of the success of a few independent candidates in the 1962 elections, the Congress continued to be powerful in the district, and the opposition parties continued to be weak Considered against this background, the elec- Congress debacle in the 1963 by-election cannot be explained by the trend set in 1962, but rather by the breakdown of the Congress organization that took place at the time of the bye-election. What alarmed the Congress leadership when the outcome of the election became known was not so much the victory of the Swatantra party, but the paralysis in the organization of the party, as reflected in the failure to mobilise adequate workers, and the lack of direction and drive in the election campaign.

How is it that the Swatantra party, which had no local organization to start with on the eve of the election, and who had nominated an outsider, could unseat the Congress in its own fortress? Was this due to the Swatantra Party's superior election strategy, its financial resources, the candidate's own national image, the support it got from traditional interests, or the ideological impact of the Swatantra programme on certain sections of the voters? These were no doubt some of the factors that influenced the outcome of the election. Though important in themselves, however, they provide little assistance in explaining the Congress organisation's failure to match the opposition attack. Only

a detailed examination of the organisational factor can help our understanding of the overall situation in which the election took place.

The Congress Organisation

In trying to explain the Congress performance in 1963, we advance the hypothesis that a party structure based on a network of personal loyalties under a dominant and powerful leader, while it proves highly successful in the short run, becomes dysfunctional to the party, once the leader ceases to provide a symbol of common loyalty. The role of U N Dhebar, former President of the Indian National Congress, in the political development of the district provides a key to the understanding of the present position of the Congress in Rajkot. A close associate of Gandhi, Dhebar rose to the stature of an all-powerful leader in the district during his tenure as the Chief Minister of the former Saurashtra State from 1948 to 1955. He combines within him the qualities of a dynamic leader, a realist in administration and politics, and a strict Gandhian in personal life. The combination of these qualities made him a successful organisational leader as well as a revered mass idol. The success of his career as Chief Minister lies in the direct link that he maintained with the people, a link that had been forged during the period of "constructive work" before Independence. This direct link had two important consequences. On the one hand, it raised the personal prestige of Dhebar and nearly turned him into a charismatic leader. On the other hand, however, it undermined the role of the party organization as a liaison between the people and the Government.

The whole structure of support for the Congress in Saurashtra was built out of an elaborate chain of personal loyalties, finally merging into a common identity with the leader. It must, of course, be emphasised here that such a diffused and personalised communication network under the domination of a powerful leader was very much in tune with the traditional culture of Saurashtra: a society which was divided into 222 small feudal states and was used to personal governance. The new government's success was mainly due to its ability to convey a modern theme through the traditional communication channels. Although this is a tribute to the genius of a pragmatic leader, it should be conceded that in the long run such an organisation of power perpetuated a situation where political relationships could not get institutionalized.

As an illustration of this general point, let us take the structure of Congress leadership in Rajkot district. The core of the district leadership initially came from Rajkot city and that too from the educated urban middle class, which has since continued to dominate, as shown in Table 4. It controlled the majority of the D C C and governmental positions. Dhebar and his colleagues in the government kept direct contacts with the rural leaders who did not challenge the control of the D C C by urban leaders, partly because of the novelty of their experience under a democratic system, and partly because they could always look forward to Dhebar for the satisfaction of their local demands. They thought they could satisfy the needs of their own local communities through their direct link with the top-most leader without needing to control the D C C. On the other hand, the urban leaders in control of the D C C gradually lost whatever contact they had with the rural voters and leaders, because, once again, their strength was dependent on their capacity to retain the confidence of Dhebar.

In 1954, Dhebar was invited to take on the Presidentship of the Indian National Congress. He resigned from the Chief Ministership of Saurashtra and presided over the historic Avadi session of the Congress in January 1955, and continued in the same position till 1958. In November 1956, Saurashtra State was merged with the bilingual Bombay State. These two developments called for an altogether different role on the part of the D C C leaders, a role that they were not equipped to play. The physical shift in the governmental decision-making centre to Bombay and a substantive change in the position of the Saurashtra ministers as subordinates under a larger set-up at once created a gap between the people and the government in Saurashtra. The district Congress organisation failed to fill this gap because it never had the status or the experience to act on its own. There was thus created a political void in Rajkot (thus underlining the critical importance of the Congress organisation in the Indian political system). Dhebar's absence from the district — no doubt raised the status of the district organisational leadership. On the other hand, Dhebar himself had also to depend on the organizational leadership at the district level for his own communication with his supporters. With this elevation of the status of district organizational leadership, there followed a competition among various aspirants for the Number Two position under Dhebar.

Here was a chance to create a heirarchy of leadership at the district level. But the compulsions of maintaining his own leadership over that of all others, and as acceptable to all factions, did not allow Dhebar to decide his next man. He kept the situation fluid so as to see that no one could gain a decisive advantage over anyone else. The resulting position, which still continues, was that there came into being four factional leaders within the D C C, each claiming to be *the* district leader. Meanwhile, the new rural leadership which had emerged under new pressures from the countryside challenged the urban leaders' monopoly in the D C C, and claimed representation in the Legislature. This further disrupted the unity of the urban leaders, each of whom tried to build his support in different sectors of the rural elite.[2] Thus the failure to institutionalise a clear line of authority resulted in acute factionalism and the consequent lack of direction to the Congress rank and file, a fact that was strikingly brought home during the 1963 bye-election.

Nature of Factionalism

The factions that emerged during 1957-62 were built around powerful individuals competing for capturing a decisive position in the district Congress. It is true that Dhebar continued to dictate the relative positions of these factions in the power structure of the district, but in so doing, he had also to take into account the comparative support potential of these

Table 1: Rajkot Parliamentary Constituency — Votes Polled by Candidate in the 1963 Bye-election

Name of the Candidates	Party Affiliation	Votes Polled
Jethalal Harikrishna Joshi	Congress	69,214
Minocher Rustom Masani	Swatantra	83,365
Nanji Savji Bhalodi	Independent	3,425

factions. The principal contenders in the district were the leader who ultimately got the Congress ticket for the parliamentary seat vacated by Dhebar (referred to here as faction leader A) and the leader who was President of the D C C until 1962 (faction leader B). B had sought to eliminate all except his own supporters during his tenure as President of the D C C. This resulted in all other factions joining in a common front against his domination. The "outgroup" gradually became a majority group. Its leadership was claimed by faction leader A. In December 1962, a change in D C C presidentship was affected under the guidance of Dhebar. This time the President was chosen from among the rural leaders. Faction leader D, representing a majority community in the rural sector, became the D C C President. This move was in part motivated by the growing need to contain the rural-urban cleavage in Rajkot district. But the change was also acceptable to the faction leader A because the new president had also joined with the majority group that ousted B from power (Leader C had also lost in importance in the course of this struggle).

When the bye-election was to be held in 1963, an uneasy alliance between these various factions was worked out by Dhebar. However, the mechanics of keeping together these diverse elements in one common front of action created an imbalance in the oranisation which dissipated energies. Although D was the D C C president, B was made the Chairman of the District Election Committee. This arrangement was dictated by B who, though not occupying a formal position was yet very powerful in district politics. He had his own supporters well entrenched in Municipalities, Local Boards and Panchayats. In order to solicit his support, he was given this important position in the election setup. This frustrated faction leader D who felt deprived of his power. The result was that he did not exert his own influence fully in the rural sector, confining his activities merely to his own home town. On the other hand, faction leader B, though he was given formal charge of the election organization, did not give sufficient attention to the organization of the campaign. His conflict with faction leader A, the candidate in the election, influenced his own behaviour. Although, he himself did not ask his supporters to sabotage the election, he did not take the necessary pains to mobilise all his resources. The factional alliance worked out by Dhebar thus resulted in inaction on the part of those who held responsible positions in the election machinery and consequent lack of direction of the Congress campaign.

Such inaction at the top resulted in free play of conflicts lower down. In each Assembly segment of the parliamentary constituency there were two groups, the in-group and the out-group. The out-group was a direct consequence of local elections in which there were more claimants for power than could be accommodated by the Congress. In the cities and town conflicts centred round the municipality whereas in the villages it was around the panchayats and taluka panchayats. In both urban and rural areas, there were also disputes on the distribution of the Congress ticket for seats in the State Legislative Assembly. In all cases, but more seriously in the rural areas where Panchayati Raj had been implemented, there were big splits in the Congress party, resulting in the emergence of a dissident group. The out-group either openly assisted the opposition or sabotaged the Congress campaign from within. The two patterns are well illustrated by factional

[1] After 1952, Khedut Sangh has been disbanded as a political organisation. Most of its leaders were provided with positions in the Congress. A few of the ex-Khedut Sangh leaders who could not get positions in the Congress remained inactive due to lack of any substantial following. These scattered individuals helped the Swatantra party during the 1963 bye-election.

[2] In Col 9 votes for 1952 are those polled by Hindu Mahasabha and Kisan Mazdoor Praja Party. In 1957 the votes are Hindu Mahasabha votes.

[3] There was one Independent candidate in 1952, one in 1957, two in 1962 and one in 1963. Of the 82,909 total votes polled by the Independents in 1962, the editor of the local opposition daily, an immediate rival of UN Dhebar, the Congress candidate, polled 61,3111 (33.10 per cent) votes. He hleped the Swatantra in 1963.

behaviour in two of the Assembly segments, namely Upleta and Jetpur. In Upleta, the *Sarpanch* group which was the out-group, worked against the MLA group (the in-group), openly defied the DCC directive, and assisted the opposition.[3] The conflict was so acute that the constituency got physically divided into two regions one consisting of out-group controlled villages, the other having villages under the influence of the MLA group. (Table 5 sharply brings out the concentration of Swatantra gains in booths where out-group was influential.) Such a clear expression of the conflict allowed the in-group to put all its strength in the campaign without any fear of backdoor sabotage. The result was that the Congress had the biggest lead in Upleta, in spite of acute internal factionalism. In Jetpur, the MLA's group and the group led by the President of the Taluka Panchayat were pitted against each other. Here however, the MLA group was the out-group. The MLA remained away from the constituency throughout the election. His supporters remained inactive and some of them even sabotaged the election.[4] Here factionalism took a more underhand form, prevented open confrontation, and resulted in the opposition securing nearly the same vote as the Congress in a constituency where the latter had a majority of about 16,000 votes in 1962.

Another interesting example of factionalism could be seen in Jasdan, a Congress stronghold, where the Congress lost by about 7,000 votes to the Swatantra in 1963. The root of the conflict goes back to the 1957 elections to the Assembly, when a local Congress leader in Jasdan was rejected in favour of a leading Muslim advocate of Rajkot (originally belonging to Jasdan) for nomination as the Congress candidate. The Jasdan Congress leader did not support the official Congress candidate who, however, got the support of the royal family of Jasdan because of his personal ties with the latter, and won the seat by a margin of more than 8,000 votes. After the elections, the dissident local Congress leader gained strength through an alliance with faction leader B at the district level. The former was brought back to a position of power by making him the President of the District Local Board, and subsequently of the Zilla Panchayat. His re-entry into local politics with renewed strength created conflict between him and the official MLA, who had also emerged as a very popular leader, and was made a Deputy Minister in the newly formed Gujarat State. The former eventually succeeded in removing the MLA from Jasdan through a carefully planned strategy in which he had the support of faction leader B at the district level. At the time of nominating the Congress candidates in 1962, he was given a ticket outside Jasdan, in Paddhari constituency, under the pretext of providing a safe seat in Jasdan to a women candidate. He lost to the Prince of Rajkot in Paddhari, as was indeed expected. Out of frustration, he left politics and took up the Chairmanship of the Public Service Commission. The Prince of Jasdan who had all along helped the Congress because of his close relations with the local MLA was very much annoyed by this move of the Congress, which in turn contributed to his decision to support the Swatantra in 1963. At the same time, with the exit of the MLA from district politics, his supporters within the Congress were gradually alienated. They helped the opposition in 1963. The cost of the alienation of the Jasdan Prince on the one hand, and the ex-MLA group, on the other, was very heavy for the Congress, whose loss in

[1] Opposition votes for Rajkot constituency were polled by two Independent candidates. Out of the 27,293 votes, 15,638 were polled by one Independent candidate who won the election. The other candidate who polled 11,654 votes was a Jan Sangh leader who had contested as an Independent. His election was managed by Jan Sangh. In the final analysis, his votes were Jan Sangh votes. In Paddhari constituency, out of 19,026 votes, the Prince of Rajkot, the successful Independent candidate polled 16,151. In Jasdan, the major opposition rival to the Congress was a PSP candidate who secured 6,504 votes. In Dhoraji and Upleta the immediate rivals to the Congress, both Communists, polled 7,855 and 7,072 votes respectively. All these opposition party candidates and Independent, except Communists, supported Swatantra in 1963 bye-election.

[2] Here, Non-Congress votes indicate only votes polled by the Swatantra candidate. Apart from the Swatantra candidate, there was one Independent who polled just 2.2 per cent of the total votes. This was negligible and our main purpose was to compare Swatantra with the Congress. His votes, therefore are not included in the non-Congress votes mentioned here.

Jasdan by 7,000 votes (from a lead of about 8,000 in 1962) was bigger than in other legislative constituency.

The example of Jasdan brings out the important relationship between factional movements within the Congress and its support base outside the party. The former, when carried too far, alienated the latter.

In the past, such conflicts, whether or not they were resolved, did not work against the Congress, because of the direct relationship of the several factional leaders with Dhebar at the top, who was considered to meet to their respective demands in a more or less impartial manner. This prevented them from operating outside the party channels as they were primarily engaged in pressing Dhebar to gain their own ends. In 1958, Dhebar ceased to be the Congress President and his position in central politics gradually became uncertain. Secondly, with the emergence of Gujarat State, he had to compete with Morarji Desai, who emerged as the undisputed leader of the congress in Gujarat. Dhebar did, of course, try to restrain Morarji Desai's influence by a calculated strategy, but the outcome was a further decline in his political prestige at the national level, and indirectly at the State level also. With his stock with Nehru at a low ebb, and his political standing uncertain, Dhebar decided to resign from the Parliament and from organizational posts in the Congress. Although it was officially announced that he was resigning from these positions in order to take up the Presidentship of the All-India Khadi Commission, the political factors behind the change was obvious. The change had its ramifications right till the level of Rajkot politics. On the one hand, his image as a leader who could satisfy the demands of all factions because of his position at the State (Chief Minister of Saurashtra) and national (as President of the Congress) levels was seriously affected. On the other hand, there was a feeling of helplessness in Rajkot district as a whole, in the Congress as well as among the people, who had always derived a sense of gratification from their identification with Dhebar and his role in central politics.[5] These reactions at the psychological level influenced the behaviour of the factional leaders during the bye-election. In spite of Dhebar's personal attempts to effect a compromise between warring factions, the conflict manifested itself in a variety of forms ranging from open hostility to complete indifference. The inability of Dhebar to contain these factions during this bye-election strikingly brought out the nature of his power which, though it may have been partly charismatic, was mainly political. It was based on his influence and control over resources which could be used to satisfy different groups. Once he was out of this controlling position, district politics semed to slip away from his firm grip.

Our analysis brings out the ambivalent role of factions in democratic politics. In Rajkot, these factions were woven around individual leaders seeking power positions in different political institutions. Factions based on individual power complexes would tend, in the long run, to paralyse the party machinery. So long as they are contained and resolved into an internal balance, factions play a very useful role of conflict articulation. This can take place either through institutional channels or the existence of a powerful leader who resolves the conflicts within the party framework. Where both are lacking, however, the opposition may gain an advantage, either through a direct split in the ruling group, or through submerged expressions in the form of either inaction or sabotage on the part of the "out-group". Even here, as shown by the contrast between Upleta and Jetpur, an open expression of the out-group's hostility is preferable to internal sabotage or non-co-operation. In other words, if factions have to become efficient categories of politics, they need to be expressed in an efficient manner, either through proper internal channels, or through a known and open split.

Organisation of the Election

If we now turn from long term to short term factors, we find once again the critical role of party organisation in the outcome of the bye-election. One of the crucial factors in the bye-election was the timely, efficient and unified organisation of the election campaign. As the Swatantra Party had practically no party machinery in the district to start with, their performance was solely dependent on the efficacy of their campaign organisation. The Congress organisation too was in bad shape and had to be properly mobilised to win the election. Thus the Rajkot bye-election has to be studied as, on the one hand, a case of organizational paralysis of the Congress, and, on the other, as one of speedy establishment and masterly conduct of the campaign organisation by the Swatantra party. The existence of these short-range conditions allows us to empirically test our hypothesis about the role of the organizational variable in the bye-election[6]

Before we discuss the campaign organisation it should be pointed out that even the permanent party organization of the Congress was not in good shape. Except in Rajkot city, there were no regular party offices, not even at Taluk headquarters. The D C C active membership has remained static over the years. They have no paid full-time workers, except one in the Rajkot

Table 4 : Rural and Urban Representation on Different Offices of the Rajkot District Congress

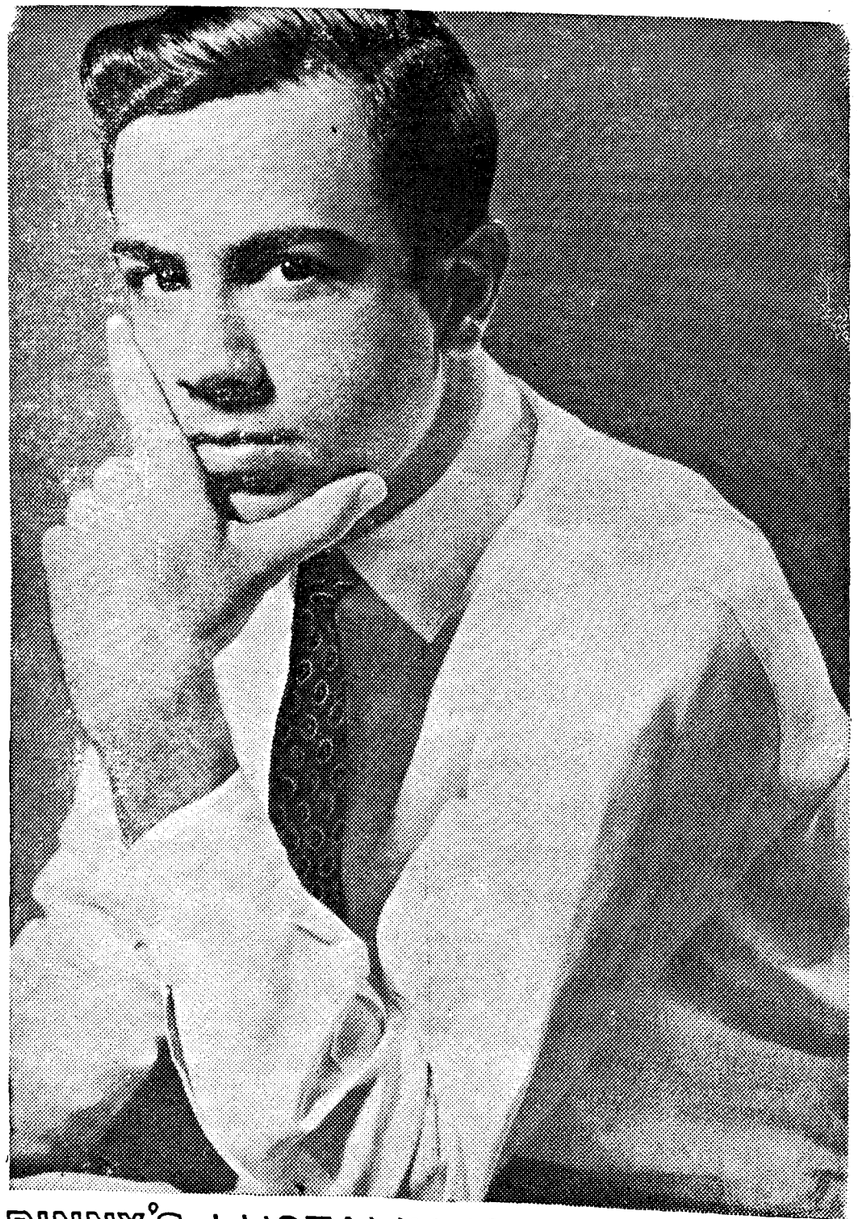
central office. One of the reasons for not starting separate branch offices employing more full-timers is lack of adequate finance. This has resulted in absence of efficient co-ordination between D C C and other Taluk Congress Commitees. Congress executives at all levels, including the D C C, are nominated. Internal organizational elections have not been held for a long time. The D C C is completely ineffective both in composing internal conflicts or in guiding party activists in the district. The Taluk Committees behave as autonomous units which do not feel a sense of loyalty and accountability towards the D C C. Such a state of party organization could continue because its functions were suspended in favour of a personalized party structure. The growing political competition in the District Congress put a heavy strain on the existing arrangements. Existence of a powerful leader who is able to contain the conflicting needs of different groups and a non-competitive political environment in all sub-areas of the district were two pre-conditions for the smooth functioning of such a personalized party structure. Once these conditions were removed, the lack of any regular party channels for the expression of conflicts, such as organizational elections and regular meetings of the Executives, were bound to lead to distortion and anaemia in the party structure. It is against this state of permanent party machinery of the Congress that we have to consider the organisation of the election campaign by the opposing parties and candidates.

Delays marked the Congress campaign from the very beginning, with the selection of the Congress candidate taking much time. All the important leaders were considered for the candidature, but some of them refused to contest on personal grounds, others who offered themselves as candidates were rejected, either out of factional considerations or because they were thought to be too junior to claim this status. Finally, as a last resort, Jethalal Joshi, a prominent district and sitting member from Rajya Sabha, was asked to contest the bye-election.[7] The time taken in reaching a decision on the selection did not leave enough time for preparation of the campaign.

The Congress campaign was formally inaugurated by a public meeting on April 28, and nominations filed on April 30. But no election organization was established till May 12 when the full election committee was constituted, and Faction Leader B, ex-President of the DCC, ultimately given charge of the whole campaign. The delay was caused due to acute differences within the DCC on this issue, which had delayed the formation of the DEC till May 9. The Taluka leaders were also waiting for a clear directive from the DEC. After May 11, one senior Congress leader, not belonging to the local area, was sent to each of the seven Assembly constitutencies to supervise and direct the local campaign. As it turned out, however, even after May 12, these leaders had to mainly devote their energies to factional fights in each constituency. The final network of coordinated organization could not be created till only a few days before May 26, the day of the election.

While the Congress leaders were struggling with their factional problems, the Swatantra campaign had already started penetrating into the district. After May 18, the Swatantra campaign created great impact and took such momentum that the Congress was compelled to leave half-way the task of organizing the basic network, and to rush in an *ad hoc* manner to patch up the cracks in their own strongholds made by the Swatantra inroads.

Swatantra Party Organisation



The Swatantra party had established election offices from May 1, thus scoring a lead of ten days over the Congress in organising the campaign. They had from the very beginning put all the Swatantra leaders in charge of different assembly segments. At the same time, their district election office was staffed by personnel brought from their central office at Bombay. This turned out to be a very business-like office organization besides which the Congress office run wholly by volunteers made a poor comparison. Even the public meetings and group contact meetings were better planned by the Swatantra party. Its managers had from the very beginning emphasized the value of group meetings. Separate meetings were arranged with leaders of different sections of the voters. If it was known that even within one section of the voters, there were two or three different groups, separate meetings were arranged for each group. The Congress organization did not show such imagination. They based their hopes on the influence of the ward leader or a "key-man" whose loyalty to the Congress was uncertain, given the fluid state of support for the official candidate. Even public meetings were better organized by the Swatantra. Their selection of the speakers and the timings of the meetings were in tune with the changing mood of the campaign. The Congress had no advance planning and, therefore, had to rush to call whoever was available from the national headquarters to counteract the Swatantra campaign. While most of the Congress leaders from outside did not devote more than one or two days to the campaign, none of the Swatantra leaders stayed in the constituency for less than 4 days.[8]

The availability of an efficient volunteer force was an important factor in sustaining the tempo of the election campaign. The Swatantra were fortu-

Table 5 : Votes Polled by Congress and Non-Congress Candidates in Booths Where the 'Outgroup' was Influential in Upleta Segment—1962 and 1963

1962 General Election[1]				1963 Bye-Election[2]			
Total Valid Votes Polled	Party Affiliation of the Candidates	Votes Polled	Total Non-Congress Vote	Total Valid Votes	Party affiliation of the Candidates	Votes Polled	Total Non-Congress Vote
	Congress	2,983			Congress	1,395

THE BUCKINGHAM & CARNATIC COMPANY LIMITED, A Subsidiary of BINNY & CO. LIMITED, MADRAS.

JWT-B.

nate in getting a disciplined group of volunteers from the local RSS and the Jan Sangh. At the same time, the President of the Gujarat Swatantra Party, who happens to be a pioneer in many fields a powerful figure, and till today the leading light in the opposition, brought with him a substantial group of University students from his own Kaira district, where he had himself created a rural University after the name of Sardar Vallabhbhai Patel. A portion of the Swatantra volunteers were employed on daily payment. The Congress had also to hire volunteers, but inadequate finances restrained their capacity to compete with the Swatantra. It was really striking that even after 15 years of control over all governmental, social and educational activities in the district, the Congress found it lifficult to mobilize the younger generation. There were reasons for this. Till 1959-60, the powerful Youth Congress controlled student associations and other social institutions in Rajkot. Once these student leaders matured into active politicians, however, they came in to conflict with faction leader B, who was controlling the D C C. B made every attempt to split the youth movement controlled by Youth Congress Workers by supporting the rival youth faction which was composed of Jan Sangh of socialist-oriented youth workers. In the event the Jan Sangh and socialist youth leaders increased their hold over students and youth associations. This proved a great loss to the Congress organization. The inability of the Congres to mobilize these sections these had its roots in the internal disputes in the party.

Mobilization of Voters

In the sphere of publicity and finance too the Congress lagged behind. The main medium of publicity was the press. Out of the three daily newspapers published from Rajkot, two were Congress sympathisers, the third one being an all-out supporter of the opposition. The daily which supported the opposition is the oldest newspaper in Saurashtra. It is also superior to the Congress press in finance, circulation and editorial capacity. The Swatantra had no difficulty in getting huge sums for election expenses. Not only did their total financial resources exceed those of the Congress, their planning and utilization was more efficient. The Congress on the other hand, could not, in the absence of any prior estimate of the expected amount, put the large sums of money that ultimately arrived to effective use. This reflected the debility of the Congress mobilisation machinery in general.

The real measure of Swatantra's organizational superiority is not to be found in the formal campaign arrangements but in its penetration of different sections of voters. This penetration was affected either by exploiting existing social and political cleavages and articulating them into bases of support, or by systematically rendering different groups to pressure and influence from outside, or by a combination of the two techniques.

A remarkable feature of the Swatantra party's electoral organisation was its ability to mobilise support on the basis of old as well as new cleavages. Before describing how such an operation was successfully put through, however, it will be useful to spell out the existing economic and social divisions within the district, and the reflection of these in groups consciously opposing each other.

The State of Saurashtra (now part of Gujarat) was formed in 1948 out of the integration of 222 princely states. The transition to an integrated democratic State was effected successfully. However, the princely past left its legacy and structure of loyalties and divisions. The main cleavage even before independence was between the petty princes and *girasdars* on the one hand and the urbanised middle classes which provided the leadership of the States' Peoples' Movement, and later on of the Congress. To this was added another cleavage after independence as a result of the government's implementation of land reforms and protection of tenants' and cultivators' interests against the interests of the land-owners. The result was an alignment between the urbanized leadership of the Congress and the rural peasantry, in the process alienating the landed gentry and their numerous hangers-on.

Within the rural community there had always been a great distance between Rajputs on the one hand and other low-caste Kshatriyas such as Kolis, Kathis, etc. The Rajputs were at the top of the Kshatriya heirarchy and controlled political as well as economic power before Independence. The State-wide reform movement of the Kshatriya Sabha did not make much headway in Saurashtra owing to this social distance, as well as divergence of interests between the Rajput landowners and the others. This divergence grew sharper after the implementation of land reforms. The Congress also retained the support of other depressed and minority communities, and especially of the Harijans and Muslims. Harijans are scattered all over the constituency,

Table 6 : Rural - Urban Break-up of Votes Obtained by the Congress and the Swatantra in all Assembly Segments—1963 Bye-election

Name of the Assembly Segment	Valid Votes Polled	Congress		Swatantra	
		Urban Votes	Rural Votes	Urban Votes	Rural Votes
Jetpur	18,528	836	8,245	2,955	5.926
Gondal	15,706	1,787	6,001	4,004	3,3499
Dhoraji	19,718	3,006	7,014	4,661	4,552
Upleta	25,256	2,273	11,322	2,586	8,476
Jasdan [1]	24,035	415	7,776	1,979	13,206
Rajkot [2]	29,381	9,248	...	2,001	...
Paddhari [3]	23,357	...	11,289	...	11,501

1 Jasadan is an exception to our general analysis. Congress has also lost heavily in rural area. This could only be explained in terms of a very substantial impact of the Prince and Princess of Jasadan on the rural voters.
2 Rajkot is an urban constituency.
3 Paddhari is a rural constituency. Although, Congress has not been able to score a lead, it has substantially improved its position as compared to its performance in the 1962 General Election. (Refer to Table 3.)

whereas Muslims are mainly concentrated in the Dhoraji-Upleta segment of the constituency.

Some of the ruling families, indignant at the Congress policy of land redistribution, contested against it in the elections held in 1949 to the Saurashtra State Council but, even with the limited franchise then, did not cut much ice. The Congress emerged as the all-powerful political force and was very popular in the rural areas. However, once the land reforms were accomplished and a few years had passed, the girasdari element came to terms with the new situation and the old cleavage began to blunt a little. Loyalties towards the princely order began to be restored. New grievances began to take place of the old ones against the princes — against the administration, the Congress, and specific factions within the Congress. Elections — State and local — helped in this process. The change was strikingly brought home in 1962 when some of the princes, pushed by the Swatantra Party and the changed political climate, made bold to contest against the Congress. The Prince of Rajkot was one of these. He succeeded in defeating the Congress for the first time in *Paddhari* constituency, and that too with a majority of 5,125 votes. It seemed as if old loyalties had once again revived, the "masses" standing more behind their Prince than behind the Congress. The alienation by the Congress of the girasdari element and its failure to accommodate them had now begun to prove costly. It is against this background that the Rajkot bye-election took place.

In the urban areas, caste and other social divisions were not the bases of groups. For the urban voters, occupational categories were more meaningful. There are mainly two broad occupational groups within the middle class — the "service" class in government and private employ and the "commercial" class representing business and trade. After these, there are the artisans, the labourers and other menial workers, including the Harijans.

As for political divisions, these were mainly on party lines, mainly Congress and non-Congress. Among the opposition parties there were CPI, Jan Sangh and PSP. Before taking a final decision to contest the parliamentary election, Masani had come to Rajkot and negotiated with all the opposition parties (except the Communists) and the independent members of the Legislative Assembly. He tried, by stages, to mobilize the support of all the opposition parties and independent members of the legislature. The process required considerable political acumen and bargaining. The opposition parties in Rajkot had all along been divided against each other. It goes to Masani's credit that he could keep them together for the whole election. This gave Masani a considerable base to start with.[10]

Feudal Element Strong

Masani had also realised that the feudal elements, specially the Girasdars and the Princes, could provide valuable material assistance, and what was more important, their traditional status in the rural areas could be exploited to make an impact on the masses. He brought some ex-rulers of big States from outside the constituency who had considerable influence on the small local rulers. The princes of Rajkot, Jasdan and Gondal actively supported the Swatantra campaign. The Girasdar Association which had fought the Congress in the 1949 interim elections to the Saurashtra State Council now supported the Swatantra party in the bye-election[11] The Jasadan prince and his sister moved from house to house and asked the people to defeat the Congress. The fact of the Prince and the Princess coming out of their palace and mixing with the people made a great emotional impact on the voters. The active participation of these traditional interests was an important factor in influencing the outcome of the election. The Congress called F P Gaikwad, former Maharaja of Baroda, to counter this move of the Swatantra party. However, his task had been made difficult as all others had decided to support the Swatantra party.[12] He had also been for long too closely identified with the Congress, and had in fact himself become a rank and file Congressman. In consequence, he did not carry the same weight as he formerly carried among the princely and Girasdari elements.[13]

The Swatantra party could also divide the votes of the minorities, which were traditionally the preserve of the Congress. The independent MLA from Rajkot, who had defeated the Congress in 1962, after defecting from it, was a leading spirit of the Harijan Sevak Sangh, controlled by the Congress. When he resigned from the Congress, he was also compelled to resign from Harijan Sevak Sangh. But his personal influence among the untouchables was very great, and with his help the Swatantra candidate penetrated into this sector. The Muslims also got divided because of an internal feud within their own community, which resulted in one rection supporting the Swatantra candidate.

The most remarkable achievement of Masani was his use of the economic and financial network in mobilising his support in the urban and peri-urban areas. This was, of course, reinforced by an ideological affinity between the business community and the Swatantra party. In the urban sector, especially in Rajkot city, the party successfully articulated the growing dissatisfaction of the business, professional and other middle classes against high taxation, rising prices, gold control and other policies. The corruption and inefficiency of the administration was also a factor that helped the Swatantra.

However, the bigger impact was along other lines. Masani's campaigners employed all tactics and pressures to mobilise the vote in his favour. The plans were worked out in great detail and the approach imaginative. Active workers and sympathisers of the Swatantra party belonging to different communities and different regional and language groups were brought to the constituency. Tamils, Biharis, Parsees, Mohammedans, all were approached in this way. Although Rajkot has a very small number of Gurkha voters, a Gurkha worker was brought from outside to mobilise their votes. The same was done for the various professions. Leading lawyers, doctors and bankers were brought to help Masani get the votes of their fellow professionals. The outsiders were asked to keep in constant touch with their own regional communities residing in Rajkot. Businessmen of Rajkot who had business connections at Bombay, Calcutta, Baroda and other such big business centres received personal letters from their counterparts requesting them to support Masani. The actual network went much further down. Letters from business and industrial houses in Bombay and elsewhere were addressed to commission agents, sales representatives, stockists, and even small salesmen in smallest towns and suburbs. Copies of all such letters were sent to Swatantra headquarters in Rajkot for them to follow up. Certain representatives of big industrial concerns at Bombay were asked to devote most of their time for Masani's campaign. Masani himself has wide-ranging contacts in the business world. He comes

from the Parsi community which is known both for its pioneering role in the industrial field, and for its cohesion and communal loyalty. Some of the leading banks in Rajkot have Parsi managers at the top. Their clients were personally requested by the Agents to help Masani, and to spread the hint further. In Gujarat where the business network is so widespread and efficient, such a strategy was bound to pay handsome dividends. The strategy of exerting influence through the economic structure which Masani operated proved even more successful than the government and patronage machinery available to the Congress. In the urban areas, the Congress was completely routed as shown by Table 6.

The leaders of the Gujarat Kshatriya Sabha worked hard to get the support of the Kshatriya masses for Masani. We have noted above how, with the tenancy legislation now being a matter of the past, the old distance between the Rajputs and lower Kshatriya communities began to narrow. This was symbolised by the fact that the Rajput leaders of Saurashtra had accepted the Prince of Jasdan, who was a Kathi, as one among them. Thus the revival of old loyalties and the strategy of building a numerically large support base by the Rajputs helped the Swatantra party, through its close identification with the Gujarat Kshatriya Sabha, to make inroads in the rural vote, which had so far always gone to the Congress. Even so, the Congress retained considerable support in the rural areas, compared with what happened in the urban areas.

Conclusion

The foregoing analysis brings out the great importance of the organisational factor in the outcome of elections. The main points that emerge are:

(i) The performance of the Congress in the elections depends on homogeneous party organization which, in turn, depends on the structure of leadership;

(ii) Where the party is dominated by one leader for a long time, the result is a highly personalised support structure, and lack of institutional expression of political loyalties. Once the original condition of efficiency is removed or weakened, the Congress is suddenly found without depth and energy, greatly divided, and lacking in drive and resources;

(iii) Such a state of internal organisation reflects great gaps in the social base of the party's support, gaps between the ordinary leadership and the masses (relying all the time on the "great leader's" appeal), and a failure to accommodate certain important segments of the social structure;

(iv) For the opposition to gain from such a situation, it is necessary for it: (a) to close its ranks and present a united front, (b) to isolate the sections alienated by the Congress and secure their support; and (c) to sustain such a support by imaginative field organisation, with the help of influential key-men, and through continuous pressure on the voters, either individually or in groups;

(v) In organising such an effort, an important element is putting into effect existing influence networks based on kinship, caste and caste associations, traditional loyalties, and economic relationships;

Notes

1 Masani does not belong to Rajkot district. He had no previous contact with the constituency. Bombay has been the base of his political career all along.

2 We can only say that this competition resulting in alignments at different levels will finally institutionalise these diffused personal relationships. The process has just begun.

3 The conflict had its origin in the elections to the taluka panchayat which preceded the bye-election.

4 Here, the whole operation of sabotage was more complicated. The Jetpur Municipality is controlled by a group of opposition independent candidates. The minority Congress group in the Municipality is composed of supporters of the MLA group (outgroup in the bye-election). Before the election, the Municipal opposition independent candidates enrolled themselves as Congress members and claimed representation on the election committee. They exploited the rift within the taluka Congress and posed as supporters of the President of the Taluka Panchayat. They occupied some important positions in the election organisation. While the MLA group remained indifferent or hostile, and the Panchayat group worked earnestly for the Congress candidate, these sympathisers from the opposition sabotaged from within the election campaign.

5 The whole constituency felt reduced in importance and stripped of its role in national politics. This was manifested in the election through the candidate orientation of the voters, who could not reconcile themselves to the Congress candidate, Jethalal Joshi, who was a district leader replacing a national leader. From this psychological angle, Masani, who is considered a national figure, had an advantage over his rival.

6 We define the "organization variable" as representing essentially two functions of the campaign organization, namely the efficiency of the formal election machinery and its capacity to mobilise different sections of the electorate.

7 The opposition, exploiting this situation, told the voters that even if they elect Masani, they are not going to lose Joshi as their representative because he was already a sitting member of Parliament.

8 Thus C Rajgopalachari himself toured the constituency from May 20 to 28. The last pre-election public meeting of the party, a historic meeting in Rajkot which attracted a record crowd was addressed by Rajaji, Acharya Kripalani, Atalvihari Bajpai of Jansangh, and Masani. Kripalani had come directly after emerging victorious from the Amroha bye-election.

9 The editor and the Managing Director of this newspaper had contested from Rajkot Parliamentary Constituency as an independent candidate in 1962 general elections, against U N Dhebar. Although Dhebar won by a considerable majority, the 61,311 votes polled by the editor showed a substantial following.

10 Refer to Table 2 and Table 3 for non-Congress support. 1962 General Election results analysed earlier give us an idea of the opposition strongholds: Rajkot city, Padadhari, a few pockets in Jasdan. The Communist party which has some following in Upleta offered to support the Congress. The Congress response to their offer was not very encouraging. They not did not realise the importance of exploiting this offer.

11 We have already referred to the feeling of antagonism created among these traditional interests when the Congress government introduced land reforms for the first time in 1948. The Girasdars and princes were pitted against the Congress in the interim elections to the State Council. After this solitary attempt, they were compelled to withdraw from active opposition by the increasing popularity of the Congress government in Saurashtra. It should not be forgotten that though Congress gave jobs to some of the more influential ex-rulers, it never consciously attempted to bring other elements under the party fold. Most of them were enrolled as members of the Congress, but never integrated with the active party work. This was partly a result of Congress party's complacency in judging their initial withdrawal as a permanent move, and partly of the increasing dominance of the cultivating class in the Congress.

12 On the other hand, Congress leaders kept accusing the Princes as reactionary. In an interesting comment on this sent to the A I C C, the Maharaja of Baroda strongly resented this and said that he found it "highly embarrassing". In the same statement he also castigated the Congress for its dualist approach to the role of the Princes in which "the Princes in the Congress are good while the others in the opposition are bad."

13 This point of "identification" is very important. We notice that even within the constituency there was great difference between the impacts created by the Prince of Rajkot and the ruler of Jasdan. The former, who had carried the day gloriously in 1962, proved less effective in 1963. Upon his election to the Legislative Assembly, he ceased to be a Prince and began mixing with other MLAs and with the constituents like other representatives. While this made a good impression on the educated who applauded the fact that the Prince was behaving like a citizen and a democrat, among the traditional population his statutre declined. Even though he remained popular, the impact of his traditional image gradually decreased. On the other hand, the Prince of Jasdan had come out in the open for the first time. This created a great impact. As a result, whereas the Congress recovered its position in *Paddhari* between 1962 and 1963, (reducing its loss from 5,125 to a mere 202) it lost heavily in Jasdan (where its majority of 8,765 turned into a loss of 6,994).

Factors Influencing Regional Variations in Farm Incomes

Tara Shukla

Wide variations in farm incomes from region to region are common in an underdeveloped economy. They gives rise to inefficient use of productive resources which an underdeveloped economy can ill afford and also evoke corresponding disparities in human welfare. Plans for economic development have, therefore, the objective of narrowing down the regional dispatities in farm incomes.

Interest in the study of regional distribution of farm incomes also stems from the fact that investible resources are limited in supply and cannot be evenly spread out our different regions. Their regional location on the basis of market indications is in most cases likely to accentuate the disparities in regional distribution of farm incomes. If these tendencies are to be countered it is necessary to indentify the factors that influence the regional distribution of farm incomes and operate upon them.

In this paper an attempt is made to study regional distribution of farm incomes — gross and net — and through correlation analysis to try to identify factors associated positively or negatively with income distribution.

IT is necessary to define (i) regions and (ii) gross and net farm incomes before proceeding with the analysis. Most purposeful definition of an economic region would be based on location pattern of production. The location of product is supposed to be predominantly influenced on the one hand by soil-climate complex and on the other by facilities for transport of product from the producer to the consumer. The second factor is relatively less important in an underdeveloped economy where production is primarily for consumption within the family and predominantly within the rural community. Of two sides of the market — demand and supply — the latter may thus have the dominant influence in the regional mapping of production. It has not been possible for us to divide the country into homogeneous areas in terms of soil and climate for this study due to non-availability of adequate data for it. The data as available, relate to administrative divisions of the country, viz, the States. As these are not homogeneous areas in terms of soil and climate, we shall not be able to keep out the influence of these two factors while analysing the influence of other factors. But the counterveiling advantage of this analytical framework is that most of the economic policies including the Five Year Plans are framed and implemented on the basis of the administrative divisions.

Besides, it is also recognised while studying this problem that individual States are too big an area to observe uniform operation of any of the economic characteristics. For instance, within two different states with, say, 25 per cent area under tenancy, we might get widely varying proportions of subregions (districts) with different degrees of extent of tenancy. Hence the aggregations available at State-level may lose much of their significance. These two serious limitations of selecting States as units of study cannot be easily overcome. The results of our analysis, therefore, would be more in the nature of *'a priori* indications' rather than definite conclusions.

We need to define farm income at least from two different angles. Knowledge of factor-income distribution is essential for any programme to achieve increased efficiency of resource use. Hence a complete picture of factor-income distribution for different States would be preferable to the regional distribution of income to any one factor. However, land being a scarce factor relative to capital or labour in India, distribution of gross and net income per unit of land may give us some policy clues to maximise farm income of the country by manipulating the other two factors where possible. Besides, land is also an immobile factor and hence less amenable to manipulation.

Alternatively, income can be defined in terms of net returns to labour. Though labour is an input for production, it is also a unit of consumption. If incomes to labour tend to equal the consumption levels of families as is believed to be the case in subsistence economies, the labour income distribution would not vary much regionally unless the relationship between earners and other members of the family is uneven. This may happen, for example, when in the same region social traditions inhibit work by women on farms.

State-wise data for gross and net output per acre and net income per worker are available for the year 1960-61.[1] Suceptibility of farm production to weather changes is known. Data for one year, therefore, may not lend to precise estimation of the relationship. In so far as the gross product is concerned the estimates of regional incomes are less dependent on guesses and inferences, since production data are independently estimated for individual State. Prices for farm products are also available separately for each States. On the other hand, a degree of guess work enters in the estimates of net incomes. Net incomes are estimated as difference between the values of inputs such as cost of seed, manure, feed for livestock, water charges, market charges and repair, maintenance and depreciation of implements and other fixed assets. Data for these inputs are based on various sources such as NSS Reports No 32 and 65, Fertiliser Statistics, Rural Credit Survey Report, various reports on "Economics of Farm Management", etc. However, the estimates of inputs so calculated do not show large variations from region to region and the gross estimates and the net estimates per acre are highly correlated with each other. However for the purposes of correlations with various factors we have used both gross and net output per acre data.

Total regional incomes from crop production are divided by total cultivated area to obtain per acre incomes for different States. Land in this case is measured in surface units, quality differences are thus ignored. To obtain per worker farm income, total farm income from crop production is divided by working population in farm sector in each State. In rural areas a section of the working population is employed in non-farm occupations for a part of the year. However, this proportion is not known. If it varies widely from State to State, it will vitiate the estimate regarding association of farm incomes with other factors.

Besides, these farm income data relate to crop production only. Animal husbandry, fishing, and forestry which are allied to farming are not taken account of. This might also vitiate the estimate of degree of association of farm incomes with other factors. Of course, some of these limitations may not be serious. However, their overall impact may be quite significant. These limitations may be kept in view while assessing the conclusions.

Factors Associated with Farm Incomes:

The following factors can be believed to have an impact on the levels of farm incomes:

(i) stock of capital;
(ii) extent of literacy;
(iii) pressure of population as indicated by man-land ratio;
(iv) crop pattern;
(v) extent of tenancy as indicated by proportion of area under tenancy to total cultivated land;
(vi) extent of concentration of cultivated holdings;
(vii) extent of use of improved seeds; and
(viii) extent of use of fertilisers. To these is added the factor of association of farm wages and farm incomes where casual relation is expected from the latter to the former. There may be several other factors influencing farm incomes but the data are not readily available regarding them.

Stock of capital includes irrigation, bullocks used for work, implements and machinery. The latter include assets like ploughs, carts, tractors, oil engines, electric pumps, etc. As non-traditional inputs like improved seeds and fertilisers are not included in this index, we have studied separately the relationship of income with both these factors. Data regarding the use of fertilisers and improved seeds[2] are based on estimates prepared by V K R V Rao on the basis of information available in the Third Five Year Plan.

For relative evaluation of the cropping pattern of different regions and its impact on the income levels, it is necessary to have crop index for different regions. For this purpose, we have used the crop pattern index constructed by J G Anand.[3] We have correlated this index with the output per acre and per worker in different regions, on the basis of indexes for these two items available once again in Anand's work. It may be mentioned that these two indexes refer to gross output only.

Literacy data are obtained from 1961 Population Census. These give no information on the extent of schooling. But in rural areas it is safe to assume that only a few persons advance beyond secondary schools.

Data regarding farm labour wages are drawn from the Second Agricultural Labour Enquiry Report of 1956. There is thus a time lag between farm incomes which relate to the year 1961 and wages which are available for 1956. However, if the wage rates as obtained in different regions during 1956 are raised upward for the price change during the period up to 1960-61, their relative positions will not change unless the regional variations in prices are sharp and of different order. This limitation of the analysis is, however, minimised by substantiating the observation based on these data with others obtained from some of the field studies.

Hypothesis

We now formulate the hypotheses thus: Factors like (i) stock of productive capital (ii) superior cropping pattern (iii) extent of use of fertilisers (iv) extent of use of improved seeds, and (v) extent of literacy, other things remaining the same, would help raise the level of agricultural incomes both per worker and per acre. On the other hand, factors like (i) extent of tenancy (ii) extent of concentration of land in cultivated holdings (iii) pressure of population on land, other things remaining the same, would affect adversely the level of farm incomes per worker and per acre.

Five of the above factors expected to have positive relation with farm income per acre and per worker are in the form of resources. They include, to repeat, capital, better crops, seeds, fertilisers and literacy. Combining more resources with given amount of land and labour would normally result in increased output. The diminishing returns would only diminish the successive rates of growth of output.

There can, however, be no unanimity regarding the impact of the other factors listed above. For instance, increased concentration of land in cultivated holdings, it can be argued, may lead to increased output. It implies larger propensity to save by big holders. But the management capacity of the family labour is accepted as a constraint and size of holding may not be closely associated with level of land productivity. There is, on the contrary, a likelihood of adverse relationship between size of holding and per-acre yields. This may obtain if in large holdings relatively poorer land is concentrated and *vice versa*. Thus the concentration of holding may in an important sense be the result of soil composition and irrigation facilities. In such cases concentration of operated land may not necessarily be positively related to per acre or per worker product.

Tenancy is traditionally believed to curb the incentive to increased production. The extent of tenancy is, therefore, expected to be negatively related with levels of output per acre or per worker. At the same time, it is not an uncommon experience that in regions with low production potential the area under tenancy is low, probably because contribution of land in the product here being low, it pays the owner to cultivate land himself and earn perhaps larger income than what can be earned from rent.

Pressure of population on land, according to conventional belief, is expected to depress per worker earnings in view of diminishing returns. Low per worker earnings would imply low capacity to save and perhaps therefore low per acre incomes too.

The above set of hypotheses has been tested very broadly with the help of available data. We have preferred a relatively less sophisticated tool of analysis, *viz* Spearman's coefficient of rank correlation for the reason that the factors which are not examined such as climate, soil, etc, and the errors in measurement of the factors that have been examined may introduce imprecision to invalidate any precise measure such as regression coefficient. For rank correlations, since they relate only the ranks of the States to the factors considered, the errors of observation and omissions would not introduce large bias in understanding relationships unless the influence of the disturbance is large enough to alter the ranks. The results of these rankings, given in a decending order, are stated in Table 1. The detailed information regarding each of the factors is given in the appendix.

The data in Table 1 yield some very useful observations. In the first place, except two, all other coefficients have positive signs. Factors like extent of

tenancy and pressure of population on the basis of widely held belief were expected to have negative relationship with both per acre and per worker income. The results are contrary to expectation. The negative sign belongs to improved seeds and concentration of cultivated holdings. Since the value of coefficient is low for seeds we cannot attach much weight to its sign. If, however, one takes a bold view, the meaning of the negative sign would be that in the areas where incomes are relatively low, enthusiasm for improved seeds obtains to a greater extent. This is not unexpected; improved seed is in most cases a neutral technology in its effect on factor-combination. Besides, its benefit/cost ratio is expected to be high. Further in specific cases like wheat, sugar cane, etc, improved varieties replace local varieties where the latter are frequently attacked by diseases or where the former are very superior to the latter as in case of cotton.

From the above analysis, considering the values of coefficients, 11 relationship out of 29 in all turn out to be high and of significance. Stock of capital is consistently highly related with both per-acre output and per-worker income when irrigation is included in the former. This should not surprise us. Even if we assume that larger output is traceable to an extent to better soil and climatic conditions, the fuller exploitation of such favourable conditions is made possible only when larger stock of capital is associated with it. When irrigation is taken out of the capital stock we find closer association of stock of capital with only per-acre output and not with per-worker incomes. This clearly implies that irrigation facilitates employment of larger capital per worker thus raising returns for the latter. In dry areas labour seems to be a closer complement to the capital stock making increased input of capital per worker difficult.

The pattern of cropping or crop combination seems to influence per-acre gross output, since greater the share of highly valued crops in the total cropped area better will be the per-acre return. The value of coefficient of rank correlation between the two is fairly high, it being 0.715. Against this, crop combination seems to have little influence on per-worker income. This would suggest that highly valued crops like sugar cane, rice need larger labour inputs and, therefore, do not necessarily give better returns to labour.

The improved inputs considered by us are improved seeds and fertilizers. To these we can add the literacy level of workers. Literacy level is expected to influence the workers' skill to operate and through it land and labour productivity. Thus all the three can be expected to have close relationship with land and labour productivity. In the relationship we have run we find rank correlation coefficients to be rather low for all the three. Not only that, for improved seeds both the coefficients have negative signs. These results are rather enigmatic. We can probably argue that the rise in literacy level is recent and it would require some time to make an impact on productivity. The same probably applies to fertilizers. Their use has spread only recently and the knowledge regarding how to use them and in what dose to make a perceptible impact is yet not perfected to suit conditions of soil and climate in India. Improved seeds, however, do not fall into this category. The research work relating to them stretches now over several decades, we are then left to make our own guess regarding this input and we have analysed this phenomenon earlier.

Of the three factors connected with land, viz (i) man/ratio (ii) concentration ratio and (iii) extent of tenancy, the first is very highly related with both land and labour productivity. The other two have relatively higher rank correlation with per-worker productivity rather than with per-acre productivity. According to the conventional hypothesis, stated earlier, the increased pressure of population should reduce incomes and savings. But such a phenomenon is not borne out of the observations. This demands rethinking on the subject. In traditional agriculture, pressure of population on land will depend on the carrying capacity of the latter. Population in low-rainfall-poor-soil regions is likely to be sparse unless otherwise warranted. With the techniques of cultivation that obtain in India, population seems to have concentrated in regions where land productivity is high. This shows that labour and capital are complementary to each other in traditional agriculture. With autonomous increases in labour, relative returns to capital increase, resulting in strong inducement to save and invest on part of the farmers.

The second important observation that challenges the conventional hypothesis is the positive and somewhat

Table 1: Values of Coefficients of Correlation between Various Factors and Levels of Income in Different Regions

Relevant Factors	Gross Output per acre	Net Output per acre	Net Income Per Worker
(1) Capital stock (A) (Rs)	0,786 (2%)	0,739 (5%)	0.619 (5%)
(2) Capital stock (B) (Rs)	0.643 (5%)	0.620 (N.S.)	0.286 (N.S.)
(3) Area under improved seeds	—0.19 (N.S.)	—0.285 (N.S.)	—0.476 (N.S.)
(4) Area under fertilisers	0.429 (N.S.)	0.310 (N.S.)	0.191 (N.S.)
(5) Man/land ratio	0.858 (1%)	0.881 (1%)	0.881 (1%)
(6) Crop pattern index	0.715 (5%)	N.A.	0,334 (N.S.)
(7) Concentration ratio for cultivated holdings	—0.239 (N.S.)	—0.191 (N.S.)	—0.643 (5%)
(8) Percentage of cultivated area under tenancy	0.358 (N.S.)	0,453 (N.S.)	0.620 (5%)
(9) Literacy level: number of literates per '000 persons	0.334 (N.S.)	0.358 (N.S.)	0.334 (N.S.)
(10) Agricultural labourer's wages (Paise)	0.453 (N.S.)	0,453 (N.S.)	0.858 (1%)

Capital stock (A) includes irrigation, bullocks, implements and machinery.

Capital stock (B) excludes irrigation but includes rest of the assets.

One of the world's outstanding cigarettes

Player's
GOLD LEAF
FILTER TIPPED

Now available to you also in the handy 10's pack, Player's Gold Leaf Filter Tipped is one of the world's outstanding cigarettes. An instant success on its introduction, Player's Gold Leaf FilterTipped is a cigarette rich in tobacco, rich in taste and with a reputation that matches its good looks. Quite the most satisfying filter cigarette you have ever smoked—try it and you'll agree

Rs.2.50 for 20
Rs.1.25 for 10

IWTGL 2206-IRI

high relationship of net income per worker with the extent of tenancy and the extent of concentration of cultivated holdings. Positive association of extent of tenancy with the per worker income, even if cautiously interpreted, would imply that the fact of tenancy by itself does not seem to curb incentive to increased production in a perceptible way. This might surprise many and, therefore, needs an explanation. The result obtained cannot be attributed to inaccuracies of data. In fact we get fairly consistent results. Punjab, Assam and West Bengal are among the areas which have tenancy well above 34 per cent. They rank as the first three States also in regard to wages of labour, income per worker and concentration ratio. A supplementary check on this observation is provided by various studies in the economics of farm management carried out in different parts of India during the period 1955-56 to 1957-58. These data also give high values of coefficients of correlations between the extent of tenancy and the values of gross and net output per acre.

Implicitly, therefore, the alternative or non-conventional hypotheses derive substantial strength from these results. One of the alternative explanations can be like this. Either due to assured rain or extensive irrigation and fairly fertile land, it is possible to combine more labour to given land (measured in surface area) than is available in the area with marginal productivity of labour diminishing at a slower pace. If the supply curve of labour is equally inelastic during rush seasons in both the areas, owners of land would be faced with relatively higher wages in potential high demand but low supply regions. The system of renting of surplus land brings about a shift in the supply curve of labour since it makes it possible for the tenant to use part-time labour of his family which can add proportionately greater amount to the total labour income. This arrangement then proves of advantage to both the leaser and the leasee. The tenant gets as his share income in the pre-change position (before leasing in) so also the land owner who gets more by way of his share in the products (after leasing out) than the pre-change surplus going to land. This has, therefore, a further implication that share rent is not the device particularly to pass on the uncertainty and risk of output varying from year to year to the less privileged class. Our analysis would show that where such risk is greater and marginal product to labour would diminish more rapidly, there will be fewer persons willing to rent land as tenants.

There might be other alternative explanation too. Expansion of industries and net out-migration from landowner class may necessitate tenancy. It is, however, difficult to relate net out-migration with labour productivity positively. The push factor whose dominance is suggested in poor countries would rather suggest a negative relationship between migration and productivity. In any case, West Bengal and Assam are not areas of high out-migration.

We should enter in at this stage an important caveat. The explanation for relationship between factors and productivity in inter-regional comparisons would not bear identity with intra-regional comparisions between farmers, unless the same or similar physical conditions obtain for the units compared.

Wages and Income per worker

So far our search was for factors that influence the regional distribution of agricultural incomes. We now take up the problem of impact of regional distribution of farm incomes on inter-class income distribution. For this we examine, in particular, the relationship between per farm worker income and wages of farm labourers.

In our analysis we find fairly the high value of 0.858 as rank correlation coefficient between wages of agricultural labour and net income per worker in agriculture. The wage data as stated earlier, are drawn from the Second Agricultural Labour Enquiry undertaken in 1956 and relate to casual male worker. The net income data relate to all workers who include self-employed cultivators' families which are overwhelmingly dominant in the total farm structure. This observation too is not surprising. If daily wage represents value of marginal product, an annual wage, which also is a value of marginal product, will be closely related to annual income per worker. We also get comparable results from data at levels below the State. The Farm Management Studies for different districts for the period 1954-55 to 1956-57, with 17 observations in all, give 0.7892 as the value of rank correlation coefficient (highly significant at 1 per cent level) between farm business income of the cultivating families and the wage rate per worker. For the individual years the value of coefficient ranged between 0.171 to 0.614 mainly because the farm business income will be influenced by weather conditions to a greater extent than the wage rate.[4] These results of Farm Management studies take us a step further. Farm Business Income is not necessarily the annual wage and hence not the value of marginal product of labour. It rather reflects the level of prosperity of farm families and hence their paying capacity. These results therefore suggest that wages of farm labourers are closely related to the paying capacity of cultivating families.

Rise in wages may result in reduced employment if the relative shortage of labour is due to the leftward shift of labour supply curve. We would then get a negative relationship between wages and employment. So also if increased employment is a mere concealment of unemployment — reduction in productivity and wages would result from it, once again giving a negative sign. However, on the basis of the data drawn from the Second Agricultural Labour Enquiry 1956, we get a high and positive value of rank correlation coefficient between labour wages and total employment per labourer. It works out to 0.619. This discounts any indication of labour exploitation in the present labour market. On the contrary, it implies that labour income (wages x employment) would be high in regions where income of farmers is high. If farm labour income is low the remedy lies, therefore, in increasing labour productivity through investment and not so much in fixing minimum wages.

It is also important to note that the wage rate showed a much weaker relationship with average productivity of land. One would ordinarily expect that larger income of farm families and high wage for labour are the result of larger per acre yield. But if higher wages are primarily the result of relative shortage of labour supply compared to demand for it, the relationship between wages and per acre yield may not be very close.

Conclusion

The study, with its several limitations, leads to important conclusions. We set out to search for factors that might explain the regional distribution of gross and net output per acre and net income per worker in agriculture. We listed as many as ten factors which divided themselves into three groups (i) durable capital (ii) improved inputs (iii) factors relating to land.

We observed that improved inputs — seeds, fertilizers and literacy level of farm population — did not show a close relationship with either per acre yield or per worker income. From group (iii) tenancy and concentration of land holdings showed close relation (latter with negative sign) with pre-worker income but not with per-acre yield. Pressure of population on land showed very close relationship with both the income variables. Of the two measures of stock of durable capital, one including irrigation showed close relation with both the per-worker income and per-acre yield, the other consisting mostly of traditional assets like bullocks and implements showed close relationship with per-acre yield only.

The pattern of influences that emerges as a result of our observations is somewhat uncommon. Factors relating to land like tenancy — and pressure of population which are supposed to be hindrances to increasing production are not found to be so. They are more in the nature of results rather than causes of the pattern of regional income distribution. Similarly, new and improved resources are expected to contribute to production but probably they have not reached the stage when they can make a perceptible impact on production.

We are then left with only one factor, viz, stock of durable capital, which explains regional income distribution. Regarding this too, it seems that only when land-substituting capital like irrigation is made available, is a perceptible impact on per worker income made. Stock of other forms of capital seems to be complementary to labour and, therefore, influences only the per-acre output.

That in a traditional agriculture, traditional forms of capital together with labour contribute to production to a major extent is too obvious to need explanation. Its importance lies, however, in the fact that it puts at a discount other hypotheses regarding role of land institutions, pressure of population or quality of land in explaining spatial income distribution. The latter hypotheses, unverified, have often resulted in misdirection of efforts and mixing of issues. Solution of the problem of tenancy, for instance, is unlikely to raise labour productivity where it is low. Nor will fixation of minimum wages help in that direction. Narrowing of variations in regional income distribution can be achieved only through a purposeful investment programme, through exploitation of investment potentialities. Where the latter do not exist, probably the only solution would be a long run one: that of either evolving suitable farm techniques or drawing labour out of agriculture through expansion programmes. Basically, this is a problem of the technological barriers of traditional agriculture.

AROUND BOMBAY MARKETS

The Recovery Continues

Wednesday, Morning

WHILE Dalal Street last week managed to make a new high mark in the current recovery phase and pushed slightly beyond its previous month's high, the going was far from being very smooth. Though bright spots did emerge now and then, they were few. And not many shares were able to retain the gains registered during the week. Several shares wound up the week with small losses, which, however, were due mainly to corrective profit-taking. With anxious short covering nearly over and outside public support remaining almost conspicuous by its absence, it was only to be expected that the pace of advance should slow down. In view of the fairly impressive recovery over the past few weeks, it should cause little surprise if the market were to take a pause and consolidate its position before pushing its way further up. What is really surprising is that the market should have completely ignored the 16 per cent power cut in the Bombay-Poona region, which, if continued for long, can adversely affect industrial production and costs.

Not many weeks ago, nothing seemed to please the stock market, not even substantial buying by the Life Insurance Corporation. But now, the market is willing to take comfort even from the reported move for a meeting between Lal Bahadur Shastri and Chou En-lai. This is an indication of a considerable improvement in the general trading sentiment. Technical considerations apart, market sentiment recently has been aided by the absence of any adverse political news; it has been all quiet on the borders for some time. Shri Subramaniam's optimistic assessment of the food situation has also perhaps had something to do with the turn in market sentiment.

The stock market has no doubt staged quite an impressive recovery from its May low. Massive buying by the L I C has resulted in a marked shrinkage in the volume of floating stocks of several scrips. There have also been some indications of revival of selective investment inquiry in cash shares. The corporate news remains, by and large, fairly encouraging. It is not unlikely that the current recovery may be further extended with intermittent setbacks. But it is extremely doubtful whether the recovery in equity prices will lead to any marked revival of market activity because of the various political and economic uncertainties. Import restrictions resulting from the deteriorating foreign exchange position can have serious repercussions on industrial growth and few can take much comfort from TTK's assurance that the country would not go bankrupt as long as he was the Finance Minister.

COTTON

Prices Above Ceiling

COTTON futures last week pushed through the marginal line of Rs 775 (per 3 quintals) and touched a high of Rs 779.25. That speculators should be willing to pay an exhorbitant margin of Rs 10,000 per 100 bales to 'bull' cotton is not the least surprising. For even after allowing for the high cost of money, the hedge contract is cheap compared to the prevailing spot prices. There is hardly any variety of cotton which can be had at or below the statutory ceiling rates. Unofficial premiums range between Rs 25 and Rs 125 per candy. Superior cottons like Digvijay and 197/3 are commanding fancy premiums which is due only partly to the delay in the announcement of the global import quota. Mills have been keen buyers of the available foreign cotton; purchases of indigenous cotton have continued to be restricted to the bare minimum needs because of the acute financial stringency. That cotton prices should be quoted well above the statutory ceiling in spite of the fact that mills have been experiencing considerable financial strain due to the piling up of large stocks with them of both cloth and yarn is an indication of the imbalance between supply and demand. With demand steadily growing with the increase in spindleage, the gap between supply and demand is likely to increase further unless domestic production of cotton improves appreciably. Prospects of securing larger supplies of foreign cotton than what the country has been getting in recent years cannot be regarded as promising.

The cotton trade has been feeling quite uneasy for some time due to reports indicating that New Delhi was thinking of taking over the export trade in order to eliminate avoidable competition in a commodity which has a reasonably assured market abroad. It is no less perturbed by the Government's decision allowing the Indian Cotton Mills' Federation to import directly about 7,000 bales of global cotton under an *ad hoc* licence.

The monsoon seems to have made a promising start. Sowings have been nearly completed in the Punjab and Marathwada has had timely rains for sowing operations. Since the production of cotton, as also of other agricultural commodities, depends almost entirely on the unpredictable weather one can only pray that the monsoon will progress satisfactorily this season. Cotton production remains miserably short of the Plan targets.

Export sales of Bengal Deshi have already exceeded 2,18 lakh bales and the country does not have much more to sell this season because of the partial failure of the Deshi crop. Actual shipments between September 1 and June 5 total 190,407 bales against 196,626 bales in the same period last season. Out of this, Japan's share is 143,118 bales against 141,444 bales. The second biggest customer has been the U S A with 17,996 bales against 15,867. The other buyers of Indian Deshi cotton in order of importance are the Continent, Hong Kong and the U K. Arrivals of foreign cotton during the same period total 656,491 bales against 506,818 bales. Of this, American cotton accounts for 307,381 bales against 240,628 bales. Imports from Egypt aggregate 143,390 bales (142,595 bales). Imports from East Africa are considerably larger at 80,329 bales against 26,885 bales, but imports from the Sudan are lower at 60,101 bales against 87,455 bales. Pakistan has also been an important source of supply this season, accounting for 50,528 bales against only 4 bales in the corresponding period last season. Syria has supplied 6,411 bales against nil last season. Imports from other countries add up to 8,351 bales (9,311 bales).

OILSEEDS

Prices Rise Further

THE oilseeds 'bull' was in an aggressive mood last week. Undeterred by the prohibitive margins and caring little for the onset of the monsoon, he

rigged up the June contract in linseed as well as castor. Linseed June was bid up to Rs 105.50 and castor June to Rs 85 (both per quintal) — new highs for the season. With linseed June rising beyond Rs 104, bulls had to pay margin at the rate of Rs 5,000 per 10 tonnes which works out to nearly 50 per cent of the actual price of the spot material. Likewise, margin at the rate of Rs 2,400 became payable in castor June when the contract moved beyond Rs 84.50; here the margin works out to nearly one-third of the prevailing price of the spot material. Inability on the part of bears to tender goods against their sales in June has emboldened bulls to tighten their grip in the maturing contract. The spread between June and September contracts has increased further because of the virtual squeeze in the maturing contract. However, the distant contracts also have continued to display remarkable strength and they have been pushed beyond the marginal lines. After being marked up to Rs 81.90 castor September receded to wind up the week at Rs 81.50, thus showing a net gain of Rs 1.30 per quintal over the week. Linseed September, however, was virtually unchanged over the week at Rs 101.55, though it had been bid up to Rs 102.10. Cottonseed futures firmed up in sympathy with linseed and castor though sentiment was also aided by the remarkable strength in cotton. The September contract rose from Rs 53.75 to Rs 55.50 and eased later to Rs 54.50 on corrective profit-taking.

While the spot market continued to hold quite firm, it displayed very little of the excitement in the futures market. Linseed oil was bid up to Rs 21.25 (per 10 kgs) but the week-end quotation was lower at Rs 20.75. Groundnut oil held steady-to-firm between Rs 24.75 and Rs 25 and castor oil Commercial was only a little better at Rs 17. Oilcake prices were slightly subdued in the absence of any important export business. Since the supply position of edible oils does not appear to be uncomfortable, prospects of any further big rise in prices are generally discounted, provided, of course, the monsoon makes satisfactory progress. Inquiries with the trade indicate that fairly large stocks of oilseeds are being held by growers and cooperative societies in the hope that they would be able secure the high prices which prevailed towards the end of last season. That will be possible only if the monsoon fails. The growers would not wish that to happen; only the stockists can hope to gain from bad weather.

Money And Banking

Thursday, Morning

CREDIT conditions in the Bombay short-term money market displayed a fairly steady trend last week. Demand was good throughout the week with only limited funds being left over at the end of each day's transactions. Yet borrowers were able to obtain their requirements fairly easily at quoted rates which were around the previous week's levels. At close on Wednesday the rate was quoted at 7¾ per cent. In Calcutta the call rate ranged between 9 and 8¾ per cent.

Bank credit has begun to contract by stages. This trend is evident from the scheduled bank returns for the week ending June 4. Net bank credit was lower by Rs 3.94 crores at Rs 2,093.24 crores. Aggregate deposits were lower as well by Rs 6.55 crores at Rs 2,660.79 crores. Demand deposits declined by Rs 8.08 crores to Rs 1,247.55 crores but time deposits rose by Rs 1.53 crores to Rs 1,413.24 crores. The contraction in bank credit was largely due to a fall in purchase and discounting of inland bills by Rs 15.65 and foreign bills by Rs 81 lakhs. Inter-bank borrowings were higher by Rs 7.59 crores. Borrowings from the Reserve Bank were higher by Rs 3.38 crores at Rs 106.39 crores while cash in hand and bank balances declined by Rs 6.07 crores to Rs 163.55 crores. Investment in Government securities was slightly better by Rs 40 lakhs at Rs 721.85 crores. Money at call and at short notice contracted by Rs 81 lakhs to Rs 47.89 crores.

Notes in circulation declined by Rs 14.06 crores to Rs 2,734.39 crores, according to the statement of affairs of the Reserve Bank for the week ending June 11. Notes held by the banking department contracted as well by Rs 10.28 crores to Rs 18.79 crores. Foreign securities remained at Rs 70 crores. Balances held abroad were lower by Rs 86 lakhs at Rs 2.67 crores. Central Government deposits at Rs 75.11 crores were higher by Rs 1.84 crores. State Government deposits also rose by Rs 1.06 crores to Rs 14.16 crores. Scheduled bank deposits were better by Rs 5.37 crores at Rs 94.95 crores. Advances to governments increased by Rs 5.64 crores to Rs 97.25 crores but advances to scheduled banks fell by Rs 1.44 crores to Rs 106.37 crores. Investments at Rs 158.47 crores were Rs 4.50 crores lower than in the previous week.

BUSINESS NOTES

Tata Mills

THE process of replacing old and worn out machinery and making additions to plant and equipment for expansion and for balancing was continued by Tata Mills during 1964 when equipment worth about Rs 38 lakhs was installed. The additions included a fancy yarn doubler, high speed spoolers, warptying machines, super-automatic pirn winder, automatic looms, drying range, etc. The government has sanctioned installation of 13,640 spindles against the company's application for 20,000 additional spindles to balance production. Of the 192 automatic looms for replacement for which the company has received permission, 92 looms have been installed and the remaining 100 are awaiting installation. The company has embarked on a capital programme of further renovation and rehabilitation costing about Rs 1.10 crores for the purpose of balancing and for improving the quality of cloth production. The management is considering the question of implementing only the spinning part of the expansion of capacity sanctioned by the Government in 1963 for the cotton textile industry. This will involve an additional capital expenditure of about Rs 13 lakhs. Besides, expenditure on building in connection with expansion of production and processing is expected to be about Rs 52 lakhs, thus bringing the aggregate expenditure to about Rs 1.75 crores to be incurred in the near future.

The 1964 results show sales of cloth, yarn and waste at around the previous level of Rs 6.09 crores. But the gross profit is up from Rs 32.04 lakhs to Rs 36.21 lakhs. With both depreciation and development rebate reserve requiring large amounts of Rs 22.14 lakhs and Rs 6 lakhs against Rs 13.79 lakhs and Rs 4.50 lakhs, respectively, net profit is down by more than a third at Rs 8.07 lakhs compared to Rs 12.74 lakhs a year ago, even though there is no provision for taxation for which Rs 1 lakh were provided in the previous year. For payment of the unchanged dividend of Rs 4.50 per share plus Re 0.375 per share on new ordinary shares, a sum of Rs 3.60 lakhs is to be withdrawn from reserves.

Ahmedabad Advance

AS a diversification of its activities, Ahmedabad Advance Mills proposes to set up a plant at Navsari in Gujarat for the manufacture annually of 3,600 tons of cold rolled steel strips of 25 to 40 swg. per shift. The steel strips will be used for manufacture of certain items used in the textile industry. The plant will also manufacture other items like bicycle rims, stamped hardware, concrete sheathings, etc. The capital cost of the project will be about Rs 69 lakhs excluding working capital of about Rs 12 lakhs. The capital cost includes the cost of import of the Sendzimir mill for rolling ferrous alloys together with other equipment and accessories from the US at a cost of about $ 700,000 for which purpose the ICICI has sanctioned a foreign exchange loan equivalent to approximately Rs 34 lakhs. The plant and equipment is expected to arrive in India at the end of the next year. The raw materials required will be hot rolled strips manufactured at Rourkela by Hindustan Steel.

The company installed during 1964 new plant and machinery worth about Rs 19 lakhs to further improve the quality and output of cloth. The main items were automatic and ordinary looms, stentering and drying range, auto copser winding machine, scouring and chemicking equipment and drawing frames and carding engines. Of the 240 automatic looms for replacement permitted by the government, 142 looms were installed and 98 were awaiting installation. Under the expansion scheme, the company has been permitted to instal additional 3,617 spindles and 101 looms, but the permission has not been utilised due to lack of space and heavy financial commitments.

During the year 1964, the company's production suffered to some extent as a result of the dismantling and erection of looms because of the continuous reorganisation taking place in the mills. The financial results were affected mainly due to an all-round increase in cost of production, particularly in wages. Sales of cloth, yarn and waste brought in Rs 3.86 crores against Rs 3.79 crores a year before, but gross profit was lower at Rs 13.90 lakhs compared to Rs 16.44 lakhs. With depreciation charges alone claiming Rs 14.40 lakhs (Rs 9.81 lakhs), the accounts show a deficit of Rs 0.50 lakh. Last year, there was a net profit of Rs 2.73 lakhs even after setting aside Rs 3.55 lakhs for development rebate reserve and Rs 0.35 lakh for the tax liability. The ordinary dividend is lowered by a point to Rs 9 per share but since the new bonus shares have also become entitled to half the dividend rate, the total requirement on this account is Rs 4.95 lakhs (5 lakhs). Preferential dividend amounts to Rs 0.71 lakh as before. For paying-dividends Rs 5.40 lakhs are to be withdrawn from general reserves.

Orissa Cement

THE refractory industry continues to face difficulty in securing sufficient orders. Much surplus capacity has been created as a result of continuous expansion without realistic assessment of demand for different types of refractories. These conditions are reflected in the working of Orissa Cement's refractories unit in 1964 when it suffered a further setback and its operations resulted in a loss. One of the basic tunnel kilns had to be closed down and the other operated below capacity. The general increase in manufacturing costs due to underutilisation of production capacity was aggravated by the rise in costs of fuel, railway freight and wages.

There has been a continuous downward trend in demand for silica bricks since 1961 due to the rapid conversion of open hearth furnaces from silica roof to basic roof. Production and despatches of steel quality silica bricks went down further in 1964. The company was, however, able to manufacture and supply a larger quantity of coke oven silica bricks. Production of fireclay refractories has been higher than in 1963 but the available capacity could not be fully utilised due to lack of balancing equipment which could not be imported for want of foreign exchange. Production and despatches from the chemically bonded section have, however, shown a welcome improvement during the year. The demand for these refractories is expected to increase further in the current year.

The working of the cement and cement products units has resulted in a slight improvement in profit due to higher production and despatches. Clinker production rose from 3.39 lakh tonnes to 3.45 lakh tonnes, cement production from 3.53 lakh tonnes to 3.71 lakh tonnes and cement despatches from 3.53 lakh tonnes to 3.64 lakh tonnes. Production and despatches of spun pipes as well as prestressed products have been substantially higher. The company has been granted a licence for manufacturing 1.5 lakh tonnes of Pozzolana cement subject to the condition that the total production of both Portland and Pozzolana cement should not exceed the installed capacity already licensed for Portland cement by more than 30,000 tonnes per annum. Manufacture of this cement is expected to start during the current year.

The company's financial results show sales lower from Rs 518.07 lakhs to Rs 502.35 lakhs and gross profit down from Rs 98.77 lakhs to Rs 88.25 lakhs. After providing Rs 53.96 lakhs (Rs 35.39 lakhs) for depreciation, Rs 7.34 lakhs (Rs 2.80 lakhs) for development rebate but nil (Rs 38.05 lakhs) for electricity charges relating to previous years, the pre-tax profit is better at Rs 26.95 lakhs compared to Rs 22.54 lakhs a year ago. To this is added a sum of Rs 11.08 lakhs (Rs 0.45 lakh) transferred from development and rehabilitation reserve. The tax charge takes away Rs 18 lakhs (Rs 9 lakhs), development and rehabilitation reserve Rs 3.42 lakhs (Rs 3.34 lakhs), contingency reserve Rs 5 lakhs (nil) and reserve for bad and doubtful debts Rs 0.15 lakh (nil). The remaining surplus of Rs 11.46 lakhs (Rs 10.66 lakhs) is allocated to dividend reserve from which will be paid the unchanged dividend of a rupee per share on ordinary shares and Rs 5.85 per share on preference shares, together requiring Rs 24.84 lakhs.

Indore Malwa

BEARING in mind the frequent stoppages of power supply and dislocation in working due to the continued programme of modernisation and renovation, the 1964 results of Indore Malwa United Mills are good. Despite only a marginal increase in sales from Rs 3.82 crores to Rs 3.87 crores, the gross profit has shown a fair improvement from Rs 20.39 lakhs to Rs 23.29 lakhs. Of this, depreciation requires Rs 16.31 lakhs against only Rs 9.30 lakhs previously. Though allocation to development rebate is lowered from Rs 4.55 lakhs to Rs 3.75 lakhs and there is no provision for taxation, which took away Rs 3 lakhs in the previous year, the disposable profit is slightly lower at Rs 3.24 lakhs against Rs 3.54 lakhs a year ago. After taking credit for Rs 0.59 lakh being refund of taxes, provision is made for paying the unchanged dividend of Rs 8 a share. This requires Rs 4 lakhs.

The Elphinstone Spg & Wvg Mills Co Ltd

Address by the Chairman Shri N K Jalan

THE following is the Address by Shri N K Jalan, Chairman, The Elphinstone Spinning & Weaving Mills Company Ltd, at the Annual General Meeting of the Shareholders of the Company held in Bombay on June 17, 1965.

Ladies & Gentlemen,

I extend to you all a warm welcome to this Fortysixth Annual General Meeting of your Company, and with your permission I will take the Directors' Report and the Audited Statement of Accounts as read.

The gross trading profit for the year under review was Rs 25,58,390. The results have to be viewed in the background of the higher cost on all counts on the one hand and uneconomic prices of the products on the other. The dividend on Ordinary Shares has, however, been proposed to be maintained at 18% subject to tax.

The Cotton Textile Industry, the premier industry of India, has been working under a number of avoidable handicaps and its disabilities are only increasing every year.

Mounting Wage Bill

Year by year in the past, I had to invariably express my anxiety before you over the continuously mounting cost of this industry. The most disturbing factor of all is the increasing wage bill, especially of the Bombay cotton mills. The average rate of dearness allowance payable to Bombay mill workers for 26 working days, which was approximately Rs 92 in 1962, went up to Rs 96 in 1963 and jumped to Rs 115 in 1964. It shot up to as high as Rs122 in last May. Incidentally it may be pointed out that this rate is perhaps the highest in the country including that for the unskilled worker though at one time the rate of dearness allowance in Ahmedabad was higher than that in Bombay. It is difficult to understand the logic of such a steep rise in D A for Bombay mill workers. The average total earning of a mill worker of Bombay per month was approximately Rs 149 in 1960 which progressively rose to Rs 183 in 1964. In last May it was as high as Rs 190.

With the alarming rate at which the dearness allowance is going up year by year and especially after the re-adjustment of the consumer price index number by the Government of Maharashtra on the basis of the Lakdawalla Committee's recommendations it is not known whether there will be any limit to such a serious development. Such high wages, having absolutely no relation to productivity or to the level of wages prevailing in other industries in this centre or elsewhere, are bound to enormously affect the smooth working of the other industries not only in the private sector but in the public too. It should be a matter of serious consideration for the Bombay mill interests and the Government of the State to see that suitable measures are taken to arrest this unhealthy trend in proper time if it is desired that the Bombay Cotton Mill industry should not lose its competitive capacity both inside and outside the country.

The Second Wage Board for the Cotton Textile Industry has been set up by the Government of India to consider, among other things, the question of a further revision of the wage structure in the industry. It is only to be hoped that the Wage Board will make its recommendations fully bearing in mind the impact of high wages on the economy of the nation as a whole and will not be instrumental in perpetuating the vicious circle of high wages and high prices.

And along with high direct wages, the liabilities of the industry towards the workers had been increased considerably only recently by way of enhanced contributions to Provident Fund and the Health Insurance Scheme and by the substantial increases in the benefits of additional leave with wages.

High Prices of Cotton

Another constant bugbear of this industry is the high price of cotton payable by the mills. Apart from the generally inadequate and uncertain availability, the prices payable are very high. The prices of all varieties had pierced the ceilings towards the end of the year under review and only the scheme of restricted stocks and purchases by the mills introduced by the Indian Cotton Mills' Federation could check the prices for the time being.

The behaviour of cotton prices this year, especially in relation to the statutory control on cloth prices, has once again established the futility of fixing ceilings for the prices of cotton. Fixing of ceiling can have a meaning only if the Government were to evolve suitable machinery for enforcing these ceilings. Unfortunately, they could never be enforced in the past and they have only been instrumental in creating undue hardships and misunderstandings between the interests concerned.

It has been suggested that the present ceiling should be raised for the next season. This will not, however, bring about the desired results at all. Only the past history will be repeated and the new ceilings will be pierced once again and create a further demand for still higher ceilings. In all such cases, the maximum prices fixed by the Government have more often than not tended to be the minimum prices and prevented the law of supply and demand from functioning even when conditions otherwise warrant a price decline. The Agricultural Prices Commission has for this very reason recommended to the Government that no ceilings should be fixed for foodgrains and I trust the Government will take a clue from these recommendations.

The mill consumption of cotton has been continuously increasing and if proper and effective steps are not taken to increase the yield of cotton in this country which is still very poor, to the level of the world average, it will only lead to further hardships. Adoption of modern methods of production and plant protection should necessarily be helpful in the direction of getting adequate and assured supplies of cotton.

High Excise Duty and Controls

Unfortunately, the mill industry is being meted out a stepmotherly treatment as against the powerlooms and handlooms. Very high rates of excise duties are payable on mill cloth, especially on fine and superfine varieties. Against this, from the very beginning, the powerloom sector has been granted concessional rates of excise duty by the Government. And even these concessional rates have been drastically reduced in the 1965 budget with the result that the duty paid by the mills today is almost a hundred times as much as the duty payable by the powerloom units of up to 49 looms. This discrimination would naturally lead to the inevitable result of drastically cutting down the competitive capacity of the mill industry with the powerloom sector.

Besides, only the mill made cloth has been brought under the purview of production and price controls while powerlooms and handlooms have been enjoying the facility of being absolutely free from these controls. The mill industry has to struggle hard between its increasingly mounting cost and the fixed controlled prices with the result that its profitability is being continuously squeezed out and it will be no wonder if a time comes in the near future when a number of mills will find it unprofitable to continue to work.

As a matter of fact, it is very necessary for the Government to help this industry, which is the third largest earner of foreign exchange for the country through its exports, by allowing it to earn sufficiently with a view to be able to finance adequately its continuous requirements of rehabilitation and modernisation with the help of its own resources and this can be done only if the industry is freed from the rigours of all controls. Ultimately, only higher production would help the consumer to get his requirements at reasonable prices and the industry to function in a smooth manner. Controls act as a deterrent to higher production.

Low Priority

Next to food, cloth is the most essential need of the people and high priority should therefore be assigned to this industry. Unfortunately, however, continued low priority is given to the cotton mill industry. The industry has been denied, inspite of repeated representations, the 10% rebate of tax conceded to certain other industries which occupy an important place in our economy, according to the Finance Minister. It is beyond comprehension as to why this essential industry should not also be treated as occupying an important place in the economy of the country.

Besides, this industry has been relegated to the ranks of those industries which will be eligible to get the benefit of only 15% Development Rebate consequent on the standard rate of Development Rebate having been cut down from 20 to 15% in the last budget. As a matter of fact, this important industry should have been grouped together with certain other specified industries in whose cases the rate of Development Rebate has been enhanced from the present 20 to 25% with effect from 1st April, 1965.

Levy of 10 Per Cent Duty

Added to all the adverse factors mentioned above, the recent levy of 10 per cent regulatory duty on imports will very much affect the working of the mills. It will considerably raise the cost of machinery required for modernisation and expansion, foreign cotton, stores, colours and chemicals. As it is, the Textile Industry has been facing severe competition in export markets owing to high prices of cotton which have been ruling above the world parity and the very high cost of labour, machinery and other materials. Cheap and sustained supplies of cotton and the availability of modern machinery at reasonable prices, among other factors, only can help the industry to successfully compete in the foreign markets. The new additional import duty, however, it is feared, will rule out all the chances for the industry to gain the competitive strength in the world markets.

The sudden impost of this additional levy has resulted in considerable losses in the sales made in the foreign markets. The compensatory benefits that would accrue to the exporting mills on account of import incentives had been duly taken into account while effecting sales for exports at highly sacrificial prices. The payment of extra 10 per cent duties on the imported material against the import incentives earned through these exports have upset all the original calculations and have ultimately turned the marginal profits into losses.

This drastic measure is also self-defeating inasmuch as the Government is otherwise intent on taking suitable measures to check inflation and to bring down prices while the added levy can only result in increasing the cost all round. I only hope the Government will repeal it at the earliest opportunity.

Drawbacks

The Government is intent on boosting the exports and is making all efforts by introducing several Export Promotion Schemes. It is, however, necessary to see that the exporters are enabled to cash the compensatory benefits without undue delay. The procedure of fixing up the quantum of draw-back rates has been made so very rigid and complicated that inordinate delay is caused in enabling the manufacturer exporters to obtain their dues which in some cases are pending since 1963. Effective steps should, therefore, be taken by the Government to remove these handicaps for the exporters.

Stock Accumulations

The recent steep increase in the bank rate has resulted in making the industrial borrowings very costly. Cloth and yarn markets have become dull and there have been heavy accumulations of stocks with the mills owing to considerably reduced offtake following the acute stringency in the money market consequent on the curbs on credit.

As against the stock of 209,800 bales of cloth at the end of February, 1964, there was a stock of as many as 381,000 bales at the end of April. The yarn stock was 85,900 bales at the end of February, 1964, and it increased to 149,100 bales at the end of April.

Bonus

In response to the Appeal made by the Chief Minister of Maharashtra, bonus was paid on account for the year 1963 in October, 1964, calculated at the rate of 4 per cent of the consolidated wages pending final adjustment in this behalf at a later date. The payment of minimum bonus of 4 per cent of the consolidated wages in the bonus formula as suggested by the Bonus Commission and accepted by the Government, even in cases where the establishments do not make any profit or even incur losses, was opposed by the employers' representatives as it is tantamount to a straight increase in wages.

Besides, the minimum of 4 per cent of the consolidated wages in fact works out to over 10 per cent of the basic wages which formed the basis of payment hitherto. It is beyond all canons of justice to force such excessive obligatory payments on companies even when they have incurred losses and there is absolutely no justification for saddling the companies with additional losses especially when some of them may be suffering from continuous losses for a number of years and may only be struggling for survival. Such arbitrary imposition of payment of bonus is even beyond the terms of reference given to the Bonus Commission.

The provision for guaranteeing the existing benefits of bonus wherever they were higher than what is provided under the formula suggested by the Bonus Commission, resulting from the persistent representations on behalf of the labour is also not fair to the employers and it will only create a number of complications and industrial disputes with the result that the very purpose for which the Bonus Commission was appointed will hardly be served.

In this context, the reported objections raised by the Law Ministry on these two important features of the bonus formulas were highly significant. The Law Ministry was reported to have pointed out that the provision for the payment of a minimum bonus ran counter to the provisions of the Constitution relating to fundamental rights and the provision guaranteeing existing benefits would be discriminatory.

Inspite of these and the most reasonable pleas of the employers' organisations to make realistic modifications, the Government ultimately chose to promulgate an ordinance on the 31st of last month for payment of bonus including the above benefits and thus the Parliament and the public have been presented with a *fait accompli*, no scope being left to them to have a free and frank discussion on a vital economic issue like this.

Restrictive Policy

I have referred to the continuously mounting cost of wages, social benefits and fringe benefits to workers. Cotton prices are going up every year as also of stores, colours and chemicals. In the background of these unceasing and relentless increases all round the fresh levies like the Bombay Municipal Octroi, the proposed exorbitant rates of inspection fees made payable compulsorily by mills on all cloth produced by them, with effect from March 1965, etc may only prove the last straw on the camel's back and it is, therefore, essential to cry a halt to all these factors leading to increased cost and the levy of fresh imposts day after day. I am constrained to say that this industry is being treated like the proverbial milch cow and if the powers-that-be do not take the remedial measures in time, they will soon kill the hen that lays the golden eggs.

As you all know money market at the present is very tight and credit for trading is not readily available. The object behind the policy of a curb on credits was perhaps to reduce the holding power of traders with a view to bringing down the prices. It is, however, apprehended that such stringency in the money market instead of helping to bring down the prices, would tend to affect adversely the production in the mills and also to increase the production costs for obvious reasons.

It is apparent that the Government is increasingly spending huge sums of money on defence and planned programmes of development thereby putting larger and larger amounts of money in circulation. Retardation of production of consumer goods at the same time due to ill-conceived restrictive policies, will only serve to further aggravate the scarcity of essential goods like cotton fabrics on the one hand and intensify the pressure of inflation on the other.

The absence of any provision for more flexibility in the fixation of cotton cloth prices has been also a great deterrent factor. If no latitude is allowed to the cotton textile industry to make adjustment in prices of controlled cloth varieties to recover the rising cost of production and raw materials, it is bound to have great adverse effects on the production of all cotton mills. In fact, due to the restrictive policy of the Government, mills are forced to produce inferior varieties of cloth for which there is rather limited market and restrict the production of better quality fabrics which are usually in great demand. As a result, the stocks of inferior varieties of cloth are mounting up. These are the reverse of what controls were designed to achieve.

I, therefore, fervently hope that the Government will take a more realistic view of the serious situation in which the mills are now placed and will relax the present restrictions, which I am sure, would have the effect of encouraging production, particularly of quality goods, and thereby bringing prices down to a reasonable level.

Other Adverse Conditions

On account of acute shortage of water, processing works are being hampered very badly.

It is regrettable that in addition to the various handicaps under which the industry is working, we have been asked to curtail our production by about 16% owing to power shortage. This will mean closure of oud mills once a week apart from the usual holidays. It is inconceivable that in this modern world, we are forced to cut out production due to shortage of electricity.

Leather Cloth Division

Inspite of our difficulties in securing adequate quantities of basic raw materials, we have been able to increase our production of Leather Cloth by about 70%. Owing to the restrictions on the import licences, indigenous raw materials had to be used in increased quantities at more than double the prices of the imported stuff which has adversely affected the earning capacity of this Division.

Modernisation and Renovation

During the period under review, the implementation of the Company's modernisation programme has proceeded apace by the installation of new machinery valued at Rs 10.65 lacs. Further orders for new machinery costing Rs 12½ lacs have already been placed and some of them are due to be received in the current year.

In the Finishing Section, the Company has placed order for a Shrinking Range with Felt Calender which will enable the Company to cater to the market requirements of particular types of finishes which are very much in demand. The Company has now also provided for the finishing of Tery-cotton fabrics and special equipment for finishing and dyeing of these fabrics which was ordered earlier is now under installation.

Note This does not purport to be a record of the proceedings of the Annual General Meeting.

Foreign Trade Of India

Principle Sources of Imports in 1964-65

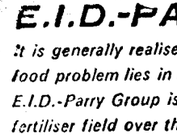
E.I.D.-PARRY IN THE FIELD



It is generally realised that the ultimate solution of the country's food problem lies in the proper use of balanced fertilisers and the E.I.D.-Parry Group is proud of its record as the leader in the fertiliser field over the last 63 years. The E.I.D.-Parry Group was the first to manufacture bone super, super-phosphate and compound fertilisers in the private sector. Factories are in full production at Ennore, Tadepalli and Ranipet, and mixing centres are operated throughout the States of Madras, Andhra, Mysore, Kerala, Maharashtra and Gujarat. The Group is also a partner in the vast project of Coromandel Fertilisers Ltd. at Visakhapatnam.

In 1963-64, the Group sold over a quarter million tonnes of fertilisers; it confidently hopes to double the sales in the next three years.

The E.I.D.-Parry Group has the unique distinction of being called "The Fertiliser Co." in the rural areas and "The Confectionery Co." in the urban areas. The Group not only leads in the fertiliser and confectionery fields, but also in the manufacture and sale of sugar, pottery, sanitaryware, fungicides and a large number of other products.

Today, the E.I.D.- Parry Group, fondly known as "Parrys", is one of the larger companies in India, consisting of 9 subsidiary and associated concerns, providing employment for more than 10,000 people.

THE CHANGING

Kulti. Neighbour to a steel town. Precursor of a proud tradition. It all really began at Kulti way back in 1870. Here was the oldest successful unit in India producing pig iron by modern methods. With production upgraded at Burnpur the blast furnaces closed down in 1958. But obsolescence never overtook Kulti. Its integrated iron, steel and non-ferrous castings foundry is still one of the largest in the East—the spun pipe foundry one of the best. Kulti's present consumption of pig iron exceeds 20% of that for the whole of India; it can, in fact, take in more, if available.

Thus Kulti continues in a career of planned growth. Serving Burnpur, serving other steel plants—and India's railways, chemical and sugar industries with complicated castings. Spinning out pipes as well by full train loads for the projects and utilities as no other unit does. And Kulti today is confident of adding on to its achievements.

Algeria without Heroes

THE night was not kindly, and Achmed Ben Bella's removal was not brought about with any particular gentleness. With the Afro-Asian Conference barely a week away, it was an embarrassing moment to undertake the coup. But Houri Boumedienne did not wait for the passing of the prestigious Conference before striking. One possible interpretation is that he was apprehensive that Ben Bella might use the Afro-Asian Conference to strengthen his domestic position. Other conjectures are equally in order. For example, last week's putsch could have been organised to forestall a rapprochement between Ait Ahmed, languishing in prison, and Ben Bella, or simply because Boumedienne was exasperated by Ben Bella's consistent down-playing of domestic interests and obsession with winning friends and influence abroad. The deadly game of capturing power in a one-party State ends with the winner taking all, and therefore even history from now on will tend to follow closely Houri Boumedienne's version of this murky affair. The rest will be oblique inferences and dark innuendoes.

What fills one with awe — and also a little bit of sadness — is the abruptness with which Ben Bella was dethroned. True, the denouement was somewhat less distasteful than a typical Middle Eastern coup d'etat, with its invariable concomitant of a lot of bloodshed. But it did not quite resemble the quasi-civilised manner in which regimes are nowadays made to topple in socialist countries either. Even in the East European countries, when it is decided to do away with a leader, at least the Central Committee of the Party is called to make the formal decision: Boumedienne did not care to call in the Committee of the FIN, possibly because, even at this stage, his followers do not constitute the majority there. Once he decided that the brother President needed to be eliminated, he had the strength to move into action immediately, and could ignore the Central Committee. No doubt the Committee too is now being purged.

The Algerian coup leaves a bitter but significant lesson behind. Once a revolution is completed, the heroes do not really matter, and sooner or later the commissars take over. Ben Bella provided the charisma of the Revolution; his was the romantic image of the movement. But it was Boumedienne who rallied the peasants and the workers during the turbulent years of 1955-61, and hammered out the militia. While every revolution needs a hero, it also needs a leader; the respective attributes do not always coincide in the same individual. Achmed Ben Bella was the hero, but Boumedienne led and made the Revolution. He was the planner, the organiser, the builder of the army, and also the man who gave the movement a positive and coherent socio-economic content. The Army of National Liberation was from the beginning completely under his control; if anything, it is more so today. It is possible to infer that he has seen to it that by now the civil administration too is adequately infiltrated by his men. Ben Bella, the crowd-charmer, was thus, in the aftermath of the Revolution, in many respects the redundant head of the movement, somewhat without a profession, somewhat miscast. Unlike the other heroes of the Revolution, he nevertheless lingered, for Boumedienne still had need for him in the difficult early days following Independence. Conceivably, he also trusted Ben Bella a little bit more than he trusted the others: after all, Brother Ben Bella is from his own *wilaya* and comes from the same peasant stock.

It looked like an ideal diumvirate: Boumedienne was the quiet consolidator of the Revolution, re-organising agriculture, charting industrial growth, pacifying the countryside, and generally looking after domestic stability. Ben Bella, on the other hand, was the man with the aura of fame, whom the outside world could look at and admire, whom the intellectuals and the urban bourgeoisie could worship—the perfect romantic foil to the desiccated realism of the army chief.

Like all beautiful understandings, this one too did not last. Perhaps Boumedienne had come to suspect some latent bourgeois deviation in Ben

Bella; perhaps he reached the conclusion that, in the present phase, what Algeria needs is internal consolidation and not external adventure; or perhaps it was just a case of falling out of two antipodal personalities. Inevitably, we slide back into the realm of speculation.

The Algerian Revolution has thus been made to shed its last and most eminent hero. In the process, Afro-Asia has been dealt with a shock extremely severe in impact. As we go to press, it is still not quite clear whether the Afro-Asian Conference will be postponed or not. But for the confusion following the coup, Harold Wilson's desperate attempt to salvage his—and the Labour Government's—reputation through the device of the Commonwealth Peace Mission for Vietnam would have come to nought, for leaders of the Afro-Asian world, who were to have assembled at Algiers, would certainly have asserted themselves and taken over the initiative. If the Conference is now postponed, the Commonwealth Mission will inherit the opportunity. However, in the face of the violent reaction of Peking and Hanoi, the Mission can achieve little—what Anthony Eden could pull off in 1954 is beyond the capability of Wilson in 1965, a capability which has been hopelessly compromised by the Labour Government's all-out endorsement of President Johnson.

If the Afro-Asian Conference does not meet on June 29, it will thus mean that any effective proposal for concerted action to bring succour to the hapless Vietnamese will not yet have been put into concrete shape. This will be, in the short run, the most grievous external consequence of the coup which has toppled Ben Bella. But, provided Algeria does not deviate from the socio-economic goals of the Revolution, the really significant issues will soon sort themselves out. Last week's development in Algiers is a pity, but there is little reason to call it a calamity yet.

Prescriptions, Spurious and Dangerous

RAPID and frightening deterioration in balance of payments, an economy strained by shortages at many vital points and a defence build-up the burden of which is, if anything, likely to grow more crushing over the next few years— that is the economic reality that faces the country at the end of its first decade and a half of planning. A great deal of optimism is necessary at this moment to avoid dismal prognostications about planning and development.

Consider the balance of payments position. We are now virtually scraping the bottom of the foreign exchange barrel and have come to a stage when we have to borrow to repay earlier loans: three-fourths of the latest credit from the International Monetary Fund is being used to repay past loans from that institution. Some new non-project, untied loans may be forthcoming, following fresh agreements with our creditors, and with these it may be possible to stave off the worst for the moment. But this balancing act will have to come to an end sooner than later.

The foreign exchange crisis is remarkable for coming in the wake of a spectacular upward surge in exports. In the initial enthusiasm over the rise in exports, what was not realised, however, was that commodities exported did not mean foreign exchange earned. It is being realised only now that export earnings have lagged behind shipment of goods and that the lag is actually becoming longer. What has not been explained is why this was allowed to happen when the country has an elaborate system of exchange control. Present regulations require an exporter to surrender export proceeds within six months to the exchange control authorities. Apparently the Exchange Control Department has slipped up and badly. Occasional cases where the invoice value of exports declared at the time of shipment of goods is higher than the proceeds subsequently realised may be unavoidable, but when this becomes the rule one should expect that the Exchange Control Department and its master, the Finance Ministry, will act to locate the loophole in the system. Instead, the public has been treated to an endless and futile debate over the discrepancies between the Customs data on exports and the Exchange Control figures. The sprawling machinery of exchange control is apparently worse than useless since it cannot discharge its principal function.

The tragic part of the foreign exchange crisis it that it cannot be ascribed to an acceleration of the pace of economic development or to a change in its strategy. The 1958 crisis was sought to be explained as the result of a lapse in plan formulation which led to under-estimation of import needs. Are we now to be told that imports requirements have been under-estimated once again? And if after the experience of the Second Plan import needs were under-stated and the possible extent of import substitution exaggerated in the Third Plan, what value is one to attach to the estimates that are currently being made for the Fourth Plan? If the Planning Commission's "Memorandum" is any guide it is likely that all the mistakes will be repeated over again.

Turning to the domestic scene, the hollowness of glib phrases like 'development with defence'—suggesting that the two are complementary—has been adequately exposed. The experience of the last three years is enough to disillusion us about the contribution of defence to development. The defence build-up has meant, on the one hand, a diversion of a substantial part of the economy's real resources, including foreign exchange of course, from development uses and, on the other hand, an increase in money incomes which has left the Third Plan's precious commodity balances high and dry. The implications of defence spending are not going to be any different in the next Plan.

Coming to the means which are being suggested for lifting the economy out of the doldrums, it is obvious that the foreign exchange crisis, alarming though it is, cannot be cured by devaluation, however tempting this simple solution may seem. It is possible to draw the inference from black market rates that the rupee is overvalued, but it is not a general overvaluation in the sense in which one talks of the problem in the context of the advanced countries. And for the problems of such partial over-valuation—e g, in relation to exports of manufactures — there are effective enough solutions in export subsidies, in whatever form. The tax credits are waiting to be tried out properly and the import entitlement scheme is not beyond reform. There are other devices which combine the merits of selective devaluation and administrative simplicity.

The pressures that are currently being exerted on us do not stop with trying to impose spurious solutions to our balance of payments problem but extend to trying, with a measure of success, to thrust the domestic economy into a strait jacket by untenably linking the foreign exchange difficulties to internal

pressures. It may be true that we ourselves are quite aware of the lack of any such connection and that if we have accepted the euphemistically termed 'stabilisation programme' it is not out of any faith in the merits of the programme but because the high priests of the IMF would insist on nothing less before approving stand-by credits. Yet let us not kid ourselves that the price we are paying is negligible or small. The possibility of a further tightening of credit in the slack season has been held out by the Reserve Bank Governor even though the severe import restrictions and the credit squeeze have already begun to tell on industry and, besides hampering growth, have substantially raised unutilised capacity. During the worst years of agricultural stagnation in the Third Plan, industrial expansion maintained a steady rate, but this may not now continue.

All this needs pointing out, and particularly now when the Finance Ministry is frantically seeking a way out of the exchange crisis. For even the economic experts in the Ministry have apparently ceased to be 'growthmen' and become 'stabilisers'. The danger of this change in attitudes is that we may lose growth in the long run without in the short run achieving stabilisation. The experience of so many countries which have undertaken stabilisation programmes at the behest of the Fund is ominious enough for India.

Weekly Notes

Spinning Out the Soul of India

BOTH Government and industry seem to be getting down to brass tacks in tackling the problems of cotton mills and cloth export. The Indian Cotton Mills Federation has earmarked Rs 15 lakhs for a project to improve cotton farming practices. This is a small beginning for an industry established more than a hundred years ago but it is, nevertheless, a worthwhile direct effort. So far the industry was content to pay an annual cess levied for the benefit of the Indian Central Cotton Committee, the continued existence of which as a separate entity is doubtful. The Committee did useful work but in a very limited field, namely the introduction of new varieties and longer staples; it did not or could not pay much attention to improvement of crop yields or the large-scale adoption of better practices. Such mundane activities have passed under the all-embracing umbrella of community development and national extension but no tangible results have emerged. In the meanwhile, raw cotton remains scarce and costs 20 to 40 per cent more than in other countries; the advantage which our industry had in international markets has been lost. Consequently, there is an annual foreign exchange drain of Rs 60 crores for raw cotton imports, which has turned the industry into a net spender of foreign exchange.

There is a strong case for improving the materials and equipment base of the industry, a relatively small investment which can earn high and quick returns. The plea made by Ramnath Podar, Chairman of the Federation, for better maintenance of machinery and training of supervisors is unexceptionable, though similar pleas have been made sporadically at annual gatherings since the twenties. What one does not appreciate equally is Podar's placement of the industrial soul of India in cotton and jute textiles, just as the industrial souls of USA, Switzerland, Germany and Japan are to be found, in his opinion, in automobiles, watches, steel and chemicals, and electronics, respectively. This metaphysics is not really necessary in the course of arguing for tax concessions on a high priority basis. As running and well established concerns, cotton mills get the maximum benefit from existing tax concessions while new enterprises in new industries do not make sufficient profits to avail themselves fully of them.

The domestic manufacturers of textile machinery, some of whom belong to groups which themselves have a large interest in cotton mills, are presenting mills with leaves out of their own book. Machinery is defective (for which allowance can be made up to a point); models are out of date, after-sales service is inadequate and "the scant respect paid to grievances gives rise to a feeling of despair rather than anger", mainly because order books are full for the next two years. In a slightly different context, one hears rather similar complaints about the quality of cloth sold by many of our mills. If the soul itself is weak, how can one blame the flesh?

From the Government, there is another useful Joshi report, which unreservedly accepts the need for modernisation (which was quite unthinkable ten years back) and goes further to stress the need for training workers to handle modern equipment (and, inevitably, setting up training institutes). The Committee has found that at present only 48 mills are equipped to produce quality goods for export but another 108 out of the total of 287 composite units could be added to this number. There is unfulfilled demand abroad for poplins, shirtings, dress materials in piece-lengths longer than normally supplied by mills, widths of over 60 inches, and pre-shrunk cloth for ready-made garments. To meet this demand at competitive prices, the Committee feels that there should be a few mills with completely modern equipment from blow-room to finishing and devoting most of their output to exports. This idea was put forward earlier in embryo form—for mills of a relatively small size—in the first Joshi report on modernisation in 1958. The economics of such mills (leave aside Bombay Dyeing, the giant established way back in the 1870's, which exports nearly 70 per cent of its output) has never been fully investigated, let alone established. If that had been done, one would have expected the Industrial Finance Corporation to have sanctioned some assistance for a project of this nature; one doubts if it has received any such proposal. The investment in fixed assets and in creating a new sales organisation abroad involved in a new enterprise will be enormous. Only the existing mills can undertake a task of this magnitude and that, too, over a period of time. It is better to concentrate on the installation of wider-width automatic looms (which have to be imported), standardisation of export qualities, manufacture of longer pieces and cloth pre-shrunk by native processes which are being widely adopted as the 'sanforized' trade mark registration is about to expire.

Oil Imports and Exchange Waste

AN excellent case for replacing imports of petroleum products through the Western oil companies with imports from the rupee payment area—mainly the Soviet Union—existed long before the present foreign ex-

change crisis forced the Government of India to take the step in March this year. Liberal supplies of the particular products we need — high speed diesel, kerosene and fuel oil — have been available against payment in rupees ever since the Soviet Union emerged as a major petroleum seller to the non-communist world. And while it may not have arrived at today's crisis point, India's foreign exchange position during these years has never been too comfortable to make the prospect of saving some fifty crores of rupees of free foreign exchange not worth bothering about. Payment in rupees apart, the comparative prices of oil from western sources and from the Soviet Union alone should have been reason enough to maximise imports from the latter. An idea of the price differential can be had from the fact that last year in terms of quantity 17 per cent of our imports of kerosene came from the rupee payment area, but the cost of these imports was only 10 per cent of the total cost of all kerosene imports into the country. In the case of lubricating oils, again, imports from the rupee payment area were 15 per cent of total in terms of quantity but only 11 per cent in terms of value.

What economic wisdom had suggested for years economic necessity finally forced the Government to accept and from the beginning of the current financial year import of kerosene, high speed diesel and fuel oil through the private oil companies has been stopped and import from the Soviet Union stepped up. The oil companies have, predictably, refused to distribute Soviet oil, ostensibly on the ground that in principle they could not handle oil which was "politically priced" but really to exploit the situation created by the public sector's lack of storage and distribution facilities. With the limited facilities that Indian Oil, the public sector refining and distributing company, has been able to build up, cessation of imports through the private companies and hence curtailment of distribution through their outlets was bound to dislocate movement of supplies and create scarcities in many parts of the country. But the oil companies have not depended entirely on the inadequacies of Indian Oil to create the scarcities which they hoped would force the Government to resume imports through them. They have sought to aggravate the scarcities by holding up the normal distribution of the output of their refineries in this country. The Oil Minister has affirmed this and a press note issued by the Ministry reveals that "after a study of the movement of kerosene and HSD from the coastal refineries to different parts of India, it was found that in recent months there has been a significant decline in the volume of these movements" and that "evidence has come to the Ministry that some companies have been deliberately restricting their normal supplies to dealers and agents although adequate stocks were available". The evidence finally compelled the Government to take powers under the Defence of India Rules to regulate distribution of the output of private refineries.

The Government has, however, still to find an answer to the problem of distributing oil imported from the rupee payment area. Burmah Oil has offered to distribute these products in Assam and other parts of the eastern region, but the other companies have stuck to their conscientious objections. That these objections can be overcome with appropriate pressure is proved by the BOC's offer. Even Esso has agreed to process crude oil imported from the Soviet Union in a refinery set up by it in Italy in collaboration with ENI. The Government need not, therefore, regard the companies' 'no' as final. Given sufficient firmness it can avoid the considerable national waste involved in the oil companies' storage and distribution facilities lying partially idle while Indian Oil struggles to create new parallel facilities.

The response of the oil companies to the decision to step up import of oil products from the Soviet Union holds an important lesson. Some at least of the refineries proposed to be set up in future will be established in collaboration with western oil companies on the model of the Cochin refinery. At Cochin while the agreement with Philips Petroleum is more favourable to us than those under which the existing private refineries operate, even Philips has been given the right to import all the crude for the refinery from sources of its own choice. If other future collaborators are given the same right it would mean tying the country down to crude imports from sources over which the Government has no control and which have to be paid for in foreign exchange and generally at higher prices than from other sources. Just now, for instance, however grave the foreign exchange situation the Government has to find some thirty to forty crores of rupees worth of exchange annually for imports of crude oil for the private refineries. It is imperative therefore that in the new refineries to be set up the Government must retain control over crude supplies. While this would very considerably reduce the attractions of participation to the private companies, they can be persuaded to accept it as a last resort as the example of the Esso-ENI refinery in Italy shows.

Legalisation of Abortion

LAST week, while delivering the convocation address at the Demographic Training and Research Centre, Bombay, the Union Education Minister perhaps surprised his audience by his firm assertion that "although I am aware that not many in this audience will agree with me, I am entirely in favour of legalising abortion". In support of his view Chagla cited the remarkable success achieved by Japan in the form of an almost 50 per cent reduction in the birth rate during 1949-1957.

Actually, the issue of legalising abortion has been a subject of considerable discussion during the past year or so. At its meeting in Bombay in August 1964, the Central Family Planning Board had set up a committee to study the question of liberalising the abortion law as a measure to promote family planning. (The Committee is yet to submit its report.) Earlier, in June 1964, the Union Health Minister had stated in the Rajya Sabha that although she was against legalising abortions entirely, "there are certain cases where it becomes very difficult to decide what is moral and what is immoral". There has also been a seminar in New Delhi to examine the pros and cons of this complex issue.

It is most unfortunate that on this very important and controversial subject, the facts are not very widely known. Abortion is legalised not only in Japan, but, *de facto*, also in Sweden, Denmark, Finland and Switzerland, and, *de jure*, in U S S R, Bulgaria, Poland, Hungary, Rumania, Yugoslavia and Czechoslovakia. Also, abortion has been just as important in Eastern Europe as in Japan in regard to its contribution to lowering the rate of live births. Each of these countries has prescribed certain conditions for permitting abortions. While these conditions and their observance in practice vary from country to country, the very diversity of the situation promises to hold useful lessons for a country like India in its search to formulate a reasonable policy regarding abortion.

It is well known that an abortion under proper hygienic conditions and adequate medical care is not a hazard to health. Mortality among women undergoing abortion in countries of Eastern Europe is substantially lower than that normally associated with reproduction and that observed in a country like Denmark or Sweden with *de facto* legalised abortion. The serious limitation imposed by the limited number of well trained medical practitioners in India can probably be met by specifying that legal abortion can be had only in certain institutions or in certain areas with adequate medical personnel. Some screening committees, including doctors as well as social workers, can also be appointed to scrutinize the applications for abortion. Further, as is the case in some countries of Eastern Europe, abortion can be forbidden if the applicant had undergone an induced abortion during a specified period prior to the present application.

The moral repugnance to abortion as a part of the family planning programme is largely irrational and needs to be overcome in view of the serious implications of unwanted additions to the family for the mental as well as physical health and welfare of the parents and other children. The Union Education Minister's strong support for legalizing abortion is a happy augury for rational thinking on the subject. It is to be hoped that careful studies of the incidence of spontaneous and induced abortion in India as well as in other countries will now be encouraged to provide the factual data essential for framing a proper policy on the subject.

Hope in Kutch

THE proposed joint declaration on the Kutch issue is expected any time between now and June 27 when Lal Bahadur Shastri returns to Delhi. Pakistan has conceded a return to the *status quo ante* as on January 1, 1965, and has ceased to insist that the Kutch problem can only be considered as part and parcel of the whole Indo-Pakistan border situation. India has agreed that the precise details of withdrawal of forces, of police patrolling and the setting up of posts shall be left unspecified until after the joint declaration.

The agreement between India and Pakistan amounts to a decision to return to the *status quo ante* without specifying what each country means by it. The British Government has apparently managed to whittle down the area of disagreement between India and Pakistan to points of detail. It is reported that India has made it clear that Pakistan may not have any standing post at Kanjarkot or anywhere else in Indian territory; she is, however, willing to let Pakistani police patrol the Ding-Kanjarkot-Surai track.

So far, so good. But what is to be made of reports that India is willing to abandon her posts in her own territory, including those at Sardar (two miles south of the boundary), Vigokot (few miles south of the boundary), and Karimsahi? Does a return to the *status quo ante* mean that Indian territory near a crucial international boundary should be left unpatrolled and open to incursions? Of course, in any international agreement there has to be a certain amount of give and take. In the present case, Pakistan has agreed not to link the Kutch issue with Kashmir. (However, since she has lost her platform at the Afro-Asian conference in Algiers, where she had threatened to air her grievance, Pakistan's capitulation on this point is not surprising.) In return, India has agreed to leave parts of her territory virtually unpoliced. Will Pakistan take this as a sign of weakness?

Assuming that the two countries don't get bogged down in the details of implementation, what can we hope for the future? That each issue at stake will be discussed separately without having to bring up all problems simultaneously; that India and Pakistan will honour an international boundary agreement; and that the two countries will move a fraction closer to some kind of understanding.

AIR Musical Chairs

ON Sunday the-then acting Director-General of All-India Radio, Y N Verma, made the wholly welcome statement that less coverage would henceforth be given to Ministers' speeches in AIR's news bulletins; on Tuesday it was announced that V K Narayana Menon had been appointed Director-General. It is to be hoped that this was no more than a coincidence. A statement by the Director-General would hardly have been enough to reduce the importance given to Ministers' speeches, nor would such a step have improved the plight of the AIR much; but the very sentiment is so right and its utterance by an AIR man so unexpected, that we cannot help wishing it is not just a flash in the pan.

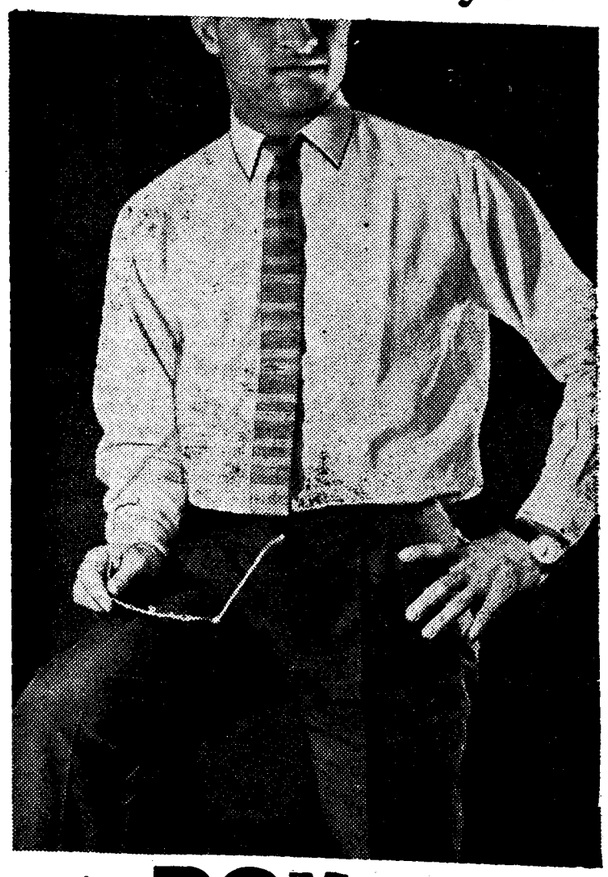
The publicity attracted by Verma's statement is a sorry indication of how little used we are to the idea of the AIR boldly making its own policy. The AIR is a colony of the Ministry of Information and Broadcasting, and susceptible to political interference from the Minister; further, it has, as an arm of the Government, become a potent source of patronage and hence subject to pressures from other Ministers and political interests. While it has undoubtedly fared better under Indira Gandhi, she has not shown, whether in Parliament or outside, the determination to protect the AIR against external pressures; nor do the new appointments betray any interest in making the AIR a professional organisation. And where Indira Gandhi has failed, lesser Ministers can hardly be expected to be effective.

The present status of the AIR is positively inimical to its fulfilment of the task of informing, educating and entertaining listerners. This is not to say that its transformation into a public corporation will remedy its mercenary quality and lack of imagination. The BBC is looked upon as a paragon of broadcasting in this country, but even the BBC had to drop "That Was the Week that Was", a weekly television programme of political satire, owing to political pressure last year. The introduction of private television nearly a decade ago and the allotment of a third TV channel last year were both hotly debated political issues in the U K which engendered some very messy lobbying.

Nevertheless, the BBC does not have to withhold or doctor news at political behest, and its day-to-day programmes are entirely its own business. And the cause of its independence is not merely its status or the public morals of British politicians. It also lies partly in the way the BBC gets and uses its personnel. No one apart from the Governor of the BBC is appointed by the Minister; all other appointments are made by the organisation itself, which thus affords an attractive career ladder to its personnel. A BBC man can rise all the way without having to please a Minister or a Secretary. Further, the BBC does not look to the Government for fresh personnel; it recruits directly from the press, the theatre, the arts and the universities.

The independence and vigour of BBC are not beyond the AIR. There is no inherent difficulty about turning it into an independent corporation; it can be made financialy independent by being given the control of radio licence fees or allowed to take adver-

tisements and it is a large enough organisation to provide its members a fulfilling career. But this is a far cry from the game of musical chairs we are now witnessing.



Yields Slightly Higher

THE terms of the two new Central loans for an aggregate amount of Rs 250 crores indicate that Government and the Reserve Bank have decided to keep the floor interest rate at 4.5 per cent. The 6-year 4.5 per cent issue offers a redemption yield of 4.58 per cent, which is slightly higher than the yield on comparable existing securities; the 25-year issue at 5.5 per cent is similarly more attractive than the 1989 loan. The downward adjustment required of the securities market is marginal. There has been no sudden jerking up of the structure of interest rates corresponding to the rise in bank rate from 4.5 per cent to 6 per cent, which would have involved a considerable depreciation in security prices. That the actual depreciation has been relatively small is mainly attributable to two reasons: banks have preferred to hold back their short-dated investments or to support their market prices instead of suffering a capital loss by outright sales; and the Reserve Bank has, through switching operations, ensured a modicum of stability in security prices. In the absence of bulk sales and purchases, market prices are nominal, and yields are out of alignment with the bank rate. The Reserve Bank and the market are both groping their way towards a new structure of interest rates.

It can be taken for granted that the Reserve Bank will have to extend a large measure of initial support to the new loans. The outstanding amount on the 3.5 per cent 1965 loan is Rs 154 crores, all of which is not likely to be offered for conversion. Government can retain subscriptions upto 10 per cent in excess of the amount offered. Banks will make hardly any net subscription except for the purpose of maintaining a safe cover over the minimum statutory requirements; their absorption will come later during the slack season when the Reserve Bank sells the new loans on tap—at slightly higher than the issue prices. Provident funds are expected to subscribe about Rs 80 crores over a period of time. The Life Insurance Corporation is likely to contribute Rs 20 crores, mainly by conversion of its treasury bill holdings. LIC changed over to this form of short-term investment when banks were debarred from paying interest on call and short notice deposits from the public. In other words, the loans will make very little impact on current liquidity. The impact, if any, will come only when banks start absorbing the loans in the next few months and then too only if the return flow of funds is as substantial as the Reserve Bank would like it to be.

There was a time when individuals and companies were fairly significant buyers of government securities. That class of subscribers has practically disappeared, partly because, in the case of individuals, investment through provident funds has replaced direct investment while companies have turned net borrowers.

Wilson's Not Disinterested Move

VIETNAM was the dominant issue in British politics last week. The American style "teach-in" at Oxford lasted some eight hours and the speakers included Britain's Foreign Secretary, Michael Stewart, and Henry Cabot Lodge who flew in especially from the United States. Of course, there were no distinguished speakers to put the other side of the question—no one from North Vietnam, the National Liberation Front of South Vietnam, Russia or China. There was little doubt that the bulk of the Oxford audience was certainly anti-American, and remained singularly unconvinced by Cabot Lodge. It was remarked, in fact, that Michael Stewart put up a far better defence of the American point of view!

Shortly following on this marathon "teach-in" came Wilson's dramatic announcement of the setting up of a Commonwealth Mission on Vietnam. The idea of using the Commonwealth Prime Ministers' Conference as a springboard for a new initiative in Vietnam was entirely Harold Wilson's own idea and certainly came as a surprise to the assembled Commonwealth Prime Ministers. Unfortunately, in view of the uncritical support that the British Government has given to the American line in Vietnam, there have been serious doubts about Wilson's motives for initiating such a move. While no one would wish to deny that Wilson, like everyone else, is anxious to see some peaceful solution of the Vietnam crisis, there is the suspicion in the minds of many people that the main reasons for this initiative are political. As one well-known Left-Wing member of the Labour Party said: "I do not know whether this is really a mission to get peace in Vietnam or peace in the Labour Party". It is a fact that the growing discontent in the Left-wing of the Labour Party of the British Government's servile support to the Americans was beginning to cause alarm. By launching a Commonwealth initiative, Wilson hoped to soothe his Left-wing followers.

The plan, as originally announced, envisaged the setting up of a Commonwealth Peace Mission consisting of Wilson, President Nkrumah, the Prime Minister of Nigeria, the Prime Minister of Trinidad and Tobago and the Prime Minister of Ceylon. There was a general feeling at the Conference that Wilson had bulldozed the assembled Prime Ministers to make a dramatic announcement on the very first day. The Labour Party attaches more importance to the Commonwealth than the Tories, and here was a heaven-sent opportunity to prove that it was more than a mere talking shop and could take joint political action on a burning issue. Here was concrete example of the utility not only of the Commonwealth itself, but of the periodic gathering of Commonwealth Prime Ministers.

Second Thoughts

Many of the assembled Prime Ministers, however, began to have second thoughts about Wilson's proposal. There was a very strong feeling that with Wilson as a member of the delegation, it could not possibly be an impartial one. The British stand on Vietnam has clearly been pro-American and so the delegation was bound to be suspect as being pro-American. This point was made very forcibly by a number of African Prime Ministers—particularly President Nyerere of Tanzania who at one stage of the proceedings stated that he disassociated his Government from the communique announcing the mission, since it appeared to be too one-sided.

Wilson explained to the assembled Prime Ministers that his inclusion in the peace mission was not as Prime Minister of Britain, but as Chairman of the Commonwealth Prime Ministers' Conference. Diplomatic negotiations continued over the week-end and after a great deal of discussion is seems likely that the four-member Commonwealth mission will shortly start on its task.

There have been, however, many alternatives and modifications. Ceylon has dropped out of the mission, ostensibly because the Prime Minister is not well enough to join. Had it not been for President Nkrumah's decision to go on the mission, the whole project might well have collapsed. But in order to obtain the suport of President Nkrumah an appeal has been issued by the four members of the Commonwealth mission calling on all the parties involved in the Vietnam war to "show the utmost restraint in military operations as a step towards the total cease-fire which the mission hopes will be established at the earliest possible opportunity." This statement is significant in two ways. By referring to *all* parties, it leaves the mission free to deal with the Viet Cong, further, it also reflects the desire of many Afro-Asian countries that American bombing of North Vietnam should cease.

During the discussions Shastri made it quite clear that merely setting up a mission was in itself no use and that what was necessary was to establish the guidelines on which it should operate. These should include insistence on the cessation of bombing by the U S A, the ending of hostilities on all sides, and eventually the withdrawal of outside forces and a cease-fire and perhaps an international group of Afro-Asian countries to see that the cease-fire was strictly observed. These are laudable objectives and any step that eases tensions in Vietnam is to be welcomed; but it seems doubtful if the Commonwealth mission will really achieve much. In the first place, it will certainly be difficult for it to look like anything but a pro-American gimmick—despite African representation on it.

Disappointment Over Rhodesia

The Commonwealth Conference itself is at the time of writing in for a stormy time with the explosive issue of Rhodesia coming up to be discussed. There is no doubt about the very strong feeling on this subject and the definite disappointment of a number of African countries about the attitude of the Labour Government on this question. There is a general feeling that the U K Government is not prepared to be tough enough with Ian Smith and that it is going back on the attitude it took in 1961 when it criticised the 1961 Rhodesian constitution for failing to provide adequate African representation or to ensure that the Government did not practise racial discrimination. Very justifiably, some African Governments are suggesting that if the Commonwealth Prime Ministers' Conference could issue a special communique on Vietnam, why could it not also issue one on the crucial question of Rhodesia?

On the announcement of the fall of Ben Bella's Government in Algeria, the Afro-Asian heads of State at the Commonwealth Conference held a private meeting. At this meeting the

Afro-Asian leaders suggested that the conference of Afro-Asian countries in Algiers should be postponed and also issued an appeal that the life of Ben Bella should be spared on humanitarian grounds.

How much will be actually achieved at the Commonwealth Prime Ministers' Conference remains to be seen, but since the very first day it has been making the headlines.

CAPITAL VIEW

An Ill-Fated Conference

Romesh Thapar

THERE is a prolonged moment in the Indian summer when it is impossible to think of anything but the heat and dust which are all-pervasive. Such a moment is the present which brings news of Ben Bella's fall from power in Algeria and the chaos which threatens to overtake the Afro-Asian Conference.

Perhaps, in a sense, the sequence of events in Algeria is almost fortuitous. It has helped to focus attention on the inhibitions, weaknesses and confusions inherent in the kind of conference which had been projected. Bandung within a specific setting yielded political dividends for Afro-Asia. Algiers could have had the opposite effect.

Unwarranted Optimism

In saying this, I am not being influenced by the mood in our Foreign Office. On the contrary, a certain optimism prevailed despite the contradictory statements made by the Prime Minister on the Vietnam situation in Moscow, Ottawa and London, statements which could get us into trouble in Algiers. The optimism was based on the reports of our roving envoys who claimed majority support for our proposal to seat the Soviet Union and Malaysia in the conference and indicated that Chou En-lai's last visit to Africa had almost turned out to be a diplomatic disaster. Japan's support had been consolidated. Algeria, too, had assured her vote. These were important gains, and seemed to mark a turning point in Afro-Asian thinking.

The optimism, I feel, was unwarranted. We failed to take note of the opposition of several African States to the inclusion of the Soviet Union on the plea that the conference would become a battleground for communist ideologies. This opposition, skilfully exploited by China and Indonesia, could certainly frustrate the taking of a decision. A retreat on this front, in the interests of the inevitable consensus, could damage the capacity of the conference fully to resist the pressures exerted by the adventurist elements led by China and Indonesia.

President Nasser, unfailing in his ability to sense the mood of emerging nations, was obviously most concerned about the 'fall-out' from a sharp and explosive collision in the conference. His effort to arrange a friendly meeting between Lal Bahadur and Chou En-lai must be viewed against this background. He hoped for a 'disengagement' between India and China. The impatient dismissed these moves as unrealistic, but Nasser knows the Chinese to be highly flexible when short-term objectives are sought. And there was no reason to believe that India would be the looser in this diplomatic doodling.

Delhi's confidence in its capacity to out-wit its tormentors was like the weather — oppressive but mercurial, heady but uninspiring. The optimism at the Foreign Office, notwithstanding, Prime Minister Lal Bahadur seemed to be shy about attending the confabulations at Algiers. He refused to be committed. He let the impression gather that V K Krishna Menon would be accompanying him. At the same time he shot down a proposal that Menon attend the opening of the Nehru Exhibition in London, presumably because it was so close to the Commonwealth Conference and might have given Menon an opportunity to prolong his stay. Foreign Minister Swaran Singh, on his part, did not want Krishna Menon anywhere in the neighbourhood of Algiers.

And when the delegation to Algiers was announced, particularly the non-official membership, it was clear that Lal Bahadur had been carefully using political gossip to neutralise the demand that he take a strong and able team with him to the conference. Tactically, he is most adept at this kind of operation. The delegation assembled for Algiers was distinguished by its undistinguished character. And some of the gentlemen included were even unsympathetic to Afro-Asian aspirations!

Developments of this kind no longer cause surprise in the Capital. Lal Bahadur has come to be regarded as a man concerned solely with preserving his own position and bothered very little about evolving viable policies for the era now unfolding. He has no perspectives. At best his aimless wandering might land him in a vantage position. And even then he might fail to exploit the advantage. It is a most unsatisfactory situation, but it will persist so long as Lal Bahadur relies only on the limited capacity of his bureaucrats and refuses to surround himself with more independent and potent expertise.

No Great Loss

As for the conference in Algiers, it matters little whether it is held or postponed — or abandoned altogether. Apart from the repercussions of Ben Bella's downfall, which will influence developments in the Arab and African States in a less positive and progressive direction, the Algiers Conference has already been blunted by the activity of those of its members who have participated in the Commonwealth talks in London. The controversial initiative on Vietnam, under Harold Wilson's prodding, has already compromised their role in the larger assembly of Afro-Asian States.

The feeling, long suppressed, that the non-aligned nations should concentrate their energies on forging a new political and economic role for themselves at a time when the two major blocs are being eroded will come to the fore. Afro-Asian jamborees had some relevance when the concept of non-alignment had yet to take full form. Today, however, these demonstrative gatherings tend only to dissipate national energies and divert attention from the crucial issues on which the non-aligned must intervene in their own interest.

Whether these implications are understood by the Prime Minister and his colleagues remains to be seen. Lal Bahadur will be back in Delhi by the end of the week. A lot of home-work has to be done, political home-work which the Congress Party is for ever seeking to avoid. These summer months certainly provide oceans of

time for just this sort of solid preparation.

A Pointer? A few months before their entry into NEFA in October 1962, the Chinese abruptly stopped the building of their half-finished Embassy in Chanakyapuri. A few weeks ago they resumed construction work . . .

A CALCUTTA DIARY

A State of Darkness

IF the smokescreen of Congress unity had not blacked out the truth, the Governments of West Bengal and Assam would have been screaming today that, on the subject of border vigilante, they had been overruled by the Centre which has not so far bothered to explain the arbitrary decision. Since so little is publicly said in this country about these things, it has to be mentioned that, from all accounts, the debacle in the Rann of Kutch followed a prize bungle by the civil border police which led to considerable embarrassment for the army. To turn to the east now, in Dahagram the civil border police acquitted itself admirably and perhaps gave the Pakistanis a little more than what it got. Faced with these local variations, New Delhi expounded the theme of a centralised border force under a single command: and all the border States were made to swallow it. That the decision was right New Delhi will have to prove as it works out the details which are in border defence no less important than general policy.

That a uniform and centrally commanded border force should have been thought of almost eighteen years after Partition is a measure of the sentimentalism with which both India and Pakistan decided to part—especially in the east. Travel was free until October, 1952. (Except for annual Urdu mashairas, the illusion of oneness in the west had ended in 1947.) In India border defence was transferred from the district police forces only in 1962 and placed under the control of a DIG, when it was found that West Bengal's PR (Public relations) was not quite enough for the EPR (East Pakistan Rifles) and Ansars.

Before Delhi Moved

The answer now found by New Delhi has to be examined in the context of West Bengal's own troubles. The police force, long divided between the West Bengal Police and the Calcutta Police, now found itself confronted with a third contender—Border Police. The unstated hostility of the earlier entities may have been countered only with a rare combination of personal courage, integrity and tact which can hardly be taken for granted for all time to come in every incumbent holding the post. In Assam there must be further complications of which the present writer has no detailed knowledge. From the point of view of the Indian polity as a whole the proposed reorganisation of the border force poses a series of questions with no ready answers. As far as one can see, which may not be far enough, the army is not immediately involved, as it perhaps should not be. Involved is G L Nanda's Ministry of Home Affairs, a monster of a set-up whose menacing visage is hidden only behind Nanda's sadachari mask. The time may have come to say that India does not want a C I A. Or, is there already one?

Uniform Doubts

There need be no deviation from India's declared adhesion to secularism to suggest that the problem of guarding the border is made infinitely more complicated by the existence of a very large number of Musilims in the border villages, many of whom came to India only in recent years. Last year this reporter motored extensively in the border districts and was bored by the monotony of one Muslim village after another; slightly scared too. What, then, is essential is what a newspaper has charmingly called "greater demographic diversification of the border"; what the coiner of the euphemism had in mind is early eviction of illegal immigrants, infiltrators, and the planting in the border villages such other citizens whose loyalty nobody will have any occasion to question. In varying degrees the problem exists in West Bengal and Assam; and it cannot be tackled without the cooperation of the State Governments.

It is obvious enough that the border States are not uniformly competent to take care of their borders with Pakistan; State politics can easily jeopardise the best of official arrangements. Yet it is rather late in the day to take the Centre's efficiency for granted. New Delhi has its duds; it has its own politics, plus State politics. The wisdom of the Centre's take-over of border control will thus have to be proved with other arguments.

The Gains

The first result of the take-over will be that the Centre will foot the entire formidable bill; West Bengal at least was beginning to find the cost of the border police very heavy. Secondly, border forces will now be better equipped, for under State control the border forces could not import their equipment without Central sanction which, when given at all, was tardy, often delayed and grudging. If Pakistan did not hesitate to use American tanks in the Rann of Kutch, there is no reason to think a border force equipped with the Army's rejects is enough. In Dahagram too the Pakistanis used mortars.

In India a military take-over seems unlikely for a long, long time, although the it-can't-happen-here is one of the stupidest of political attitudes. Yet even in a democracy there is a sort of balance of power; there is a line beyond which additional strength to a particular agency, civil or military, has to be watched in the interests of democracy itself. Following the Chinese attack, India's armed forces have been given enormous funds; they themselves constitute tremendous additional power over the country's economy — to say nothing of the accretion of what in the absence of a better term can be called political bargaining power. The same criteria must be applied to the Ministry of Home Affairs; chasing Left Communists and financial crooks at all levels has given the ministry's officials access to many private affairs of the country's citizens. Then there is security in whose name Gulzarilal's men — India's G-Men? — can get away with almost anything. The friend of a Calcutta police official was recently told, in confidence of course, how the frequency of some individuals' visits to a particular woman, demi-monde, was being carefully recorded in the books of the police. An undeclared police State is in some ways worse than a military regime.

—Flibbertigibbet

LETTER FROM SOUTH

Crosscurrents in Tamilnad

THE Tamilnad Congress Committee's conference held recently in Coimbatore presented an interesting study of contrasts. There were the glimmerings of a new vision in the speech of Kamaraj as well as in the resolution on democratic socialism. As a counterpoise there was the thoroughly wooden, bureaucratic and authoritarian approach of the Chief Minister, Bhaktavatsalam. Yet neither the dais nor the audience appeared to notice the sharp difference. There was no opposition, no debate on either of the two attitudes. Undoubtedly, Kamaraj's appeal was far greater but none could be sure as to whether this was due to the legend around him or to the ideas he was propounding. In passing, it can be noted that in Kamaraj the common man, not only in Tamilnad, sees a combination of simplicity and power which is what he desires, above all else, in a politician. Such a combination is rare enough in India to give the Congress President quite an unique status.

The only Congress leader from outside Tamilnad who attended the meeting was Indira Gandhi. And very popular she proved, too. Kamaraj's insistence on her presence stemmed from two closely related considerations. The first was the need to create a sense of continuity, of carrying on the Nehru approach as the true destiny of Congress evolution. The other was the desire to make clear the Tamilnad Congress choice in the present conflict of policies and personalities in which the ruling party is embroiled. Evidently, the Congress President wants to sharply demarcate himself from the 'syndicate' clique with which he was unfortunately involved in the first months after Nehru's death.

English Must Go Quickly

Kamaraj made a strong appeal for the removal of English. This could be done fairly quickly, and as the first step, at the regional level. He said that he had already spoken to the UPSC about the possibility of speedily introducing Tamil as an exam medium. In the State itself strenuous efforts would have to be made to ensure that those who received their instruction in Tamil would find it profitable to do so. This commonsense and patriotic approach was followed up by a slashing attack on "English lovers" who opposed Hindi on the ground that it was alien, conveniently overlooking that English was the language of spiritual conquest and even more alien.

The supporters of English, the Congress President said, were the upholders of wealth and privilege. They represented the forces of reaction and of big property who were still a considerable power in the land. These were the forces which also opposed socialism, since through the implementation of this ideal the Congress sought to better the living conditions of the poor and ensure equitable distribution of wealth. If the Congress was to be correctly criticised it should be from the angle that both on the language issue as well as on economic policy it had failed to move swiftly enough to make the common people the real masters of India. He took up Rajaji's challenge and said that the Congress was quite ready to face any combination that the Swatantra leader's hatred for the Congress could bring together. This challenge would not be met by any retreat but by still more vigorous advance towards socialism. In other words, the menace from the right would be met by hewing a left-ward course.

Resolutions, But No Programmes

This encouraging attitude was reflected in the two major resolutions, other than the one on language, passed at the conference. The first was a firmly worded statement of approval of the policy of non-alignment as not only inherent in India's evolution as a free nation but also as her best contribution to ensure a world at peace and rid of colonialism. The other was on democratic socialism. In this resolution the need was emphasised for the public sector undertaking the entire distribution of foodgrains, for the supply of free food, books and dress to students at all levels and for providing free house sites to the landless poor in the rural areas. The resolution also stated that not only the basic industries but also units for the production of essential commodities should be taken up either by the public or cooperative sector. Moving this resolution, Union Food Minister Subramaniam stressed that socialism envisaged equitable distribution of newly-created national wealth. Distribution through private trade could not subserve this process. He added that it would be improper to ask the poor of this country to be years for the improvement in their conditions.

While all this is refreshingly unambiguous, what was totally lacking was any immediate programme of action to concretise the declaration of faith in terms of policy decisions. There are rumours that Kamaraj is moving towards accepting the idea of the nationalisation of banks. But there was nothing in the resolution even to remotely suggest that radical institutional changes were being contemplated. Similarly, the fiscal policies of the Government need to be geared to the goal of equity but the sponsors of the resolution do not appear to have given this matter any thought. The same was the case with land reforms or agricultural income-tax. The emphasis seemed to be on the equitable distribution of newly-created wealth and not on disturbing the highly unjust existing property and income relations.

Wrong Approach

Far more disturbing than this lack of a programme of action was the speech of Bhaktavatsalam. He was concentrating on the language problem. Making hardly any attempt to present a rational and partiotic case, he stated that he had complete lists of all teachers and students who were likely Resolutions, But No Programmes to create trouble again on August 15 on the instructions of the DMK. These people would be severely dealt with and the trouble would be scotched. "We know how to tackle such a situation", he roundly declared in Kamraj's presence, seemingly obvious to the fact that the Congress President had publicly criticised the manner in which the administration had "tackled" the anti-Hindi agitation only some months ago.

Relying on police reports and police bullets would be the surest way to ensure a swift rise in the popularity of the DMK-Swatantra-Muslim combine. Not only would it alienate large sections of the people, but it would mean further concentration of power in the hands of the top echelons of the police and administrative services — implaccable foes of the push towards equity socialism envisaged in the other resolution. It was a pity but characteristic that no attempt was made, even by implication, by anybody to repudiate this petty man's cussedness.

Bureaucratic Discretion and Economic Development

Arthagnani

Foreign Enterprise in India : Laws and Policies by Matthew J Kust: Oxford University Press, 1965; pp 498; Rs 35.

AS is described in the Foreword, this is a study "of the legal environment for foreign investment" in India. Necessarily, it is a compendium of legal provisions and administrative decisions on its subject-matter, and, being such, is uneven in its ability to hold interest. For example, the chapters on "Historical Background" and on "Basic Legal Structure" must, to any person conversant with India, sound elementary, and appear necessary only to the extent that may make the book appear all-inclusive.

However, even a compendium can throw up interesting details, and the best parts of the book to this reviewer are those relating to the evolution of the erosion of property rights through constitutional amendment (pp 93-107), the particular applications of the Industries (Development and Regulation) Act, 1951 (pp 144-155), and the historical survey of the Indian Government's attitude to patent rights (pp 419-431), an issue which even now does not appear to be settled.

Indefiniteness of Law

One of the essential features of the Indian legal system, particularly in the post-planning legislation, is the indefiniteness of the legal provisions and the vast amount of discretion which the bureaucracy vests in itself through legislation. Under this system, there is no legal provision stating that a citizen has certain rights if he satisfies certain conditions. Rather, all decisions — the giving of a licence, the vesting of a right — are left to be taken by bureaucrats on merits, which is the euphemistic name given to the vegaries of decisions taken by bureaucrats in their discretion. This would be most clear to any one who reads the Industries (Development and Regulation) Act, 1951 and the rules framed under it, as also the import and the capital issues control legislation.

Taking only the Industries (Development and Regulation) Act, 1951, the author describes fairly the provisions of the Act, and the rules made thereunder. Here is what the author says about it:

> "The act is characterized by its brevity (consisting of only twenty pages) and its skeletal nature. It provides the legal framework within which the policies and procedures are to be worked out by its administrators. The policies are derived from the imperatives of economic development and thus susceptible to change from time to time as these economic imperatives dictate. This gives the entire structure a flexibility highly desirable for the difficult task of economic development in an underdeveloped country." (p 113).

What does this flexibility come to in actual practice?

Time Lost in Bargaining

The author refers, particularly on pp 148-150, to cases where foreign enterprises were allowed majority shareholding in their Indian ventures. He gives the (official) justification for these decisions, but here is the reason (in the author's own words) why the English Electric Company Limited was allowed 100 per cent shareholding in its Indian venture: "Finally, hard bargaining and persistence played its part. In the words of an English Electric executive, 'We just kept insisting on 100 per cent ownership for fourteen months until we got it.'" (p 148). This clearly is the sorriest example of the use of bureaucratic discretion. Is this likely to inspire confidence in foreigners? Was the time lost in bargaining worth the results achieved? Is this to form the basis of India's massive effort at industrialisation?

For, it has to be recognised that not only does administrative discretion lead to varying (if not inconsistent) decisions but also to much loss of time, and a consequent slowing of the development process. It is not possible to list all cases where administrative negotiations have slowed down decisions: one has only to refer to Esso's offer of setting up a lubricating plant, which has remained unanswered for almost four years. In the meanwhile, we continue to import lubricating oil and have managed to run into two foreign exchange crises (May 1962 and now) involving delays or cuts in import licensing.

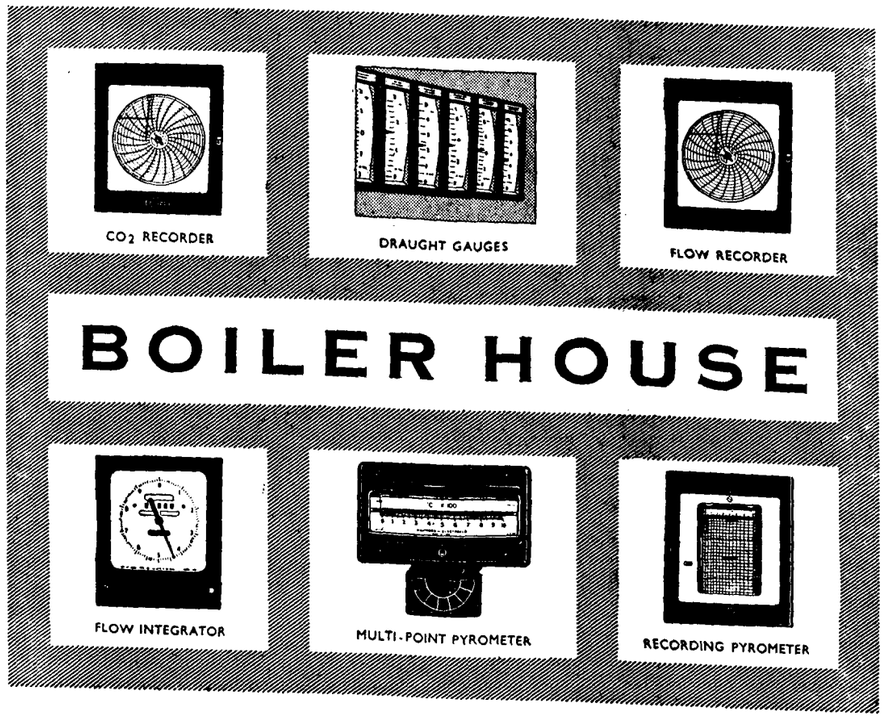
Matter for Political Decision

The author, being a foreigner, tries to gloss over the implications of vesting discretion in bureaucrats — he even adduces justification for this, as in the quotation given above. But if we are interested in a massive effort at development, it is necessary to ask ourselves whether our machinery and procedures conduce to this end. Is it impossible to codify rules on these subjects (industrial licensing, foreign participation and so on) and limit bureaucratic discretion? Perhaps, the bureaucrats are too much in love with the powers they have acquired to want to do it. What the bureaucrats managed to do, for example, was to reduce the import duty on cars from 150 per cent to 60 per cent in 1963, so as to enable each civil servant who had stayed abroad to bring in a car, but they have never provided the rules for the automatic issue of an import licence for a car to ordinary citizens who satisfy the specified conditions. These, however, are matters, reform of which cannot arise out of bureaucratic initiative. They are matters for political decision.

It is doubtful, therefore, how far the author's exercise in describing Indian law would be helpful to foreigners. So also, the chapter on taxation in some respects has become outdated by the changes introduced by the 1965-66 Budget. These are hazards which a book like the present one cannot avoid. What is necessary is to provide for annual supplements to notice changes in the exercise of administrative discretion and in the framing of laws.

The author is an authority on taxation, and his chapter on the subject is illuminating. Necessarily, the book holds interest in varying degrees: to those who know the subjects, the chapters might appear elementary; to those who do not know but are likely

to operate in India, the information would need to be supplemented by the special treatises on the subjects.



In a book of this type and size, some inaccuracies are bound to creep through: for instance, managing agencies are *not* permitted in banking and insurance (p 278); and Kaldor advocated a maximum tax rate of 45 per cent (not 50-per cent) on personal incomes (p 364).

But, allowing for all this, this is a useful, well-documented compendium. It would be necessary, though (despite the simplicity of its style) stern, reading for an intending foreign investor on his plane journey to India. But, as in the mystery stories one reads on such journeys, the ultimate conclusion of his own mission given the system of bureaucratic discretion in India, will come as a surprise to him.

The Personality Factor in Local Politics

A Study of the Calcutta Municipal Election

Robi Chakravorti

The Calcutta Municipality held its first election on the basis of universal adult franchise in March this year. A study of the election yields some interesting insights into voting behaviour.

Voters in constituencies with communally mixed populations tended to vote community-wise, supporting candidates of their own communities. The different political parties had apparently anticipated this and had chosen their candidates accordingly.

The elections also revealed the importance of what may be described, in advertising terminology, as "the circulation and pulling power" of the candidate. In the general elections a constituency covers an area three times the size of a municipal ward and, therefore, personal contacts can be neither so tangible nor so intense as in municipal elections. In the latter, both the size of the constituency as well as the issues raised make the personality of the candidate and his personal pull on voters decisive, rendering his political affiliations a factor of secondary importance.

THE Calcutta Corporation's history can be traced back to 1726 when a Royal Charter established a Corporation, consisting of a Mayor and nine Aldermen and a Mayor's court exercising civil, criminal and ecclesiastical jurisdiction over British inhabitants. This was, however, a far cry from local self-government which had not made even a modest beginning until Surendra Nath Bannerjea introduced his Municipal Bill in 1921. The franchise under the Bill was restricted to occupiers of houses who paid a rent of Rs 25 per month and hut-owners in bustees who paid at least Rs 12 during the year preceding the election year, and of course, payers of municipal rates, or tax of at least Rs 12. The Calcutta Municipal Act of 1951 saw the next major expansion of the franchise as a result of which not only payers of rate, tax or licence fee (of any amount) or rent (Rs 4 or more per month in case of a bustee dweller, Rs 8 or more in case of a pucca house resident), but also all citizens who had passed Matriculation examination or an equivalent State examination or a diploma examination in any State-recognised technical or vocational institution became eligible to vote.

Through these stages of slow 'escalation' of the franchise, Calcutta eventually arrived at adult franchise on March 28, 1965 when elections of Municipal Councillors were held on this basis for the first time in the Municipality's chequered history. The electoral rolls prepared for the 1962 General Elections were used for these elections with additions following applications by intending voters. Many, therefore, saw in these Municipal Elections an outline of the shape of things to come in the next General Elections.

There were 100 seats in the Municipal Elections, with three major parties contesting: The Congress; the United Citizens' Committee, consisting of both wings of the CPI, RSP, RCPI and Forward Bloc (Marxist) and the Progressive Citizens' Bloc, dominated by the SSP and PSP. The final party position after the elections was: the Congress, 49; the UCC, 35; the PCB, 8; the Jan Sangh, 1; and Independents, 7. Among the elected were six detenues held under the Defence of India Rules—five from the UCC, therefore, Communists; one from the PCB. Percentage-wise, Congress polled 44.3 per cent of votes cast; the UCC 36 per cent, Independents 10.8 per cent and the PCB 7 per cent. In the 1962 General Elections to the State Assembly from Calcutta area, the Congress bagged 14 and the CPI—Left combination 12 of the total of 26 seats, as against 7 and 19, respectively, in 1957.

Communal Voting

On March 27, 1965, the night before the elections of Councillors to the Calcutta Municipal Corporation were held for the first time on the basis of adult franchise, this writer happened to pass through a constituency in South Calcutta. Some of the streets, poorly lit before, were ablaze with flourescent tube lights, fixed a couple of days before at the initiative of the local Councillor who was seeking re-election. The Councillor, who had once won election on the Leftist ticket, had since crossed over to the Congress ranks, and in the election on March 28, he was re-elected. Neither the change in the basis of franchise nor the fact that the Councillor was a turncoat made any difference in his political fortunes. This instance proves that any hasty conclusion about the voting behaviour of the people would not do. Yet, the election results, analysed polling booth-wise in relation to the composition of the constituency and the character of the candidate and his election campaign, do give some pointers to the voting behaviour of Calcutta's electorate.

One of these pointers is that voters in constituencies with mixed communities tended to vote community-wise. Several instances of this communal trend of voting could be cited. In fact, the parties fighting the elections clearly anticipated this trend and chose candidates accordingly.

Instance no 1: Ward no 27 has a minority, but a substantial one, of Hindi-speaking voters. The Bengali candidate, Krishna Kundu rode to a handsome victory chiefly on the strength of Bengali voters, on which his campaign managers outspokenly banked. One of them, in fact, confidently predicted his victory on the election day, because, as he said, "Bengalees constituted a majority in the ward and they will all vote for Krishna Kundu". Kundu won 6,000 votes against 1,625 won by his Hindi-speaking rival. The fact that Kundu is a popular figure in the area and belonged to the Left-dominated United Citizens' Committee, was not so much a determinant of voting behaviour of the constituency as the fact that he was a Bengali engaged in a straight fight against a Hindi-speaking candidate.

Instance no 2: Ward No 6 has a number of Hindi-speaking voters scat-

tered over the constituency, with a sizeable concentration along Cossipore Road where a medley of Hindi-speaking workers live in wayside slums or as shopkeepers run little shops. The contest here was three-cornered—a U C C candidate who won (4,309 votes), a Congress candidate (4,013 votes) and an independent Hindi-speaking candidate (2,457). The independent candidate's votes were almost wholly from pockets of Hindi-speaking voters. The breakdown of voting in the polling both covering Cossipore Road is a clear proof of this voting pattern. In this section of the constituency, the voting was as follows:

Ward 6

Cossipore Road Section

Total votes	3,143
Votes polled	1,973
Congress	647
U C C	441
Hindi-speaking independent	885

This happens to be the only polling area in the constituency where the Hindi-speaking candidate won a majority of votes against both the winning U C C candidate and the Congress candidate who came a close second.

Instance no 3: Other things being equal, the communal pattern of voting held good in mixed Hindu-Muslim areas also. As in the case of ward no 27, where a Bengali candidate defeated his Hindi-speaking rival, a Hindu candidate defeated two Muslim candidates in ward no 30, where Muslim voters had a numerical edge over Hindu voters. The Muslim votes were, however, split between the U C C candidate and the Congress one, and through this split the Hindu candidate belonging to the Socialist-dominated Progressive Citizens' Bloc slipped through to victory. The voting was as follows:

Ward 30

P C B (Hindu)	3,169
U C C (Muslim)	3,103
Congress (Muslim)	2,422

It may be assumed that a Muslim candidate would have won this seat, no matter which party ticket he had carried, if there was a straight fight between a Hindu candidate and a Muslim one.

The communal pattern of voting was, however, only one aspect of the Municipal Elections, held on the basis of electoral rolls prepared during the General Elections, 1962. The other and a more important feature was what can best be described in advertising terminology as the 'circulation and the pulling power' of the candidate. A candidate who circulated well in the locality and had been able to project the image of a personality with a pulling power had a better chance of winning than a candidate who may belong to the right party in the majority's view, but lacks in these two qualities.

The Personality Factor

What these two qualities are capable of achieving was dramatically illustrated in the election result in ward no 87. Here, all the parties, formed for the civic elections, put up their candidates—the Congress, the U C C and the P C B, and even an independent candidate. But the person who very nearly stole the show was an outsider, belonging to a splinter Marxist party, the Socialist Unity Centre which had broken away from the Communist-dominated United Citizens' Committee (U C C) not so much on ideological issues as on that of selection of candidates in constituencies which the S U C thought favoured them. The S U C candidate in ward no 87. Ranjit Dhar is a young bachelor of around thirty, who circulated well in the locality. He is well-known in the area as the moving spirit behind an organization, Sanghashree, which has made a name for itself throughout Calcutta for colourful staging of Durga Puja, the most cherished annual festival of Bengali Hindus. He mixes well with young people of the area, has a corps of devoted workers to help him, whether it is the Municipal election or the 5-day-long Durga Puja festivities. The fact that he had the ticket of a breakaway small party did not seem to matter at all in the election campaign which was based almost entirely on his youth and popularity. His popularity was enhanced by the fact that the two main parties, the U C C and the Congress, concentrated their attacks on each other, neglecting the S U C candidate who they thought did not have a chance. Dhar, thus free of any mud which stuck to the U C C and Congress candidates during the election campaign, presented to a large number of voters a healthy 'third force'. The basis of this force was, however, his personal popularity, not his party affiliation. The Congress candidate won the seat, but only by a squeaking margin. Dhar lost by 148 votes. Since he was a candidate of a Leftist party, it is valid speculation that he would have defeated the Congress candidate by a handsome majority if there were no contestant from the U C C. This is supported by the following breakdown of voting in this constituency:

Ward 87

Congress	
Ranjit Dhar	3,752
U C C	3,604
P C B	1,676
Independent	209
	64

The neighbouring contituency, ward no 88, which this writer studied more closely than any other, because of his residence in the area, confirmed the importance of the circulation and the pulling power of the candidate in a communally "pure" constituency. There was a straight fight between two 'freshman' candidates: Haimiprasad Basu and Anil Chatterji. Neither had fought an election for public office before. Basu, about 40, is a popular physician whose consulting rooms have always been thronged by patients, a large number of whom come from the next-door bustee areas and lower middle class homes. He was arrested along with several Left-CPI members and supporters all over the country. He sent his nomination paper from jail and fought and won the election from there.

Chatterji, around 45, a prosperous contractor is, like Dr Basu, an old resident of the area. He is no less personally popular than Dr Basu. Dr Basu's popularity was built on his medical practice and social activities, such as helping people in distress, putting up vaccination centres in his home during epidemic seasons and organizing a private Durga Puja at his residence for the past few years. Dr Basu, always very polite, would sit in front of his house during the five days of the Puja and would not let you pass by without having partaken of the *prasad*. Chatterji is also well-known in the area for his help to people in distress. A man of great politeness and charm, his home is the hub of social activities as much as Dr Basu's. He is associated with at least a dozen clubs in the area and is the secretary of the committee which celebrates the annual worship of the Goddess Kali at the famous Keortala crematorium. He was also the chief patron of the annual Durga Puja held in the little park adjacent to his house. Both candidates were, thus, evenly matched in circulation and pulling power.

Before we go into an analysis of the voting pattern in the constituency, a

word about its political tradition is in order. This ward, constituting one-third of an Assembly constituency, has consistently voted Communist in the last two General Elections, although in the last Municipal Elections, held under the restricted franchise of Corporation rate-payers, a Congress candidate had won. The record of voting in this area in the last General Elections (1962), obtained from the Congress candidate's file, compares as follows with that of the voting in the Municipal Elections on March 28:

Ward 88

	General Election 1962	Municipal Election 1965
Congress	4,095	4,226
Communist	6,442	5,347
Margin of victory	2,347	1,121

It is risky to draw general conclusion from this reduction in the margin of the Communist candidate victory. The electoral roll being the same in the two elections, one thing is clear, that less people voted Communist in the Municipal Elections than in the General Election and the Congress candidate polled a few votes. The total votes polled have fallen, but this fall affected the Communist candidate's poll comparatively more than the Congress candidate's. A detailed analysis of voting, however, yields some interesting results.

Sahanagar Road and Chandra Mondal Lane are like two arms, going east to west of the constituency, the former skirting the Congress candidate's house, the latter passing very near the Communist candidate's residence. Chandra Mondal Lane which, like Sahanagar Road is peopled by a large number of bustee dwellers and lower middle class people, voted communist as it had in the General Elections, the margin remaining virtually identical. The contiguity of the candidate's house did not make much difference. But Sahanagar road voted Congress in the Municipal Elections while it had voted overwhelmingly Communist in the 1962 General Elections. The table below gives the comparison:

Ward 88

	General Election 1962	Municipal Election 1963
Shahnagar Road		
Congress	344	572
Communist	770	535
Chandra Mondal Lane		
Congress	378	333
Communist	693	639

The only plausible explanation of the Congress gain in Sahanagar Road can be that the Congress candidate's popularity must have been felt very strongly in his immediate neighbourhood. The candidate is the moving spirit behind the most important social festival of the neighbourhood, namely the Durga puja which draws into its vortex his next-door Hindu neighbours. The relation between the contiguity of the candidate's residence with the polling area and the pattern of voting is further proved by the interesting fact that all along the Pratapaditya Road which runs north to south, the Congress candidate lost, excepting in that stretch which passes in front of his house. In the distant part of the road, he polled 148 votes against the Communist candidate's 230; in the near part, he polled 233 votes against Dr Basu's 150 — almost the reverse. In the part in between the voting was: Chatterji 233 and Basu 291.

Class, Not an Important Factor

The class composition of voters seemed to have little bearing on voting trends. As has been shown earlier, although the Sahanagar Road and Chandra Mondal Lane have virtually the same composition in terms of economic classes, they voted differently. Likewise, Pratapaditya Place which is the more affluent part of the constituency, consisting mostly of middle, middle-middle and some upper-middle class people, voted strongly for the Communist candidate, 321 against 161. Tollygunje Road, on the other hand, is almost entirely inhabited by the poor class; and yet, here the Congress greatly improved upon its performance in the 1962 Election.

Ward 88

Tollygunje Road

	General Election 1962	Municipal Election 1965
Congress	975	1,221
Communist	1,863	1,315
Margin of victory	888	94

The shift in the voting pattern in this area may have been due to the planned, intensive and far-sighted electioneering by the Congress candidate. The Congress candidate carried out good social welfare work in the area. When, for instance, the Railways acquired some land in the area hereby displacing some inhabitants, the Congress candidate saw to their rehabilitation outside the constituency. These voters had remained on the electoral rolls and were brought by the Congress candidate to the Constituency the night before the election. The Congress candidate had thought that his social work in this area will bear dividend in the form of a big margin in his favour; but, as it turned out, the Communist hold on the area was substantially weakened, but not enough to give him victory. The Congress campaigned throughout the ward on the basis of the candidate's popularity and the theme was that the issue was not politics but practical solutions for the particular civic problems of the area. "He is a good candidate. The Congress is in power in the State and it will come to power in the Corporation too. So, you ensure your civic interests by voting for this good, popular, keen and social service-minded gentleman." This, in brief, was the approach of the Congress campaign.

The Communist campaign, on the other hand, linked the specific civic failures with what they alleged to be the generic degeneration of the Congress. "Throw the rascals out," this was their campaign theme. This was underpinned by the propaganda that the Communist candidate was unfairly put in jail. Appeals were made to the sentiments of the householders on this point. Womenfolk of the candidate's family visited the voters' homes and were heard pleading that if the candidate was elected, he might be released from wrongful confinement. It is difficult to assess precisely how far the fact of the Communist candidate's arrest helped or hindered his victory. The Communists played up the fact of his arrest to the full. Not only in ward no 88, but in other wards as well where jailed communists stood for election, big hand-painted posters with a picture of the jailed Communist leader were displayed with a message from him. In ward no 88, the candidate was shown behind bars, with a statement that he had been a physician busy with his practice, and he still not know why he had been arrested at all. In ward no 7, in the northernmost part of Calcutta, the UCC candidate's campaigners displayed a large picture of the local Left-communist leader, an MLC, who is in jail, along with a statement demanding a trial to prove the allegations on the basis of which he had been arrested under the Defence of India Rules.

The appeals were made not only to the sentiment of the voters but also

to his sense of fairplay and justice, and these may have moved some voters' minds. But, it would be incorrect to regard these appeals down as an important factor that swayed a large number of votes. If these appeals were so important, the votes for the Communist candidate in ward no 88 would have exceeded those obtained by his partyman in the 1962 General election for the Assembly seat. The jailed Communist got less votes in the municipal elections than his comrade got in the General Elections.

The personality of the candidate and his pull on the voters, therefore, seem to be more important factors than the candidate's political affiliation or sentimental appeals to voters. This pull cannot be built up overnight, nor can it make itself felt without planned election moves, such as intensive electioneering and preparing its basis through social work and contacts. The significance of voting pattern in ward no 88, which this author studied more closely than the others in his random sampling of constituencies, lies in the clue it gives to the importance of the personality of the candidate which depends not so much on his party affiliation as on his contacts with his constituency. In the General Elections, a constituency covers an area three times that of a municipal ward and, therefore, personal contacts cannot be made so tangibly concrete and concentrated as in the case of a municipal ward where each voter is within a couple of minutes' walking distance from the candidate's house. Also, general political issues which the Congress shelved as irrelevant in the Corporation elections figure prominently in the General Elections. The political aspects of the candidate's personality will, to that extent, have a weaker role to play in the General Elections.

This does not mean, however, that the personal image of the candidate bolstered by careful contacts with key pockets of the constituency over a period of time and with the help of social organizations cease to have an important bearing on voting behaviour in the General Elections, when political issues and party image come much more to the fore than they do in Corporation Elections.

Taxation and Profits of Foreign Companies in India

Anant R Negandhi

This article studies the two most important factors which determine the climate for foreign investment in India — taxation and profits of foreign companies operating here.

The rates of personal and corporate taxation may be high in India compared to those in other countries, but if the many tax incentives and concessions are taken into account the actual tax burden on companies in India proves to be much less than what the formal tax rates would indicate.

This and the high profitability of investment in India make for the fact that profits, after taxation, of foreign companies operating in India are among the highest in the world, higher than in many developing countries and generally higher than in the companies' home countries.

This fact of high profitability of investment in India is established both by factual data as well as by interviews with business executives in the United States and India.

THIS paper analyzes two of the most important factors determining the Indian investment climate, namely, taxation and profits of foreign companies operating in India. It is realized, however, that the foreign investment decisions are much more complex and dependent upon many factors other than these two variables. The company investing in a foreign country, besides seeking profits and an expanding market, also looks for the security of its capital, which in turn depends upon the socio-economic and political environment in the host country and the attitude of the host government toward foreign private investment. To evaluate, therefore, total investment climate in India, these various factors were investigated in a research study recently completed at Michigan State University.

The findings of this research seem to suggest that the following factors are favourable in India:

(a) Indian economic growth and stability;

(b) Indian socio-economic and political conditions;

(c) Market potential for foreign companies;

(d) Indian Government's attitude toward foreign private investment; and,

(e) Indian remittance and repatriation policies.

These factors have been analyzed by the author elsewhere.[2] In this paper we shall concern ourselves with the remaining two factors: taxation and profits of foreign companies in India. To gain a fuller perspective, an attempt has been made to compare taxation and profits of foreign companies in India with those of other advanced and developing countries which are competing to secure American private investment.

Indian taxation is very complex and it is beyond the scope of the present paper to review the entire tax structure. Only some of the important elements of this policy which directly impinge upon the private foreign investor in India have been discussed and analyzed here. There are four elements of Indian taxation policy which directly affect foreign investors in India. These are:

(a) Personal taxation — the income tax;

(b) Taxation of company profits (corporate taxation);

(c) Taxation of intercorporate investment; and,

(d) Taxation of patent royalties.

Although most foreign investment comes from corporations abroad, personal taxes impinge upon foreign investment due to the fact that some foreign personnel always accompany investment from abroad. Also, India, like many other developing countries, is in short supply of trained technical and managerial personnel. Therefore, if foreign technical and administrative personnel consider personal taxation in India to be too much higher than other countries, they may decide to go somewhere else where the take-home pay is higher. In this context, therefore, the incidence of personal taxation assumes special significance.

The maximum marginal rates of personal taxation are much higher in India than in many developed and developing countries. For example, the tax rate for earned income of Rs 300,000 is 74.75 per cent in India, 62.1 per cent in the United Kingdom, 35.0 per cent in the United States, 44.6 per cent in Canada, 49.4 per cent in Japan, 66.9 per cent in Pakistan, 72.7 per cent in Burma, 33.2 per cent in Malaya, and 26.6 per cent in Brazil. The tax rates in India are also much higher as compared to those in these countries in the range of incomes in which most of the salaries of foreign personnel lie (i e, Rs 30,000 to Rs 150,000).[3]

Similarly, the total tax burdens on companies in India are very high as

Table 1 Maximum Marginal Rates of Taxation on Undistributed Profits of Large Companies

Country	Maximum Marginal tax Rate *(Per cent)*
India	70.00
Developed Countries:	
France*	56.00
United Kingdom*	53.75
United States*	52.00
Austria*	51.92
Germany*	51.00
Canada*	50.00
Netherlands*	45.00
Denmark*	44.00
Ireland*	41.66
Greece*	40.25
Luxemburg*	40.00
Australia*	40.00

** "India: Business International Roundtable Conference", *Business International*, New York, 1961, p 43.

compared to those in many developed and developing countries. It can be seen from Table 1 that the maximum marginal tax on undistributed profits of companies in France is 56 per cent; United Kingdom, 53.75 per cent; United States, 52 per cent; Australia, 40 per cent; Germany, 51 per cent; Japan, 50 per cent; Philippines, 46.80 per cent; and Egypt, 22.20 per cent. The corporate tax rate on branches of foreign companies is fixed at 65 per cent on earnings. As shown in Table 2, Indian corporate taxation on foreign branches compares unfavourably with that of other advanced and developing countries.

In addition to the basic income tax and surtax on corporate profits as discussed in the preceding sections, the foreign investor must pay taxes on the dividends received from India. Since foreign investment generally comes in the form of a two-tier structure—a company in a foreign country investing in another company in India—it attracts a double burden of taxes. (Whether it be a subsidiary or a minority shareholding in an Indian company, there is income tax and surtax on the profits of the Indian enterprise, and also tax on the dividend income that flows to the investing companies abroad.)

During 1963-64, the tax rates on intercorporate dividends varied from 25 per cent to 50 per cent, depending upon the company's date of registration in India. The foreign companies registered before April 1, 1959, paid higher taxes than newer foreign companies in India. However, the budget proposals announced on February 29, 1964, abolished this discrimination. Now all foreign companies in India will be taxed on their intercorporate dividends at a fixed rate of 25 per cent.

Still, the rate of 25 per cent on intercorporate dividends compares unfavourably with the tax provisions of other countries. In most other countries, dividends from domestic intercorporate investments are either completely exempt from taxes or attract a much lower rate than India. Countries that do not impose any such tax are: The United Kingdom, Australia, New Zealand, Canada, Ceylon, Malaya, South American Republics, Belgium, Norway, Finland, Greece, and Japan. Several countries exempt dividends if the recipient company participates substantially in the equity capital—25 per cent or more of the company distributing dividends. Such countries are: Austria, Holland, West Germany, and Switzerland. In the United States, the effective tax on domestic intercorporate investment is only 7.8 per cent. In France, it is 12.5 per cent when the investing company holds more than 20 per cent of the capital.[4]

The high incidence of tax on intercorporate dividends places India in an unfavourable position compared with other countries. The total tax burden on the foreign subsidiary making 100 per cent dividend distribution is higher in India than in many advanced and developing countries. This is shown in Table 3.

India, like many other developing countries, needs to import technical and managerial know-how from the industrially advanced countries. In view of the great importance of technical know-how for industrial expansion, the trend toward foreign technical collaboration will continue. However, to secure foreign technical collaboration, India has to offer attractive returns to the collaborator. The returns incurred from such technical collaboration depend upon two factors: (1) the rate of royalty which must have approval of the Indian government, and (2) the impact of Indian taxation on the gross royalty remittance.

The royalty rate for straight licensing agreements approved by the Indian government varies from 2 per cent to 7.5 per cent on total sales. The Indian government will approve higher rates in some cases where technical know-how is of major importance in developing a particular industry. The tax rate on royalties transmitted has ranged from 50 per cent to 63 per cent. It was 63 per cent for agreements made before April 1, 1961, and 50 per cent for agreements made on or after April 1, 1961.[5] The budget proposals of 1964-65 have made the tax rate uniform of 50 per cent. However, even the new rate compares unfavourably with the rates in other countries. This can be seen from Table 4.

Table 2: Corporate Tax Rate on Foreign Branches

Advanced Countries	Tax Rates on Foreign Branches (Per cent)	Developing Countries	Tax Rate on Foreign Branches (Per cent)
Japan	49.00	Philippines	50.00
Australia	40.00	Malaya	40.00
United Kingdom	53.75	Peru	37.00
France	50.00	Columbia	40.00
Canada	51.5	India (Budget of 1964-65)	65.00

High Profits

It is quite evident, then, that Indian tax rates are much higher than those in most of the developed and developing countries. However, for the Foreign businessman contemplating investment overseas, taxation is but one important factor. The other equally important factor is profitability of his venture. This second factor, therefore, will be discussed in this section.

Foreign private investors in India have been, and are making good profits. For example, the average net profit, after taxes, of American subsidiaries in India was 12 per cent in 1958. Union Carbide (60 per cent US owned) made a net profit, after taxes, of 26.4 per cent, and Indian Aluminium (65 per cent Canadian owned) made 23.3 per cent profit in 1959.[6] These compared very favourably with the net profits made by the same companies in the home countries. In 1959, Union Carbide made 11.21 per cent profit after taxes in the United States, while the Aluminum Company made only 4.78 per cent profit in Canada.[7] In 1962, Union Carbide earned 22 per cent of its net worth after taxes, Indian Aluminum 18.5 per cent, Dunlop Rubber 19.9 per cent; ESSO 12.2 per cent, and Caltex 9.9 per cent.[8]

A United States Department of Commerce survey shows that in 1962 the rate of earnings, after foreign taxation, of American investments in manufacturing enterprises in India was among the highest of any country in the world. American companies received an earning ratio of 20.6 per cent on some 63 million dollars of these investments in India. This compares very favourably with 9.1 per cent in Japan, 6.3 per cent in France, 18 per cent in the Philippines, 7.5 per cent in Italy, 20 per cent in Germany, and 10 per cent in the United Kingdom. The earning ratios of the American companies in Latin America, Europe, and the Far East are shown in Table 4A, B and C. A recent survey of 78 large manufacturing companies in India showed that the average profit made by these companies was 22 per cent after taxes, yielding a return of 11.4 per cent of net worth. This was one of the highest in recent years.[9]

There is also ample support for the hypothesis of higher profitability of foreign firms in data relating to individual companies. It can be seen from Table 5 that the three companies, namely, Unilever, Imperial Chemical Industries, and Metal Box, have made higher profits in India year after year than in their respective home countries.

The satisfactory profitability of Indian ventures also was confirmed in research interviews conducted in the United States and India. Of the 54 executives interviewed, some 44 (81.4 per cent) were satisfied with their rate of return in India. Only 2 executives (3.7 per cent) were not satisfied. The detailed breakdown of the responses of the executives concerning profitability in India is given in Table 6.

Summary

This article analyzes two of the most important factors determining the climate for foreign private investment in India, namely, taxation and profits of foreign companies in India. The research findings suggest that Indian taxation, as compared to many developed and developing countries, is much higher. However, India offers many tax incentives to the foreign investor, and if various tax incentives are taken into consideration then the Indian tax burden will be much less than what mere aggregate figures indicate. The justification of higher tax rates in India lies in the necessity of mobilizing resources for the country's economic development plans. The Indian government also justifies the high incidence of tax on company profits by the fact that companies in India are enjoying much higher returns on their invested capital as compared to many other countries where taxes are lower. The higher profitability in India was confirmed by both factual data and the viewpoint of business executives.

Problems of Gramdan

A Study in Rajasthan

T K Oommen

Some 5,000 gramdan villages all over the country are at present reported to be in the process of building up the non-violent social order which is the Bhoodan movement's ultimate objective. In recognition of its importance, the Government has extended official patronage to the movement by bringing donations of land received by it under the purview of law by offering special pecuniary and other incentives to Gramdan villages.

It is doubtful, however, whether either the agencies which are in charge of carrying forward this approach to rural reconstruction or the Government which has formulated policies to encourage the spread of the movement are adequately aware of the socio-economic and political problems which have arisen in Gramdan villages.

It is intended here to discuss some of these problems.

BORN out of the violence of the Telengana peasant riot[1] the Bhoodan-Gramdan movement has attracted world-wide attention. Ever since the first land-gift made by Ramchandra Reddy of Pochampalli village in Telengana to Vinoba Bhave the growth and achievement of the movement has been regularly reported in the national press and exclusive communication forums[2] have been established to propagate and strengthen the movement. Bhoodan (land-gift) has developed into Gramdan[3] (village-gift) and at present over 5,000 Gramdan villages are reported to be in the process of transformation. Experiments in bringing about a non-violent social order is underway in these villages. Government recognition too has been extended to the movement by bringing the donations of Bhoodan-Gramdan under the purview of law and by offering special incentives for Gramdan villages. However, it is doubtful whether either the voluntary organizations which sponsor and carry forward this line of rural reconstruction or the Governmental policies which are framed to facilitate the spread of the movement,[4] take cognisance of the socio-economic and political problems that have arisen in these villages. This paper attempts to uncover some of these problems. In order to appreciate these problems in their manifold ramifications we have to look for their genesis. Are they endogenic or exogenic to the movement? The evidence that we have indicates that the problems faced by the Gramdan villages are created by the way in which the movement is engineered. We start with an analysis of the nature and types of Gramdan villages to support our hypothesis.

Table 1 attempts to make a comparison of the size of Gramdan villages with other villages in the country. It is clear that the Gramdan village is far smaller in comparison with the typical villages in all States and in certain States like Kerala an average village is 75 times bigger. The questions to be asked at this juncture are: Are Gramdan villages, villages at all? How are they rendered atypical?

Are these Villages?

In order to unfold the problems that are faced by the Gramdan villages and to examine the causes of the atypicality of these villages we propose to subject the gramdan villages in one of the States in India (Rajasthan) to a systematic analysis. Of the 236 Gramdan Villages in Rajasthan 65 have been brought under the Rajasthan Gramdan Act 1960.[5] The near absence of any reliable detailed data regarding the villages which are not brought under the Act compels us to limit our analysis to the 'declared cases'. Only 11 districts have any Gramdan villages (there are 26 districts in Rajasthan) and of these 3 districts do not have any village brought under the Act, while as many as 62 villages are concentrated in 5 districts in the State and hence our discussion will be focussed on these 'Gramdan pockets' and the implications worked out are mainly applicable to them.

It is clear from Table 2 that the size of the Gramdan villages in terms of the area of land, number of households and population stands in sharp contrast to an average village both in the districts and in the State. Let us concentrate on the 65 Gramdan villages brought under the Act.

Table 3A shows that a mere 10.7 per cent villages own more than 1,000

£ Jammu and Kashmir, Madras, Delhi and Himachal Pradesh, excluded for working out the average.
N A—Not Available.

acres of land and the land owned by 38.5 per cent villages is as little as 200 or less acres. Similarly Table 3B shows that only 4.6 per cent of the Gramdan villages have more than 100 households, and as many as 50.8 per cent are constituted of 25 households or less. Again Table 3C reveals that only 6.2 per cent villages have a population over 500 and as many as 33.8 per cent villages have only 100 or less people. Table 4A gives information on types of Gramdan villages. Of the 65 villages 52.3 per cent are exclusively tribal, 6.2 per cent are predominantly so, 18.5 per cent villages are single — caste ones while 7.7 per cent villages are having only two caste groups. However, 15.4 per cent villages have three or more caste groups. It may, therefore, be inferred that Gramdan villages are, socially, less complex.

Table 4B explains how Gramdan villages emerged. While 46.2 per cent villages are brought under the Act without any change in their strucrure and composition, 41.5 per cent villages are but hamlets which have been conferred the status of Gramdan villages and 12.3 per cent villages are new colonies established on common land donated either by Government or by private philanthropists.

Our main interest in the present context as has been indicated at the outset is not to present a typology of the Gramdan villages as such but to work out the implications of their emergence and existence. Generally speaking a typical Rajasthan village has a number of parts attached to the village-core or the central village. The definition of the village for the purposes of the Rajasthan Gramdan Act 1960 was the same as given in the Rajasthan Land Revenue Act 1956. According to this, parts of villages whether called a hamlet, 'thok', 'patti', 'dhani', 'pra', 'fala', 'wada' or otherwise are included in the village and are not considered as separate units. In tribal areas it may be the castes — which inhabit this village-core and the different hamlets are occupied by the Adiwasis or tribals. But such a clear-cut residential clustering of cultural groups is not easily found everywhere[6] However, the village-core may often be inhabited by an erstwhile caste along with the artisan and serving castes while the peasants may form hamlets in proximity to their agricultural fields. In non-jagirdari area it may be an economically dominant caste which usually occupies the village-core. Notwithstanding the territorial separation between the hamlets and the village-core the latter with its temples, shops, panchayat ghars and other common social centres offers sufficient opportunity for the members of the entire village community to interact with considerable frequency. This results in developing a sense of belonging to the village. This social-historical background has been adverseiy affected by the emergence of several Gramdan villages which were bifurcated from the old revenue villages. This in turn has created a number of economic and political problems.

Types of Cases

To facilitate discussion we note the types of cases involved below:

(1) Cases where all the hamlets have been given the status of revenue village separately under the Act and the village-core has remained outside the fold of *Gramdan.*

(2) Cases where some of the hamlets and the village-core have been brought under the Act as new separate revenue villages and the remaining hamlets have been left out.

(3) Cases where only certain hamlets have been brought under the Act and rendered revenue units while the village-core and the remaining hamlets have continued as they were.

(4) Cases where all the hamlets and the village-core have been brought under the Act not as as one unit but as several separate revenue villages.

Voluntary action being the basis of Gramdan the application of coercion has been theoretically ruled out and hence if persons inhabiting certain parts of the revenue village want to be under Gramdan such a desire cannot be ignored and the only way to recognize their desire in the governmental framework is to bring that part under the Act separately. However, even those villages, where all the hamlets and village-core wanted to be under Gramdan, have been bifurcated into different units. The atypicality of the Gramdan villages in terms of size as revealed earlier is the result of conferring the status of full villages to mere hamlets and the bifurcation of villages into a number of new units. The actual number of Gramdan villages is thus larger than the number of revenue units that have opted for Gramdan. In fact many of these are not villages at all. The problems created by this situation are discussed below.

Donation can only be made of privately owned land for, in Rajasthan villages, the pasture land, the culturable waste land, the abadi land, (the village-site) the waste land, etc, are under the common possession of the village, the ownership being vested in the Government. When the different parts or any one of the parts have been assigned the status of a new village the problem of dividing the common land between the new units comes up and it has not yet been possible to work out a formula for effecting this division. A number of boundary disputes between the new villages created by Gramdan have been noted by the author. Thus paradoxically enough the major value, that the land belongs to society (i e a new system of property relations), on which the entire philosophy of Gramdan is being built up itself has received a blow as a consequence of the creation of these new villages which are anxious

Table 2: Gramdan Villages in Rajasthan

Name of the District/State	Average Acreage Per Village		No of Households Per Village		Population Per Villages	
	Gramdan	General	Gramdan	General	Gramdan	General
Chittor	318.5	1201.8	23.4	65.9	126.6	217.2
Nagpur	1016.4	3563.7	26.0	119.6	152.0	679.1
Jaipur	430.9	1253.5	21.8	93.5	121.9	520.5
Dungarpur	434.3	1139.0	46.0	87.3	235.5	472.4
Baswara	524.0	874.0	55.0	57.3	284.3	315.8
All India	511.7	2405.5	40.0	97.2	210.5	523.3

Note: The District-wise analysis is confined to the five districts where there is a high concentration of Gramdan villages. Of the 65 villages brought under the Act 62 are distributed in these districts. While the general averages have been worked out on the basis of the information provided by the Superintendent of Census operations, Rajasthan, the district-wise Gramdan averages have been worked out on the basis of data collected by the author.

to demarcate their respective land boundaries especially in regard to common lands. This poses a major problem as to whether the village can successfully operate in a set-up where the predominant values are contrary to the goals sought by it.

Political Problems

The political problems created by the bifurcation of villages are still more complicated. When a Gramdan village is brought under the Act it is bifurcated from the vikas and nyaya panchayats to which it belongs. The gram sabha president with considerable powers replaces the existing sarpanch and ward panches.[7] A number of villages constitute a vikas panchayat and quite often a few villages under the panchayat or parts of certain big villages are brought under the purview of Gramdan. The sarpanch of the vikas panchayat ceases to have jurisdiction over villages or parts of villages which come within the fold of Gramdan. Such situations have resulted in conflicts between Gram Sabha office-holders and the panchayat personnel, who man the affairs of the non-Gramdan part or parts of the revenue village.

The power in a Gramdan village is vested in gram sabha or village parliament constituted of the entire adult population of the village. The Gramdan village is not directly linked with the vikas panchayats or nyaya panchayats through the mechanisms of election or nomination. But provision has been made in the Act that one representative per thousand persons in the Gramdan villages can be sent to the *panchayat samiti.* This provision presupposes the existence of certain factors like the existence of the requisite population in Gramdan villages in one compact area, the possibility of consensus of opinion amongst the people in different Gramdan villages in regard to sending a representative, etc. As is evident from the data presented above a typical Gramdan village is very small and only a few such villages can have as many as 1,000 persons. It is also unlikely that these villages will be located in a compact or contiguous area and that they will have sufficient communication between them so as to be able to select a representative for the panchayat samiti. The legal provision creates two problems.

(1) The Gramdan representatives may capture a number of seats in a Panchayat Samiti in areas where there are a large number of Gramdan villages thereby converting these villages into 'political power-hives'. For example the Dungarpur panchayat samiti with a population of 62,996 has 31 sarpanches, i e, 1 sarpanch represents 2,032 persons. The Gramdan population of 6000 in the panchayat samiti is, on the other hand, legally entitled to have 6 representatives.

(2) There is the possibility of the Gramdan vllages being reduced into 'political isolates' due to the absence of the requisite size of population in one village or in a compact gramdan area so as to earn representation at the panchayat samiti level. This is the situation in districts like Jaipur, Nagaur, etc.

Both the problems noted above are equally damaging for the *Gramdan* movement. The possibility of securing representation directly at the panchayat samiti level would motivate frustrated village politicians to try their hand at bringing more villages under the Act without necessarily commiting themselves to the ideology of Gramdan movement. On the other hand, the absence of systematic linking of Gramdan villages with the local governmental structure might relegate the economic and social interests of these villages into the background especially in regard to the allocation of resources for developmental purposes.

Let us examine the possibility of getting out of this difficulty. The Gramdan village is not linked with the vikas panchayat or nyava panchayat but can have representation at the *panchayat samiti* level directly provided it fulfils certain qualifications, e g, a minimum of a thousand persons living together. As we have noted, the typical Gramdan village is too small (the average Gramdan village in Rajasthan has a population of 210) to have direct representation at the panchayat samiti level. Even in one panchayat samiti area there may not be enough villages to constitute the requisite population to earn representation in the panchayat samiti. If we assume that there are enough Gramdan villages in a panchayat samiti to secure representation in the Samiti these may not be a compact area and may not, therefore, have sufficient inter-communication to agree upon the choice of a representative. In such a situation representation of Gramdan villages in the vikas panchayats seems to provide the answer. This makes it possible for the Gramdan village or villages to have a representative on the vikas panchayat even when their population is much less than a thousand. Similarly if there are enough representatives of Gramdan villages on the vikas panchayat they can select a representative of theirs for the panchayat samiti. Such an arrangement will probably resolve the present difficulties.

The difficulties faced by the Gramdan villages at the operational level bring us to the general point that any social reconstruction programme if it is to be successful, should operate in a sufficiently big, compact and contiguous area. However, while this is a necessary condition it may be a suffi-

Table 3: Size of Gramdan villages

(A) Size by Area of Land

Land in Acres	No of Villages in the Group	Percentage of Villages in the Size-Group

cient one. Let us examine the meaning of this proposition.

One of the pre-requisites for bringing a village under the Act is that a minimum of 51 per cent of the privately owned land should be donated by the villagers. Generally, this condition laid down in the Act is observed. However, in quite a few cases it is not. The implications of non-observance of this requirement deserve notice. In one of the Gramdan villages in Chittor district, of the 452 acres of land individually owned as much as 292 acres (i e nearly 65 per cent) are owned by persons who do not belong to the village, and these absentee-owners refused to donate their land. This means that only 35 per cent of the land under individual ownership has been donated. The instance of one of the Gramdan villages in Nagaur district is more revealing. While it has 1,547 acres of land under private ownership only 240 acres of land (i e a little over 15 per cent) is owned by the villagers and the rest belongs to outside owners who did not donate their land. Such cases render the working of gram sabhas nearly impossible. The Act gives considerable powers to the gram sabha. These, however, cannot be effectively exercised in cases where a large majority of land owners of the village do not subscribe to Gramdan community life.

Table 4: Types of Gramdan Villages

(A) Classified by Caste

Types	No of Villages	Percentage of Villages in the Group
Unicaste	12	18.5
Bi-caste	5	7.7
Multicaste	10	15.4
Castes and Tribes	4	6.2
Tribe	34	52.3
	65	100.

(B) Classified by Origin

Origin	No of Villages	Percentage of Villages in the Group
Revenue villages brought under the Act as they were	30	46.2
Hamlets conferred the status of villages under the Act	27	41.5
New colonies brought under the Act	8	12.3
	65	100.0

It can be equally difficult when a land-holder in a Gramdan village also owns land in a neighbouring non-Gramdan village. The instance of a land-holder in one of the Gramdan villages in Nagaur District with 6 acres of land inside the village and 120 acres in a neighbouring village is illustrative. While he subscribes to the idea of Gramdan community life by donating the land in the village in which he lives, the land owned by him in the neighbouring villlages which are not in Gramdan is kept under private ownership. The situation can be true on a village level too. The people in one of the Gramdan villages in Jaipur District own 360 acres of land of which 185 acres are (over 51 per cent) in neighbouring villages which are not under Gramdan. Thus even if a village is brought under the fold of Gramdan this is not necessarily effective in transferring the individual ownership of land to the community, under the conditions in which the Gramdan villagers operate today.

Notes

1 As early as in 1947 a revolutionary peasant movement had slowly been forming, led by communist leaders in Telengana. Telengana was the eastern half of the princely State of Hyderabad, comprising 8 districts having an area of 44,000 sq miles, populated mainly by the Telugu-speaking people. Under the Nizam a notoriously semi-feudal agrarian system had been perpetuated and the peasantry was ripe for radical leadership. The communist set in motion an indigenous mass campaign against the landlords and the State autocracy and concentrated mainly in the districts of Nalgonda and Warangal. According to Communist claims a total of 3,000 villages had been sovietized, and one milion acres had been seized by the peasants during riot period. See Gene D Overstreet and Marshall Windmiller, "Communism in India", University of California Press, Barkeley 1959, especially pages 246, 266 — 67 and 300. Communist leaders have been very optimistic about the achievements of the peasant movement in Telengana. For instance G Adhikari in his "Resurgent India", claims that the movement shook for the first time the main bastions of the feudal orders in India to its very foundations" and "blazed the path of Indian people's Democratic Revolution." For an official version of the Communist party of India of the Telengana peasant riot see on "Telengana", Information Document No 7, 1950, (place not given) and "Zamendari — Police Terror in Andhra", (place and date not given).

2 For instance, (1) *Bhoodan Yajna* (in Hindi) started in 1954. Since 1956 *Bhoodan* is being published in English too. Both these publications are weeklies and are edited by Dhirendra Muzumdar. (2) *Gramdan*, started in 1957 and edited by A W Sahasrabudhe and Sachidanand. These publications are exclusively devoted to reporting the progress of the Bhoodan-gramdan movement; but publication like *Sarvodaya* and *Gandhi Marg* too publicise the activities of the movement.

3 The first *Bhoodan* (land-gift) of hundred acres was made on April 18, 1951 to Vinoba Bhave, the initiator of the movement. Later the donations widened out into Gramdan, donation of entire villages. The first Gramdan was made in May 1952 by the villagers of Mangrot in Hamirpur district of Uttar Pradesh.

4 The Akhil Bharat Sarva Seva Sangh, Kashi, works as the co-ordinating agency of the Sarva Seva Sanghs established on a State-wise basis. Several agencies like the Khadi and Village Industries Commission give priority to Gramdan villages in developmental programmes manned by them—for instance, in the establishment of Gram Ekais. In several States legislation encourages the spread of the movement by extending concessions like direct representation at the panchayat samiti level, etc.

5 The Rajasthan Gramdan Act 1960 is referred to as 'the Act' in this paper hereinafter, unless otherwise specified. The salient features of the Act are given below in order to facilitate the discussion that would follow in this paper.

6 See Brij Raj Chauhan, "Residential Concentrations and Caste Groupings in the Rural Setting in *Man in India*, Vol 44, No 2, 1964, pp 175-181.

(1) In order that a village may be brought under the Act the land donations should consti-

tute not less than 51 per cent of the total land under private ownership in that village.

(2) The number of persons who donate this 51 per cent of land should not be less than 80 per cent of the total number of persons owning land and residing in the village.

(3) The donors should not be less than 75 per cent of the adult persons residing in the village and should be prepared to participate in the Gramdan Community.

(4) Once the donations are confirmed by law the ownership of these land will vest in the gram sabha established for that Gramdan village. The ownership of all common lands in the village shall also be vest in the gram sabha.

(5) The gram sabha shall be responsible for the payment of land revenue and other cesses on the entire land in the village, including land under private ownership of non-donors. Non-donors in the village are to pay the cess and taxes to the gram sabha.

(6) The gram sabha shall consist of all adult persons who either are residents of the Gramdan village or own lands in it.

(7) The gram sabha shall be a body corporate having perpetual succession and a common seal with power to enter into contracts and to acquire, hold, administer and dispose of property, both movable and immovable.

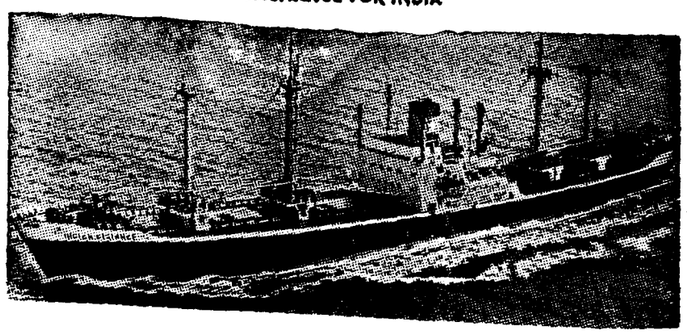
(8) When the gram sabha is established in a Gramdan village it shall exercise such powers and discharge such duties and functions as done by the panchayat so far.

(9) The gram sabha shall have powers to borrow moneys on the security of Gram Nidhi (a fund raised through donations, bequests, gifts or loans from the central or the State Government or any local authority or any person) or any other property not being lands vested in the Gram Sabha.

[7] It is pertinent to note here the differences between the gram sabha under the panchayati raj set-up and the gramdan set-up. Under the former the gram sabha is convened only twice a year to be appraised of the activities of the panchayat. The gram sabha in a gramdan village is a very powerful body consisting of the entire adult population and combines in itself the powers of both the vikas panchayat and the nyaya panchayat and is convened at least once in a month.

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress . . . Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.



Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

FROM THE CHAIR

Alembic Chemical Works Company Ltd, Baroda

Speech of the Chairman, Shri R B Amin

THE following is the text of the speech of Shri R. B. Amin, Chairman, Alembic Chemical Works Company Limited, Baroda, at the 58th Annual General Meeting of the Company held on June 17, 1965 :

Ladies & Gentlemen,

I have great pleasure in welcoming you to the 58th Annual General Meeting of the Company. The Accounts for the year ended 31st December, 1964 and the Directors' Report have been circulated to you, and with your permission, I shall take them as read.

It may be recalled that during the last three years the Company had undertaken and completed various schemes of expansion. The more important amongst these were : the expansion of the Penicillin Plant, the Sulphuric Acid and Fertilizers Plants and the Distillery. I am glad to say that these expansions have contributed to the very satisfactory working results of the year under review.

The increase in the sales achieved in the year 1964, and expected in the current year, might make it necessary to undertake further expansion in the capacities of the Yeast Plant and the Fertilizers Plant. The use of better strain in the manufacture of Penicillin has improved its yield and with the expected higher yields we would be able to meet the continuously rising demand.

Some of the products of the new Hompro Division, like Rubex Ointment and Nasal Drops were introduced in the market in the current year. Tooth Paste and Shaving Cream will be in the market soon.

I had mentioned to you, when we met last, our intention to undertake the manufacture of two Antibiotics viz. Erythromycin and Kanamycin. We have secured the collaboration of reputed manufacturers of these products. It has, however, not been possible to get Government approval yet. It appears, Government was undecided about whether the manufacture of these and other new Antibiotics should be reserved for the Public Sector. There can be no discremination between the two sectors of our economy and there need not be any conflict between them also. Any manufacturing unit which has an immediate plan for the manufacture of a product, which it is desirable to manufacture in the country, should be allowed to do so. It would not be in the national interest to sell it on the ground that the public sector might like to undertake it at a later date.

A Letter of Intent for the manufacture of Hydroxocobalamin has been granted to us and the terms of collaboration are being negotiated with the Foreign Collaborators and the Government of India. We expect that the necessary industrial licence will be issued to us soon.

Availability of finance and the continuity of good management are perhaps the two most important requirements for the growth of Industry. They are more so in the conditions of India to-day when the country is striving for a rapid industrialisation. It is, therefore, unfortunate that measures are being taken by Government which tend to affect these adversely.

It may be necessary to take steps to discourage or restrict the flow of funds to unproductive or speculative purposes. But a blanket ban, like the one the Reserve Bank has placed, on the utilisation of the funds returned during the slack season would starve the Industry of the funds which they need and to which they look forward in this season.

The credit squeeze and the resultant high interest rate would make investment in shares and debentures less attractive and force a further recession in their prices. What is most necessary to be done is that wasteful and unproductive expenditure, both in Government and in the public sector undertakings must be stopped because that contributes to inflation. Any restrictions on the funds needed for Industry can only affect production adversely with the resultant pressure on prices.

In our country the traditional form of Management of joint—stock organisations has been the Managing Agency system. Managing Agents have pioneered many industries and have provided the necessary entrepreneurship and financial resources. They have also provided a firm and stable management. The Managing Agency system offers most of the advantages of group management under which comprehensive services are rendered to companies under their management, and in this respect may be said to have anticipated the recent trend in industrially advanced countries of a single company providing technical, managerial and expert personnel services to several companies in which it has a financial interest.

It is wrong to think that the institution of Managing Agency has outlived its useful purpose. Entrepreneurship is not restricted to the initial stages of the history of a concern. The need to be alert and inventive remains vital throughout. There are the almost never ending problems of expansion, innovation and replacements. In as much as, therefore, entrepreneurship persists at all stages of a concern, the need for a continuation of the management is clearly indicated. By providing risk and other capital to managed companies, both from their own resources and by attracting savings of others, the Managing Agents continue to help in the expansion of existing enterprises also.

If the institution of the Managing Agency has proved to be very useful in the past and is thus necessary for the present, it would not be wise to end it in the existing state of our economy. It has been mended several times in the past and the powers assumed by the Government under the existing provisions of the Company legislation are more than sufficient to prevent any mismanagement by a Managing Agency. There is no particular merit or advantage on the insistance of management of companies by Board of Directors alone. The form of management of a particular joint—stock company is a question of suitability and convenience to be decided by the shareholders of that Company. The Government can, and does, act as a reviewing authority and can prevent wrong people from taking over the management by unfair means. But a honest and competent Managing Agency House should be allowed to continue. That would be in the interest of the Company and of the rapid industrialisation of the country.

In a planned economy, it may be necessary to fix some priorities; it might also call for some amount of

control by Government. But these should be broad and general, and planning and control should not degenerate into a bureaucracy. That all things must be decided in accordance with the wishes of those that are most affected by it is a rule that must be allowed to operate subject only to the overall interest of the nation. But otherwise, there must be no restrictions and fetters on the initiative and the will of individuals and organisations. Only thus can institutions and nations make progress.

Before I conclude, I wish to thank all my colleagues on the Board as well as the Managing Agents, Staff and the Workers of the Company for their co-operation. I now commend the Annual Accounts and Directors' Report for your consideration.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

AROUND BOMBAY MARKETS

Dalal Street Forges Ahead

Wednesday, Morning

DALAL STREET did not pause for long to 'digest' the gains already made. It took a big leap forward last week and pushed its way into new high ground. Equities recorded impressive gains all-round. Rayons, Steels, Engineerings, Shippings and Dyes and Chemicals—all these vied with one another to steal the show. There was a marked improvement in turnover. Though activity continued to be mainly professional, interest broadened appreciably and quite a number of cash scrips received good attention and scored handsome gains.

In a matter of days Century improved from Rs 535 to Rs 552, National Rayon from Rs 388 to Rs 409, Tata Steel from Rs 153.75 to Rs 160, Tata Locomotive from Rs 233 to Rs 249.50, Scindia from Rs 14.24 to Rs 14.80, Indian Dyestuff from Rs 192 to Rs 208, Tata Chemicals from Rs 19 to Rs 19.56, SLM—Maneklal from Rs 116 to Rs 130.50, Tractors and Bulldozers from Rs 134 to Rs 157.50 and Baroda Rayon from Rs 67 to Rs 79—to mention some of the more important names.

Market psychology had for some time been veering round to the constructive side. Sentiment earlier in the week was aided by the absence of any adverse political news and the announcement of the British and U S loans for Rs 6.6 crores and Rs 92.3 crores respectively. But the spurt in prices which occured mostly after the turn of the settlement on June 18 was caused essentially by the marked decline in the carry-forward charges in certain popular counters, reflecting serious shortage of floating stocks resulting from the massive purchases by the Life Insurance Corporation over the past several weeks. Despite the closure of transfer books, the carry-forward charges in Tata Locomotive were on the low side and the 'budli' actually turned against the sellers in the case of Tata Steel — an extraordinary situation, never noticed in this scrip for years.

The manner in which the stock market made its upward thrust after the turn of the settlement suggested that it had simply been waiting for an opportunity which was provided by the low carry-forward charges. In its constructive mood, the market took very little notice of the higher rates of interest offered on the two new loans, which, of course, merely reflect the existing money market pattern. Sentiment was considerably helped by renewed optimism about an early agreement on cease-fire in Kutch and the restoration of the 16 per cent power cut enforced during the second week of June. Reports suggesting a big World Bank loan for maintenance imports during the current year had also a steadying effect on the market.

The market has changed and it does not seem to be simply due to the magic of fluctuations—trading sentiment steadies up with the rise in prices which in turn causes a further rise in prices. Apart from technical factors, the turn in market sentiment is attributable to improved prospects of a negotiated settlement of the Kutch border dispute. Improvement in the political situation can have a significant impact on the general market psychology. But since any further big rise is likely to focus attention on the yield on equities, the market will find it difficult to sustain an upward trend for long. Credit squeeze is unlikely to be relaxed and interest rates are not expected to come down in the foreseeable future. Production costs continue to rise and with the foreign exchange position being what it is, import policy will continue to be extremely restrictive and it might well adversely affect industrial production. The economic prospect is not conducive to the revival of investors' confidence without which the current recovery cannot be transformed into a major upward movement. Dalal Street's recent behaviour, however, holds out the hope that the current recovery phase will be extended further.

COTTON

Premiums Harden Further

COTTON prices have been quoted well above the statutory ceilings for quite some time. The premiums continued to harden week by week but the authorities seem altogether unconcerned about it. If price control is to make any sense, those who contravene the control order must be punished severely and the authorities entrusted with administering price control must also be made to explain their conduct (misconduct will perhaps be more appropriate). Market men reported fairly good demand for cotton used for coarser counts and the prices of Kalagin and Wagad rose by about Rs 25 to Rs 50 per candy last week. Strangely enough, mills which seem to be greatly worried over the accumulation of stocks of both cloth and yarn and the consequent financial strain, have not raised any cry against soaring cotton prices. The Indian Cotton Mills' Federation does not talk any more of self-discipline in respect of cotton purchases. This is perhaps because the Federation feels that any such talk is likely to displease the State Government (or Governments) which does not really pay in the long run.

June is nearing end but the Government of India has still to make up its mind on the cotton policy for the 1965-66 season. The policy announcement does not really count for much. There is hardly any evidence to show that sowings of cotton are in any way guided by the Government's price policy; nor has the price policy any important bearing on the marketing of the produce because business is transacted freely above the statutory ceilings whenever the demand and supply equation pushes prices beyond the ceilings. It is perhaps time that the Government of India gave up all pretence of controlling prices if it does not have the willingness and/or administrative ability to enforce strictly the price control order. Partial control over cloth prices is not a sufficient cause for maintaining control over cotton prices—control which in any case is reduced to a farce almost every year.

Market men do not seem happy with the progress of the monsoon. It if of course a little too premature to feel uneasy because of insufficient rains. Only if the cotton producing areas do not get enough rains in the next fortnight or so will there be some cause for worry. Of course, it will need ideal weather conditions throughout the season to have a crop which will be large enough to meet the cotton textile industry's growing requirements at reasonable prices. The prospects of securing large quantities of cotton from abroad every year being none-too-promising, the gap between demand and supply will need to be bridged through larger use of man-made fibres. The Government has done well to allow an excise duty refund of 50 paise per kilogram of staple fibre that the mills will be using for blending it with cotton. This will make blending of staple fibre with cotton profitable to the mills.

There is very little to mention about futures trading in cotton during the week. The August contract fluctuated between Rs 776 and Rs 777.50 per 3 quintals and the total turnover put through the week did not perhaps exceed a thousand bales. The penal margin of Rs 10,000 per 100 bales has brought futures trading to a standstill. Except those who live on fluctuations, nobody need feel really sorry for the virtual closure of the futures market. But the Forward Markets Commission need take no credit for having enforced any kind of discipline on the futures market.

OILSEEDS

Still Firm

THE oilseeds market displayed very little of its previous week's excitement caused essentially by strong bull manipulation in the maturing contracts in castor as well as linseed. While the June contract continued distinctly firm without much business, the distant contracts gradually drifted lower due to lack of fresh support and scattered bear pressure induced by ideas of monsoon. Castor September eased from Rs 81.50 to Rs 80.65 and linseed September moved down from Rs 101.55 to Rs 100.25 (both per quintal). Cottonseed September hovered around Rs 53.50 with nominal turnover.

Conditions in the spot market were not very different. The turnover was restricted and prices generally displayed a firm tendency, with sentiment guided mainly by the remarkable strength in mustard oil and linseed oil; linseed oil has simply been following the trend in mustard oil. Mustard oil prices have been moving up because of the large-scale smuggling into East Pakistan where this oil is reported to be quoted around Rs 5,000 to Rs 5,500 per tonne. In Calcutta, mustard oil is being sold around Rs 3,300 per tonne. The sustained demand for linseed oil, which is currently quoted around Rs 2100 per tonne, is mainly for the purpose of mixing it with the high-priced mustard oil. Groundnut oil ready has been steady between Rs 24.30 and Rs 25 (per 10 kgs) for the past several weeks. Castor oil also has been steady around Rs 16.85 to Rs 17 per 10 kgs.

The trend of oilseeds and oil prices in the near future is likely to be governed mainly by the progress of the monsoon. Reports from the groundnut producing area indicate insufficient rains so far with the result that sowings have already been delayed by ten days or so. Weather in the next fortnight or so will be crucial for sowing operations. Since we have had reasonably good weather over the past three years, the country will need to have real luck to have favourable weather this year as well. Considering that prices have continued to remain very high despite fairly good harvests in recent years, the prospect of bad weather is frightening.

Export houses did not report any important business last week. Russia was said to have purchased about 1,500 tons of castor oil recently. Fresh business in groundnut extractions and cottonseed cake was limited. Reports from New Delhi indicate the possibility of the export trade in groundnut extractions being taken up by the State Trading Corporation in

GOVERNMENT OF INDIA

4½ PER CENT LOAN 1971

ISSUE PRICE RS 99.50 PER RS 100 (NOMINAL) REDEEMABLE AT PAR ON 1ST OF JULY 1971

5½ PER CENT LOAN 1990

ISSUE PRICE RS 100.00 PER RS 100 (NOMINAL) REDEEMABLE AT PAR ON 1ST OF JULY 1990

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs 250 crores (approximately). Subscriptions may be in the form of (i) cash/cheque or (ii) securities of the National Plan Bonds—Second Series (3½ per cent 1965) which will be accepted for conversion at par.

Interest on the securities tendered for conversion will be paid upto and inclusive of 30th June 1965.

The new loans will bear interest from the 1st of July 1965. Interest will be paid half-yearly on the 1st of January and 1st of July and will be subject to tax under the Income-tax Act, 1961.

Subscription lists will open on the 1st of July 1965 and close on 3rd of July 1965 or earlier without notice.

Applications for the new loans will be received at:—

(a) Offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi;

(b) Branches of the subsidiary banks of the State Bank of India conducting Government treasury work; and

(c) Branches of the State Bank of India at other places in India.

For full particulars please apply to any of these offices or branches.

the not-to-distant future. It is said that all export sales have to be routed through the Corporation. This step is perhaps designed to check the leakage of foreign exchange through under-invoicing. While there is a great deal to be said in favour of canalisation of exports through centralised agencies, the country's interest will be better served only if the agency conducting export business is both honest and efficient. Export of groundnut extractions is a specialised trade and since it is already earning large amounts of valuable foreign exchange—about Rs 35 crores—the Government will be well advised to consider the matter carefully before taking a final decision on it. India's difficult foreign exchange position does not permit taking of big risks.

Money and Banking

Thursday Morning:

CREDIT conditions in the Bombay short-term money market were fairly comfortable during the week to June 23. Demands for funds was maintained around the previous week's level and the inflow of funds, though slow, was higher. Interest rates during the earlier part of the week to June 18 were maintained at between 7.75 per cent and 7.50 per cent. Later a declining trend was evident and on Wednesday evening the rate stood at 6.75 per cent. Marketmen, however, feel that this is a passing phase and that the rates would firm up again when the government loans enter the market on July 1.

Scheduled bank returns for the week to June 11 show that the return flow of credit into the banking system has been distinctly slow this year. There was a substantial increase in the volume of advances from Rs 1757.80 crores to Rs 1774.31 crores, the outcome of a marked expansion in loans, cash credits and overdrafts. Credit expansion during the week was placed at about Rs 1.35 crores taking total credit at the end of the week to Rs 2094.59 crores. This was accompanied by an increase in borrowings from the Reserve Bank by Rs 1.36 crores to Rs 107.75 crores. Aggregate deposits were higher by Rs 9.38 crores at Rs 2670.17 crores; the rise was Rs 9.30 crores to Rs 1422.54 crores in time deposits and Rs 8 lakhs to Rs 1247.36 crores in demand deposits. Money at call and short notice advanced to Rs 50.53 crores against Rs 47.89 crores at the end of the previous week. Cash with the banks rose modestly by Rs 46 lakhs while balances held with the Reserve Bank increased by Rs 1.88 crores to Rs 93.68 crores. Investment in government securities was placed at Rs 722.90 crores against Rs 721.85 crores during the previous week.

During the week to June 18 a substantial increase was recorded in balances held abroad from Rs 2.67 to Rs 9.47 crores, according to the Statement of Affairs of the Reserve Bank of India. Foreign securities, however, remained stagnant at Rs 70 crores. Notes in circulation were lower by Rs 28 crores at Rs 2,706.40 crores. Central government deposits declined by Rs 52.99 crores while deposits of State governments recorded a modest increase of Rs 63 lakhs. Scheduled bank deposits were higher by Rs 3.33 crores at Rs 98.28 crores. There was also an increase of Rs 40.78 crores in investments at Rs 199.25 crores.

BUSINESS NOTES

Textile Machinery Corporation

IN the next few months the Textile Machinery Corporation intends to deliver to the market most modern textile machines with a number of new features. Besides the regular machines, the manufacture of high quality ring frames in collaboration with Zinser Textilmaschinen of West Germany is proceeding according to schedule, and these machines are expected to be put on the market in the first quarter of the next year. The company has received an industrial licence to expand installed capacity of textile machinery, and the expansion programme is progressing satisfactorily. In the machine tool division the company has already achieved 75 per cent indigenous content, and almost all major parts of the machine are expected to be made indigenously by the end of this year. The project for the manufacture of No 7 combination turret lathes has, however, not made satisfactory progress because of difficulty in getting foreign exchange. The expansion of the steel foundry from the existing capacity of 3,600 tons to 9,600 tones is proceeding well, and production is expected to begin before the end of the year.

The 1964 results of the company reflect the cumulative effect of occasional labour troubles, difficulties in the procurement of certain raw materials and components and a large increase in wages due to enhancement of dearness allowance. The increase of ten per cent in customs duty has also added to the cost of production, and its effect will be felt after the stock of previous supplies has been exhausted. During the year to December last, sales were slightly lower at Rs 11.62 crores (Rs 11.85 crores) and gross profit a little higher at Rs 2.37 crores (Rs 2.31 crores). After setting aside Rs 29.71 lakhs (Rs 26.29 lakhs) for depreciation, Rs 119.60 lakhs (Rs 123.75 lakhs) for taxation and Rs 5.40 lakhs (Rs 4.87 lakhs) for development rebate reserve, Rs 45 lakhs (Rs 42 lakhs) have been allocated to general reserve. Preferential dividends require Rs 11.36 lakhs (same), and the equity dividend raised by 25 P to Rs 1.75 a share demands Rs 26.25 lakhs (Rs 22.50 lakhs). The dividends are amply protected by earnings.

Simtools

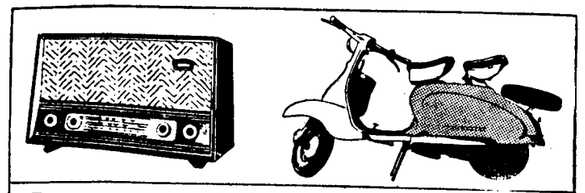
SCOTTISH Indian Machine Tools, a new company promoted jointly by Scottish Machine Tool Corporation of Glasgow and Voltas of Bombay for the manufacture of plate and bar working machine tools, is shortly entering the capital market with a public issue of 19,200 equity shares of Rs 100 each. The authorised capital of the company is Rs 1 crore and issued capital Rs 64 lakhs. The paid-up capital is Rs 44.80 lakhs whereof the Glassgow firm, through their wholly-owned subsidiary, Scottish Machine Tool (Overseas), hold Rs 25.60 lakhs and Voltas, together with their associates and friends, Rs 19.20 lakhs. The balance of Rs 19.20 lakhs will be offered for public subscription at par.

The company will manufacture at its factory at Thana, near Bombay, guillotine shears, plate bending rolls, single ended punching machines, punching shear and bar cropping machines, power presses, press brakes and beam bending machines of heavier types. The construction of the factory is nearing completion. The bulk of the plant and machinery is already at the site, and is being erected. The capital outlay on the project is estimated at Rs 1.05 crores of which Rs 64 lakhs will be met by share capital, Rs 26 lakhs by term loan from I F C and Rs 15 lakhs by bank borrowings. Voltas will be appointed sole distributor for the products to be manufactured by the company.

Travancore Rayon

THE heavy burden of excise duty on rayon yarn and the consequent dull market conditions in the last five months of 1964 are reflected in the year's working results of Travancore Rayon. The company's production of rayon and cellulose film has been satisfactory though owing to accumulation of stocks, production in the rayon division had to be stopped for over 1½ months by announcing a lay-off. Production of rayon grade pulp from cotton linters reached the rated capacity of ten tonnes a day. Installation of the six tube spinning machines in the rayon division has been completed; four went into production in the latter half of 1964 and two early in 1965. The quality of yarn from these machines has been found quite satisfactory. Erection of a steam raising boiler at an estimated cost of Rs 15 lakhs is expected to be completed by the end of this year or early next year.

The company's sales during 1964 increased from Rs 3.43 crores to Rs 4.06 crores but profits were only a shade better at Rs 58.46 lakhs compared to previous year's Rs 58.06 lakhs, reflecting contraction in margins. Of the profit, depreciation charge has taken up Rs 42.40 lakhs (Rs 32.20 lakhs) and development rebate reserve Rs 6.05 lakhs (Rs 8.50 lakhs). There is no tax liability for which Rs 4.60 lakhs were provided last year. After taking credit for Rs 0.72 lakh, being refund of income-tax, Rs 3.91 lakhs written back from previous years' provisions for taxation and transfer of Rs 1 lakh from dividend equalisation reserve, provision is made for payment of unchanged dividends on preference and ordinary shares, together requiring Rs 15.75 lakhs.



Elphinstone Mills

SPEAKING to shareholders of Elphinstone Spinning and Weaving Mills at their annual general meeting in Bombay recently, N K Jalan, Chairman, once again, as invariably year after year in the past, expressed his anxiety over the ever-rising costs of cotton textile industry. He apprehended that in the background of unceasing and relentless increases all round in the shape of continuously mounting cost of wages, social benefits and fringe benefit to workers, increasing prices of cotton fresh levies like the Bombay Municipal octroi, the proposed exorbitant and stores, chemical and colours, rates of inspection fees made payable compulsorily by mills on all cloth produced by them with effect from March last might only prove the last straw on the camel's back. Jalan complained that the textile industry was being treated like the proverbial milch cow and if the powers-that-be did not take the remedial measures in time, they would soon kill the goose that laid the golden eggs. He said that the absence of any provision for more flexibility in the fixation of cotton cloth prices had been a great deterrent factor. If no latitude was allowed to the cotton textile industry to make adjustment in prices of controlled cloth to cover the rising cost of production and raw materials, it was bound to have great adverse effect on the production of all cotton mills.

Lufthansa

Net profits of Lufthansa have increased during 1964 to 9.2 million U S dollars according to a press note issued by the company. The profit will be used as follows: 8.2 million dollars have been alloted to various reserves, 0.75 million dollars have been set aside as special reserves; and the pilots' training school at Brehmen is to receive .25 million dollars.

The encouraging results produced by the company during the last year were largely due to reduction in operation costs and increase in overall load factor from 57 to 61 per cent in 1964.

You'll find that shipping with us couldn't be easier. All you have to do is make one phone call and describe your shipment. We'll give you full information, including costs.

You expect shipping with us to be fast. But you may be pleasantly surprised to find out that it can save you substantially on packing (no heavy crates needed), on insurance (because there's far less breakage, spoilage, or pilferage), on inland shipping (air freight can deliver your goods just about anywhere). And you can eliminate the cost of overseas warehousing (as you can now make overnight delivery of factory-fresh goods almost anywhere in the world).

Let us show you. Ship with us now, and we think you'll want to make us a permanent part of your shipping system in the future. Call your Pan American Cargo Agent. Or call us at Bombay, Calcutta, New Delhi, Madras, Colombo (Ceylon).
