SEVENTY-FIVE PAISE

Not quite though—for an average day's work at Kulti is a stupendous reality. Making complicated castings of a wide variety to serve India's steel, sugar and chemical industries, the railways and many units of the public sector. Spinning out pipes by full train loads as not done anywhere else for India's projects and utilities. The consumption of pig iron by Kulti's integrated foundry in a year exceeds 20% of that for the whole of India; it can consume more if available... All perhaps in our Kulti works' tradition of nearly a century.

Panic Measures N 49.17

When New Delhi delayed its import policy announcement by three months with the barely-concealed intention of enforcing a reduction in imports, the least one would have expected was that the time gained would be used to formulate a well thought out policy which would rationalise import control and check abuse of the export incentive schemes. These schemes have, if press reports are to be given credence, now been made to appear the villains of the piece; the lag in export receipts, the over-invoicing of exports to obtain larger import entitlements and the failure of the much-publicised increase in exports to yield correspondingly higher foreign exchange receipts have all been ascribed to them. But evidently the breathing space offered by what has been graphically, though not accurately, described as an 'import holiday' has not been used to set things right. Instead, official concern on a weekly or perhaps daily basis with the state of exchange reserves has led to a series of piecemeal measures of which the notification requiring importers to deposit 25 per cent of the value of imports in advance and the announcement of a further cut in established importers' licenses are typical examples.

What the real intention of the authorities was in requiring advance deposits against imports it is difficult to make out. The usefulness of this device either as a measure to regulate import demand or as a tool of monetary control in any system is open to question, not to mention in a planned economy. Several Latin American countries have tried it with varying degrees of ineffectiveness. In any event, it made more sense in their case as they rarely had severe physical controls on imports and advance deposits were politically more acceptable than import taxes. In these countries advance deposits have formed part of stabilisation measures *a la* IMF which aim at reducing pressure of domestic expenditure along with a liberalisation of direct restrictions on trade and payments. In our economy where imports are severely rationed in accordance — isn't it taken for granted? — with Plan priorities the use of the advance deposit device makes little sense unless it is suggested that we are going to simultaneously loosen the physical controls. This, one hopes, is not the intention!

What advance import deposits would do is to raise the cost to importers of importing goods. It is not clear whether the authorities intend the regulation to apply also to imports on deferred payment terms, imports for the private sector under aid agreements and imports by the private sector of PL 480 goods like cotton and soya beans. The increase in costs of imports would in our economy only increase the overall price index, without any effect to the level of actual imports, for, given the gap between import demand and supply it would be fairly simple for the importer to pass the added burden on to the consumer. If the intention of the advance deposit is to tax the element of windfall profit accruing to importers, it is not certain that this is a device preferable to fiscal levies or monopoly imports by the State Trading Corporation of those commodities where there is profiteering. Nor can the device be regarded as an effective monetary instrument. The amount of funds likely to be drawn out of the system has been variously estimated but in no case is it likely to exceed Rs 35 to Rs 40 crores which is not large enough to make any significant difference to the level of money supply.

If the purpose of the advance deposit requirement is obscure, the net effect of the cut in import quotas of established importers and the total ban on imports of a number of commodities by this category of importers will be so small as to be of practically no relevance to the foreign exchange crisis. Established importers account for less than 2 per cent of the country's total import bill and impressive as the act of banning imports of 60-odd items may seem, its actual impact on import payments will be negligible though it will be a windfall to those who have stocks of these goods and to the manufacturers of Indian substitutes.

It has been repeatedly stressed in these columns that what is necessary to face our balance of payments problem is a careful and thorough review

of the possibilities of import substitution and an objective assessment of export promotion schemes. The tax credit certificates scheme for exporters proposed in the Budget has, after four months, yet to be spelt out and implemented; the case for other incentive devices which may be more effective

and less easy to abuse has to be examined; and, at the same time, the present regulatory import surcharge needs to be reviewed with the objective of assessing the justification for a selective stepping up of the rate of surcharge. In short, what is needed is a policy, not a series of panic measures.

Swaran Singh decided not to go to Algiers because Bhutto was keeping him company in London. This was a negative response in tune with the rest of Indian activities. When, at the last moment, the Pakistani Foreign Minister flew out by a chartered plane to Algiers, we felt cheated; it is as if an act of perfidy has been committed by the Pakistanis. Petulant immaturity has obviously taken over our external policy-making.

The Government of India has set up a committee to review the working of the country's foreign service under the chairmanship of N R Pillai, who was Secretary-General of the Ministry of External Affairs for a number of years. But it is unlikely that the Committee's deliberations will lead to any fundamental revolution in the working of the foreign service. A committee of ex-civil servants and civil servants is bound to miss out the political element which should in fact be at the centre of the review. Given the composition of the committee, its conclusions would largely pertain to the mode of recruitment, the working conditions, the salary scales and such relative trivialities. The committee is most unlikely to deal with political issues because that would be going outside its frame of reference. But the crucial question in Indian external policy-making is the political question; the mode of recruitment and the types of people that are recruited are heavily influenced by this element.

In the reorientation of India's foreign policy, the first task naturally is to lay out a firmly-based framework of policy. This is a matter for the politicians. It is only when the guidelines of policy have been determined that it will be possible to discuss the quality of the permanent civil servants who will conduct the day-to-day operations of external policy. In the matter of recruitment, a careful judgment indeed needs to be exercised. The Indian foreign service has been Indianised, but it cannot be said that it has been nationalised. By and large, given the social background of the recruits, the foreign service consists of persons whose political orientation is towards the Western countries.

So long as Pandit Nehru was at the helm of affairs and Krishna Menon had a say, while the permanent civil servants grumbled at some of the decisions reached at the top, they did not dare to sabotage the broad frame of policy. Since the Chinese imbroglio, and especially since Nehru's death

In Lieu of Foreign Policy

THINGS continue to be in a state of flux in Algeria. It is yet not quite clear whether the new regime is on top of the situation; stray reports of demonstrations and disturbances in Algiers are filtering through. Even the political character of the regime is in doubt. One would have assumed that, given the agrarian roots of the Army of National Liberation which master-minded the coup, at least Fidel Castro would have acquiesced in the change-over: after all, in many respects, the assumption of power by Boumedienne has been in the nature of a supplanting of a bourgeois set-up by people who have sprung from the rural soil. But Castro has proclaimed himself against the coup; to him, the coup is an opportunistic manoeuvre which no 'true Marxist-Leninist' can support. At the same time, the correspondent of the French Communist newspaper, *L'Humanite*, has been expelled from Algiers for sending out allegedly scurrilous reports, and the organ of the Italian Communist Party has published some despatches which will be legitimately considered to be defamatory of the new regime. Even the Chinese, after their hasty move to recognise Boumedienne — presumably because they were anxious to salvage the Afro-Asian Conference — have been lying low. Those who rush in with snap judgments regarding the allegedly 'revisionist' or allegedly 'sectarian' character of the new Government are therefore more likely to come to grief than not.

Since sporadic disturbances are still continuing in Algiers, it was but inevitable that the Afro-Asian Conference should be postponed. There is scarcely any cause for expressing jubilation over the postponement; rather, it is a setback for the whole of Afro-Asia, and particularly for those who were anxious that the forum of the Conference could provide the opportunity for evolving a formula for resolving the Vietnam tangle. Thus the antics of a number of Indian diplomats and

journalists over the postponement of the Conference seem bizarre. It is an index of how much we worry about relatively inconsequential matters and tend to overlook the substantial issues of foreign policy that our representatives have attempted to turn the question of postponement into a major point of diplomacy. Early in the week it was trumpeted that the decision to postpone the Conference was a great victory for India and, therefore, a major defeat for China and Pakistan. Soon, however, a change of note occurred, and the tenor of the assessments during the past few days is as if victory has been snatched away from us at the last moment. The reason for this reassessment of the position was the co-sponsorship by China, Pakistan and Indonesia of the resolution postponing the Conference, which India was not asked to sign. Apparently the Indian diplomats did not even know that such a resolution was being drafted in the preparatory committee of the Conference, or even that the committee was meeting somewhere in Algiers.

Let us repeat, the postponement of the Conference can hardly be a major Indian conquest. Nor does the fact that India missed being one of the sponsors of the actual resolution deferring the date of the Conference have to be considered a loss of face. In either instance the Indian responses have been expressions of hasty, snappy and ill-considered judgment.

True, in Algiers Indian diplomats have been out-manoeuvred by the smart Pakistanis. This has been a continuing story for some years, and cannot be reversed unless and until our basic deficiencies are analysed and cured. The first deficiency is that we cannot see beyond our noses, and our decisions are heavily coloured by our short-period emotions. Doing the reverse of whatever China and Pakistan do might be exciting cocktail talk, but it cannot constitute foreign policy.

a complete transformation of the situation has taken place. The civil servants are now aware that the calibre of political thinking is a great deal lower and the Minister for External Affairs is more or less innocent of ideology so much so that they can

openly assert their personal predilections. Much of the reason why of late we have grown distant from the Afro-Asian countries is the lack of empathy on the part of our permanent civil servants. Beyond the United States of America and Western Europe, the rest

of the world has ceased to exist for them. Whether we are able to re-gain the initiative in our dealings with the rest of the world will depend on our ability to reverse this trend, and not on what our snoopers can tell on China or Pakistan.

Weekly Notes

Resisting the Funeral

SEMINARS, like drain-pipe troubles, are in fashion. One was held recently by the Federation of Chambers of Commerce and Industry. The subject was managing agency, the purpose to mobilise opinion and present a united business front in favour of continuation of the system. About 150 representatives of leading business houses, including Tatas who resigned from FICCI two years back, graced the occasion. Past glories and benefits were recalled and the tremendous potential which the system has for future growth was emphasised. The participants deplored administrative rejection of a large number of applications for renewal of managing agency agreements and the renewal of some for short leases only in well-established industries like cotton and tea.

Managing agents are understandably nervous. Between April 1964 and February 1965, renewal of such traditional management leases was granted in 33 cases and refused in 40. Quite a few renewals during that period and since have been approved for 2 years or less, pending submission of the report of the I G Patel Committee appointed in January to enquire into the abolition of managing agency in five industries: cotton, jute, sugar, cement and paper, and in any other industry or business. The report is expected soon. Packed as the Committee is wholly with officials, it is unlikely to recommend the indefinite continuation of the system since the Finance Minister himself suggested its abolition two months before the appointment of the Committee.

Beginning with the Industrial Commission 1916-18, every high-power body appointed to look into industrial finance and management has expressed its dissatisfaction with the working of the managing agency system and, yet, every time a plea is made for tolerating it a little longer. The financing functions of managing agents withered away long ago; only

a pale shadow of them is left in the shape of guarantees of bank loans, a soothing balm discovered by the Imperial Bank in Bombay and applied by other banks too to relieve themselves of necessary home work. Foreign collaborators, whose tribe has multiplied many times over, provide the technical and other know-how which managing agents were alleged to be supplying or procuring, for which the collaborators are paid handsomely and separately. Management functions are being increasingly performed (as they have to be in an increasingly complex situation) by professional managers. What managing agents provide is the pedigree and prestige.

In the twenties and thirties, protection and the entry of technicians and managers, not the munificence of managing agents as a body, saved the cotton mill industry. The most eloquent testimonial to the performance of managing agents in that period was the fact that in 1928, managing agents of 73 cotton mills in Bombay surrendered about Rs 2 lakhs of Commission and Rs 7 lakhs of interest on loans but received nevertheless more than Rs 18 lakhs of commission and allowances when the mills under their management made a loss of Rs 1.26 crores before depreciation and Rs 2.99 crores after depreciation. In 1927, the benign managing agents, in pursuit of charity no doubt, received Rs 31 lakhs as commission and allowances when the managed mills incurred a loss of Rs 7 lakhs (see Lokanathan: *Industrial Organisation in India*, p 345, footnote).

All that managing agents deserve now is a state funeral.

Lesson of Jowar Procurement

WHY Food Minister Subramaniam should have been invited to preside over the meeting organised in Bombay by the Maharashtra State Co-operative Marketing Society to review the progress of the State's jowar procurement scheme is rather difficult to understand. The scheme was launched without consulting the

Food Ministry and, it was well known, the Food Minister had not forgiven the State Government for this. To make matters worse, only the other day Chief Minister Naik had passed some unkindly-worded, though not entirely unjustified, strictures on the Central Government's handling of the food situation. It was hardly to be expected, then, that Subramaniam would be impressed by the speeches of the Chief Minister and others at the meeting praising the jowar procurement scheme as embodying the important elements of a rational food policy. He was not. His glee at the failure of the scheme was barely concealed; it prevented him from realising that the failure, from which he was so eager to dissociate himself, may hold some lesson for him.

In a sense the jowar procurement scheme has failed. Out of a total crop of 3.3 million tonnes what has been procured so far is a mere 2.6 lakh tonnes. If one-third of the produce is normally marketed, this is just about one-fourth of the marketable surplus of jowar in the State. And this in spite of the fact that only co-operative societies operating under the scheme are allowed to buy jowar from the farmers. Other conditions too are particularly favourable to the success of the scheme. The highly developed state of the co-operative movement in Maharashtra is well known. In addition, the co-operative system, under the State Co-operative Marketing Society, had made elaborate arrangements to implement the scheme. For instance, as Professor D R Gadgil pointed out, the work of purchase of jowar was carried out at some 800 centres which is far more than the number of regulated markets in the State, and which ensured that every farmer was within ten miles of a purchasing centre. Finally, the co-operatives began their operations right from harvest time so that no part of the crop could pass into other hands.

Considering all these circumstances, the inability of the co-operatives to

collect more jowar than they actually have can be explained only in terms of the procurement price. This price was fixed at Rs 43 to 45 per quintal, which was considered reasonable in view of the fact that the prevailing prices in the producers' markets at harvest time in the previous season were about Rs 30 per quintal. Farmers, therefore, should have found the procurement price attractive enough to have sold their surpluses to the co-operatives. And yet they didn't. Evidently, whatever the price at which the smaller farmers had been forced to sell their produce last year, the bigger farmers with the bulk of the marketable surplus expect a price higher than Rs 45 per quintal.

Here is the significance of Maharashtra's experience for Subramaniam. The procurement price fixed by Maharashtra is higher than the all-India support price for jowar of about Rs 38 per quintal announced by the Food Ministry some time back on the advice of the Agricultural Prices Commission. With arrangements for buying grain from farmers which other States, and certainly the Food Corporation, will find difficult to better or even match, Maharashtra's experience indicates that at the price announced by the Food Ministry very little grain is likely to pass into the Government's hands anywhere. Along with the price of jowar, the Ministry had also announced prices for paddy, bajra and maize. It is not unlikely that the farmer's idea of a reasonable price for these foodgrains as well may vary from that of the Food Ministry and the Agricultural Prices Commission.

Action against Capitation Fees

THE meeting of the Indian Medical Council at Bangalore last week has focussed attention on some of the crucial problems of medical education in this country. While the reports in the Press have highlighted the Council's concern at and opposition to the increase in the number of medical colleges, the Council was actually preoccupied with the problem of ensuring a satisfactory qualitative standard in medical education. To this end it suggested an amendment to the Indian Medical Council Act which would make it obligatory for new medical colleges to get the approval of the Council in regard to staff, equipment, accommodation, laboratory and library, before admitting students. Also, the Council warned the Universities of Mysore and Nagpur that if they did not set right certain irregularities in admitting

students to their MBBS courses, the recognition given to their examinations would be withdrawn.

The proposed amendment and the warning are placed in their proper perspective by the reports that at least the warning to the University of Mysore is a sequel to the Council's apparently ineffective protests against the levy of capitation fees in medical colleges in that State, a subject commented on in these columns in the issue of May 15, 1965. A new medical college in Davangere, Mysore, organised by a certain "Bapuji's Association" (the word 'Bapuji' apparently refers to Gandhiji) formed by leading members of the Lingayat community in the town, has filled in all its 100 seats by charging capitation fees ranging from Rs 7,000 to Rs 11,000 (the figures are thus actually higher than those mentioned in our earlier comment!). A majority of the students have come from States other than Mysore and it has been alleged that considerations of academic merit were thrown to the winds.

The Union Health Minister has reportedly opposed this venture and the Indian Medical Council has refused to recognise the college. But the promoters of the college have the staunch support of most of the State's top Congress leaders and the State Chief Minister is reported to have himself personally encouraged them. According to some reports, the purse to be presented to the Chief Minister on his 63rd birthday will be gifted to the college which, in turn, will be named after him. The University of Mysore is too weak to resist the political pressures and has apparently agreed to recognise the college in spite of the opposition of the Union Health Ministry and the Indian Medical Council.

It is thus evident that only the intervention of the University Grants Commission and the Union Government will succeed in persuading the University of Mysore to regularise medical education in areas under its jurisdiction. In the ultimate analysis, the way to root out the shameful practice of levying capitation fees is to rid education of opportunist entrepreneurs and politicians. Simultaneously the appropriate professional bodies need to be given a greater role. Against this background, the suggested amendment to the Indian Medical Council Act deserves wide public support as well as emulation in other branches of education.

Insurance Kick-back

THE pace of growth of general insurance is none too satisfactory. Adjusted for changes in wholesale

prices and premium rates, the growth rate has been steadily declining since 1959, according to data released by the Controller of Insurance. Added to this is the exchange drain on account of the operations of non-Indian insurers, re-insurance abroad and the losses of Indian insurers on their business outside India. The drain came to Rs 175 lakhs in 1963. How this drain could be reduced and eliminated is being looked into by India Reinsurance and Indian Guarantee, the two specialised re-insurers. The magnitude of loss sustained by Indian insurers on their direct business of Rs 17 crores written overseas is surprisingly large, especially under that all-embracing head 'Miscellaneous'. If these losses are to be sustained year after year (formerly they took place mainly under Fire), the situation becomes serious indeed.

The total gross premium income of Indian and non-Indian insurers in India amounted to Rs 38 crores and Rs 10 crores, respectively, in 1963, making a total of Rs 48 crores. By convention, that is, in terms of common business practice, about 15 per cent of this amount is given by way of commission to so-called agents who are, in practice, the nominees of clients seeking insurance cover. These nominees do not generally procure business, rather the other way about. The 15 per cent cut, amounting in absolute terms to Rs 6 crores, is a concealed (though legal) rebate which goes to sweeten the lives of those who control the offering of business. Even LIC and its subsidiaries observe this unwritten but universal rule. Under-the-counter rebates and commission are, of course, extra. A common device now being used by leading insurance companies is to make underwriting of capital issues and granting of loans or guarantees of loans conditional upon the placement of the clients' entire insurance business with them. All these are clearly practices in restraint of trade, but who is bothered?

Complaints of cut-throat competition and fears of LIC spoiling the market have become less frequent and much less noisy of late. A large number of weak units have been eliminated which probably accounts for the restoration of normal blood pressure. For the time being, LIC is adhering to the standard rates though it is not bound by them and the other companies in their turn are careful not to annoy Big Brother. In fact, one hears some company chairmen welcoming the measures which LIC is taking to improve the tone of the insurance market. Times do change!

Extending Deposit Insurance

URBAN co-operative credit banks have shown considerable progress during the last few years after a long period of stagnation. According to the Reserve Bank these banks had built up deposits of Rs 66 crores with capital reserves of Rs 21 crores by June 1962. About 67 per cent of the deposits of urban co-operative banks were received from non-members. That they could attract deposits from non-members to this extent is certainly a tribute to their strength and vitality.

Competition from the commercial banks is, however, getting more and more acute. In their drive for branch expansion, commercial banks have been penetrating deeper into residential areas of cities which were till recently regarded as the domain of the urban co-operative banks. With the expansion of education and employment among women, there has been a considerable increase in the number of women depositors. Deposits may now be tapped not only in the areas where income originates, in the industrial and commercial centres, but also in areas where the income is spent, in the residential areas.

Branches of commercial banks carry the prestige of their names and their more impressive capital structure. This may wean non-member depositors away from urban co-operative banks. An additional factor in favour of the commercial banks is that the coverage offered by the Deposit Insurance Corporation is now restricted to their deposits. Depositors of urban co-operative banks are not protected by deposit insurance. On both these counts urban banks suffer a serious handicap.

The proposal has been mooted, therefore, that insurance coverage should be extended to depositors of urban co-operative banks. This will involve inspection of these banks by the Reserve Bank since, to quote from a recent speech by the Governor of the Reserve Bank, "eventualities like liquidation and amalgamation of any bank covered by the scheme of the Deposit Insurance Corporation will entail liability on the Corporation and the latter depends on the Reserve Bank to safeguard its interest in such eventualities". In this connection the Governor sought to allay the apprehension of the co-operative banks that they would be subject to the dual control of the Registrar of Co-operatives and the Reserve Bank. He held out the assurance that co-ordination would be achieved between the two agencies in regard to inspection.

The Reserve Bank's periodical inspection

of banks gives depositors a sort of assurance that the security of their funds has the attention of the monetary authorities. The extension of deposit insurance to the urban co-operative banks will thus not only guarantee depositors safety of deposits upto Rs 1,500, it will also assure the larger depositors that their interests are being looked after.

State Bank's Ten Years

THE State Bank has reason to be pleased with its performance over what it describes as "a decade of service". The bare facts are impressive enough. On July 1, 1955 the bank had only 477 offices; today it has 1206. Along with its subsidiaries it now accounts for 30 per cent of all bank offices in the country. This tremendous branch expansion has opened up many new areas to banking. The SBI's experience in its new branches, especially those in unbanked centres, has been revealing; it has proved that there is enough banking business in these areas which can be tapped.

The SBI's task is not just that of opening new offices — it has to serve as a banking overhead. The fact that there is a branch of the State Bank at an outlying centre means also the existence of remittance, safe custody and banking facilities for other banks. It would be interesting to know how many banks have followed the SBI to the less banked centres.

The vast organisational changes that the branch expansion programme has entailed, the large increase in staff and the decentralisation of central control through opening more local offices have all been undertaken at a time when the bank's business has been expanding very rapidly. Some years ago the Bank was a favourite target of criticism for being the recipient of PL 480 funds, but now most of these funds have been transferred (Chairman Dehejia has mentioned that only Rs 21 crores of PL 480 funds are still with the bank.) The transfer of these funds notwithstanding, the State Bank's present deposit level shows a striking increase over the decade as does the level of its advances. In fact with PL 480 funds out of its system the bank has reverted to its commercial character with a high advances-deposits ratio. (The experience of the last busy season is only added confirmation of this.) Alongside its usual business, the bank has stepped up its advances to small industries and co-operatives and these are forming an

increasingly sizeable part of its total business.

All in all, the SBI would be justified in taking pride in its performance. It has had a distinguished line of Chairmen. The terms of John Matthai and H V R Iengar were taken up with problems of transition; and P C Bhat-tacharyya's period saw the bank being launched on its expanding developmental role. One cannot also fail to mention the transformation of the bank in the next three years when B Venkatappiah was at its helm. This was the period when the vast internal organisational changes were carried out without disruption of the bank's normal business and its expanding developmental role.

Census Publications

THE extraordinarily wide and ambitious nature of the 1961 Census of India is clearly evident in the "Guide to the 1961 Census Publication Programme", published by the Office of the Registrar-General. Besides a census of population, the 1961 Census programme included a census of housing and industrial establishments, of land holdings, land rights and household industry, and of scientific and technical personnel in the country. In addition, the various States and Union Territories were encouraged to undertake special surveys of a total of 580 villages, 166 handicrafts, and fairs and festivals. Several other special studies have also been planned and the scope of the tabulation programme is unusually broad.

Thanks to this extensive programme, the total number of Census publications is estimated at 1,476, of which 86 will relate to all India. Since these figures may frighten prospective users of census data, it may be mentioned that a total of 746 publications will pertain to special surveys, 48 reports not for sale will refer to administrative matters and 369 will be district census handbooks which will bring together the census data as well as the available non-census statistics for each district in a single volume. Of the remaining 313 publications, 170 volumes will contain the Census tables for States and Union Territories or the country as a whole and 22 will contain an atlas presenting the highlights of the census data in attractive maps and illustrations.

The unique nature of this programme has won encomiums for its highly competent and imaginative architect, the Registrar-General and

ex-officio Census Commissioner, who is now additional secretary in the Planning Commission. But there has been increasing concern at the slow pace of publication of Census data. Nearly four years after the 1961 Census was taken, i.e. at the end of 1964, only 222 of the 1,474 Census publications were "likely to be published" and the actual achievement was inevitably short of this estimate. Admittedly, India has a large population and the compilation of the Census tables is done through hand-sorting and, not infrequently, hand-operated calculators. Also, the data on the size of the population, by sex, literacy, work status and the industrial category of workers in rural and urban areas of every district were published some time near the middle of 1962. It also needs to be said that the Registrar-General has always adopted an enlightened approach towards scholars interested in using the Census data for analysis and research. Yet not all

interested students would care or dare to approach the "high authorities" in Delhi. So dissatisfaction with the delay in publication becomes inevitable.

In fact, however, the Census authorities are not entirely responsible for the delay. Very often, the suitable printing presses are not available to take up the onerous task of printing a mass of numbers. But there is reason to think that the vast scope of the Census programme has led at least some State officers to take a distorted view of the priorities in publication. Village surveys have sometimes received preference over the main Census data. And it is time to take a hard look at the practice of writing an official report on the Census data for each State or Union Territory, a task for which administrative officers are not always fitted. We should probably switch over to the pattern in USA where the Census Bureau is mainly a collector and publisher of data and undertakes, by and

large, only evaluative studies. While the 1971 Census of India will inevitably use more of sampling procedures and mechanical aids in tabulation of the data, a proper phasing of all the operations and a stricter enforcement of priorities will be most essential.

Finally, a word about the distribution of Census publications. The Manager of Publications in Delhi has proved to be not up to the task of ensuring easy availability of Census reports at least in the major cities. At the moment there are delays of a minimum of about four to six months between the formal publication of Census reports and their availability in libraries which have placed standing orders. Purchase orders with agents of Government publications in a city like Bombay remain unexecuted for more than four months. It is time something is done to streamline the machinery for distributing Census reports as well as other official publications.

CAPITAL VIEW

Shastri's Doubtful Triumphs

Ramesh Thapar

1954 Geneva Conference (principles which, when applied, compromise the US presence in South Viet Nam) and his involvement, however peripheral, in the moves initiated in London by Prime Minister Wilson (himself an open supporter of US policy in Viet Nam) has made India appear as if she is frightened to cause offence to anyone. A most unfortunate impression!

Then again, on the holding of the Algiers conference, bad staff work and lack of co-ordination between the Foreign Minister and his Secretary have sparked the story that India was only too willing to 'sabotage' the conference. And, now, even the credit for the postponement is claimed by those who were denouncing India's sabotage. We did not have to stick our fingers into this mess as we did. Sometimes it is better to mobilise others for the dirty work. Whatever persuaded our bureaucrats to become so active? A holiday abroad?

Indeed, already there is talk that the build-up we have been giving ourselves may well represent an attempt to provide an antidote for what is to follow — the implementation of the British-sponsored formula on the Rann of Kutch, the formula which it is presumed will open the way for a peaceful demarcation of a border which Pakistan has challenged. Delhi, it is said, expects sharp criticism about a so-

called 'betrayal' and is attempting to muffle it with stories of Lal Bahadur's triumphs in the West.

Certainly, there are advantages which a military dictatorship has over a democratic state where it is difficult to doctor embarrassing news. For example, Pakistan expended a great deal of energy publicising her 'victory' in the Rann of Kutch. But when a similar attack in the Kargil area in Kashmir was thrown back and two strategic pickets were seized by the Indian army on the Pakistan side of the cease-fire line, there was silence. The local commander had proved an important point: a military dictatorship is fearful of accepting a military defeat. The punishment administered at Kargil to the Pakistani army has had a sobering effect on Rawalpindi. It could have been administered in Kutch, too. Do our political and military big-wigs appreciate this?

If, as we are told, Ayub of Pakistan is now genuinely concerned about a final solution of border disputes, and is at the same time prepared to treat the Kashmir issue separately, there is no reason why we should not respond warmly. We do not need Harold Wilson to hold our hands. There would be overwhelming support in both countries for an initiative which would deactivate the disputed sectors of our borders as a first step to their exact

demarcation by a mutually acceptable arbitration. But the present piecemeal approach, which very often puts a premium on aggressive enemy attacks (as in the Rann of Kutch!), has serious political repercussions on a democratic, federal State like India. We are left wondering where the next blow will be struck, for each blow is aimed ultimately at the unity and viability of this country. This applies to Pakistani tactics as it does to China's. We always seem to forget this stubborn fact.

However, we are now neatly caught in the Kutch trap. The promised arbitration, the talks, despite formulas, are bound to drag on, to complicate our relations with Pakistan and to offer the British Government the chance it has been long waiting for, the chance to play mediator. Harold Wilson will rise, again and again, in the House of Commons to report on the progress of his noble efforts. And we gullibles in the Capital had assumed that having sampled western meddling on Kashmir, we would refuse to be tampered with again. The faith of the ruling elite in Whitehall's justice obviously remains undimmed. Or is it the persuasion of the entrenched bureaucracy which muddles a perspective-less political leadership?

Deep Discontent

The sections in the Congress leadership which would call a halt to this meandering, which would rather that we learned to live with border problems until the possibility of a real and lasting solution offers itself, and which would do much more to reduce our reliance on foreign economic and military supports, seems to be unable to act collectively. There is deep discontent, discontent over policies and discontent over the failure to evolve remedial sanctions. And the financial crisis, described by some as 'bankruptcy', only robs these sections of the little initiative that they still possess.

The rumblings that can be heard have little to do with policies and programmes. There is talk in the Capital that T T Krishnamachari is feeling terribly isolated, that he has fallen out with Lal Bahadur and Gulzarilal Nanda, that only Kamaraj has to be persuaded to agree to his removal from the Cabinet. Kamaraj himself is an enigma. He speaks the language of a radical, even attempts to contact those who will provide him with more radical economic argumentation, but he makes

no effort to gather around him a secretariat to work out his ideas. He is booked for another crucial two-year term as Congress President, because no one really wants Atulya Ghosh hovering over election tickets in 1966, but he is unprepared to commit. Morarji Desai dabbles here and there — even in dangerous Uttar Pradesh — hoping to revive his sagging fortunes. Meanwhile, Lal Bahadur encourages gossip about a Cabinet re-shuffle. Perhaps, what he plans is the introduction of some deputy ministers!

When Chief Minister Naik of Maharashtra marshals a mass of rather opportunist criticism against the Centre, and is promptly supported by Chief Minister Sen of Bengal, there is excited comment and speculation about Lal Bahadur's reactions and the effect of these snarls on the forthcoming AICC session at Bangalore. Is this

a new attack being mounted by the provincial chieftains to compel the Centre to respond to their demands? After all, the discussions on the Fourth Plan are in their final stage — and we may witness more of this kind of lobbying.

Whatever the perambulations of the Lal Bahadur Government there is no denying that we are slowly entering a potentially political phase. It is linked to the growing consciousness that within a year the ruling party will be preparing to face the crucial elections of 1967. Inevitably, alignments will now be conditioned by this perspective.

Maybe, in this context, Lal Bahadur might also see the need to revamp his Cabinet in the interest of consolidating his hold on the party. Let us hope that he will. Certain Ministries of the GOI need a good shaking.

DELHI SCHOOL OF ECONOMICS

Research Scholarships in the Department of Economics

The Department of Economics has the following scholarships to offer to candidates who wish to register themselves for the Ph D course in Economics in the Delhi School of Economics, University of Delhi.

- | | |
|---|----------------|
| (1) The Ranade Scholarship | Rs 150 pm |
| (2) The Kikabhai Prem Chand Scholarship | Rs 150 pm |
| (3) 3 Research Scholarships in the Department | Rs 150 pm each |
| (4) 2 Research Scholarships offered in the Department as a Centre for Advanced Study in Economic History and Economic Development | Rs 200 pm each |

The scholarships are to be awarded on all-India basis and candidates of merit from all Universities will be considered.

Applicants should have a good academic record at the undergraduate and post-graduate level and should have secured a First Division or a very high Second Division in the Master's Degree examination. Ordinarily they should not be also more than 30 years of age. All applications should give full details of age, academic career, and institutions in which earlier training was received; they should also contain a statement (of about 600 words) indicating the area of special interest of the candidate and the kind of problems on which the candidate intends to do research.

Research scholarships offered in the Department as a Centre for Advanced Study will be available to only those who intend to do research in problems of Economic History or Economic Development. Candidates who have specialized earlier in History will also be considered for these scholarships. Only candidates who have had an outstanding academic record and can give evidence of extensive reading in the subject need however apply.

Candidates selected for interview will be expected to come to Delhi at their own expense.

Applications on plain paper addressed to the Director, Delhi School of Economics, University of Delhi, Delhi-7 should reach the office of the School by July 7, 1965 or by July 19, 1965 in special circumstances.

The Commonwealth's Economic Links

IN the event, the major items dominating the fourteenth Commonwealth Prime Ministers' Conference were the Commonwealth Peace Mission to Vietnam, the repercussions of the *coup d'état* in Algeria on the Afro-Asian Conference, and, as had always been expected, the explosive situation in Rhodesia. Against these issues, it is not surprising that Commonwealth trade and aid took a very minor place in the general discussions, and the announcements made during the debate on this question came as rather a damp squib after the great build-up that had been given to this question and the general belief that Wilson was going to produce some new dramatic initiative in this respect.

Co-ordination of Planning

Barbara Castle, who addressed one of the sessions, explained the balance of payments difficulties faced by Britain which inhibited the Government from providing aid in as large a measure as it would have wished. She pointed out that as she herself had a seat on the Cabinet, she would work vigorously to be as generous as possible in the face of the arguments of the Treasury. She made three main points. The first was that the UK Government was now following a policy of planning in real earnest, and that there was, therefore, a great possibility of co-ordinating planning in the UK with planning in recipient countries. There was now an Economic Planning Unit in her Ministry, and they were able to undertake forward planning or perspective planning. While Britain was developing special industries in the special areas in Great Britain which needed assistance, she would also take into consideration the needs of recipient countries.

The second point Barbara Castle made was that the British authorities had a unit in the Middle East to provide advice on the preparation of economic plans for countries such as Iraq, Jordan, etc. She thought it would be a good idea to extend this experiment, and set up a similar body for East Africa and other developing areas in the Commonwealth which might require such assistance.

The next point she made was that while financial assistance was of cru-

cial importance, so was the whole question of technical aid. She wished to see the establishment of overseas aid services which would assist such developing countries as required the services of high-powered British experts, but could not afford British rates of pay. Under this scheme they would receive assistance from the British Government which would pay the difference in the salary. This would mean that developing countries could now afford the services of top-notch experts.

Interest-Free Loans

However, Mrs Castle's main proposal was that interest charges on loans to selected developing countries should be waived. At the moment, in the case of selected countries a waiver is given when the repayment of a loan should start. It was now proposed to abolish all interest. She made it very clear that this new concession could only apply to new loans. She also mentioned that Canada was already giving interest-free loans charging only a very nominal sum, about one-quarter of one per cent for service charges. This was of great help to developing countries, but Britain was now proposing to go one step further — to not only abolish interest, but service charges as well. Under the present system, the Commonwealth Development Corporation gives loans where, during the fructifying period, a nominal rate of interest is charged. This interest is now to be waived. While most of the developing members of the Commonwealth welcomed these moves, there was a general feeling that they did not really go far enough. President Nkrumah, for example, felt that more emphasis should be paid to trade rather than aid as such, and he himself was perfectly prepared to pay interest on his loans so long as this was nominal. In his view, the real problem lay in the instability of prices of primary commodities, and he quoted with great effect the example of cocoa.

Both the Australian and Canadian Prime Ministers explained what they had done about aid to the developing members of the Commonwealth, and Menzies made a special mention of the recent steps taken by Australia to

grant preferential treatment to imports from developing countries.

Commercial Credit is Not Aid

It is understood that Shastri's speech was very well received. He pointed out that, in a sense, economic problems related to the whole world situation, since many of the tensions were due to economic causes, and the split between the 'haves' and 'have-nots'. He made a very telling point about the bulk of so-called aid being no more than commercial credit on which the recipient countries had to pay the commercial rates of interest. Credit for export promotion could not really be equated to aid. He also made the point that Western European countries which had gained so much from Marshall aid, seemed reluctant to give similar aid to developing countries. The net result was that while monumental projects like the building of large dams and irrigation schemes in developing countries went ahead, they sometimes tended to distort the economy, because, for example, money could not be provided to dig the necessary irrigation channels!

Another point he emphasized was that what was important, as far as aid was concerned, was not so much the quantity of the aid, as the quality of the aid, and here he put great emphasis on the provision of soft untied aid. He also pointed out that if aid was given on the present terms, after six years or so, India would start paying more to the country from which she had borrowed than the amount she would receive. He made particular reference to the grants which Canada provided, and commented favourably on the fact that the UK's terms of supplying aid were also improving.

Wilson's statement which had been awaited with great interest, amounted in the end to very little. He pointed out that there had been a clear understanding that aid by itself was not enough and that aid and trade were inextricably linked. This applied to the UK as well because the UK could only help other countries when her own trade position improved. He explained the background to Britain's import surcharges, and the measures that Britain was taking both externally

and internally. The Income Policy to deal with the internal situation and the external policies to reduce overseas expenditure which would take into account a reduction in the Rhine Army, and the recent steps taken to reduce overseas investment, particularly the Corporation Tax were all dealt with. He said that many people had been misled by the outcry against the Corporation Tax and pointed out that if overseas companies ploughed back their money they would not be seriously affected. He also pointed out that in the course of the Budget debate concessions had been made by the Government with which the President of the Federation of British Industries was now very satisfied. (It should be mentioned, however, that both Ghana and Pakistan said that they believed that the Finance Bill would discourage investment in developing countries.) He would like to see that the Commonwealth did not suffer as a result of these measures, and that perhaps companies in these areas would plough back their profits, but the British Government would certainly like to get back some of their dollar holdings.

Britain's Trade with the Commonwealth

He then went on to point out that if Britain did more trade with the Commonwealth, he would be able to do more to help them. He admitted that much of the fault lay with British exporters, and suggested that the Commonwealth should collaborate in the Kennedy Round. He also pointed out that there was considerable scope for Commonwealth collaboration. There might perhaps be collaboration in state purchasing arrangements.

In essence, however, the main burden of his plea seemed to be not so much increase in imports from other Commonwealth developing countries into Britain to aid their balance of payments, but increase in British exports to Commonwealth countries!

The latest figures on Commonwealth trade, published by the Board of Trade Journal, show that there was a 13 per cent rise in British imports from the Commonwealth in 1964 — the biggest in 10 years. Imports came mainly from Canada, Australia and New Zealand. Exports to the UK from India, Pakistan and Singapore, showed a slight decline. It is interesting that during the debate, one of the points most Prime Ministers stressed was the damage done to some sectors of Commonwealth trade in manufactures by the British import surcharge. British

exports to the Commonwealth, on the other hand, showed a decline. Compared with 31 per cent of total exports in 1962, they amounted to only 29 per cent in 1964.

One of Wilson's main proposals was to revive the Commonwealth Air Transport Council which had been allowed to lapse by the Tories, and had met last in 1956. He also dealt with the question of commodity prices, and admitted that one of the most urgent needs was for the streamlining of commodity agreements. He said that he himself had always been in favour of such agreements, and that he might almost be described as the father of the International Wheat Agreement. He had also played an important role in setting up the Commonwealth Sugar Agreement.

Wilson's Proposals

To sum up his proposals:

- (1) No Commonwealth trade programme can be decided upon straight away. There should be a Conference of Commonwealth Trade Ministers which should be convened when the Commonwealth Finance Ministers met in Jamaica at the end of September. They could then work out the lines on which Commonwealth trade could be developed.
- (2) Concrete suggestions should be made for collaboration on Commonwealth problems. Perhaps a Commonwealth Planning Conference could be set up, since the UK now had its own five-year national economic development plan, and many of the Commonwealth countries had long-term plans, and these could, perhaps, be inter-locked. There is, for instance, scope for collaboration in the field of fertilisers. Uganda

had phosphates. Britain could supply the machinery to develop these phosphates, and India could then make fertilisers from these phosphates.

- (3) The machinery for civil aviation liaison should be reactivated. For example, even though at present people regard the vertical take-off plane as having merely military uses, might it not be possible that such a plane would be useful for civil purposes for countries who cannot afford to build big runways?

India's Problems

As far as India is concerned, with the exception of the announcement of the abolition of interest on loans in specific cases, there is little of fundamental importance in the economic proposals made at the Conference. Perhaps there will be more scope to deal with the specific difficulties from which India suffers in her trade with the Commonwealth in general, and Britain in particular, at the Commonwealth Trade Ministers' meeting. However, some Prime Ministers have already expressed scepticism about the results of the Trade Minister's Conference, and it is, therefore, quite possible that there will be a preliminary meeting of officials before the Trade Ministers meet.

Shastri made constructive contributions to the discussion on disarmament and the Vietnam Peace Mission; it was he who originally suggested that guidelines should be set down for the Mission. The final communique reflects much of his thinking on these two subjects. Shastri has seemed this time positively to enjoy his contacts with new people, and in his own way has won the affection and respect of his fellow Commonwealth Prime Ministers.

INDIAN ECONOMIC GROWTH

Performance and Prospects

The Illusion of the Student Revolution

THIS will be known as the year of the student revolution on American college campuses. The amount of publicity devoted to the student movement during the past academic year has been unprecedented, and to judge by its scope, the American campus has been shaken by student unrest on a variety of issues, from Vietnam to university administration and academic policies. While it is true that the amount of student protest has been substantial in the recent past, particularly in comparison to the sterile decade of the 1950's the student revolution is really a creature of the mass media. It is doubtful that the recent rash of demonstrations will have any on-going politicizing effect on the student community, and it is entirely possible that next year might see a total lull in student social-action.

Too Much Attention

The fact that the mass media, as well as more serious journals and commentators, have paid so much attention to the student movement during the past year may, however, have some lasting effect. Even if the situation on the campus remains essentially unchanged, educators and the general public may be more aware of the problems of higher education at a time of transition. For the first time in decades, college administrators have to justify their policies to concerned faculty members and interested trustees. Although it is clear that Clark Kerr's "multiversity" is here to stay, it is possible that these new educational monoliths may come under careful public scrutiny. Even if this is the only result of the "revolution" of 1965, it will be of vital importance.

As for the student rebellion itself, it is unlikely that this year's outbursts of discontent have been much greater in intensity than those of the past few years. Student demonstrations which last year would have received only local coverage have now been reported in *The New York Times*, and analysed in such august publications as *Life* and *The Saturday Evening Post* not to mention the *Nation* and *The New Leader*. The recent Free Speech Movement, which rocked the University of California, received massive publicity, while similar sit-ins at the University of Chicago several

years ago received scant attention from the press.

The Students for Democratic Society, probably the largest campus social protest movement at the present time, has also been the subject of much analysis and publicity. Yet, two years ago the Student Peace Union, a group with similar aims and programmes, a larger membership, and more campus affiliates than the SDS now has, was largely ignored by the press. This year's student Vietnam demonstration in Washington, organized by the SDS, with the support of the rest of the campus "left" groups, received far more press coverage than a student disarmament demonstration several years ago, which attracted almost as large a participation.

The student civil rights movement, which has been active on the campus for several years, has actually lost ground this year. Campus CORE and NAACP groups have lost much of their strength, and even SNCC, the most activist-oriented of the civil rights organizations, probably has fewer supporters this year than last. The fact that many white middle class students have ceased to participate in the civil rights movement removes one of the few remaining bridges between the Negro mass movement and white liberals and moderates.

Change in Character

What is more important, perhaps, is that the nature of the student movement has substantially changed in the past year. In a sense, the middle has fallen out of the movement. Groups like the Student Peace Union which fostered discussions concerning peace and disarmament, as well as militant demonstrations, have lost their popularity. Moreover, the SPU emphasised a rational evaluation of Cold War issues, thereby encouraging independent thought and discussion critical of the American government as well as of the Soviet Union and China. The Young Peoples Socialist League, another organisation which placed emphasis on critical discussion, has also lost much of its popularity. YPSL's fairly moderate democratic socialist approach to politics seemingly has been eclipsed on the campus.

The causes of a radicalisation of the

student movement are not too difficult to find. The policies of the American government in both Vietnam and in the Dominican Republic have been quite unpopular on the campus. It is fair to say that, in spite of its relatively good record on domestic issues, the Johnson Administration has almost totally antagonised the college campus. Not since the leadership vacuum of the Eisenhower years have liberal-minded American students been so disenchanted with the administration. A feeling of frustration, of failure to create a "dialogue" with the Establishment, has pushed the students into the streets.

Small Splinter Groups Active

Moreover, the present student left is much misunderstood by the mass media. As has been pointed out, numerically, the left on the campus is not larger than in the past few years. Student radical organisations today probably have fewer campus chapters than a year ago, even though some of these chapters have been particularly active. The two largest movements, the Students for a Democratic Society, and the Student Non-violent Co-ordinating Committee, are more amorphous groupings than organisations. Unlike previous student organisations, these groups have very broad policy statements and a wide range of concerns, thus enabling small factions to use these groups for their own purposes. In their reaction to loyalty oaths and "red baiting", the mainstream of the student movement has gone to the other extreme, and permits any elements, regardless of views or motives, to use the banner of the student movement for their own purposes. Thus, it has been possible for a small faction such as the "May 2nd" committee, a creature of the pro-Chinese Progressive Labour Movement, to set the tone for many anti-government Vietnam demonstrations. While it is clear that the leadership of SDS is clearly left-liberal in its orientation, it has simply been unable to maintain adequate control over its organisation.

The small left wing splinter groups have been successful in achieving publicity, though, in little else. Such organisations, as the DuBois Clubs and May 2nd Committee, have a very limited membership, and what members they do have are highly concentrated in

such centres as New York City and San Francisco. The influence of these groups is non-existent on most of America's campuses. The press, attracted by their "ultra" political and social views, and their non-conformist behaviour, has given these splinter groups publicity far out of proportion with their influence on the campus. If the past is any indication, these groups will disappear from the campus within a semester or two, and will have achieved very little in the way of attracting members from the student community or of building any kind of movement.

No Ideology

The student movement finds itself without ideology, and virtually without intellectual roots at a time when serious thinking must be done on educational issues and on problems of international politics. The "activists" alienated by increasingly bureaucratized colleges and universities, and by seemingly irrational governmental policies, have dominated over the more thoughtful elements in the student movement. These elements certainly make for interesting newspaper copy, though they do not necessarily build a meaningful student movement. It is interesting that much of the impetus for the present rash of student demonstrations has come from the two groups most maltrated on the campus—the undergraduates, who hardly ever see a full professor and are merely numbers on IBM machines, and the first and second year graduate students, who are often under the not-too-benevolent thumb of a senior professor more interested in cheap labour than in education. They were mainly responsible for the renowned Free Speech Movement at the University of California, which in turn sparked many of the other student revolts this year.

The student movement in America does not really deserve the name of a movement. While the student communities in other countries have toppled governments by their actions, America has no tradition of student political activism. The present movement provides no exception to this rule. Student activity has been sporadic, it has lacked co-ordination, and has been diffused over a wide range of issues. It has lacked both organizational and ideological cohesiveness. *Indeed, much of the activity which has made headlines is more of an emotional response to outside stimuli than a conscious programme for protest and social reform.

The leaders of the student movement have not sought to provide the kind of programmatic outlines so necessary, and have certainly not given any ideological basis to the movement. Even the leftist groups which are wedded to one brand of Marxism or another, have been almost totally pragmatic in their approach, merely taking advantage of whatever discontent cropped up on this or that campus. The leadership of the Students for a Democratic Society is a good example of this: These people, for the most part younger graduate students, intellectually fairly serious and free from outside political control, have encouraged the student movement to wander from issue to issue, feeling, with some justification, that what was "swinging" on one campus, might be dead on another. As a result, the energies of the students have been dissipated in many small struggles, and no cohesive movement has been formed. The probability that the momentum which has been built up during the present academic year will be carried over to the next is slight under these circumstances.

Eclipse of Right-Wing Groups

The right wing student movement offers an interesting comparison with the present predominantly left-oriented student movement. In 1960, the right wing students under the leadership of the Young Americans for Freedom, with substantial financial support, made an attempt to take over the liberal-dominated National Student Association. Although they were unsuccessful in their attempt, many commentators on student affairs saw the YAF and the button-down young reactionaries as the wave of the future on the student front. To everyone's surprise, the whole conservative student movement disappeared from view the very next semester, and not a word has been heard from it since. It is entirely likely that this year's crop of leftist organizations will suffer the same fate.

One can say that the American student movement is almost always faced with the inevitability of failure. In the developing nations the student community is part of the elite group and is small enough to muster and mobilize a mass following. In the United States, the student community, being 5,000,000 strong, does not constitute an incipient elite, and is much too large to be co-ordinated into any meaningful movement. Furthermore, America has

no tradition of student political activity. Student politics, whether on the right or on the left, has always been confined to a fairly small minority. Finally, there is no mass of educated unemployed in the United States which in other countries has been a potent cause of student unrest.

The 'Multiversity' Issue

The only new issue which has been injected into American higher education in the past decade is the transformation of the college into a 'multiversity'. This issue has, in turn, engendered a good deal of concern among educators, and more recently among students as well. The roots of the Free Speech Movement at California and the less publicized, but equally crucial, campaign at Yale to retain a popular professor who was fired for failing to publish sufficient scholarly articles lie in this new innovation. The students' contribution to the discussion on the future of education, dramatised through sit-ins, has been substantial and will doubtless help to make educational planners and administrators aware that many students are increasingly alienated from the educational process and that a substantial amount of discontent does exist on the campus. Whether the students will be able to alter the basic direction in which higher education seems to be headed is another question.

It seems clear that the student revolution of 1965 is largely a creation of over-eager publicists. Much of the attention which has been given to the student movement in the recent past is unjustified in the light of the actual role of the student movement on the campus, and in comparison to its former activity and size. The left wing of the student movement has in particular received undue attention whereas the strong and active Christian groups, among others, have been almost totally ignored, even though these student groups provide indispensable personnel for student civil rights work.

If history is any indication, the current rash of student activity does not necessarily mean that there has been any lasting change in the campus. The spotlight on the student movement may, however, be to the good; it will not have been in vain if some of the important questions facing higher education, raised during the agitations and demonstrations, can give the impetus for realistic discussion.

— Philip G Altbach

OFFICIAL PAPER

Gaps in Co-operative Movement

Review of the Co-operative Movement in India, Reserve Bank of India, 1965; pp 167, price Rs 3.

THE Reserve Bank's "Review of the Co-operative Movement" is a very useful adjunct to its "Statistical Statements Relating to the Co-operative Movement" published every year, inasmuch as it summarises in a convenient form the accounting details of the latter and, therefore, lends itself better to interpretation. The Review for 1960-62 highlights some of the glaring deficiencies in the movement. By and large, it concerns itself with the purely quantitative aspects — the number and kinds of societies, membership, the financial resources available, the size of loan disbursements, etc — and one does not get much help here if one is interested in assessing the impact of the co-operative movement on the rival sector. To questions like why co-operatives lag in some States and how they have made spectacular progress in others, there is no answer. What is it that has attracted the Maharashtrian peasant or trader to the co-operatives? Is it state initiative? Is it the lead gained by the earlier Bombay State? Are there special social and psychological factors? Or, is it simply a question of greater resources?

Maharashtra's Achievement

Indeed, the record of the co-operative movement in Maharashtra, even as gleaned from the brief description here related to only two years, is a striking example of how, when something has caught on once, the people respond to it with imagination and zeal. Maharashtra has the largest number of all types of co-operative societies; it has 100 per cent coverage of its villages; and co-operative credit contributes relatively more to the total credit requirements of the peasant and trader here than elsewhere. The co-operative principle has been tried out in a wide range of activities. The State has the largest volume of operation in co-operative marketing; it has been the most successful in mobilising deposits from individuals in both the rural and urban areas. The amount of loan grew fastest in the State during 1960-62. In carrying out improvements and reforms, it has been usually energetic and imaginative. When refinance facilities were first introduced the State was the first to avail of it. It has also brought in suitable legislation to expedite the procedure for grant of loans by the

land mortgage banks. Crop loans have been tried on a larger scale than elsewhere in the country. The industrial estates scheme was implemented enthusiastically by opening 23 such industrial estates in the State — the highest number for any State in the country. The co-operatives were utilised for promoting education, medical aid and other "better living aims" and every conceivable social activity. If co-operation has indeed been so successful in Maharashtra, why have not the Co-operation Departments of other States and the Central Government thought it fit to study and analyse this phenomenon? We have copious diagnoses of failures, rarely ever of successes.

There are chapters in the Review, like the one on "Policy Decisions" which give very useful information, though one wishes more light were thrown on the rationale behind the sudden shifts in official policy. It is interesting to find that while official policy favoured the one-village-one-society principle and discouraged the creation of large-sized societies, the latter continue to hold a dominant position. They were just three per cent of the total number of primary agricultural credit societies and had no more than 20 per cent of the total membership in 1962, yet they accounted for as much as one-third of the resources and loans of all primary agricultural credit societies put together. The obvious question seems to have escaped the authorities — which is important, viability or coverage?

Excessive Reliance on State

While undeniably there has been "substantial progress" (to put it in officialese) in terms of the increase in number of societies, in size of operations and in resources, it is clear that much of this has taken place only in a few States: Madras, Gujarat, Uttar Pradesh, Andhra Pradesh, Mysore and Punjab apart from Maharashtra of course. The record of the other States makes dismal reading. The report notes what has become the common pattern: slow accretion of deposits and heavy reliance on governmental agencies (in Bihar 89 per cent of the share capital of the State Co-operative Bank is contributed by the State Government) and large overdues, ranging from 25 to 30 per cent.

Whether governmental backing does not discourage initiative is a question that should receive more thought from the following finding of the Reserve Bank: The State Co-operative Banks, now used to the concessional finance offered by the Reserve Bank, have learnt not to treat it as a supplementary source as it should be treated, but try to procure the maximum limit possible and then charge differential rates of interest on their funds according to their source, thus defeating the purpose of assistance, namely, subsidized credit to the poor borrower! This practice has, of course, been discontinued in some States. How much faith can one put in de-officialisation claims when, as the report notes, increased state participation in share capital has implied more government nominees on boards of directors of State and Central Co-operative Banks.

Faulty Policies

The working of co-operative credit continues to be hampered by irrational loan policies. This, the report feels, is largely responsible for the increasing percentage of overdues at the primary level. Loan disbursal and recovery are not properly adjusted to seasonal demands and conditions. Among the State and Central Co-operative Banks, since credit disbursal is confined mostly to agricultural requirements, often idle surpluses accumulate due to the lack of diversification. In accommodating the primary societies, absolute limits are fixed unduly low, mortgage security is insisted on and if a society is a defaulter requests from even those of its members who have no loans overdue are turned down. In Assam, the State Co-operative Bank undertakes to finance individual tea gardens directly and in U P short-term funds are diverted to long-term needs like housing — practises which the Review does not consider conducive to the healthy growth of co-operatives.

The distribution of agricultural credit and non-agricultural credit societies according to the audit classification awarded to them between 1958-59 and 1960-61 reproduced on page 63 of the report gives a clue to the quality of the co-operative societies. Of the total of 2,11,369 agricultural credit societies in 1960-61 only

THE ECONOMIC WEEKLY

15.57 per cent could qualify as "satisfactory"; 57.27 per cent were mediocre; and the remaining 27.16 per cent were in a very bad way and deserved to be liquidated. The contribution of co-operative credit to rural needs has been very neatly summarised in two tables on pages 69 and 71 of the Review. In some States, like Kerala for instance, about half of the total borrowing is accounted for by sources other than the co-operatives.

If we consider non-credit functions, while the number of the various types of societies has expanded rapidly, the next great push needed is in marketing. The institutional structure with respect to co-operative marketing has

been well-nigh completed, but the proportion of marketable surplus handled by co-operations is as yet not significant. One heartening feature is the increase in the volume of agricultural requisites like seeds and fertilisers, handled by co-operatives.

That co-operation can seek varied expression is illustrated by enterprising Punjab and literary Kerala. Punjab boasts of 911 women's co-operatives, exclusively run by women, headed by a lady assistant registrar. These engage in a number of activities like knitting, sewing, embroidery, preparation of articles for domestic consumption like pickles, *papad*, squashes and

providing school supplies for children. But Kerala's Literary Co-operatives are unique. They buy books and copyrights of the works of its members and undertake book-publication and sale. During 1961-62, the Sahithyapravarthaka Co-operative Society at Kottayam purchased or produced books of the value of Rs 4.98 lakhs and took several measures to promote literary activity among Malayalam writers. Thus while the debt-ridden Indian peasant has still to find the answer to his problems in the co-operatives, one can derive some consolation from the co-operatives' role in encouraging self-reliance among our women and in promoting regional literature.

BOOK REVIEW

National Integration, et al

S K Nath

Three Basic Problems of India by Jaya Prakash Narayan; Asia Publishing House, Bombay, 1964; pp ; price Rs 6.

THERE are some thought-provoking suggestions—largely about India's relations with her immediate neighbours — in this little collection of lectures by Jaya Prakash Narayan, but its general effect is disappointing. The lectures (delivered in 1962 on the invitation of the trustees of the Dada-bhai Naoroji Memorial Prize Fund) seem to have been under the title of 'national integration': however, they do not provide an informative analysis of the relevant problems.

In the first lecture, entitled "The Concept of Nationhood", J P makes an enlightened effort to make us feel thoroughly reconciled to the partition of India. But one of his arguments is curious. If the British had not imposed unity on India, he says, "undivided India would have been perhaps one of the lesser possibilities." If this argument were to be accepted, we should not regret too much any further bifurcation of the country. Surely, the only correct attitude to Pakistan is that it was a mistake ever to partition India but that it would be an infinitely bigger mistake for the sub-continent to be re-united through anything except mutual goodwill.

JP's conclusions in this first lecture seem to be that nationalist feeling is not necessarily good, that it might lead to strife between nations, that civilization is more important than nationalism. Each one of these conclusions is unquestionable, yet one feels that J P needed to emphasize that in a country with as intricate and deep a labyrinth

of divisions in its social structure as India, there might be an urgent need to foster nationalism which would yet be outward-looking and magnanimous rather than inward-looking and mean.

The second lecture on "Building the National Community", is a big disappointment, none of the particularist problems of the Indian society gets mentioned. There is no discussion of the little things Indians habitually blow up to separate one group from another; reading this lecture one might get the impression that Indians are not especially unfortunate as compared to many other nations in having strong prejudices against one another on account of such things as religion, region, caste, language food habits, complexion and economic status. No doubt J P holds up a noble ideal for Indians (and mankind in general). "... the identification of the individual with other human beings, an ever-expanding area of human beings, till we identify ourselves with the entire human community—the world community of beings—and we become world citizens". But this ideal is recommended in the name of dharma and "spirituality". In a country where such untold mischief has been perpetrated for centuries by populist conceptions of spirituality, *dharma*, *muzhab* and similar things—and where religion and spirituality (at least in the hands of their customary custodians) still continue to support inhuman practices and attitudes—it is tragic irony for a national leader to try to propagate fellow-feeling in the name of spirituality. No matter what

refined and humane kind of spirituality an educated and progressive leader recommends, for the majority of Indians it remains true that so long as they are bound by spiritual values they are likely to be anti-national.

Our hope lies in educating the masses about what the progress of science, social sciences and psychology has taught us about human beings, about their weaknesses and potentialities, and not in romanticizing our past way of life and old scriptures. Untouchability, a vision largely restricted to the immediate locality, low status of women, a vague or active contempt for different people (different in race or religion)—all these are as much a part of our ancient heritage as some of the nobler things which are often paraded about. To extol our past way of life and then expect our masses, who are still clearly permeated with many of the regressive old values, to choose from it only that part which meets the modern humane standards is not only a circuitous but also a self-defeating way of propagating reforms.

In this second lecture J P also recommends local self-rule in small communities in the name of spirituality—"As you know, this process is going on all the time in London which is a city made of many cities, boroughs with their municipalities"! Another curious refrain is a misguided understanding of the welfare state: "In a welfare State, nobody is responsible for anybody"; further, "In a Welfare State, of course, there may be government schemes for employees, but nothing for the man

on the street". Perhaps this misunderstanding results from our ruling politicians' habit of describing India as a welfare state; but in India really nobody is responsible for anybody; and the truth is that our politicians are either dishonest or confused, because India is anything but a welfare state yet.

The last lecture is called "India in the World Community". JP is at his best here. Though spirituality crops up here too, his comments on some specific problems and incidents of India's foreign policy are enlivened. These is a just criticism of India's hesitations in making a fair comment on the developments in Hungary and Tibet, and of our action in Goa. He

rightly argues that though by the standards observed by most other nations our action in Goa was justified, it did not match up to our proclamations, and that it cost us heavily in terms of international prestige and influence. Moreover, as he says, "If nations do not even at this stage agree among themselves to eschew violence for the settlement of any dispute that might arise between them, what is the sense of forming the United Nations?"

We have come to associate a refreshing and rare honesty with J P regarding our disputes with other countries. There is ample evidence of that here. Surely most thinking Indians ought to agree with him when he says: "... India's foreign policy, our

professions of peace and goodwill, our professions of one world community, are all an trial in this sphere of Indo-Pakistan conflict". Regarding Kashmir he aptly remarks: "I do not think that any kind of international settlement can be arrived at which will favour only our viewpoint. We must be mature enough to settle our differences on a give-and-take basis". His comment on our dispute with China is equally enlightened. He argues that since both India and China claim certain border areas as theirs, the obvious thing to do is to go for arbitration. As he points out, other countries before us (e g, the U S A and Canada) have solved their border disputes by just that method.

Changes in Literacy and Education

Study of Villages in UP and Punjab

P C Joshi
M R Rao

There is now a growing realisation among planners in India that the creation of opportunities is not by itself a sufficient condition for development. The effective utilisation of these opportunities is impeded by several economic and non-economic factors.

A study of changes in literacy and education in selected villages of UP and Punjab confirms that in the field of rural education as well, the creation of educational opportunities has not been followed up by their effective utilisation. The unsatisfactory pace of educational progress in rural areas resulting from the insufficient use of educational opportunities should be a cause for great concern.

THIS paper attempts to analyse changes in literacy and education in selected villages of UP and Punjab on the basis of data collected by the Agricultural Economics Centre of the University of Delhi in the course of resurveys of these villages. The resurveys were undertaken by and large after an interval of five years. For the present study, nine such villages have been selected, five from Punjab and four from UP.¹ They are not representative of the region as a whole but do provide certain insights into those aspects and processes of change which are often not available from large-scale, estimational surveys. Similar case studies for other regions may provide a better understanding of the educational situation in rural India as a whole and may act as a necessary corrective to generalisations derived from aggregative data.

One of the important insights gained from these case studies is that, though the rate of progress of literacy and education in the selected villages is very slow, the picture of concentration of literacy and education among the upper and the dominant intermediate castes, so very characteristic of traditional rural society, is changing. The number and percentage of literates and the educated specially among the lower and scheduled castes, is on the increase and an educated elite is in the process of formation among these hitherto illiterate castes. This process, however, is characterised by great unevenness in different villages. In the educational ladder the distance between high castes on the one hand and the lower castes on the other is still very wide.

Secondly, in spite of the initial advantage which the upper castes enjoy

because of their superior social and economic position, progress in education is taking place at an uneven pace among persons within the upper and dominant intermediate castes on account of economic disparities among them.

Thirdly, as a corollary to what has been stated above, the economic factor appears to be of increasing importance in determining educational progress among persons within the same caste as well as among those belonging to different castes. Consequently, for further progress of education in breadth and depth, acceleration of the tempo of economic progress embracing the majority of persons within each caste group has to accompany efforts at expanding educational opportunities. In the absence of this, education may only promote the elite-mass hiatus in different degrees within each caste group.

II

Number and Proportion of Literates

The percentages of male and female literates for nine villages of UP and Punjab for the first and second points of survey are presented in Table 1. The table shows that there is no marked progress of literacy in any of the selected villages. The change of literacy percentage ranges between +5 per cent and -1 per cent. Further, the literacy rate in these villages presents a mixed pattern, showing some increase in two villages (Rattakhera and Ratol Rohi), minor increase in another two villages (Bahutwas and Muhammadpur-Gajmalpur), stagnation in four villages (Bhatian, Sanoli, Kalinjar and Gati) and decline in one village (Saran).

However, in contrast to variation in literacy percentage, the number of literates has increased in all the villages during a period of five years. It is the faster increase in the population which obviously depresses the literacy rate. A close scrutiny of the data

relating to individual villages (see Table 2) also shows that the number of literates among females has remained by and large stagnant. This further contributes to keeping the literacy percentages low.

Changes in literacy in different caste groups can be seen from Tables 3 and 4. Considering all the villages together, the percentage of literates has shown some increase only among two caste-groups, viz, 'cultivating castes' and 'backward and scheduled castes'. In the remaining caste and community groups, viz, 'Brahmins and other high caste Hindus', 'artisan castes' and Christians, the percentage of literates has registered a decline. Viewing the villages separately, it is seen that the percentage of literates has increased: among the backward and scheduled castes in seven out of nine villages; among cultivating castes in four villages; among artisan castes in two villages; among Brahmins and other high caste Hindus in two villages; and finally, among Christians in only one village. In the remaining villages the percentage of literates for all the caste groups has either remained unchanged or declined.

In spite of the differential rates of change in literacy in various caste groups one notices that the number of literates has increased in all the caste groups. Thus, the decline in percentage of literates among certain caste groups has been caused by a relatively greater increase of population in these groups. The contribution of each caste group to the total literates in the villages at both the points of study are presented in Table 5. It can be seen that taking all the villages together, while the cultivating castes were at the top of the literacy ladder, the backward and scheduled castes improved their relative position while Brahmins and other high castes Hindus showed a certain decline from their previous position. Considering individual villages: the relative position of Brahmins and other high caste Hindus

Counted in digits, Canara Bank's RESOURCES run into high nine digits — a positive pointer that Canara Bank is one of the largest banks in the country. ■ And yet, Canara Bank firmly believes that in banking, people matter more than money — counted in digits. ■ Strong and stable, dynamic and progressive, helpful and friendly, Canara Bank is a Bank that understands people. ■ That is why, to the hundreds of thousands of its customers, Canara Bank is known as the, BANK FOR ACTION, because Canara Bank offers service that satisfies.

¹ A list of the selected villages along with details of their economic and social characteristics and the period of their first-point survey and resurvey has been given in the Appendix.

declined in six villages and improved in one village; that of cultivating castes had improved in six villages and declined in three villages; and that of backward and scheduled castes had improved in seven villages and declined in two villages. It can be seen that the shifts in relative positions were most significantly in favour of backward and scheduled castes.

III

Literacy among Age-Groups

A crucial indicator of change is the proportion of literates in different age groups, especially the age group 5-14 (see Table 6). It can be seen that in the age group 5-14, the overall literacy rate has increased for all villages except Saran, Sanoli and Gati. In villages Saran and Gati the percentage of literates has declined for both males and females in the age group 5-14. In the case of Sanoli, though the male literacy rate has gone up slightly, the female literacy rate has remained nil and as a result the overall literacy rate has remained stagnant.

It is noteworthy that the male literacy rate in the 5-14 age group has increased in six villages. The female literacy rate has increased in only three villages, while it has declined in four villages and remained unchanged in the remaining villages.

A more sensitive index of educational progress is the change in the number of school-going children between the two points of time. The figures in Table 7 give the number of children in the village going to school both inside or outside the village. Data relating to school-going children have been collected at the household level and not from enrolment in school registers. It can be seen that the percentage of school going children in the 5-14 age group has declined in four villages, viz, Saran, Bahutwas, Rattakhera and Ratol Rohi. In three of these four villages in Punjab, the decline in percentage of school-going children has occurred for both males and females. It is, however, significant that the number of school-going children increased in all the villages except Bahutwas; the number of school-going male children has gone up in all the villages except Bahutwas; and the number of school-going female children has gone up in four villages while it has declined in the remaining five villages. Thus, in this case also, greater increase in the number of children in the school-going age-group has resulted in a decline in the percentage of school-going children in

some villages at the second point of time.

Castewise distribution of school-going children at the two points of time (Table 8) shows certain interesting features. It is worthy of note that for all the nine villages together, in spite of an increase in the number of school-going children from 421 to 500, the percentage of school going children had by and large remained unchanged at about 30 per cent. Further, it is seen that in the nine villages as a whole: the percentage of school going population had increased among Brahmins and high caste

Hindus, among Christians and among backward and scheduled castes; it had declined in all the remaining caste and community groups.

IV

Level of Education among Caste-Groups

The distribution of educated persons according to their level of education and caste or community status is presented in Table 9. It can be seen that considering all villages together, the number of persons educated upto the primary level had increased from 217 to 284, upto the middle level from

	2nd point	289	89	267	12	556

18 to 28, and upto university level from 4 to 13. The number of persons educated upto intermediate level was unchanged. Thus, there was progress only at the primary, middle and university levels of education during the intervening years.

The number of persons educated upto the primary level had increased in seven villages, upto the middle level in six villages, upto the matric level in five villages and upto the intermediate level in only two villages. The number of graduates and professional degree holders had increased in only two villages. It is evident from Table 9 that progress at all other levels except the primary and middle level in most of the villages has been by and large not very significant.

Considering the caste-wise distribution at different levels of education it can be seen that at the primary level,

caste groups showing marked progress were "cultivating castes" and "backward and scheduled castes"; at the middle level "Brahmins and other high caste Hindus," "cultivating castes" and "backward and scheduled castes"; at the matriculation level "cultivating castes" and "backward and scheduled castes"; and finally, the number of graduates and professional degree holders had shown some increase only among "cultivating castes."

V

Changes among Different Size-Groups of Operated Land Holdings

It can be seen from Tables 10 and 11 that the number of literates and educated persons had increased in all the size groups of operated land holdings. Considering the percentage of literates and of the educated to

the total population it is noteworthy that the percentage increase was by and large greater in the higher size-groups than in the lower size-groups. It is also noteworthy that the proportion of educated to the literates registered a greater increase than that of educated to the total population in most of the size groups.

It may also be noted that at both the points of time, the percentage of literates and the educated to the total population, steadily increased with an increase in the size of the operated land holding. However, the percentage of educated to the total number of literates, appears to be generally high irrespective of the size of the operated land holding.

Considering the changes in the number and percentage of school-going population according to land-size groups it can be seen that: the number

78 to 115, upto the matric level from of school-going children has increased in all the size groups (except 20-50 acres size group); the percentage increase in the school-going population is not very marked in any of the size groups; the percentage of school-going children to total population in the group steadily increases with an increase in the size of operated land holding at both the points of time.

VI

Size of Land-Holding as a Factor

The distribution of educated persons according to their level of education in different caste and land-size groups in all the nine villages is presented in Table 12. It can be seen that the lower land-size groups were significantly represented among the beneficiaries of primary education at both the points and particularly at the second point of study; in respect of education beyond the primary level, size of holding appears to be an important factor determining the number of recipients. Size of holding appears to be particularly significant in respect of the graduate and post-graduate levels of education.

The changes in the number of recipients of different types of education according to size-groups of operated land holding within each of the important caste-groups has been presented in Table 12. It is important to clarify that the category of non-cultivators is an omnibus category, including those who derive their income primarily from sources other than cultivation and belonging to a wide range of income levels. This is one of the reasons why quite important increases in the number of recipients of different types of education have occurred among the group of non-cultivators. It can be seen from the table that there were significant differences among the group of 'Brahmins and other high caste Hindus' in respect of changes in the number of recipients of different types of education and these changes were, to a certain extent, associated with the intra-group economic differences as denoted by the size distribution of operated land holdings. The same trend is observed in the case of two other caste groups viz, 'the cultivating castes' and the 'backward and scheduled castes'.

In a nutshell, there were important intra-group variations within each of the important caste-groups in respect of educational progress and these variations were to some extent linked with economic differences as denoted by size

of land holding. Further, the economic differences appear to gain in importance in higher (ie, graduate and post-graduate) as compared to lower (ie, primary) levels of education.

VII

This paper has been devoted mainly to an analysis of changes in the pattern of literacy and education at two points of time. A more crucial aspect of the study viz, the analysis of causes responsible for these changes, has not been attempted here because of the lack of adequate qualitative data in these village surveys.

It may be pointed out, however, that seven out of the nine villages had primary schools at both the points of time. Villages Sanoli and Mohammadpur-Gajmalpur, however, had no primary schools within the village though facilities for primary education were available in close proximity of these villages. The facilities for education beyond the primary level were available in all cases outside these villages. Thus, the variations in educational performance of different villages were evidently not due to the absence of

facilities in the sense of existence of schools. To what extent these variations were due to other factors including differential rates of economic growth in these villages requires a deeper probe of the resurvey data. This aspect of the study has, therefore, been kept pending until the detailed tabulation of resurvey data.

Summary of Conclusions

To sum up, the data relating to changes in literacy in nine villages of Uttar Pradesh and Punjab show that:

- (1) The overall literacy rate has shown a certain increase during a period of five years in four villages, it shows stagnation in another four villages while it has declined in one village.
- (2) Important variations are discernible in the proportion of literates as between males and females. The increase in the proportion of literates is much more marked among males than among females. The literacy rate among males has increased in a larger number of villages than that among females.

“Indian Economic Growth: Performance and Prospects”

Some Comments

Ashok Rudra

- (3) The number of male literates has increased in all the villages while the number of female literates has increased in six villages. The number of all literates, both males and females, has increased in all the villages. It is the greater increases in population whether due to natural factors or immigration which is responsible for the lack of marked progress in literacy in the selected villages. The virtual stagnation in female literacy has also contributed to keeping the literacy percentages low.

(4) Considering all the villages together, the percentage of literates has shown a certain increase only among the 'cultivating castes' and 'backward and scheduled castes'. This trend is broadly applicable to individual villages as well. The relative position of different castes in respect of their literacy
- status has shown significant shifts in favour of backward and scheduled castes.

(5) It is significant to note that the proportion of literates in the age-group 5-14 where one would expect the maximum increase to occur has increased in only six villages. The female literacy in this age group has increased in only three villages.

(6) The total number of school-going children has increased in eight out of the nine villages. Still the proportion of school going children in the age group 5-14 has increased only in five villages and declined in the remaining villages. This decline is caused because of the relatively greater increase in the population of this age-group.

(7) Considering the percentage of literates and of the educated to the total population according to size-groups of operated land holding in all the nine villages,
- it is noteworthy that the percentage increase is by and large greater in the higher size-groups than in the lower size-groups.

(8) The important beneficiaries of education during the period upto the level of intermediate education are Brahmins and other high castes Hindus, cultivating castes, and backward and scheduled castes; education beyond the intermediate level is concentrated only among the 'cultivating castes' and that too in only two of the nine villages under study.

(9) Finally, there are important intra-group variations within each of the important caste groups in respect of educational progress and these variations were to some extent linked with economic differences as denoted by size-groups of land holdings. Further, the economic differences appear to gain in importance in higher as compared to lower levels of education.

I AM sure K N Raj would not have published and publicised his two Nalanda lectures if he was expecting a wide common agreement on all the points he makes. I am presenting below some points which appear to call for further clarification and discussion. I am deliberately refraining from engaging myself either in writing a full critique of Raj's thesis or presenting an alternative thesis.

(1) On page 17, Raj writes "Growth of national income at a compound rate of 7 per cent per annum (and perhaps a little more) is *therefore* within our reach in the next few years provided we are prepared to make that *minimum of additional effort* now required" (italics mine). As I understand it, the statement makes two points. The first is that a 7 per cent rate of growth has got some particular crucial significance for the economy as of now; and the second is that this rate of growth is "within our reach". In order to support my contention that Raj does attach some particular significance to the 7 per cent rate, let me also quote the following two sentences from pages 9 and 13:

"On these general considerations, it is fairly clear that a rate of growth of around 5 per cent per annum in agriculture is the *minimum* that needs to be achieved in the coming years" (italics mine).

"Failure to achieve the higher rate now required can be fatal in its consequences" (italics mine).

It may be mentioned here that a 5 per cent rate of growth of agriculture is considered by Raj as concomitant to a 7 per cent rate of growth of income.

(a) I have no quarrel with the arithmetic and the subsidiary assumptions that establish that a 5 per cent rate of growth of agriculture and a 10 per cent rate of growth of industry results in a 7 per cent rate of growth of income. But, then, various alternative combinations are possible. One can equally correctly say that a 7 per cent rate of growth of agriculture together with a

12 per cent rate of growth of industry would lead to an income growth of around 8.5 per cent; or that a 4 per cent rate of growth of agriculture and a 8.5 per cent rate of growth of industry would lead to an income growth of about 6 per cent. Raj selects the combination of 5 per cent for agriculture and 7 per cent for income and repeatedly refers to them as the minimum required, but never explains 'minimum' in what sense. Nor does he argue anywhere that this combination is an optimal combination in any sense. However, a hint is available as to the possible explanation for his choice in the following statement on page 20: "if the rate of growth of agriculture is stepped up to around 5 per cent per annum, about one quarter of the higher rate of growth of national income is saved, and at the same time the present trend of rising export earnings is maintained, it should be possible without much strain on the economy to dispense altogether with net inflows of foreign savings within the next decade". If the combination of 5 per cent for agriculture and 7 per cent for income is considered the *minimum* required from the point of view of the objective of making the economy self-sustaining within a decade, one cannot very well accept the contention in the very general way in which it is made. The argument has to be presented in terms of a model with realistic and plausible values for the parameters, especially considering that it involves specific magnitudes: the rate of growth for agriculture, the marginal rate of saving and the time horizon.

(b) When Raj says "therefore within our reach" and "that minimum of additional effort" what does he mean? One would think that he has described in detail the minimum effort necessary to raise the rate of growth of agriculture from 3 per cent to 5 per cent, for he talks of "*that* minimum effort" (italics mine). But he has not done anything of the sort. It is true that he has discussed the phenomena of shortfall in production and shortage in market supply of agricultural products in some detail. One may perhaps agree with

him that the recent fall in agricultural production and in the market supply of agricultural products could be explained partly by price fluctuations that were either uncontrolled or even aggravated by incorrectly-timed releases of imported grains; also, that the present state of tenurial relations between cultivators and land owners do not provide sufficient incentive to farmers for the use of expensive inputs. However, these general comments do not amount to any specific diagnosis nor to any recommendation of concrete measures to be adopted. When Raj writes "What is necessary now is... a precise determination of certain specific measures required to accelerate agricultural development" (page 12) or "if, however, increased supply of the required inputs for agriculture is combined with a minimum number of measures on the institutional side to improve the responsiveness of producers, there is no reason why a higher rate of growth in agriculture of the order required cannot be achieved within a very short period" (page 13), he is neither diagnosing nor prescribing but only indulging in tautologies. It may be noted that Raj himself does not fail to remark that the 3 per cent rate of growth in agriculture recorded up till now has largely "come from extension of area and only a small proportion from increase in yields" (page 11); and that "since the scope for extending cultivated area is limited agricultural production can continue to grow rapidly only if yields per acre can be steadily increased..." (page 11). He also argues that "the rates already realised do not compare unfavourably with rates recorded in other countries placed in broadly comparable situations". All this would justify the expectation that the rate would *fall* rather than that it would rise. When Raj talks about *doubling* the average rate of growth of income—from 3.5 per cent to 7 per cent—does he not take any account of his own cautious statement: "It is, therefore, possible to claim with some confidence that the economy is continuing to grow at an average rate

of no less than 3½ per cent per annum" (page 2)? Will tautologies achieve this feat of doubling?

(c) I seek a clarification of the main burden of Raj's argument about the effect price fluctuations might have had on production and supply. He seems to find both price rise and price fall to be factors contributing to short supply. On the one hand he writes "the large scale releases of imported foodgrains in the years of bumper harvests kept their prices at a low level relatively to the prices of manufactured products and created the impression that the Government had no interest in maintaining a structure of relative prices which would give incentive (or at least not create disincentive) for raising foodgrain production" (page 4). On the other hand, he argues "A sharp improvement in the terms of trade, as has been witnessed in the case of wheat in the course of the last year, could have thus brought about a significant reduction in the amounts marketed". There is an apparent contradiction between the two statements. Is Raj assuming an upward sloping curve for production and a downward sloping curve for market supply? If the elasticity of demand for foodgrains with respect to income of agricultural producers and the elasticity with respect to price for non-agricultural consumers are suitably chosen, increase in price, increased production, increased self-consumption and increased market supply may be shown as consistent. But why should in the first instance the farmer increase output in response to price rise if he is going to sell less? It may be mentioned that Raj is not thinking here of the shortage in market supply due to holding back of stocks to which he devotes another paragraph.

(2) While discussing the effects of price instability on changes in production and supply of agricultural products, Raj speaks extensively about the terms of trade between agriculture and industry. One of the strong recommendations he makes is not to allow "a situation to develop in which the terms of trade turn sharply against foodgrain producers" (page 8). In particular he recommends that it is "necessary to ensure that the index number of prices of rice and wheat are not allowed to fall below 125 if possible and 120 under any circumstances" (page 7). Earlier he writes "The rise in price of rice since 1962-63 has been really only of the order required to correct the turn in terms of trade in favour of

manufactured products between 1958-59 and 1962-63".

It appears to me surprising that one should discuss the levels at which to fix agricultural prices only in terms of the so-called terms of trade, especially when the latter are to be measured in terms of the ratio of the index numbers of agricultural prices and industrial prices. One would have thought that there was a welfare aspect to the question. Agricultural prices largely represent prices of wage goods, whereas most manufactured products do not enter the wage basket nor are they by and large such intermediate and capital goods as would interest agricultural producers. Thus, it cannot even be said that the ratio of these two index numbers in any sense measures the relative purchasing powers of consumers depending on agriculture and industry respectively. It would appear from Raj's argument that whenever there is a rise in the price of manufactured goods, he would recommend a matching rise in that of agricultural products so as to "correct" the terms of trade back to those prevailing during some arbitrarily fixed base year. He does not anywhere bring in the index number of consumer prices. Is the fact that this latter index rose from 96 in 1955 to 170 in October 1964 not to be taken into account in any way in discussing the problem of price stabilisation?

(3) Raj deliberately underplays the importance of the shortfall of foodgrain production as a factor giving rise to the phenomenal price rise of last year. He writes "If therefore the imports of foodgrains into the country had been used to build up stocks in the years of good harvest and supplement domestic production in the bad years, there would have been no reduction in the per capita availability of foodgrains for consumption during this period" (page 4). Probably true; but to prevent a price rise surely it was not enough that per capita availability was not diminished: it required to be increased, considering that per capita income has been constantly going up. The income elasticity of demand for foodgrains is not as low as it used to be thought at one time. It is definitely higher than 0.5. If one bases oneself on cross-section data the figure comes out nearabout 0.7. It is higher, around 0.9, when one bases calculations on time-series data which is the more appropriate thing to do.

(4) Raj emphasises at a number of

places the fact that the official series of national income in India underestimates the growth of the small scale industries sector. I am in agreement with his hunch. However, I would like to make two comments on the way he uses this possibility in his argument.

(a) He writes a page 2: "When allowance is made for such under-estimation the gap between the planned and the actual rate of growth of national income during this period may be found to be negligible". This argument cannot be accepted. For the planned rates of growth emerge from calculations which are made within the very framework of national accounting which is alleged to involve an under-estimation of the rate of growth of small scale industries. If the national income series is to be corrected for this under-estimation before interpreting it as reflecting the rates of growth actually realised, they may be compared with the plan target rates only after the latter are also similarly revised upwards.

(b) Raj does not take into account this under-estimation in the growth of national income when discussing the probable increase in the rate of saving. As the estimate of saving is arrived at indirectly from the estimate of capital formation, it follows that if the rate of growth of income is under-estimated in the official series, the rise in the rate of saving would be over-estimated if the uncorrected series is used in the denominator, as it is by Raj.

(5) Talking of price rise during the period under review, Raj writes: "Wholesale prices in 1960-61 were only about 12 per cent higher than in 1951-52 and about 25 per cent higher than in 1952-53. (The price level remained at around the 1960-61 level till 1963-64)" (page 19). The part of the statement within brackets seems to be factually wrong; the remaining part of it also loses much of its force when one examines the paths actually followed by prices instead of comparing two end-points. We present in the table on the following page the series of index numbers for wholesale prices (general index: new series) and consumer prices (all-India: general). The consumer price index number is obviously the more relevant for the present purpose.

It is strange that Raj should show so little concern with the rise in the cost of living. On page 7 he writes "... the fixed and low income groups in

the urban sector (together with landless agricultural labour in the rural sector) have perhaps had to bear in real terms almost the whole of the additional burden imposed by defence. To give these sections of the population some relief at the earliest opportunity is likely to be politically tempting...". Raj is vehemently against the government yielding to the temptation. But can there not be anything other than political expediency to justify giving relief to consumers?

Year	Wholesale price Index (Base: '52-53=100)	Consumer price Index (Base: '49=100)
1951	125.0	105
1952	102.3	103
1953	104.1	106
1954	99.6	101
1955	91.5	96
1956	102.7	105
1957	108.7	111
1958	111.0	116
1959	115.5	121
1960	122.9	124
1961	125.8	126
1962	127.2	130
1963	132.5	134
1964 (January)	136.3	140
1964 (October)	157.9	170

Source: Monthly Abstract of Statistics, C S O.

(6) Discussing the marginal rate of saving achieved during the decade 1951-52 to 1960-61, Raj writes: "It is not the level of average per capita income which governs the rate of saving so much as the pattern of distribution of income, and this latter is indeed very favourable to a high marginal rate of saving in India", for, as he has observed immediately before, "Income distribution in India is perhaps more skewed than in many other countries".

To the extent that the pattern of income distribution determines the rate of saving, the rate of marginal saving would reflect the distribution of incremental income. Raj has earlier demonstrated that the marginal rate of saving during the period of planning has been much higher than, almost double, the highest average rate reached during the period. The obvious conclusion to draw is that the incremental income has been distributed more unequally than the average income, which implies a change in the income distribution towards greater inequality. This is also one important aspect of the "performance and prospects" of the Indian economy.

SERVING YOU ON THE SEVEN SEAS

Tight, staunch and strong, 'JAG' Ships carry cargo across the seven seas. Whatever the merchandise, you can count on them to carry it with speed and safety. With steady growth and world-wide operations, 'Jag' fleet also promotes India's maritime trade.

Foodgrains Shortage will Continue in the Fourth Plan

M J K Thavaraj
A Vasudevan

Excess of demand for foodgrains over supply will continue as the dominant characteristic of the Indian economy at least till 1970-71. But the gap between demand and supply may not be very wide if an average annual rate of growth of 5 per cent in agricultural output is achieved during the Fourth Plan period.

The implications of excess demand for foodgrains, nevertheless, have to be carefully examined and the necessary institutional arrangements made in the interests of economic growth and price stability.

MODERN economic analysis regards excess demands as the basic factor causing inflation. This is largely indicated in developing economies where the attempted rate of investment is substantially higher than the voluntary or mobilised rate of saving. Part of the investment may be financed through external borrowing; but the uncovered gap is often bridged through created money. The possible adverse effects of increased money supply arising thereby may partially be neutralised by hoarding or monetarisation of the barter-based pockets in the economy. The utilisation of idle capacity that might exist in directly productive sectors or the shortening of the average frutition lag of investment programme may also partially offset the net increase in the aggregate demand generated through deficit financing. Despite all these, if supply falls short of demand, there will develop an inflationary pressure. This has been recognised by the monetary authorities of the country, the Reserve Bank of India, when they maintain in their Report of Currency and Finance for the year 1963-64 that the recent rise in prices in India is "basically the outcome of the widening gap between aggregate demand and supply (p 1). The same phenomenon is also more cogently analysed by K N Raj.¹ Though excess demand appears to be the overall feature of the current economic situation in India, nowhere else is it as acute as in the case of food-grains. We have already analysed the current demand for and supply of foodgrains and their projected trends for the rest of the Third Plan period have already appeared in these columns earlier.² The present exercise is to extend the analysis to the Fourth Plan period. These estimates may be related to the entire economy as well as to the urban population which is likely to expand more rapidly as compared with the

rest of the economy.

Agricultural productivity, in general, is influenced by a large number of factors such as the area of cultivable land, cropping patterns, ownership structure, market environment, organisation and management of land, irrigation facilities as well as the use of fertilisers, seed, and manures and improved implements. It may be mentioned that in older agrarian communities with a given ownership structure the growth of agricultural output would largely be a function of the application of intensive methods of cultivation.³ In the earlier stages, the available irrigation potential might be tapped to the best advantage. But when the scope for further extension of irrigation becomes narrow or costlier increased reliance may have to be placed on bringing more areas under better seed improved implements, chemical fertilizers, pesticides, etc. It should however, be recognised that even the best methods of intensive cultivation may flounder against badly conceived and implemented institutional arrangements.⁴ Even where peasant farming provides the basis of agricultural organisation suitable market environment in the form of incentive prices, appropriate marketing and credit facilities may have to be made more effective as stimulants to agricultural production.⁵ For, there is very little evidence to support the theory of the backward sloping supply curve in agriculture.⁶ At best it may be maintained that where the bulk of the peasants live below the margin of subsistence, any increase in food production may result in increased farm consumption rather than in enlarged surplus. But insofar as the middle and rich peasants account for the bulk of the food production as well as the marketed surplus an appropriate market environment may be expected to have a favourable impact on agricultural output as well as on the marketable surplus. The

opening up of the country through a widespread network of transport and communication and the glimpses of urban life as seen through the mass media of communication such as films seem to induce the farmers to market a larger proportion of a given output in order to enjoy some of the comforts of urban life⁷.

It is true that all that is marketed by the farmers does not enter the urban market. This may be designated, for our own convenience, as gross marketed surplus. A part of what is marketed immediately after harvest may be bought back by the farmers themselves at later stages at higher prices in order to provide for their requirements of seed or consumption. A part of the surplus may be consumed by the non-agricultural rural population.⁸ When these are deducted from the gross marketed surplus the remainder, which may be called the net marketed surplus, is made available for consumption to the urban sector (or for export, beyond the level of self-sufficiency). In India, however, the net marketed surplus along with the net depletion of inventories and net imports constitute the effective supply of food-grains in the urban market.

There is no precise or upto-date estimate of either gross or net marketed surplus covering the entire economy. Attempts were made by official agencies to collect figures of net marketed surplus for wheat and rice in a few States in 1955-56 and 1956-57 respectively. They seem to be the latest attempts made. The Average of net marketed surplus of rice in 10 states in 1956-57 was about 31.4 per cent of the total rice output. In 1955-56 the average of net marketed surplus of wheat in 5 States constituted about 32.7 per cent of the total production.⁹ The official estimates seem to include the 'buy back' of the cultivators. Neverthe-

THE ECONOMIC WEEKLY

less, these ratios would provide a rough measure of the net marketed surplus in the Indian economy.

Project Demand

With these clarifications about the concept of marketed surplus we may now proceed to examine the supply position of foodgrains at present vis-a-vis the demand. We may also project the demand for food-grains upto the end of the Fourth Five Year Plan, i.e. 1970-71. Applying different rates of growth to food output we may estimate the quantum of food production, that is likely to be realised by 1970-71. We may also project the net marketed surplus that may be required by the end of the Fourth Five Year Plan. It is hoped that these projections would throw some light on the excess demand phenomenon noticeable in foodgrains.

The total food-grains production was about 81 million tonnes (1 tonne = 1 metric ton = about 2204 lbs) during 1960-61. About 10 million tonnes of this (i.e., 12.5 per cent of total production) are treated as retention by the farmers for use as seeds, live-stock feeds, waste etc. Two-thirds of the remaining 71 million tonnes are said to have been consumed in the rural sector. Applying the officially estimated ratio mentioned earlier, we would get the figure of 24 million tonnes as net marketed surplus. On a *per capita* basis, however, the amount consumed in the rural sector could be regarded as an irreducible minimum. But in view of the fact that 5 to 10 per cent of the farmers account for 60 per cent of the net marketed surplus, any increase in the output of these big farms may be expected to bring about a more than proportionate increase in the net marketed surplus, their staying power remaining unchanged. For the same reasons, stagnated agricultural output in the face of growing population may bring about a less than proportionate reduction in the net marketed surplus though in this process it might cut into the per capita consumption of food-grains of the bulk of the small peasants and landless agricultural labour. In so far as the relative prices move against the agricultural sector the farmers may have to restrain their consumption further in order to buy a given or increased amount of urban goods required for their consumption or agricultural operation. Though analytically such marginal relationships between increments in output and increments in net marketed surplus as well as the impact of the varying terms of trade on the net marketed surplus are conceivable, no empirical quantifica-

tion is available for use in the projections about net marketed surplus. Hence we have to rely on per capita rural consumption at a constant or increasing level as the basis of estimating net marketed surplus.

The Third Five Year Plan document had made a projection that India would need 100 million tonnes of foodgrains by the end of 1965-66.¹⁰ This target might indicate the aggregate agricultural output required to attain self-sufficiency, a concept which has been employed in the body of the Third Plan document. It could also imply the 'production potential' of a given investment programme consistent with a minimum nutritional standard. A 'self-sufficiency' target normally may or may not allow for import of foodgrains. Besides, it might refer to the minimum required to maintain a given level of consumption through a rigorous system of rationing and control. However, the Plan documents seem to have set this target as a production potential with no net imports of foodgrains. But with the stagnant foodgrains output in the first three years of the Third Plan, the food-grains target seems to have been revised downward to 90 million tonnes in the recent documents of the Planning Commission.¹¹ Assuming that this target would be realised over the remaining years of the Third Plan it is likely that there will be an overall shortage of about 7 million tonnes covering the entire economy and a gap of the same order might arise between the net marketed surplus and the urban demand unless it is covered through imports.¹²

The recent Indian Census placed India's population around 439 million in 1961. It is believed that population is presently growing at 2.4 per cent per annum and that it might touch a figure of 492 million by 1965-66 and 555 million by 1970-71.¹³ If in view of the enlarged programme of industrialisation the urban population may be assumed to claim about 20 per cent

of the total population then the actual urban population might register an increase of about 33 million over the decade 1960-61 to 1970-71.

In order to reach the minimum nutritional standards for India's population, it is believed that 403 grams of cereals and 104 grams of pulses are required per head per day. But the actual availability at present is only about 375 grams of cereals and 65 grams of pulses.¹⁴ In accordance with these standards, the total amount of cereals and pulses needed over the period upto 1970-71 was estimated as in the table below:

These are net figures excluding the 12.5 per cent of the production of foodgrains that is currently used for seed, animal feed, wastage and manufacture of non-food products. The gross production to be aimed at would be 82.7 million tonnes of cereals and 21.4 million tonnes of pulses by the end of 1965-66; and 93.3 million tonnes and 24.1 million tonnes of pulses by the end of 1970-71 with the set nutritional standards. Assuming that about 30 per cent of the produce may be entering the urban market, the net marketed surplus should be around 31 million tonnes and 35 million tonnes in 1965-66 and 1970-71, respectively. These estimates, however, assume that food habits would gradually change from cereals and pulses in favour of fruits, vegetables, milk, meat etc.

The planned targets envisaged need not necessarily correspond to the estimates made on the basis of nutritional standards. Assuming that there will be 2.4 per cent population growth per annum and an increase of 66 rupees in per capita incomes, there will be a need for at least 13 percent increase in food over and above the level that would be obtained in 1965-66. This means that the demand requirement by the end of the Fourth Five Year Plan will be 110 million tonnes. This figure is arrived at on the assumption that there will be no

	Population (Millions)	Cereals Required (Million tonnes)	Pulses Required (Million tonnes)
1959-60 to 1961-62	438 (1961 census)	58.5	10.5
1965-66	492	72.4	18.7
1970-71	555	81.6	21.1

change in the level of per capita consumption as compared with 1960-61. The Perspective Planning Division has already worked out that the demand requirement by the end of 1970-71 to be about 122 million tonnes on the assumption that the per capita consumption of food-grains would be improved from the per cent 163 kilograms to 186 kilograms.¹⁵ Over the same period, the relative growth of the urban sector, might give rise to an additional demand of about 40 per cent at constant levels of consumption. This would mean that the net marketed surplus should be about 40 million tonnes by 1970-71. If we allow for an increase of 12 percent in the per capita consumption the net marketed surplus may have to be in the neighbourhood of 45 million tonnes by the end of the Fourth Five Year Plan.

The actual supply position, on the other hand, may ultimately turn out to be different from the nutritionally desirable targets and/or planned targets as described above. The Perspective Planning Division has assumed 5 per cent rate of growth of food-grain by 1970-71 which means that the supply position will be 112 million tonnes which will be exactly equal to the planned target at the existing per capita consumption. But the past trends in food-grains production do not seem to justify this assumption. In the first ten years of planning, there has been an increase in food-grains' output by slightly more than 40 per cent i.e. 4 percent per annum. Part of this increase is said to be on account of better reporting and coverage. Of the balance a major part is attributable to extended area of cultivation rather than to increased yield per acre.¹⁶

And in the Third Plan, the annual average growth of food-grains may range between 2 and 2.5 per cent. Perhaps with better irrigation facilities and larger inputs like fertilisers, manures, seeds, pesticides etc and with improved organisational arrangements it should be possible to have 4 percent growth per annum in food-grains, during the fourth Plan Period. Under this assumption, the food-grains output by 1970-71 would stand around 105 million tonnes leaving a gap of about 7 million tonnes between the projected demand requirements at the existing per capita consumption and supply. If we allow a 12 percent increase in the per capita consumption of the entire population the excess demand phenomenon would become as large as 17 million tonnes.

Even if we assume 5 per cent rate of growth in food-grains' output there will be an excess demand for food-grains of about 10 million tonnes, if the per capita consumption is allowed to improve by 12 per cent. If output turns out to be 105 million tonnes by 1970-71, the net marketed surplus may actually be around 32 million tonnes, while the required marketed surplus would be about 40 million tonnes. Even if the total food-grains output reaches the target of 112 million tonnes the marketed surplus may not exceed 34 million tonnes thus leaving an uncovered gap of 6 million tonnes, on the basis of a constant level of consumption and more than 11 million tonnes when a 12 percent increase in the level of urban consumption is allowed for. Thus, there seems to be no escape from the fact that the excess demand phenomenon in food-grains would continue to persist till the end of the Fourth Five Year Plan.

To conclude, excess demand in food-grains is likely to continue as the dominant characteristic of the Indian economy at least till 1970-71. But the gap between demand and supply may not be very wide if an average rate of growth of 5 per cent could be realised in agriculture during the Fourth Five Year Plan period which case import of food-grains may have to continue. But the implications of excess demand will have to be carefully examined and the necessary institutional arrangement made in the interests of economic growth with price stability. Much would, obviously, depend upon the rate of growth of output of food-grains in the next seven years. The higher the supply elasticity, the larger would be the growth potential and the lower the price instability.

¹² M J K Thavaraj *op cit* p 1602. Applying the present rate of growth of population the urban demand may reach a figure by 33 million tonnes whereas the net marketed surplus may not exceed 26 million tonnes.

¹³ "Notes on Perspective of Development India: 1960-61 to 1975-76", *op cit*, Table 1, p 3. Even this rate is regarded as an under estimate and the actual rate of growth is said to be in the neighbourhood of 3 per cent.

¹⁴ V G Panse, V N Amble and T P Abraham: "A Plan for Improvement of Nutrition of India's Population", *Indian Journal of Agricultural Economics*, April-June 1964, p 14.

¹⁵ The emphasis placed by the Perspective Planning Division was on the production of cereals and pulses to meet the demand of growing population enjoying rising incomes. As such, food habits may not be expected to change widely in the next ten years or so.

¹⁶ Area under food-grains seems to have increased at the rate of 1.6 per cent per annum over the first decade of Indian Planning.

The Metal Box Company of India Ltd

Chairman's Review

THE Thirty-second Annual General Meeting of The Metal Box Company of India Limited will be held on Tuesday, the 20th July 1965 at 59C Chowringhee, Calcutta.

The following is a copy of the Review by the Chairman, Mr M K Velodi, which has already been circulated to members".

Sales

Having regard to the raw material shortages which were recurrent throughout the year, I am particularly happy to be able to report good progress: the Company's product sales, at Rs 16.77 crores, increased 21% over the previous year. The net growth, at constant prices, of 16% (against 11 to 12% for the two preceding years) was achieved by building up the sales of non-tinplate products whose growth was doubled.

By careful planning we managed to meet all the commitments we undertook, but regrettably not our customers' total requirements of tinplate and polyethylene products. This was frustrating to them and to us, particularly at a time when our efforts to balance and modernise equipment and methods had begun, both in qualitative and quantitative terms, to show results.

Supplies to the Defence authorities were more than twice the previous year's. The problems which always seem to dog this kind of work continue, but significant progress has been made and continuous production of a number of important items established. Our technical men have visited Defence establishments in England and the USA: from these sources and our own experience we now have considerable expertise. It is to be hoped that Government policy will permit its continued use and keep active in the national interest the additional plant installed specially for Defence requirements.

Export sales were adversely affected by the political situation in Burma and crippling restrictions in Ceylon. However, new markets have been explored, especially in West Asia where we hope to make good our setback. We are aiming at an export target of Rs 40 lakhs; but we shall not hit it unless some of the difficulties connected with raw materials can be overcome. In our export markets delivery within thirty days is a common stipulation:

because of insufficient stocks of raw material we have failed to meet delivery dates and business has been lost. Moreover, our overseas competitors have the advantage of cheaper materials, even after we have allowed for every export incentive in our costs. We have accepted the Ministry of Commerce's invitation to identify the problems inhibiting exports and we hope that a satisfactory solution, making possible the expansion of our exports on the scale we have targeted, will be found. A further point needs to be made: in certain areas of our business, exporting at our target level will affect our service to our home markets. We regret any annoyance that this may cause our customers in India which we will, of course, make every attempt to minimise. However, we hope very much that our customers will accept some short term inconvenience as necessary in the wider context of national interest.

Following our representations that packing should be recognised as an industry in its own right, the Planning Commission have, in the context of the Fourth Five Year Plan, set up a Committee for the development of the Packaging Industry to consider the industry's requirements of plant, raw materials and technical manpower. This Committee has already collected valuable data on the likely demand for consumer goods and the resources necessary to meet it. We are collaborating closely and several of our senior managers are associated with the Committee's work.

Food and cash crops are reported to be satisfactory for the current year and the demand for our products is expected to continue to remain at a high level. It is therefore a matter of great regret; if not surprise, that raw material availability should reflect so directly the deterioration in the country's balance of payments. For want of imported tinplate, supplies of Open Top cans for the fruit and vegetable processing and similar industries, for which imported qualities of tinplate are essential, have had virtually to be suspended, at a time when 35% of the fruit and vegetables grown go to waste.

For 1965/66 the maximum availability of tinplate in the country is likely to be only 145,000 to 150,000 tonnes compared with an estimated demand of 212,000 tonnes. We appreciate the

many urgent claims on the country's hard pressed foreign exchange resources but it seems inevitable that efforts to hold the prices of important consumer commodities will be undermined if a high priority is not given to tinplate imports.

Tinplate vs Substitutes

Whilst tinplate capacity in the country is being built up—it should match demand in two to three years' time—our strategy has been to develop as rapidly as possible the use of substitute packaging materials, aluminium sheet and foil, laminated paper, foil/plastic products, Diotainer plastic bottles and Diothene bags, with injection moulded plastic components, replacing tinplate wherever possible. It would, however, be a great mistake to under-estimate the importance, both in the immediate and long term, of tinplate as an indispensable packaging material in a country where the climate is extreme, retail outlets are far distant from manufacturing centres, and the shelf-life of consumer goods is long. There are many products for which tinplate's functional properties make it, for the next decade at least, India's most practicable packaging material. Doubtless, such considerations have influenced Government's decision to plan a massive increase in tinplate manufacturing capacity over the next two to three years.

Having secured the medium term future, it is greatly to be hoped that Government will succeed in finding the foreign exchange to bridge the short gap between now and the time that Rourkela's new five stand mill comes on stream in 1966/67. It would be tragic if the price line should be pushed upwards as a consequence of a sufficient volume of important consumer goods failing to get to market for want of packages. This could affect, for example, milk, baby foods, fish, fruit and vegetable canning, food beverages, biscuits and food oils. If the necessary bare minimum is not spent this year on tinplate imports, Rs 250 crores worth of essential goods will be affected. It would be equally tragic if by holding up, in this way, the natural growth of the market for consumer goods the future market for which this tinplate mills is being installed is seriously jeopardised.

This future market may also be put in hazard through damping down its

demand by the imposition on tinplate of punitive excise and import duties. It should be borne in mind that tinplate anywhere in the world is a high cost packaging material. In Bombay where there is the largest concentration of packers in India, local tinplate costs precisely twice as much as it costs the packer in England. Of this a quarter is due entirely to excise. In India tinplate is as much a poor man's packing medium as any other man's: for example, kerosene oil tins account for some 35,000 tonnes. These tins and indeed most of the tins made in the country (say another 100,000 tonnes) have an after-use as household utensils for working and middle class families. They are used to store kerosene and such comestibles as food grains, sugar, cooking fats and oils and to protect them from the depredations of rodents, termites and other insects. Their importance in the economy can be gauged by the fact that a second-hand four gallon can will be purchased for household use at a price close to that paid by the packer of kerosene. This applies to most tins fitted with resealable closures. Therefore, when considering alternatives for tinplate, the fact that none of the substitutes so far developed have the same sort of domestic after-use value must be remembered. If tinplate were eliminated for packaging, it might well have to be reintroduced in the form of household hardware for storing food.

When planning the end-uses of the product of the new tinplate mill it will be wishful thinking to say "if three years hence there is an inadequate domestic market then we shall export our tinplate". Tinplate is a highly sophisticated steel product and the new plant will require several years of high activity for the domestic market before an export surplus of the quality demanded by the markets overseas can be developed. It is an unpleasant thing to say, but at this moment in time Indian tinplate quality is probably the poorest in the world. For this reason our export markets insist that the entire tinplate content of all the packaging materials we export shall be imported; and Indian canned goods are only acceptable in these markets in cans made from imported tinplate. This is the unhappy position, even though Rourkela's reversing mill has been operational since 1961. Rourkela in overcoming the inevitable teething troubles in setting up a new mill and learning a new and difficult trade has, and will continue to have, all our support. In time we have no doubt that they will achieve the re-

quired consistency of quality. We stress the time factor in order to make abundantly clear how long it takes to establish tinplate quality. There should therefore be no easy optimism about tinplate exports: these are unlikely to be achieved within the next five years.

Raw Materials

Raw material supplies throughout the year presented problems; they were generally insufficient, often irregular and frequently of variable quality. The already high local price of tinplate rose by 20% during the year under review—nearly three times the rise in the Wholesale Price Index for Manufactured Articles as a whole. These price increases were absorbed by the economy because of the large gap between supply and demand, though they have reflected sharply on a wide range of essential consumer products.

With the steady increase in the growth of non-tinplate products, aluminium has become an important raw material in the form of container sheets, slugs and foil. Supplies of container sheets improved but slugs and foil were not available in the quantities required. Polyethylene supplies improved during the second half of the year but may cause concern once again if the availability of alcohol is restricted. We hope, however, to get sufficient quantities for 1965/1966, albeit at approximately three times the domestic price in the UK!

While adequate quantities of paper and board were available, quality, never very high, deteriorated to the detriment of the printing. There are signs of shortages arising during the coming year and we are continuing our efforts with our suppliers to improve both the quality and volume of supplies.

Decoration materials, particularly items with imported ingredients, were difficult to obtain—a result of the general foreign exchange situation. As these are critical to our entire operation, our Research Department is devoting much energy to developing further alternative materials made from indigenous ingredients, an obviously slow and difficult task since quality and cost have to be safeguarded.

Research, Design and Development

Metal Packages

BOMBAY BRANCH. During the year most of the Branch's printing equipment has been transferred to Bombay No. 2 (Deonar) where it is now fully operational. Their improved and

more spacious plant layout makes possible the use of modern handling methods, greatly enhancing efficiency. An extension of Bombay No. 2 is currently being planned to provide additional storage facilities for raw material and finished goods. The remaining plant at Bombay No. 1 (Worli) is being re-laid out to improve the factory's efficiency.

CALCUTTA No. 1 FACTORY. At Calcutta No. 1 considerable progress has been made with the introduction of improved manufacturing methods, resulting in economies in the use of materials and a marked increase in labour productivity.

MADRAS BRANCH. The activity of our Madras Factory has increased substantially and a building extension is under construction. On the West Coast a ten-acre site has been purchased adjacent to the railway on the outskirts of Ernakulam. A modern factory is being constructed to re-house the equipment at present in Cochin and so improve our services to the exporters of canned prawns. At Mangalore where we cater principally to the export requirements of the cashew packers, we have been able to purchase the freehold of our factory site.

Paper Group

The promise of the good start I reported last year has been fulfilled and the year's production targets were comfortably exceeded. The training of personnel, particularly printers, has advanced successfully which enables the factory, when so required, to run on double shift.

Flexible Packages and Plastics

Last year I mentioned the sanction by Government of the expansion of our Flexible Packaging Works at Calcutta No. 2. Unfortunately, owing to delays in obtaining the necessary import licence, the plant has only recently been ordered. Meanwhile, the introduction of new laminated materials has provided a further substitute for tinplate containers. The acquisition of a majority interest in Kosmek enables us to extend throughout India an integrated operation, making available, for packaging purposes, plastic bottles made to international standards and also to develop the use of the new thermoplastic materials which can be blow-moulded as soon as they become available in India.

Defence Products and Industrial Components

Throughout the year a large proportion of our technical resources at Cal-

cutta No. 2 have been devoted to supplying the Ordnance Factories. Specialised lines have been established to produce highly accurate components which have necessitated the purchase of additional plant and equipment.

Machinery Building

There is now a need to increase the installed capacity of our Machinery Building Section and we have applied to Government. We hope to have the additional equipment operating within the next two to three years. Throughout the year we continued to export machinery to overseas customers and our associates.

Research Department

The Research Department continues to play a major part in the development of the Company. During the year our Customer Research Canning Laboratory commenced operation. This additional service to the canning industry will assist in resolving problems involving canning technology. Additional buildings are being constructed for a new Paper & Board Laboratory as well as for the expansion of the existing laboratories. In collaboration with our suppliers a steady reduction in the imported content of many essential finishing and process materials is being achieved.

Technical Development Division

Despite heavy calls on T.D.D.'s services to assist Calcutta No. 2 with Defence work, there has been continued progress in the development of improved tamperproof containers and closures. Its development of new manufacturing techniques has contributed to the improved productivity of the production units.

Visits From Associates

During the year we received much valuable advice from our Consultants, some of it on the spot. In particular we had pleasure in welcoming Mr K D Brough who, apart from being a member of our Board, is Managing Director of The Metal Box Company Overseas Ltd and a Director of The Metal Box Company Ltd. We were able to discuss with him pressing current problems, in particular, the procurement of plant and raw materials.

Other visitors from our Company in the UK and other associates abroad were: Lord Murray of Newhaven, KCB, who has recently joined the Board of

The Metal Box Company Ltd, Mr V E Bowyer, Head of Staff & Personnel Division of The Metal Box Company Ltd, Mr D I Allport, Territorial Officer for Asia and Mr J G Nicholson, Head of Administration of The Metal Box Company Overseas Ltd. Technical visits were made by Mr R L Bowyer, Mr J H Brown and Mr J D Flemingham from Metal Box's U K staff. Other visitors included Mr R L Perin, Vice-Chairman of Continental Can Company, Inc, and Dr Adolf Mannicke, Head of Marketing, Advertising and Sales Control Department of Schmalbach's, West Germany. The very considerable knowledge and experience of these visitors was of great use to us in planning our development programmes.

Employee Relations

The past year has not been a particularly happy one from the viewpoint of labour relations in the country. The man-days lost as a result of strikes and lock-outs (7.3 million against 3.3 million in 1963) reflect the general unrest generated by the sharp rise in prices and their impact on the cost of living. Against such a background, it was perhaps inevitable that we too would have to face our share of turbulence.

Nevertheless, the year began well in Bombay where a comprehensive bipartite agreement, due to expire in September 1965, was concluded with our daily rated employees. However, an outside union continued to press its demands on behalf of a minority, and the matter eventually went before a tribunal which gave its award in our favour. In Mangalore, failing an agreement on wages, adjudication became necessary. Although the tribunal upheld our contention that there was no case for revision, we are continuing our efforts to get our relationship with our employees there on a more satisfactory footing. In Madras, negotiations on the renewal of the agreement with the monthly rated staff are proceeding satisfactorily.

Our real trouble spot has been Faridabad where an outside union, which we do not recognise, incited our workers to adopt go-slow tactics in spite of the fact that all the pending disputes had been referred to a tribunal. Matters came to a head in March when the workers resorted to a sustained go-slow campaign with intermittent sit-down strikes, leading to a situation where a lock-out had to be declared. This regrettable step was taken only when it became quite clear that without it a

lasting solution to the malaise would not be possible. We hope that the restoration of normal relations between the Company and its employees in Faridabad will not take too long to achieve.

The three-year agreement on Prosperity Bonus expired this year, and future arrangements will have to be in accordance with the Bonus Ordinance.

Training continues to be regarded by your Company as being highly important. This year ten Indian officers were sent for specialised training to the U K: one senior manager attended the Administrative Staff College at Henley. At the Company's Training Centre in Calcutta two General Management Courses were attended by twenty-eight officers of whom two came from associates in South East Asia. In all, there have been twelve such courses since their inception and over 80% of our management have participated in these with beneficial effect. We also organised a residential course on Sales Management and three Supervisory Courses. These two courses were supplemented regionally by non-residential courses at the Factories.

I am happy to be able to mention once again the assistance received from the Company's employees in our activities and I wish to thank all of them and the management for another year's successful effort.

Board Changes

Your Board has been strengthened by the addition of an experienced industrialist from Bombay, Mr Akbar Hydari and Mr D I Allport, Metal Box's Territorial Officer for Asia. Mr Chiswell Jones whose services with the Group in Italy have prevented his attending our meetings gives up his seat on the Board. His resignation will be accepted with particular regret, his services to the Company as Chairman and Managing Director over a period of seventeen years have made a lasting contribution to your Company's development.

Nehru Memorial Fund

The Company has made a contribution to the Nehru Memorial Fund of Rs 61,600 in accordance with the recommendations of the Indian Engineering Association.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

The Oriental Fire and General Insurance Co Ltd

Speech of the Chairman, Shri B D Pande, ICS

THE following is the speech delivered by the Chairman, Shri B D Pande, I C S, at the Seventeenth Annual General Meeting of the Shareholders held in Bombay on Monday, the 28th June, 1965:

GENTLEMEN,

The Report, Accounts and Balance Sheet for the year ended 31st December, 1964 are already in your hands and with your permission, I propose to take them as read. Before we proceed to consider these for adoption, I would like to make a reference to the entry of Life Insurance Corporation of India into the general insurance field.

Considering the business available in the country and the present trend of increase in the total general insurance premium, I am confident that both the Life Insurance Corporation and its subsidiary, the "Oriental Fire" which is so well established in the General Insurance field will have sufficient scope for expansion. The approach of both the Organisations must be to get a larger share of the general insurance business available in the country. I also expect them to give a lead in exploring fresh avenues in the field of general insurance and serve the growing needs of the country. With the very rapid growth, economic and technological, in our country it is necessary that we should attempt a new thinking with respect to the general insurance industry. Still greater growth, industrial and agricultural is inevitable and the General Insurance Industry should also fall in step by introducing new schemes helpful to the country.

I would like to make a reference to our business abroad. The overall results from business abroad are still not satisfactory and in some territories we are compelled to reduce our business with a view to improving our results. We have stopped accepting business in Indonesia mainly due to the reason that we are not permitted

to repatriate any surplus funds from that country. Our operations in Pakistan were giving us cause for concern for some time now and in spite of our best efforts, the position remains unsatisfactory. Under the circumstances, we considered it prudent to stop writing new business from June 1965 and necessary steps are being taken in this direction.

Coming to the results of the year's working, I am gratified to state that the year 1964 has been the best year so far. The gross profit for the year 1964 is Rs 124.50 lacs against a gross profit of Rs 29.61 lacs in 1963. The net profit amounts to Rs 42.50 lacs against Rs 17.11 lacs in 1963. The improved results are largely due to substantial reduction in the claims ratio, particularly in Fire and Miscellaneous Departments.

The gross premium of the Company for the year 1964 was Rs 1,053.92 lacs as against Rs 1,014.93 lacs in the year 1963 showing an increase of Rs 38.99 lacs (3.84%).

The overall ratio of net claims to net premiums was 50.66% for the year 1964 as against a ratio of 59.71% for the year 1963.

The Fire Department's claim ratio for the year 1964 was 34.27% (Rs 57.21 lacs) compared to that of the previous year's 46.31% (Rs 82.90 lacs). This can be attributed to the satisfactory experience in Indian business.

In the Miscellaneous Section also the claims ratio has come down to 51.17% (Rs 194.83 lacs) during the year 1964 as compared to 61.22% (Rs 210.19 lacs) for 1963.

In the Marine Section, the claims ratio has registered a small improvement at 87.54% as compared to 1963 ratio of 90.34%.

The overall ratio of commission and expenses of management to net premiums is 29.92% during 1964 against

32.43% in 1963 which can be considered satisfactory.

As a result of the year's working, the Departmental Reserves have shown an increase of 7.30% as compared to 15.67% for the year 1963.

Our investments for the year 1964 aggregated to Rs 529.79 lacs and the total depreciation ascertained at Rs 11.78 lacs is covered by the Investment Reserve. Considering the total investment and the general fall in prices of shares and securities, the depreciation of Rs 11.78 lacs (2.22%) should be considered nominal.

Your Directors have recommended a dividend at the rate of 10% (subject to deduction of tax at prescribed rates), as against a rate of 8% for the year 1963.

The Reserves have been further augmented by an appropriation of Rs 26.40 lacs as under:—

	Rs in lacs
General Reserve	11.50
Contingency Reserve	10.00
Dividend Equalisation Reserve	4.90
Total:	26.40

The year's working has resulted in an increase in the funds of the Company from Rs 504.60 lacs in 1963 to Rs 562.28 lacs during the year 1964 registering an increase of Rs 57.68 lacs or 11.43% over the last year.

In conclusion, I take this opportunity to express my thanks to our clients and well-wishers both in India and abroad who have continued to extend us their support. I also thank the Officers, Staff and Development officials of the Company for their loyal and good work.

N B: This does not purport to be a record of the proceedings of the Annual General Meeting.

Duncan Brothers

THE financial result of Duncan Brothers and Company for the year to December 1964 shows maintenance of the upward trend established in the previous year. But the achievement has been offset by heavy taxation. Climatically, the 1964 season in North-east India was favourable for harvesting a large tea crop, and the company's managed properties shared in this improved outturn by placing on the world markets some eight per cent more tea. Plantations in South India were as a whole less fortunate than those in the North, for here crops were considerably reduced as a result of excessively dry weather. In Pakistan the tea industry enjoyed another good season, and with the production of a record crop, it was possible to resume overseas shipments on a small scale. Development of the tea estates in the company's agency has continued to the maximum extent possible and existing tea areas are being extended wherever the requisite soil conditions can be found. The introduction of more up-to-date techniques in both factory and field have also been continued, with more estates adopting Rotorvane and C T C processing, the planting of improved quality strains of higher yielding clonal tea and the extension of artificial overhead wherever chemically suitable water supplies are readily available. Trading in tea during 1964 was not quite as successful as in the previous year because increased crop production resulted in a somewhat weaker market during part of the season, thereby lowering profit margins.

Although the company's group of jute mills continued to operate at maximum capacity, trading margins were substantially lower than in the preceding year. Considerable price fluctuations were once again witnessed, in raw materials towards the middle of the year and in sacking during the last quarter. Efforts are being continued towards diversification of activities. Modernisation of machinery in the dressing and winding sections has been completed. Export of jute goods increased very substantially, and the company now enjoys a prominent place among shippers of jute goods from Calcutta.

During the year, production at the woolcombing plant could not be maintained due mainly to the curtailment

of foreign exchange allocations to the industry for import of wool. Besides, defence orders came to an end, and as a result there was a slump in the market for tops from Indian wool. The working of the dye plant still remains affected by shortage of dyestuffs. Phillips Carbon Black recorded its first profit in 1964, when production of industrial carbon black increased considerably. At the present rate, the plant is expected to meet the production target of 30 million pounds during the current year. Plans for the expansion of capacity by ten million pounds have been finalised, and the programme should be completed by the end of this year. Schrader-Scovill's factory has begun full production of valves for motor vehicle tyres. National-Standard Duncan's factory started manufacture of beadwire in February this year, and production is gathering momentum.

The year's result shows a jump in sales and other income from Rs 5.72 crores to Rs 8.47 crores, but gross profit rose only moderately from Rs 44.73 lakhs to Rs 49.83 lakhs. Depreciation has taken up Rs 1.82 lakhs (Rs 1.58 lakhs) and taxation Rs 29.35 lakhs (Rs 26.15 lakhs). After taking into account the net loss on investments and some other adjustments, there is left a disposable surplus of Rs 16.61 lakhs compared to Rs 10.84 lakhs previously. To this is added Rs 1 lakh written back from contingency reserve to enable transfer of Rs 1.50 lakhs (same) to capital redemption reserve, Rs 0.13 lakh (Rs 0.24 lakh) to development rebate reserve and payment dividends on preference and equity capital requiring Rs 15.90 lakhs (Rs 15.60 lakhs). The dividend on equity capital is unchanged at Rs 12 a share.

Indian Copper

SPEAKING to shareholders of Indian Copper Corporation at their annual meeting held some time ago in Calcutta, the Chairman, S C Gladstone, said that the company's expansion scheme comprised an electrolytic plant, a new flash smelter of advanced design, a plant to produce sulphuric acid and a nickel sulphate plant and certain crushing, concentrating and mining machinery. The electrolytic refinery was now being put into production and the first wirebars were expected shortly. The refinery had more

than its share of teething troubles due to the poor quality of some of the indigenous plant and delays in delivery. Blister copper was still not available from the US and although the company has held an import licence since March last year it had not been possible to make any purchase. A part of the licence had been converted to a general currency area licence, and it was expected that it would be possible to obtain some copper early in the next year. Meanwhile, copper surplus to the requirements of the rolling mill had been accumulated and stocks were sufficient to keep the refinery in operation for the next seven months.

Gladstone added that the company had entered into agreements with John Miles and Partners of the U K and Outokumpu Oy of Finland for the flash smelter and flash furnace respectively. A second agreement was signed with the latter company for the design of a special type of nickel sulphate plant which would treat the residues from the electrolytic refinery. The machinery for ore grinding at Surda and crushing at Mosaboni was now being manufactured.

He expressed the hope that these projects, which would increase the production of copper and produce sulphuric acid and nickel sulphate from raw materials which would otherwise go waste, should give a reasonable return on investment when put into operation at the end of 1966.

SLM-Maneklal

FAIRLY pleasing results have been produced by SLM-Maneklal Industries for the year to March 31, last, when both sales and earnings were substantially higher than the previous levels. But the directors have not recommended any dividend with a view to conserving funds.

The preliminary profit figures released by the company recently relate to twelve months whereas those of the preceding period were compiled for 15 months and are, therefore, not strictly comparable. However, sales during the year have gone up to Rs 55.80 lakhs from Rs 36.08 lakhs of the previous 15-month period, and gross profit has jumped to Rs 23.49 lakhs from a mere Rs 6.10 lakhs. Provisions for depreciation and development rebate have syphoned off bigger slices of the profit, taking Rs 7.63 lakhs and Rs 7.29 lakhs as against only Rs 1.53 lakhs and Rs 1.40 lakhs, respectively. Taxation demands a slightly lower amount of Rs 0.75 lakh (Rs 1.30 lakhs) and there is left a surplus of Rs 7.82 lakhs compared to only Rs 0.10 lakh previously

July 3, 1965

which was arrived at after adjusting the preceding year's loss. Of the surplus, Rs 7.75 lakhs are ploughed back to general reserve, and the directors are of the view that a major portion of this amount will be exempt from tax. Reviewing the 1964-65 performance, one is encouraged to expect that the company may pay a maiden dividend for the current year.

Alembic Chemical

THERE can be no discrimination between the two sectors of our economy, and there need not be any conflict between them also. Any manufacturing unit which has an immediate plan for the manufacture of a product, which it is desirable to manufacture in the country, should be allowed to do so. It would not be in the national interest to hold it up on the ground that the public sector might like to undertake manufacture of the item at a later date. These observations were made by R B Amin, Chairman, Alembic Chemical Works, at the 58th annual meeting of the company held some

time ago at Baroda, while telling shareholders that the company had not been able to get approval of Government for its proposal to undertake the manufacture of two antibiotics, viz, Erythromycin and Kanamycin. The company had also secured the collaboration of reputed manufacturers of these products. Amin said that the Government appeared to be undecided about whether the manufacture of these and other new antibiotics should be reserved for the public sector.

Reviewing the progress made by the company over the past three years, Amin said that it had undertaken and completed various schemes of expansion. The more important among these were: the expansion of the penicillin plant, the sulphuric acid and fertilizers plants and the distillery. These schemes had contributed to the satisfactory results of 1964. The company had been granted a letter of intent for the manufacture of hydroxocobalamin, and the terms of collaboration were being negotiated with the foreign collaborators and the Government.

Shamsher Sterling Cable

AN expansion programme estimated to cost Rs 90 lakhs is envisaged by Shamsher Sterling Cable. The programme covers manufacture of 400 miles of PVC power cables, 600 tons of magnetic wires and 2,400 tons of ACSR and AA conductors per annum. Of the estimated capital outlay, Rs 35 lakhs are intended to be raised by the issue of additional capital and the remaining amount by a loan from IFC. The Japanese collaborators have agreed to subscribe for Rs 12.5 lakhs worth of equity shares out of the proposed capital issue. Meanwhile, the company's conductor section installed in December 1963 has been working satisfactorily, and the thermoplastic unit began production in September last year.

During the year ended December 1964, the company's sales advanced from Rs 41.42 lakhs to Rs 65.07 lakhs and gross profit improved from Rs 5.03 lakhs to Rs 5.89 lakhs. Of this, Rs 5.84 lakhs have been taken up by the provision for depreciation for the year 1964 and arrears on that account.

INTO THE VERY HEART OF INDIA!

Ten years ago...that's when we first started. It seems but yesterday. We've been busy going out to help people, different people. We've met them in town and in village...in plain and in woodland...in mansion and in hut. Together with our Subsidiaries we have over 1800 offices to serve them. Yet our work has only just begun. There are years, many years ahead. And today, we at the State Bank of India, pledge ourselves anew, to the dedicated service of our people and our country.

Fair warning: next year will be too late!

This is the last year to see the New York World's Fair—so fabulous that it's in its second year. Hundreds of exhibits covering 650 acres. More than a hundred restaurants. Cuisine from every land. Choose from any of our 3 routes. Nonstop—Tokyo to California. Via Manila and Hawaii. Or via Tokyo and Hawaii, where sunny days and beguiling nights await you. See as many as 20 cities across the U.S.A. Pan Am also offers daily through service from India to New York, via Europe. In New York, we'll arrange a 3-day stay: including hotel, sightseeing and a

World's Fair admission only \$ 22. Isn't this the year to see the U.S.A.?

Presented by United States Steel © 1951, New York World's Fair 1964-1965 Corporation.

Age is not all... nor the mere fact of survival on the frayed ends of tradition. Among the earliest promoters of a concept — that of self-sufficiency for our country through extensive industrialization, we have known no ingenious ways to overcome obstacles apart from flexibility in decision making, and regard for ordinary principles of management wedded to probity. If we are today a rational complement of industrial units, that is because of our reluctance to sit on the fence of the status quo — waiting for an overwhelming consumer demand to develop before being able to set our sights. And if we have a modest reputation of worthiness, we intend to live up to it through an optimum use of talents, available resources and initiative.

**AGE
IS NOT
ALL...**

AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON AND STEEL CO. LTD.: With an enviable record of production efficiency the million ton integrated steel plant at Burnpur is ready with another two-phase expansion programme to double its production capacity by the end of the Fourth Plan period. The largest foundry in the Commonwealth at Kulti is being steadily modernized and expanded.

A subsidiary, The HISCO-Station Pipe and Foundry Company Limited, recently inaugurated, has its brand new factory coming up at Ujjain for the manufacture of spun iron pipes and ancillaries directly for the benefit of consumers in developing areas.

BURN & COMPANY LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building

industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive springs and components.

THE HOOGHLY DOCKING & ENGINEERING CO. LTD. Established in 1819, the Company with its shipbuilding yard, dry dock and extensive workshops is geared to meet defence and civilian requirements, and to produce dredges to keep our new harbours and channels of inland navigation open.

ROBERT HUDSON (INDIA) LTD.: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES: Some of the first feeder railways in India, with six systems in four states, still a great aid to suburban travel.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India, serving a wide area in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester. Hand operated and electric overhead travelling cranes and chain pulley blocks.

REYROLLE BURN LTD.: A collaboration with A. Reyrolle & Co. Ltd., Hebburn, England—for the manufacture of specialised types of electrical switchgear of worldwide repute.

People of account at The Bank of Baroda

Smart Businessman:

Mr. V. N. Das, director of a leading firm, has a Current Account at the Bank of Baroda. He issues any number of cheques he wants while the Bank sees to the payment of his monthly bills, insurance premia, rent etc. and thus saves a good deal of his time.

Lively teenager:

This lively teenager is a fine example to the others—she's got a Minor's Account with the Bank of Baroda. She really likes the Bank! It's teaching her how to handle money—how to save. And she feels so important.

Promising young man:

Young man of today—and of tomorrow, Sunil Mehta. Ambitious, conscious of prestige—he made sure he chose the right bank. That's why his first pay-cheque went straight to the Bank of Baroda.

Active house-wife:

Meet Mrs. Shanker—enterprising social worker with a practical mind. Keeps her valuables and jewellery in a Bank of Baroda Safe Deposit Locker. Tells other house-wives: "This way I needn't worry about them, for I know they are in safe hands."

All kinds of people—today's people—have come to rely on the many facilities offered by the Bank of Baroda. Maybe it is because of the courteous, helpful service they always get. Or the well-reasoned advice—advice that only a Bank with so much experience could give... Or the convenience of over 225 branches in India and 15 abroad. Or the interest on Savings Account which is as high as 4%! Perhaps it's all these things. Why not visit us and see for yourself!

Development Decade

THE appraisal by the Secretary-General of the United Nations of the Development Decade at mid-point is not a cheerful document. The Decade of Development launched by the United Nations was designed to remind both the developed and underdeveloped worlds of a number of things. First, that the process of development itself was irreversible—the world is adopting to its use the modern instruments of science and technology. It also sought to stimulate the imagination of the people and to make them aware of the increasing inter-dependence of the whole process—the growth, underneath the vicissitudes of day to day politics, of a sub-stratum of economic and social experience which is more or less common to all the nations of the world. Above all, it tries to dramatise the stark fact that the gap between developed and developing countries is tending to widen, leaving two-thirds of humanity below the poverty line.

Today, half way through the Development Decade, the harsh fact persists that many of the poorest economies grow the slowest, that the gap between per capita incomes of the developed and underdeveloped countries has widened during the sixties and the flow of international assistance and capital to developing countries, which could narrow the gap, has virtually ceased to increase. The progress towards the modest goal of the developed countries transferring one per cent of their national income to the developing ones in the form of aid emphasised by the General Assembly, has been halted. The prospect of developing countries attaining a minimum annual growth of national income of 5 per cent at the end of the Decade, which the General Assembly had set as its target in its resolution on the subject, has receded; the annual growth rate of these countries as a whole slowed down from 4.5 per cent in 1955-60 to 4 per cent in 1960-63.

The misery of much of the developing world threatens to grow worse in the second half of the Decade. On present showing, the numbers of unemployed and those who suffer from hunger and malnutrition will be markedly greater in 1970 than today. This is dismal enough but the picture is made even more dismal by rapid and uncontrolled growth of population in the underdeveloped countries and the rapid migration to the cities, adding to the growth of more densely-crowded shanty towns and leading to further deterioration of standards of housing, health and sanitation.

Yet the Secretary-General sees no cause for despair. Modern technology has unlocked the doors of skill and output, confounded the gloomy prophets and fantastically increased man's power to produce. And poorer nations have the past experience of the advanced nations to draw upon. Today, with hindsight, we can better interpret what has been happening. Another advantage is the scale of information now available in every field connected with development. The vastness of potential innovation is the best guarantee to progress and the task of transferring knowledge to it is correspondingly urgent. Not that modern technology is all gain for the developing nations. Much of it has been designed for other societies at other times. It does not always meet their present needs. Worse still, it involves them in difficulties as when modern measures of health bring about a sharp increase in population before food production, educational and industrial development have become really dynamic. Moreover, much of this technology is geared to the needs of societies in which the labour is scarce and capital abundant. The trend of research in the developed nations continually leads to producing synthetic substitutes, which displace primary products, instead of increasing their competitiveness or diversifying their use.

The basic premise on which rests the effectiveness of the United Nations for giving or channelling aid to help the developing and underdeveloped countries is that of sharing of resources between the richer and poorer countries. At bottom, it demands the recognition, however dim or imperfect it may be, of the right of the people in any part of the world of working with an amount of capital per head which, if not equal, should not be too disproportionate. U Thant in the course of his appraisal more than once allows himself the thought that just as developed countries have progressed towards a fairer sharing of incomes within their own societies, some day the same principle will come to prevail among the different countries of the

Coup de Gaulle

world. And the United Nations, acting as a forum for international co-operation, is the fittest instrument for bringing it about.

Since the Decade began, the flow of aid has flattened out though more of it, 10 per cent in 1963 as against 6 per cent in the late '50s, is now flowing through multilateral channels, which is a gain. The total of aid, however, must continue to expand if the growth targets for the Development Decade are to be attained. Projections clearly indicate the increase in the gap that needs to be financed by external capital. And at the mid-point of the Decade, one cannot say that the future of this essential financing is secured. In fact, the levelling off of the flow since 1961 has set back progress towards the target. The Secretary-General complains that it is as though development programmes financed by foreign aid or loan have lost the élan of a new venture before they had acquired the respectability of old usage.

The need for external assistance is not confined to long-term capital. Working capital also needed to underpin international trade is provided by the IMF. But though it has started to operate a modest scheme of compensating primary producing countries for fluctuations in export receipts, much of the finance made available by the IMF has gone to developed countries and the general growth of world trade is outstripping its resources.

Because sharing of resources is the basic strategy of development, the steps towards expanding the export trade opportunities of the developing countries initiated by the U N Conference on Trade and Development, the Secretary-General hails as the most important event so far of the Development Decade. But U Thant is also aware—how could he possibly be not?—that :

“The United Nations does not exist apart from its Member Governments and, in the last analysis, governmental decisions will determine the tempo of its activities over the rest of the Development Decade”.

With the United Nations itself under a cloud and its function as an instrument in lessening political friction in eclipse, there is an unmistakable tragic note in the words and it is not difficult to see why the mid-point appraisal should lack cheer. But one lives in the hope that the logic of world events, if nothing else, will restore the UN to greater effectiveness. And, if the UN is to survive, it can do so only by being a world body in the real sense of the term.

EVER since its inception in 1958 the European Economic Community has impressed the world as a grand structure. It has conveyed this impression in various ways: by bringing together some of the world's leading industrial nations, by reaching ever new heights of prosperity and by proving a tough bargainer in trade negotiations. But above all it has impressed by its promise. As Walter Hallstein, its President, said, the Community was not in business, it was in politics. It was the ambition of its architects to create a nation comparable to the world's greatest in power and grandeur, and perhaps to surpass them all.

Without the promise, without the ambition, without the idealism, however ill-defined and inconsistent it was, there would have been no EEC. And yet, the skeleton of the EEC was a bargain between the industrial Germany and Benelux on the one hand and the less developed France and Italy on the other. What was proposed was a Common Market, not only for industrial goods, but also for agricultural products, for labour and for capital.

The market for labour and capital has been unified; so will be the market for industrial goods by 1967. The agricultural arrangements still hang fire; since they will mainly benefit the French, they feel that the part of the bargain that has been carried out is unfair to them. On the other hand, the industrial Common Market did not hurt France as it was expected to, and her partners deny that they owe a debt of gratitude to her.

And yet they went far towards paying it. In December they agreed on common cereal prices to be achieved in 1969 which would virtually wipe out cereal growing in Germany and Benelux and leave the cereal market to French farmers. The final agreement on subsidies to maintain farmers' incomes and to help them change their product patterns was also favourable to France. The only outstanding question was the financing of the subsidies: it had to be settled by June 30.

It was not settled. France proposed that the subsidies be financed by pro-rata contributions from the member countries and administered by the European Economic Commission, while the Commission, supported by the other five, proposed that the entire proceeds of import duties levied by the Community be turned over to it for the financing of subsidies as well as

other collective endeavours of the member countries. It would thereby collect over \$ 2,400 million by 1972, of which about \$ 1,000 million would be left with it for collective purposes.

The financial implications of the Commission's proposal were not necessarily unfavourable to France. They, however, would make the Commission financially independent, and put large resources under the control of the Commission and of the EEC Parliament. In other words, the proposal was designed to provide the financial underpinnings of a supra-national authority. This assured its rejection by General de Gaulle. Not that he is against such an authority, but he would like it to command a European army, and he would want it to agree with and so, in effect, implement his foreign policy.

Following the breakdown of negotiations on June 30, de Gaulle's recall of the French Ambassador to the European Economic Commission, and the beginning of non-co-operation with various EEC working groups were unimportant events — undistinguished examples of de Gaulle's mastery of gestures. More significant is the breakdown of negotiations between the EEC and Nigeria. As long as France stays unrepresented, the Commission cannot negotiate: it is paralysed in its external relations. This will also mean the breakdown of negotiations with Austria and Denmark, as well as of the Kennedy Round and may well give new strength to the European Free Trade Area and revive interests in African and Commonwealth trading arrangements. Hitherto it was difficult to reach any agreement with the EEC because all its six members had to ratify it; now it will be impossible since one will not be there at all. A small change for non-members of the EEC, but it could turn the tide against Brussels.

Where does the EEC go from here? It is unlikely to die: it would be too much trouble all round dismantling it, and France would rather be in a Common Market that excludes Britain than be out of one that includes it. Even an agreement on agriculture is not quite ruled out: de Gaulle is an able tactician and has a brilliant negotiator in Couve de Murville, and a compromise can certainly be reached without any principles being involved.

The EEC will survive; it will still remain a milestone. But it will no longer mark the beginning of a road: it will mark its end.

Cochin Refinery: Same Story

WHEN the agreement to set up the Cochin refinery was signed two years ago with Phillips Petroleum Company of USA, it was acclaimed as being a considerable improvement, from the point of view of the country's interests, over the agreements with Burmah-Shell, Esso and Caltex. This, no doubt, it was—in many respects. The feat of persuading a major American oil company to collaborate on a minority basis with the Government was itself considered an achievement for the Oil Ministry, then under K D Malaviya, as well as a sign of the changed times. In one crucial respect, however, the agreement with Phillips followed the pattern of the earlier agreements. Like Burmah-Shell, Esso and Caltex, Phillips was given the exclusive right to import crude oil for the refinery for a period of 15 years from sources of its own choice.

How onerous and contrary to national interest this commitment can be, has been driven home to us by the present foreign exchange crisis. Because of exchange difficulties, the Government has had to turn off a major part of the imports of oil products through the private oil companies and substitute for them imports from the Soviet Union and other countries in the rupee payment area. As was pointed out in these columns in the issue of June 26, 1965, imports of oil products from these sources, apart from being against payment in rupees, are also cheaper. This is as much true of crude as of products. But here the Government has its hands tied by the refinery agreements which give the companies the right to import oil from their own sources. Thus, however grave the exchange situation, the Government has no alternative but to go on spending foreign exchange at the rate of Rs 30 to 40 crores annually for the three private sector refineries even though a good part of these imports could be had without spending a dollar of foreign exchange and at cheaper prices per gallon. When the Cochin refinery goes on stream the annual commitment of foreign exchange for import of crude will increase further, the refinery having a capacity of 2.5 million tonnes expandable to 3.5 million tonnes.

The Oil Ministry has already had a taste of what is in store. In anticipa-

tion of the refinery starting operations in January next year, Phillips has negotiated with a supplier in the Middle-East for the necessary crude supplies. It has to do this since its own principal concessions are in Libya, and getting crude from the Middle East will save on transport costs. What is worrying the Oil Ministry, however, is the price per gallon at which Phillips is going to import the crude. This price is reported to be actually higher than that at which the private refineries import their crude, which is itself too high since the companies are not giving us the maximum discounts which are currently available on the so-called posted price of crude oil. Under the terms of the Cochin refinery agreement Phillips is obliged to purchase crude “on the best terms possible”, but this constraint doesn't mean a thing as has been shown by the practice of the private refineries which are also bound to import crude on the best terms available. Discounts on crude were first given to India by these companies long after they had become quite common in the international oil market and then after some bullying by the Oil Ministry. Even so the rates of discount have consistently lagged behind those which the same companies have allowed to other countries. The Oil Ministry is either in the dark about the maximum discounts currently available or is unwilling to force them on the oil companies.

In the case of the Cochin refinery, the Oil Ministry will be a little less helpless, or so one hopes. The reason for this hope is that under the terms of the agreement and in keeping with its majority participation in the share capital, the Government will nominate five of the nine directors of the refinery company. Phillips Petroleum's right to import crude will be beyond the control of the board of directors, being written into the original agreement, but there is no reason why the board should accept Phillips' prices if these can be proved to be too high. It remains to be seen how effectively the Government will wield its control of the board to ensure that crude prices are kept down to the minimum.

Incidentally, it has been clear from the very beginning that the pricing arrangements contained in the Cochin refinery agreement are more than a little curious. The agreement provides that Phillips will import crude on the “best terms possible”; it also provides

that the refinery company will get a process margin of 1.35 dollars per barrel of crude (apparently to assure Phillips and its Indian associate, Duncan Brothers, their profit margin); and, finally, it enjoins that the refinery will make available all its products, other than those for export, to the Government (or its nominees) at prices not exceeding those determined by the Oil Price Enquiry Committee. These three provisions could prove incompatible and, in fact, it is likely that at the price at which Phillips is reported to be preparing to supply crude, and after allowing for the refinery margin, the price of oil products may turn out to be higher than those fixed by the Oil Price Enquiry Committee, which are now likely to be reduced further if the Talukdar Committee takes into account the full discounts which are currently available in international markets. In that case what will give way: crude price, refinery margin or product prices?

Fifth Steel Plant

THE penultimate round of the battle for the fifth public steel plant to be located in the peninsula has been won by Andhra. The British-American Steelworks for India Consortium (BASIC) has selected Visakhapatnam as the best site in preference to Bailadila, Goa, Hospet, Salem and Neyveli. Hospet is indicated as the best inland site but the Consortium has plumped for a deep water site, partly because it would cost somewhat less but mainly because it can be oriented much more easily to import of coke and export of finished products—and because potential financiers have demonstrated “a genuine preference” for such location. It has an advantage of about Re 1 per ingot tonne in variable cost and of Rs 11 crores in capital cost over Hospet. Bailadila and Goa have been ruled out due to their poor transport connections and commitments to export iron ore. Iron ore costs at Salem would be substantially higher though it is favourably located for the distribution of finished products.

Inter-State rivalries have not been slow to come out into the open after the disclosure of the Consortium's recommendations. The Andhra Chief Minister rushed to say that the just claims of his State had been accepted, which provoked Lal Bahadur Shastri to caution him that the Centre (which

is responsible for the project) has still to come to a decision. Mysore has asserted that Hospet cannot be brushed aside. Madras, armed with the earlier Dastur report on Salem and with a Japanese collaborator in sight, has claimed that Salem with its projected half million tonnes of specialised steels is a different proposition, quite independent of the Consortium's investigations. It was the Centre's inability to deal with these pressures which led it to refer the question of location to the Consortium which, there is no doubt, has been swayed as much by the merits of various sites as by the inclinations of potential lenders of foreign exchange in Europe and U.S., some of whom have received generous public relations treatment from the Steel Minister in the course of his recent extended foreign tour.

In the inter-State wrangles which are sure to be witnessed during coming months, the key questions regarding the fifth plant are likely to be lost sight of. Is BASIC going to get a turn-key contract with consultants acting as suppliers also? How much of the plant and equipment would be imported? What are the terms of the credits that are likely to be offered by the financiers? Would export or corresponding import commitments be part of the contract since the parties concerned are so keen to have a foreign trade-oriented location? These questions are of greater importance than which State gets the plant.

The One That Survived

THESE are hard times for international get-togethers. The Afro-Asian conference slipped through the chink created by Ben Bella's fall, to the barely disguised relief of a substantial section of Afro-Asian opinion: whether Humpty Dumpty can be put together again remains to be seen, but some potential participants at least are gratified that they are spared the agony of choosing between Peking and Moscow, between Djakarta and Kuala Lumpur. But the Afro-Asian conference, famous as it now is because it raised so much dust in trying to meet, is only the most dramatic failure. The United Nations itself, queen of the multitudinous assemblies, remains paralysed on the surface for lack of cash, but at a deeper level high and dry on the rocks of new nationalism — de Gaulle, Kossygin, Sukarno and now, most important, President Johnson, quite clearly no longer need the ideological trappings of United Nations when there are apparently only dis-

united ones, when unilateral action seems to pay. The twentieth anniversary of UN in San Francisco offered little hope of a brighter future — only the insistent reiteration of the central nationalist dilemma which killed the League of Nations, even if heavily garnished with traditional pieties.

Other associations have not done much better. For the moment, the Common Market has defeated de Gaulle and opted for a strong central executive. In doing so, it has threatened its own existence. Such threats have occurred before and have been survived, but France will soon have to choose between using the Community as a setting to project its own national power, and submerging its identity in a supra-national entity, commanded by a professional bureaucracy. SEATO, far away and never as significant as EEC, remains looking slightly absurd

since America scarcely bothered even to notify it of its action in Viet Nam. The defection of France is only the largest nail in SEATO's coffin to date. The Organisation of American States has also hardly recovered from its role as by-stander while the United States invaded the Dominican Republic — shoot first, consult afterwards, is not the best recipe to persuade Latin America that Washington has its best interests at heart. Meanwhile, a longer crisis threatens the dissolution of one of the largest and most heavily armour-plated mammoths, NATO. The straws in the Washington wind suggest that there is a powerful faction within the Administration (using as its mouthpiece the Disarmament Agency) pressing for an immediate follow-up to the Test-Ban Treaty to prevent the proliferation of nuclear weapons and, despite Viet Nam, seal the Soviet-American detente. This is all very

well, but the advocates also go on to argue that the detente may be achieved at the cost of NATO's latest ploy to contain de Gaulle and all the undeclared nationalists, the Multilateral Defence Force. Crudely, the argument demands that a Moscow-Washington axis be swapped for the Atlantic Alliance.

Thus, these are not just hard times for those who wanted, through international meetings between statesmen, to transcend the brutal simplicities of the Cold War; it is just as hard for the exponents of simplicity, for the shrinking cohorts of cold warriors. Paradoxically, one of the least strong members of that select club of international-meeters, the Commonwealth Prime Ministers, has currently made the biggest dent in the world press — perhaps partly because most other assemblies are plunged in gloom, half-listening to the creak of faulty timbers. Despite all the manifest disagreements within the Commonwealth, bound together by no more than a shared experience of the same imperialism (but including the imperialist as well), Harold Wilson has been able to use it as a means to try and find some way through the Vietnamese jungle. Of course, he did it pre-eminently to safeguard himself from attack by the Labour Party Left (quite rightly grumbling at the total subordination of Labour Britain to American foreign policy; the prize for obedience, not so often noticed, was seen in the foreign credits that have supported sterling since last October) and to cut a dash on the international scene preparatory to the possible general election this autumn, much as Macmillan skipped about Russia in a white fur hat to impress the British voter before the 1959 election. He might also have done it because Washington desperately needs some face-saver in Viet Nam. However, whatever the reasons, the astonishing result is that the Commonwealth did not evaporate under the strain. The grumblers were there, and since the Conference they have proved largely right. Moscow refuses to talk on behalf of the Viet Cong; China and North Viet Nam do also refuse, adding acidly that a power so totally loyal to Washington as Britain could never be regarded as an impartial arbitrator or even honest broker, even if President Nkrumah is hiked along to make the mission seem more respectable. Wilson has edged along to suggest that the mission might meet the Viet Cong also — only to find America angered at this playing with fire. Even the

prospect of an amiable chat between the Commonwealth mission and U Thant has now been scotched.

But although the mission is unlikely to achieve anything, as a lesson in public relations Wilson's exploit will go down in the mythology of the Commonwealth as an illustrious deed that somehow makes the Commonwealth worthwhile. More to the point, in the wrack and ruin of international assemblies which we are currently witnessing — the old chrysalis has not yet shown what manner of butterfly 1966 will see — it is odd to see the one with apparently the least to hold it together in fact outliving the rest. It may be the cohesion that presages disintegration; it may be that there is so little to the Commonwealth, there is nothing that could disintegrate; it may be the illogicality that defies reason, so beloved of the ruddled; it may be the sentimentality of the last generation, awaiting only the newcomers to dissipate. Whatever it is, it has survived the assault of Harold Wilson with dignity and almost come to mean something — the reverse trend to sister international associations.

Village Industries in Fourth Plan

A Correspondent writes:

WHEN U N Dhebar says "not hurt", he apparently means "hurt". According to newspaper reports, he has written to the Prime Minister that he would not feel hurt if the Prime Minister thought it fit to disband the Khadi and Village Industries Commission, of which he is the Chairman. The reason for this offer of self-immolation is Dhebar's dissatisfaction with the Planning Commission's attitude towards khadi and other village industries as expressed in the Fourth Plan targets of additional powerlooms, spindles, rice mills and footwear factories. The Khadi Commission has proposed an outlay of Rs 160 to Rs 170 crores for its Fourth Plan schemes, as against the Third Plan allocation of Rs 93 crores. The physical target proposed for khadi production is 250 million yards by the end of the Fourth Plan as against a target of 160 million yards by the end of the Third Plan and an achievement to date of only about 100 million yards. It is claimed that 2.4 million people are getting part time employment in khadi and village industries and that this figure will be raised to 5 millions by the end of the Fourth Plan.

It may be too hasty to conclude optimistically that the dispute is a sign of the dawning of economic sense in the Planning Commission in a field which has up till now been left entirely to the fads of ideological enthusiasts at the cost of the scarce savings of the nation. About Rs 200 crores would have been spent on these industries during the course of the first three Plans and it is doubtful whether there could have been a worse way of spending the amount. For, there can be absolutely no economic justification, either from the growth or even from the welfare point of view, for subsidising these thoroughly inefficient industries. To describe these industries as inefficient is not enough; for it is not merely that they are not competitive. It is often forgotten even by critics that while khadi cloth has got in this country a certain consumer demand, producers of most of the other industries of the groups do not meet any consumer demands at all. There is no market whatsoever, either in the urban or in the rural areas, for such products as cottage matches, hand-made paper, cottage soap, etc.

These so-called industries have gained from the confusion arising from their being associated with other very different industries also passing for small scale industries. Thus, there are the industries that can be set up on a small scale but with power and modern technology; there are the handicrafts, which incorporate traditionally inherited skills that cannot be simulated by machines, which have, therefore, a market of their own and great possibilities of export. There are products, like handloom cloth which cater largely to luxury demand and khadi cloth for which also there is demand though this is not likely to expand. Lastly, there are the so-called village industries, the products of which have no market whatsoever. There cannot be the same set of arguments for this very heterogeneous group of industries.

It may be recalled that economics of this group of industries were discussed threadbare in a series of articles in this journal during the early years of the Second Plan. The discussions established the uneconomic character of the khadi industries beyond any doubt. The Ambar Charkha which was supposed to be a great improvement over the traditional charkha was found equally uneconomic. However, at that time, calculations were based on the assumption that "the Ambar Charkha could be plied for 300 working days in

DELHI SCHOOL OF ECONOMICS

Research Scholarships in the Department of Economics

The Department of Economics has the following scholarships to offer to candidates who wish to register themselves for the Ph D course in Economics in the Delhi School of Economics, University of Delhi.

- | | |
|---|----------------|
| (1) The Ranade Scholarship | Rs 150 pm |
| (2) The Kikabhai Prem Chand Scholarship | Rs 150 pm |
| (3) 3 Research Scholarships in the Department | Rs 150 pm each |
| (4) 2 Research Scholarships offered in the Department as a Centre for Advanced Study in Economic History and Economic Development | Rs 200 pm each |

The scholarships are to be awarded on all-India basis and candidates of merit from all Universities will be considered.

Applicants should have a good academic record at the undergraduate and post-graduate level and should have secured a First Division or a very high Second Division in the Master's Degree examination. Ordinarily they should not be also more than 30 years of age. All applications should give full details of age, academic career, and institutions in which earlier training was received; they should also contain a statement (of about 600 words) indicating the area of special interest of the candidate and the kind of problems on which the candidate intends to do research.

Research scholarships offered in the Department as a Centre for Advanced Study will be available to only those who intend to do research in problems of Economic History or Economic Development. Candidates who have specialized earlier in History will also be considered for these scholarships. Only candidates who have had an outstanding academic record and can give evidence of extensive reading in the subject need however apply.

Candidates selected for interview will be expected to come to Delhi at their own expense.

Applications on plain paper addressed to the Director, Delhi School of Economics, University of Delhi, Delhi-7 should reach the office of the School by July 7, 1965 or by July 19, 1965 in special circumstances.

a year and produce 6 or 8 hanks per day". The Third Plan admitted that in fact the Ambar Charkhas "were worked on an average for about two hours in a day for about 200 days in a year and the average production was only 1.8 hanks per day." Production even at this low rate has led to accumulation of stocks of unsold products. This latter indication of faulty resource allocation is not confined to the khadi and village industries alone as the very near crisis of stocks of handloom products in South India demonstrated.

Planning Commission's Veto

THE Planning Commission has not given up its opposition to the small car project. Newspaper reports indicate that the Commission is against inclusion of the project in the Fourth Plan. Apart from the merits of the project, the Planning Commission's stand raises the old question: Where does the Commission's function end and the executive agency take over?

The Planning Commission has long been used to taking a hand in executive decisions (and, in the process, not doing its own work well). Its eagerness to record its opinion on the small car project reflects this habit. A rational division of labour would, of course, require the Planning Commission to restrict itself to recommending general policy. For example, it can lay down the target for passenger cars for 1971. (The present decision on the small car implies that this target will not be raised, for raising the target for existing producers will also involve commitment of foreign exchange, the lack of which is the ostensible reason for not allowing the small car project). Then, assuming that this target requires a rise in capacity and production, the Planning Commission can lay down the policy relating to projects for achieving the target. It can state, for instance, how much foreign exchange (and, of what kind—rupee payment, tied or free) would be allowed to be used on capital account and on current account, and what would be the obligations of the party (whether existing producer or new) in regard to output and prices. This would be the legitimate function of the Planning Commission.

Instead, the Planning Commission, without committing itself to any policy, pronounces judgment on individual projects. This is ideal ground for vested interests to play off Government orga-

nisations—in this case, the Planning Commission and the Industry Ministry—against one another. Having got the small car project torpedoed, they no doubt hope later to be able to secure approval for their own expansion projects which might not only be more expensive in terms of foreign exchange but might also not help to reduce car prices. The existing production facilities have been set up on wrong lines so that, as the producers themselves admit, there is practically no scope for any economies of scale.

Coming to the small car project itself, one fails to understand the logic of the Planning Commission's reported decision. Is it the intention to perpetuate the car shortage—and provide monopolistic advantages to existing producers? The foreign exchange argument against the project does not hold water in the case of some of the proposals at least: Czechoslovakia has offered credit on rupee payment terms and the Renaults are reportedly prepared to give an export guarantee.

Profitability and All That

RUSSIAN economists faced a serious problem a few years ago when stocks of certain lines of garments and shoes began to mount: apparently, the consumers were on strike against them. The stocks were liquidated somehow, but similar problems continue to recur, and have caused much discussion. Much of the discussion concentrates on the quality of the goods, with which the unsaleability of the goods has an obvious connection; but argument has also extended to whether the present way of specifying a large number of "success indicators" for individual enterprises is good enough. Professor Liberman of Kharkov has suggested that they should be replaced by a single criterion—that of profitability, and his proposal has attracted much notice in the non-communist world and has been looked at as a portent of an era when communist economies will adopt capitalist mores.

This proposal has hitherto tended to overshadow Liberman's other ideas, which are just as important to the case he is making. In a paper that has recently reached us, he explicitly recognises that a reform of prices is an essential precondition to the application of profitability criteria. He says that prices should take the quality of goods, i.e., their effectiveness in operation, re-

liability and durability into account, and that prices should be set as goods become antiquated or obsolescent. He also favours the replacement of notionally set output targets by orders from trading enterprises, construction sites, etc., which would be able to specify quality requirements. A buyers' market for goods and competition between enterprises are also advocated, so that there is a relation between the efficiency of enterprises and the demand for goods.

The discussion on the Liberman proposals still continues to lean towards ritual and doctrine; the question whether it is "unsocialist" to make profits still obsesses many Russian economists. But the problems which gave rise to the proposals also persist.

Insofar as the accumulation of stocks has something to do with quality, the implementation of Liberman's suggestions will certainly alleviate it. But there is probably a Keynesian reason for their accumulation. It is well known that the growth of production of consumer goods has been accelerated in the Soviet Union's Seventh Plan. Production of these goods has been rising faster in relation to consumer incomes, and has probably led to excess supply of a number of consumer goods, especially consumer durables. So even if the Russians advance in the solution of the problems of pricing and quality control, they will still be left with the task of learning to regulate aggregate demand.

Errata

Ashok Rudra has drawn our attention to the following misprints in his articles:

- (i) In the article, "Indian Economic Growth: Performance and Prospects" — Some Comments", in the issue of July 3, 1965, on page 1070, column one, the 28th line from bottom should read "and decreased market supply may be" instead of "and increased market supply may be".
- (ii) In the book review, "Pathetic Women", in the issue of June 19, 1965, on page 980, column two, the 33rd line from top should read "none for the world in which she" instead of "many more for the world in which she".

The errors are regretted.—Ed.

CAPITAL VIEW

Impending Battles

Romesh Thapar

THERE is a perceptible flexing of political muscle in the Capital. Reports from the States also suggest that in-fights, major and minor, are being planned. All this no doubt has something to do with the forthcoming AICC deliberations at Bangalore, when various disgruntled but still ambitious groups within the ruling party plan to challenge the powerful move to clear the way for Kamaraj's second term as Congress President, but it would be short-sighted to assume that the inner-party struggle is taking place in a total vacuum. Although the vendettas between various political personalities strengthen this impression, fortunately for us certain rather substantial developments have now begun to intrude upon thinking within the ruling party and might help discipline the impending battles.

Planning Commission on Defensive

At Yojana Bhavan, Asoka Mehta is the first to notice the faint smell of gunpowder. Reports are current that Fourth Plan targets are again under assault and that many critical sectors will feel the axe. It would be idle to record the multitude of rumours in circulation until the scale of the plan is officially released, but there is no denying that the anti-planners are mobilising behind the slogan of 'consolidation' to blunt our development effort which they see as a growing threat to the *status quo* of privilege and profit.

The panic spread by the Finance Ministry about the balance of payments gap has certainly the effect of putting the Planning Commission on the defensive. There is demoralisation, too, in the Finance Ministry over the prospect of having to negotiate large loans merely to pay back the interest on earlier loans. And T T Krishnamachari, disgruntled and isolated, has yet to make up his mind about what is to be done. His silence, and the fact that his friends are deserting him in his decline, do not help matters at this critical moment.

The lack of economic and social perspectives at the level of the political leadership is startling, to say the least. Apart from mouthing slogans about self-sufficiency, no one is prepared to spell out what sacrifices are called for. The balance of payments crisis has highlighted the often obscured fact that our industry, despite three five-

year plans, remains terribly dependent on foreign spares and servicing. We have also learned that little has been done to twist the ears of manufacturers who are behind in their commitment to become self-sufficient. Yet, when in despair, someone urges that in order to build the foreign exchange funds for this disastrous lapse, a call should go forth to ban the consumption of those things which can be readily sold abroad—sugar, for instance—the politicians begin to whimper about the angry outbursts such a policy might spark.

Again, the real trouble is that there is no one to give a lead. We prefer to beg in the capitals of the world. We seem to have forgotten, despite many pointed lessons, that there are other ways to survive. Indeed, judging from the comments which appear in our daily newspapers, it is no longer politically healthy to recall this embarrassing truth. But, as I have said earlier, events are conspiring to bring us into collision with reality.

For example, the story of the GOI's clash with the oil companies has kindled the embers of national self-respect. Oil products, paid for in rupees, are being forced upon a reluctant private distribution network. This is being done despite the quiet warnings being given about the possible repercussions on aid-giving countries in the West. The demand to nationalise a rebellious oil industry can be heard in the most cautious of political circles. Obviously the managers of these oil companies either did not appreciate the crisis facing the country or were misled into believing that they were still powerful enough openly to manipulate the policies of a meandering GOI. You can now hear them going around the corridors of the Secretariat claiming that they have been 'raped'!

Naval Aid from USSR

To take another example, we could perhaps talk in similar vein in London and Washington on the question of naval hardware. For long months, we have been knocking at various doors in Whitehall and at the Pentagon to get ourselves a few submarines, some fast moving torpedo and rocket-firing boats and some other naval craft. We were also told to keep away from the Kremlin, for this would lead to a boycott by the West. But having been spurned, we are at last heading Moscow-wards with

full Cabinet backing. The 'shocked' British, our traditional suppliers for the Navy, are now threatening to abandon a vital frigate-building project. They have also promised to block all future naval aid, whatever that may mean. Commonwealth, indeed!

Tanks were denied to us because we were told that we were likely to use them against Pakistan. The naval shipping list, so essential for the defence of the Andamans and Nicobars, was also described as likely to make the Pakistanis suspicious. In fact, it was pointed out that the Anglo-American naval concentration in South-East Asia was adequate protection for the Indian Ocean. The argument clearly revealed what was intended—an India forever dependent on western protection. It's cheap, they said. And we were encouraged to go West in the hope that we would receive free gifts of equipment. This sorry tale is over. We shall pay in rupees—to the Soviet Union, it's healthier. Even the Cabinet, terribly inhibited not so long ago, has at last been persuaded.

But because every Cabinet Minister is a law unto himself, the lesson drawn is never applied generally. We have developed extraordinarily gullible attitudes. Take the latest bit of cynical expertise which has been offered us by a Western steel consortium. Vishakhapatnam has been chosen by these tongue-in-cheek specialists as the location of the fifth steel plant which is planned to expand to 4 million ton capacity. The Western consortium has not only obliged Steel Minister Reddy who hails from Andhra, but has also indicated that it will only support a project so located. Another quite unnecessary threat!

Agitations are bound to be started to change the location, particularly in Mysore where the Hospet site is known to have been approved earlier. Reading the summaries of the Western consortium's reasons for selecting Vishakhapatnam one would imagine that locations are to be determined because of their convenience for the suppliers and contractors. Vishakhapatnam may well be alright, but it passes comprehension why a group of specialists should decide to 'dictate' a site to the government. These strange tactics will probably hinder speedy implementation by trying up the project in political controversies.

BINNY'S MARLBOROUGH SUITING

67% 'TERENE'/33% COTTON

Economically priced. Superb durability. Economical to maintain—just an overnight wash and it is ready to wear in the morning. 10 shades with subtle check designs for men's suiting, boys' wear and dresses for the lady executive. Undeniably magnificent value for money.

THE BUCKINGHAM & CARNATIC COMPANY LIMITED, A Subsidiary of BINNY & CO. LIMITED, MADRAS

for the battle at Bangalore, they will have to weigh some of these issues with care before they raise their hands in support of this or that contender for leadership. We are passing through a complex phase in our development. The leadership of the party during this period will be compelled to re-forge those perspectives which died with Nehru. This is no easy task in the absence of a dynamic man or group of men. The dry rot over which Prime

Minister Lal Bahadur sits firmly will have to be treated.

The first step is to prevent the subversion of the central apparatus of the party by politicians who have the make-up of gangsters. At the moment, Kamaraj looks as if he is the man who can salvage the healthiest cadre of the ruling party and entrench it for the elections of 1967. He will need energetic assistance—but, then, that is the next step.

FROM THE LONDON END

Labour's Second Wind

HAROLD WILSON's categorical announcement that he has no intention of calling a General Election this year, means that barring accidents the Labour Party will continue in office for at least another twelve months, and this will now provide it with the opportunity to take the steps to prove that Labour will introduce the type of changes into the British economy for which they were elected. In the fresh start that is to be made, it appears likely that there will be some reorganisation of Wilson's cabinet and that a new drive will be made to improve the image of the Party.

Unpopular Measures First

Perhaps on the advice of Earl Attlee, Wilson decided to proceed with the unpopular things first, and although this has certainly reduced the popularity of the Labour Government, it may have left the way open for more positive action which will serve to reassure and reinspire Labour supporters who at present are disappointed and disillusioned with the record of the Government. It appears likely that in the next session there will be an impressive programme calculated to win back waning public support. This could well include bills on mortgage rates, criminal justice reforms based on a White Paper to be published shortly, wage related national insurance benefits and contributions, a guaranteed minimum income for old people, some cuts in defence expenditure as the Defence Review progresses, and a second wave of new towns. With these sights in view, it is not surprising that Wilson has decided to battle on despite his razor edge majority. The controversial Finance Bill is now out of the way and it is not yet certain whether the Steel Bill will be postponed or not. It also seems likely that it will be too late to debate the Jard Commission proposals before the summer recess as the White Paper has not

yet been published.

In many ways this is a courageous decision for Wilson to take because it means that he will have to face up to the difficult sterling situation which is likely to crop up once more in autumn. Traditionally, September is a time of strain for sterling, but in 1965 the pattern of payments has been so distorted that it may well be that purely seasonal pressures may be less. The figures put out by the Treasury on the gold reserves have been set out in such a way that they hide more than they reveal. Officially, the reserves at end-June were down £24 million, or £21 million if interest payments to the US are excluded. However, an unstated amount was drawn against the \$750 million credit line with the New York Federal Bank. Therefore, it is really impossible to gauge the real situation, and generally speaking, foreign exchange markets now pay more attention to monthly trade figures than to recorded movements in the reserves.

The fact remains that the economic horizon is still far from clear, and recent figures on the balance of payments are not as favourable as might have been hoped. Despite the fact that the balance of payments figures for the first quarter showed the expected improvement, they did not succeed in restoring complete confidence in sterling. The fact that world opinion still continues to be jumpy about the prospects of sterling was confirmed by the rumours of sterling devaluation which spread around Wall Street on the eve of Callaghan's visit to the US. The unusually heavy outflow of capital in the first quarter was partly offset by the improvement in trade, but this has not been maintained since. Much depends on how effective the action taken in the budget to discourage overseas investment will turn out to be. The Chancellor of the Exchequer hopes to reduce last year's deficit of £745

A clash at Bangalore would do nobody any harm. Too long have the bitter skirmishes between the factions and leaders been held behind a smokescreen of goodwill and friendship. A few open battles would prove invigorating for a party which looks mentally and physically palsied but continues surprisingly enough to show strength at the polls. We would then know who stands for what and where—a pre-condition for the treatment of the dry rot.

million to £300 million in 1965 and eliminate it by 1966. Certain factors assisted the first quarter figures. To begin with, the figures on imports into Britain were affected by the New York dock strike which held up shipments of exports to Britain; this factor will not apply again. On the other hand, the pressure of US companies to repatriate funds, and the uncertainties about sterling which led to heavy remittances from subsidiaries of foreign firms, may well continue. However, some relief will be obtained from the agreement recently concluded by which Germany will offset foreign exchange costs of British forces by buying British goods worth £127½ million. The crux of the situation, therefore, continues to be the need for Britain to increase exports and decrease imports. This is a factor which will continue to overhang the British economy for the next few years. Britain's share of world trade has fallen from 20 per cent in 1954 to 14 per cent in 1964 and the downward trend seems to be continuing.

Labour's Strategy

The main strategy on the economic front relates to the Economic Plan which should be ready by mid-September. It is understood that replies to the Department of Economic Affairs growth questionnaire suggest that British industry believes that as things stand at present, it is unlikely that the growth target of 25 per cent increase in domestic product will be reached by 1970—the improvement is likely to be nearer 23½ per cent. Again, industry believes that the shortage of workers will amount to 500,000 rather than the anticipated 300,000. Productivity is unlikely to reach the 3.5 per cent improvement for which the Government is hoping, and will probably be nearer 3 per cent. British industry believes that with the possibility of a contraction in demand from the Common

Market countries and the USA, competition overseas is likely to become increasingly severe in the next year or two.

The second bolt in the Government's armoury is its Prices and Incomes Policy. How effective this will turn out in practice still remains to be seen, but the Government is claiming that George Brown and Aubrey Jones of the Prices and Incomes Board, have won a significant victory over the road haulage industry. This, they hope, will set a precedent for further successes. The fact remains that since the Government is not in a position to impose price controls, the organisation really has no teeth and most of the pressure so far has been more on the wages than on the prices front. Fighting speeches have not been lacking about the need to control prices, and George Brown in his speech last week-end at Bristol, said that Britain was being "taken for a ride" by unscrupulous firms inflating their prices unnecessarily. He also went on to say that the Government would "make the biggest drive that has yet been made to get prices stabilised and all incomes within the level of the productivity rise". The attack on the incomes front was continued by Callaghan who told a Labour Party Conference in Swansea over the week-end that incomes have been rising too quickly and faster than production.

A World Slump?

What do Britain's economic prospects look like at the moment? The Chancellor of the Exchequer assured the US Administration that Britain had a good chance of winning her balance of payments battle by the end of 1966, but even he admitted that it would be a long and hard haul in which gimmicks could play no useful part. The fact remains that the UK economy is far from healthy. The economy appears to be overheated, and the latest Ministry of Labour figures show that there is over full employment. At the same time, prices on the Stock Exchange have been slipping sharply, reflecting the same trend in Wall Street. Indeed, the whole world economic picture appears to be far from rosy, and it is not surprising that people are beginning to wonder whether the world is sliding into a second slump. There are many similarities between 1965 and 1929, and it is for this reason that Martin, the Chairman of the US Federal Reserve System recently appealed that the world should take "seriously" recent comparisons between the present and the period preceding the

breakdown of the inter-war economy and heed to warnings about the threat of another "great depression". Looking at the international scene, there is the return of a dollar gap, financial difficulties in Japan and Western Europe, the tightening of world money markets, the fact that many developing countries have no hope of servicing the external debts they have accumulated.

At the same time, the present system working since the two reserve currencies are no longer doing the work they should be. Since the rest of the sterling balances are being used and dollars are being converted into gold, while exchange controls are undermining the reserve roles of these two currencies. If this trend continues and both the UK and the USA eliminate their balance of payments deficits and inter-

national reserves are concentrated in Western Europe, there will be no effective machinery for using these surpluses in other countries, and the whole problem of international liquidity will assume a very menacing form. In these circumstances, it was not surprising that this was the principal subject discussed in Washington by the British Chancellor of the Exchequer. Any hope that the Labour Party will be able to achieve the objects which it set out in its Election programme must depend on the state of the British economy, which, in its turn, depends on the state of the British economy, which, in its turn, depends upon the state of the world economy as a whole, and it is hoped that some more sensible approach to this question of international liquidity will now be considered.

BOOK REVIEW

Social Stratification Among Muslims

Imtiaz Ahmad

Muslim Communities in Gujarat: Preliminary Studies in their History and Social Organization by S C Misra, Asia Publishing House, 1964; pp XVI + 207, Rs. 18.00

SOCIOLOGISTS and social anthropologists have not paid much attention to the study of Indian Muslim social structure. While in recent years they have made systematic field studies of several Hindu communities which have enriched our understanding of Hindu social structure, few attempts have been made to study Muslim communities. Even students of village communities in which Muslims constitute a substantial proportion of the total population have neglected the analysis of Muslim social institutions. They have generally treated Muslims as a single and an undifferentiated social entity and have paid little attention to the examination of social groupings and patterns of social stratification and inter-group relations among them.² In the situation this study of the history and social organization of Muslim communities in Gujarat is bound to be received as a significant contribution to Indian sociological literature.

The study is primarily concerned with a socio-historical analysis of the social organization of Muslim communities in Gujarat. The author tries to examine the ways in which Islamic culture penetrated and interacted with the local Indian tradition at the social level, the changes which came into Islam as a result of this interaction, the manner in which foreign Muslim communities became increasingly Indianized and the local converts merged into the Muslim society and, finally, how Indian Islam shaped itself not only in its ideational and cultural aspects but also in social and inter-personal spheres. In short, the book is concerned with an examination of the process of adoption of the Islamic Great Tradition to the Indian Little Tradition.

Two Approaches

The problem which the author attempts to examine here can be approached in two different ways. It can be approached from a historical point of view by making a study of the rise and development of Muslim society through the centuries. One can study the various social institutions and ways of life which Muslims of foreign origin

brought with them when they migrated to India, the manner in which Indian beliefs, usages and practices affected these social institutions and ways of life, the factors which led to the conversion of local Hindu population to Islam, the extent to which social institutions, beliefs and religious practices of the early converts became a part and parcel of Muslim society and the adjustment which Muslims made with Hindus in the regions where they settled. In other words, one can examine the forces which acted and inter-acted in the formation of Muslim society through centuries.

The other approach is sociological. One can select a community or group of communities of Muslims, spend sometime living in it and make a systematic study of its various social and cultural aspects. One can, for example, examine what are the social institutions of that community and the specific functions they perform in the total social system. One can also compare the social institutions of the Muslim communities with the social institutions of Hindus and examine the pattern of interaction between the two societies. Although a sociological study can provide greater insight into the internal and external structure of social relations within the society, its usefulness in understanding the dynamics of Muslim society is very limited.

However, neither approach is adequate when used alone in understanding the complex nature of Muslim social structure. Muslims had already possessed a flourishing civilization and an elaborate socio-cultural system before their contact with India. A knowledge of their past history is, therefore, necessary for the analysis of their social structure. At the same time, since their establishment in India, Muslims have been living side by side and in close contact with Hindus and the two societies have interacted upon one another in several important ways. In order to understand the nature of this interaction it is necessary to study actually existing social relations between them in a contemporary setting. For a proper study of Muslim social structure it is necessary that an analysis along his-

torical lines should somehow be combined with an analysis along sociological lines. In this book Misra tries to bring together the different approaches of history and sociology.

The book is divided into three separate parts. In the first part the author presents a brief sketch of the rise and development of Islam in Gujarat and discusses the Bohra and Khojah missionaries. He shows that the settlement of Muslims in Gujarat dates back to a very early period. Being a coastal area Gujarat had been attracting Persian and Arab traders from early times and in the ninth and tenth centuries there were flourishing Muslim settlements. The Muslim trading communities lived in close proximity with Hindus and the relations between the two communities were cordial. The Hindu rulers were tolerant and secular in their treatment of Muslims. During the reign of Siddharaj Jaysingha (1094-1143), for instance, a mosque demolished by fire worshippers was reconstructed at state expense and the miscreants were severely punished. The charisma of Siddharaj Jaysingha's personality among the Muslim subjects was such that three of the major Muslim communities in Gujarat, namely, Bohras, Khojahs and Sunnis claim to have converted him to Islam.

Treatment Inadequate

The author's treatment of the historical aspects of Islam in Gujarat seems extremely inadequate when it is recalled that his objective in the book is to study the social aspects of Indo-Muslim contact. He merely presents an account of the presence of Muslim communities in Gujarat and discusses the Bohra and Khojah missionaries on the basis of historical sources and local traditions. He does not deal with the specifically social aspects of the problem. For example, he does not provide any information on the social stratification of early Muslim settlers in Gujarat and the kind of influences which made an impact upon their social structure. Even while dealing with Khojah and Bohra missionaries he does not tell us to what extent these mis-

sionaries contributed to the spread and development of Islam in Gujarat.

It seems to me that in the context of socio-historical aspects of Indian Islam a fundamental problem is the impact of the typically Indian social institutions, beliefs, usages and practices upon the social structure of Muslim society. This problem can be studied by examining the castes and classes from which converts were recruited, what were the patterns of social stratification among them, what kinds of social relations they developed with Muslim of foreign origin and how their incorporation into the Islamic fold finally led to the emergence of a composite social stratification among Indian Muslims.

Historical Material Available

The analysis of these problems calls for painstaking effort no doubt but material for their study is not entirely lacking. Persian chronicles, inscriptions, coins, foreign travellers' accounts, Persian, Arabic and Indian literatures and local traditions provide information which can be used for the analysis of these problems. In a study of Muslims in Bengal, for instance, Abdul Karim³ has used these sources to analyse Muslim society in Bengal. He examines the socio-political background of Bengal on the eve of Islamic impact, the contribution made by various elements such as the Sultans, Muslim scholars and Sufi saints to the consolidation of Islam and discusses the composition of Muslim society and the local aspects of religious and daily life of Bengali Muslims. He shows how Islam came into Bengal as a foreign religion but was slowly integrated into the socio-religious system of the people. Although Karim's treatment of Muslims in Bengal is historical and no attempt is made to deal with sociological problems, his study provides a very satisfactory analysis of the forces acting and interacting in the formation of Muslim society in Bengal. It is from studies of this kind that the social aspects of Indo-Muslim contact can be adequately understood. Students of Muslim social history are likely to be disappointed by Misra's treatment of the rise and development of Muslim society in Gujarat.

The second part of the book attempts to analyse the culture and social organisation of Muslims in Gujarat. In this part the author gives ethnographic accounts of the Muslim communities in Gujarat. The accounts are concerned primarily with the manners and customs, social volitions, dress and social organization of the differ-

ent communities. The data on which these accounts are based were partly derived from documentary sources such as the National Register of Citizens and District Reports etc, and were partly collected through field work among the communities. Some accounts are more detailed than others for two reasons: in the first place, some communities are larger and more widely distributed so that they show greater regional variation; secondly, field work could not be done intensively among some communities.

In the nineteenth century ethnographic glossaries and compendium were compiled in different parts of India.⁴ These glossaries and compendiums provided valuable information on the origin, religious beliefs and usages, customs and manners and kinship and caste organization of all important castes and tribes in different regions. In latter years the reports of the decennial censuses provided detailed accounts of castes and tribes and the changes taking place among them in the different provinces. In many ways the second part of Misra's book resembles the ethnographic glossaries and list of castes contained in the census reports. Although it provides valuable information on customs, manners and social organization of Muslim communities in Gujarat, it does not provide information on the nature of inter-relations between these communities so that a sociologist interested in an analysis of the inter-relations between the different castes and communities will find them extremely inadequate.

Total Social Structure Ignored

The author treats each community as separate and independent. He discusses the occupation, customs and manners and social organization of each caste as if it exists in isolation from the rest of society. Even while discussing recent changes in occupations, dress customs and styles of life of members of the different communities he does not attempt to relate these changes to the total social structure and makes no effort to see how far these changes are local reflections of wider social changes.

Sometimes sociologists and social anthropologists isolate a particular community from its total social network and study its form and structure in detail. Such an isolation is, however, an analytical device used to facilitate a systematic understanding of the internal structure of the community. In actual situations every caste or community is embedded into a wider social

system and it derives its existence by the fact that it is a unit in a system of similar units. In studies of social structure it is necessary to place each community in relation to groups of like order.

The importance of studying a caste or community in its social context has been stressed by many sociologists and social anthropologists. Marriott⁵ for instance shows that the apparent uniqueness and seemingly fortitious variety within caste in India and Pakistan become capable of regular analyses and understanding when a caste is examined, not historically in isolation, but locally and regionally with systematic regard for its contexts. Ansari⁶ has also said that the examination of inter-caste relations is necessary for a fuller understanding of the way in which the caste system operates among Muslims. Misra's treatment of each community as an isolate unit leads to many drawbacks in the analysis of Muslim social stratification.

Relations with Hindus Ignored

In the first place, we are unable to study the nature of social stratification in the Muslim society of Gujarat from the ethnographic accounts given in the second part of the book. For a proper analysis of the system of social stratification it is necessary that we should have information on the patterns of status groups, economic classes and power groups in any society. Such an information can be obtained only through the analysis of interrelations between the various communities in social, economic, political and jural spheres. Since each community is treated here in isolation this information is not available.

Secondly, since only the Muslim communities are the focus of attention, the relationships between these communities and Hindus with whom they may be living in close proximity are omitted from analysis. It is up to the author of a book to limit the scope of his study and he can easily choose to leave out any set of relationships from analysis. Nevertheless, the nature of interaction between Hindus and Muslims constitutes an important area for study of Muslim social stratification for without an understanding of this interaction it would be difficult to appreciate the influences wrought by Hindu social structure on the social structure of Islam in India.

Broadly, the relationships involved in the study of Muslim social structure can be reduced to three main categories.

First, there are relationships which exist among the different Muslim communities or castes residing in a local area or region. Each relationship in this category form part of sub-systems of ritual economic and political relations by reference to which groups are defined and consequently the status of members of each group as well as their behaviour and mode of conduct when acting as such towards members of similar groups is differentiated. Secondly, there are relations between persons either as individuals or as members of kinship groups of different kinds such as household, family and lineage etc. Most of these relations exist between members of the same caste and community and the behaviour of members in respect of each other is undifferentiated. Finally, there are relations of Muslims both as an undifferentiated unit and as individual members of specific caste groups with Hindus as a single social entity and as individual members of caste groups. In dealing with problems of social structure it is necessary that these different categories of social relationships should be separately investigated.

It is difficult to deal with the three categories of social relationships mentioned above at the provincial level. It would, therefore, have been useful if the author had narrowed the area of his field study. He should have organized fieldwork in a few peasant and urban communities in different parts of Gujarat and tried to examine the kinship, inter-caste and inter-community relations at local levels. Such a study would have provided more socio-logically useful data.

Elements of Caste System

The third part of the book is a general discussion of Muslim social organization. In this part the author discusses the elements of a caste system in the system of social stratification among Muslims, the self-governing institutions and marriage and family customs, especially the hypergamous and endogamous marriage patterns and some of the restrictions which family obligations put upon its members. He also tries to locate the trends and processes of social change among the Muslim communities in Gujarat. Although the discussion is largely based upon data provided in the book, the author has also drawn upon material from other areas for comparative purposes.

The author argues that social stratification among Muslim communities in Gujarat is patterned on the Hindu

caste system. In his opinion there are two bases from which this similar patterning might have originated. In the first place, it might have originated from the recognition of consideration of propinquity and status among Muslims elsewhere. The spread of Islam led to the proliferation of power groups and racial considerations became important determinants of status. In Islam, thus arose a highly fluid communal system which, though flexible and highly responsive to subtle nuances, was still affiliated to birth as a status symbol. This system provided a basis for the development of a caste-like system among Indian Muslims.

Different from Hindu Caste

The other basis of a caste-like system among the Muslims in India lies in the social stratification system in the indigenous population which became incorporated into Muslim society through conversion. Originally, the local population belonged to a caste society in which status was rigidly defined by birth and maintained by strong social sanctions. When these groups became incorporated into Islam through conversion either by peaceful persuasion, threat of force, offer of material or political advantages or aspirations of upward mobility they imported their social system with them. Since much of early conversion was group conversion this was relatively easy.

The author, however, points out that the system of social stratification among Indian Muslims also shows some significant differences when compared with the Hindu caste system. For one thing, the acceptance of the principle of caste in Muslim society is different from the Hindu caste system. While both the systems resemble each other in the endogamous pattern of marriages and keen sense of birth and lineage among the Muslims the system has not been elaborated to any great extent. The degree of hierarchical gradation is looser and mobility is relatively easy within the scale of Muslim castes. Further, status which is a subtle blend of so many definable and indefinable elements plays an important role in determining social distance so that it is difficult to arrange the castes into any definite hierarchy. Secondly, since the Muslim social system admits wealth and status as determinants of status honour, comparatively less emphasis is placed in it upon pollution. Thirdly, within the Muslim social stratification there is no ritually pure caste like Brahmins with dispensations and obligations which may be peculiar to them

alone. Sayyads who are given a prominent place among the Muslim castes lack the charisma which has given the Brahmins their peculiar place in the Hindu society. Fourthly, while endogamy is accepted as a general social restriction among most caste groups some of the intermediate castes intermarry freely. Finally, the Muslim system of social stratification has no independent existence. It has developed symbiotic relationship with the Hindu caste system so that it has become, in a wider sense, a part of a larger whole.

Several scholars have mentioned that there is no elaboration of hierarchical ranking of castes in the Muslim society.⁷ Marriott⁸ has, however, shown that this relative simplicity of ranking in Muslim society is not associated with the predominance of Islam in any region. The elaborateness of the hierarchical ranking of castes is determined, among other factors, by the number of local caste groups in the society. To favour an elaborate caste ranking it is necessary that the concrete structural units of the society must be numerous. He suspects that the simple development of hierarchical ranking of castes among Muslims may be connected with the simple structure of local communities.

In Eastern U P

There seem many good reasons for correlating the elaborateness of hierarchical ranking of castes among Muslims with the size of community structure and number of caste groups. My own data show that the predominantly Muslim villages of eastern U P consisting of a number of Muslim caste groups have elaborately developed hierarchical rankings and the different caste groups in those villages can be arranged into fairly definite positions of status honour.⁹ In the middle Indus and Bengal Delta, however, where the local communities are small and the number of castes in them is limited the hierarchical ranking is very simple. Although Misra has made no attempt to correlate ranking to the number of caste groups in this book, this is a problem which should be investigated before the simplicity of hierarchical ranking among Indian Muslims can be accepted finally.

The author identifies a process of mobility among the Muslim communities to which he gives the name Islamization. It implies patterning of the way of life of a particular caste on the more respectable pattern in Islam, changes in occupation and dress and the weakening of the traditional self-

governing, *janat-bandi*, organization. This process always takes place within the caste system because it is intended to bring about upward mobility and it affects the total structural arrangement of the society. The author does not provide any discussion of how this process is actually brought about within a group of communities. Further, he considers the existence of local reference groups irrelevant to the process of Islamization. My own data, however, suggest that along with the process of Islamization of the style of life of a caste, the Islamizing group also begins to lay claim to a superior status. Also, since the process always takes place in a local setting the existence of local reference groups determines the extent and direction of this process.

It is obvious that the usefulness of this book is very limited for sociologists and historians interested in the study of Indo-Muslim contact. It is, however, likely to be very useful for the students of Islamic studies. In the past they have generally based their studies of Muslim social structure on the study of religious literature and textual sources, and side-stepped the peculiarities of Indian Islam. They have also hesitated to survey the communities whose faith and history have been their chosen theme. This book, as Professor Grunebaum remarks in his Preface "opens the door to one of the least investigated sectors of the Islamic world and it provides a rich introduction to the composition and stratification of Gujarati Islam and the social realities within which the Muslim faith is lived in the complexities of an area where traditions are mingled rather than blended".

Notes

¹ For a number of years Ghaus Ansari's study, "Muslim Caste in Uttar Pradesh: A Study of Culture Contact" (Lucknow 1960), has remained the only standard sociological work on social stratification among Indian Muslims.

² See, for instance, Dube, S C "Indian Village", London, 1957 and Srinivas, M N 'Social System of a Mysore Village'. In *Village India* (ed) Makim Marriott, Chicago, 1957. Although Muslims respectively constitute 16.6 and 11.8 per cent of the villages studied by Dube and Srinivas and there are suggestions in their works that they consist of several district sub-divisions both authors treat the entire Muslim population as

an undifferentiated unit.

Price Controls in the Indian Economy

Do They Hamper Growth?

V C Shah

The two crucial questions which arise in any discussion of the role of price controls in the Indian economy are:

- Is the choice of commodities whose prices are controlled rational and justifiable? and,*
- Do price controls impede the flow of investment resources into the industries whose products are subject to price control?*

An attempt is made here to examine from these two angles the existing controls on prices of manufactured goods.

THERE is an impression in some quarters, both in India and particularly in foreign countries, that the Indian economy is studded with a number of price controls. Such an impression is unjustified. This is evident from the fact that out of the numerous non-agricultural products only 17 commodities are at present subject to price controls. The twelve commodities whose prices are controlled statutorily are sugar, kerosene, coal and coke (higher varieties), woollen yarn and articles, worsted weaving and hand knitting yarn, iron and steel (flat products), cotton, fertilisers, cotton yarn and textiles (coarse and fine varieties) cement, ethyl alcohol and molasses. The remaining commodities — paper, motor vehicles, petroleum and petroleum products, matches and bicycles — are subject to non-statutory price control.

The story of price controls on agricultural commodities in India is the same as in the Western countries, such as the USA and the Federal Republic of Germany. There is, however, a basic difference. In the USA, for instance, the Government follows a price support policy for agricultural products in order to maintain parity between agricultural prices and industrial prices in the interests of farmers. In India, agricultural price policy is designed not only to protect the consumers' interests but also to induce farmers to increase agricultural output. This analysis is confined to price controls on the 17 non-agricultural commodities. It does not attempt to cover agricultural price policy which is a challenging topic by itself.

There are two crucial questions which should be considered in discussing the role of price controls in the Indian economy. Firstly, it is necessary to analyse the choice of products within the framework of economic justification for imposing price controls on them. Secondly, one

must examine the impact of the operation of price controls on the flow of investment resources into industries whose products are subject to price controls. This is a very basic question for various reasons. After all, price control policy is a short term measure to meet the problems created by the shortage of supply in relation to the demand. But the long run solution is to equate supply to demand by, increasing the production capacity of the industry. This is possible only if the operation of price control does not discourage investment in the industry.

Why Price Control?

The price mechanism in a free enterprise economy brings about an optimum allocation of resources given certain assumptions. These are (a) perfect competition in both the product and factor markets, (b) perfect divisibility of all resources and products, (c) absence of direct interdependence among producers and consumers, i.e. absence of any divergence between social benefit and private gain as well as social cost and private cost.

In addition, two points pertaining to the Pareto optimum are worth noting. The general equilibrium theory is after all a static theory and therefore fails to take into account the implications of dynamic forces in a growing economy — for instance, the concept of pecuniary external economies and diseconomies. Secondly, the Pareto theorem does not offer any policy norms for income distribution. On account of these characteristics of the Pareto theorem together with its unrealistic assumptions, the price mechanism left to itself as suggested by the static equilibrium theory in both its general and its partial form, cannot serve the basic objectives of economic policy. Hence, the need for Govern-

ment interference with the market mechanism.

In India, price control has been one of the instruments in the armoury of the Government for achieving economic objectives and for implementing the Five Year Plans. Specifically, there are four objectives which price controls on the 17 non-agricultural products are expected to fulfil. These are:

- to protect the interests of the vulnerable sections of the consumers given the income distribution;
- to facilitate investment in priority industries which are essential for laying the foundation for rapid economic development of the country;
- to prevent monopolistic exploitation by a few firms belonging to a single industry, and
- to ensure a reasonable degree of price stability.

(a) The consumption of essential products like sugar, kerosene, coarse varieties of cotton textiles and molasses is vital to those sections of the Indian society which are relatively poor. In a growing economy when prices of such products are under pressure, it is natural that these vulnerable sections cannot purchase their day-to-day requirements at market prices. Just as during war time essential consumer goods are subject to price controls and rationing in the interest of the consumers, their prices are at present controlled in India in the interest of the lower income groups. And the pressure on consumer goods prices is generated by the strains and stresses inherent in the process of accelerating the rate of the growth of the Indian economy.

(b) Economic planning implies investment priorities. Such priorities have to be determined because the market mechanism fails to allocate the scarce resources in a manner that would hasten the pace of economic

growth of India. The failure of the market mechanism, in turn, is due to the divergence between social and private cost, as well as social and private gains. It is extremely desirable that scarce resources, particularly the basic inputs such as steel, cement and coal are made available for priority investments in adequate quantity, at the proper time and at reasonable prices. This is because the flow of basic inputs to the different sectors of the Indian economy, is essential for maintaining the time schedule of various key projects. If the time schedule is upset, the problem of phasing the Five Year Plans would become extremely difficult. This is particularly so in the case of India because it does not possess the safety valve of imports to supplement the deficiencies in the domestic production of basic inputs. Thus the rationale behind price controls coupled with distribution controls on cement, higher varieties of coal and coke and flat

products of iron and steel industry is to enable the user industries to purchase them at reasonable prices and in adequate quantities.

In the absence of price controls, some of the priority industries requiring cement, steel and coal would find it very difficult to buy them in adequate quantities and at reasonable prices in the free market. It is very likely that cement would be available for luxurious residential construction in the growing urban areas whereas construction of irrigation canals and dams would be starved of cement. Everyone, however, would agree that investment in dams and canals is more beneficial than investment in luxurious construction from the point of view of the society as a whole.

(c) It is true that the number of producing units in a given industry is not a necessary and sufficient condition for considering the industry a monopoly or an oligopoly. However, market conditions tend to be mono-

polistic or oligopolistic when the number of enterprises in a given industry is relatively small. It is, therefore, not incorrect to regard paper, motor vehicles, matches, bicycles, iron and steel, fertilisers, and petroleum and petroleum products industries as monopolistic or oligopolistic. This is because the number of units manufacturing paper and paper board were 45 in 1964, those manufacturing motor vehicles were 9, scooters, motor cycles and three-wheelers 9, and bicycles 20. There were only four companies which manufacture petroleum and petroleum products and only 6 producing matches, and two main private sector units in the iron and steel industry.

Given the market structure for the products of each of these industries, it is not unlikely that they might follow a policy of administered pricing. If so, these industries would tend to exploit the consumers of products such as paper, motor vehicles, petroleum

Table: Profitability Ratios Industry-wise, 1960-61 to 1962-63

Industry	Gross Profits as Percentage of Total Capital Employed			Profits after Tax as Percentage of Net Worth			Dividends as Percentage of Paid-up Capital		
	1960-61	1961-62	1962-63	1960-61	1961-62	1962-63	1960-61	1961-62	1962-63
Coal mining	8.9	8.3	9.5	7.8	5.7	8.1	9.2	8.8	7.8
Sugar	8.8	7.4	7.6	11.2	7.4	3.5	13.9	11.6	9.7

and petroleum products, matches and bicycles. Such a situation would not be consistent with the objective of preventing exploitation of the consumers and also concentration of economic power. The Governments in Western countries, such as the UK and the USA do not allow full freedom to the management of an oligopolistic industry to adopt an administered pricing policy. The Government in India would likewise be justified in becoming a party to the determination of prices of these commodities.

Theoretically, effective maximum price of a commodity produced by a monopolist or an oligopolist might lead to increased output and more efficient allocation of resources. If the maximum price is somewhere between the equilibrium price which would be determined in the absence of price control and the point of intersection of marginal revenue and marginal cost itself, a monopolist or an oligopolist would regard the demand curve for his product as perfectly elastic upto a certain limit. The new marginal revenue curve upto a limit (which would also be equal to the average revenue curve) would be lower than the original marginal revenue curve. The producer would determine the equilibrium output by equating his new marginal revenue curve with the marginal cost curve. Hence there would be higher output provided the producer had not already reached the point of production beyond which his marginal cost curve had become perfectly inelastic.

It is plausible that in the Indian conditions, effective maximum prices of products like paper, motor vehicles, iron and steel, matches and bicycles may not have the effect of increasing their output. This is because producers in these industries are likely to be operating their plants at full capacity in the sense that they would have stretched output to the point beyond which marginal cost would have become inelastic.

(d) Price control policy has also another important objective to fulfil, viz, maintaining a reasonable degree of price stability. If prices of sugar, kerosene, coarse varieties of cotton textiles and molasses which enter into the cost of living of the masses of India are not controlled, it is very likely that trade unions would be under pressure to push up the wage rates. If trade unions were to succeed in raising the wage rates to compensate the working class for rise

in cost of living, industrial development would suffer. In other words, India would experience the familiar cost push inflation which countries like the UK and the USA have faced in the post-war period. Since cost push or for that matter demand pull inflation is not desirable for economic growth of either a developed or an underdeveloped country, the Government of India is justified in resorting to price controls of these essential consumer goods.

Again if steel prices, for instance, are not subject to price controls, the cost of production of a number of industries consuming steel would rise. Just as steel prices in the USA are extremely important for maintaining stability of the American economy, they are equally important not only for the stability of the Indian economy but also for its growth.

The analysis thus indicates that the choice of commodities subject to price controls can be justified on economic grounds. The policy is consistent with the objectives of maintaining reasonable degree of economic stability, preventing exploitation of vulnerable classes of the society and mitigating the effects of imperfect market structure.

The important question that now remains is whether the price control policy has created conditions for the long run solution of the problem of shortage of certain commodities. In other words, the policy should be scrutinised from the point of view of its impact on the flow of investment resources into the controlled industries in order to raise their capacity consistent with the requirements of other sectors of the economy. One should, therefore, examine the basis on which price of a commodity is fixed by the Government.

Formula for Fixing Prices

The Government fully recognises that the efficiency of an enterprise depends to a great extent on its price policy. It believes that prices charged by an industry should provide sufficient resources to that industry for its expansion. The price policy should also enable an industry to attract new investment for its growth. In other words, the prices fixed by the Government should yield a reasonable margin of profit — reasonable in terms of enabling the industry to build up adequate reserves for expansion and reasonable in terms of attracting new capital by offering a handsome

rate of return to the prospective investors.

It seems that the Government has followed the cost plus principle in fixing prices for the 17 commodities. Such a principle is a necessary but not a sufficient condition for making price control policy adequately flexible for ensuring a reasonable rate of return to the investors in industries subject to price controls. For this purpose, the Government has to estimate the cost of production including replacement of plant and machinery at current or prospective cost.¹ It should also determine a rate of return which is consistent with the degree of risk and uncertainty inherent in an industry whose product price is to be fixed, in comparison with the degree of risk and uncertainty in other industries.

Another important aspect of price control policy is to determine relative prices of multiple products manufactured by a single industry, in such a way that the structure of production would be in conformity with the pattern of demand for the multiple products over a period of time. This calls for projection of the pattern of demand for industries like iron and steel and petroleum and petroleum products. If the relative prices fixed by the Government fail to reflect the changing pattern of demand in a growing economy, the structure of production could become distorted. Such a development particularly in the case of a basic industry would have very adverse effects on the rate of growth of the economy.²

The formula evolved by the Tariff Commission is by and large followed by the Government, while fixing prices of various products. The formula, generally, provides for 12 per cent before tax return on total 'capital employed'. It may be useful to examine the implications of the formula in terms of the maximum rate of return that it may determine.

Let,

$$R_c = P_o R_o + P_b R_b$$

P_o = proportion of owned capital to total capital employed.

P_b = proportion of long term borrowed capital to total capital employed.

R_o = rate of return on owned capital.

R_b = rate of interest on long term borrowed capital.

R_c = profits before tax as percentage of total capital employed.

Let us assume that R_c = 12 per cent. If the long-term borrowed capital can be raised at 8 per cent rate of interest and if the ratio of owned capital to borrowed capital is 1:1, the formula would yield a ceiling of 16 per cent before tax return on owned capital. With a higher ratio (owned capital to long-term capital) of 1:2, the ceiling on the rate of return (before tax) on owned capital, according to the formula, would be 20 per cent.

In the case of priority industries, Indian companies in which public are substantially interested and whose ratio of owned capital to long-term borrowed capital is 1:1, would at present bear an aggregate tax incidence of 45 per cent so long as profits before tax on owned capital would not exceed 20 per cent. If, however, such companies in the priority industries are entitled to various tax concessions and if the ratio of their owned capital to long-term borrowed capital is 1:2, the tax incidence would be lower than 45 per cent. Thus the ceiling of 20 per cent return on owned capital determined by the formula, would yield a maximum net return (after tax) of more than 10 per cent.

Incidentally, it may be noted that industries subject to price controls except the consumer goods industries are regarded as priority industries entitled to tax concessions including the proposed special development rebate introduced in the Budget for 1965-66. Hence, industries producing basic inputs have scope for earning a net rate of return of more than 10 per cent on owned capital.

From the long run point of view, the crucial question is whether investment resources are diverted from controlled industries to non-controlled industries. This is indeed a very difficult question to answer. The reason is that for this purpose, it is necessary to determine the optimum differential rates of return in various industries according to the degree of risk and uncertainty prevailing in the different industries. If the actual differential rate of return in a given industry is below the optimum differential that would bring about equilibrium of investment resources in the economy, one can easily draw the inference that additional capacity in such an industry would not be created.

In the absence of data on the optimum differential rates of return, it may be useful to turn to the profitability ratios estimated by the Reserve Bank of India. The Table shows that in the case of industries whose products are subject to price controls, gross profits as percentage of total capital employed did not exceed 12 per cent except in the case of matches during the three years 1960-61 to 1962-63. Similarly, gross profits as percentage of total capital employed in other industries were not appreciably higher than 12 per cent except in the case of woollen textiles, mineral oils and medicines and pharmaceuticals. Again, profits after tax as percentage of owned capital in the industries subject to price controls varied between 3.5 to 13.4 per cent. The same profitability ratio for other industries except woollen textiles, medicines, pharmaceuticals ranged between 4.4 per cent to 14.7 per cent. The behaviour of dividends as percentage of paid-up capital declared by the controlled as well as non-controlled industries was more or less similar to that of other profitability ratios. Subject to the limitations of these profitability ratios, one may, therefore, infer that there does not exist wide divergence between rates of return in various industries, which may justify investment in the non-controlled industries at the cost investment in industries subject to price controls.

tries at the cost investment in industries subject to price controls.

The analysis indicates that it may not be proper to blame entirely the price control policy for lack of adequate expansion, if any, in some of the industries whose product prices are fixed by the Government. Even if these industries are capable of raising financial resources, additional capacity may not be created at a desired rate because of bottlenecks in the supply of essential inputs which they require. It is, therefore, necessary to find out in the case of each individual industry whether the difficulties in obtaining the required inputs both indigenous and imported or the price control policy is responsible for any lag in the growth of the industry.

Notes

¹ This implies that the controlled prices should be changed whenever cost of production changes. Such a flexibility is evident in the upward revision of controlled prices of some of the products, such as coal and steel.

² This point is very well stressed by the Raj Committee. See Report of Committee on Steel Control, Government of India, October 1963, pp 13-14.

THE INDIAN IRON & STEEL CO LTD

NOTICE

THE Register for Ordinary Shares in the Company will be closed from Tuesday, the 20th July, 1965 to Tuesday, the 3rd August, 1965, both days inclusive, for the purpose of payment in due course of final dividend on Ordinary Shares in the Company for the year ended 31st March, 1965. The dividend when declared will be paid to those Shareholders whose names appear on the Company's Register of Members for Ordinary Shares on the 3rd August, 1965 or to their mandatories.

BY ORDER OF THE BOARD,
MARTIN BURN LIMITED,

F G Liversedge

Managing Director,
Managing Agents.

Registered Office:
12, Mission Row,
Calcutta-1.
29th June, 1965.

Managing Agency System Far From Dead

R K Hazari

The managing agency system is far from dead or dying. It still thrives in large non-government public industrial companies.

The powers and remuneration of managing agents have been statutorily restricted but law and policy have still to make a significant impact on the area of corporate activity under their management.

The rate at which this system of management is declining in importance is far too slow and gradual. A quiet and easy killing of rentier management is now necessary in the interest of developing a rational managerial set-up for large public industrial companies.

[This article supplements the author's earlier article on the same subject in the Annual Number, February 1964, in which he made out a case for the abolition of the managing agency system on the basis of his own research. The present article is written with a historical perspective and brings together available facts and opinions expressed over the last few decades.]

THE managing agency system grew out of the enterprise of European individuals who came to Calcutta as representatives of trading companies. They found the country lacking in industrial leaders, since imports from Britain had crippled the master craftsmen, and traders, moneylenders and big landowners had neither the inclination nor the experience to go into modern industry. The prospects of local processing and rudimentary manufacture for export were attractive because of the availability of raw materials and cheap labour. With the opening of the Suez Canal and the laying of railways, the Indian market also appeared on the business horizon. Exploitation of the prospects required capital, contacts with suppliers of equipment and buyers of produce, and skilled labour; these the European representatives were well-qualified to supply or procure. Their mercantile experience and connections proved invaluable; the deficiency of technical expertise was made up by hiring it from Britain. The field open to each entrepreneur was wide; mistakes could be made without burning of fingers. Entrepreneurs moved from jute into coal, from tea into steamers, from these into some kind of engineering, to find a market for one in the other. The Industrial Commission of 1916-18 noted that:

"A characteristic feature of organised industry and commerce in all the chief Indian centres is the presence of the large agency firms, which, except in the case of Bombay, are mainly European. In addition to participating in the export and import trade, they finance and manage industrial ventures all over the country and often have several branches in the large towns. The importance of these agency houses may be gauged from the fact that they control the majority of the cotton, jute and other mills, as well as of the tea gardens and the coal mines. This system originat-

ed and has still continued owing to the ability of these houses to furnish financial help to industries; it also owes its existence to some extent to the difficulty, in the case of companies under European control, of finding among the relatively small class of leading men of business available in India directors, especially managing directors, who will remain in the country long enough to guarantee continuous supervision... An agency firm as a rule comprises several partners, some of whom are in India, while the others attend to the firm's affairs in London or elsewhere. There is no doubt but that the system is in many ways well adapted to present conditions in India, and has a far greater list of successes to its credit than can be shown by ordinary company management under individual managing directors."

In Calcutta, the system, thus, combined ownership mainly by residents in Britain with management by partners and assistants in India. Although family influences predominated and the partnership was carried on from generation to generation, the more enterprising and ambitious of the junior assistants could look forward to becoming partners ultimately. Managing agents did the preliminary work of starting new concerns, promoted joint stock companies, employed their own funds or arranged for finance by acting as guarantors, and also managed the concerns. Besides these promotional, financing and managerial functions, they acted as agents for sales and purchases. The more important managing agencies also carried on export and import trade, insurance, banking and various kinds of agency business.

On the West Coast, the managing agents were, with some exceptions, Indian. The first written managing agency agreement was between the Bombay Spinning and Weaving Company and Cowasjee Nanabhoj Davar concluded in or about 1854; the agree-

ment provided for his remuneration on the basis of yarn produced (see S D Mehta: "The Indian Cotton Mill Industry 1854 to 1954"). It can be safely presumed that the managing agency arrangements in Calcutta were imitated in Bombay by Indian merchants, who made fortunes from the opium trade with China and later, during the American Civil War, from the export of raw cotton to Lancashire; the latter alone was said to have earned Rs 51 crores worth of gold and silver. Cowasjee Davar and Manockjee Petit in Bombay and Ranchhod Chhotatal in Ahmedabad, and those who followed them raised most of the capital from their own resources but also secured substantial monetary and other assistance from agents of British machinery suppliers and friends. Though the mill companies were public, they had very few shareholders. In Ahmedabad, where, unlike Bombay, most of the bigger managing agents were by tradition bankers rather than traders, funds were raised in the form of deposits, too; the larger suppliers of capital got a share in the managing agency, contingent upon taking up a specified part of the share capital of the managed company — a rudimentary form of underwriting.

In both these centres, capital was also raised from potential selling agents, etc, in consideration of future contracts. Commission to agents of machinery suppliers was often paid for in shares. The managers and technicians were generally British till the twenties. The privilege of sharing the fruits of managing agency was, however, normally restricted to members of the founding family with financiers as the only co-sharers, if any. From the thirties and forties onwards, however, some Indian managing agents in these centres and in Delhi, Kanpur, etc, began to give a share in the managing agency commission to senior employees also.

The common practice with managing agents (leaving aside the fly-by-night variety found in all countries) was to promote and set up a concern and when it was reasonably well established to either make it a public company and throw open its share capital to the public or otherwise dispose off their holdings. Care was taken at all times to retain permanent management rights; in most cases, adequate share capital was also retained in order to frustrate any move to oust them. What little evidence there is of shareholdings by managing agents in the first half of this century indicates that, whatever the position might have been in the 19th century, the well known managing agents held only a small part of the share capital of the companies under their management, and the proportion tended to decline even before 1939. Both Lokanathan and Basu, (whose works are the principal sources of information for the early history of the system) observed that the holdings of leading managing agents in the companies under their management were tending to shrink in cotton and jute companies, at any rate.

Lokanathan found ("Industrial Organisation in India", pp 41-43) that, in the twenties, the holdings of managing agents in managed companies were small and in many cases the holdings belonged to the partners/directors of the managing agents. The Bombay Shareholders Association testified on the basis of shareholding data before the Tariff Board in 1932 that managing agents had ceased to be the principal shareholders in Bombay cotton mills. A representative of Martin and Co stated that his firm did not hold even 20 per cent of the shares of the companies under their managing agency because they prided themselves on the fact that they were successful agents. Obviously, therefore, managing agents were not, in general, inclined to lock up their resources but took the earliest opportunity to free their funds for investment in other directions. The Tariff Board of 1932 observed that:

"Where the managing agent represents a high standard of ability and sense of responsibility, it may make little difference to the company to what extent the managing agent is interested in the share capital of the company. The better class of managing agent works partly for the remuneration fixed for him under his agreement but partly also out of regard for his reputation

and out of a sense of pride in the tradition of management associated with his concern."

As the direct contribution of managing agents to share capital declined, they sought security in permanent and comprehensive rights of management. These rights were assured through agreements in which managing agents acted in a dual capacity, as managers and as shareholders. Until 1913, the law did not require an elected board of directors. When the law made elections mandatory, the outside directors depended for their continuance upon the loyalty they showed to the managing agents. Thus, although the managed companies were joint stock concerns with boards of directors, they were more akin to partnerships with outside shareholders as sleeping partners. As the holders of considerable shares (either in their own names or through partners and associated companies), it was in the managing agents' interest that the companies be managed efficiently and fair dividends be paid. But managing agents were paid in a number of other ways, too: commissions on profits, purchases, sales, and insurance, re-

muneration to relatives, etc.

Managing agency by itself secured a certain value because of its rights and privileges apart from its ability to show profit in the concerns managed; the dividend earnings of agents were subordinate to their earnings in other forms. As the managers-cum-key owners were not chiefly interested in returns on investment, the general inducement to invest and public confidence in investment was adversely affected. Managing agency rights became a negotiable asset; in every boom period, the rights in many companies were transferred at fabulous prices and capitalised at inflated values; during slumps, transfers took place because the managing agents as distinct from the managed companies were in trouble and could no more raise finances on their guarantees. Even the Tatas handed over the majority control in the managing agency of their electric companies to an American syndicate without the prior sanction of the shareholders of the companies.

Originally, the common method of remuneration to managing agents was a commission on output. When ring

Source: Company News and Notes, September 2, 1963.

spindles replaced mules in cotton mills, this system led to abuses. J N Tata was the first in 1886 to change over to a commission on profits. Till 1956, however, Ahmedabad cotton mills and Calcutta jute mills generally gave a commission on output, in addition to an office allowance. The tea industry paid 2½ per cent on sales and a further 2½ per cent on profits. Coal and cement companies paid on the basis of profits while in sugar, both the systems existed side by side. In 1916, Tata Iron and Steel adopted a sliding scale of remuneration, rising from 5 per cent to 9 per cent of profits according to various slabs of dividends declared. With the notable exception of Tata companies, profits were defined for this purpose as profits before interest and depreciation.

Many reputable managing agents surrendered their commission when the managed companies were in difficulties, and even gave up the interest due on debenture holdings, beside providing or securing large finances. In 1928, managing agents of 73 cotton mills in Bombay surrendered Rs 1.91 lakhs of managing agency commission and Rs 7.40 lakhs of interest on loans and debentures. From 1922 to 1927, Ahmedabad mill agents surrendered Rs 13.31 lakhs of managing agency commission. The surrender in Bombay was not exactly munificent (see Table 1).

Mixed Blessing

That the managing agency system was a mixed blessing was being recognised even before 1920. The Industrial Commission was impressed by the high financial prestige of "the better-class agency firms and the readiness of the investing public to follow their lead" but was not altogether complacent about their performance.

"...they (the better-class agency firms) have not escaped criticism as being unduly conservative in their methods of business and as exhibiting undue reluctance to embark on new ventures. They have been charged with lack of enterprise and an unwillingness to follow up lines of development naturally proceeding from the expansion of operations in their own specialised industries. In other words, they have been inclined to develop commerce rather than industries, and have thus been at times less helpful than might have been the case, in clearing the way for continuous industrial progress." (Report, pp. 8-9).

The Central Banking Enquiry Committee 1931 had the benefit of con-

siderable evidence on the working of the system during the twenties, especially in the western region. Appraisal of this evidence induced the Committee to recommend lesser dependence on the managing agency system for industrial development:

"Although the Managing Agency system is reported to have done a great deal for the industrial development of Bombay, it is admitted that it is not by any means a perfect arrangement but has many serious drawbacks. There have been cases where the Managing Agents have, besides managing their own mills, traded and speculated and the resulting weakness in their position has reacted on the financial position of the mills themselves and led to banks withdrawing their cash credits even when the mills were in-

trinsically sound, merely because the Managing Agents had become weak. Further, although it is true that in times of crisis such as Bombay has been going through, Managing Agents have incurred extensive losses as a direct result of financing the mills under their control, there have been a few cases in which these Agents have turned their loans to the mills into debentures, with the result that the concerns have passed into their hands and the shareholders have lost all their capital.... This system works well when everything goes on smoothly and when the industries are prosperous... when conditions alter and the industry or the particular concern comes up against bad times and the Managing Agents find themselves compelled to find more money to support the industry, it is found that they

are not able in all cases to cope with the requirements.

We suggest therefore that attempts should be made to make industrial enterprise in India less dependant on this system for future development. The establishment of direct financial relations between industrial companies and commercial banks is desirable...." (Report, Vol. I, pp 279-80.).

Lokanathan (in 1935) also expressed dissatisfaction with the working of the system in all its three main aspects, namely, promotion, finance and management:

"There have been cases of waste... ill-conceived and fraudulent promotion. They (the managing agents) have been unwilling to pioneer and risk in

new enterprises, where the profits have been neither large nor certain. However, successful the managing agency system of promotion might have been in the past, it cannot be concluded that it is so at present, or will continue to do so in the future.

Since most Indian concerns have been under-capitalised, with share capital barely sufficient for block expenditure, the balance has to be raised from various short term or undependable or expensive sources. With debentures and preference unpopular funds had to be raised by or through managing agents which had the result of further strengthening of the managing agency system. Had the share and permanent capital raised at the start been sufficient to cover the

needs of working expenses, there would not have been the same need for the continuance of an institution like the managing agent to finance industrial concerns.

While its (the system's) power for doing injury may be great, its capacity to do good is limited. So far as the Indian section of the managing agency system is concerned, its continuance can be explained and justified only because of the concentration of ability, experience and capital in the hands of a few persons who have done great service to industrial development. If it became possible to persuade them to do so for industry in an altered status what they have been doing as members of agency firms, the result would perhaps be wholly

good. There are no benefits which would be lost by such a change, for those benefits are not the result of the system but of the ability and resources of the persons who run the system".

Statutory restrictions on the powers of managing agents were imposed for the first time in 1936. The duration of appointment of a managing agent in public companies was limited to 20 years at a time, but there was no restriction on re-appointments long before the expiry of the initial appointment. Managing agents could be re-

moved if they were convicted of a non-bailable offence punishable under the Penal Code in relation to the affairs of the company. They could transfer their office only with the approval of the company in general meeting. Powers of management were vested in the board of directors, but subject to the articles of association of the company which proved a gaping loophole. In 1938, insurance companies were debarred from having managing agents; banking companies were similarly excluded in 1949.

Statistical data on the significance of the managing agency system have been available since the mid-fifties. (Tables 2 to 4). In 1954-55, there were 3,944 managing agents, of which 2,522 were unincorporated firms, 1,238 were private companies and 184 were public companies. These managing agents managed in all 5,055 companies, out of the total of 28,568 companies (excluding banking, insurance and government companies) in that year. The 5,055 managed companies accounted for 54 per cent of the total share capital of 28,568 companies. Management by managing agents was more pronounced in public companies, 71 per cent of the share capital of which (excluding the three above mentioned categories) was in companies managed by managing agents.

Out of 3,944 managing agents, 3,526 managed only one company each, and 250 managed two companies each. About 95 per cent of the managing agents, thus, managed two companies or less. Only 17 managing agents managed 10 or more companies each.

In 1962-63, the number of managing agents came down to 1,044, of which 548 were unincorporated firms, 402 private companies and 94 public companies. The 1,044 managing agents managed 1,440 companies, out of a total of 24,598 companies (excluding banking, insurance and government companies) in that year.

Of the 1,044 managing agents in 1962-63, 899 managed one company each and 67 two each. About 93 per cent of the managing agents thus managed two companies or less. Only 7 managing agents managed 10 companies each, which excludes others which they managed as secretaries and treasurers.

In 1954-55 the system was of predominant importance in plantations, coal, grains and pulses, vegetable oil, sugar, textiles, iron and steel, transport equipment, cement, clay and glass, paper, power and transport (Table 5). Its importance was relatively nominal in services and in two industries, tobacco and rubber which were mainly under the control of international combines (Imperial Tobacco and Dunlop Rubber). By 1960-61, the importance of the system in the aggregate was greatly reduced by the formation of government companies, transmutation of erstwhile managing agents into secretaries and treasurers, greater frequency of subsidiaries, and flotation of new companies with other forms of management. In that year, managing agents continued to be of predominant importance in plantations (in tea, subsidiaries and director managed companies became more significant), vegetable oil and dairy products, sugar, textiles, cement and power.

Secretaries and Treasurers

The institution of secretaries and treasurers was recognised for the first time in the Companies Act 1956. There was no reference to it in the report of the Bhabha Committee. The intention of the then Finance Minister, C D Deshmukh, in encouraging this new system was, among other things, to smoothen the transition from managing agency to other forms of management and to enable those managing agents which managed more than 10 companies to retain the management of the excess number. Under the Act, secretaries and treasurers had practically the same powers as managing agents, except that they had no right to nominate directors and their maximum remuneration was 7½ per cent of profits.

Before the expiry of all old managing agency agreements on the notified date, namely, August 15, 1960, there were only 9 companies with paid up capital of Rs 1.6 crores which were managed by secretaries and treasurers. As of August 16, 1960, 179 companies were managed by 45 secretaries and treasurers (see Table 6). The overwhelming majority of companies under such management, thus, consist of companies which were formerly managed by managing agents. Out of the 45 secretaries and treasurers (20 public, 15 private, 8 unincorporated and 2 foreign bodies), 23 which managed 144 companies in

this form also acted as managing agents of 146 other companies. This dual role enabled the leading managing agents which had previously managed more

than 10 companies to retain the management of the excess companies.

Between mid-August 1960 and end-March 1963, 45 more companies adopt-

ed this new form of management. Of these, 29 had secretaries and treasurers which also acted as managing agents of other companies. Only 18 (14 in 1960-62 and 4 in 1962-63) were new companies; the remaining 27 were in existence before and probably had other forms of management (*Company News and Notes*, November 16, 1963 and December 16, 1963).

Since 1956, the number of new companies proposing the appointment of managing agents has declined

steeply. Between April 1956 and March 1963, 9,150 new companies were formed. Of these 134 had managing agents, 15 had managers, 18 secretaries and treasurers, and 2,681 had managing directors; the remaining 6,302 were managed by boards of directors without any statutory managerial personnel (Table 7).

In 1964, nevertheless, the relative importance of the managing agency system in terms of the share capital of managed companies in public non-

government sector remained practically unassailed (Table 8). More than one-half of the share capital of non-government public companies was in companies managed by managing agents and their close variant, secretaries and treasurers. If banks, insurance and other service companies, and subsidiaries of international combines, which either do not or cannot have managing agents are excluded, the proportion would rise from one-half to about three-fourths or more. In spite

Note: Data relate to only those companies which were managed by managing agents. Profits are taken as before managing agency commission and taxation. Figures in parentheses relate to secretaries and treasurers.

of the decline in its popularity, *the managing agency system is far from dead or dying*. Managing directors and their variant, managers, are comparatively insignificant as a form of management.

It should be emphasised at the same time that remuneration to managing agents has been tending to decline. It was 13.4 per cent of profits before tax (which is slightly different from the definition of profit for calculating the remuneration of managerial personnel in the Companies Act) in the aggregate Reserve Bank sample of public companies (including those not managed by managing agents) in 1950 and 4.9 per cent in 1962-63 (Table 9). The decline has taken place mostly in large sized companies, i.e., those having a paid up capital of Rs 50 lakhs and above (Table 10). Separate data for companies managed by managing agents are available only for 1955-59. The number of companies so managed declined during this period and remuneration as percentage of profits came down from 24 per cent in 1955 to 12 per cent in 1956 and to 7 per cent in 1959. Shrinkage in remuneration was most obvious in traditionally managing agency managed industries like tea, coal, sugar and textiles (Table 11).

Common impressions notwithstanding, the managing agency system still predominates in the management of large public industrial companies as it did before, only slightly less so. Law and policy have succeeded in somewhat restricting the managing agents' powers and reducing the remuneration paid to them but they still have a vast area of corporate activity under their managerial control. Ever since the report of the Industrial Commission in 1918, pleas have been made for giving a little more time to the system. According to business spokesmen, the time has not arrived even now—just as it had not arrived thirty years back. When the Companies Act, 1956 imposed a wide variety of restrictions on managing agents, it was said that business enterprise would be throttled. That unhappy consummation has not come about. We are now being told by the same people that the Companies Act has done all that was necessary to mend the system and that there is no need to end it; they do not object to further mending! How long are we going to tolerate this twisted logic in defence of irrational management? Euthanasia rather than a further dose of irksome procedural restrictions is clearly what is indicated.

Export Promotion Through Import Entitlement

A Reply

I S Gulati

RG SARAIYA does me great honour by commenting in your issue of June 22, 1965 on my article on the above subject published in the issue of May 22. But I am not certain that I can honestly accept his compliments when he observes that I have "brought a certain amount of clear thinking on the problem which is of vital interest to the country". After reading Saraiya's letter I have got the distinct impression that the exposition in my article was not clear enough.

Let me, therefore, try to state my position clearly. Firstly, a distinction should be drawn between two parts of Import Entitlement, i.e., (i) entitlement against import content, and (ii) entitlement towards bonus. Secondly, what I object to in the existing scheme is not the 100 per cent entitlement against import content but to the linking of the second part of Import Entitlement, viz, bonus entitlement, to import content. This yields the ludicrously self-defeating result demonstrated in my article, namely, "that a scheme designed to promote exports with a view to augmenting the country's export earnings should, in effect, have a bias operating in the opposite direction." Thirdly, the modified scheme for the distribution of entitlement applies to the bonus part of import entitlement and not the part that is given against import content, i.e., even assuming that the modified scheme were adopted, Import Entitlement will still be given in two parts, one against import content at the rate of 100 per cent and the other against net export earnings at the rate of 31.5 per cent or 47 per cent or what have you, depending upon the constraint under which one operates.

In the light of the above, it is not correct for Saraiya to say that my modified scheme "substitutes bonus entitlement a 36.5 per cent of export earning against the present scheme which gives import entitlement by way of twice the import content of an export product...". The correct position is that my bonus entitlement at 36.5 per cent of net export earnings will substitute the existing bonus entitlement (and not total Import Entitlement). Therefore, the objection that under my modified scheme certain exporters "are likely to be seriously handicapped as the bonus entitlement

at 36.5 per cent of the export earning is less than the value of the import content of the exported article" is not valid.

I would invite Saraiya's attention to the table below which compares schematically the total import entitlement against each category of export. I now feel that I ought to have included this table in the original article. If I had done so it would not have caused the above misunderstanding. It can be observed from this table that even export product K, with import content as high as 90 per cent of FOB value gets 94 per cent import entitlement under my modified scheme and this evidently more than covers the import content of the export. As regards export product D, Import Entitlement under my scheme would be higher at 52 per cent against 50 per cent under the existing scheme. So the incentive to the producer of this particular export product, as also of export products A to C, to export will be greater under my modified scheme than to-day. I am sure that in view of the clarification now offered Saraiya will agree with me that my scheme will not only not have a retro-

grade effect on the total volume of exports covered under entitlement scheme but have, *what I claim to be its chief merit*, a positive effect on exports and a still more positive effect on export earnings.

Saraiya's second objection concerns my manner of appraising the existing scheme of Import Entitlement. Again, the distinction between the two parts of entitlement, that against import content and that towards bonus, is very useful. I have argued that it is the total outlay on the bonus part of Import Entitlement which ought to be related to the increase in net export earnings from the products covered by the scheme. My reason for excluding the other part (i.e., that against import content) is that this entitlement would have been given in any case if the item in question was to be produced locally. But I was afraid at the time I wrote the original article that it exposed me to the possible objection that I was being generous in my appraisal because the underlying assumption that entitlement against import content would have to be given in any case was not necessarily valid. A question might well be

Table : Comparative Import Entitlement Against Exports.

Export Product	Import Entitlement under the Existing Scheme			Import Entitlement under the Modified Scheme		
	Against Import Content	Against Bonus	Total	Against Import Content	Against Bonus	Total
A	10	10	20	10	33	43
B	15	15	30	15	30	45
C	20	20	40	20	29	49
D	25	25	50	25	27	52
E	30	30	60	30	26	56
F	37.5	37.5	75	37.5	23	60.5
G	50	50	100	50	19	69
H	60	40	100	60	15	75
I	70	30	100	70	11	81
J	80	20	100	80	7	87
K	90	10	100	10	4	94
L	100	0	100	100	0	100

Note: This table is based on Tables 2, 3A and 3B of the original article published in *The Economic Weekly*, May 22, 1965.

raised: Aren't several industries in India working below capacity for want of foreign exchange? The entitlement specifically given against any export is meant not so much to raise the utilisation of capacity and thereby to increase the availability of output locally but to increase exports.

On the other hand, Saraiya takes me to task for being less than generous in relating the increase in export earnings to the total outlay and not just the increase in outlay on the bonus part of the Import Entitlement. (Incidentally, even the Ministry of Commerce takes the increase in total Import Entitlement and not just the bonus part. Saraiya seems to go even further, unless, of course, he is using the term bonus entitlement as synonymous with Import Entitlement, which is not unlikely in view of what has been said above.)

Let us examine Saraiya's argument a little more closely. If goods are not allowed to be imported under the export promotion scheme, he says, they would have to be imported in any case; because there is, to put it in his own words, "a genuine shortage of a

number of goods in India which have to be imported as a necessity and not as a luxury". If we accept Saraiya's argument, this means that all outlay of exchange on Import Entitlement, be it against import content or towards bonus, be it an extension of the previous year's outlay or an increase over and above that, would have been incurred in any case. It further follows that all increase in export earnings under the Import Entitlement Scheme represents a genuine increase and no netting is called for, *not even by the increase in outlay in bonus entitlement.*

This surely is an absurd position which I am doubtful if Saraiya will really want to maintain. I am more convinced now than I was when I wrote the original article that the criterion for appraising the Import Entitlement Scheme suggested by me is the logical and the most reasonable one to adopt. And in terms of this criterion the existing Import Entitlement Scheme turns out to be no better than a dead mouse unearthed from under the hill.

As regards "the question of the importance to be attached to imports

which are allowed under the existing bonus entitlement scheme" and are sold in the internal market, its only relevance to the problem of export earnings is that so much of exchange is given up not according to internal priorities but with a view to promoting exports. Whether imported things are consumed locally for fun or otherwise is extraneous to the issues discussed by me.

Before I conclude, let me state clearly that my conclusions based on the study of the existing scheme of Import Entitlement should not be taken to reflect adversely on the idea that under a regime of import controls, exports could be promoted by linking import licensing with exports. All that I would like to claim for my study is that it shows that the manner in which import entitlements are given under the existing scheme is not designed to achieve the best results.

I must apologize to Saraiya that I am not adequately equipped with information on Pakistan's Bonus Vouchers Scheme and am, therefore, unable to offer my comment, at this stage at least.

INTO THE VERY HEART OF INDIA!

Ten years ago...that's when we first started. It seems but yesterday. We've been busy going out to help people, different people. We've met them in town and in village...in plain and in woodland...in mansion and in hut. Together with our Subsidiaries we have over 1800 offices to serve them. Yet our work has only just begun. There are years, many years ahead. And today, we at the State Bank of India, pledge ourselves anew, to the dedicated service of our people and our country.

STATE BANK FOR SERVICE

Case Against Collaboration in Advertising

I HAVE read with interest the article "Case for Foreign Collaboration in Advertising" in your issue of May 22, 1965 and have the following comments to make on it.

The first thing that needs to be pointed out is that the inflow of foreign capital that might result from the two collaboration agreements is a mere £10,000. So, obviously, from the point of view of their contribution to strengthening our exchange reserves there is not much to commend them.

Your contributor has justified collaboration in advertising on the ground that Indian-owned and Indian-managed agencies do not have "technical know-how" and "managerial skills". But this has to be established. The Government appointed a Commission in 1952 under the chairmanship of Justice Rajadhyaksha to report on the state of the Press in this country. The Commission's recommendations, made public in 1954, were accepted unanimously by the Government and Parliament. Unfortunately, only a few of them have been implemented by Government either by legislation or by administrative action. Referring to the position of advertising agencies, the Commission noted the fact that the bulk of advertising was being handled by five major foreign-owned agencies. "We would like", the Committee added, "that Indian capital and Indian personnel be associated with advertising agencies." What has become of the Press Commission's observations, and of the Government's assurances on the floor of Parliament?

Your correspondent was unfair to Indian advertising agencies. The standard of advertising in India during the past 15 years has improved tremendously. The campaigns done on behalf of LIC, Telco, Vicks, Sanforized, Indian Oil Corporation, Golden Tobacco, to mention only a few, can stand comparison with the best in the world. It cannot be said that the agencies which handle these accounts have been "leading a sheltered life" nor that they "secured and retained accounts by means other than fair." Also, it seems nothing to say that Indian advertising is "at least 20 or 30 years behind the times." Development of advertising must necessarily depend on development of industries and their needs for scientific marketing and advertising.

Market research assumes importance only when there is keen competition in a *laissez faire* economy. In India,

as in any other developing countries where the standard of living is low, market research cannot assume the importance that it has in, say, the U.S.A. However, a number of Indian agencies have been giving assistance to their clients in market and product research. Similarly, motivational research, if it is to be realistic, will have to be developed essentially by indigenous expertise. Motivation research is being conducted in the major cities and certainly we have felt no need for foreign collaboration. Further, it is not as if no attempt at all has been made to train managerial personnel in this country.

The volume of press (Indian and Eastern Newspaper Society members only) advertising in the country has gone up from Rs 1.79 crores in 1952 to Rs 11.11 crores in 1964. In the process, the share of the foreign agencies has dropped from 54 per cent to 32 per cent in 1964. Here the figures quoted by your correspondent do not reflect the correct position. But even on the basis of his figures, it is obvious that foreign collaboration will

first eliminate the Indian agencies who, according to your correspondent, are weak and handle only 18 per cent of total advertising.

It is also argued in favour of foreign collaboration in advertising that we have to promote sale of our goods in foreign markets and that the Indian agencies are unequal to this task. While it is true that Indian agencies have not established their own offices abroad, they are certainly in a position to get the services of leading advertising agencies abroad on associationship basis.

In conclusion, I have to say that this hankering after foreign collaboration which has received the blessings of the Government creates an inferiority complex among Indian advertising agencies. One would have expected that at least in creative work sham imitation and a slavish mentality would be fought against. I, for one, can never believe that creative ability in India has reached a point where we have to await waves of inspiration from across the seas.

—RST

BUSINESS NOTES

Tata Oil

THE key feature of Tata Oil's financial results for the year to March 1965 is that margins as measured by the ratio of pre-tax profits to sales turnover have substantially widened. According to the preliminary profit figures, total sales advanced by six per cent from Rs 13.80 crores to Rs 14.63 crores but pre-tax earnings were pushed up over 57 per cent from Rs 29.12 lakhs to Rs 45.86 lakhs. These profit figures have been arrived at after providing for depreciation charge which amount, however, is not disclosed. For the year 1963-64, this provision was Rs 18.07 lakhs.

But the picture is completely reversed after other necessary provisions are made. Taxation bites much deeper, having chopped off Rs 25.60 lakhs against only Rs 9.39 lakhs previously, and development rebate reserve too requires a higher amount of Rs 7.60 lakhs against Rs five lakhs. Equity earnings are, therefore, actually lower at Rs 12.66 lakhs compared to the previous year's Rs 14.73 lakhs. The equity dividend is maintained at Rs three per share but it requires a bigger amount of Rs 16.82 lakhs against Rs 12.61 lakhs, because the 1,40,000 new

bonus shares are now entitled to the dividend distribution. Apart from Rs 1.35 lakhs (same) required for the preferential dividend liability, Rs 0.22 lakhs (0.75 lakh) are to be written off debenture issue expenses. Accordingly the directors have to withdraw a sum of Rs 5.38 lakhs from general reserve to make up the deficiency in the disposable profit.

TISCO

DALAL Street received a rude jolt on July 1 on announcement that the Board of Tata Iron and Steel Company had decided to keep the dividend unchanged at Rs 12 per share. Not only did Tata Steel Ordinary tumble down, but several other active shares lost considerable ground on hasty bull liquidation and aggressive bear selling. The weakness was not confined to Dalal Street alone; but was also reflected in other stock markets in the country. This was but a natural reaction, for a widely held belief, that the dividend would be stepped up by a rupee or so, was shattered. This belief was inspired by quite a few factors, chief among which

SISTA'S-CMI-363

was the feeling that the company had had a more prosperous year since it had surpassed the previous output records and also had the benefit of decontrol of about 45 per cent of its production. It was also argued that the Board would bear in mind the need to create a favourable climate in the market, particularly because the company might need to raise additional capital for the contemplated further expansion. Besides, the increase in dividend in the preceding two years in succession had whetted the shareholders' appetite and they thought they were unlikely to be disappointed when, in view of the rising trend in the interest structure, there was a stronger case for the Board to adopt a more liberal dividend policy. All these hopes, however, were belied, and the directors decided to toe a conservative line.

The preliminary statement of financial results for the year to March 1965, as expected, shows a satisfactory growth in turnover which is up nearly 12 per cent from Rs 110.44 crores to Rs 123.55 crores. Gross profit is, however, only a shade better at Rs 24.85 crores compared to the previous year's Rs 24.44 crores, showing thereby a visible dent in the profit-margin which is down from 22 per cent to 20 per cent. This is partly due to the provision for interest liability payable on the Rs 10-crore special advance from the Government. It may be noted that this liability is still the subject of negotiation with the Government. So far it amounts to Rs 3.5 crores, but the company has not provided the full amount in the accounts, though it has not been specified as to how much amount has been provided. A better picture of the performance could be had if this information were made available. Meanwhile, the absence of any official clarification has led to conjectures in the market.

The provision for depreciation is stepped up from Rs 7.97 crores to Rs 10.14 crores and that for the tax liability from Rs 4.75 crores to Rs 6.15 crores, with the result that the after-tax profit is down by well over a fourth to Rs 8.56 crores compared to the previous year's Rs 11.72 crores. The allocation to development rebate is lowered from Rs one crore to Rs 30 lakhs. After taking into account the preferential dividend liability of Rs 0.84 crores, equity earnings work out to Rs 7.42 crores against Rs 9.88 crores. As before, equity dividend requires Rs 4.41 crores. The dividend

cover has shrunk from 2.24 times to 1.68 times. Of the remaining surplus, Rs three crores have been allocated to deferred taxation reserve which last year received Rs 2.70 crores. It has not been possible to add any amount to general reserve to which as much as Rs 2.75 crores were transferred a year ago.

Metal Box

STRESSING the importance of tinplates as a packaging material, M K Vellodi, Chairman, Metal Box Company of India, said in his annual review circulated to shareholders that it is indispensable in a country where the climate is extreme, retail outlets are far distant from manufacturing centres and the shelf-life of consumer goods is long. There are many products for which tinplate's functional properties make it, for the next decade at least, India's most practicable packaging material. Doubtlessly, such considerations have influenced Government's decision to plan a massive increase in tinplate manufacturing capacity over the next two to three years. Having secured the medium term future, it is to be hoped that Government will succeed in finding the foreign exchange to bridge the gap between now and the time that Rourkela's new five stand mill goes on stream in 1966-67. It would be tragic, Vellodi says, if the price line should be pushed upwards as a consequence of a sufficient volume of important consumer goods failing to get to market for want of packing material. This could affect, for example, milk, baby foods, fish, fruit and vegetable canning, food beverages, biscuits and food oils. He warned that if the necessary bare minimum is not spent this year on tinplate imports, Rs 250 crores worth of essential goods will be affected.

In regard to the quality of Indian tinplate, Vellodi says, that at present Indian quality is probably the poorest in the world and export markets insist that the entire tinplate content of all the company's packaging materials shall be imported; and Indian canned goods are only acceptable in these markets in cans made from imported tinplate. This is a unhappy position, even though Rourkela's reversing mill has been operational since 1961. He has stressed the time factor in order to make abundantly clear how long it takes to establish tinplate quality. There should therefore be no easy optimism about tinplate exports; these

are unlikely to be achieved within the next five years, according to Vellodi.

Kirloskar Pneumatic

ONCE again, Kirloskar Pneumatic has produced good results enabling directors to step up dividend by 2.5 per cent to 15 per cent, which is also payable proportionately on the capital increased by the issue of rights shares. In the previous year also the dividend was lifted by 2.5 per cent. With a view to raising additional capital of Rs 25 lakhs for further expansion, another rights issue is proposed to be made on the basis of one-for-two at par.

According to the preliminary profit figures, sales turnover during the year to March 1965 has risen from Rs 2.88 crores to Rs 4.02 crores, and gross profit has advanced at a more brisk pace, from Rs 45.19 lakhs to Rs 77.20 lakhs. The necessary provisions for depreciation and taxation have taken up more at Rs 11.11 lakhs and Rs 40.63 lakhs compared to Rs 7.77 lakhs and Rs 23.50 lakhs, respectively, in the previous year. The allocation to development rebate reserve has also been raised from Rs 2.25 lakhs to Rs 3.86 lakhs. Besides, Rs 0.21 lakh (nil) are required to make up for the short provision for the previous year's dividend. The preferential dividend this time demands only Rs 0.03 lakh (0.15 lakh) because a major portion of the preference capital has been converted into equity.

After making these provisions, there is left a substantially higher amount of Rs 21.36 lakhs compared to the previous year's Rs 11.52 lakhs. Of this, ordinary dividend demands Rs 6.25 lakhs (3.88 lakhs). What is more significant from the shareholders' point of view is that despite the considerably increased dividend liability, the earnings cover is better at 3.4 times, against three times in the previous year, which itself is a sufficient indication that the company should not find difficulty in maintaining the dividend rate on the enlarged capital, even if earnings stay at the present level.

Oriental Fire

SPEAKING to shareholders of Oriental Fire and General Insurance Company at their annual meeting in Bombay a few days back, the Chairman, B D Pande, said that the overall results from the company's business abroad were still not satisfactory and that in some territories the manage-

WE ARE THE

We represent a tradition almost a century old, command a management service going back to 1892. Over the years too we have acquired an understanding—of a basic industry, and developed an attitude—towards the challenge of its expansion... When the nation needs better iron, more steel and more diversified end products they must come first from the more efficient working of existing installations which new plant and equipment should balance and supplement at a comparatively low investment cost. Expand, consolidate, expand. Aim assuredly at impact—but not by sacrificing in-phase economies. This then is the principle to guide us in our assigned role to take production to 2 million tonnes of ingot steel through another two-phase expansion programme.

TRADITION MAKERS

FOR REALISTIC
PLANNING AND
FULFILMENT

THE INDIAN IRON & STEEL COMPANY LIMITED ONE OF THE MARTIN BURN GROUP

HC-108

THE ECONOMIC WEEKLY

ment was compelled to reduce business with a view to improving results. It had stopped accepting business in Indonesia mainly due to the reason that the company was not permitted to repatriate its surplus funds from that country. The operations in Pakistan were giving the management cause for concern for some time and, in spite of the best efforts, the position remained unsatisfactory. Accordingly, it was decided to stop writing new business from June 1965, and necessary steps were being taken in that direction.

Referring to the entry of LIC into the general insurance field, Pande said that, considering the business available in the country and the present trend of increase in the total general insurance premium, he was confident that both LIC and Oriental Fire would have sufficient scope for expansion. He hoped that both would provide a lead in exploring fresh avenues in the field of general insurance and serve growing needs of the country.

Utkal Machinery

UTKAL Machinery has successfully cast, machined and ground large drying cylinders of 1500 mm diameter with a face width of 3.5 metres. Five such cylinders together with spiral scoop and heat insulating plates have been fabricated for a paper mill and six others are under manufacture for another client.

The Company feels that the government can now restrict imports of drying cylinders. To meet the requirements of smaller paper mills the Company has plans to manufacture drying cylinders of 1200 mm diameter. The Company has at present a production capacity of 48 drying cylinders per annum. All components are indigenously fabricated and no foreign exchange is, therefore, involved.

Larsen and Toubro are the selling agents of Utkal Machinery.

Money and Banking

Thursday Morning:

EASINESS in the call money market continued during the week with interest rates declining rather sharply. Demand for funds was largely unchanged and with the supply position having improved substantially due to the increased inflow of funds, borrowers were able to secure their requirements easily. Rates of interest declined from last week's level of 5 per cent to $3\frac{3}{4}$ per cent. The two Central Government loans were fully, subscribed within

a short period but did not have any effect on the money market.

During the week to June 25 aggregate deposits of the scheduled banks increased by Rs 23.52 crores to Rs 2704.31 crores. Increase in demand deposits was particularly marked by Rs 22.45 crores to Rs 1272.33 crores. Time deposits increased slightly by Rs 1.07 crores to Rs 1432.18 crores. Bank credit declined by Rs 12.49 crores to Rs 2069.83 crores. Borrowings from the Reserve Bank also came down from Rs 85.59 crores to Rs 65.99 crores. Investments in Government securities at Rs 726.72 crores showed an increase of Rs 2.64 crores. Cash in hand and balance with the Reserve Bank increased by Rs 2.42 crores to Rs 170.69 crores. Money at call and short notice were higher by Rs 8.44 crores to Rs 65.49 crores.

Notes in circulation during the week

to July 2 increased by Rs 12.92 crores to Rs 2677.50 crores, according to the Statement of Affairs of the Reserve Bank of India. Foreign securities decreased from Rs 70 crores to Rs 68.35 crores and balances held abroad were lower by Rs 2.46 crores at Rs 4.85 crores. Rupee securities came down from Rs 2403.07 crores to Rs 2394.72 crores. Deposits of the Central Government showed an increase of Rs 43.95 crores at Rs 109.59 crores. State governments' deposits were higher at Rs 16.71 crores by Rs 1.93 crores. Scheduled bank deposits at Rs 102.94 crores were Rs 3.40 crores higher than in the previous week. Loans and advances to governments decreased by Rs 25.71 crores to Rs 49.64 crores. Advances to scheduled banks rose by Rs 4.80 crores to Rs 68.46 crores. Investment increased by Rs 59.71 crores to Rs 298.38 crores.

Shree Digvijay Cement Company Limited

Speech of the Chairman, Shri G L Bangur

FOLLOWING is the speech of Shri G L Bangur, the Chairman, delivered in his absence by Shri B D Somani, at the Twentieth Annual General Meeting of the Shareholders held at Sikka on Tuesday, the 29th June 1965.

Gentlemen:

I have pleasure in welcoming you to the Twentieth Annual General Meeting of the Company. The Directors' Report and Audited Statement of Accounts have been in your hands for some time past and with your consent, I take them as read.

We are at present passing through a very difficult period in the economic and political arena of our national life. While many of our economic problems of importance still remain unsolved, we are at this critical juncture facing on our border two aggressive neighbours — China and Pakistan — which compels us to divert our valuable resources for the defence of our country. It is, however, gratifying to observe from Press reports that there is likelihood of imminent accord between India and Pakistan on the Kutch Border issue. If the cease-fire agreement does take place, I hope that it may gradually lead to establishment of better relations between the two countries followed by settlement of other outstanding issues. I hardly need to mention the fact that the economy of both the countries, i.e. India and Pakistan is very closely inter-woven and therefore the settlement of the disputes is bound to benefit the people of both the countries. I hope that under the able stewardship of our Prime Minister the country would be able to surmount all these difficulties.

The working results of your company for the year under review have shown good improvement over the previous year. It has been decided by your company to expand the existing capacity of cement by 2 lakh tonnes for which the company has been permitted by the Government of India to import machinery of the value of Rs. 60 lakhs against the sub-loan of foreign currency from the Industrial Finance Corporation of India and the Industrial Credit and Investment Cor-

poration of India Ltd. It is expected that the additional capacity of 2 lakh tonnes will be achieved by the 2nd/3rd quarter of 1966. The Company has also recently received a Letter of Intent for expansion of the capacity of its asbestos products by another 36,000 tonnes per annum. In order to finance the proposed integrated expansion programme, the Company is intending to issue debentures to the extent of Rs. 2.25 crores secured by a pari passu charge on the fixed assets of the Company with the Industrial Finance Corporation of India and the Industrial Credit and Investment Corporation of India Ltd.

As you know, the rise in demand for cement has far out-stripped the increase in output. There is keen anxiety on the part of the Government as well as the industry that production should increase rapidly as well as substantially. But the fact remains that the rate of growth of the industry is slow which is clear from the fact that the installed capacity in 1964 was only 10.50 million tonnes against 10.12 million tonnes in the previous year, i.e. the actual increase has been less than 4 per cent.

The cost of production of the cement industry has been increasing progressively mainly due to general increase in price level in the country and the increase in railway freight as well as in labour wages. In spite of this pressure of increase in cost, the question of adequate price increase for cement has always been delayed. However, I welcome the increase of Rs 4 per tonne in the retention price with effect from 1st June, 1965 and this, I hope, would enable the industry to meet the rise in the industry's cost of production for the time being.

I would, however, like to draw the attention of the Government to some important aspects of the price policy which deserve their serious consideration. Firstly, the present price structure of the cement industry will fall due for revision from 1st April 1966. Any reference to the Tariff Commission by the Government at this stage may involve a lot of delay as the Tariff Commission will not be able to complete its examination and submit its recommendations to the Government

in time for the price revision to be decided from the period beginning 1st April 1966. I, therefore, strongly urge the Government to introduce some simple procedure of examining the cost structure through their own cost Account so that necessary data may be available to the Government in time to determine the prices.

Secondly, the question of allowing a suitable price increase exclusively earmarked for expansion purposes is of crucial importance, at a time when the country is faced with a serious shortage of cement. The Government should have favourably responded to the representations of the Cement Industry for a suitable increase earmarked for expansion. I, however, regret to say that the Government has turned down the proposal of the industry and have expressed their inability to allow any increase for purposes of expansion. It will be really helpful if the Government would permit a specified percentage of the industry's production to be sold in the free market so that people are not to run even for small quantities of cement required by them for their own housing, repair work, etc. It will help all concerned and may be expected to yield satisfactory result to consumers, producers and Government alike.

I would like to congratulate the Finance Minister on his bold step in providing new incentives under the Finance Act, 1965, which will stimulate industrial production and exports. I hope Government would take a liberal view of the scheme, while selecting the industries to which the incentives would be extended and the rate at which Tax Credit Certificates would be allowed. The Tax Credit Certificates should also be made negotiable.

Managing Agency System

At a time when the country is undergoing so many severe economic pressures, it is unthinkable that Government should engage its mind on small things. There are enough provisions made by the Government in the Companies Act to curtail and keep within bounds the powers of

the managing agents, including payments to managing agents which have been specifically prescribed and brought down to the lowest level. Whatever the form of management, whether by managing agents or otherwise, the cost of management will be there and it does not seem that by abolishing the managing agents, it will result in lesser expenses. Managing Agents consist of several individuals working together and pooling their resources through the group management, as a whole which has proved to be helpful in knitting the organisation together and thereby bringing down management costs to the minimum extent possible. The financial resources and managerial skill provided by them have been of great value for continuity of working as well as retention of confidence. Bankers and other financial institutions always take an orthodox view based on the backing of the experience, credit and respectability of the particular group of management. Quite often industrial units have been saved from conditions of adversity by timely help of the managing agents and there are instances where managing agents have given up moneys due to them from managed companies for years together. It is, therefore, not clear why the question of doing away with the system altogether should be considered at all, particularly at this juncture when the necessity of pooling both managerial as well as financial resources is of great importance.

Wage Board for Cement Industry

Shareholders are perhaps aware that the Government of India has constituted a Second Wage Board for the Cement Industry composed of a Chairman and six members, two representing Employers, two representing Employees and two independent members. The terms of reference of this Wage Board are similar to those made applicable to the first Wage Board, namely: determination of fair wages on principles set forth in the report of the Committee on Fair Wages. At the same time, considering the serious handicaps under which the industry operates and also the fact that the previous Wage Board had after substantially increasing the wage level evolved a formula to link dearness allowance with the cost of living indices, I do not quite see why a Second Wage Board should have been appointed. The Board, however, has already started on its task and it is hoped

that in making its recommendations, it will consider linking any increase in emoluments that it may recommend with increased productivity and work load on the part of the workers.

The labour-management relations at all the factories remained cordial throughout the year.

Before I conclude, I would like to

express on behalf of the Management warm appreciation of the loyalty, hard work and whole-hearted co-operation of the company's employees at all levels at the office and the different Works.

NB: This does not purport to be a record of the proceedings of the Annual General Meeting.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Don't say a 'ROUND THE WORLD TRIP is only for "somebody else"

Charming San Francisco!

Fabulous European Castles!

See historic London!

Bustling, elegant, sophisticated New York!

Most people think a 'Round-the-World trip costs a king's ransom. On Pan Am it doesn't.

A 'Round-the-World trip need not be just a dream! A Pan Am 'Round-the-World economy class ticket costs *less* than the return first class fare from Bombay to New York

What does a Pan Am 'Round-the-World trip include? Up to 20 U.S. cities...major cities in Europe...the Middle East...the Orient. You enjoy stopovers almost anywhere. You'll find more places to see, more things to do. And everywhere you travel, you enjoy the good feeling knowing you're flying with the very best there is.

For reservations, call your Pan Am Travel Agent or Pan Am in:

Bombay: Taj Mahal Hotel, Tel: 211063-64
Calcutta: 42 Chowringhee, Tel: 44-3251 (5 lines)

No Light Still

IT is difficult to believe that in withholding announcement of the import policy for the current year the Government had no more serious purpose in mind than to create uncertainty and panic. But if there was some other purpose, what was it? Of course, since no import licenses were issued in the first quarter of the year a certain reduction of import demand may have been achieved, but, surely, the import bill for the year could have been cut in a more rational and less indiscriminate manner. That apart, can it be honestly maintained, even by spokesmen of the Government, that the public has been given any evidence so far of the time gained being put to good use to evolve policies and procedures which will cut imports according to estimates of availability of foreign exchange with the minimum of impact on industrial production and, particularly, on exports? What we have had instead, as was pointed out in these columns in the issue of July 3, is a series of piecemeal measures. That a device so uncertain in its impact as advance deposits against imports was thought of as a means to phase out imports over the year when the same result could have been achieved more directly through the elaborate import control machinery that the Government has at its command is indicative of the inability of current official thinking to come to grips with the basic elements of the foreign exchange crisis. As if to confirm this, no sooner was the advance deposits scheme announced than it was withdrawn for certain categories of imports.

The latest instalment of import policy announced on Thursday gives no idea of the monetary ceilings for import of various items. Licences to actual users will be issued on the recommendations of the sponsoring authorities "out of the overall monetary ceilings allocated to these authorities for the purpose". In other words, applications would be considered increasingly on individual merits, which is a good thing so long as one is reasonably sure that merit implies clear priorities. Too often, however, it becomes a matter of relative and extraneous pressures, succumbing to which is passed off as proof of flexibility. True, the Red Book in the past also did not give the monetary ceilings but the ceilings are a matter of far greater concern to manufacturers now that there is known to be acute foreign exchange stringency. If there has been any foreign exchange budgeting done in New Delhi, these ceilings must have been laid down for the more important items at any rate. Why not then publish them, if only as evidence that they exist?

So far as the permissible items are concerned, there is no doubt that the policy is less stringent than was expected. No article of machinery (other than machine tools) has been added to the ordinarily banned list. There is also practically no change in the list of machinery items which can be imported by actual users if they can prove that indigenous supplies are not available. As regards raw materials and components, it is claimed that care has been taken to prevent any slowing down of industrial production. But since the rate of growth of industrial production has already slowed down this is a claim rather difficult to concede readily.

To return to the areas which remain dark, export incentives continue to be uncertain though earlier it was promised that they would be announced with the import policy for actual users. The announcement has now been further postponed. Such prevarication on export incentives can indicate only more-than-ordinarily-acute inter-Ministerial wrangle. Otherwise export promotion schemes should have been the first to receive attention since they have been squarely blamed for the most striking aspect of the foreign exchange crisis: the failure of export earnings to match declared physical exports of goods. Nothing is yet known about the future of the much-criticised import entitlement scheme. At the same time, the tax credit scheme proposed in the 1964-65 Budget remains to be spelt out. It is not disclosed at what stage of its labours the committee of officials appointed to re-examine existing export incentive schemes and to determine the quantum of tax credits against exports of different categories of commodities is. There can be no doubt that in certain commodities, import entitlement could be reduced to substantially below the export performance and the reduction made up through tax credits. It should be possible, in fact, to taper off the import entitlements over a definite period of time replacing them gradually with tax credits.

Towards a Healthy Press

—A Test Case

AN organisation, once it has been properly set going, seems to run by itself. That is why newspaper readers in the country have had no reason yet to suspect that anything was seriously wrong with India's largest group of newspapers, the 127-year-old *Times of India* and the *Illustrated Weekly, Navbharat Times, Maharashtra Times* and the others owned by Bennett Coleman & Co Ltd which, in turn, is owned by Shanti Prasad Jain (and his relatives and companies), the industrial magnate of Vivian Bose Enquiry fame. The management of this group of newspapers has for some time been in the hands of a Board of Directors appointed under a consent order of the Companies Tribunal, set up under the amended Companies Act, to which Government had petitioned for the removal of the management of the Company. The petition was filed under several provisions of the Companies Act which provide *inter alia* for the removal of managerial personnel on charges of mismanagement and also under a wider provision recently inserted which empowers the Tribunal to intervene when the management of a company is found acting against the public interest.

As an offshoot of the Vivian Bose Enquiry which investigated the case of one live and nine dead companies in which Dalmia and Shanti Prasad Jain were involved, Government appointed an Inspector in April 1963 to investigate the affairs of Bennett Coleman & Co. The senior officers of the company under the direction of Shanti Prasad did not co-operate in this enquiry in the beginning but later, when assured by the late Prime Minister Jawaharlal Nehru that the case against the offenders would be actively pursued, they came forward to give evidence and produce documents, regarding the alleged malpractices of Shanti Prasad. Government issued an ordinance in July last year to protect the service and interests of the employees during the pendency of investigations by the Inspector or proceedings before a Tribunal appointed under the Act.

The interim Board of Directors consists of four directors representing the shareholders, two directors nominated by Government, and a Chairman who was acceptable to both sides and who has been vested with a limited power of veto. This interim Board, however, does not seem to have worked smoothly,

for a fresh petition was filed by the Government in February last praying for an alternative arrangement for the management of this group of newspapers either by a Board of Management, or a Special Officer, or any other arrangement which the Tribunal might deem fit.

The allegations against Shanti Prasad and other directors, which are being considered by the Companies Tribunal, are of misappropriation of large sums of money, manipulation of accounts of income in order to get approval of the Controller of Capital Issues for issue of new shares at par, various payments to settle losses in speculation of Shanti Prasad or his companies, and interference in editorial policy. The latter was brought out forcefully by the Editor of the *Times of India* in his letter to Pandit Nehru in which he complained of the "nerve-shattering difficulties and frustrations" under which he had to work. The Editor had confidently expected the late Prime Minister's "unconditional endorsement that the paper should be independent and honest in the expression of its views" to be followed up by suitable action. He had also put forward the view of the senior officers that the paper "should be organised with Government aid and initiative into a co-operative" in order to ensure clean administration and editorial independence. This proposal had been put forward in the Press Commission's report also in a general context.

The petitions filed before the Companies Tribunal are pending and the above allegations are subject to judicial determination in due course. Meanwhile, part of the proceedings of the Tribunal have been stayed by the Bombay High Court on technical grounds on an application by Shanti Prasad.

The growth of a healthy press in the country had been one of Pandit Nehru's abiding hopes and enduring interests. He had particularly regretted that large sections of the Press in the country should be owned and controlled by industrial magnates. The public, therefore, has much greater concern in the case of Bennett Coleman & Co, which is before the Companies Law Tribunal and has been the subject of investigation by the Special Police Establishment with which the case was registered in January 1964, than what arises from violations of the Companies

Act or alleged mismanagement. The fate of the largest group of newspapers in the country will be watched with more than usual interest for on it will depend largely the future and the possibilities of the growth of a healthy press.

It is reported that the Home Minister who is the Chairman of the Vivian Bose Sub-Committee of the Cabinet is no longer in favour of criminal prosecution which should have followed the Special Police Establishment investigations completed early this year and in the course of which several thousand documents were seized. Instead, the possibility of bringing about a settlement with Shanti Prasad Jain is being explored. It is incredible that the Home Minister, who is bent upon eradicating corruption in all walks of life, could be in favour of such a course. It is not only Nandaji who is committed to the eradication of all corruption; Lal Bahadur Shastri is on record as saying that the common man has lost confidence in the Government and it is the duty of the Government to see that this is restored. Will such a settlement be conducive to the restoration of confidence?

If there is such a move—we hope there is not—then this is certainly the most propitious time to push it through. Parliament is not in session, so inconvenient questions will not be asked, at least not for some time and the controversial AICC session in Bangalore will keep the top men all busy.

There is no reason, however, to believe that all is lost yet. There is a question of propriety and procedure—whether the Home Ministry is entitled to interfere with the normal process of law when once it has been set in motion. There is the more urgent and pressing question which arises in view of the delay in following up the report of the Special Police Establishment: Has the Home Ministry taken the independent advice and opinion of the Attorney General on the report submitted by the S P E? But apart from questions of propriety and procedure, the ground for hope that all is not lost lies in this that it is a matter of such importance as to engage the attention of the Cabinet at the Centre and it would be difficult to imagine that the Cabinet can ever dispose of this matter in so cavalier a fashion without due consideration of its wider implications. The future of the press and the institutional basis of a healthy press is a national issue today and we shall not believe that the Government will lose this opportunity of setting the right precedent.

Weekly Notes

Significance of Plan Size

THE resources committee of the National Development Council has decided to stick to the target of Rs 21,500 crores to Rs 22,500 crores for the size of the Fourth Plan. Does this mark the end of the excited, though not particularly fruitful, debate which has been going on, even in official circles, since the publication of the Planning Commission's "Memorandum" in October 1964. We have heard urgent argument for reducing the Plan as well as for enlarging it. But the scales were weighted in favour of the former. The Planning Commission itself had cut the physical targets suggested for a number of important sectors. Then the Prime Minister put a stop to talk of enlarging the size. There were, therefore, grounds for apprehension that a downward revision was on the cards, especially in view of the fact that the States had come up with very much lower estimates of resources than expected by the Planning Commission. The National Development Council has now resolved to raise additional resources to the tune of Rs 3,000 crores by various means including additional taxation. The disciplining of the States has been achieved just as we had said in these columns two weeks ago it would be. The States have undertaken to raise proportionately a larger share of the additional resources in the Fourth Plan than in the Third Plan against concessions of a relatively unimportant nature.

So far so good. But how far? What significance is to be attached to the financial figure representing the size of the Plan? It has not been sufficiently strongly stated by economists that the size of the Plan as thus indicated is not of any significance. It is the sum of two figures—"investment" in the private sector and, in the case of the public sector, what is called "outlay", which includes investment as well as additional current expenditure on Plan account. Then again, purely statistically, the target for the public sector is meaningful in the sense of being *ex post* verifiable; no such meaning can be attached to the so-called target for the private sector, for which the estimates of savings and investment are admittedly of an extremely sketchy character.

But the most serious of the objec-

tionable features of this particular concept of size is that it is a value measure and, therefore, meaningful only when the prices at which it is measured are specified. But this is nowhere done and one talks of Rs 21,500 crores or Rs 22,500 crores as if they were measures of absolute physical units. It is true that in the Planning Commission's "Memorandum" it was mentioned that the financial figures are in the prices of 1963-64. But since then, during the last year to be precise, prices rose sharply and yet in all the discussions and loud thinking, there has been little concern at the fact that each time one talked of Rs 21,500 crores, one was talking of a different magnitude in real terms.

When the country is supposedly wedded officially to the concept and philosophy of physical planning, why should there be all this emphasis on a financial figure as representing the size of the Plan? There is obviously a contradiction between fixed physical targets and a fixed financial size when there are no targets for prices. This contradiction has exploded the balances of the Third Plan where the physical achievements have fallen far short of targets and yet the outlay targets have been over-fulfilled. In most Planning Commission pronouncements and documents, much satisfaction is drawn from the fact that if not in anything else at least in the matter of outlay, the Third Plan targets have been fulfilled. A fine testimony indeed for the planners' faith in physical planning! It is gratifying, however, that the irrelevance of the concern for financial figures was pointed out at the meeting and by no less a person than the Food Minister who is reported to have said that most of the present economic difficulties were due to the failures in the Third Plan and emphasised that unless we ensured that similar failures did not recur, the Fourth Plan would have no meaning.

Seasonal Price Fluctuations

A RESERVE BANK study of variations in the prices of agricultural goods shows that seasonal variations in the prices of a number of commodities have lessened in the past fourteen years. The study calculates the trend-cycle component by means of a twelve-month moving average and the seasonal component as the

per cent deviation of monthly averages from the corresponding moving averages; a residual remains after the extraction of the trend-cycle and seasonal elements, which is called the irregular component.

The amplitude of seasonal fluctuations (i.e., the difference between their peak and trough) differs greatly between commodities—its average over the 14 years is as high as 10.0, 12.2 and 14 per cent for wheat, rice and groundnuts and as low as 4.2 for raw cotton. There does not seem to be much correspondence between the violence of seasonal variation and the degree of concentration of market arrivals: the arrivals of groundnuts and cotton are equally concentrated, and those of wheat far more concentrated than of rice, and yet seasonal fluctuations are greater in the prices of groundnuts than of cotton and in the prices of rice than of wheat. Evidently, institutional factors are also at work.

Prices at each point of time have to be such that people are induced to hold neither more nor less than the existing stocks; so apart from the unevenness of market arrivals, the costs of storage and the minimum rate of return on storage required by stockists must also influence the prices. It is possible that the storage costs of rice, wheat and groundnuts are higher than of cotton and jute: apart from their greater bulk, they also lose weight during storage as a result of dehydration.

However, the market organisation seems to exercise a significant effect. Stocks of the industrial raw materials are held partly by cotton and jute mills and partly by traders in close touch with them; the risks of holding stocks are, therefore, at a minimum, and so are the required profits. Owing to the greater dispersion of stocks of wheat, rice and groundnuts, the risks and the minimum profits in their storage are higher.

It is interesting that the amplitude of seasonal variations in the price of jute has declined from 18.0 per cent in 1951-52 to 7.2 per cent in 1964-65, and that of cotton from 4.6 to 3.7. The decline might be attributed to the price stabilisation and buffer stock activities of the Jute Board, the Cotton Commissioner and the Forward Markets Commission. The stability of variations in the case of wheat, rice and groundnuts is puzzling; possibly, the

restrictions on inter-State movements and on stock-holding have offset the tendency towards greater stability of prices. However, this problem calls for a more detailed analysis and the analysis should be extended to more commodities. It is to be hoped that the Reserve Bank will undertake it.

Wrong about Bilingualism

SUMMARY of a paper prepared by the Secretary of the Education Commission appearing in the Press a few days ago suggested that according to the 1961 Census data on languages known to people, the position of Hindi in non-Hindi areas was "far from happy". The highest and the lowest percentages of Hindi-knowing population in Southern States were, respectively, 1.28 in Mysore and 0.20 in Madras. English was described as "the most largely-known subsidiary language in India with a clientele which is even larger than that of Hindi as a subsidiary language (9.36 million)".

A scrutiny of the relevant census material shows that both the conclusions drawn in the paper mentioned above are unwarranted. This is not because the number of persons knowing a language other than his mother-tongue is underestimated. But the instructions to enumerators laid down that he should not record more than two languages against the question eliciting information on bilingualism. Further, even in the case of persons reported as knowing more than one language (besides their mother-tongue), the tabulation is based only on the language first recorded by the enumerator. All this is clearly stated on the flyleaf to Table C-VI of the 1961 Census of India, Volume I, Part II-C (ii), "Language Tables" (p 137). It implies that the pattern of bilingualism shown by the Census tables is seriously affected by the order in which a person named the language other than his mother-tongue known to him. If a person with Tamil as his mother-tongue and knowing both English and Hindi reported them in this order, the present census table on bilingualism indicates him to be knowing only English. If, therefore, the Education Commission wants to know the extent to which Hindi is known in non-Hindi areas as a subsidiary language, it must embark on a special tabulation of the Census data on bilingualism. It might even recommend for the 1971 Census a special question on the knowledge of Hindi; that would resemble the special ques-

tion on 'literacy in English' which was a part of the Indian Censuses prior to 1951. Also to make a complete inventory of the extent of multi-lingualism in the country, the Census may be asked to record all the languages known to respondents. But it is obviously unfair to draw invalid inference from the Census data. It is possible that the Secretary of the Education Commission has qualified his inference in the paper; but then he should have corrected the misreporting in the Press.

Oil Price and Storage Capacity

THE cuts in crude prices announced by Burmah-Shell and Caltex will save Rs 1 crore and Rs 17 lakhs, respectively, of foreign exchange, it has been reported. Esso is said to be preparing to follow suit. The price of Iranian crude would now be \$1.48 a barrel and of Kuwait \$1.34. The new prices are effective from July 1. They compare favourably with the best offers of \$1.50 Iranian and \$1.35 Kuwait for the Madras refinery. As Ankleshwar, which supplies a quality comparable with that from Iranian sources, increases its despatches to Bombay refineries, the imports of Kuwait crude can be stepped up, bringing down the foreign exchange cost further. This gesture by the oil companies is only remotely connected with the squeeze applied by the Government on distribution of refined products. The immediate provocation for it lies in the forthcoming submission of the Talukdar Committee's report on oil prices—and the negotiations for expansion of coastal refineries which were stalled pending agreement on crude prices. Agreement is, of course, still a distant prospect because hard negotiations will commence only after the Talukdar report is submitted and the terms will depend on the final offers for Madras and Haldia.

In the meanwhile, Indian Oil appears to have overcome the desperate problem of arranging supplies of diesel and kerosene in areas where it had little or no distribution and storage facilities. Complaints of shortages are muted for the time being but how long can it maintain its emergency pace? Procedures and facilities designed to meet emergency requirements cannot be maintained indefinitely. They have to be formalised. Nearly one-half of the inland storage capacity of the oil companies will remain idle since their imports will never be restored to the previous level, while Indian Oil has a

THE ECONOMIC WEEKLY

long way to go before it can have adequate storages. At the end of March 1964 it had only 65 depots with a capacity of 31,600 kls and 624 retail outlets, against a target of 145 depots with a capacity of 46,750 kls and 1,650 retail outlets. The situation could not have improved appreciably since then in spite of its heroic performance during the last few months. Its sales increased more than 5 times, from 2,11,000 kls in 1961-62 to 11,72,000 kls in 1963-64 but the percentage of target achievement fell from 83 to 63 per cent. It has lost special discounts, amounting to at least Rs 18 lakhs which the Russians would have offered for scheduled lifting of quantities additional to those agreed in 1960, and lost a further Rs 50 lakhs on a product exchange arrangement with the oil companies, all due to inadequate storage and marketing facilities. The costs imposed on it this year too must have been considerable. One way out of this wasteful situation is for the Government to induce the oil companies to lease part of their inland storage to Indian Oil. The only alternative to this is to requisition the capacity.

Goa: Referendum At Last

WHAT made the Congress Parliamentary Board reverse the Party's policy on the future of Goa was less the wishes of the people of Goa, more those of the Congress leaders of Maharashtra. To that extent the Mysore Chief Minister is right to feel aggrieved—the patent absurdity of Mysore's claim to Goa notwithstanding. It was strange that at the meeting between Lal Bahadur Shastri and the Goa Chief Minister, the other person present should have been Y B Chavan.

Ever since the elections in Goa in 1963, there has been close rapport between Maharashtra Congress and the Maharashtra Gomantak, the ruling party in Goa, somewhat reminiscent of the collaboration between the Congress and the Samyukta Maharashtra Samiti at the time of the agitation for merger of Bombay in Maharashtra. In this set-up the position of the Goa Congress, which is after all the Congress organisation in Goa, has become increasingly queer. It contested the elections, disastrously, on the plank of retaining the *status quo* for the time being and since then its President has come out openly against merger with Maharashtra. What role the Goa Congress plays in the coming elections it will be indeed interesting to see. It will be difficult to make a *volte face* and campaign for merger

THE ECONOMIC WEEKLY

now; nor will the Congress want to dig its grave by joining hands with the United Goans, the chances of a popular vote in favour of merger being as good as they are. So perhaps it will stay out of the elections altogether.

In that case the election will be a straight fight between the Maharashtra Gomantak, actively aided by the Maharashtra Congress, and the United Goans. What we will have in effect will be a referendum even though the Government of India may not like the word allegedly because it might set a "dangerous" precedent. This kind of casuistry is so typical of the Congress. If to consult public opinion on an issue like that faced in Goa is to set a dangerous precedent, then a referendum amateurishly camouflaged as an election is no better than a straight referendum.

The need for all this double-talk could have been avoided had the truth been faced at the outset that since the present political division of the country was determined by the States Reorganisation Commission and since Goa was not a part of the country then, a decision had to be taken about it and there could be nothing wrong if in taking this decision the opinion of the people involved was consulted. Surely this is not going to set a precedent for agitation by DMK in Madras or by Akalis in Punjab or indeed by Pakistan in Kashmir!

PL 480, Once Again

FOR a subject which is not at all a matter of opinion but of ascertaining the true facts, the impact of PL 480 transactions on money supply has provoked a surprising amount of controversy. Exactly what happens when PL 480 counterpart funds are spent by Government has been described, step by step, by the Reserve Bank and the Finance Ministry. But that has not stilled the controversy. Now the National Council of Applied Economic Research has raked up the subject in its latest report, on "Management of Public Debt in India". The full text of the report is not available yet but, to judge from detailed newspaper accounts, the Council has come to the conclusion that under the present procedures PL 480 funds are spent twice over, thereby contributing to an expansion in money supply. It has, therefore, recommended that the funds should be impounded with the Reserve Bank instead of being invested in Special Securities issued by the Government as at present.

Neither this recommendation, nor the

judgment about the impact of PL 480 funds on money supply on which it is based, is new. Both have been closely examined and rejected, by official economists and others. Under the present procedure, followed since May 1960, when PL 480 imports are paid for, all that happens is that imported commodities are exchanged for Special Securities issued by the Government. There is no effect whatsoever on money circulation. Subsequently when the imported commodities are sold, there is a contraction in money supply which is, however, offset when the sale pro-

ceeds are spent. The confusion is created when the impact of the proceeds of the Special Securities spent by the Government is equated with the impact of PL 480 funds. The difficulty arises because PL 480 transactions are not treated in isolation, as they should be for analysing their impact on money supply, and normal budgetary exigencies are traced to the emergence of the PL 480 funds.

The Council's analysis appears to be marred by other flaws as well. It is stated, for instance, that while the direct effect on money supply of the

THE GREAT EASTERN SHIPPING COMPANY LTD.

procedures under which the Government sells wheat and spends the sale proceeds is neutral, the indirect effect will be positive provided there occurs a net increase in bank deposits. What is one to make of this statement? If the impact on money supply is neutral, how can there be an increase in bank deposits? It is possible that the authors of the study have at the back of their minds changes in the currency-deposits ratio consequent on Government's spending of counterpart funds, for they say that a rise in bank deposits may or may not occur depending on the public's relative preference for holding bank deposits and currency. But, surely, the currency-deposits ratio does not change from day to day, depending as it does on the growth of the banking habit? It is hardly likely that the ratio will be different when the Government contracts money supply through sale of commodities from when it spends the sale proceeds.

Similarly, while examining disbursement of counterpart funds, it is stated that when the US Embassy disburses counterpart funds it must first sell some of the Special Securities and that if the Government buys these Securities back its cash balances with the banks and the latter's investments will go down so that the effect on money supply is neutral. But, obviously, this neutral impact on money supply is possible when the fall in the non-monetary liabilities of the banking system is matched by equivalent fall in its financial assets, whereas in this case the Special Securities are *not* the financial assets of the banking system. They are held only by the US Embassy.

Sluggish Package Programme

THREE years after it was started, Maharashtra's Intensive Agricultural District Programme still has to get over its teething troubles. This is particularly disturbing, considering that the very rationale of the IADP is to select a few highly promising districts and then, by concentrating there a whole package of better and increased inputs, obtain quick improvements in yields per acre. The idea of a package programme for selected districts has been in the air since at least the late fifties; it was introduced on a pilot basis in three districts in 1960-61. It is amazing, therefore, that in 1965 the administration in one of the better run States should be treating difficulties like those of recruitment and of the credit-worthiness of the farmers, as newly discovered problems.

The programme in Maharashtra got

off to a bad start. It seems that the State Government would have liked to choose Kolaba district but that the Union Government, on advice of Reserve Bank officials, insisted on Bhandara district because it was thought that the latter had more irrigation tanks. However, a large number of tanks turned out to be in a state of disrepair. Similarly, the co-operative societies were found to be much weaker than had been expected; many of their members were defaulters; and about 50 per cent of the cultivators in the package programme did not belong to any co-operative society. The State Government has turned a number of short-term loans into long-term ones, stood guarantee for them for the first two years of the programme, and has started a campaign

LETTERS TO EDITOR

Census Publications

THE Registrar General's office feels grateful for the very appreciative notice in your issue of July 3 on the Census publication programme. It will be of interest to your readers to know that already 90 volumes of Tables for all India and for each State have been published. The additional number of volumes of Tables which will be published without fail by the end of this year will be 72. The number of districts in India is 332. A total of 295 District Handbooks will be published by next December and already 84 have been published. By this programme, all the important demographic, social, cultural and economic tables projected in the 1961 Census will have been published, down to the level of each village, for most of India. The number of analytical Census reports already published is 33. Another 34 will be published by December. Nine State atlases will have been published at the end of the year. The firm figure of the number of volumes to be published by next December is 735.

Even with their electronic appliances and facilities for offset printing directly from tables printed by computers, it has not yet been possible for any other country which took its census in 1960 or 1961, to produce more than a fraction of this amount. It may seem odd, as indeed you have observed, that while some tables still remain to be published, as many as 200 village monographs should have been published. We have a great dearth of presses which print tables in 6 or 8 point type. Mono printing facilities for

to increase the membership of the co-operatives. There is also a phased programme to repair the damaged irrigation tanks. Effort is also being made to link credit with marketing. The plan is to construct 309 godowns for this purpose in the district. Of these 130 have been completed and the rest are under construction.

There are few other indications of energetic activity, however. It is to be hoped that the lack of pre-planning which resulted in appointment of staff taking three years will now be a thing of the past. It would be interesting to find out if the slow progress of the programme in Maharashtra has anything to do with its implementation not being the direct responsibility of the State Government as in other States but that of the Zilla Parishad.

statistical tables are extremely limited. It is gratifying that the Census of 1961 has been able to augment India's capacity in this direction by a piece of planning started in 1958-59. The tables and village survey monographs are printed in non-competing presses. In other words, the village surveys are printed in presses which cannot undertake table printing. By common acknowledgment, at home and abroad, these monographs by my colleagues have been an outstanding contribution. This office has been complimented time and again that a similar output has not been possible elsewhere at any time.

Your readers will be happy to learn that an attempt is being made to attach a branch of the Publications Division to the Registrar General's Office at Delhi to pay prompt attention to demands for copies of Census reports.

You have thought fit to make the following comment: "And it is time to take a hard look at the practice of writing an official report on the Census data for each State or Union Territory, a task for which administrative officers are not always fitted. We should probably switch over to the pattern in USA where the Census Bureau is mainly a collector and publisher of data and undertakes, by and large, only evaluative studies." Although one feels tongue-tied yet, in the interests of future demographic research, the facts had better be faced. You will perhaps concede that not very much of independent demographic analysis of Indian data worth the name exists outside of the official reports of Cen-

sus Commissioners and State Superintendents and much of what has so far passed for non-official and independent demographic analysis of census data has been to a considerable extent acknowledged or unacknowledged rehashes of extracts and conclusions from published official reports on the Census. My colleagues have received high praise from very exacting scholarly circles at home and particularly abroad on the quality of the 1961 Census reports of several States, the official age and life tables, and the analytical reports so far published on the demographic, economic, cultural and language data. While admittedly, official reports have been and will be of varying quality, it is doubtful whether in the present sluggish state of scholarly enterprise in India they could really be dispensed with. Besides, unlike in other countries members of the Indian Administrative, Statistical and Economic Services, who write these official reports, have had as good a scholarly academic record in their university days as any. It is hardly surprising therefore if with four to six years of dedicated and unremitting work of 14 to 16 hours a day and with their opportunity of keeping their ears to the ground, they should relapse into laudable scholarship and outdo in their own field academic scholars who usually spend no more than four hours every day with more than four months of vacation thrown in every year. This indeed is a serious matter in a much wider national context.

This office feels grateful, too, for your gracious comment on its effort at stimulating scholarly enterprise in India.

A Mitra

PL 480 Transactions

I HAVE read with interest M. Z. Mogri's article "PL 480 Transactions" in your issue of May 29, 1965. I do not agree with the author's thesis that although PL 480 transactions individually and severally do vary cash flows in the economy, their net impact is nil as far as money supply with the public is concerned. The main defect in the author's analysis, as also in the analysis of Reserve Bank and Government of India economists (V V Bhatt, D R Khatkhate, etc), is that PL 480 transactions are considered in a static

rather than in a dynamic setting.

It is clear from Mogri's Table that deposits created in favour of the Government of India with the Reserve Bank of India initially on the basis of *ad hoc* Treasury bills remain unaffected. The only change that takes place after a week or so is that *ad hoc* Treasury bills are transformed into special Government securities created in favour of the US Embassy. These deposits are drawn upon by the spending units of the Government and thus the stream of Government expenditure is swollen. As a result of the fresh injection of cash into the economy, the cash resources of the credit institutions increase and the credit institutions are thus in a better position to create credit in favour of spending units both in the private and public sectors.

The process of creation of currency is similar to that under the commodity currency standard advocated by a school of economists led by Milton Friedman, but with a little difference. The arrangement for sale of food stocks is well known. The Government of India sells the stock of foodgrains to the State Governments who, in order to take delivery of the stocks, seek fresh credit facilities from the State Bank of India. The creation of fresh credit in favour of the State Governments would theoretically cancel out the deposits created by the Reserve Bank in favour of the Government of India. But in practice, such adjustments take place only after a great time-lag. Till such adjustments are effected, the two lines of credit, namely one with the Reserve Bank and the other with the State Bank, run concurrently. Needless to say, the impact of these credits is expansionary.

Again, the sale of foodgrains by the State Governments takes place against lines of credit created in favour of licensed traders by the commercial banks. These credits are retired as the consumers pay cash out of income earned in the previous period for foodgrains obtained from the grain shops. The impact of this transaction is contractionary, but it does not wholly offset the preceding expansionary impact for the simple reason that the injection of cash *via* Government spending has a multiplier effect on the money supply and the speed with which the spending units of the Government spend is several times faster than that with which the selling units of the Government collect cash. Hence, I have no hesitation in concluding that the analysis of Mogri and of the official

economists of the impact of PL 480 transactions is wrong.

Village Industries

IN his note "Village Industries in the Fourth Plan" (July 10, 1965) your correspondent betrays only his incomprehension, ignorance and indifference to the suffering of common people. U N Dhebar objected to making the Boeing and the bullock cart run on the track; he wanted both to run. In effect what he wanted was necessary co-ordination between the policies of the Government of India (the Planning Commission is a mere agency of the Government) towards organised and decentralised sectors. If the Government wants to get yarn from spinning mills it should not assist Khadi; if it decides to assist Khadi there should be no more of spinning mills. So much for your correspondent's incomprehension.

His ignorance finds expression in the very bold statement that "there is no market whatsoever, either in the urban or in the rural areas, for such products as cottage matches, handmade papers, cottage soap, etc". Let your correspondent enquire of the principal paper traders in the city about handmade paper consumption. He might profitably look up some of the prestige publications of renowned companies as well as the match boxes used by them. Suffice it to say, there is as yet no marketing problems for cottage soap.

In many areas of the country there is marked preference for ghani oil and hand-pounded paddy. Unfortunately licencing of mills (contrary to recommendations of expert committees) has severely affected the stability and competitive capacity of these industries.

The Khadi and Village Industries Commission, I am sure, will reply to the specific criticism of its programmes. I shall only refer to the correspondent's amazing insensitivity to economic reality. According to one of the most reliable estimates during 1961-62 more than 25 crores of people in this country did not have even fifty paise to spend per day. Any occupation that yields even this much of income is economic, relevant and worth all the support. But many village industries do yield a larger income.

The Congress Troikas

Romesh Thapar

THESE days, the leaders of the Congress who are regularly closetted with Prime Minister Lal Bahadur discussing matters pertaining to the future of factions and factotems in the States always come away marvelling at the visible excitement of the 'boss' over various incidents in his foreign tours, excitement which temporarily has deflected his attention from the intrigues of the party — intrigues which normally absorb his time and energy. That this should be happening on the eve of the impending battles at Bangalore is significant. Lal Bahadur quite clearly continues in command of a situation which, according to him, only looks unhealthy from the outside.

For example, those who make a study of the permutations and combinations of personality and policy within the ruling party maintain that the behind-the-scenes Syndicate has now dissolved into four troikas which are contending for power and influence in the coming year of election preparations. The troika which is in the lead is made up of Lal Bahadur, Gulzarilal Nanda and Kamaraj. It is at the moment receiving crucial support from the troika of Indira Gandhi, Y B Chavan and Subramaniam. Two troikas are in opposition. One comprises S K Patil, Sanjiva Reddy and Atulya Ghosh. The other, which seeks to make an impact, consists of Morarji Desai, Jagjivan Ram and Vijayalakshmi Pandit.

Kamaraj's Second Term

Each troika claims bases in the States either through Chief Ministers or through the party 'bosses'. At the Centre, too, alignments are said to be along these four broad divisions. Prime Minister Lal Bahadur's skill lies in controlling one of the two troikas opposed to him. And it is this troika of Patil, Reddy and Ghosh which is being uncertainly wooed by Morarji Desai and his supporters. A break up of this troika, or its neutralisation on a crucial issue like the projected second term for Kamaraj, is sought as the first step to consolidate the ascendancy of the right wing in the hierarchy of the Congress Party.

Those who plan to challenge the present balance of forces within the party claim that what is required is an unfettered, critical group within the party. Only then, they claim, will

it be possible to smash the 'Nehruist dogmas' which have made Lal Bahadur and his colleagues 'the prisoners of indecision'. The fact that Vijayalakshmi Pandit is considered to be part of this group is highlighted. It is assumed that her influence, for whatever it is worth, will eat into the wavering supporters of the two troikas which cement the present government, the troikas headed by Lal Bahadur and Indira Gandhi.

If Morarji Desai manages to block Kamaraj's second term, and there is a likelihood of either Jagjivan Ram or Atulya Ghosh contesting for the presidency, then it looks very much as if Indira Gandhi will have to relinquish her ministership and face the challenge from the right wing. It is maintained that she is about the only person who could ride the storm. But it is unlikely that there will be this kind of upset. Each day sees support for Kamaraj gather. He has certainly become the symbol of stability and fair play in the eyes of the rank-and-file leadership.

The rise of Kamaraj to national prominence has astonished even Kamaraj. Every now and then he confides to his close friends that he would like to return to the chief ministership of Madras State. This frequent refrain is probably designed to convince himself that this is no longer possible—or, for that matter, necessary. He is also beginning to draw crowds all over the country, a sure sign that he has broken through a major barrier for a regional politician. Indeed, even his silences are interpreted as meaningful. Foreign governments, too, are taking note.

The Soviet Union, for instance, is very much alive to the influence that Kamaraj is beginning to wield. This probably explains the extraordinary official invitation extended to him to visit the USSR. From all accounts, a rather lavish reception is planned for him. If this becomes a fashion, Kamaraj may soon find himself, like fellow troika-ist Lal Bahadur, a much travelled man. All this is to the good. We need to give a new status to the organisational leadership of the ruling party. It is, presumably one way of puncturing those monopolists of all public glory—the ministerialists—and of making the organisational wing look as attractive. Strange yardsticks, but of such stuff is democratic politics made in India.

The halo of VIP foreign travel, arranged by some to escape the harshness of summer's heat and engineered by others as an essential part of their search for national recognition and respect, is now about the most sought after distinction in this supposedly 'socialistic' Capital. At one stage, it is believed that over twenty ministers of the GOI were abroad for one reason or the other, including Cabinet Minister Satyanarain Sinha who on his own admission spent a great deal of his time examining how night clubs and strip-tease shows encourage tourism! Small wonder then that our bureaucrats are not far behind.

Kamaraj's second term as President of the Congress Party could be historic, that is if he is prepared to mobilise a team of purposeful activists who will help him purge the party of those elements which have reduced it to the most prosperous managing agency in the country. Individualistic interventions, based on a personal preference for this or that leader, will no longer repair the damage. The political deterioration in Punjab has underlined this fact. The Congress President has to crack the hold of the cynical 'bosses' of the party. Not an easy task, but one which has to be accomplished if the party is to release the initiative of its younger, more talented and dedicated supporters.

Purge of Congress Vital

This purge, so vital if the most able persons are to represent the party in the legislatures and Parliament, has always been thwarted by the fear that the purged will join with parties like the Swatantra to make it difficult going for the Congress in the elections. Kamaraj has to accept this challenge. He has to urge acceptance of reduced majorities in the legislatures and in Parliament, even the loss of a few States, should opportunist alliances make this inevitable. He has to project political perspectives into the party, perspectives rooted in the conviction that democratic action will ultimately restore the prestige of the party of Gandhi and Nehru against the rabble of self-seekers who threaten dire consequences whenever they are interfered with or purged.

Some such thinking is beginning to percolate into quarters close to Kamaraj. Perhaps, in the coming months it

will, like floodwater, help cleanse the Congress organisation. What with all the crises that are developing, the ruling party has to be re-tempered. Clear thinking, political ability and a militant dedication to the economic and social objectives enunciated at

numerous party conferences must provide the foundation for Kamaraj's presidency. Without this foundation, the rot, the dry rot, will spread. It will spread despite the manipulations of the troikas.

Tailpiece: The Chanda Committee,

moving at a leisurely pace in its initial investigation of AIR, now desires to tour the Soviet Union, Europe and the United Kingdom to study broadcasting set-ups. Two to three weeks of study is planned. Chairman A. K. Chanda has also requested for ambassadorial rank!

FROM THE LONDON END

Common Market on Ice

AFTER France's dramatic walk-out following the impasse over agricultural financing arrangements, the cracks on the Common Market surface are beginning to yawn in a rather alarming manner. Whatever the final outcome may be, there is no doubt that, for the moment at any rate, the Common Market must remain in a state of suspended animation.

The French are now sulking like Achilles in his tent, and have returned to Paris with the comment: "It is unthinkable that in present circumstances further meetings of the Common Market Council of Ministers can be held". The French Ambassador to the Common Market has also been withdrawn.

De Gaulle's Real Motive

Although the crisis has ostensibly arisen over the question of agriculture, it is perfectly obvious that the break has come because of the supranational implications of the Common Market which, when it was originally founded, was meant to have a political personality as important, or indeed even more so, as its economic personality. It is on this question of supranationality that de Gaulle has always had the gravest suspicion. To him, the only possibility of European political association is his idea of the *Europe des patries*, and not the supranational type of association favoured by the original architects of the Common Market. Many believe that this latest crisis has almost deliberately been engineered by France in order to avoid an irrevocable obligation to a future supranational Europe.

The facts which led to the dramatic breakdown at 2 a.m. in the morning are fairly simple. The point at issue was a common Community price for farm products. The French point of view was that the spirit of the Rome Treaty included not only a Common Market for industrial goods, but one for agriculture as well. As the largest agricultural producer, with an urgent

need for access to the Community market, France stood to benefit substantially from any common policy on agricultural prices. The original proposals were that a common grain policy should come in on July 1, 1967, and that Community financing should begin on the same date. This financing involved an elaborate system of import levies, balanced by home outlays on research and export promotion which should be borne by the Community rather than by the Governments. The Commission had also been asked to produce a scheme whereby Community financing could be organised, and at the same time it was intended that a transitional programme should be drawn up to begin after June 1965.

The scheme presented by the Commission showed that the domestic payments that were needed (\$1,000m a year) exceeded receipts from import levies by \$400m. The Commission then suggested that since an additional source of income was needed, the member Governments' contributions should be replaced by an independent source of finances for the Community. Under Article 201 of the Treaty, the Commission can make proposals to transfer industrial tariffs from national to Community coffers. The Commission, therefore, proposed that as from July 1967, these revenues should go to the Commission. But since these would now stand at the substantial sum of \$2,300m it was necessary that the Commission's budget should be controlled by the European Parliament. It was this that triggered off the crisis, because here was the thin end of the supranational wedge. France tried a compromise resolution which, while agreeing that import levies should pass into the hands of the Commission by July 1, 1967, suggested that the Industrial common market and the central collection of industrial tariffs should be delayed until 1970, and in the intervening period, national contributions, as at present, should make up the Commission's shortfall. This would mean

that Parliamentary control would not be necessary.

One of the interesting features in this disagreement was the revelation that at long last, instead of kowtowing to the French, some of the Common Market partners, particularly Germany, Italy and Holland, were prepared to stand up to them. The other members of the Six were willing to renew the finance regulations until 1967, but not until 1970.

If the French proposal had been accepted, it would have perpetuated the present state of affairs by which the other members of the Community, specially Germany and Italy, were financing to a very considerable extent the export of France's farming surpluses. Again it must be appreciated that under the Rome Treaty, the whole system of industrial tariff reduction demands that the full industrial customs union must come about by July 1967, particularly now that the European Free Trade Association arrangements are expected to be completed by January 1967.

French Dilemma

Of course, for the French, this is an awkward dilemma. Hitherto, French farmers have received generous subventions from the Community Fund and have the hope that the Community market would be opened up as an export outlet. If things now go wrong, this will prove to be an empty dream and de Gaulle will have to face severe opposition from the farm vote. On the other hand, if there is a choice between this and the possibility of creating a supranational authority, there is no doubt which way the General's choice will go.

While there has been a certain amount of wry amusement in Britain over the crisis in the Community, there are a number of difficulties that are bound to have their impact, not only

on the Common Market, but on the world as a whole. To begin with, there will now quite obviously be even further delays in the ill-fated Kennedy Round because, as has always been known, unless some solution can be found to the question of agricultural prices in the Community, no across the board tariff concessions will be permitted. Further delays will now result and the Kennedy Round may well pass the deadline date originally suggested by the Americans, without any satisfactory outcome.

While the Common Market is in this State there certainly does not seem to be much scope for Britain to attempt the type of bridge-building and tunnelling between the Common Market and EFTA as originally proposed by Harold Wilson. However, from the point of view of the British, there may well be reason for some hope that if the Common Market is not going to be the tightly knit organisation originally intended, there may well be room for a more receptive attitude to British association with the Community. Does this now mean that the grandiose scheme of General de Gaulle's *Europe des patries*, which will include an association of the whole of Europe from the Atlantic to the Urals, including the Soviet Union and Eastern European countries, is now any nearer attainment? For de Gaulle, this would be the perfect answer to the divisions of Europe and would provide a viable alternative to the NATO organisation. This may well account for the General's friendship to Russia and his "reasonable" attitude on Vietnam and the Dominican Republic. Commenting on this the *Statist* says:

"What does this mean for Britain? If this analysis of President de Gaulle's thinking is correct, there is the possibility of a relationship developing inside Europe which would be more satisfactory than most of the compromises proposed so far, and surprisingly in line with British thinking. Perhaps President de Gaulle will one day offer some free-trading arrangement to Britain and her present partners as an extension of the frozen position inside the Common Market. But that is a distant prospect. Although in view of the latest collapse in Brussels the General regards any talk of British entry into Europe as academic, he would still hope that the community of his own devising can emerge."

Win the battle of international trade

There is a rich market for Indian goods abroad. But as an exporter, you cannot sell sub-standard goods. You have to bear the brunt of the battle against powerful western rivals in the world market.

You can win this battle of international trade only on quality, competitive prices and service facilities. The export market can be a source of continuous earning power, provided you exercise strict quality control in the manufacture of goods, adopt modern techniques in production and adhere to high standard of specifications.

Thus you can help the country tide over her foreign exchange crisis and also maintain her prestige in the world.

We are here to guide and assist you in promoting your export.

LETTER FROM AMERICA

A Period of Transition

AS midsummer approaches, and Americans turn their thoughts to the annual vacation while the colleges and universities are quiet, a mood of frustration seems to have permeated the liberal, radical and student movements in the United States. Despite President Johnson's impressive record on domestic issues and his seeming absolute control over the usually recalcitrant Congress, most of the comment that has emanated from liberal spokesmen has been critical. Attacks on the much vaunted "War on Poverty" have grown in recent months, as it has become clear that many of the programmes have fallen under the control of political bosses rather than professional social workers. The greatest source of frustration remains, however, issues of foreign policy. The Dominican episode, which was opposed almost unanimously by the liberal press and the intellectual community, has receded into the background. Indeed, it would seem that informed American opinion was so dumbfounded by the Administration's handling of the Dominican crisis (which still lingers on) that it was almost speechless. Even analysts usually favourable to the State Department remained silent, or even mildly opposed to the Dominican adventure. The big issue is Vietnam, and the news from this embattled land has been frustrating to everyone in America.

Teach-ins Sap Energy

The intellectual community, which has waged an almost continuous protest campaign against Administration's Vietnam policy, has been rebuffed at a almost every turn. A recent televised debate between a group of critics of the Administration and McGeorge Bundy, the President's Special Assistant and one of the architects of Vietnam policy, proved indecisive since Bundy would not agree with the facts and statistics marshalled by the critics, led by the University of Chicago's Hans Morgenthau, a former adviser to the State Department. The series of more than fifty teach-ins, culminated by a massive 24-hour teach-in in Washington, sapped the energy of the academic community while eliciting snide statements from Administration officials. The rapport which President Kennedy had with the intellectuals has completely disappeared under the present Administration, and is not likely to return. At present, the frustra-

tion which is so evident on the campuses shows no indication of turning to further protest. Professors in America have, after all, never been noted for their courage in matters of public policy, although the recent protests have been a hopeful sign of a possible change in attitude by the intellectual and academic communities.

Frustration has also taken hold, in Washington, which is usually a hotbed of discussion and speculation in any case. While President Johnson continues to increase his popularity among the people (according to the Gallup Poll, some 70 per cent of the population approve of the President, an almost unprecedented figure), he has become rather unpopular in the nation's capital. He has alienated much of the press corps by his high handed press relations, and his style does not seem to fit in with the sophistication characteristic of Washington life. As one analyst has pointed out, American history has shown that when a President is unpopular in Washington for long enough, this trend spreads to the nation as a whole.

The Vietnam war continues to dominate the news, and almost daily stories of South Vietnamese government defeats, and the rising toll of American dead in a conflict which is imperfectly understood in the United States has increased the apprehension of many people. Pictures of tortured Viet-Cong prisoners and of the general devastation of Vietnam have not helped matters, and televised documentaries have frankly discussed the facts of the situation.

Frustration in Student Movement

The student movement, which grew substantially during the past academic year, has also been characterized by a sense of frustration. The Free Speech Movement at the University of California, while achieving substantial gains, has lapsed into inactivity. Student protests against American Vietnam policy have fallen on deaf ears, and even student civil rights activity has not aroused the amount of enthusiasm that it did a year ago. The movement, led by the Students for a Democratic Society, may well be pushed to more extreme forms of protest, and will inevitably see its constituency shrink considerably.

The civil rights organizations themselves, which have just concluded their

annual conventions, seem to be searching for an issue which will offer the possibility of quick success. Impressive victories have been gained in recent years, and the civil rights movement has grown into a powerful force in American society, but it must continue to hold the loyalty of the masses of urban Negroes in the North, and in the rural South. Frontal attacks on housing and job discrimination have not yielded the dramatic results expected, and the movement is left at the present time without an issue to rally masses of Negroes. In Chicago, for instance, protests against the present School Board have turned on the city administration itself, and have alienated many Negroes while not solving any of the day to day problems of the Negro worker.

Search for New Directions

Thus, the long, hot summer has arrived in the United States. So far, it has been marked by silence and apathy. The Vietnam crisis seems to be heading toward a direct confrontation with China, and Soviet-American relations have been severely strained. The Administration, despite protests and widespread dissatisfaction in important sectors of the society shows no sign of moving from its present policy. The liberal and intellectual communities are presently unsure of themselves, and suffer under the frustration of continued defeats and rebuffs from the Establishment. The student movement, though normally quiet during the summer months, is also searching for new directions, and its prospects for the future remain unclear.

Northern cities were rocked by racial violence during the past summer, and it is entirely possible that similar events will occur as the temperature rises. The leadership of the civil rights movement has lost some of its popularity among the Negro masses, and it is possible that any disturbances which do take place will be harder to control than in the past. All of the social movements in the United States are in a period of transition, and their future direction remains unclear at present. In the meantime, events move inexorably toward a climax. Vietnam is not waiting, and neither is the growing discontent among American Negroes. Perhaps the summer will help to clarify some of these pressing issues.

— Philip G Altbach

Zonal Councils in the Indian Federal System

A Case Study

Shriram Maheshwari

The functioning of the Central Zonal Council during the seven years from its inception to 1963 refutes the many criticisms levelled against the institution of zonal councils in our federal system.

The fear that these Councils would become the proverbial fifth wheel in the administrative coach serving no purpose other than impeding speed and efficiency has proved entirely unfounded. Nor have the Councils become one other tier in the power hierarchy. The States constituting a Zonal Council are not required to get the clearance of the Council before proceeding with any programme or policy.

Though the Zonal Councils are the Centre's creation and the Union Home Minister is the Chairman of all the Councils, it has not happened that in their operation the Councils have functioned as handmaids of the Centre. Use of the Councils to persuade the States to accept some policies of the Central Government is just one aspect of the role of the Councils.

If it is not true that the Zonal Councils have been used to weaken the federal system by the Centre encroaching on the spheres of the States, the opposite is also not true. The formation of the Councils has in no way created a challenge to the authority of the Centre, nor is there any possibility of this happening in future. The Council's working is regulated by the Union Home Minister and the Joint Secretary of the Council, who is a nominee of the Government of India, is virtually the resident agent of the Central Government in the Zone, exercising administrative control over the Secretariat of the Council. The Zonal Councils have functioned as purely advisory bodies without exercising anything like coercive powers against either the Centre or the States.

ZONAL Councils, set up under the States Re-organisation Act, 1956, have as their avowed object the development of "co-operative working" to counter "too acute a State-consciousness which has been encouraged even more by arguments about linguism and the like." They have been called upon to promote inter-State co-operation and co-ordination, this being obviously a necessary pre-requisite for the ordered progress of the individual States no less than of the nation as a whole. These Councils, thus, represent an interesting experiment in co-operative federalism, forming a part of the complex of processes for relieving, or, at any rate, reducing the strains and stresses inherent in a federal polity. In particular, they may make recommendations with regard to:

- "(a) any matter of common interest in the field of economic and social planning;
- (b) any matter concerning border disputes, linguistic minorities or inter-State transport;
- (c) any matter connected with or arising out of the re-organisation of the States under this Act."

The present paper is restricted to the discussion of the Central Zonal Council.³ Each Council, it is true, has developed its own nuances and undertones, and, therefore, differs from its counterparts both in matters of details and positive achievements. Nevertheless the common institutional characteristics of these Councils do not, perhaps, make for any fundamental de-

viations. The over-all conclusions emerging from the present study may, therefore, generally hold good in the case of other Councils as well.

The Central Zonal Council consists of Uttar Pradesh, the largest State of the Indian Union from the point of population, and Madhya Pradesh, the largest in respect of area. It covers slightly less than one-fourth of the total area of the country, and is inhabited by one-fourth, approximately, of the country's population. This Zone is the largest in area, and in regard to population is second only to the Eastern Zone. Yet, of all the Zones, this one manifests the highest degree of linguistic homogeneity. Consequently, no psychological barriers, born of differences in the language spoken at different parts, have confronted the Central Zonal Council. Happily placed in this respect, it can usefully address itself to quite a few problems facing the participating States of Uttar Pradesh and Madhya Pradesh. In particular, the following problems may be solved more effectively if tackled on a zonal basis:

- (1) The problem of dacoity in the Chambal ravines and in the contiguous areas calls for inter-State administrative arrangements.
- (ii) The border between U P and M P is, in the opinion of many, not as rational as it could be; and in matters such as the construction and maintenance of roads, administration of justice, implementation of development

projects, there is constant and daily need for co-operation between the two Governments.

- (iii) Fuller utilisation of power projects near the border between the two States calls for increased co-operation and understanding between them. It is not unlikely that while demand for power exists in one State, the potential for power generation may abound in a contiguous area falling within the other State. "For the achievement of optimum benefits development schemes of different States have to be clearly co-ordinated. Water stored in the reservoirs in one State may be used with advantage for irrigation and power generation in the adjoining State. Similarly, power available in one State may be distributed in other States. In certain cases, it may be necessary to divert waters from one basin to the other for the benefit of the region as a whole. Co-operation between the States is therefore, essential for investigations, road surveys, allocation of waters and power generated and sharing of their costs."

The Central Zonal Council was inaugurated on May 1, 1957, and had held five meetings until 1963: First meeting: May 1, 1957; Second meeting: January 4, 1958; Third meeting: June 22, 1958; Fourth meeting: August 28, 1960; Fifth meeting: January 29 and 30, 1963.

It may be noted that the Council has not been meeting at regular intervals and the interval between successive meetings has been getting longer.⁵ In course of these five meetings the Council discussed 67 items including items concerning purely procedural matters. This number also includes the items that figured on the agenda on an earlier occasion as well but on which the discussion could not be completed, or was postponed for consideration at the subsequent meeting of the Council. Below is a list of the more important subjects discussed by the Central Zonal Council during the seven years to 1963.

- (1) Agricultural production programme for achieving the revised production targets.
- (2) Recasting of State plans in consequence of States' re-organisation.
- (3) Man-power planning.
- (4) Acquisition of land for Rihand dam.
- (5) Supply of electric energy and water for irrigation and other purposes to Madhya Pradesh from Rihand dam.
- (6) Supply of water and power to M P from Matatila dam.
- (7) Development of Chitrakut and surrounding areas.
- (8) Power development on Zonal basis in the Central Zone.
- (9) Recruitment of one-third of the number of the High Court judges from outside the State.
- (10) Inclusion in the 'core' of the Second Five Year Plan of all power development schemes under implementation in the Zone.
- (11) Inclusion of all power projects of the Zone in the Second Plan.
- (12) Formation of a Common Police Reserve Force in the Central Zone.
- (13) Development of border roads.
- (14) Joint selection of technical personnel.
- (15) Establishment of Joint Office of the Administrator-General and Official Trustee for the Central Zone.
- (16) Maintenance of inter-State river bridges.
- (17) Co-ordination of technical educational facilities in the two States.
- (18) Conversion of certain State Highways into National Highways.
- (19) Integrated road development programme for the border areas

in the north of M P and south of U P.

- (20) Appointment of a 'study group' to examine the Motor Vehicles Rules of both the States with a view to ensuring more smooth operation of both goods and passenger road transport services on inter-State routes and connected reciprocal arrangements.
- (21) Examination of possibilities of extending irrigation from Rangan reservoir and Ken canal in M P by U P engineers.
- (22) Improvement of communications between U P and M P.
- (23) Implementation of the safeguards for linguistic minorities in U P and M P.

As mentioned earlier, the Central Zonal Council met five times since its inception to 1963, the number of participants at a meeting fluctuating between 14 and 19. This number includes the Chairman (who is the Central Home Minister), the ministers including the Chief Ministers of the participating States, their 'advisers', and some senior officials of the Central Government. In addition to the Chief Ministers of both the States, there are, as a rule, one or two other ministers from each State. Among the 'advisers' are the Chief Secretaries and Development Secretaries of both the States. The Council, thus, partakes of the features of a summit meeting of the chief executives of the member-States. A senior official of the Planning Commission has also been attending the meetings. His association with the deliberations of the Council is reflective of an urge to make the Council attend to problems of regional development and planning in a more concentrated way. Besides, there are officials of the Central Government attending the meetings. The Central Ministry of Home Affairs is invariably represented by 2/4 officials, generally of the rank of Deputy Secretary and above. The representatives of other Central Ministries which have something to do with, or say on, some items figuring on the agenda in a particular meeting, are also invited.

The nature of membership of the Council, its infrequent meetings, and short one-day sessions do not make it a suitable body for going into details of administrative policies. Inevitably, therefore, it has to depend upon committees,⁶ at one stage or the other, for most of its work. These committees, comprising officials of the two Governments, can meet more frequently and

they submit the results of their deliberations to the Council which then takes appropriate decisions. The Central Zonal Council had appointed the following committees, each entrusted with specific problems:

(1) Man power Planning Committee, consisting of Chief Secretaries, Development Commissioners, and Re-organisation (or Integration) Officers of the two States, to study the man-power problem in the Zone.

(2) Power Development (Technical) Committee for power development on Zonal basis, consisting of the following:

- (i) a representative of the Central Water and Power Commission;
- (ii) a representative of the Central Ministry of Commerce and Industry;
- (iii) Chief Engineers of the Electricity Departments, and/or Electricity Boards of the two States;
- (iv) two representatives of the Development Commissioners of each of the States;
- (v) Directors of Industries of the two States;
- (vi) a representative of the Federation of Electricity Undertakings of India;
- (vii) a representative of the Natural Resources Division of the Planning Commission;
- (viii) Joint Secretary of the Central Zonal Council.

(3) On M P's request for supply of power and water to M P from Rihand dam, the Council appointed a committee to consider this question. It consisted of the following:

- (i) Secretaries of the Irrigation and Power Departments of both the States;
- (ii) Chief Engineers of the department of Irrigation and Power of both the States;
- (iii) representatives of the Finance Departments of both the States; and,
- (vi) Joint Secretary of the Central Zonal Council.

(4) A committee consisting of the following was appointed to examine the feasibility of having a common Police Reserve Force for the Zone, and to draw up a scheme therefor:

- (i) Secretary, Central Zonal Council (Chief Secretary, M P);
- (ii) Home Secretaries of both the States;
- (iii) Inspectors-General of Police of both the States;
- (iv) Joint Secretary of the Central Zonal Council.

(5) A committee, consisting of the following, to prepare an integrated

road development programme for border areas of the two States in the South of U P and north of M P:

- (i) Joint Secretary of the Central Zonal Council;
- (ii) Chief Engineer, M P;
- (iii) Chief Engineer, U P.

(6) A committee was appointed to make recommendations to determine the principles on which payment should be made for lands, houses, etc, for Rihand dam. It consisted of the following:

- (i) Joint Secretary, Central Zonal Council;
- (ii) Revenue Secretaries of both the States;
- (iii) Secretary, Public Works Department, M P;
- (iv) Secretary, Irrigation & Power, U P.

(7) A committee, consisting of the following, to draw up a scheme for the joint control of ferries crossing Chambal and other rivers in the border areas of Madhya Pradesh:

- (i) Secretaries of the Public Works Departments of both the States;
- (ii) Secretaries of the Local-Self Government Departments of both the States;
- (iii) Home Secretaries of both the States;
- (iv) Joint Secretary of the Central Zonal Council.

(8) A committee, consisting of the following, to prepare a progress report on the Matatila dam and to suggest ways and means for expediting its completion:

- (i) a representative of the Central Ministry of Irrigation and Power;
- (ii) a representative of each of the two States;
- (iii) Joint Secretary of the Central Zonal Council.

(9) A committee, consisting of Chief Engineers of U P and M P, was appointed to suggest a suitable method for the sharing of income from inter-State bridges.

(10) A "study group" consisting of the following to examine the Motor Vehicles Rules of both the States with a view suggesting amendment of the Rules to ensure smoother operation of both goods and passenger road transport services on inter-State routes:

- (i) Road Transport Commissioners of both the States;
- (ii) Joint Secretary of the Central Zonal Council.

(11) A Standing Committee of the Chief Ministers of both the States to review from time to time the progress of implementation of the various policy

decisions taken by the Chief Ministers' Conference relating to safeguards for linguistic minorities and national integration.

In the nature of things, all these committees (except Nos 2 and 11) have been of an *ad hoc* nature, ceasing to exist after completing the investigation of the problems with which they were charged. The Power Development (Technical) Committee, which was originally set up as an *ad hoc* body, was later converted into a standing one in view of the obvious importance of power planning on zonal basis.

Committees and Policy-Making

It may be mentioned that the formation of these committees may either precede policy making or follow it. Generally the Zonal Council would wait until the problem has been thoroughly explored by a committee. It has, however, happened that a committee was set up after a policy had already secured approval, and in such a case what the committee is required to do is to prepare a detailed scheme with a view to its implementation. The committee entrusted with the drawing up of a scheme for the joint control of ferries plying between either banks of the Chambal and other rivers in the border areas of Madhya Pradesh, is an example of the latter type of committees. Most of the committees have, however, been constituted preparatory to policy-making.

The pattern of composition of these committees reveals that they are manned exclusively by officials, the joint Secretary of the Council acting as member-Secretary of each committee. The Standing Committee of the two Chief Ministers is the only instance of a committee whose membership is of a political nature. These committees act as the arm of the Council, and certainly do not render the latter less effective, as the final decision rests, obviously, with the Zonal Council itself. The Committee to determine the principles on which payments were to be made for lands, houses, etc, to be acquired in M P for Rihand dam made unanimous recommendations except on one point. The point in dispute related to additional compensation payable to displaced persons. While M P was insistent upon payment being made at the rate of Rs 250 per family of displaced persons, U P was inclined to pay only at the rate payable in its own State, which was Rs 125 per family. The Zonal Council accepted the recommendations of the committee on all matters relat-

ing to compensation for lands, etc, acquired in M P for Rihand dam, but as regards additional compensation to displaced persons for purposes of resettlement, it agreed that payment be made at the rate of Rs 125 instead of Rs 250 per family. Similarly, the committee to inquire into the question of supply of power and water from Rihand dam to M P could not make unanimous recommendations. The Zonal Council decided that the Chief Ministers of U P and M P should try to settle the matter between themselves.

As said earlier, the Central Minister for Home Affairs is the Chairman of the Council and the Chief Ministers of the two States hold office as vice-chairmen alternatively. The Chief Secretary of the State is the Secretary of the Council by rotation in the same order. The office of Secretary being floating in nature, the real functionary is the Joint Secretary who should be a person "not in the service of any of the States represented in the Council". A senior official of the Central Home Ministry has so far been appointed in this post. Subject to the control of the Secretary, the Joint Secretary is competent to perform all or any of the functions of the Secretary and he also acts as the member-secretary of every committee constituted by the Council. The meetings of the Council are held by rotation in U P and M P but the office of the Council is located at Allahabad (U P). The sanctioned strength of the staff of the Council Secretariat is as follows:

(i) Secretary	1
(ii) Joint Secretary	1
(iii) Section Officer	1
(iv) Upper Division Clerk-cum-Cashier	1
(v) Lower Division Clerks	2
(vi) Class IV Staff	6

The work of the Central Zonal Council may, perhaps, be better appreciated if one studies its role

(i) as an institution to help in the implementation of certain national policies and objectives;

(ii) as an institution to help promote planning on zonal instead of State basis;

(iii) as a forum for the participating States to put up a united stand on certain matters against the Centre; and

(iv) as a forum for resolving inter-State disputes.

The Central Government has in the Central Zonal Council an institution to persuade the participating States to fall in line with centrally sponsored objectives and policies. The delicacy of this task is obvious in a federal constitu-

WE LOOK

Forward planning has always been a part of management thinking at IISCO. This made it possible for us to complete by 1960 a two-phase expansion programme to take production to 1 million tonnes of ingot steel well ahead of schedule.

With the challenge there again to provide more steel for the nation produced efficiently, we are on the edge of another two-phase expansion

programme to reach a target of 2 million tonnes. Research and the constant application of new techniques will win better iron, more steel and more diversified end products from Burnpur's existing installations which new plant and equipment should ideally balance and supplement—at an investment cost *considerably less* than that required for an entirely new plant of the same tonnage.

THE INDIAN IRON & STEEL COMPANY LIMITED ONE OF THE MARTIN BURN GROUP

tion which demarcates the spheres of activities of the Centre and States. The participating States in the Central Zonal Council being predominantly agricultural, the Central Government has been exhorting them to step up food production. The Chairman, for instance, observed at the second meeting of the Council: "The food situation, I am sorry to say, has deteriorated since we met last, and both the states included in this Zone are seriously affected. Our planned development and stability of our economy depend vitally on our achieving self-sufficiency in food. It calls for a total effort on our part to bring additional areas under cultivation and to increase food output per acre. I hope, each meeting of the Zonal Council will serve to focus attention to this national issue of vital importance." Again, alarmed at the upsurge of disintegrating forces in the country, the Chairman sounded a warning at the fourth meeting of the Council held in August 1960: "Nearer home, while we are engaged in the great task of the economic reconstruction of India, we are faced with a challenge to the integrity of our country and the freedom of our people... In a country so large as ours, it may be difficult to cast off completely regional and other lesser affiliations but unless the supremacy of national interests is unreservedly accepted, our liberty itself may be greatly imperilled. Our independence would be incomplete, fragmentary and even transient if we do not firmly set our face against all the narrow loyalties which stand in the way of our building an abiding sense of a harmoniously integrated nationhood."

Use for Implementing Policies

The Central Government also uses the Zonal Council to implement its policies. The Centrally sponsored safeguards for linguistic minorities have been accepted by the Central Zonal Council and are being implemented now. The Council has set up a Standing Committee comprising the two Chief Ministers to review periodically the implementation of the various policy decisions taken by the Chief Ministers' Conference relating to safeguards for linguistic minorities and national integration. It has, also, agreed to implement the centrally evolved three-language formula, and, further, to dispense with the system of compulsory tests in the regional language for purposes of recruitment. The Council is, thus, emerging as a bulwark of national integration, which is obviously an important role in the

context of the fissiparous tendencies increasingly coming to the surface in the country. Similarly, the Central Government pressed for acceptance of its proposal for recruitment of one-third of the High Court judges of a State from outside that State. This proposal was accepted "in principle" at the third meeting of the Council, held in January 1958. The Central Government, moreover, has won over the participating States to its proposal for a common Police Reserve Force. Initially, this proposal encountered some opposition but was finally carried through. The Council could not for some time, take any decision on the formation of a common Police Reserve Force, as the Chief Minister of M.P., supported by his U.P. counterpart, sought postponement in order to give further thought to the proposal and examine in greater detail the financial implications involved. Occasionally, some concession has to be made to the sentiments of the States to make easier the "selling" of such proposals. This may be illustrated by the Central Government's proposal regarding the appointment of one-third of the High Court judges from outside the State. This proposal has been accepted but the Centre had to make one concession, viz, that it has to secure the prior approval of the State in which the appointment is to be made.

Finally, the Central Zonal Council approved the proposal made by the Central Government, for the exchange of agenda and proceedings between the five Zonal Councils. Although a minor measure in itself, this sets the functioning of the Council in a much wider context.

The permanent association with the Zonal Council of a high-ranking official of the Planning Commission is calculated more to make the Council planning-conscious. The inclusion of a representative of the Natural Resources Division of the Planning Commission in the Power Development (Technical) Committee, set up by the Zonal Council in 1958, is a step in the same direction. The Zonal Council has been giving attention to schemes of mutual interest and concern since its inception which is well borne out by programmes like those for man-power planning in the Zone, power development on zonal basis, integrated road development for border areas of the two States, joint selection of technical personnel, etc.

Of vital importance to the successful execution of the Five Year Plans is the

assessment of man-power requirements. The Zonal Council set up at its first meeting a Committee to study man-power problems of the entire zone. The Council has succeeded in evolving a new approach to the problem of power generation which is now being tackled keeping in view the requirements of the Zone as a whole, thereby making power available throughout the Zone. The proposal for power development on zonal basis, sponsored by the Central Ministry of Irrigation and Power, was approved at the second meeting of the Council held in 1958; and the Power Development Committee has been in existence.

Area Approach to Development

The problem of integrated road development for border areas of the two States in the South of U.P. and north of M.P. has been receiving the attention of the Council since 1958, when it constituted a committee to prepare an integrated programme of road development for border areas. As a result of the deliberations in the Council, and also of the offer of some financial assistance from the Central Government, agreement has been concluded for the construction of bridges over Chambal and Yamuna so that the Bhind-Gwalior-Etawah Road, which crosses these two rivers, can be completed. Mention may also be made here of the joint selection of technical personnel by one Public Service Commission instead of the hitherto followed practice of selection by the respective Commissions. This, to be sure, has necessitated some relaxation in rules, and requisite instructions have accordingly been issued to the respective Commissions. Finally, an illustration of planning on a Zonal level has been provided in the vicinity of Chitrakut, in the District of Banda (U.P.), which is important as a pilgrim centre. A joint development programme for this area was proposed in the Council in 1958. At the suggestion of the chairman, the two Governments have since agreed to allot a sum of Rs 50,000 each for development work, in the first instance. The Zonal Council has approved of the setting-up of a development authority south of the river Mandakini under the M.P. Government and a similar authority north of the river Mandakini under the U.P. Government, and, of the establishment of a Joint Advisory Committee to prepare a development plan for the entire region and to co-ordinate the working of these two bodies. This is an attempt

AIR-INDIA
IN ASSOCIATION WITH B.O.A.C. & QANTAS

at evolving an area-approach to issues of public administration, and such attempts as have been made may, under wise political and administrative leadership, develop into a widespread practice in course of time.

Just as the Central Government has in the form of the Zonal Council an institution to secure the States' compliance with certain matters, the participating States, too, have a parallel opportunity to urge acceptance, by the Central Government, of their proposals by putting up a united stand on certain matters against the Centre. They have been to an extent successful in such united attempts. At the very first meeting of the Council, the Chief Minister of U P referred to the need for a larger allotment of funds in the central sector of the Five Year Plan. The following issues may be cited as other illustrations of the use made of this forum by the States:

- Inclusion in the 'core' of the Second Five Year Plan of all power development schemes under implementation in the zone.
- Inclusion of all power projects of the Zone in the Third Five Year Plan.
- Conversion of certain State Highways into National Highways.

The first two suggestions emerged from the Power Development (Technical) Committee, which had recommended that (i) all power development schemes under implementation in the zone should be included in the 'core' of the Second Five Year Plan; and (ii) all power projects of the Zone should be included in the Third Five Year Plan. These proposals were formally introduced in the Council by the two States. The chairman and the representative of the Planning Commission were not favourable to be proposed; they emphasised difficulties of getting foreign exchange. On M P's suggestion that these two resolutions being of vital importance to both the States, should be referred to the Planning Commission, the Zonal Council consented to pass these on to the Planning Commission together with copies of the discussions at the meeting. Although the material outcome of this proposal was practically nil, it is an indication of how the States have not been mere camp-followers always. Similarly, a united stand was taken on the question of conversion of certain State Highways into National Highways. The representative of the Central Ministry of Transport and Communications

indicated a "very remote" possibility of making any addition to the existing National Highway System during the Third Five Year Plan. The two States, however, insisted that the Central Government accept "in principle" the conversion of the following roads into National Highways:

- Saugar - Chattarpur - Gonda-Tulsipur-Nepal Border Road;
- Gwalior - Bhind - Pilibhit - Pithorgarh-Dharchula - Lipulekh Road;
- Jhansi - Mauranipur - Nowgong-Satna-Bela Road.

The proposal was accepted by the Zonal Council, which forwarded it to the Union Ministry of Transport and Communications for consideration.

Use for Attracting Central Aid

These demands apart, the participating States have also been utilising the Zonal Council for inducing greater financial involvement of the Central Government in certain spheres. This may be illustrated by the following examples. At the third meeting of the Council there was a proposal for construction of bridges over Chambal and Yamuna on the Gwalior-Bhind-Etawah Road. The representatives of M P remarked that out of the three bridges to be constructed, M P had already constructed the bridge on the river Kauri in their territory, and requested that the bridge over the river Yamuna should be constructed by U P, while the bridge on the river Chambal, which forms the border of the two States, should be constructed by both the States jointly. But, as all the available funds with both the States were already earmarked for the Plan, M P pressed for the Centre's financial contribution to the extent of two-thirds of the cost of both the bridges. U P, on the other hand, expressed its inability to provide funds for the construction of any of these bridges because, in the first place, these were not of great importance from its point of view, and secondly, because in its own territory there was felt a more pressing need for the construction of bridges at other places on both the Ganga and the Yamuna. It, therefore, urged that the Central Government should contribute two-thirds of the cost of construction of both the bridges while the balance could be provided by the two States. The Central Zonal Council, therefore, recommended that the Central Government should examine whether two-thirds of the cost of the two bridges

could be made available from the States' share of the Central Roads Fund. U P alone is to contribute for the bridge on Yamuna, while U P and M P are to make equal contribution for the construction of the bridge on Chambal. The Council further recommended that the Central Government should contribute the balance of one-third of the cost of the two bridges. Similarly, on another occasion, the financial commitment of the Central Government was sought to be increased in the case of another bridge, Naughat-ghat bridge. Both the States again combined on this issue, and as a result, the Zonal Council recommended that the Central Government's contribution towards the cost of Naughat-ghat bridge be enhanced to one-third of the cost, notwithstanding the original commitment limited to Rs 8 lakhs.

Fortunately, U P and M P do not have any boundary disputes, such as have bedevilled the relations of some other States. The deliberations of the Central Zonal Council have not, therefore, been marred by injured feelings and acrimony. This, however, does not imply that complaints are never heard at the meetings of the Zonal Council. Quite a few items figuring on the agenda relate to irrigation and power problems but these, it may be added, do not appear to be the peculiar to this zone alone. Practically every river-valley project in the country has given rise to disputes among the States through which the river flows over the distribution of power and irrigation resources created. To come to this zone, M P, a comparatively backward State, has thus been insisting on an adequate supply of power and water from the Rihand and Matatila Projects, both in U P, but the catchment areas of which lie in the north-east districts of M P. At the second meeting of the Council, M P moved for consideration the following two items:

- supply of power and water for irrigation and other purposes to M P from Rihand dam;
- supply of power and water to M P from Matatila dam.

As the construction of Matatila dam had been lagging behind, the question of supply of power and water to M P was considered untimely. In fact, there has been in existence an agreement between the two Governments signed as early as 1953, and it is to be adhered to. The question of supply of power and water from the Rihand dam was, however, entrusted to a Committee consisting of the officials

of both the States. This committee succeeded in making agreed recommendations in regard to sharing of waters, compensation to be paid for lands to be acquired for the dam, and utilisation of water for irrigation by "bundling up" in the upper reaches of the Rihand dam. It, however, could not reach an agreement in regard to the question of supply of power to M P and the price to be charged. The Council thereupon asked the Chief Ministers to settle this matter between themselves. Success did not attend such informal efforts as were made by them, and this problem remained with the Council. At its meeting held in January 1963 it again figured on the agenda. In deference to the Council's desire, however, it was informally discussed, in the first instance, between the two Chief Ministers, and to enable this get-together, the Council even adjourned its meeting, and agreed to continue deliberations the following day. Nothing concrete emerged from this informal discussion, and the Council, when it resumed its sitting the following day, was virtually faced with a deadlock. All it could do, however, was to convene a meeting of the Council the following month with the specific purpose of resolving this dispute. As a result, the Council again met in February 1963. The first day's discussion held out little hope of an agreed solution, and, in an obvious bid to keep the discussion going, the Council constituted a Committee of five officials to report "by tomorrow noon" on the question of sharing of power and water. Successive meetings helped to narrow down the points of difference, and, ultimately, a resolution agreeable to both the States emerged many months later.

The dragging on of this dispute over a period of seven years and its eventual solution bring to the fore two points worth noting. First, the Council has no 'coercive' power to compel compliance with its decisions. What is more, it is aware of its weakness, for, despite the formal provision for voting incorporated in the statute itself, there is a marked reticence to invoke it, the intention obviously being to arrive at agreed solutions. In fact, voting has never been resorted to so far. Secondly, frequent recourse to informal channels of settlement under the aegis of the Council, yet outside its direct control, has been encouraged by the fact of the same political party being in power both at the Centre and in the States. The resultant homogeneous behavioural pattern has helped

to enhance the status and prestige of the Council by reinforcing its effectiveness.

Conclusions

The functioning of the Central Zonal Council over the seven years to 1963 serves to dispose off the various criticisms levelled against Zonal Councils. The fear that these Councils constitute the proverbial fifth wheel in the administrative coach impeding speed and efficiency has proved to be entirely unfounded. An institution discussing, in the course of seven years, sixty-seven items including items of a purely routine nature as well as those which figured on the agenda more than once hardly deserves this criticism. Further, the participating States are not bound to first obtain clearance from the Council before adopting any course of action. The Council therefore, does not constitute another level in the traditional hierarchy. It is also not entirely true that the Zonal Council is the handmaid of the Centre, brought into existence to do the latter's bidding. True, the Zonal Councils are the Centre's creation, the Home Minister is the chairman of all the Councils and the expenses incurred on Council are a charge upon the Central Government. Nevertheless, acceptance of some centrally sponsored policies forms but one aspect of the performance of the Zonal Council. Nor does it emerge from the functioning of this body that the Zonal Councils may grow powerful to the extent of weakening the authority of the Centre. The Council's working is regulated by the Home Minister, and the Joint Secretary of the Council is virtually the resident-agent of the Central Government in the Zone, exercising administrative control over the secretariat of the Council. Besides, the Council has a purely advisory status which obviously inhibits the exercise of anything like dictatorial powers over either the Centre or the participating States.

In the end, a word may be said about the dispute over the supply of power and water to M P. As disputes of this nature have confronted other Zonal Councils as well, it is pertinent to ask: Should solution of problems so vital as sharing of powers and water be allowed to depend upon the moods of the States, particularly when the demand for power is everywhere much in excess of available supply? The existing arrangement stands in favour of the State in which the pro-

THE ECONOMIC WEEKLY

ject is located, and further, inevitably causes delay, which very often serves only to aggravate the existing dispute by leading to a hardening of attitudes on all sides. All this is injurious to the cause of balanced regional development, and, perhaps, calls for administrative steps to bring all projects under particular regions under some form of integrated control.

Notes

- 1 It may be noted that the States Reorganisation Commission (1953-55) made no mention of them in its Report.
- 2 Section 21(2) of the States Reorganisation Act, 1956 (henceforth referred to as the S R Act).
- 3 The S R Act has set up a Council for each of the following zones: (i) Northern zone, (ii) Southern zone, (iii) Eastern zone, (iv) Western zone, and (v) Central zone.
- 4 Agarwal, P P: 'A Note on the Experiences of the First Five Year Plan, in relation to Irrigation and Power Projects', in "Fourth Irrigation and Power Seminar", Central Water and Power Commission, New Delhi, 46-47.
- 5 This is the trend in all the Zonal Councils. The Eastern Zonal Council, thus, met once in 1957, twice in 1958, once in 1959, 1961 and 1962. It did not hold any meeting during 1960. The Southern Zonal Council, too, met twice in 1957 and 1958, and once in 1961 and 1962. Similarly, the Northern Zonal Council met twice in 1957 and 1959, and once in 1958 and 1961. It did not hold any meeting in 1960.
- 6 Provision has been made under Section 18 of the S R Act for the appointment of committees of the Zonal Councils for studying any particular problem or for performing such other functions as the Council may decide. The Act says: "A Zonal Council may from time to time by resolution passed at a meeting appoint Committees of its members and Advisers for performing such functions as may be specified in the resolution and may associate with any such Committee such Ministers either for the Union or for the States and such officers serving either in connection with the affairs of the Union or of the States as may be nominated in that behalf by the Council".

Occupational Structure of Cities, 1901-61

B R Kalra

The industrial structure of Indian cities presents contrasting pictures before and after 1931.

Up to 1931 the cities, along with the rest of the country, had been passing through the historical phase of 'de-industrialisation' as a result of the decay of the handicrafts and other traditional industries. The workers dislodged from traditional industries swelled 'other services' as domestic servants, general labourers, etc. The growth in 'other services' was poverty induced and was accompanied by stagnation in construction, trade and transport.

Industrialisation gained momentum after 1931 with the introduction of discriminating protection and through other State and private efforts and the full impact of these developments was reflected in the Census results of 1951. In 1951 and 1961 we get a picture of developing industrialisation and growth of the infra-structure of the urban economy.

As the economic situation in the cities improved the marginal workers in 'other services' shifted to more remunerative and productive occupations and there took place an allround rationalisation of economic activity.

THE paper deals with occupational or industrial structure of all cities (having population of 1 lakh and more) from 1901 to 1961 (excluding 1941). The workers of occupational categories included in earlier censuses have been re-grouped into nine broad industrial categories of 1961. For this purpose, the study covers 26 cities in 1901, 25 cities in 1911, 29 cities in 1921, 32 cities in 1931, 75 cities in 1951 and 107 cities in 1961. Table 1 gives summary position of industrial structure of cities over the last 60 years.

Table 1 brings out the following important points. Except for a slight reversal during 1921, the categories of cultivators and agricultural labourers and activities ancillary to agriculture have been showing declining proportions. The agricultural portion of the city economy has, of course, been very small. Mining and quarrying had been declining up to 1931 but showed an upward trend in 1951. For 1961, the workers in cities engaged in mining and quarrying are not available separately. Manufacturing including household industry declined sharply till 1931 but it showed an equally sharp upward trend in 1951 and 1961. The categories of workers in construction, commerce and transport, and communication showed irregular movement till 1931 and registered steady increase after that. The proportions of these categories in 1951 and 1961 are well above those recorded for earlier census years. The category of 'Other Services' indicates an opposite trend as compared to manufacturing. It increased speedily up to 1931 and declined thereafter.

The table, thus, presents a contrasting picture of industrial structure in cities before and after 1931. Upto

1931, the cities, along with the rest of the country, had been passing through the historical phase of "de-industrialization" through decay of handicrafts and other traditional industries. The workers dislodged from traditional industries swelled 'Other Services' as domestic servants, general labourers, etc. The growth in the 'Other Services' was poverty induced, and was accompanied by stagnation in construction, trade and transport. Industrialization gained momentum with the introduction of discriminating protection in 1932 and other State and private efforts and the full impact of these measures was reflected in the Census results of 1951. In 1951 and 1961 we get a more favourable picture of developing industrialization and infra-structure of the urban economy. As the economic condition in cities improved, the marginal workers in 'Other Services' shifted to more remunerative and productive occupations in categories V to VIII. As a matter of fact, there took place an allround rationalisation of economic activities.

The rate of growth of population in cities during 1931-61 was seven times as much as recorded for the previous 30 years. The rate of growth of general population in 1931-61 was three times as much as during 1901-1931. Thus we notice a concomitant phenomenon of identical trends in industrialization and urbanisation. The pattern of economic growth of cities during the last 30 years seems to be on the lines of urban growth in western countries during the 19th century. The halting growth of cities during the first 30 years was due partly to lower rate of population growth mainly as a result of natural factors and partly due to the disruption of the older systems of production,

transportation and distribution under the *laissez faire* policy. This period recorded a higher proportion of workers in agriculture which may suggest that many industrial workers moved back to agriculture not only in rural areas but also from cities and other urban areas. As stated by D R Gadgil, "The craftsmen slowly gave up their old occupations, and had to resort to agriculture or any other occupations in which they found an opening. Such a decay of handicrafts and the consequent decrease of population was the fate of a great number of old towns."*

Table 2 gives industrial distribution of working force in cities classified according to certain size ranges of population. However, the cross sectional study of cities at a point of time does not corroborate the pattern obtained through time series data. The table, however, reveals a more balanced structure in 1951 and 1961 in respect of both big and small cities. At macro-level, cities still seem to be more or less self-sufficient nuclei of the areas which they cater.

It may be desirable to analyse more closely the controversial issue regarding the function of urban growth. It may also help to judge urbanisation in the context of economic growth. Such a study may be undertaken either by classifying cities according to their functional or industrial characteristics and comparing their relative growth rates or, alternatively, the cities may be classified according to their differential growth rates to see if they make out any industrial pattern. The second course seems to be more practicable since it is easier to classify workers in cities into indus-

* 'The Industrial Revolution of India' by D R Gadgil, pp 140.

trial categories than to classify the cities themselves. For computing the rate of growth between two census periods we have to take into account only those cities which existed in both the censuses. Thus for any given period, new cities are not taken into consideration. For example, while studying the rate of growth of different cities between 1901-11 a city which existed in 1911 but not in 1901, is not taken into account. That city is, of course, included while working out the growth between 1911-21. Table 3 which is based upon the above approach brings out significant results. The table neatly spells out a clear-cut functional relationship between the industrial composition of cities and their differential growth rates. It can be seen that during each census period the cities whose industrial and infrastructure was more developed registered much higher rate of growth as compared to others with less balanced economic structure. The cities which

recorded the maximum growth rate (50 per cent and above) between 1951-61 were the industrial cities of Jamshedpur, Ludhiana, South Suburban and Visakhapatnam and two administrative-cum-service cities of Delhi and Bhopal. In other cases, the table brings out an inverse relationship between the proportion of workers in 'Other Services' and the rate of population growth. The sanctity behind urbanization is fully borne out by Table 3 and Table 4. Table 4 gives industrial distribution of workers in cities classified according to rate of growth above and below average. It bears out that cities whose rate of growth was above average had higher proportion of workers in categories IV to VIII and lower proportion of workers in Category IX as compared to cities whose rate of growth was below average.

It may be relevant to trace the industrial structure of working force

in non-city urban and rural areas from 1901 to 1961 as worked out in Table 5. The agricultural sector had been growing absolutely as well as relatively upto 1931 and showed some slight improvement (in proportions only) after that. It is significant to note that categories IV and V (manufacturing including household industry) had been declining right upto 1951. While cities faced foreign competition upto 1951 and recovered thereafter, the indigenous industries in non-city urban and rural areas suffered, in the beginning, at the hands of imported goods which had started pouring into the mofussil area by the turn of the century and, later on, from city made goods. Slight improvement noticed in 1961 is due to the emergence of new industrial townships in non-city urban areas. As a matter of fact, the entire non-agricultural component of rural areas got its sustenance from agriculture and it languished when agriculture stopped releasing any surpluses. Soci-

(d) Rural					40.3	45.1
(e) Total population	46.6	48.1	46.9	43.33	39.1	43.0

ally too, the village communities were interlocked through *jajmani* and caste systems and the non-agricultural sector especially personal services degenerated along with the old social set up.

In the next two annexed Tables 6 and 7 some further details of structural changes between 1951-61 are given. Table 6 indicates industrial composition of working force by cities, non-city urban and rural separately for 1951 and 1961. The proportion of workers in manufacturing including household industry, construction, trade, transport and 'Other Services' was higher in cities than in non-city urban areas in both 1951 and 1961. It

is interesting to note that in non-city urban areas, both the census years registered about 20 per cent of workers in cultivation and activities ancillary to agriculture. Table 7 gives percentage distribution of increase in working force in each industrial category between 1951-61 by urban, cities and rural. The Table shows that while 20 per cent of the total increase of population was in urban areas about 50 per cent of the increase in workers in manufacturing including household industry and construction had gone to urban areas. The rural areas recorded a net fall in the number of workers in trade and commerce and the entire increase in the number of

workers in this category belonged to urban areas. 83 per cent of the additional workers in transport and in 'Other Services' was in urban areas and the rest in rural areas. Within urban areas, cities accounted for about 50 per cent of the total increase in manufacturing including household industry, construction and transport and bulk of the increase in trade and services.

Table 8 brings out participation rate of workers by areas from 1901 to 1961. It is interesting to note that during all censuses larger cities recorded higher rate of participation as compared to smaller cities.

THREE THOUSAND SUNS HAVE COME AND GONE

Ten years ago...that's when we first started. It seems but yesterday. We've been busy going out to help people, different people. We've met them in town and in village...in plain and in woodland...in mansion and in hut. Together with our Subsidiaries we have over 1800 offices to serve them. Yet our work has only just begun. There are years, many years ahead. And today, we at the State Bank of India, pledge ourselves anew, to the dedicated service of our people and our country.

STATE BANK FOR SERVICE

LPE-Aiyars S. 2 A

The Search for Hope

Ashok V Desai

The Crisis of India by Ronald Segal; Penguin, 1965; pp 326, 5s.

“THE visitor to India, aware of the enormous problems which the country faces and unimpressed by the progress towards appropriate solutions that he is able to register, may find himself impatient with the laborious, sometimes seemingly self-defeating processes of democratic rule, may catch himself longing — and supposing that many Indians long as well — for a ruthless government that would, however authoritarily, tackle at least the crises of poverty and over-population, superstition and separatism, official corruption and the crude self-seeking of the commercial classes, head on. Indeed, he may find it surprising that signs of a drift towards totalitarianism are so faint and so few, exceptionally so in a former colonial world of so many authoritarian — many of them military — regimes. He is inclined to suspect the credentials of Indian democracy altogether, and see the government of Congress as a disguised, if rather benign, one-party despotism popularly imposed.”

These words echo the thoughts of many who are no visitors to this country; and Ronald Segal's concern, his indignation, his determination not to give up hope for India, are by no means foreign to us. The issues Segal has chosen fly in our faces. This is not a book one can fall in love with. Many readers are likely to be annoyed by the way Segal rips the rags of pride and decency off India, and those who can take it coolly will be inclined to complain about his selection of evidence, his failure to consider alternative explanations, his simplifications. But I think they will all, through reading him, have advanced their thinking on our political and social problems.

I

Segal finds India unique. This much is incontrovertible; all foreigners, whether from industrial countries or unindustrialised, tropical or temperate, eastern or western, find India different, as do Indians themselves. But in what does this uniqueness lie? In Hinduism, Segal would say. But the way he describes Hinduism (p 15), it means nothing but the Indian scene. It doesn't get us anywhere nearer the Indian uniqueness. And really, it is futile to try to define it in terms of particular features:

it lies, not in those features, but in the peculiar combination of them that one encounters in India.

But surely caste is all Indian? Segal calls caste “the very structure of social survival”, and “the fundamental rhythm of life itself” (p 35). The meaning of these phrases is quite beyond me; but in showing that caste is ubiquitous, Segal has mixed it up with *dharma* and *varna*; he has treated precept and practice, myth, epic and folklore as one. *Varna* is not caste. The vast majority of the Indian population is neither Brahmin, Kshatriya nor Shudra, and much of this residue would not recognise itself as Vaishya. And to read *varna* into the present-day castes is to miss their variety, their complication and their regional limits. There is a world of difference between the simple functional classification that the Aryans — presumably — brought with them and the chaotic maze of castes we find today. And what the religious texts support is *varna*. They are concerned, not with coiffures and the frequency of sexual intercourse, but with the maintenance of the *varna* hierarchy. That a society should have literature that supports the existing hierarchy is nothing unusual; nor is it an Indian peculiarity that we have deified the heroes of our novels or written romances involving our Gods. But the castes which exist as mutually exclusive social groups did not obtain their sanction from scriptures and epics. Their strength depends on the punishment that the people themselves mete out to those who misbehave. To explain why the untouchable behave as they do, we should go, not to the *Dharma-sutras* and *Mahabharata*, but to the high-caste ownership of land and water.

What then are castes? Castes are hereditary groups with rules limiting social intercourse with outsiders. All castes have rules regarding marriage. About other rules, there is much less uniformity: all that is common to them is their purpose of limiting external social contacts. Even today groups that attempt to isolate themselves by means of conventions spring up all over the world. The mutual behaviour of the English and the various coloured communities in England or of Italians

and the natives in Switzerland is very similar to that of castes.

II

Segal races through 4,500 years of Indian history in eighty pages. I am not competent to judge the accuracy of his entire account, but I cannot help feeling that it is too daring. The account rests on more substantial grounds when it comes to the last century; the interpretation of the period as one full of chances lost by a pig-headed British government or an over-confident Congress is interesting and, I think, tenable. However, Segal seems to imply (p 106) that the Muslims were a cohesive political force right since the beginning of the century. On the other hand, there is the view which I think one can ascribe to Nehru, that in India power was bound increasingly to vest in the masses, and that the Congress, being the only mass party, was destined to have a growing share of it: other parties would be crushed by democracy. Up to the 1940s, the evidence favoured this view: look what happened to the Liberals, the Forward Bloc, the Swarajists. So it was possible to deny a future to the Muslim League and to look upon Jinnah as an opportunist who was bound to fail. Then came the killings of 1946-47; the League proved its strength in an unexpected fashion. Did Nehru and the Congress misjudge the traditional communal forces, or were the forces non-existent till the late forties? Is tradition an ever-present influence on history or is it just an instrument for occasional politicians? Maybe, we were too little conscious of communalism till the forties: maybe we are over-conscious now. It is easy to read tradition into history, but impossible to refute its influence.

III

In a chapter on “The Character of Custom”, Segal selects the most detestable Indian characteristics — our indifference, dirt, cruelty towards women, inconsistency, insensitivity, colour prejudice and many other unsavoury traits. I have before criticised Segal for selective evidence, but I cannot here. With every instance Segal draws blood: I, for one, am inclined neither to contradict him nor to attempt justification.

For explanations Segal goes back to history and tradition. Social irresponsibility is linked to caste, inconsistency to a belief in *maya*, colour prejudice to the Aryans, pessimism to *dharma* and to centuries of victimisation by man and nature.

With some of these explanations one runs into trouble about cause and effect. How far did the absence of a social conscience contribute to the growth of caste, and how far the other way? How far is the conception of *maya* an offshoot of the Indian tendency to "reconcile" inconsistencies (compare the examination questions where students are asked to "reconcile" contradictory theories)?

But really, we must start with the question, what constitutes the explanation of a behavioural characteristic? Segal answers it this way: "The Indian is a different sort of person from the Frenchman because his history has been different, his culture is different, his political and economic experience has been different, his relationship to his family, his neighbours, his people, and his world are different. If his character is peculiar, it is because his customs are peculiar, the consequence of different events, sanctions and ideas. He behaves in a particular way because he is expected — and educated — by his context to behave in such a way. It is not his blood or the shape of his skull, but his society, that makes him broadly different. And because he is part of society, however paltry a part, he in turn confirms the broad difference of his society by accepting and transmitting it."

This is right, I feel, but too general. For the explanation of a man's behaviour pattern, we should look to his upbringing: behaviour owes its regular element to the rules a person picked up in the groups that he entered successively as a novice: his family, school, working place, dance-hall, etc. In studying the acquisition of such rules we might take the psychologist's approach and concentrate on some events whose victim or recipient the person has been, or we might follow the ethnologist and study behaviour in the context of the educative institutions; or we might go sociological and do pretty well what we like. But at least this first step must relate to the immediate history of the person, and not go back to his ancestors. History and tradition can come in at the next step, but they can contribute only if the social institutions have emerged or changed over time. If the past was just like the present, it does not in any

sense explain the latter. Causes must be found in events, and not just in the state of things.

From this point of view, I find very little conclusive evidence in Indian history to explain any of our characteristics. Maybe colour prejudice came with the Aryans, or may be some Muslim emperors brought it by introducing Negro slaves. Spanish peasant women swaddle themselves with clothes when they work in fields, leaving only the eyes and hands uncovered; how did they acquire their colour prejudice? Historical speculation is all good fun, but one loses oneself in the sands of time.

Social psychology is somewhat more helpful; it at least provides plausible explanations of specific traits of behaviour, and suggests how they might be improved or countervailed. Dirty habits, cruelty and colour prejudice are, for example, obviously due to social training. When we come to attitudes such as indifference and inconsistency, however, we haven't much to go on. Possibly attitudes are maintained through social sanctions, people taking up abnormal attitudes are ostracised; although this is somewhat doubtful. But how are they inculcated? There are no standard ways of training people in attitudes. I think we are here dealing with concepts that are too general: we find inadequate words for vague feelings that trouble us, and buttress them by selective evidence. Take Segal's examples of indifferent people: maybe there are some people who, when knocked down by cars, just walk away; on the other hand, motorists who knock down pedestrians are also often beaten up. And as regards the landless labourers of limited ambition described by Kusum Nair, a desire for a higher standard of living is generated by the experience of a rising standard of living, and it is natural that people with a long history of stagnant living standards should want little more than they have. But this is the least important of problems: even a slight improvement in the living standards of the poor engenders a disproportionate increase in their desired income. Apparently, Segal does not notice the contradiction between his imputation of material indifference to people and his remarks on the ubiquity of corruption. People are not corrupt for the fun of it, they also get some income from it.

Indifference, or the various traits of behaviour that one lists under this catch-all concept, will diminish with economic changes. It is not something

one needs to worry about; what one should be concerned about is the unequal spread of ambition. In a country where economic change is new, there remain pockets of stagnant standards of living, e.g. among the aborigines, or among the landless labourers investigated by Kusum Nair. Their falling behind and becoming "depressed classes" is a much more serious matter; it will cause much injustice and tension in the long run.

IV

This brings us to economics. Segal points out that Indian economic progress has been slow both in relation to what needs to be achieved and in relation to what China has achieved. I take this as incontrovertible. One can take the view that the difference between the Indian and Chinese rates of growth is not alarming. But the fact remains that the industrial production in China has risen far more rapidly and much more employment has been generated; in agriculture where our record perhaps compares more favourably, the Chinese are not faced with an equally serious problem. And since we started in the same state of economic affairs as the Chinese it might also be fairly said that our performance has fallen short of what can be achieved.

Segal has very little to say on why it has been so; he is more concerned with the distribution of income, which he thinks has been getting more unequal. This concern seems to be based on humanitarian considerations, and not on a belief that a control on income distribution or a mechanism that ensures that personal incomes do not fall below a minimum or rise above a maximum would permit a higher rate of growth of income. I think such a view is tenable and would provide a much more powerful case for institutional changes.

For improvement of income distribution Segal recommends co-operative farming and the abolition of large landed estates (pp 216-17). Now, if this abolition is to be any better than nominal, it will have to embrace the not-so-large estates — say, up to 10 acres — as well, and it is hard to see any benefits of keeping smaller holdings in private ownership. So I do not see why Segal does not argue for fully co-operative farming. Apart from its redistributive effects, it would also permit fuller use of the labour force and facilitate agricultural investment.

But this proposal raises many problems. To take one, is it possible to operate a system in which the income

distribution is much more equal in agriculture than in industry? Will not industry attract the more able people from agriculture? Exodus of the abler people from agriculture is a familiar phenomenon it might be more pronounced with co-operative agriculture and privately owned industry.

However, this is not a problem which need worry one: if one finds that introduction of co-operatives intensifies the exodus, one can then remove industries from private ownership. The important question is, who is to do so? And who is to make agriculture co-operative in the first place?

The Congress, Segal says (p 217). About the same Congress, he also says, "It has guided its followers by its own example of cynical manoeuvring in the pursuit of power, its repeated sacrifices of principle to immediate electoral expediency" (p 246) and that "the determination of policy has fallen further and further into the hands of the party bosses, the political entrepreneurs who collect the contributions of the business community, transmitting its desires along with its gifts, and then organise the constituencies for battle" (p 303). So when Segal suggests that the Congress should introduce co-operatives into agriculture, his reason seems to have been seduced by wishful thinking. But more likely, it is just the conflict between hegelianism and political sociology which afflicts us all.

V

So many of us keep thinking and saying that the State should do this or that. Underneath lies the recognition that reforms that we favour — whether in the agrarian structure, in the ownership of property, in the distribution of income and work, or in the social practices — are never going to be realised by popular initiative or demand; that, in fact, democracy is likely to inhibit them. No democratic government would have banned public hangings in seventeenth century Britain, witch-baiting in eighteenth-century Germany or the burning of widows in nineteenth-century India; none would prohibit bull-fights in Spain and marriages within caste in India. So we wish to give the ideal policy-maker a distinct personality and, in the Hegelian tradition, call it the State. This is the master of the destiny of India whose praises we sing in our national anthem.

And yet we realise in our moments of reflection that the actual state is not a master of its own destiny even; it is just a set of institutions governed

by conventions regarding the distribution of power and its shifts. Given the distribution of political power in India, and taking into account its likely trends, we may be fairly certain that the governments in India will not be very keen on reform.

So what do we do? We can hope. With Segal we might say, "I for one do not begin to have an idea of when and how such a revolution in Indian history will come about. But that it must come, I have no doubt. I believe the alternative to be finally unendurable". It is the common habit of mankind to hope. But *that* reason for hope — that the alternative will be finally unendurable — is false. For it *will* be endurable. We will be the judges of what is to come, and if we can endure the present, so will we the future. We — whether it is we the wellfed or we the starving — endure the present; we pass by hundreds sitting and sleeping on the pavements, eating stale rice and grams, having epileptic fits and dying, and it upsets us none too much. If famine comes tomorrow, we will let hundreds die; if they rise and riot, we will shoot them and forget them. No one can live with a feeling of guilt; we keep changing our definition of crime to suit our basic love of life.

In these circumstances, verbal manifestations of a social conscience are

worthless except as a means of livelihood. If journalists, academics, writers earn their bread by advocating social reform in various ways, it is understandable, it is even natural, but it is hardly a social service, any more than is table talk.

Social service consists in action that either propitiates one's social conscience or extends the freedom of manoeuvre of others who would follow theirs. If one is in a position to influence the government, one should persuade it to do what one considers politically desirable, taking account of its social character in one's advocacy. If one objects to the system, social, political or economic, and is in a position to do anything about it, one should try one's best to overthrow it. For the mass of us, who in a position of little influence and who cannot or do not aspire to do any better, the socially useful task is just to decide our job and do it well. Hopes that India can have a beautiful or just or rapidly progressing society are unjustified at least for the present; but to make it a more professional society, to introduce rewards for good work and sanctions against bad, is still within our reach, and we will thereby make it a more pleasant society to live in. *Dharma* has more meaning than Segal would allow.

The Indian Iron & Steel Co Ltd

Notice

AT a meeting of the Board of Directors held to-day the Directors have recommended in respect of the Ordinary Share Capital payment, under deduction of tax in accordance with the provisions of the Income Tax Act, of a final dividend for the year ended 31st March 1965, of 95 paise per share, making with the interim dividend of 75 paise per share declared by the Board on the 9th February 1965 a total distribution for the year of Rs 1.70 per share. This final dividend awaits sanction by the shareholders at the Annual General Meeting to be convened for Friday, the 3rd September, 1965.

The net profit after provision of Rs 4,46,49,507 for depreciation, Rs 4,53,50,000 for taxation and net transfer of Rs 4,14,82,699 to Appropriation Reserves is Rs 2,29,04,228. For the previous year the net profit was Rs 2,29,04,228 after provision of Rs 4,40,25,006 for depreciation, Rs 3,87,00,000 for taxation and net transfer of Rs 5,35,17,685 to Appropriation Reserves.

The Ordinary Share Register of the Company, as already announced, will be closed from the 20th July 1965 to the 3rd August 1965, both days inclusive, and the final dividend if sanctioned will be paid on and after the 3rd September 1965 to those shareholders whose names appear on the Register of Members on the 3rd August, 1965.

By Order of the Board
MARTIN BURN LIMITED,

F G LIVERSEDGE
Managing Agents.

Conscience of a Socialist Congressman

The Danger of Right Reaction by H D Malaviya, A Socialist Congressman Publication, 1965; pp 402, Rs 10.

H D MALAVIYA is a leftist, but lest he be mistaken he begins with an outburst against "China's perfidious and treacherous aggression against our holy motherland..." Credentials established, he proceeds to write a book which is inconsequential except to those who share his political purpose.

Admittedly Malaviya has a difficult task. He has to establish that the danger of right reaction has assumed serious proportions in India and at the same time prove the socialist character of the Congress Party and of the policies of the Congress Government. His technique is to use words—extensive quotations from texts of Congress Party resolutions and from speeches of Congress leaders, principally Nehru—to establish the socialism of the Congress and facts—the actual economic and political trends since Independence—to prove that the threat from the right is growing.

The book proceeds in the manner of a 'thriller'. The danger of right reaction is first described in awesome terms, but finally Congress is shown to prevail over all. The Third General Election, in Malaviya's colourful language, was "the first right reactionary challenge of its kind, to all that stands for progress in India", meaning the Congress of course. He invests the success of the Swatantra Party and the Jan Sangh with ominous significance. Yet, lest he should give the impression that the people's faith in the Congress had

* This should seem normal behaviour on the part of opposition parties, but Malaviya does not think so. To him "the correct attitude (for the rightist parties) would have been to get into touch with the Congress and the Government authorities at different levels, particularly in the many committees of the Parliament where issues could have been discussed, information elicited and constructive suggestions made!" As it was, "the extent of the abuse of civil liberties and democratic rights by these parties (was such as to) shock any lover of this country". Why, if this was so, did not the socialist Congress Government act against these abusers of civil liberties and democratic rights instead of finding other scapegoats to arrest and imprison without trial?

suffered, he promptly restores the balance with the statement that the election had proved that "the people stand foursquare behind the socialist programme of the Congress". The most he will admit to is that there were "factional disputes" among "some power-hungry Congressmen" and by clipping the Congress majority the people had merely shown their disapproval of this.

The balancing act is repeated in discussing the consequences of the Chinese attack in 1962. The Chinese imbroglio gave right reaction an opportunity to stage a "general offensive". Demands were pressed for radical changes in domestic and foreign policies; a successful campaign was mounted to remove the Defence and Oil Ministers from the Cabinet and, for the first time, even Nehru was not spared from direct attack.* All this is suitably described in hyperbolic prose. But the balancing statement is not long in coming: "The crisis proved again that Nehru was enshrined in the hearts of the Indian people".

It is when he comes to the actual performance of Congress socialism that the balancing act finally breaks down. At great length Malaviya describes how the Congress party's socialist orientation had been established during the freedom struggle and how after Independence it evolved "a very patriotic programme of national development", covering land reform and economic planning requiring expansion of the public sector and control of the private sector to achieve rapid economic growth and reduction of economic inequalities. What the fruits of this programme have been, is well known. In Malaviya's own words:

"... the weaker sections of the village community, who constitute the overwhelming majority, continue in the condition of poverty and destitution. There is at the other end a very small percentage of the rural population which is well off amidst all round poverty..."

"... control of major industrial economic activity is passing into the hands of a few persons, and the same set of persons or Houses are seen at the apex in different industries."

"Official data available irrefutably prove that, as in the colonial period, so now, in the period of

mixed economy, socio-economic inequality is growing."

Malaviya draws attention to these facts to establish the danger of right reaction. But how did the Congress party's socialist programme produce such contrary results? This he does not explain, which is hardly surprising since if he tried to it would knock the bottom out of his thesis that the Congress is a socialist party. What he can do is to blame right reaction. This he does most generously: "Feudalists", industrial and financial "monopolists" and the "monopoly press" have opposed and sabotaged Congress policies. The truth that the sabotage would have been impossible without the connivance of the Congress party itself is neatly avoided. There are only half-hearted admissions of "sections in the Congress" not having "seriously accepted the socialist orientation" followed quickly by the assertion that "such stragglers from the path, however, have singularly failed to affect the image of the Congress in the mind of the Indian people as a party of social and economic change". Two stragglers are singled out for mention, S K Patil and Kamalayan Bajaj. However, we are assured that their views "are not representative of opinion either of the Congress organisation or of its top leadership". It is nowhere mentioned that the Congress organisation as a whole has subsisted almost entirely on funds provided by "feudalists" and "monopolists" or that practically every important Congress leader has compromised himself with individual "monopolists".**

Against these facts and the facts of abortive land reform, concentration of control over industry and growth of economic disparities, Malaviya can only quote copiously from Congress resolutions on socialism and from the speeches of Congress leaders—speeches made precisely for the purpose to which Malaviya puts them: to persuade the people that the Con-

** Malaviya takes umbrage at G D Birla's recent warning that criticism of industrialists by Congress leaders would one day prove dangerous to the Congress. But, surely, he doesn't need to be reminded that the Birla's close association with the Congress did not end with Gandhi's assassination in Birla House?

gress is socialistic. Malaviya and his brand of socialist Congressmen are welcome to pin their faith on this leader or that—it was Pandit Nehru ("India's beloved leader") then; now it is Indira Gandhi ("symbol of our

departed leader, hope of India and a leader of her people by her own right") and Kamaraj ("who symbolises in his person the urges and aspirations of the toiling millions of India"). Others would rather judge the Con-

gress not by its professions nor by the proclivities of individual leaders, but by its practice as a political organisation and the party in power in the country.

AROUND BOMBAY MARKETS

Gloom Pervades Stock Market

Wednesday Morning

THE stock market is an awfully bad shape. Equities have suffered an all-round sharp decline over the past fortnight or so, which has brought the market back again almost to its year's low recorded in the last week of May. The fall has occurred despite the ceasefire in Kutch and the consequent easing of tension on the borders, which, however, is scarcely surprising. The fairly impressive recovery in June had been essentially in the nature of a technical correction of the preceding steep decline and the rally might not have proceeded as far as it did but for the massive purchases of a large number of scrips by the Life Insurance Corporation and to some extent by the Unit Trust which created a scarcity of floating stocks. The technical rally would have petered out in course of time in any case but the duration of the corrective phase was cut short by the announcement of an unchanged dividend by the Tata Iron and Steel Company which caused widespread disappointment in market circles. The absence of any news about the widely anticipated bonus issue by Tata Engineering and Locomotive Company along with the dividend announcement added to the market's frustration.

With the change in sentiment, market's attention has once again been focussed on the deteriorating foreign exchange position and its possible repercussions on industrial production through restricted imports of raw materials and components. Responsible spokesmen of a number of companies have hinted at prospects of a considerable decline in production because of restricted imports. The Reserve Bank of India's special deposit scheme for imports, which has been somewhat modified recently, credit curbs and fear of a fresh rise in interest rates have further increased industry's worries. The steel industry's wage bill will swell further as a result of the recent increase in minimum wages as recommended by the wage board for the steel industry.

Trading sentiment on the stock market has been further unsettled by rumours of a possible supplementary budget. These rumours have gained

wide currency following the suggestion made by the resources committee of the National Development Council that the Centre and the State Government should raise additional resources through supplementary budgets in the current financial year. The stock market which is already in a crippled form dreads the very idea of a supplementary budget.

The recent sudden and sharp decline in equity prices has created some payments difficulties though the settlement has been through with one member of the stock exchange closing his business, without being officially declared a defaulter. The stock exchange community is passing through an extremely difficult time. The turnover has shrunk to such small proportions that many stockbrokers are finding it difficult to make their two ends meet. There seems no early end to the stock market's difficulties.

COTTON

Well Above Ceilings

SO FAR, weather reports from most of the cotton growing areas have been far from satisfactory. The monsoon has been weak all through. The rainfall has been quite inadequate at most places. As it is, it only means a delay in the harvesting of the crop but if the monsoon does not oblige soon enough and the cotton producing areas do not get sufficient rainfall, the size of the crop itself will be affected, depending on the nature of the weather. The prospect of a poor crop is extremely disturbing because cotton prices in India are already very high—about Rs 200 to Rs 300 per candy, higher than the prices of comparable cottons abroad—which reflects the continuing imbalance between indigenous production and the industry's requirements.

Mill consumption of cotton during 1963-64 totalled 60.81 lakh bales as against 56.70 lakhs in the preceding season. Consumption during the first eight months of the current season (1964-65) is placed at 42.89 lakh bales of which 5.20 lakh bales are of foreign cotton. On this basis cotton consumption this season is likely to exceed 64

lakh bales which means that the current season will end with a smaller carry-over. Cotton prices are already quoted between Rs 50 and Rs 175 per candy above the statutory ceilings. Except for a very short period, prices have remained well above the ceilings most of the time this season. With consumption continuing to increase with the expansion of spindleage, cotton prices can be expected to rise to new high levels if the new cotton crop turns out to be a poor one as the shortfall cannot be easily made good through imports because of the critical foreign exchange position.

New Delhi has still to announce the cotton policy for the new season (1965-66). It is really amazing that the policy should not have been announced before the commencement of sowings. Perhaps the Government shares the widely held view that prices do not have any significant bearing on agricultural production in the country, more particularly in the case of a commodity which is generally quoted at well above the statutory ceilings. According to informed sources, the Government proposes to raise the floor prices by about Rs 100 per candy and the ceiling prices by about Rs 80 per candy. If the authorities are reconciled to raising ceiling prices by that margin, it would be much better to do away with price control altogether, which, has been reduced to a farce in any case.

OILSEEDS

Prices At New Highs

OILSEEDS prices have recorded a spectacular rise since about the beginning of this month. Within less than a fortnight castor September shot up from Rs 82.40 to Rs 93.75 (per quintal) and linseed September advanced from Rs 102 to Rs 120 (per quintal). Futures simply soared, the penal margins notwithstanding. Bulls are called upon to pay a margin of Rs 5,000 per unit of trading (10 tonnes) in the case of linseed and Rs 2,400 per 10 tonnes in the case of castor. The rise in futures has led to payments difficulties and the market has had to be officially closed to resolve the payments deadlock. Offi-

cial trading has been at a standstill at any rate as futures have remained well above the weekly maximum limits for quite a long while.

But the rise in oilseeds prices cannot be attributed to the evil doings of certain powerful speculators. The rise has been no less pronounced in the spot market. Groundnut oil ready has risen from Rs 25 to Rs 28.80 (per 10 kgs) within a fortnight and linseed oil has improved from Rs 22 to Rs 25. Castor oil has risen from Rs 17 to Rs 18.50. Oilcakes prices have also firmed up by about Rs 15 to Rs 20 per tonne. The bullish fervour in oilseeds markets has gained immense strength from reports of inadequate rains in nearly all the important groundnut producing areas.

Oilseeds prices are now standing at the highest level for the current season and are not much lower than the fantastic levels which prevailed at the fag-end of last season. If this be the position when the country has had good harvests — the best so far —, exports of edible oils remained banned and the supply has been augmented through sizable imports of soyabean oil and mutton tallow, the price situation could easily get out of control if the weather does not oblige and groundnut production is seriously affected. Despite various package plans and other measures to step up farm output, agricultural production remains at best a gamble in rains.

Export activity continues to be restricted to groundnut extractions and cottonseed cake. The performance in respect of groundnut extractions has not been exciting recently. The trade is feeling quite uneasy over the prospect of export of oilcakes being canalized through the State Trading Corporation.

Money and Banking

Thursday, Morning
CONDITIONS in the Bombay short term money market continued to rule easy during the week to July 14. Funds were ample in the market as the inflow from mofussil areas gathered strength. Demand for funds continued more or less at the previous week's level. The rate of interest fluctuated around the previous week's level between 4 per cent and 3 per cent—at the time of writing it was 4 per cent.

During the week to July 7 aggregate deposits of scheduled banks increased by Rs 20.71 crores to Rs 2076.91 crores according to the latest returns issued by the Reserve Bank. This represented an increase of Rs 11.15 crores to Rs 1283.48 crores in demand

deposits and Rs 9.56 crores to Rs 1441.74 crores in time deposits. Cash in hand and balances held with the Reserve Bank registered a rise of Rs 5.25 crores to Rs 175.94 crores. Investments in government securities increased by Rs 3.95 crores to Rs 730.67 crores. Money at call and short notice declined by Rs 5.07 crores to Rs 60.42 crores. Borrowings from the Reserve Bank advanced from Rs 65.99 crores to Rs 68.67 crores.

Notes in circulation increased by Rs 11.84 crores to Rs 2689.34 crores during the week to July 9, according to the Statement of Affairs of the Reserve Bank. While foreign securi-

ties were unchanged at Rs 68.35 crores, balances held abroad were slightly lower by Rs 39 lakhs at Rs 4.46 crores. Deposits of the Central government showed a sharp decline of Rs 32.17 crores to Rs 77.42 crores. State government deposits were slightly higher by Rs 48 lakhs at Rs 17.19 crores. Deposits of the scheduled banks at Rs 104.32 crores were higher by 1.40 crores. Loans and advances to governments were lower by Rs 4.82 crores at Rs 44.22 crores while advances to scheduled banks recorded a decline of Rs 13.47 crores at Rs 54.99 crores. Investments at Rs 276.53 crores were lower by Rs 19.84 crores.

BUSINESS NOTES

Tata Engineering

THE year to March 1965 has proved more prosperous for Tata Engineering and Locomotive Company. It has recorded a very satisfactory increase in sales turnover and profits — the former rising by 28 per cent to Rs 66.13 crores and the latter, at the gross level, by nearly 24 per cent to Rs 8.24 crores, according to the preliminary profit figures. The advance at the pre-tax profit stage, however, has considerably narrowed down, since depreciation charge has syphoned off as much as Rs 84.37 lakhs more at Rs 3.44 crores. But with the tax liability, which though claims Rs eight lakhs more at Rs 2.08 crores, considerably lower at 43.5 per cent against 49.5 per cent in the previous year, the directors are left with an after-tax profit of Rs 2.71 crores, nearly a third more than the previous year's Rs 2.04 crores. The allocation to development rebate has been stepped up from Rs 68.10 lakhs to Rs 95.36 lakhs.

The equity dividend rate remains unchanged at Rs 14.50 a share which, however, requires a larger amount of Rs 148.52 lakhs against Rs 135.32 lakhs, as the new equity shares issued as "rights" are entitled to a proportionate distribution. As before, the preferential dividend demands Rs 8.33 lakhs. Despite the enhanced dividend liability, the cover is appreciably strengthened from 0.9 times to 1.4 times. Of the proposed dividend, nearly 16 per cent will be exempt from tax as against 23 per cent in the previous year. A sum of Rs 16 lakhs is allocated to deferred taxation reserve.

Contrary to expectations in the stock market, the directors have not announced a bonus issue, probably

with a view to considering the issue after the Government's import policy announcement for actual users as the company's production and profitability depends to a large extent on the availability of certain essential components and raw materials which are imported, although it has achieved a fairly high level of indigenous content in the manufacture of commercial trucks. There are already reports that the company has effected a cut in production of the automobile division following restrictions on imports in the first quarters of the current year. Besides, what may have also influenced the directors to defer a decision on the bonus issue is the increased future liability not only on account of the "rights" shares but also on the proposed Rs two-crores preference issue and on the proposed new debentures carrying interest at 7.5 per cent per annum instead of the present rate of five per cent. Before raising the capital further by capitalising the share premium account, the management would naturally like to assess its future profitability prospects so that it may be able to maintain the dividend rate on the enlarged capital.

Larsen and Toubro

A PRELIMINARY statement from Larsen and Toubro for the year to March 1965 shows continued growth in sales turnover and other income which rose by 13 per cent to exceed Rs 10-crore mark. But with costs rising in all directions and margins under pressure, gross profit has risen by six per cent from Rs 1.11 crores to Rs 1.18 crores. After providing Rs 20.81 lakhs (Rs 18.46 lakhs) for depreciation, Rs 51 lakhs (Rs 50.50 lakhs) for taxation and

Rs 3.29 lakhs (Rs 4.46 lakhs) for development rebate reserve, there is left a disposable profit of Rs 42.66 lakhs compared to Rs 37.85 lakhs a year ago. Equity dividend is kept unchanged at 15 per cent, but it is now also payable on the additional capital of Rs 66 lakhs which ranks for four months. The total dividend liability, including that on the preference capital, has thus risen to Rs 29.02 lakhs (Rs 25.72 lakhs). Of the remaining surplus, Rs 13.50 lakhs are transferred to reserves which received Rs 12.08 lakhs in the previous year.

Even though margins have narrowed, the increase in earnings is such that the cover for the enhanced dividend liability has remained unchanged at just under 1.5 times. Judged solely by this yardstick, it is reasonable to expect that, barring unforeseen circumstances, this swiftly growing concern with diverse fields of activities should not find it difficult to maintain the dividend rate for the current year on the enlarged capital. What is more significant is that during 1964-65 the output from the company's modern industrial complex at Powai increased further by 26 per cent on top of a 62 per cent jump registered a year before. The plans for expansion are being implemented, and the management is confident that production and sales will rise further as there is a growing demand of high quality engineering equipment and services supplied by the company.

Burn and Company

OWING to the go-slow tactics adopted by labour in Burn and Company's structural shop at its Howrah works, the tonnes per man per month output fell far short of previous performance in that shop and of performance of similar shops in works owned by other companies in the Calcutta area. The most distressing aspect of the matter, however, was that structural work to the extent of some 8,000 tonnes planned by the company against orders of vital national importance had to be transferred to other fabricators. The company was also not able to complete wagons because the Railways themselves failed in their undertaking to supply in time certain components and steel.

The working of the factory for making magnesite shapes materially improved, but sales of magnesite on the export market dropped owing to keen competition from Europe. Experiments

are being conducted in the beneficiation of the raw materials to improve the company's ability to withstand this competition. The sales of the company's refractory works in various parts of the country continue to be satisfactory but less remunerative owing to a depression in selling prices caused by the fact that the capacity of this industry far exceeds the national demand. Reyrolle Burn, the new company, began production in June 1964 but owing to a shortage of some raw materials output was not upto expectations till the end of March last. But production is now rising and, with the initial teething troubles over, it is hoped that this unit will record steady progress.

During the year to April 1965, Martin Burn's sales advanced by nearly Rs one crore to Rs 13.74 crores but increased costs without correspondingly higher selling prices led to a diminution of the margin of gross profits. The overall financial results, however, showed a very happy picture, as the gross profit was sharply up by nearly Rs 51 lakhs to Rs 2.06 crores. This was primarily due to the fact that the year's accounts did not suffer the heavy debit on account of arrears of profit sharing bonus as had been the case in the preceding year following an award against the company.

After charging depreciation of Rs 42.56 lakhs (Rs 42.94 lakhs), and after providing for taxation Rs 98.65 lakhs (Rs 64.50 lakhs), for development rebate reserve Rs 2.25 lakhs (Rs 9.59 lakhs), for gratuity reserve Rs 13.35 lakhs (Rs 5.24 lakhs) and for capital profits reserve Rs 0.64 lakh (Rs 0.21 lakh), there is left a surplus of Rs 48.38 lakhs, nearly a half more than the last year's. Out of this, Rs 7.03 lakhs (Rs 4.93 lakhs) are set aside for works reconstruction and expansion reserve and Rs 9 lakhs (nil) for the Niwar project reserve. As before, the preferential dividend demands Rs 2.35 lakhs. The equity dividend is stepped up 2.5 per cent to 17.5 per cent, and requires Rs 29.40 lakhs (Rs 25.20 lakhs).

Sandvik Asia

GOOD progress has been made by Sandvik Asia in its programme of expansion of tungsten carbide capacity by three-and-a-half times to 84 tons a year. The construction of the factory building for expansion is expected to be completed before the end of the year. The machinery will start arriving from September and will be commissioned by June next.

Meanwhile, during the year to March 1965 the company reached its licensed capacity in tungsten carbide sintered products, but the rock drill steel factory worked to half the capacity owing to the availability within the country of imported rock drill steel which competed with indigenously manufactured items. A greater utilisation of this plant can be expected, since demand has looked up from the beginning of 1965.

The company has produced good results for 1964-65. Sales advanced from Rs 1.04 crores to Rs 1.23 crores and gross profits jumped from Rs 25.88 lakhs to Rs 37.86 lakhs. Depreciation charge has taken up Rs 14.62 lakhs (Rs 12.09 lakhs), taxation Rs 6.75 lakhs (nil) and development rebate reserve Rs 2.52 lakhs (Rs 4.50 lakhs). A sum of Rs nine lakhs is allocated to general reserve which received only Rs 1.25 lakhs last year. The dividend as raised by two per cent to eight per cent (tax-free) demands Rs 4.80 lakhs compared to Rs 3.60 lakhs previously, and is so well covered by earnings that the maintenance of the present rate of dividend does not seem to be in doubt on the capital proposed to be enlarged by a one-for-four rights issue.

Zenith Steel Pipes

PRELIMINARY profit figures from Zenith Steel Pipes for the year ended April 1965 show further all-round improvement in production, sales and profits. During the year, the company produced 37,000 tonnes of steel pipes as against 32,000 tonnes and 12,000 tonnes in the preceding two years. Of the 1964-65 production, the company was able to export 5,700 tonnes comprising about 45 per cent of the country's total exports of this product. Sales turnover, which had advanced from Rs 1.48 crores to Rs 4.33 crores in the preceding year, improved to Rs 4.77 crores, and the company earned a gross profit of Rs 54.10 lakhs compared to Rs 52.70 lakhs and Rs 34.78 lakhs, respectively, in the previous two years. With the provisions for depreciation, taxation and development rebate reserve claiming Rs 8.21 lakhs (7.87 lakhs), Rs 15 lakhs (13.85 lakhs) and Rs 1.33 lakhs (1.77 lakhs) respectively, the year's equity earnings are slightly higher at Rs 29.56 lakhs compared to Rs 29.21 lakhs. The equity dividend, stepped up by two per cent for the second year in succession to ten per cent, requires Rs seven lakhs (5.60 lakhs), and is covered nearly four-

and-a-quarter times by earnings. As before, the entire dividend is expected to be exempt from tax.

The management has been actively pursuing its project for the manufacture of seamless pipes which involves quite a large investment. Negotiations are in progress with the IFC, Washington and also with the Government of India, and a decision in regard to its implementation is expected to be taken up by the end of 1965. Meanwhile, the implementation of other projects for which the company holds industrial licences has also been deferred, as the seamless pipes project is engaging the management's full attention.

Permanent Magnets

ALTHOUGH Permanent Magnets experienced good demand during 1964 and its sales nearly trebled to Rs 19.15 lakhs but these were lower than expected because of the Government's policy of not completely banning the import of permanent magnets despite representations by the indigenous producers. Besides, sales were affected by the crisis in the electric meter industry, where many units had to curtail their production.

The company's factory is now equipped to produce 180 tonnes of permanent magnets per year. Only a few more machines are required which are expected to arrive before the end of the current year. Meanwhile, the directors expect about 50 per cent rise in the current year's sales. This assessment is based on the fact that in the first five months of the year sales amounted to Rs 10.43 lakhs and there were orders on hand for Rs 14.76 lakhs.

During the year to December 1964, the company earned a profit of Rs 1.77 lakhs against a loss of Rs 3.47 lakhs in the previous year, after charging depreciation of Rs 2.97 lakhs (2.39 lakhs). Development rebate amounting to Rs 4.65 lakhs is yet not provided. The year's profit together with a small amount written back is utilised to reduce the total deficit from Rs 5.29 lakhs to Rs 3.49 lakhs.

Digvijay Cement

GL BANGUR, Chairman, Shree Digvijay Cement Company, has urged upon the Government to introduce some simple procedure of examining the costs of cement industry through its own Cost Accountant so

that necessary data may be available to it in time to determine the prices when the present price structure falls due for revision from April 1, 1966. In his address to the shareholders at their annual meeting held at Sikka a few days back, Bangur said that any reference to the Tariff Commission at this stage may involve a lot of delay as the Commission will not be able to complete its examination and submit its recommendations in time.

The cost of production of the cement industry has been increasing progressively mainly due to general increase in the price level in the country, and the increase in railway freight as well as in labour wages. In spite of this pressure of increase in cost, the question of adequate price increase for cement has always been delayed, says Bangur. He, however, welcomed the increase of Rs four per tonne in the retention price with effect from June 1, and has expressed the hope that the industry will be able to largely meet the rise in the cost of production for the time being.

He regretted that the Government has turned down the industry's request for grant of a suitable price increase exclusively earmarked for expansion when the country is faced with a serious shortage of cement. Bangur said that it will be really helpful if the Government would permit a specified percentage of production to be sold in the free market so that people may not have to run even for small quantities of cement required for their own housing, repair work, etc. In regard to the company's expansion programme, Bangur said that the additional capacity of two lakh tonnes of cement will be achieved by the second/third quarter of 1966. The company has also received recently a letter of intent for expansion of the capacity of its asbestos products by another 36,000 tonnes per annum.

Indu Mills

THE reduction in the 1964 margins of India United Mills, which has been forced by the many factors that affected the fortunes of the cotton textile industry as a whole, has been aggravated by overstaffing and low productivity of the Mills. The combination of these unfavourable factors has resulted in a lower gross profit of Rs 86.70 lakhs, a third lower than the previous year's, even though sales of cloth and other products fetched Rs 1.13 crores more at Rs 16.29 crores

THE ECONOMIC WEEKLY

and income from other sources also brought in more. The number of workers employed is on an average 20 per cent more than in other progressive mills in Bombay. The excess in employment is particularly due to the fact that there is a great deal of old, out-dated and undersized machinery installed in the Mills. The weaving productivity is lower by about 15 per cent as compared to that of the progressive units of the ordinary plain looms. As a result of an overall increase in wages, salaries and other benefits including dearness allowance, the ratio of wages and salaries to realisations has increased by about five per cent which alone works out to nearly Rs 80 lakhs as an additional outgoing.

To the year's profit is added Rs 5.20 lakhs, being the previous year's surplus, Rs 0.95 lakh, refund of taxes of previous years, Rs 30 lakhs, balance of general reserve and Rs 2.22 lakhs, balance of development rebate reserve to make a total of Rs 1.25 crores for disposal. Of this, depreciation has taken up Rs 30.23 lakhs (Rs 17.10 lakhs), development rebate Rs 11.07 lakhs (Rs 9.40 lakhs), tax on dividend Rs 3.05 lakhs (Rs 21.60 lakhs), provision for obsolete stores, dyes and chemicals Rs 0.50 lakh (nil), contribution to gratuity for previous years Rs 5 lakhs (nil), reserve for doubtful debts Rs 5,641 (Rs 7,528), bonus to staff Rs 54.81 lakhs (Rs 27.02 lakhs) and previous years' taxation Rs 2.52 lakhs (nil). Dividend on ordinary shares is cut from Rs 1.25 to 62.5 Paise per share and that on deferred shares from 31.25 Paise to 6.25 Paise per share. Dividend requires Rs 15.63 lakhs (Rs 40.63 lakhs) and the remaining surplus of Rs 2.21 lakhs is to be carried forward.

The programme of renovation and rehabilitation of plant and machinery in all the units continued during 1964. Further orders for machinery worth about Rs 50 lakhs were placed. The modernisation and renovation so far carried out in the Mills, however, is very meagre compared to the needs of the Mills which are estimated at around Rs 10 crores. The directors have chalked out the second phase of modernisation programme involving an expenditure of Rs 2.60 crores, which is proposed to be financed by borrowings. Meanwhile, looking to the performance of the company in the first five months of the year, they have expressed the view that the current year's prospects too look bleak.

CURRENT STATISTICS

FRESH AND GLOWING...

Get that fresh and glowing complexion with daily Hamam care. Hamam's rich, fragrant and gentle lather actually refreshes your skin as it cleanses—gives you a radiant glow. Use longer-lasting Hamam—the toilet soap that keeps its shape, always. Hamam is a Tata Product.

CBTH-2A

Age is not all... nor the mere fact of survival on the frayed ends of tradition. Among the earliest promoters of a concept — that of self-sufficiency for our country through extensive industrialization, we have known no ingenious ways to overcome obstacles apart from flexibility in decision making, and regard for ordinary principles of management wedded to probity. If we are today a rational complement of industrial units, that is because of our reluctance to sit on the fence of the status quo — waiting for an overwhelming consumer demand to develop before being able to set our sights. And if we have a modest reputation of worthiness, we intend to live up to it through an optimum use of talents, available resources and initiative.

**AGE
IS NOT
ALL...**

AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON AND STEEL CO. LTD.: With an enviable record of production efficiency the million ton integrated steel plant at Burnpur is ready with another two-phase expansion programme to double its production capacity by the end of the Fourth Plan period. The largest foundry in the Commonwealth at Kulti is being steadily modernized and expanded.

A subsidiary, The HISCO-Stanton Pipe and Foundry Company Limited, recently inaugurated, has its brand new factory coming up at Ujjain for the manufacture of spun iron pipes and ancillaries directly for the benefit of consumers in developing areas.

BURN & COMPANY LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building

industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive springs and components.

THE HOOGHLY DOCKING & ENGINEERING CO. LTD. Established in 1819, the Company with its shipbuilding yard, dry dock and extensive workshops is geared to meet defence and civilian requirements, and to produce dredges to keep our new harbours and channels of inland navigation open.

ROBERT HUDSON (INDIA) LTD.: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES: Some of the first feeder railways in India, with six systems in four states, still a great aid to suburban travel.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India serving a wide area in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester. Hand operated and electric overhead travelling cranes and chain pulley blocks.

REYROLLE BURN LTD.: A collaboration with A. Reyrolle & Co. Ltd., Habburn, England—for the manufacture of specialised types of electrical switchgear of worldwide repute.

A Negative Achievement

THE Finance Minister has spoken not a day too soon. Rumours of devaluation have been gathering and making the foreign exchange crisis even more acute, offering as they did a premium on withholding of payments. These have been scotched for the time being by his bold and forthright statement that India will not devalue nor would she declare a moratorium on foreign payments. It is the measures for strengthening the rupee which he listed that leave much room for thought, not with regard to the immediate situation but as a solution to our long run problems. His outright and emphatic rejection of devaluation will be widely endorsed. To look upon it as a possible solution is to assume away our basic problem which, as he correctly pointed out, is that of bringing about structural changes in the economy and enlarging the base of domestic production. The obvious and preferable alternative is the selective approach to the subject of imports and exports and judicious use of incentives and disincentives for giving a stimulus both to import substitution and export promotion.

Notwithstanding the acute concern that it has caused and the wide publicity it has received, the present crisis is not as serious as it has been made out to be. It has been blown up out of all proportions. The regrettable part of it—regrettable, being easily avoidable—is the slackness of our foreign exchange budgeting, the administrative inefficiency which allowed such a wide and incredible divergence between actual shipments and export receipts. That it has gone on so long without anybody bothering to do anything about it is, to repeat, incredible. Even today nobody knows for sure how it happened and who was at fault. True, in retrospect many things appear clear which at the time of their occurrence may have been obscure. But surely one did not need the gift of hindsight to suspect the possible impact of a sharp rise in the Bank of England rate on India's payments position. And that happened way back in October last year. Followed the decline in India's foreign exchange reserves, advertised all over the world, leading to speculation about possible devaluation, the prescription of the Fund on such occasions being no secret to anybody.

That the immediate situation can be met by the measures that have been taken goes without saying. Import entitlements issued in advance of export receipts have been stopped. The leakage resulting from tardy or deliberately delayed crediting of export receipts, it is hoped, will be duly and thoroughly investigated and export control apparatus properly mended to take care of it.

These are not the only factors, however, which upset even the loose form of foreign exchange budgeting that we have. There were other drains on it, food, fertilisers and defence. Can one say that they were really so unexpected, or beyond the range of the provision which prudence demands? Another factor mentioned in this connection is the rise in the price of imported manufactures, plants and machinery. Not that it was supposed that foreign trade and transactions could be conducted without a cushion of reserves but the need for more adequate reserves has probably been brought out this time with much greater force than ever before. Vagaries of the monsoon and consequently of food production have always been with us. To them has now been added unexpected and extraordinary demands for defence outside the country's planned defence build-up.

The present crisis, despite its severity, is no more than a passing affair. It is superimposed on a continued and longstanding strain on our payments position which, however, is not a matter of accident but the result of deliberate design, impelled by the urge for development. The homely prescription of "living within our means" which the Finance Minister has also mentioned in the course of his broadcast, is therefore apt to be misunderstood. Taken literally, it is a counsel of despair for a developing economy which has, perforce, to strike a balance between its aspirations and efforts, if not achievements. At which point should this balance be struck?

The Finance Minister is quite explicit about it that the measures that have now been taken to meet the immediate crisis "are calculated to pro-

duce a better balance in our external accounts over the current year as a whole". But do they also give any indication about the future? Do they suggest the path the country is going to take? There's the rub. Throughout the last few weeks or days when rumours of devaluation and moratorium have been buzzing, there have also been siren voices, like background music, of offers of generous aid to pull the country out of its difficulties provided India would only listen and retrace her path from self-defeating controls, demolish the structure of Import Control and replace it by steps towards freer imports, tempered, if need be, by judicious import duties; wise counsel to call a halt to the mad rush of development, and compromise in favour of consolidation, if only for a year. Along with these there have been gestures of much more aid based on the premise, which can hardly be controverted, that foreign exchange requirements of all our Plans have been grossly under-estimated resulting in periodic crises and continuous strain.

While short term measures will rectify the immediate imbalance, the mounting burden of repayment and amortisation on past debts will remain. This burden, the Finance Minister has also made it clear, is not proposed to be met by declaring a moratorium. The debt obligations will be met all right but it is the creditors who would be asked for the present to take care of them.

What about the future? The present measures taking into account those which can be immediately implemented will certainly be a stop gap but will they also ensure that development will not be halted, that the rate of growth of industrial production, e.g. will not slow down or that more and more of the production capacity, built at such high cost, will not be rendered idle? The Finance Minister concluded his broadcast on a heroic note. While scorning illusory short cuts, he held up before the country the need for a greater sense of discipline and determination over a period of years. Brave words these! But this is a direction which can be followed only through resolute collective action, the call for which cannot come from the Ministry of Finance. At about the same time that the Finance Minister spoke, Lal Bahadur Shastri did some loud thinking on the economic problems facing the country. At the meeting of the Productivity Council he seemed to strike a different note, more

in favour of the thesis of consolidation and lowering our sights to agriculture, to which later in his Bombay talks, the Finance Minister added

machine building. All this definitely points to slackening of development rather than a bold and confident march forward.

Pakistan's Lesson in Aid

OSTENSIBLY the U S has only postponed her aid commitment to Pakistan till after the Congress passes the Administration's aid bill. But, clearly, the point of the move has been driven home to Ayub Khan's government; and for the benefit of the public, wide publicity has been given to the testimony of the U S Assistant Secretary of State, Phillips Talbot, before the House sub-committee on aid appropriations. Talbot but the matter plainly enough. The U S, he said, had been "deeply concerned by the extent of the warming up of relations Pakistan has had with Communist China at a time when the aggressive intentions of Communist China in South-East Asia have been increasingly clear... Clearly, in our (US-Pakistan) relationship the desire to have a common policy has underlain a good deal of what we have been doing... If it should, in the future, become clear that we are taking substantially different roads politically, this, obviously, would have its effect on the rather special aid relationship we have had up to now".

So Pakistan could either return to the path of righteousness with the prospect of continuance of the special aid relationship or she could persist in her erring ways at the cost of this relationship. At the moment it does not appear as if the choice of Pakistan will be in favour of the first alternative. Ignoring the expected spate of anti-American public protests and the alleged (though highly improbable) threat to recognise North Vietnam, there are indications that the Pakistan Government is not entirely unprepared for a reconsideration of U S-Pakistan relations generally, including naturally their aid relationship.

For enlisting as a member of the American camp in the cold war, for joining U S-promoted military pacts and for offering the country for American military bases, Pakistan has been, on a per capita basis, among the most favoured recipients of U S aid. One half of the investment in her second plan came from foreign aid—almost entirely from the western bloc and mostly from the U S. In the

third plan, just launched, the proportion has been brought down, but it is still 40 per cent; in absolute terms aid required will be actually higher—Rs 1,500 crores compared to Rs 1,100 crores in the second plan.

Aid, whether U S, Russian or other, is not charity; the aid-giver expects to exact a price. How high the price is depends on the bargaining strength of the aid-receiver; and the experience of country after country has shown that the most important determinant of this bargaining strength is the availability to the country of alternative sources of aid. In this respect Pakistan's has been a woefully weak position—a fact of which the Pakistan Government has been aware, at least recently. This alone would have been reason enough for Pakistan to look for new sources of aid. But there is another: for many of the heavy industrial projects included in the third plan aid will best come from the Soviet Union and the eastern European countries (and China, perhaps). In April Pakistan signed a trade agreement with the Soviet Union to raise trade between the two countries four-fold by 1967 over the level of 1963. Another agreement on economic co-operation signed simultaneously provides for a 10-year Soviet supplier's credit of Rs 15 crores for import of machinery and a Rs 25 crore loan for the third plan's oil exploration programme.

The source-pattern of assistance in Pakistan's third plan will have been thus in any case materially different from that in the second plan. This change will now be facilitated and accelerated by the U S show of arm-twisting. It is inconceivable that U S aid to Pakistan will be cut off altogether; it will come down from the present "special" levels, but over the third plan the U S will most likely remain the foremost provider of aid, as she has been in the case of India. Nevertheless, Pakistan's aid relations will be in the process put on a healthier basis, and one in keeping with her national interests. Without this crucial change the recent realistic realignment of her foreign relations would have been incomplete and indeed impossible to sustain.

Tax Credits on Exports

THE export tax credits announced last week cover 22 items, most of which do not qualify for import entitlements at present. They account for exports of about Rs 500 crores out of a total of Rs 900 crores. The credits will be allowed on all exports since February 28. Jute manufactures, loose tea, cashewnuts, and de-oiled rice bran will get a 2 per cent tax credit; packed and green tea and calcined magnesite 5 per cent; iron ore, coal, fresh fruits, surgical cotton, gum, myrobalan fruit extracts, crushed bones, refractories and earthen tiles will get 10 per cent. The highest rate of 15 per cent is applicable to alcoholic beverages, manganese, ferro-manganese and processed mica powder. The 10 and 15 per cent credits have been confined to non-traditional commodities or commodities which face severe price competition. Sugar exports, which are to be stepped up in the face of declining international price, will continue to receive a straight subsidy. A considerable part of the exports covered by the tax credit scheme is canalised through the two state trading corporations; it is not clear who the beneficiary of the credits in such cases would be.

Other export promotion schemes which involve import entitlements have been left intact, except for a few significant procedural changes. The import of certain dyestuffs has been completely banned. Art silk exporters are not required any more to import machinery but they cannot import polyester fibres and yarn either. Imported stainless steel cannot be diverted to the manufacture of utensils. More important than all these are the embargo on utilisation of 50 per cent of the entitlement till January 31, and the stipulation that entitlements will accrue only after the production of a banker's certificate regarding export receipts. These announcements will remove the nagging uncertainty that exporters felt since the Budget and more acutely since a large part of the additional export receipts was found missing. Under the import entitlement procedure as existing hitherto, exporters had an incentive to spread out their exports, delay the surrender of foreign exchange and at the same time to utilise their import entitlements as soon as they could without having to wait for the

receipt of export proceeds.

There is considerable sense and advantage in providing for continuity of export incentive schemes, especially at a time when risks can hardly be taken with the foreign exchange situation. This paper has repeatedly expressed the view that import entitlements and tax credits are not mutually exclusive but that over a period of time the latter should be progressively substituted for the former. As more experience is gained with the working of tax credits, it should be possible to bring this about.

Unit Trust's "Over 6 Per Cent"

THE Unit Trust has been able to scrape through to an "over 6 per cent" dividend as promised at its inception. It has declared a dividend of 6.1 per cent for the period ended June 1965. The amount available for distribution to unit holders, after making the maximum statutory deduction for chargeable expenses, was 6.14 per cent, earned by unit holders' funds which had been invested for a maximum period of 10 months only. The fulfilment of the promised rate has, however, been possible only by not making, for the time being, any provision for the depreciation of 1.6 per cent in the market value of investments as compared with their book value. Had such provision been made in full, which few large investors other than banks are ever able to do, the income would have been reduced by roughly Rs 35 lakhs and a 6 per cent dividend to unit-holders would not have been possible.

Even when allowance is made for its statutory privileges like exemption from tax, there is no doubt that UTI has done well in the very first year of its operations. Hardly any enterprise of this nature can start giving an income-tax free return of 6.1 per cent, which is equivalent to a taxable dividend of 7.62 per cent, within a year of its establishment. It is not the current return which the UTI is offering but the prospects of receipt of new moneys in future that causes some anxiety. Out of the total unit funds of Rs 19.13 crores received till end-June, Rs 17.38 crores came in during the first six weeks of sales and another Rs 95 lakhs shortly thereafter. Since then the sale of units has been disappointing. The unit purchasers have stuck to their investments—only 2 per cent or Rs 40 lakhs out of the units

sold have been re-purchased. The problem now is to sell more units and to earn more income funds in order to provide a higher and more attractive return to unit holders. The Reserve Bank expected UTI to provide Rs 40 crores of share capital to the private sector during the Third Plan period and Rs 150 crores during the Fourth Plan. At the current pace of receipt of unit subscriptions, the Third Plan target may well remain unfulfilled.

The trustees of the Unit Trust have taken in hand the formulation of savings plans "which will be announced in due course". They are also organising publicity, in co-operation with the Savings Mobilisation Board, in smaller towns and rural areas. Arrangements are also being made with banks for granting loans against units. In the meanwhile, UTI has to concentrate its attention on earning a higher return. It took up debenture issues in a big way shortly before the Reserve Bank put up the bank rate to 6 per cent, which led to jacking up of rates on new issues, and depreciation of prices of those already issued. Ultimately, of course, the Unit Trust's returns depend upon the state of the capital market but even within that there is scope for improvement of earnings.

Tinkering with Cotton

Our Market Correspondent writes:

UNCERTAINTY about the cotton policy for the 1965-66 season has at last been ended. The Government has decided to raise both the floor and ceiling prices—floor prices by Rs 75 to Rs 100 per candy (784 lbs) and ceilings by Rs 50 to Rs 75 a candy, the exact quantum of increase depending on the variety of cotton. While the obligation of the mills to purchase Cambodia A and B, ISC-67 and Andrews cotton to the extent of 10 per cent of their consumption of indigenous cottons has been retained, the other aspects of the cotton policy, such as the quota system of mill buying and exports, are to be reconsidered later after ascertaining the crop estimates of the new season. The system of varietal or zonal surveys has been dispensed with. There will be compulsory survey only when cotton is sold at or above the basic ceiling price.

It is not known whether the floor and ceiling prices of cotton have been revised upward at the instance of the Agricultural Prices Commission which

has been enquiring into cost-price relationships of different agricultural commodities with a view to evolving an integrated price policy. In the absence of authoritative studies of costs of production and prices of different agricultural commodities it is difficult to compare the return that the farmer receives from the cultivation of cotton and other crops. But considering that the area under cotton has increased over the past few years, production of cotton cannot be said to have suffered for want of remunerative prices.

That the Government has never been able to administer the price control on cotton is well known. This season, except for a very short period, cotton prices have been quoted well above the statutory ceilings throughout. Unofficial premiums at present range between Rs 50 and Rs 150 per candy. In raising the ceiling prices for the new season, the Government has thus merely accepted the *de facto* situation, putting its official seal of approval on the unofficial premiums. Unwilling to abolish cotton control because of the partial statutory control over cloth prices and yet lacking the administrative ability to implement the price control effectively, the Government has now taken the easy way out by raising the controlled prices to the level of the market prices which it has singularly failed to restrain. This solution of the problem has the further, politically important, advantage of being one that will please the farmer.

Unless the new crop turns out to be substantially larger than the 1964-65 crop, cotton prices are unlikely to register any significant decline from the current high levels because on present reckoning the current season is likely to end with a smaller carry-over due both to increased consumption and a smaller crop. The upward revision of ceiling prices will make possible smoother marketing of the crop with a greater measure of freedom to the trade. The revision of floor and ceiling prices is only of academic interest for the farmers who are in any case selling at the maximum possible prices—well above the statutory ceilings.

Not many years ago Indian cotton was the cheapest in the world; but today it is costlier by anything between 30 and 40 per cent after allowing for the spinning value of domestic and foreign cottons. The prices of Indian cotton have been moving up year after year, reflecting the growing imbalance between demand and supply,

resulting from near-static production and increased consumption due to expansion of spindleage. But the rise in prices has not led to any significant improvement in production which continues to depend almost entirely on the unpredictable weather. The ridiculously low average yield of 110/118 lbs an acre, which is less than half the world average, speaks for the efforts that have so far been made by various Government agencies to step up production. The Government has yet to learn that the way to go about helping the farmer is not by continuously raising prices, but by giving him the necessary assistance to increase his production by raising yields.

Unplanned Planners

A Correspondent writes:

FOR a body charged with the responsibility of planning the growth of the country's economy, the Planning Commission seems to have precious little idea of the causes of its own inefficiency as an organisation. Reports which have appeared in the Press of a so-called reorganisation of the Commission show that it cannot think of anything more than reshuffling existing arrangements in the hope of bringing about increased efficiency somehow miraculously. The reorganisation is reported to proceed on the basis of the candid admission that the Commission is not "research-oriented" even though it was intended to be precisely so oriented and that it is run on a "secretarial pattern" rather than as a body of high level experts assisted by a complement of technical staff. The reorganisation scheme which is said to be already under implementation aims to secure "increased output of work, coupled with qualitative improvement". And how is this intended to be achieved?

One of the changes proposed is the removal of all secretarial officials, from lower division clerks to joint secretaries, except in the administrative and accounts sections. To anyone who knows something of the working of the Commission it should be obvious that what is intended is really a change in designations; it is hardly to be expected that all non-technical and non-research-oriented officials can be replaced by technical personnel. And reduction in the number of clerks will most likely have the same effect on efficiency as the earlier removal of peons had: to the extent an official has to keep his own

THE ECONOMIC WEEKLY

files and go to the post office himself his efficiency as a research worker is unlikely to increase!

The fact, of course, is that the members of the Planning Commission and its highest level officials are either of political or of civil service background with very little experience of research work of any kind; and as long as this continues the organisation cannot but have a secretarial orientation with a penchant for "unnecessary and repetitive notes" and all that. It is not as if a planning bureau cannot be research-oriented. The example of the French planning organisation proves that this is perfectly possible. There, however, the organisation is headed by a man who has made his mark internationally as a mathematical economist and econometrician. The various sections are headed, not by retired politicians and administrators, but by relatively young economic experts who have been collectively responsible for establishing what may be called a French school of thought in economics which has received wide recognition.

The proposed creation by the Indian Planning Commission of a "pool of planners" consisting of experts engaged for limited periods at a time on contract basis to work on specific planning problems has all the appearance of a fanciful scheme—and one which is quite unnecessary. There is enough scope within the present set up for such work being done by experts employed on a permanent basis either in the Planning Commission itself (in the Economic Division and the Perspective Planning Division) or in the associated Central Statistical Organisation and the Planning Unit of the Indian Statistical Institute. If no great amount of high quality work has been done up till now in these bodies, the explanation may well be the limited capacity of the Planning Commission to appreciate and make use of such work.

New US Look at Liquidity

THE recent proposal of Henry Fowler, the American Secretary of the Treasury, for a conference to discuss the world's monetary problems has caused some surprise. For many years the attitude of the United States on international monetary issues has been very conservative: the view has been roughly that if a country is running a payments deficit it is committing a moral delict which it must atone for by paying out of its

THE ECONOMIC WEEKLY

reserves or deflating. This view was made much easier to hold by the large gold reserves of the United States and by the fact that the U S did not have to pay its payments deficits in gold because dollars were equally acceptable abroad.

However, the circumstances have changed now. The gold reserves, though still large, have fallen below the minimum currency backing, and the currency law has had to be amended. And there is greater reluctance among foreigners to hold dollars; so there is a prospect that an increasing proportion of payments deficits will have to be paid in gold.

Even more important than the reserve position are the lessons taught by the American and British efforts to improve their payments. The Americans have had a tax on investment income earned abroad for nearly three years now; in the last year the Treasury has also been exercising powerful pressure on the largest companies to reduce foreign investment. These measures have certainly improved the balance of payments; for the first time since 1957 the USA had a payments surplus in the first quarter of this year. But much of this improvement was, it is feared, seasonal. The annual balance might still show a deficit somewhere between \$1 and 3 billion.

The British measures have been much more drastic and less effective. First a surcharge of 15 per cent was imposed on imports in November, much to the horror of international institutions and the chagrin of Britain's trade partners. It has had no visible effect on imports. Then a corporation tax designed to discriminate against foreign investment was introduced in April. Though we must wait longer to see its impact, it has hitherto had little.

One will always be able to say that the Americans and the British failed because they did not go far enough. In particular, they have used physical restrictions on neither commodity trade nor financial flows, and they have made little use of tax-subsidy measures. They have not exhausted a tenth part of the various gimmicks that we in our desperation have tried in this country.

But such policies cannot even be considered, let alone tried, by Britain and the U S. There is a long *laissez faire* tradition to overcome, and if a government like the present Labour one dares go against it, there are still

powerful political forces, particularly in industry and finance, to cope with. The post-war situation in the western countries has been highly inimical to trade and financial restrictions.

So Fowler has not been very daring in his proposal; on the contrary, it is the result of despair regarding the possibility of correcting the balance of payments by means of unilateral measures. Even the present interest equalisation tax has evoked much opposition from American industries and from friendly countries like Britain and Australia. How much bigger the furore would be if the tax were extended to bank loans abroad!

However, the most that can be expected from an international monetary conference is some extension of international credit, and extension of short-term credit will not help the U S much. The essence of short-term credit is that it has to be repaid in a short period, and it cannot, therefore, be used to finance a continuing payments deficit. Even long-term credit becomes inappropriate if the deficit lasts as long as the Indian one has; short-term credit simply does not help, except in an emergency holding operation.

This is what Giscard d'Estaing, the French Finance Minister, has been saying for the last three years, and he has said so again in response to Fowler. He has laid down two preconditions to a conference. First, the present system should be improved, which chiefly means that the U S should liquidate foreign dollar holdings by repaying them in gold. This is a frankly nationalistic position, but that cannot be a criticism of it: it is unfair that Americans should be able to buy European securities and assets for dollars while Europeans must pay in gold for their purchases in the U S. Unfair, that is, if one does not believe that a dollar is as good as gold.

Second, there should be some agreement on the principles of monetary reform, which means basically agreement on the division of the burden of adjustment between debtors and creditors. Having been a persistent creditor for the last seven years, France insists that debtors should correct their own payments deficits by internal means. The United States was also a persistent creditor during the last War, and in 1944 it insisted on an IMF in which cards were stacked against the debtors. It can hardly complain now if France has stolen its mantle.

States and Planning

LIKE Chief Ministers of other States, Ajit Prasad Jain, who is Governor of Kerala, was speaking up for the interests of the State which is temporarily in his charge when he said in Trivandrum on Friday last week that States should have the right to decide inter-sectoral priorities for allocation of investment under the Plans according to their requirements. Though he did not say what they were, there are apparently differences between the Planning Commission and the Kerala administration over distribution of the investment proposed in the State's Fourth Plan and over the projects to be included in it. Jain is anxious that Kerala's views on these matters should be accepted by the Planning Commission. This immediate and limited purpose he has formulated into a general principle of planning—that the States' and not the Planning Commission's should be the final decision on how the investment in the State Plans should be distributed under different heads and on different projects.

The Kerala Governor's proposal, in the form in which it is made, is plainly silly. Planning is not just fixing investment targets; much more it is deciding a pattern of investment on the basis of priorities established to achieve desired economic and social objectives. Over half the proposed public sector outlay in the Fourth Plan is allocated to the States and Union Territories. Is it proposed that in respect of this part of the outlay there should be 14 different plans or more (why should the Union Territories be denied the privilege?) with different sectoral priorities decided independently by each State?

However, if one ignores the Kerala Governor's exact words and instead considers the spirit in which his remark was probably made, it is difficult not to agree with him a little. Kerala is not the only State that is dissatisfied with the Planning Commission's dispensation. What the protracted bouts of bargaining between the Planning Commission and the States, which we have witnessed in recent months, and the expressions of disaffection by spokesmen of the States underline is that even today, after the experience of formulating and implementing three Five-Year Plans, no satisfactory procedure has been evolved to secure the effective participation of the States in the planning process. No expert planning

bodies have been set up in the States to formulate plans which are technically viable, consistent and complete and not just a string of programmes and projects which add up to an impressive outlay total. (The lack of planning organisations in the States, incidentally, makes the Kerala Governor's suggestion that the States should decide their own investment priorities even sillier than it would be otherwise.) As it is, the State plans are prepared with the minimum of contact and consultation with the Planning Commission; and after they are ready the main use they are put to in discussion between the States and the Commission is to horse-trade and bargain over the aggregate outlay figure. The plans themselves are never closely examined, which under the existing arrangements is perhaps

no great loss considering, first, the quality of the State plans formulated mainly by administrative officials and, secondly, the fact that without a live liaison with the States the Planning Commission has not the necessary knowledge of local needs and problems.

If, with his recently-gained experience of dealing with the Planning Commission over Kerala's Fourth Plan, A P Jain had drawn attention to these problems, he would have served some purpose. As it is, he was perhaps only playing to the gallery; one gets the impression that if instead of being Governor of Kerala, he had been a member of the Planning Commission, he would have been taking the States to task for wanting to depart from the priorities laid down by the Commission.

Census Publications

I HAVE read with great interest your comment and A Mitra's letter on the subject of census publications in the issues of July 3 and 17, respectively. Mitra's letter is very encouraging indeed. In particular, the consumers of census data will heartily welcome the proposal to attach a branch of the Publications Division to the Registrar General's Office.

It is not quite clear whether Mitra's comparison of the publication record of the last Indian census with that of other countries relates only to the number of volumes published. The 1961 census of Pakistan, which relied largely on hand-sorting, had, in fact, published all of its basic data by about the middle of 1963 in six census bulletins; and by the end of 1964, the main national, provincial and district census reports were also out. It is my impression also that almost all the tables based on the 1960 census of U S A, which uses the most up-to-date mechanical equipment, were published by the end of 1963. Of course, the differences in (i) the size of the population, (ii) the number of territorial units for which the data are tabulated and published, (iii) the scope of the tabulation programme, and (iv) the level of mechanisation severely limit the validity of such comparisons. But unless Mitra's assertion relates only to the number of census publications, I have strong doubts whether it is tenable.

Now, as was noted in your comment, the 1961 census has been uni-

que in its scope. I am an admirer of the quality of its output as well as of its richness. When one hears of delays in its publications, one may point to the experience of the United Kingdom where the general report on the 1951 census was published only in 1959. Besides, many who complain about these delays seldom give more than a cursory glance to the census volumes when they came out. But at least genuinely interested students would benefit a great deal from better speed in the publication of census data; and perhaps the necessary printing facilities, etc, need to be planned on a much larger scale than has been done so far.

As for other things, one is not really convinced about the value of an official report for each State or Union Territory. It is doubtful whether one needs to refer to the general state of scholarly enterprise in this country to appreciate the point here. It is certainly true that we are indebted to the past census reports for their laudable contribution to both demographic and/or socio-economic research in the country or, more correctly, in the entire sub-continent. But the demographic expertise in the country has increased markedly during the past decade or so. India is often said to be a major exporter of demographers who occupy responsible positions and do competent work in international institutions or in the public services of foreign countries. Further, there are reports that the Demographic Advisory Committee of the Government of

India has made grants for special demographic studies of each State within the country. Such studies are bound to rely greatly on the census data and while they may not actually be "re-hashes" of the State reports which are yet to be published, the common source of much of the empirical material will inevitably involve a good deal of avoidable duplication. The best course of action, under the circumstances, would probably be to bring out, instead of the State reports, one or two special volumes of papers contributed by State census officials who may thereby communicate to interested scholars and posterity the insights gained by them in the course of their work. Such an approach will further expand the scope for stimulating scholars to work on various demographic and non-demographic topics, and a vigorous dialogue between academic personnel and the technical branch of the administration, such as has been encouraged by the Office of the Registrar-General, will be advantageous for the country.

Village Industries

The author of the Weekly Note "Village Industries in the Fourth Plan" published in our issue of July 3, 1965, writes:

SUBHASH Chandra Sarker's letter (July 17, 1965) is more weighty in invective than in economic argument. Discussion would be possible if he would provide facts and figures about capital invested, value added, employment generated and surplus created in the village industries. Whatever criterion of economic efficiency one chooses, one will draw only one result. Of course, no discussion is possible if Sarker is going to judge the efficiency of investment by counting every paise of income without counting the rupees that are sunk. As to the marketability of products of village industries also, the dispute may be settled if he were to produce figures of the quantity produced and the quantity sold. Purchase of village industry products by certain people for fanciful reasons does not create a mass market. It is revealing that Sarker cites the instance of "prestige publications of renowned companies as well as the match boxes used by them". He could have also mentioned Ministers' homes being furnished in top quality khadi!

Peace-Makers Divided

(From Our London Correspondent, recently in Helsinki)

THE World Congress for Peace, National Independence and General Disarmament, held in Helsinki from July 10 to 15, brought together 1,470 participants representing popular organisations from 98 countries on all continents, and 17 international organisations. The last Congress for Disarmament and Peace was held in Moscow in 1962 and when the present Congress was called nearly a year ago, the sponsors thought of it essentially as a Congress for reaffirming and reorganising the work for peace throughout the world. In the event, of course, the actual war situation in Vietnam meant that this present Congress was clearly dominated by the situation in Vietnam which was considered as even more urgent than the general discussion of peace. The Congress, however, also took into account other threats to peace, particularly those created by the growth of weapons of mass destruction, as well as the general economic state of the divided world in which the gap between the wealthy nations and the poor ones far from lessening, has increased notably in these last years, creating a situation which is fast becoming unbearable.

A notable feature of the Helsinki Conference was the decision to reduce to a minimum general statements in plenary sessions, and to concentrate on the work of detailed discussion and Commissions. There were in all seven Commissions, the first dealing with the question of Vietnam; the second with the liberation of peoples still under colonial domination, maintenance of national sovereignty and its defence against encroachment, apartheid, racism and violation of human rights; the third with nuclear weapons and disarmament; the fourth with elimination of the vestiges of the Second World War; the fifth with economic sovereignty of nations and the freedom for them to develop their own pattern of economic development and trade and international co-operation; the sixth with social and economic consequences of the arms race; and the seventh with the creation of an atmosphere favourable to peace, as well as the practical considerations of the reform of the United Nations.

Professor Bernal, the Chairman of the Presidential Committee of the World Council of Peace, said in his opening address:

"After the great movements of liberation at the beginning of this decade, we are now witnessing a definite neo-colonialist counter-revolution showing itself all over the world from Korea to the Congo and Brazil. Strong bases of the old colonialism still exist in South Africa, Rhodesia, Portuguese Africa, and military dictatorships, old and new in Paraguay, Peru and other states of Latin America with U S support. Until these bases are removed, as well as the thousands of U S military bases around the world, there can be no secure peace. People must be led to understand the real world situation and so resolve to act to change it in the interests of their own safety and future.

"But we cannot claim that this situation is yet really widely understood. Represented at this Congress are people who take a wide variety of attitudes, even on the nature of the Vietnam war. They range from those who are calling for active support for the South Vietnam National Front for Liberation and the Democratic Republic of Vietnam to those who are actuated by reasons of humanity to ask for negotiations to stop this brutal war, but who still imagine that one can look impartially on the two contestants. It is very unlikely that any here actually support U S aggression in Vietnam."

The pity is that the peace movement still remains divided, and during the Helsinki Conference, there were still signs of the clash between the Russians and majority view, and the minority view held by China, supported vociferously by the Albanians, the Indonesians and one of the rival Japanese delegations. The Chinese, of course, wished to give the impression that the Russians are revisionists, and by concentrating on questions like disarmament and nuclear bans are, in essence, selling the pass to the Americans. The Chinese and their supporters wanted an outright condemnation of "United States aggression". Indeed they believe that until imperialism is wiped off the face of the world, there is no hope for peace, and to discuss or even think of anything else is a complete waste of time. The real duty of the peace movement is to fight imperialism. The Chinese lost no chance to insult and provoke the Russians who, however, behaved with considerable moderation.

There were, therefore, a number of clashes which, of course, caught the headlines. After a protest at the opening session led by an Albanian delegate who demanded that leaders of all delegations should be allowed to speak at the plenary session, eventually it was agreed to permit delegates to speak at a late plenary session, and at this a number of delegations including the Chinese and the Indonesians were permitted to put forward their own points of view.

India sent a large delegation of nearly 100, led by K D Malaviya. As a result of the size of the delegation, India was represented on each of the seven Commissions, Malaviya himself being attached to Commission 5 dealing with the economic sovereignty of nations, economic development of trade and international co-operation. At the plenary session he spoke on the contribution made by non-alignment to efforts for peace and national independence.

The Conference itself was opened in the presence of the Finnish President. Finland is pre-eminently a non-aligned country, and the President has devoted a considerable part of his work to the development of peaceful relations between Finland and the people of different countries. The last Peace Conference held in Helsinki was in 1955 — a period of international detente very different from the situation to-day.

A number of distinguished writers were present including Ilya Ehrenburg, the Chilean poet Pablo Neruda who made one of the most moving speeches at the Conference, Mulk Raj Anand and Jean Paul Sartre, who, in a brilliant speech introduced the resolution on Vietnam. Perhaps one of the most impressive speeches was that made by the delegate from the South Vietnamese Liberation Front. Nothing could have conveyed more poignantly and with more dignity the actual situation in South Vietnam to-day. During the session, a public meeting was held in Helsinki on July 10 which was designated "Vietnam Day".

One of the interesting features of the present Conference was the large American delegation. At a plenary session of the Conference, Carlton Goodlet the chief U S delegate, made

a powerful indictment of U S imperialism and its policy in Vietnam. He said that the U S peace movement would fight to make the U S Government enter into negotiations with the South Vietnam National Liberation Front, and was firmly convinced that joint action could put an end to the threat to world peace that has developed in South East Asia. He also proposed that the Helsinki Conference should send a peace council mission to Peking, Hanoi, the South Vietnam National Liberation Front, Washington and the United Nations. At the end of the speech, Goodlet received a standing ovation from the Conference, with the exception of the Chinese who remained resolutely seated and took no part in the applause.

After all the fireworks and the disagreements during the Conference, it was good to see that, on the last day of the session, the resolution on Vietnam was passed without any opposition and the second resolution covering a *tour de horizon* of imperialist aggression and neo-colonialism, as well as the situation in Europe and the necessity to ban nuclear weapons, was passed practically unanimously.

As J D Bernal pointed out in his closing speech, the resolution which the Congress passed on the subject of the Vietnamese liberation struggle was undoubtedly its most important action, and would not remain a mere resolution: "It should crystallize much of the activity which is spontaneous in almost every country of the world against the atrocities, the gross unfairness and the sheer folly of the Vietnam war." The Congress based its essential decisions on the fundamental right of the Vietnamese people to national independence and called for a stop to external military aggression. Dealing with the question of the refusal of the people of Vietnam to negotiate with the American Government to end the war, J D Bernal pointed out: "It is on this question that the only really serious difference of opinion which occurred at the Congress has turned. The refusal to negotiate seemed to shock even some of the most determined opponents of U S aggression, both in America and Britain. All should understand by now the meaning of this refusal. It is not because negotiation is rejected, but the conditions for fruitful negotiations do not yet exist". It was for this reason that the Congress was unable to accept the genuine and well-intentioned sugges-

tion from the U S to send delegates from the Congress to the countries involved. This would have had the same negative and confusion effect as previous efforts in this direction.

Bernal, who is relinquishing his post for reasons of ill health, said in conclusion: "What we need now is more and more people and more work for peace from each person. We

have to enlarge all the movements for peace and at the same time educate people at least to see that their differences in this struggle are not as important as their common objectives. The objectives of the Congress are more than the mere securing of a state of peace, vital though that is. Peace without the end of injustice and exploitation will be a bitter mockery".

With some it is a question of judiciously investing their money, with others it is a question of holding back a few fleeting paise.

LETTERS FROM SOUTH

Krishna Menon in Kerala

THERE are strong indications that Krishna Menon may get deeply involved in Kamaraj's plan to give the Congress in Kerala a new look and a different orientation. Observers in the State had noted his active campaigning during the recent elections. Their hopes or forebodings, as the case may be, seemed to be confirmed when he gave days of his time to attend a seminar to commemorate the death of the late President of Kerala Pradesh Congress, C K Govindan Nair. It is true that Govindan Nair had been a close personal friend who had stood by him in his dark days. But the unusual patience displayed in quietly listening to speeches, much of which he may not have understood and almost all of which were far from intellectually entertaining, obviously had some political motivation. Krishna Menon did not deny his interest in the future of the Congress in Kerala when questioned, though he did not affirm that he intended taking it over.

Kamaraj's Support

In this case there is, however, a clear possibility of marriage of desires. The Congress in Kerala has absolutely no leader of any standing in the State, to say nothing of one who commands the least attention outside. Krishna Menon has no mass base which is localised or organised to add weight to his undoubted qualities of leadership and his reputation. If Kerala had Krishna Menon and he had Kerala, the feeling is that both could go places quickly.

What gives this speculation a good deal of plausibility is the interest that Kamaraj has shown in both the concerned parties as well as in their coming together. The Congress President has been close to Krishna Menon for quite some time. He was among those who supported Menon, gave him a platform and ostentatiously appeared on it together with him at the time when Menon's popularity was at the lowest ebb. At the same time during the days when the Syndicate was powerful he was not able to give him a berth in the Working Committee or to press for his inclusion in the Central Cabinet. Krishna Menon's folly in flirting with Morarji Desai at the moment of succession only further estranged the two. Yet they kept in touch and the turn of events has brought them closer once again.

Kamaraj now realises that his former Syndicate colleagues now regard him as one of the biggest obstacles in their attempt to completely take over the High Command. Atulya Ghosh wants the Presidentship while Sanjeeva Reddy is feeling his way towards a rapprochement with Morarji Desai. Moreover, his genuine desire that the Congress should start moving again in the direction of radicalism—he calls it radical socialism—has only evoked hostility from those who helped to build the consensus at the time of Shastri's installation. He knows that the invitation extended to him by the Central Communist Party of the Soviet Union to visit Moscow in his official capacity has made him even more suspect in their eyes. With his feel for the popular mood he realises that it is not at all safe to look complacently at the Congress success in the bye-elections and to conclude that the masses are satisfied with the *status quo*. He knows that, to say the least, they will be neutral spectators should a determined Right minority act firmly and upset the applecart. It was no sudden compulsion that made him contribute an outspoken foreword to H D Malaviya's book about the danger from the Right.

Fight for Control of States

At the same time he seems to be convinced, as Nehru was before him, that it is only the Congress which can deliver the goods in India. Not only does he see no alternative to this ramshackle, creaking and amorphous body, but he also does not, as yet, visualise the need for the Congress or the radically oriented within it to seek allies or to build joint fronts. He feels that if there is to be any united front to ensure advance in the direction of socialism, it should be within the Congress. But the basis has to be laid by a rallying together of like-minded persons within the ruling party to frustrate the plans of the Right to achieve a monopoly of control over the State. Hence, his keenness to get Krishna Menon out of the rarefied realm of foreign affairs and into the thick of provincial politics.

Kerala is, however, a rather difficult State in which to try this experiment. It is still the one State in the Indian Union which has a clear, progress alternative to the Congress. The split in the Communist Party did

great damage to this prospect and dampened the radical spirits in the State but by no means extinguished them. In recent months there has been a growing trend towards united action by the two CPs, including a most important decision to share power in an united peasant organisation. The C P I's peasant march from Cannanore in the north to Trivandrum in the extreme south and its active cooperation in the petition campaign of the C P (Marxist) to secure the release of detenus has meant a degree of joint campaigning which augurs well for the future of both the parties but restricts the scope for any radical reorientation of the Congress in the State.

Progress or Power?

The central dilemma that will confront Krishna Menon, should he decide to plunge into Kerala politics, is whether he should make the Congress strive for progress or for power. Unfortunately for the Congress these are two conflicting aims at the present time. If there is to be any tangible radical advance in Kerala it will have to come, for the present at any rate, under the aegis of one or another of a left united front which will firmly oppose both the official as well as the dissident Congress. If the official Congress, no matter who leads it, wants to stem the tide and win a Ministry its only course will be to try to bring together a communal conglomeration of the Catholic bishops, Nair chieftains and a few Ezhava showboys. It will have to come to terms with the dissidents and to some kind of working agreement with the Muslim League. This might still do the trick in 1967 should the two C Ps again fly violently apart. But it will mean the end of any hope of a radical Congress and frustrate the progressive intentions of Krishna Menon.

At the same time the official Congress in Kerala is so rotten and so much an organisation of careerists that it is rather difficult to imagine its continued significant existence when its leadership will aim to lead it into the wilderness of so-called constructive opposition. Already President's rule has seen the flight of some of the top Congress leadership into various private jobs and firms. This could become a fullscale exodus should Krishna Menon plump for progress

and not immediately for Ministerial power. Moreover, his vicious enemies in the High Command would pounce on any such development to deliver the *coup de grace* against him, holding him responsible for any Communist success. Would Kamraj then be able to hold back the anti-Menon crusaders or would he throw him to the wolves? Yet, if Krishna Menon does decide to act with courage, it will not enti-

Vizag as Site for Fifth Steel Plant

—An Andhra View

CVH

THE best and most appropriate way of looking at the Report of the British-American Steelworks for India Consortium (BASIC) on the location of the fifth steel plant at Visakhapatnam is not to look at it from a political angle. Narrow local interests apart, what should determine the siting of a major national project like the steel plant is whether or not satisfies some essential criteria. The issue has to be examined from the point of view of the relative advantages and disadvantages of the particular place. If Visakhapatnam does fulfil all the necessary conditions, and is otherwise found suitable, it will indeed be setting a dangerous precedent to yield to political pressures and set aside impartial expert opinion.

That BASIC's preference for Visakhapatnam over Hospet, Salem or any other site caused disappointment in Mysore and to a certain extent in Madras is understandable. If their recommendation had been otherwise, it would have caused similar disappointment in Andhra. What is important, therefore, is to consider the issue with a certain objectivity and to view it from the standpoint solely of the appropriateness of the choice.

It is evident that the facility with which a large steel plant can be established at Visakhapatnam and the decided advantages it possesses over other places tilted the scales in its favour. The Anglo-American Consortium took note of the fact that Visakhapatnam is a deep-water port. This will facilitate, as the work on the project advances, import of metallurgical coal and after the plant goes into production export of the finished product at a lower cost than would be the case if the plant were located inland.

rely be due to high principles or altruism. Intellectual brilliance and the reputation achieved in the Security Council are obviously not enough in the powerscramble in the Congress. Some kind of mass base is a *sine qua non* of his political survival. And Kerala is the only place where this can be secured. It cannot, therefore, be ruled out that lively days are ahead for this frustrated State.

Elucidating this, the Report points out that Belgium, France, Japan, the United Kingdom and the United States have recognised the increasing importance of the flexibility which plants situated at deep-water ports provide. As the other Indian plants, all of which are now located inland, expand, a coastal plant would retain the flexibility to change over to all or part imported coking coal, thereby relieving the increasing coal demands on Indian coal mines, washeries and the railway system. Such a plant would also be most favourably situated for import of other raw materials required from time to time. Besides, it would encourage coastal shipping which could provide an alternative transportation system for the pig iron and other semi-finished and finished products to important coastal markets. According to the Consortium's estimates, a saving of about Rs 11.72 crores will be achieved in the cost of transport of mining equipment and other materials to the plant site.

Visakhapatnam is also likely to secure financial support from private investors from Europe and the United States more readily because of these deepwater port facilities. This could well become a deciding factor in ensuring speedy implementation of the project so that the country would benefit from its production by the end of the Fourth or the commencement of the Fifth Plan. The variable cost of the project at Visakhapatnam and at Hospet are approximately equal, says the Consortium report; but taking into account the fact that the D B K railway will be in operation in the next few years, these costs may also be actually lower in case of the Visakhapatnam site.

For Andhra Pradesh, the recommendation has naturally considerable significance. Establishment of a major

steel plant within the State amounts to a recognition of the claim, repeatedly advanced by the State Government and the public of Andhra, that the State should have its due share of the public sector projects that are set up under the Centre's auspices. It will help redress inter-regional imbalances and the backwardness of Andhra Pradesh in economic development. Andhra Pradesh is known to lag behind the southern States in particular and other States in general in industrial progress. The steel plant will help utilisation of raw materials like coal and pig iron available in the State and of other facilities that are being provided for setting up industries, some of which can be developed as ancillaries to the steel mill.

But the Consortium's recommendation has still to become the firm decision of the Union Government. The decision is expected in the next two months or so, after the Union Steel Ministry has completed their preliminary studies and consulted the various official agencies of the Centre about it. Meanwhile Sanjeeva Reddi, Union Steel Minister, has avoided expressing any opinion, lest it be misunderstood that he favoured Visakhapatnam because he is from Andhra.

While Andhra Pradesh is happy over the recommendation, there will be genuine regret here if the steel plant turns out to be an element of discord among the southern States. It is gratifying that the Mysore Chief Minister, S Nijalingappa, while expressing disappointment at the preference given to Visakhapatnam, has suggested that another plant, a small one, should be set up at Hospet, which can be expanded later on. The Madras Industries Minister, R Venkataraman, has also put forward a proposal for a medium-sized steel plant at Salem as part of the State's Fourth Plan and not in competition with either Visakhapatnam or Hospet.

Anticipating political opposition to the Consortium's recommendation, Sanjeeva Reddi attempted to disarm possible critics by stating at Hyderabad that even if the fifth steel plant scheduled for the Fourth Plan was set up in Visakhapatnam, it need not rule out other plants in other States — for example, at Hospet or Salem. These sites can be considered during the next Plan, especially the one at Hospet, which is the Consortium's second choice after Visakhapatnam, and its first if the decision is finally in favour of an inland site.

The Durable Joint Family

Andre Beteille

Some Aspects of Family in Mahuva by I P Desai; Asia Publishing House, 1964; pp xii+239, Rs 18.00.

I P DESAI examines the pattern of family relations in a small coastal town in Gujarat and raises certain questions regarding the proper approach to the study of changes in family structure in contemporary India. His own approach is directed by the interest to find out how far the joint family system is breaking down and his conclusion seems to be that the evidence does not permit one to say that there is any fundamental change.

The author rightly draws attention to the shortcomings of studies based exclusively on censuses in which common residence is viewed as the only defining principle of the family. He argues that one has to go beyond the residential unit because mutual obligations of a very important kind quite frequently out across the household. One has to study not only what kinds of people live together but how people feel and act towards each other whether or not they live together. One has also to take into account the development of cycle of the family because the change from joint to nuclear families is not always irreversible.

Classification

The study uses a twofold classification of households. There is first a classification based on the internal composition of the household and then another which takes into account the kinds of relations maintained with kins and affines who may be living separately. The second classification adopts a "scale of jointness", using three sets of factors, common residence, joint ownership of property and the fulfilment of mutual obligations. These factors exist either singly or in combination and the "highest degree of jointness" is of course found where all three elements coexist, although a household which is residentially nuclear may show a "high degree of jointness" due to the presence of other elements.

The first part of the book deals with certain conceptual problems. Nuclearity and jointness are in the author's view to be understood not

simply in terms of frequency distributions but also in relation to the norms and values of the society as a whole. As a residential group, the nuclear unit comprising parents and unmarried children is perhaps common to every society, and was certainly present in traditional India. But even in a society where nuclear households outnumber joint ones, the latter may be considered the ideal. The "norm of jointness" which was a characteristic feature of traditional Indian society still plays an important part in Mahuva. And it is here, Desai will argue, that nuclear households in Mahuva differ from structurally similar units in Western countries.

No Evidence of Decline of Joint Family

But has there been any weakening of the "norm of jointness" in Mahuva itself over the last several decades? There seems to be very little evidence to suggest a positive answer. One cannot even say whether there has been any significant increase in recent times in the proportion of nuclear families. What one can say from the data brought together by the study is that the transformation from joint to nuclear family is very often reversed over a period of one or two generations. British anthropologists working in Africa have used the concept of developmental cycle with striking effect, and it is a pity that Desai merely indicates that such a process also operates in Mahuva without providing a clear picture of its mechanics.

Having shown in the first part of the book that jointness and nuclearity cannot be understood simply in terms of frequency distribution, the author proceeds to examine in the second part the relations between the degree of jointness and various other social factors such as religion, caste, occupation and education. The conclusions are on the whole negative. The norm of jointness is common to Hindus, Jains and Muslims. Again, the results of the study indicate "the probability that there is no relationship between the status of the caste and jointness" (P 80). There seems to be some rela-

tionship between jointness and occupational patterns, families governed by traditional occupational relations showing a higher degree of jointness.

While Desai deserves praise for having drawn attention to a number of important problems, the manner in which he has done this leaves very much to be desired. Concepts and categories are used with deplorable laxity and the author's prose is likely to try the reader's patience severely. Quite apart from an almost cheerful indifference to the rules of grammar and syntax, some of the statements appear to be entirely misleading. One wonders why so little care was taken to put the matter into presentable form.

For reasons not made very clear, households comprising married brothers, their wives and unmarried children (Type II b) are defined as being not joint but nuclear. Yet the author himself has some misgiving about this and says, "The type II-b is not joint because of the criterion of generation, but they are, *really speaking*, joint households. But we have put them in the category of nuclear for the sake of logical consistency" (p 35, my italics). Again, a few pages later, "Now type IIb according to our definition includes relatives who do not add to generation depth and therefore we do not call this type joint. *But really speaking they are joint*" (p 42, my italics). And, then, almost in the same breath and with a certain smugness, "This is the trick that the definition does" (p 43). Indeed! We would prefer Desai not to play such tricks on his readers.

Gandhi, Social Worker

H R Chaturvedi

Social Welfare in India: Mahatma Gandhi's Contribution. by Ammu Menon Muzumdar, Asia Publishing House, 1964; pp XV+179, Rs 12.50.

SOcial work education began about thirty years back in India. Since then the number of institutions imparting social work education have rapidly multiplied. But the development of social work literature has been far too inadequate. In fact there is very little of literature which social work can claim its own. Most of the available literature is in the nature of survey of social welfare programmes. There is hardly any writing on the subject where attempt has been made to clarify social work concepts or to discuss its tools and techniques suitable to Indian conditions. In the available literature for instance one finds a good deal of confusion about the concepts of social work and social welfare. In fact, a good many times these two concepts are interchangeably used. There is also little of organised literature describing the socio-cultural conditions in which social work has grown in this country.

Pioneering Effort

In such a situation Dr Muzumdar's book is a pioneering effort in social work literature. Muzumdar has clearly defined the concept of social work and developed a framework to study social welfare programmes for Harijans, women and rural people. She has very aptly named her book 'Social Welfare in India'. The book is organised in three parts. In the first part itself she has traced the socio-cultural and political forces which gave rise to various reform movements finally culminating in the development of the concept of modern social work. This section of the book would be very helpful to all social work students in analysing and understanding various conditions in which social work has grown in this society. In this section she has also dealt with, in considerable detail the impact of Gandhi on both the growing concept of social work and on social welfare programmes in India. While describing Gandhi's leadership qualities she discusses Max Weber's theories of leadership in some details. One may find such a discussion a little out of place.

In the second section she has given a lucid account of various social welfare programmes for Harijans, women and rural people. She has done well to explain the circumstances which led

Gandhi to concentrate his attention on these aspects of welfare.

Professional Approach

In the third part she has tried to bring out Gandhi's contribution to social welfare programmes as they evolved and stabilised in his times and subsequently in the post-independent India. She has established that Gandhi's approach was similar to that of the professional social worker. She has remarked that Gandhi prepared the ground for the establishment of the profession of social work in India. She has also mentioned that Gandhi used social work methods like case work and group work. In this way she has made a few bold statements which should really stimulate further writings on the subject.

Social welfare programmes and the underlying principles and methods guiding them are evolved and stabilized in a society in response to the socio-cultural economic needs of its people. Thus a meaningful discussion

on social welfare programmes in a country should be rooted in its historical past. Muzumdar has really fulfilled this object in this book by devoting almost one-third of it to tracing the socio-cultural conditions in Indian society.

Muzumdar's pre-occupation with searching for meaning in the past does not, as may be ordinarily expected, give rise to an ethnocentric bias. In fact she attempts a possible synthesis between the Western concept of social work and the Indian experiences. She has, therefore, clearly acknowledged that it was our contact with the west which deeply influenced our social thinkers of the 19th and 20th centuries as also the reform movements and subsequently our social welfare programmes.

In many ways this book is a departure from available writings on the subject and as such would prove to be of great value for the students and teachers of social work as well as for the practitioners in the field.

OFFICIAL PAPER

Export Talk

Export Promotion: Report of the Northern India Conference on Export Promotion: The Indian Institute of Foreign Trade, New Delhi, 1965.

THIS Report serves two important purposes: first, it presents a comprehensive review of the problems facing export products of the northern region; and, secondly, it brings out the main recommendations of the Conference for finding practical solutions to these problems. The Conference decided that the northern region should be able to contribute at least Rs 20 crores to the increase of Rs 60 crores in the country's exports in the current year over 1964-65.

The Conference brought together representatives of industry and trade from Punjab, Delhi, Rajasthan and UP; officers from the Ministry of Commerce; State directors of industries; and officers from institutions connected with the export effort. It was inaugurated by the Union Commerce Minister. The total attendance was about 700; nearly 250 delegates participated in the deliberations of the ten Working Groups, into which the

Conference had been divided. The deliberations had as their objective greater production of export goods and creation of larger surpluses for export abroad.

The ten Working Groups studied problems relating to (i) export assistance; (ii) quality control; (iii) export publicity and exhibitions; (iv) engineering and electrical products; (v) chemicals and plastics; (vi) handlooms and handicrafts; (vii) leather and leather manufactures; (viii) textiles; (ix) processed food products and (x) sugar. Their reports were discussed in the concluding session of the Conference. A notable feature of the Conference was the setting up of an Operational Committee which would pursue the recommendations with the concerned authorities for implementation.

Export Assistance

The Conference made some useful suggestions in respect of export as-

THE ECONOMIC WEEKLY

sistance. It considered it necessary to remove all restrictions on, and disincentives to, Indian exporters to help them compete freely in foreign markets, and to view export promotion as a measure of economic progress. A major problem faced by the Indian exporter is the uncompetitiveness of his product owing to high costs of production and the attraction of home market as against the market abroad. Any promotional measure must, therefore, be directed to make Indian goods more competitive abroad. Against this background, the Conference discussed a broad spectrum of problems which included export assistance and incentives, quality control and pre-shipment inspection, export publicity, participation in exhibitions and trade fairs abroad.

The Conference noted the vital role export assistance schemes have played in increasing exports. It emphasised the need for a reasonable degree of stability in these schemes and wanted the quantum of assistance ensured on a long-term basis so that individual manufacturers could plan their export programmes with certainty and confidence. Some of the specific proposals that emerged from the deliberations of the Conference were: (1) setting up of Delhi as a Dry Port to enable the northern region exporters to dispatch goods directly through the clearing agents; (2) granting foreign exchange, up to a specified percentage of the f o b value of exports, for use only in market studies and export publicity by the exporters; (3) adequate warehousing facilities at a nominal charge at ports for goods consigned for export; and (4) granting recognition through suitable rewards in the shape of flags, lapel buttons, certificates of merit, etc, for outstanding performance in exports.

Engineering Products

The Conference made a detailed study of a number of export items from this region. It found that, of the total export of engineering goods amounting to Rs 19.5 crores in 1964-65, the share of the northern region came to about Rs 1.5 crores. In view of the progress achieved so far it felt that exports from northern India could be rapidly increased, and the target for 1965-66 was fixed at Rs 3 crores.

The prospects of promoting exports of other commodities from this region were also considered. These included chemicals and chemical products, textiles, handicrafts and handlooms, pro-

cessed foods and sugar. Targets were fixed for each of these for the current financial year.

On the whole, it is an interesting and clearly presented report and it gives a comprehensive review of the problems faced by exporters from the

northern region. The Report should provide the stimulus for much-needed further thought and study in this field. There can be no doubt that exporters not only from the northern region but also from other regions will find it highly useful.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Congress versus Swatantra

A Bye-Election to the Orissa Assembly

Pranab Mahapatra

This paper analyses voting behaviour as revealed in a bye-election to the Orissa State Assembly from a constituency forming part of an erstwhile princely State.

In Orissa the opposition of the former princes had kept the Congress at bay in every election till the mid-term election of 1961. In this election the Congress, under a new and dynamic leadership, had won a majority of seats in the Assembly, enabling it to form a stable Government in the State for the first time since Independence.

The constituency studied here has always returned a non-Congress member to the Assembly—even in the 1961 election when the general trend in the State was so favourable to the Congress.

In the 1965 bye-election the Congress was opposed by the Swatantra Party which was the Ganatantra Parishad under another name. The analysis of voting in the bye-election result attempted here seems to indicate that broad national issues—alleged Congress socialism versus the alleged feudal-capitalist support base of the Swatantra Party; planning versus free enterprise—on which the Congress laid much emphasis did not influence the electorate at all. What did was the personality and acceptability of the candidates, the standing of the leaders of the two parties and the local traditions, affiliations and interests of this remote constituency.

THIS paper analyses voting behaviour as revealed in a bye-election to the Orissa State Assembly from a constituency, part of an erstwhile native State. Prior to Independence this area was not a part of British India and had not, therefore, seen democratic elections. The principality of Keonjhar was merged into Orissa in December 1949 and the first election there held in 1952.

On June 27, 1965 Keonjhar went to polls to elect a member to the Orissa Legislative Assembly in a bye-election caused by the death of the sitting member, Janardan Bhanj, of the Swatantra Party, the main opposition in the Assembly (hereafter referred to as O L A). Bhanj was elected to the O L A in the mid-term election in June 1961. The bye-election was thus held four years after the mid-term elections in which the Congress Party won a striking success gaining 81 out of 144 seats to secure an absolute majority and formed a stable government in the State for the first time after Independence. The mid-term election brought into limelight the emergent leadership of the youthful, vigorous and flamboyant ex-pilot industrialist, Biju Patnaik, who overtly challenged the then veteran Congress leadership of H K Mahatab. The position of the Congress Party after the 1957 Elections was truly precarious; it first tried to form a Government by wooing the members of the Jharkhand Party and Independents, but when this failed, it formed a coalition with the main Opposition Party, the Ganatantra Parishad. The coalition government faced rough going from the beginning and finally collapsed after 21 months.

Keonjhar was one of the States under the Eastern States Agency. It

had an area of 3,216 sq miles. The whole area after merger into Orissa in 1949 formed a separate district of the State. The population in 1951 was 588,441 and in 1961, 743,315. In the 1952 Election the district had three double-member constituencies and returned 6 members to O L A. Each of the three sub-divisions, Sadar, Anandpur and Champu with slight modifications formed a double-member constituency. In the 1961 mid-term election the constituencies were bifurcated and delimited to single-member ones. Thus Keonjhar Sadar was broken up into Keonjhar and Telkoi and the latter was reserved for scheduled tribes. The Keonjhar (General) Constituency, comprising Sadar P S but excluding two gram panchayats and Ghatgaon P S, came into being in 1961. This includes Keonjhar town known as the Keonjhar-garh which is the headquarters of the district. The Collector and other district executive and judiciary officials are stationed there. There is a district hospital and a Mining School in the town. The palace of the ex-ruler is situated here. There is an old temple of Baldeoji in the town. Keonjhar-garh is connected on the south to the Jajpur-Keonjhar Road Railway Station on the Howrah-Madras main line by a 74-mile black topped road. This road connects Keonjhar-garh with Champua (a sub-divisional headquarters) the Bardil-Joda Mining complex, and also with Chaibasa, Chakradharpur and Ranchi in Bihar State. Besides this major road there is a ghat road to Telkoi, which is being re-built as a National Highway, and another road connects it to Mayurbhaj.

Keonjhar as a whole is a backward area except for the rich mineral belt to its north-west, now known as the

Bardil-Joda-Kiriburu complex. Prior to merger, there was only a single all-weather road bisecting the district from north to south. The population includes a large number of scheduled tribes; among other castes, the chasas (cultivators) predominate. There are a few prosperous Muslims in the area. The river Biatarani and its tributaries flow across the district, originating in the hills at Gomukhi.

Ex-Rulers Dominate

The constituency has both urban and rural characteristics. In the rural parts the tribals constitute nearly 35 per cent of the population. The total population of the constituency is nearly 100,700 with an area of 500 sq miles. The urban-rural breakdown of population is roughly: urban (municipal area), 20,000; rural, 75,700. The tribal content of the population includes Rajkuli Bhuiyans, Bhuiyans, Gonds, Juangs, Mundas and Kolhs. The economy of the constituency is agricultural and cultivation is backward. The urban population consists mostly of Government servants, lawyers and traders. There are practically no industries.

In the 1952 General Election this area formed part of a double-member constituency with one general seat and one seat (now Telkoi) reserved for S Tribes. The size of the electorate was more than a lakh. Out of it, 52,771 voted at the elections, the first in the history for the area. The Ganatantra Parishad (G P) organised by the ex-rulers of erstwhile princely States was the main rival of the Congress in Orissa and naturally dominated in the former princely States. In 1952 the G P did not contest the general seat in this constituency. An independent candidate, L N Bhanideo, brother

of the Raja of Keonjhar, popularly known as Chotrai Sahab, won the seat. The Congress did not contest the general seat either. The G P supported Bhanjdeo who was opposed by a socialist candidate.

Bhanjdeo secured 51 per cent of the votes polled. The Congress had no organisation in the area and it was the G P which had swayed the electorate in this as in other ex-princely State areas. The change to regular administration had introduced many complications and there were inevitable delays in disposal of public grievances. These were exploited by the G P. The Congress was identified with the maladies of the administration. The over-whelming majority of the independent candidate supported by G P was thus the manifestation of popular apathy to the changes introduced and of basic adherence to the traditions of the princely order.

The picture had not changed materially in five years, by the time of the 1957 General Election. Though Congress had extended its organisation to the area, it was still in a rudimentary stage. The glamour of the princely order had not died down. Some mine-owners, no doubt, supported the Congress, but there had been labour troubles in the mining belt of Bardil resulting in a police firing which had its echo in Keonjhar-garh and was exploited by G P.

This time a kinsman of the Raja, Janardan Bhanj, was the G P candidate for general seat. The sitting member, Bhanjdeo, had preferred to contest the Parliamentary seat. G P was opposed by Congress, Jharkhand and independent candidates. The Congress polled 21.7 per cent of the votes polled, whereas G P and others secured 78.3 per cent, G P alone securing 47.9 per cent. Janardan Bhanj retained this seat in the Assembly till his death.

A New Congress Leadership

In the 1961 mid-term elections the Congress had been transformed under the leadership of Biju Patnaik. I Bhanj was the G P nominee who was opposed by a Congress candidate and 5 independents. Keonjhar was now a single member constituency. Out of the total electorate of 46,802, only 11,418 (nearly 25 per cent) voted. The returns were as follows:

G P	:	4,657
Congress	:	3,078
Others	:	3,683

Congress secured only 27 per cent of the votes while the others secured

73 per cent and G P alone polled 47.7 per cent.

G P retained its fortress against the onslaught of the Congress and in spite of the general trend favourable to it in the State as a whole, the Congress failed to carry this constituency. This showed that the feudal elements had not lost their hold on the people. It also reflected the fact that the district Congress organisation had yet to grow roots in the area.

In April 1965 the sitting member, J Bhanj, died, necessitating a bye-election. It came immediately after the publication of C B I report on the charges of corruption against the Orissa Congress leaders. Much capital was made out of it by the opposition parties as also by dissidents within the Congress. Patnaik had been made to resign from Chief Ministership under the Kamaraj Plan and his successor Mitra had also to resign under rather unhappy circumstances. The publication of the C B I report and the publicity it had received all over the country had tarnished the image of the flamboyant leadership of Orissa Congress. The Opposition and the dissidents in the party sought the intervention of the Centre to remove the existing leadership and to order an enquiry commission like the Das Commission appointed to enquire into charges against Kairon. Prior to the C B I report, the three-month long students' agitation had shaken the Congress Government.

Significance of Bye-Election

Against the background of all this turmoil it was inevitable that the bye-election in this constituency acquired a special significance. It was taken up as a challenge and counter-challenge by the Congress and the opposition. Therefore, although four bye-elections to O L A had taken place since 1961, two in Ganjam, one in Sambalpur and one in Cuttack district, such a keen contest had not been seen. Preparations for the election were begun early. The choice of candidate was a difficult one for both the Congress and Swatantra. The Congress finally nominated Bankim Das, an M A, LL B, a former journalist, and an associate of Biju Patnaik for several years, when the reported offer to a member of the Raj family was not accepted. Swatantra chose Karunakar Pradhan, a local lawyer. It was a straight contest between Congress and Swatantra.

The election campaign of the Congress was formally inaugurated by the

party President Kamaraj who visited the constituency in the course of his tour of Orissa in the first week of June 1965. Biju Patnaik, Orissa Congress Chief, and Chief Minister Tripathi accompanied Kamaraj. The essence of the Congress strategy was to appeal the electorate to reject the feudalistic approach of the Swatantra Party so that awakening and development could come to this hitherto underdeveloped constituency. The Opposition interpreted this as a threat to the electorate to choose Congress or to remain underdeveloped. The other preoccupation of the Congress campaign was with rebutting the charges of corruption against Congress leaders and with overcoming the unpopularity resulting from the students' agitation and publication of C B I report. The challenge was accepted by Patnaik, Routrai (Home Minister) and Pani (P C C Chief). They camped at Keonjhar for three weeks. Besides, there was an influx of M L As and M Ps from various parts of the State and all Ministers of the State Government except the Chief Minister and a couple of his colleagues camped in the constituency. The result was a vigorous campaign uncommon for an Assembly bye-election.

On the other side, the elaborate Swatantra campaign was led by P K Deo, M P, (the Maharaja of Kalahandi). They had also mustered most of their M L As and M Ps, except R N Singhdeo (Maharaja of Patna) who was ill. An eminent writer politician, Nityanand Mahapatra, canvassed for Swatantra. The P S P remained neutral.

Hitherto neglected villages in the hills were visited by leaders, and the hill-paths echoed with the sound of automobiles. It was alleged by both the parties that the other was using intimidating tactics. Swatantra leaders sent telegrams to the Election Commission complaining that the Government machinery and State publicity media were engaged by the Congress Party.

Polling, however, took place in a quieter atmosphere; in fact, only 35 per cent of the electorate exercised their franchise, which was very poor considering the vigorous campaign. The Congress candidate was defeated by 1,818 votes. Nearly a thousand votes were declared invalid. And so once again the Congress could not penetrate this citadel of the Swatantra Party.

The reasons for this may now be briefly examined. The Congress candidate, Das, was a stranger to the area.

His father was an employee of the Raja who had a few years earlier settled at Keonjhar with his family. The candidate himself had been educated outside the region and with his high academic degrees had joined journalism and later turned to service under Biju Patnaik. He was not well known to the people. Unfortunately he was identified as a protégé of Patnaik with very much to his own credit. The Raj family gave their support to the Congress and Chotrai who is now a Congress M P actively helped the election, but this could not counter-balance the above factor. The Swatantra candidate, Pradhan, is a local lawyer and had an advantage over Das.

Congress Candidate a Stranger

In the Congress recovery in the 1961 mid-term election to the Assembly in 1961 and in the 1962 General Election to Lok Sabha, Biju Patnaik had played the crucial role, but at the time of the Keonjhar bye-election he was under a cloud, as a result of the publication of the C B I report. And, at the most inopportune moment, an American plane landed at Bhubaneswar and as a chance accident Patnaik helped it to land in a dark night. Many stories were circulated associating Patnaik with that incident and his opponents made much capital out of it. Oriya dailies circulated various interpretations of this episode, which were widely told to the electorate.

P K Deo, a master of election tactics, exploited Congress drawbacks to the fullest extent. Congress workers were alleged to have been surreptitiously won over by him. He also emphasised the traditional respect for the princely order among the people. He had tribal workers to mix with the tribals and speak to them in their dialect which had a psychological impact. By contrast, the deluge of ministers who lived in bungalows and circuit houses in pomp with their official retinues and moved in cars did not give a good account of the Congress to people. As opposed to it, Swatantra leaders moved in the villages and spent nights with the people which rebutted Congress propaganda against their aristocratic sympathies. It was admitted by Congressmen themselves that booths which were left in charges of ministers showed poor results while those manned by ordinary workers did well. Of the 44 booth the Congress polled a majority of the votes in about 40 per cent.

Besides the Congress organisation had no roots in the area and its paid workers mobilised for the occasion were mostly opportunists who came only for the money without any conviction or sincerity and at the earliest opportunity changed their colour. Swatantra workers on the other hand were sincere and devoted, and their campaign was worker-oriented rather than leader-oriented. The unpopularity of the D C C President and the circumstances attending his recent removal from the office of the president of the Zilla Parishad counted against the Congress. Congress dissidents, it is alleged, helped the Swatantra Party covertly though the latter deny this.

Another important factor was the proposed Aradia river valley project. River Aradia, a tributary of Baitarani, flows within a few miles from Keonjhar and under the proposed project nearly 65 villages would be submerged. An investigation had already been conducted and the submergible area was demarcated by the Public Works staff which convinced the people that the project would come soon and they would be displaced. They were not convinced by the Ministers' assurances that the project was not included even in the Fourth Plan. As a result these villages solidly voted for Swatantra.

In urban areas vote was equally

divided between Swatantra and Congress. In many hill tribe booths Congress polled more votes but among the plain tribals Swatantra won. The influential chasas (Pradhans) favoured Swatantra because of the Government's land reforms measures which affected their interests. However, in this constituency caste did not play any major role through the scheduled castes perhaps preferred the Congress out of their feeling that the Congress had emancipated them from exploitation.

In spite of much hard work, expense and painstaking electioneering and a flood of V I Ps into the constituency, the Congress could not succeed in the bye-election. Obviously, the electorate did not measure the lofty ideals of a socialistic pattern of society of the Congress as against the feudalism-capitalism of the Swatantra Party. The voters did not understand the distinction between public sector and private enterprise; between planned development, and private enterprise; nor did they bother much about the country's international relations. These great issues and causes did not apparently influence the voting behaviour; what did was the personality and acceptability of the candidates, the standing of party leaders, and the traditions, local affiliations and interests in this remote constituency.

Bank of America in Spain

PERMISSION to participate in a new investment bank in Madrid has been received by Bank of America (International), New York subsidiary of the Bank of America. Approval has been granted by Spanish authorities and the US Federal Reserve Board to establish the investment bank as a joint venture with Banco de Santander, one of the leading banks in Spain operating 140 branches in the country. Bank of America (International) will also acquire joint ownership in an existing Madrid commercial bank currently owned by Banco de Santander. Spain's booming economy and the substantial incentives offered by its government to new investments provide great opportunities for an investment bank.

The new bank, Banco Intercontinental Espanol, with head office in Madrid, will have authorised capital of 500 mil-

lion Pesetas (\$8,350,000). Under existing regulations it may open up to three branch offices in Spain. It is planned that a branch will be opened in Barcelona shortly after establishment of the bank. Bank of America (International) will have 50 per cent equity in the venture.

The primary function of investment banks in Spain is to promote and participate in new industrial and agricultural enterprises, stimulate private initiative and collaborate in the extension of term financing. Such banks may accept certain deposits, grant term loans, and issue certificates of deposit or debentures.

Acquisition of an interest in the commercial bank in Madrid will enhance the European operations of Bank of America (International) and the parent Bank of America.

Size, Technology and Economics A Study of the Indian Cotton Textiles Industry

J C Sandesara

It is commonly held that small industrial units are labour-intensive and large industrial units capital-intensive; that small units have lower productivity per worker, lower wage per worker and also lower surplus per worker; and that they have higher output but lower surplus per unit of capital.

Since labour-intensity is held to be characteristic of small units, it is also held almost as a corollary that labour intensive technology has lower productivity, lower wages and lower surplus per worker; and that it has higher output but lower surplus per unit of capital than capital intensive technology.

These hypotheses are here tested with reference to the Indian Cotton Textiles Industry.

[The writer acknowledges his gratitude to M M Dadi, I S Gulati, V N Kothari, D T Lakdawala, B V Mehta and C H Shah for their comments on the draft of this draft of this paper.]

THIS paper is divided in four parts: part I sets out the hypotheses and the scope of the paper; part II presents the broad outline of the approach; part III consists of the analyses, and part IV comprises of the conclusions, their limitations and implications. The basic tables are presented in the Appendix.

I The Hypotheses

It is commonly held that small industrial units are labour-intensive and large industrial units capital-intensive. That is, the former use less capital per worker than the latter. It is furthermore held that small units have lower productivity per worker, lower wage per worker and also lower surplus per worker; and that they have higher output but lower surplus per unit of capital than the large ones.

Since, as noted above, labour-intensity is held to be immanent in small units, it is also held, almost as a corollary, that the labour-intensive technology has lower productivity per worker, lower wage per worker and also lower surplus per worker; and that it has higher output but lower surplus per unit of capital than the capital-intensive technology.

This writer is currently engaged in an empirical examination of these hypotheses with reference to Indian manufacturing industries. This larger study, under preparation now, may take about a year in publication. Meanwhile, an opportunity is being taken here to present the results of the enquiry into the Cotton Textiles Industry not only because of its topicality but also with a view to provoking comments and discussion since some of the results obtained are such as challenge the notions commonly held.

II The Approach

The enquiry is based on the Census of Indian Manufactures for the years 1953-58.

The Census is conducted with the factory as the unit of enumeration. It is confined to the units registered under the Factories Act, 1948 and employing 20 or more workers on any day and using power. The Censuses for the years 1953-58 give data on the coverage of factories, capital and labour employed, output produced, wages, etc, and value added by size of factories as denoted by the number of persons employed—the size-groups being: below 20, 20-49, 50-99, 100-249, 250-499, 500-999, 1000-1999, 2000-4999, and 5000 and above workers.

On the basis of relevant data given for these size-groups, we have worked out capital-labour, output-labour, wages-labour, surplus-labour, output-capital and surplus-capital ratios. While for the detailed connotation of the terms used reference should be made to the Census, the following may be permitted even in this short paper.

The term capital is used for total productive capital employed—working and fixed together; the term labour for the average number of persons employed; the term output for value added; the term wages for salaries, wages and other benefits or privileges, all as defined in the Census. The term surplus is defined to cover the residual of value added after wages are deducted.

The data are presented in three tables. Table 1 gives the rank correlation coefficient between size and (a) technology (i.e. capital-intensity). Table 2 gives the rank correlation coefficient between size and (b) output-labour, (c) wages-labour, (d) surplus-labour,

(e) output-capital and (f) surplus-capital ratios. The data to the left in Table 3 give the rank and those to the right the product-moment coefficient correlations between technology and each of these five characteristics. The basic tables are presented in the Appendix.

III The Analyses

(A) Size and Technology

The hypothesis tested here is that size and capital-intensity are positively associated, that is, small units are labour-intensive and large units capital-intensive.

The data for the years 1953-58 do not lend any support to the hypothesis of positive association. In fact, they may be taken as an indication that size and technology are negatively associated; that is, small units are capital-intensive and large units labour-intensive.

It would be seen from Table 1 that the correlation was negative for all the six years. The value was less than the critical value, having a minus sign, at the 2.5 per cent level of significance, for three (1953, 1954 and 1957) out of six years. Here the hypothesis of independence is rejected at the 2.5 per cent level of significance against the

Table 1: Value of the Rank Correlation Coefficient between Size and Technology, 1953-58.

It works out to nearly 900 million Charminar cigarettes sold every month ! Yes, Charminar is certainly the most popular cigarette in India—by far ! Why ? Because no other cigarette can match Charminar's rich flavour and unique taste. How does The Vazir Sultan Tobacco Company do it ? With quality tobaccos, special processes and expert know-how . . . in the largest cigarette factory in South-East Asia !

Experts choose only the finest tobaccos, developed specially for Charminar. Skilled workers prepare the leaves. Scientists laboratory-check each batch. Connoisseurs blend the tobaccos, which are triple-matured. Next, an extra process exclusive to Charminar. Only then do the tobaccos go to the automatic machines for rapid, 'untouched-by-hand' manufacture . . . to produce over 20,000 Charminars a minute !

There's nothing like Charminar — India's greatest cigarette!

MAKERS OF INDIA'S GREATEST CIGARETTE!

CAS/VS-2

alternative that there is negative association.*

* Readers not conversant with statistical reasoning may find the following note helpful.

The critical value of the rank correlation coefficient to be used in testing the hypothesis of independence, at the 5 per cent level of significance, against the alternative hypothesis that there is association (either positive or negative) when $n = 9$ (as in the present case) is .68. The hypothesis is tested in the following manner:

$$\begin{aligned} \text{Pr (either } r \leq -.68 \text{ or } r \geq +.68) &= .05 \\ \text{Pr } (r \leq -.68) &= .025 \\ \text{Pr } (r \geq +.68) &= .025 \end{aligned}$$

To elaborate: If r is less than or equal to $-.68$ or greater than or equal to $+.68$, the hypothesis of independence is rejected at the 5 per cent level of significance against the alternative hypothesis that there is association (either negative or positive). If r is less than or equal to $-.68$, the hypothesis of independence is rejected at the 2.5 per cent level of signi-

ficance against the alternative that there is negative association. If r is greater than or equal to $+.68$, the hypothesis of independence is rejected at the 2.5 per cent level of significance against the alternative that there is positive association.

(B) Size and Economic Characteristics

The hypotheses tested below are that (i) size and (b) productivity per worker, (c) wage per worker and (d) surplus per worker are all positively associated; (ii) size and (e) output-capital ratio are negatively associated; and (iii) size and surplus-capital ratio are positively associated.

The rank correlation coefficients were consistently positive for all the six years in all the five cases. It would be furthermore observed from Table 2 that the value was greater than the critical value, having a plus sign, at the 2.5 per cent level of significance, for all the six years for output-labour and output-capital ratios; for three years (1953, 1954 and 1955) for wages-labour ratio; and for two years each (1954 and 1955) for surplus-labour and surplus-capital ratios. Here the hypo-

theses of independence are rejected at the 2.5 per cent level of significance against the alternative that there are positive associations in these cases.

The data above seem to support the hypotheses of positive association between size and (b) productivity per worker, (c) wage per worker and (d) surplus per worker; and (f) surplus per unit of capital. But the evidence above does not support the hypothesis of negative association between size and (e) output-capital ratio. In point of fact it may be taken as suggesting positive association between size and output per unit of capital. Thus, small units can be said to have lower productivity, lower wage and lower surplus per worker; and lower output and lower surplus per unit of capital than large ones.

(C) Technology and Economic Characteristics

The hypotheses now tested are that (i) technology and (b) productivity per worker, (c) wages per worker and (d) surplus per worker are all positively associated; (ii) technology and (e) output-capital ratio are negatively associated; and (iii) technology and (f) surplus-capital ratio are positively associated.

The rank correlation was consistently negative for all the six years in all the five cases. The value of the coefficient was less than or equal to the critical value, having a minus sign, at the 2.5 per cent level of significance for five years (i.e., excepting 1955) for the output-capital ratio; for three (1953, 1956 and 1957) for the output-labour ratio; for two years (1956 and 1958) for the surplus-capital ratio; and for one year (1953) for the wages-labour ratio. Thus here too, the hypotheses of independence are rejected at the 2.5 per cent level of signi-

Table 2: Value of the Rank Correlation Coefficient between Size and Economic Characteristics, 1953-58.

Year	Output-Labour Ratio	Wages Labour Ratio	Surplus-Labour Ratio	Output-Capital Ratio	Surplus-Capital Ratio
(1)	(2)	(3)	(4)	(5)	(6)
1953	.98	1.00	.58	.98	.63
1954	.98	.92	.73	.98	.80
1955	1.00	1.00	.70	1.00	.98
1956	.92	.53	.35	.85	.47
1957	.98	.52	.48	.90	.57
1958	.93	.57	.18	.73	.35

Table 3: Value of the Coefficients between Technology and Economic Characteristics, 1953-58

Year	Rank Correlation Coefficient					Product-Moment Correlation Coefficient				
	Output: Labour Ratio	Wages-Labour Ratio	Surplus-Labour Ratio	Output: Capital Ratio	Surplus-Capital Ratio	Output: Labour Ratio	Wages-Labour Ratio	Surplus-Labour Ratio	Output: Capital Ratio	Surplus-Capital Ratio
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
1953	-.87	-.83	-.60	-.87	-.66	-.69	-.58	-.95	-.48	-.76
1954	-.43	-.50	-.40	-.82	-.53	-.91	-.33	-.96	-.36	-.82
1955	-.60	-.57	-.35	-.57	-.58	-.74	-.57	-.80	-.76	-.86
1956	-.70	-.16	-.48	-.93	-.68	-.69	+.22	-.28	-.80	-.45
1957	-.78	-.42	-.33	-.95	-.44	-.87	+.19	-.51	-.40	-.62
1958	-.63	-.38	-.27	-.95	-.77	-.42	-.45	-.78	-.81	-.51

ficance against the hypotheses of negative association in all these cases.

Except in the case of wages-labour ratio where it was positive for two years (1956 and 1958) though negative for the other four years, the product-moment correlation was consistently negative for all the six years in the other characteristics.

The value of this coefficient was less than the critical value, having a minus sign, at the 2.5 per cent level of significance for five years (ie excepting 1958) for the output-labour ratio; for four years (1953, 1954, 1955 and 1958) for the surplus-labour ratio; and for three years each for the output-capital (1955, 1956 and 1958) and surplus-capital (1953, 1954 and 1955) ratios. Thus, here again the hypotheses of independence are rejected at the 2.5 per cent level of significance against the alternatives of negative association.

Thus the data above do not support the hypotheses of positive association between technology and (b) productivity per worker, (c) wages per worker and (d) surplus per worker; and (f) surplus per unit of capital. On the other hand they may be taken as suggesting the hypotheses of negative association in all these cases. The evidence on the relationship between technology and (e) output-capital ratio seems also to support the hypothesis of negative association. Thus, in an overall view, the evidence may be taken to suggest that the labour-intensive technology has higher productivity, higher wage and higher surplus per worker; and also that it has higher output and higher surplus per unit of capital than capital-intensive technology.

IV Conclusion, Their Limitations and Implications

(A) Conclusions

The above analyses may be taken as tending towards the following conclusions:

- (1) Small units are capital-intensive and large units labour-intensive.
- (2) Small units have lower productivity, lower wage and lower surplus per worker; and also lower output and lower surplus per unit of capital than the large ones.
- (3) Labour-intensive technology has higher productivity, higher wage and higher surplus per worker; and also higher output and higher surplus per unit of capital than capital-intensive technology.

Note: More than two decimal points occurring in Tables A-5 and A-6 in some columns are for a clearer ranking.

The trouble with the small units, it would seem, arises not because they have paucity of capital, but possibly because they suffer from a plethora of it! For the small units are found to be capital-intensive.

(B) Limitations

These conclusions are to be considered with reference to their context. In the first place, they are for the Cotton Textiles Industry. Secondly, they are based on the analyses of data for six years, 1953-58. And thirdly, they are confined to factories employing 20 or more workers on any day and using power. It is only fair to emphasise here again that the smaller units, or the units which one would like to label as really small (such as the completely manual units — the handspinning or the handweaving type — and the small power-based workshops employing not more than 19 workers on any day — the powerloom type) are not covered by our source.

Since these conclusions are based on the analyses of the census data, the limitations of the latter would naturally plague the results. Some of these are: use of the actual output data; valuation of capital as per books of the units; relating capital stock as at the end of the year instead of at the mid-year date with the output or its divisions; arbitrary method in arriving at surplus; limited reference period of six years only; and exclusion of the really smaller units from the coverage of the source. It is not possible to discuss in details the influence of all these on our conclusions. It may however be noted that our conclusions portray only a relative picture; and the relative position will remain undisturbed if the factors concerned influence the size-groups in a uniform manner and/or in an equal measure. The influence of these limitations is being examined in the larger work referred to above. By way of an interim note, it may be added that the tone and the tendency of these conclusions are not likely to be much disturbed.

(C) Implications

How can we explain our results? And what is their significance for economic policy?

The large-sized units reveal a use of resources superior to or more economical than that in the small-sized units. Possibly, the organisational economies or the economies of scale as such, arising out of bulk buying and selling, easier availability of finance and on more favourable terms, better supervi-

sion and management, and superior entrepreneurial ability are more important than the technological economies or the economies arising out of employment of capital-intensive technology. In a word, the technological economies are perhaps not so sensational, or perhaps do not accrue in as great a measure in practice, in this industry at least, as may be commonly thought. The large units are possibly headed by entrepreneurs how very effectively combine factors of production as is reveal-

ed by our results. The crucial factor which could possibly explain our results may well be the factor of enterprise.

Secondly, the underlying assumption of the public policy of promoting small industrial units in a country like ours, seems to be that such units use capital, the scarce resource, sparingly, and labour, the plentiful resource, abundantly in the sense that they embody a technology which produces more output and employs more labour per

unit of capital than the large units. This assumption is not borne out by our data. Perhaps the case appears to be quite the contrary. Such virtues as are claimed or tacitly assumed for the small units are to be found precisely in large units! To the extent our conclusions are valid, such a policy would be tantamount to promoting those which should be penalised, and penalising those which should be promoted. Surely, the large units do seem to deserve a new and better deal.

Agricultural Growth in Madras, 1949-50 to 1960-61

T Ramakrishnan Rao

An attempt is made here, first, to estimate the rates of growth of agricultural production in Madras during the period 1949-50 to 1960-61, for the different crops as well as for the different districts.

Second, the association of rates of growth of production with the rates of increase in acreage and yield is examined.

Finally, it is investigated whether extensive cultivation and higher yields are associated with faster rates of growth in production.

[This is part of a larger study of "Agricultural Development in Madras State" being conducted by the author at the Agricultural Economics Research Centre, Madras.]

IT is well known that Madras has a good record of agricultural development in the three Plans. There are many facets of agricultural development. In this paper, development or growth is defined in the restricted sense of increase in production. Aggregate production is a composite concept: Production is aggregated over space and over crops. In order to examine the variations in the level of development, 10 districts (the smallest homogeneous area for which data is available in Season and Crop Reports) in Madras State (Kanyakumari, due to lack of time series data and Nilgiris because of its unique Cropping Pattern are omitted) and 10 major crops or crop groups (Paddy, Cholan, Ragi, Cumbu, Minor Cereals, All Cereals, Pulses, Sugarcane, Groundnut and Cotton) grown in these districts are studied.

This study seeks, first, to estimate the growth rates in agricultural production, district-wise and crop-wise; second, to examine the association of growth rates in production with rates of increase in acreage and yields; and,

finally, to investigate whether extensive cultivation and higher yield levels are associated with faster rates of growth in production.

A linear growth area for the period under study is assumed. The formula used is given below:

$Y_{ijt} = a + b_{ij} x_t$ where Y_{ijt} is the production index of the i^{th} crop in the j^{th} district in the t^{th} year. X_t is the time factor ($t = 1$ to 10 years) and b_{ij} is the j^{th} district. Production index is calculated for each year with the average of the first three years as the base. The problem of autocorrelation in time series and the possibility of slight upward bias in the production indices based on three-years' average are acknowledged. However the period under study is short and the linear equations approximate a fairly good fit.

The estimated growth rates of production are given in the Table 1. Cholan, Cumbu, Ragi, Minor Cereals, Pulses and Cotton register low or negative growth rates in most of the districts. Rates of growth in Rice, Sugar-

cane and to some extent, Groundnut are noticeably high (>10) in a majority of the districts. This seems to have been achieved to a certain extent by a sacrifice in the rates of growth in the production of Cumbu, Ragi and Minor Cereals. It is a welcome feature that the growth rates are high in these important cash crops which are evidently more profitable.

Among districts, Ramanathapuram shows spectacular increase in its growth rates in all except three crops. The low growth rates are for Cholan, Ragi and Cotton. Chingleput, North Arcot and Salem get the second rank. The production increases are mostly in Rice, Sugarcane and Groundnut. The third rank districts, viz, Coimbatore, Thanjavur and Tirunelveli, record high growth rates in Sugarcane. The stagnant districts are Madurai and Tiruchirappalli. South Arcot registers negative growth rates in as many as 6 crops.

Some of the reasons for the high growth rates in production are increases in irrigated area, intensity of cropping and better management. The index

Table 1: Growth Rates of Production 1949-50 to 1960-61

Number of Districts with Growth Rates	<10	4	2	1	—	1	3	1	6	4	2		
	>10	6	6	3	6	7	8	3	5	6			
	-ve.	—	2	6	4	3	—	1	1	2			

of intensity of cropping is almost constant. The increases in irrigated area achieved by Ramanathapuram, Coimbatore, North Arcot, Salem and Chingleput districts (in descending order) are worth mentioning. Growth in production is associated with acreage and yield per acre growth rates. The increase in production has been achieved mainly through an increase in acreage. For four main crops — Rice, Sugarcane, Groundnut and Cotton — which showed high growth rates, production rates and acreage rates (calculated in an identical manner as for production) were correlated by ranking the districts in order of the magnitude of the rates. Similar procedure is followed for yield levels.

It could be easily seen that production and area are highly correlated in all the districts. On the other hand, the low correlation, which is not statistically significant at 5 per cent probability level establishes the fact that area and productivity are not generally correlated. Thus most of the growth in production is due to area increase only and this makes a strong case for intensive cultivation with improved practices.

Finally, the hypothesis that extensive cultivation and a high level of yields are conducive to a higher rate of growth in production is examined. When a crop is taken to be "established" in a district (like rice in Tanjore and Cotton in Coimbatore), a steady increase in production could be expected. Similarly, high levels of yields are usually associated with better cultivation practices and increasing awareness and acceptance of modern methods of cultivation among the already enlightened farmers could be expected.

So rank correlation coefficients have been worked out for the four crops for production growth rate, percentage of area under the crop and yield level during 1949-50 and are found to be not significant. The hypothesis is not strictly borne out by the facts. Reasons may be marginal and submarginal lands being brought under cultivation with low yields; Stagnation or saturation at the present level of low yields even among the districts with comparatively higher levels of yield might be another cause for this phenomena.

In conclusion, it is seen that most of the growth in agricultural production in Madras State over the decade 1949-50 to 1960-61 can be attributed to the high income yielding crops, viz, Paddy, Sugarcane, Groundnut and Cotton,

which together account for 52 percent of the total cropped area in the State. Ramanathapuram ranked first in its growth rates followed by Chingleput, North Arcot and Salem. Production increase has been mainly brought about

by increase in area rather than through higher yield levels. High growth rate in production is not necessarily associated with higher levels of yield and greater area under cultivation of the crop.

Table 2: Rank Correlation Coefficient

Crop	Production and Area	Production and Productivity	Area and Productivity
Rice	0.94 (H.S.)	0.47 (N.S.)	0.33 (N.S.)
Sugarcane	0.95 (H.S.)	0.33 (N.S.)	0.19 (N.S.)
Groundnut	0.96 (H.S.)	0.56 (S)	0.41 (N.S.)
Cotton	0.87 (H.S.)	0.47 (N.S.)	0.10 (N.S.)

H S — Highly Significant (1% level)

S — Significant (5% level)

N S — Not significant (5% level)

Why Export Receipts Lag Behind Exports

Some Possible Explanations

Jagdish Bhagwati

I WAS rather surprised to find you writing tangentially ("Panic Measures", July 3, 1965), without critical comment, about the widespread and popular contention that the import entitlement schemes are responsible, *via* over-invoicing and advance entitlements, for the apparent discrepancy between recorded exports and export receipts of over Rs 84 crores during 1964-65.

I must confess that I have not yet seen any official pronouncement or evidence concerning this alleged discrepancy, although the figure and the explanation are being widely bandied about. The matter is of great interest from the economic point of view and also from the viewpoint of its implications for the entitlement schemes' future; hence, I shall accept, for the sake of proceeding further with the argument, that there is indeed a discrepancy of this order and that it is significantly larger than the normal (if any).

The discrepancy *cannot* be explained by over-invoicing of exports. Over-invoicing leads to a discrepancy, *not* between exports (declared and effected) and export receipts, but rather between *declared* exports and *actual* exports. Once the exports have been declared, albeit at an inflated value, the rules require that the corresponding "earnings" be brought into the country and surrendered to the Reserve Bank. From this point of view, therefore, over-invoicing has nothing at all to offer by way of explaining the alleged discrepancy between declared exports and receipts.

Nor is it possible to condemn the system of advance entitlements (presumably now removed) for this discrepancy. The defaults and delays on the executed bonds explain only the delays in *effecting* exports, *not* the alleged discrepancy between recorded exports and receipts.

While these popular explanations are fallacious, it is possible to think of several possible explanations which can account for the discrepancy. I proceed to list the most likely ones below:

(1) It is known that *fictitious* firms have disappeared, in zari and pepper for example, after securing their entitlements. Now, where the firms secured *advance* entitlements, and the

firms disappeared prior to effecting exports, there cannot be any effect on the alleged discrepancy at all. Where, however, the firms disappeared *after* effecting exports, there would be a shortfall in receipts below recorded exports. Surely, however, this phenomenon cannot explain more than a tiny fraction of the alleged discrepancy. Moreover, it should be noted that whereas entitlement schemes (owing to their subsidy implications) certainly enhance the profitability of such frauds, these can occur even in the absence of these schemes whenever there is any significant incentive for anyone to take capital abroad in an illegal manner.

(2) Another practice, which appears to have been recently detected, is the destruction of the GR form at the Customs by bribing the clerks. Since this form has to be sent on by the Customs to the RBI, whereupon the latter proceeds to enforce the exchange rules governing exchange earnings, destruction of the form means that the RBI does not come to know of the export transaction at all! While this practice is ingenious, and the drive against black money recently may have made it worth pursuing with considerable bribery, it is unlikely to account for a significant fraction of the alleged discrepancy; also, it is wrong to blame entitlement schemes for this malpractice.

(3) Perhaps the most likely explanation, and one which needs to be looked into closely before conclusions are drawn for trade policy by the authorities, is a swing of trade credits against India. If the *average* lag between exports and receipts is three months for example (the *maximum* being six months, with exception for certain sales of capital goods), then a lengthening of this lag by even a month could conceivably account for a discrepancy of around Rs 60 crores on our present export level. (The exact effect on the time-profile of receipts vis-a-vis exports, of such a shift, is fairly complex to work out in practice, although the well-known work of Bent Hansen on the subject of foreign exchange credits and swings therein has clarified the theoretical position considerably.) This lengthening of the lag may well be expected when devaluation is expected, or in-

terest differentials have moved in favour of foreign holdings; and so on.

(4) While some of these standard explanations may well have been valid as from the last quarter of 1964-65, there are at least two interesting ways in which the lengthening may have occurred in India as a result of the entitlement schemes as then in operation. Let me take the less important one first. If over-invoicing has indeed been going on in any significant manner (as it is almost certain to have, what with the discount on the rupee for illegal transfers being rarely above 35 per cent at any Centre during 1961-65 and the *de facto* subsidy on f.o.b. export value in most schemes, *via* entitlements, being significantly above that), it is possible that the lag may have increased owing to over-invoicing, through the resulting delays in finding unauthorised exchange *and* a possible tendency on the part of over-invoicers to put off buying the unauthorised funds until the very end (thereby saving on interest costs).

(5) I should guess, however, that a more important cause of the lengthening lag is to be found in the fact (assuming that I am correctly informed about the relevant procedures) that entitlements have been related to, and exports recorded as of, the date of the *shipping bill* whereas the receipts have to be surrendered to the RBI within six months of the date of *shipment*. Now, if the lag between the dates of the shipping bill and the shipping increases, the average lag between shipment and receipt remaining unchanged, there is a *de facto* lengthening of the lag between the dates of the recorded export and the receipt therefrom. There seems to be evidence of this having happened during 1964-65. Whereas the "normal" lag between the shipping bill and the shipment used to be around 7-10 days, with the maximum possibility of 21 days, this lag seems to have stretched out to an average of over three weeks during 1964-65, owing partly to congestion at the ports but largely to the desire on the part of exporters, keen to get their entitlements, to have their shipping bills executed at the earliest.

Of course, there may even be more

mundane explanations such as a go-slow policy on the part of RBI computing staff, leading to illusory short-falls in receipts, though this seems quite extraordinary and unlikely.

If what I have argued above is correct, then it is wrong to condemn the entitlement schemes for the alleged discrepancy between recorded exports and receipts (except in the sense suggested in explanations (4) and (5), the latter of which is, again, remov-

able by reform of the procedures). While I wish to stress this, so that the entitlement schemes are not considered defective for the wrong reasons, I would like to disclaim to defend them as necessarily the ideal method of subsidising exports. I have read I S Gulati's recent paper on these schemes (*The Economic Weekly*, May 22, 1965) with very great interest. It seems to me, however, that Gulati would have us replace one

"arbitrary" rule of (*de facto*) subsidies by another. He also seems to accept the government's tenuous contention that the rule is to fix the entitlements at twice the value of import content. Nor do I find him persuasive when he bases his economic analysis squarely on the implicit assumption that the entire entitlement is a social cost. Both the *real politik* and the economics of the entitlement schemes seem to me rather more complex than that.

AROUND BOMBAY MARKETS

Impressive Rally

Wednesday, Morning

DALAL STREET staged quite an impressive recovery last week, with several leading counters making good the losses suffered in the preceding week. To mention a few important names, Century which had been sold down to Rs 512 towards the close of the previous week were up again at Rs 543 by the week-end; National Rayon rallied from Rs 374 to Rs 395, Standard Mills from Rs 408 to Rs 437, Telco from Rs 224 to Rs 236, Hindustan Motors from Rs 16 to Rs 16.68, Scindia from Rs 13.96 to Rs 14.48, Tata Chemicals from Rs 18.60 to Rs 19.20, Indian Iron from Rs 24.96 to Rs 25.70 and Tata Steel from Rs 148.50 to Rs 155.25. Scarcity of fresh offerings, short covering, replacement buying, renewed fresh bull support — all these contributed to last week's recovery in equity prices. Activity continued to be mainly professional and the turnover was generally poor; it was only near the week-end that the market presented a somewhat lively appearance.

Since last week's decline had brought the market extremely close to its year's low, it was not altogether unexpected that the market should receive some professional support around this level. But the recovery was not induced by technical consideration alone. There were other factors which greatly aided market sentiment. The import policy for actual users, though vague in certain important respects, was considered to be less stringent than what had been widely feared. The stock market seemed particularly impressed by the Finance Minister Krishnamachari's promise that as much of rupee resources and aid as possible would be utilised for the import of raw materials and components to supplement the limited supply that industries would be entitled to under the stringent import policy. TTK's categorical statement ruling out devaluation and moratorium on foreign debt payments in order to tide over the foreign exchange crisis were well received in market circles. New Delhi's decision to continue all the export promotion schemes subject to some changes and the announcement of tax credit to 22 commodities including some traditional items, had also a steadying effect on market sentiment.

The Finance Minister's statement that a greater sense of discipline and

determination required for dealing with the critical foreign exchange position must be reflected continuously in the budgetary and credit policies, indeed in the shape and the size of the Plans for development has been widely welcomed on the interpretation that since the Government has belatedly realised that the nation must live within its means the size of the Fourth Plan will be suitably cut down thereby avoiding serious strains on the economy. Only about a week ago the stock market had been shaken by the National Development Council's hint about a possible supplementary budget for raising additional resources in the current year itself.

While the Finance Minister's decision to promote external solvency through a greater sense of discipline and determination will be welcomed, the stock market bull needs the reminder that if these are to be reflected in the budgetary and credit policies there is little prospect of any relief in the tax burden and/or relaxation of the credit squeeze. If the tax burden is not reduced and credit gets scarce and costlier, it will be difficult for the stock market to push its way up in a big way. Even as it is, despite all the talk about the slump in the stock market, the average yield on equities cannot be regarded as attractive when compared with the prevailing structure of interest rates and the return obtainable from investment outside the stock market.

OILSEEDS

Prices Remain High

THE bullish fever has not subsided with reports of highly beneficial rains from almost all the groundnut producing areas in the country. Nor has TTK's categorical statement scotching devaluation rumours had any noticeable effect on the market. Oilseeds prices continue remarkably firm around the highest levels of the season and the strength in the spot material has been even more marked than in futures. With prices all the time above the maximum limits set for the week, official dealings in futures have remained suspended for quite a few weeks. But this has neither put an end to unofficial transactions nor to the rising trend in prices. Cas-

tor September and linseed September are currently quoted around Rs 97 and Rs 119 (per quintal) as against the maximum limits of Rs 92 and Rs 113.30 respectively; in a rising market, the weekly limits keep rising week by week. Bulls continue to dominate the scene, the penal margins notwithstanding. In the spot market, groundnut oil has been quoted between Rs 28.50 and Rs 29.25, linseed oil between Rs 24.50 and Rs 25 and castor oil between Rs 19 and Rs 19.25 — all per 10 kgs. With mustard oil quoted around Rs 32.50 (in Delhi) and coconut oil quoted around Rs 48.50 there seems no prospect of any important decline in groundnut oil prices. Strange as it might appear, the price of coconut oil has been inflated mainly by the exorbitant profit charged by the State Trading Corporation on the sale of copra, which works out to around Rs 2,200 a tonne in terms of oil. Even on mutton tallow, imported under P L 480, the STC is known to be making a profit of about Rs 500 a tonne. As against the landed price of about Rs 1,300, mutton tallow is being sold by the Corporation at around Rs 1,800. Prices cannot be expected to come down when a Government body chooses to make such fantastic profits. Prices of coconut oil and even of mutton tallow do have a bearing on the general price trend in vegetable oils — edible as well as non-edible.

Since official trading in oilseeds futures has been at a standstill for quite some time, the market authorities have decided to start trading in new crop hedge contracts. It is not that speculation has any useful economic function to perform; the market has to be kept alive because quite a large number of people are engaged in this vocation — the business of fluctuations. The first hedge contract in respect of both castor and linseed will be April instead of March. April is said to have been preferred to March with a view to facilitating delivery of goods because of the larger flow of goods during this month. While no margin has been proposed in respect of castorseed, margin at the rate of Rs 1,000 per 10 tonnes will become payable by bulls in linseed when the price moves beyond Rs 105 per quintal. Cottonseed will attract margin of Rs 500 per 10 tonnes when its price rises above Rs 58. The weekly price range of fluct-

tuations — applicable only in a rising market — will be Rs 4 for linseed, Rs 3 for castor and Rs 2 for cottonseed. These weekly ceilings will become operative only beyond Rs 80 for castor, Rs 95 for linseed and Rs 54 for cottonseed.

Policy for Groundnut Extractions

New Delhi's decision to continue the existing export promotion schemes and the announcement of tax credit facilities has left the oilseeds market cold because the export of groundnut oil and vanaspati continues to be banned and oilseeds, oils and oilcakes do not figure among the 22 commodities to which tax credit has been extended. The export trade is, in fact, shocked by the drastic change in export policy for groundnut extractions. The press note issued by the Commerce Ministry says: "In order to better regulate the quality and improve shipping facilities, exports of deoiled groundnut extractions will be made only by manufacturing units, e.g., the solvent extractions units licensed under the Industries Act or such solvent extraction units as are working under approval of the Small Scale Industries Organisation. These units can export deoiled groundnut cake as per their annual production. Quality control and pre-shipment inspection measures on these extractions are also being enforced. This procedure and policy will come into effect for shipments of deoiled groundnut extractions on and after October 1, 1965."

The view is widely shared among informed observers that the new policy will adversely affect the export of groundnut extractions which is making an extremely valuable contribution to the country's foreign exchange earnings. Even now there is no discrimination or disability attached to the manufacturers exporting directly. But only a few choose to export on their own; the others prefer to export through the established shippers. Selling abroad is a highly specialised job, requiring considerable experience, resources, connections and efficient organisational set up. And not many manufacturers can qualify for efficient export performance. It is therefore surprising that the Government should have decided to allow export of groundnut extractions to be conducted only by the manufacturers, particularly when the country is in desperate need of boosting exports anyhow. Even recognised export houses are being denied the export of groundnut extrac-

tions. It is common knowledge that a considerable amount of export business is done on the basis of charter freight. Manufacturers will find it difficult to get together in order to avail of this facility. Informed observers feel that the national interest has been sacrificed with a view to benefiting certain big manufacturers of groundnut extractions who have also been engaged in export business. It is difficult to say how the elimination of established shippers from this trade will effect the prices that Indian groundnut extractions might realise in overseas markets. Odds are that the overseas buyers will be able to outwit the Indian manufacturers-exporters.

Money and Banking

Thursday, Morning

CREDIT conditions during the week to July 21 were comfortable in the Bombay short-term money market. Demand for funds remained unchanged and with ample supplies borrowers were able to get their requirements fairly easily. The rate of interest was maintained around 4 per cent during the major part of the week, though some business was transacted at 3½ per cent as well.

Aggregate deposits of the scheduled banks during the week to July 9 increased by Rs 2.85 crores to Rs 2728.07 crores, according to the latest

BUSINESS NOTES

Tata Oil Mills

JR D TATA, Chairman, Tata Oil Mills Company, in his annual statement circulated to shareholders with the accounts for the year to March last, says that in spite of repeated representations submitted by the industry over the years, the Government has chosen to continue, and in fact further extend, its misguided policy of discrimination against the power operated sector of the soap industry. Whereas the excise duty on laundry bar soap manufactured in the organised sector of the industry has been stepped up by Rs 30 to Rs 216 per tonne, the duty on soap produced by the non-power operated sector of the industry ranging between Rs 93 and Rs 159 per tonne has been withdrawn. Consequently, not only has the production of laundry soap in power-operated units declined during the last two years, but the consumer has been deprived of the better soap.

Tata has expressed regret that Tata-Finlay, in which Tata Oil Mills has an

weekly statement issued by the Reserve Bank. Bank credit, however, declined by Rs 4.61 crores to Rs 2072.30 crores. Contraction in credit was mainly under advances against inland bills. Investments in government securities advanced by Rs 14.99 crores to Rs 745.66 crores. Borrowings from the Reserve Bank declined by Rs 13.77 crores to Rs 54.90 crores. Money at call and short notice increased by Rs 6.95 crores to Rs 67.37 crores.

Balances held abroad increased by Rs 4.54 crores to Rs 9.40 crores during the week to July 16 according to the Statement of Affairs of the Reserve Bank. Foreign securities, however, remained unchanged at the previous week's level of Rs 68.35 crores. Notes in circulation declined by Rs 34.05 crores to Rs 2655.29 crores. Central Government deposits fell by Rs 12.15 crores to Rs 65.28 crores but State government's deposits were slightly higher by Rs 30 lakhs at Rs 17.49 crores. Deposits of the scheduled banks at Rs 125.11 crores showed a decline of Rs 20.79 crores. Loans and advances to governments increased by Rs 12.52 crores to Rs 56.74 crores. Advances to the scheduled banks contracted by Rs 28.51 crores. Investments of the Reserve Bank at Rs 291.62 crores showed an increase of Rs 15.09 crores over the previous week.

investment of Rs 34 lakhs, has not yet lived up to the earlier expectations in both its packet tea and instant tea divisions. In particular, packet tea operation has faced considerable resistance in its efforts to break into a consumer market virtually monopolised for decades by two powerful foreign firms in which the pattern of consumer taste and preference has been established over nearly 70 years.

The setback in the packet tea division could be fairly quickly made up from the profits from the instant tea division once the latter got fully under way. Here again, however, unexpected difficulties have been encountered. There has been a delay in the completion of the factory. It was possible for the company in June last to overcome the teething troubles and make a stable product of the exacting quality and specifications required by the American market for which it has been primarily destined. Meanwhile, the

elaborate programme of planning and marketing of the tea in the US, including intensive market testing, has been held in abeyance and is expected to be resumed in the next few weeks, too late to launch the product on the American market this summer. The purpose of Tata Oil Mills' investment in this venture was two-fold: sharing in an ultimately profitable operation and earning revenues in the form of selling commission for which purpose it had acquired its sole selling agency. Neither of these two sources of revenue has materialised so far and the selling agency agreement has been terminated through mutual consent from April 1, 1965.

Although the management would be on the look out for further opportunities for branching out, for the time being Tata Oil Mills is back in its original field where activity is characteristically marked by high volume and low profit margins. But the current year's operations are expected to show some improvement. The new solvent extraction plant at Tatapuram is now in regular production. The erection of the synthetic detergent plant in Bombay has been completed, and trial runs were started in May last. After some delay due to the late arrival of the boiler plant, the Ghaziabad factory started operations in September 1964, and is now on a regular production schedule of laundry and toilet soap and crude glycerine.

Indian Iron

THE Board of Indian Iron and Steel Company has proposed to pay a final dividend of 9.5 per cent, making a total of 17 per cent for the year to March 1965, the same as in the previous year. Last year, the company had raised distribution by one per cent which constituted a special cash bonus. But this year the bonus element has been merged with the dividend itself. The share markets reacted favourable to the dividend news as was reflected in a small gain in the price of the share immediately after the announcement.

A brief preliminary statement from the company shows that the gross profit, which had risen sharply from Rs 12.52 crores to Rs 15.91 crores in the preceding year, has recorded a small set-back of Rs 47 lakhs at Rs 15.44 crores. Looking to the year's production performance, however, this small fall in gross earnings appears insignificant, because the output of salable

steel recorded a decline of seven per cent.

Of the profit, depreciation has taken away Rs 6 lakhs more at Rs 4.46 crores and with the tax liability demanding Rs 67 lakhs more at Rs 4.54 crores, the after-tax profit has shown a visible dent, having declined by Rs 1.20 crores to Rs 6.44 crores. As before, the preferential dividend requires Rs 0.18 crore and equity dividend Rs 2.11 crores. The net appropriations to reserves have, therefore, been reduced from Rs 5.35 crores to Rs 4.15 crores. The shareholders, however, have the satisfaction that even then the dividends are very adequately covered by earnings, and the company's financial position is excellent and has been gathering strength year after year.

Colour-Chem

AFTER having established an unbroken record of a strong growth both in sales and profits, since the company started production, Colour-Chem has suffered a set-back in earnings in its eighth year which ended on March 31, last. The year's sales turnover is not disclosed in the preliminary statement released by the company, but it shows gross profit down by more than six per cent and net earnings nearly 25 per cent lower than the previous year's levels. The dividend rate is maintained at Rs 16 a share, subject to tax, against the previous year's entire tax-free distribution. The dividend cover has come down from 3.45 times to 2.58 times.

According to the preliminary statement, gross profit is lower at Rs 158.78 lakhs compared to Rs 169.37 lakhs a year ago. After charging depreciation of Rs 15.66 lakhs (9.36 lakhs) and providing for development rebate reserve Rs 4.57 lakhs (0.56 lakh) and for taxation Rs 87 lakhs (90.50 lakhs), the directors are left with a net profit of Rs 51.55 lakhs, against Rs 68.95 lakhs, of which the proposed dividend demands Rs 20 lakhs (same). General reserve is allocated Rs 25.75 lakhs (41 lakhs), dividend equalisation reserve Rs 5 lakhs (8 lakhs) and gratuity reserve Rs 0.78 lakh (0.52 lakh).

Kirloskar Oil Engines

AS was anticipated by its Chairman a year ago, Kirloskar Oil Engines has once again come out with good results. According to a preliminary statement from the company for the year to March 1965, sales turnover has ex-

panded by 20 per cent to Rs 6.77 crores and gross profit has advanced by 27 per cent to Rs 1.24 crores. Even though depreciation has taken up more at Rs 21.75 lakhs (16.17 lakhs) and taxation Rs 56.50 lakhs (46 lakhs) and allocation to development rebate reserve is only a shade lower at Rs 3.67 lakhs (3.79 lakhs), equity earnings are about 40 per cent up at Rs 38.34 lakhs against 27.60 lakhs previously, after providing the same amount of Rs four lakhs for preferential dividends. The ordinary dividend is maintained at Rs 16 a share to demand Rs 9.60 lakhs (same), and the cover is strengthened from around 2.9 times to four times. In order to finance further expansion, the directors have proposed a rights issue at par in the ratio of five-for-twelve to raise additional capital of Rs 25 lakhs.

Firth Sterling Steel

OF all the tool and alloy steel projects licensed so far, Firth Sterling Steel Company of India would be the first to go into production. But the management apprehends that when the company begins production it is likely to meet a severe competition in the market as a result of the large quantities of high speed steel allowed to be imported against various credits. A representation is, therefore, being made to the Government not to allow imports of finished items. Meanwhile, the construction of the factory is completed, and the machinery of the first phase is under erection. The second phase of the project will be completed with the installation of the rolling mill that has been ordered from the US. The mill machinery is expected to arrive some time in the middle of the next year.

The total project cost is expected to rise considerably over the original estimates due to the imposition of the 10 per cent regulatory duty on imports. Moreover, it has now been decided, as far as possible, to import all new machinery owing to certain difficulties involved in obtaining re-conditioned machinery as was originally planned. The additional cost involved is being worked out, and is proposed to be met by a further assistance from IFC. During the year to March 1965, the company has shown a loss of Rs 0.35 lakh. Together with the previous loss, the total loss comes to Rs 0.98 lakh to be carried forward. An expenditure of Rs 2.67 lakhs incurred during the year has been transferred to "expenditure under construction account."

Tata Engineering and Locomotive Company Ltd

Statement of the Chairman Shri JRD Tata

THE following is the statement of Shri J R D Tata, Chairman of the Tata Engineering and Locomotive Company Limited, for the year 1964-65.

To the Members,

While the Company's operations during the year showed material progress over the previous year, they could have been substantially better had it not been for the troubles which arose on the labour front at Jamshedpur to which a reference has been made in the Directors' Report. Internal rivalries within the recognised Union which have split the ranks of our labour force, brought down standards of discipline and productivity and affected production. In fact, during the month of December 1964, the Company was compelled to shut down the plant for two weeks. The position at the moment shows some signs of improvement and it must be earnestly hoped that the situation will return to normal and better conditions will prevail during the current year.

2. During the year, the gross block of the Company increased by Rs 8.7 crores mainly in connection with the current expansion programme of the Automobile Division on which Rs 15.6 crores have already been spent. The first stage of this expansion has been completed and capacity for production at the rate of 18,000 vehicles per year, or 1,500 per month, has been established. In fact output in excess of this rate was achieved during the latter part of the year under review. Thus the large capital expenditure incurred during the last two or three years has begun to show appreciable results and an increase of 28% in turnover was achieved during the year together with a proportionate increase in profits despite rising costs of raw materials and bought-out components.

3. The final stage of the expansion for 24,000 vehicles per year is under way. The second A I D Loan Agreement for \$ 11.8 million has been finalised and orders for the requisite plant and equipment are now being placed. Additional capacity is also being set up for the production of Tata-PEH excavators for which the demand continues to be very good. This product

is already the second largest contributor to the turnover of your Company.

4. The improved profits for the year have made it possible for the Company to maintain the dividend on Ordinary Shares at 14½% on the increased capital without having to draw upon reserves as was necessary during the past two years. The allocation of Rs 16 lakhs to deferred taxation reserve was considered necessary by your Directors because the depreciation charged in the accounts, in accordance with the principles in force in your Company, was lower than that calculated under income-tax rules. The resulting tax saving this year will be made up by higher tax payments in future years for which the deferred tax allocation is intended to provide.

5. Prospects of further substantial progress in the current year were bright until the recent suspension of imports as a result of the foreign exchange crisis hit us without any prior notice. Since April 1965, the Company has received no import licences whatever for essential raw materials and supplies; neither has it received any indication as to when shipments will be resumed. The Company cannot hold excess stocks of imported raw materials and components in order to provide a cushion for an unforeseen major break down in supplies both because the rate of imports is closely regulated by Government and because of lack of finance. As a result, the cessation of imports for the whole of the first quarter of the current year has compelled us to cut back on production with effect from June 1965. Even if import licences for our full requirements for the year are issued in the near future, it will not be possible to make fully up for such loss of output and the production of vehicles during the current year is not likely to exceed materially that achieved in the past year while the incidence of depreciation and interest will increase substantially.

6. Such a situation is not only a source of great disappointment to us all but it also involves a serious loss to the country far transcending our own, for apart from Telco, the present foreign exchange crisis affects all manu-

facturing industries which require imports of materials from abroad. Thus, manufacturing facilities established by us and others at great cost remain partly unutilised.

7. While planning is recognised as a necessary instrument of rapid economic growth in a country in which scarce resources have to be allocated on a careful order of priority, sound planning requires that imbalances within the economy be foreseen and prevented as far as possible. The shortage of various kinds facing a number of industries today has arisen largely from the failure to back up the rapid increase in their capacity with a corresponding expansion of sources of indigenous raw materials and components, as a result of which additional capacity installed at heavy cost to the economy is only partially utilised.

8. The present situation in our own Company is a typical illustration of this state of affairs. When the current expansion of our Automobile Division capacity from 12,000 to 24,000 vehicles per annum was undertaken at the instance of Government as part of the overall expansion of the Automobile industry in the Third Plan, Government were fully aware of the requirements of special steels and other materials essential to the operations of the new facilities. Yet, at the end of the Third Plan and over ten years after we began to make commercial vehicles, virtually none of the special steels incorporated in our vehicles are made in the country or likely to be made for some years.

9. Instead of creating large additional industrial capacity which cannot be fully utilised due to paucity of foreign exchange or of indigenous raw materials, the logic of industrial planning should in fact allow, at the very outset, for some margin in raw materials and time—in raw materials, to ensure that the plant, when installed, is kept fully utilised, and in time, to allow for unexpected delays.

10. The high cost of borrowing has, as you will observe from the accounts, greatly increased the interest charges paid by your Company. The regulatory additional duty of 10% on the value

of all imports, indiscriminately on capital as well as current account, has increased our capital and production costs. During the current year your Company alone will have to pay almost Rs 2 crores more as a result of this new impost. Recently, a new measure requiring the deposit of 25% of the value of imported raw materials and components has been announced. This will impose yet another burden on the strained finances of the Company and industry generally.

11. Your Company has been conscious of the need to make vigorous efforts to earn as much foreign exchange as possible by exporting its products. Thanks to the assistance of our associates, Messrs Daimler-Benz, the export orders during the current year have increased significantly. The value of exports already made and of firm orders on hand exceed a crore of rupees. We have every hope that before long we shall be able to secure a sizeable export market for our products.

12. In view of the wide public interest evinced in the small car project and press reports about the possibility of your Company undertaking it, I would like to clarify the position as far as we are concerned. To your Company which has made a success of the production of commercial vehicles, the manufacture of a passenger car would be a logical extension of our existing operations and your Directors have therefore maintained their interest in the possibility of such a project being entrusted to Telco. In May this year, having ascertained that the Government of India might be willing to consider such a possibility, we held discussions in Germany with our partners, Messrs Daimler-Benz, to ascertain the feasibility of producing in India a suitable model of the DKW car manufactured by Messrs Auto Union which has been for some time a 100 per cent subsidiary Daimler-Benz. As a result of recent developments, however, Daimler-Benz no longer hold a controlling interest in Auto Union. Our discussions revealed that as a result of the altered circumstances and for other reasons, it would be neither desirable nor feasible for your Company to undertake the production of any model of the DKW. We have therefore had reluctantly to inform Government that we are not in a position to put forward a scheme for the manufacture of a small passenger car.

13. From recent newspaper reports, it would seem that the project is likely to be shelved for the present owing

to the current economic situation and foreign exchange crisis. While there is therefore no possibility of your Company entering the field of passenger car manufacture in the near future, your Directors will continue to keep the matter under review and hope that sooner or later the day may come when the Company will round off and diversify its operations by entering the passenger car field. With the continued industrialisation and economic development of the country and in view of our enormous population, it is clear that a large expansion in the production of passenger cars must be undertaken sooner or later. When that time comes, your Company, with its large resources and experience in the field of commercial vehicles, will be in an exceptionally favourable position to take part in such a development. I can only hope that circumstances and Government policies will then make it possible for us to do so.

14. Causes for rejoicing are so rare these days that I must refer to the gratifying landmark in the history of our Automobile Division, which we passed on the 3rd of June this year when our 100,000th Tata Mercedes-Benz vehicle came off the assembly line. As a token of our Company's appreciation of the support and loyalty which it has consistently received from users of our vehicles, we made a gift of the 100,000th vehicle at a special function at Jamshedpur to the Montgomery Co-operative Goods Transport Society, New Delhi in exchange for the oldest T M B truck on the road. This was despatched to its owners on the 4th November, 1954, and has since then given trouble-free and profitable service for about 500,000 miles. We can take justifiable pride both in the number of vehicles we have produced and in their high quality and productivity.

15. The production of our 100,000th vehicle brings into focus the progress achieved, in the face of innumerable difficulties and obstacles, since the beginning of the Automobile Division a little over ten years ago. In that period we have produced equipment worth Rs 356 crores, and saved about Rs 105 crores in foreign exchange; we have paid Rs 37 crores in wages, Rs 76 crores in taxes, excise and customs duty; distributed Rs 10 crores in dividends; invested Rs 40 crores into the business. Apart from the direct employment we have created for 15,000 people, a million or more people have obtained their livelihood from the 100,000 vehicles and other products we have

sold in the last 10 years. Last but by no means the least, we have created technical and managerial skills of the highest order, amongst the most scarce and valuable assets in a developing country.

16. We may therefore look back with some satisfaction on these ten years of achievement, progress and service to the country. To all those who have contributed to the success of this great undertaking, to our staff and workers, to our collaborators and our dealers we owe a deep debt of gratitude.

17. While we do not propose to rest on our oars after we complete our current expansion projects and will look for further opportunities of profitable and constructive expansion, I may assure you that we shall not overlook the need to digest our present programmes and to consolidate our resources in labour and managerial skills and in finance.

18. While we must be prepared for a temporary setback in the current year due to the cut back in our production, we shall by 1967 have established in Telco an incomparably strong, versatile, resourceful and self-sustaining engineering base. Subject only to uncertainties in regard to Government's future policies and the general economic situation in the country, our ability to produce and sell such a large volume of products of the highest quality should not only ensure the continued profitability of our operations and the financial security of our Company but also our ability to take full advantage of any rewarding opportunity that may offer itself for further growth in the years to come.

19. Before closing my remarks, I would like to record our deep regret at the passing away of one of our ablest and most loyal officials in the person of Mr V Srinivasan who was the Chief Accountant of the Company in Bombay for nearly nineteen years until his death in May this year. Your Directors have placed on record their deep appreciation of his invaluable services and devotion to duty.

20. On behalf of the Directors and on your behalf, I would like to express my thanks and appreciation to the Company's workers and staff who, under the leadership of Lt Gen S D Verma, our General Manager, have made possible the results achieved during the year in the face of innumerable difficulties.

N B: This does not purport to be a record of the proceedings of the Annual General Meeting.

Index Of Industrial Production

(Base: 1965=100)

Items	March	Febru- ary	January	March, 64
GENERAL INDEX				
Seasonally adjusted	189.2	184.6	185.1	173.2

**QUIET
EFFICIENCY**

Behind us the tradition of nearly a century. With us a management mellowed by about 75 years. Experience is our most important single attribute which makes us believe that steel plant efficiency is more than setting a few production norms and excelling them occasionally. That it is a continuous process tied to operational research and progressive integration.

Thus when the nation needs better iron, more steel and more diversified end products—our answer

is another two-phase expansion programme to double annual production to 2 million tonnes of ingot steel. We intend first to introduce the latest techniques, and balance our existing plant and equipment to increase output by 30%. We hope next to look around and decide on the shape of phase II. Our planning will ensure that each phase complements the other with the lowest possible investment costs for the country.

Telegrams: "FACT", Udyogamandal. Telephones: 48, Alwaye and 474, Ernakulam.

Capital Authorised: Rs. 10,00,00,000

Capital Issued: Rs. 6,95,97,740

PRODUCTION: At present FACT has an annual production capacity of 100,000 tons of ammonium sulphate, 8000 tons of ammonium chloride, 33,000 tons of FACTAMFOS (Ammonium Phosphate 16 : 20) 44,000 tons of superphosphate, 100,000 tons of sulphuric acid and 3,500 tons of liquid sulphur dioxide.

EXPANSION: In 1964, the Company launched a multi-phased expansion programme. The first and second stages of this expansion programme, involving respectively Rs. 3 crores and Rs. 2 crores, have since been completed. The second stage, completed in 1962, ushered in the Company's new oil gasification complex, the first of its kind in India.

FACT is at present engaged in putting through its third stage expansion programme estimated to cost Rs. 12 crores — a programme which will more than double its present production capacities.

Congress Is Like That

IT had been widely believed and emphatically given out from knowledgeable circles that the Bangalore session of the AICC would be a stormy one, that there was seething discontent within the party, that this would find vociferous outlet and that there would be head-on collisions among the leaders, many of whom are in the State Ministries, not only over the many inter-State disputes but even on the outstanding question before the country today of a unified all-India food policy. Overshadowing all these, however, was the Kutch cease-fire agreement. Large sections of the rank and file of the Congress party violently opposed what they regarded to be an abject surrender and the aggrieved were spoiling for a fight with the High Command. The growing resentment against the High Command, it had been expected, would be pin-pointed in the sharp opposition to the resolution for allowing a second term of office to the Congress President and Secretaries, setting aside the very wise resolution, passed at the Hyderabad session some years ago with the active support of Pandit Nehru, directing that there should be no second term of office for them. And in the last few days before the AICC meeting the Goa issue had come up in a big way, but not South Viet Nam, despite what had been happening there: the escalation of the war with the liberation forces and against the sovereign state of North Viet Nam which has been subjected to increasingly severe bombing and the use of American forces in ever-increasing numbers as combatants. No, not Viet Nam, but it was Goa which had aroused popular passions. It was Mysore's violent protest on the Goa question and the black flag demonstration which greeted Lal Bahadur Shastri on his arrival that laid the setting of the AICC session.

Was it then that the AICC was too preoccupied with the country's internal problems to pay any attention to Viet Nam, prudently deciding that turning a blind eye on Viet Nam was not too high a price for foreign food and foreign aid?

Not even that. Food and foreign exchange or foreign aid were both shelved. The Central Food Minister made a statement that by August 15 a unified food policy would be settled. The Finance Minister circulated a note to the members of the Working Committee on the economic situation and on the Fourth Plan which was not even discussed at the AICC. Curiously enough, even the Kutch agreement which was guaranteed to draw fire was for that very reason kept out of the debate. The subject was treated generally in Shastriji's address to the AICC for the very prudent reason that once a formal resolution was moved, it would be difficult to avoid an open clash in view of the sharp divergence of views. In his general review of the international situation which scrupulously avoided any mention of Viet Nam, the Prime Minister only incidentally dealt with the Kutch dispute. The absence of any criticism of his statement can now be construed as an endorsement by the party of the Government's position.

There were hard-hitting speeches and much airing of grievances at the beginning of the session. A little blowing off of steam does nobody any harm. The session was conducted with an adroitness, not unlike that of an experienced and wise board of directors managing a stormy shareholders' meeting. The AICC concerned itself almost exclusively with internal party matters and with the problem of setting its own house in order. The High Command got an almost unanimous vote of thanks in the resolution extending another term to the President and the Secretaries of the Congress, if considered necessary. Morarji's was the lone voice of opposition but it was an opposition which he prudently, and for obvious reasons, did not press to a division.

This is not to under-estimate, however, the importance or gravity of the problems which the session sought to deal with. One was that of inter-State harmony, on which a resolution was carried to the effect that all efforts must be made to settle inter-State disputes by mutual negotiations and in cases where such efforts do not succeed, the Government of India should set up appropriate machinery for a speedy and final settlement of the disputes. The other resolution was on organisational unity; to resolve faction fights among Congressmen, it was recommended that the Working Committee should

constitute a panel, out of which the President may appoint boards to settle all differences.

Whichever way one may look at it, one may still ask what was there so very special about the Bangalore session? It has always been like this. The rank and file may let off a little steam but the Congress leaders know that in the end they come round and, as always, the High Command has its way on all the issues. What does make a difference, and this is what lends significance to Bangalore, is the support the High Command gained for itself, and for its members. For, a second term of office means just that. This comes at a time when Lal Bahadur's own position had not been secure beyond doubt. It now is. The Syndicate or triumvirate no longer rules. It is now Lal Bahadur and Kamaraj and the earlier evidences which suggested a lack of accord between the two, as on the language question or on the size of the Fourth Plan and its con-

How 'Asian', the Asian Bank?

NOTHING could be more misleading than the reports appearing in the Indian Press, some of which are obviously inspired from New Delhi, that the Asian Development Bank will have an Asian bias and will have a majority Asian vote and that "this will be in striking contrast to the World Bank, which has an American accent and an Atlantic bias" (*Indian Express*, July 23).

This unfortunately is not the true position and a look at the shape of things to come suggests that the bank and its operation will be completely dominated by the USA through her friends in Asia like Japan, Thailand and Australia. Right at the very start the bank has got off on the wrong foot and wool is being pulled over the eyes of the Asians. This will be very clear from the progress of the proposal so far.

Until recently the Americans were very cold in their attitude towards the Asian Bank. At the meeting of the ECAFE in March in Wellington, the American delegate made a statement in which he expressed considerable doubt that such a bank will really help, and he made the US offer of any capital subscription to the bank conditional upon the Asian members raising a substantial part of the capital themselves first. The representative of the

comitant, a greater devolution of economic powers and functions to the States, are now to be definitely discounted.

The analogy cannot be drawn from the record of political parties in parliamentary systems elsewhere that party conferences lack much significance as a guide to future government policies on the ground that the Prime Minister and the Cabinet are accountable to parliament alone, and to no outside body, not even to the party conferences. For that situation to arise the Prime Minister and the parliamentary party have to attain the requisite status. The inference may not be unwarranted from his handling of the Bangalore session that Shastriji is now coming up to that status, if he has not already achieved it. And he has done so by his own technique of quiet diplomacy, working through compromise and conciliation, rather than by facing up to problems and attacking them boldly.

World Bank doubted whether the bank would be able to add any fresh capital to what was already flowing into the area and this statement drew an angry rejoinder from the Executive Secretary of the ECAFE. The Japanese, too, until last year were very doubtful about the wisdom of setting up such a bank and their spokesmen made no secret of it that Japan would prefer to set up a separate Japanese Development Bank.

All this suddenly changed when President Johnson made his somewhat dramatic announcement that US will put a billion dollars aside for providing assistance to South-East Asia in an effort to show to the world that Americans could also hold up the carrot while wielding the big stick in S E Asia and appointed the former President of the World Bank, Eugene Black, as the administrator of this Fund. At this point US economic policy in South-East Asia underwent a sea change all of a sudden. Soon after this, Walter Rostow, the State Department's top economic planner paid a fortnight's visit to Japan where, among other things, he discussed with members of the Planning Agency in the Government of Japan the joint role of USA and Japan in the economic development of S-E Asia. This was followed by the visit of a high-powered Japanese Economic Mission

which spent a couple of weeks in Washington. Eugene Black paid a special visit to a meeting of the Asian Bank Consultative Committee in Bangkok and offered \$200 million out of the \$1 billion Fund towards the capital of the Asian Development Bank, without any prior condition that Asians raise their own contribution first. The Japanese delegate in the Consultative Committee developed overnight a lot of warmth for the Asian Development Bank and even the Thai delegate struck a very enthusiastic note in sharp contrast to his earlier reservations. Thailand is also wooing Malaysia to form a bloc with itself so that Malaysia and Thailand may act together within the counsels of the Bank.

The emerging strategy for the bank is thus becoming quite clear. Out of the proposed \$1,000 million capital of the bank, about \$500 million is to be raised between Japan, USA and America's "Asian" cousin, Australia. With the help of other countries like South Korea, South Vietnam, Philippines and Thailand, and Malaysia being also drawn into this constellation, a solid block of \$600 million will be under one control—USA-Japan control. The rest of Asia—India, Pakistan, Burma, Ceylon, Afghanistan, Nepal, and Iran—will contribute and, therefore, control voting strength of less than \$400 million, with India's share at about \$90 million as against Japan's quota of \$200 million. India will in this case be in a permanent minority along with the bloc of countries other than those in the Pacific area. USA and Japan with all the smaller countries in the Pacific area which are virtually US allies will dominate the bank's management, even though they may offer India and Pakistan a few glittering but ineffective positions on the bank's management staff!

India's position in the Asian Development Bank will not be as good as it is in the World Bank. In the World Bank, India's share capital is significantly larger than that of Japan and India appoints a permanent director, not an elective one. This position of pre-eminence has been sought to be challenged by both Germany and Japan in recent years but neither has succeeded in obtaining a larger voting strength than India's. India's role in the World Bank, though presumably based on the volume of capital subscription, of which only 18 per cent is paid in US dollars and the rest in local currency but also to its national in-

come, population, size and such other factors. On these grounds India's position as a shareholder in the World Bank rests on considerations other than its contribution in foreign exchange. Such a position was secured for India by the British who argued the case for India when the World Bank was first established.

Now in the case of the Asian Development Bank, where we are arguing our own case, it is sad to find that we have not been able to secure for India a position comparable to what we have in the International Monetary Fund and the World Bank. Here Japan acting jointly with the USA will have the predominant voice. It is now common

knowledge that a Japanese will be the first President of the Asian Bank and even his name is not much of a secret. India will have to take whatever position is offered to it by the Japanese and the Americans and will at no time be able to mobilise enough voting strength to neutralise any policy stand jointly taken by the USA and Japan. This position of inferiority is being accepted for India with open eyes by the Government of India and its civil servants, who play the role of bankers and do not even care to grasp the basic issues.

In the case of the African Development Bank which came up well ahead of the Asian Development Bank, the

Africans successfully resisted the temptation of having their bank dominated by non-African powers. But as it is emerging, there is little that is Asian about the Asian Development Bank. India which supported this project with considerable enthusiasm at all stages is being relegated to an ineffective minority position and is hardly aware of what it is doing to harm its future role and stakes in the World Bank and the International Monetary Fund. For, in the counsels of the World Bank and the Fund Japan can now turn round and challenge India's position by citing and using its own pre-eminent position in the Asian Development Bank!

Weekly Notes

What Do These Figures Mean?

THE figures of targets of and achievement in employment are among the statistical curiosities of planning in India. It is, of course, entirely understandable that liquidation of unemployment should be given its due place of importance among the objectives of planning and also that attempts should be made to measure the progressive impact made on the problem by the plans. The conceptual problems of measurement of employment and unemployment are well known. The National Sample Survey has established that the number of persons without work and actively seeking work at any time constitute a negligible proportion of the working force. Unemployment really takes the form of less than full-time work for those capable of working and the only way of measuring it is by estimating the frequency distribution of persons according to degrees of underemployment. This approach was found too complicated by the planning authorities in the country who took recourse to a method of calculation which yields figures of the number of employed and unemployed persons. The result is that all figures of targets and achievement appear completely meaningless though, as one is never told exactly how the underemployment figures are translated into figures of unemployment, they never get challenged by anybody.

There seem to be three stages in the calculation of unemployment figures. First, the addition to the labour force during a plan period is calculated on the basis of population growth. With this part there can be

no quarrel. Next, some figures are produced purporting to be the employment potential of the plan in terms of persons to be employed additionally. Presumably certain crude sectoral employment-outlay ratios are used. What empirical basis these ratios might have is not known. For one thing, in most branches of the economy empirical data relate to total amount of labour time employed, not to the number of persons employed. Second, very little information is available about the labour time employed usefully in such sectors as agriculture and the services. All the same, a target of 3.5 million additional employment in agriculture was cheerfully set for the Third Plan (without counting employment generated through the rural works programme) and even more cheerfully now it is claimed (on what basis?) that this target is going to be fulfilled. No doubts are felt by official statisticians on account of the non-fulfilment of physical targets of production in agriculture. Not that employment in agriculture ought to be proportional to output, but to what is it considered proportional and why? The third stage of the calculation concerns employment actually created. One understands the proportions of fact and fiction in this calculation if one considers the official statement that there will be a shortfall of one million in the Third Plan employment target which was 14 million "new jobs". The anticipation that 13 million "new jobs" will be actually created in the Third Plan is based on the direct evidence that in the public sector and in industrial units employing 25 or more persons in the non-agricultural private sector employment had gone up by about 1.5 million by the middle of the Third

Plan and that by the end of the Plan the figure might reach 4.5 million. Another 5 million employment opportunities are assumed to be generated in the small industries and the services sector and another 3.5 million in agriculture — both these on the basis of no evidence one can think of!

One indication of the calculations underlying these "estimates" being meaningless is that they seem to be quite insensitive to other aspects of the performance of the economy. The figure of 13 million "new jobs" likely to be created in the Third Plan was arrived at as early as in the latter part of 1963. All the evidence about the performance of the economy since then appears to have necessitated no change at all in the estimate. The fact that these figures do not really mean anything at all to even the planners and policy makers is seen from the very different interpretations of them by Cabinet Ministers themselves. In August 1963 the then Planning Minister, G. L. Nanda, spoke despairingly of the ever-widening gap between target and achievement in employment in different sectors, and confessed his ignorance about how the gap could be bridged. It was hopeless to expect, according to him, that the proportion of the agricultural population to the total would shrink from 70 per cent to 60 per cent during the 15-year period up to the end of the Fifth Plan. However, T. T. Krishnamachari, on the basis of exactly the same data, expressed in November 1964 the hope that by the time the Fifth Plan was implemented unemployment would cease to exist. And more recently in January of this year the present Minister of Labour, Sanjivayya, spoke heroically about what was to be done to attain the

"objective of providing employment to all work-seekers by the middle of the next decade" and thought it possible "to reduce the proportion of working force dependent on agriculture to around 60 per cent by 1976"

New Winds among Tories

AFTER a long holding operation, Alec Home has resigned the leadership of the Conservative Party and Heath has been elected leader.

The succession has a number of striking features. For one thing, this is the first time in the history of the party that a leader has been elected by ballot. This can be said to be an unwitting achievement of Macmillan; if he had not blocked a democratic selection of the leader last August, the method of selection would not have become a live issue and Home might not have had to promise a ballot. But more significantly, the ballot reflects the social disintegration of the ruling circle in the party. Until very recently, the honorary character of full-time party jobs had kept them in the hands of men of means; and among them, those who went to Eton and Harrow maintained a social homogeneity which ensured inbreeding of the leader.

This time there was not a single Etonian or Harrovian among the chief contenders. Heath, Maudling, Power—these were all outsiders. Further, they had all made their mark in something besides politics. So within a year the party has gone over from the dynastic principle to choice by merit. The change cannot but have a grave influence on the balance of power within the party. We might expect dynastic power to decline. Its decline was portended even when Macmillan defied Salisbury over Rhodesia in 1963. Now men of the dynasty are inconspicuous even on the back benches.

It is also possible that struggles within the party might revolve more around principles and issues and less around personalities. The preoccupation of the party with Macmillan in his last years and with Home in the past few months is well known; Heath is unlikely to give rise to such speculation and intrigue. On the other hand, the conflict between the reformist tendencies represented by MacLeod and the *laissez-faire* doctrines expounded by Powell might have a greater chance of reaching the party rostrum. Such a development will make the party less of a subject of gossip and render it more amenable to discussion. For the next few months, however, both gossip

and discussion must be stilled, for the foremost goal of the party will be to force and win a general election.

PL 480 Burden Made Heavier

THE hurried exchange of notes between USA and India for the sale of one million tonnes of PL 480 wheat to us has some surprising features. Amidst recurrent official claims about generally good crops it is odd that the need should have been felt for such an emergency arrangement. But then we know that neither the government's long-standing programme of building up buffer stocks nor this year's procurement campaign has made the expected progress so far.

The other feature of the arrangement is a bigger surprise: the US government has made the related terms less generous than before. Half the total imported wheat comes in American ships; now for the first time India will have to pay the freight charges in foreign exchange. Previously 80 per cent of the sale proceeds of the wheat were made available to the Indian Government for development purposes; now the percentage has been lowered to 75. The proportion retained by the US has been used for such purposes as covering the expenses of her various missions in India, giving loans to American firms here, giving aid to other countries like Nepal and Burma, and selling rupees to American tourists. It has recently been reported that the USA now wants to intensify such uses of her soft currency holdings in the under-developed countries. In a very real sense the 25 per cent of the price of the imported wheat that the USA uses in this way represents a loss of foreign exchange that we might have earned otherwise. Hence it is wrong to consider PL 480 wheat as entirely free.

And there are other and less obvious costs. Of the share of the sale proceeds (80 per cent) that used to be given to the Indian Government only half was in the form of grants; the other half used to be in the form of loans. This latter amount is the property of the US Government—even though it can use this amount only on projects the Indian Government agrees to. Moreover, since this amount earns interest in one form or another, it has been growing. According to a rough estimate made in 1962, the various rupee holdings of the US Government were expected to amount to about one-fifth of the total Indian money supply by the end of the Third Plan. It was

further estimated that if the arrangements for the disposal of these funds (partly as loans instead of totally as grants) were to remain unaltered, then in another two to three decades they might roughly amount to one-third of the Indian money supply. "Money supply" is a hazy concept; so these estimates are necessarily exceedingly rough. Yet they do show that a part of the PL 480 funds (the part which is given to India as loans) has been accumulating in a way which might in the long run raise serious problems of liquidation through either a transfer of resources from here to the USA or their belated final use in India.

It was for such reasons that the present Chief of US AID mission in India, John P Lewis, had recommended in his book ("The Quiet Crisis in India") that in future PL 480 agreements a larger proportion of the sale proceeds should be given to India as grant and that even the old agreements should possibly be renegotiated to incorporate this provision. But the recent exchange of notes about the one million tonnes of wheat—while a new PL 480 agreement is being negotiated for the next year, under which India is requesting for 6 million tonnes of wheat and 200,000 tonnes of rice—provides that no part of the 75 per cent of the sale proceeds which will be given to the Indian Government will be in the form of it will now all be a loan. We can only hope that this is a temporary aberration and that our negotiators will not let such a provision be included in the new agreement.

Maldives: Independence and After

THE British-protected sultanate of the Maldiv Islands became a sovereign nation on July 26. This group of 2,000 islands of which only 214 are inhabited, situated 400 miles south-west of Ceylon, achieved independence at the price of allowing the continuance of a British base on the island of Gan till 1986. The Sultan, Mohammed Farid Didi, had demanded independence as far back as 1958 in return for the re-establishment of a Second World War airfield at Gan. Negotiations broke down and by a remarkable coincidence a revolt led by Abdullah Afif Didi broke out in the southern Maldives where Gan is situated. The Sultan accused Britain of inspiring the revolt in order to pressurize him into agreement about the base. A year later Abdullah Afif's United Suvadive Islands Government dissolved itself. The British re-started negotiations. The

outcome, after several years of wrangling, is freedom for the Maldives with the proviso of continued British military presence on the island of Gan.

For the time being both parties to the agreement are content. This state of tranquility is, however, unlikely to last for more than a short time. Nationalist sentiment is gathering strength for a showdown against the British as well as the feudal oligarchy of the Sultan. The British are unlikely to come to terms with nationalist sentiment as Gan is a vital refuelling base for British military planes flying to Malaysia and the Far East. As long as Britain retains her defence commitments in Malaysia she will have to maintain her base on Gan at all costs unless she builds a base in the Seychelles or some other group of islands in the Indian Ocean. If the Anglo-American plan "to fill the power vacuum" in the Indian Ocean or the "Nuclear Umbrella" plan materializes then it is quite possible that Gan will be converted from a staging post into an air base for nuclear bombers. If this happens only the gods will be able to save the Maldives from becoming another little unwilling pawn in the game of big-power politics.

Misuse of Import Control

THE cut in the import quota for books to 37½ per cent of last year's imports betrays thoughtlessness as well as an illiterate habit of mind in the Ministry of Commerce. In the absence of quality control, imports of books of scientific and literary merit will bear the brunt of the cut while fast-selling cheap fiction will continue to be sold in heaps on our pavements. Apparently the latter constitutes the staple reading of our policy makers. The selection of books displayed in our best bookshops is poor even in comparison to bookshops in Beirut; now the government is stepping in to reinforce the sluggish ways of our booksellers and reading public.

The common arguments regarding the balance of payments and import substitution have no application to books. Books constitute less than a four-hundredth part of our imports; there are far more harmless, painless and effective ways of reducing imports. And imports substitution of knowledge will be hampered rather than encouraged by the reduced imports, for the discovery of knowledge is a skill that has to be learnt from example.

Hope that the cut in quota will help Indian publishers is misplaced. High cost of paper as well as the small market will continue to inhibit the publication of foreign books in India, while books published by Indian publishers simply are not close enough substitutes for foreign books to benefit from the restrictions. The only beneficiaries will be the subsidiaries in India of foreign publishing houses. They have raised the exchange rate for pricing the books imported by them to 90 paise per shilling and there is a prospect of further rise to a rupee a shilling. So much for the import cut that is to defend the values of the rupee.

Compared to the effect of the import cut, that of the 25 per cent import deposit is even more immediately catastrophic. Let alone the paperwork generated in making out invoices for the exact value of books to be imported including their postage and other costs and in the issue of receipts by the Reserve Bank (perhaps this would be considered an achievement in our paper-ridden country); the system imposes responsibilities on foreign publishers which they have no interest in fulfilling. It is only as a matter of convenience to prospective buyers that publishers give out approximate prices and dates of publication in book lists, they neither commit themselves to either nor send out notifications on publication. Now, however, an Indian importer needs to know the exact price to be able to calculate the import deposit. Since the price becomes fixed only on publication and as the importer would be disinclined to let his working balances lie idle longer than is necessary in the Reserve Bank, he will tend to order books only after he knows that they have been published. This is not only much less convenient than the present system wherein importers keep running accounts with publishers and let them know their requirements early, it will also increase the delay in getting books from abroad.

Import restrictions are very powerful investment in the efforts to manage our parlous payments; they are both necessary and useful. In the case of books, however, they are being perniciously misused.

Is There an Alternative?

A correspondent writes:

WOULD it be a bad thing if the starting of Fourth Plan projects is delayed by a year or two, as demand

ed by the World Bank and other members of the Consortium? The demand has not been made that blatantly. It is couched in more positive language: the Consortium will give adequate aid for completion of Third Plan projects and for bringing their production to capacity level; project aid would be confined to the setting up of balancing projects. Aid for Fourth Plan projects would be considered after this consolidation is satisfactorily completed—and sufficient care has been taken of agriculture and public enterprises. Had India been a creditor in this kind of situation, it would have imposed the same—or stiffer—terms. The creditors are within their rights to demand that full value be recovered for their money; whether and when they do so loudly or diplomatically is up to them to decide.

The choice before India was either to have a strategy and pattern of development which minimised dependence upon foreign aid and investment with all that it implies in terms of consumption restraints and the political and administrative capacity to carry it out or to maximise such dependence for a couple of decades in the hope of reducing it substantially later. We chose the latter course, which has run into trouble principally due to two reasons. Creditor countries were misled by the analogy of the Marshall Plan into believing that aid to under-developed countries was a temporary shot in the arm and are now disillusioned to find that it is a very long-term proposition in which things get worse before they have a chance to get better. At our end, avoidable mishaps and delays have tended to give the impression of impaired credit-worthiness with understandable consequences.

Leaving aside the heroic statements about a Rs 22,500 crore Fourth Plan, the fact is clear that its real size has been greatly whittled down by price inflation and that its physical components are still uncertain in terms of magnitudes and pattern as is the ability to achieve them. There can be no sanctity about the figure of 22,500 or the sector-wise targets when long delays in attaining them are taken for granted all the time. Widespread cynicism has now taken away the popular appeal which targets were supposed to have; that does not make targets useless or meaningless but it takes the shine off them. Targets are meaningful in terms of timely achievement at reasonable cost and in terms of inter-sectoral balances; to the extent these

qualities are tarnished, targets cease to impress people at home and abroad.

The upshot of all this is that since we are unlikely to be able to change our strategy and pattern of development to minimise dependence upon foreign aid, we have really no alternative but to settle down to such phasing of the Fourth Plan as would enable us, in the first two years, to realise the full benefits of past investments and to realise them in such a manner as to reduce the demands on foreign exchange in future years. To some extent this would come about automatically because greater production of intermediate and capital goods and food would obviate imports. It is quite possible that if this policy is carried out properly it may help fulfilment of the original long-term targets of investment more easily. In any event, a phased plan of this nature would be better than a large plan on paper and then exposing it to spasmodic and *ad hoc* cuts which would upset the entire balance of the plan.

Emphasise Motivation Not Means

THE country celebrated a family planning week from July 15 to 22 with promoting the use of intra-uterine contraceptive devices (IUCD) as the main goal. While in the country as a whole the campaign to propagate IUCDs was restricted to urban areas, with an adequate contingent of doctors Maharashtra has decided to take it to rural areas as well. During the same week, the Federation of Obstetrics and Gynaecological Societies of India sponsored in Bombay, a three-day International Medical Seminar on Modern Contraceptives which was inaugurated by the Union Health Minister. Earlier, there was a report from Lucknow that under the auspices of the Public Health Service Department of the Central Government, a researcher discovered a herb, *Butia Monosperma*, to be effective as contraceptive, if used with some other seeds.

For quite some time now there has been much talk of a "crash programme" to lower the birth rate. But one wonders whether in our frantic search for a solution to the problem of rapid population growth, we are not clutching at any straw that comes our way. Official policy seems to change emphasis frequently. The rhythm method was in vogue during the First Plan period. Later the emphasis shifted to foam tablets and the like. The

draft outline of the Third Plan marked the beginning of emphasis on vasectomy and now we are out to promote IUCDs as the final solution to our problem. There is no doubt that the country must take advantage of the latest advances in contraceptive techniques; the emphasis on propagating IUCDs is, therefore, most welcome. But sometimes one does get the impression that a sense of balance is lacking.

It seems to be forgotten that before propagating this method or that, what has to be done is to create the motivation for family limitation. Specific techniques are less important because even a less efficient technique such as *coitus interruptus* can lead to a significant drop in the birth rate if it is adopted by a sufficiently large segment of the population, as the experience of some Western countries bears out. Our mass-media are still to evolve an effective programme to take the "gospel" of family planning to the millions in the rural areas and it is in this sphere that the crash programme must make a dent. Similarly programmes to impart sex education to those who will soon enter the reproductive ages are virtually absent — a lacuna which increases every year the number of uninitiated persons who must be contacted by the special family planning workers.

Incidentally, the Bombay seminar on modern contraceptives reportedly produced a consensus against the adoption of abortion as a means of family planning and against its legalisation, seeing in it "certain inherent dangers" which the seminar thought should be made plain to the people. International experience in the Scandinavian and Eastern European countries seems to suggest that the dangers of legalising abortion can be exaggerated and that, in any case, these dangers are not "inherent". It is possible to legalise abortions only in certain areas; and it can be permitted only in cases which satisfy certain conditions. Its main role can probably be to mitigate the complex problems arising in cases of accidental pregnancies, occurring despite the use of contraceptives—including the IUCDs. Thus abortion need not necessarily be adopted only as a full-fledged part of the family planning programme; yet it will have a vital role to play in family planning under certain restrictive conditions. It is to be hoped that the committee appointed to study various aspects of legalising abortion will take an objective view of the problem.

LETTER TO EDITOR

Plan Size and Profits

I ALWAYS read Romesh Thapar with interest but must he make such sweeping generalisations?

In your issue of July 10 he asserts that "anti-planners are mobilising behind the slogan of consolidation to blunt our development effort which they see as a growing threat to the *status quo* of privilege and profit" I do not know what he means by this but if he is equating big plans with low profits and *vice versa*, he is quite wrong.

Businessmen have known for a long time that big plans mean big profits. Only our bright economists and statisticians have had to wait for Mahalanobis and Co's dismal report on income distribution to discover that the present pattern of plan expenditure has led to greater inequality in incomes. Romesh Thapar might usefully refer to your issue of July 3, 1965, in which Ashok Rudra has pricked some of the bubbles in K N Raj's vast apologia delivered at Nalanda. "The obvious conclusion to draw", says Rudra "is that the incremental income has been distributed more unequally than the average income, which implies a change in the income distribution towards greater inequality. This is also one important aspect of the 'performance and prospects' of the Indian economy."

There is little doubt that a bigger plan will increase rather than reduce the trend towards inequality. One reason for this is that a big plan will almost certainly be implemented more inefficiently than a small one and Thapar must know that in an inefficient and non-competitive milieu it is the relatively better organised and efficient people—like businessmen—who tend to corner all the profits. No sir! Romesh Thapar must really think twice and come up with more convincing reasons as to why the business community is opposing the 'growth maniacs' in Yojana Bhavan.

On the available evidence, therefore, 'privilege and profit' have little to lose and a great deal to gain by big plans, even if the country goes to the dogs. Or is it that the rich and the privileged care for the country too?

J DUBASHI

Delhi,
July 15.

CAPITAL VIEW

Bangalore and After

Romesh Thapar

THE blue sky is now visible over Delhi. The monsoon has arrived. The green is breaking through the parched shrubs. The dust has settled. But the atmosphere of the Capital is anything but refreshing. We are living with a heap of crisis, and there doesn't seem to be anyone around with the guts to attempt to sweep them away. So, like local soothsayers, we are waiting for the stars to turn auspicious.

Morarji's Friends Abandon Him

The Bangalore session is as good a peg as any to hang the events of the past fortnight. To begin with, Morarji Desai is probably the most disappointed man in the Congress Party today. Plying his charkha three hours a day, with plenty of time to meditate upon the erosion of his role ever since he was 'Kamarajed', Morarji Desai had planned rather thoroughly to challenge the established leadership of Lal Bahadur and his friends. His technical objections to permitting Kamaraj another term as president of the party were designed to test his strength for a major collision which he believed would force the formation of a dedicated and principled opposition to the ruling group within the party. But all his plans went awry. In Bangalore, he stood almost alone. Even his closest allies faltered when the moment of challenge arrived.

Prime Minister Lal Bahadur is no chicken. As I have always said, he is most skilled in handling the unprincipled tussles which now dominate the Congress Party. This skill he brought into play when Morarji Desai made known his order of battle. The ambitious Atulya Ghosh was persuaded by fellow-conspirator S K Patil to withdraw from the presidential contest with the loaded argument that a contest would be exploited by Morarji Desai to push Jagjivan Ram, or even Vijayalakshmi Pandit if the situation warranted. Atulya Ghosh had also been made more than ordinarily receptive by a carefully encouraged threat to his leadership of West Bengal Congress from the Congress organisation in the Midnapore district.

Mrs Pandit Kept Out of AICC

As soon as this gambit had paid off, Lal Bahadur watched with mounting

amusement the embarrassed antics of Orissa's Patnaik and some of his supporters, like ginger-grouper S N Misra, who were opposed to a second term for Kamaraj. He had earlier neutralised the Uttar Pradesh and Bihar factions. It appeared to the ordinary observer that Morarji Desai would have to hold his ammunition for another day. But Lal Bahadur was taking no chances. Vijayalakshmi Pandit had asked to be nominated to the AICC. Lal Bahadur was only too willing to oblige. However, he left for Bangalore without making the nomination, but after permitting the rumour that Indira Gandhi had vetoed the nomination!

According to the political gossips in the Capital, Lal Bahadur had good reason to keep Vijayalakshmi Pandit far from the AICC. He had been informed, it is said, that Morarji Desai was planning a desperate counter-move to stun the ruling group. Vijayalakshmi Pandit would be mobilised to attack the idea of a second term for Kamaraj, and would at the same time be presented as a possible presidential candidate. Lal Bahadur would have to oppose Nehru's sister. Indira Gandhi would perhaps play the neutral. There would be embarrassment all around. A situation would be created very similar to the one on the eve of the elections within the Congress parliamentary group when Vijayalakshmi Pandit had to be persuaded to withdraw.

Morarji Desai refuses to accept the general opinion that his political fortune is at its nadir. His speech at the AICC session may be dismissed as the double-talk of a cornered politician, but he sees it as the beginning of the revolt against the dead conformism which prevails in the AICC and which he, among others, had done so much to perpetuate in the past. However, it is clear that he will have to move beyond peripheral sniping at this or that policy if he wants to create major repercussions. At the moment, the operation has all the flavour of a gang-up for squeezing tickets out of the ruling group, tickets for men opposed to the guiding principles of Jawaharlal Nehru's policies. Even the Congressmen who support Morarji Desai see it as nothing more and nothing less.

It will be political wilderness for those who oppose the Congress Esta-

blishment unless they thrash out a plan which makes sense in terms of the crisis which confronts the country. Tough postures are not enough, for they tend to make them appear irresponsible despite the supposedly fearless and upright stand of their leader. Morarji Desai's attempt to enunciate an approach to policy-making through pompously-worded (or ghost-written!) newspaper articles creates the kind of reaction which he least expects.eldom has a man been so badly advised. Or are these the inner voices he hears when spinning the charkha?

Need for a Right Wing

I say this because many knowledgeable observers in the Capital would like to see the emergence of a coherent right wing in the Congress Party. This would provide a healthy foil for those in the Centre and on the left who now wish to make the party face up to the massive problems which the country will face during the next crucial decade. These problems cannot be tackled by the in-fighting expertise Lal Bahadur has exhibited in dealing with those who would dislodge him. Something more fundamental is demanded, together with bold and inspiring leadership. A whole people have to be lifted from their wretched state. And yet policies have to be implemented not by *diktat* but by persuasion. The task looks forbidding.

Returning from Bangalore very much in the saddle, Kamaraj will have to knuckle down to this job. The state of tension and demoralisation in the various departments of the GOI and among the factions into which the leadership is divided call for close co-ordination between the ministerial and organisational wings of the ruling party. Confidence has to be created—and it will not be created if the leadership continues to trot out generalities of the kind it used for rejecting suggestions that India's currency be devalued to salvage the economy and restore its health. At no point has the public been educated on the issues involved. If the World Bank is in error, let us prove it conclusively. The way the debate is being conducted suggests that the Ministries which now envelope us with rules and regulations—often self-defeating—are loth to open the door to doubts which might des-

stroy their extraordinary power. And, ironically, the debate is not joined by our economists. Something must be done to spark the controversy. This feeling prevails within an important section of the Cabinet, too. Then, perhaps, we may get at some of the facts which are denied to us.

The Prime Minister has been 'thinking aloud', as he calls it. This rather strenuous exercise has persuaded him that we need a 'pause'. Apart from the fact that the stratagem appears to have become Lal Bahadur's panacea for all ills, national and international, we have been asking ourselves: a pause from what? The question is important, or else we may soon find ourselves justifying our innate fatalism, our helpless wait-and-see attitudes.

TTK's Clash with Planning Commission

This aspect of our crisis is underlined as Finance Minister Krishnamachari begins again to run away from his commitments to the Fourth Plan—and, of course, to influence others to do likewise. The 'pause', a popular word among our politically lazy leaders, could well put the country into reverse gear. Pauses be damned. We need to get at the practices which are paralysing our administrators and managers, killing initiative, breaking the spirit and halting the drive of those who have not succumbed to the 'babus' who would have us perish so long as their 'system' remains intact.

The Finance Minister never thinks aloud. He cannot afford to for the stock markets would topple! But when he does attempt to intervene we are astonished by the lack of positive ideas, the lack of precision. Is this how we hope to ease the paralysis which threatens the economy? Devaluation or no devaluation, a great deal has to be done to change our methods, our organisation and the way we tackle problems. We do not seem to have imbibed a single new idea in running our affairs ever since the British left us.

The Prime Minister sensing the developing conflict between Planning Chief, Asoka Mehta, and TTK, is not yet sure what line he should take. He knows, instinctively, that this conflict could have deep political repercussions within the party and outside. He will, however, have to take a final decision on his return from Yugoslavia. Wherever you go in the Capital today—that is, beyond the furtive groups of flatterers and fixers—the same anxious questions recur: What are they wait-

ing for? When will they act? How long can we remain as we are? 'Who will give a lead? Why are we so helpless? Probably, this is the mood in the States, too.

To Make the Leadership Move

Occasionally, even President Radhakrishnan is compelled to needle the government with a provocative speech. We in the Capital see it as an attempt to make the leadership move. In the present situation, this is all to the good. We need a ferment of thinking, even though some, like General Cariappa, get so enthused that they suggest the need for a presidential regime between now and the general election in 1967!

LETTER FROM SOUTH

Why Mysore Is Angry

IT was rather strange that the decision to hold elections to determine Goa's future should have provoked Mysore to wrath. Nobody in that State very seriously believes that there is even a ghost of a chance that Goa will ever integrate with it. The claims of conquest in the past are extraordinary, to put it mildly. As the Maharashtra Chief Minister quipped, in that case his State could lay a claim to Delhi! There can be a case for not disturbing the *status quo* in Goa—indeed, that is one of the issues to be decided if the elections do take place—but if Goa is to be integrated with another State, the only legitimate claimant can be Maharashtra.

The burst of emotion, one imagines, had very little to do with Goa directly. The anger was more against Chavan than Lal Bahadur and more at not being consulted than at not gaining Goa. For quite some time now Mysore has been feeling that it is being taken too much for granted by the Centre. It feels that after the initial spurt of industrial investment around Bangalore, nothing else has come its way for years. Very recently, the British-American Steel Consortium report giving preference to Visakhapatnam as the site of the fifth steel plant was a rude shock. Nobody believed that it was merely a technical opinion. Everybody thought that Sanjeeva Reddy had made it clear to the Steel Mission how much easier the ultimate construction arrangements would be for them if they were negotiating with a pleased Minister rather than an irate one. With

Indeed, if a few opinion-makers and commentators are jolted into realising that we must continuously explore ways of resolving our crises, much will have been achieved. The Establishment in India is small. A penetration here or there can crack the conformism and break the cliques which paralyse action.

The Bangalore session of the AICC never addressed itself to the real problems. It was content to play around with the animosities over Goa and the tussles between the States. These side-issues assume prominence because the fundamental challenges are ignored.

And so, we wait—surprisingly enough, patient as ever!

such political pressure Hospet stood no chance.

Belgaum is another element in Mysore's anger with Maharashtra. Mysore knows quite well that it cannot cling on to Belgaum for ever. The consistent electoral victories of the Eikikaran Samiti have made it clear that one day the town and most of the surrounding area will have to be handed over to Maharashtra. This would mean a further loss of prestige and a fair amount of income, considering Belgaum's importance as a military and railway centre. If any territorial readjustments with regard to Goa are made an electoral issue—and that too fairly soon, as a matter of crisis—then who knows when Chavan and Naik will insist on some kind of a referendum in Belgaum and Karwar? However unjust it may be on Mysore's part to want to cling on to linguistically dissimilar territory, its fears can be understood.

Then, one has to take into consideration the internal situation in the Congress as well as in the main opposition party, the PSP. Some dissident Congressmen set up a rival party only a few months ago. Their allegation is that Nijalingappa is so corrupt that he, would have been thrown out a long time ago were it not for his servility before Shastri and Kamaraj. The actual language used is far more disrespectful and uncomplimentary towards all the persons involved. Inside the Congress there is the Hanumanthayya group which has always maintained the closest links with the Morarji Desai cabal. They are not only virulently

opposed to the present Mysore ministry but ceaselessly propagate that the country is not safe in Shastri's fumbling hands. Their charge is the familiar one that none of the Prime Minister's decisions are really his own. It is almost invariably the decision of the one who has shouted the loudest and where sonic pressure cannot be judged there is the famous consensus, which almost always means everything to everybody. In the Goa decision, following upon the Visakhapatnam report, they thought they had a wonderful opportunity to pull down the prestige of both the Prime Minister and the Chief Minister. Nijalingappa's threat of resignation rather pulled the carpet from under their feet.

The PSP opposition is really hard to demarcate from a dissident Congress group. In this it is true to its origin.

FROM THE LONDON END

Struggle for Tory Leadership

ALTHOUGH the struggle for the leadership of the Conservative Party has been going on behind the scenes ever since Sir Alec Douglas-Home's appointment as the compromise candidate after the Blackpool debacle, Sir Alec's announcement that he was relinquishing the leadership of the Party certainly came as a surprise to most observers. Indeed, only a little while before, Sir Alec had been saying that he intended to lead the Party to victory in the next election. A number of factors finally decided Sir Alec's mind, among them the National Opinion Polls which rated his performance, as opposed to that of Wilson, so low. That, coupled with the dissatisfaction and unrest within the Conservative Party and the general belief, though never too openly voiced, that the only hope for the Party was a change of leadership, must have convinced Sir Alec that now, if ever, was the time to retire gracefully from his position and set in motion the new method of electing the leader of the Party—a method which had to be created largely to wipe away the most unfavourable impression which had been created by the way in which Sir Alec himself had been selected. The fact that Harold Wilson had recently announced, quite categorically, that there would be no autumn election, must have prompted Sir Alec to feel that in the circumstances, this would give

It has neither the vision nor the cadres to engage the ruling party on economic issues or on ideological-political grounds. It can only bank on parochialism and the general popular belief (more justified than not) that every Congress Minister is corrupt. For the Congress Ministry it is not too difficult to call the PSP's bluff on the latter count as many of its leaders have far from savoury reputations. And as for parochialism, Nijalingappa has now demonstrated that Mysoreans can find him as vociferous as the next person.

All this excitement created exactly the right atmosphere for the AICC meeting. Kutch, foreign exchange, food, Fourth Plan size—all these seem to be passing out of the consciousness of most Congressmen. They are left to chance, to counter-vailing pressures from the American or the socialist

the new leader time to play himself in before the election actually took place.

While many people have commented on the fact that nothing has become Sir Alec's political career so well as his manner of leaving it, and have pointed out that he is the first Conservative leader in living memory who voluntarily decided to retire in the public interest, the political correspondent of the *Times* points out quite rightly that the full truth is that Sir Alec is the first Conservative leader in peacetime to have been driven out by a Labour leader. "Sir Alec's resignation is now the bravest feather worn in Wilson's cap during the nine months of his Prime Ministership. Almost single handed Wilson forced a large part of the Conservative Party, in and outside Parliament, to accept that Sir Alec would never be a match for him as a leader in the Commons or in the country; and once he saw that plain, Sir Alec brushed aside his advisers and resigned".

After the appalling scenes at the Blackpool Conference in 1963, the Tories are determined to behave like gentlemen, in public at any rate, despite the private backbiting and pushing for place that has been going on. The new method of electing the Party leader requires that at the first ballot, the successful contender has to win by a 15 per cent lead over all other candidates. If no candidate obtains

camps and to the "very intelligent" advisors and civilians. All that matters is that the final decisions taken should not irritate too many people too much and too soon. So long as popular nerves are not ruffled too much the local Congress bosses could not care less. And so it turned out that at the meeting of the highest policy-making body of the ruling party national problems figured only marginally. And the people of Bangalore, at least the more restive sections, demonstrated their anger over Goa and not over national bankruptcy or the looming food crisis. Kamaraj's re-election is, of course, only to be welcomed but unless he goes out of his way to build a group around a programme he will not be more than a powerful machineman. He has yet to make the transition from bossdom to leadership.

this lead, a second ballot will be held where an overall majority for any one candidate will be sufficient. The 15 per cent lead will not be required. If there is a deadlock on the second ballot, a third ballot will be held immediately. Only the top three candidates from the second ballot will appear, and voters will have to cast a second as well as a first preference. The candidate with the fewest first preference votes will be eliminated, and the second preferences of his supporters will be distributed among the other two so that a victor will finally emerge.

This article is written before the first ballot on Tuesday (in which Edward Heath was chosen leader—*Ed*). There are now three contestants for the post, of whom Edward Heath and Reginald Maudling have been in the running for a very long time. Indeed, Maudling was one of the possibilities in 1963, but his flat and unemotional speech at Blackpool ruled him out at that time. Both Heath and Maudling are said, at the moment, to be neck to neck, with the odds a little in favour of Reginald Maudling because of rumours that it was the plot of Heath's supporters during the 1922 Committee meeting to push their own candidate, which finally forced Sir Alec's hand. At one time it was thought that it would be a contest between Maudling and Heath who represent very much the new public

image that the Tory Party wishes to present, as opposed to the old "grouse moor" image, although their personalities are so completely different. However, a new element has entered the struggle in the form of Enoch Powell who has now come forward as the third candidate. This makes it likely that no decision will be reached in the first ballot and a second may become necessary.

Enoch Powell is a very different kettle of fish from both Heath and Maudling. He has sometimes been described as the keeper of the Conservative Party's conscience. Powell has his own particular spartan brand of free-enterprise theology. It is understood that Powell agreed to stand for nomination because of his high-principled desire to allow the Party to vote on his brand of conservatism. Personally he is a man of great probity. He resigned with Thorneycroft and Birch. He is, however, a believer in almost undiluted *laissez-faire*. He is entirely opposed to any kind of incomes policy and certainly to all kinds of planning. He believes that unfettered private enterprise is the best solution, and that the man in Whitehall is almost invariably wrong. On other matters, however, he is to the left of many Conservatives, as evidenced by his speech on Holi and his views on the abolition of the death penalty. His brand of conservatism has been labelled "Powellism" and it is understood that he has won many converts among the younger MPs. Of course, some senior Tory backbenchers are upset by this intervention which they feel will only delay the question of the leadership and undo the good that the new democratic open election procedure could have brought. Indeed, some of them believe that his candidature may be the equivalent of "Gold-waterism" in British politics.

The two favourites, however, remain Heath and Maudling, and although newcomers may enter the field if the first ballot proves unsatisfactory—possible candidates may include Thorneycroft, Selwyn Lloyd and Quentin Hogg—it does seem likely that eventually either Heath or Maudling will be elected.

It is difficult to judge the exact support that both these candidates at the moment command. It is known that in the industrial North, Heath is much more popular because of his hard-hitting methods and his indomitable energy. Many believe that he would be the ideal opponent of Wilson in the

House of Commons, and that someone with his cut and thrust would be a better choice Labour leader than the amiable Maudling. Although both candidates stand for modernisation, many believe that Heath is the more purposive of the two and would get more things done. They point, for example, to his success in pushing through the Resale Price Maintenance Act against strong opposition. They believe that what is needed is a Prime Minister who is strong enough to take action, however unpopular, since if Britain is to emerge from the economic doldrums it is necessary that very unpopular measures will have to be taken. Because of the very nature of his personality, Heath inspires fervent admirers and bitter enemies, whereas the image projected by Maudling is much amiable and easy-going. It is said that behind Maudling, together with the Tory ladies who see in him a more cosy image. Both men have connections in the City. Heath is a director of the merchant bankers, Brown Shipley, while Maudling is a director of Kleinwort Benson. Heath's appeal is mainly to the young up-and-coming professionals and white-collared folk, while Maudling's appeal is to the women and the establishment. Some believe that Maudling with his deceptive soft-sell approach will get better results for big business. Again, Maudling has the advantage of being married and leading a happy family life, whereas Heath is a bachelor (though one of England's more successful Prime Ministers was the younger Pitt who himself was a bachelor!)

While Maudling gives the impression of someone who is perhaps more experienced and can take a wider long-term view than Heath, he does not give the same impression of uncompromising zeal and energy, or the picture of an activist who will do all he can to achieve results, and many believe that what the Conservative Party needs, particularly in view of the difficult economic situation ahead, is an active, zealous uncompromising leader who will be able to take unpopular actions and will have the energy and drive that is necessary to see them through. Maudling's term as Chancellor of the Exchequer in 1964, by economic standards, was certainly a disaster. Although the balance of payments deficit was known to be devastatingly large in relation to Britain's reserves, Maudling did nothing to arrest the domestic boom or stop the external outflow of funds. Heath is more popular among

foreign bankers who hold Maudling responsible for the large deficit Britain built up during his period as Chancellor of the Exchequer.

While last minute canvassing for votes is going ahead, there is no doubt that the choice the Conservative Party is now facing is indeed a 'fundamental one'. While it is true that Sir Alec was never a success as Prime Minister, and that his resignation gave the Stock Market a shot in the arm, the present election is of crucial importance to the Conservative Party since the man who is elected at this ballot, particularly if he is one of the younger candidates, will be the leader of the Conservative Party for perhaps some 20 years. It is, therefore, essential that the new leader must, in view of Britain's present economic situation, have a firm understanding of economic problems, and not, like Sir Alec, rely on matchsticks to understand these. He must also be able to match the supreme professionalism of Harold Wilson and stand up to the cut and thrust of parliamentary debates. In many respects, from the Tory Party's own point of view, the wisest choice would perhaps be Edward Heath.

Calico Mills

THE Polyvinyl Acetate plant of Ahmedabad Manufacturing and Calico Printing Company, commonly known as Calico Mills, was commissioned in February last. According to the 85th annual report of the directors, the emulsions and solutions of PVA and copolymers placed on the market conform to the same quality standards as those of the well-known brands of the company's technical collaborators, Vinyl Products of the UK. Another significant feature of the company's working during the year to March last was that it was able to expand exports by 15 per cent to Rs 2.2 crores. It had the distinction of being the largest exporter of cotton textiles to the quality-conscious market of West Germany.

The company secured from ICICI a loan of Rs 24 lakhs in foreign currency to meet the foreign exchange component of the capital expenditure of the Trychlor-Perchlor-Ethylene project. Plant and machinery for the project was ordered during the year. In spite of higher costs, the company was able to increase profitability as a result of the sustained efforts of the management.

BOOK REVIEWS

Regulated Movement of Indian Politics

Jawid Laiq

The Government and Politics of India by W H Morris-Jones; Hutchinson and Co, 1964; pp 236, 15s.

THE constant dilemma faced by those who write on Indian politics is how to present a coherent and comprehensible view of a complicated and often very confusing political scene without falling into the trap of basing their analyses on unproven assumptions or facile generalisations. It is refreshing to find that Morris-Jones has taken deliberate care to avoid this trap. He overcomes the dilemma by viewing Indian politics as an inter-action of 'government' and 'movement' within a 'mediating framework'. 'Government', as understood by him, means mainly the British Indian bureaucracy before Independence; after Independence the term implies the entire personnel and machinery of administration and development from Cabinet Minister to Block Development Officer, from Planning Commission to public corporation. 'Movement' implies the independence movement based largely on the struggle of the Indian National Congress to oust the British Raj. After 1947, 'movement' comes to mean the political forces at work within and outside the Congress Party as well as those emanating from social and economic divisions, such as caste, which act as informal political pressure groups. 'Mediating framework' connotes the institutional restraints imposed on both 'government' and 'movement' by the Constitution, the parliamentary system and the judiciary.

This approach is both novel and undogmatic. Indian politics is not tailored to fit any existing formulae. Economic development is not the only arbiter of political stability in India. Nor is caste the presiding deity of all political motivations. The political sociologist finds his 'behaviourist' approach going berserk, for sample surveys remain just samples which do not fit into any general pattern. Thus the most effective approach to analysing Indian politics has been the "seminar" method—collecting essays on different topics, each written by a specialist. An excellent product of this approach is Park and Tinker's "Leadership and Political Institutions in India". The other method is for the

same author to write a series of connected essays. This is the method that Morris-Jones follows, though it must be said that his book is more than a collection of essays. He has neatly tied up the different topics he discusses into a thought-provoking and eminently readable book.

The first chapter, 'Some Legacies', contains some acute observations. "It is in more than one sense that the new India inherited government...it inherited a widely held sentiment regarding the importance of there being a government. This is not as usual as it sounds; it is not difficult to think of new States which have suffered grievously by the absence of such sentiment." But the obvious corollary to this sentiment is left unsaid. Does not the common attitude also go along with it that the government is responsible for doing everything for everyone? Too much energy is wasted on pressurising the government to get things done instead of more profitably using these energies to solve one's own problems.

In the second chapter, 'Politics and Society', the consequences of Westernisation are thoughtfully explained. "So long as alien rule prevails, the impact of Westernisation on the political system is well-nigh complete whereas the impact on society is partial and uneven. This at any rate is the Indian experience. The incoherence of polity and society is fully disclosed only with the start of an Indian polity. Moreover, in such a polity the incoherence is unstable and from both sides forces move in to establish consistency. This is the process which gives rise to many of the fascinating features of Indian politics today. It also provides a strong and special reason for believing that without attention to social forces the study of such politics is peculiarly partial and misleading." This conflict of cultures leads to political activity being conducted at three levels or in three languages: the language of modern Western politics, the language of traditional politics and the language of saintly politics. The language of traditional politics "is the language of a

host of tiny worlds... the little worlds of *jati*, not *varna*. However, *jati*, an essentially local group, has been able to throw out links to its 'opposite numbers' in neighbouring localities; caste begins to manifest itself as regional rather than local, increasingly independent and competitive in relation to other castes rather than interdependent and co-operative, and as an organised association rather than a natural social group." The language of saintly politics is in a quantitative sense relatively unimportant. It is a normative language used as an ideal which ought to be followed by those who practise the politics of the other two languages. The figure that represents this idiom is Vinoba Bhave, the 'Saint on the March'.

Speaking of saints one cannot help but feel that what India needs is perhaps a man who speaks in the language of saints but whose ideals are not 'saintly' but modern, rational and dynamic. Perhaps such a leader could arouse sufficient charisma in a nation notoriously and fervently attached to saints and lead them out of their traditional apathy into a new dynamic one. This role seems to be beyond the capabilities of the present leadership or of any foreseeable alternative leadership. So it remains a digression into rather cloudy regions.

Talk of ideals leads one to that bane of Indian politics, corruption. Much of what we call corruption is nothing more than a confusion of values in the eyes of Morris-Jones' original analysis. "The behaviour which the traditional language holds to be irresponsible is for the modern idiom responsible and that which the modern regards as improper is for the other the very opposite". Distrust in relations between people strikes Morris-Jones as a common feature of Indian life. This seems to be accurate observation. "In the courts a man in India is innocent until he is proved guilty, but in social and political life the position tends to be reversed... If we understand the character of caste, this is hardly surprising, for its little

worlds of mental attitudes and styles of behaviour."

Economic development and national integration are among the issues discussed in the third chapter, "Events and Issues Since 1947", which deals mainly with events. The discussion is largely a statement of facts, little else. One did expect some illuminating insights into the *rationale* of economic development and its effect on society. The facts stated are sketchy; figures and statements would have been useful here but have been left out.

There is a short but effective section on the Planning Commission in the next chapter, "Government". Morris-Jones sees the Planning Commission as a primary force in smoothening Centre-State relations and promoting co-operative federalism. He admits that the Planning Commission is often an arena for conflict, but conflict that is constructive as it ultimately balances the interests of the different units of the federal structure, resulting in 'bargaining federalism'.

'Political forces', the fifth chapter, is the most enlightening part of the book. The *raison d'être* of the Congress Party is particularly well explained. Congress is seen as 'a great educator'. "Its election ideology and shifting centrist policies are not great handicaps to the performance of its task as the instructor of new recruits to this modern political process. Thus a dominant party is a unifying agent not merely in the obvious 'horizontal' sense in which it holds together a range of opinions and interests but also in the important 'vertical' sense that it brings into contact and interpenetration all levels of politics from the most sophisticated to the most simple and traditional". This and the rest of the well reasoned section on the Congress Party will restore the confidence of most of those who have come to be alarmed about the vagaries of the Congress. There is also a good review of politics within the Congress.

The other political parties are sketchily treated. Political forces at the village level, on the other hand, are concisely and competently examined. Local politics in the shape of Panchayati Raj is regarded with optimism. "Panchayati Raj will step up mobility and competitiveness in rural politics... these new elected bodies will by increasing political competition assist peaceful social revolution...the old

village leaders will be replaced to some extent by abler men from lower social ranks aided by radical parties."

The sixth chapter, 'The Ordering Framework', deals with the political institutions and the Constitution, Parliament, law and the courts. The central idea of this chapter is that government and politics has been channelised into working in an orderly fashion by the restraining effect of these institutions. These imported institutions have not only been altered in their functioning by the pressures of Indian society but they in turn have also succeeded in influencing some segments of society with their own ideals.

The negative role of the intelligentsia comes in for well deserved criticism in the last chapter, 'Tendencies and Ideas'. "The educated middle-class citizen of India was the spearhead of the nationalist movement in its early days and was hardly displaced by any of the consequences of Gandhi. They are in its great measure being bypassed and left behind by the new politics of bread and butter. Yet they remain the commentators, the articulate ones—the journalists, teachers, and publicists. Little wonder that the great positive changes take place unnoticed, while the air is filled with cries of lamentation and anger from the non-participating intelligentsia... The distaste and frustration they feel colour profoundly the picture of Indian politics as presented to all who stand outside it." 'Non-participating' is the key word in the author's diagnosis of the frustration of the intelligentsia and this will be widely endorsed. Carping, cynical criticism has become a way of life among the intelligentsia who are almost exclusively urban. Yet they are not willing to take the risk of participating actively in resolving issues. This is well illustrated by the lack of serious research on the political and sociological behaviour of village communities. This does lead to the sad conclusion that barking dogs seldom bite.

If there is cause for indignation about the negativism of the intelligentsia there is not sufficient cause for alarm about the general complexion of Indian government and politics as Ronald Segal in "The Crisis of India" would have us believe: "The disease from which the Kuomintang collapsed has already infected Congress. It is a far cry from the one-time chaos of Nanking to the present-day splendours

THE ECONOMIC WEEKLY

of New Delhi. But the alarm has begun to sound." Has it? One is more inclined to agree with Morris-Jones that there is no need to sound the alarm as both the country and the Congress Party are going through a perplexing but all the same fairly orderly and systematic period of growth towards maturity.

In this otherwise competitive study, there are two surprising omissions: the role of the army and of foreign relations as they affect the internal politics of the country. Despite some omissions, however, "The Government and Politics of India" is much more comprehensive than "an introductory guide" as modestly claimed by the author. There is also an excellent bibliography at the end.

After a volley of sensationally dire or rosy predictions from others, it is comforting to be assured by the cool and balanced judgment of Morris-Jones that "The combination, the containment in peaceful inter-penetration, of these diverse and in principle competitive languages of politics is the great achievement of political life in independent India. Vast social and economic changes are being accomplished steadily and without obvious drama and are being accommodated and digested by and within a political structure which is successfully flexible, 'politically multi-lingual'... The main point to be emphasised is that it is in itself a signal achievement of the Indian polity that it has, over a relatively short period, acquired definable change and form—stability not in the sense of a stationary state but in the sense of regulated movement."

Note

¹Ronald Segal in "The Crisis of India", like many others, gives the impression that without an accelerated rate of economic development there is bound to be a drastic political upheaval.

A Textbook of Development

S K Nath

Economic Development by Charles P Kindleberger (second edition); McGraw-Hill Book Co, New York, 1965; pp xvii + 425; Price \$ 8.95

KINDLEBERGER'S second edition of his textbook of economic development is a greatly improved introduction to the subject. While the structure of the book is the same as before, the contents of some important and controversial chapters have been changed; a new chapter summarising the more prominent growth theories has been added; R S Eckaus supplies a useful appendix on Development Planning; and at the end of each chapter there is a selective bibliography with notes.

The most marked change is in the chapters where the role of the market mechanism is compared with that of government planning in promoting economic growth. Some western economists hold the view that the market mechanism — provided it can be made to work "smoothly" (exactly how that is to be done is never spelt out) — is capable of promoting quite rapid growth in the underdeveloped countries, and that government planning is either irrelevant or a hindrance. However, in underdeveloped countries the major economic problems are not confined to avoiding inflation and fluctuations in employment, and preventing a recurring deficit in the balance of payments, but also include the basic problem of changing a large stagnant and tradition bound economic system into a rapidly expanding one. In such countries, a great deal of economic activity needs to be generated in a rather short time, so that the repercussions are widespread and important; and since the inelasticities of supply of the various factors of production are significant, without proper planning, balancing and phasing there could easily be unnecessary waste. Moreover, there are important economic activities in most economies where private and social returns differ. Examples are: investment in power, transport, irrigation, education, health, and the first few industrial units in a backward region, etc. These investments form a substantial part of the new economic activity in an underdeveloped country.

The chapters of the first edition dealing with these problems were confused; now they have been thoroughly revised, and Kindleberger clearly argues for balanced development plan-

ning in underdeveloped countries. This is a great improvement — particularly when one recalls that new textbooks on economic development are still being written which perpetuate the old confusions on these problems (cf E Enke, "Economics for Development").

Perhaps one needs to add an important footnote about the administrative aspects of fairly extensive government planning, controls and inducements coupled with fairly widespread private enterprise. Few students of the performance of the Indian economy over the last 13 years would argue that there are not serious problems concerning the operational feasibility of a mixed economy in an underdeveloped country. Whether these administrative problems justify a dilution of the mixed economy towards less government planning, controls and inducements or towards less private enterprise is largely an empirical question (with inevitable and weighty political ingredients) which is in urgent need of investigation and debate in India.

The new appendix by Eckaus is a lucid introduction in about 20 pages to different forms of planning. It briefly describes what is so far theoretically possible and actually practicable in this field. The forms of planning covered are progressively disaggregated: project planning, which is used in some form or another by almost all countries and is particularly suitable for such underdeveloped countries as have almost no statistics and very limited administrative resources; macro planning, which relies on overall capital-output and saving ratios and is very commonly used but has obvious limitations as far as the problem of proper sectoral balances and phasing are concerned; and lastly multisectoral planning models, which are the most suitable for co-ordination and are capable of different degrees of disaggregation to be chosen according to the availability of data and the requisite personnel as well as the purpose of planning. The method of analysis used for these models is input-output accounting; brief expositions are provided of its simpler and somewhat more complex forms.

One particular merit of Eckaus' exposition is to emphasize the distinction between consistency and optimality: consistency only demands that

the various parts of a plan should be so balanced as to avoid unnecessary excess demand or supply in any sector; optimality demands that a plan should be the best possible (or the most economical) in achieving certain specified social targets with the given constraints within a certain stretch of time. A number of plans (for the same social aims) may be consistent, but only one of them will be optimal. Hence the need for a country to formulate more than one plan for the same aims and compare them for their optimality. Moreover, often the social aims — particularly their relative importance or what might be called the relevant constraints — are only dimly recognised even by the policy-makers. A clearer perception of the relative importance of such things often requires a comparison of different consistent plans working out the implications of alternative social objectives — not in the form of pious hopes or ultimate aims, in which case there would hardly be any disagreement about them, but as embodied in Plans for the next five years or so. Unfortunately, as Eckaus points out, such a comparison of alternative plans seldom taken place anywhere. "More typically, the making of one plan absorbs all the energies of the available technicians and is the focus of attention of all the entire political process. It is subjected to partial revision and compromises, the implications of which are not fully explored. This concentration on preparing a single plan without alternatives is partly the result of devoting inadequate resources to the planning effort. Finally, the economic analysis necessary for rational planning is itself still at an early stage of development and has not yet been fully understood".

The first edition contained some discussion of only the Harrod-Domar model, but in this edition there is also something about the Ricardian model, the Kaldor model, and the recent empirical investigations of factors responsible for growth. As in the first edition, there is a useful chapter introducing the problems in the choice of techniques, and a detailed chapter examining the role of foreign trade in economic development; after discussing the various theories which have

been put forward in this respect, the correct conclusion is reached that the role which foreign trade can play depends on the external and internal circumstances of a particular country, which must always be investigated. All in all, when the cheap Asian copy of the second edition comes out,

Kindleberger's book will perhaps be the best textbook on economic development available to Indian students at a reasonable price.

Istambul Agreement on Regional Co-operation Review of the First Year

Satya M Rai

The Istambul Agreement on Regional Cooperation for Development emphasises Cento's loss of significance. Among the three countries who concluded the Agreement in 1964—Pakistan, Iran and Turkey—there is a realisation that they have gained little from their military entanglement with the US which has, at the same time, cost them their prestige in the Afro-Asian world. The disillusionment of Cento countries with their Western allies and their desire to project their national aspirations through independent political and economic systems was thus responsible for the Istambul Agreement.

For Pakistan, however, the Agreement is something more than that. Since its inception, Pakistan has suffered from a small power complex vis-a-vis India. She realises that in South Asia she cannot hope to build up a sphere of influence of her own because of the presence of India. But allied with the Persian Gulf countries, to whom she is bound by common religion, she changed her position from that of a small power to that of a bigger power.

Whatever the objectives of the participating countries, the progress of the Istambul Agreement needs to be carefully studied. As an experiment in regional co-operation it deserves to be welcomed and may hold many lessons for similar experiments in other parts of Asia.

ON the occasion of the first anniversary of the Istambul Agreement on Regional Co-operation for Development (RCD) which fell on July 22, 1965, President Ayub Khan, the Shah of Iran and President Kemal Gursel of Turkey, extolled the success of RCD in their three countries and expressed confidence that it would make further progress. In view of the importance of the Pact, not only for the Persian Gulf countries and Pakistan, but for any regional arrangement in South Asia, it is important to review the progress made under RCD during the first year and the prospects for the future.

RCD was established on July 22, 1964 by a joint statement by the Heads of States of Iran, Pakistan and Turkey issued in Istambul. In the post-war years the world has witnessed a general trend towards regional cohesion. The emergence of the Arab League, the Organisation of African Unity, the Alliance for Progress and the European Economic Community is evidence of this trend. RCD, according to its sponsors is, similarly, the reflection of the natural desire of the people belonging to the "non-Arab and Turko-Persian culture" to get together in a regional arrangement.

The idea of confederation or common arrangement among the Muslim countries can be traced back to the time when Pakistan was created in 1947. Both Jinnah and Liaquat Ali Khan talked about closer relations with the Muslim countries. At the Commonwealth Prime Ministers Conference in 1949, Liaquat Ali Khan said:

"The natural and religious links, the common culture and the identity of common outlook that exist between our people will stand the strain of will stand the strain of the people

of Muslim countries and many a test and will, am sure, prove a stabilising factor in Asia."

Prime Minister Feroze Khan Noon and Abdul Kayum Khan of N W F P raised the slogan of confederation among the Muslim countries. Motamar-e-Alam-e-Islamic (World Muslim Conference) organised its two sessions in 1949 and 1951, which were attended by nearly 17 countries. The International Muslim Economic Conference, held on November 25, 1949, was attended by 18 countries in which the Finance Minister of Pakistan, Ghulam Mohammad, urged the Muslim countries "to develop a system of collective bargaining and collective security."

Despite all these efforts, the idea of confederation could not be carried through as nationalism in most West Asian countries was defined in modern secular terms and they could not appreciate religion being given preference over other factors. Pakistan's image also, because of its entanglement with the West, had been considerably tarnished before the African and Arab countries who were engaged in an anti-imperialist and anti-colonial struggle. Besides, these countries had very good relations with India and they refused to be involved against the latter in the name of Muslim unity.

After being rebuffed by Arab countries by Egypt in particular, Pakistan turned towards the countries of the Persian Gulf for some kind of economic organisation. The opportunity offered itself, when Turkey, Iraq, Iran and Pakistan became members of the Baghdad Pact on February 24, 1955, (later named CENTO after the exist of Iraq).

The organisation of RCD at a time when all the three countries continue

to be members of CENTO and when within CENTO itself the emphasis has shifted to economics, has evoked considerable interest. The reasons lie deeper than the dream of the three countries to harmonise their national interests. It is true that ten years of experience in a military organisation has convinced them that unity cannot be imposed from without but that it must grow from within. These countries, therefore, while continuing to get benefits from the economic aid being given by the U S A and Great Britain towards CENTO affairs, (approximately \$33 million by U S A and £850,000 per year by UK) also want to build up an independent economic system based on the pattern of industrial specialisation.

The RCD is, thus, neither an offshoot of CENTO nor is it antagonistic to the latter. It is the product of the political sagacity of its organisers, particularly President Ayub Khan. Turkey to start with was not keen to get involved in an Asian arrangement. According to Ayub, he told the Turks: "however much they wanted to be part of Europe, they would never be accepted as equals by Europeans, while the new organisation offered them a chance to be 'first class Moslems and first class Turks'."

Furthermore, RCD suited the new neutral posture of Pakistan. It could make Pakistan more acceptable to the Afro-Asian countries, help to appease China and Indonesia and could besides be used to exert pressure on the West. Since November 1962 the United States has extended military aid to India and Pakistan has repeatedly complained that it was grossly unfair to treat an allied country and a non-aligned country on an equal footing. Disgruntled Pakistan expressed its resentment by

intensification of its diplomatic activity with socialist and Afro-Asian countries. RCD is also the result of this particular trend during the period. Bhutto has complained that the Western powers were giving massive military and economic aid to the non-aligned nations to the detriment of the members of military alliances; the aligned states were, therefore, forced to forge regional arrangements outside military pacts.⁵

The R C D thus, emphasises the fact that CENTO has lost its former significance. There is also a feeling in these countries that they have gained little from their military entanglement, but have lost much of their prestige in the Afro-Asian World. Commenting on the Istanbul Agreement, President Ayub said it had become necessary because there were big and small countries in Asia. If countries like India and China become ambitious in terms of territorial or economic expansion they could pose a danger to the smaller countries like Pakistan, Burma, Iran and Turkey. It was therefore, necessary for the Muslims of this region to come together for mutual security.⁶

It is also believed by Pakistan that the focus of international affairs has shifted from the Middle-East to South-East Asia. While the West is convinced that the Soviet Union will not disturb the *status quo* in the Middle East, they are more worried about the Chinese upsetting the equilibrium in South-East Asia, as the present events in Vietnam show. Turkish and Iranian fears of the Soviet Union are also receding and both of them are now engaged in improving relations with the latter. Soviet Union has agreed to give technical assistance to Turkey, Pakistan and Iran. On the other hand, anti-Western currents are visible in Turkey on the Cyprus issue.

The disillusionment of CENTO countries with their Western allies and the desire to project their national aspirations through independent political and economic systems has been responsible for the creation of R C D. For Pakistan, however, it is something more than that. Since its inception, Pakistan has suffered from a small power complex *vis-a-vis* India. She also realised that in South Asia, she cannot hope to have any sphere of influence because of the presence of India. But if it allied itself with the Persian Gulf countries it changes its position from that of a small power to that of a bigger power. This aspiration has been

unwittingly expressed by Aslam Siddiqi:

"Pakistan is almost a Persian Gulf power and is extremely well placed to influence developments in this region."⁷

II

The political intentions of the leaders of the R C D, however, are based on the possibility of developing a common economic system on the basis of E C M. The main idea behind the R C D is to pool economic resources, to help offset the adverse effects of Western cartels on developing economies in this region and to increase the collective bargaining power of the R C D countries *vis-a-vis* the E C M and E F T A and to reduce dependence on foreign assistance and foster self-reliance. In order to see whether these objectives are not too ambitious, it is necessary to examine the economic potentialities of this region.

The region encompassed by the R C D has a total area of 12,93,000 square miles—Turkey 3,00,000, Iran 6,28,000 and Pakistan 3,64,000—and a total population of nearly 150 million. The natural resources of the region in foodgrains, other agricultural crops, minerals, especially in iron ore, petroleum and natural gas are quite impressive. But all these countries are industrially backward and lack capital and technical know-how for future development.

The sponsors of R C D, however, believe that the region's natural resources can best be tapped through joint planning on a regional basis. It is true, they say, that the economies of the three countries are not altogether complementary, but they can increase economic exchanges by expanding trade, developing communications, evolving a common policy for the marketing of goods and launching joint industrial ventures.

The Regional Planning Council and Ministerial Council of the R C D has laid down the following economic programme for R C D:

- to establish a joint Chamber of Commerce and Industry;
- to establish a joint shipping line in which Pakistan's share will be 50 per cent, Turkey's 35 per cent and Iran's 15 per cent;
- to establish a joint airline;
- to administer a technical assistance programme.

The R C D in addition plans to undertake joint purpose enterprises in

19 different industries, start post, telegraph and telecommunication offices on the borders of the R C D nations, reduce air surcharge on letters and draw up new agreements to promote tourism and expand the operations of banking and insurance institutions. It is also planned to facilitate exchange of information, create liaison between radio organisations and revive cultural ties to strengthen the sense of unity among the R C D member states.⁸

The R C D insurance centre was opened at Karachi on July 4 with the object of integrating the insurance markets of R C D countries. It is believed that it has all the potentials of becoming an important and influential element in the world insurance and re-insurance market. The R C D Chamber of Commerce and Industry is also expected to start operation shortly. This Chamber will, *inter alia*, establish common showrooms and promote the exchange of lists of importers and exporters of those items which can enter the trade of three countries. Studies will also be conducted for expanding the trade of manufactured goods including electric goods, glass and glassware, cutlery, trucks and buses and cotton textiles. The Regional Co-operation for Development Trade Committee held its meeting on July 7 and considered, among other things, the report of the study group on trade appointed by it in December. According to a PPA report, an RCD shipping venture will be launched in January 1966 with its headquarters at Islamabad. In addition to handling the trade of the three countries, it will operate on the USA route and develop intra-regional trade and trade with north Africa. Besides promoting trade, the new service will benefit Muslim pilgrims—a reflection of the religious element in R C D.

It is also suggested that a R C D import-export bank should be established to facilitate expansion of trade as "without these facilities trade would be treated on bilateral footing between the three countries, and the possibilities of triangular trade would remain frustrated." Agha Ghouse, Economic Adviser of the Pakistan Chamber of Commerce, suggested that the proposed bank should support the establishment of joint industrial ventures in the three countries, whose products would have a growing market within the region. If the commercial banks of these three countries could pool their resources and form the proposed bank, it could ultimately, according

to him, undertake financing of the region's major exports to foreign countries.

III

Many ideas, thus, have been discussed, but RCD is yet in its formative stage. According to the *Economist*, it is apparent that the three countries are finding co-operation for development "none too easy". Some people in Pakistan had earlier expected an agreement on petro-chemicals, defining areas in which each of the countries would specialise, but the subject did not even find a mention in the joint communique of the Ministerial Council meeting held in March, 1965. Evidently, it was found difficult to reconcile national industrial aspirations with RCD activities. Here the difficulties that the E C M is facing are a pointer that all will not be smooth sailing within RCD.

Of the three countries, Pakistan is the most anxious to make the R C D succeed. "As a nation with large industrial aspirations, it sees better prospects for the sophisticated capital-intensive ventures it envisages if markets can be shared. This sharing is intended to be based on an agreed pattern of industrial specialisation."¹ Pakistan believes that the smaller countries of Asia have a "very bleak future" unless they get together and form cohesive groups to resist the pressure of the continent's three large powers: Russia, China and India.

Whether the joint schemes envisaged by RCD will ever materialise, it is difficult to say yet. The three countries lack the necessary capital. Who will then finance these projects? The West, committed to CENTO which initiated and financed the unified communication system and other joint plans will not like to finance the RCD schemes which overlap those of CENTO. These countries may approach the Soviet Union, but to what extent the latter agrees to commit itself is a question which needs further investigation.

RCD is not an exclusive club and as to who else should be associated in it, there seems to be difference of opinion. While Iran and Turkey do not attach much importance to religion and the former actually asked India to join it, Pakistan is anxious to associate Afghanistan, Malaysia and Indonesia because they belong to the Muslim world. Pakistan will naturally be opposed to India becoming a mem-

ber, for then her very purpose in creating RCD will be defeated.

The RCD has also evoked different reactions among different nations. The Arab countries as well as the West have viewed it with distrust; correspondingly, China and its supporters have welcomed it. Its activities, however, need to be watched and studied carefully. In case it is able to break the hold of the West on these countries and enables them to pursue policies more in keeping with national and regional interests, it deserves to be welcomed by all developing countries.

Surplus Flows in A Dual Economy A Case Study of India

Yoginder K Alagh

The literature on economic growth of underdeveloped economies, both theoretical and empirical, is increasingly emphasising the importance of a transfer of surplus from a Traditional agriculture Sector (primarily and household production) to a Modern Sector (Primarily industrial).¹ An attempt is made in this paper to analyse these flows for the Indian economy.

It is suggested here that holding and purchasing of financial claims by the household sector on the modern sector is a counterpart of surplus flows between these sectors. Apart from income and agricultural output, we find that these flows are inversely related to relative price movements between the household and modern sector. It is suggested, with some inferential empirical evidence, that investment behaviour might be influencing relative price movements and through them surplus flows.

EXISTING analyses of surplus flows in the Indian economy either try to work with rural savings estimates or make some estimates of the agricultural surplus in terms of marketable foodgrains. As we see below, the statistical basis of such studies is extremely tenuous and in any case, these estimates are not necessary for estimating inter-sectoral surplus flows.

The rural savings estimates used are generally those of The Reserve Bank of India.² Time series estimates of savings of the household sector or incorporated business have deficiencies all over the world,³ but the Indian data are particularly poor, especially in the estimates of rural housing, and capital formation in the farms; the time series estimates being based on projections of the blow-ups estimated from a cross-section survey for one year.⁴ The agriculture surplus data, is either some non-comparable data on market arrivals in some selected agricultural markets released by the Directorate of Economics and Statistics of the Ministry of Food and Agriculture, or some isolated and irregular farm studies.⁵

The upshot, however, is that in the studies of surplus flows from the Traditional to the Modern Sector, estimates of savings which are used *within the traditional sector* are not needed. When we are concerned with intersectoral flows we can legitimately ignore savings invested within a sector. We can, therefore, conveniently drop the suspicious parts of the savings estimates i.e. rural and urban housing and rural capital formation. Direct estimates of the marketable agricultural surplus are also unnecessary for our immediate purpose. Some simple accounting relations can illustrate these two propositions.

Let us conceive of a three sector economy. There is a Modern Production

Sector (which we will call M), which includes organized industrial production both in the private corporate sector and the government sector (ours is a mixed economy). The Traditional Production Sector (which we will call T) consists of agriculture and small scale businesses. The third sector is the Traditional Consumption or Household Sector (which we call C), in which we include all household consumption. (The emphasis is added to explicitly indicate that all consumption is placed in the household consumption sector, there being no modern consumption sector. This simplification seems appropriate for our purposes). Let us now examine the interrelations between these sectors in a simple framework.

M Sector gets its labor from C and raw materials from T. It might also use its own profits for investment. Its output in turn goes to C as industrial consumer goods and government services, or to T as small tools and intermediate products or is used-up as capital goods within M itself.

Thus:

$$(1) L_1 + W_1 + P = Q_T + Q_C + I_1$$

where L_1 = Labor flow from C to M
 W_1 = Raw materials flow from T to M

P = Profits from M used in the Sector itself

Q_T = Industrial output flow from M to T

Q_C = Industrial output flow from M to C

I_1 = Investment within M.

The T Sector gets its labor from the C Sector and intermediate products from M and its output is used as raw materials in M, or wage-goods in C, or for investment purposes within the Sector itself. So:—

$$(2) L_2 + Q_T = W_1 + W_2 + I_2$$

where in addition to Q_T and W_1

L_2 = Labor flow from C to T

W_2 = Wage Goods sent from T to C

I_2 = Investment in T.

The C Sector sells its labor services to M and T. The income it gets is either used as consumption (of either industrial goods from M or agricultural goods from T) or is saved. These savings may alternately be considered as purchase of claims on the production sectors. Thus:—

$$(3) Q_C + W_2 + S = L_1 + L_2$$

where, in addition to Q_C , W_2 , L_1 and L_2
 S = Savings of C or purchase of claims on M and T.

Adding up equations 1, 2 and 3 and clearing similar terms and rearranging gives us

$$(4) S + P = I_1 + I_2$$

or investment in the economy as a whole ($I_1 + I_2$) is financed by savings in C and reinvestment of profits in M (which is equal to $S + P$). We can also rearrange (4) as

$$(5) S - I_2 = I_1 - P$$

or the deficit on investment account in M (or $I_1 - P$; where $I_1 > P$) is financed by a flow of surplus from C (after meeting the investment requirements of T).

We have already indicated that S may also be looked on as purchase of claims on M (which we may call S_1) and on T. We can, therefore say that:—

$$(6) S = I_1 - P = S_1 - I_2$$

S_M , as it can be seen, excludes investment within T, and it is the crucial flow of savings from the traditional to the modern sector which is the central

subject of this paper. It can also be shown that S_M is equal to the net flow of real resources from the traditional sector (now including both T and C or traditional production and the consumption sector) to the modern sector. Adding up equations (2) and (3) gives us:

$$(7) S - I = (W_1 + L_1) - (Q_T + Q_C)$$

Using equation (6)

$$(8) S_M = (W_1 + L_1) - (Q_T + Q_C)$$

$(W_1 + L_1)$ measures the flow of raw materials (from T to M) and labor (from C to M) from the traditional to the modern sector; while $(Q_T + Q_C)$ is the flow in the opposite direction. $(W_1 + L_1) - (Q_T + Q_C)$ is therefore the net flow of real resources. In other words the financial claims of the household consumption sector on the modern sector, are equivalent to the flow of real resources from the traditional to the modern sector.

The purpose of this exercise above is to suggest that in studying surplus flows in a two sector economy we are concerned only with net flows (and can, therefore ignore savings of a particular sector reinvested within it; and again the statistics on purchase of financial claims by the traditional sector from the modern sector also estimate the net flow of real resources from the traditional sector to the modern sector. These are important considerations if a selective use is to be made of available statistical material in India, for estimating such flows.

The Problem and the Statistical Estimates Used

The purpose of this paper is to examine the factors that influence the flow of net surplus from the traditional household sector to the modern industrial sector in the Indian economy. We postulate the initial hypothesis that these factors are the income available to the traditional sector, or alternately and more specifically the important and fluctuating component of output in the household sector i.e. agricultural output. In addition the movement of relative prices between the two sectors could be another factor influencing net surplus flow between them and finally investment in the modern sector itself could have a modified type of Keynesian accelerator or more appropriately a Hirschman type of Backward Linkage Effect, raising output and savings, through an induced movement in the Traditional Sector.

The analysis is still at a highly aggregative level though more detailed than earlier one sector studies.

The estimates of net surplus flows from the Traditional Household Sector to the Modern Sector were constructed from the Reserve Bank of India's saving estimates of the household sector (in constant prices) from 1950-51 to 1962-63.⁶ These savings estimates include savings in the form of cash holdings, net bank deposits, insurance policies, provident funds, net claims on the government sector, corporate and co-operative shares and securities and savings in the form of physical assets in the household sector. As was indicated earlier, the last component of household saving (i.e. physical assets which includes rural housing and farm capital formation) are more guesses than statistical estimates, but as equation (6) indicates, the net surplus flows (S_M) are calculated after deducting investment within the traditional sector (I_2) from the total savings

of the household sector (S). We, therefore, deduct, the estimates of savings, in the form of physical assets in the household sector, from the total savings, to arrive at our estimates of Net Surplus Flows (S_M) in constant prices, in Table-1 (Statistical Appendix). In other words, we are not using the weak components of the Reserve Bank of India's savings estimates. Again as equation (8) indicates S_M is also an estimate of net flow of real resources from the household to the modern sector.

One of the independent variables or factors influencing S_M is the income available to the household sector. The nearest statistical approximation to Disposable Income in India are the estimates of Private Income issued by the Central Statistical Organisation.⁷ These exclude income accruing to the government sector from net domestic product at factor cost, but include national debt interest and other transfer payments to the private sector

Sources :

- (1) Net Surplus Flows from household sector are from "Estimates of Saving and Investment in the Indian Economy: 1950-51 to 1962-63", Reserve Bank of India Bulletin, March 1965, Table IV, p 325. These estimates are estimates of saving of the household sector minus savings in the form of physical assets.
- (2) Private Income Statistics are from Government of India, Cabinet Secretariat, C S O, "Estimates of National Income". The estimates in current prices were deflated by the National income deflator for constant price estimates. National income deflator = Money Income $\times$ 100. Real Income
- (3) Agricultural Output Index is from Government of India, Ministry of Food and Agriculture, Department of Economics and Statistics, Agricultural Situation of India, August 1964, p 514.

and also earned income and net private donations from abroad. We deflated the estimates of private income at current prices, by the implicit national income deflator to arrive at the estimates of private income in constant prices. (Table 1).

Alternately to Private Income, we also decided to use Agricultural Output as an independent variable. The reasons for this were twofold. First agricultural output formed a major part of output in the household production sector. Second fluctuations in agricultural output have long been considered a strategic influence on the Indian economy, particular on important variables like surplus and savings,⁸ and also on the rate of economic growth (the latter because agricultural income forms half of the nation's income). The estimates of agricultural output used was the Directorate of Economics and Statistics of the Ministry of Food and Agriculture's Index of Agricultural Output, which is now prepared from output series corrected for changes in reporting area. (See Table 1).

An exciting suggestion has always been that relative price movements affect surplus flows in the Indian economy. The price of agricultural goods, for example, would affect input costs for the industrial sector and determine factor incomes generated by the household production sector. Prices of manufactured goods, on the other hand, are costs of intermediate products to the household production sector and, of consumer goods to the household consumption sector. It is sometimes suggested that due to non-monetisation and other institutional conditions, relative price movements, are not important in an economy of the Indian type. This is a hypothesis which can be subjected to empirical testing, and the type of influence that relative price movements exert, examined. Recognising the importance of relative price movements in determining net inter-sectoral surplus flows, still leaves the problem of the choice of relevant price indices. We chose a weighted index of food prices and industrial raw material prices as our Index of Household Production Sector Prices (P_H), and the Index of Manufactured Goods prices as our Index of Modern Industrial Sector Prices (P_M).

$\frac{P_H}{P_M} = P_R$ (or Relative Price Movements) was constructed as our ratio of household sector prices to modern

sector prices, to be used as a variable determining S_M (See Table -2).

Finally, as we have indicated earlier, we wanted to examine the hypothesis that investment in the modern sector induces surplus flows from the traditional sector. This entailed construction of estimates of investment in the private corporate and government sector of the Indian economy. The earlier estimates were those by Sastry and Antony.⁹ Estimates of government capital formation are available from the national income estimates, but the estimates for the private corporate sector have to be constructed. The private corporate sector in India consists of (i) Public Limited Joint-Stock Companies, (ii) Private Limited Companies, (iii) Foreign Companies. Sastry and Antony had used the Taxation Enquiry Commission's estimates on capital formation in Public Limited Companies for 1947-51 and the Reserve Bank of India's estimates from 1951-56. They then assumed that the Private Limited Companies added 20% and Foreign Companies 18.5% of the capital formation of Public Limited Companies to total corporate capital formation. Total corporate capital formation, thus arrived at was deflated by the Index of Wholesale Prices to arrive at estimates of corporate capital formation at constant prices. Our problem was twofold. First the Sastry estimates had to be updated (till 1962-63), and second an

effort was to be made to improve them. From 1956-57 to 1962-63, we took the Reserve Bank of India's sample studies of finances of Public Limited Companies, Private Limited Companies, and Foreign Companies, and blew up the sample estimates of capital formation according to the percentage of total paid-up capital the sample firms contributed. Sastry and Antony had done this only for public limited companies.¹⁰ The estimate of total corporate capital formation thus constructed is in two parts—assets and inventories. To obtain estimates in constant prices we deflated the assets component by the Index of Machinery and Transport Equipment prices and inventories by the Index of Raw Material Prices.¹¹ This gives us the estimate of total corporate capital formation in constant prices. (See Table 3).

The Statistical Results

We estimated the influence of our independent variables in determining S_M by simple linear regression. The results are, therefore, subject to the limitations of the assumptions of the linear regression model.¹² The violation of some of these assumptions, however, would show up in some of the properties of the estimates and tests on them (as we will see below) e.g. multi-collinearity would lead to high standard errors of the estimates of coefficients and autocorrelation

could be detected by the Durbin-Watson statistic.¹³ (The latter test shows lack of autocorrelation in residuals in our equations).

The results of our study, for the period 1950-51 to 1962-63, were as follows:

$$(9) S_M = 205.05 + .10Y - 10.68P_R \\ (336.04) (.013) (3.505)$$

$$R^2 = 0.83$$

where, in addition to S_M and P_R Y = Private Income in constant prices (as defined earlier). The co-efficients of the independent variables are significant at 99% levels of significance apart from the constant term which is insignificant. The Y co-efficient indicates that the propensity to transfer S_M out of additional income accruing to the household sector, is .10, (holding P_R constant). This seems a reasonable estimate.

The relative price coefficient is significant, but shows a minus sign. This would indicate that if the index of manufactured goods prices rises by 1 point relative to agricultural prices, the flow of resources to the modern sector increases by Rs 10.68 crores (1 crore = 10 million). This result indicates a responsiveness to price behaviour in the surplus flow movements in the economy, but not along lines that traditional economic theory would make us expect. Since agriculture is the predominant part of the household production sector, traditional economic reasoning would have us believe, that as the terms of trade moved in favour of the household sector; or P_R rose, S_M would increase. But our result indicates the opposite. As P_R rises, S_M falls. This behavioural pattern has also been noted in the Indian context by earlier studies. We will examine the explanations, already given, and then suggest an alternative hypothesis; together with further statistical evidence to support it.

Some Indian economists have argued that the marketed surplus of food-grains in India is inversely related to price movements.¹⁴ This is done on the basis of two process of reasoning, both of which smack very strongly of Neo-Classical Friedman-Patinkin monetary theory. One suggests that subsistence farmers have a unit elasticity demand for cash. Farmers do not have a money illusion. As the terms of trade move against agriculture, money savings rise, although real savings ("Real Balances held") are constant. Conversely if terms of trade in

favour of the agricultural sector money savings fall.¹⁵ Our evidence does not support this reasoning, because the inverse relative price relationship in equation (9) is not for money but real savings.

The second process of reasoning argues that farmer's cash requirements are fixed and, therefore, his own consumption is a residual. Thus if terms of trade move against the household production sector, S_M will rise and conversely, if terms of trade move in favour of it S_M will fall. Then it is argued that "under these conditions a change in prices brought about by an exogenous shock will be accentuated by the inverse relationship between price and marketable surplus."¹⁷ (emphasis added). Instead of leaving the whole structure to be set off by an exogenous shock, we propose to suggest some further explanations, and then verify them statistically; but before doing this it might be appropriate to indicate that if we use agricultural output instead of Y as an independent variable, the results of equation (9) are not significantly changed:—

$$(10) S_M = 15.73 + 9.75 Q_A - 9.37 P_R \\ (339.79) (1.26) (3.46)$$

$$R^2 = 0.83$$

where the new term Q_A = Index of Agricultural Output. Q_A performs as well as Y as an independent variable. This equation indicates that holding P_R constant, S_M rises by Rs 9.75 crores as the Index of Agricultural Output increases by 1 point. This corroborates Professor Raj Krishna's earlier results, from more limited data.¹⁸

Continuing the main thread of the argument, instead of the Neo-Classical explanations of savings behaviour, given above, we would like to suggest that investment may be the factor determining both relative prices and savings flow.¹⁹ The mysterious exogenous shock referred to above may be the investment pressure due to economic planning. In an economy with supply bottlenecks and a relatively long gestation period for investment projects, the implementation of investment projects in the industrial sector would create inflationary pressures within this sector and turn relative prices in favour of the modern industrial sector in the short run (be-

Sources: Corporate Capital Formation and Inventory Formation figures from 1949-50 to 1955-56 are from *op cit* Sastry and Antony. They are corrected by Index of Machinery and Equipment and raw material prices respectively. Estimates from 1956-57 to 1961-62 are taken from Reserve Bank of India Company Finance Studies of Public Limited, Private Limited and foreign companies. The sample figures of capital formation and inventories are blown up by percentage of total paid-up capital in company sector, covered by the particular study. Estimates in current prices are corrected for price changes as above. The government figures are from *op cit*, "Estimates of National Income". Current price series are again deflated by Index of Machinery and Equipment for capital formation and by wholesale price index for administrative capital formation.

fore the additional output due to this investment is produced). The period of analysis for our model is the short run, viz: one year, and in India the average gestation period for investment is placed between two to three years. We are also envisaging an economy in which an attempt is made to keep investment at a high level. It might also be insisted here that we are talking of a relative price movement. In the absolute sense prices of both sectors may rise. The increase in investment may, however, in the short run, also attract more resources from the household sector. Pressure on traditional sector prices may be kept down partly by utilisation of surplus labor. In this scheme, therefore, relative price movements and investment both operate in the same direction in determining surplus flows, and relative price movements become a proxy variable. In the above example a movement of prices against the agricultural sector (which is the same as a movement in favour of the industrial sector) leads to an increase in S_M . We are suggesting that I (or investment in the modern sector) is a crucial link. Conversely, if I goes down, relative prices will move against industry or in favour of agriculture in the short run, but S_M will fall because of lack of demand—explaining the inverse price relationship indicated above. More complicated and also more realistic sequences of interaction between agricultural output, investment in the modern sector, and relative price movements can be posited, but their statistical verification, is not possible within the limits of the single equation analysis conducted in this paper. We can only provide inferential support for our relatively simple hypothesis. It was estimated that:

$$(11) S_M = -634.15 + .73Y + 0.34 I_{-1} \\ (.20) (0.26)$$

$$R^2 = .72$$

where the new variable I_{-1} is investment in the modern sector lagged by one year, and alternately,

$$(12) S_M = -714.69 + 7.47Q_A + 0.32 I_{-1} \\ (1.85) (0.24)$$

$$R^2 = .75$$

There is a difficulty in equation (11) to the extent of multicollinearity between Y and I_{-1} . Of course, this problem does not exist in equation (12) because agricultural output is not determined by investment in the modern sector. To a great extent the problem is obviated in equation (11) also, because agricultural output de-

termines Y to a large extent, and also the gestation period of investment projects in India is on the average much higher than one year, which is the period of our analysis. The constant terms are again insignificant, but the other coefficients are significant (the Y and Q_A coefficients at 99 per cent levels, and I_{-1} coefficients at 90 per cent levels). R^2 in equations (11) and (12) is not as high as in equations (9) and (10), but is still reasonably high. There is therefore, some indication, that I_{-1} is an alternate variable influencing the determination of S_M , rather than P_R .

Further adding I_{-1} to equations (9) and (10) does not seem to improve the regression to a great extent, because,

$$(13) S_M = 295.06 + 0.08Y - 10.66 P_R \\ + 0.33 I_{-1} \\ (0.01) (3.15) (0.18) \\ R^2 = .86$$

and,

$$(14) S_M = 137.06 + 8.22 Q_A - 9.57 P_R \\ + 0.34 I_{-1} \\ (1.38) (3.08) (0.18) \\ R^2 = .86$$

Again the constants are insignificant, but Y , Q_A , P_R and I_{-1} are significant (I_{-1} again only at 90 per cent levels). The addition of I_{-1} to equations (9) and (10) only improves R^2 from .83 to .86, but the substitution of I_{-1} for P_R , in the same equations, still keeps R^2 at quite high levels (.72—.75). Of course, if the P_R and I_{-1} coefficients in equations (13) and (14) had turned out to be insignificant, our case would have been strengthened, because this would suggest a high degree of multicollinearity between the two variables in determining S_M —but this is not actually the case.

Conclusion

We have in this paper suggested that holding and purchase of financial claims by the household sector on the modern sector is a counterpart of surplus flows between these sectors also. We have then examined the factors that influence these flows. Apart from income or agricultural output, we find that these flows are inversely related to relative price movements between the household and modern sector. We have, with some inferential empirical evidence, suggested that investment behaviour might be

influencing relative price movements and through them surplus flows.

¹⁰ Their contention that the ratio of paid-up capital to capital formation is far apart in Private Limited Companies and foreign companies, than in Public Limited Companies does not seem to be corroborated by later statistics.

¹¹ The same deflation procedures were employed for the 1950-56 estimates given by Sastry and Antony in current prices.

¹² J Johnston, "Econometric Methods" p 107. A limitation of all the studies on India cited below, is that the analysis, is not in terms of a system of simultaneous relationships. This is a shortcoming this study is subject to also, although an attempt has been made to widen the number of independent variable.

¹³ *Ibid*, Chapters 7-8.

¹⁴ For a recent quantitative study corroborating this viewpoint, and review—the earlier literature see T N Krishnan, "The Marketed Surplus of Foodgrains—Is it Inversely Related to Price", *Economic Weekly*, Annual Number, February 1965, pp 325-28.

¹⁵ See A M Khuro, "Reflections on Redistribution of Income, Wealth and Opportunities in India, 1950-60", *Enquiry*, pp 80-82.

¹⁶ *Op cit*, T N. Krishnan.

¹⁷ *Ibid*, p 327.

¹⁸ *Op cit*, Raj Krishna. He makes marketable surplus a linear function of agricultural output.

¹⁹ This is in tune with the spirit of post Keynesian growth theories e.g. Joan Robinson and Nicholas Kaldor; although our hypothesis has to be modified to suit the scarcity aspect of Indian conditions.

THE GREAT EASTERN SHIPPING COMPANY LTD.

AROUND BOMBAY MARKETS

Equities Drift Lower

Wednesday Morning

DALAL STREET last week struggled in vain to move beyond its previous week's high. Though some of the popular scrips such as Century, National Rayon and Hindustan Motors, did strike new highs they were unable to pull the entire market up and later these shares also shed all their gains. Net changes over the week were small but losses predominated. The turnover was a little better but activity continued to be entirely professional and interest was very selective. Equities drifted lower mainly due to lack of support. Selling was seldom heavy. The market's performance could have been worse but for the highly encouraging corporate news. Hindustan Motors, Indian Dyestuff and Gwalior Rayon stepped up their dividends and Cellulose Products declared a maiden dividend. There were a few other companies which reported an increase in their earnings. But the good corporate news merely discouraged selling; bulls were in no mood to be aggressive.

The stock market did take some comfort from Finance Minister Krishnamachari's note on the economic situation prepared for the AICC session as it contained the assurance of a "realistic assessment of resources" in deciding on the size of the Fourth Plan and of modifications in credit restraints on a selective basis should that be considered necessary to stimulate production. But the stock market did not take kindly to TTK's earlier observations in Bombay that the market had a tendency to "gamble" on all types of rumours and that while the revival of capital-market had a place in the country's economic development there were other priorities like the need to augment foreign exchange resources and to fight inflationary pressures which had to be attained to first. "Capital market finance is important, but if it does not come, we will find substitutes", said TTK. Shri Krishnamachari's views will be widely endorsed, outside the stock exchange community, of course. The capital market cannot be revived without restoring health and vitality to the economy. The capital market is in bad shape because the country's economy is under serious strains. Dalal Street's main worry, however is the progressive decline in the volume of speculative business over the years, the tremendous growth of the corporate sector notwithstanding.

OILSEEDS

Wide Swings in Prices

NEW crop oilseeds contracts made their first official appearance on July 22. Linseed April opened at Rs 112 (per 100 kgs) and after rising to Rs 113 it dropped sharply to Rs 106.50 the same day. It shot up to Rs 116 on July 26 but was down again at Rs 109 the next day. Castorseed April started at Rs 90 (per 100 kgs), rose to Rs 92.50, eased quickly to Rs 88.75, advanced again to Rs 93.25 but dropped sharply Rs 87.75. Trading in cottonseed January commenced at Rs 53 but the contract rose quickly to Rs 57 and held firm around Rs 56 most of the time.

The start has indeed been very exciting. For never have new season's contracts been quoted so high right in the very beginning and rarely, if ever, have prices fluctuated so widely as they did last week. There have been occasions in the past when linseed futures did not fluctuate by the last week's range—Rs 9.50 per 100 kgs., that is, Rs 23.25 per 250 kgs which used to be the basis of quotation for the hedge contract in the past—in the entire season.

Nobody perhaps need bother much about the up and down movements in the new crop contracts as they affect only the fortunes of professional speculators. Since both linseed and castorseed crops have yet to be sown, it would be foolish to make any assessment of the new crop prospects. Current prices of new crop contracts are being influenced mainly by the prevailing spot prices. It is not possible to explain satisfactorily the wide swings in futures in terms of the week's news. All that one can say is that while bulls are taking their inspiration from the remarkable strength in the spot material, bear operations are based mainly on the generally satisfactory weather reports from nearly all the oilseeds producing areas; at present, weather is of particular significance only for the groundnut crop.

In view of the facility to transact business in new crop contracts, outstanding positions in linseed September and castor September contracts are being squared up at mutually agreed rates—Rs 117.25 for linseed and Rs 95.25 for castor. The rates fixed for squaring-up outstanding positions suggest that bulls have had an upper hand

in the matter; these rates are higher than the maximum prices permissible for the week when the decision was taken. With prices keeping well above the maximum limits set for the week, official trading in futures (current crop contracts) has remained suspended for many weeks.

Neither reports about very favourable weather in nearly all the groundnut producing areas, nor the control of credit against security of oilseeds in order to discourage utilisation of bank credit for speculative built-up of stocks, has had any visible impact on the trend of spot prices. Nor has the market taken any serious notice of the vanaspati manufacturers' reported decision to abstain from buying groundnut above certain specified rates—Rs 2,700 a tonne in Bombay. This is presumably because not many manufacturers are strictly observing the self-imposed restraint. The spot market continued to display remarkable strength last week. Groundnut oil was marked up to Rs 31.50 (per 10 kgs) and linseed oil was bid up to Rs 28.25—new high levels for the season. Near the week-end, however, prices suffered a small setback in sympathy with the sharp decline in futures induced mainly by heavy upcountry selling.

Export houses did not report any fresh important business. Overseas quotations, both for groundnut extractions and cottonseed cake, showed a moderate improvement, which in turn imparted strength to oilcakes prices here. Prospects of putting through very substantial business in groundnut extractions on a forward business are said to have been adversely affected by the change in the Government's policy permitting export business to be conducted only by the manufacturers from October which marks the beginning of the new groundnut season.

COTTON

Prices How High

COTTON prices continue to be quoted well above the statutory ceilings. Since unofficial premiums range up to Rs 150 per candy, quite a few varieties are quoted higher than even the revised ceilings for the new season (1965-66). And judging from the easy manner in which business is being transacted one wonders whether there really exists any kind of control over cotton prices. The open violation of

the price control order reflects very poorly on the authorities entrusted with the task of administering control. But then who bothers. How unfortunate!

The cotton mill industry protests, no more against the rise in price above the statutory ceilings. And that is not about all. It is really intriguing that while, on the one hand, mills continue to seek concessions by way of liberal financial accommodation to meet the burden of mounting stocks of cloth and yarn, on the other hand, they keep accumulating cotton at prices well above the statutory ceilings. At the end of May, mills had with them 22.93 lakh bales of cotton-18.82 bales of Indian cotton and 4.11 lakh bales of foreign cotton-the highest figure not only for the current season but for a much longer period of time. Apparently, mills wish to have as much cotton as they can possibly afford to keep, the price factor being only a secondary consideration.

Of course, the mills' attitude is not understandable. Consumption of cotton is going up steadily with the increase in spindleage. And there is nothing to suggest that cotton production will keep pace with the industry's growing requirements. During the first nine months of the current season—September to May—mills have consumed 48.15 lakh bales—42.33 lakh bales Indian and 5.82 lakh bales foreign—as against 45.61 lakh bales, comprising 41 lakh bales Indian and 4.61 lakh bales foreign cotton, during the same period last season. As the 1964/65 cotton crop has been smaller than in the preceding season, the current season which ends on August 31 is likely to finish off with a reduced carryover.

Though the export policy for the new season has yet to be made known, it is taken for granted that export will continue to be allowed freely. There have already been reports about fair amount of business in Bengal Deshi having been negotiated with Japan.

Money and Banking

Thursday, Morning

CONDITIONS in the Bombay short-term money market were more or less unchanged during the week ending July 28. Demand continued to be moderate, though lower than in the previous week. Supply of funds was well held around the previous level. Interest rates were maintained around 4 per cent but after clearing transactions were done mostly at 3½

per cent. Rates in the Calcutta call money market were between 4½ and 4¾ per cent. Some lots were reported to be transacted at 4 per cent as well.

During the week to July 9 there was a net contraction in bank credit by Rs 9.61 crores to Rs 2,062.69 crores, yet the figure of outstanding bank credit is higher by Rs 321.45 crores than at the corresponding time last year. Contraction during the week was effected mainly under advances against inland bills. Deposits on the other hand have increased by Rs 23.41 crores to Rs 2,751.48 crores. Investments in government securities were higher by Rs 19.22 crores at Rs 764.88 crores. Borrowings from the Reserve Bank decreased by Rs 28.51 crores to Rs 26.39 crores.

Total notes in circulation during the week to July 23 declined by Rs 47.98

BUSINESS NOTES

Tata Engineering

WHILE planning is recognised as a necessity for rapid economic growth in a country, wherein scarce resources have to be allocated on a careful order of priority, sound planning requires that imbalances within the economy be foreseen and prevented as far as possible. The shortage of various kinds facing several industries today has arisen largely from the failure to back up the rapid increase in the capacity with a corresponding expansion of sources of indigenous raw materials and components as a result of which additional capacity installed at heavy cost to the economy is only partially utilised.

Citing the present situation in Tata Engineering and Locomotive Company in this context, J R D Tata has said in his Chairman's statement circulated with the company's annual report for the year to March last that when the current expansion of the automobile division capacity from 12,000 to 24,000 vehicles per annum was undertaken at the instance of the Government as part of the overall expansion of the automobile industry in the Third Plan, the Government was fully aware of the requirements of special steels and other materials essential to the operations of the new facilities. Yet, at the end of the Third Plan and over ten years after the company began to make commercial vehicles, virtually none of the special steels incorporated in the company's vehicles are made in the country or likely to be

crores to Rs 2,607.31 crores, according to the Statement of Affairs of the Reserve Bank. Foreign securities remained unchanged at the previous week's level of Rs 68.35 crores, but balances held abroad were lower by Rs 2.16 crores at Rs 7.24 crores. Rupee securities were lower as well at Rs 2,329.72 crores by Rs 50 crores. Deposits of the Central Government showed an increase of Rs 22.43 crores at Rs 87.71 crores. State government deposits were lower, however, by Rs 92 lakhs. Scheduled bank deposits were also lower by Rs 16.31 crores at Rs 108.80 crores. Loans and advances to governments at Rs 61.54 crores showed an increase of Rs 4.80 crores. Scheduled bank borrowings are lower by Rs 10.98 crores at Rs 15.50 crores. Investments showed an increase of Rs 19.68 crores at Rs 311.30 crores.

made for some years. Tata has rightly pointed out that instead of creating large additional industrial capacity, which cannot be fully utilised due to paucity of foreign exchange or of indigenous raw materials, the logic of industrial planning should in fact allow, at the very outset, for some margin in raw materials and time.

Since April last, TELCO has received no import licences whatsoever for essential raw materials and supplies; neither has it received any indication as to when shipments will be resumed. As a result, the management has been compelled to cut back on production with effect from June 1965. Even if import licences for full requirements for the year are issued in the near future, it will not be possible to make up fully for such loss of output, and the production of vehicles during the current year is not likely to exceed materially that achieved in the past year.

The company has completed the first stage of expansion and established capacity for production at the rate of 18,000 vehicles per annum. During 1964-65, the output of TMB vehicles rose by 25 per cent from 12,800 to 16,025. The final stage of expansion for 24,000 vehicles per annum is under way. The second AID loan agreement for \$11.8 million has been finalised, and orders for the requisite plant and equipment are now being placed. Additional capacity is also being set up for the production of

Tata-P & H excavators for which there is good demand. The company is concentrating on the production of a selected number of standardised items of pulp and paper machinery. The manufacturing capacity established for such machinery has yet to be fully utilised, because the paper industry continues to be so depressed that few companies, if any, are implementing their expansion plans.

The production of the metre-gauge steam locomotives increased by 11 to 68 during the year. Under the current five-year contract for the delivery of 325 locomotives, the company has supplied 241 locomotives to the Government upto March last, and the balance is to be delivered over the next 1½ years. The company has agreed to deliver a further and final lot of 200 locomotives during the Fourth Plan period. With the installation of the new forging equipment to be secured under the second AID loan, the requirements of forgings for the increased output of TMB vehicles will be entirely met from the forge division.

The first stage expansion of the alloy iron foundry to meet the increased requirements of the automobile division was completed, and the output of alloy iron castings increased by nearly 25 per cent. Further expansion of this foundry is in progress. The implementation of the new project to be established at Poona for the manufacture of large press tools and complex dies has been hampered by the non-receipt of foreign exchange for the import of the special purpose machinery.

Unit Trust of India

BY declaring a maiden dividend of 6.1 per cent for the year to June 1965, Unit Trust of India has fulfilled its assurance to the unit holders of a tax-free return of six per cent. The gross income of the Trust has amounted to Rs 1.53 crores, after deducting the net loss of Rs 1.48 lakhs incurred on sales of Government securities. The initial capital of the Trust was Rs 5 crores, unit capital raised from initial sales from July 1 to August 14 was Rs 17.38 crores and from unit sales at a premium thereafter was Rs 1.76 crores. The gross income has been distributed between initial capital and unit capital in the ratio the former bore to the latter as at the end of June last, that is, Rs 32 lakhs to initial capital and Rs 1.21 crores to the unit

capital. After deducting expenses of Rs 6.06 lakhs at five per cent of the income allocated to unit capital, the net amount available for distribution to unit holders comes to Rs 1.15 crores. This could yield a dividend of 6.14 per cent, or 61.4 Paise per unit of Rs 10, but the Trustees have decided to distribute a round sum of 61 Paise per unit, and carry forward the balance.

R S Bhatt, in his Chairman's statement to the contributors to the initial capital of the Trust and Unit holders, has said that the investible funds were at the disposal of the Trust for a maximum period of 10 months only, and the rate of income distribution compares favourably with the return on similar types of investment. Since the increase in the Bank Rate on February 17, the pattern of yields has moved upwards and the Trust will have the opportunity of earning a higher rate of return on fresh investments. The Trust, therefore, hopes that it will be possible to improve the overall return which would be reflected in the income distribution to the unit holders for the current year.

The Trust had initially invested a fairly substantial amount in Government securities, but gradually switched over to other types of securities as investment opportunities occurred during the course of the year. The Trust's funds have been invested in securities of about 250 sound companies which include securities regarded as "blue chips". The bulk of investible funds amounting to 99.2 per cent is invested in companies which are on regular interest or dividend paying basis. The remaining 0.8 per cent has been invested in growth stocks of 19 companies, all of which have gone into production and hold out prospects of capital appreciation. In view of the downward movement in prices of debentures, preference shares and equities, there has been a slight depreciation of 1.6 per cent in the market value of investments of the Trust over their book value as on June 30 last. The Board of Trustees is making arrangements for ways and means to reduce the impact of such depreciation on the prices for sale and repurchase of units.

Hindustan Lever

A PRELIMINARY statement of Hindustan Lever's working results for the first half of the current year shows a 13 per cent rise in sales turnover from Rs 33.21 crores to Rs 37.41 crores and an over 81 per cent jump in profit before tax from Rs 1.54

crores to Rs 2.79 crores despite lower margins due to the rising costs of raw materials and increased wage bill. The overall trading results reflect the benefit of a reduced loss as a result of the continued ban on export of edible oils. With the provision for taxation demanding a substantially higher amount of Rs 1.74 crores, against Rs 82 lakhs, the after-tax profit is Rs 1.05 crores compared to Rs 72 lakhs in the corresponding period of 1964. The directors, however, state that in estimating the tax liability, no account has been taken of the various tax credit certificate schemes in the absence of details thereof.

In the previous full year ended December last, the company's sales realisation was Rs 61.87 crores on which it earned a pre-tax profit of Rs 3.74 crores and an after-tax profit of Rs 1.65 crores. The results of the second half of 1965 are likely to be affected by an increase in the export loss, since exports are essential to the company for earning import entitlements for the import of necessary raw materials from abroad.

Bayer (India)

SPEAKING to newsmen in Bombay some time ago, E Graef, Managing Director of Bayer (India) Ltd, stated that about 15 per cent of our total food output worth Rs 1,000 crores was being destroyed by pests every year and, even if half of it was saved, the country could be self-sufficient in food. Citing the effectiveness of pesticides in raising food availability, Graef said that Japan, despite a growing population, could stop rice imports during the past two years through plant protection measures.

Engaged in the manufacture of insecticides, weedicides, fungicides and pharmaceuticals for the past seven years, Bayer (India) is putting up a new factory at Kolshet near Thana in Maharashtra to produce annually 1,903 tons of rubber chemicals, 250 tons of Ethyl Parathion and 200 tons of Methyl Parathion on the basis of recipes evolved by the internationally known laboratories of Farbenfabriken Bayer AG, Leverkusen, West Germany, the company's foreign collaborators. Parathion, which the company proposes to manufacture, is playing a vital role in reducing crop losses. The construction work on the site is in progress, and the proposed expansion is expected to be completed by the middle of 1966. The full annual capacity of the plant is likely to be reached within

three years of commissioning the plant.

Meanwhile, due to the heavy expenses incurred in respect of the expansion programme during the transitional period, the company has earned a small net profit of only Rs 0.40 lakh in the year to March last compared to Rs 3.51 lakhs a year before, after providing Rs 1.52 lakhs (Rs 1.14 lakhs) for depreciation, Rs 0.11 lakh (Rs 0.15 lakh) for development rebate reserve and Rs 1 lakh (Rs 6.80 lakhs) for taxation liability. Together with the sum of Rs 0.21 brought forward from the previous year, there is a total of Rs 0.61 lakh for disposal out of which Rs 0.50 lakh (Rs 2.50 lakhs) have been transferred to general reserve.

Dhrangadhra Chemical

A NOTHER good year has been experienced by Dhrangadhra Chemical Works enabling directors to lift dividend for the third time in succession by two per cent to 12 per cent. According to a preliminary statement, sales during the year to March last have risen by 12.5 per cent to Rs 5.56 crores following a nearly 17.8 per cent increase in the production of caustic soda. The gross profit has moved up a little faster registering an advance of 13.7 per cent to Rs 1.50 crores. The profit could have been still better but for loss of production due to two major power restrictions imposed by the Madras Electricity Board and numerous shut-offs resulting from voltage fluctuation. Moreover, the profit has been arrived at after providing an additional outgo of Rs 6 lakhs on account of dearness allowance and bonus to employees.

Of the aforesaid profit, depreciation has absorbed Rs 55.47 lakhs (Rs 54.61 lakhs), taxation Rs 5.50 lakhs (nil) and development rebate reserve Rs 56 lakhs (Rs 40 lakhs). As before, preference dividends require Rs 4.68 lakhs, and out of the equity earnings of Rs 28.15 lakhs (Rs 32.51 lakhs) ordinary dividend demands Rs 12.90 lakhs compared to Rs 10.75 lakhs. General reserve, which received Rs 23 lakhs in the previous year, is strengthened by a further transfer of Rs 16 lakhs.

The company's liquid chlorine plant is expected to go into production soon. A scheme for the manufacture of Tri Perchloroethylene has been undertaken with the technical collaboration of a reputed Japanese firm. Besides, it is intended to take up a phased pro-

gramme of rehabilitating the soda ash unit at Dhrangadhra.

Cellulose Products

A FAIR improvement has been recorded by Cellulose Products of India in the year ended March 1965. According to a preliminary statement, the company has earned a gross profit of Rs 19.31 lakhs compared to Rs 13.95 lakhs a year ago, following rise in sales from Rs 38.69 lakhs to Rs 61.45 lakhs. The directors have provided for depreciation Rs 7.01 lakhs (Rs 5.53 lakhs), for taxation Rs 2.10 lakhs (Rs 0.10 lakh) and for development rebate reserve Rs 3.78 lakhs (Rs 3.96 lakhs). A sum of Rs 6 lakhs is allocated to general reserve to which no amount could be transferred in the previous year. The directors have deferred decision on dividends, which, if recommended, would be paid out of the general reserve. Last year, the company cleared arrears of preferential dividends upto the year ended March 1963.

The company's straw and grey boards plant and the pulp plant, which began trial runs in February last, are expected to achieve the rated capacity of 3,600 tonnes per annum by the end of 1965. The sodium monochloroacetate plant reached the full capacity of 360 tonnes per annum in March 1965. A further improvement can be expected in the company's performance in the current year.

New Standard Engg

A LL-ROUND good progress has been achieved by New Standard Engineering Company in its manufacturing operations. In particular, progress has been impressive in the manufacture of pneumatic hammers and forges. The blow room department has produced a large number of blow room lines, and the manufacture of cranes has been fairly satisfactory with the target of supply for the current year placed at 40 units. The construction of the Goregaon foundry has progressed further, and this year production of castings is expected to be more than doubled. Indrabator Ltd, a company managed by N S E, has already begun production of shot blast equipment at its Goregaon works, and has also secured orders worth Rs 20 lakhs.

During the year to March last, the company's sales turnover reached a new peak of Rs 3.08 crores compared to Rs 2.40 crores in 1963-64 and Rs 1.83 crores in 1962-63. As against this, the gross profit moved up at a faster

pace rising from Rs 26.88 lakhs to Rs 42.71 lakhs. Of this, depreciation has taken up Rs 14.76 lakhs (Rs 10.09 lakhs), taxation Rs 6.25 lakhs (Rs 5.70 lakhs) and development rebate reserve Rs 7.57 lakhs (Rs 1.03 lakhs). The directors have recommended payment of unchanged dividend of 10 per cent. The transfer to general reserve has been stepped up from Rs 2.75 lakhs to Rs 5.50 lakhs.

E I D-Parry

THE interim report released by EID-Parry for the first half of the year 1964-65 shows all-round good progress. The group's profits before tax for the period upto end-March at £439,915 are 75 per cent higher than those for the corresponding period last year. The main factors that have led to the better results were the increase in sales of 16 per cent and improved performance of the Ennore factory and the Ceramic Division at Ranipet. The sales of spirits and carbonic acid gas as also of chemicals have continued at a satisfactory level. Most of the initial problems in stabilising production in the Ceramics Division having been overcome, the sales and profits have considerably improved. Sales of all fertilisers have been higher than in the previous year. In particular, sales of mixtures and superphosphates have recorded more significant increases.

The Ennore factory production during this period was 16,875 tonnes of which 12,834 tonnes were sold as against 7,263 tonnes produced and 4,548 tonnes sold during the corresponding period of the previous year. This production may be considered quite satisfactory in view of the fact that the plant had to be shut down on a few occasions due to various factors such as power failure, boiler inspection, plant overhaul, etc. Crushing for the 1964-65 main season began on November 16, 1964 and upto March 31, last, 2,67,534 tonnes of cane were crushed and 23,584 tonnes of sugar produced with a recovery rate of 8.82 per cent. This compares with 2,52,890 tonnes cane and 23,048 tonnes sugar produced at a recovery rate of 9.12 per cent in the corresponding period last year. The lower recovery was due mainly to adverse climatic conditions.

The directors have declared an interim dividend of seven per cent, the same as in the previous year. They hope to maintain the total dividend for the year at the previous level.

IT NEEDS YEARS OF EXPERIENCE...

to make pipes durable enough to serve generations. Our vertically cast pipe foundry makes cast iron pressure pipes up to 48" diameter—and larger, on special order. The two spun pipe foundries—among the best in the East—make centrifugally cast pipes from 3" to 30" diameter, to an annual capacity of 160,000 tonnes. Prosaic details perhaps, but what's more important—at Kulti experience marches with nearly a century of tradition, and knowledge adds depth to know-how to make it an incomparable asset in the manufacture of pipes and fittings for India's many projects and utilities.

IC-107A

THE 12TH "FIRST" IN 61 YEARS OF PIONEERING 8 COLOUR ROTOGRAVURE PRINTING ONE OF THE LARGEST PRESSES IN ASIA

One of the largest rotogravure presses in the East, made by James Halley & Sons Limited, a Baker Perkins company, is now installed in the Calcutta factory of India Foils Limited, a Tube Investments subsidiary. The press will shortly be in production, printing both .009 mm

gauge unsupported, and laminated Aluminium Foil at speeds up to 600 ft. per minute, enabling India Foils to offer a wider range of highest quality Al Foil printed packaging for home and export markets.

TWELVE 'FIRSTS' IN 61 YEARS OF PIONEERING

1905—Lead-rolling for Tea Chest Linings.

1935—Aluminium Foil Tea Chest Linings.

1949—Al Foil specifications for the Tobacco, Confectionery and Electrical Industries.

1954—Flexographic Printing and single colour coating on Al Foil.

1955—Lamination and Embossing.

1956—Al Foil Bitumen/Kraft Lamination for mass packaging of Cigarettes.

1958—Rolling of Container Sheet.

1958—5-colour Rotogravure printing on Al Foil.

1958—Waxing for Confectionery and Heat-seal Biscuit wraps.

1959—Bangle Foil, now a flourishing export Cottage Industry.

1959—Al Foil Polythene laminates for Pharmaceutical strip-packaging

1965—8-colour Rotogravure printing on Al Foil.

FACTS ABOUT THE HALLEY

95 ft. superb engineering — Extended Drier for varnishing and coating under tropical conditions — Electronic print registration controls — Automatic viscosity controls — Flying Splicers for changing reels "on the run" — Mobile units for high-speed job change-over — Syncroscopes for on-the-spot inspection

PERFORMANCE OF THE HALLEY

High speed top quality rotogravure printing in eight colours or, alternatively, two jobs of 5 and 3 colours may run simultaneously.

THE CHANGING

Kulti. Neighbour to a steel town. Precursor of a proud tradition. It all really began at Kulti way back in 1870. Here was the oldest successful unit in India producing pig iron by modern methods. With production upgraded at Burnpur the blast furnaces closed down in 1958. But obsolescence never overtook Kulti. Its integrated iron, steel and non-ferrous castings foundry is still one of the largest in the East—the spun pipe foundry one of the best. Kulti's present consumption of pig iron exceeds 20% of that for the whole of India; it can, in fact, take in more, if available.

Thus Kulti continues in a career of planned growth. Serving Burnpur, serving other steel plants—and India's railways, chemical and sugar industries with complicated castings. Spinning out pipes as well by full train loads for the projects and utilities as no other unit does. And Kulti today is confident of adding on to its achievements.

Without Aid, If Need Be

THE country has passed through difficult periods in the last three years —the Chinese aggression, recurrence of poor food crops and acute food shortage, especially in the last year. What has happened during the last three months to change the atmosphere from that of difficulties boldly faced and mistakes frankly admitted followed by resolve to prevent their recurrence into one of abject surrender and defeat? The food crisis of last year in retrospect appears to have done some positive good. For there are hopeful indications of facing the problem squarely, based on the recognition that for years to come, food production will remain susceptible to unpredictable fluctuations and that without relaxing the efforts to reduce the dependence of our agriculture on the vagaries of the monsoon, the necessary institutional changes and organisational efforts will also be made in order that a more equitable distribution can be ensured.

It was not even a month ago that Asoka Mehta was speaking hopefully of breaking through the poverty barrier into a period of sustained and assured growth, undeterred by price rises, frankly admitting that the present pressure on prices might persist for the next ten years and that this was a necessary price to pay if the country wanted to achieve sustained and assured growth. It was also only a month ago that the committee of the National Development Council reached an unanimous decision about the additional resources which would have to be raised by the Centre and the States for the Fourth Plan and had also agreed—so ran the press reports—that to pave the way for the mobilisation of resources of the required magnitude, supplementary budget should be introduced by both the Centre and the States during the current financial year. But now the task, it is made out, is that of resource-based and not of need-based planning. How far can any under-developed country go if it bases its aspirations on free, existing resources? Why this new gospel at this late stage, after all these years of planning? What has happened in the meanwhile that those who should know better seem to be losing their nerve and succumbing to the spirit of defeatism which seems to have overcome them? Even the foreign exchange crisis, never far, has not grown any worse.

Speculations raised by the probings by the Monetary Fund and the World Bank about the possibility of the devaluation of the rupee has been effectively scotched by the Finance Minister. But the other speculations which revolve round the pressure for devaluation persist and have by no means been laid to rest, that of the offer of generous short-term aid on the condition that it would be exclusively for maintenance imports to revive the economy and the further condition that there is to be a pause from planning and consolidation for a year before any further development were taken up. In fact, subsequent developments tend to confirm rather than rebut them. On the same day that TTK denied rumours of devaluation, the Prime Minister allowed himself the liberty of thinking aloud in favour of a year of consolidation. From that point onwards followed a series of pronouncements and reflections. S K Patil told a Bombay audience that there had to be a holiday from planning "just to stop for some time and think anew". Lal Bahadur Shastri directed the Planning Commission to prepare an one-year-plan in order to pull the economy out of the present stagnation. Since then there have been closed door meetings of the Planning Commission about the one-year-plan which is expected to be considered at the full meeting of the Commission scheduled for the 8th of this month.

Sensing what was in the air, J R D Tata came out in favour of staggering the Fourth Plan over a period of seven years with limited expenditure in the first two years. The President of the Indian Chamber of Commerce and Industry, S L Kiroloskar, went one better with the recommendation that since the system of "totalitarian" planning had failed, the country should go in for indicative planning of the French type. Planned recess and concentration on agriculture and machine-building now hold the field. A defeatism, the like of which the country has not known in the last fifteen years of economic vicissitudes, has seized the top leaders. What the people at large

think about it or how they will react to this counsel of despair, it may not be difficult to imagine. But the rank and file of the Congress who are supposed to be in touch with the people did not communicate their views at the AICC. They do not even seem to have any views at all on such subjects, judging from the proceedings of the Bangalore session. There seems to be a conspiracy in the air for scuttling the plan and for frustrating the fifteen years of developmental effort pursued with perseverance, if not always with persistence, vigour and energy.

By rapid stages, the country has been presented with what looks like a *fait accompli*, in the last few days or weeks. No final decision may have been reached yet, but there is little room for doubt about what it is going to be. A series of pronouncements and statements, one more dramatic and damaging than the other, has followed in quick succession, unfolding a consensus among the leadership in the Government and the ruling party. The consensus is on the futility of planning and development, on the merits of sliding back all along the line, of a sudden halt and a retreat which at this stage can only lead to a rout.

The States will not tax agriculture and antagonise the largest single group of political supporters of those who started back-sliding from the time of run State politics. The Centre had the last budget, choosing the easy path of winning cheap popularity with minor tax concessions in preference to the unpopular fiscal measures that were needed to contain the inflationary pressures. But lost opportunities in raising resources are not the Centre's worst failure. Far more grievous has been its inability and unwillingness to attack and overcome the administrative and organisational weaknesses which have obstructed progress and prevented adequate returns being obtained from the very substantial investments that have gone into public undertakings in recent years. The latest from Nandaji who wants a shift in Plan priorities from heavy industry to food, cloth, edible oils and cement, pin-points this, his "admission" that less than two years at the Home Ministry have brought home to him the glaring inadequacies of the administrative system of which he was not aware during his long years in the Yojana Bhavan! Why not change the administrative system, instead of giving up the pursuit of self-reliant growth and development?

Nothing has happened in the last

three months which could not have been foreseen by the Finance Ministry and guarded against in time. There is nothing to warrant this defeatism, all these counsels of despair. In the life of a nation there are periods when it must pass through stress and strain. The thing to do in a situation like this is not to run away from it or to give up in despair but to face it coolly and with firm determination. Nothing has happened to call seriously into question the basic structure of the plans. Nor can the objective of self-reliant growth be given up by a people sunk in abject poverty whose only succour lies not in easy short-cuts but in changing the economic and social structure that condemns them to poverty and is bound to keep them down for ever.

The first step necessary to restore confidence and fight defeatism is to take the country into confidence. If this is done, people themselves will have the good sense to realise that the situation is not beyond repair and that it can be rectified by well directed effort to overcome the weaknesses in the economy. Since the foreign exchange crisis is the immediate provocation for all this talk of retreat any other factor, in creating a psychology of defeatism, let us get down to the bottom of it. Let us face it that the progress of import substitution which should have contributed most to self-reliant growth has been disappointing so far. This is not because the programme itself is misconceived but its execution has been half-hearted, slack and halting, particularly in the area of heavy industry, heavy electricals, and chemicals, including fertilisers. Far from suggesting that these programmes need to be given a lower priority, these are, on the contrary, the programmes to be given an even higher priority and executed with the utmost speed and despatch, particularly if foreign exchange is today the major constraint.

Indications have not been wanting for some time past that the attitude in the West in regard to foreign aid has been undergoing a marked change. The enthusiasm for it, arising from the illusory and misleading experience of the Marshall Aid, has been visibly wanting. Marshall Aid was for the rehabilitation of fully developed economies temporarily damaged by war. The problem of developing economies, on the other hand, is that of a wholesale transformation, of structural changes, which is a different proposition altogether. There is a growing

weariness in the minds of aid-givers and if the truth has to be told, complacency and helpless dependence—which is quite the opposite of the spirit of self-reliance aid was expected to foster—in the minds of aid-receivers. Though our plans are directed, rightly and effectively, to self-reliant growth, aid has militated against the growth of the spirit of self-reliance.

If aid ceases to be as freely available as in the past, we have to gird up our loins and face it. That should be a blessing in disguise, for the challenge will have to be met and the country will thus be roused from its present mood of despondency to the requisite high pitch of effort. Foreign aid was welcomed because it promised development without too much sacrifice. After three five-year plans, if the present leaders are not prepared to face the prospects of doing with less aid, there are others to take up the challenge.

Foreign exchange, however, is by no means the only constraint. In fact, paradoxically enough, it is the easiest one to get round, with the help of foreign aid. More difficult to surmount are the domestic ones, such as that of facing an electorate barely two years hence, without the show of a reinvigorated economy even though it be no more than a flash in the pan. Then there is the embarrassing business of raising resources in the crucial pre-election year. Is it then any wonder that the brave talk of supplementary budgets, though it came from a committee of the National Development Council, failed to raise any echo and is no longer heard of?

There is an obvious way out, though it may not be an easy way. That is to take the bull by the horn and request the aid-givers, if they are halting and reluctant, not for any fresh aid. The foreign exchange already committed for the Third Plan and left unutilised at the end of it can see the country through. All that needs to be done is to ask for a suspension—moratorium is a word which the Finance Minister does not seem to like—of the repayment and service charges which will fall due in the next Plan period and the total of which will amount to the unutilised part of the aid already committed. A hard decision, perhaps the hardest ever in fifteen years of planning, has to be taken. It is fatally defeatist for the country to go on pretending even though not believing that the decision can be shelved.

Labour's Immigration Act

THE Labour Government's new restrictions on immigration only go to prove an old political adage: idealism is a luxury which is incompatible with responsible government. In 1962 the Conservative Government passed the Commonwealth Immigration Act in the teeth of Labour opposition. In 1963 and successive years when the time came to renew the Act, the opposition became less and less vociferous and finally Labour endorsed the Government's policy. However, Labour did continue to maintain that immigration was best controlled, not by the rigid enforcement of a discriminatory Act, but by "informal" methods arrived at in consultation with other Commonwealth governments. It is indeed an irony of fate that in 1965 a Labour government should (after due consultation) impose a far harsher immigration law than was conceived of only three years ago by the Conservative Government.

The new Act takes effect immediately; the number of employment vouchers will be stabilised at 8,500 per year, of which 1,000 per year will be temporarily allocated to Maltese citizens. Moreover, since Category C vouchers (for unskilled workers) will be discontinued entirely—none have been issued anyway since September 1964—Britain is in fact accepting only skilled workers, who are sorely needed in their own countries. Given the restrictions on employment vouchers, a similar harshening of the rules concerning immigration of dependents was to be expected. The withdrawal of the concession admitting children aged 16-18 to join a parent and children under 16 to join other relatives is defended on the grounds that it was being used to bring in young workers without employment vouchers. That cases of individual hardship may occur through the break-up of families has been recognised by the Government; the adopted solution is to give the Home Secretary yet another set of discretionary powers. It would have been better to have regulations concerning the immigration of these young people—for instance, requiring a declaration that they have lived as members of the family for a certain number of years.

In Category A and Category B the controls are simply being tightened and the numbers lowered. In Category

A (people with a specific job to go to) no Commonwealth country will be allowed more than 15 per cent of the vouchers issued, in order that permits may be evenly distributed between member-nations. The nature of distribution of vouchers among the three categories pin-points the main worry of the British Government, namely integration. Immigrants in Category C are more difficult to absorb into the community than those in the other two categories. By and large, immigrants in Categories A and B are literate and English-speaking; hence the difficulties of integration are considerably lessened. They tend not to settle in those areas where there are large numbers of immigrants, with a shortage of houses and other facilities and where racial tension breeds easily. Moreover, since Category C immigrants are always coloured (whereas a fair proportion of the other two categories are not), the Government clearly hopes that the new Act, by reducing the number of coloured immigrants, will help to prevent the increase of racial tension in Britain.

The Government intends to take firm steps to prevent evasion of immigration regulations, even going so far as to require some Commonwealth citizens to register with the police. Since most countries have this regulation in respect of all foreigners, the British Government is not too restrictive to demand it of a few potentially undesirable Commonwealth citizens. The proposals for more intensive health checks can only be welcomed in the interests of all.

The new Act is bound to shake the faith of many Commonwealth citizens in the integrity of the Labour Government. When Labour (under Gaitskell) opposed the Immigration Act of 1962, they knew about the problems of over-crowding, racial tension and integration. These problems have not particularly worsened in three years, yet at election time the Labour party moved only to the point of recognising the necessity for "informal" controls with consultation. That they failed to inform their electorate that immigration controls in their present form had come to stay was a clear piece of hypocrisy.

The new Immigration Act has finally put the seal on the myth that Britain is the mother country opening her arms to all comers from the Com-

monwealth, whatever their race or creed. She has taken her position along with Canada and Australia, who, incidentally, could reverse their immigration policies with great benefit to themselves. In fact, the Labour party of Australia, which is not in power, has deleted the 'White Australia' clause from its manifesto. The need for any Immigration Act in Britain is a sad reflection on her history as a colonial power. Since she failed miserably to improve living standards in her colonial territories, even over decades, while she herself became wealthy, now some of her ex-subjects want to flock to her, rather than stay in their own countries, in order to achieve a decent life for themselves. The ultimate solution—which will take many years yet to achieve—lies not just in controlling immigration and promoting a true multi-racial society in Britain, but in raising life in the developing Commonwealth countries above the level of a grim unending battle with poverty.

Steel Twins

THE heads of the two private steel companies appear this year to have co-ordinated their statements to shareholders rather well. There is no overlap of content between the two statements. J R D Tata has spoken of expansion during the Fourth Plan, Biren Mookerjee of colliery development, specifications of tested steel and stock accumulation. Tata has once again expressed himself strongly against a 16½ mn tonne target for carbon steel for the Fourth Plan which is based on the belief that serious consequences would follow from the slightest gap between supply and demand for ordinary steels; he would prefer a diversion of investment to special steels and steel-using industries, which result in more valuable production and employment potential per rupee of investment. This plea notwithstanding, the company has accepted the Government's latest informal advice to double the capacity at Jamshedpur from 2 to 4 mn tonnes during the Fourth Plan, provided the problem of finance, return to shareholders, and availability of raw materials, transport and power are satisfactorily solved. This would bring the plant to the ultimate maximum capacity and overcome the permanent objection to its earlier one million tonne expansion proposal, which was rendered uneconomic by

the excess capacity built into the strip mill. The processing of this project will require considerable time. With the preliminary clearance of this project and with a similar go-ahead signal for Indian Iron, the private sector is assured of an honoured place in the Fourth Plan steel programmes which, its merits apart, should help improve the climate for aid from the Consortium. In the Fifth Plan period, only Indian iron can conceivably expand by a further million tonnes or so since Tata would have exhausted the physical space available for expansion.

Disappointment was in store for Sir Biren this year. One furnace in his plant had an unusual and rare kind of breakdown and the average ash content of coal which he thought had reached the peak level of 18.76 per cent went up further to 19.55 per cent. His company's project at Channalla and in the adjoining region to raise 1 mn tonnes of coal has made satisfactory progress; the World Bank had given a loan for this project at the beginning of the Third Plan. The new standard specifications laid down for steel give room for dangerous use of inferior qualities for structural works and mixing of qualities in trade stockyards. The practice adopted by the steel plants of building up large inventories of finished goods through the year and then liquidating them in a hurry before the end of the accounting year is imposing an avoidable strain on the transport system and also leads to uneven supplies to consumers. Sir Biren could have added that this practice strains the banking system too

Lament for Textile Machinery

MORE than a hundred years after the establishment of the cotton mill industry, the availability and quality of domestic textile machinery remains extremely unsatisfactory. The Fourth Plan requirement of mill machinery is estimated at Rs 337 crores, of which the Indian Cotton Mills Federation claims that domestic suppliers can provide only Rs 125 crores;

machinery entitlements under the export promotion schemes would allow the import of Rs 55 crores worth of machinery, leaving a gap of approximately Rs 160 crores. The figures of domestic production given in the table below indicate stagnation if not decline and considerable under-utilisation of capacity. How has this disturbing situation come about?

The mills complain of obsolete models, long delivery periods, non-adherence to delivery schedules, unsatisfactory performance and woeful lack of after-sales service. The Birla group, which is the leading manufacturer of textile machinery and also has a large interest in cotton mills, has entered a counter complaint of lack of orders, which is confirmed by the production statistics for 1964, but is unable to explain the reasons for lack of orders. Obviously mills prefer to depend upon import entitlements and Japanese credits for their replacement and expansion programmes even at the risk of slowing down the programmes. That this controversy should have come out in the open tells its own tale: the patience of mills is exhausted while the machinery manufacturers are tied down to obsolete models under their collaboration agreements and have enjoyed their monopolistic position too long to improve their quality and selling policies to suit mill requirements but now feel that import entitlements and Japanese credits have eroded their protected shelter.

In a free market economy, machinery manufacturers would have either gone out of existence or been pushed into a concerted attempt at modernisation. Though the big stick is practically absent, the attempt of ICMF to persuade Government to accept a larger foreign exchange liability is clearly aimed at prodding the machinery manufacturers into improving their production and selling performance. This prodding has its limits, defined by the severe shortage of foreign exchange and the political influence of business groups which are well en-

trenched in machinery manufacture. The country is, therefore, likely to get the worst of both the worlds: more foreign exchange would be spent and machinery manufacture will remain inefficient. The problem is too serious to be left in this state. A thorough expert investigation of the machinery industry is called for to put it on a sound basis.

Statistical Picture of Education

THE Education Ministry has this week released through the Press Information Bureau a mass of statistics to highlight the progress of education since Independence (see the "Current Statistics" pages of this issue). Naturally, there are today more schools and colleges and more boys and girls (still far fewer girls than boys though) are flocking into them. We had in 1946-47, 1,72,661 primary schools, 12,843 middle schools and 5,298 secondary schools. Today, we have close to 4 lakhs primary schools, 78,000 middle schools and 27,000 secondary schools. A closer examination of these impressive aggregates reveals the gaps between our requirements and our achievements.

As education is a State subject, the bulk of expenditure on education is borne by the States. While the Central Government contributed 45.3 per cent in 1946-47, today its share is only around 7.3 per cent; the States today put up 65.5 per cent of the total expenditure. All public bodies together provide 79.3 per cent, the rest coming from private sources. Thus education has certainly been taken over as the responsibility of the public sector but how near are we to the goal of universal, free, compulsory primary education? The proportion of population of age group 6-10 enrolled in classes I to V has risen from 35 per cent in 1946-47 to 77.8 per cent in 1965, but of these a sizeable number drop out after a year or two so that of the 10-year olds hardly 43.2 per cent reach class V, the minimum level of some sort of elementary education. Of the age-group 11-13, while in 1946-47 only 9 per cent attended school, today 31.7 per cent do; in the next higher ladder, the 14-16 age-group, however, only 16.8 per cent are able to reach the high school or higher secondary level.

These aggregate percentages hide considerable discrepancies between urban and rural sectors and between the sexes. Girls' education lags very much behind. In the rele-

vant age-groups, 21.7 per cent reach class V, 12.5 per cent complete middle school and a mere 6 per cent high school.

Technical and vocational education at the school level is still marginal: for every 24 students that crowd the general schools, only one takes technical training in our 650 vocational schools.

Finding out how well we are being educated is harder. There can be no precise measurement; however, one can use some rough indications like the pupil-teacher ratio, the qualifications of teachers and the equipment available in schools. The pupil-teacher ratio has grown unfavourable at all levels. There are not enough teachers to go round. On the other hand, the available teachers are apparently better qualified. Only 64.1 per cent of our primary school teachers were trained nineteen years ago and about 90 per cent of them were not even matriculates. Today 70 per cent of them are trained and about half have completed matriculation. In the middle schools, too, trained teachers now form 70 per cent of total and only 36 per cent are under-matriculいたes as against nearly 62 per cent in 1946-47. But what is startling is that even in our high schools some 8 per cent teachers have less than matriculation level education, though this proportion has been reduced from 17.4 per cent.

As for equipment, almost the only equipment our schools seem to have to boast of are teachers. At the primary level, 90 per cent of the total expenditure goes towards teachers' salaries; at the middle and high school levels the proportion is slightly lower, but still very high. Taking all levels, the proportion of expenditure on buildings, libraries, laboratories, etc. (breakdowns are not available) has increased slightly.

A final point of interest: fewer girls than boys may be educated but proportionately more educated girls than boys educate others. The proportion of women teachers has been increasing over the years.

Aid Prospects

THE Development Assistance Committee of the OECD has just published its report for 1964 on international aid. It reveals several grounds for concern. Up to 1962 new commitments of aid were each year much greater than disbursements: but

in 1963 while disbursements increased further, new commitments actually declined, with the result that "aid in the pipeline" had been reduced to \$ 667 million from \$ 1,476 million in 1962. Thus though the recent acceleration of disbursements is heartening, new commitments must also pick up speed.

In 1963 there was some softening of lending terms by the aid-giving countries. The percentage of loans carrying interest rates of 5 per cent or more fell from 70 in 1961 to 40 in 1962 and then to about 30 in 1963. Over the same period the percentage of loans with less than 3 per cent interest rose from 19 to 40. However, these concessions were offset to some extent by a decline by a few percentage points in the relative share of grants in total aid. During 1963 the USA accorded grace periods of 10 years for more than half of its new lending, but the report suggests that there were indications that the US terms of lending would not be made any softer. In 1963 the UK also introduced a new provision for waiving of all interest payments during the initial years of some loans.

Nevertheless, the burden of debt charges on the developing countries has been rising, and if this trend is not reversed it might soon result in seriously diminishing the net flow of aid. In view of this, the Development Assistance Committee (DAC) has recommended that aid-giving countries should provide a high proportion of their aid on favourable terms—i.e., either as outright grants or as loans with long maturities (25 years or more) at less than three per cent rates of interest. It is further recommended that the average grace period on loans should be seven years.

During 1964 the actual outflow of aid from the rich to the poor countries was slightly greater than in 1963; but the new bilateral commitments entered into by the DAC member countries during 1963 were 5.9 per cent below those of 1962. The contributions of these countries to the multilateral agencies have also been declining; they reached a peak (\$ 811 million) in 1961, but declined to \$ 602 million in 1962, and then further to \$ 396 million in 1963. Again, the increase in 1963 in government-guaranteed net export credits with maturities in excess of five years was less than the increase in 1962 by \$ 36 million.

Thus there are signs of slackening. The DAC claims that no case of decrease was due to any policy decisions in the country concerned to cut back its aid operations: rather, it thinks the causes have been largely procedural. Perhaps it is true; let us hope it is true. But there is no doubt that there is some disappointment in the aid-giving countries with the results achieved so far in the under-developed countries. Our case for more aid really depends on how well we use the currently available aid; and in India at least there has been some evidence of obtaining aid for a project and then losing all interest in ensuring that it is a running success. **Let's Let the Hiltons In**

A recent visitor to Puerto Rico writes:

THE proposal to have the world-wide-known hoteliers, the Hiltons, to manage and operate a chain of hotels in India has been hanging fire for over a year now. A coalition of ideologically diametrically opposed groups, with Indian hoteliers on the one extreme and left communists on the other extreme, is putting up a stiff fight against the proposed move.

Political overtones aside, the proposal is being opposed on the following grounds: (1) Hiltons are not required to participate in the capital outlay; (2) the proposal to pay one-third of the gross annual profit to the Hiltons is rather generous; and (3) the period of lease, viz 50 years, is too long.

Let us see to what extent the objections are valid. It is true that the Hiltons won't be spending a pie on capital outlay and this raises genuine questions about the degree of their involvement in the enterprise. At the same time, it should not be overlooked that the proposed agreement does not seem to guarantee any level of profit whatsoever to the Hiltons. Only if the hotels make profit, the Hiltons will get one-third of it. Moreover, it appears that the current outlays will be met entirely by the Hiltons out of their own funds. In other words, the circulating part of the capital will be provided by the Hiltons. It is not true, therefore, that the Hilton's involvement in capital will be zero.

As regards Hiltons' share of profits, i.e., one-third, the knowledgeable among hoteliers must know that the Hiltons have gone into other under-developed countries on far more generous terms. In Puerto Rico, Jamaica and Trinidad, Hiltons have been guaranteed one-half of gross profits and that too free of income-tax for the

Capacity and Production of Textile Machinery

	1962		1963		1964	
	Production	Capacity	Production	Capacity	Production	Capacity
(1) Blow room lines	10	24	16	66	15	66
(2) Cards	1,498	2,976	1,590	2,976	1,938	3,130
(3) Ring frames	1,571	3,252	1,890	3,852	2,134	5,366
(4) Plain looms	5,360	8,520	1,802	8,520	2,609	8,520
(5) Auto looms	496	5,700	3,382	5,700	1,610	5,700

first 10 to 15 years. In India, on the other hand, they are evidently prepared to accept one-third of the gross profits *subject to income-tax at 65 per cent* payable by foreign companies. This reduces the Hiltons' effective share to less than one-seventh of the gross profits.

Finally, is the period of lease too long? It is very difficult to answer this question one way or the other. But the fact that the Hiltons, and not the Government, are asking for a long lease does show their genuine interest in making a success of the proposed enterprise.

Having dealt with the objections, let us now take a look at how similar

arrangements have worked in other countries. In Puerto Rico, the Carib Hilton was built by the Government in the early 1950's. The Government has already recovered the full capital outlay and is since 1963 investing its share of the profits, which currently runs at around \$2 millions a year, in the industrial development of the island. During this period tourist traffic in Puerto Rico has increased several fold and a large number of foreign hoteliers have come in entirely on their own. It is this dynamic impact of a chain of hotels with international reputation that should be the most important consideration in India too, if the challenge of tourism is to be effectively met.

and came to the conclusion that because the Special Securities are held outside the banking system and because the *ad hoc* Treasury bills have been retired, there is no impact on money supply. These two authors were responsible for setting up the model for analysis of money supply. The Reserve Bank and the Government are blindly following that model. Both should now probe that analysis further in the light of the comments made above.

The official economists also failed to note that the draft on the food stocks for sale to the public is not continuous. There are sharp seasonal variations in drafts on food stocks kept with the Government. It is common knowledge that in the post-harvest season, drafts would be small while during the lean season the drafts on the Government's stocks would be heavy. Thus there will be sharp variations in the cash inflows to Exchequer. I need not analyse the impact of these variations in cash inflows on the money supply.

Corrections

Size, Technology and Economics

In the article "Size, Technology and Economics" by J C Sandesara published in our issue of July 24, the following printing errors need to be corrected:

P 1173, line 17, '>' should be '<'
" line 19, '>' should be '<'

P 1174, table A-2 column 7, item 3, '1,532' should be '1,537'

P 1174, table A-2, column 7, item 4, '1,467' should be '1,462'

P 1174, table A-3, column 7, item 2, '829' should be '828'

P 1175, table A-5, column 4, item 3, '231' should be '321'

The errors are regretted.

Commonwealth Common Market

The book "Commonwealth Common Market—A Proposal" by K Venkatarigiri Gowda which was reviewed in our issue of June 12 (p 946) is published by Messrs Rao and Raghavan, Mysore, and not Asia Publishing House. The error is regretted.

CAPITAL VIEW

The Jungle and the System

Romesh Thapar

ANYTHING is possible these days.

Modern saints, or *babas*, dressed in red raw silk, with hair curled in elaborate coiffures, belch and nod. Congress leaders, in the finest khadi *kurtas* and pyjamas, finger the charms given them by their astrologers and soothsayers even as they attempt to tinker with the problems of economic survival. The men of the Finance Ministry, in their dactron suits studying the unpredictable tactics of TTK, mouth the philosophy of the CPI as their debate with the World Bank gets warmer and warmer. And Prime Minister Lal Bahadur, who creates instant charisma like instant coffee the moment he crosses the frontiers of India, relaxes aglow with his trail of triumphs. Small wonder that we appear complex to friend and foe alike.

Within a few days we will be celebrating that therapeutic moment when power was transferred to our hands. Already, minds are ranging over the eighteen years since 1947 and marvelling at the changes which have taken place—yes, even at the level of the hovels where the bulk of socialistic (*sic!*) India still lives. The changes, visible and otherwise, have been quite significant, despite the banalities of the forums of 'democratic research' and the anguished cries of the captains of profitable industry who would have us believe that this progress has been built upon their sacrifice and suffering. The seed has indeed been sown for profound transformations, but this August an attempt is being made to destroy the seed.

The attack develops from several directions. Some speak of a 'pause', the 'need for consolidation', for a 'plan holiday' and almost lend support to the call for the extension of the fourth five-year plan into a seven-year effort embodying a two-year 'pause' (whatever that may mean). There are others who would persuade us to temporarily halt our efforts to industrialise so that we might concentrate on agriculture, for they prefer not to see how industry and agriculture are inter-locked in our dream to unshackle ourselves from dependence on others, to stand on our own feet. Production targets are challenged. Aid is denied or tied. Foreign exchange earnings are clipped through prices, incen-

tives, profits and perjury. Devaluation is advanced as the answer, but is firmly opposed, on the radio and in the press.

A whole people are stricken with confusion. A crisis of confidence, say the sophisticated apologists of the present drift. But the more one goes into this business, the more one is convinced that the core of the problem is never mentioned, never in all its dimensions—that we have created, unconsciously at first, but now wilfully, a jungle of bureaucratic rules and regulations based upon pre-August 1947 practice which has literally choked the implementation of the five-year plans by concentrating paralysing power at the highest points, particularly within the Finance Ministry which holds the purse-strings, and denying the initiative of vital decision-making at lower levels of administration and organisation. An army of pen-pushers, including specialists-turned-bureaucrats, push the nation deeper and deeper into a mesh of meaningless, repetitive, barren controls.

The 'System' Has Many Protectors

So many vested interests have been created that although everyone in the Capital agrees that we are trapped in this jungle no one is prepared to order its cutting down, its clearance. This is true of the state of affairs which prevails within government—and even outside, where positions of patronage and influence are sought in order to remain active and effective. The 'system', as it is referred to by those dealing with it, is so ramified that a few days ago the Union Home Ministry was compelled to blacklist 300 (yes, three hundred!) representatives of business houses in the Capital whose job it is to keep the files moving with or without the greasing of various cogs in the GOI. Whose files will move now? Only those who can get at the higher ministerial and bureaucratic echelons?

Whether it is the Finance Ministry or the World Bank, the ruling party or the opposition groups, the bureaucrats or specialists, creative workers or cranks, everyone is convinced that the system which is protected by this jungle of rules and regulations must go if the country is to revive and develop the energy to meet the chal-

lenges which are forming. Unfortunately, those who batten on the system defend it passionately as the 'institutional frame-work of our socialistic society'. And those who would destroy it, chatter unrealistically about returning to 'the free play of the market'. Where are the men working at the problem of providing a healthy administrative set up for what, in our conditions, has to be a planned society? If they are at work, they are not heard.

All the current controversies belong to the jungle and the system it protects. Secretive bureaucrats notwithstanding, the World Bank has been harping on this theme for a long time. Now this body feels that it has the upper hand and can intensify the pressure to force devaluation of the rupee—to some 50 per cent of its present value, to begin with—by the simple expedient of making clear that there will be no aid until a fairly fundamental reorganisation is carried out. In fact, a substantial untied loan is offered if devaluation is agreed to and steps are taken to free the flow of imports which have to be very large even to service the estimated forty per cent of industrial capacity which is believed to be lying unutilised. Demanding a reform of administrative and managerial procedures, confident that devaluation and increased productivity would make Indian exports competitive, the World Bank calls for a bigger Fourth Plan and a bigger taxation effort.

As you can well imagine, the policy-makers in the Capital have been startled by the vehemence of the criticism and its all-embracing character. Suppressed anger is quite visible in official circles. It is felt that an attempt is being made deliberately to exaggerate the crisis and to put through suspect remedial measures which would pulverise economic planning, and even open the public sector to stock market operators. Suspicions become convictions when the feeling spreads that India alone is being singled out for this kind of one-sided attack, an attack which carries the implied threat that further aid-giving will be dependent on how far India adjusts to the thinking of the World Bank.

Significantly enough, endless dis-

LETTER TO EDITOR

P L 480 Once Again

I READ the weekly note "PL 480 Once Again" in your issue of July 17, 1965. The last three lines of your commentary tacitly support what the Reserve Bank and Government economists have all along asserted, viz, PL 480 transactions do not affect money supply. To pin-point where and how the official economists have gone wrong and to facilitate discussion, I quote below the relevant extract from the Reserve Bank of India *Bulletin* article "Effects of the United States Commodity Assistance to India on Money Supply" by D R Khatkhate and V V Bhatt:

"When the food is imported, Government makes payment to the US Embassy by selling *ad hoc* Treasury bills to the Reserve Bank; thus the net bank credit to the Government and hence money supply increases by an equivalent amount. However, since the US Embassy invests these funds in special securities, the Government gets back the amount paid to the US Embassy and with these funds retires the *ad hoc* Treasury bills held by the Reserve Bank. Thus the initial expansionary impact on the net bank credit to the Government and money supply would be offset and the food imports would have no impact on the net bank credit to the Government and on money supply".

You will notice that one cannot quarrel with what has been said by the official economists in the first part of the above quoted paragraph. In the second part of the paragraph, the

official economists have committed an egregious blunder. I shall show how and why they have gone wrong.

Reserve Bank first creates credit in favour of Government against the issue of *ad hoc* Treasury Bills. Reserve Bank at the behest of the Government debits the Government account and credits the US Embassy account. Again when the US Embassy invests in special Government Securities which are *held outside the banking system*, Reserve Bank debits the US Embassy account with it and transfers the amount to the credit of the Government account, because the Government has sold Special Securities to the US Embassy. In this process, Reserve Bank's liability to the US Embassy is extinguished. Therefore, on the assets side, the Reserve Bank finds surplus assets in the form of *ad hoc* Treasury bills because it has received sale proceeds of special securities tendered by Government. It is thus forced to retire the surplus *ad hoc* Treasury bills. If it does not do so, it would have earned equivalent profit and the Government would have got back this profit at a later date in any case. Thus like a chameleon, *ad hoc* Treasury bills change their colour and take the form of Special Securities. The official economists failed to consider the fact that the Reserve Bank's indebtedness to the US Embassy is created cash and its retransfer to Government is also created cash. They, therefore, mistakenly directed their attention and the attention of the public to the retirement of *ad hoc* Treasury bills

cussion goes on in the Finance Ministry as to whether the arguments of the World Bank should be controverted through the media available to the G.O.I. Of course, it is not intended directly to drag the World Bank into a public controversy; only issues are sought to be debated. The hesitation in the Finance Ministry arises from the fear that public controversy will explode many myths and legends, even expose the closely guarded jungle of rules and regulations, and the system which battens on it, to ridicule and contempt. This is, in fact, the heart of the problem—devaluation or no devaluation. If we had the political leadership to tackle the problem, the World Bank would perhaps also revise its ideas—for, there are differences of approach within the World Bank too.

But bureaucratic power has become so concentrated, and encrusted by powerful private vested interests, that it will require almost an upheaval within the ruling party to force through an energetic programme of administrative, managerial and procedural reform. Such a reform, while liberating the decision-making faculty at various levels, would also have to restore the policy-making initiative to the Centre which very often these days is reduced to preparing agendas for meetings of parochial Chief Ministers. The task looks forbidding, but, is there any escape? The entrenched bureaucracy seems to wallow in the belief that business can continue as usual. This is sheer madness.

We have already entered that phase of bureaucratic decadence where unchecked power is being used to harass those who have no 'godfather'. We call it corruption, but it is rapidly taking on vicious forms. Politically, whether in a democratic or authoritarian society, this means that an explosive situation is beginning to mature. The urchin goondaism witnessed in Calcutta, the communal clashes at the smallest provocation in various towns, the growing impatience with those who throw their weight around, all point to an infection which threatens the health of our society.

In a sense, August is an appropriate month for organising correctives to the practices which we have built up over these eighteen years of freedom, practices inspired by the colonial attitude and behaviour of an alien ruling elite. The jungle of rules and regulations must be thinned out, cleared if possible—and then the system it protects will stand exposed for what it is. This is the pre-requisite for ending the crisis which makes nonsense of so much of what we do. And it need not mean a surrender of socialist commitments.

WHERE THERE'S TRADE COMMERCE EXPORT INDUSTRY

THERE IS THE UNION BANK

Union Bank investments encourage industrial growth. Union Bank helps traders and businessmen by providing facilities for both industry and export. Helps the country earn valuable foreign exchange.

In Defence of Food Zones

A SIMPLE argument against the food zones is that they restrict the area of operation of private trade and consequently their opportunities for profit. If one accepted that the objective of policy should be to put profits in private trade's way, this argument would be unanswerable. This is not, however, the argument that one hears. What one hears is that the system of zones has prevented a national approach to the food problem and the evolution of a national food policy. This argument needs examination.

In his note of dissent to the report of the Agricultural Prices Commission, released this week, Raj Krishna, one of the members, argues for abolition of the single-State zones for rice. He opposes restrictions on movement of rice on two grounds: first, the zonal system increases the commitments of the Central Government to supply foodgrains to the deficit States; and, second, it prevents the overall shortages of foodgrains being shared equitably among the different States.

To take the first argument: Should the primary objective of food policy be to keep down to the minimum the Government's commitments? One would have thought that the Government's commitments were what it took on itself depending on what it wanted to do. To put the argument in the form that any policy or arrangement which increases the Government's commitments should be, on that score, rejected is perverse. If shortages occur, prices rise and people go without food, can the Government be absolved of responsibility on the ground that free private trade is allowed and it had itself taken on no specific commitments to supply foodgrains? The Food Minister played this trick at the height of the food crisis last year when he joined in, and indeed led, the general chorus of accusation against private traders who were after all trying to make the best of a heaven-sent opportunity which the Government had thrown in their lap. The Government must not be allowed to get away with this trick again; it must be made to accept specific responsibilities in respect of distribution of foodgrains. Action to gain command of the necessary supplies to fulfil these responsibilities should follow and not the other way round. The quantity of foodgrains that the Gov-

ernment can procure is not something fixed. The Government can gain control of varying proportions of the total marketable surplus by following different policies. It is these policies which should be changed so as to meet the Government's commitments.

Equalisation of Prices or Supplies?

Coming to the other argument: need the restrictions on private trade under the zonal system prevent equitable distribution of the overall shortages, favouring the surplus States and penalising the deficit States? According to Raj Krishna, the main criterion "of equity in inter-regional distribution of food has to be the minimisation of price differentials" and this, he thinks, would be best achieved by free private trade across the country.

Given the inter-regional and inter-personal differences in distribution of purchasing power, equalisation of prices cannot reflect equalisation of the real burden of shortages either between regions or between different sections of the population. The real measure of equal distribution of scarcity would be (rough) equalisation of the physical quantities available per head of the population. And in this respect what has been the experience with food zones? This is what the Agricultural Prices Commission has to say on the subject:

"As a result of procurement and allocation operations of the Government, the inter-State differences in per capita availability of foodgrains have been considerably reduced. The co-efficient of variation of per capita net production of cereals in 1965 as between different States was 29.5 per cent. As a consequence of transfers from surplus to deficit States effected by the Central Government, the co-efficient of variation of per capita availability of cereals was reduced to 15.0 per cent. Reduction in inequalities brought about in the case of rice and wheat was also substantial. The co-efficient of variation came down from 105.7 per cent to 67.8 per cent in the case of rice and from 264.0 per cent to 96.2 per cent in the case of wheat. Thus, it is not true that the surpluses in the better-off States have not been shared by the deficit States in 1965 under the Single-State Zones.

"The result of the programme of planned procurement and distribution on Government account likely to be achieved in 1965 compares favourably

with that achieved during the period 1961-65, when foodgrains movement was relatively free. The co-efficient of variation of per capita availability of cereals in 1965 would be 15 per cent as compared to 17 per cent during 1961 to 1963."

Of course, nothing is said here about inter-personal differences in availability of cereals within States. Without arrangements to control distribution it cannot be assumed that inter-personal differences have also been reduced. But at least the Agricultural Prices Commission has found proof that banning of private trade and procurement and movement by the Government has narrowed differences in per capita availability between surplus and deficit States. This is basis enough to argue that overall shortages of foodgrains are less unequally distributed without free private trade than with it.

The argument is strengthened if it is considered that the food zones scheme has been most imperfectly implemented so far. The rationale of the system requires Central planning of procurement and distribution in terms of a national food budget. As the Prices Commission recommends, "immediate steps should be taken to make a realistic assessment of the surpluses and deficits of foodgrains—separately for wheat, rice and coarse grains—for each State on an objective basis and draw up a comprehensive National Food Budget."

To sum up, the system of food zones—imperfectly as they have worked so far, hampered by parochial political pulls and administrative half-heartedness—has led to more equitable inter-regional distribution of cereals than in the past under free private trade. Obviously, then, efforts should now be directed at, not scrapping the system and restoring free private trade, but strengthening it by getting the States to accept a national food budget which would objectively estimate the surpluses of surplus States and the requirements of deficit States. The resultant equalisation of inter-State distribution of foodgrains can be converted by a policy of rationed distribution into equal inter-personal distribution, which should be the objective of food policy in the present context when shortage of foodgrains is expected to continue over the next many years.

A Seminar on Priorities?

By a Seminarist

A NEW class of people is slowly emerging in the country. For want of a better word, we can but call them 'seminarwallahs'. There is an aura of irresponsibility about seminars. One knows that there will be a 'background' paper or papers which some donkeys—maybe research students desperately anxious to propitiate the supervising professor or a few lower-rung journalists hard-up for some extra money—have slugged out and the organisers will have circulated a neatly-mimographed agenda mostly consisting of clichés and banalities: the strain has therefore been taken out of participation. One can safely accept invitations to seminars: the paraphernalia is by now stereotyped. If you cannot get hold of a Cabinet Minister or a member of the Planning Commission to 'inaugurate' your seminar, somebody from the US embassy or consulate will always be available. The so-called discussions will be generously interlarded with luncheons and dinners; at the concluding sessions, the Press will be called in for an euphoristic briefing, and you will be moving on to your next seminar.

There is an exchange of purchasing power for what passes for scholarship, and therefore, in the speculative environment, one does not want to burn one's fingers by clinging too long to what one possesses. Seminars are ideal for quick unloading of 'knowledge'. Who knows, by tomorrow somebody may beat you to the game and the market-value of your 'knowledge' may turn worthless. It is this neurosis which impels university dons in the United States to churn out a book every twelve months. Still, books have to be written, and do call for a minimum of intellectual effort. Seminars, on the other hand, have only to be organised. There need not be even a faint correlation between one's ability to organise a jamboree and the quality of one's intellect. On the contrary, a man of intellect may happen to be a man of conscience. Conscience is an unfortunate attribute for a 'seminarwallah' to have.

One should not perhaps take the whole of it out on the university people: till recently, they were not accustomed to high living, and the glitter of lush food, air-conditioned lodging and easy lure is difficult for them to resist in the prevailing atmosphere. After all, in this degradation of morals which seminars foment and represent,

our civil servants too have contributed in their own modest fashion. The task of economic development has led to the enunciation of the myth of 'interaction'—how can the country progress without the intellectuals and the bureaucrats 'interacting' amongst themselves? Seminars are just the thing for busy civil servants who are nonetheless hell-bent on commingling with the citizenry and profiting from the 'feedback'. Also, a seminar is merely one step beyond an inter-departmental committee, and the civil servant does not often even feel the transition.

Of course, in the absence of American foundations and PL 480 money, seminars could not possibly have proliferated in this country, at least, not in the present amplitude. This is another aspect of the rubbing-off effect one hears of. Seminars are a phenomenon of affluence; they represent the tertiary sector of intellectual pursuit. An over-affluent economy can stave off crises only by creating new service occupations: whomever superior technology displaces from material production get absorbed in such occupations. In the United States, a certain proportion of the academic people have to be continuously diverted, on a revolving basis, to seminars and seminar-like occupations so that equilibrium might be maintained.

But both history and economic logic emphasise one point: the base for material production must enlarge first, and it is only when the primary and secondary sectors of the economy have reached the stage of maturity and consolidation, that the tertiary sector of services would start expanding. By definition, a service sector will have to serve other sectors; it will be without an occupation till the other sectors have not come up.

In India, it would seem, we are determined to lop off the inconvenient stages of the historical-economic process. There are wide gaps in our primary and secondary stages of education. Technical and engineering schools fall woefully short of the requisite number; laboratory apparatus and equipment are missing; the universities lack able and effective teachers; the quality of textbooks at all levels and in almost all subjects is deplorable. Deep calls to the deep, and an existing low standard of liberal as well as scientific education is an enticement to a progressive lowering of standards. There is no question that the basic

infra-structure is missing; the service industries nonetheless keep on springing on Indian soil. Never mind whether we have already succeeded in enlarging the 'material' base, let us reverse history, and have the service activity first. This has happened in this way because we have gradually allowed our educational planning to slip out of our hands and into the hands of foreign advisers and donors of funds. The latter, all honourable and well-meaning men, have imported their cultural model—the concept of seminars has thus become the *tour de resistance*.

It could be argued that, after all, the money belongs to the foreigners and, beyond a point, we can have but little say in the matter whether they should use it to foster a dozen seminars on 'motivations of development' or 'change-agents' and such like topics, or use it to buy equipment for our workshops and technical schools. But the pattern set has second-order effects which may be altogether pernicious, and which is why it is necessary to question the bona fides of the pattern itself. Seminars beget other seminars, unwholesome notions lead on to still more unwholesome notions. In the melee, genuine scholarship tends to get shelved, the 'bread-and-butter', relatively unsophisticated, but immensely more important and fundamental, issues of education are blotted out. If this process continues for a while, the priorities of national educational planning are bound to get irrevocably distorted.

A final point. The vast sums which the US Agency for International Development is spending on organising seminars and summer parleys and orientation courses in this country come out of the PL 480 block of currency. On top of derailing the nation's priorities, therefore, the expenditure of these sums—let it be said—has also an inflationary impact on the economy.

BOOK REVIEW

Political Economy of Indian Planning

Ashok Rudra

Planning in India: Achievements and Problems by Ajit Roy; National Publishers, Calcutta, 1965; pp 523, Rs 30.

CURIOUS things have kept happening to the Indian economy since the first year of the last decade. There are practically no economic experts—official or non-official—who have not been caught by surprise again and again by many of the developments that have taken place. There have not been any forecasters who could forecast, say, the current year's foreign exchange crisis or the last three year's crisis of agricultural production. But these are only the latest crises which happen to be fresh in our mind. Has the last 14 years of planning not been a succession of unforeseen crises rather than a series of planned advances? We have all been, in each case, wise after the event, but did not have any better idea of the next event that was to throw us off our balance. This lamentable situation is a result of a fact that nobody has as yet undertaken a thorough-going analysis of our post-war social and economic experience from the standpoint of political economy.

I dare say that to be really satisfactory, to provide us with an analytical model that could be used to anticipate and understand events as they take place, one will have to work with such Marxian categories as "classes" and "class conflicts." Marxism is not exactly fashionable in this country at the moment and to say that the poverty of political economy in India is a result of the poverty of Marxism in India is to risk one's reputation in the academic world. This prejudice against Marxian analysis is born largely out of ignorance of the Marxian concepts,—an ignorance shared by both Marxists and non-Marxists; it is also a reaction to the extremely poor examples of such analysis that Indian Marxists have provided so far.

A class according to Marx is a group of economic individuals who are relatively homogeneous from the point of view of their economic interests objectively defined in terms of their legal relations with respect to the instruments of production. Between members of two classes the conflicts of interest are to be more important than the conflicts of interest among members of the same class. There need not be any immutable classes. For different analytic purposes one may work out different schemes of classes. Marx him-

self used a simple two-class model of political economic analysis, just as he used a simple two-sector model to analyse the process of economic growth. The fact that this simple two-class model is often found inadequate to analyse the dynamics of a complex modern society does not condemn the approach: the Harrod-Domar model or the Mahalanobis-Feldman model is not to be regarded as useless because they do not serve the same purpose as the dynamic Leontief model or a multi-sector programming model. When it comes to analysing a particular society during a limited historical period, the two-class model has to be discarded in favour of a more sophisticated model involving a larger number of classes suitably defined on the basis of the same principles. Marx himself gave examples of such adaptation of his model when dealing with particular historical problems (e.g. his analysis of the Commune of 1881). The task was left to the political economists who followed him to develop and improve upon his method, but unfortunately it was never taken up. The approach, however, remains as valid as ever—if one is trying to understand the economic and social problems given rise to by the business of renting out residential accommodation, the class approach suggests a division of the persons involved into two categories, the landlords and the tenants and what can be more reasonable? The definition of the classes in this particular problem is simple—it is much less so in more complicated problems; but one has not even tried the application of sophisticated analytical tools to the problem. Thus, I fancy, it should be possible to apply the statistical technique of discriminatory analysis to the definition of classes.

It is necessary to define classes and identify class conflicts before we can understand what is happening to the Indian economy as it is only in terms of classes that we can try to understand the policies adopted by the government and the reactions to it of the different private economic decision-makers. While every single question about the Indian economy can be analysed in these terms, it is extremely important that two in particular are posed and answered before anything

else is taken up. The first concerns the Indian state: what class interests does the Indian state represents more than others and what is the mechanism of class interests affecting state policy? Answer to this question is necessary if we are to understand the extent to which the public sector is laying the foundations of a socialist society by relatively weakening the private sector and the extent to which it is strengthening and building up capitalism by supplying the needs of the private sector. The second question concerns Indian agriculture: what classes and class conflicts have emerged as a result of the land reforms among the population deriving their income from agriculture? Which are the classes that are investing in agriculture and have promoted the increase in production that has taken place during the plan period? How much more of advance in agricultural productivity can be expected within the framework of the present class structure in agriculture and the size distribution of holdings? It is because we have not posed the problem in these terms up to now that it has not been possible to have any understanding of the factors that have caused the agricultural crisis of the Third Plan period. Is this stagnation on the production front nothing more than a phase in the weather cycle? Or can we say that the potential of development of the present set-up—i.e., the present holding structure as well as class structure—is nearing exhaustion and that further technological and financial inputs would yield returns only at a rapidly diminishing rate?

Ajit Roy is no armchair Marxist: he is an active participant in the struggle for socialism in this country and at the same time he is among the very few such activists who have devoted years of painstaking work to serious research in problems of political economy. His earlier book on monopoly concentration in the Indian economy was of a pioneering nature. It is, therefore, natural for a reader acquainted with the author's background to expect that here at last was the Marxian analysis of Indian economic growth that one has been waiting for. It may not be too severe a criticism of the book to say that in this

expectation the reader will be disappointed.

As a matter of fact the book has turned out to be quite a readable and useful critical account of planning in India. The historical and documentary part of the book is ably put together and a teacher giving a course of lectures on planning will find it useful to be guided by its chapters. But the very comprehensive character of the book has resulted in the analytical part falling short of one's expectation. Whether the author intended to write a text book or not, content and style of the book is highly textbookish; while facts and figures are faithfully and systematically presented, the author is cursory in his treatment of the more critical and controversial issues. Thus, on the agrarian question the author describes the present situation as one of a struggle between two alternative paths—the so-called American path and the Prussian path—but devotes no more than three pages to its discussion! Where are the facts and figures that would make his hypothesis appear plausible and why not any attempt to indicate, on the basis of factual evidence, where, how, why and to what extent which line is getting more established and with what consequences? Again, discussing the public sector the author indulges in such bald statements as:

"The second category of state projects is formed by the hydro-electric schemes, the steel plants, fertiliser factories, machine tool manufacture, etc. These projects were undertaken to help the private sector, including big business, to expand quickly as the former strengthen and extend the infra-structure on which the edifice of private capitalist industrial complex can expand."

This proposition deserve to be thoroughly investigated, not just stated and one expected that Ajit Roy's book would consist precisely of such investigations.

Another example of cursory treatment of matter calling for deep probing is the author's statement that the country will enter the phase of "technological take off" by the end of the Fourth Plan. This is too optimistic a view based on a neglect of the persisting character of the problem of import substitution. The author's suggestions (on page 342) regarding mobilisation of domestic resources are also of the nature of slogans: whether nationalisation of banks would enable the public sector to control the private sector more effectively or render

the private sector's influence on the public sector more compact and pervasive is very much an open question. Two crucial chapters of the book, those on monopoly concentration and the public sector, are reproductions of certain earlier published works by the author. As such they remain not quite integrated into the main stream of argument of the book.

A further illustration of the author's shyness to get into the deep waters of class analysis is that he talks most of the time of the "Indian bourgeoisie" and the "ruling class" without stopping to define their coverage and without worrying about the degree of heterogeneity that may be expected within this broad class. Can we really

get any insight into the problems of Indian political economy if the conflicts within the class called the bourgeoisie are all overlooked? The discussion of the public sector ends by giving the name of "State Capitalism" to the public sector in India, but to spelling out the particular features and shades of class relations covered by the term the author devotes no more than a mere half page!

Despite all the deficiencies that one can point out the book deserves to be welcomed as a useful addition to the collection of books on Indian planning. One must, however, record a protest against the extremely high price set for the book, especially so in view of the poor paper and binding.

THE INDIAN IRON AND STEEL COMPANY LIMITED NOTICE

NOTICE is hereby given that the Annual General Meeting (being the Forty-Eighth Ordinary General Meeting) of the Company will be held at the Registered Office, No. 12, Mission Row, Calcutta, at 3 p.m. on Friday, 3rd September, 1965, for the following purposes:

1. To receive and adopt the Audited Accounts for the year ended 31st March, 1965, and the Directors' and Auditors' Reports thereon.
2. To confirm the payment of interim dividend for the year ended 31st March, 1965 on the Ordinary Share Capital as declared by the Board of Directors on the 9th February, 1965 and to declare a final ordinary dividend in respect of the said year. The final dividend, if sanctioned, will be paid on and after the 3rd September, 1965.
3. To appoint a Director in place of Mr Gokul Chand Bangur who retires by rotation and is eligible for re-appointment.
4. To appoint a Director in place of Mr Sachindra Chaudhuri who retires by rotation and is eligible for re-appointment.
5. To appoint a Director in place of Mr. Subrata Kumar Ghose who retires by rotation and is eligible for re-appointment.
6. To re-appoint Auditors and fix their remuneration.

A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote on a poll instead of himself and a proxy need not be a member.

Ownership of Daily Newspapers in India

Five industrial groups, namely, Goenka, Sahu Jain, Birla, Andrew Yule and Karnani, occupy a predominant place in the ownership of daily newspapers in India. In addition, there are some 11 major newspaper groups, in the sense that their controlling interests had practically no interest in industrial activities. Whether one takes only the five industrial groups or all the 16 groups, concentration of ownership of daily newspaper circulation is very high.

This article is concerned with (a) listing the leading chains-cum-groups in the daily press, and (b) examining their share of total circulation.

At the end of 1963, India had nearly 7,800 newspapers and periodicals. Of these 4,570, for which data are available with the Registrar of Newspapers, had a total circulation of 20 million. The total number of dailies was 503; the circulation of 345 dailies, for which data are available, was 5.6 million.

The Registrar classifies newspapers (including both dailies and periodicals) under common ownership in three broad categories:

- (a) *Chains*: More than one newspaper under common ownership from more than one centre.
- (b) *Groups*: More than one newspaper of the same title, language and periodicity under common ownership from the same centre.
- (c) *Multiple units*: More than one newspaper of the same title, language and periodicity under common ownership from different centres.

These categories overlap in the sense that particular organizations of newspapers, say, the *Times of India* embraces all the three categories: it publishes five dailies, and seven periodicals from Bombay ('group') and two of the dailies are published simultaneously from Bombay and Delhi

Table 1: Number and Circulation of Dailies, by Language in 1963

Language	No of Newspapers	Total Circulation ('000)
1 English	47	1,452
2 Hindi	86	764

* Including others.

Each edition is counted separately.

Figures in parenthesis in rows (a) indicate the number of editions from different centres.

('chain' and 'multiple units'). While groups, and to a lesser extent chains, are a common feature in many countries, the frequency of multiple units in India is a rather unusual feature. There are 27 multiple units, against 15 chains and 36 groups, again with overlaps.

With the exception of *Statesman*, *Thanthi* and *Malai Murasu*, all the leading multiple unit dailies belong to the large chains and/or groups. At the same time, some independent dailies with a small circulation also have multiple units, but this phenomenon is practically confined to Hindi and Punjabi papers. Curiously enough, the Birla group's chain has no multiple unit whatever (though it has a Kanpur supplement to the *Hindustan Times* published from Delhi). On the whole, it would be correct to say that the bigger multiple units tend to coincide with big chains and groups.

Since it is difficult to unscramble the chains and groups, we may satisfy ourselves with two broad particulars: (1) the leading chains-cum-groups, and (2) their share in total circulation.

In 1963, 143 dailies (including multiple units) were under common ownership; their circulation of 3.8 million accounted for 68 per cent of the total circulation of all dailies. In 1962, the figures were 130, 3.5 million and 66 per cent. The increase in the share of

dailies under common ownership would have been greater if more newsprint had been available to them.

Five industrial groups, namely, Goenka, Sahu Jain, Birla, Andrew Yule, and Karnani, play a major role in the ownership of daily newspapers (besides periodicals with which we are not concerned here). These groups (derisively called the Jute Press) had 28 per cent of total national circulation in 1963. This proportion is rather deceptive, because their share in the circulation of English dailies was 60 per cent, Telugu 44 per cent, Marathi 41 per cent, and Hindi 31 per cent. Their share in Tamil circulation was 19 per cent and in Gujarati only 3 per cent. They had no share whatever in Bengali, Kannada and Malayalam. English dailies provided more than 56 per cent of their total circulation.

There were roughly 11 major 'pure' newspaper groups in the sense that their controlling interests had practically no interest in industrial activities. These 11 groups had 23 per cent of total national circulation. Two of them, however, accounted for 84 per cent of the circulation of all Bengali dailies, and one had 34 per cent of Tamil circulation. The share of all the 11 groups in English dailies was 22 per cent, Hindi 13 per cent, Gujarati 22 per cent, Kannada 28 per cent and Malayalam 27 per cent.

Whether one takes only the five industrial groups or all the sixteen groups, the concentration of circulation is high. In languages like Gujarati, Kannada and Malayalam, where the concentration appears to be low, there are relatively few dailies.

Dailies are highly localised so far as the centres of publication are concerned but the circulation of leading dailies is spread over a wide area. Out of 503 dailies at the end of 1963, 204 were published from State capitals, 185 from cities with population exceeding 100,000 and only 114 from smaller towns. Bombay had 36 dailies, Calcutta 25, Madras 23, and Delhi 20, making a total of 104 from metropolitan centres.

The precise area-wise circulation of metropolitan and other dailies is not available, but the leading metropolitan dailies sell a large part (actually the larger part in many cases) of their copies to readers outside the metropolitan centres. Restrictions on the import and use of newsprint and growth of population in large cities have tended to restrict the outstation circulation of metropolitan dailies in 1962 and 1963. While the number of dailies published from small towns has increased, there is nevertheless, little doubt that dailies in India continue to mean, in effect, metropolitan dailies only.

Table 4 : Circulation of Metropolitan Dailies

Growth Stage Theories and Agricultural Development Policy

Vernon W Ruttan

This paper reviews and attempts to evaluate the potential contribution of growth stage theories to the formulation of agricultural development policies.

As economists have been asked to extend their services to policy makers and planners in countries which are just beginning to experience modern economic growth, a consensus has developed to the effect that economic analysis conducted within the framework of either the older developments associated with the "marginal revolution" or post-Keynesian income, employment and growth theory has been less effective than anticipated in providing the knowledge needed to solve the development problems of the emerging non-western economies.

No clear-cut system of "new development economics" dominates the field as completely as the "new economics" based on Keynes' work dominated economic thinking after 1936. However, the growth stage approaches have established a substantial "claim" in the race to stake out the boundaries of a "new development economics."

GROWTH stage theories are not new in the history of economic thought. The older literature, primarily a product of the nineteenth century German economic historian, exhibits three main types of stage schema based on:

(a) shifts in occupational distribution (List);

(b) changes in the degree of economic integration (Hilderbrand, Bücher, Schomoller); and,

(c) changes in the system of property rights and associated changes in economic ideology (Sombart, Marx).

Industrial Fundamentalism

List distinguishes five development stages: (a) savage; (b) pastoral; (c) agricultural; (d) agricultural and manufacturing; and finally, (e) agricultural, manufacturing, and commercial. However, he stresses "a description of the conditions under which a mature agricultural stage can exist, under which it may progress, and how an agricultural stage can be transformed into one on a higher level by the introduction of manufacturers".

He was particularly concerned with demonstrating the positive role of industrial protectionism for countries (such as Germany or the United States in the nineteenth century) which were in transition from a high level of agricultural development to industrialisation. At the same time, he argued that free trade was to appropriate economic policy for countries (a) which are "by nature" agricultural or which have not yet achieved a high level of agricultural development (mainly tropical), and (b) which have achieved an advanced level of industrial development (such as Great Britain). List believed that progress in agricultural could only occur (a) under the stimulus of export demand, or, more important, (b)

through the impact of domestic industrial development.

Structural Transformation

There is a close resemblance between List's last three stages and the concept of primary, secondary, and tertiary production developed in the 1930's by A G B Fisher and Colin Clark. This formation emphasised the "steady shift of employment and investment from the essential 'primary' activities ... to secondary activities of all kinds, and even to a still greater extent into tertiary production" which accompanies economic progress. The economic growth which accompanies this transformation is achieved *first*, by increases in output per worker in any sector, and *second*, by the transfer of labour from sectors with low output per worker to sectors with higher output per worker.

The Fisher-Clark generalisations had an important impact on both economic thought and economic policy during the decade immediately following World War II. But by the mid-1950's, the analytical validity and statistical foundation, as well as the policy implications of these generalisations were being questioned.

Leading Sectors

The decline of interest in the Fisher-Clark stages during the last decade resulted primarily from the emergence of Rostow's leading sector growth stage approach. Rostow identifies five stages in the transition from a primitive to a modern economy: (a) the traditional society; (b) the preconditions for take-off; (c) the take-off; (d) the drive to maturity; and (e) the age of high mass consumption.

Rostow is primarily concerned with the process by which a society moves from one stage to another, and his historical analysis is conducted to pro-

vide policy guidance to the developing countries since "it is useful, as well as roughly accurate, to regard the process of development now going forward in Asia, the Middle East, Africa and Latin America as analogous to the stages of preconditions and take-off of other societies in the late eighteenth, nineteenth, and early twentieth centuries".

The problem of transition from one stage to another in Rostow's system becomes how to offset the tendency for deceleration in individual sectors to achieve growth in the total economy. On the supply side, Rostow introduces the concept of a sequence of leading sectors which succeed each other as the basic generators of growth. On the demand side, declining rates of growth in demand are introduced as factors dampening the growth rates of leading sectors and transforming them to sustaining or declining sectors. Technology plays an important role in both the emergence of new leading sectors and the dampening of growth or elimination of older sectors.

Only Rostow's system clearly specifies a dynamic role for the agricultural sector in the transition process. In an open economy, primary sector industries may act as leading sectors and, at a particular time, carry the burden of accelerating growth. In addition, agriculture must (a) provide food for a rapidly increasing population; (b) provide a mass market for the products of the emerging industrial sectors, and (c) generate the capital investment for new leading sectors outside of agriculture.

Most of the papers presented at a 1960 conference of the International Economic Association on "The Economics of the Take-Off Into Sustained Growth" rejected (a) either Rostow's dating of the take-off for presently advance countries or (b) the concept of the take-off itself. Students from less

developed countries have found even greater difficulty in identifying their experience with any particular stage. A recent article reached the rather startling conclusion that "after entering the 'take-off' stage in 1957, the (Philippine) economy immediately slipped back into the 'preconditions' ... stage ...". Furthermore, the approach contains no mechanism to explain why countries such as Argentina, Chile, Ceylon, Burma and India, all of which experienced very rapid growth during the latter years of the 19th century, failed to achieve a successful take-off.

Agricultural Development Stages

The insights into the general growth process provided by the several growth stage approaches has led to a re-examination of agricultural development patterns within the context of growth stage sequences by western economists.

The Industrial Impact Hypothesis

The implications of the Fisher-Clark structural transformation model for the agricultural sector have been formulated by Schultz in the form of three statements: (1) "Economic development occurs in a specific locational matrix...; (2) These locational matrices are primarily industrial-urban in composition...; (3) The existing economic organisation works best at or near the centre of a particular matrix of economic development and it also works best in those parts of agriculture which are situated favourably in relation to such a centre. In formulating this hypothesis, Schultz was particularly concerned with the failure of agricultural production and price policy to remove the substantial regional disparities in the rate and level of development in American agriculture.

The policy implications of the Schultz industrial impact hypothesis appear to be most relevant for the less developed regions of the more highly industrialised countries. In these areas, agricultural development can be accelerated by either increased industrial decentralisation or migration of surplus agricultural workers to more distant urban-industrial centres. Such policies appear to have less scope in many of the less developed countries where the "pathological" growth of urban centres resulting from population pressure in rural areas frequently runs ahead of growth in the demand for non-farm workers.

Three-Stage Sequence

A sequence of three agricultural development stages which roughly

parallel the precondition, take-off, and drive to maturity stages in the Rostow model has been suggested by a number of agricultural economists.

In the agricultural development stage models, major policy interest focuses on the programme instruments and measures that are required to move rapidly from Stage I (Static) through Stage II (Transitional) to Stage III (Dynamic). Within the agricultural sector, emphasis is typically placed on (a) the importance of biological innovations and intensity of labour use during the transition from Stage I to Stage II with (b) higher inputs of power in the form of mechanisation being reserved for the transition from Stage II to Stage III. Recommendation that public social overhead investments (education, research, extension) and institutional modifications (tenure, credit, and market structure reforms) should lead the more capital intensive public infra-structure investment (communications, roads, dams) is also frequently implied. The importance of positive population policy to dampen the birth rate is increasingly identified as essential for a rapid transition from Stage I to Stage III.

Some authors have followed Rostow in emphasising the importance of leading commercial sectors within agriculture, in contrast to the more static subsistence sectors, in the adoption of technological innovations and as a source of much of the increase in the output of food and export commodities. Others, using Japan and Taiwan as models, emphasise the possibilities of transforming the subsistence sector into a small scale commercial sector.

The issue that remains unresolved is (a) can growth be achieved most effectively by the commercial sector absorbing the land resources and releasing the labour resources of the subsistence sector for non-farm employment, or (b) can the subsistence sector be gradually transformed into a small scale commercial sector and eventually into a large scale commercial sector? The difficulty of resolving this issue, within the framework of growth stage analysis, is symptomatic of the difficulty faced by stage approaches in generating useful guides to agricultural development policy at any particular time in economic history.

Growth Stage Theories and Agricultural Policy Analysis

What guidance can the economic analyst working within the context of growth stage models provide the policy

maker or planner in making the policy decisions and formulating the programme designs necessary to achieve more rapid agricultural development? One method of answering this question is to examine the policy prescriptions implied by the agricultural growth stage approaches for several of the agricultural development choices which the nations of Southeast Asia now face.

Agricultural Production Policy

Throughout most of Southeast Asia, population growth rates fall in the 2.5 to 3.5 per cent per year range. Thus, even modest per capita income growth rates imply an increase in the demand for farm output of 3.0 to 5.0 per cent per year. During the interval which precedes effective population control, this range may well result in rising food prices, and as Rostow stresses, dampen the rate of total economic growth.

Example 1: Irrigation

The agricultural growth stage models, drawing heavily on Japanese experience, stress the importance of biological innovations and labour intensive methods of production during the early stages of agricultural development. Yet in most of Southeast Asia, the productivity of many of the biological innovations and labour intensive cultural practices, regarded as appropriate in Stage I, will be severely limited until the completion of capital intensive irrigation developments. In spite of a monsoon climate, lack of water is an important obstacle to full employment of both land and manpower in most rice producing areas of Southeast Asia.

Example 2: Mechanisation

Growth stage models typically identify mechanisation as appropriate only during the later part of the transition from Stage II to Stage III. Modifications are frequently introduced for economies with a dual (i.e., plantation and subsistence) structure in the agricultural sector which favour mechanisation in the plantation sector earlier than in the subsistence sector.

An increasing body of evidence from South and Southeast Asia provides specific instances of relatively high returns on investment in mechanical power in the subsistence sector. Even in densely populated areas there are substantial areas of land which are not cultivated at all or only during certain parts of the year because (a) the power requirements are in excess of the amount available in the traditional man-animal technology, or (b)

operations cannot be performed at sufficient speed to utilise the land at a high level of intensity. In such situations, analysis of the productivity of power inputs cannot be treated entirely within a labour substitution framework or depend on historical analogies with small scale agricultural development in temperate regions.

Structural Change

Both Rostow and the agricultural development stage theorists have emphasised the importance of structural changes during the early stages of economic development. Tenure reform, fiscal policy reform, and others have identified as important factors in reducing the political power of those who have a vested interest in the *status quo*, and releasing the productive energies of the peasants and the emerging middle class.

With these reforms agricultural prosperity is expected to stimulate industrial development by providing the mass purchasing power needed to sustain an expanding urban-industrial sector. Since initiation of steps leading to exchange decontrol in the Philippines in 1961, the agricultural and commodity sectors have experienced sustained increases in prices, output, and income. At the same time the sectors producing primarily for domestic consumption have, with the exception of the domestic agriculture and construction industries, failed to share in this growth.

One explanation for this paradox of prosperity in the commodity sectors and lagging growth in the manufacturing sectors is that the higher aggregate income in the agricultural and commodity sectors reinforces an already highly unequal income distribution. As a result, the income is being utilized for non-industrial construction and importation of consumer durables rather than the purchase of the mass consumption consumer goods produced by local industry.

Use of political means to alter the income distribution effects of expanded export earnings or to achieve any of the desired structural reforms, is particularly difficult to achieve in practice. Agricultural prosperity reinforces the political power of the same groups who benefit from the present situation and delays the emergence of the appropriate political and social "preconditions".

An Evaluation of the Agricultural Development Stage Approaches

Neither the general stage models nor

the agricultural development stage models provide definitive guides for the resolution of the agricultural development policy issues which have been raised in the previous section. Have they made any positive contribution at all to the analysis of these issues in a manner useful to the policy maker or planner?

(1) Clearly Rostow's leading sector model and the agricultural development approaches have helped focus attention on the critical role of the agricultural sector in the development process. This represents a healthy reversal of the failure to appreciate agriculture's contribution in earlier growth stage approaches and a positive contribution to economic "doctrine" (ideology?).

(2) The leading sector concept does add a potentially useful tool to our analytical capacity. The concept has largely been ignored by the debate

over the timing and/or existence of the "take-off".

(3) The basic limitation of the growth stage approach when employed as a guide to development policy is that it substitutes a search for economic doctrine in the form of historical generalisations, for the development of analytical power.

(4) Emphasis on the "take-off" and the differentiation of "stages" in both the general and agricultural development stage approaches represents a "blind alley" rather than the route to a new "revolution" in economic thought. Even if current disagreements with respect to "take-off" dates could be resolved we would at best be confronted with a set of valid historical generalisations concerning the processes by which countries which are now developed arrived at their current level of development.

What is Holding up Rural Housing?

S K Iyer

The impression that housing is no problem at all in rural areas is as wrong as it is widespread. That this attitude to rural housing is shared at the highest levels in the Government is indicated by the meagre provision of Rs 13 crores in the Third Plan.

But while the pitiful financial allocation reflects neglect of rural housing, it cannot be said that rural housing is being held up for want of finance. In fact it is now certain that a large part of the Third Plan allocation will ultimately go unutilised.

An attempt is made here to examine the factors responsible for the slow progress of the rural housing programme and to suggest the lines along which action might be taken to speed it up.

THE tragedy of rural housing in India is that it has not yet obtained recognition as a serious problem in national development. This may be said of housing in general too, but the fact remains that urban housing secures much greater attention than rural housing. Details regarding funds utilised for rural housing during the Third Plan period show that out of Rs 12.7 crores allotted only Rs 2.9 crores have been spent so far. According to the Mid-Term Appraisal of the Third Plan 16,500 houses were built during the first three years under the village housing project scheme, the target for the entire plan period being 1,25,000 houses. This comes to an average of one house for every 30 villages. During the Second Plan period, 3000 houses were constructed, that is one new house for every 180 villages. The conclusion that may legitimately be drawn from these facts is that not more than 30 per cent of the funds available would have been spent on rural houses when the Third Plan ends. It also appears that the governments of the States regard funds meant for rural housing as convenient sources for diversion to other purposes. This has led to the suggestion that during the Fourth Plan the village housing scheme should be in the central sector.

The under-utilisation of available funds points to the fact that in the sphere of rural housing the problem is not just one of finance but of organisation. It will be more correct to say that it is a problem of finance and organisation. The failure to evolve an efficient organisation is probably the main cause of the lack of capacity to spend the funds. The general impression that housing is no problem at all in the rural areas is also an important factor. The provision of finance is thus an inadequate solution for the problem.

It is also true that finance is not a serious problem in rural housing. Land-cost which is a major element in urban housing is not a difficult problem at all so far as the villages are concerned.

With the co-operation of village people and panchayats it is possible to obtain the land required for the re-planning of villages. The law may also be resorted to in difficult cases. In any case, the cost of land is bound to be small. So is the case with building materials. It is now an accepted proposition that locally available materials should be used, to the extent possible, in the construction of houses in the rural areas. Some amount of useful research work has also been done in this field. The cost of such local materials is expected to be within the means of the villagers. In this sphere, however, organisational work on a large scale is necessary both for the production of building materials and their popularisation. Labour charges, another important element in urban housing, could be reduced to the barest minimum if the villagers are induced to contribute labour to build houses for themselves. With such possibilities of reduction in the cost of land, materials and labour, villagers do not have to spend more than rupees three hundred to rupees one thousand for houses, the actual amount depending on family size and requirement. A hotise and a garden of five cents of land around could be the aim in rural housing. The existing system under which village houses are located in a small central site has outlived its usefulness and should be abolished in stages.

The question which next arises is how the required amount of money can be made available to rural families. The lapse of even the meagre funds available for rural housing goes to show that rural families do not have the capacity to utilise the funds made available to them by Government. As stated earlier organisational defects have contributed much to the slow progress in rural housing. The Community Development scheme has not played any significant role in housing. The scheme, with all its achievements, has not succeeded in achieving balanced development in different spheres of rural life. Housing in particular has received scant attention in the Blocks and the arguments usual

ly advanced in defence of the existing state of affairs do not stand scrutiny. It is also doubtful whether the engineering personnel working in the scheme are competent to evolve and execute good housing schemes for the rural areas. The professional training acquired by them does not appear to be the one required for rural areas and the training in rural housing now being imparted to them also does not seem to have succeeded in producing a changed outlook in them. These facts lead to the conclusion that the entire training programme should be reorganised and further the trainees and the staff employed under the training programme in rural housing should be given intensive training in extension methods. The villagers have to be made aware of the importance of better housing and how it could be had. Vigorous extension work and close cooperation among different agencies connected with rural housing are required to achieve this result. The procedure for the grant of loans has also to be simplified so that the simple villager does not have to go through too many formalities. The truth is that the existing rules regarding the grant of loans actually kill enthusiasm for improved housing.

Socio-economic studies of villages lead to the unmistakable conclusion that the large majority of the villagers just do not have any money to spare for housing purposes. This applies both to the construction of new houses and to repairs to existing ones. When more pressing wants still remain unsatisfied it is but natural that housing ceases to be a problem. An increase in income is therefore essential if housing improvement should become a felt need of the villager. Housing thus merges into the whole problem of rural development and it follows that the latter should be intensified if the finance necessary for the former is to be obtained. This no doubt, is a long-term solution. The question therefore is whether rural housing schemes should be slowed down and speeded up later when the villagers acquire the capacity

to utilise funds available for the purpose from the State. The answer can only be in the negative. There seems to be insufficient realisation of the fact that poor housing in the rural areas is a major factor responsible for ill-health and inefficiency and investment on a large scale in rural housing will promote economic efficiency and production to a considerable extent. Housing improvement is thus investment in man and deserves high priority in schemes of rural development.

The funds set apart for rural housing should be placed at the disposal of housing co-operative societies. These societies should not merely disburse loans but also undertake the production of building materials on a large scale. One society for a group of villages should be the rule. But it is important that the villagers should be induced to join the co-operatives. The Panchayats too have their part to play and should, if necessary, exercise their powers to secure land for those who require them for housing purposes. The possibility of providing common services for construction purposes should also be explored by the Panchayats. The community development blocks should simultaneously attend to the extension work necessary for the success of housing scheme and provide technical guidance. These are excellent principles and have been laid down by the Planning Commission itself. But very little effort has been taken to convert these principles into practice.

The idle man-power which now goes to waste should be mobilised and converted into capital for building purposes. A large amount of capital could be available by adopting this method. Once the villagers realise that they are working for their own benefit they would cheerfully co-operate for the success of the scheme. The possibilities of capital formation through this method have not yet been tapped to the extent desirable. Certain voluntary agencies have achieved remarkable success in organising voluntary labour for productive purposes. The villagers should therefore be organised for the purpose of house-building and also provided with simple training in construction methods where necessary. It may be said that the success of the village housing programme depends to a great extent on the efficiency with which labour is organised for purposes of construction.

There is also a case for devising a suitable machinery in the villages to

mobilise the monetary savings of the people for the specific purpose of improved housing. At present there is very limited scope for such savings, but it is bound to increase as developmental schemes expand in the rural areas. The additional incomes obtained as a result of economic development are likely to be frittered away on articles of consumption which are not essential. A scheme to popularise savings for the specific purpose of improved housing is likely to find favour with the villagers as savings, in this case, leads to the acquisition of a definite asset. General schemes for the promotion of savings do not have an equal chance of success. What is required is a scheme under which very small sums are accepted as deposits and the amount thus collected is used for the repayment of loan instalments secured for housing purposes. The village panchayats should be entrusted with this work.

The provision of water supply, sanitation, lighting and other facilities is also part of housing development. The government and the panchayats

should assume responsibility in these matters. The scheme for the popularisation of sanitary latrines has made little progress in the rural areas. There is enough scope for people's contribution in labour in these fields too.

The disintegration of the old village society has already reached a critical stage. The old society is likely to collapse abruptly and throw the entire rural economy in disorder unless facilities for modern living are provided. The pull of the urban areas will soon become irresistible. Pulls and pushes would thus combine to dislocate the agricultural economy. This is a serious prospect for which the remedy lies in the energetic replanning of villages. The Planning Commission's working group on rural housing has thus done the right thing in recommending an expenditure of Rs 100 crores on rural housing during the Fourth Plan. An expenditure of this magnitude requires elaborate organisation and an efficient machinery. The lesson of the three Plans is that the more provision of finance does not ensure the construction of houses.

Unesco's Model to Predict Flood

FLOODS on the Mekong River can now be predicted 20 days in advance with a "more than reasonable degree of accuracy" by a mathematical model which has been developed for the United Nations Special Fund by UNESCO. This achievement was announced last month at UNESCO House in Paris following a recent meeting of participants in this mathematical model study of the Mekong Delta. It brought together representatives of the governments of South Vietnam and Cambodia, UNESCO and the Mekong Committee of the United Nations Economic Commission for Asia and the Far East.

On the basis of studies made of Mekong floods from 1961 to 1964 the model, it has been claimed, can now predict crests downstream from Penh, the capital of Cambodia, with an accuracy of 20 centimetres at 80 per cent of all measuring points. To be useful the model must predict not only flood levels but the speed at which the river will go up, which is vital information for rice-growers whose crop can be "drowned" by fast-rising waters. The model consists simply of three large reels of magnetic tape which are fed into a computer. One copy of the model will be confined to the Committee for the Co-ordination of Investigations of the Lower Mekong

Basin, consisting of Cambodia, Laos, Thailand and South Vietnam. Two more will be with Cambodia and South Vietnam and one with UNESCO.

The decision to study the behaviour of the Mekong in its delta by means of a mathematical model was taken in view of the almost insuperable problems that would have been posed by the usual physical model. The slope of the delta is so slight that such a model would have covered several acres in order to reflect it accurately. The primary purpose of the model is to provide data needed by engineers planning a dam on the Tonle Sap, a tributary of the Mekong 150 kilometres north of Pnem Penh. This dam, designed to provide both flood control and irrigation, is part of the development scheme for the Mekong Basin that is now being prepared with the co-operation of the United Nations and 24 countries. The proposed site of the Tonle Sap dam is at the head of Cambodia's Great Lake which measures 12,000 square kilometres when the Mekong is in flood. Once the Tonle Sap has been dammed, it is hoped to use the Great Lake to store excess water in the rainy season for irrigation during dry months. But even before construction starts on the dam, the mathematical model can serve a number of purposes.

Despondency Pervades Dalal Street

Wednesday, Morning

DALAL STREET has slipped back again to very near its year's low. As in the preceding week, last week's setback also was due primarily to lack of support. Turnover shrank further and most of the time activity was almost at a standstill. The entire week's business could have easily been transacted in a single two-hour session without making the market look very lively. Little wonder therefore that there is a feeling of utter frustration among the stock exchange community.

Apart from the Reserve Bank's warning about a possible tightening of credit curbs if commodity prices did not register even their normal seasonal decline and the tension in Calcutta owing to the agitation against the increase in tram fares, there was hardly anything in the week's news to add to the market's feeling of despondency.

The corporate news was, in fact fairly encouraging. But in its mood of frustration resulting mainly from the persisting lack of business, the market was more inclined to point towards bear factors wherever it could locate them. Shri J R D Tata's defence of the maintenance of TISCO's dividend in view of the large tax liability drew larger attention than the announcement of higher dividends by Machinery Manufacturers, Imperial Tobacco and Digvijay Woollens.

Several suggestions have been made from time to time to revive the capital market which is not merely shy but is virtually dead. But the Madras Industries Minister's suggestion that new enterprises could speed up the declaration of maiden dividends by foregoing their claims for the development rebate and some other tax relief sounds fantastic. Shri R Venkataraman is reported to have made that suggestion in his inaugural address to the quarterly meeting of the All India Manufacturers' Organisation. If dividends alone could encourage investors, then the investment market would not be in such a bad shape as it is today. Equity prices have been drifting lower despite good corporate news.

COTTON

Weather Good, Prices High

NEARLY all the cotton growing areas continue to report almost ideal weather conditions. But this has not had even the slightest impact on the market. Activity in futures re-

mains virtually at a standstill, with the August contract quoted only a little lower than the ceiling which is not the least surprising in view of the enormous premiums that cotton is commanding in the ready market. If the turnover in the spot cotton market continues to be restricted, it is not because the mills are already carrying large stocks of cotton, nor is it because mills have their financial resources strained by the accumulation of heavy stocks of both cloth and yarn. Turnover in ready is limited only by the availability of good quality cottons. There seems no dearth of buyers, the high prices notwithstanding, but quality cottons are scarce.

That the market sentiment should remain quite unaffected by the weather is an indication of the serious imbalance between demand and supply which is unlikely to be rectified unless there is a very appreciable increase in cotton production during the 1965-66 season. Who can say what the new crop will be like when everything is at the mercy of the the unpredictable weather. Cotton production is not only keeping far behind the Plan targets it is unable to keep pace even with the limited expansion in spindleage. The scarcity of cotton would have become far more acute had all the spindle capacity proposed in the Third Plan been created according to schedule.

Futures Trading

With futures trading in the August contract virtually at a standstill, the trade is eagerly awaiting the commencement of business in the new crop contract. The East India Cotton Association has convened a meeting of its members on August 13 to finalise the draft amendments to the by-laws for the 1965-66 season's hedge contract. In keeping with the Government of India's new cotton schedule, the EICA has suggested that Vidarbha/MP Virnar 27/32" should form the basis of the new season's hedge contract, tenderable up to 27/32" 'on' and 2/32" 'off', instead of Moglai fine 25/32". Of the present tenderable descriptions, M G Ankleshwar and M G Surti have been dispensed with and a new description MG Sanjaya (CJ 73) with staple of 26/32" has been added. The tenderable 'on' and 'off' staples and the staples of various descriptions will be in line with the Textile Commissioner's sche-

dule for 1965-66 season except in certain cases like Jaydhar B and Iaxmi B which will continue as at present, with basic staple 27/32" and Dholleras with 1/32" 'off' staple only. The present delivery months of March, May and August will continue. Similarly, there will be no change in the provisions regarding tendering differences and invoicing back cotton and there will be no ceiling within the ceiling. By-law 223 (v) is proposed to be amended to empower the Board to fix the unit for price quotation. Certain other amendments have also been proposed to by-laws relating to outstanding delivery contracts clarifying the position of buyers' and sellers' rights and obligations. Since there is very little to be said against the proposed amendments to the by-laws which have been necessitated primarily by the Government's decision on the basic variety, futures trading in the new season's contract can be expected to start before the end of the current month.

OILSEEDS

Prices Recede

OILSEEDS prices have suffered an all-round sizable setback from their previous week's highs — the highest for the season. Groundnut oil which had been bid up to Rs 31.50 (per 10 kgs) has come down to Rs 28.50; linseed oil has declined from Rs 28.25 to Rs 25.50 and castor oil has eased from Rs 19.50 to Rs 18.25. During the same period, spot prices of linseed, groundnut and castorseed have declined by Rs 6 to Rs 4 per quintal. The fall has been more pronounced in futures — new crop contracts — with linseed April down from Rs 116 to Rs 103.50 and castor April from Rs 93.25 to Rs 82.50 (per quintal). Cottonseed futures have continued to rule steady, with the January contract moving irregularly between Rs 57 and Rs 55.50.

In an unofficial note circulated "for favour of publication", the vanaspati manufacturers have claimed that groundnut oil prices have eased — from Rs 3,030 to Rs 2,950 a tonne — following their decision to abstain from purchases in the open market. But the decline has occurred only in the past two days whereas it was some three weeks ago that the vanaspati industry made known its decision not to buy groundnut oil in the open market at

THE BANK WITH SERVICE PLUS

a price exceeding Rs 2,700 a tonne and the price of groundnut oil shot up from Rs 2,750 to Rs 3,150 after the industry's decision to observe the voluntary price ceiling. And that is not about all. In Saurashtra, groundnut oil was quoted very much lower when the industry fixed the ceiling of Rs 2,700. The voluntary price is to be remain in force until August 10 when the managing committee of the Vanaspati Manufacturers' Association will meet again in Bombay to review the position.

The vanaspati industry's decision to keep off the market has contributed only a little to the recent decline in groundnut oil prices. While technical considerations alone could have produced a sizeable setback—no market even keeps rising without occasional setbacks—the recent all-round recession in oilseeds reflects largely the turn in market psychology following very favourable weather conditions in almost all the groundnut producing areas. Up-country has been reported as a persistent seller in linseed and castor futures, particularly in linseed. Stockist who had been sitting tight on the unhappy chance that the weather might not oblige are now beginning to feel uneasy as the weather has continued to be very satisfactory. For the first time, near the week-end, market men reported some anxious selling in groundnut oil by stockists. Business put through was not large but prices fell because of the preponderance of sellers. It is too premature to make any assessment of groundnut crop prospects, let alone castor and linseed crops which have yet to be sown. Too much should not be made of the recent setback in oilseeds prices as prices had been pushed to very high levels. The price trend in coming weeks is likely to be moulded mainly by the weather news because it is the weather which holds the real key to production.

On the export front, only cottonseed cake is doing well as the business is quite remunerative, thanks to the incentive scheme. Export business in groundnut extraction has been affected by the Government's new policy under which only the manufacturers will be allowed to conduct export business from October. Exporters who are not having any extraction plants of their own are in no mood to enter into forward commitments normal for this time of the year. Groundnut extraction prices have eased by about Rs 15 per tonne over the past few days due to poor overseas inquiries.

Money and Banking

Thursday, Morning

CONDITIONS in the Bombay short-term money market during the week to August 5 displayed a slightly tightening trend. The easiness prevailing in the previous weeks seemed to be coming to an end as rates of interest moved slowly upwards. Demand for funds showed a small increase as funds were withdrawn for investment in treasury bills. The rate of interest as on Thursday morning was $4\frac{1}{2}$ per cent against 4 per cent last week.

Scheduled bank deposits during the week to July 23 showed an increase of Rs 26.37 crores to Rs 2777.85 crores, according to the latest scheduled bank returns. Total credit, declined by Rs 28.06 crores to Rs 2034.61 crores. Cash in hand was lower as well at Rs 69.65 crores against Rs 72.66 crores during the previous week. Balances with the Reserve Bank increased by Rs 9.69 crores to Rs 112.14 crores. Borrowing from the Reserve Bank at Rs 15.65 crores showed a decline of Rs 10.74 crores. Investment in government securities was substantially higher at Rs 811.95 crores against Rs 764.88 crores during the previous week. Loans and advances showed a decline of Rs 24.79 crores

at Rs 792.34 crores. During the week there was a slight decline in the amount of inland bill purchased and discounted by Rs 4.37 crores at Rs 162.04 crores. Foreign bills purchased and discounted showed a small increase of Rs 1.08 crores at Rs 80.23 crores. Money at call and short notice declined by Rs 37 lakhs at Rs 64.51 crores.

Notes in circulation during the week to July 30 were substantially lower at Rs 2573.42 crores against Rs 2607.31 crores in the previous week, according to the latest Statement of Affairs of the Reserve Bank. Deposits of the Central Government were higher by Rs 31.44 crores at Rs 119.45 crores. State Government deposits were better as well by Rs 47 lakhs at Rs 17.04 crores. Deposits of the scheduled banks were, however, lower at Rs 99.51 crores by Rs 9.29 crores. Foreign securities with the Reserve Bank were unchanged at Rs 68.35 crores while balances held abroad were slightly higher by Rs 18 lakhs at Rs 7.42 crores. Advance to governments were lower by Rs 5.52 crores at Rs 56.01 crores. Advances to scheduled banks were lower as well at Rs 9.49 crores against Rs 15.51 crores during the previous week. Investments moved up again during this week by Rs 14.93 crores at Rs 326.23 crores.

BUSINESS NOTES

Tata Steel

J R D TATA, Chairman, Tata Iron and Steel Company, has urged rethinking about the planning of steel expansion in the Fourth and Fifth Plans on the basis of a rigorous assessment of the relative priorities to be attached to steel and other products in short supply. He has questioned the wisdom of planning to spend over Rs 1,000 crores during the next Plan on raising steel producing capacity to about 16.5 million tonnes with the intention of achieving self-sufficiency and creating an exportable surplus. In a country where shortages and imbalances afflict the economy, is it reasonable, Tata asks, to give a higher priority to steel for non-essential purposes than to fertilisers, road transport, electric power, education, medical care and other purposes in all of which there will be persisting shortages even after the Fourth Plan. In his statement circulated with the company's report for the year to March last, Tata says that the steel industry is the most capital intensive of all engineering industries and one which

provides about the lowest employment potential. For every rupee spent in creating new steel capacity, we create products worth only half a rupee every year, whereas the ratio is at least 1:1 in industries manufacturing products made of iron and steel, and their employment potential is many times higher. As regards exports, steel-making capacity exceeds demand in most steel producing countries and exports from India can be made only at a heavy loss.

Tata states that, when in 1959 the steel industry was consulted by the Planning Commission in regard to the Third Plan targets he had questioned the need for placing so much emphasis and allocating such a large proportion of resources for the development of the basic steel industry. He had then pointed out that in other countries the ratio of steel consumed to the total production of manufactured goods was much lower than that planned for our country and that while it was essential to meet in full the needs of manufacturing industries

5½ per cent State Government Loans, 1977

STATE	AMOUNT (IN CRORES OF RS)	ISSUE PRICE PER CENT Rs
1. Andhra Pradesh	9	99.50
2. Assam	3	99.00
3. Bihar	4	99.00
4. Gujarat	7	100.00
5. Kerala	4	99.00
6. Madhya Pradesh	5	99.00
7. Madras	14	99.50
8. Maharashtra	15	100.00
9. Mysore	5	99.00
10. Orissa	8	99.00
11. Punjab	5	99.00
12. Rajasthan	5	99.00
13. Uttar Pradesh	10	99.50
14. West Bengal	7	99.50

All loans will open for subscription on Monday, 23rd August 1965 and close on Saturday, 28th August 1965 or earlier without notice as soon as subscriptions approximate to the amount of each issue. All the State Governments reserve their right to retain subscriptions upto ten per cent in excess of the notified amounts.

The loans will be redeemable at par after 12 years i.e. 23rd August 1977 and interest will be paid half-yearly on 23rd February and 23rd August each year.

Subscriptions may be in the form of CASH/CHEQUE.

Applications for *all the loans* will be received at the offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi, the State Bank of India, Patna and the State Bank of Hyderabad, Hyderabad.

Applications will also be received *at other places within the respective States* as follows:—

- Branches of the Subsidiary Banks of the State Bank of India conducting Government treasury work.
- Branches of the State Bank of India at places where there are no branches of its Subsidiary Banks conducting Government treasury work.
- Treasuries and Sub-treasuries (except in the States of Assam and West Bengal) at places not served by the aforesaid branches.

Copies of the Notifications and Application Forms may be obtained from the Receiving Offices concerned.

Those tendering applications at the offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi will, in the event of oversubscription to the loan applied for, be given the option of transferring their cash refunds to any of the State Government loans which may still be open for subscription. To avail themselves of this facility, the applicants should complete the "Special Option Form" (copies of which can be obtained at any of the foregoing offices of the Reserve Bank of India) and tender the form along with their applications.

consuming steel, particularly of costly special steels, there was no justification for committing so much scarce resources in money and foreign exchange to ensure complete self-sufficiency in steels used for non-essential purposes. He had also pointed out that it was wasteful to invest vast sums in steel capacity without making sure of a simultaneous expansion of raw materials, transport, power, technical and managerial skills, without which the new capacity would remain idle or take an unduly long time to reach full utilisation. But his views were not accepted by the authorities concerned.

Recently, the Government has asked the company to consider a further expansion of about two million ingot tonnes in the Fourth Plan period. The doubling once again of the capacity of the Jamshedpur plant poses technical, financial and other problems of tremendous magnitude and complexity, the solution of which is fraught with many uncertainties. The company will obtain from a firm of independent consulting engineers a preliminary project report or feasibility study on which will be based future consideration of the project. The whole project, if it fructifies, will depend on the financial support and approval of the World Bank. At the moment, however, the picture is somewhat nebulous, and it is not expected that the company will be in a position to place concrete proposals before the shareholders for another year.

Indian Iron

A RETROGRADE step has been taken in according Indian Standards Specification to certain steels of definitely inferior quality, according to Sir Biren Mookerjee, Chairman of Indian Iron and Steel Company. In his annual statement issued to the company's shareholders, Sir Biren says that in the place of the former "Tested" steel we now have steel of "Standard Quality" and of "Fusion Welding Quality" governed by prescribed and adequate specifications but "Untested" steel is now replaced by "Ordinary" (or, as it is popularly designated, "Commercial") quality steel to two differing specifications and by "Off-grade Quality" steel, to which, being the dregs of production, no specification could conceivably be assigned. It is entirely fallacious to imagine that because of its lower price of Rs 45 per tonne, the use of "Commercial St 32-0 Quality" steel leads to economy in the cost of structures. This steel must on no

account be used in structures for carrying dynamic live loads. If used for other structures in disregard of the usage intended according to its specification, then heavier sections must be utilised because of its lesser strength. Taking this consideration into account, the use of Commercial St 32-0 Quality steel leads to excessive consumption of steel, varying between 14½ per cent to 25 per cent, and the total cost of steel is actually from 8½ per cent to 19 per cent higher.

Sir Biren has also pointed out the grave risks attendant upon any mixing of Commercial or off-grade quality steel with Standard Quality steel, for, he says, if any of the former steel were to be used on structures bearing dynamic live loads, or if the differing characteristics of the Commercial and Standard qualities were to remain uncompensated—even in respect of one member only of a Structure—then the effect could well be disastrous. Appreciating that perfection of production in the industry can never be achieved and that there must always be a certain quantity of Commercial and Off-grade quality of steel to be disposed of, Sir Biren has stressed that the consumer should be safeguarded against the possibility of the mixing of Commercial and Off-grade quality steel with steel of Standard Quality. In order to minimise this possibility only the producers whose reputations are involved and who have the organisation and facilities for the strictest possible supervision, should be permitted to stock all qualities of steel for sale to the consumer. As regards other stockists, he has suggested that these should be divided into two separate and distinct categories: one handling Standard Quality, Fusion Welding Quality and Commercial (St 44-0) Quality steel only and the other Commercial (St 32-0) Quality steel and Off-grade steel alone. Sir Biren feels that the present practice of allowing any stockist to stock and sell steel of all qualities is fraught with the gravest dangers.

In regard to the company's working during the year to March last, Sir Biren says that as a consequence of some untoward events production of steel ingots fell to 949,887 tonnes, lower than the previous year's level. Among these, the major misfortune was a mishap to No. 3 blast furnace resulting from the sudden fracturing

of the heavy-duty alloy steel rod from which is suspended a large sealing bell weighing some 15 tonnes. The bell dropped inside the furnace and the furnace could be put back on blast only after about ten days, and it took furnace to normality. Besides, the poor and violently fluctuating quality of the supplies of coal and limestone rendered operations exceptionally difficult.

Mukand Iron

THE trading results of Mukand Iron and Steel Works for the year to March 31 last are more or less the same as in the previous year, with gross profit a shade lower at Rs 92.09 lakhs compared to Rs 92.26 lakhs. With small savings in each of the necessary provisions, however, the net profit for disposal is about Rs 2 lakhs higher than the previous year.

Provision for depreciation has absorbed Rs 20.65 lakhs (Rs 21.46 lakhs), that for taxation Rs 38 lakhs (Rs 38.50 lakhs) and that for development rebate reserve Rs 1.20 lakhs (Rs 2.55 lakhs). No amount has been set aside for bad and doubtful debts which received Rs 0.05 lakhs last year. After making these provisions, the balance profit amounting to Rs 32.29 lakhs (Rs 30.44 lakhs) is allocated to general reserve from which the dividend, when recommended, will be paid. Last year, the company paid at the rate of Rs 1.20 per fully paid ordinary share, Rs 0.24 per partly paid share and Rs 37.24 per deferred share, which together absorbed Rs 17.75 lakhs.

Machinery Manufacturers

MACHINERY Manufacturers Corporation has had another good year. According to a preliminary statement for the year to March 1965, sales expanded from Rs 2.54 crores to Rs 2.89 crores and gross profit improved from Rs 65.18 lakhs to Rs 75.64 lakhs. Of this, depreciation has taken up Rs 14.15 lakhs (Rs 13.34 lakhs), taxation Rs 35.50 lakhs (Rs 31 lakhs) and development rebate reserve Rs 1.90 lakhs (Rs 2.12 lakhs). After setting aside Rs 2.19 lakhs (same) for payment of preference dividends, equity earnings stand at Rs 21.90 lakhs to compare with the previous year's Rs 16.53 lakhs. The recommended equity dividend is unchanged at 15 per cent plus an extra 2.5 per cent by way of bonus, covered 4.16 times against 3.66 times in the previous year. At first glance this distribution looks ungenerous in view of good earnings cover, but the directors have made it clear that additional

5½ Per Cent Maharashtra State Development Loan, 1977

ISSUE PRICE AT PAR

OPEN ON MONDAY, THE 23rd AUGUST 1965

The loan will be closed as soon as the total amount of Rs 15 crores has been subscribed and in any case not later than the close of business on the 28th August 1965.

The applications for the loan will be received at:—

- (A) the offices of the Reserve Bank of India, Bangalore, Bombay (Fort & Byculla), Calcutta, Madras, Nagpur and New Delhi,
- (B) the branch of the State Bank of India at Patna,
- (C) the branch of the State Bank of Hyderabad at Hyderabad,
- (D) the branches of the State Bank of Hyderabad conducting Government treasury work within the State of Maharashtra,
- (E) the branches of the State Bank of India within the State of Maharashtra except at Bombay and Nagpur and at places covered by item (d).
- (F) the Government treasuries and Sub-treasuries in the State of Maharashtra at places not covered by items (d) and (e).

Full particulars can be obtained at any of the offices mentioned above.

KSS/3-8-65.

finance is required for further expansion.

Approval has been secured for the manufacture of the crosrol-varga high production device in collaboration with Carding Specialists of the U K and high production draw frames in collaboration with Whitin International of the U S. The company expects to get the necessary loan from I F C.

Gwalior Rayon

DURING the year to March last Gwalior Rayon's staple fibre production rose by 2.5 million kgs to 32.18 million kgs, but unsold stock at the year-end increased by five million kgs to 13.4 million kgs due partly to unconsumed stocks of imported staple fibers with the spinning mills and partly to unremunerative prices of staple yarn. The offtake of fibre, however, has improved considerably, following reduction in excise duty from March last and particularly after the draw back of 50 paper kg allowed from June 19 to manufacturers of cotton staple fibre blended yarn. The pulp division produced during the year 16,418 tons of paper pulp and 25,770 tons of rayon grade pulp. Since February last, the production of paper pulp has been stopped. The factory has achieved a production of 125 tons of rayon grade pulp per day which would enable the Nagda plant to run at full capacity without any imported pulp.

With a view to eventually overcoming the shortage of bamboos, the company has acquired 30,000 acres of land in Nilambur in Kerala State for growing eucalyptus plantation. An enquiry has been received by it from a foreign firm for supply of technical know-how for manufacturing rayon grade pulp from bamboos. The weaving division has taken up a phased programme of modernising and expanding its plant and machinery. The staple fibre factory has also taken in hand modernisation and expansion of its machinery and equipment. A loan of Rs 28 lakhs has been secured from I C I C I for the import of some balancing equipment for improving further the quality of rayon grade pulp.

According to a preliminary statement, gross sales during 1964-65 advanced over Rs 6 crores to Rs 22.32 crores but gross profit could improve by only Rs 34.33 lakhs to Rs 4.54 crores, reflecting severe pressure on margins due to rising costs. After providing Rs 1.51 crores (Rs 1.63 crores)

for depreciation, Rs 1.48 crores (Rs 1.24 crores) for taxation, Rs 15.72 lakhs (Rs 7.98 lakhs) for development rebate reserve and Rs 13 lakhs (same) for payment of preferential dividends, equity earnings amount to Rs 1.26 crores (Rs 1.11 crores) of which the dividend raised by 25 paise for the second time in succession, to Rs three per share requires Rs 75 lakhs against Rs 68.75 lakhs a year ago.

Indian Dyestuff

AFTER paying 7 per cent for each of the preceding three years, Indian Dyestuff is raising dividend by two per cent for the year to March 1965. The proposed distribution is payable fully on the capital as increased by one-for-fourteen rights issue. A preliminary statement from the company shows rise in net sales (after deducting excise duty paid) from Rs 2.20 crores to Rs 3.09 crores followed by a relatively faster advance in gross profits from Rs 42.73 lakhs to Rs 72.58 lakhs. Of this, depreciation charge has taken up a higher amount of Rs 45.27 lakhs against Rs 32.76 lakhs provided in the previous year. It may, however, be pointed out that the method of calculating depreciation charge has been changed; provision on the basis of the former method would have required a much bigger sum of Rs 1.21 crores. As before, there is no tax charge. Also, no provision has been made for development rebate reserve which absorbed Rs 9.97 lakhs last year. Together with the previous year's arrears, the total arrears of development rebate amount to Rs 45.31 lakhs.

After writing back Rs 4.87 lakhs and setting aside Rs 2.81 lakhs for payment of preference dividend, there remains for disposal a sum of Rs 29.37 lakhs (loss of Rs 2.81 lakhs). The enhanced equity dividend distribution demands Rs 20.20 lakhs (Rs 14.63 lakhs), and Rs 9 lakhs are being allocated to general reserve. Last year, Rs 10.83 lakhs were transferred back from general reserve and Rs 6.59 lakhs from development rebate reserve to pay the dividends.

Indian Organic

THE erection of the inorganic acetate plant of Indian Organic Chemicals has been recently completed, and the trial runs have proved successful. The chlorination plant is nearing completion and is expected to be commissioned shortly. The erection of the ester plant was completed in October 1964, and the manufacture of

ethyl acetate commenced soon thereafter. The production of butyl acetate, being dependent on the import of butanol, could be started only in May last.

During the year to March last, sales of carboys showed sizable improvement over those of the previous year, and the production of acetic acid glacial improved from 56 per cent to 83 per cent of the rated capacity due to the improved supplies of alcohol, though prices realised were not satisfactory owing to heavy competition. The company's total turnover expanded from Rs 39.77 lakhs to Rs 48.01 lakhs on which was earned a profit of Rs 5.69 lakhs, against a loss of Rs 5.52 lakhs incurred in the previous year, after providing Rs 9.75 lakhs (Rs 12.27 lakhs) for depreciation and Rs 0.80 lakh (Rs 7.60 lakhs) for development rebate reserve, and transferring Rs 2.67 lakhs (nil) to capital account. After writing off Rs 18,898 as preliminary expenses, a deficit of Rs 3.27 lakhs is carried to the balance sheet. The dividend is again skipped.

Ruby General

HIGHER net premium income from all the three departments and a substantially bigger profit from the Miscellaneous insurance revenue account are the key features of Ruby General Insurance Company's operations during the year to December 1964. The company has earned a higher profit of Rs 32.49 lakhs compared to Rs 28.56 lakhs a year before, after writing off Rs 5.39 lakhs (nil) in respect of its business in Burma. After setting aside Rs 18.50 lakhs (Rs 14.70 lakhs) for the tax liability, Rs 7.50 lakhs (same) have been transferred to general reserve, and Rs 6.50 lakhs (Rs 5.36 lakhs) to dividend reserve from which the proposed dividend of Rs 1.50 a share requiring 6 lakhs is to be disbursed.

The general insurance business was nationalised in Burma in February 1964, but the company has so far not been able to transfer from that country the surplus funds relating to the year 1961 and onwards. The directors say that in the present situation there is no certainty of remittance of surplus funds from that country. The company's application for the issue of bonus shares out of the share premium account was rejected by the Controller of Capital Issues on the ground that the subscribed capital of Rs one crores was not fully paid-up. The management is still pursuing the matter with the Government.

FROM THE CHAIR

The Indian Iron and Steel Company Limited

Statement by the Chairman, Sir Biren Mookerjee

THE following statement by Sir Biren Mookerjee, Chairman of the Indian & Steel Co Ltd dealing with Company's working for the year ended 31st March, 1965, has been issued to shareholders. The Annual General Meeting of the Company will be held on Friday, the 3rd September, 1965, at 3 p.m. at the Registered Office of the Company, 12, Mission Row, Calcutta-1:

I would at the outset pay tribute to the memory of the late Mr Thomas Leslie Martin who died in Calcutta on the 6th June 1965. Mr Martin was a Director of your Company from 1930 to 1958 and during the major part of this period was Chairman of the Board. The Company owes much to his wise counsel and capable guidance both as a Director and through its Managing Agents, in which latter capacity his valued advice remained available to the Company after his retirement from its Board until the date of his death. His loss is keenly felt.

Operations

Following upon the achievement for two years in succession of a production of steel approximating to the rated capacity of the plant, I had stated last year that, barring untoward events, it was hoped that this position would be maintained. Unfortunately, in the year under review untoward events did, in fact, occur and as a consequence the production of steel ingots fell to 949,887 tonnes, representing a reduction of 76,899 tonnes from the production of the previous year. These events are briefly narrated in your Directors Report but it will, I think, be of interest if I explain the position in somewhat fuller detail.

The major misfortune was the loss of output occasioned by a mishap to No 3 Blast Furnace that occurred on the 26th June 1964. The mishap was of an unusual type which has never before happened in India and which, in fact, has been of the rarest occurrence in the history of blast furnace operation elsewhere. The insertion of a charge into a blast furnace is made from the top and it is naturally necessary that the furnace shall remain sealed throughout the process of charging. This is effected by means of the alternate operation of two Sealing Bells within the furnace: a small one above and a larger one below. The large Bell is suspended from and operated by means of a heavy-duty alloy steel Rod and the mishap that occurred was the sudden fracturing of this Rod, with the result that the large Bell, weighing some fifteen tonnes, dropped inside the furnace. The accident would have been less serious had the furnace been fully charged at the time, but unfortunately it occurred shortly after the furnace had been tapped and, as a result, the bell fell a considerable distance and lodged in an inaccessible position inside. After a study of all factors it was decided not to take the furnace out of production, which would have meant a long and difficult process of removal of the solidified residue within and the sacrifice of the remaining life of the lining, but rather to replace the large Bell and Rod assembly and get the furnace back into operation again with all possible speed.

The task of replacing the Bell was accomplished in an expeditious and efficient manner and the furnace was put back on blast on the 5th July 1964. The difficulties and hazards of restarting a blast furnace after a long and premature emergency shut-down are well known, and this occasion was no exception. It was only after many disappointing and at times heart-breaking experiences that the furnace was successfully restored to normality on the 8th August 1964, the loss of iron production occasioned by the occurrence amounting to approximately 60,000 tonnes.

The poor and violently fluctuating quality of the supplies of

coal and limestone rendered operations throughout the year exceptionally difficult. Fluctuation in quality is of itself no new problem, but in the matter of average quality it had been thought previously that as regards coal the position could not conceivably deteriorate further from that of the previous year, when the average ash content of the coal supplies reached the appallingly high figure of 18.76%. In the event, quality did, in fact, still further deteriorate and in the year under review the average ash content of our coal amounted to no less than 19.55%. The resultant increase in the ash content of the coke charged to the blast furnaces led to still greater difficulties of operation and was inevitably reflected in an increased volume of slag, with consequent marked reduction in the output of iron from the furnaces.

In this matter of coal we are to a large extent helpless, since the position resolves itself essentially into a question either of accepting the allotments made by the Coal Controller or of going without. In saying this I imply no criticism whatsoever of this official, who is discharging a most difficult task in an able and efficient manner; the fundamental cause of the trouble is, of course, the deterioration in quality of the output of so many mines, as the presently worked seams of metallurgical coal are gradually becoming exhausted. Nevertheless it is somewhat galling, in the circumstances, to find ourselves in the position of having in certain cases to pay a price based on former quality, while receiving a coal of presently definitely inferior grade.

Many years ago we had, as we thought, protected our coal position by the entering into of long-term contracts with selected collieries, an arrangement designed to ensure to us over a considerable period a basic quantity of first grade coking coal. With the assumption by Government of control over coal distribution, these contracts were, however, rendered inoperative and we became thereafter dependent upon such supplies as might be allotted to us. At a later stage, plans were made by Government for the setting up of various Coal Washery Plants, including one at Pathardih, which latter plant, we were given to understand, would in due course cover the supply to us of reasonable quantities of good quality washed coal. Considerable delay was, however, incurred in the completion of the Pathardih Plant and, with operational difficulties subsequently intervening, it has not proved possible yet to obtain any supplies from this source—the future position being also uncertain in view of the increasing requirements of washed coal by the steel plants in the Public Sector.

It is apparent, therefore, that any long-term relief is to be looked for only in the building up of production from the Company's own colliery properties and the vast Collieries Development Project on which we are now fully launched is being pressed forward with the utmost possible expedition. The completion of this Project will render us practically independent of outside sources and will ensure regular supplies of consistently good quality coking coal with great consequential benefit in the operational efficiency of our blast furnaces.

Kulti Foundries

The total production of castings for the year under review was again governed largely by the availability of pig iron and, at 213,399 tonnes, remained below the capacity of the foundries. In addition to meeting the requirements of the Burnpur Works in this respect ingot moulds and bottom plates were produced for the other steel companies, as also ladles for hot metal and slag. Manufacture of rolls for the 18" Rolling Mill at Burnpur continued satisfactorily

THE ECONOMIC WEEKLY

and the possibility of enlargement of the scope of roll manufacture is presently under examination. In regard to covering the non-ferrous castings requirements of Burnpur, good progress has been made and we are, to an ever-increasing extent, approaching self-sufficiency.

From the technical aspect, the year was interesting as establishing our ability satisfactorily to undertake a range of castings, both of steel and of iron, of a more difficult and intricate nature than previously indigenously produced and in the development by us of a new type of sand stowing pipe; whilst research was continued towards the meeting to a wider degree of the specialised castings requirements of the country's chemical industries.

The Former "Tested" and "Untested" Steel

To my mind a retrograde step has been taken by the according of Indian Standards Specification to certain steel of definitely inferior quality. Gone are the old terms of "Tested" and "Untested" steel. In the place of "Tested" steel we now have steel of "Standard Quality" and of "Fusion Welding Quality" governed by prescribed and adequate specifications. To this there can, of course, be no objection, save only from those who find difficulty in changing their terminology. "Untested Steel", however, is now replaced by "Ordinary"

nary" (or as it is popularly designated "Commercial") quality steel to two differing specifications and by "Off-grade Quality" steel, to which, being the dregs of production, no specification could conceivably be assigned.

It has always been my creed that the aim of the producer should be an output entirely composed of "Tested" steel. This, of course, in actual practice must remain an ideal even in the best of circumstances, and with the quality of the raw materials presently available and the conditions under which operations are, perforce, now being carried on, is still further impossible of achievement. Nevertheless, once a Works is allowed to relax its striving towards perfection and to substitute quantity instead of quality of production as the criterion, a position is established which, in my opinion, is detrimental to the best interests of the country and one from which it may be a matter of the very greatest difficulty ever to recover. I deprecate, therefore, anything tending to invest poor quality production with a specification status capable of obscuring the fact that it remains poor quality.

In the comparative chart appended, I have had set out the various grades of steel, their characteristics, price differentials and suitability for usage purposes according to their relative specifications. The first point I would stress is that it is entirely fallacious to

imagine that because of its lower price of Rs 45 per tonne, the use of "Commercial St 32.0 Quality" Steel leads to economy in the cost of Structures. It will be seen that this steel must on no account be used in structures for carrying dynamic live loads and I will assume that no one would knowingly use it for such purpose. It used for other Structures in disregard of the usage intended according to its specification, then heavier sections than those of Standard Quality Steel must be utilised because of its lesser strength. The chart will indicate that, taking this consideration into account, the use of Commercial St 32.0 Quality Steel leads to excessive consumption of steel, varying between 14½% to 25%, and that far from there being any monetary saving the total cost of the steel is actually from 8½% to 19% higher according to the section in question.

The grave risks attendant upon any mixing of Commercial or Off-grade Quality Steel with Standard Quality Steel will also be appreciated, for if any of the former steel were to be used on Structures bearing dynamic live loads, or if the differing characteristics between the Commercial and Standard qualities were to remain uncompensated—even in respect of one member only of a Structure—then the effect could well be disastrous.

Since perfection of production in the industry can never be achieved, there must always be a certain quantity of Commercial and Off-grade Quality of steel to be disposed of and I am concerned that the Consumer should be safeguarded to the maximum practicable extent against the possibility of the mixing—whether advertent or inadvertent—of Commercial and Off-grade Quality Steel with steel of Standard Quality.

While the Consumer cannot always be protected against himself, I would recommend that the fullest publicity be given to the grave risks attendant upon the use of steel of a quality or of uncompensated characteristics inadequate for each particular work. In order to minimise the possibility of mixing of different categories, I would strongly recommend that only the producers themselves, whose reputations are involved and who in the greatest measure have the organisation and facilities for the strictest possible supervision, should be permitted to stock all qualities of steel for sale to the Consumer. As regards other stockists, I would urge that these should be divided into two separate and distinct categories: one handling Standard Quality, Fusion Welding Quality and Commercial (St 44.0) Quality steel only and the other Commercial (St. 32.0) Quality steel and Off-grade steel alone. The present practice of allowing any stockist to stock and sell steel of all qualities is, to my mind, fraught with the gravest dangers.

Collieries Development Project

Having regard to the vital importance to the Company of the Collieries Development Project in the circumstances I have earlier explained, it will doubtless be of interest if I supplement to some extent the Report of the Directors regarding the progress of the development work.

The Project embraces the three coal-bearing properties of the Company, comprising the virgin area at Chasnalla together with the existing mines at Noonodih-Jitpur, some 5½ miles from Chasnalla, and Ramnagore, adjoining the Kulti Works. The programme for Ramnagore covers primarily the sand stowing and de-pillaring of the workings and that for Noonodih-Jitpur sand stowing of existing workings and the deepening of the mines to tap new and lower seams of coal, the principal objective of the Project being the large scale opening up of the Chasnalla area. Noonodih-Jitpur will be connected by ropeway to Chasnalla and from Chasnalla, where the coal preparation plant is sited, another ropeway over 33 miles in length will connect with the Burnpur Works.

Work on the No 3 Shaft at Jitpur has already reached a depth of over 800 ft from the original level of 250 ft and is now in hand on the Noonodih Shaft. Of the three shafts at Chasnalla, the main

17 ft diameter West Mine Up-cast Shaft has reached a depth of 215 ft against an ultimate depth of 1750 ft, while the shaft-head collars at the West Mine Downcast Shaft and the East Mine Shaft have been constructed and the foundations for the permanent head towers for all three shafts substantially completed. The main coal preparation plant building, which will ultimately be about 76 ft high, is taking shape—with some of the concrete columns already 18 ft above ground-level. The main Ropeway Coal Bunker structure is now virtually finished and foundations for other structures are in varying stages, that for the 2000-ton Coal Blending Bunker being well advanced. The road system is fully adequate, with about 95 per cent of the programmed heavy-duty roads and 85 per cent of the lighter roads already in regular use.

As regards electric power, all the temporary sub-stations, together with three of the permanent sub-stations, are completed and now in use in full cover of constructional requirements and work on the permanent overhead power lines is well advanced. Adequate water services have been installed for construction and residential purposes. Well over 500 workers quarters have been completed and the staff colony accords with requirements and includes also a small inspection bungalow, two hostels and a club. The over-all planning includes park areas and recreational grounds for the enjoyment of all staff and workers, and many trees have been planted, the creation of the best possible surroundings and climatic conditions in a self-contained working area such as Chasnalla being, to my mind, matters of very great importance in any industrial development planning.

Stock Accumulations

Reference has been made in the Report by your Directors to difficulties encountered in the despatch of finished steel from the Works. Due to Railway traffic restrictions and regional shortages from time to time of special types of wagons, there is a tendency in all the steelworks towards a gradual build-up over the course of a working year of a backlog of despatches requiring to be cleared—the position being capable of accentuation by a tendency also for the tempo of production to increase somewhat towards the end of the operational year. With the operational years of all the steel plants of the country at present coinciding, a concerted demand for additional transport for despatch of finished steel in a natural desire to minimise the volume of closing stocks can, accordingly, then develop which is quite beyond the ability of the Railways to meet.

Whatever the reasons, however, whether transportational, operational, psychological or a combination of all three, the resultant practical position of a year-end accumulation of stocks does, I suggest, call for recognition and is one, perhaps, that might well be worthy of consideration in determining the working years of coming new entrants into the field of the steel industry of the country. So long as steel remains in short supply, it is obviously very desirable that the full output of all the plants should be available to the consumers within the shortest possible period of its production; this naturally requiring avoidance of duplication of any factors that could tend towards an additional accumulation at any one time of stocks awaiting despatch.

Acknowledgments

In conclusion I would express, on behalf of the Board of Directors, our appreciation of the services rendered by the General Manager, Mr. McCracken, his executive heads and the entire staff and workers of the Company under the very difficult operational conditions with which they have had to contend throughout the year.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

The Tata Iron and Steel Company Limited

Statement by the Chairman, Mr J R D Tata

THE following statement by Mr J R D Tata, Chairman of the Tata Iron and Steel Company Limited, dealing with the company's working for the year ended March 31, 1965, has been issued to the shareholders. The Annual General Meeting of the Company will be held on Thursday, August 26, 1965 at 4-30 pm at the Birla Matushri Sabhagar, 19, Marine Lines, Bombay 1.

To the Members

I am aware that rumours in the Stock Exchange had led some shareholders to expect a higher dividend than last year. I am sure that on reading the Directors' Report and studying the annexed accounts, shareholders will have realised that the Stock Exchange expectations were unjustified and based on incorrect estimates of the disposable profits.

2 Although good progress was made by your Company during the year under review and the turnover and operating profits were appreciable larger than last year, higher depreciation, higher taxation and an exceptional provision for interest in respect of the Special Advance of Rs 10 crores from Government, absorbed substantially more than the excess profit made over the previous year. In the net result the amount available for appropriations was over Rs 3 crores less than last year and there were therefore no grounds on which the Directors could have justified a higher dividend.

3. As some shareholders may question the need for appropriating Rs 3 crores to deferred taxation in addition to the Rs 2.70 crores provided last year, I may remind them that the sole purpose of this reserve is to insulate shareholders from the burden of additional taxation which will become progressively heavier in the coming years as a result of the growing gap which will arise from 1966 onwards between the depreciation allowed by the Income Tax authorities on the written down value basis adopted by them and the larger amount provided in our accounts on the straight line method adopted by us. We calculate, that during the next few years we shall have to pay about Rs 11 crores more in taxes than would be

payable if such taxes were based only on the profits shown in our annual profit and loss accounts for those years. As against the Rs 11 crores required, we have provided upto now only Rs 5.70 crores including this year's allocation of Rs 3 crores.

4 As stated in the Directors' Report, out of the sum of Rs 1.75 crores for interest on the Special Advance provided in the accounts before you, Rs 49 lakhs represent the interest payable in respect of the year 1964-65, and the balance for the period 1961-62 to 1963-64. As at the date of this report the exact terms of repayment of the Special Advance and interest thereon have not been finalised with Government. But as a settlement is now likely in the very near future and as it will include interest from at least 1st April 1961, your Directors have considered it necessary to provide for interest upto and including the year ending 31st March 1965.

Expansion

5 In my statement last year, I mentioned the possibility of a further large scale expansion of the Jamshedpur plant being included in the Fourth Five-Year Plan. In response to Government's request, we submitted tentative proposals for a million tonne expansion to be rolled into flat products. Subsequently however Government felt that the excess capacity built into a Strip Mill of the width contemplated would make the capital cost per tonne of our project unduly high and that it might therefore be postponed to a time when it could be undertaken to its full ultimate capacity of about two million tonnes. At that stage, therefore, it seemed probable that a further expansion at Jamshedpur would be postponed to the Fifth Five-Year Plan.

6 Recently, however, as the planning of the steel targets in the Fourth Five-Year Plan advanced to its final stages, the Planning Commission and the Steel Ministry seem to have come to the conclusion that it would be necessary to undertake the expansion of the two Private Sector plants during the Fourth Plan period in addition to that of the three existing Government plants and the creation of two new steel plants in the Public Sector. As a consequence of this, we have recently

been asked by Government to consider an expansion of about Two Million ingot tonnes in the Fourth Plan period although full production would not be achieved until the Fifth Plan period.

7 A project for doubling once again the capacity of the Jamshedpur plant obviously poses technical, financial and other problems of tremendous magnitude and complexity, the solution of which is still fraught with many uncertainties.

8 Notwithstanding the magnitude of the commitments that would be involved in such an undertaking, your Directors tentatively took the view that, provided the problem of finance could be solved on a basis which would ensure the continued financial stability of the Company and the maintenance of existing dividends on the present capital and offer prospects of a fair reward to shareholders, and provided further that all requirements of raw materials, rail transport and power could be assured, the Company should not reject such an opportunity of bringing the plant up to its ultimate maximum capacity and efficiency and of serving the needs of the country.

9 A further expansion upto a total capacity of 3.8 million tonnes to 4 million tonnes of ingot steel per annum, based on the installation of new plant and equipment of the most modern and productive kind and permitting the shutting down of old and obsolete units, would ensure to the Company a degree of efficiency, productivity and earning power which would obviously be of the greatest long term advantage to shareholders.

10 We have, therefore, in recent discussions informed Government that provided the scheme can be made viable financially, technically and economically and subject to the approval of the shareholders whose concurrence in regard to the large additional borrowings would, in any case, be required under the law, the Company would be prepared to consider such an expansion programme.

11 I must make it clear that discussions with Government upto now have been entirely on an informal basis without any firm commitment on either side. The only decision made and

commitment undertaken, with the approval of the Government of India, is to obtain from a firm of independent consulting engineers a preliminary project report or feasibility study on which will be based future consideration of the project. The whole project, if it fructifies, will depend on the financial support and approval of the World Bank who also will want to satisfy themselves in regard to its viability, availability of rupee finance, market demand and other factors. Shareholders will therefore appreciate that the picture is still somewhat nebulous and that many months must pass before firm conclusions can be reached. In any case, I do not expect that we shall be in a position to place concrete proposals before the shareholders for another year.

12 While on the subject of steel expansion in the Fourth Plan, and irrespective of whether the expansion of our own plant is ultimately included in it, I should like once again to sound a note of caution, however unpopular I know it to be in some circles. In 1959, when the steel industry was consulted by the Planning Commission in regard to the Third Plan targets, I questioned the need, in the context of our over-all economic development, for placing so much emphasis on, and allocating such a large proportion of our resources to, the development of the basic steel industry. I pointed out at the time that in other countries the ratio of steel consumed to the total production of manufactured goods was much lower than planned for our country; that while it was essential to meet in full the needs of manufacturing industries consuming steel, and particularly costly special steels, there was no justification for committing so much of our scarce resources in money and foreign exchange to ensure complete self-sufficiency in steels used for non-essential purposes; that it was wasteful to invest vast sums in steel capacity without making sure of a simultaneous expansion of raw materials, transport, power, technical and managerial skills, without which partly the new capacity would remain idle or take an unduly long time to reach full utilisation. I therefore advocated a curtailment of the steel targets. My views were not accepted.

13 As it turned out, the expansion of steel capacity undertaken in the Third Plan period suffered greatly for a time from delays, shortages and deficiencies in raw materials and trans-

port, and the bulk of the special steels required by steel processing industries had to be imported. Right now, ten years after beginning the manufacture of commercial vehicles, a company like Telco has still to import almost every kilo of special steel incorporated in its products, and today, because of the foreign exchange crisis, those imports have been curtailed and Telco, along with many other industries depending on imported raw materials, is compelled to curtail production. While, admittedly, a large expansion of the special steel industry is now included in the Fourth Plan, shortages in these essential materials will continue to prevail for many years to come and the country will continue to suffer heavy loss in the unnecessary expenditure of foreign exchange on the one hand, and recurring set-backs in production on the other.

14 In regard to ordinary carbon steels, the belief apparently continues to prevail that serious consequences would follow from the slightest gap between supply and demand for ordinary steels, and we are planning to spend over Rs 1,000 crores during the next Plan period on raising steel making capacity to about 16½ million tonnes. In fact, production in excess of domestic demand is proposed with the intention of exporting the surplus. With great respect, this does not make sound economic sense to me.

15 The steel industry is the most capital intensive of all engineering industries and the one which provides for about the lowest employment potential. For every rupee we spend in creating new steel capacity, we create products worth only half a rupee per year, whereas the ratio is at least 1:1 in more advanced industries manufacturing products made of iron and steel, while their employment potential is many times higher. As regards exports, there is already a large excess steel making capacity in most steel producing countries and exports from India can only be made at a heavy loss.

16 Such heavy sacrifices on achieving total self-sufficiency or even a surplus in ordinary steels would be worthwhile if they were essential to our industrial and general economic growth, as special steels in fact are, but all steel is not consumed for essential purposes. In a developing country like ours where shortages and imbalances prevail throughout our economy and will continue for many years, is it reasonable

to give a higher priority to steel for non-essential purposes than to fertilisers, road transport, electric power, education, medical care and other purposes in all of which there will be persisting shortages even after the Fourth Plan? Surely our efforts and sadly limited resources should first be concentrated on essential needs and not on projects likely to perpetuate and aggravate existing imbalances.

17 While there is still time, I would most earnestly urge some rethinking in the planning of steel expansion in the Fourth and Fifth Plan periods based on a rigorous assessment of the relative essentiality of demand as between steel and other products in short supply. I have no doubt in my own mind that a postponement of a part of the Fourth Plan expansion to a later Plan and a resulting saving of the order of Rs 200 crores, half of it in foreign exchange, could be achieved without any adverse effect whatever on the rate of our economic growth. Such rethinking should apply not only to steel but to other projects. The same objective could be attained by making the Fourth Plan a Seven Year instead of a Five Year one with the minimum of expenditure incurred in the first two years. This would not only release the pressure on resources but also give time for consolidation and the full digestion of previous projects.

18. In closing, I should like, on behalf of the Board and the shareholders, to thank all our staff and workers at Jamshedpur and elsewhere for their good work during the year which contributed so materially to the improved operating results.

J R D TATA
Chairman

Bombay, July, 23rd 1965.

Request to Readers

AS there is a demand from new subscribers for the following back issues of *The Economic Weekly*, it will be much appreciated if readers kindly mail back these copies to the Business Manager, The Economic Weekly, Co-operative Insurance Building, Sir P. M. Road, Bombay-1: 7, 8, 14 and 20 dated January 2, 9, Volume XVII-Nos: 1, 2, 3, 4 to 6, 16, Annual Number, February 20, 27, April 3 and May 15, 1965. The copies will be paid for.

Unisphere® presented by United States Steel. ©1961 New York World's Fair 1964-1965 Corporation.

You never had a better reason to fly with us to New York!

Last year, 27,000,000 people looked in on the New York World's Fair—and they all said "Wonderful!" This fabulous collection of entertainments, exhibits, experiences is so great it's in its second year.

But in late October, it all will be gone, and you'll have lost for ever the chance to enjoy these 640 acres of enchantment—one of the most delightful Fairs ever.

Don't you miss it. Call your Pan Am Travel Agent today. Or call us. We're an Official World's Fair Information Centre, and can show you all kinds of bargains. 3 days (2 nights) in New York, for example—including hotel, sightseeing and a World's Fair admission—just \$ 22.

We make getting there easy, too. Nobody else flies nearly as many transatlantic Jets. And you'll have a good feeling knowing you've chosen the very best—the world's most experienced airline.

Call today!

MALAYSIA has come apart. The end came suddenly and abruptly, and the orgy of mutual recriminations in which the Malayan and Singapore politicians are indulging this week would suggest that President Soekarno's instinct was correct. It was a marriage of convenience, but, obviously, the dislike of communism and neo-communism cannot unilaterally provide the conditions for a lasting union. The end may not have come as a direct consequence of President Soekarno's 'Crush Malaysia' campaign, it could be that the internal contradictions were proving too much for Malaysia, but the point still holds. Where the rest of the objective factors are all arrayed against fusion, the mere presence of hatred of communism is not enough. Anti-communism is not and cannot be a philosophy of living, nor can it take on the role of a catalyser of elements which are otherwise immersed in deep animosities towards each other.

This is a lesson which should be brought home to others, and particularly to the United States Government. Given the American obduracy, where does one go in Vietnam from here? The terms which the National Liberation Front and the Hanoi regime had spelled out to the Ghana delegation for restoring peace are clearly not yet reconcilable with the American notion of 'honour'. The Foreign Minister of Ghana was given short shrift in Washington: President Johnson detained him for barely twenty minutes. The Americans know that the war is continuing remorselessly against them. The ejection of the local population from the Danang base has proved conclusively, if any proof was still required, that the Americans can trust hardly anybody in Vietnam; but even this removal has not saved the base from mauling. The Americans are now, truly and wholly, an army of occupation holding on by force to a few cities and ports and bases, just as much as Nazis who took over Norway in 1940 were. The availability of one or two quislings does not alter this truth. In this sense, the Vietnam has undergone a radical transformation in recent weeks. The so-called government in Saigon has ceased to be of relevance. Whether it is a still grimmer confrontation in the fields and valley and hills or a negotiation across the table on conditions for peace, the parties will now have to be the National Liberation Front and the United States Government.

Once this proposition is accepted, it also follows that the Americans are in Vietnam as aggressors, usurpers and imposters. The world is not guided by either the morality or the metaphysics as adumbrated by the American administration, and concepts of what are democracy, popular will, rule of law, etc, cannot just be handed down by the United States. The Americans may continue to claim that they are fighting the battle of democracy and anti-totalitarianism is South Vietnam. But since the local population does not want to have any part of this fight, they simply have no business to be there any more, whatever may be the earlier set of factors under which they went in. Morality is not the monopoly of the Americans, and millions of people all over the world are feeling a moral urge to condemn the barbarities which President Johnson's regime is perpetrating in Vietnam.

The President of the United States has gone on record that the war in Vietnam has been transformed into a war for the salvaging of American honour. We in this part of the world, despite the fact that many amongst us are obligated to the Americans for economic assistance, cannot be too bothered about their honour in this instance. It is not on the advice of Asians and Africans that the United States launched its aggressive adventure in Vietnam. It was very much a unilateral decision on their part, and in the escalation that they have assiduously brought about over the last twelve months they did not have the support, either overt or tacit, of any of the Afro-Asian nations. Even in Europe, the one government which has chosen to declare all-out support to the American cause is that of Great Britain. But Britain under the great 'socialist', Harold Wilson, is a sadly burnt-out case: she has sacrificed moral conscience in order to salvage her balance of payments. Elsewhere it is only the two Conservative governments of Australia and New Zealand who are with the Americans, and one can raise a query

August 14, 1965

about the proportion of the total world population these two countries represent.

On the Vietnam issue, therefore, the Americans are isolated as they never have been in recent years. The pointed statement by the Japanese Prime Minister should be the final eye opener. The US administration would be wrong to conclude from this demonstration of virulent dissent that there is no gratitude left anywhere in the world. It is the Americans themselves who are sadly out of touch with the reality of sentiments elsewhere in the world, and it could well be suggested that it is cussedness on their part to brush aside large segments of Asian, African and European opinion and to continue with their depredation. What is going on in Vietnam, culminating in the use of even such things as ordinary cigarette lighters for burning down villages and fields and settlements, is mad and criminal. Even on their own arguments, the United States cannot justify the present phase of their involvement. The question of American honour apart, the other reason preferred for the US administration's decision to dig in Vietnam is their acceptance of the so-called 'domino theory', namely that, once South Vietnam falls to the communists, the rest of the South Asian countries, including Thailand and Malaysia, will also collapse. But the Dominican Republic and Haiti did not disappear when Cuba crossed over to communism. And if the rest of South Asia did not abdicate when Ho Chi Minh took over in Hanoi, it is difficult to see why the catastrophe will take place now just because Vietnam will come under a unified administration. Malaysia has collapsed this week, but her coming to grief has nothing to do with the 'domino theory'.

It is a sad reflection that the Americans have yet to learn some of the more elementary lessons of political reality. What happened in East Europe in the wake of the march of the Red Army was an aberration. Communism does not spread primarily through subversion. It is the state of the objective factors within a country which determines the possibilities for the advance of communism. In Asia, India has survived and so too have Pakistan, Ceylon and Burma. If Indonesia is moving towards communism, it is again on account of the set of conditions obtaining within. The reason why in South Vietnam the Viet Cong are able to

helped by massive infiltration from the North, but simply that the domestic conditions made it ripe for a wholesale internal uprising against the corrupt regime foisted on the population by

THE ECONOMIC WEEKLY

the Americans. For all one knows, if John Foster Dulles had been somewhat more perspicacious in 1954, things today would have been very much different in Vietnam.

Shadow Fight over Plan

TO all intents and purposes the battle for the Plan is over. And it has been won by the upholders of the big plan. The size of the Plan has been finally set at Rs 21,500 crores — the lower-limit of the Memorandum figure (though, naturally, nobody bothers much about the prices at which the figure is measured). A gap of Rs 3,000 crores between the resources position estimated by the Ministry of Finance and the target is to be filled up by additional taxation and to some extent through pricing policy. Another gap of Rs 650 crores is proposed to be made good by, to quote a report, "economy in the administration, more efficient running of public sector enterprises and additional savings from the economy, including taxation". What is most consoling and reassuring, the news report continues, "there were no discordant voices" at the meeting of the Planning Commission that took the decision which will be placed before the National Development Council in the first week of September for final ratification. There is going to be no 'pause' in planning, no 'plan holiday', no 'consolidation for one year', no staggering of the Plan over seven years. The planners have triumphed.

We used the expression the battle for the Plan. We know who have won: the upholders of a big plan, which now includes the Prime Minister and the Finance Minister as well as the Deputy Chairman of the Planning Commission. Who have lost then? Was there really anybody wanting a smaller plan? Were there really any differences? Did not Asoka Mehta deny after the meeting that there had been any differences between himself and the Finance Minister and did he not quote the latter as saying "If there are two people in Delhi who share common objectives and approaches, it is Mr Mehta and I". Were we deluded last week when we talked about there being "a conspiracy in the air of scuttling the plan and frustrating the fifteen years of development effort?" Do we not find in this week's air, a conspiracy — an open one — for saving the plan at any

It does not, however, take too penetrating an eye to discern in the resolution arrived at this week the needs of later dissolution, to detect in the summing up of Shastri, described by Asoka Mehta as "luminous and full of clarity and confidence" the shine of polished, impeccable make-believe. The net outcome of the deliberations and loud thinking in last two weeks may not be summed up by the slogan "the plan at any cost, without aid if need be" but another one, uttered as it were by a tight-lipped leader of a conspiratorial group: "The show must go on — until the zero hour".

For there is a conspiracy, may be a deeper one than what we imagined last week. The consensus for halting the plan so rapidly gaining ground among the top leaders and then, equally quickly, a consensus to save it, speak of a deep strategy underlying superficial changes in tactics. As a matter of fact, the existence of such a strategy, of a tacit understanding among the top leaders about finally discarding the plans, should have occurred to those who watched the way the Fourth Plan was being prepared and discussed. One could not possibly have failed to notice the air of unreality and make believe that surrounded it; the very cool and unperturbed manner in which the Planning Commission went on setting targets for the Fourth Plan and elaborating a perspective plan to take the country to the "take off stage", oblivious of the difficulties encountered by the Third Plan. Apparently the admission of failure in the Mid-Term Appraisal of the Third Plan, worked out by one division of the Planning Commission did not have any effect at all on those working in some other division, engaged in elaborating the Perspective Plan. The latter is indeed a logically coherent piece of work — more so in fact than any one of the earlier three plans. But the curious thing is that while a great deal of care has been taken to ensure that the Fourth Plan is properly integrated with the Fifth Plan, there is no attempt whatsoever to develop the Fourth Plan as one following out of

the Third Plan. Is it any wonder then that as it draws near, it looks threateningly more and more suspended in the air, still seeking a lodgment and a home, or a firm base in reality?

The Perspective Plan starts off with certain assumed positions for the end-year attainments of the Third Plan. To the extent that other divisions in the Commission changed any one of these figures, the Perspective Plan also incorporated them, without changing any other figure anywhere: in other words, the underlying crucial ratios and proportions were implicitly, if not explicitly, changed just to suit the needs! This way of linking the Third Plan with the Fourth Plan is, of course, merely of the nature of arithmetic manipulation. Nowhere has the Perspective Plan or the Fourth Plan as a part of it undergone any modification in matters of policy, strategy or approach, based on any diagnosis of the difficulties that attended upon the Third Plan.

This incredible indifference to and callous disregard of the economic aspects of the problem rather than the statistical ones continues to mark all thinking on planning even to the

last meeting of the Planning Commission. Shastriji had insisted that the Fourth Plan should give priority to agriculture: but what does this mean considering that the Fourth Plan Memorandum was drawn up with agricultural growth at 5 per cent per year as its first objective? Again, another instance of the lack of seriousness of purpose of the Planning Commission is its reported finding on the two one-year plans it has prepared for the next year, one as a part of the Fourth Plan according to the Memorandum proposals, another according to the proposals made by Shastri for an annual plan for agriculture with only such industrial projects as have already been started, viz that both these call for the same outlay, Rs 2,200 crores! Now the Memorandum proposals could not have visualised a first year plan which would leave unfinished projects high and dry. So how is it possible for both the plans to have the same outlay? If under the Shastri-variant a much higher allocation is to be given to agriculture, the question arises: is such a high allocation called for by balanced growth? If not, what is the

justification for it? If yes, then how could the Memorandum suggest a smaller allocation?

Critical analysis of the above type of the various details of decision-making by the Planning Commission leads to the unavoidable conclusion that ever since the middle of the Third Plan, leaders in the country have lost faith in planning, partly because of the difficulties of implementing the plans, and partly because planning of this type is no longer of much use to the vested business interests and is no more favoured by the aid-giving countries. A large consensus must have been reached among the politicians — as could be seen from the change of line of even Nanda. The administration has been left to carry on to prepare a Fourth Plan and a Perspective Plan which nobody seriously wanted to implement. Hence the unreality of the discussions on the Fourth Plan and even more so on the Perspective Plan. A show had to be kept up for the benefit of the public. The show is still on, but it may be called off soon. One is waiting for the politically opportune moment.

Weekly Notes

Tunku Breaks Malaysia

THE secession of Singapore has dealt a mortal blow to the very concept of the Malaysian Federation. The association of Singapore, with its large Chinese population, in a larger federation brought hopes that a genuine multi-racial Malaysia would evolve. The People's Action Party represented a progressive socialist-oriented and genuinely multi-racial party which in course of time might have offered a socialist alternative to the right-oriented Alliance Government which now rules Malaysia. The divorce of Singapore from Malaysia dashes these hopes. In fact, it is reported that the PAP's decision to contest the federal elections was a major cause of misunderstanding between Tunku Abdul Rahman and Lee Kuan Yew of Singapore.

The instability of Malaysia has been exposed; it is not so much Soekarno's confrontation tactics as internal racial animosities that have broken it up. The continuation of Sarawak and Sabah in the Federation must now be a matter for speculation.

And for fomenting these internal animosities Tunku Rahman's United Malays National Organisation must be held primarily responsible. The Malaysia for Malays streak in the UMNO has become prominent though it is not the only party to blame in this respect. The unfortunate racial clashes last year in Singapore have been exploited by both the right and the left in Malaya. The Barisan Socialist Party, it will be recalled, is as much opposed to the Malaysia concept as some of the extremist Malay politicians. The Tunku's statesmanship lay in convincing his fellow Malays of the advantages of a multi-racial polity. The Tunku could still have made a major effort to ease racial tensions but this would have called for an alliance of all progressive elements in the Federation on a non-racial basis; instead, it is the UMNO, basically a feudal party, and the Malayan Chinese Association, a party of Chinese businessmen, to which the Tunku turned. Neither of these parties could have shared a common economic platform with the PAP.

Malayan politics will be bedevilled

by racial animosities as long as political alliances are based on ethnic affinities rather than economic principles (our own experience with separate electorates is a pointer). The tragedy of Singapore's exit is the failure of a non-racial, economics-based movement to influence the trend of Malayan politics.

And Now, Foreign Collaboration in Air Services?

THERE is no retreat from nationalisation of the air services yet. The IAC will go on from strength to strength but domestic air services are no longer to be reserved exclusively for the public sector. This time it is no backsliding from established policy under pressure from a private operator with the right contacts at the top, as it happened with Kalinga Airways, but a policy decision of some consequence though the immediate effect may not be spectacular. When the air services were nationalised, private operators were permitted to run non-scheduled charter services and these were by no means confined to carrying of cargo only. Communication with

Assam being so very difficult — the railway route from Calcutta being circuitous and time-consuming — that chartered flights from Calcutta to various places in Assam were very much in demand right from the beginning. Over the years these chartered flights have been run more or less on a regular time table and for all practical purposes, have operated as scheduled services without however the benefit of a proper licence.

Powers have now been taken under an amendment to the Indian Aircraft Rules 1937 to permit the running of scheduled air services to private companies, thus lifting the prohibition on the operation of scheduled flights by private companies under the Nationalisation of Air Services Act of 1953. The companies which have been permitted to operate scheduled air services, however, are those which had been running regular chartered flights both for passengers and cargo from Dum Dum to various points in Assam. Their flight schedules as also the maximum and minimum fares and freight rates charged by them have to be approved by the Director General of Civil Aviation. The Gazette Notification or rather the press release adds a rider that permits will normally be granted only for operation on the short distance routes where IAC cannot operate because of insufficient resources.

The relaxation, however, goes much farther than giving *de jure* recognition to what have been *de facto* scheduled services on the short distance routes, mostly in the West Bengal-Assam sector. For under the amended rules,

"the Director-General of Civil Aviation is authorised to permit the running of scheduled air services by any citizen of India. Operation by a company or corporate body will also be permitted if it is registered and has its principal place of business within India and the chairman and at least two-thirds of its directors are Indian citizens and its substantial ownership and effective control is vested in Indians.

"The permit will be valid for a period of not more than five years as may be fixed by the Director-General at the time it is granted".

This will open up domestic air services to companies with 'substantial ownership' in Indian hands to negotiate foreign collaboration for running regular services on the routes which the IAC is unable, whatever the reason, to cover. There are today any number of such routes and they are likely to increase with time for with the growth of traffic on the main routes, the demand for feeder services has steadily expanded. In fact, the tourist department has long

been urging a considerable expansion of feeder services for expanding tourist traffic. There is undoubtedly need for such expansion even from the narrow point of view of attracting more tourists to this country. For tourists naturally want to see not only the big cities and the traditional places of tourist interest but also the interesting spots which are now either completely inaccessible by air or the services to which, e.g., Khajuraho, are wholly inadequate. The need for feeder services, however, is by no means exhausted by the tourists' requirements alone.

The stumbling block to the needed expansion is foreign exchange. The charter operators to Assam who are now permitted to run scheduled services will not thereby be automatically able to expand their complement of aircraft nor replace the ex-stock which is largely composed of obsolete and uneconomic Dakotas. If the Government could spare the foreign exchange for these feeder services, it could have readily expanded the operation of the IAC. There is no reason to believe that the Department of Civil Aviation has been moved by the more sophisticated arguments in favour of rationalisation and better utilisation of existing capacity in organisation and personnel of the air companies. The need is for new aircraft which cost a lot of foreign exchange. This may well be the thin end of the wedge for the private foreign investor to enter a new, expanding and remunerative field of enterprise. If the present structure of the IAC is retained and its resources steadily augmented, there is no reason to suppose that the relaxation will seriously threaten to unbalance its operations provided the authorities stick to the professed aim of supplementing the nationalised sector by confining private companies, with or without foreign collaboration, only to the feeder services.

The MIG Story Over Again

SUBMARINES, except for one that was supposed to come from UK for training in anti-submarine operations, were not part of the Rs 5,000 crore five-year defence plan. The prospect of getting this submarine disappeared when UK discovered that the quoted cost of Rs 5 crores would be as much a luxury for India as for itself. India then had no alternative but to turn to the Soviet Union which had offered to supply naval equipment a long time back. In the bargain, four submarines instead of one appear to have become feasible. Lower cost must have had something to do with this increase but the idea now is obviously to build up a submarine fleet,

not to have just anti-submarine training.

This means that we are stepping outside the original five-year defence plan but whoever heard of a defence plan remaining rigid and unchanged for so long a period as five years? The situation has changed materially since this plan was drawn up in consultation with and on the advice of the US and UK. Relations with Pakistan have deteriorated sharply, Ceylon is more unstable and our defence planners see a threat to the security of Andamans even from Indonesia. The south and east coast is practically undefended; the implicit umbrella provided by the entry of the US Seventh Fleet into the Indian Ocean is too remote to provide any cover. Our aging little naval fleet is almost wholly concentrated on the west coast, it has in effect only one offensive arm and that is the aircraft carrier *Vikrant*, the air complement of which needs replacement, and which is too vulnerable to be committed in a forward position.

The Indian Navy, royal or post-royal, has never had a submarine, without which no country today considers itself a naval power. But a long coastline requires a balanced naval contingent and a core of personnel trained in all departments of conventional limited warfare.

What effect will the move to buy Soviet submarines have on the prospects of economic aid from the Consortium? The MIG deal with USSR also clouded aid negotiations for some time; western experts then asserted that India did not really need these planes or alternatively that they could be procured from western sources, none of which ultimately proved willing either to supply comparable planes at a reasonable price or help us to manufacture them. Over the last year or so, objections to this deal have quietened down and there has been no complaint about passing on of secret information to USSR through mixing of equipment and personnel. But now the objection is heard once again, in the context of the submarines this time, that the Russians might find out the working of secret devices to be installed in the Leander frigates under construction in Bombay. This is silly really; if these devices were really as secret as they are made out to be, they would not have been contracted for delivery to India; even without any Russians or Russian submarines around, it is possible for

British personnel or British-trained Indian personnel to pass on military secrets to Russia.

The real objection of the US and the UK to the submarines deal is different: the deal breaks, for the first time, a strand in the cord which has hitherto tied India fast to Western, mainly British, naval stores and equipment.

Disorders and Response

THE head of the Kashmir Government calls it invasion. New Delhi, while not underestimating the gravity of the situation and fully exposing the participation of Pakistani armed forces and arms in the affair, prefers to describe it still as infiltration. News reports make no secret of it that the infiltrators have reached the outskirts of Srinagar. Even in the invasion of 1947 they had not come so close to the capital of the State. As we go to press, a fresh encounter has been reported between Pakistani armed infiltrators and Indian security forces on the outskirts of Srinagar city. Pakistan Radio has been shouting about a general uprising of the populace of Kashmir. A Delhi report, officially inspired, goes on to say that the entire plan of the raiders seems to be on the lines of the Algerian type of guerilla warfare which President Ayub Khan had been threatening in Jammu and Kashmir, little realising the folly and inappropriateness of the parallel.

It is not the Kashmiris who are the infiltrators but Pakistani saboteurs and Nandaji has been urged upon by the State Congress leaders and Kashmir cabinet ministers to take strong action against those questioning Kashmir's accession to the Indian Union. Sovereignty is not negotiable and Kashmir's accession cannot be called into question, and infiltration with Pakistani arms and manned in the main by Pakistani personnel cannot have the remotest complexion of a political problem to be settled on the political plane. It is a problem of security, of defending the country's frontiers and it has to be backed by the defence forces by strengthening security measures. The reported progress of the infiltrators and the wide area of their operations powerfully suggest the extent and quality of the operations' military intelligence in the area.

The motivation behind Pakistani activity is not difficult to see. Its link with the procedure agreed to for settlement of the Kutch dispute now in

progress is very apparent. If the Kutch could be, though only in part, left to a tribunal, it is President Ayub Khan's aspiration to push Kashmir into the same frame. India has appealed to the UN for expanding and strengthening the UN Observer set-up. That, however, can only bring to light the fact of infringement and violation of the cease-fire line. It is the recurrence which has to be stopped once and for all.

But violation of the Kashmir frontier is not the only disturbing news which has worried the people of the country during the week; in an altogether different sphere what has troubled people more are the happenings in Bihar. At the time of this writing, Patna, Ranchi and Muzzafarpur are still under curfew. Mass protests against rising prices and food shortages organised by the opposition parties, synchronising with student agitation against raising of fees, have led to wide-spread disorder, hooliganism, police firing and all the rest, some of the highlights of which are the arrests of Lohia and the editor of *Searchlight* of Patna under DIR.

Those who have followed the way the Congress Government in Bihar has been utterly mismanaging the affairs in the State over the years would not be surprised by the response that the protest meeting have evoked. Even so they would be taken aback by some of the steps which the Government of the State has taken to bring the situation under control and to restore normalcy. What makes the situation in Bihar even more poignant is the depressing thought that this utter bankruptcy of the State has come at a time when the disagreements among the State Congress factions had been successfully overcome, perhaps for the first time since independence. This gave the State the possibility of having a cohesive party and cabinet to tackle its problems. The success of the 'Bandh' and the protest, however disastrous their consequences, should at least prove an eye-opener to the local authorities and also to the High Command of the Congress in whose name the Government of the State is run.

Obote's Visit

INDO-AFRICAN relations have received a shot in the arm with the Ugandan Prime Minister's week-long official visit here. The Government of India's efforts to establish close relations with Africa have not

been all that they might have been. Certainly Africa has not received the attention that the West and the Soviet Union have. This is matched by the general ignorance about Africa (excluding perhaps the Arab countries) on the part of even the educated public here. As Milton Obote told us before he left, "you will have to do something about it".

The joint communique issued at the end of the talks between the two Prime Ministers stressed their agreement on several important matters. Uganda considers herself to be non-aligned and puts particular emphasis on finding peaceful solutions to international problems. Over Viet Nam, the two leaders agreed that a political rather than a military solution was the answer. There was also agreement that India and Uganda should work together on the problems of disarmament and non-proliferation of nuclear weapons.

The talks on promoting trade and mutually beneficial economic co-operation between Uganda and India have proved fruitful; a new trade agreement is about to be signed and plans for joint ventures are well under way. There is a market in Uganda for many Indian goods, not only the traditional textiles and spices, but chemicals, plastics, machinery, pharmaceuticals and other new exports. The Indo-Uganda Development Agency and the Uganda Development Corporation have advanced plans for setting up four sugar factories in Uganda, with Indian machinery and know-how.

Fortunately, anti-Indian feeling, which exists in some of the East African countries, is largely non-existent in Uganda. Most of the country's 72,000 Indians have taken Ugandan nationality and are well-integrated into life there. A number of Ugandan students come to India, and they should be welcomed in greater numbers. It should be possible for India to attract more African students since she has a far wider range of educational facilities than most of the recently-independent African countries have.

India's opportunity in Africa is not limited to the expanding markets for Indian goods. If Indians have become a little more aware of the common problems of disease and poverty shared with most African countries, if they recognise a little more clearly the important role they can play, together with the African countries, in the fight against colonialism (and neo-colonialism), then Dr Obote's visit would have achieved something more than strengthening Indo-Ugandan ties.

Excise Duty Rebate

A Correspondent Writes:

ACTION has been taken on TTK's budget proposal for giving excise duty relief to specified industries as an incentive for higher production. The industries selected are cement, paper, newsprint, soda ash and caustic soda, and the extent of rebate on excise duty has been fixed at 25 per cent for cement and newsprint, 20 per cent for caustic soda and ash, and 15 per cent for paper (other than newsprint and boards) on that part of output in excess of that in the last financial year.

The industries selected are a mixed lot, four out of the five are under price control. There is formal price control in the case of cement and paper. Caustic soda and soda ash prices were de-controlled towards the end of 1963, but some of the large manufacturers (Tata Chemicals, Sasurashtra Chemicals) have an informal price-holding arrangement.

There is no doubt that most of these products, paper excluded, are in short supply. The growth of production in these industries has been slow, and certainly below requirements as shown in the table below.

Cement output is perhaps 2 million tons below demand. The State Trading Corporation has been importing huge quantities of caustic soda on the basis of *ad hoc* licenses. There is at present only one newsprint manufacturer (that too, in the public sector), and India imports about 80,000 tons of newsprint per year for restricted distribution; the two newsprint licenses, talked about at the beginning of the Third Plan, have failed to make any headway. The odd man out is paper where supply is equal to or above demand (particularly with the commissioning of the huge Amlai project), and the rationale of the excise duty relief remains to be found in this case.

As a fiscal device, this measure is among the more sophisticated parts of TTK's budget. However, in the larger context, one can question the basis of the excise tax credit. Would it not be more rational to allow these

industries a price rise to enable them to make higher profits and finance expansion? Most of these commodities are intermediate products, and inter-industry transfers through higher prices should help to finance increased production. Budgetary relief can then more appropriately be applied, for example, to capital goods manufacture where high prices of indigenous equipment affect the long-term export competitiveness of Indian industry.

LETTER TO EDITOR

Food Zones

IN your issue of August 7 an interesting defence of the food zones appeared (p 1223). It highlights a basic finding of the Agricultural Prices Commission, viz, that the coefficients of variations of per capita availability of cereals as well as those of wheat and rice (as between different States) have gone down since the zones were introduced. The other argument advanced in defence of the food zones is that free movement of food between States would lead to the private traders' buying cereals in surplus States, and then speculating; in such a situation the Central Government's likely refusal to increase its commitments (coupled with denouncements of the private trade) would only lead to increased hardship of the consumers. This, too, is justified.

But something needs to be said on the other side also. If there is not a firm and total commitment on the part of the Central Government to supply all the needs of the deficit States, then the latter are bound to denounce the zonal system, which according to them lets the surplus States hold on to their surpluses. (There does seem to have been some evidence of this.) Further, a process is started in deficit States to try to become self-sufficient in food. If this took the form of increased output from the same area, it would be splendid. But only too often it threatens to take the form of a switch from commercial crops (in which some deficit States have a comparative advantage) to food crops.

(in thousand tons)*

Year	Cement	Caustic Soda	Soda Ash	Paper
1960	7,844	98	145	285
1961	8,245	120	177	298
1962	8,586	127	223	319
1963	9,355	152	267	384
1964	9,690	184	282	413

* Metric tons in the case of cement only.

The Central Government, for its part, has had the problem that the deficit States over-estimate their deficits and the surplus States under estimate their surpluses. This problem, along with the inevitable desire on the part of the Central Government to minimise work for itself, explains its hesitation to enter into firm commitments. The Agricultural Prices Commission has recommended that "Immediate steps should be taken to make a realistic assessment of the surpluses and deficits of foodgrains... for each State..." But this is not good enough. Two necessary pre-conditions which must be satisfied before the Central Government can enter into complete commitments to the deficit States are: a proper procurement policy actually in operation, and adequate buffer stocks well distributed all over the country.

This issue of the food zones illuminates an important aspect of our economy, i.e, the habits and responses of our businessmen; they are vastly different from what economic theory assumes in its models of perfect competition or even imperfect competition. A rise in demand, leading to a rise in price, should after some time lag result in increased supply of most things. In India this increase in supply hardly ever occurs; instead there is increased adulteration of milk, foodgrains and other merchandise. This happens to some extent in other countries too, but in economies like ours, it is so much the norm that it calls for a different model of the "price mechanism". Similarly, according to the standard textbook theory speculation should help to stabilise price. But in India, if speculation were left alone it might often lead to an explosive inflation.

The foreign experts, with their unconscious assimilation of conventional economic theory, need to revise their models of reference when looking at our problems. On the other hand, it must also be admitted that State planning, initiative, and enterprise have in India, if anything, shown less vigour than we might have expected from the experience of some western countries. Hence the elements in our choice are particularly difficult. Still, perhaps, since lives are directly involved in food, we might expect government agencies to be more responsible than private traders.

CAPITAL VIEW

Obscurantists on the Move

Romesh Thapar

DICTIONARIES describe the obscurant as one who opposes enlightenment or reform. This is as good a description as any, but when we apply it to the obscurantists who operate in Indian politics we soon realise that it just does not hold. Our obscurantists are very often enlightened men sufficiently reformed to pass as modern images—but, and this is what disturbs, only too anxious to join forces with the traditionalists and revivalists to win political prestige. We have been sharply reminded of this rather disturbing fact during the past few weeks.

Surveying the ferment taking place among the vocal sections of India's Muslims over the attempt being made to carry out a long-delayed clean up of the mess that is Aligarh University, the assumption would be that Union Education Minister Chagla has mishandled and complicated a rather simple problem of student indiscipline which had some communal overtones. Indeed, one would soon be persuaded that Chagla is an opportunist who is parading his nationalism in order to secure his position within the Congress hierarchy, that he is a man without a base, without any support in the country. In fact, Chagla appears from reports now circulating to be the villain of the piece who is operating through a puppet Vice-Chancellor.

The public assumes that it is being fed on something approximating the truth. There has been no independent assessment made of the situation. Yet, it is well-known that the implied allegation of Pakistani involvement in the recent fracas was contained in a background press release by an information officer — the allegation that is supposed to have incensed a host of otherwise patriotic Muslims. These elements are doubly incensed because of Chagla's appeal to 'nationalist' Muslims to support the measures he is taking to clean up the Aligarh mess; the argument is that the community is sought to be divided into nationalists and communalists by an opportunist Muslims minister. The demand is that Chagla be sacked, that the smearing of Aligarh University's pure secular character be stopped, and that the infamous ordinance be withdrawn.

We are still in the midst of a public relations effort to depict Aligarh University as a cradle of secularism and

nationalism. Newspapers are being flooded with letters from indignant Muslims all over country recording the great services rendered by Aligarh University as the training ground for nationalists. Conventions are being held by indignant Muslim leaders who claim that the actions of the Education Minister are an affront to the community. Even some indignant meetings are being planned by a united front of Muslim organisations, including Congressmen and Muslim Leaguers. Those who raise their voice in support of Education Minister Chagla are dismissed as 'stooges', as 'unrepresentative'.

It may be that there have been mistakes made in the handling of the Aligarh University crisis. It may be that it was not politically wise to emphasise the role of avowedly communal elements in the university because various confusions and misunderstandings have provided an opening for the communalists among the students and the faculty members. It may be that the purge in the university could have been ordered without resort to a provocative ordinance, for the interests of a minority community were being dealt with. Mistakes in handling and emphasis are not new to our administration. How is it then that such a ramified campaign has been launched against one of our most courageous ministers who is known to be above the factions — communal, political and educational — which vitiate life in our universities?

The answer is so simple that it is startling. Muslim colleagues of the Education Minister, senior Muslims within the hierarchy of government, disgruntled Muslims who are members of the Congress party, have come together with the communal elements in their community to exaggerate, exploit and sponsor a possibly explosive agitation for their narrow political ends. Cabinet collectivity has been violated. Party discipline has been challenged. Freedom has been given to the mischief-makers, bitternesses and anxieties of a community which since the partition of the country has been more or less leaderless. We are today witnessing in the attack on Chagla, an attack on the modern Indian, the advanced Indian, the Indian who alone can lift this land

from a past tortured by religious and social obscurantism.

The Congress leadership has to take serious note of these developments, particularly the Home Ministry under Gulzarilal Nanda. Ever since the death of Jawaharlal Nehru, there has been an unhealthy tendency to close communists, real and unreal, because understanding of developments within the communist world is totally lacking. The minors at the Home Ministry, relying heavily on old files and records, are out of touch with present-day reality. And in the process the communalists, including the Hindus, are enjoying a freedom seldom enjoyed in the past. That this should be happening under the stewardship of Gulzarilal Nanda, believed to hold healthy views on these matters, is all the more intriguing.

The infection spreads because of an unstable economic situation which in turn has weakened seriously the political power of the Centre. Ambitious, disruptionist groups, held in check so long as the ruling leadership was confident, are again moving to assert their regional role — a trend which is strengthened by the knowledge that within a year the people will be organising for a general election. This is also the backdrop for the recent recrudescence of Akali activity. The call is again heard for a Punjabi-speaking State, for a Sikhistan.

The most extraordinary exhibition of obscurantism was witnessed in the Capital at a press conference at which Master Tara Singh presided. There was much talk about Hindu tyranny, the desecration of Sikh places of worship, the general plight of the community and the need for a separate State. Significantly, sympathy was expressed for Sheikh Abdullah and Master Tara Singh announced a visit to Pakistan. This mumbo-jumbo of allegations, demands and commitments is not subscribed to by enlightened sections of the community, but judging from the new Akali recruits paraded by Tara Singh on the platform, and the more sophisticated but not so different performance of Sant Fateh Singh during his meeting with Prime Minister Lal Bahadur, we are about to witness an attempted revival of communal discord in a leaderless Punjab.

The Congress party, while denying

much of the propaganda being engineered by the communal leaders of the minorities, cannot consider itself blameless. Its reluctance to break ruthlessly the back of Hindu revivalists who are active destroying the secular fabric of the Republic has demoralised and silenced the enlightened, and also fed the ambitions of the worst communal elements among the minorities. Over the past weeks, communal clashes have taken place in several towns. And we have still to be convinced that the punishment of the guilty has been sharp and severe. We must view these eruptions as threats to the security of this country and act accordingly. Why does Gulzarilal Nanda not respond today like he did to the killings in Calcutta in January 1964 when Nehru was still with us?

The crushing of communal incendiaries and the isolation of the obscu-

FROM THE LONDON END

The £, Above Everything

THE Censure Motion provided an opportunity to assess the debut of Edward Heath as Leader of the Opposition, the record of the Labour Party, after nine months office, and the deep-seated malaise of the British economy. Heath's much-heralded speech as Leader of the Opposition turned out to be a damp squib and came as a pathetic anti-climax to his build-up as the pugnacious leader who would outpoint Wilson.

Ironically enough, it was the easy-going Maudling who made a far better, and indeed more trenchant, speech than Heath. So much so that Harold Wilson could not resist the temptation to say that it was a great pity Maudling had not made the speech a fortnight earlier! Perhaps Heath's was a flop because it really is cynical humbug for the Conservatives to move a Motion of Censure when they had completely neglected the balance of payments deficit in view of the General Election, and in view of the fact that the remedies they had in the bag then were identical to the ones that the Labour Government itself was now using. Loss of confidence because of inept handling of the situation may have exaggerated the gravity of the crisis that faces Britain, but even if the Conservatives had been returned to power the situation would have been little different. This naturally acted as an inhibiting factor in Heath's speech, and most people agreed that he was certainly not a

rantists in our political life should have as high a priority as the recruitment of army divisions — for inevitably, when law-and-order situations get out of hand, the army is diverted from its duties to undertake police action. But it is a priority which both government and the ruling party have lost sight of in the midst of the confusions and crises generated by the collision with China in 1962 and the aggravation of our border tensions with Pakistan now heightened by enemy infiltrators in the Kashmir Valley.

To restore this priority is an urgent task, a task closely connected with the formulation of political perspectives without which there can be no effective economic planning or solid social transformation or a determined defence of national sovereignty.

his best. If the House of Commons were nothing more than a boxing ring, there is no doubt that Wilson would be the unrivalled champion though he be the unwi2yi5a 7890-‡1234 though he does not always abide by the Queensberry rules! The Censure Motion failed to raise a spark in the House, and in the event, the Government had a majority of thirteen votes. William Warbey, the left-wing rebel, who proclaimed that he had no confidence in Wilson as leader of the Party, abstained from voting, and it is not yet clear what disciplinary action the Labour Party proposes to take against him.

While Wilson was able to ridicule the Conservative speakers, his performance was not quite as good as that of the week before, when in a fighting speech he had defended the actions of the Labour Party and maintained that every election promise made by the Party would be honoured in due course. He described the earlier Conservative motion as "the most bizarre Censure Motion I have seen. It complains that we have, in less than 300 days, failed to do all the things Conservative did not do, neglected to do or refused to do, or did not know how to do—not in 300, but in 5,000 days". With reference to Labour's election pledges, he pointed out that the programme was for a full parliament, and not for a single session, or even two. Many Conservatives had doubled the Government's ability to

carry it through in a full session. Now they accuse the Labour Party of not carrying it through in nine months.

However, leaving aside the parliamentary brilliance, which is recognised on all sides, of Wilson, it is necessary to make a more sober analysis of the Labour Party's first nine months in office. Government, above all things, is a question of priorities, and the courage to act upon these priorities. While there is little doubt that the Labour Government's priorities are correct, the methods that they have adopted to achieve these priorities, and the manner in which they have acted, have not always been the most effective. Given the massive balance of payments deficit they had inherited and given the paramount need to defend the value of the pound and setting the economy to rights, it was essential that they take unpopular measures to act directly on the balance of payments, and to reassure foreign holders of sterling that some check would be put on the economy to prevent the situation from worsening. The question that remains is whether the actual actions they took were the right ones and enough, whether they were taken at the right time and with sufficient forethought and whether they were the kind of actions to be expected from a Labour Government, or merely a rehash of the old "stop-go" measures used over the last few years by the Conservatives.

Some direct action had to be taken to check imports, but surely a Party which is in favour of planning could have chosen the imposition of import quotas (acceptable to G A T T) rather than the import surcharges which did so much damage to opinion abroad. Restriction on capital investment abroad is also certainly necessary, but the manner in which this was imposed and the fact that no distinction was made between capital exports to developing countries and to other countries is also disappointing. Since one of the basic difficulties of Britain lies in the fact that her exports are simply not expanding, some direct stimulus for these is necessary, and one wonders whether the measures taken by the Government are in themselves sufficient. Cuts in expenditure too are also inevitable, but should the axe have fallen on social services—such a vital part of the Labour party programme—or should they have fallen on more expendable defence expenditure? Cuts in this field have, of course, been made by the Labour Government, but do they really go

THE ECONOMIC WEEKLY

far enough? Britain's military expenditure abroad accounts for more than half the deficit in the balance of payments. Under these circumstances, it is good to see that a full meeting of the Parliamentary Labour Party held recently unanimously adopted a motion calling on the Government to speed up cuts in defence expenditure as the only means of solving Britain's economic difficulties.

All the unpopular economic measures taken up to date by the Labour Government have been to shore up the defences of the pound, and reassure foreign opinion whose confidence in the Labour Party's ability to maintain the value of the pound was minimal, and declined rapidly as British exports failed to rise. Continuous pressure on the pound, following the November crisis, led to a further series of restrictive measures, culminating in Callaghan's last package of restrictive measures, popularly referred to as his third budget. These are by far the most severe that have yet been undertaken, and follow the classic pattern welcomed by international banking circles, of a sharp dose of deflationary medicine, concentrating with it a further tightening of hire purchase regulations, stricter exchange

control and curbs on direct overseas investment. The Labour Party has gone out of its way to emphasize the difference between these measures and the Tory "stop-go" ones, by pointing out that the Labour measures are more selective in that regions of high unemployment have been excluded, and that expenditure on housing and education has not been cut; also, it is pointed out that if there is any sign that a recession is on the way, these measures can quickly be rescinded. Recourse to these measures, particularly the cuts on social services, the postponement of cheaper mortgage rates for owner-occupiers and the Income Guarantee Scheme, means that large parts of the programme on which the Labour Government was elected are being put aside, at least for the time being.

Foreign confidence in Britain's economic performance has continued to be shaky, and the recent survey of the U K economy, published by the Organisation for Economic Co-operation and Development emphasizes the deep-seated malaise of the British economy. It points out that the balance of payments difficulties of Britain have been growing over a long period. Britain's export per-

formance has been consistently unsatisfactory, although world demand has been generally buoyant. Exports of manufactured goods, which make up the bulk of U K exports, have risen less fast than those of the other major industrial countries. The report argues out that the way to deal with the root causes of Britain's economic difficulties is not only to impose direct controls checking the export of capital and the flow of imports but to correct the over-heating of the domestic economy. This is the path that the Chancellor of the Exchequer has now chosen, perhaps galvanised into activity by the massive conversion by China of its holdings of sterling into gold, which further weakened confidence in the pound and which must have provided an alarming parallel to Labour leaders of the situation in 1931. If there is one thing that the Present Government does not wish to be forced into, it is a devaluation of the pound, and the drastic action that has now been taken will probably, finally, convince overseas opinion that Labour's first priority is to defend the pound, even if this means giving in by cutting social expenditure and toeing the American line on Vietnam.

**"Someone should
tell him about State Bank
Travellers Cheques!"**

**Armed guards can cost a lot of money.
Why not carry all the cash you want
in the form of State Bank Travellers
Cheques? They're absolutely safe,
and much more convenient.**

The State Bank of India issues its own Rupee Travellers Cheques in denominations of Rs. 50/- and Rs. 100/-. These can be cashed at any of the over 1800 Offices of the State Bank of India and its Subsidiaries. They are also encashable at encashing Agents at airports, and hotels and shops; in India and abroad. They're good anywhere, anytime, even after banking hours.

No irksome formalities. No risk. If lost, these cheques can easily be replaced.

Don't take risks.

Take State Bank Travellers Cheques.

STATE BANK FOR SERVICE

LETTER FROM AMERICA

Johnsonism, at Home and Abroad

PRESIDENT Johnson's recent speeches on the Vietnamese situation have made a deep impression on those Americans who were not still aware of the gravity of the U.S. position in that war-torn land. The American man in the street, usually not concerned with matters of foreign policy, is now very much aware of the Vietnam situation, and the newspapers have been full of news from there. Johnson's virtual declaration of war has already increased the numbers of men called for compulsory service, and informed sources in Washington are convinced that this increase is merely a prelude to more sizable addition to the armed forces, including calling up sections of the reserves. Indeed, the Defence Department has already ordered stepped up training for units of the reserve.

Pressures on the President

It is fairly clear that many of President Johnson's advisors wanted to take more stringent measures last week, but many Congressional critics have persuaded him to hold off, at least for the present. Thus, the recent increase of American forces in Vietnam to 125,000 is a sort of compromise between men like Senator Fulbright, who are pressing for negotiations, and the military officials, who seem to want a direct confrontation with the Chinese. The fact that an intense power struggle is now going on in Washington is indicated by President Johnson's denunciation of the House Minority Leader, Ford, for leaking out some of the dissension which has taken place. According to Ford, a number of influential Senate Democrats, led by the Majority Leader Mansfield, strongly urged the President to moderate his stand on Vietnam, claiming that a substantial number of Senators would not support him, and that his position was losing popularity among the people. Although this version has been flatly denied by the White House, it would seem to have more than a bit of truth. Although only Senators Morse and Gruening have spoken out publicly against the Administration, there seems to be much private criticism going on in high places. And as civilian critics become more vocal, the military and their allies in the State Department

have stepped up their pressure for more direct action in Vietnam.

Thus, the final decision on Vietnam clearly have not been made yet. The debate, which has been mostly behind closed doors, continues although it seems likely that the President will expand the Vietnam war to its maximum extent without deliberately provoking China. The situation, however, threatens to grow even more serious in the near future. In the meantime, the news from Vietnam is both heavily censored and highly contradictory.

Legislative Victories

President Johnson finds himself in a rather strange situation in the United States. His popularity among the people, if one can rely on the public opinion polls, stands at an all time high, with almost 70 per cent supporting the President's overall policies. Yet, he has been almost continuously attacked by the press and seems to be an object of derision in the salons of official Washington. His style, which is in especially sharp contrast to that of President Kennedy, rubs educated Americans the wrong way. His frequent use of off-colour language and his diplomatic mistakes (such as publicly attacking a Spanish official at an official function) have caused a good deal of criticism. Yet, the Administration's domestic legislative victories have been impressive from any point of view, and more progressive legislation has been passed by the present Congress under the continual prodding of the President, than any Congress since the time of Franklin D. Roosevelt. The Medicare legislation, which has just been signed into law, does not provide America with a British-style National Health Service, but it does give substantial coverage to the old and poor, the segments of the population which need this help most. One of the key civil rights measures, the voting rights bill, will pass the Congress within a short time, and will provide a major breakthrough in changing the political structure of American south.

In addition to these legislative victories, which are highly significant to the poor and to the Negroes, several of President Johnson's recent appointments have received high praise. The new United Nations ambassador,

although a novice at international affairs, is an articulate liberal who is almost universally respected in the United States and will probably have something of a moderating influence on President Johnson. The new associate Justice of the Supreme Court, Fortas, has also received high praise in Washington. Finally, the mission of Harriman, the roving ambassador, to Moscow, Belgrade, and Western Europe, has been seen as a move to reassure the Soviet Union of basic American policy.

From the foregoing comments, it is clear that American politics, particularly in that fish bowl called Washington, is taking on something of the "cult of the personality". President Johnson has developed something of an American "Gaullism" although without the finesse or intelligence of *le grand Charles*. Not since the era of President Roosevelt has one man dominated so much of America's national life. Even during the Kennedy administration, one man did not play the kind of central role that President Johnson currently plays. In sum, American liberals have supported the President's domestic programme strongly and only the extreme right wing press has attacked his domestic record. On foreign policy issues, however, the entire intellectual community and many Washington officials are simply praying that Johnson will not engulf the world in a holocaust.

The Paradox.

The domestic situation has been kind indeed to the Johnson administration. The economy continues to break records, and the usual summer slack has not taken place. Employment rates have risen, and earnings are at an all time high. Government revenues, despite the substantial tax cut, continue at a high level, and a month-long stock market decline seems as if it has ended. Practically all economists are convinced that the economy is basically sound, and forsee nothing but continued expansion in the coming months. The increases in defence spending made necessary by the Vietnam situation, will help to spur the economy. Other domestic matters also seem under control. The racial situation, both north and south, has remained relatively stable and quiet.

The Negro movement has not yet found adequate leadership and Martin Luther King simply cannot personally provide guidance to the nation's 11 million Negroes. Even the labour movement has been accommodating by refraining from any major strikes in recent months.

Americans are basically still isolationists and want to be left to themselves. They are not disturbed by foreign events unless they threaten immediate effects. Thus, the Dominican fiasco hardly caused a ripple in the public apathy (except for the

intellectuals, who were very much opposed to the Administration's actions. Indeed, it is doubtful that anyone would care much if the United States made the Dominican Republic a colony in name as well as in fact. Vietnam has struck closer to home, but the situation will have to grow worse, as seems to be likely, before the public discontent (perhaps confusion is a better word) will get out of hand. Right now, it is a small but vocal group of legislators who have managed to get the facts about Vietnam, a difficult task in itself, and the intel-

lectuals and students who are urging the Administration to restrain itself. The prospects for their success seem to be slim at the present time. Foreign pressure, which is officially discounted, may have some effects on the Administration. Thus, America is faced with a paradox. Its foreign policy has been a total failure with no prospects for improvement, while the domestic record of the Administration has been excellent, and more progressive legislation seems to be on the horizon.

BOOK REVIEWS

Vietnam and China

Subhash Chandra Sarker

Communism in North Vietnam by P. J. Honey; Ampersand Ltd, London, 1965; pp 206, Price 7s 6d.

THIS is a study of the policies of the Vietnamese Communist Party (officially known as Dang Lao Dong Viet Nam, i.e., Vietnamese Workers' Party) during the decade following the final Vietnamese victory over France in 1954. However, the major part of the book deals with developments between 1957 and early 1963 with particular reference to the relations of the Vietnamese Communist Party with the Communist Party of China and the Communist Party of the Soviet Union. The author's approach is that of an analyst, who does not have any sympathy with Vietnamese aspirations but who wants to understand the broad delineations of Vietnamese Communist policies with a view to suggesting an appropriate course of action on the part of the western powers, particularly the United States of America (this is however, nowhere made explicit in the book itself; the author's stated objective is to determine the position of Vietnamese Communist party in the Sino-Soviet dispute.)

Honey's antipathy to the Vietnamese Communist Party is reflected in his assessment of the role of Ho Chi Minh. He writes: "The consequence of Ho's decision was involvement of both the United States and Communist China in the Indo-Chinese war, thereby increasing the scale and significance of the conflict and causing more bloodshed, suffering, and damage to the Vietnamese people." Whatever may be Honey's faults, sympathy for Vietnam and the Vietnamese is not one

of them. Yet in a peculiar way this avowed antipathy is not without its merit; for it ensures that any positive statement about the Vietnamese Communist Party in his study need not be doubted and can be accepted as fairly accurate and approximate to truth.

Vietnam Is Nobody's Pawn

Read in this light, the book is of particular relevance to Indians who have yet to comprehend the true significance of the struggle in Vietnam. After the traumatic experience on the India-China border, many Indians view the U.S. involvement against Vietnam's struggle for independence as a guarantee against Chinese expansionism. Much as these Indians feel sorry for the suffering of the Vietnamese people they, nevertheless, consider this historically inevitable and, under the circumstances, also justifiable to a considerable extent. Nothing, however, could be more misconceived. Those who are acquainted with Vietnamese history know that the history of the past several centuries in Vietnam has been one of struggle against China. A measure of friendship and understanding was achieved between the Chinese and the Vietnamese during the anti-colonial liberation struggles against western colonialism. But that was nothing more than what grew between the Chinese and the Indians (who sent a medical mission to China fighting against Japan) or between the Indians and Indonesians. In their fight against the French

colonialists the Vietnamese had of necessity to seek some Chinese help (which was indirect all through the war against France); the Vietnamese are understandably grateful to the Chinese for this help. But it is utter misreading of events to view the Vietnamese Communists as the instruments of furthering any possible Chinese designs in Vietnam or any other Asian country. On the other hand, the Communist leaders of Vietnam have constantly endeavoured to uphold and strengthen their independence of action *vis-a-vis* not only France and the U.S.A but also China and the Soviet Union. Honey's study establishes this fact beyond any dispute.

Honey writes: "The attitude of virtually all Vietnamese toward the Chinese is so complex and difficult to describe... Nevertheless the overriding emotion of the Vietnamese is dislike (stories of the greed, the duplicity, and the terrible cruelty of the Chinese rulers during the two periods of Chinese domination abound in Vietnam and are recounted as though the events of history had taken place only recently) and that is why communist campaigns stressing 'historical friendship' between the peoples of Vietnam and China had to be abandoned hurriedly when they encountered so much ridicule in North Vietnam. It is interesting to note that many of the new factories and industrial undertakings in North Vietnam have been named after Vietnamese heroes venerated because of their victories

Not quite though—for an average day's work at Kulti is a stupendous reality. Making complicated castings of a wide variety to serve India's steel, sugar and chemical industries, the railways and many units of the public sector. Spinning out pipes by full train loads as not done anywhere else for India's projects and utilities. The consumption of pig iron by Kulti's integrated foundry in a year exceeds 20% of that for the whole of India; it can consume more if available... All perhaps in our Kulti works' tradition of nearly a century.

over Chinese invaders, and that the anniversary of Emperor Quang Trung, who not only defeated a Chinese army but also laid claim to territory in Southern China during the eighteenth century, is celebrated annually by the Communist authorities".

Neutral in Sino-Soviet Conflict

It is again of no little significance that the Vietnamese Communists have consistently refused to side with the Chinese Communists in the Sino-Soviet controversy, despite considerable Chinese pressure.

For understandable reasons the Chinese have sought to align the Vietnamese Communists with their policy not only with regard to the Soviet Union and the United States of America but also with regard to various political, economic, social and military issues. Honey has given a number of instances of Chinese overtures seeking Vietnamese alignment with China. The Vietnamese have always refused to identify themselves unreservedly with China — a refusal the significance of which certainly goes very much beyond involvement in the Sino-Soviet dispute which provided the pretext for the decision. In view of the geographical proximity of China and the considerable dependence of the Vietnamese leaders on Chinese goodwill and support in order to meet the very real US threat to Vietnamese independence, Vietnamese neutrality in the Sino-Soviet dispute must be regarded as an extremely courageous action which speaks eloquently of the desire of the Vietnamese Communist leaders to pursue a course of their own making and in accordance with the national interests of the Vietnamese people to maintain friendly relations with all countries.

The zigzags in Vietnamese policy towards the Sino-Soviet dispute in which they at one time seemed to favour China and at another time the Soviet Union, never irrevocably committing themselves to one side, have to be interpreted in the light of this overriding desire to retain freedom of action. Honey writes: "North Vietnam could afford no such indulgence (of siding with either Soviet Union or China) because she badly needed all the economic assistance she could obtain from every quarter. To antagonise any communist country would be tantamount to inviting that country to cease supplying and... Consequently, Ho Chi Minh found himself in mid-1961 more heavily committed than ever before to his policy of re-

maintaining on good terms with all Communist countries, of avoiding any participation in the Sino-Soviet dispute and of using any means at his disposal to bring this dangerous conflict to an end".

Ho Chi Minh's Role

The Sino-Soviet rivalry in Vietnam and the latter's response to the chal-

lenges of the two giants throw interesting light on the various tactics employed by the contestants in pressing their peculiar carrot and stick policies. Displeasure or pleasure would be shown by taking hold of the most flimsy of pretexts. For example, when in 1963 the Soviet Union was favourably disposed towards Vietnam it devoted "many times more publicity

n towards progress...

India Steamship Co., Ltd. has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

A Basic History of Germany by Hubertus Prince zu Loewenstein; Inter Nationes, Bonn, 1965; price not stated.

than in the previous year to the thirteenth anniversary of the establishment of North Vietnamese-Soviet relations on 30 January and eulogising the Lao Dong Party on the occasion of the thirty-third anniversary on 3rd February," while China, vexed at the effusion of Vietnamese-Soviet cordiality, ignored the occasion completely, although it had devoted much time and space to the thirty-second anniversary a year earlier. The Vietnamese likewise resorted to publication and suppression of events and actions of China and the Soviet Union to show approval and disapproval.

Vietnam is contiguous to China and has in recent years received considerable help from China. The Vietnamese Communists in particular owe over a good deal to the Chinese communists for their victory over France and for their success in economic reconstruction in Vietnam. It is not surprising therefore if a section of the Vietnamese communists should see in greater Vietnam-China co-operation a better future for Vietnam; the history of resistance to China again ensures that this pro-China tendency will be contested by others. Honey believes that an eruption of the fighting between these two diverging elements within the Vietnamese communist party has been put off only by the presence, of Ho Chi Minh, who, at 77, enjoys undisputed supremacy over the party and the people in Vietnam. His pursuit of a Vietnamese policy independent of China is firmly supported by the confirmed anti-Chinese Vietnamese Minister of Defence, General Vo Nguyen Giap. Apparently in late 1957 the pro-Chinese elements sought to capture power but had to yield to Ho Chi Minh eventually. What course the future will disclose will depend considerably on the outcome of the struggle of the South Vietnamese people, who have so far found only China to be genuinely concerned at their suffering and, unless there is a change in the attitude of other Asian Governments to the war in Vietnam, may in the event of their victory over the Americans (which cannot be very far off) find themselves obliged to turn to China for support and sustenance. The communist leaders in North Vietnam would not, in that case, be able to withstand the two-pronged pressure of the Chinese from the north and the south Vietnamese from the South and would be pushed to a closer identification with China (irrespective of the consequences of such an identification).

THE purpose of this book is "to acquaint other nations with the basic facts of German history as a part of occidental mankind, and to demonstrate that in our modern world freedom is supranational and indivisible". Thus, it is meant to be a case-pleading type of history. The case to be pleaded is that the ideas of freedom and democracy are immanent in the entire German history.

Actually, the thread is quite lost in this book; it compares not so much with *grand ligne* historical treatises as with a common school text. It is a string of dates, names and moves; one looks in vain for the accidental mankind in it.

If the book has a point of view, it is strictly nationalistic; since one hears two voices from Germany nowadays, those of the Federal Republic and of the Democratic Republic, one had better call it federal-nationalistic. There are memorable quotations which presumably warm German hearts: Frederick the Great saying, "Everything is lost. I shall not survive the downfall of my country"; von Stein saying, "My God, here I lie prostrate while they are fighting in Poland!"; Frederick William proclaiming, "I have placed myself and my people under the honoured banner of the German Reich". Bismark prorogued the Prussian Parliament in 1863 to avoid having to get its approval for the budget, he thereby saved the state from disintegration. When the French and Belgians occupied the Ruhr in 1923, the Germans replied with passive resistance. But passive resistance also had to be broken off "if Germany as a nation and as a free republic was to be saved".

This line of argument is unlikely to influence the unconvinced. While it is no crime to be a nationalist, it is a sign of incompetence if a historian with a case fails to convey it.

The idea of this book — to inform foreigners about Germany and to make propaganda at the same time — is misconceived. There is much in German history that can interest an

ignorant foreigner. It has such a fairy tale quality. Take King Otto III, born in 980 and in his grave at twenty-two. Apparently, he became king at the age of three, defeated the Danish-Norwegian fleet at the age of fourteen and thereby established dominion over Germany, Italy and Burgundy; appointed his aunt Matilda as Governess of Germany and retired to salubrious Italy at the age of fifteen. There he helped his cousin, Bruno of Carinthia, to become Pope, and then had this twenty-four year-old Pope, Gregor V, put Charlemagne's imperial crown on his head. About this exchange of honours, Loewenstein says, "It must have been one of the great dramatic moments of history. A chiliastic fever of hope, fear and exaltation swept across the occidental world at the end of the first Christian millenium. Christ's second coming was by many held to be imminent. During this period, when people in all countries prepared themselves for the Awful Judgment, the reins of the world's government were held by two glowing youths, both filled with highest ideals and conscious of the exalted position of their respective offices. The complete harmony between the spiritual and the temporal orders must have appeared as a foreshadowing of the coming of the Kingdom." Truth here is more entertaining than fiction — if properly told.

If, however, propaganda must be made, modern Germany is a much better advertisement of itself than Germany at any other time in its history. West Germany is prosperous, powerful, democratic and also quite generous in its own penny-wise way. Some material help together with some modest self-advertisement can win it many friends. The insistence, on the other hand, that Germany's friends should share its enemies, that they must be its comrades in ideology, is the worst propaganda it could make for itself. There is something pathological about the way West Germany counts petty diplomatic victories and hectors its friends: as in our own case, this is the mark of a nation that seeks verbal consolation in its impotence against international problems.

Planned Balanced Growth vs Plan Holiday

S K Nath

It is possible for somebody who is not an anti-planner to argue that the economy at present reveals certain imbalances which are bigger than they need have been if the Third Plan been fully implemented and that they are too serious to be left to look after themselves.

To have a short spell of restoring balances when investment is largely confined to high priority projects still requires planning. Indeed, it requires more careful planning than if there had been no marked imbalances. It certainly does not call for a "plan holiday" when we just "stop for some time and think anew". This is a slogan which suits the purposes of those who would have us give up governmental guidance and planning of economic development.

CERTAIN elements in the controversy sparked off by the present economic crisis have got needlessly mixed, so that often the protagonists do not know what they are arguing about. There is no doubt that the economy today has some new economic problems, apart from those—such as population, unemployment, and insufficient food—which have been with us for a long time. The "new" economic problems (of foreign exchange gap, rising prices, idle capacity, and construction of projects behind schedule) are "new" in the sense that they have seldom been so severe before; or at least their present conglomeration is rather new.

Imbalances Must Be Corrected

Rationality demands that even those who consider that planning is essential for India's economic growth should examine if the present situation calls for any change in the programme of action for at least the immediate future. It is possible for somebody who is not an anti-planner to argue that the economy at present reveals certain imbalances which are bigger than what they need have been if the Third Plan had been fully implemented, and that they are too serious to be left to look after themselves. To argue that the immediate task should be to restore some element of balance in the economy does not amount to an argument that there are no longer-term tasks to be done. It is possible to argue for extraordinary efforts (extraordinary by the standards of our record hitherto) for producing important gains within a short time, i.e., within a year or two, in the sectors of food, cloth, edible oil, and cement (where there are particularly marked shortages); for quickly bringing to completion the projects in heavy industry, heavy electricals, chemicals and fertilisers, which have been languishing behind schedule for so long; and for taking steps to utilise the 40 per cent idle capacity in industry—it is possible to argue for all these things under our

present circumstances even though one is in favour of state planning.

But let it be said at once that there are a number of people who are arguing for the above things as well as against state planning. In fact the present imbalances are being used as evidence to show that planning does not work. These imbalances can be viewed as the result of two factors: faulty anticipation largely due to poor planning but also partly due to unavoidable uncertainty regarding future developments; and faulty implementation. Even if somebody were to argue that our planning and its implementation cannot possibly improve any further, it would not demolish the case for state planning in India. In spite of all its faults and recurrent crises of various kinds, there has been greater growth under planning than there ever was without any planning. And, in any case, there definitely is hope of improvement both in our planning techniques and in implementation. (Superficial appearances apart, even in countries where the economic problems are much simpler than ours, political parties of almost any colour—when actually in power—come to see the need for some degree of economic planning by the government.)

Shortcomings of Implementation

Shortcomings of plan implementation are illustrated by the following assortment of facts. As we all know by now, in a number of projects, construction is woefully behind schedule, so that their actual outputs in the last year of the current plan are going to be much below targets. Of finished steel, the output in 1965-66 is likely to be 5.8 million tons instead of the target of 6.8; of alloy, tool and stainless steels the output is likely to be just over half the target; of nitrogenous fertilizers the output is likely to be 500,000 instead of 800,000 tons; and of phosphatic fertilizers, only half the target. In agriculture, the Ladejinsky report, which has at last been made public, reveals the

gap between policy proclamations regarding land reform and their actual implementation, and also the distance between the intentions of the intensive package programme and its achievements.

There is, then, a genuine and widening hiatus in implementation which needs immediate attention, otherwise Plan targets and policies will cease to be taken at all seriously. And there is also real economic sense in somehow ensuring that the major part of the 40 per cent idle capacity in industry is brought into use. To the extent that the present inflationary pressures require increased supplies rather quickly, full utilization of installed capacity is an obvious way of bringing about increased supplies. Of course this requires increased maintenance imports which do compete with other imports, e.g., imports of machinery. Hence, fully utilizing the installed capacity does call for some change in priorities in the short-run; but this needs to be done within the framework of a carefully formulated Plan. If full utilization of the installed capacity in a non-essential industry competes with the import of machinery for new capacity in an essential industry, then the former needs to be rejected in favour of the latter. It may be that this is an artificial example; but whether there are any such conflicts or not can only be discovered if there is systematic planning.

Case for a Sub-Plan

To have a short spell of restoring balances during a period of consolidation in which investment is largely confined to high priority projects still requires planning—indeed it requires more careful planning than if there had been no marked imbalances—but it definitely does not require a period in which we just "stop for some time and think anew". The latter is a slogan which can in principle nicely fit those who would have us give up gov-

ernmental guidance and planning of economic development; while the former cannot. A 'plan holiday' is in fact the thin end of the wedge which the anti-planners might use. Yet, those who consider state planning essential, need not deny the need for some change in the emphases and strategy for the next year or two, and for a fundamental change in the character of implementation. (Similarly, though some of those who argue against controls also argue against planning, there is no reason why the supporters of planning should not want to modify any controls which do not serve the planned objectives. See in this connection, the report of the Committee on Steel Control.)

But what about the size of the Fourth Plan? Surely the controversy about the size of the Plan is premature? If performance relating to the short-term targets of the next Plan is worse than our recent general performance, then even the reduced size which some people recommend at present may prove too large; on the other hand, if the next two years see the long-awaited burst of energy on various fronts, it may then well be possible to raise our sights even higher than the present larger size and its accompanying targets. Isn't there then a lot to be said for leaving for the moment the Fourth Plan size and targets as they are, and formulating an eighteen-month sub-Plan for its first phase, in which, for once, an effort will be made to overfulfill all targets? The suitable ultimate size, and the ultimate specific targets, of the Plan can then be reviewed at the end of that period.

Imperial Tobacco Pays More

A **SIZABLE** rise in earnings has enabled Imperial Tobacco Company of India to lift the total dividend for the year, ended March 1965 by two and a half points to nine per cent, with a final of four per cent. This level compares with that of two years before. Brief preliminary results show net profit at Rs 157.60 lakhs against Rs 94.92 lakhs a year before, after deducting all charges and expenses, providing for taxation a higher amount of Rs 266.61 lakhs (Rs 187.46 lakhs) and transferring Rs 4.47 lakhs (Rs 4.33 lakhs) to development rebate reserve. The directors also intend to declare a first interim dividend of 2.5 per cent for the current year.

MORE FOREIGN EXCHANGE FOR THE NATIONAL PLAN...

Foreign Capital Requirements in India's Perspective Planning

Arjun Sengupta

The desire to be free from dependence on foreign capital at an early date will be shared by most Indians. But it is not certain that every one of us is aware of its implications.

According to the Planning Commission's perspective plan it is expected that by 1975 the economic structure of the country will be radically transformed and we will be firmly set on the path of self-sustained economic growth, completely independent of foreign capital.

By independence from foreign capital what is meant is that after 1975 there will be no increase in our foreign liabilities, that further inflow of foreign funds will not be needed. By that time we shall have enlarged our domestic resources sufficiently so that after meeting the increased needs of consumption at home and the rate of investment required to maintain a stipulated rate of growth, enough will be left to pay for amortisation, interest and dividend to foreigners for their past contributions of capital. In other words, it is claimed that domestic savings will exceed the required investment by an amount at least equal to the service payments on all forms of foreign capital coming to India until 1975.

It is proposed here to examine this claim.

IT has been solemnly proclaimed in responsible quarters that our country has a "date with destiny" in 1975. By that date, it is asserted with laudable optimism, the economic structure of our country will be radically transformed and we shall be firmly set on the path of self-sustained economic growth. Among many highly desirable things that will happen to us by that time, one is that we shall become independent of foreign capital.

Presumably, this independence from foreign capital does not imply that we shall be free from all foreign liabilities. To the extent foreign capital comes to us in the form of private investment, they will remain as that in periods beyond 1975 and a part of our resources will continue to flow out every year as dividend payments to foreigners, and occasional repatriation of capital. In addition to this, a substantial part of foreign loans will not be liquidated by that time, and we have to provide every year funds for amortisation and interest payments abroad for many years to come. All that is meant by independence from foreign capital is that after 1975 there will be no increase in our foreign liability, that we shall be free from the need for further inflow of foreign funds. By that time we shall have enlarged our domestic resources sufficiently, so that after meeting the increasing needs of consumption at home and the rate of investment required to maintain a stipulated rate of growth, enough will be left out of those resources to pay for the amortisation, interest and dividends to foreigners for their past contribution of capital. In other words, domestic savings will

exceed the required investments by an amount at least equal to the service payments on all forms of foreign capital coming to India until 1975.

I examine this claim somewhat closely in this paper. The desire to be free from foreign capital at an early date is a sentiment that will definitely be shared by most Indians. But I am not sure if everyone of us is aware of its implications. One may suggest that our development potentialities are such that the need for fresh inflow of foreign funds will disappear by 1975 as a matter of course. Otherwise, we may introduce this terminal date as a policy decision and plan our developmental activity in accordance with that. In either case this has certain definite implications in terms of the magnitudes of efforts or sacrifices that will be expected of us during this period. It is only after an assessment of these magnitudes that we shall be able to decide if our aspirations have parted too much from reality or we are prepared for the task and can take the appropriate policies.

In Section I, I shall give the results of an application to Indian data of some methods that I have developed and which are presented in Section II. In Section II, I shall discuss some general issues relevant to the question and the methods of making quantitative assessment of its implications. I have made use of very simple algebraic formulas which can be easily derived by extending the Harrod-Domar formulas to allow for the effect of foreign capital*. This kind of aggregate approach, with an implicit assumption that all other relevant variables some-

how get adjusted to each other behind the scene, can only give an overall view. But this is justified for the simple reason that any plan must at least be consistent at the aggregate level and the implications of such aggregate model are the minimum that must be taken note of.

II

Before proceeding with the application to any concrete situation of the methods to be outlined in the next section for estimating foreign capital requirements, I should underline their aggregative nature. All the aggregative magnitudes involved here are in fact summaries of the corresponding detailed magnitudes of a long run plan, and the consistency of these magnitudes is only a check for the internal consistency of the detailed plan. Further, estimating foreign capital requirements is only a part of the overall plan and depends very much upon the consistency and accuracy of other parts of the plan.

This is the reason why the exercise in this section will be confined only to the Perspective Plan for India for 1960-61 to 1975-76, prepared by the PPD. The assumption is that all other parts of the perspective plan are correct and consistent. I shall only examine the implications of the assumption made by the PPD that by 1975-76 no foreign capital inflow will be necessary, in the sense of finding out what are the consistent values of the different magnitudes, if the PPD claim is borne out in practice. Further, starting from the initial values of the different variables as given by PPD, I shall try to indicate the number of years required

to attain self-sufficiency consistent with different assumptions about several intensive magnitudes. Since this exercise is concerned with the PPD plan only, I have chosen to stick to the PPD figures for the initial year 1960-61. Since estimates of foreign capital requirements must be consistent with the overall plan, they must be based on the initial year values of the same plan.

The PPD claims that the main role of external assistance "will primarily be to fill the gap in the balance of payments rather than to supplement domestic savings." One gets the impression from the context that by external assistance it is meant all types of foreign capital. So foreign capital is viewed mainly as an instrument for covering the foreign exchange gap, but when it is claimed that by 1975-76 inflow of foreign capital will be nil, it also implies that by that period sufficient domestic savings will be generated to eliminate the savings-investment gap.

The PPD projection of exports for 1975-76 of Rs 1624 crores exceeds the projection of imports, excluding invisible, for that year of Rs 1610 crores. For the purpose of the present paper I shall assume that these projections are correct. But it should be noted that the import figures of the PPD can very well be regarded as the minimum import requirements according to our terminology. The PPD itself claims that "as the proportion of luxury items and otherwise dispensable goods is small in our imports, the scope for effecting any substantial saving of foreign exchange by curtailing imports of unessential goods is very limited." It also observes that "it will be unsafe to provide for imports of commodities of value less than Rs 1350 crores in 1970-71 and Rs 1600 crores in 1975-76 in the context of a growth of industrial production of the order of 10 per cent per year."

In fact, total imports to increase from Rs 1120 crores in 1960-61 to only Rs 1600 crores in 1975-76 when national income is expected to increase from Rs 14140 crores to about Rs 37300 crores during this period would require a tremendous amount of effort and import substitution especially in metals, machinery and chemical industries. The PPD programme envisages a fall in the proportion of imports to national income from about 8 per cent in 1960-61 to a little over

4 per cent in 1975-76 and for all practical reasons this can be regarded as the bare minimum level of imports that has to be financed.

This minimum nature of import requirements has to be emphasised if only to point out how much weight the PPD projections for our exports will have to bear if foreign capital requirement is to become nil by 1975-76 to cover the export-import gap. The PPD export projections are highly optimistic. Total exports are expected to increase from about Rs 672 crores in 1961-62 to about Rs 1225 crores in 1970-71 and further to Rs 1624 crores in 1975-76. Agriculture and animal base exports which accounted for more than three-fourths of our export earnings in 1961-62 would increase from about Rs 509 crores in that year to about Rs 722 crores by 1970-71 (a rate of growth of about 4 per cent per year), and to Rs 863 crores by 1975-76 increasing at a rate of about 3.6 per cent for these last 5 years. The proportion of the contribution of this group of products would fall to about 52 per cent in 1975-76. But exports of manufactured goods would increase from Rs 60 crores in 1961-62 to Rs 276 crores by 1970-71 and to Rs 484 crores by 1975-76. The rate of growth of exports of these items is expected to be 18.5 per cent between 1970-71 and about 12 per cent between 1970-71 and 1975-76. The expected growth of exports of mineral ores is no less optimistic. From Rs 40 crores in 1961-62, they are expected to rise at the rate of 17.5 per cent per year to Rs 171 crores in 1970-71 and then at the rate of about 6 per cent per year to Rs 230 crores in 1975-76. All these projections are obviously very optimistic—and although it is not within the scope of this paper to examine these projections, it seems reasonable to harbour some doubts about them. And to the extent these estimates are subject to doubts, the claim that exports will be enough to finance the minimum import requirements by 1975-76 is not quite tenable.

It may be noted that the estimates for imports here do not include net invisibles which continue to be a net drain on the country's foreign exchange resources. In 1975-76 the deficit in net invisible account is expected to be of the order of Rs 90 crores. The net investment income which has to be remitted abroad has been very conservatively estimated at Rs 246

crores in that year. The deficit has been reduced by highly optimistic estimates of net receipts on account of foreign travel transport and private donations.

In any case, since it is not the purpose of the paper to examine in detail the claim that foreign exchange gap will be eliminated by 1975-76, we shall accept all these projections as correct and concentrate on the savings-investment gap. To simplify matters, I shall assume that this savings-investment gap is covered by foreign capital coming in in the form of grants only. This is obviously unrealistic but such an exercise is justified by the fact that this gives the minimum that will be required, the minimum number of years that will be needed to attain independence from foreign capital.

Foreign capital will naturally come in the form of a mixed bag. There will be some grants in it, but there will also be a substantial amount of foreign direct investment as well as different kinds of loans capital, all entailing definite repayment obligations. It is almost impossible to predict the exact weights of the different kinds of foreign capital in the total inflow in the future, nor is it easy to estimate the repayment obligation. The returns on direct investment even of the past is very difficult to assess and it is even more difficult to project for the future. The terms of loan capital vary widely as between different types of loans and different sources of them. There is a marked tendency in the world today for loan terms becoming easier for the underdeveloped countries, especially after the IDA has come into operation. But there is no certainty that this trend will continue, or India will benefit much from this for a long period. But to the extent these repayment obligations are there, they would detract from the foreign exchange available. In addition to this, there will remain payment obligations of incomes on past investment so that even if all future foreign capital flows in as grants, all of it will not be available to cover the savings-investment gap. As a result of all these, the year of independence for our foreign capital will only recede in the future. So to repeat, the value of 'n' (the year when independence from foreign capital is achieved) obtained by treating all foreign capital inflows as grants will only be the minimum, which all possible realistic values of 'n' will surely exceed.

The PPD figures for the base year, 1960-61, are given below:

	(thousand millions)
GNP at market prices	Rs 159.4
Gross capital formation	Rs 21.0
Public consumption	Rs 11.6
Private consumption	Rs 132.0
Gross domestic savings	Rs 15.8
Net inflow of foreign assistance	Rs 5.2

Gross domestic savings as a percentage of GNP = 9.9 per cent.

This rate of gross domestic savings is naturally higher than the rate of net domestic savings as a proportion of national income.

The rate of growth in the perspective plan for the period 1960-61 to 1975-76 is expected to be 6.6 per cent per year. The following table gives the consistent values of gross marginal capital-output ratio and the marginal rate of savings if, in accordance with the perspective plan, the country becomes self-supporting after 15 years (n = year of independence from foreign capital = 15).

Table 1

Gross Capital- Output Ratio (K)	Marginal Rate of Saving (s)
2.5	21.5%
3.0	27.0%
3.5	32.4%
4	37.9%

Table 2 gives different values of the year of independence for different values of the marginal rate of savings and marginal capital-output ratios.

Table 2

K/s	r = 6.6			
	.20	.25	.30	.35
2.5	19.5	10.0	7.5	5.2
3.0	—	18.8	12.3	8.4
3.5	—	43.1	19.2	12.6
4.0	—	—	32.6	18.3

Independent estimates of marginal gross capital-output ratios or of marginal gross rate of savings of the recent past are not available so that one can form some judgment about the plausibility of some of the figures for the future. For this reason Table 3 and 4 give alternative figures for the consistent values of marginal net capital-output ratio and marginal net rate of savings and the number of years required to attain self-sufficiency,

although such netting involves the arbitrariness about using depreciation figures. The PPD figures for 1960-61 for net national product at factor cost or national income is Rs 141.4 (,000 millions), total net investment is Rs 16.2 (,000 millions), net foreign inflow, as before, Rs 5.2 (,000 millions) and net domestic savings Rs 11.0 (,000 millions). This gives the initial rate of savings = 7.8 per cent. The PPD figure for the rate of growth of national income is 6.6 per cent per year between 1960-75. Tables 3 and 4 are based on these figures.

Table 3

Consistent values of K and s with
 $n = 15$
 $r = 6.6\%$

K	s
2.5	22.1%
3.0	27.3%
3.5	32.6%
4.0	38.0%

Table 4

Value of n with $r = 6.6\%$

K/s	.20	.25	.30	.35
2.5	20.0	11.2	7.8	6.1
3.0	64.3	18.7	12.2	9.1
3.5	—	34.5	18.3	12.9
4.0	—	—	28.5	17.7

Independent estimates of marginal net capital output ratios and marginal net rate of savings are available in RBI Bulletin of March 1965. One should of course note that there is substantial difference in the estimates of savings and capital formation of the PPD and the RBI but the RBI figures would give some broad order of magnitudes which would enable us to form some judgment about the plausible values of different variables.

The RBI figures for the marginal capital output ratio for the period 1956-57 to 1958-59 is 4.21 and for the period 1959-60 to 1962-63 is 3.91. Alternatively for the entire Second Plan period, the RBI estimate for the marginal capital output ratio is 3.86 and for the first two years of the Third Plan (1961-62 and 1962-63) it is 3.53. As mentioned above, the marginal capital-output ratios are all intensive magnitudes, they emerge out of productive operation in different units and there is no reason for their taking one particular value rather than another. But it is difficult to think that the productivity of investment will increase so much that there will be a declining trend in this ratio

in the near future. On the average, I would venture to presume that the marginal capital output ratio over the period 1960-75, will not probably fall below 3.5, or more definitely not below 3.0.

The RBI estimate for the aggregate marginal savings rate for 1956-57 to 1958-59 is only 10.7 per cent and for 1959-60 to 1962-63 is only 19 per cent. Alternatively, for the entire Second Plan the marginal rate of savings was estimated to be 18.9 per cent while for 1961-62 and 1962-63 it was only 14.6 per cent. Allowing for this under-estimation of the RBI, if we assume that the marginal rate of saving will be around 20 per cent on the average for the coming years, it will be seen that with a marginal capital output ratio of 3.0, we will need 64 years to be self-supporting. If we assumed an average marginal rate of savings of 25 per cent per year, it will take 19 years with an average marginal capital output ratio of 3.0, and about 35 years with an average marginal capital output ratio of 3.5 to attain independence from foreign capital.

Finally, one should note that all these figures are purely illustrative and I do not want to attach much predictive significance to any of these values. One should also remember that these calculations do not include repayment of investment incomes abroad. But I believe I may with some reason claim, from Tables 1 and 3, that if we want to be free from dependence on foreign capital by 1975-76, we should be able to generate a marginal rate of savings of at least 27 to 30 per cent in the coming years. This is on the average for the whole period of the Third, Fourth and Fifth Plans, and if our performance upto now has been much lower than this, we have to aim at a much higher ratio for the remaining years of this period.

[II]

At any point of time, the total amount of resources available to a country which it can consume and devote to (gross) investment or use for exports is equal to the country's gross national product plus its imports, where exports and imports refer to the credit and debit items of the current accounts of the country's balance of payments. It follows from this identity that at any time, the difference between a country's gross investments and gross domestic savings is necessarily equal to the difference between

Alvars MG 1913

its imports and exports. So, a country can invest more than it can save, and thus achieve a growth rate higher than that determined by its domestic savings rate, if it could import more than its exports by the same amount. This will naturally depend upon how it finances the import-surplus.

A justifiable assumption to make here is that over a long period an underdeveloped country should not depend upon the depletion of foreign exchange resources or selling gold to finance such import-surplus. In that case, a net inflow of foreign capital remains the only offsetting item in the balance of payments to finance the deficit in the current account.

With this assumption, the role of foreign capital in a growing economy becomes clear. A given amount of foreign capital can finance an equal amount of import-surplus of the capital-receiving country and also allow its investment to exceed its domestic saving by the same amount, that is,

$$I_t - S_t = M_t - X_t = F_t \dots\dots\dots (1)$$

where the variables refer to gross investment, gross domestic savings, imports, exports and net inflow of foreign capital at time 't' respectively.

If gross incremental capital-output ratio is denoted by k , and the rate of growth of GNP by r , then

$$I_t = k \cdot r \cdot Y_t \dots\dots\dots (2)$$

where $Y_t =$ GNP at time t .

The rate of savings is expected to rise over time. Let s_0 be the average rate of savings at the initial period and s , the incremental savings rate and assume the savings function to be of the form,

$$S_t = s_0 Y_0 + s (Y_t - Y_0) = (s_0 - s) Y_0 + s Y_t \dots\dots\dots (3)$$

Then using relation (1), we get

$$\left. \begin{aligned} k_r Y_t - [(s_0 - s) Y_0 + s Y_t] &= F_t \\ \text{or } (k_r - s) Y_t + (s - s_0) Y_0 &= F_t \end{aligned} \right\} \dots\dots\dots (4)$$

$$\text{or } R = 1/k \left[\frac{(s_0 - s) Y_0}{Y_t} + s + \frac{F_t}{Y_t} \right] \dots\dots\dots (5)$$

These give us a unique relationship between the rate of growth r and the net inflow of foreign capital. Given the incremental capital output ratio, marginal rate of savings, average savings rate at the initial period and the initial and the current level of GNP we can obtain the net inflow of foreign capital received to achieve a target rate of growth, or what rate of growth can be achieved with a given inflow of foreign capital. Note also $\frac{dR}{dF} > 0$,

or a larger inflow of foreign capital can achieve a higher rate of growth.

This way of looking at the relationship between foreign capital and the rate of growth of GNP implies that every year the import-surplus somehow gets adjusted to the net inflow of foreign funds. Total imports become automatically equal to the two exogenous variables X_t and F_t and the growth rate entirely depends on how far F_t can eliminate the bottleneck of the low rate of domestic savings. But imports may not be so freely adjustable in the underdeveloped country and a more realistic model should contain some additional constraints in the form of some kind of import bottlenecks.

For instance, one may assume that there is a rigid relation between the minimum level of imports required and the level of GNP. In that case a given amount of foreign capital by financing a rate of investment in excess of domestic savings may not achieve an increase in income, as determined by the capital output ratio, if the maximum level of imports corresponding to the increased level of income exceeds the exports by more than the given inflow of foreign capital. Alternatively, one might suggest that there is a minimum proportion of investment expenditure which must be spent on imports. In that case the rate of growth determined, *ceteris paribus*, by a rate of investment corresponding to a given inflow of foreign capital may not be achieved if the minimum imports out of that investment expenditure exceed the exports by more than the given inflow of foreign capital.

In either case the condition for a given amount of foreign capital inflow to achieve a rate of growth of income determined by the amount of savings investment gap it can finance, is that $M \leq X + F$, where M stands for the minimum level of imports. If this condition is not fulfilled, there will be two operative constraints on the level of income and its growth. The solution of the system then will depend upon whichever constraint is more restrictive, i.e. whichever gives the minimum solution.

Bruno and Chenery in their model for the Israeli economy introduced a variant of the first kind of import restriction mentioned above and estimated the import requirements from the solutions of an input-output model under some strict assumptions. They observed that at lower levels of GNP

the import bottleneck is more restrictive than the savings bottleneck. Their method can be described in a simplified form in the following way. Let the import minimum

$$M = m' (C + I + X)$$

Where C is private and public consumption. The GNP is defined as:

$$Y = C + I + X - M = (I - m') (C + I + X)$$

Then from the equation

$$M = X + F$$

We get

$$\frac{m'}{1 - m'} \cdot Y_t = Y_t + F_t$$

$$\text{or } Y_t = \left(\frac{1 - m'}{m'} \right) (X_t + F_t)$$

which gives a relationship between GNP and foreign capital.

The alternative method of introducing this import restriction, in the form of some minimum developmental imports being a fixed proportion of gross investment, seems to me to be somewhat more realistic than the Bruno-Chenery method. In a planned economy, where the Government can effectively use fiscal, monetary and other kind of quantitative controls, the relative prices, the exchange rate and import-substitution, at least in consumption, are very much dependent on policy decisions and it is difficult to conceive of a minimum import requirement as a given proportion of GNP or total private and public consumption expenditure. On the other hand the proportions of gross investment to be spent on developmental imports will depend very much upon technological relationships. Gross investment here is the required investment corresponding to a target rate of growth and the overall incremental capital-output ratio is a summary of the detailed capital requirements of all the different projects which have to be carried out to achieve that rate of growth. If there is little technological substitutability between different kinds of capital goods in any of these projects, it is possible to calculate the amount of capital goods that have to be imported for any level of required investment from the expected availabilities of these goods within the economy.

Let m_t be the proportion of required investment which is the minimum that must be spent on imports. Then, from equation (2), we get

$$M_t = m_t I_t = m_t k \cdot r \cdot Y_t \dots\dots\dots (6)$$

The condition $M_t \leq X_t + F_t$ gives us

$$m_t k \cdot r \cdot Y_t \leq Y_t + F_t$$

or

$$r \leq \frac{1}{m_t k} \left(\frac{X_t}{Y_t} + \frac{F_t}{Y_t} \right) \dots (7)$$

This relation gives the upperbound to the rate of growth of GNP that can be achieved in this system. A net inflow of foreign capital, by covering the savings-investment gap, as in equation (5), cannot achieve a rate of growth which is higher than

$$\frac{1}{m_t k} \left(\frac{X_t}{Y_t} + \frac{F_t}{Y_t} \right).$$

The rate of growth can be equal to it, when the savings-investment gap is exactly equal to the gap between exports and the minimum imports, or it can be less, when the economy is able to import more than the minimum.

It can also be seen that this upperbound or the import constraint on the rate of growth becomes less and less restrictive as time goes on. If exports increase at a faster rate than GNP then even if foreign capital inflow tapers off this will not offset the effects of increasing exports as it is normally only a fraction of total exports. Further, there is every reason to expect that m_t will decline over time, as with the rising GNP, more and more of different kinds of capital goods will be produced domestically. Thus, in the long run the savings — investment gap will determine the effect of foreign capital on the rate of growth, although in the early phase of development the import constraint may be more important.

From the relation (7) it is possible to calculate the number of years after which the minimum import-requirements can be fully financed by the country's exports without being supplemented by foreign capital. Let n be the year when such independence from foreign capital is achieved. Then

$$M_n = X_n$$

$$\text{or } m_n k r Y_n = X_n$$

Assuming a constant rate of growth over time in GNP and exports, we get $m_n k r Y_0 (1+r)^n = X_0 (1+e)^n$

$$\text{or } \frac{(1+r)^n}{(1+e)^n} = \frac{1}{m_n k r} \cdot \frac{X_0}{Y_0} \dots (8)$$

from which the value of n can be obtained.

It should be clear from the above discussion that this n need not be equal to the n obtained from the relation (4). The latter gives the number of years after which the country will generate enough domestic savings to finance the investments required to attain a given rate of

growth without depending on foreign capital. This can be obtained from the relation (4) in the following way:

The relation (4)

$$(kr-s) Y_t + (s-s_0) Y_0 = F_t$$

becomes in the n th year when $F_n = 0$

$$(kr-s) Y_n + (s-s_0) Y_0 = 0$$

$$\text{or } Y_n = \frac{s-s_0}{s-k} \cdot Y_0$$

Since $Y_n = Y_0 (1+r)^n$, we get

$$(1+r)^n = \frac{s-s_0}{s-k} \dots (9)$$

from which the value of n can be obtained.

It is obvious from all this that the essential condition for the country's becoming independent from foreign capital at a future date is that $s > k \cdot r$ or the marginal rate of savings should exceed the required rate of investment. Further, smaller will be the value of n , i.e. earlier will be the year of such self-sufficiency, the bigger the difference between the marginal rate of savings and the required investment and the higher the value of the initial rate of savings (s_0).

Until now, no reference has been made to the problem of repayment and servicing of foreign capital. Unless foreign capital comes purely in the form of grants and donations, funds will have to be provided every year for dividend or interest and amortisation payments. This implies that there will be an annual drain from the country's domestic savings as well as from its foreign exchange earnings an amount equal to the payment of investment and amortisation abroad. Since the minimum import requirements, considered above have been made to depend either only on the rate of investment or on domestic expenditures, this drain in foreign exchange and domestic savings which any foreign capital inflow other than grants necessarily entails has to be explicitly taken into account in the equation of foreign capital requirement.

Before we introduce this factor, it should be clear that the relations (4), (5), and (9) all refer to the case of foreign capital inflow purely in the form of grants. No repayment obligation is attached to them, and after the n th year that is, the year of independence from foreign capital is reached, the country's domestic savings will exceed the required investment rate. In that case, if the same rate of growth is maintained, the country will have to export capital

abroad. Otherwise the country's rate of growth will have to increase every year so that the rate of investment required to achieve the higher rate of growth is equal to the increasing domestic savings. The model then will look like a simple Harrod-Domar system.

$$I_t = S_t$$

$$\text{or } k r_t Y_t = (s-s_0) Y_0 + s Y_t$$

$$\text{or } r_t = 1/k \cdot s - 1/k (s-s_0) \frac{Y_0}{Y_t}$$

This increasing rate of growth will approach, as time passes, $\frac{s}{k}$ for the

$$\text{expression } 1/k (s-s_0) \frac{Y_0}{Y_t}$$

will become smaller and smaller.

I shall consider in the following two types of foreign capital inflow which have some form of repayment obligation attached to them. In case A, I shall consider the case of direct foreign investment which entails an obligation of payments of dividend income abroad but no repayment of capital. There may be some repatriation of direct/foreign investment every year, but since this is not necessarily related to the past inflow, it will not be explicitly introduced in the system. As the foreign capital inflow figures are netted against outflows, such repatriations will be reflected in the size of the foreign capital. In case B, I shall consider the case of foreign loan capital which has an obligation of a series of interest and amortisation payments abroad for a stipulated period attached to it. The important difference between foreign loan capital and foreign direct investment is that the former liability is totally liquidated after a stipulated period while even when no net direct investment is flowing in, the country has to provide for dividend payments abroad for an indefinite period.

Case A

Here, let us suppose that all foreign capital is coming in the form of direct investment. The required amount of foreign capital is no longer simply the difference between the required rate of investment, to achieve a target rate of growth, and the rate of savings. Funds have to be provided in foreign exchange every year to pay for the dividends on the past foreign investments and the amount of foreign capital required every year will be equal to the gap, between the required investment plus such dividend payments and domestic savings. If D_0 is the accumulated foreign investments

at the initial year and i , the average rate of dividends to be paid on the j th year's inflow of direct investment, then foreign capital required at n th period will be

$$F_n = I_n - S_n + i_0 D_0 + \sum_{j=1}^{n-1} i_j F_j$$

For simplicity assume a constant average rate of dividends over time, equal to i , — though it is obvious that F_n could be determined if i_j 's could be estimated correctly for the different years.

Then we obtain,

$$F_n = I_n - S_n + i D_0 + i \sum_{j=1}^{n-1} F_j$$

This can be expanded as follows:

$$\begin{aligned} F_n &= I_n - S_n + i D_0 + i \sum_{j=1}^{n-1} F_j \\ &= I_n - S_n + i D_0 \\ &\quad + i \left[I_{n-1} - S_{n-1} + i D_0 + i \sum_{j=1}^{n-2} F_j \right] + i \sum_{j=1}^{n-2} F_j \\ &= I_n - S_n + i D_0 \\ &\quad + i \left[I_{n-1} - S_{n-1} \right] + i^2 D_0 \\ &\quad + i \left(1+i \right) \sum_{j=1}^{n-2} F_j \\ &= I_n - S_n + i D_0 \\ &\quad + i (I_{n-1} - S_{n-1}) + i^2 D_0 \\ &\quad + i (1+i) (I_{n-2} - S_{n-2}) + i^2 (1+i) D_0 \\ &\quad + i (1+i)^2 \sum_{j=1}^{n-3} F_j \\ &= I_n - S_n + i D_0 \\ &\quad + i (I_{n-1} - S_{n-1}) + i^2 D_0 \\ &\quad + i (1+i) (I_{n-2} - S_{n-2}) + i^2 (1+i) D_0 \\ &\quad + i (1+i)^2 (I_{n-3} - S_{n-3}) + i^2 (1+i)^2 D_0 \\ &\quad + i (1+i)^3 \sum_{j=1}^{n-4} F_j \\ &\dots \dots \dots \end{aligned}$$

$$\begin{aligned} &= \left[(I_n - S_n) + i (I_{n-1} - S_{n-1}) + i (1+i) (I_{n-2} - S_{n-2}) \right. \\ &\quad \left. + i (1+i)^2 (I_{n-3} - S_{n-3}) + \dots \dots \dots \right. \\ &\quad \left. + i (1+i)^{n-2} (I_1 - S_1) \right] \\ &\quad + i D_0 (1+i)^{n-1} \dots \dots \dots 10 \end{aligned}$$

Assuming a constant rate of growth ($r \neq i$), we can use the relations

$$I_n = k r Y_0 (1+r)^n$$

$$S_n = Y_0 (s_0 - s) + Y_0 s (1+r)^n$$

$$\text{from (2) and (3) as } Y_n = Y_0 (1+r)^n$$

$$\text{Then, } I_n - S_n = (kr - S) Y_0 (1+r)^n - Y_0 (s_0 - s)$$

Putting $n=n, n-1, n-2, \dots, 1$ we get from (10)

$$\begin{aligned} F_n &= (kr-s) Y_0 \left[(1+r)^n + i (1+r)^{n-1} + i (1+r)^{n-2} \right. \\ &\quad \left. + \dots + i (1+i)^{n-2} (1+r) \right] \\ &\quad - (s_0-s) Y_0 \left[1 + i (1+i) + \dots + i (1+i)^{n-2} \right] + i D_0 (1+i)^{n-1} \end{aligned}$$

$$\text{or } F_n = (kr-s) Y_0 (1+r)$$

$$\begin{aligned} &\left[i \frac{(1+i)^{n-1} - (1+r)^{n-1}}{i-r} \right] \\ &+ Y_0 (s-s_0) (1+i)^{n-1} + i D_0 \end{aligned} \dots (11)$$

From this relation, by putting $F_n = 0$, one is able to determine the number of years after which no fresh inflow of foreign capital, all coming in the form of direct investment is required to maintain a given rate of growth.

As before, this essential condition for independence from foreign capital at a future date is $s > Kr$ or the marginal rate of savings should exceed the rate of investment required. But the period taken to achieve this independence will obviously be longer than in the case of grants. The pure savings-investment gap will be covered at a relatively early period, but inflows of foreign capital will continue to be required as domestic savings will not be sufficient to pay for dividends on the accumulated investment. Only, at the year of independence, domestic savings will be enough to meet the needs for the required investment as well dividend payments. But, as mentioned earlier, this does not mean that after the year n , all domestic savings can be invested. A sum of

$$\left[i \sum_{j=1}^{n-1} F_j + i D_0 \right], \text{ will have to}$$

be paid continuously, if no capital is repatriated and only the amount of savings in excess of this sum can be invested. So, after the year the rate of growth will start rising, as in the case of grants, but at a much slower rate.

Case B

In the case of foreign loan capital payment obligations abroad include in addition to interest payments every year amortisation payments for every loan. The exact time profile of such payments will depend upon the arrangements for amortisation and

interest payments for different kinds of loans. Interest and amortisation can be charged on the net debt outstanding, in which case loans are not completely liquidated but the unliquidated balance of each loan becomes smaller and smaller every year. On the other hand while interest is charged on the net debt outstanding, yearly amortisation may be 1/T of the original value of each loan for T periods. Alternatively, the equal instalment method may be followed, when amortisation and interest on each loan are paid off in a series of equal annual instalments.

There may be several other ways of charging interest and amortisation on different kinds of loans, and in any particular year the total amount of foreign loan will be composed of several kinds of loans subject to different methods of charging interest and amortisation rates. Quite often some kind of "grace period" is attached to official loans when the interest and/or amortisation payments do not begin till some years after the loans are granted.

I shall consider here only the equal instalment method which is probably the most commonly used method for different kinds of official loans. It is also easily comparable to the earlier results and can highlight the issues involved in any such illustration. According to this method, if F is the amount equal to a F will be repaid every year, from one year after the loan is granted, for a period of T years to pay off both the principal and the interest on such loan. This 'a' can be called the rate of servicing of foreign loans. The stream of annual payments is like an annuity, the present discounted value of which is equal to the original value of the foreign loan.

If $v = 1 + i$, where i is the rate of interest, using the standard formula for the present value of an annuity, we get

$$F = \frac{aF(vT-1)}{vT(v-1)}$$

From this, we get the rate of servicing

$$a = \frac{vT(v-1)}{vT-1} \dots (12)$$

Note that the value of 'a' depends only on the rate of interest and the period of loan T. If i is given, then a will be larger, smaller the value of T. The grace period can be easily accommodated within this formula. Suppose a loan is granted for 40 years of which for the first ten years no

payment is involved and the principal and interest are paid off in equal instalments in the remaining 30 years.

Then a will be equal to $\frac{v^{30}(v-1)}{v^{30}-1}$ but the annual payments will be for the last 30 years equal to aFv^{10} .

Let us assume that all foreign loans are given for a period of T years and the rate of interest i is the same for all loans and over time. Even then the estimation of foreign capital requirements in this case is quite complicated. We have to consider explicitly the fact that after every $T + j$ year, the j 'th year's foreign loan is completely liquidated and no more repayment obligation is involved for this. Consider this following sequence.

$$F_1 = I_1 - S_1 + a(F_0 + F_{-1} + F_{-2} + \dots + F_{-(T-1)})$$

$$F_2 = I_2 - S_2 + a(F_1 + F_0 + F_{-1} + \dots + F_{-(T-2)})$$

$$F_T = I_T - S_T + a(F_{T-1} + F_{T-2} + \dots + F_0)$$

$$F_{T+1} = I_{T+1} - S_{T+1} + a(F_T + F_{T-1} + \dots + F_1)$$

which can be generalised in the formula:

$$F_n = I_n - S_n + a \sum_{j=1}^{n-1} F_j \dots (13)$$

Now, if this time profile of all the foreign loans previous to the initial period $j = 1$ are known, or if the investment, savings and growth relationship can be projected backwards, the system can still be solved. Since our purpose is mainly illustrative, we can simplify by assuming that no foreign loan was outstanding at the initial period and F_0 is simply equal to $(I_1 - S_1)$. If, in addition to this we assume $T > n$, then our equation (13) becomes:

$$F_n = I_n - S_n + a \sum_{j=1}^{n-1} F_j \dots (14)$$

which is comparable to the earlier relation (10), of the case of direct investment, with $D_0 = 0$, and a replacing i . The solution for this will be:

$$F_n = (kr - s) Y_0 (1 + r) \left[\frac{a(1+a)^{n-1} - r(1+r)^{n-1}}{a-r} \right] + Y_0 (s - s_0) (1 + a)^{n-1} \dots (15)$$

From this, the value of n , the year of independence when $F_n = 0$, can be calculated.

An important distinction between foreign loan and foreign direct investment is that although after the year

of independence the entire amount of domestic savings cannot immediately be channelled into investment, the amount of the drain of resources on account of service charges on foreign loans will be declining until the year $n + T - 1$, after which no more service charges will be required. Thus in the case of foreign loans between the years n and $n + T - 1$ the rate of growth of the economy will be increasing at a slower rate than in the case of grants but at a faster rate than in the case of direct investment. But after $n + T - 1$ years, the rate

of growth will be similar for both the cases of foreign loans and foreign grants.

The Agricultural Prices Commission What It Has Done and What It Could Have

Rustic

When the Agricultural Prices Commission was appointed six months ago, there was considerable scepticism about its possible usefulness. No one knew what a price policy was supposed to achieve, and no one expected that three people without any executive authority could get the government to buy, sell and build stocks that were essential to make recommended prices effective.

Now we know what the Commission regards as its task, and from its report on "Price Policy for Kharif Cereals, 1965-66" we can also have a rough idea of the competence with which it will carry it out.

THE Agricultural Prices Commission regards itself as an arbitrator in the distribution of real incomes between producers and consumers of agricultural consumer goods, mainly foodgrains. When it earlier declared minimum prices for rabi crops it explained that they were such as to give a reasonable return to an efficient farmer. While such calculations can only be crude and of limited significance, the ideal of being fair to the puritan, hard-working farmer is clear. The declared preference for stable prices is also justified on the grounds that they would make the farmer's calculations of expected profits more reliable. So the Commission will engage itself on working out prices on a cost-plus basis and collecting little bits of cost information for the purpose.

This idea of a just price is not an economic concept; but that is no condemnation of it, for economics has nothing to say on justice. Food prices are a crucial issue of urban politics, and our various governments are highly sensitive to urban pressures, so there is and will be a food price policy—one with the intention of minimising urban food prices. It will be no loss if the Commission manages to introduce some long-term consistency in the policy. The notions of the economic farmer and correct terms of trade, although they are myths, are unlikely to prove pernicious myths.

However, this price-fixing activity is likely to become a routine exercise; the Commission seems unconsciously to have turned to another task for its main business. It is made up of thinking individuals who still probably get some time to concentrate on problems; it would be impossible for them to fix Kharif prices without thinking about their implications. It is this working out of implications that is the main interest of the report on Kharif prices; and if properly done, it will be enough to justify the

existence of the Commission. Agriculture is such a bedevilled subject politically and the views one hears on it are based on such unashamed vested interests that some disinterested argument in official clothing can only improve the tone of the debate.

Inter-State Trade

The Commission is drawn to discuss two issues—those of inter-State trade and the procurement-distribution mechanism. A praiseworthy feature of the discussion is that it does not just present a case; various alternatives are presented, and the Commission gives reasons for preferring one or the other. Unfortunately, the reasons given are poor. Let us take the Commission's justification for restrictions on inter-State movement for example:

"While flow of supplies of foodgrains from surplus to deficit States is natural and desirable, it is apprehended that in a situation of shortage, entirely unregulated movement on private trade account may lead to an indiscriminate rise in prices everywhere. Moreover, as purchasing power of different regions does not necessarily match their needs, there is a possibility that surpluses of the producing regions may be moved out to such an extent that prices in those regions are pushed up to a level which would cause hardship to the vulnerable sections of the population in those regions. Hence some degree of regulation of inter-State movement of foodgrains appears to be inescapable in the present context."

Now it is as justified to say that unrestricted movement of foodgrains will lead to an indiscriminate rise in prices as that it will lead to an indiscriminate fall. Movement restrictions or their removal primarily affects relative prices. If the price-elasticity of demand for foodgrains were lower in surplus States than in deficit ones, removal of restrictions would raise the average price level; but the Commission has nowhere made this as-

sumption, let alone justified it, and it is unlikely that it even thought of it.

The welfare reason given for restrictions—that they prevent hardship to the poor in surplus areas—is equally specious, since it ignores the poor in deficit areas. There might be grounds for believing that the former poor are poorer or more vulnerable than the latter poor. The per capita availability of cereals is highest in the surplus States of Orissa and Madhya Pradesh, and it is possible that this is so because of poverty (i.e. because the poor eat relatively more cereals). So State food zones might conceivably increase the real incomes of the poorest. But the argument is very tenuous and requires a great deal of substantiation.

The Commission claims that "as a result of procurement and allocation operations of the Government, the inter-State differences in per capita availability of foodgrains have been considerably reduced". If we are to judge by the figures given by the Commission there is no substance in the claim at all. The figures relate to "coefficients of variation"; presumably what is meant is the standard deviation of observations which have been normalised in some fashion. The coefficient of variation of per capita net production of cereals in States in 1965 is given as 29.5 per cent, while the coefficients for per capita availability was 15 per cent. The fact is, however, that cereals tend to move from States with high availability to ones with low availability, and so as long as there was movement of cereals, availability would show less variation than production. If procurement and allocation operations did not lead to more equal availability than production, they would have to be regarded as highly perverse and pernicious. The coefficient for availability in 1961 to 1963 when the movement of foodgrains was relatively free was 17 per cent. It is so nearly the same as the

1965 coefficient that to argue that it fell as a result of government operations betrays statistical illiteracy. The conclusion that the Commission's figures justify is quite the contrary of the one it draws—it is that if it was the purpose of the government in introducing procurement and allocation to equalise per capita availability between States, it has signally failed in this purpose.

In fact, a suspicion of fiddling with figures cannot be avoided. Raj Krishna says in his note of dissent that "...the variation in the availability of wheat and of all cereals as between States has declined, but the variation in the availability of rice has increased in 1965 in comparison with the variation in 1961-63". It is impossible to evaluate this conclusion since the actual figures are not given; the Commission should really have given all the relevant figures that it worked out. But if Raj Krishna is right, the picture might be a very unfavourable one to State food zones. For it appears that food zones have reduced the flow of rice from surplus to deficit States, and the resulting shortfall has been made up by the issue of imported wheat to rice deficit States. This conjecture might well be wrong, but there is nothing in the Commission's report to suggest that it is.

Procurement

As regards procurement, the Commission suggests a partial levy which would bring in about 25 per cent of the marketed surplus of rice. It is essential for the government to have some assured supply of cereals to provision fair price shops, and monopoly purchase would cause much discontent among farmers. Hence the compromise of a partial levy.

In spite of the crudity of its projections, it is difficult to question the Commission's view that given the rate at which the demand for grain sold by fair price shops is growing, compulsory procurement is inescapable. But the details of its proposal are vague. The levy might be imposed either on producers or on millers. Theoretically, a levy on millers should be easier to administer; but the actual results of such levies have been disappointing.

If the levy is to be imposed on farmers, the question of its base is important. A levy on production would be difficult to assess, and a levy on sales even more so. The easiest levy to work would be one

based on area with some adjustments for fertility perhaps. Its estimation would follow the same principles as land revenue. However, the economics of such a levy needs to be explored very fully. Should it apply only to land under cereals or to all land? Should compensation for the procured grain be given entirely in money or partly in kind? What element of taxation should there be in the prices paid? These questions need to be raised and answered—answered with imagination, intelligence and daring.

Piecemeal Approach

The most important contribution of the report is to emphasise that the provision of towns through fair price shops necessarily entails compulsory procurement, and that procurement must be equitable as between States—that it must be based on what the Commission calls a National Food Budget. This is not very profound, but it needs to be said and said again, in view of the general reluctance to act and respect for local interests.

Having said this, the Commission ought to have gone on to work out the National Food Budget itself and the pattern of procurement; it should have formulated policy for entire agriculture, and not just fixed prices of Akkulu, Kattaisamba, Suthersaul and other varieties of rice. True, it might by doing so, have transgressed the strict limits of its terms of reference, but no one would have minded this terribly if the Commission had something worthwhile to say. The important fact is that everybody

knows that we are just now in a desperate position agriculturally, everybody feels the need for State action. But policy is made, not out of high ideals and pious declarations, but out of careful, concrete proposals that bring objectives and administration together. The Commission is eminently suited, both by its composition and by its tasks, to work out such proposals.

At this point this review should end. But a protest must be made against the Commission's notion that procurement must be a battle of wills between the government and farmers. It is true that if we want to maintain fair price shops farmers must be made to provide a regular supply of foodgrains. The necessity is even more inescapable now that statutory rationing covering millions is proposed. But must the farmers be given unattractive below-market prices for the procured grains? Why not pay them in goods and services instead? Pay them in fertilisers, seed, pumps, schools, storage services, in whatever would help them increase output. This two-way traffic in goods can be used to put some purpose and life into the Food Corporation which is languishing for lack of work. It will alleviate the antagonism latent in a levy system, impose obligations in respect of agricultural investment and improvement which both the State and the farming people have shirked hitherto, and lead to most/reliable, rapid and steady increase in agricultural output.

Modern Fibres of India

A NEW Company, Modern Fibres of India, has been registered in Bangalore for the manufacture of acetate fibres using acetate flakes as raw material. The Rs 6 crore project is proposed as a joint venture of Modern Mills, Bombay, and a prominent UK manufacturer of man-made fibres, who together are expected to subscribe to 50 per cent of the total equity capital of Rs 2 crores. The sponsors have approached an international institution to subscribe to another 25 per cent of the equity capital, leaving a balance of Rs 50 lakhs in equity capital, which will be offered to the public towards the end of this year, together with another Rs 25 lakhs in preference capital. The public issue is expected to be fully underwritten. The plant and machinery for the project has been tendered

UK, which has recently supplied two acetate fibre plants to the Soviet Union.

Acetate filament yarn, which has silk-like qualities, has been enjoying a boom in the last few years throughout the world. In the United States, the production of acetate filament yarn for the textile industry is now double that of viscose filament yarn, both of which are of cellulosic origin. In India, on the other hand, the production of acetate filament is hardly 8 per cent of the total cellulosic filament yarn production which is predominantly viscose.

The new project expects to initially produce finer deniers of acetate yarn which are not presently manufactured in the country and which, under the present import restrictions, cannot be

Dalal Street at New Low

Wednesday, Morning

ON the stock market, it is almost the same story every week. The turnover continues to be extremely restricted and equities keep sagging for sheer want of support. There is no outside money flowing into the market to feed the professional speculators who therefore are in no mood to extend fresh large commitments. With the stockbroking community keeping idle most of the time, utter frustration prevails in the market and the feeling of despondency is increasing with time.

News hardly matters—not bullish news anyway. A possible reduction in the size of the Fourth Plan, exemption of a few more categories of imports from the deposit requirements, encouraging corporate news, reports suggesting a agreement on the repayment of Government loans taken by the two steel companies—TISCO and IISCO—none of these brought any relief to the market. Except for a little steadier sentiment on August 7, Dalal Street displayed a subdued tendency most of the time and it developed distinct easiness near the weekend following disturbing developments in Kashmir. Extensive Pakistani infiltration into the territory of Jammu and Kashmir has been viewed with serious concern by New Delhi. Dalal Street which had never been in good shape has chosen to beat a further retreat, striking a new low for the year—the lowest for many years.

There seems to be no end to the stock market's difficulties. How long the current phase of agonising dullness will continue is anybody's guess. Activity on the stock market is unlikely to revive appreciably unless investment in equities begins to appear quite attractive in the context of the prevailing structure of high interest rates and the economic and political climate holds out a reasonable hope of capital appreciation. The prospect in this regard is far from promising at present.

COTTON

Credit Curbs — Why Not

WITH activity in cotton futures virtually at a standstill, turnover in the spot market also extreme-

ly restricted and prices keeping almost at the season's highest, perhaps the only thing that needs to be mentioned about the cotton market is the trade's strong protest against the Reserve Bank of India's decision extending, for the first time, the scheme of selective credit control to cotton and 'kapas'. The minimum margin on bank advances against cotton and 'kapas' (advances to cotton mills have been exempted) has been fixed at 50 per cent of the value of the relative stocks. Margin has been made applicable with immediate effect in respect of new limits, while in respect of existing limits it will come into force not later than August 20.

The trade's anxiety is understandable. Scheduled banks are known to have been making advances against cotton with a margin of 20 to 25 per cent. The 25 to 30 per cent increase in the margin is bound to cause serious strain on the trade's resources as it is reported to be carrying a stock of nearly 10 lakh bales. It is estimated that the trade will have to find about Rs 15 crores by August 26 to meet the margin liability and this is no easy job. It has therefore represented to the Reserve Bank Governor that foreign cotton, exportable indigenous cotton and cotton stocks held by the trade on behalf of the mills should be exempted from the new margin rules.

There is something to be said for giving the trade sufficient time to be able to make adequate arrangements to cope with the new margin requirements, a fortnight's period being rather too short. But considering that cotton has been quoted well above the statutory ceilings all through the season—the premiums range up to Rs 150 a candy at present—one really wonders why the trade should be having any stocks at all. The existence of large stocks with the trade as also with farmers and cooperative societies in face of the acute financial stringency and in spite of the fantastic premiums that cotton is enjoying over the statutory ceilings is an indication of complete disrespect for the law. Exorbitant premiums and large stocks amidst serious financial stringency present an intriguing phenomenon. Nobody can re-

ally have any sympathy for those who openly violate the price control order

OILSEEDS

Remarkably Firm

THE setback in oilseeds prices noticed in the preceding week has proved to be a very short-lived affair. The market has again developed remarkable firmness, with ready groundnut oil price striking a new high for the season. Linseed oil and castor oil also are not much below their season's best. Groundnut oil which had recently eased from Rs. 31.50 to Rs 28.50 was up again at Rs 31.70 (per 10 kgs) on August 10. Linseed oil has recovered from Rs 25.50 to Rs 27.50 and castor oil from Rs 18.25 to Rs 19.10. The recovery in oilseeds futures has been no less spectacular. Linseed April has recovered from Rs 102.75 to Rs 112 and castor April from Rs 82.50 to Rs 91, which takes them fairly close to their recent best. Last week's highs were recorded only in kerb deals, official trading at above Rs 110.50 for linseed and Rs 89.75 for castor being prohibited by the maximum limits set for the price rise during the week. It bears repetition that the rise in futures that occurred last week has, in the past, been the full season's range at times. Who can satisfactorily explain such wide (wild is perhaps more appropriate) swings in prices in a matter of days?

There was nothing very disturbing in the weather news to explain the renewed spurt in prices. Weather reports were generally satisfactory though some parts in Andhra, Mysore and Madras were said to be in need of early rains. What is more, the rise in bank advances against vegetable oil and oilseeds (excluding groundnut and cottonseed). If tightening of credit control measures has failed to produce even the slightest impact on the oilseeds market it is essentially because stocks of oilseeds and oils are being held mainly by the farmers and cooperative societies and not by merchants and it is not the scheduled bank's credit which has been employed for financing these stocks but cooperative credit which remains outside the purview of selective credit control measures.

Vanspati Buying

But more than anything else, it was the vanaspati manufacturers' decision to put an end to their gentlemen's agreement under which they had been reportedly keeping off the groundnut oil market for a month which caused a spurt in oilseeds prices last week. The vanaspati industry's scheme of self-restraint has failed miserably. Few people ever really believed that vanaspati manufacturers had refrained from making fresh purchases because groundnut oil had all the time been quoted above the 'ceiling' rate of Rs. 2,700 a tonne; it is easily possible for anyone to effect purchases without having to disclose the real identity. Nobody need criticise the industry for its decision to resume open market purchases of groundnut oil with effect from August 10 at well above the 'ceiling' of Rs 2,700—business on August 10 was put through at between Rs 3,050 and Rs 3,150 a tonne. For the industry is quite free to chalk out its programme of action so far as purchase of groundnut oil is concerned. But it is necessary to point out that when the industry chose to abstain from buying groundnut oil in the open market at a price not exceeding Rs 2,700 per tonne it need not have made the boastful claim that the decision had been taken with a view to curbing unhealthy speculation and preventing any increase in the price of groundnut oil."

NTSD -Contracts

Mention must be made of New Delhi's announcement that non-transferable specific delivery contracts in groundnut and groundnut oil can hereafter be entered only between or through or with members of associations recognised for forward trading in these commodities under Section 6 of the Forward Contracts (Regulation) Act. The decision is said to have been taken following a steep rise in prices of groundnut and groundnut oil and to prevent speculation being diverted to non-transferable specific delivery contracts as hedge trading in these commodities is virtually at a standstill.

The regulation of trading in non-transferable specific delivery contracts under the Section 15 of the Forward Contracts Act throughout the country implies that the entire trade will be routed through the associations recognised for conducting hedge trading. This is a far reaching step and

its implications need to be examined very carefully before implementing such a measure. Trading in NTSD contracts cannot be equated with hedge trading. Will these contracts be subjected to the ceilings prescribed for hedge contracts? It needs to be mentioned that whereas the Forward Markets Commission has prescribed a ceiling of Rs 105 per quintal for the groundnut hedge contract, spot groundnut (Karad Bold) is currently quoted around Rs 152. It is the arbitrary and unrealistic ceiling which has brought futures trading in groundnut to a standstill; of course few will regret the lack of facility to speculate in groundnut.

Unwise Move

Reliable reports indicate that the Union Commerce Minister Manubhai Shah has urged the Solvent Extractors Association of India to consider seriously the proposal of a leading firm—Ulhas Oil and Chemical Industries (Private) Ltd. to purchase 3 lakh tonnes of groundnut extractions on a mutually agreeable formula for export to the U K on an exclusive basis. The Honourable Minister has expressed the view that the proposal is "in the interest of the country as it would stabilise export trade to the U K" which is the primary interest at the present time of his Ministry. The proposal was submitted at the meeting which the Solvent Extractors Association of India recently had with the Union Minister in order to finalise the details of the revised export scheme under which the export trade will be conducted only by the manufacturers after the end of September. Shri Manubhai Shah's support to the proposal for the purchase of a huge quantity of 3 lakh tonnes for export on an exclusive basis seems most unfortunate, to say the least. India has been doing well in regard to the export of groundnut extractions—setting new records every year. Where is the need to encourage one particular firm to export as much as 3 lakh tonnes on an exclusive basis? If the Commerce Minister has any fear that the export performance of groundnut extractions this year is unlikely to show an improvement over the previous year's record shipments, he had better have a second thought on the revised policy for export of groundnut extractions which prohibits established shippers from participating in the business.

THE ECONOMIC WEEKLY

MONEY AND BANKING

Tightness Returns

TIGHT conditions prevailed in the Bombay short-term money market during the week to August 11. Demand for funds continued at a high level while supply of funds was lower due to larger purchases of treasury bills. The position is likely to become even more stringent during the coming weeks in view of the State Government loans floated recently. Interest rates ruled firm throughout the week and on Wednesday evening the rate quoted was 5 per cent. Conditions in the Calcutta market were more or less similar. Demand for funds was keen with supply small and the rate quoted was around 6½ per cent.

Scheduled bank deposits during the week to July 30 were higher by Rs 11.11 crores at Rs 2,788.96 crores, according to the latest weekly statement issued by the Reserve Bank. Bank credit, on the other hand, was lower at Rs 2,025.94 crores by Rs 8.67 crores. Cash and balances with Reserve Bank were also lower at Rs Rs 166.09 crores against Rs 181.78 crores. Borrowings from the Reserve Bank declined by Rs 6.02 crores at Rs 9.62 crores. Investment in government securities was better by Rs 17.37 crores at Rs Rs 829.32 crores against the previous week's level of Rs 811.95 crores.

Notes in circulation during the week to August 6 increased substantially from Rs 2,573.43 crores to Rs 2,617.38 crores, according to the Statement of Affairs of the Reserve Bank. Central Government deposits at Rs. 92.74 showed a fall of Rs 26.41 crores. State Governments' deposits were lower as well by Rs 3.36 crores at Rs 13.69 crores. Scheduled bank deposits show a fall of Rs 3.36 crores at Rs 13.69 crores. Scheduled bank deposits declined by Rs 8.02 crores to Rs 91.49 crores. Foreign securities stayed unchanged at Rs 68.35 crores but balances held abroad were slightly better by Rs 29 lakhs at Rs 7.72 crores. Rupee securities were higher by Rs 25 crores at Rs 2,339.72 crores. Loans and advances to governments increased by Rs 9.74 crores to Rs 65.75 crores. Advances to scheduled banks moved down from Rs 9.49 crores to Rs 6.13 crores. Investments were lower at Rs 298.31 crores by Rs 27.92 crores.

THE ECONOMIC WEEKLY

Larsen & Toubro

DURING the last few years, Larsen and Toubro has displayed all-round growth in its activities as reflected in increasing sales, development of new products, execution of large contracts for both the public and private sectors and contacts and collaboration with leading foreign companies. These achievements should enable it to look forward with confidence to increasing business opportunities in all its lines of activity. In his Chairman's statement issued with the company's report for 1964-65, H. Holck-Larsen says that the industries the company serves as supplier of plant, equipment and technical know-how and as engineer and contractor are those with a high rate of growth. They are industries vital as a basis for an industrially developing country, and the management is taking the projected widening of the country's industrial base into account in its long-term planning.

So far the company has been able to exceed its targets, but in the current year strict curbs on imports and restrictions on bank finance are proving formidable obstacles to progress. There is a possibility that some of the manufacturing activities may be temporarily idle owing to shortages of raw materials and vital components. Nevertheless, the strong foundation and resources should assist the company in the times ahead. Holck-Larsen is of the view that even if the company's plans have to be modified and some targets curtailed, these unfavourable circumstances will not be allowed to prevent, for any length of time, the overall growth and prosperity of the company and its subsidiary and associates companies.

In the year ended March 1965, the company's revenue from sales, servicing, commission, compensation, engineering fees and other sources increased by 13 per cent to Rs 10.29 crores to establish a new record in the company's history. But the profit rose by only six per cent to Rs 1.18 crores mainly because of the steep increase in expenses on dearness allowance and interest on borrowings, items on which the company has little or no control. Investment in new fixed assets was Rs 69.35 lakhs compared with Rs 41.44 lakhs in the previous year. The bulk of investment was once again at Powai. The total output from the workshops and the wholly-owned

subsidiaries at Powai increased by 26 per cent. A cement machinery division was established to undertake progressive manufacture of complete plant and machinery for the cement industry with technical collaboration of F L Smidth and Co A/S of Denmark. The capacity of the general workshop is also being enlarged to meet the growing demands on its facilities.

The company was awarded a Rs 3-crore contract by Atomic Energy Establishment, Trombay, for the construction, on turn-key basis, of its radiological laboratory which, besides being highly sophisticated, is expected to be the largest of its kind in Asia. The subsidiaries, Alu Capsules, Christensen Longyear (India), Engineering Construction Corporation, Indian Crown Cork and Willcox Buckwell India — have all recorded encouraging growth during the year. The associate companies have also fared well, contributing more income to the company's revenue by way of selling agency commission and dividends. Audco India has plans in hand to widen the existing range and to add new products. Eutectic welding Alloys of India has commenced trial production, and is expected to begin sales in the course of the year. The construction of the new factory for Tractor Engineers at Powai is in progress and is expected to be completed by April next year.

Utkal Machinery made a "rights" issue of Rs 60 lakhs in January this year to finance production and sales which have begun to increase after the initial setbacks caused by strikes and riots between January and April last year. The three German collaborators agreed to take up Rs 2.08 lakhs each and renounced the balance totalling Rs 31.20 lakhs in favour of DEG, a West German Government financial institution. In order to maintain the same ratio of holding as that of each of the collaborators, Larsen and Toubro agreed to take up Rs 2.08 lakhs and renounced the balance share of Rs 10.40 lakhs in favour of ICICI and LIC to whom guarantee has been given for the purchase of these shares after five years, but not later than seven years, at par plus a payment of seven per cent per annum from the date of allotment.

Tata's New Thermal Unit

THE Tata Electric Companies have recently commissioned a 150/160

MW steam turbo-generator at their thermal power station at Trombay which has brought the much needed relief to the critical power supply shortage in the Bombay-Poona region. This is the fourth thermal unit to be added to the power station and is the largest so far built in India. The turbo-generator operates with the highest steam conditions, namely, 2,400 psig and 1000°/1050°F. It is an efficient unit having a comparatively low fuel consumption and incorporating several interesting and new features, such as, controlled circulation boiler, boiler feed pumps, sophisticated instrumentation and highly automated controls for safe and efficient operation.

The project costing over Rs 18 crores was initiated with the assistance of the Agency for International Development. The unit has been brought into commercial operation within the scheduled period of three years, the construction on the project having commenced after the monsoon in 1962.

Digvijaya Woollen

CONSIDERING the difficulties faced by the woollen industry, Shree Digvijaya Woollen Mills' working results for the year to March last are satisfactory, with sales up from Rs 1.87 crores to Rs 2.06 crores and gross profit slightly better at Rs 51.41 lakhs against Rs 51.21 lakhs previously. The profit would have been higher but for the provision of Rs five lakhs for the increased dearness allowance and the consequent increase in bonus besides the contribution of Rs 1.5 lakhs to the Woollen Research Association. The directors have provided for managing agents' remuneration Rs 3.38 lakhs (3.71 lakhs), for depreciation Rs 4.14 lakhs (2.24 lakhs), for development rebate reserve Rs 0.80 lakh (1.80 lakhs) and for taxation Rs 25 lakhs (28.50 lakhs). Transfer to general reserve has been raised by two lakhs to Rs seven lakhs. The preference dividend claims Rs 1.72 lakhs (same) and the equity dividend lifted by one point to 19 per cent requires Rs 9.48 lakhs (7.94 lakhs).

Polychem

DESPITE rise in sales from Rs 2.73 crores to Rs 3.21 crores, Polychem has earned a lower gross profit of Rs 69.06 lakhs in the year to March last compared to Rs 88.12 lakhs a year before. Of this, depreciation has taken up Rs 44.91 lakhs (56.47 lakhs), development rebate Rs one lakh (27.33 lakhs) and taxation Rs nine lakhs (nil). After setting

aside, as before, Rs 3.33 lakhs for payment of preference dividend, equity earnings amount to Rs 10.82 lakhs against only Rs 4.32 lakhs previously. The equity dividend unchanged at 15 per cent requires a bigger amount of Rs 9.99 lakhs (8.40 lakhs), being also payable proportionately on the bonus shares issued last year in the proportion of three-for-seven.

Simplex Mills

UNLIKE the experience of many textile units, Simplex Mills is having only a small unsold stock of cloth. Speaking to the shareholders at their annual general meeting some time back in Bombay, the Chairman, S R Damani said that the Mills carried an average packed stock equivalent to less than a week's production. Damani explained that following the statutory partial control by the Government, the Mills had to make drastic changes in the pattern of production which included the manufacture of new varieties, and initially it did lead to a little accumulation of stock but the consumer preference on account of the good quality of products helped clear the accumulated stock to a great extent.

During the year to March last, the company's sales and profits were the highest on record, reflecting the benefits of continuous modernisation. In the last five years the company spent Rs 91 lakhs on modernisation programme aimed at equipping the Mills with the latest machinery to fully cater to the ever-changing consumer taste. The company has already begun regular production of 2 x 2 poplins, and full voiles and Terene blended fabrics and screen printed dress materials are expected to be marketed before the end of this year.

NOCIL

DUE chiefly to the regulatory duty of 10 per cent on imports and increase of one per cent in Bank Rate, the initial capital requirements of National Organic Chemical Industries' petro-chemical project have increased by about Rs five crores to Rs 35.89 crores, including Rs 16.27 crores in foreign exchange. Of the increased total equity, Shell Petroleum will contribute Rs four crore in Sterling, and the balance of Rs eight crores will be subscribed by the Mafatlal Group, their friends and associates and the Indian public. The directors are considering the timing of the public issue.

In addition to subscribing to the

equity capital of Rs four crores, Shell Petroleum will provide the balance of the foreign exchange requirements of Rs 12.27 crores by advancing a loan in freely convertible Sterling. Negotiations for rupee loan of Rs 11.62 crores are in an advanced stage with the financing institutions in India. Meanwhile, construction work on the 300-acre factory site on the Thana-Belapur area in Maharashtra has started. Plant and machinery from overseas suppliers will start arriving soon after the monsoon.

Amul Dairy

AN UNUSUAL decline in milk collection during the last four months of its financial year ended March 1965 has been reported by Kaira District Co-operative Milk Producers' Union, popularly known as Amul Dairy. The management has attributed the decline in milk production to under feeding owing to high feed cost. The Union's cattle feed plant that came into production in the end of October last has been effective in controlling the prices of cattle feed besides providing better concentrates. The establishment of the cattle feed plant and the work of ear-tagging and milk recording are some of the items the Union has undertaken under the programme for doubling milk production. It is proposed to set up a specialised agency to do research, development and extension work.

The production of baby food during 1964-65 exceeded the licensed capacity, and the Government has permitted increase in the capacity which will enable the Union to meet with the growing demand for this product. The production of cheese was increased, and is proposed to be stepped up as the milk collection goes on increasing. A new product called butter milk powder was made during the year from sweet unneutralised butter milk. It is comparable in quality and usage to skim milk powder. The second dairy has been nearly completed, and the Union will handle double the quantity of milk and will also be able to convert extra milk into milk powder and butter for which there is a great demand and from both defence services and the public. The Union proposes to manufacture different types of feeds, like dry cattle ration and poultry feed. It was not able to manufacture lime juice during the year, as the lime crop was poor and prices were much higher than in the previous years. The management feels that the Union may have to give up this activity.

Win the battle of International trade

There is a rich market for Indian goods abroad. But as an exporter, you cannot sell sub-standard goods. You have to bear the brunt of the battle against powerful western rivals in the world market.

You can win this battle of international trade only on quality, competitive prices and service facilities. The export market can be a source of continuous earning power, provided you exercise strict quality control in the manufacture of goods, adopt modern techniques in production and adhere to high standard of specifications.

Thus you can help the country tide over her foreign exchange crisis and also maintain her prestige in the world.

We are here to guide and assist you in promoting your export.

14/1B, Ezra Street, (3rd Floor) Calcutta-1.

FROM THE CHAIR

Indian Sugar Mills Association Presidential Address of Shri S Jaipuria, M P

Bright prospects lie ahead of the Sugar Industry: Need to remove impediments to increased production

THE following are extracts from the Presidential Address of Shri S Jaipuria, M P, delivered at the 32nd Annual General Meeting of the Indian Sugar Mills Association held at New Delhi on August 4, 1965:

Record output: Sugar Industry's endeavours to increase output assisted by Government's policy of incentives and a good cane crop have borne fruit in the current season 1964-65 when production is expected to exceed 32 lakh tonnes, the highest output ever recorded. It is hoped that the 3rd Plan production target of 35 lakh tonnes will not be difficult to achieve in the next season being the last year of the Plan. In fact, sugar production in the current season itself would have been higher had factories specially those in West U P got adequate cane supplies and large scale cane diversion to gur and khandsari manufacture had been prevented. According to the U P Government's own estimate, the loss in sugar output due to closure and intermittent working of West U P factories was over 1 lakh tonnes.

Need for long term policy. The problem of large scale cane diversion to gur and khandsari manufacture needs to be tackled effectively and permanently. For this, a long term policy is necessary. It is hoped that after the Sen Sugar Enquiry Commission's report becomes available, it would be possible for the Government to formulate a long term policy.

Relaxation of consumption curbs: Following the record sugar output in the current season, the sugar supply position has become comfortable and, therefore, the existing consumption curbs should be relaxed to provide the much desired relief to consumers. Sugar rationing in vogue in some of the cities should be done away with and sugar allotment to bulk industrial consumers should be liberalised. Further, the cut which was imposed on

the gate sale sugar quota of the factories should be restored and some additional quantities should also be allotted to the factories for distribution amongst cane growers. If the existing curbs on consumption continue, the total offtake may be more or less restricted to last year's figure of about 23 lakh tonnes. This will leave a sizeable carryover stock of about 6 to 7 lakh tonnes with the factories while the country will continue to starve for sugar which is hardly fair. Reports about the next season's cane crop are also encouraging.

Cash and credit limits: During the current season, in Bihar production rose by about 65% while in East U P the increase was of the order of 45%. Factories generally finance their production, maintain regular payment of cane price, salaries and Government dues by borrowing from the commercial banks against sugar stocks. The commercial banks generally regretted their inability to accede to the requests of the factories for additional cash credit limit in view of credit restriction policy followed by the Reserve Bank. The credit restriction policy was essentially to curb inflationary tendency in the Indian economy and not to impede industrial growth and output. Higher cash credit limits as are required due to increased production should be granted as a matter of routine otherwise the financial problems of the factories would be even more acute in the next season when sizeable increase in sugar production is visualised. In this connection, the recent directive issued by the Reserve Bank of India to all banks to ensure that the aggregate of unsecured advances granted by them should not exceed the amount of such aggregate as on 25th June 1965 is also unjustified. If the Reserve Bank desires to reduce the limits, a more rational basis should be found so as to ensure that no particular industry or unit suffers unduly.

Rebate in corporate tax: The Sugar Industry is directly tied with the well-being of hundreds of thousands of cane growers and there is no other industry on which rural economic development so much depends. Sugar is also contributing significantly towards the country's foreign exchange earnings. Sizeable expansion of the industry is visualised during the 4th Plan period. Therefore, sugar must be included in the list of industries allowed rebate in corporate tax, under the 1964-65 and 1965-66 budget proposals.

Rebate in excise duty on excess production: There is a provision in the 1965-66 budget proposal for granting excise duty rebate on excess production in the form of tax credit certificates. Having regard to the higher sugar output achieved by the policy of granting excise duty rebate on excess production during the last two seasons as also in the past, the scheme of granting tax credit certificates should be extended to cover the sugar industry also. Since the quantum of rebate allowed has a direct bearing on the factories' ability to draw cane supplies in competition with gur and khandsari, ceiling rate of 25% should be permitted to the sugar industry to stimulate sugar output.

Cane development: It is gratifying to note that at the instance of the Central Government intensive cane development schemes have been launched in U P, Bihar and the Punjab. The implementation of the scheme in Punjab and Bihar should be expedited and the practical difficulties impeding the progress of the scheme in U P should be removed. Moreover, intensive cane development schemes should be extended to cover larger areas, the ultimate object being to bring the entire reserved areas of factories within their purview.

It is welcome that the Union Government proposes to increase alloca-

tion for sugarcane development to Rs 90 crores, in the 4th Plan period. It is further heartening that the Food and Agriculture Ministry proposes to make available Rs 2.14 crores for sugarcane research. The State Governments too should play their due part and make available their entire cane cess collection for cane development as has already been done by the Punjab Government.

Evolution of improved cane varieties suited to different soils and climatic conditions is a "must" for cane development. Commercial propagation of newly released varieties should also be expedited.

Land Ceilings: In the context of the compelling needs to increase cane productivity, it is unfortunate that the State Governments of Maharashtra and UP have not exempted factories cane farms from the purview of their land ceiling legislations. This take-over is contrary to the recommendation made by the Planning Commission and the Study Group (Export Sector) on agricultural commodities and agriculture-based industries, set up recently under the Chairmanship of Shri V Shankar, former Food Secretary. The Ministry of Food and Agriculture proposes to allow the joint stock companies to take up farming operations on Government waste lands. There are also reports that Government proposes to set up big sugar factories of 4000/5000 tonnes capacity with attached cane farms to feed them. When in Government's thinking, the importance and need for factory farms is recognised, it is only proper and desirable that the State Governments of UP and Maharashtra should reconsider their decision to take over factory cane farms.

New Capacity: About 8.73 lakh tonnes additional capacity remains to be licensed to achieve the 4th Plan capacity target of 45 lakh tonnes. The existing units must be given priority to expand over the setting up of new units depending upon the availability of cane. Factories would be requiring additional capacity to crush increased quantities of cane forthcoming due to introduction of intensive cane development schemes in the various States, otherwise disposal of cane in the existing areas may pose a very serious problem for the growers in the years to come. Sound economic and commercial con-

siderations also demand that expansions should get preference as the cost involved would be only half as compared to new units according to estimates of the Development Council for Sugar Industry and the time required for bringing the additional capacity into operation would also be very much less. The Development Council for Sugar Industry has also placed economic capacity of a sugar factory at 2000 tonnes and it is therefore only fair that wherever feasible the existing units should be allowed to expand upto this size. If all the existing units are allowed to expand upto 2000 tonnes, the total additional capacity available would be about 24 lakh tonnes.

For licensing additional capacity, the present and future cane requirements of the existing factories should be carefully assessed to assure that their working is not affected by licensing of additional capacity in other areas. Government should constitute a Stand-Committee compressing of reputed technologists to go into the grievances of the existing factories, if any, before additional capacity is sanctioned. Demarcation of cane zones to factories specially in Maharashtra should be expedited.

Smaller Units: There are a large number of small units in the country that deserve prior consideration from the Government for their expansion programmes. The Gundu Rao Committee appointed by the Government to consider this matter has submitted its report and its recommendation should be expeditiously implemented for the healthy development of the sugar industry in general. This development is jeopardised by the reported move of the Government to do away with the Managing Agency System in the sugar industry. The system is inherently sound and needs to be retained on its merits.

Sugar Export: So far about 2.73 lakh tonnes have been sold for shipment against a target of 3.5 lakh tonnes set by the Government. In view of the comfortable sugar supply position in the country, exports could be further increased to earn the much needed foreign exchange for the country. A significant development in the export field this year has been our joining the Commonwealth Sugar Agreement as a full-fledged member which signifies recognition to India as

an established and permanent exporter of both raw and white sugar.

Bagasse: The matter regarding economic disposal of the sugar industry's main bye-products especially bagasse should be ensured through assurance of adequate demand from paper and straw board mills. Concessional railway freight should be offered on bagasse moved from sugar factories to paper and straw board mills.

Transport facilities should be improved for expeditious movement of essential store materials required by the sugar factories in the process of manufacture.

Losing companies must be exempted from payment of minimum bonus as provided under the Bonus Ordinance and essential prior charges like Rehabilitation should be allowed.

Allotment of Sulphur: Another serious problem presently faced is the inadequate supplies of sulphur essentially needed for clarification purposes. The open market price of Sulphur is exorbitant. While the provisional allotment of 8000 tonnes of sulphur for the Sugar Industry by the Directorate of Technical Development is no doubt welcome, the quantity is hardly sufficient to meet even one-third of the sulphur requirement of the factories in the next season and increased quantities of sulphur must be allotted commensurate with the actual requirements of the factories.

Future prospects: The difficulties presently faced have to be viewed in the context of bright prospects that lie ahead of the sugar industry. The internal demand for sugar is continuously rising and Government intend to import annually about 5 to 7.5 lakh tonnes. Accordingly, a higher production target of 45 lakh tonnes has been fixed for the 4th Five-Year Plan. Industries dependent on sugar for raw material are also fast progressing. All these factors underline the need for substantial expansion of the sugar industry in the years to come. It is suggested that Government should constitute a Committee on the lines of the Sugar Controller's Advisory Committee, which was in existence some time back, for a periodic review of the problems of sugar factories.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Want to increase your overseas profits?

Here are 17 ways we can help you.

1 Our World-Wide Marketing Service personnel can help you find new markets. We have specialists in 124 world trade centres. Let them analyze your profit potential, show you where your product is needed, where you can ship to and sell most easily.

2 We can advertise your needs. Do you want to buy something? Sell something? We can spread the word. Our monthly magazine, "Clipper Cargo Horizons," published in 6 languages, can place your listing before more than 176,000 top executives around the world. No charge.

3 We can develop new contacts for you. Our professional marketing experts can make your first new overseas sales approaches for you—free.

4 We can find you additional suppliers. Want to buy for less? Get a special design? Get higher quality? Let our specialists discover new sources for you... see that you get catalogues and prices.

5 We can cut your packing and crating costs. We don't require the heavy, expensive crates of surface shipping.

6 We can lower your air Cargo rate. Pan Am's AirPak Savings Plan employs newly-introduced corrugated containers that can earn you a discount of 12%. And remember, Pan Am has reduced rates in recent months on many products, perhaps yours.

7 We can help you cut warehouse expenses. Because we can deliver overnight almost anywhere in the world, you don't have to maintain costly warehouses overseas.

8 We can lower your inventory cost. Our rapid delivery means you can order direct from the factory as needs arise... you won't have to maintain costly inventories.

9 We can help you match a local producer's delivery time. Don't let foreign competitors take business from you because they can deliver faster. Our rapid delivery makes you, in effect, a "local producer"

anywhere in the world, lets you cash in on unexpected opportunities overseas.

10 We can solve distribution bottlenecks. When you have to produce more than your regular distribution facilities can handle, call us. We'll see your customers get their orders on time, every time.

11 We can help you bank your profit sooner. The sooner your goods are delivered, the sooner you get paid. Our rapid delivery often means you get paid several weeks sooner.

12 We can reduce obsolescence losses. Could a newly introduced model or a change in public taste cut into your sales? Or even destroy your market? Minimize this risk... with our overnight delivery.

13 We can slash wharfage, docking, trucking costs. Call us. We'll be glad to show you how and how much.

14 We can reduce clerical expenses. For example, one Pan Am airway bill will take your shipment anywhere in the world. Let us rid you of use-

less, expensive, time-consuming paperwork.

15 We can greatly reduce insurance costs. Did you realize that shipping with us can save you in insurance as much as 90% of your surface shipping insurance costs? We'll be glad to show you the proof.

16 We can cut or eliminate spoilage, breakage, pilferage. The longer a shipment is in transit, the greater the likelihood of damage. To get your goods delivered fast, in factory-fresh shape, call us.

17 We can cut or eliminate disassembly-reassembly. No need to take large items apart and put them back together when you ship with us. You save time, trouble and cost.

Profit from these 17 ways Pan Am can help you.

We'll be glad to have one of our cargo experts help you make a thorough analysis of your supply and delivery system. No charge, no obligation. Call your Pan Am Cargo Agent, or ring us up. Do it today. (Tel. 211063/64)

World's largest Air Cargo carrier • World's most experienced airline

PURE PROTECTION

The egg is the dream pack devised by nature for pure protection. Taking a tip from nature we, at India Foils, have made it our business to manufacture a whole range of aluminium foil dream packs which offer pure protection for products within. Heat or moisture, germs or odours Al Foil resists them all for years and years. Food products retain their flavour and freshness. Most important of all the adulteration expert cannot get at them. Send your products how you like by road or waterways, drop them from the air and Al Foil flexible packaging will retain its protective properties. And India Foils continue to provide pure protection to a wide range of products, which we need almost every day.

On the Boil Again

IT is a queer situation in Kashmir. About eight Pakistani battalions, comprising more than three thousand men, Gulzarilal Nanda suggests, have infiltrated across the border. Mufti or no mufti, it is certainly astonishing that such a large number could enter without being accosted, and travel miles on end reaching as far into the interior as Srinagar, the capital city. The suggestion strains credulity. On the other hand, if this is in fact what has happened, it speaks ill—extremely ill—of our border and security forces. Despite Defence Minister Chavan's bravado in the Lok Sabha, the citizens at large could legitimately expect—and demand—better return on the one thousand crores of rupees that are being annually turned over to the Ministry of Defence. Off and on in recent weeks we have been treated to reassuring statements from Union Ministers about our present defence capability. Hints have been freely thrown out regarding how we could now take on China and Pakistan together. There has also been plenty of talk concerning the overhaul of the border police, and recent moves to centralise the State border forces under Nanda's strict surveillance were intended to make the arrangements super-efficient. There is no question that there has been a very bad slip-up, and for once the members of the opposition would be voicing the genuine uneasiness felt by the people when they condemn the bungling along the Kashmir border.

Now that there is no further report of any open and large-scale incursion by Pakistani troops, our forces should be able to complete the task of mopping up the intruders within the next few days. So long as Bhutto was scheduled to visit New Delhi next week, one could speculate that the Pakistan Government might think it prudent to lower the tension, and issue instructions accordingly. On the other hand, if Bhutto's ploy in New Delhi was to be to de-freeze the Kutch agreement, the Pakistanis might well have decided to pile on provocations along the entire stretch of the Jammu-Kashmir border. With Bhutto's visit called off there is no point in speculating about the Pakistani intentions in regard to the proposed meeting. Having signed the Kutch Agreement, we should not feel tempted to use the Kashmir incidents to renege our own commitments, nor should we allow the Pakistani Foreign Minister any opening through which he could wriggle out. The Parliament has therefore done the right thing in giving support to the agreement, despite bitter attacks from the Opposition. It should be the Indian endeavour to treat Kutch and the present series of incidents in Kashmir as separate episodes, at least till the Pakistanis on their own do not move to nullify this assumption.

But other, more basic issues would still remain. The present impasse in Kashmir cannot continue for ever. It is an unreal situation there, with scores of people thrown into prison, and the Defence of India Rules deployed every now and then to suppress popular modes of expression. The present Prime Minister of the State is an honest, well-meaning person, but he knows and about everybody knows that his hold on the Kashmiri people is still uncertain. By detaining Sheikh Abdullah in far-away Ooty, we are merely postponing the day of reckoning. The fact remains that whatever administration New Delhi might foster in Srinagar—call it by the appellation National Conference or National Congress—would continue to be dissociated from the mainstream of Kashmiri opinion, and, quite candidly, in moments of stress, would have to lean heavily on the defence forces and the police. How long can democracy be staved off in the name of the Emergency, be it in Kashmir or the rest of India? Apart from everything else, so long as the present abnormalcy is allowed to reign, some provocateurs or other from across the border will continue to feel sorely tempted to ignite a "revolution" in Kashmir. Each such attempt at a "revolution", however abortive, gives India a bad image. For the truth is, while the mood of the broad strata of the Kashmiri people is sullen, they are not itching for a revolution—agitations, and occasional acts of violence, are as far as they are prepared to go.

Whether we can achieve a *detente* in Kashmir or not, obviously we have to brace ourselves for a state of quasi-permanent hostility with Pakistan. For

there are many knowledgeable people who believe that the end of the Kashmir dispute will not automatically lead to the establishment of cordial relations with Pakistan. Ordinary prudence therefore demands that, before we venture on such a long-term gambit, we try to restore some of our Asian fences. In so far as confrontation with Pakistan is concerned—and particularly when Kashmir would constitute the central issue—we have learnt to our cost that we can hardly depend on moral support from either the USA or the UK. Also, long-distance friends, however powerful, are of no avail when prickly, little disputes spring up every now and then between neighbours. The moral backing of powers closer to home is in such circumstances of much greater practical value. If we and Pakistan stay unreconciled, commonsense

What Plan Figures Don't Tell

IN his Independence Day address from the Red Fort, the Prime Minister solemnly declared that the size of the Fourth Five Year Plan would be Rs 21,500 crores and that there would be no deficit financing. This is a strikingly bold statement in all conscience, considering what the Prime Minister himself and others had been saying earlier. The underlying tone of all the earlier prognostications and advice for going slow was much worse than that of just caution. The impression inevitably created in the public mind was that of a failure in planning, of achievements falling so far short of expectations as to have changed the outlook altogether. Foreign exchange shortage, the decline in the rate of increase of industrial production, among others, were held up as danger signals.

The battle of the figures has at last been ended and though what is now accepted as the target is a full thousand crores below what had been provided for in the Fourth Plan Memorandum, it is still to be welcome as a great gain, in the light of the depressing and defeatist talk that had spread gloom in the air. It is indeed a victory for Asoka Mehta, the Deputy Chairman of the Planning Commission, that he could make the Prime Minister see reason. The backing of the States which he managed to win must have been a determining factor, for it is no secret that with the—possibly single—exception of C Subramaniam, the Food Minister, all the other members had been extremely chary of plan perfor-

would then indicate some exertion on our part for a rapprochement with China and Indonesia. Unfortunately, our quarrel with China has reached such a stalemate that it will be rather difficult to get a move on in the short period. A beginning nonetheless should be made, and Shastriji's rejection of President Nasser's offer to mediate afresh must be dubbed as short-sighted on several counts. A friendly overture to Indonesia could mark this beginning. With the collapse of Malaysia, we have very little reason to continue pleading the Tunku's cause, more specially since the Malaysian Prime Minister himself has pointedly refused to take sides in the Indo-Pakistani dispute. Let us try to win back at least some neighbours—a few favourably disposed nations in Asia will not do us much harm.

mance and pessimistic about the future. The logic of the situation obviously favoured the Deputy Chairman, for the Chief Ministers were naturally reluctant to face the electorate with smaller plans which would have to be presented as Congress Manifestoes.

The particular figure which the Prime Minister presented to the nation is not, however, one which he has himself accepted without any reservation. In the discussions still going on for finalising the plan, the figure is presented in two parts: Rs 20,500 crores as the operative minimum and another thousand as a complementary figure, to be kept in sight and attempted 'to the extent possible' but not a firm commitment. Judging from the manner in which these discussions are usually carried on, it is hardly necessary to add that definiteness and finality are relative concepts and have to be taken with a pinch of salt. Academicians have also to be enlightened that the Prime Minister's conversion to the quantity theory, implicit in his statement about no deficit financing, is a qualified one; it is quantity theory tempered by commonsense.

The constraint this time is not inadequacy of foreign aid. The resources gap is, therefore, crucial and the conflicting figures that have been put up about the gap constitute the heart of the controversy. This is not a situation, however, which one would be disposed to accept so readily, considering that resources grow out of production and if the Third Plan has

achieved its main objectives even substantially, that by itself should enable us to raise our sights in the Fourth Plan. There has been no appraisal of Plan performance after the gloomy one made at mid-period. It is only in the latter half that a plan picks up. In the absence of any subsequent assessment, the impression has been widespread that everything has gone wrong with the plan which is by no means the case. With the Planning Commission on the defensive, however, this goes unchallenged. Worse still is the reluctance of the Planning Commission to face the future squarely, to own up deficiencies in plan performance and institute measures straightaway for rectifying them. Since one plan grows out of another, it is not necessary to labour the point. What exactly is it that has gone wrong? Have investments been inadequate or foreign aid insufficient, tardy in its flow and not available on time? Or is it that implementation has been so defective over wide areas where the bulk of the investments have gone—and these are areas in the public sector—and execution so faulty that returns have been hopelessly inadequate and far short of what had been expected? Much hope was, therefore, roused when the newspapers reported that C Subramaniam had pressed the Planning Commission for an enquiry into administration while arguing powerfully in favour of retaining the original figure of Rs 22,500 crores and opposing any cuts in it.

While the decision for a large-sized plan, whether it is firm or final or not, is certainly to be welcomed, dissociation of the plan objectives from a searching enquiry into the instruments of implementation portends the perpetuation of the same state of scepticism and distrust in the public mind which covers the subject of planning today. It is high time, therefore, to match the plan size with the agencies of implementation and to treat them as inseparable, in order to win back public confidence. At the moment, public confidence is being steadily undermined by persisting doubts that bulk of the investments, substantial by any standards, are going into an area for which the Government has not been able to develop a workable and efficient system of management and administration, that it has not even applied its mind to the problem. A start has to be made with fixing responsibilities, and it has to begin from the top.

Oil Stays in Public Sector

THE statement on oil policy laid before Parliament deals with both long and short-term questions of crude supply, refining capacity and distribution. Exploration within the country is being intensified through the Oil and Natural Gas Commission and through joint enterprises with foreign collaborators "wherever suitable terms are obtainable"; contract drilling in Iranian off-shore areas is also being pursued vigorously. Once crude is produced by a Government agency in India or abroad, it will be utilised, first, in fully-owned Government refineries, and the surplus will be supplied to existing and future refineries that may be erected with foreign collaboration. If Government imports crude at prices lower than those obtained by private refineries, the refineries must either match these prices or accept Government crude. The price cut accepted by Phillips Petroleum for the Cochin refinery will save Rs 1 crore of foreign exchange annually, while the increased despatches of Ankleshwar crude to the Bombay refineries will save another Rs 8.5 crores. The cuts in import prices recently accepted by the three oil companies will raise the total saving by Rs 3 crores to about Rs 12 crores.

Enough new refining capacity would be created to achieve self-sufficiency in as many petroleum products as possible. As hitherto, all new refining capacity shall be wholly Government-owned when the crude oil belongs to Government. Foreign participation may be needed to cover foreign exchange costs in some cases which, judging by experience so far, is likely to entail a commitment to purchase crude from the collaborator. Such commitments would be limited to the minimum period possible and care would be taken to see that such contracts do not conflict with the fullest use of indigenous or Government-owned crude. Steps would be taken simultaneously to promote domestic manufacture of refinery equipment. The existing agreements with the three private refineries are under revision in order to replace the agreements concluded in 1951 with normal industrial licenses under the Industrial Development and Regulation Act, from which the refineries are now exempt. Expansion of these, as of other refineries, would be considered in the light of product demand in

the relevant areas—which implies that the chances of expansion for them are remote.

As for marketing, deficit products would be procured at the best price irrespective of source "with some preference to rupee sources so long as this is necessary". Self-sufficiency in diesel is expected before the end of the Third Plan, imports of kerosene would be substantially reduced over Fourth Plan, and the use of furnace oil would be regulated under a rational coal-oil policy. A substantial reduction of 24 per cent in the price of aviation fuel from a western source will save about Rs 1.5 crores.

The aggregate saving of Rs 14 crores approximately, claimed by the Minister for Petroleum and Chemicals, should make a substantial impact on the petroleum import bill which had been drastically cut in 1964. The denial of import licenses for deficit products to oil companies since May this year is an additional saving but though the prices of Russian products are lower, the quantity contracted for import is somewhat larger than normal in order to overcome regional shortages.

The Minister has claimed that "complaints of shortage have now become extremely rare", and that satisfactory distribution arrangements have been made without recourse to emergency powers. Without in any way detracting from the creditable performance of Indian Oil in recent months, this claim is not altogether justified as the uproar which greeted it in Parliament indicates. It would take better planning and utilisation of existing storage and distribution facilities to overcome shortages in pockets of scarcity.

Non-Academic Uses of a University

THE recent trouble in Aligarh University has brought to the fore once again the latent communalism in the country. Its latest manifestation is a virulent attack on Chagla at the all-India Convention of the old boys of the University. On April 25 there were violent student demonstrations on the Aligarh University campus (supposedly over an alteration in the admission procedure) which culminated in an assault on the Vice-Chancellor. On May 4 Education Minister Chagla revealed the details of what was in fact a communal plot, directed at the V-C, Ali

Yavar Jung. According to the reports, a small minority of reactionary, communal elements among the students, encouraged and abetted by certain members of the staff, objected to the appointment of Ali Yavar Jung, who wanted to ensure the maintenance of secular standards in the University. These elements—whom the Vice-Chancellor described as not merely communal, but Fascist—formed a students' action committee, ostensibly to agitate against the change in admission rules, but in reality to conspire against the Vice-Chancellor.

After the revelation that University life at Aligarh was infected by an unhealthy communalism, not of an anti-Muslim character, but of a reactionary anti-secular type, the Government decided to promulgate the Aligarh University Ordinance. The Ordinance, intended to be a temporary measure, will be followed by a bill in Parliament, similar to the Banaras Hindu University Bill which has not yet been revoked. The Ordinance provides for an advisory court of 51 members, 30 of them to be nominated by the Visitor (President Radhakrishnan), and an executive council of nine members, seven of them to be nominated by the Visitor. The executive council, with the Vice-Chancellor as Chairman, will be vested with full powers to administer the University.

The Ordinance has raised a storm of protest among a vocal Muslim minority, who, it should be noted, ignore the fact that a similar Ordinance was promulgated for the Banaras Hindu University in 1958. It is claimed that the Muslim character of the University has been destroyed, and that academic autonomy has been threatened. The promulgation of the Ordinance has brought to light a persistent misapprehension on the part of a reactionary minority of the role that Aligarh Muslim University should play in a modern secular State. The University is intended to be an all-India University, "specialising in subjects concerned with Muslim culture and having due regard to the claims of deserving Muslim students". It is not, as the Muslim University Act of 1920 made clear, a University to be run solely by Muslims for Muslims.

The most deplorable result of the Aligarh University disturbances is that they have been seized upon by a few mischief-mongers as a peg on which to hang a whole number of non-academic

grievances. The two-day all-India convention of the Aligarh Muslim University old boys was used by a reactionary minority to air their views. Their purpose was to arouse communal feelings; this is clear from the fantastic demand that was made, asking all Muslims to withdraw their support from Congress if the convention's claims were not conceded. Speakers used the platform to complain about the status of Muslims in the services and the Legislatures and about the status of Urdu. The convention demanded the withdrawal of the Ordinance claiming that the University is "a cultural, religious and educational centre of Indian Muslims."

The Government received full support for promulgating the Ordinance at a joint session of the Bihar State Congress Muslims' Convention and the Jamiat Ulema. The meeting condemned communalism in the strongest terms and appealed to Muslims not to succumb to anti-social and anti-national forces. Chagla is to be commended for his firmness in dealing with the troubles at the University; a reactionary minority must not be allowed to infect the whole community, and thus prevent Aligarh University from becoming a national secular institution.

Britain's 'East of Suez' Policy

Our London Correspondent writes: SOME rethinking on Britain's "East of Suez" policy has obviously become necessary with the dramatic secession of Singapore from the Malaysian Federation. One of the main elements that justified this policy was the protection of the integrity of the British-engineered Malaysian Federation made up of disparate racial groupings. The British had little desire to part with their very large base at Singapore and as it became increasingly evident early in the sixties that independence would soon have to be granted to Singapore whose population was predominantly Chinese, and with a definite left-wing orientation, the Malaysian Federation was created to incorporate Singapore with the already independent and moderate Malaya. In order to balance the Chinese predominance in Singapore, Sarawak and Sabah in North Borneo were brought in to make what was always an artificial federation. It is interesting that this is the third British-created federation that has broken up in disarray — the first two to break up being the Rhodesian and the Caribbean federations. It marks the end of yet another multi-

racial experiment. Malaysia without Singapore has no *raison d'être*. And with the disintegration of the Federation, the cogent reason for maintaining large British forces in this area no longer remains. If the Indonesian "confrontation" of Malaysia were now to stop, would there be any further justification for Britain retaining its large base? Balance of payments considerations would certainly work in favour of reducing British commitments in this area, but this would mean a complete break with the policy that has hitherto been followed.

There is, however, no doubt that a fairly wide spectrum of political opinion in the U.K. is in favour of the withdrawal of British forces from areas East of Suez, ranging from the extreme left-wing to such staunch conservatives as Enoch Powell. Obviously, there are elements in both parties which while looking around desperately for areas in which to make cuts in military expenditure which are so vital if Britain is to strengthen her economy, feel that areas East of Suez are certainly ripe for economies.

The Conservative Party under Edward Heath would certainly be more Europe-oriented; the Commonwealth has never occupied first place in the thoughts of Heath, as was made only too plain during the abortive Common Market negotiations, and therefore, cuts in expenditure in this area would make economic sense to him. The left-wing elements in the Labour Party who see the British base in Singapore as an undesirable remnant of colonialism, would like to see it closed down.

The Prime Minister of Singapore has already asked Britain to negotiate a new agreement under which Britain would retain its interests in the base to meet the security needs of both Singapore and Malaysia. But the base would not be available to be used for Britain's treaty relations with SEATO. Tunku Abdul Rahman, however, has suggested that if Singapore is going to put restrictions on the use of the base, Britain should establish a new base on Malaysian territory.

Industrial Location

It has been reported that the Planning Commission has asked State Governments to set up area development corporations for develop-

THE ECONOMIC WEEKLY

oping industrial areas where ready-made sites will be made available for industry. At a time when it is clear that the growth in the output of mining and factory establishments has slackened, it might seem odd to want to devote any attention to industrial location. Yet efficient planning requires that while short-term targets are energetically pursued, essential work continues to be done for the long-term objectives as well. One of our long-term aims definitely is to have a pattern of industrial development which is as evenly spread over the country as is compatible with the distribution of the various economic resources.

A modest beginning was made during the Second Plan with the creation of industrial estates; however, most of these estates were too near the largest cities. Realising that this was undesirable, the authorities decided in 1959 to start some rural industrial estates in places with a population smaller than 2,500 persons. But this was going to the other extreme. The largest cities have a number of advantages for new industrial units; but, since the social amenities there are already hard pressed, the aim should be to divert the new units to places where an increased population can be relatively easily absorbed and where the preconditions for industrial growth are also available or can be easily provided.

Places which satisfy this double condition are small and medium towns of which there are plenty in India. Compared to some of the developed countries our distribution of population is fairly even over cities of various sizes: in the five largest cities of the country, 3.2 per cent of India's population is to be found; the percentage for America is 9.6 and for Japan 16.3. Eighty-two per cent of our population is rural (i.e., lives in places with less than 2,500 persons); 11 per cent lives in places with more than 50,000 people, and about 7 per cent in places of more than 2,500 but less than 50,000. As far as can be done without adversely affecting its rate of growth, we need to direct new industry to the last category of towns. A major advantage of this would be that a large proportion of new industrial workers could continue to stay in their villages and travel to work in towns, many of which are within a few miles of some villages. It is hoped that by the end of the Fifth Plan the share of agriculture in the total labour force will drop from 70 per cent to 60 per cent. If this change is not to add to the already great num-

THE ECONOMIC WEEKLY

bers of slum and payment dwellers in large cities, some amount of taking industry to the people (rather than bringing people to the industry) will have to be consciously arranged. Agro-industries are particularly suitable for this purpose as the Planning Commission points out in its proposals to the States.

As a part of the policy of attracting private industry to the smaller towns, provision has been made in the last Budget to allow for refund of capital gains tax if the sale proceeds are invested in an industry which is located away from the metropolitan areas. The State Governments have been asked to provide the necessary overhead facilities for private enterprise in new industrial regions, and also, whenever the considerations of raw materials, power and the like point it, to take public sector projects to backward regions. These are all moves in the right direction. Though parochialism is bad, yet if the various kinds of representatives of the people take a keen interest in the development possibilities of their regions and, without forcing the sacrifice of economic considerations, do not let the legitimate claims of their regions be ignored, then it would perhaps be a good thing for the country in the long run.

Maintenance Loans from IDA

A SECOND IDA loan, this time of \$100 million against \$90 million in June last year, for the import of materials, components and spare parts for engineering and construction industries has been announced. The credit will benefit the manufacture of commercial vehicles, automotive components, machine tools and cutting tools and electrical and heavy construction equipment. The first credit made higher utilisation of capacity possible in these industries. Production of switch-gear, motors, transformers and cutting tools increased by more than a third over the previous year and that of construction equipment and commercial vehicles by a quarter. The interest taken by IDA in extending such credits has given confidence to manufacturers in the future availability of critical materials, components and ex-stock spare parts and has thereby improved production planning and inventory control. Together with credits from other sources, it should be possible to increase the output of these industries by about 25 per cent in 1965-66 over the 1964-65 level, which itself was more than 25 per cent higher than in the previous year.

Output of engineering goods recorded a fairly satisfactory rate of increase in 1964, but other industries like textiles and chemicals tended to slow down. Difficulties in obtaining adequate cotton supplies, both domestic and foreign, are partly responsible for the relative stagnation in cotton mill output, but fluctuations of output in this industry, which has a weightage of one-third in the index of industrial production, are always difficult to appraise due to the growing output of powerlooms and handlooms and constant shifts in the composition of mill output itself. The slowing down and, in the aggregate, a decline in the output of nearly all chemical products is a more serious portent, for which an adequate explanation has yet to be offered. The shortage of sulphur has proved to be a crippling factor but that is not the only item in short supply. Most of the basic and intermediate chemicals are scarce but, simultaneously, the available supplies of domestic, East European and US goods are facing price and/or quality resistance. Chemicals have a very small weightage in the index of industrial production (base 1956) but their impact on output in other branches of industry is next only to that of agricultural materials, power and transport.

Since the IDA has stretched its scope of assistance sufficiently to cover maintenance requirements, it would be worthwhile to approach it for assistance to cover at least the minimum requirements of chemicals. True, these do not rank entirely on par with basic engineering maintenance requirements since the latter get embodied in capital goods and hence save on foreign exchange required for various projects while chemicals remain as intermediate goods, except for the very small part used as ingredients for the manufacture of capital goods. But the possibility is worth exploring, especially as the only source of credits for chemicals at present is the US, whose prices quoted are often 30 to 50 per cent higher, inclusive of the higher dollar freights payable. These higher prices, unlike those for equipment to some extent, are hardly compensated by superior quality as compared with West European or even East European supplies.

At Last, Vote for the Negro

An American Correspondent writes:

WHEN the voting rights bill was signed into law by President Johnson recently, the most significant piece of legislation concerning the Ne-

gro in many years came into effect. As a precedent-creating ceremony at the Congress, the President declared that federal authorities would implement the law quickly and efficiently, and as a token of his conviction, he ordered law suits brought against several southern States for long-standing violations of the new law. Representatives from the Congress of Racial Equality have said that the bill will enable 900,000 Negroes in the south to register and vote this year. Regardless of the number who register, it is clear that the pattern of political affairs in the South will undergo a basic change in the immediate future.

Since 1870, the American south has been ruled by the white man. The Negroes, who were freed from slavery a century ago, were effectively robbed of their franchise by white-majority legislatures. The federal government, content with the *status quo*, did nothing to disturb this situation until the civil rights revolution of the past few years forced action. At present, only a small fraction of the Negroes eligible to vote are actually registered, due primarily to the fact that the white majority has refused, through various legal tricks, to let them vote. Until recently, the southern Negro community was apathetic and generally accepted its fate. Now, with the militancy of the civil rights movement, combined with effective federal legislation and, it is hoped, its prompt enforcement, the situation will change radically.

The voting rights bill itself is a relatively simple document. It stipulates that all people must be able to vote, in federal as well as State and local elections, and that if there is any discrimination by local authorities, the federal government may step in and register voters itself. It also outlaws the "poll tax" which a number of southern States still levy. No more will people have to pay for the privilege of voting in the United States. The main change from preceding legislation is the enforcement procedures which the new law provides. For the first time federal authorities will actually be able to enter a local district and make sure that the law is being enforced fairly. In the past, long court proceedings were necessary, and even then the enforcement was dependent on local officials, who were often opposed to the law and to the Negroes.

The new law will cause substantial changes by providing the setting for a change in the political structure of the south. In the past, State and local

offices were firmly in the hands of segregationist whites who did not even have to consider the Negroes, since they were effectively deprived of the vote. Since Negroes are the majority in a number of southern localities, and are a substantial minority in many others, under the new law, they will wield considerable political power. White politicians, who in the past satisfied the most reactionary elements in the community, will now have to meet at least some of the demands of the Negroes if they want to stay in office. Already, a member of the Student Non-Violent Co-ordinating Committee, the militant civil rights group, has been elected to the State legislature of Georgia. With the militant and effective programme of the Mississippi Freedom Democratic Party, a mostly Negro group with a substantial following, rapid change may even be possible in Mississippi, one of the last strongholds of all-out segregation.

For the first time, Southern Negroes will have political power within their grasp, and the mere threat of the use of this power will force moderation in the power structure of the south. It must be remembered that it cost the lives of three civil rights workers, murdered last year in the swamps of Mississippi, to initiate this legislation, and the mounting pressure of the Negro mass movement to get it passed by the Congress. But the measure is passed, and the political structure of the south will be changed as a result.

Exports Sluggish Again

THE search for missing export receipts in 1964-65 has yielded one surprising result. The value of exports was over-estimated by Rs 23 crores of which manufactured jute shipped from Calcutta alone accounted for Rs 20 crores. Bombay accounted for the remaining Rs 3 crores. Some errors and omissions in statistics are normal; statistics of piecegoods exports from Bombay have often enough been in the plural. But an error of Rs 20 crores in one commodity from one port, whatever the importance of that commodity or port, is serious enough to merit close attention; in the event, the original figure of exports of jute exceeded the revised figure of Rs 169 crores by 12 per cent.

As a result of this revision, the figure of total exports in 1964-65 has been revised from Rs 838 crores to Rs 815 crores, which represents an increase of only Rs 22 crores over 1963-64. This increase was concentrated in jute (revised figures), ores and alloys, and engineering goods. Veget-

table oils and seeds (Rs 15 crores), sugar (Rs 8 crores), art silk fabrics and handicrafts together recorded a decline of Rs 32 crores.

In the first quarter of the current financial year, there was a net fall of Rs 11 crores in exports as compared with the corresponding quarter of 1964-65; the entire decline occurred in sugar (Rs 8 crores) and cotton piecegoods (Rs 3 crores). The lower earnings from sugar (Rs 4 crores against Rs 12 crores) are attributable to lower prices since the quantity exported actually went up from 147,000 tonnes to 156,000 tonnes. For mill cloth, both value and quantity have been lower. Most of the decline in aggregate exports this year has been in respect of ECAFE countries (mainly Japan) and UK.

The increase in exports witnessed

LETTER TO EDITOR

To Collaborate or Not to Collaborate?

THE two articles "Case for Foreign Collaboration in Advertising" (May 22, 1965) and the "Case against Foreign Collaboration in Advertising" by RST (July 10, 1965) would sound like quibbling over small change when compared to the recent collaboration proposal of the Hilton International group. According to reports the proposal would amount to handing over a chain of government built hotels, for a duration of 25-50 years, to be run by Hilton International who would take 33½ per cent of the gross operating profits in addition to repatriating all expenses incurred by them. In absolute terms, Hiltons would repatriate, annually, about Rs 8 lakhs per hotel and on the assumption of an initial chain of 5 hotels, Hiltons would cause a drain on the reserves to the tune of Rs 40 lakhs per annum. Lynx eyed observers like RST would no doubt give vent to their protests in no uncertain terms.

It is interesting that public opinion against foreign collaboration suddenly gets galvanised when the government considers sanctioning a collaboration agreement for advertising (LPE-Aiyers), brassiers (Maidenform-Eve Apparel) or hotels (Hilton International-Government). RST aptly sums up the anti-collaborationists' view: "I for one can never believe that creative ability in India has reached a point where we have to await waves of inspiration from across the seas". It is somewhat unfortunate that the 'anti-collaborationists' restrict their tirade against what Michael Kidron aptly calls the over-

THE ECONOMIC WEEKLY

since 1962 is levelling off but that is not all. The net terms of trade which had improved from 100 in 1958 to 113 in 1962 have declined consistently since then to 110 in 1963 and 107 in 1964. Uncertainty about the continuance and modification of export incentive schemes has had something to do with the renewed sluggishness of exports, but this cannot be an adequate explanation because these schemes apply to only about one-quarter of total exports. Foreign demand, available surpluses for exports, and export prices have set a short term ceiling, to pierce which requires, first, an increase in domestic production, second, stabilisation of internal prices, and third, concentrated efforts to improve the export of non-traditional items like ready-made garments and engineering goods.

import of technology (*Economic Weekly*, April 24, 1965), merely to brassiers, hotels and advertising. For, who has heard of a small-scale filter paper producer who protested, not so long ago, against the government's threat to sanction foreign collaboration for producing filter paper? The stifling of Indian know-how in items distant from the public view is perhaps a more serious problem since such inequities rarely come into the open.

Foreign collaboration takes the form of the almost outrageous Hilton proposal mainly because of the restrictive policy adopted towards foreign investment. If the foreign partner is not permitted a stake in profits, through ownership of a part of the share capital, he is bound to adopt circuitous, though sometimes more lucrative, means to obtain his share of the profits. An open-door liberal policy towards foreign investment would at worst lead to control of industry by foreigners (a point so cogently exaggerated by President de Gaulle) but would it not be less demeaning than a major reorganisation, at the instance of the *World Bank*, of the once powerful Directorate-General of Technical Development by an American firm, Allen and Hamilton International? We certainly seem to be caught between the Scylla of foreign equity and the Charybdis of foreign loans!

CAPITAL VIEW

A Defeat for Pakistan, but...

Romesh Thapar

WITH the Pakistani infiltrators in Kashmir in a state of disarray, and a military 'drag-net' supposedly closing in on them, one is tempted to ask whether President Ayub, like President Kennedy after the fiasco of the Bay of Pigs operation in Cuba, is weeping over the fate of his men who were given to believe that the people of the Valley would rise to their support. He has reason to weep. Despite the dishonest chatter in sections of the western press about a popular revolt in the Valley, he knows that the events of the past few days have made a sorry mess of his ramified intrigues over Kashmir.

We have still to locate the hidden hand behind the so-called infiltration which Prime Minister Lal Bahadur has rightly described as a thinly-disguised invasion. Speculation ranges over a wide field. Was Ayub trying desperately to divert his people from the anti-US rantings of Bhutto? Did the omnipresent CIA trigger the operation for their loyal stalwart? Are the Chinese instructors, reported to be operating on the Pakistani side of the cease-fire line, the real culprits? Was the infiltration carried out over a few days or over months? Does Rawalpindi plan a sustained operation of this kind to loosen India's hold on the Valley? Will the cease-fire line be challenged too?

Pointless Official Briefings

As always, the official briefings of the press make the simplest matters look confused. No purposeful homework is done. Responsibility is divided. Seniority in the bureaucratic hierarchy, whether civil or military, dictates who will speak. The men who know the facts hang around in the shadows unable to intervene or to put sense into the proceedings. We have still to be told how the infiltration took place, and at what points. We have still to be given the human story of how the people of the Valley helped to isolate the raiders and to prevent their convergence on certain strategic points. We have still to nail down the lies and fabrications being spread within the country and outside to smear the Kashmiri people and to fan communal hatred.

Notwithstanding the emergency within 'The Emergency', even as the people of the Valley faced the dis-

guised invasion, the GOI was on holiday through Saturday and Sunday. Some sections planned a holiday for Monday, too, taking it for granted that Sunday was a holiday any way. And most newspapers did not appear on Monday. That this should have been the mood long after Defence Minister Yeshwantrao Chavan and his army staff had been compelled to recognise the gravity of the infiltration—earlier reports from Srinagar having been dismissed as exaggerated—only helps to confirm a generally held opinion that the GOI does not take its responsibility seriously and is always caught napping.

How the News Came

The first confirmation of a major infiltration was in the hands of the State Government early on Saturday, August 7. Ironically, the Prime Minister, seldom available for urgent consultations, received the report late that night. As for the rest of the Union Cabinet, the less said the better. The dangerous extent of the infiltration, via a gap near Gulmarg, became apparent in the following days. The State Government was most energetic. Its police units bore the brunt of the attack with great courage. The people of the Valley refused to respond to the engineered propaganda of the 'ghost' radio. The infiltrators, currently estimated at over 3,500, failed to co-ordinate. And when the army moved in, it was possible to prevent the concentration of the infiltrators and begin their destruction, pocket after pocket. However, delay in the counter-attack allowed a large number of the groups to escape to the mountains and forests. These demoralised, desperate men are still at large.

In the Capital, the initial reaction to the developments in the Kashmir Valley was puerile and thoughtless. First, there was the usual wild talk about the failure to prevent infiltrators getting through 'our positions' along the cease-fire line—as if our army in the State is organised in a solid phalanx. Then, the report that the infiltration had been going on surreptitiously since May was seized upon by several bureaucrats, politicians and ministers to spread the idea that the people of the Valley had been sheltering the infiltrators—an indication of how thin and fragile secular attitudes are within the ruling party,

the GOI and the Union Cabinet. And finally, believe it or not, the mess-makers united to whisper the canard that the State Government could have been more effective—a whisper which had to be loudly and emphatically silenced by Prime Minister Lal Bahadur in the course of his speech from the Red Fort on Independence Day.

Jan Sangh Demonstrations

The muck of Indian politics certainly comes to the top every time there is a crisis. On this occasion, communal and parochial attitudes have been visible in the most unexpected quarters. Indeed, one could not help noticing how easy it was for the Jan Sangh to fix its saffron flags and its loudspeakers over municipal property for an elaborate demonstration before Parliament which happened to coincide with the developments in Kashmir. The cynics claim that these communal-type demonstrations are encouraged to underline 'Hindu feelings'. The attempted rationalisation by those who are sympathetic is along familiar lines: one communalism must be fought by another! If we permit this political racketeering in high places, the demand may soon be voiced openly that Nationalism be equated with Hindu communalism.

This sickness which increasingly afflicts policy-making is reflected in our inability to strike at the roots of the problem in the Kashmir Valley. Integration of the State with India, so vociferously espoused by all and sundry, is not merely a question to be settled by constitutional amendments. A wonderfully talented people have to be lifted out of their despondency, persuaded that they are very much a part of a society which plans for an enlightened and secure future, that their Valley has a role to play beyond that of a tourist playground, that as a part of India they have something tangible to live for and fight for. That the people of the Valley denied the infiltrators a base, despite years of bad and corrupt government, despite the political and economic confusion which still prevails, is a fact which needs to be chewed upon particularly by the guilty men who continue to regard the region as something apart.

This is the crux of the problem. An airport which is paralysed every time heavy clouds gather, a road which

could not be more undependable, a railway which has yet to reach Jammu and a thoroughly primitive telephone system, are obvious pointers to our blatant, almost criminal, neglect of the Valley. As for the not-so-obvious evidence of our neglect, it is even more damning. The Valley still functions only for the tourist and 'closes down' during the long winter of six months. No plans are there to make the Valley viable round the year. Recruitment from the Valley to the Indian services is practically nil. Never does a Kashmiri find himself in the multitude of advisory committees which buttress the G.O.I. As for Kashmiri representation at the Centre, in policy-making, we are conscious of the need for it. Indeed, the people of the State still do not enjoy the various political and social rights which we do in other parts of the country. Labour laws in Kashmir, for example, are of the nineteen-thirties variety!

To argue glibly that vast sums of money have at least been poured into the valley is to reduce ourselves to the level of colonisers who need a piece of real estate, which is of strategic importance, and who pretend that they are interested in its welfare. It is the reactions in the valley to this smug, superior Indian attitude which feeds the propaganda of those who dream of independent *sheikhdoms*. No significant opinion in the valley is pro-Pakistani. True, a few successful business families, enriched by their link with the Indian market and now seeking political power in a merger with Pakistan, do subsidise the activities of the pro-Pakistani elements. But such ambitions and stirrings will always be a feature of life in the fringe areas where political frontiers meet — at least, until major economic advances have broken the hold of traditionalist and revivalist leaders.

The proper *integration* of the valley, in other words, has to begin with a massive opening up of communications, a substantial recruitment of Kashmir personnel into the services and a crash programme to sustain work and activity in the valley right through the year. This is a challenging task made all the more urgent by the events of the past fortnight. We should not be diverted, for Pakistan is unlikely to give up her infiltration tactics. And the confrontation may take on more dangerous forms as in the Kargil sector. The Kashmir situation is made up of many facets. We must keep them all in view.

We have failed repeatedly to keep

our promises to the people in the valley. Another failure, and we may not be presented with an opportunity

to try again. Pakistan has been defeated, but Pakistan banks on our continuing neglect of the valley.

What Prevents Unity?

K D Malaviya

OUR relations with Pakistan are fast deteriorating. Many of us believe that it is only Kashmir that stands between India and Pakistan. This is not so. We have now been drawn into the whirlpool of world politics in a precarious way and Pakistan is playing its game treacherously but skilfully. We are now involved in some country's struggle for domination in world affairs and Pakistan is only playing a tool in its hands. We too, therefore, should look for a political rather than a military solution. But it does not mean that we should not beat Pakistan back soon. No, we should do so very promptly...

What is the quarrel between China and India? NEFA? No. Is it Aksai-Chin? Yes, to a certain extent, but can this not be settled? Let the Chinese ponder over it. The initiative lies with them and not with us. There can be ways and means of probing for a solution, but only where there is a will. In the present attitude of the Chinese leaders, it seems difficult to find a line of action. Let the leaders of Asiatic powers coolly ponder over various issues that face us in Asia. If they do so, they will find that it is the economic backwardness and inertia of the people that come in the way of all types of progress — political, social, economic and cultural. Racial or national superiority or rivalry will not remove the evils of inertia of Asiatic peoples. A Socialist Asia should be our dream, but that can happen when some of us look to our national economic problems and others to our international relations and attitudes for the purpose of surging forward to a stage of collective understanding, wherein all barriers in the way of building a socialist society are quickly removed. Let China think about it before Mao tse-tung goes or events in India and Pakistan lead to painful turmoil.

It is good to talk about unity. It is equally good to appeal for such unity and for clearing the atmosphere of discord caused by personal ambitions. But we must never forget that unity does not come for the asking of it, that there are perfectly scientific causes of the phenomenon of disunity. These reasons are social and accumu-

late in a society like toxic matters in the system of human beings. If the toxin accumulated in the body politic of a social system is not removed, the disease is not cured in spite of great prayers and pious wishes, or unity is not achieved in spite of incessant appeals.

Let us take the case of Bihar Congress. For a long time this State, like its neighbours, was full of discord. Petty ambitions in politics, caste frictions and rivalries built on feudal and primitive attitudes were rampant. Corruption and inefficiency appeared to be the order of the day. Some senior Ministers of the Government of India thought that evils like corruption or inefficiency or rivalry were absolute evils and could be removed by prayers, appeals or exhortation on the pattern of our praying the Almighty for rains. Unfortunately, however, neither rain nor unity is brought about by prayers. But when it suits the interests of the parties or when warlords get tired of fighting, differences are patched up. This is what happened in Bihar. Unity having been achieved, Bihar should have improved its affairs and been a stronger and better State today than a month ago.

But what do we see? Immediately on the morrow of unity, Bihar was seen to be on fire. From distant corners of the State come news of sabotage, disruption of communications, loot, arson, murder, and complete anarchy. Why did this happen if the great problem of unity between the two warring factions in the Congress was settled? Has it not been said that all would be well in the country if Congressmen unite and live in love and peace? How is it that in spite of so much love in sight, the State of Bihar is still in trouble and its people in great distress?

I will only pose this question and not try to offer the answer. For, if I start saying in answer that prompt removal of economic disparity and revolutionary concessions to the tillers of land and announcement of a concrete socialist programme alone can bring about a better time, then people will start calling me a fellow traveller, or a dogmatist cut-off from the realities of India.

BOOK REVIEWS

Precursors to an Economic History of Asia?

J Krishnamurty

The Economic Development of South-East Asia, edited by C D Cowan; George Allen and Unwin, 1964; pp 192. 32s.

The Economic Development of China and Japan edited by C D Cowan; George Allen and Unwin, 1964; pp 255 35s.

THE two books under review represent efforts to bring together the considerable work that has gone into the study of East and South-East Asia, in order to assess the economic, historical and political factors relevant to a study of economic growth and economic backwardness in a region where both exist side by side. Such an undertaking is certainly an ambitious one and success or failure should be judged in relation to the magnitude of the problems involved.

Fortunately, or unfortunately, economic history — especially of the underdeveloped countries of today — has tended to go into certain limited lines of enquiry. There has been a tendency to concentrate on the study of foreign trade and, to a lesser extent, of extractive and plantation industries and of institutional aspects of agriculture. To a large extent this stems, not from the adoption of the view point of colonial rulers, but from the limitations of the availability of data. To some extent the two volumes under review reflect this problem.

Out of the seventeen papers collected in "The Economic Development of South-East Asia", no less than six deal with foreign trade, and a good many more deal with the impact of the West on export industries. Partly, this is due to the fact that all these papers were read at a conference held in July 1961 at the London School of Oriental and African Studies, and reflect the orientation of western thought on the problems of East and South-East Asia. In fact only three out of the seventeen papers are Asian contributions. The western orientation is obvious in the introduction — which is common to both books — by C D Cowan. He says: "Many current problems... hark back to the growth of trading ports and export crops, the importation of western colonial regimes and western funds and skills, the related development of indigenous trading communities and the economic bases of unrest underlying the nationalist movements of the late nineteenth and twentieth centuries." The result is a number of case studies of Asia *versus* the West, written largely from the western standpoint.

At the same time, the scholarly

nature of the contributions should not be underrated. This is particularly true of the volume on China and Japan. The study of the overland trade between Russia and China by Mark Macnall is certainly a commendable effort. He not merely studies the qualitative and quantitative impact of this trade — known as the Kiakhta trade — but also compares it with the trade at Canton. This comparison is certainly instructive. The Kiakhta trade, which began in 1689 and continued right down to 1858, was of mutual benefit to both Russia and China, unlike the trade through the treaty ports, between Western Europe and China which was an unjust imposition.

Kwang-Ching Liu's paper on "British-Chinese Steamship Rivalry, 1873-85" presents a comprehensive account of the superiority of the British steamship companies, due largely to their enterprise and initiative compared to the inertia of the Chinese companies, subjected to continuous intervention by an incompetent State bureaucracy.

The gross inefficiency of the State comes out even more vividly in Feuerwerker's account of the attempt to develop steel production in nineteenth century China. The failure of *Kuan-tu Shang-pan* (government supervision and merchant operation) to provide proper industrial leadership, sound economic judgement and manoeuvrability in operation, and the belief of government officials in their omnipotence led to a tragic series of developments, whereby an ironworks was developed at a wrong location, was manifestly uneconomic and was operated through chaotic financial methods. Large parts of Feuerwerker's accounts read like reports on Indian public and private enterprise. For instance: "In the company's three divisions... there are at least 1,200 officials and executives. Most of them are Sheng-Hsuan-huai's protégés and the relatives of his concubines. Their only forte is enriching themselves..." This is certainly a paper which should be read by all persons concerned with policy-making in India.

Jean Chesneaux's paper on the Chinese labour force in the first part of

the twentieth century is a good case study of the problems created by the lack of an industrial tradition among workers in underdeveloped societies. Alexander Eckstein in his paper on Sino-Soviet economic relations counters the Galenson hypothesis that these relations were disadvantageous to the Russians. He suggests, instead that it led to mutual benefit and that perhaps the Soviet Union benefited more.

The final paper on China by K R Walker is more a study in the history of economic thought in modern China. He studies the views of Ma Yin-Chu a leading economist and political thinker in China. Ma stands out as an advocate of balanced growth, birth control, and of more economic incentives in planning.

Allen's paper on Japanese economic growth is far too general, and is not in keeping with the specialist nature of the other papers. Professor Rosovsky's paper on capital formation in Japan is an excellent piece of quantitative analysis and he succeeds in showing that Japanese economic growth was remarkable in the way tradition and modernity were integrated to keep capital-output ratios low at the initial stages of industrialisation. The last paper by Professor Shinohara carefully analyses changes in foreign trade in pre-war Japan. He highlights the close correlation between rapid industrial growth and foreign trade.

The volume on South-East Asia is not as good as the one on China and Japan. Leighton Boyce discusses British exchange banking; Hyde, British shipping companies; Charles Fisher, population growth; Caldwell, Indonesian exports under colonial rule; Ingram, Thailand's rice trade; Wong Lin Ken, Malaya's tin industry; Norman Parmer, unrest among Malayan plantation workers and T E Smith, immigration in Malaya.

Some general comments on some of these papers seem to be in order. Francis Hyde's paper on British Shipping Companies and East and South East Asia, 1860-1939, covers much the same ground as Liu's paper on British-Chinese Steamship rivalry, 1873-85,

how did CHARMINAR become

one of the world's

top selling cigarettes?

because of VAZIR SULTAN

Ask any Charminar smoker this question and he'll say, "Because of the flavour!" Who put the rich flavour and unique taste into Charminar? Dedicated experts at The Vazir Sultan Tobacco Company Limited.

At their factory—the largest in South-East Asia—traditional secrets combine with modern tobacco know-how. Charminar's unique taste starts with the very finest tobaccos, developed by experts for Charminar. Other experts carefully blend the select triple-matured tobaccos. Then an extra process exclusive to Charminar gives you its rich flavour and unique taste. No wonder nearly 900 million Charminar cigarettes are bought every month...making Charminar one of the world's top selling cigarettes.

There's nothing like Charminar—India's greatest cigarette!

THE VAZIR SULTAN TOBACCO COMPANY LIMITED
MAKERS OF INDIA'S GREATEST CIGARETTE!

but Liu's work seems to be much richer in detail especially statistical evidence. This perhaps is one of the advantages of taking up a more specific problem and period.

Caldwell's paper on Indonesian exports presents very interesting data. He shows very clearly how in a colonial economy foreign trade has had a certain type of dynamism within specified boundaries. Throughout the period 1865-1939, different products predominate in the export market, yet all these products really belong to the same economic type—either plantation products, or the products of extractive industries. Table V (page 78) illustrates this point well. During the period 1865-1914, the percentage share of the value

of agriculture, forestry and the two main mining exports, to the value of all exports was never below 93.9 per cent.

The final paper by Smith on immigration and settlement of Chinese and Indians in Malaya is in some ways an indictment of the approach embodied in almost all the papers presented in the two volumes. Smith only considers the pull factors operating on migration into Malaya, and their demographic consequences. No attempt is made to consider the push factors which led to migration out of China and India and to the impact of all these factors on the economic attitudes of these migrants. This would surely be a fascinating line of study.

The moral of the two volumes seems to be that it is high time specialists in area studies got together and did more comprehensive work. Instead of a number of very scholarly works on different countries, on very specialised problems, a more comprehensive economic history of Asia may thus come to be written. One earnestly hopes that the specialists who met in the London School of Oriental and African Studies in July 1961 have by now got down to this vital task. It is rather a pity that the editor of these volumes could not provide a summary of the discussion among these experts, and, therefore, we are left without a clue as to its outcome.

Power Politics in World Affairs

Philip G Altbach

Undercurrents in American Foreign Relations by M S Venkataramani; Asia Publishing House, 1965; Pp 218, Rs 14.

THERE is certainly a need for increased understanding of the background and basis of American foreign policy. Venkataramani has performed a valuable service by analyzing several recent events in United States policy from the point of view of an outside observer. All too often foreign observers try to understand American policy without considering vital domestic issues facing the decision makers in Washington. The present volume is guilty of this fault, although this is somewhat offset by it providing a reasonably well researched and documented analysis unbiased by undue closeness to events as they took place in the United States. Perhaps most important, however, is the fact that this book shows the possibility and the value of outside research into American foreign and domestic policy. The United States is a complex society, and the more understanding that can be shed on its affairs, by Indians as well as by Americans, the better off both countries will be. Furthermore, it is only fair that since many American scholars have come to India to dissect its social and political life, competent Indians should return the compliment in the United States.

This book consists of four separate essays concerning America's foreign relations. These studies stand by themselves, and are, in fact, unrelated to each other. The first two deal with America's relations with India prior to India's independence and specifically concern India's recurring food problems. The other two essays deal with the Suez

Crisis of 1956, and the U-2 incident of 1960. The essays are very different in nature, and stress different aspects of American foreign policy. It would seem that the author has committed different sins in each of his essays, thus making it necessary to criticize each one and detracting from their value.

The first two essays, dealing with the Great Indian famine of 1943, and the food crisis of 1946 respectively show that the author has an admirable grasp of the facts of the situation and presents a competent presentation of the relation of the United States to these important events in India. Venkataramani neglects, however, to take American domestic politics into account. Indeed, throughout the two essays runs the unspoken assumption that India has, until very recently, played a very minor role in American foreign policy considerations. If this clear fact would have been stated at the outset, the two events which are under discussion would be easier to examine.

Probably the key elements in understanding America's reaction to India during the past three decades have been its ignorance of the country and its people, and a basic unconcern for the subcontinent. Only since the Chinese revolution of 1948 has the emphasis of the United States shifted from China to other parts of Asia. India is now seen as a counterweight to the growing threat of China, and vast amounts of American funds have been poured into India, although with varying results. Prior to the Communist takeover,

however, China was the keystone of American Asian policy. It would seem that the American policy makers have always had a difficult time understanding India and Indians. Indian reality just does not seem to fit into the well-defined categories of American pragmatism, and Americans are hard pressed not to throw up their hands in despair at India's problems and lack of discipline.

These essays correctly point out that the United States turned a deaf ear to India's needs in 1943 and in 1946 and documents the various manoeuvres of the American government in dealing with this matter. It is particularly embarrassing for the United States, since it was at this time giving huge amounts of food and other material to the Soviet Union, and by 1946 to the devastated nations of Europe. The author correctly states that the U S officials were more interested in keeping Winston Churchill happy than in feeding three hundred million starving people in India. But this is simply the way that power politics works, and the Allies were at this time involved in a life-or-death struggle with Nazi Germany; therefore, the needs of the Indian people, however legitimate, were passed over in the rush of events. To be fair to the United States, one should state that any other great power in a similar position would have chosen the same response.

Power politics does not excuse American indifference to India's needs, particularly, as Venkataramani points

out, when there was sufficient food and transport available in 1946 and probably also in 1947. It merely points out that nations, however loud their propaganda, are simply not motivated by humanitarianism.

These essays also overlook matters of domestic politics for the most part. It should be noted that the whole concept of foreign aid did not take concrete shape until 1948, when the Marshall Plan was reluctantly accepted by the United States Senate. The American president, Roosevelt, may have felt that the people would not accept this kind of aid programme at the time. Indeed, if the present aid programme to India was not linked to the issues of the Cold War, it is unlikely that the Congress would agree to the expenditures or that the American people would approve of it.

The final two essays in this short book provide some valuable insights into two of the crisis of the Cold War, the Suez Crisis of 1956 and the U-2 Affair of 1960. In these essays, the author has made good use of the documentary materials available to him. In the chapter on Suez, the degree of involvement by American oil interests in the situation and their influence on the actions of the American government are outlined. The Suez crisis is placed in the context of the Cold War by noting the central importance of the Middle East to the survival of Europe and the United States in terms of oil. While there are no revelations presented in this chapter, the author has summarized the available material skillfully and presents a case study of how economic interests motivated American foreign policy in this particular situation and how the forces of economics, power politics and diplomacy intermeshed to bring the crisis to an end. This analysis was preponderant by liberal analysts in the US and in Britain immediately following the crisis, but it is still interesting coming from someone completely uninvolved in the crisis.

The final chapter on the U-2 deals mostly with the developments in the United States which led up to the use of spy planes to gain information about Soviet military strength. The post-war period is seen through the eyes of American strategists, who saw their nation lose a monopoly of nuclear weapons and then saw the Soviet Union succeed in catching up with the United States in military affairs. Again, the power politics have shaped

American policy, and the U-2 flights are ordered by President Eisenhower to ensure that the security of the United States will not be impaired. The American government knew full well that these flights were in violation of international law, and the response of the State Department when the whole affair was uncovered by the Russians showed the embarrassment of the United States.

Thus, this book is a contribution

not so much to an understanding of the roots of American policy, but to the importance of power politics in world affairs. The four incidents which are presented do not offer enough evidence to gain a thorough understanding of the under currents of American foreign policy. Yet, a beginning has been made, and it is hoped that, scholars in India and elsewhere will look closely at the foreign relations of the United States, and of other nations as well.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Singapore's Future

G M Telang

THE Prime Minister of Singapore, Lee Kuan Yew, is reported to have broken down while announcing the secession of Singapore—aptly termed "ejection" by *The Times*, London—from the Federation of Malaysia. It was the natural reaction of a man who had cajoled, pleaded, argued and parted ways with friends and tenaciously fought for the integration of the island of Singapore with the Malayan mainland as a part of the Malaysian scheme. His long-cherished ideal of a new multi-racial nation of Malays, Indians and Chinese gradually advancing to socialism had been smothered under the onslaught of Malay racial exclusiveness and political conservatism.

Curiously enough, Lee's first encounter had been with the communists. That was way back in 1960 when he wanted the integration of Singapore with Malaya to be adopted by his People's Action Party (P A P) as its main plank. The communists in the party stood for an independent Singapore. The Socialists led by Lee and S Rajaratnam (later joined by the leading trade unionist, C Devan Nair who was earlier with the communists) had come to the conclusion that it would be difficult to further the socialist cause without drawing the Malay peasantry and youth into the mass movement. They felt that one of the main handicaps of the post-war movement for freedom in Malaya was the fact that it had not embraced the Malays in general. The Malayan Communist Party was completely Chinese in composition and in spite of its prolonged struggle against the British it was baulked of its objective because of the non-participation of Malays. For Lee and his colleagues, therefore, the immediate task before the socialist movement was to weld the three races in Malaya into a new national entity and then gradually work towards the egalitarian ideal.

His communist co-workers took a different view. Their thinking was conditioned more by the requirements of the current strategy of international communism than by the specific needs of domestic politics. They attached little importance to the need for a multi-racial movement and saw visions of an independent Singapore as a base for a possible armed struggle later within Malaya. The differences between

Lee and the communists led by Lim Chin Seong took a violent turn in 1961 when the latter broke away from the P A P and formed the Barisan Socialist (Socialist Front). The island then rocked under a fierce campaign by Lee, Nair and Rajaratnam to denounce the Barisan slogan of an independent Singapore.

Today Lim Chin Seong may well turn round and say triumphantly: "I told you so". But will he co-operate with Lee in consolidating Singapore's independence or will he still regard the socialists as his main enemy? There is no doubt that the strength of the Barisan Socialists which, three years ago, appeared to be in a position to claim the largest following among Singapore's population of two million (over 80 per cent Chinese) is today much weaker and the P A P commands greater influence. Lee proved this conclusively by winning a key bye-election in a constituency a few weeks ago which had twice before rejected his party candidates. However, the P A P cannot afford to be complacent.

The die-hards in Tunku Abdul Rahman's United Malay National Organisation have succeeded in frustrating Lee. He is a much disillusioned man. But he is not the sort to slide into passivity under defeat. The dice was loaded heavily against him in fighting for the creation of a multi-racial Malaysia. His handiwork has been undone, but he faces a new challenge now.

Running the affairs of a strategically situated island state will be a tough problem. The hostility of Kuala Lumpur's politicians is not the least of the difficulties that will beset Lee. The complicated defence arrangements that are being finalised between the U K, Malaysia, or what is left of it, and Singapore may place severe limitations on the new state's freedom of action. And the twists of Indonesian policy may not always be helpful.

Indonesia has welcomed the separation of Singapore from Malaysia. But she may not resume normal diplomatic relations with Singapore in the near future. If President Soekarno embarks upon a policy of working more actively for the separation of the Borneo territories from Malaysia, Lee will be placed in a quandary. Much will also

depend upon the policy the Barisan Socialist might adopt in conjunction with the Indonesian Communist Party.

A person like Lee in whom socialist idealism and political realism are combined can rise to the occasion. His socialism is opposed to communism; yet, anti-communism is not an article of faith with him. It is good to remember that it was largely because of his personal explanation of the Malaysia scheme during visits to several non-aligned capitals that Kuala Lumpur's credentials were accepted in the Afro-Asian world. How Lee faces now as leader of independent Singapore will be of significance wholly out of proportion to the size of Singapore. The leadership of the 240 square mile island will have a vital bearing on the political orientation of the large numbers of Chinese in South-East Asia.

Fourth Thermal Unit at Trombay

THE Tata Electric Companies have announced the commissioning of a 150/160 mW steam turbo-generator installed at their thermal power station. It is the largest thermal unit so far built in India. The turbo-generator operates with the highest steam conditions. It is a highly efficient unit having a comparatively low fuel consumption. It incorporates several interesting and new features not to be found in any other unit in this country, such as, controlled circulation boiler, boiler feed pumps with booster pumps, sophisticated instrumentation and highly automated controls for safe and efficient operation.

The project, which costs over Rs 15 crores, was initiated with the assistance of the Agency for International Development. The unit has been brought into commercial operation within the scheduled period of three years, the construction on the project having commenced after the monsoon in 1962. The project has been carried out by the engineers of the Tata Electric Companies. The indigenous content in design and installation of the unit has been much more than in any other comparable power plant so far erected in the country, only specialist advice being sought from the company's Consultants, Ebasco Services Inc, New York.

Changes in Cropping Pattern

A Study of U P

Shyam S Bhatia

Between 1950 and 1961 there have been considerable changes in the cropping pattern in Uttar Pradesh. These changes, however, are not manifest when data at the State level are considered. Obviously, changes in the cropping pattern have to be studied at least at the district level in order to understand their nature and to bring out the regional distribution of such changes within the State.

In UP the cropping patterns in different parts of the State have undergone change in varying degrees. Generally speaking, western UP is more dynamic than the eastern part where some districts, like Azamgarh and Basti, seem almost to resist change.

There also appears to have been some regional redistribution of crops. There are indications that the density of some crops is increasing in areas where it was already high. In other words, there appears to be a tendency towards geographical concentration of crops. This process of concentration has been slow during the period under study, but it is definitely discernible. Further studies are needed to understand the implications of the process.

IN the First and Second Plans considerable emphasis was laid on agricultural development in Uttar Pradesh. It is the purpose of this paper to make a preliminary report on changes in cropping pattern during the decade between 1950-51 and 1960-61. Here cropping patterns at district level have been compared at two points of time, namely, 1950-51 and 1960-61. The cropping pattern in 1950-51 is taken to represent conditions prevailing in the area prior to the introduction of the development plans and the cropping pattern in 1960-61 presents conditions approximately at the end of the Second Plan.

As data are not available for the northern districts of Garhwal, Tehri Garhwal, Almora and Nainital, this study is confined to the remaining 47 districts of the State. References to the State as a whole in the context of this paper imply these 47 districts taken together. Further, the study is based on a consideration of the proportion of cropland under seven cereals (rice, wheat, barley, jowar, bajra, ragi and maize), other small millets, gram, other pulses (excluding gram), sugar-cane, total oilseeds, cotton, and fodder crops. These crops accounted for 97.2 per cent of the total cropped area in 1950-51 and 96.8 per cent of the total cropped area in 1960-61.

Changes in the cropping pattern referred to in this paper mean changes in the proportion of cropland devoted to various crops. Change is measured here by taking percentage point difference between the 1950-51 and 1960-61 proportions of cropland under each crop. For example, if in any district, wheat occupied 22 per cent of cropland in 1950-51 and 24 per cent of cropland in 1960-61, change is taken to be an increase of 2 per cent as the crop

has improved its relative strength in the cropping pattern by 2 per cent.

Change in State as a Whole

A comparison of the proportion of cropland devoted to different crops in 1950-51 and 1960-61 showed that in Uttar Pradesh as a whole, the changes in cropping pattern were small (Table 1). In 1950-51, foodgrains occupied 86.1 per cent of the total cropped area while in 1960-61 they occupied 84.8 per cent. Cereals and millets occupied 63.1 per cent of cropland in 1950-51 and 62.9 per cent less in 1960-61. Total pulses declined by 1.1 per cent during the decade.

Further, the proportion of wheat increased by 1.6 per cent while that of barley decreased by 1.5 per cent. Maize gained by 0.6 per cent and jowar declined by the same amount while gram decreased by 0.7 per cent. Among the non-foodgrains, sugar-cane increased by one per cent while oilseeds gained by 0.3 per cent. Cotton which has been progressively declining since 1930-31, showed an improvement by one tenth of a per cent during the decade under consideration. Taking the increase and decrease in the proportion of cropland devoted to the above noted crops, it appears that only about 4.0 per cent of the total cropped area was involved in crop pattern changes during the decade.

Foodgrains

Though the proportion of foodgrains has declined by 1.3 per cent in the State, interesting regional and inter-district variations can be observed. Whereas in 1950-51, only 8 districts (mostly western) had less than 80 per cent of cropped area under foodgrains, the number of such districts increased to 12 a decade later. In two districts, Muzaffarnagar and Meerut, foodgrains declined to 54.4 and 57.5 per cent of

cropland respectively in 1960-61. On the contrary, there were 12 districts in 1950-51 with more than 90 per cent of total cropped area under foodgrains, and the number of such districts increased to 15 in 1960-61.

Further, it appears that the districts that already had a comparatively low proportion of cropland under foodgrains in 1950-51 declined still more as in the case of Meerut and Muzaffarnagar. On the other hand, some districts

Sources: Compiled from district data.

which had a rather high proportion of foodgrains in 1950-51, have gained further as in the case of Jalaun, Jhansi, Hamirpur and Mirzapur where the acreage under foodgrains increased under the impact of increased irrigation.

The inter-district variations of change in foodgrains range from a decline of 6.5 per cent to a gain of 8.6 per cent (Table 2). In all, 18 districts showed a relative increase while 27 districts showed a decrease (there was no change in the strength of foodgrains in two districts). Of the 18 districts registering an increase, 5 districts showed an increase of less than one per cent, 7 districts an increase of one to 1.9 per cent, 4 districts an increase of 2 to 2.9 per cent while two districts increased by more than three per cent (these were Jhansi, 8.6 per cent and Hamirpur, 4.5 per cent).

Among the 27 districts registering a decline in foodgrains, 3 districts declined by less than 1 per cent, 5 districts showed a decline of 1 to 1.9 per cent, 7 districts decreased by 2 to 2.9 per cent and 12 districts showed a decline of more than 3 per cent. In Muzaffarnagar, foodgrains declined by 6.5 per cent, in Meerut by 6.3 per cent, in Kheri and Bijnor by 6.2 per cent each, and in Saharanpur by 5.6 per cent. In their regional distribution, all the western and northern districts (except Gorakhpur) have registered a decline in foodgrains. Here, the proportion of sugar-cane appears to have increased considerably. The emphasis on cash crops, so very prominent in the western districts, appears to be spreading elsewhere and seems to be a desirable trend.

Rice

The inter-regional and inter-district changes in the proportion of rice indicate that rice declined in north-eastern and south-eastern districts where it occupied a relatively high proportion of cropped area in 1950-51. It also declined in the western and mid-western districts where the proportion of cropland under it was already low. The increase in proportion of rice seems to have mostly occurred in the mid-central districts of Uttar Pradesh (of the eight districts that showed an increase of more than two per cent in rice, seven are located here). It may also be mentioned that rice was the leading increased crop in five districts in this part of the State.

The changes in the proportion of rice vary from an increase of 4.4 per

cent to a decline of 6.3 per cent (Table 3). In the 25 districts that showed an increase in rice during the decade, ten districts gained less than one per cent while seven others gained from one to 1.9 per cent. Unao and Mainpuri gained more than any other district, their respective increase being 4.4 and 4.2 per cent. In Unao, rice occupied third position in 1950-51 while it became the leading crop in 1960-61. In Mainpuri, too, rice has moved to a third position in 1960-61 while it was of minor significance in 1950-51. On the other hand, of the 21 districts which experienced a relative decline in rice during the decade, ten districts declined by less than one per cent, seven districts between one and 1.9 per cent, and four districts declined by more than two per cent. Mirzapur and Rampur showed more decline than the other districts, their respective decrease being 6.3 and 3.0 per cent. Also, in both these districts, no other crop declined as much as rice. In Mirzapur, rice continued to be the leading crop inspite of its high decrease. In Rampur, rice which was the leading crop in 1950-51 yielded the first position to wheat in 1960-61.

Sultanpur	31.8	32.6	+0.8
Unao	14.3	18.7	+4.4

Wheat

The crop that seems to have pushed forward in a real big way in Uttar Pradesh, is wheat. The proportion of wheat in the State increased by 1.6 per cent in a decade and this increase was more than that of any other crop. The phenomenal increase in wheat was reflected at the district level by the fact that as many as forty districts showed a relative increase in wheat. In as many as thirteen districts, wheat was the leading increased crop, that is, it gained more than any other crop. Among the forty districts that showed an increase in wheat, 29 districts gained more than one per cent, 15 districts gained more than two per cent, 6 districts gained more than three per cent, and 3 districts gained more than five per cent during the last decade. Jhansi, Kanpur and Mathura were the three main increase districts with a gain of 7.6, 5.7 and 5.6 per cent respectively (Table 4).

Though wheat had gained in most parts of the state, the areas of comparatively higher increase were in the southern and south-western sections where almost all the districts increased by more than two per cent. In the

districts where wheat was the leading increase crop, the leading decrease crops were jowar, gram, barley or oilseeds.

Wheat declined in only eight districts, viz, Azamgarh, Basti, Etah, Muzaffarnagar, Rampur, Shahjahanpur, Saharanpur and Dehra Dun. In six districts, the decline in wheat was less than 2 per cent and in the remaining two, Saharanpur and Dehra Dun, there was a decrease of 2.1 and 4.1 per cent respectively. Interestingly, in four of the eight wheat decline districts, sugar-cane was the leading increase crop. (In both Saharanpur and Dehra Dun, sugar-cane increased by at least five per cent during the decade.)

Barley

The crop that has registered a considerable decline in Uttar Pradesh as a whole is barley. It has declined by 1.5 per cent during the decade and in this respect, it has moved in a reverse direction to that of wheat though on an equally extensive scale.

The crop declined in as many as 37 districts in the state. Of these, 9 districts showed a decline of less than 1 per cent, 16 districts a decline of 1 to 1.9 per cent, 8 districts a decline of 2 to 2.9 per cent while 4 districts showed a decline of more than 3 per cent. In Dehra Dun, barley declined by 5 per cent (Table 5). In its regional distribution, barley has declined in nearly all parts of the state, particularly in the west central districts and the mid northern districts.

Barley showed an increase in only 8 districts of which 6 showed an increase of less than 1 per cent. Jaunpur showed an increase of 2.2 per cent while Ballia had an increase of 1.2 per cent.

Of all the crops that showed a decline in the various districts, barley appeared as the leading decrease crop in 8 districts. These 8 districts are Gonda, Bahraich, Kheri, Sitapur, Unao, Aligarh, Budaun and Moradabad. Barley was the leading increase crop in only one district, namely, Jaunpur.

Jowar

During the decade under consideration, all the dry cereals, namely, jowar, bajra and small millets have declined in the State. Among these three crops, jowar has declined most extensively though it showed a proportional decrease of 0.6 per cent in the study area as a whole.

During 1950-51, jowar was grown fairly widely in the southern and south western districts. Its proportion gradually declined towards east and north-east. As a result of decline in the cultivation of jowar during the decade, the crop seems to be confined in 1960-61 to only the southern and mid-central districts of the state. The crop declined in as many as 29 districts, of which 9 showed a decline of less than one per cent. In the remaining 20 districts, 11 showed a decline of one to 1.9 per cent, 6 a decline of 2 to 2.9 per cent, while in 3 districts, jowar decreased by more than 3 per cent during the decade. Mainpuri registered a decline of 4.9 per cent while Etawah and Mathura showed a decline of 3.3 per cent each (Table 6). The south-western districts seem conspicuous in the relative decline of jowar and in a good number of districts in the south west, the crop not only showed a decline, but it was also the leading decrease crop. In 5 districts in the south west, namely, Mathura, Agra, Mainpuri, Farrukhabad and Etawah, jowar decreased more than any other crop during the decade. In Allahabad and Bareilly also, jowar was the leading decrease crop during the decade.

Jowar showed a relative increase in only 9 districts of which 7 showed a small increase of less than half a per cent. The districts of Jhansi and Hamirpur showed an increase of 2.3 and 1.7 per cent respectively. In these two districts, the impact of irrigation brought about a redistribution of the area under crops resulting in an increase in wheat as well as jowar. The increase in wheat and jowar in Jhansi and Hamirpur appears to have taken place particularly through a decline in the proportion of oilseeds in the cropping pattern. It may also be mentioned here that jowar did not increase more than any other crop in any of the districts in the state. It indicates that though jowar did show an increase of more than 2 per cent in Jhansi, another crop, namely, wheat was more dynamic and showed a higher in the district.

Bajra

In the State as a whole, the proportion of bajra seems to have remained almost the same in 1960-61 as it was in 1950-51. However, there seems to have been a spatial redistribution of the crop. In 1950-51, bajra was essentially confined to the western

Table 4: Change in Area under Wheat in Selected Districts

E.I.D.-PARRY AND EXPORTS The E.I.D.—Parry Group has always been export-oriented and among the first exports—at the end of the 18th century—were piece-goods, cotton stuffs, paintings, saltpetre, vegetable oils, animal horns, redwood, indigo and sugar.

The E.I.D.—Parry Group is constantly in search of new export items and markets and today exports its popular confectionery and Parryware (sanitaryware) to the Middle East and Malaysia. Items like handloom goods, canned prawns and cashew are exported to Europe and America. The Group is also entering the vast markets of resurgent Africa.

Apart from earning foreign exchange by export, the Group has consistently sought to check the outflow of exchange for imports by setting up manufacturing units in the country. It leads in the manufacture and sale of sugar, confectionery, fertilisers & sanitaryware and in the formulation of plant protection products.

The E.I.D.—Parry Group, fondly known as "Parrys", is one of the larger companies in India consisting of 9 subsidiary and associated concerns providing employment for more than 10,000 people.

and south western districts and its density gradually declined towards east and north east. In 1960-61 the area of higher density seems to have shrunk while the eastern districts (which had rather low proportion of cropland devoted to bajra earlier) seem to show an increase though the increase is rather small in most of the districts. Generally speaking, the western and north-western districts have experienced a decline in the proportion of bajra while the eastern and central districts have gained. In the state as a whole, 21 districts showed an increase in the proportion of cropland under bajra and of these as many as 15 showed an increase of less than one per cent. Etah showed an increase of 7.2 per cent and this increase is more than any other crop in the district during the decade. This increase seems to have been at the expense of small millets which showed a decline of 7.4 per cent in the district. Other gain districts are: Budaun 1.9 per cent, Mainpuri and Varanasi 1.5 per cent each, Ballia 1.1 per cent and Ghazipur 1 per cent.

Bajra declined in 19 districts of which 12 showed a decline of less than 1 per cent while the remaining seven showed a decline of 1 to 1.9 per cent. The latter mentioned districts are Agra, Bareilly, Hardoi, Jalaun, Lucknow, Muzaffarnagar, and Saharanpur.

Maize

In Uttar Pradesh, maize with an increase of 0.6 per cent during the decade ranks next to wheat and sugarcane. As many as 32 districts showed an increase in maize and of these, 14 districts experienced an increase of more than one per cent while 77 districts had an increase of more than 2 per cent. The three leading increase districts were Dehra Dun (5.7), Rampur (4.3) and Sitapur (4.0). All the northern, western, north western and north eastern districts showed increase in the strength of maize in the cropping pattern. Maize declined in only 8 districts of which 7 showed a decline of less than 1 per cent and six of these declined by less than half a per cent. The districts showing decline were Jaunpur, Mirzapur, Barabanki, Fyzabad, Gonda, Lucknow, Mainpuri and Jhansi.

Gram

In general, pulses declined by 1.1 per cent in Uttar Pradesh as a whole. Gram showed a decline of 0.7 per cent in the state, though it continued to

have a third rank among the various crops. The change in proportion of gram ranges from a gain of 2.2 per cent to a decline of 5.7 per cent. In all, 18 districts showed a gain and of these, 7 districts gained less than 1 per cent, 8 districts gained from 1.0 to 1.9 per cent, while 3 districts gained more than 2 per cent. The 3 leading gain districts were Lucknow, Fatehpur and Hardoi with a respective gain of 2.4, 2.2 and 2.0 per cent. The gain districts form a contiguous block from Gorakhpur to Bahraich in the north to Partapgarh and Fatehpur in the south, and Shahjahanpur and Hardoi in the west.

Gram decreased in 29 districts of which 18 showed a decrease of more than 1 per cent. Nearly all the districts in the west (except Agra and Etah) and all the districts in the south and in the east showed a decline in the production of gram. The leading decline districts were Muzaffarnagar, Saharanpur, Meerut, Kanpur, Ballia and Banda (Table 7).

Comparing the decline of gram to that of other crops, it appears that

gram decreased more than any other crop in as many as 10 districts in the State. Five of these districts form a block in the west comprising Bijnor, Saharanpur, Muzaffarnagar, Meerut and Bulandshahr, while the remaining 5 districts where gram was the leading decrease crop were Pilibhit, Kanpur, Banda, Varanasi and Ballia. In all the western districts that showed gram as the leading decrease crop, sugar-cane was the leading increase crop. In Pilibhit also, sugar-cane was the leading increase crop. The other leading increase crops in the districts where gram was the leading decrease crop, were maize and wheat. Gram was the leading increase crop in 4 districts, namely, Bahraich, Barabanki, Sultanpur and Fatehpur. In Bahraich, barley was the leading decrease crop while in Bareilly and Sultanpur, small millets were the main decrease crop.

Other Pulses

In 1950-51, other pulses (excluding gram) occupied 10.2 per cent of the total cropped area whereas in 1960-61, the proportion declined to 9.8 per cent.

Table 6: Change in Area under Jowar in Selected Districts

(As per cent of total cropped area)

Districts	1950-51	1960-61	Change
Agra	6.1	3.4	-2.7
Allahabad	7.5	5.5	-2.0
Bareilly	5.4	4.1	-1.3
Etah	4.3	1.7	-2.6
Etawah	6.9	3.6	-3.3
Fatehpur	14.4	13.6	-0.8
Hamirpur	18.4	20.1	+1.7
Jhansi	22.8	25.1	+2.3
Kanpur	15.0	12.5	-2.5
Mainpuri	8.6	3.7	-4.9
Mathura	11.2	7.9	-3.3

Table 7: Change in Area under Gram in Selected Districts

(As per cent of total cropped area)

Districts	1950-51	1960-61	Change
Agra	20.8	21.8	+1.0
Ballia	15.6	12.5	-3.1
Banda	36.5	33.5	-3.0
Bulandshahr	7.7	5.1	-2.6
Fatehpur	20.9	23.1	+2.2
Hardoi	12.4	14.4	+2.0
Jalaun	37.5	36.7	-0.8
Jhansi	23.2	22.5	-0.7
Kanpur	19.4	15.4	-4.0
Meerut	9.6	5.8	-3.8
Muzaffarnagar	13.4	7.7	-5.7
Pilibhit	14.4	11.8	-2.6
Saharanpur	15.4	10.2	-5.2

The inter-district variations in other pulses showed a high range from an increase of 5.6 per cent to a decrease of 5.6 per cent. Generally speaking, the other pulses experienced a decline in the cropping patterns of various districts. In all, 28 districts showed a relative decrease in other pulses. Of these, 11 districts had a decrease of less than one per cent, 12 districts a decrease of 1 to 1.9 per cent, 3 districts a decrease of 2 to 2.9 per cent and 2 districts decreased by more than 3 per cent. The leading decrease districts in other pulses were Dehra Dun which showed a decline of 5.6 per cent and Fyzabad which experienced a decrease of 5 per cent (Table 8).

The other pulses showed an increase in 17 districts of which 6 had an increase of less than one per cent, 8 districts an increase of one to 1.9 per cent and 3 districts an increase of over 3 per cent. The three leading increase districts were Mirzapur which gained 5.6 per cent; and Aligarh and Ghazipur which gained 3.1 per cent each.

Considering the various crops that decreased during the period under study, other pulses decreased more than any other crop in 8 districts. These 8 districts were Deoria, Gorakhpur, Basti, Fyzabad, Azamgarh, Fatehpur, Hardoi and Dehra Dun. Correspondingly, other pulses increased more than any other crop in 3 districts, namely, Ghazipur, Mirzapur and Shahjahanpur. In the districts where other pulses formed the leading decrease crop, the corresponding leading increase crops were sugar-cane, wheat, gram, oilseeds and maize.

In Mirzapur, other pulses increased by 5.6 per cent and rice showed a decline of 6.3 per cent. In Ghazipur, other pulses gained by 3.1 per cent while rice decreased by 1.9 per cent. In Shahjahanpur, the other pulses increased by 1.3 per cent and wheat declined by 1.7 per cent. In Basti, other pulses declined by 1.8 per cent while sugar-cane increased by 1.6 per cent. In Deoria, the other pulses declined by 2.6 per cent and sugar-cane increased by 5.1 per cent. In Dehra Dun, other pulses declined by 5.6 per cent while maize showed an increase of 5.7 per cent. In Hardoi, other pulses declined by 2.2 per cent while oilseeds increased by 2.7 per cent. In Fyzabad, other pulses declined by 5 per cent while wheat increased by 2.5 per cent.

From a comparison of the decline in other pulses and the increase in

other crops, it appears that the area under other pulses is passing on to either cereals or to sugar-cane.

Sugar-Cane

In the State as a whole, sugar-cane showed an increase of 1 per cent in 1960-61 over the proportion which it occupied in 1950-51. This small increase in the area as a whole does not reflect the phenomenal changes that have occurred in the distribution of this crop. As many as 25 districts showed an increase in the proportion of sugar-cane. Of these, 9 districts gained less than 1 per cent, 4 districts 1 to 1.9 per cent, 3 districts 2 to 2.9 per cent and 9 districts an increase of more than 3 per cent. All the northern districts from Deoria to Dehra Dun (except Bahraich) and all the western districts from Agra in the south to Dehra Dun in the north have experienced an increase during the decade. The western districts have had a not-

able increase in sugar-cane and Muzaffarnagar had about a quarter of its total cropped area under sugar-cane in 1960-61. All the western districts from Aligarh in the south to Dehra Dun in the north showed an increase of more than 3 per cent. The leading increase districts were Muzaffarnagar (7.1 per cent), Saharanpur (5.6 per cent), Dehra Dun, Meerut and Bulandshahr (Table 9).

A study of the distribution of sugar-cane increase shows that nearly all the districts which already had a higher than the average proportion of area under sugar-cane, were the very districts that gained most. Further, it appears that the trend in general is towards a larger proportion of area under sugar-cane and this seems to be happening at the cost of foodgrains in general and cereals in particular. For example, in Dehra Dun where sugar-cane increased by 5.0 per cent during the decade, wheat declined by 4 per

Table 8: Change in Area under Other Pulses (excluding Gram) in Selected Districts

5½ Per Cent Maharashtra State Development Loan, 1977

ISSUE PRICE AT PAR

OPEN ON MONDAY, THE 23rd AUGUST 1965

The loan will be closed as soon as the total amount of Rs 15 crores has been subscribed and in any case not later than the close of business on the 28th August 1965.

The applications for the loan will be received at:—

- (A) the offices of the Reserve Bank of India, Bangalore, Bombay (Fort & Byculla), Calcutta, Madras, Nagpur and New Delhi,
- (B) the branch of the State Bank of India at Patna,
- (C) the branch of the State Bank of Hyderabad at Hyderabad,
- (D) the branches of the State Bank of Hyderabad conducting Government treasury work within the State of Maharashtra,
- (E) the branches of the State Bank of India within the State of Maharashtra except at Bombay and Nagpur and at places covered by item (d).
- (F) the Government treasuries and Sub-treasuries in the State of Maharashtra at places not covered by items (d) and (e).

Full particulars can be obtained at any of the offices mentioned above.

KSS/3-8-65.

cent and barley by 5 per cent. In Saharanpur, wheat declined by 2.1 per cent, bajra by 1.4 per cent and gram by 5.2 per cent, but sugar-cane gained by 5.6 per cent. In Muzaffarnagar, which had the highest relative increase in sugar-cane in the state, barley decreased by 1 per cent, bajra by 1.1 per cent and gram by 5.7 per cent.

Among the northern districts, in Deoria rice decreased by 1.7 per cent and barley by 2.1 per cent while sugar-cane increased by more than 5 per cent. In Kheri, barley decreased by 3.5 per cent and rice decreased by 1.4 per cent whereas sugar-cane increased by 4.6 per cent. Generally, it is the small grains and dry crops which seem to be yielding place to sugar-cane but in a large number of districts, sugar-cane to be displacing the major cereals as well.

As many as 18 districts showed a relative decline in sugar-cane and of these, 12 showed a decrease of less than 1 per cent and the remaining showed a decrease of one to 1.9 per cent. The regional distribution of the districts registering a relative decrease showed that these districts mostly lie in the eastern and south eastern parts of the state and these are the districts where the proportion of sugar-cane is generally low. These facts suggest that areal shifts are under way in the distribution of sugar-cane and the crop is moving towards northern and western districts of the state while its proportion in the south eastern, southern and mid-central districts is declining.

It may also be mentioned here that in 1950-51, only 5 districts had more than 10 per cent of area under sugar-cane while in 1960-61, the number of such districts had risen to ten. And two districts, viz., Muzaffarnagar and Meerut, devoted more than 20 per cent of the total cropped area to sugar-cane.

Oilseeds

In 1950-51, oilseeds occupied only 1.8 per cent of the total cropped area in the state and a decade later they showed an increase of 0.3 per cent. But, there seem to be some interesting shifts in the areal distribution of oilseeds that have taken place during the decade. Oilseeds increased in 24 districts, of which 12 showed an increase of less than one per cent, 7 an increase of one to 1.9 per cent, 4 an increase of two to 2.9 per cent, while one district showed an increase of more than 3 per cent. Oilseeds decreased in 17 districts, of which 11 showed a decline

of less than one per cent, 3 districts a decline of one to 1.9 per cent and another 3 districts a decline of more than 2 per cent.

The interesting feature of the distributional change appears to be that oilseeds seem to have declined in southern and south western districts. The decline in Jhansi has been 6.2 per cent, in Hamirpur 4.6 per cent and the other south western districts of Jalaun and Etawah also showed a decline in oilseeds. Here, in three districts, namely, Jalaun, Jhansi and Hamirpur, oilseeds declined more than any other crop in the district. In contrast to this the major grain in oilseeds seems to have occurred in several districts from Hardoi in the east to Moradabad in the west. In this area, in at least three districts namely, Moradabad, Bareilly, and Hardoi, oilseeds increased more than any other crop in the district.

Major Increases and Decreases

Considering all the crops that showed relative increase during the decade 1950-51 to 1960-61 in the various districts, two crops appear to stand out. These are wheat and sugar-cane. While wheat was the leading increase crop in the southern and south western districts, sugar-cane was the main increase crop in all the western and northern districts of the state. Wheat formed the leading increase crop in 13 districts while sugar-cane increased more than any other crop in 11 districts. Oilseeds were the leading increase crop in 3 districts. Maize increased more than any other crop in five widely scattered districts from Ballia in the east to Dehra Dun in the north west.

Among the leading decrease crops, jowar, barley, gram, small millets, and other pulses were quite conspicuous. They were the leading decrease crop in as many as 40 districts. Barley, small millets and other pulses (excluding gram) declined more than any other crop in 23 districts. These include the terai districts from Deoria to Kheri and east central districts as far south as Rae-Bareilly, Partapgarh and Jaunpur.

Gram was the leading decrease crop in 10 districts, barley in 8 districts, jowar in 7 districts, small millets in another seven and other pulses in eight districts. In a block of 3 districts comprising Jalaun, Jhansi and Hamirpur, oilseeds decreased more than any other crop.

Though it may not be quite possible to state which crops actually provided cropland for the growth and expansion of a certain other crop, a comparison of the leading increase and decrease crops does indicate some of the ingredients involved in the replacement or substitution of crops in any area. Such a comparison provides lines for further investigation to find out the physical and economic factors that were responsible for a reshuffle of cropland between various crops resulting in changes in the cropping pattern.* For this purpose, the leading increase crop of each district was tabulated against its leading decrease crop to find out the occurrence of common groups and contiguous areas.

* It is possible that some crops experienced a relative decline because of the expansion of total cropped area.

Table 10 Leading Increase and Decrease in Crops in Selected Districts
(In Parentheses : Per Cent Change)

District	Leading Increase Crop	Leading Decrease Crop
Agra	Wheat (3.4)	Jowar (2.7)
Aligarh	Sugar-cane (3.4)	Barley (2.9)
Bijnor	Sugar-cane (4.4)	Gram (2.3)
Bulandshahr	Sugar-cane (3.9)	Gram (2.6)
Etawah	Rice (3.0)	Jowar (3.3)
Hamirpur	Wheat (3.7)	Oilseeds (4.6)
Jhansi	Wheat (7.6)	Oilseeds (6.2)
Kheri	Sugar-cane (4.6)	Barley (3.5)
Meerut	Sugar-cane (4.5)	Gram (3.8)
Moradabad	Oilseeds (2.6)	Barley (2.7)
Muzaffarnagar	Sugar-cane (7.1)	Gram (5.7)
Pilibhit	Sugar-cane (2.2)	Gram (2.6)
Saharanpur	Sugar-cane (5.6)	Gram (5.2)
Unao	Rice (4.4)	Barley (2.3)

The comparison of leading increase and decrease crops showed some interesting features that seem to offer a partial explanation of the nature of shifts in the cropping pattern. The leading increase crop of wheat corresponded to the leading decrease crop of jowar in three districts (Agra, Mathura and Allahabad), of oilseeds in three other contiguous districts (Jalaun, Jhansi and Hamirpur), and of gram in another three districts (Banda, Kanpur and Varanasi). A fair portion of the relative increase in wheat in these districts seems to have occurred at the expense of the leading decrease crops though it can not categorically be stated that wheat was actually substituted for jowar or oilseeds or gram. Likewise, the leading increase crop of sugar-cane corresponded to the leading decrease crop of gram in six districts (Pilibhit and a contiguous area consisting of Bijnor, Saharanpur, Muzaffarnagar, Meerut and Bulandshahr), of barley in two districts (Aligarh and Kheri), and of other pulses and small millets in a horse-shoe shaped area comprising Basti, Azamgarh and Deoria (Table 10).

That the leading increase and decrease crops do constitute major components of crop substitution is borne out by a study of the changes in the cropping pattern of various districts. For example, in Jhansi the main increase crops were: wheat (7.6 per cent), jowar (2.3 per cent) and other pulses (1.8 per cent) while the main decrease crops were: oilseeds (6.2 per cent), small millets (1.4 per cent) and barley (1.0 per cent). Again, in Saharanpur, the main increase crops were: sugar-cane (5.6 per cent) and rice (3.6 per cent) while the main decrease crops were: gram (5.2 per cent), wheat (2.1 per cent) and bajra (1.4 per cent). It must be emphasized here that a comparison of the leading increase and decrease crops only points to the possible crop substitutions and detailed studies alone can provide more satisfactory answers to the problem.

Total Volume of Change: Measure of Agricultural Dynamism

Changes in the relative strength of some individual crops have been discussed above. We may now make an assessment of the total volume of change that has occurred in the cropping pattern. Obviously the districts in which a large percentage of total

cropland is involved in change, would be relatively more dynamic than those in which only a small percentage of the cropland is involved. The districts which show little change can be identified with a view to find out the inhibiting factors responsible for their stagnation.

For the purpose of assessing the total volume of change, positive changes and negative changes were separately added for each district. Normally, for any given district, the sum of positive changes should equal the sum of negative changes. Where the two values vary, the difference would be due to changes in crops not included in the study. However, the larger of the two values (from amongst the sum of positive and negative changes) may be taken to represent the total volume of change that the cropland has undergone.

In Uttar Pradesh as a whole, the crops showing positive change were: wheat (1.6 per cent), sugar-cane (1.0 per cent), maize (0.6 per cent), oilseeds (0.3 per cent) and cotton (0.1 per cent), all adding upto 3.6 per cent. The crops showing negative change were: barley (1.5 per cent), gram (0.7 per cent), jowar (0.6 per cent), fodder (0.5 per cent), other pulses (0.4 per cent), bajra (0.1 per cent), rice (0.1 per cent) and small millets (0.1 per cent), all adding upto 4.0 per cent. The sum of increase crops differs from the sum of decrease crops by 0.4 per cent. This difference is explained by the fact that some crops not considered here have gained by 0.4 per cent. A look at Table 1 confirms this view as the crops considered in this study occupied 97.2 per cent of cropland in 1950-51 and 96.8 per cent of cropland in 1960-61. Obviously, this decline of 0.4 per cent has meant an increase in the proportion of cropland under crops not considered here. The total volume of change in Uttar Pradesh has, as such, involved only 4.0 per cent of the cropland. This statement is applicable only for the state as a whole and the component districts would certainly present a different picture.

The total volume of change, as explained above, was computed for each district of Uttar Pradesh. The inter-district variations in the volume of change range from 2.7 to 18.3 per cent (the median value is about 8.6). Taking the volume of change in the entire state as a standard, the districts can be grouped into four categories: (a) those with less than four per cent

change, (b) those with a change of four to eight per cent, (c) those with a change of eight to twelve per cent, and (d) those with a change of more than twelve per cent. The first two categories, (a) and (b), include 23 districts while the remaining two categories, (c) and (d), include 24 districts. The former may be considered as relatively stable and the latter as relatively dynamic. In general, it can be said that the eastern half of Uttar Pradesh is relatively stable and the western half is relatively dynamic so far as agriculture is concerned.

On the basis of the total volume of change, it can be stated that the four districts in category (a), namely, Azamgarh, Basti, Gonda and Sultanpur, appear to be very stable and almost seem to resist change (Table 11). On the other hand, the three districts in category (d), namely, Dehra Dun, Etah and Mirzapur, may be said to be very dynamic. Here, crop shifts involved 18.3 per cent of cropland in Dehra Dun, 16.6 per cent in Etah and 13.5 per cent in Mirzapur.

Further, in the otherwise stable eastern half of the state, the districts of Deoria, Fyzabad, Varanasi and Mirzapur seem to stand out conspicuously with a higher volume of change. Likewise, in the relatively dynamic western half of the state, a block of three contiguous districts comprising Bareilly, Pilibhit and Shahjahanpur seems to be changing less rapidly than the surrounding area.

Table II: Total Volume of Change in Selected Districts

(As per cent of Cropland)

District	Volume of Change
Azamgarh	3.4
Basti	3.8
(a) Gonda	2.7
Sultanpur	3.6
Allahabad	5.3
Ballia	6.9
(b) Partapgarh	4.6
Shahjahanpur	4.6
Unao	7.0
Aligarh	10.1
Etawah	9.0
(c) Mathura	11.4
Meerut	9.4
Saharanpur	10.7
Dehra Dun	18.3
(d) Etah	16.6
Mirzapur	13.5

Conclusion

On the basis of the above, it may be said that during 1950-61, there have been considerable changes in the cropping pattern of Uttar Pradesh. However, these changes are not manifest when data are considered at the State level alone. Changes in the cropping pattern obviously need to be studied at least at the district level in order to comprehend their nature

Labour Party's Surrender to Racialism

From Our London Correspondent

BORN out of Leyton and Smethwick, the Government's White Paper on Commonwealth Immigration is a tragic surrender to racialism and colour prejudice in Britain. As David Pitt, the West Indian G P and Greater London County Counsellor and Chairman of the Campaign Against Racial Discrimination (CARD), said, the White Paper proves that the Labour Party has decided to base its immigration policy on colour prejudice. As a protest he has resigned the Executive of the London Labour Party. Lord Brockway, the Chairman of the British Overseas Socialist Federation, an official Labour Party organisation, also pointed out that the White Paper was "weighted against Commonwealth immigrants who are coloured". Even the *Observer*, commenting on the White Paper, says that it is a concession to colour prejudice, and blames the paper for not acknowledging this.

There is little in the White Paper to give cause for satisfaction. The positive measures that it recommends are so slight as to have very little effect on the problems, while the negative features give cause for considerable disquiet. Perhaps the most disquieting feature is the 60 per cent cut that has now been made in the number of Ministry of Labour vouchers issued to intending immigrants. The total number of entry permits that will be issued to professional and skilled workers from the Commonwealth will now amount each year to 7,500. At the same time, 1,000 immigrants from Malta will be allowed to come in each year, for after all, the Maltese are white! Such figures as are available seem to prove that it is not coloured immigrants from the Commonwealth who provide the largest number of entries into the coun-

and to bring out the real character of such changes within the State.

Further, the cropping patterns in different parts of the state have undergone change in varying degrees. Generally speaking, western Uttar Pradesh is relatively more dynamic than the eastern part where some districts, like Azamgarh and Basti, almost seem to be resisting change.

There also appears to have been

try. For example, in 1964, 14,000 Commonwealth citizens entered Britain, with labour permits, compared with 42,000 aliens, most of whom, with few exceptions, were white Europeans. It is interesting to note that the number of permits issued for Commonwealth citizens in that year amounted to 28,824. Therefore, it is quite obvious that the dangers of coloured immigration have been greatly exaggerated. The White Paper gives no reasons at all to justify the very drastic cut that has now been proposed.

Another dangerous section in the White Paper is the one which gives the Home Secretary arbitrary powers of deportation. It has even been suggested that immigration officers should be empowered to require students to register with the police. What a change from the attitude the Labour Party took when, during the Enahoro affair, they were castigating Henry Brooke for his action in deporting the Chief!

Shortage of Labour

This pandering to the colour prejudice of the electorate will do no good, and, indeed, might even harm the British economy. In the recent censure debate, the Chancellor of the Exchequer pointed out the gravity of the continuing labour shortage. In these circumstances, the Minister for Economic Affairs can hardly be happy about the new restrictions that have been placed on immigrant labour. The estimates made by the Government show that by 1970 there will be labour shortage of 300,000; the Federation of British Industries anticipates that this shortage will be nearer 500,000. Against this background, an annual quota of 8,500 immigrants is hardly enough, and the Government

some regional redistribution of crops. There are indications that the density of some crops is increasing in areas where it was already high, i.e., there is a tendency towards areal concentration. The process of concentration seems to have been rather slow during the period under study but it is discernable. Further studies are needed to understand the implications of this process in the context of changes in the cropping pattern of Uttar Pradesh.

is deliberately allowing colour prejudice to override economic considerations.

Immigrant labour is a convenient method of easing the shortage of labour in certain bottleneck areas and industries at particular periods when the economy has run into a high boom. The main attraction of immigrant labour is the fact that it is prepared to be mobile and move into areas and jobs where UK citizens are unwilling to go; immigrants move automatically to areas of most acute labour shortage because that is where it is easiest to get jobs. In this way they do a very useful service to the economy. Indeed, it is on the basis of immigrant labour that many of the countries in Western Europe, particularly Western Germany, have been able to achieve a faster rate of growth and a lower level of unemployment. Since 1961 when unemployment in West Germany dropped below 1 per cent (at around which figure it has since remained), the net influx of foreign workers has been about 150,000 a year. The UK Government seems to believe that foreign workers are difficult, and coloured people are an electoral nuisance and, therefore, they are not prepared to underline the lesson that Britain, like Germany, could have faster rate of growth and a lower level of unemployment if it followed Germany's example in accepting immigrant workers.

Brain Drain

Another disquieting feature of the Bill is that it could lead to a serious "brain drain" from Commonwealth countries, just at a time when they have the greatest need for their own trained personnel. Out of the total number of permits to be issued each year for Commonwealth immigrants, 6,000 of the permits are for doctors,

nurses, teachers and qualified scientists or technicians, whereas the unskilled labour which causes a burden to Commonwealth countries, but could be usefully employed in Britain, is denied entry. It is somewhat ironic that Barbara Castle's White Paper on the Ministry of Overseas Development should have been published shortly after the Immigration White Paper. Her document draws attention, quite rightly, to the large number of professional and skilled people who are continuing to emigrate permanently from the developing to develop countries with consequent damage to the growth of their own economies. Yet it is these very people in India, Africa and the West Indies to whom the Immigration Bill is giving fresh encouragement to leave their own countries, as they will be specially favoured entrants into Britain. While Barbara Castle is proposing to step up the supply of teachers and technicians for developing countries, the "brain drain" is being encouraged by the Immigration Bill!

The Black 'White Paper'

What are the positive aspects of the Bill? These mainly consist of half-measures. Some financial help will be given to local authorities to take on extra social service workers to help immigrants who are already here to settle down in the country and deal with problems of transition and adjustment, but the field in which the greatest financial help is required, that of housing, which lies at the base of many of the problems of the coloured immigrants, is to receive no assistance! Yet what chance is there for integration when the Bill and its new restrictions makes it quite clear that coloured immigrants are not welcome. With the Government itself setting a bad example of restricting coloured immigrants to 2 per cent of the population, is it all surprising that taking their cue from this, the same measures might be applied both by employers and landlords?

Of course, as was only to be expected, there have been a number of bitter protests. Chief among the organisations in Britain to protest is the Campaign Against Racial Discrimination which passed a resolution condemning the Government's policy as "a acceptance of prejudice ... harmful to the good name of the country and to race relations". The resolution added: "this policy is based on racialism. If implemented, it will destroy the Com-

monwealth. We call on members of parliament, all parliamentary candidates and members of local authorities, to reject this policy and compel the Government to base its immigration policy on economic considerations and the wellbeing of this country and the Commonwealth".

CARD has been in existence for seven months. In view of his own record in the matter of coloured immigration, it is not surprising that Hugh Gaitskell's daughter is one of the leading lights. The organisation had some success with the early drafting of the Race Relations Bill through lobbying individual members, but the Immigration Bill has shown that it is not really effective as a pressure group. Other organisations likely to take a more active role are the Racial Adjustment Action Society led by Michael de Freitas, a "black men only" movement which claims to have a national membership running to tens of thousands, and the West Indian Standing Conference with about 6,000 members.

A motion has been tabled to be presented to the Executive of the London Labour Party to call on the Government to reconsider its White Paper on immigration. The motion recognises "the social part played by Commonwealth immigrants in the life and economy of Greater London" and

seeks the withdrawal of proposals which will place them "at a disadvantage compared with aliens". The motion was tabled in an attempt to persuade David Pitt to withdraw his resignation from the London Labour Party Executive.

Eric Williams, the Prime Minister of Trinidad and Tobago, has frankly stated that the system of control of Commonwealth immigrants outlined in the White Paper is based on colour prejudice which is incompatible with the multi-racial Commonwealth. He said that the Commonwealth could well founder on the issue of sterner controls of immigration to Britain. The Jamaican House of Representatives unanimously passed a resolution accusing Britain of imposing restrictions on Commonwealth immigration on the basis of racial prejudice and not for economic reasons.

Whichever way one looks at it, the Immigration Bill is an unwise and unfortunate one. It will, of course, give encouragement to elements like Colin Jordan, Cyril Osborne and Peter Griffiths, to push for large-scale repatriation, and perhaps a total entry ban to coloured immigrants. So far, the only person who seems to be pleased is Peter Thorneycroft! No wonder the *Economist* has described the white paper on immigration as the "black paper".

Junior Technical Schools A Flop

ABOUT 36 per cent of students joining junior technical schools completed their three-year studies but only half of them secured industrial employment, indicating that almost 82 per cent of the facilities in junior technical schools remained unutilised. This is one of the conclusions reached by the Planning Commission after a factual survey of junior technical schools which were established during the Second Plan in a few States. The survey was undertaken as part of preparatory work for the Fourth Plan.

Junior technical schools have the objective of enabling students who pass out of these schools to join either a polytechnic for higher technical education or industry as apprentices or operators. As an experimental measure, 39 junior technical schools were approved in different States by 1960-61. The Third Plan provided for establishment of 96 more such schools.

The survey shows that there were considerable variations in the manner in which this scheme is being implemented by the States, in terms of the academic aptitudes of students catered to and the end-objectives of the course. In all the schools under the survey, there were not many students who had secured 60 per cent or more marks at the qualifying examinations. The survey indicates that junior technical schools mostly admitted students of 'average' and 'below average' academic scores. It had also been found that there was a large percentage of "drop-outs", that is, students who did not continue studies for the full period of the course, which involved, along with sizeable number of failures, a substantial wastage of facilities.

The findings of the survey will be taken into consideration in preparing schemes for improving the standards of junior technical schools in the Fourth Plan.

A New Role for Managing Agencies

Priyakant N Patel

The managing agency system has come to be associated with many malpractices and abuses, mainly the result of its long-established association with management of joint stock companies. There is a strong case, therefore, for forbidding management of companies by managing agencies.

However, the managing agencies which undisputably possess experienced personnel and an organisational framework that can be made use of for developing and vitalising the capital market in general and the new issues market in particular. This can be done by inducing them to form, or covert themselves into, issuing house companies.

A GREAT deal of light has been thrown on the managing agency system, especially its achievements and drawbacks, in recent discussions in the press and the Parliament. It would, therefore, be futile to repeat the arguments here. In this short note I have tried to suggest a new role which can be entrusted to the managing agency system, thereby enabling it to contribute its share to the industrial development of India.

The crux of the argument against the managing agency system is that the malpractices and abuses that have come to be associated with the system have sprung up mainly from its close association with the management of a joint-stock company. This means that to get rid of these malpractices and abuses, which are inherent in the present form, the close association of managing agencies with the management of company needs to be broken. This, in turn, leads us to the conclusion that managing agencies, at least in the field of company management, should be abolished. However, although the system is out-of-date, and should be stripped of its association with the joint-stock company, it need not be scrapped entirely. It can still play an important part, though in a quite different field, as it possesses an experienced and well-established organisational framework. In the following pages an attempt has been made to spell out what this part can be.

It is well known that the Indian capital market, otherwise well-organized, is conspicuously lacking in a machinery which can investigate and evaluate investment proposals; which can vet financial schemes and provide advice and guidance on raising finance for joint-stock companies in the capital market. The formation of the financial institutions, like issuing houses of Britain and investment banks of the USA, can go a long way in vetting, issuing and underwriting of new issues. They can also help small companies in meeting their financial requirements by nursing their issues in the initial stage of company formation, and putting them on the market when conditions

permit. Moreover, such institutions, if formed, can familiarise joint-stock companies with various special financial corporations, and help them in getting credit and capital to meet their increasing needs.

Having seen the need for "issuing house institutions", the question, which is generally not raised (or if raised, is not answered) is: How to form such institutions? It is here that the managing agency system comes into the picture. Assuming that the device of the managing agency is forbidden in the management of companies in India, and there is no reason why it should not be forbidden, the present managing agencies can be induced to form themselves into issuing house companies. For this to occur, the Government may be required to give them some incentives, monetary and fiscal, as well as others, such as legal. Some big managing agencies, viz, Martin Burn, Tatas, etc, may be encouraged to take up issue business. Moreover, a large number of small managing agencies may be encouraged to amalgamate and form issuing houses. However, since too many issuing houses will not be economical and conducive to the growth of the new issue market, the Companies Act can fix an absolute limit on their number, say, 25 to 30 issuing house companies, beyond which the permission for undertaking such business will not be granted. It is not necessary to say that the limit should be subject to periodical revision by the Company Law Department. Such a limit will act as a strong stimulus to get together on the part of the managing agencies and harness their resources and personnel, which are at present widely scattered and uneconomically utilised.

It should be noted that it is essential that the proposed issuing house companies should be allowed to be formed only in the form of public limited companies. The reasons are quite obvious: other forms of company formation, especially private limited company, may give rise to concentration of power and wealth, which is one of the problems that the abolition of the managing agency system is supposed to mitigate. Moreover, to safe-

guard them against such concentration, it should be obligatory that the shares of an issuing house company should be widely distributed, say among not less than 1,500 to 2,000 shareholders, discounting very small shareholdings. It is absolutely essential for such companies to have a strong capital base. This can be achieved by imposing some sort of legal requirement as to their net worth (paid up capital plus earned surplus). For instance, no company must have less than Rs 2 crores of net worth. Moreover, the capital requirement should be linked with their liabilities; for instance, their liabilities (including underwriting commitments) should not exceed, say, 20 to 25 times their net worth.

Coming to the functions they should perform, it is absolutely essential that they do nothing but issuing house business. The law should properly define this business. These may include all activities connected with issuing of new issues, underwriting, placing and distribution of new issues, advising on matters of investment and portfolio management, formation and management of unit trusts or investment trusts, etc. They should be legally forbidden to take any part in the management, and control of a company, participating in the profits of a company, and financing or subscribing (except for short periods or in case of underwriting commitments) to share capital of a company. It can be seen from the foregoing discussion that they should be expected to work purely as issuing house institutions and not as investment companies. The reasons for this are quite obvious: firstly, they will not be financially capable of financing industries. Secondly, there are a vast number of agencies, in the public as well as private sectors, catering to the financial requirements of the joint-stock companies and hence, there is no need for duplication of their functions. Finally — this is more important in the present context —, these restrictions will prevent them from acting as managing agencies in disguise.

Managing agencies are especially suited to form themselves into issuing

**You can get
all your electrical requirements
from one source**

- Siemens and their Licencees make a comprehensive range of electrical equipment... whose high standards are internationally well-known. Whatever your needs, Siemens can meet them — whether individual units or complete plants.
 - Siemens engineers are specialists. They are thoroughly trained to deal with the special problems of particular industries — and to advise on the diverse applications of electrical equipment.
 - Siemens have a wide network of dealers. As a result, products reach customers promptly in any part of the country.
- SIEMENS vast technological resources are behind every item of Siemens equipment... behind every aspect of Siemens service, whether planning, designing, supplying, installation, or After Sales Service.

For your specific requirements contact any Siemens branch office, or your nearest Siemens dealer.

SHB-SE-131

house agencies because they, by have years of association with industry, have gained the required experience and expertise to undertake such a huge task. Moreover, it has been claimed, time and again, that the managing agents are responsible, to a large extent, in attracting share capital from the public by lending their good name and reputation to new issues. If there is any truth in this claim, and I personally do not question it, then they are perhaps the most appropriate instrument through which the suggested machinery can function. The issues floated by the issuing house companies, formed by the reputable managing agencies, can go a long way in revitalising the new issue market. Moreover, they can be of an immense help to the investor, who at present, as is well known, has to depend almost entirely on the integrity and reputation of the managing agents associated with the issue instead of relying on its intrinsic worth.

Finally, I would like to suggest a few measures which the Government may be asked to undertake in order to create a proper climate for the creation of such a machinery. Firstly, it is absolutely necessary for inducing the managing agencies to form the issuing house companies to give the managing agencies, which are prepared to form such companies and to carry on their business strictly in the line of the (proposed) Act, the tax incentives. Such a business is an untried one in India and, therefore, there is every likelihood that most of them will not be able to earn profits in the initial stages. The Government can allow a tax holiday for the first ten years and these concessions should be extended to the shareholders of the issuing house companies. Secondly, the special financial agencies, such as IFC, ICICI, SFCs, etc, should be asked to give first preference to these companies with respect to sub-underwriting. Thirdly, although they will be expected to meet their financial needs out of their own capital (equity and borrowed capital), they should be able to borrow, at least in the initial period, either from the Industrial Development Bank or from the Reserve Bank, to meet their short-term requirements. However, such short-term assistance should be limited to 90 days. It is absolutely necessary that they have a ready and reliable source of short-term credit since the activity of issuing new issues and underwriting them requires occasional, large sums of money. If they cannot get such assistance when needed, especially in times

of stringent money market conditions, the timing, and even the success, of new issues may be affected seriously, and this may disrupt the new issue market as a whole.

Conclusion

The managing agency system has come to be associated with many malpractices and abuses. This in turn is due to its long-established association with the management of joint-stock companies. It is, therefore, necessary that it should be forbidden as a form of company management, at any rate in the case of public limited companies. However, as we have discussed above, the system, which still possesses experienced personnel and an organisational framework can be utilized for developing and vitalizing the Indian capital market in general, and the new issue market in particular. This can be done by inducing (and even persuading if need be) the present managing agencies to form, or convert themselves into, issuing house companies. Of course, they will have to be completely forbidden to undertake management and financing activities. On the other hand, the prospects of their earning good

profits can be assured by fixing a limit on the number of such companies, and also, by encouraging managing agencies to amalgamate and form large and strong organisations. Moreover, they can be given fiscal and monetary concessions so that they can ride over the initial teething troubles easily, and may earn reasonable profits. It should be noted that a great deal of success of this scheme depends on the Government's goodwill and assistance in inducing the managing agents to explore the hitherto untrodden path. However, the rewards are worth trying for.

A Digression

Whether the managing agency system is abolished or not, it should be made obligatory on the part of the company management to employ a qualified company secretary on its staff, as is required under the English Companies Act. So long as such an obligation is not imposed by the law, the hereditary element involved in the Indian company management in general, and the managing agency form of management in particular, will be very difficult, if not impossible, to eliminate.

TISCO's Four-Year Agreement with Workers

INCREASED basic wages and dearness allowance for all categories of workers and supervisors in the Union sphere, conversion of all daily-rated grades into monthly rates, incentive bonus according to the revised basic salary, free primary and middle school education for employees' children, extensive medical facilities without charge for all categories of employees and their families, and quarters with greater amenities at concessional rent are some of the highlights of a four-year settlement signed this month between TISCO and the Tata Workers' Union at a conciliation meeting.

This settlement means an additional annual expenditure of about Rs 2.20 crores for the Company, as against the Wage Board's estimated figure of about Rs 1.85 crores. The cost of concessions and benefits, given by the Company, including those not covered by the Wage Board, works out to Rs 14.60 per tonne of finished steel.

In an appeal to the employees, on the occasion of the signing of the agreement, R S Pande, Resident Director of TISCO at Jamshedpur, said that the annual additional cost of about Rs 2.20 crores would be a great burden on the Company, but that it had

been shouldered gladly in the fullest hope that the employees, as always in the past, would extend their active co-operation in bringing about greater efficiency and increased productivity. Referring to the proposed large-scale expansion of the TISCO Works, he was confident that the employees would rise to the occasion and give of their best to make it a complete success, if and when it was launched. He described the Agreement as yet another landmark in labour-management relationship in TISCO, and expressed his firm belief that the understanding would grow in strength and lead to greater prosperity, both for the employees and the Company.

A Streetcar Named Dementia

BRITAIN still remembers its General Strike of 1926 which Sir George Sitwell has told us, suddenly collapsed because Sir John Simon had thought up the idea of declaring it illegal; every striker, it is said, muttered, "Blimey, what I'm doin' a'n't legal", and called it a day. Calcutta is about to forget the two General Strikes it went through in a single week recently. The law of diminishing returns came into force, even if that was the only law that did; the second strike was not quite so successful as the first. The sponsors of the strikes, an assortment of Left parties with not much in common, are not very proud of their performance; the Government seems resigned to periodic stoppages of work which, in its complacent view, represent not popular dissatisfaction but only the malevolence of an opposition in dicarray. For the latter the property of the Calcutta Tramways has long been a convenient target. With the consent of the State Government, tram fares were recently "rationalised", meaning increased; and this came on top of a general rise in prices of most things.

Neither the Government nor the opposition showed much respect for the public's intelligence or convenience. The former, especially when represented by Saila Mukherjee, who takes care of both finance and transport, is so insensitive that it simply does not seem to care. The opposition, which did nothing about increased bus fares, was wrong in thinking that the partially foreign nature of CTC's capital structure would today produce the same antipathy as of old. What in the event held the field was massive cynicism. It did not seem to make any difference whether one went to work or one did not.

Like so much else in Bengali life today, Calcutta's trams are symbolic of the living corpse Bengali culture has become. The trams, an obsolete form of transport in most countries, once represented progress. There are men in Calcutta who still remember the horse-drawn trams; the switchover to electricity was progress in itself. With the exception of Geneva and one or two others, no city had more comfortable trams than Calcutta. For the true native of Calcutta the quicker buses, nationalised or private, held no temptation; "gentlemen" always preferred trams. When everything was going off the rails, the trams moved on them and gave a sense of security.

They still had first class and second, in conformity with the Hindu caste system without which no society seems cohesive. With trams one knew where one was; buses were so often wayward.

What with one thing and another, this stability has gone out of Bengali life, never to return. The longing remains. The bourgeois view still holds that the tram is not for burning; and politicians of the Left betray their total lack of rapport with the Babu when they burn trams and think the Calcuttan likes it. He does not. Something that is part of him is burnt when a tram car is on fire. For him the tram is not so much a mode of transport as a way of life; and neither the Government nor the opposition appears to have grasped the emotive content of Calcutta trams. In days gone by, the Time Ball at 1 p.m. from Fort William told everyone that the British Empire was there and all was well with the world; not to hear the familiar noise of the trams in the morning these days is to sense trouble, fear, turmoil, some derailment of norms.

Prafulla Sen seems fairly confident that he has got the better of the agitation against increased tram fares. He may even be right; and politicians are not always less dangerous when they are right than when they are wrong. The Government's consent to the increased tram fares was given in a manner which still has not been convincingly explained. The opposition has questioned CTC's book-keeping methods, in spite of the prospect of increased dearness allowances for workers from increased passenger fares. Both the Government and CTC had been saying that increased fares would contribute to the fund which would enable the Government to buy up the tramways and nationalise it. There have been hints lately that there may never be enough funds for the Government to buy out CTC; so the most sensible thing may be to abolish trams altogether. In this triangular game—the public, of course, does not matter—somebody is obviously not being strictly truthful.

It may well be that traffic in Calcutta is slower than in most other cities in India; the trams are probably the nuisance. Yet it is not at all easy to see how these can be replaced in the foreseeable future. Officially inspired talk of their abolition mainly suggests that somebody somewhere is

working hard to wriggle out of the commitment on nationalisation which alone was the excuse for official consent to a succession of increased tram fares. And this elaborate fraud would be pulled off in the name of progress. Trams are slow; out with them! Why then the increased fares? Sorry, no reply.

The trams are only a part of the steadily shrinking life of Calcutta. There is a "dry" day, Thursday, on which none can drink at a public place, which may seem no great deprivation in the even more benighted cities. Then there is a meatless day, on which one cannot get in a restaurant any mutton, pork or beef; happily it coincides with the "dry" day on which gentlemen make their own arrangements with apparently little difficulty put in their way by officialdom which is not always unaccommodating. Then there is the "fishless" day. Soon there may be no sandesh, the sweet without which Bengali hospitality is less than itself. Tramless days still seem hard to contemplate in Calcutta which has no real past worth talking about but lives in its defiance of all modern developments. It is significant still that Authority should speak of abolition of trams, especially when it is remembered that privately-owned buses have recently made their reappearance on routes long monopolised by the State Transport Corporation. Abolition of trams would create further opportunities for private bus owners, who are good friends of the ruling party.

Still and all, there is something to that term "rationalisation". It means, of course, that users of public transport will pay more; it also means that they will be made to believe that they are paying less and investing wisely in a future nationalised tramway system; simultaneously, they are being asked to believe that the acme of progress will be reached when there will be no trams at all. As a cure for his arthritis, Prafulla Sen is said to ride a bicycle every morning. No doubt this two-wheeler will soon be recommended to us all. Pedlars of further austerity will equally surely come forward to tell us how good it is for us to walk to work in the morning and walk back home in the evening. We must be very grateful, or very obtuse, indeed not to see that anything the Government does is for our good.

—Flibbertigibbet

Dalal Street Retreats Further

Wednesday Morning

DALAL STREET was forced to beat a further retreat last week; forced, because last week's setback in equity prices was not just due to lack of support but there was considerable amount of bear pressure. Sellers dominated the scene throughout the week and they appeared to be quite aggressive at times. The turnover was somewhat better but that brought little relief to the market which was long been starved of business. This is because quite a good deal of business was in the nature of 'distress' selling—whether it was from professional bulls or from investors.

The stock market's performance could scarcely have been very different; it might have fared much worse had it not been standing at its present low level—the lowest for over six years perhaps. It was not J R D Tata's statement that the crisis which had been an annual feature had now come in battalion strength that perturbed the market; industrialists have been known to be fond of using the language of crisis. The stock market felt a little uneasy over the Planning Commission's decision to fix the Fourth Plan target at Rs 21,500 crores involving a huge additional tax effort and it also felt disturbed on account of the growing internal unrest resulting from soaring foodgrains and edible oil prices. But it was the anxiety over the Kashmir situation which really shock the market.

With the economy under severe strains and the political situation very tense, it would be too much to expect any significant revival of confidence in the stock market in the immediate future. There are reports (unconfirmed of course) hinting the possibility of a supplementary Budget in September which while proposing further increase in import duties might include some tax concessions aimed at stimulating the capital market. There is a case for abolishing the capital gains tax on bonus issues and also for modifying the dividend tax. But it is doubtful whether such fiscal relief alone can contribute much to the revival of the capital market.

COTTON

More Time for Margins

THE trade's protests against the new margin restrictions on bank advances against cotton and 'kapas' have not been altogether in vain. The

Reserve Bank has decided to extend the time limit for enforcing the increased margin requirements (a minimum of 50 per cent) up to September 20 subject to the condition that the margin should not be less than 35 per cent by September 6. Under the Reserve Bank's earlier directive, the enhanced margin was to apply with immediate effect in respect of new limits and in respect of existing limits it was come into effect not later than August 20. While pleading for sufficient time for making adjustments in their bank borrowings, cotton traders had also urged the authorities to exempt imported cotton, indigenous cotton meant for export and cotton held on behalf of the mills from the purview of margin restrictions.

It is natural for the trade to resent any measure which restricts the scope of its operations. But considering that cotton prices are already quoted substantially above the statutory ceilings, it is difficult to understand why the trade should be carrying large stocks on its own account and/or on behalf of the mills. The trade has a very limited role to play when prices keep well above the ceilings all the time. The extension of the time limit for the operation of enhanced margin should enable traders to dispose of the stocks they are holding on behalf of the mills. Besides all the cotton intended for export would have been shipped during this period. There is still time for new crop Deshi cotton to move into the market.

Apart from the margin controversy there was hardly any new development in the cotton market to report. Business in the spot market was extremely limited and trading in futures was almost at a standstill with the August contract quoted nominally around Rs 795. Trading in the new crop contract has yet to commence. While most other details have been settled, the trade and the market authorities have not yet been able to agree on the unit of quotation for hedge trading. The jobbers and brokers are said to have opposed the Forward Markets Commission's suggestion that the unit of quotation in the hedge contract should be one quintal instead of three quintals as at present. The argument runs that the lowering of the unit of trading leads to much wider fluctuations which is fully borne out

by the behaviour of the futures contracts in oilseeds. But it is rather strange that people who live on fluctuations should be opposed to wide swings in prices. It should, in fact, be the other way round. The Commission and not the speculators should be really opposed to wide swings in prices.

All does not seem to be well with the weather. Many of the cotton growing areas are said to be in need of early rains for the proper growth of the plants. Rajasthan, Gujarat and Mysore need rains more urgently than the other tracts. To point out that the outlook for the crop depends on the progress of the weather is to state the obvious. Indigenous production of cotton has got to be stepped up very appreciably in order to be able to achieve the targets set for cloth production because it is becoming increasingly difficult to fill the gap through imports which cost so much of precious foreign exchange.

New Delhi has released the long-awaited global quota for the import of 2.14 lakh bales of cotton. Though this is the second instalment of the global cotton quota of 4.28 lakh bales for the current season, shipments under it will be allowed only from October with the result that actual imports will materialise only during the 1965-66 season. The delay in the announcement of the import quota is attributed to the acute shortage of foreign exchange. But the industry cannot complain that it has been deprived of adequate supply of foreign cotton during the current season. Actual imports of cotton since the beginning of the current season up to August 7 total 782,866 bales as against 607,093 bales in the same period of the preceding season. Exports of cotton from India during the same period total 234,600 bales against 254,150 bales.

OILSEEDS

Tendency Still Firm

IT has been a rather unexciting week for the oilseeds market. The turnover, both in ready and futures, was rather small. Price fluctuations were confined within narrow limits. But in spite of the recent spurt in prices, the market showed little inclination of beating a retreat. In futures, linseed April moved irregu-

larly between Rs 111.50 and Rs 109.50 (per quintal) and castor April fluctuated between Rs 89.75 and Rs 87. Cottonseed futures were neglected at around Rs 57. In ready, groundnut oil touched a new high at Rs 32.50 due more to scarcity of offerings than to any aggressive buying by consumers or vanaspati manufacturers. The Gujarat Government's move to seek New Delhi's permission to restrict the movement of groundnut oil outside the State added to the bullish fervour. So did reports of inadequate rains in most of the groundnut growing areas. Rajasthan, Madhya Pradesh, Khandesh and Gujarat were said to be in need of early rains. Production would suffer if the weather does not oblige in the next fortnight or so. Every thing depends on the unpredictable monsoon. How unfortunate!

Vegetable oil prices did not register any further net gains over the week; prices were, in fact, slightly easier which does not call for any comment. Linseed oil at around Rs 26.75 and castor oil Commercial around Rs 18.70 (per 10 kgs) are still on the very high side. Nobody really knows how far edible oil prices might go. It is not merely a question of assessing the overall demand and supply position. For, quite a good deal depends on the policies adopted by the State Governments in regard to the movement of these goods outside their boundaries. The Centre seems too weak to enforce its will on the States.

Export business has become slack. Only cottonseed cake is doing well. Export of groundnut extractions has lost much of its momentum because of the change in the export policy. Overseas prices have declined by about £1 per tonne over the past fortnight or so. Internal prices of groundnut extractions have also eased by about Rs 15 to Rs 20 a tonne. Informed marketmen have been heard saying that a representative of a giant international firm has been having discussions with the Government of India for the purchase of the entire quantity, on an exclusive basis, of groundnut extractions that India normally sells to the UK and the Continent annually. It is to be hoped that New Delhi does not play into the hands of big foreign firms.

MONEY AND BANKING

Stringency Continues

CONDITIONS in the Bombay short-term money market during the week to August 19 continued to be stringent. Supply, though well

around the previous week's level, was not enough in view of the additional demand during the week. The rate of interest was maintained at the previous week's level with little or no fluctuations during the week. The rate on Thursday morning was between 5 and 5½ per cent. Conditions in Calcutta were more or less similar. Though the turnover in Wednesday's session was comparatively low, the week as a whole recorded good business. Rates continue at 6½ per cent.

During the week to August 6 deposits of scheduled banks remained unchanged at the previous week's level of Rs 2,788.96 crores, according to the latest statement of the working of scheduled bank issued by the Reserve Bank. Bank credit however was higher by Rs 6.52 crores at Rs 2,032.46 crores. Borrowings from the Reserve Bank dropped by Rs 3.75 crores to Rs 5.87 crores. Balances held with the Reserve Bank were lower as well at Rs 95.80 crores against Rs 98.45 crores the week before. Investments in government securities were better by Rs 5.29

BUSINESS NOTES

Hindustan Motors

THE foreign exchange crisis is having its impact on the production of cars and trucks. During the past few months, manufacturers have received neither any import licences for necessary raw materials and components nor any indication as to when the licences would be issued. In the absence of a regular flow of materials, the manufacturers find it difficult to plan production. As in the case of Tata Engineering and Locomotive, the annual report of Hindustan Motors also narrates the difficulties being experienced due to shortages of essential materials. It says sometimes licences for components alone are received with no licence for raw materials, and sometimes licences for raw materials only are received with no licences for components. During the year ended March last, the company was able to substantially increase production of cars and also register a small rise in truck production. The output would have been higher in both the cases but for the difficulty in getting licences for components and raw materials. The prices of raw materials have constantly been increasing, and sometimes the company has to buy raw materials through barter deals which add to the cost. Besides, the cost of

THE ECONOMIC WEEKLY

crores at Rs 834.61 crores. Cash in hand with the scheduled banks increased by Rs 1.01 crores at Rs 68.64 crores. Money at call and short notice declined by Rs 6.37 crores at Rs 58.68 crores.

Notes in circulation during the week to August 13 decreased by Rs 3 crores at Rs 2,614.38 crores, according to the latest Statement of Affairs of the Reserve Bank. Foreign securities remained unchanged at Rs 68.35 crores but balances held abroad were slightly higher by Rs 9 lakhs at Rs 7.81 crores. Deposits of the Central Government were lower at Rs 71.28 crores against Rs 92.74 crores, while State Governments' deposits moved upwards by about Rs 7.71 crores at Rs 21.40 crores. Scheduled bank deposits were better as well at Rs 98.25 crores against Rs 91.49 crores. Loans and advances to governments were lower by Rs 18.80 crores at Rs 46.95 crores. Advances to the scheduled banks were also lower at Rs 3.83 crores against Rs 6.13 crores. Investments declined slightly by Rs 6 lakhs at Rs 298.25 crores.

production has increased considerably due to the all-round rise in wages, bonus, freight, electricity etc. In the absence of any increase in the price of products, the percentage of profit on production and sale has suffered a reduction.

Against the loan of Rs 7.5 crores from AID and Rs 60 lakhs from CDFC obtained for the first expansion programme, machinery worth Rs 6.27 crores has been imported, and most of it has been already installed. The remaining machines are expected soon. When these machines are installed, the company expects to exceed the target of 90 per cent indigenous content. Agreements for another loan from AID amounting to \$23 million for the next phase of the expansion programme as well as for the production of Bedford engines and for another loan for \$2.95 million to cover the cost of equipment for manufacture of shovels have been signed, and necessary import licences for both have been received. Some of the machinery is expected to arrive in the next financial year.

The company has negotiated with CDFC for a loan of £2,50,000 for the balance of capital goods required

THE ECONOMIC WEEKLY

for the manufacture of cranes and for the expansion of the steel structural shop. The production of cranes and scrapers has increased, but output of shovels could not be raised on account of non-availability of import licence for components. The steel foundry is expected to start working in the latter part of the year, and the truck engine manufacturing programme should start operation in the next financial year provided machines arrive in time.

In regard to the Government's proposal for manufacture of a small car, the company has represented to the Government that with a small amount of balancing equipment it can substantially increase its capacity. No decision has yet been taken by the Government on this proposal, nor any final sanction has been received yet for the collaboration agreements for the proposed manufacture of certain types of machine tools. The booking for cars has been steadily increasing, but the directors are unable to say what proportion of the bookings is fictitious. They expect, however, that the new procedure whereby Rs 2,000 will have to be deposited in postal certificates for registration of each car will bring down advance booking to normal proportions. Already a sharp decline in fresh bookings has been noticed.

Meanwhile, the company has produced good results for the year 1964-65, with sales up from Rs 32.56 crores to Rs 41.08 crores and gross profit higher at Rs 5.72 crores compared to the previous year's Rs 3.98 crores. Of this, depreciation has taken up Rs 1.85 crores (Rs 1.06 crores), development rebate reserve Rs 1.65 crores (Rs 30 lakhs) and taxation Rs 94.50 lakhs (Rs 1.43 crores). A sum of Rs 25 lakhs is allocated to general reserve after making provision for payment of preference and equity dividends, the former requiring Rs 0.60 lakh (Rs 0.70 lakh) and the latter at the rate of Rs 1.25, against Rs 1.15, per share, Rs 1.01 crores (Rs 93.09 lakhs).

Ahmedabad Electricity

HAVING regard to the fact that the option to purchase the company's electricity undertaking vests with the "purchasing authority" in the year 1975, the directors of Ahmedabad Electricity Company consider it desirable that there should remain with the company some other reasonably lucrative business apart from the

electricity undertaking which, if the option is exercised by the "purchasing authority", will have to be parted with. For this purpose they have examined several projects. They have now under consideration projects for the manufacture of production gauges, precision instruments, machine tools, industrial turbines, printing machines and accessories, etc. The company's Memorandum of Association is, therefore, proposed to be amended suitably to provide for such activities.

Meanwhile, the company has shown satisfactory performance during the financial year to March last when it sold 1,050,597,279 units of energy against sales of 948,446,166 units and 859,035,720 units, respectively, in the preceding two years. Net earnings from sale of energy brought in Rs 9.96 crores against Rs 8.28 crores in the previous year. After providing Rs 77.16 lakhs (Rs 71.28 lakhs) for depreciation and Rs 93.48 lakhs (Rs 44 lakhs) for taxation, the company earned a considerably higher profit of Rs 1.25 crores compared to the previous year's Rs 89.97 lakhs. Of this, contingency reserve gets Rs 6.53 lakhs (Rs 5.62 lakhs), consumers' benefit Rs 2.01 lakhs (Rs 1.11 lakhs), development reserve Rs 38.90 lakhs (Rs 20.96 lakhs) and dividend equalisation reserve Rs 5.72 lakhs (Rs 0.97 lakh). After writing off certain amounts from promotion expenditure, stamp duty, brokerage, etc, and making some other necessary provisions, an allocation of Rs 69.98 lakhs is made for payment of the total dividend at the unchanged rate of eight per cent inclusive of the three per cent paid by way of interim distribution.

The writ petition filed by the company against the order of the Gujarat Electricity Board appointing a Rating Committee was heard in December last and the High Court quashed the said order of the Electricity Board. The Electricity Board then applied for leave to appeal to the Supreme Court which has been granted by the High Court. In view of this, the arbitration pending before the Central Electricity Authority will not be proceeded with till the disposal of the appeal by the Supreme Court.

Estrela Batteries

DURING the year to March last Estrela Batteries experienced considerable shrinkage in margins as reflected in lower earnings despite higher

sales. Profit margins have been squeezed between a higher wage bill and a larger amount spent on purchase of necessary raw materials from the open market owing to the cut in import licences. The company is faced with problems arising from the restrictions of imports getting acute in the current year; it will have to buy bigger quantities of raw materials from the market in order to maintain the tempo of production. Meanwhile, on a review of the market for batteries of flat type construction, it is intended to implement the project of establishing 35 million cells capacity in stages. The company has applied to ICICI for a loan of Rs 5 lakhs for the import of plant and machinery for the first stage aimed at a capacity of five million cells.

The 1964-65 results show net sales turnover up from Rs 1.59 crores to Rs 1.80 crores and gross profit down from Rs 21.39 lakhs to Rs 17.99 lakhs. Of this, depreciation has absorbed Rs 1.94 lakhs (Rs 1.85 lakhs), taxation Rs 10.20 lakhs (Rs 12.10 lakhs) and development rebate reserve Rs 0.52 lakh (Rs 0.10 lakh). After setting aside Rs 0.71 lakh (same) for payment of preferential dividend, there remains equity profit of Rs 4.62 lakhs compared to the previous year's Rs 6.63 lakhs. The directors have recommended payment of the unchanged dividend of 10 per cent, but last year two per cent was paid extra by way of silver jubilee bonus. Equity dividend, therefore, demands a lower amount of Rs 1.89 lakhs (Rs 2.27 lakhs).

Bajaj Auto

A PRELIMINARY statement from Bajaj Auto for the year to March last shows impressive rise in gross profit from Rs 29.71 lakhs to Rs 39.08 lakhs. The advance, however, has been narrowed down at the equity earnings level, since all necessary provisions have absorbed more than in the last year. Depreciation has taken up Rs 14.34 lakhs (Rs 11.42 lakhs), taxation Rs 8 lakhs (Rs 5 lakhs) and development rebate reserve Rs 3.60 lakhs (Rs 2.84 lakhs). But even then net earnings are better at Rs 13.14 lakhs compared to the previous year's Rs 10.46 lakhs. The directors have yet not announced their decision about the dividend. Last year, it was paid at the rate of 10 per cent which absorbed Rs 7 lakhs. Per share earnings have improved from around 1.5 times to 1.88 times over the year.

Hindustan Twyford's

THE estimated investment in the Fourth Plan on housing is Rs 2,460 crores, and nearly six million houses are expected to be constructed. The demand for sanitaryware is expected to increase every year. Hindustan Twyford's has, therefore, scope for gradual expansion in its manufacturing activity that ranges from sanitaryware, earthenware, stoneware and China glass to insulators and refractories. The company's total production during the year to end-March last was 2,378 tons against the figure of 1,720 tons in the previous year and the licensed capacity of 5,400 tons. Production was hampered by a strike at the factory which lasted for a month. The current year's production will also be affected because of the need to effect certain repairs and overhauls to plant and equipment. During the year, pastel colours and sophisticated fixtures were introduced by the company, and these were well received in the market.

The 1964-65 results show impressive rise in turnover from Rs 45.98 lakhs to Rs 77.84 lakhs and in gross profit from Rs 19.65 lakhs to Rs 35.97 lakhs. Viewed against the background of the slow progress of housing programmes, shortage of cement, the Government's dear-money policy and the 25 per cent cut effected in prices to meet competition, the year's performance is quite pleasing. After providing for depreciation Rs 5.88 lakhs (Rs 12.23 lakhs), for development rebate reserve Rs 10.91 lakhs (Rs 1.03 lakhs) and for taxation Rs 0.50 lakh (nil), there is left a balance of Rs 18.68 lakhs which is utilised to wipe off the loss of Rs 5.11 lakhs brought forward from the previous year and to pay dividends on preference shares together with arrears and on equity shares at 10 per cent, to absorb a total sum of Rs 9.59 lakhs. Of the surplus, a sum of Rs 2.50 lakhs is allocated to preference share redemption reserve and Rs 1.45 lakhs to general reserve.

From the beginning of the current year, the company has further reduced its selling prices. Other producers with foreign collaboration have recently started production, and this is likely to result in some excess capacity. But the directors expect to be able to meet competition.

German Credit for ICICI

As part of the assistance from the Federal Republic of Germany to India for the final year of the Third

Plan, Kreditanstalt für Wiederaufbau (KfW) has made available to ICICI a further line of credit of DM 20 million. With this line, ICICI has so far received from KfW total funds aggregating DM 60 million in five lines of credit.

Of the four lines of credit aggregating DM 40 million received so far, ICICI has already sanctioned more than DM 30 million for assistance to Indian Companies. Both traditional industries like cotton textiles and sugar

and also newly developing industries, particularly in the metallurgical and engineering field have benefited. The number of companies assisted so far out of the KfW lines is about 60.

KfW funds have been an important addition to ICICI's finances. Besides the KfW funds, ICICI has obtained six lines of credit aggregating US \$140 million from the World Bank and one line of credit of US \$5 million from the United States Agency for International Development.

**SERVING
YOU
ON THE
SEVEN
SEAS**

Tight, staunch and strong, 'JAG' Ships carry cargo across the seven seas. Whatever the merchandise, you can count on them to carry it with speed and safety. With steady growth and world-wide operations, 'Jag' fleet also promotes India's maritime trade.

Where in the world do you want to go?

Great! That's where we go.

You name it. The U.S.A. ? The Middle East ? Asia ? Africa ? The Pacific ? Latin America ? Pan Am can take you there. Pan Am Jets serve over 100 cities in 86 lands on all 6 continents.

Whether you're bound for Buenos Aires or Alaska, Tokyo or Trinidad, Helsinki or New York, better check with Pan Am. You fly for the same jet fare as on any other airline—but that's all that's the same. Pan Am has more nonstop flights. More no-change-of-plane flights. More frequent flights, better connections. One Pan Am ticket will take you anywhere. And Pan Am's 900 offices throughout the world are your home away from home.

When you fly Pan Am you have superb meals en route—delicious cuisine inspired by *Maxim's of Paris*. And the service is friendly and generous.

Best reason of all for flying Pan Am—the good feeling you have knowing you've chosen the very best there is: the world's most experienced airline.

For reservations, see your Pan Am Travel Agent or the nearest Pan Am Office at

SEVENTY-FIVE PAISE

When do I get my Ambassador? When would it be my turn?

These are the questions you put to our dealers. Their supply depends on our production. Though we have doubled our production in the last five years, we can't cope with ever-increasing demand. Orders pour in day after day; the rate of booking for Ambassador far outstrips our production.

Why not produce more? You may say.

Yes, we do. As much as we can. Have a look at the record: 1954-55—2,500 Ambassadors; 1959-60—7,000 Ambassadors and 1964-65—16,000 Ambassadors. This year production is being further stepped up. We are, however, handicapped by the scarcity of foreign exchange which is required for pressing national needs, particularly for the defence of the country. Aware of the critical position, we have been relying less and less on foreign exchange by increasing the indigenous content of the Ambassador. Yet some imports are necessary for the present.

Hence, production can't cope with demand. So, the waiting period. Irksome, yet unavoidable. Beyond our control. We are doing our best to meet your demand, and certainly not hiding our face.

In Lieu of Devaluation

THE Finance Minister's new tax proposals are designed primarily to cover, firstly the short-fall in capital receipts of Rs 65 crores, including the expected short-fall of Rs 15 crores under annuity deposits, and secondly the unanticipated increase in expenditure by way of additional dearness allowance to Government employees and additional financial assistance to the State Governments. These tax proposals are designed to yield an additional revenue of Rs 173 crores in a full year. But in the current year, the Finance Minister expects to collect over Rs 100 crores.

Broadly speaking, the tax measures fall into two categories. First, the import tariff has been restructured to yield higher revenue to the tune of Rs 119 crores a year. The imports will hereafter fall into four classes: (1) machinery; (2) basic industrial raw materials; (3) processed industrial raw materials; and (4) consumer goods. The respective import duty rates are fixed at 35 per cent, 40 per cent, 60 per cent and 100 per cent. Of course, exceptions have been provided for, but the broad picture of the restructured tariff will be as indicated above.

In the second category fall the increases in excise duty on petroleum products, and on ferrous and non-ferrous metals. Together with countervailing import duties these increases in excise duties are expected to yield an additional Rs 55 crores in a full year.

Krishnamachari has justified the introduction of the supplementary budget on the ground that he wants to avoid deficit finance during the current year, so that resources for growth are raised without inflation. At the time he presented the current year's Budget he took great pride in presenting a surplus budget after so many years. Now he finds that he had over-estimated the receipts and under-estimated the expenditure and has, therefore, to raise additional revenue. He cannot now take cover behind the fortuitous circumstance that Pakistan has decided upon a suicidal policy of full scale confrontation against India for whatever short-falls in receipts or increases in expenditures he omitted to provide for in his original estimates for the current year.

In restructuring the import tariff, Krishnamachari hopes not only to raise additional revenue but also to rationalise it with the objective of promoting maximum import substitution—an objective which in the context of foreign exchange difficulties is most unexceptionable. Let us try to appraise his proposals on the basis of the criterion set by the Finance Minister himself. It must be conceded that higher rates of duty on import of machinery and processed industrial materials should induce industrialists in the country to look for locally fabricated machines and equipment and also to go in for maximum processing of industrial raw materials at home. In fact, this is precisely what industrialised nations of the West have for decades done with the help of their tariff structure. Even today, the ECM tariff discriminates against imported processed industrial materials and treats unprocessed material imports more liberally.

But it is difficult, to appreciate what persuaded the Finance Minister to retrace his steps with respect to the development rebate at the same time. A development rebate at the rate of 35 per cent for priority industries amounts to reducing the effective rate of import duty on machinery to such industries, according to one calculation, from 35 per cent to 14 per cent. Is it that import substitution is not called for in priority industries? Or is it that there is no scope for import substitution in these industries? Recent reports regarding the extent to which import substitution has been possible at Koyali suggest that, given imaginative leadership and constructive orientation, even in industries involving complex technology considerable savings of foreign exchange cost can be effected through local fabrication. But what the Finance Minister attempted to achieve with one hand is nullified by the other.

Even on its own merits, development rebate has no place in the fiscal system of an under-developed country with surplus manpower.

Experience has shown that the existing five-year tax holiday is availed of very little at present in view of the existing liberal development rebate. It is, therefore, doubtful what real impact the extension of the holiday to the Fourth Plan will have. Certainly with the abolition of development rebate, tax holiday would be availed of on a much larger scale but without providing the wrong incentives. In fact, one would go further and recommend a more liberal tax holiday coupled with more liberal depreciation allowances scaled to the rate of utilisation of capacity in place of the development rebate with a view to promoting import substitution as well as full utilisation of productive capacity, including manpower.

These objectives, close now to the heart of our Finance Minister, are unlikely to be fulfilled by the measures taken through the supplementary budget. Whatever the Finance Minister may claim for it, it is a most uninspiring budget, a budget that misses the mark and once again fails to seize the opportunity.

This is about the impact of the tax proposals on import substitution and on speeding up development — the criteria laid down by the Finance Minister himself. But since the bulk

of the resources are to be raised from an enhancement of import duties, the foreign exchange aspect of these proposals are obviously of even greater importance. The Finance Minister is actually trying to kill two birds with one stone. The recasting of import tariffs is to be taken as an earnest of the measures to come in the future "to liberalise imports to the maximum possible extent" in support of which endeavour the Government proposes to seek the co-operation of friendly foreign countries and international institutions. A preliminary condition for getting such friendly assistance, it has been well known for quite some time, is the liberalisation of imports through devaluation and substitution of the market process of pricing out of imports for the present administrative and physical controls. The sharp increase in import tariff is a partial move in that direction. Whether higher duties will appreciably relieve the pressure on imports and thus make some relaxation of controls possible or not, remains to be seen but meanwhile this gesture is made in the hope that, though the Finance Minister has not actually said so, it will be accepted as partial recompense, taken in conjunction with the schemes of subsidising exports, direct and indirect, that are already in operation.

acceptance of a steady contraction in life, which has led almost to a total elimination of the "margin" beyond the minimum which distinguishes civilised existence from the primitive and elemental, is also typical of Bengal today. There is no creative response to contemporary challenges; only acceptance or futile and noisy resistance dissipating itself in demonstrations either wasted on the streets or made violent from the university campus. Nobody told the Government what the Government could, within its means, do to ensure milk supplies for infants and the infirm without asking sandesh to vanish from Bengali life. (I am forgetting Bengali culture for the moment, as I so often seem to do these days)

Several red herrings—this fish is mentioned because not many Bengalis eat it; otherwise this might cause a riot—have already been drawn across the trail. The Centre, a very convenient whipping boy, often deservedly, has refused the requisite foreign exchange for importing tinned milk powder. The *gowallahs*, almost exclusively from Bihar, are not co-operating with Haringhata, which has some 2,000 or more unoccupied cowsheds. But why are they unoccupied? That the *gowallahs* can be cursed is not doubted; yet it is difficult to see them turn away the higher profits the amenities of Haringhata are, in theory, promising them. There has been more than one highly publicised "Operation Khatal" by the Calcutta Police to rid the city limits of unhygienic cowsheds next to or within residential areas. None availed. The inescapable conclusion is that the *gowallahs* make more money now even after paying higher rents for cowsheds within the city than they would under Haringhata patronage. Behind it all lies official incompetence; and a local daily has suggested borrowing men from Bombay's Aarey to teach Haringhata how to run its milkless colony. "What Bengal thinks today... ha, ha, ha!"

One had seen some of the queues of mothers, middle class Bengali wives, outside shops selling baby food; and one had heard stories about milk shortages in Calcutta hospitals. Then one read the Bengali dailies; and one could not help a feeling of total unreality. At least one ebullient reporter wrote that the Bengali had already lost his "lathi", once so gloriously idolised by no less a man than Bankimchandra Chatterji; now he was going to lose also his sandesh, alas! It had

sometimes in excellent prose, heavily on what has been called the "cultural" aspect. This aspect of Bengali life today will require fuller treatment later in the report.

Meanwhile the mundane details, all locally ignored: Bombay was so proud of its Aarey Milk Colony that the State Government made it obligatory on poor Khrushchev to go and see it. (Well served, though, for this reporter was once taken to see a dairy in the Soviet Union.) So Bidhan's Bengal could hardly lag behind. Thus was began Haringhata; and, as with so many things in Bengal, it did rather well briefly. Then everything went awry, and few have been asking why.

Instead, the confectioners themselves have been suggesting that there be a sandeshless day; Bengal, incidentally, already has a meatless day, a fishless day and a drinkless day in restaurants. This docile and resigned

apparently not occurred to the estimable colleague that there might be a causal connection between the two, that a people which had lost or forgotten its "lathi" was almost certain to lose its sandesh.

The reaction, as I was saying, is as significant as the event. There has indeed been a feeble official attempt to introduce soya bean milk, which serves China, Japan and all East Asia well enough. There has been no evidence of popular enthusiasm for the substitute. There have been no suggestions for local alternatives. There have been no exhortations to forget sandesh and get on with life. There has been no demand that Haringhata make available sufficient milk for sandesh and all else, no demand that the Ministers and officials guilty be openly punished. All we have had is a pathetic whine for the loss and a

nostalgic and literary sigh for what is passing away.

The dearth of split milk for sandesh represents only a small part of the much bigger split in Bengal. Partition was a many-splintered thing of which only a few have so far surfaced. Casein for sandesh is not the question at all. Many Bengalis have already lost their taste for sandesh for one reason or another; the fare provided on ceremonial occasions had already been going down fast in quality. Vulgar *borphis* with louder sweetness had already begun to replace the sandesh, even in Bengali weddings. Some of the greatest traditional sandesh-making families in Calcutta had already got involved in protracted litigation of one sort or another, disputing the rights of splinters of fragmented joint families. Congelation, the essence of the process of sandesh

making, had been falling apart long before the unfeeling order from Fazlur Rahman, the Minister responsible for doing the *halal* on sandesh.

"Things fall apart, the centre cannot hold", wrote Yeats without knowing anything about sandesh which was a favourite of Tagore, whom Yeats in a sense introduced to the big world outside Bengal. The sentimental Bengalis, perhaps me included, are silly to lament the lack in so literary and futile a manner; but the whole process, from the order banning sandesh to its ineffective enforcement to the accompaniment of lament on a scale no non-Bengali can fully understand, symbolises the whole Bengali predicament today. The sweetness is gone; the bitterness is faced only in bits and pieces.

Weekly Notes

Opposition in Disarray

THE 'no confidence' motion which came up in Parliament at a time when infiltrators from Pakistan had broken into Kashmir and the danger to that border was greater than at any other time since the Pakistani raiders were pushed back in 1947. But for the timing of it, perhaps, the opposition parties cannot be blamed. They could not possibly have anticipated it. What made it so grotesque, however, was the complete lack of cohesion among the opposition parties who supported it, lending point to the Prime Minister's objection that when censures became a routine annual affair, they served little useful purpose and only set an unhealthy precedent. How grotesque it became could not have been better put than by Hiren Mukherjee, the most accomplished of debaters in Parliament, when he had to explain that his group had been disappointed that M R Masani had not in his reply reflected the common feeling of all the opposition groups! What did he really expect? That Masani would put forward the Right Communist line? While voting for the motion the Communists and PSP groups made it clear that they did so for their own separate reasons, and did not associate themselves with the views put forward by the Swatantra group which had

sponsored the motion. What purpose could such a motion serve? Yet the Government's failings on the food front and its ditherings in Plan implementation cry to the high heavens for redress and needed to be ventilated. But for that, too, it was not the time. No country can put up its best front in fighting aggression while its Parliamentarians wrangle over failures on the domestic front.

Even so, the motion has served more than one useful purpose. It brought out the full support of the opposition parties to the stand taken against the infiltrators into Kashmir and it wrested a statement from the Prime Minister of the Government's intention to appoint a high-powered commission to examine the need for improvement in the administration, and for more effective implementation of programmes and policies, in the Secretariat, the various Directorates and in the Districts.

Also welcome would have been the assurance from the Prime Minister that the resources gap in the Fourth Plan will be filled, had it not been preceded by a disturbing statement by him that land revenue would not be touched, because it would create 'tension' among agriculturists. This is discon-

certing, indeed. A large part of the growth during the last three plans, the figures for which he threw at the face of the Swatantra critics, has taken place in the agricultural sector which accounts for merely half of the national income. Shouldn't the latter contribute its fair share to the investments in agriculture which is proposed to be vastly increased and which, the Prime Minister assured, would not be cut under any circumstance. Against this background, the Finance Minister's optimism in regard to foreign aid and adequate untied aid to step up the industrial growth rate to 14 and 15 per cent looks deceptive and ill-founded.

Pakistan's Game in Kashmir

PAKISTAN'S objectives in launching the large-scale infiltration into Kashmir remain unclear. The most facile assumption, and the one which is naturally most current in this country, is that this was Ayub Khan's own Bay of Pigs: the infiltrators had been sent in the expectation that the local population would rise in support of them, sparking off a war of liberation at a suitable stage of which the Pakistani army would enter the arena. This expectation was belied, which is hardly surprising; what would be sur-

A CALCUTTA DIARY

Bengal's Bitter Sandesh

IT is the considered opinion of this writer that the biggest safeguards of freedom in this country are our politicians' fear of unpopularity and our officials' wonderful incompetence. One or the other, or a combination of both, will probably see to it that even after August 24, when an order under the Defence of India Rules is to abolish public manufacture and sale of Bengal's dearest sweet, sandesh, there will be sandesh galore; perhaps under the counter but assuredly at higher prices. Meetings and demonstrations were held, as after the Gold Control Order, to impress upon the people and the Government that the order would end not only sandesh, officially, but also employment for many, actually. The Government on this occasion has at least spared the public mendacious promises of unbounded alternative employment. The economic aspect of the order has, however, been the least discussed in the Press; the emphasis has been,

prising is that the leaders of Pakistan had really believed that it would not be. It is not only that security arrangements in Kashmir have always been elaborate, but that, as was pointed out in these columns last week, while large sections of Kashmiris may be sullen nobody could consider them ripe material for revolt; in fact, it is not unlikely that they were as much taken aback by the infiltrators from across the borders as the Indian army.

Any way, if it was Pakistan's hope to start a revolt in Kashmir, there is every reason for relief, if not rejoicing; but the progress of the Indian army's operations to mop up the infiltrators during the three weeks since they were first detected is such as to cause some uneasiness. The Government now seems to have revised upwards its estimate of the number of infiltrators; Nanda's figure less than two weeks ago was 3,000, but in his statement to the Lok Sabha this Monday the Defence Minister estimated that "our operations have to take account of the fact that about 3,000 to 5,000 infiltrators still have to be dealt with in the Jammu and Kashmir area" — that is, excluding the almost 1,000 who, the Minister claimed in the same speech, had been either killed or captured or otherwise put out of action by the army. While very little is revealed about the activities of this large body of hostile men within our borders, except for reports of stray encounters with Indian troops or of depredation against the civilian population, the mere fact of their continued survival at large is a matter for concern, however well they may have been provisioned before they crossed over. The mystery deepens with the confident assurances by the most authoritative quarters that the infiltrators had met with nothing but unrelenting hostility from the local population. And they are not merely surviving; the very low figure of those captured — less than a 100 — compared to about 800 killed or put out of action in encounters with the Indian army, seems to indicate that they are neither down and out nor even lying low.

An alternative to the Bay of Pigs theory about Pakistan's intentions is that she is aiming to keep Kashmir on the boil for a long time. No immediate or spectacular successes are sought; what is, is to keep up tension by engaging the Indian army and by forcing the Government to snuff out civil liberties as would be unavoidable

in a state of hostilities across the cease-fire line and of sabotage and subversion by the infiltrators who manage to evade the Indian army. This will be consistent with the tactics which Pakistan has adopted in Kashmir in the past. It may also explain why Pakistani leaders have reacted with surprising lack of belligerence even to the capture by Indian troops of not only Kargil, which had been occupied earlier in May, but also three other posts. Pakistan may be preparing for a long drawn out harassing operation. The implications of this for the eastern border between the two countries may be no less serious than those for Kashmir itself. The inevitable consequence of Indo-Pak tension here will be persecution and squeezing out of minorities on both sides, a problem which is not amenable to the military *modus operandi*.

New Prop for Japan's Prosperity

THE conclusion of the Japan-South Korea normalisation agreement registers a new developing *status quo* in East Asia. Despite Korea's experience of Japanese imperialism (1910-45) and continuous anti-imperialist pressure within South Korea, President Park has opted for 'normalisation' after some 14 years of desultory negotiation.

Japanese industry faced with an increasingly serious labour shortage that threatens in the long term to curb economic growth and stimulate wage increases faster than productivity, has thus located again its former source of cheap labour. Japanese companies are falling over themselves to establish factories in Korea now, and even last April, before 'normalisation', seventy such companies were said to be waiting in Seoul (*Asahi*, April 13). In the short-term recession currently depressing the Japanese growth rate (slightly) and Tokyo stock exchange (dramatically), the economic clauses of the agreement are welcome to hard-pressed business on other grounds. Japanese reparations payments in goods and services, a useful and lucrative element in past booms, has slackened (payments to Burma and South Vietnam ended recently), and 'normalisation' includes a Japanese offer of 800 million dollars of grants and loans to South Korea. One Japanese newspaper recently noted that cynics observe that "reparations agreements happened to materialise whenever there were signs of an impending economic slump in Japan" (*Yomiuri*, May

10). For the old Japanese Right (what little is left of it), dreams of the Greater East Asian Co-Prosperity Sphere must seem less remote, especially when normalisation is taken in conjunction with simultaneous continued encouragement to China (Prime Minister Sato's 'high posture' foreign policy, or rather foreign trade policy) and to Taiwan (150 million dollars credit was offered last April, and more over the next five years). To the 50 million dollars credit given Indonesia last year has been added a further 24 million last May, including, to the horror of the British and Malaysians, eight Kappa space-sounding rockets in July. These are small signs, but do indicate the recognition of Japanese business that further expansion in a world market, the rate of increase of which seems to be contracting, demands generous injections of tied aid to its immediate neighbours. South-east Asia takes a third of Japan's exports at the moment, but cannot expand this proportion without massive help. That help might be the beginning of a new pattern of economic imperialism.

For the United States, 'normalisation' has been the long-term aim as the first tentative step towards a North East Asian Treaty Organisation (Japan-South Korea-Taiwan-US) that will skim off some of the froth of the Japanese export boom and divert it into armaments: so simultaneously relieving US defence costs in the area and relieving some of the merciless competition in the world market. This is a delicate operation that involves countering the profound anti-war neutralism of many Japanese and revising the Constitution to permit Japanese rearmament — 'Japan's defence budget is far too low today', McNamara put it bluntly last April. The needs of Vietnam that strain US military resources throughout East Asia have added an immediate edge to this demand. On June 28, coinciding with some of the worst stock exchange crashes in the current Japanese recession as well as a large popular revulsion from the Vietnam war, the US offered Japan at a third of their normal price, two battalions of Nike air-to-ground missiles. Further, the payment for these (200 million dollars) was then to be used by the US to purchase military equipment in Japan, an astonishingly 'generous' offer. Japan responded eagerly, although there are still many outstanding points of friction with the US. US investment in Japan at 500

million dollars is substantial (roughly 5 per cent of one estimate of the total value of investment in Japan), but this has not shielded Japan from measures to strengthen the dollar; nor has recent Japanese moves to liberalise its trade prompted the US to revise restrictions on its wool and cotton imports, its Buy American schemes, its ban on Japan Airlines overflight of the US, nor has it ended the boycott of Japanese goods by the US fishing industry (retaliation for alleged unfair competition in the Alaska salmon waters). Japanese business has a long memory and current experience of the 'liberal' attitudes of Western business when, and only when, it is in a position of overwhelming supremacy. Where serious Japanese competition threatens, Western liberalism abruptly ends. But the US is still Japan's biggest market, and thus the ties are more than immediate frictions can disturb, *ceteris paribus*.

The 'normalisation' agreement is thus a crucial step in the expansion of Japanese business and the decentralisation of US hegemony in the area. Korean students, fighting to keep open the door of possible future reunification of Korea, and Japanese students and trade unionists, fighting to prevent Japanese incorporation into the Western defence system, have both thus reacted sensitively — the implications are clear in the short term, even if in the long other possibilities become apparent.

Exchange Earnings of Shipping

Our Shipping Correspondent writes: THE Minister of Transport, in his speech to the National Shipping Board in Madras, has once again brought up the question of Indian ships trading between two foreign countries. The Indian fleet carries 10 per cent of the country's international trade today and it could carry 17 per cent, according to the Minister, if all our vessels were plying to and from India. Seven per cent of capacity is therefore lost to India in cross-trades.

This does not necessarily mean that cross-trading is bad; obviously if an Indian vessel is plying between two foreign ports, its earnings and expenses are in foreign exchange and if the earnings exceed expenditure, the excess would be *net* foreign exchange earning for India. Secondly, even if more Indian ships wanted to ply to and from India, this may not always be possible because shipping arrange-

ments are controlled by foreigners. Japanese steel mills buying iron ore seldom give any cargo to Indian vessels if Japanese vessels are available; nor is India in a position to dictate shipping terms — the Japanese could easily go elsewhere for their requirements, it is not a seller's market at the moment.

Any policy is best determined by going back to first principles: Why does India want a merchant navy? Briefly, (1) to earn or save foreign exchange, (2) to have a say in the international cartels which liner trades have, and (3) as a second line of defence in case of a major catastrophe. Having said this, one has to go a little further; foreign exchange earning or saving is possible both by cross-trading and home-trading, and which is more profitable can only be decided in a given set of circumstances. Sometimes cross-trading is more profitable, sometimes it is better to have the ships plying to and from India. What to do in a particular case requires skill and judgement — the kind of judgement that very few Indian shipowners have. One of the difficulties of an outsider, however, is a question of data: there are no statistics available to tell us how much net foreign exchange (i.e., foreign earning less foreign expenditure) any particular Indian company makes.

The fault here lies with the Reserve Bank; the Exchange Control Department is interested in keeping a sort of control on shipping expenses without fully understanding what they are controlling. In practice, the most ludicrous system is followed, the control is severest not where it is needed most, but where the Government understands most. For instance it is well-known that the three Indian lines plying in the UK trade pay widely differing commission ranging from an average of 5 per cent for one company to 12 per cent for another. *Prima facie* there is no reason why commission should differ so widely, but Exchange Control does not enquire into this because it does not have the necessary technical knowledge to investigate; on the other hand if a ship needs essential stores or repairs, the entire elaborate procedure of import licences and haggling with the Government has to be gone through. From an operational point of view and from that of the country's larger interest, it is very much better if the exchange is spent on maintaining the ships than on commissions to freight forwarders.

This criticism of the method of exchange control may seem to have an only oblique relevance to cross-trading, until one realises that the only way of adequately knowing how much a shipping company earns in foreign exchange is by allowing it to operate its own foreign accounts. The scheme that is therefore suggested is that shipping companies should be allowed to maintain a foreign account with the proviso that they will not be entitled to any remittance of exchange from India. They would then have to meet their foreign expenses from their foreign earnings and their performance in exchange earnings could be judged from their net remittances to India.

It will no doubt be argued that this is advocating nothing less than complete freedom from exchange control. In effect that is so, but international shipping, like international airlines, differ from other exports to the extent that not only is their earning in foreign exchange but so also their expenditure. Under the present system of Exchange Control there is no way to know whether shipping or airlines in fact spend more or less in foreign exchange than they earn, and until one knows how much exchange a ship in a particular trade is earning, no useful policy decision on trading of Indian ships can be taken.

Sugar: No decontrol

THE sugar industry's petitions to the Government for decontrol of distribution are quite clearly premature. The expected production of 32 lakh tonnes or very slightly more in the 1964-65 season is no doubt the highest so far; it is also true that the industry has come a long way since 1962-63 when a total production of only 21 lakh tonnes forced even so staunch a proponent of the free market as S K Patil, then Food Minister, to control sugar price and regulate distribution through a system of State quotas. But flushed as they are with the record output of this season, the sugar mills will do well to remember that their achievement has been made possible by a circumstance which may be ephemeral and definitely is beyond their control — a bumper sugarcane crop.

It was not so long ago, in fact it was only in the last season, that the sugar industry was scouring the countryside for cane. In that season and the one before mills were threatening to close down for want of cane. Why, even with this year's good

Much Hangs in the Balance

Romesh Thapar

THE debate in Parliament continues to disappoint. There is anger, but little coherence. There is little concentrated effort to focus on crucial, inter-related aspects. Even the violence we have witnessed during the past few weeks at widely separate points is anarchic, calculated to create the chaos from which fatalistically it is believed something will emerge. Without coherent anger, without dedication to some worked-out perspectives, without a frame of action, the situation can only deteriorate. This is the brutal truth. All else is peripheral.

U N Fails

In Kashmir, the cease-fire line has been eroded dangerously. The U N observers are either thoroughly incompetent or they have decided to permit an escalation in the hope that it will bring India and Pakistan face to face with the reality of war. The escalation is certainly pronounced. The failure of the U N stems from the lack of decisiveness which Secretary-General U Thant has displayed, particularly after India inexplicably delayed the publication of his immediate reactions which were very largely critical of Pakistan. After this delay, the active Pakistan lobby seems to have paralysed him.

However, the fact is that both countries are today closer to a full-blooded armed clash than at any time since the cease-fire in Kashmir. Pakistan's traditional friends are, of course, disturbed by the conclusive evidence of her aggressive actions, and they might still succeed in salvaging the situation for her, but there is no denying that in the Indian consciousness Pakistan is again fast replacing China as the main enemy. Meanwhile, our friends (the Soviet Union, included) continue to play hide-and-seek.

A large number of the raiders or marauders or infiltrators or commandos — call them what you will — have apparently evaded capture. While some have withdrawn to the mountains and woods, others appear to have concentrated at a few points in the hope of holding out until reinforcements arrive from across the cease-fire line. Reports imply that the failure of the Indian army to act speedily against the infiltrators has made possible this new attempt to establish so-called 'liberated areas'.

Perhaps, this was part of Rawalpindi's plan in the event of a setback. How else the name, 'Gibraltar Forces'? The old Sandhurst-trained boys who rule in Pakistan have limited imagination.

Fortunately, we have shown some faint skill in dealing with Foreign Minister Bhutto's trip for the first phase of the Kutch talks. A surprised Foreign Office learned rather late that Bhutto was planning a three-day trip to India — one day in Delhi, one day visiting the grave of his sister in Poona, and a day sight-seeing in Bombay! This was quickly stopped, and Swaran Singh was rescued from what could have become a rather ludicrous conference. But, as always, we failed to properly publicise the background to our decision.

We are still unclear as to how the India-Pakistan military confrontation will develop over the next few weeks, but at least Prime Minister Lal Bahadur can rejoice in the fact that the rains have arrived in north India to save the withering crops and to push back the prospect of a crop failure. The relief is widespread. Food Minister Subramaniam has been receiving congratulations from many regions. His 'stars' obviously are auspicious! Now, we expect to harvest more than last year.

Of course, Subramaniam's troubles are not over. From reports reaching the capital, President Johnson has decided that PL 480 food must be made difficult to get. The assumption is that the more difficult it is to get, the more it will be valued. Being an old political manipulator, Johnson will stage manage technical hold-ups of the legislation in the U S Congress. It is easy to forecast the disastrous repercussion of this kind of fiddling, but then who is to enlighten the self-opinionated President of the USA? A damaging interruption in PL 480 supplies has been prevented for the moment by the intervention of the U S Ambassador in India. But one can feel the fears mounting in Delhi because buffer stocks are not as yet adequate.

Subramaniam knows that there is no sympathy for those who continue to depend on food gifts. He has despatched a memorandum to the U S Government, explaining the perspectives sketched by the Food Ministry and linking these with the declared aim of the Fifth Five-Year Plan to bring foreign economic aid to an end of

before 1975. These assertions, it is hoped, will make Johnson responsive to serious and constructive petitioning by India. In this, he has the solid support of Asoka Mehta at the Planning Commission who knows that the food problem cannot be solved overnight.

Thank the Plan Framework

It is fortunate that we still have the framework of the five-year plans to provide some guidelines during the critical period now unfolding. This framework — under heavy assault from a variety of groups and interests who have become richer and more powerful under these plans but who are now convinced that the massive development of the public sector envisaged in the Fourth and Fifth Plans will be at their expense — is the only one to have been presented. None of the opposition parties, whether Communist, Swatantra, Jan Sangh or Socialist, possess carefully thought-out alternatives. Indeed, their experts talk as if they oppose merely for the sake of opposing.

If the critics of the GOI's economic policies only realised that this crisis-ridden, sprawling country retains some degree of cohesion and strength because of the cement provided by the planning process, then it would be possible to concentrate political attention on the urgent, neglected task of more affective and efficient implementation. It has still to be seen whether the Planning Commission can carry this understanding to the critics and compel them to apply their minds to the grave realities we face. This means, in essence, that the Planning Commission should be curbed or disciplined or encouraged by the formation of shadow planning commissions by the opposition parties. Until this happens, the discussions on targets, investments and resources will remain at a puerile, agitational level.

That we have not even begun to create a base for this institutional development can be seen from the confusion on the Fourth Plan which exist within the ruling hierarchy. When the National Development Council meets early in September, the Chief Ministers will probably add to the confusion. The truth is that the Congress Party has to re-affirm its commitments. In the absence of these commitments, every political *dada* becomes a law unto himself.

crop, according to the President of the Indian Sugar Mills' Association, sugar production "would have been higher had the factories, especially those in west UP, been able to get adequate cane supplies. The working of these factories was seriously disrupted by largescale cane diversion to gur and khandsari manufacturers. The growers completely or partially stopped cane supplies to a large number of factories in west UP demanding higher cane price, and consequently factories had either to stop crushing operations or to work intermittently". It is perhaps natural for the sugar industry to view the diversion of sugarcane to gur and khandsari as a "problem" which "needs to be tackled effectively and permanently", by imposing statutory controls on these industries if necessary. The fact, however, is that our total production of sugarcane is not sufficient to meet the requirements of the three competing users, commensurate with the growing demand for sweetening agents.

In any case, the industry's fears of being left with onerously large stocks out of this year's production are clearly unwarranted. With a carryover of about one lakh tonnes at the beginning and the production of 32 lakh tonnes, total supply this season will be 33 lakh tonnes. On the basis of the present State quotas, internal consumption is estimated at 26 lakh tonnes; in addition, 2.25 lakh tonnes are scheduled to be exported, leaving stocks of less than 5 lakh tonnes, equal to two to three months' consumption, at the end of the season. This can hardly be regarded as excessive. On the contrary, a buffer stock of this size is the minimum considering the volatility of sugarcane crops and the consequent sharp ups and downs in sugar production.

The Food Minister is, therefore, entirely right to react to this year's record sugar output with caution. He has merely raised the quotas of the States modestly by about 15,000 tonnes a month and made slight increases in the allotment of sugar to food processing industries. This should be all

for this season and the policy for the next will naturally depend on the output. Next season the position will need careful watching so that the Food Ministry does not find itself in the predicament of 1961 when, faced with burgeoning stocks, S K Patil had to take the obvious but short-sighted step of ordering a cut in production—a step which had a disastrous impact on the sugarcane crop of 1961-62

LETTER TO EDITOR

PL 480 Once Again

IN a letter published in *The Economic Weekly* of August 7, Bashuri Ghosh has found fault with our analysis of the impact of PL 480 transactions on money supply. It is her discovery that we have committed an 'egregious blunder' in concluding that the initial payments by the Government for imports of PL 480 commodities under the existing arrangements do not produce any effect on monetary circulation.

But for the provocative tone of the letter of Bashuri Ghosh, I would have refrained from flogging this dead horse over again. Let me put simply what happens to the balance sheet of the Reserve Bank when the payment is made by the Government to finance PL 480 imports. There are, in all, four steps involved in the initial payments:

- (1) the government sells *ad hoc* treasury bills to the Reserve Bank;
- (2) it pays the U S Embassy;
- (3) the U S Embassy invests the sums received in Special Securities; and
- (4) government uses what is received through Special Securities for retirement of the treasury bills. It is open to government, however, to maintain cash balances higher than before rather than use the excess of cash balances to retire the treasury bills. But this is not of any consequence for measuring the impact as I would show below.

and was responsible for the three seasons of short output of sugar which followed. Instead of alternating between control and decontrol from year to year, what the sugar industry needs is a long-term policy which will relax controls on distribution gradually in pace with output, while striving to raise production, mainly through bigger and better quality sugarcane crops.

These four steps are illustrated in the table below by tracing the changes in the balance sheet of the R B I. It should be clear from the illustration that at the end of all these transactions, neither the assets nor the liabilities of the Reserve Bank have changed. It is an elementary principle of monetary analysis that if money supply is to rise or fall either the financial assets of the banking system including the Reserve Bank or the net non-monetary liabilities of the banking system have to change. Since as a result of the transactions referred to above nothing has changed in regard to the balance sheet of the Reserve Bank (and commercial banks do not come in under the existing arrangements adopted for payment of P L 480 transactions), money supply cannot vary.

Bashuri Ghosh makes also the curious statement that "... on the assets side, the Reserve Bank finds surplus assets in the form of *ad hoc* treasury bills because it has received sale proceeds of Special Securities tendered by Government. It is thus forced to retire the surplus *ad hoc* treasury bills. If it does not do so, it would have earned equivalent profit...". I am afraid the so-called surplus (*sic*) assets which Bashuri Ghosh talks about is not profit. The mere rise in assets or a fall in liabilities in a balance sheet does not mean that the Bank earns profit.

August 26.

Balance Sheet of the Reserve Bank of India

(Assume Rs 100 crores are to be paid for PL 480 imports)

Liabilities		Assets	
First step	+ Rs 100 crores	— cash balances of the government	+ Rs 100 crores
Second step	+ Rs 100 crores	— other deposits of the R B I which includes the U S Embassy account	+ Rs 100 crores
Third step	+ Rs 100 crores	— government cash balances	+ Rs 100 crores
Fourth step	— Rs 100 crores	— government cash balances	— Rs 100 crores
		— <i>ad hoc</i> treasury bills	— <i>ad hoc</i> treasury bills
		— <i>ad hoc</i> treasury bills	— <i>ad hoc</i> treasury bills

The Finance Ministry, under the moody stewardship of T T Krishnamachari, is sampling some of the confusion which it has itself helped to generate. The despondent, despairing reactions to the surprise supplementary budget are thoroughly out of focus because the business and commercial world has been subjected to so many twists and turns in financial policy that it has lost its bearings. TTK's supplementary budget represents partial devaluation, an attempt to meet some of the criticism of the World Bank, a result of the re-thinking over the past few weeks. It is clear, even

FROM THE LONDON END

Heading Towards Recession?

THE latest economic indicators show quite clearly that, at long last, the restrictive measures introduced by the Labour Government in order to protect the balance of payments are beginning to bite. This raises once more the fundamental dilemma which faces Britain, how is the country to obtain a satisfactory rate of economic development, and at the same time get her balance of payments position right? The burden of operating a reserve currency requires that unless some new measures are taken to increase international liquidity, the British will have to continue to damp down internal demand in order to protect the pound and prevent a run on sterling brought about because of the adverse balance of payments. This means that once more the axe has got to come down on the rate of economic growth inside the country itself.

Two recent economic reports by independent organisations on the state of the economy—by the National Institute for Economic and Social Research and the *London and Cambridge Economic Bulletin*—both seem to agree that the only way in which Britain can achieve a payments surplus sufficiently large to pay off her debts by 1970 is by putting up with quasi-stagnation at home.

To deal first with the verdict of the National Institute. When this organisation produced its report shortly after the budget in May, it believed that the Government would not achieve its aim of eliminating the balance of payments deficit by the end of 1966. However, the various restrictive measures undertaken in rapid succession by the Government are beginning to take effect. This is clearly reflected in the disappointing production figures for June, when the index of industrial production showed a fall of one point

to the dullest, that this necessary re-thinking will continue right through September — and we will have more surprises offered us in October.

However, this is no time to speculate. We are hemmed in by too many critical decisions awaiting to be taken. One decision influences the other; so they have to be taken together. Who will take them? The Centre or the *satraps* in the States? The ministerial wing of the ruling party or the organisational? The chaos-makers or those who build on the solid achievements of the past? Much hangs in the balance.

to 131 (1958=100). The index for the second quarter, seasonally adjusted, is provisionally estimated to be about $\frac{1}{2}$ per cent lower than in the first quarter. This, together with the fact that unemployment figures are now beginning to rise, has made the Institute change its mind, and it now believes that by the second half of next year, Britain's deficit will have been eliminated, even if the import surcharge is abolished altogether. But in order to obtain this objective, the Institute expects that there will be a year-and-a-half's pause in the growth of national output, and a rise in the level of unemployment by the end of 1965 to $1\frac{1}{2}$ per cent and by the end of 1966 to as much as $2\frac{1}{2}$ to 2 per cent. Thus, if the present trend continues, by the end of 1966, output will have been stagnant for well over a year, and unemployment will be relatively high and still rising.

The *London and Cambridge Economic Bulletin* points out that Britain is once more in the middle of a "stop-go" cycle, and claims that events have continued to unfold in a sequence very like that of the previous cycle four years ago. In 1961, and now again in July 1965, the Government has felt compelled to impose fresh deflationary measures at a time when there was already clear evidence that the pressure of demand had begun to ease off.

Devaluation Unavoidable?

These gloomy economic forecasts, together with the information that Fords have begun to work on short time and that their example will shortly be followed by other motor-car companies, have led to an air of gloom in business circles. The general view among industrialists seems to be that until the end of 1966, there can be

no question of resuming the fast rate of growth that the country has been aspiring for. It appears, however, that the view that Britain is in for a long spell of unbroken stagnation and rising unemployment is almost certainly too gloomy, and surely one that, for political reasons alone, would not be permitted by the Labour Government. Once the balance of payments becomes healthier, it is more than likely that the Government will work for a modest reflation which will keep the economy growing in line with capacity and prevent unemployment from rising. Therefore, in 12 to 18 months some reflation of the economy is to be expected, although direct action on imports may still be necessary to prevent the trade balance getting out of hand. The question that remains is whether the rate of growth can then be anything like the 4 per cent target of Brown's development plan. Does it now mean that recent developments indicate that this target must be radically amended.

It is indeed a tragedy that in view of the serious balance of payments position they inherited, the Labour Party had to adopt a policy of deflation which cuts right across the whole spirit of their general philosophy. Obviously, there are deep-seated difficulties in the British economy which cannot just be shrugged off, but is there then no hope, short of devaluation, which most people agree will not really be of any basic assistance to the economy?

Naturally, the Government is most anxious to see that depressing economic reports do not spread pessimism which in its turn could prevent business from investing, and so bring about the recession which everyone wishes to avoid. Brown's Department of Economic Affairs is still sticking to the objective of a 25 per cent increase in output for the period 1964 to 1970. The Ministry of State, Department of Economic Affairs, Austen Albu, last week at a Yorkshire Miners' Trade Union summer school said quite clearly that the forecast made by the National Institute of Economic and Social Research that Britain would face near stagnation in production need not necessarily come true. The type of economic forecasts made by institutions like the National Institute were based on the assumption that present trends could be projected, and that they would be accepted passively. The whole object of economic planning was to improve on the situation, to find out what had to be done

to improve the present trends, and then to decide how this action could be taken. The trouble with economic forecasts was that they "tended to become self-fulfilling prophecies". These types of prophecies created alarm and despondency and persuaded industrialists to reduce investment plans and Trade Unions to resist changes in methods or abolition of protective practices. The net result was that the country would get exactly what has been prophesied.

A great deal could be done both by the Government and by industry to change the trends on which these fore-

casts were based. Indeed, a new economic situation could be created if Britain could raise the proportion of her manufactured production sent overseas by 2 per cent, and make a similar small reduction in imports. It appears likely that the Economic Plan which is soon to be published by the Department of Economic Affairs, will still be designed for a sustained rate of growth, and a target of 25 per cent expansion by 1970. This would imply an annual growth rate of 3.8 per cent, and in the light of the present economic situation, it looks as if it will all have to be crammed into the last two

The Supplementary Budget

THE reasons which have led the Finance Minister to present a supplementary budget are many. The price situation has deteriorated again and the foreign exchange position is worse than ever. It has been found necessary to prune the borrowing programme of the Centre by Rs 20 crores from Rs 270 crores in view of the conditions in the money market. Small savings collections are expected to be Rs 125 crores against the Budget figure of Rs 135 crores and there would be a shortfall of Rs 15 crores under annuity deposits. Customs revenue so far has been somewhat higher than expected but excise and income taxes are not upto expectations. At the same time, there have been increases in expenditure owing to higher dearness allowances to staff and larger disbursements to the States, apart from the large increase that is now bound to take place on security and defence.

In order to keep the promise of no deficit financing and at the same time to stave off devaluation, a number of changes have been effected mainly in customs and excise duties to raise an additional amount of Rs 131 crores from import duties and Rs 50 crores from excise duties in a full year. Some minor changes are also proposed in direct taxation without, however, involving the rates of tax on individuals and companies. There are significant increases in the rates of development rebate.

Custom Duties

The customs tariff is proposed to be rationalised and simplified and considerably raised in the process, in the interest of raising additional revenue and for encouraging import substitution. The duties on fabricated and

unfabricated items would in general be raised to 60 and 40, per cent, respectively. For instance, the various specific and *ad valorem* rates with varying incidence averaging about 20 per cent on iron and steel material would be raised to 40 per cent *ad valorem* for unfabricated and 60 per cent for fabricated items to raise Rs 32 crores. Non-ferrous metals which bear duties ranging from nil to 50 per cent with an average of 25 per cent would be charged at 40 per cent and 60 per cent on the same basis to yield Rs 9 crores. Machinery (main items) taxed at present at 15 to 20 per cent (a few categories are free and some GATT-bound at 10 per cent) would be taxed at 40 per cent (statutory) and 35 per cent (effective) to yield Rs 58 crores. Machinery imported for projects would now be assessed in bulk instead of each item being assessed separately. The duty on chemicals would be raised from varying rates, mainly 40 per cent standard and 30 per cent preferential, to 60 and 50 per cent, respectively. The rate on lubricating oil would be raised from 16 per cent to 40 per cent and that on art silk yarn from 75 per cent to 100 per cent. The *status quo ante* would be maintained for GATT-bound articles (though attempts are being made to secure releases from binding agreements), certain imports from Pakistan and Burma, fertilisers and pesticides, raw cotton and raw jute, raw cashewnuts, newsprint, raw hides and skins, family planning materials and educational and research material. Sulphur, of which there is an extreme shortage and imports of which from the USA under aid agreements are at prices much higher than international prices and which is at present taxed at 10 per cent would be admitted duty free. The surcharge of 10 per

years of the period.

Perhaps the actual prospects for Britain lie somewhere between the gloomy forecasts of the National Institute, and the optimistic tone of the Department of Economic Affairs. However, one thing is very clear. Without a complete overhaul and modernisation of Britain's industries and industrial outlook, and without some far-reaching and viable solution to the problem of international liquidity to which the British economy through its reserve currency is so firmly tied, there can be no permanent solution of Britain's economic dilemma.

cent of duty is being withdrawn but the regulatory customs duty of 10 per cent is being retained.

Countervailing import duties to offset the impact of higher excise duties are being imposed on petroleum products, iron and steel, and non-ferrous metals to fetch Rs 12 crores, of which non-ferrous metals account for Rs 9 crores.

Excise Duties

The main burden of excise duties is on petroleum products (Rs 29 crores), and iron and steel (Rs 13 crores). The duty on inferior kerosene is left unchanged while that on light diesel oil has been substantially lowered. The duty on internal combustion engines of 10 h p or less is abolished altogether to benefit users of stationery engines for irrigation purposes. The purpose of these measures is to raise revenue as well as to restrain consumption. The duties on iron and steel products are to some extent graded in such a way as to discourage the use of the scarcer varieties. Simultaneously, the control over the price and distribution of pig iron has been removed altogether as a further step towards the implementation of the Raj Committee's recommendations.

Direct Taxes and Concessions

The principal change in the field of direct taxation relates to the raising of the development rebate for essential industries from 25 per cent to 35 per cent, as partial compensation for the higher rates of duty on imported equipment and to give a further incentive to investment in high priority industries; this rate will stay constant till March 1970, after which it will come down to 25 per cent. This

is in keeping with the policy announced earlier to assure continuity of both tax rates and concessions. The coal industry was getting a development rebate of 35 per cent till March 1966 after it was to get 20 per cent till March 1967 and 15 per cent thereafter. Coal and lignite will now be included among priority industries and will get the same development rebate as other priority industries for the same period. Other industries were to get a development rebate of 20 per cent till March 1967 and 15 per cent thereafter. This will now be 20 per cent thereafter.

The tax holiday for income upto 6 per cent on the capital employed in a new industrial undertaking or hotel would be available for investment from April 1966 when it is due to expire till March 1971.

The amount of tax credit admissible to an assessee for export performance was to be allowed at the end of 12 months. Now it would be payable immediately.

To encourage investment in equities further, the tax credits which were announced for investment in fresh equity issues would not be treated as the income of an individual who has given funds to his spouse or minor children for the purchase of these issues.

A person who happens to make an excess deposit of annuity payable by him would be entitled to a refund instead of waiting to having it offset against his future annuity liabilities.

A new and relatively long-term scheme for voluntary disclosure of concealed income and wealth has been brought into force. It will not apply to assets which have been discovered in the course of raids, etc, or have been detected or deemed to have been detected in the course of any proceedings by any government agency. On the amount disclosed, a non-company assessee will be charged the current rate of tax, without any unearned income surcharge and without any personal allowances in the case of individuals and HUF's. A firm making a declaration will be assessed as an unregistered firm. A company making such a declaration would be charged at the standard rate applicable to it, i.e., 50 per cent if the public is substantially interested, 60 per cent if the public is not substantially interested, and 65 per cent if it is a foreign company. In the case of a narrowly owned company, the voluntarily disclosed amount will not be

taken into account for any penal tax on account of non-distribution of the statutory percentage of profit as dividend.

The assessed tax is payable within 35 days of the notice of demand. With the previous assent of the Commissioner, and the deposit of satisfactory security, 10 per cent of the amount payable as tax can be paid within the period of demand notice and the balance in instalments over a maximum period of four years, at an interest of 6 per cent on the balance due. The income so declared will not

be assessed to any other direct tax levied by the Centre.

The rate of interest payable on any defaults by an assessee or by Government in case of refunds has been raised from 4 to 6 per cent. Provision is being made to allow relief on surtax under avoidance of double taxation relief agreements. To clarify the intention of the original legislation, it is being expressly laid down that donations for religious purposes would not be treated as charitable and, therefore, eligible for relief as donations.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

BOOK REVIEWS

Industrial Relations: Two Points of View

Harold Crouch

Industrial Relations: What Is Wrong with the System? An Essay on Its Theory and Future by Allan Flanders; Faber and Faber, 1965; pp 63, 12s 6d.

Industrial Relations: A Point of View by G Ramanujam; Indian National Trade Union Congress, 1965; pp 127, Rs 5.

IN the past the study of industrial relations has been treated as an off-shoot of economics, law and other disciplines. It has not been treated as a separate discipline in itself. Instead of a general theory of industrial relations we have had empirical studies of particular aspects of industrial relations in particular circumstances. Allan Flanders, who is a senior lecturer in industrial relations at Oxford, has felt the need to approach his discipline from a more theoretical point of view, and after creating a theoretical framework, he examines the industrial relations system operating in Britain, identifies certain changes that have taken place in recent times, and makes some predictions and recommendations for the future.

Without going into descriptive detail, Flanders points to three essential principles which have constituted the spirit of the British system of industrial relations. It is not so much the institutions of the system as such, as the spirit in which the system actually operates, that distinguishes one system from another.

The first principle is that of a preference for collective bargaining for the settlement of disputes. As Flanders points out, collective bargaining "did not rise like a phoenix out of the ashes of individual bargaining" (p 22) but developed to suit historical circumstances. In Britain it was found that governmental control of industrial relations in the earlier stages of industrialisation "was far too inflexible to suit a dynamic industrial society" (p 22).

A second major principle distinguishing the British system is its preference for voluntary procedural rules for collective bargaining. Unlike collective bargaining as practised in the United States, the system in Britain "has provided little work for lawyers" (p 23). Agreements are kept because it is in the interest of the parties to keep the agreement, not because of any legal force behind such agreements, and if an agreement is broken, the parties themselves must settle the question again. The system depends

very heavily on the continued recognition of a mutual interest in settling disputes without the intervention of the state.

The British system is further distinguished by an emphasis on procedure as opposed to substance. The parties seem less concerned with obtaining "justice" than with reaching a workable compromise through the accepted machinery. In the USA, the emphasis is on the substance of the agreement, wages, hours, and so on, whereas in Britain it seems that it is enough that an agreement be reached.

It is Flanders' central thesis "that the principles of any national system of industrial relations... are derived from the values by which the nation judges and legitimizes the system's working and results" (p 30). The values which have determined the British system are a belief in economic freedom and a desire for industrial peace.

However, since the second world war changes have been taking place in the system, partly because other values are being added to the traditional two. The system is consequently in a state of flux, being affected by an increasing recognition of the role of government in promoting economic development, and by the tendency for the shop stewards in the factory to take on certain negotiating functions that had previously been in the hands of the national union leaders.

The "challenge from above", that of increased governmental intervention in the economy and, as a result, in industrial relations, must inevitably alter the traditional system of collective bargaining. Flanders believes that it is essentially because of Britain's recurring balance-of-payments crises rather than any theoretical case for an incomes policy, that the post-war governments at first tried to introduce some measure of "wage restraint" or "planned growth of wages" as the Labour Party now prefers to call it. The adoption of a national incomes policy, which has been supported by both the previous Conservative and the present

Labour government, must necessarily restrict the scope of traditional collective bargaining.

The power of the national unions in collective bargaining and the success of the government's incomes policy are both undermined by the "challenge from below". With full employment the workers in a particular work-place have gained sufficient bargaining strength to negotiate with their own management. One consequence of this is an increase in "unofficial strikes", conducted without the sanction of the top leadership of the union; another consequence is the "earnings drift" which can seriously affect any planned wage policy. Full employment and even labour shortages have enabled shop stewards in particular factories to negotiate for wage payments above those agreed on after industry-wide collective bargaining. In 1959 it was estimated that average earnings were 26 per cent higher than the rates agreed on by collective bargaining at the industry level. In addition an increase in overtime widened the gap further between actual earnings and negotiated rates of payment.

How can the traditional system of collective bargaining at the national-industry level adjust itself to the recognised need for economic planning including the planning of wage levels? Flanders has identified the problem but has been unable to provide anything but generalities for a solution (for which he can hardly be blamed, as the problem is just about insoluble). Each side must accept the need for economic growth and an incomes policy. Planning of wage movements must necessarily be "indicative" if the goodwill of both sides is to be kept, but, as Flanders accepts, "Probably some breaches will not be avoided" (p 53). Flanders seems to be reduced to a plea that management and unions should each adopt a more long-run approach and more responsible methods, and that the government should encourage them in this. The success of the incomes policy will apparently depend more on the personal qualities of industrial leaders than on any basic institutional changes.

The problems of industrial relations in a country like India have only a superficial resemblance to the situation in countries like Britain. If the underlying values of the British system have been economic freedom and industrial peace, the central requirements in India have been rapid economic growth and the maintenance of political stability. These requirements have resulted in a system of industrial relations based on government control. The government actively works to secure industrial peace, partly because strikes hinder economic development and very largely because the development of a strong, militant trade union

movement represents a potential threat to political stability.

In addition to setting up machinery to regulate industrial relations the Congress government has also encouraged the growth of the Indian National Trade Union Congress, the present general secretary of which is G Ramanujam. Ramanujam's book of essays is not meant to be a scientific analysis of the Indian system of industrial relations. Its interest lies less in any intrinsic merit than in the fact that it authoritatively sets out the INTUC position on a wide variety of topics.

Like most Indian trade unionists,

Ramanujam goes through the ritual of denouncing party-policies in trade unionism, but perhaps we can take him a little more seriously than most others, as he is not, in fact, a member of the Congress party. (This may, of course, be more a result of the apparently friendly relations between the Congress Government and the Hind Mazdoor Sabha in Ramanujam's home state of Madras, rather than any differences in principle between Ramanujam and the Congress). While denouncing party-policies, Ramanujam does point out that trade unions must inevitably concern themselves with politics in the wider sense.

Asia's Dismal Export Prospects

G C da Costa

Trade Prospects for Developing Countries by Bela A Balassa; Richard D Irwin, 1964; pp xii + 450.

IN this book Bela Balassa examines, in considerable detail, the trade problems of developing countries. These problems are examined both in retrospect — 1928 to 1960 — as well as in perspective — 1960 to 1975. The study has been divided into two parts. In the first, the trade patterns of less developed areas are examined and the following aspects receive attention: (1) exports and economic growth in the developing countries; (2) economic growth in the developed countries; (3) future of exports from the developing countries; (4) import requirements of the developing countries and the consequent trade gap; (5) current account gap and alternative policies that can fill the gap. In the second part, the prospects for individual commodities have received somewhat detailed consideration.

Balassa finds that during the years 1928-1955, the exports of the developing countries grew at a rate considerably below that of the GNP of the developed countries — an 88 per cent increase in the GNP of the developed countries was accompanied by a 38 per cent increase in the volume of their imports. This, of course, does not suggest any uniformity during the period. For example, whereas between 1928 and 1938 export growth into the developed countries was only slightly lower than the latter's GNP the gap widened considerably from 1938 to 1955. In this latter phase a 68 per cent increase in GNP was accompanied by a 27 per cent increase in the exports of the less developed countries. The explanation is to be found in the

policy measures introduced during the War and technological changes in production that have taken place since. The substitution process might also be said to have developed during this period. Thus, whereas there was no synthetic rubber production in 1938, in 1955 in the United States the share of natural rubber in rubber consumption had declined to 42 per cent and in Western Europe to 85 per cent. Similar was the case with other synthetic substitutes. However, in the period 1955-1961 the growth of the exports of the developing countries exceeded the growth of the GNP of the developed countries. It is of interest to note that about half the increase is accounted for by fuels. Mineral exports, in particular to Western Europe, also showed some buoyancy. Manufactures fared well but their role in the aggregate was insignificant as they accounted for only about 7 per cent of the aggregate exports of the developing areas.

Future Trends

In order to estimate the future export prospects Balassa has calculated the future trends in incomes in the developed regions: North America, Western Europe and Japan. Several variants of the income variable have been used. These are per capita disposable income, gross national product (total and per capita), industrial production and in the case of certain raw materials specific indicators regarding the individual industries. Two alternative estimates have been used: (I) a 'most likely' estimate based on past

trends; (II) a high or optimistic estimate which could become a reality only if suitable economic policies were followed. Under the first assumption the projected increase in GNP is 80 per cent and under the second it is 96 per cent.

A detailed presentation of the conclusions here is, of course, impossible and uncalled for. But a few highlights are revealing of the trends that might be expected. We shall concern ourselves only with the 'most likely' assumption. First of all, in overall terms, he finds that the exports of the developing countries at 1960 prices would rise from \$19.5 billion in 1960 to \$29.1 billion in 1970 and \$36.0 billion in 1975. This would yield an income elasticity of import demand, for the developed countries, exceeding unity. This he compares with the period 1953-54 to 1960-61 when the imports of the developed countries rose by 48 per cent as against the 31 per cent rise in their GNP. The export prospects to Japan appear relatively the best. This is due to the special features of the Japanese economy; viz, earlier stage of development as compared with W Europe and the United States, lack of domestic sources of raw materials, in particular, minerals and the character of the Japanese diet. In Western Europe exports of fuel and minerals are expected to fare well. This is again due to the special features of the Western economy as compared with that of the United States: (a) the substitution process of liquid fuel for coal has been completed in the United States whereas it

is still taking place in W Europe; (b) W Europe has insignificant oil reserves; and (c) W Europe is at a lower level of technological and economic development. Export prospects in the United States and the Canadian markets appear least encouraging.

The bulk of the increase in the value of the exports of the developing countries will be accounted for by fuels and non-fuel minerals. Thus taking into account the fact that only in a few developing countries do these feature as important exports the position of the developing countries is much less optimistic than might appear in the aggregate projections. In fact there are some who would even prefer to exclude the exporters of fuel from the category of developing countries and include them in the category of the developed countries. It is no surprise then that Balassa finds the income elasticity of demand for cereals and potatoes negative and zero or slightly above zero for fish, oils and fats, sugar and tea. The case of tea is interesting for two reasons: first it is so important in India's exports; and, secondly, Balassa's results in respect of it corroborate the present reviewer's own findings.* The 'world' income elasticity of demand for our tea was found to be +0.07. As against this, the UK income elasticity of demand was -0.71, of the US +1.40 and of Canada -1.04. In view of the overwhelming importance of the UK in our tea exports the weighted average of these three countries' income elasticity closely approximates our global estimates.

Balassa confirms the view that the income elasticities of demand for primary commodities is low. Here he expects that by 1975 while the GNP of the developed countries would grow by 80 per cent their imports of this group of commodities would grow by only 31 per cent. The prospects for coffee, cocoa and bananas appear only slightly better: the exports are expected to rise by 44 per cent during the same period. He does not, for well known reasons, envisage any bright prospect for cotton and jute textile exports. On the other hand, non-fuel mineral exports may double and fuel exports more than double. Exports of manufactures may rise by about 120 per cent. All these projec-

* Period 1953-1962. The detailed study will appear in the next issue of the *Indian Economic Journal*.

tions are worked out in considerable detail.

Balassa next turns to the study of the import requirements of the developing countries. Here he finds, on the basis of past experience, that the greatest increases are likely for the Middle East and Asia and relatively smaller increases for Latin America and Africa. Together with his findings that the exports of the Latin American countries, Africa and Middle East are expected to rise by more than 66 per cent while those of Asia will rise by only 50 per cent he concludes that the trade gap of the Asian countries will comparatively worsen. How much it will worsen may be seen from the following figures. While the trade gap of all the developing countries together is likely to rise from \$1.3 billion in 1960 to \$5.2 billion in 1975 for Asia alone the trade gap is likely to grow from \$1.5 billion in 1960 to \$5.2 billion in 1975. Thus the entire gap will be concentrated in Asia. This he attributes to the slower growth of Asian exports and the faster growth of its import demand.

Several measures for filling the 'current account' gap are considered: accelerated growth in the developed countries, reduction of trade barriers, increased trade to the Sino-Soviet area, regional integration and capital inflow. He has, however, ignored the possibility that domestic measures by the developing countries might also help. His concentration on the demand side to the exclusion of the supply side prevents the emergence of a more realistic picture of the problem. Too often inflationary policies in the developing countries tend to divert resources away from the export sector. An export-oriented pattern of investment might go a long way in raising export earnings in the developing countries.

In the second part of the book Balassa examines the export prospects for individual countries. This is the more interesting part of the book. The commodities have been classified and studied under seven separate heads; (1) temperate zone food items; (2) competing tropical food items; (3) non-competing tropical food items; (4) agricultural raw materials; (5) non-agricultural raw materials which include all non-fuels minerals and metals; (6) fuels; and (7) manufactures. The export prospects for products falling within these groups have been examined with refer-

ence to North America, Western Europe, Japan and Oceania. The prospects vary both in respect of the group as well as the markets.

The methodology followed to forecast the trends in imports and exports is extensively discussed in the Appendix. Here too we find almost 80 pages of useful tables. In conclusion we may make two observations: First, as the study is general the export prospect facing an individual country should be deducted from it only with care. A separate study would naturally be best and Balassa's work lays the groundwork for it. Second, his conclusions are not new. There is a considerable amount of literature today that has arrived at broadly the same results. The merit of the work lies in its painstaking attempt to quantify economic relationships in the international trade of the developing countries. The expected relative deterioration in the trade position of the Asian countries would seem to suggest that this region deserves the most attention in international efforts designed to boost the exports of the developing countries.

Vaikunthbhai Mehta Committee An Appeal

HIS great devotion and life-long service to the co-operative movement and his patient work for developing the decentralised sector of the economy which, he firmly believed, held the key to the egalitarian society of the future are to be commemorated in a fitting manner by raising a memorial to the late Vaikunthbhai L Mehta. A trust has been formed for this purpose with the following trustees:

U N Dhebar	Chairman
D R Gadgil	Vice-Chairman
B Venkatappiah	Treasurer
Shantilal H Shah	
Dhwaja Prasad Sahu	
V P Varde	
Vadilal Dagli	Secretary

The trustees and Vaikunthbhai's admirers and co-workers have issued an appeal to the public, especially to those engaged in the activities which he had made the concern of his life, to contribute funds for the memorial.

Contributions are to be sent to the Treasurer, Vaikunthbhai Mehta Smarak Trust, Royal Insurance Building, 4th Floor, 14, Jamshedji Tata Road, Bombay-1. (BR).

The South Madras Electric Supply Corporation Ltd

Registered Office:

Power House, Tennur, Tiruchirapalli

THE following are extracts from the speech of Sri K A P Visvanatham, Chairman, delivered on the occasion of the 25th Annual General Meeting of the Company held on the 18th August, 1965.

I have great pleasure in welcoming you to this Twentyfifth Annual General Meeting of the Company.

This year marks the Silver Jubilee of the amalgamated Company, which as you would no doubt remember, was forged out of three independent companies, styled the Trichinopoly-Srirangam Electric Corporation Ltd, the East Tanjore Electric Supply Corporation Ltd, and the East Ramnad Electric Supply Corporation Ltd, in August, 1940.

As you will see from the Directors' Report as well as the Accounts that have been in your hands for sometime now, the working of the Company has been very satisfactory in the year under review. Power restrictions affected us somewhat in June/July 1964 and were sources of great annoyance to consumers. Fortunately, this spell was brief, thanks to Neiveli Thermal Power. This year too we had anxious moments almost upto end of July, due to the onset of the monsoon, but thermal power availability averted a crisis.

Expansion

The tempo of expansion has been kept up, by a capital investment of Rs 22 lakhs as against Rs 17 lakhs last year; the addition to the total number of consumers was 5,923 and 161 Kilometers of new lines were constructed, 32 new substations were put up. The revenue collections for the year at Rs 1,36,11,885/- touched a new peak which is indeed gratifying.

I am glad to say that the Company's programme envisages the keeping up of this tempo and for this purpose it is fortunate that the Government of India has approved the renewal of the Managing Agency

agreement of this Company with Seshasayee Brothers Private Limited for a further period of 5 years.

Though the Government had indicated to us that we should not expect any financial assistance from them, by way of loans for rural expansion work, I am glad to say that they have come forward with help for specific programmes aimed at increasing food production.

An immediate case in point is the "Agricultural Crash Programme" in Thanjavoor district. As you are aware from the press reports it is proposed to install a very large number of tubewells in the proximity of river beds to draw water in the non-irrigation season (February to June of every year) to raise seed beds in advance and thus accelerate and increase food production, making it possible to raise two crops. In our area, for the 1965-66 season it is proposed to install 700/800 such pumps and the electrical works involved to supply power to these pumps, estimated at about Rs 15 to Rs 20 lakhs, will be advanced by the Government.

Deposit Scheme

Apart from specified agricultural expansions, the Company's capital programmes as regards urban expansion system improvement and other industrial and domestic lighting schemes continue to be attended to in the best possible manner, though I must admit, that due to paucity of finance there has been considerable discontent among users of power on the delays in our meeting their needs. To raise capital to meet this category of supplies the Directors have decided to raise short term deposits on attractive rates of interest and notices describing this activity have been posted to all of you. I am sure this will commend to all of you and in the interest of the Company's expansions, I hope you will avail of this attractive investment opportunity and also recommend the same to your friends. The deposit scheme is not necessarily

restricted to shareholders or consumers, but is open to all friends.

Electrification of Model Village

In the context of our expanding activities, I would like to also mention to you of the electrification of a model village 'Ahli' we undertook near Delhi. The Government of India's Ministry of Irrigation and Power invited several Electricity Boards to select a few model villages and electrify them, so that standards of workmanship and costs may be examined. Your Company had the unique privilege of having been invited to participate in the scheme as the only representative of the private sector in public utility services.

I would also take this opportunity to warmly thank all ranks of staff for their loyal and enthusiastic services and efforts in creating greater prosperity to your Company.

The Company's working as I have mentioned, has been satisfactory and this is reflected in the recommendation that your Directors have made that the dividends on equity shares be raised from the 11 per cent paid last year to 11½ per cent this year. I am sure this meets with your approval and it is my hope that in the years to come we will be able to keep to this level.

Note: This does not purport to be the record of the proceedings of the 25th Annual General Meeting of the Company.

NON-RECEIPT OF COPIES

Subscribers are requested to inform us regarding non-receipt of their copies within a fortnight of the date of publication. It will not be possible to replace a missing issue, free of cost, unless timely intimation is given.

Complaints can be attended to promptly if subscribers kindly remember to mention their subscription number.

Class and Caste

Nirmal Kumar Bose

It is not the purpose of this paper either to find fault with the Marxian viewpoint or to show up its differences with the Gandhian method of bringing about social change through constructive work and satyagraha, to which the author is personally committed. The author has only tried to present the Marxian viewpoint with regard to caste as faithfully as possible.

But the conclusion that he arrives at is that the Marxian system is as much an idealistic system, an instrument of social re-organisation, as the Indian system of four varnas happened to be in the past. One may, of course, claim that Marx worked for 'human emancipation', while Mānu worked for preserving the rights and privileges of Brahmins. That is, however, an argument which can be modified and controverted from the social historian's point of view. That exercise, however, need not be attempted here.

The point that is sought to be made is that class in the Marxian sense is an intellectual instrument of action, and not a pure description of social phenomena into which Weber tried to convert it.

IT is necessary to draw a distinction between the way in which Weber and Marx have used the term class.

Weber tried to discover by means of comparison and analysis how some societies were actually stratified into classes. One part of a community might be distinguished from another by differences in the level of consumption, or in the distribution of economic or political power, or in some other way. After having examined various ways in which classes were marked off from one another, and also how they had evolved in course of time, Weber tried to find out a suitable definition of the term class, so that the widest range of observed phenomena might be covered under it with precision.

By contrast, the intention of Marx was something more than a scientific description of a particular kind of social phenomenon. After having examined the history of many societies, he came to the conclusion that all of them were divided into privileged and unprivileged classes; although the dividing line might be obscure in many cases. The real difference between classes lay in the manner in which one class laboured and produced wealth, while another, which exercised private rights of ownership over the means of production, lived more or less on the toils of the labourers.

In their own time, Proudhon, Tolstoy or Gandhi also held that, all over the world, men were divided into those who toiled, and the rest who lived on the toils of others, and were therefore thieves. (For Gandhi see Bose 1962a, pp 1-125).

It is interesting that the ideal distinction of Marx, Tolstoy or Gandhi into producers and non-producers is never neatly defined. There may be a hundred ways in which the dividing line may be rendered obscure. Even labourers may be divided into sub-

classes, distinguishable from one another by the proportion between what they produce and what they consume, or by the power which they exercise over their fellowmen, which helps them in gathering for their own interest and use, varying fractions of the surplus value produced by the toilers. In addition, the same sub-class may function as 'exploiter' in relation to one below it, and 'exploited' in relation to another above it.

According to Marx, it is this indistinctness which is responsible, to some extent, for the persistence of many of these stratified societies all over the world. This is true as much of the present age as of the past. Marx saw through, or he felt that he saw through, this camouflage placed over basic and real class differences. His reading of history led him to the conclusion that progress has taken place through a succession of class conflicts. Every conflict does not necessarily lead to victory of the labouring section of mankind; but it may be guided to that end. At least, that was the view strongly held by Lenin who thought that the moral responsibility of this leadership lies with the True Party which represents the interests of the proletariat.

Both Marx and Lenin, therefore, held that anything which masks real class-contradictions should be unmasked, class-consciousness accentuated, so that class-conflicts may come nearer home. Indeed, even defeats are not useless. Every conflict can, at least, be utilized for augmenting class-consciousness by laying bare the involved contradictions. This line of action has to be intelligently pursued, and with determination; because it leads to a shortening of the process of progressive evolution which is already taking place in human history. The revolutionist's task is to render the process of social change more economical and more efficient. He thus helps consciously and participates

actively in the process of 'natural' change. The polarity of interests has to be heightened by him before progress can take place with rapidity as it ought to in the present age of science.

Marx was thus not so much interested in describing what was happening in the world. This he did occasionally; and then he played the role of a social philosopher rather than that of a revolutionist in action. For him, the primary duty of a philosopher is not merely to understand, but to change. Marx thus used the concept of class as an operational instrument rather than as a descriptive term which would cover a wide range of camouflaged and un-camouflaged class antagonisms.

It is, therefore, not fair to say that Marx now and then contradicted himself in his use of the term class. To say that Weber is logically more consistent, and thus an improvement upon Marx is also not quite correct. One was interested in classifying social phenomena, the other in fashioning an intellectual concept which would pierce through obscurities, and serve as a tool of action. In the use of the same term, Marx and Weber thus stood widely apart from one another.

Caste: The Four Orders

It is possible to look upon the Indian concept of Varna in the same manner as Marx's class, i.e., as an instrument of social re-organisation rather than as a description of historical facts.

The Brahminical peoples were confronted in the past by the presence of many communities with whom they came into contact either in peace or in war. Such communities were frequently marked off from the Vedic people by sharp contrasts of language, beliefs or social customs. Brahmins had already developed a system of preserving the text of the Vedas by relegating sections of it to the keep-

A Siemens valve transmits FIRST MARS PICTURES

Siemens valve —
the length
of a matchstick.

A transmitter valve the length of a matchstick played an indispensable role in the USA's Mariner IV space project. It kept scientists on earth informed of Mariner IV's exact location in space. It transmitted the first pictures ever of the planet Mars. This vital component was specially manufactured and developed by Siemens.

Photos from 230,000,000 kilometres in space

6.10 a.m. Indian Standard Time, 15th July 1965. This was the historic moment. After 229 days, hurtling 230,000,000 kilometres through space, the capsule approached the mysterious planet to give us the closest-ever look. Within a few hours the priceless photographs were seen on television by millions the world over. Mariner IV had achieved one of the greatest triumphs in space exploration.

15,000 meshes per square centimetre

The guided tube in the valve had a plane control-grid of guided tungsten wires, each wire 1/100 of a millimetre in diameter. These wires formed a network with 15,000 meshes per square centimetre. Such a delicate design called for the most thorough testing possible. A 500-hour test was part of the rigorous selection programme. In addition, each sample valve was X-rayed and minutely examined both before and after the test. A major challenge to Siemens engineers, the valve was built to endure all the conditions of a long space flight. Special manufacturing and design techniques were employed — the latest at the time.

A product of unrelenting precision, the transmitter valve (called the RH-Cc) provided yet another link between Siemens and scientific progress.

POWER FOR PROGRESS—THROUGH SIEMENS

ing of specific lineages. This system had worked perfectly, and it can be imagined that its success led them to transfer the pattern to the economic organisation of society as well.

The rule was established that separate communities or *jatis* should be in charge of separate technological processes, or of services like priesthood, trade, defence and so on. They were theoretically to be in enjoyment of monopoly in respect of their allotted function in each regionally distinct area; and there was to be no competition between such groups. Yet, a sufficient amount of resilience was introduced into the system by means of 'alternative rules', or *apad-dharma*, from fairly early times. Manu has recorded this elaborately in his *Institutes* (X, 74 ff).

Legislators like Manu had in their time, to examine the situation arising out of the economic and social mingling of many *jatis*. Some of these were evidently of foreign origin; while others arose out of progressive differentiation of occupations, and as a few among them tired to rise high in social status by concealing their birth and adopting the ways of castes 'superior' to them. (See, for instance, *Mahabharata*, *Shantiparvan*, ch 65). In order to bring a system into this chance conglomeration of *jatis*, social legislators tried to reduce them ideally into a scheme in which only four *Varnas* were recognized.

It is interesting to note in this connexion that the classification into Brahmin, Kshatriya, Vaishya and Sudra was not confined to the world of men. Soils, temples, gems, gods and even the stars were actually classified into the same four orders. (See Bose 1963, 45-47; Tagore 1879.)

Manu believed in the possibility of transmission of character-types from parents to children; and he also held that a person or a community or *jati* eventually drifts into the occupation for which it is temperamentally equipped by heredity. If the origin of a *jati* is not known, it can be found out by reference to the ideal order in which the Brahmin is contemplative, selfless, devoted to learning; the Kshatriya is fond of fighting or ruling; the Vaishya interested in trade, and the Sudra in service. By applying this four-fold scheme, he claimed to find out the origin of every *jati*; and then he assigned each to one or other of the four *Varnas* by means of some other rules.

The *Manu Samhita* in its present form is considered to have

been written between 200 B C and 100 A D*. The following quotations illustrating Manu's Theory of Heredity are from Sir William Jones' translation entitled "The Institutes of Manu according to the Gloss of Kulluka" (Calcutta, 1794):

IX, 31 Learn now that excellent law, universally salutary, which was declared, concerning issue, by great and good sages formerly born.

IX, 33 The woman is considered in law as the field, and the man as the grain: now vegetable bodies are formed by the united operation of the seed and the field.

IX, 34 In some cases the prolific power of the male is chiefly distinguished; in others, the receptacle of the female: but when both are equal in dignity, the offspring is most highly esteemed:

IX, 37 Certainly this earth is called the primeval womb of many beings: but the seed exhibits not in its vegetation any properties of the womb.

IX, 38 On earth here below, even in the same ploughed field, seeds of many different forms, having been sown by husbandmen in the proper season, vegetate according to their nature.

IX, 40 That one plant should be sown, and another produced, cannot happen: whatever seed may be sown, even that produced its proper stem.

X, 69 As good grain, springing from good soil, is in all respects excellent, thus a man, springing from a respectable father by a respectable mother, has claim to the whole institution of the twiceborn.

X, 70 Some sages give a preference to the grain; others to the field; and others consider both field and grain; on this point the decision follows:

X, 71 Grain, cast into bad ground, wholly perishes, and a good field with no grain sown in it, is a mere heap of clods;

X, 72 But since, by the virtue of eminent fathers, even the sons of wild animals, as Risyasringa, and others, have been transformed into holy men revered and extolled, the paternal side, therefore, prevails.

X, 59 Whether a man of debased birth assume the character of his father or of his mother, he can at no time conceal his origin:

X, 60 He, whose family had been exalted, but whose parents were criminal in marrying, has a base nature, according as the offence of his mother

* Kane, P V: "History of Dharmasastras", Vol 3, p xvii.

was great or small.

X, 8 From a Brahmana, on a wife of the Vaisya class is born a son called Ambastha, or Vaidya, on a Sudra wife a Nisada, named also Parasava.

X, 9 From a Ksatriya, on a wife of the Sudra class springs a creature, called Ugra, with a nature partly warlike and partly servile, ferocious in his manners, cruel, in his acts.

X, 40 These, among various mixed classes, have been described by their several fathers and mothers; and, whether concealed or open, they may be known by their occupations.

By such rules, the people of Bengal became divided into two orders, namely, Brahmin and Sudra, although there are numerous *jatis* or castes among them. In other parts of India, all four Orders are present; and this is how many *jatis* became federated into an ideal system invented by Brahmin thinkers.

Class and Caste

Many authors have described caste as one variety of the class system. There is no doubt that Brahminical communities reserved for themselves a position of privilege in society, while the work by means of which people lived was relegated to the 'lower' orders. Caste was thus class; and this is a fact which has been emphasised by many historians in the past, as well as by sociologists like Bhupendra Nath Datta, M N Srinivas and Narmadeshwar Prasad in more recent times.

We must, however, remember the fact that class-antagonisms within the caste system failed to generate a sufficient amount of opposition and revolt among the subordinated communities. Narmadeshwar Prasad has tried to account for this by saying that the Brahmins successfully prevented reaction and revolt by the creation of a widespread 'myth' about their own holiness and infallibility, by a belief in the Law of *Karma* and transmigration of the soul, and so on. M N Srinivas is of opinion that the concern and value attached to ritual purity is so deep-rooted among Hindus, and the belief in *Karma* so pervasive, that both the privileged and un-privileged remain content with the status and role into which they have been born. So much so that there is no desire to rise and revolt against gross inequality.

Srinivas also says that the 'upper' classes have succeeded in retaining their positions of advantage, not only by extensive indoctrination of the 'lower', but also by usurping positions

of authority in other ways. In the past, they did so by ownership of land and an alignment with the ruling powers. In the present age, the same upper castes have taken advantage of modern education, and progressively 'westernised' themselves so as to join the ranks of the new ruling class. This they do by joining the administrative services, or by alliance with one or other of the political parties as they come into power. The 'upper' castes have thus adapted themselves to change, and still form the upper class; while those who are below, because of poverty, lack of education and social subordination retain their attachment to caste's ancient values, and prefer to raise themselves in rank by 'sanskritization' instead of by 'secularization' or 'westernisation'.

In the opinion of the present author, however, these hypotheses as explanations of the continuity of caste through the ages, in spite of political or cultural upheavals, do not appear to be wholly adequate. In case, there are several other elements which help in creating a *positive* sense by loyalty among the subordinated classes, even when some of them know that they are suppressed. These possible causes are enumerated below:

(1) In an economy of relative scarcity, particularly when there were swift changes of rulers, the rules of caste were devised in a manner so that various communal groups were woven together into a network of mutual interdependence.

(2) Competition was positively discouraged. An artisan or priest could seek the protection of the king, or of the local college of Brahmins, or even of the caste—or village-panchayat if he was threatened by competition by anyone who infringed upon his preserves.

(3) Each caste was left free to pursue its specific regional or communal customs in an atmosphere of comparative freedom and equality. In other words, cultural autonomy was thus guaranteed to each of the federated communities.

(4) If class differences brought about a growing inequality of income, as they were likely to do, the evils of increasing polarisation were offset by the custom of 'conspicuous expenditure'. Anyone who spent lavishly in beneficial acts, or even in sheer exhibitionism, was applauded more than one who hoarded. A practice was likewise built up in connection with birth, marriage or funerary ceremonies in which even the poorest householder

had to make gifts to priests, scholars and the indigent. The more lavishly one spent, even by incurring debts, the more approbation one received.

These elements in the culture of the people mitigated, but did not obliterate, the evils and strains resulting from class-differences within the caste system. And, it is the belief of the present author, that it is this fact, which might either be labelled as a camouflage or a conscious limitation of the growing ills of caste's productive system, which prevented the progressive polarisation of class-differences. The latter could have led to class war in India; but actually did not on account of the various safeguards thus built into the social structure.

Marxian Class and Caste

According to the Marxian way of thinking, this ingenious system helped the Brahmin-Kshatriya or upper class leadership to preserve itself intact through centuries. This was achieved by not allowing the contradictions in the distribution of power between class and class to develop as it did in the West.

The contradiction between technological progress and growth of population could not, however, be solved by this ingenuity. People remained poor, famine was followed by famine; and caste persisted because it gave a feeling of security even under the most straitened circumstances. Under the exigency of famine or natural calamity, people turned either to their joint families, or their own kinsmen or caste-men for protection or support. Ancient governments were frequently powerless to cope with such calamities, except by an extensive system of doles or gifts.

The remedy, according to the Marxian, lies in tearing aside the arrangements in the superstructure of caste, which prevent the 'natural' sharpening of class-antagonisms. That alone can prepare the ground for an already belated class-conflict, which will inevitably lead to the victory of the organised proletariat under the guidance of the True Party.

Comments

It is not our purpose in the present paper either to find fault with the Marxian viewpoint, or show up its differences with the Gandhian method of bringing about social change through constructive work and *sa'ya-*

graha, to which the author is personally committed. We have only tried to present the Marxian viewpoint with regard to caste as faithfully as possible.

But the conclusion to which we arrive is that, the latter is as much an idealistic system, an instrument of social re-organisation as the Indian system of four *Varnas* happened to be in the past. One may, of course, claim that Marx worked for 'human emancipation', while Manu worked for preserving the rights and privileges of Brahmins. That is, however, a point which can be modified and controverted from the social historian's point of view. But we need not indulge in that exercise for the present.

The point which we have been trying to build up is that class in the Marxian sense is an intellectual instrument of action, and not a pure description of social phenomena into which Weber tried to convert it.

Cuba, 1965

Joan Robinson

There is a different atmosphere in Cuba nowadays. The romantic phase of the Revolution was beautiful while it lasted, but it was too extravagant. It was magnificent, but it was not economics. This phase is now over.

Unromantic economics is now the order of the day.

The Cuban authorities have to evolve their system of planning, control and management just at the time when all established ideas in the European socialist countries are being questioned.

From one point of view this is a great advantage: it saves Cuba from the pressure of the dogmatists. On the other hand, the new ideas arising in the Soviet Union, after half a century of experience, are irrelevant to a young Revolution and cause confusion.

"THE romantic phase of the revolution is over." There is regret as well as pride in the words. The romantic phase was beautiful while it lasted, but it was too extravagant. Luxury flats were built for the slum dwellers, with elegant fittings in the bath rooms. An economist defended it to me at the time: "We have a building industry for luxury, so why not use it for the benefit of the poor?" Now it is realised that too few get rehoused that way. Factories were built to give urban employment without thought of the import bill for materials. The agricultural workers were rescued from the misery of the dead season by all-the-year-round farming, and then there was not enough labour to cut the sugar cane. All the young people who took part in the literacy campaign were offered scholarships when there was already a scarcity of teachers. It was magnificent, but it was not economics.

There is a different atmosphere nowadays, though there are still food shortages, there is urban unemployment and there is heavy dependence on foreign aid. Observers from other socialist countries are apt to criticise or even scold the Cubans for the way they go on. But they themselves have found that installing socialist institutions does not change national character overnight. The remarkable thing is how much, not how little, liberation has transformed Cuban life. Every people is what history and geography have made them. Neither the traditions of Spain and of Africa, nor the example of wealthy American pleasure seekers, were propitious to economic development. The Cubans have responded to the Revolution, not only with heroism in a crisis, but with cool resolution under continuous menace. (Timid characters left). For this they command respect as well as admiration. But foresight, exactitude, and steady slogging do not come easily to them. Moreover they feel that it is their task to prove to Latin

America that socialism can be gay. (Their new dance, the Martinique, will go like wild fire in the capitalist world once it gets out). The Cubans have had plenty of advice on economic affairs, and in technical details they rely upon it entirely but foreign advisers cannot teach people how to manage themselves.

Even the romantic period of Cuban revolution had considerable achievements to its credit. The greatest achievement, of course, is just to have carried on under the fantastic threat hanging over them. Besides, they survived, somehow or other, the abrupt switch of trade from a haul of a few days to a haul of several months, with changed specifications of all goods imported. The industry left on their hands was kept running, more or less. Agriculture, somehow or other, was organised. A network of education and health services was thrown over the whole country. In same period they had to repel an invasion, undergo an emergency requiring general mobilisation, and repair the damage of a devastating hurricane. It was the romantic, heroic, revolutionary spirit, not economic commonsense, that carried them through.

II

Unromantic economics is now the order of the day. The situation of Cuba is unlike that of other developing countries. The problem is not to industrialise so as to make use of surplus labour from an overcrowded rural population. On the contrary, there is potentially rich land still uncultivated and a shortage of hands for the area already being worked. About a third is now in small holdings, (small that is by Cuban standards; the legal maximum under the second land reform is 60 acres) but there is no self-subsistence peasant economy. Even in the mountains, the small farmers sell their crops and buy bread at the bakery. The majority of agri-

cultural workers were not peasants at all, but paid hands who had to live from half a year's employment on the sugar estates. From one point of view this was favourable for the development of socialism. It was possible to go straight to state farms on the greater part of the cultivated land. This form of organisation, certainly has its own problems, but it is the shortest cut to modern, capital-intensive agriculture. On the other hand, the lack of the traditions of an old native peasantry means so much the less comfort at a given statistical standard of life. For instance, there is plenty of bamboo and coconut in the country, but no one thinks of using them for furniture and household utensils. What the family cannot afford to buy at the shop, they have to do without.

The main problems for Cuba were the seasonal unemployment of sugar raising and the under-cultivation of land in cattle ranches. The state farms, giving work all the year round, created the opposite problem—a drop in sugar production for lack of hands in the harvest season. For the time being the gap is filled by the army and by volunteers—office workers, factory workers, students and so forth, led, of course, by Fidel himself. It is said that after three seasons they have become expert cane cutters, but this is a solution in the heroic rather than the economical style. All this people, who receive their normal salaries, are leaving their own work undone for several months. Mechanisation is relied upon for a permanent solution. Grabs for lifting the cane (supplied from USSR) have already made a big contribution in 1965; the hope is that in a few years' time almost the whole job will be done by combines, at least on the level ground. In many underdeveloped countries mechanisation is causing rural unemployment, or has to be restrained for fear that it will. In Cuba it has to be pressed on to make development possible at all.

UP IN ARMS

FOC-44

This is serious. The Armed Forces urgently require a new type of packaging for troop rations—one that would keep food nutritious and wholesome under the most extreme conditions of high altitudes. The Research Team at India Foils gets busy. Drawing upon all their technical knowledge and their vast experience, they attack the problem and the answer is ready. The right gauge, the right laminate, the right Al Foil for the job. And so India Foils are always prepared with aluminium foil to meet the most exacting packaging requirements at all times, under any conditions.

Britain)

Branch : Baroda Bank Building, Apollo Street, Bombay

The official statisticians reckon that there is unemployment of 7 per cent of the labour force. Since 40 per cent of workers are in agriculture, this means more than 11 per cent of urban unemployment, largely because the abrupt change in way of life has left many misfits. (At one time they had a plan for training ex-housemaids and prostitutes as taxi drivers, but this did not turn out well). All the same Havana shows little of the obvious signs of disguised unemployment, so obvious in, say, Mexico City (not to mention New Delhi)—beggars, shoe blacks, street sellers and little boys competing to mind the car—perhaps because the children are in school. Luxury restaurants and night clubs have been kept going and provide for shoals of employees. This cannot be considered unproductive work, for it fulfils the useful function of syphoning back excess purchasing power into the exchequer.

The grand strategy that has been adopted is to continue to develop sugar, and to push ahead with cattle raising and fruit (as well as increasing home food production), thus building up foreign earnings from whoever will buy, using the proceeds for import-saving industrial investments, and so getting the spiral of development going. This is a sharp break with conceptions hitherto current in the socialist world. The achievement of more than six million tons of sugar in 1965, a striking success in intensive poultry farming and a promising start with cattle, inspire confidence that the new programme can succeed.

Formerly the cattle (of Indian breed) were left to graze on huge ranches, and it was perfectly normal for thousands to die when the summer rains were a little late. Now the arts of making hay and silage are being learned. An agriculturalist remarked to me that a hard winter is a training in discipline and foresight which the Cubans never had. The half-wild cows are being broken in to milking; crossing with bulls imported from Canada is relied upon to improve the herds. Three systems are being introduced—strip grazing, dry-lot feeding with grass and molasses, and intensive feeding based on cultivation of cereals. Each method has passionate advocates; the authorities are sensibly allowing them all to be given full scale trials to see which answers best, taking the human element as well as the climate into account. When production is in hand, problems of refrigeration and marketing will loom up.

III

The Cuban authorities have to evolve their system of planning, control and management just at the time when all received ideas in the European socialist countries are being questioned. From one point of view, this is a great advantage—it saves them from the pressure of the dogmatists. On the other hand, new ideas arising in USSR, after half a century of experience are irrelevant to a young revolution, and cause confusion.

In particular, there seems to be a great deal of confusion, in the debate going on in Cuba at present between incentives to achieve success and criteria of what success consists of. Thus arguments against a particular method of accounting, in which the profits of an enterprise appear as an item, are often conducted in terms of the case against using material incentives to promote production. There is, at present, a small element of bonus in the pay packet for norm-fulfilment for the ordinary worker, and fines for absenteeism but there seem to be no bonuses to management or to enterprises as a whole. Reliance is placed mainly on "socialist emulation", very little on the money motive.

There are two very strong arguments against putting much weight on monetary incentives. The first is political. It would undermine the process of socialist education, which is still rudimentary. Socialism came to Cuba as a by-product of national liberation (while the opposition, whatever liberal principles they may have thought they believed in, turned out in practice to be Quislings to the United States). There was neither a traditionally revolutionary working class, soaked in Marxist philosophy, nor an old liberated area where a whole generation could experiment and study. There were professed Marxists in Cuba but it was not they who made the revolution. Socialism came to the insulted and injured in Cuba from Fidel promising:

the right of peasants to land;
the right of the worker to the fruit of his labour;
the right of children to receive education;
the right of the sick to receive medical and hospital care;
the right of the young to work;
the right of students to receive free instruction, practical and scientific;
the right of Negroes and Indians to a full measure of human dignity;
the right of the aged to a secure old age;

the right of intellectuals, artists and scientists to fight through their works for a better world;
the right of States to nationalize imperialist monopolies as a means of recovering national wealth and resources;
the right of countries to engage freely in trade with all other countries of the world;
the right of nations to full sovereignty;
the right of the people to convert their fortresses into schools and to arm their workers, peasants, students, intellectuals, Negroes, Indians, women, the young, the old, all the oppressed and exploited; that they may better defend, with their own hands, their rights and their future. (Declaration of Havana, September, 1960).

It was this which gave charm to the romantic period of the revolution, but a way of life cannot be changed in a single burst of enthusiasm. Habits of co-operation, of self-denial and service, of the honesty which comes from self-respect are not permanently formed in a day. To appeal to individualism now might uproot the plant before it had grown. It may be necessary later, when a generation has grown up for whom the revolution is a commonplace, but the time is not yet.

The second reason for avoiding monetary incentives is purely practical. There is not yet enough with which to implement them. There is no advantage in larger money earnings (except to spend in the black market) when the individual can already buy his rations. The greatest needs are for housing, improvements in the medical service and in access to education. These are gradually being met collectively and individual earnings would not help.

On the other hand, something will have to be done about the income scale, which is chaotic. The old regime left an ill legacy to the revolution in the relatively high wage rates of a small group of urban workers, mostly in public utilities, which for obvious political reasons could not be attacked. The rule is that no one, when he changes his job, gets less income than before, so that after personnel has been shuffled about, in offices and enterprises, individuals doing the same job get widely different rates of pay, and there is no correspondence between the hierarchy of income and the hierarchy of responsibility. There is no painless

Scientific packaging must keep pace with the planned growth of consumer goods industries

Each of the products listed below needs scientific packaging for its preservation and distribution. And so, as their production grows from Plan to Plan, it is essential that the consumer packaging industry keep pace.

The packaging industry like any other, must grow by its own efforts. By utilising its resources to maximum advantage. By undertaking ceaseless research and imaginative development. By keeping constantly in touch with the mainstream of international packaging know-how.

And while the packaging industry is doing and will do all these things, it must be

assured of one thing—adequate supplies of the basic raw materials it needs to keep production moving and growing.

Especially supplies of tinplate—the primary consumer packaging medium. Until such time as the expanding local production of tinplate meets the packaging industry's requirements fully, this essential metal will have to be imported.

Without adequate tinplate the growth of the packaging industry will be seriously hindered—much of the fruits of planning go waste.

PRODUCTION TARGETS FOR SELECTED INDUSTRIES

(Third & Fourth Plans)

Industry	Unit	1965-66	1970-71
FOOD PRODUCTS			
1. Biscuits	'000 tonnes	40	73
2. Confectionery	"	25	50
3. Vanaspati	"	450	550
4. Fruits & Vegetables (Preserved)	"	75	150
NON-FOOD PRODUCTS			
1. Lubricating Oils	"	100	800
2. Paints & Varnishes	"	120	200
3. Cosmetics	Rs. million	150	250
4. Arc Welding Electrodes	mill. meters	274	550
5. Soap	'000 tonnes	220	320
6. Drugs & Pharmaceuticals	Rs. million	1750	3000

Commodities	1965-66 +		1970-71

way to move from this to a rational wage scale—an inheritance from the romantic phase which is source of concern to the would-be economists.

In the debate going on in Cuba, the question of incentives is mixed up with the question of accounting. Most enterprises are run on the "budget system", according to which the management, say, of a factory is given certain tasks, and is allotted drawing rights on the bank for the sums estimated to cover the costs. Some, however, are run on the system described as "self-finance" which seems to mean normal accounting principles of profit and loss. The difference, in practice, affects the manner in which the bank keeps its records, more than anything of substance, for in either case an enterprise whose costs prove to be excessive will be scolded and bailed out, and in either case net earnings are paid into the exchequer.

The point of substance is the relationship of management to the bureaucracy. In principle, the "budget system" gives the Ministry more direct control over the business, but in practice, once more, the difference is formal rather than real. When there is a manager in charge of a plant who knows his technique and has the natural authority that comes from ability and self-confidence, he will get his way from the Ministry whichever system he works under; and contrary-wise.

The problem of management is acute in a country emerging from semi-colonialism, which has scarcely any trained personnel accustomed to take responsibility. (The general view is that, with a small number of exceptions, those who left would not have been much use if they had stayed.) The old dilemma, that it is not safe to let a child into the water till he has learned to swim, seems to be inhibiting the growth of a breed of managers who have enough initiative but not, as is common in Cuba, a little too much.

The choice of the criterion of success has caused endless trouble in the European socialist countries. To fall back, as is now being suggested, upon net profit seems to be a counsel of despair. It certainly would have no meaning in Cuba, where the pattern of prices is admittedly arbitrary, where there is no turnover tax to mop up the consequent surpluses, and where costs are erratic, depending largely upon deliveries of sea-born supplies. The method of regulating

production through detailed contracts between enterprises, within the broad framework of a loose-jointed central plan, which appears to work well in China, evidently requires a Chinese capacity for foresight and exactitude. The Cubans are only now beginning to give serious attention to the problem of choosing the method that is least unsuitable to their particular situation. Meanwhile bureaucracy and excessive paper work are being scolded from posters, themselves printed on paper.

All the same, the style of work that Fidel Castro has established has the qualities of its defects—candour, open-mindedness and capacity to admit mistakes. It is a pity to have lost so much time zigzagging about, but more has been lost elsewhere by carefully following an inappropriate model.

IV

Social change, also follows a zigzag. The rate of growth of population is alarmingly high and women in the country are oppressed with family cares, but birth-control is only mildly encouraged and abortion is kept illegal (mainly with an eye to the "image" of socialism in Catholic America). Communist ideology, in spite of the militia girls, does not seem to have made much dint in the "male chauvinism" characteristic of Latin culture. There is something priggish in pressing legal marriage upon well-established couples who, by old custom, had not formerly registered; and, in the back areas, abruptly, breaking up an accepted and respectable polygamy. The campaign against homosexuality was excused by some scandals which would have been no better if girls had been involved. But the artists, so far, have been left free to follow "decadent" capitalist fashions as much as they please.

The Trade Unions, modelled in those of other socialist countries, represent the view of the Party and the government rather than of the workers. As a corrective, Workers Councils have been set up, elected from the rank-and-file, to adjudicate on cases where an employee claims to have been unfairly treated. The plaintiff and the management each has the right to appeal from decisions of a Council to the Ministry. A wise manager prides himself on avoiding cases by satisfying the workers' sense of justice in the first place.

Notwithstanding the curb upon extravagance much imaginative social

work is still going on. Dedicated young people have gone into the mountains to teach. At one place the teachers got together and set up a boarding school on the coast for the older children. Those remaining with the first grades come down on Saturdays to work out the next week's lessons. Only after this scheme was well established the Ministry took it over and is now providing a school house. The stinking shanty towns around Havana have been wiped up. At first whole colonies of slum-dwellers were moved together into new quarters, which did not sufficiently change their outlook. Now a new system has been developed. An overcrowded neighbourhood is surveyed, some new places are found, scattered about the city and prepared (in Old Havana sometimes in co-operation with the department for preservation of national monuments); then the people are asked to suggest whose needs are greatest and the designated families are shown the new flats and asked if they would like to move. The romantic spirit of the revolution is still working in the new harness of commonsense.

V

The 64 dollar question that visitors returned from Cuba are asked is always: Does Fidel Castro still command the loyalty of the people? The short answer seems to be: Yes, he does, and, if he did not, President Johnson is making sure that he would.

British Aid to India

INDIA and Pakistan have been among the chief beneficiaries of British financial aid to developing countries in recent years, according to a British Government White Paper published in London this month by the Ministry of Overseas Development.

Bilateral financial aid to India for 1964-65 amounts to £30 million (Rs. 40 crores), all of it in loans. The figure for 1963-64 was £26 million (Rs. 34.66 crores). Bilateral financial aid to Pakistan for 1964-65 amounts to £9 million (Rs. 12.4 crores), almost all of it in loans. The figure for 1963-64 was £8.25 million (Rs. 11 crores). Bilateral financial aid to Ceylon for 1964-65 amounts to £0.55 million (Rs. 7.3 million), all of it in loans. The figure was the same for 1963-64.

In 1964-65 India and Pakistan received about 27 per cent of all British bilateral financial aid.

"Indian Economic Growth: Performance and Prospects"

Reply

K N Raj

I HAVE read with interest Ashok Rudra's comments (*The Economic Weekly*, July 3, 1965) on my lectures at Nalanda last January. It seems a pity that he deliberately refrained from writing a full critique or presenting an alternative thesis, as I have had some difficulty in making out what precisely was the sort of "clarification" and "discussion" he was seeking.

For instance, Rudra wants to know why I picked on a 7 per cent rate of growth for the economy as a whole and a 5 per cent rate for the agricultural sector as the targets to be achieved, and why I have not argued the case for these rates "in terms of a model with realistic and plausible values for the parameters". I would have expected him to recognise them as the estimates of the Perspective Planning Division and, since the details have been published, he should have had no difficulty in understanding the assumptions on which they are based. I have, of course, seen Rudra's paper (published earlier in your journal) contesting the correctness of the estimate for the agricultural sector and have also had the privilege of listening to him on this subject at a seminar in the Delhi School of Economics; but, as he might recall, a large number of us were not very convinced by his reasoning and had doubts in particular about his estimate of income elasticity of demand for food based on time series data. The suggestion that I should have developed my argument in terms of a model gives me also the impression that Rudra has perhaps misunderstood the purpose of the lectures and the kind of audience for which they were intended.

Similarly, I do not know what to make of his concluding comment about the income-distribution aspect of the growth experience during this period. If he was implying that I had ignored this aspect of the growth experience he was being inaccurate and less than fair (as he would find if he took a second look at p 27 of the brochure). If, however, he was wanting me to accept his reasoning that, since the marginal rate of saving during the period was almost double the highest

average rate achieved, "the obvious conclusion to draw is that the incremental income has been distributed more unequally than the average income", all I can say is that the conclusion does not necessarily follow. The marginal rate could be higher than the average at either the beginning or end of a period without having itself risen during the period. Even if it rises it could be due to a variety of reasons other than a more unequal distribution of income. For instance, if the marginal propensity to save is higher in the rural than in the urban sector for comparable income-groups a shift in income-distribution in favour of the rural sector can raise the marginal rate of saving in the economy as a whole without increasing the overall concentration ratio. Further empirical work seems to be therefore necessary before one can assert with confidence that there has been a change in income distribution towards greater inequality.

I am also at a loss to understand what exactly Rudra means by a "tautology". Apparently he concedes that agricultural production is affected adversely by instability of agricultural prices; that the existing tenurial system does not provide sufficient incentive for the optimal use of inputs; and that more intensive application of inputs could raise agricultural production. How is it then a tautology to say that a higher rate of growth can be achieved in agriculture if the tenurial system is reformed (such that at least there is incentive at the margin to apply more inputs), prices stabilised (through measures too well known now to need repetition), and larger supplies made available of the necessary inputs (water, fertiliser, credit, etc)?

Perhaps what Rudra wants to say is that he is not convinced that all these measures will be adequate to raise the rate of growth in agriculture from 3 to 5 per cent. If so, he might well be right, but I think it is upto him to say why precisely he is sceptical. Those who think a higher rate of growth is realisable can give a number of reasons, such as the following:

(i) The rate of growth of agricultural production has been

stepped up since 1951 to a compound rate of 3 per cent per annum, from 1 per cent or less in the earlier British period, despite very little progress being made in reform of tenancies, stabilisation of agricultural prices, and provision of inputs like fertilisers.

(ii) Farm management studies in package programme areas like Tanjore have shown that tenants who are required to pay 60 per cent or more of their produce as rent have incentive to apply only about one-third of the recommended package of inputs, and that the inputs and productivity increases realised are greater in the case of peasant proprietors. There is, therefore, a strong presumption that reform of tenancies will lead to a substantial increase in productivity.

(iii) A number of studies have established that farmers in newly irrigated areas take a long time (as much as 15 to 20 years) to get used to irrigated cultivation and make the best of the facility. The full impact of the heavy investment in irrigation since 1951 may, therefore, be evident only in the next decade.

(iv) Rates of growth of around 5 per cent per annum in agriculture have already been achieved in the last decade in the Punjab and Madras, and in some districts even higher rates of growth. There is, therefore, no reason to assume *a priori* that rates of growth of this order cannot be achieved.

(v) While it is true that, a large part of the increase in agricultural output in the last decade has come from extension of cultivated area, it is significant that productivity per acre has gone up in the case of many crops whose prices have remained relatively stable and where there

A tired man working on exhausted soil. That has been the picture of the Indian farmer. The freakish monsoons have kept him eternally in prayer.

Changing the pattern of agriculture is part of the Plan. Fertilisers lend energy to the soil, while research makes available improved varieties of seed. The vagaries of the monsoon and turbulent rivers are checked by irrigation projects that bring an assured supply of water to more and more land.

Agriculture is the base of our economy

July 28, 1965

has been incentive for more intensive application of expensive inputs.

One cannot, of course, be too sure about one's forecasts in a sector like agriculture, particularly in an economy at this stage of development. But is Rudra's apparent presumption that a higher rate of growth cannot be achieved in agriculture based on any stronger grounds than the hypothesis that it can be? If he feels that he has stronger grounds for believing otherwise he should state clearly what they are.

Rudra seems to think also that there is some contradiction in assuming for foodgrains an upward sloping curve for production and a downward sloping curve for market supply. "Why", he asks, "should in the first instance the farmer increase output in response to price rise if he is going to sell less?" Surely it is one of the elementary propositions in economic theory that production can be elastic with respect to price and yet, if the producer is a consumer of his own product, the income effect of a price change may be such as to produce a backward sloping curve. All I had said was that the decline in output of wheat after 1960-61 was "likely to have made a more than proportionate difference to the amounts marketed by producers", and that one of the probable reasons was increased self-consumption by small producers following the sharp rise in the price of wheat. Of course, if the relevant elasticities are "suitably chosen" (as Rudra argues), "increase in price, increased production, increased self-consumption and increased market supply may be shown as consistent". But is Rudra trying to establish merely a logical possibility (with which no one can have any quarrel), or is he suggesting that the actual elasticities are such that despite the rise in prices the self-consumption of wheat by producers must have fallen by at least the same proportion as output? If he is making a strong assertion of the second sort I would be interested to know more about the basis of the assertion.

Rudra has also drawn attention to what he regards as factual errors and misleading interpretations of statistical data. He says that my statement that the level of wholesale prices remained "at around the 1960-61 level till 1963-64" is factually wrong. I have therefore checked my statistics once again. I find that the index number

of wholesale prices (1952-53=100) stood at 127.5 in 1960-61, fell to 122.9 in 1961-62, and rose again to 127.4 in 1962-63. It remained at 128.2 even in the first week of April, 1963 and began rising only from then on. I fail to see what is the factual error Rudra is referring to. Perhaps he has been misled by comparing the level of wholesale prices in the calendar year 1960 with its level in the calendar year 1963.

Rudra also questions the meaningfulness of my statement that "wholesale prices in 1960-61 were only about 12 per cent higher than in 1951-52 and about 25 per cent higher than in 1952-53". He says that it loses much of its force "when one examines the paths actually followed by prices instead of comparing two end-points". He also draws my attention to a statistical statement showing not only the index numbers of wholesale prices but the consumer price index numbers (which he says, quite correctly, are

more relevant if one is concerned with the welfare aspects of the problem). I do not quite understand, however, why the path followed by prices over the period takes away the force of my statement (based on comparing prices at three points of time) unless Rudra has some reason to think that the low level of prices in 1954 and 1955 following bumper harvests should be taken as normal in some sense. I have also compared the movement of the whole price index numbers with that of the consumer price index numbers and find that they moved remarkably closely over the entire period 1952 to 1964; the correlation coefficient for the two series given by Rudra is in fact as high as 0.939. The other point Rudra apparently wishes to establish, namely that the rise in consumer prices has been very much higher than the rise in wholesale prices, is true only if we compare their levels at the two end-points he has chosen to show in his statement.

Firm Size and Efficiency in Manufacturing Industries

S Hajra

In his article in *The Economic Weekly* of July 24, 1965, I C Sandesara examined the Cotton Textile Industry and found that higher capital-labour ratio size groups were inefficient as compared with lower capital-labour ratio size groups. His study showed that firm size had consistent relationships with (a) labour productivity; (b) capital productivity; (c) wage rate; and, (d) surplus per unit of labour and capital. But the relationship with capital-labour ratio was what was contrary to common belief, i.e., smaller size-groups had higher capital-labour ratios. The stability of these relationships over a period of six years made it likely that they are not of an accidental type.

An attempt is made here to examine how far other industries support the results which Sandesara found to hold good for the cotton textile industry.

WE consider in this paper seventeen industries. All the statistical data are from the Census of Manufacturing Industries of India. The concepts are also the same as used in the Census.

The data are given in detail for 1955 and 1958 in Tables 1 and 2. The notations in the tables are: K = total productive capital; Y = ex-factory sales value of output; V = net value added, i.e., ex-factory sales of output less raw material and other costs and less depreciation; L = total employed persons; W = total payments in wages and salaries and benefits; M = total material costs, fuels, electricity, etc., consumed, and amount paid to other concerns for work done by them.

We compare two size groups for 1955 and 1958: one size group is in the lowest quartile and the other in the highest quartile. The results are interpreted below.

Firm Size and Capital-Labour Ratio

It can be seen that capital-labour ratio is higher for the larger size group in all industries with the exception of wheat-flour, distilleries and breweries, and cotton textile in 1955 and wheat flour and distilleries and breweries in 1958. On the whole, therefore, the evidence suggests that the relationship between firm size and capital-labour ratio is direct for the group of industries examined here.

From Tables 1 and 2 it can be seen that the general tendency is: higher capital-output ratio for smaller units and conversely. For 1955 it can be seen that capital-output ratio was higher for smaller size groups for 12 out of the 17 industries. The industries for which capital-output ratio was higher for the larger size-group are, paper, tanning, woollen textile, chemicals, and aluminium-copper and

brass. For 1958 capital-output ratio was higher for the smaller size-group for 13 out of 17 industries. The industries for which capital-output ratio was higher for the larger size-group are, sugar, chemicals, bicycle, and general engineering and electrical engineering. It can be seen that the only industry for which capital-output ratio was higher for the larger size group in both 1955 and 1958 is chemicals.

Firm Size and Productivity

It has been seen earlier that capital-output ratio and firm size tend to have an inverse relationship. Capital-output ratio is the inverse of partial productivity of capital. Higher capital-output ratio for the smaller size group thus means lower productivity of capital. The values of V/K which is the inverse of capital-output ratio are given in Tables 1 and 2. The values of V/L which is the partial productivity of labour are also given in the

tables. From the tables it can be seen that the smaller size group also has lower labour productivity. The important feature of firm size and productivity thus suggests lower productivity of capital and lower productivity of labour for smaller size-group. For 1955 it can be seen that the same 12 industries for which capital-output ratio was lower for the larger size group have both: higher productivity of labour and of capital. For the rest it can be seen that productivity of labour is higher for the larger size group and of capital lower. From all the industries therefore the unmistakable evidence is that of higher labour productivity for the larger size group and, to a large extent, higher productivity of capital also. This suggests that the larger size group, because of higher capital intensity, saves both labour and capital.

The definition of surplus value here is the value added net of wage cost, which may be defined as the share of

Table 1

Industries	Ratio of Labour Productivity of Small and Large Size-Group		Ratio of Unit Material Cost of Small and Large Size-Group

capital in the extended sense, and this is equal to (V-W). The surplus-labour and surplus-capital ratios are given in the table as V-W/L and V-W/K. For 1955 it can be seen that surplus per unit of capital and labour are higher for the larger size groups in 12 out of the 17 industries. For 1958 the surplus per unit of capital and labour are higher in 13 out of the 17 industries. The industries for which the surplus per unit of capital and labour is higher for the small size group in 1955 are distilleries and breweries, cotton textiles, woollen textiles, chemicals, aluminium, copper and brass. The industries for which surplus per unit of capital and labour is higher for the smaller size group in 1958 are: tanning, cotton textiles, chemicals, bicycles and general engineering and electrical engineering.

On the whole, it can thus be said that the larger size group, by and large, has:

- (1) higher capital-labour ratio;
- (2) higher productivity of both capital and labour; and,
- (3) higher rate of surplus per unit of labour and capital.

Firm Size and Production Cost

Two costs, (a) wage cost, and (b) material cost, are compared here for the two size groups. Both the costs have been expressed as unit cost, i.e., cost per unit of values added. W/V represents unit wage cost and M/V represents unit material cost. Both these costs are given in Tables 1 and 2. From the tables it can be seen that unit wage costs were higher for the smaller size group in 1955 for 12 out of 17 industries; in 1958 it was so for 9 out of 17 industries. Unit material cost was higher for the smaller size group both in 1955 and 1958 for all the industries. Unit wage cost and material cost together are given in the tables as M+W/V. This is equivalent to total operating cost of production. From the tables it can be seen that the smaller size group of all the industries both in 1955 and 1958 had higher unit operating cost. The larger size group, therefore, had differential cost advantage, which added greatly to its efficiency in generating higher surplus.

From the above analysis it can be seen that smaller size group tend to have:

- (a) lower capital-labour ratio;
- (b) lower productivity of capital and labour;
- (c) lower surplus per unit of labour and capital; and,
- (d) higher unit operating cost.

The difference in labour productivity

and the difference in unit material cost between the smaller and larger size groups for most of the industries are quite remarkable. Labour productivity and unit material cost of the smaller size group as proportion of those of the larger size group are given in Table 3 for 1955 and 1958. From the table it can be seen that there is good deal of inter-industry variation in labour productivity and unit material cost between small and large size groups, and that this variation is persistent. What is even more important is that there is for a particular industry a good deal of variation in labour productivity and unit material cost between small and large size groups, which is also persistent. In 1955 it can be seen that the productivity differential for labour is between one-third and one-half for 10 out of 17 industries. Higher capital intensity of the large size group can, however, explain higher labour productivity but the wide variation in unit material cost is difficult to explain. However, if higher capital intensity represents also better technique, it can to a certain extent explain the differential in unit material cost but the differentials for many observations in the table are possibly beyond any technological explanation.

One possible explanation of inefficiency of the smaller size group may be that the raw material market is tight for the smaller size group and that it has to buy material at prices much higher than those paid by the larger size group. The measure of output that has been used in this study is that of value-added, which is equivalent to output at factor cost. This measure of output is ex-factory sales value of output less all material costs. Since raw material costs themselves are so very different between smaller and larger size groups, it is questionable how far the value added measure of output can be used for analysis of technical efficiency that is imputed to capital-labour ratio (as Sandesara has done).

In Tables 1 and 2 the proportion of ex-factory sales per unit of value added is given as Y/V. If we examine the Y/V column we find that Y in relation to V is bigger for the smaller size group in nearly all the industries. This sales-value added ratio can be taken as one possible indicator of the efficiency of firms: sales-value added ratio will mean inefficiency and conversely. How far the smaller sales-value added ratio of larger firms can be attributed to technical efficiency

because of higher capital-labour ratio, it is difficult to say in a situation where cost differentials are spectacular. Variations in capital labour ratios between the smaller and larger size groups may be due to the differences in the degree of utilisation of capacity, and it may also be expected that scarcity of raw material for the smaller size group as evident in higher material cost may lead to under-utilisation of capacity and hence higher capital-labour ratio.

For the cotton textile industry unit material cost is twice as high for the smaller size group and it is quite possible that this may be responsible for under-utilisation of capacity of smaller size groups and hence higher capital-labour ratio. A study of unit operating cost in relation to degree of utilisation of capacity may give at least a partial explanation of higher capital-labour ratio of the smaller size groups as found by Sandesara.

In conclusion, therefore, it can be mentioned that the larger size group is definitely more efficient than the smaller size group for the industries examined here. But Sandesara's finding of higher capital intensity for the smaller size group in cotton textiles cannot be accepted for other industries also.

The fundamental problem of the smaller size group lies in higher cost-structure and unless something specific is done to mitigate the cost differential, policies intended to encourage small industry will be frustrated. The higher cost structure of smaller size group, it seems, is not a purely technological phenomenon; it rather seems that the raw material market in India has many imperfections as a result of which the smaller size group suffers. Failure to remove these imperfections will leave firms in the smaller size group with two alternatives: either to merge into the larger size group or is go out of business. A third alternative, however, may be mentioned here. The smaller and large size groups can be made to depend on one another through sub-contracting, i.e. instead of having common production programmes, they can evolve a production programme where the smaller size groups are complementary to the larger size group. The need for different policies for smaller and larger units can be avoided only if the extent of sub-contracting can be increased and common production programmes abandoned. (In another article the author will discuss the role of sub-contracting in Indian manufacturing industries.)

AROUND BOMBAY MARKETS

New Delhi Gives In

Wednesday, Morning.

GROUNDNUT OIL has been in the news again. It is not just that the Gujarat Government has reimposed the ban on its movement outside the State, which is probably bad enough, but, far more disturbing is the sequence of events which has culminated in the ban, unless, of course, one is to disregard completely the news that has been appearing in daily papers. According to Press reports dated August 19, New Delhi had rejected Gujarat's plea for reimposing the ban on the export of groundnut oil from the State. On August 21, the president of the Ahmedabad City Congress Committee, Trikamlal J Patel called for the creation of an oil zone and an end to free trade in edible oils to avoid "a wave of consternation and anger" in Gujarat over the rising trend in groundnut oil prices. Not only that; in a communication to the Union Food Minister Patel warned that "if there is any bloodshed in the State on the issue, the responsibility will be of the Centre and not of Gujarat". The very next evening New Delhi permitted Gujarat Government to have its way and reimpose the ban on the movement of groundnut oil, solvent oil, refined groundnut oil and any mixture containing groundnut oil. Apparently, the threat worked and New Delhi bowed before the State Government. This is most unfortunate, to say the least. Far more serious than the possible repercussions of the export ban on the relative movements in the prices of groundnut oil both within and outside the Gujarat State is the Centre's inability to exercise an effective control over the States even when it is equipped with all the necessary powers.

The announcement of the export ban has led to a sharp decline of nearly Rs 450 a tonne in the price of groundnut oil within Gujarat, the quotation having been marked down from around Rs 3,200 to Rs 2,750 in Rajkot. Prices of groundnut and groundnut oilcake have also moved down in sympathy. In Bombay, groundnut oil which had eased from Rs 32.25 to Rs 30.50 over the preceding week under the spell of beneficial rains in nearly all the groundnut producing areas, was again marked up to Rs 32.25 on August 23 and the latest quotation is only a little lower around

Rs 31.80 (per 10 kgs). Gujarat has always been the main source of supply to Bombay. If the price of groundnut oil has not registered a sharper rise following the reimposition of the ban, it is because the price of Rs 32 is considered to be high enough in the context of improved supply of edible oils this season to attract supplies from other States, more particularly from Andhra and Madras. Besides, the more recent rains have considerably allayed fears of serious damage to the new groundnut crop following the prolonged dry spell. The future trend of groundnut oil prices, as also of other vegetable oils, is difficult to forecast partly because of the unpredictable nature of the weather in coming weeks and partly because of the not-infrequent interruptions in the free movement of goods between different States. All that one can say is that edible oil prices are unlikely to register any appreciable decline even from the current high levels, which are not unusual for this time of the year, unless there is an appreciable improvement in the overall supply position because demand, of which no reliable estimates are available, continues to expand with the growth of population and rising money incomes.

The Press Note on the export ban says that the Order applies, besides groundnut oil, to solvent oil, refined groundnut and any mixture containing groundnut oil. This has quite naturally caused considerable confusion in the trade because the State authorities have not yet been able to clarify whether the export ban also covers groundnut expeller cake which contains some 7 per cent oil and vanaspati which is made from groundnut oil. Fears of possible restriction on the movement of groundnut expellers outside Gujarat have imparted strength to groundnut expeller cake prices in Bombay. The position in regard to vanaspati is even more uncertain because vanaspati falls within the jurisdiction of the Central authority. If the export of vanaspati outside Gujarat continues to be allowed freely, the five factories operating within the State, of which Bhavnagar Vegetable Products is the largest unit, will earn a huge windfall resulting from the substantially lower price of groundnut oil within the State compared with prices

elsewhere in the country. Will these factories be allowed to get away with these windfall gains? It is hardly necessary to point out that the reimposition of the export ban suggests that the Gujarat Government has been unable to procure sufficient stocks of oil through the voluntary levy of 22.5 per cent of production of the crushing units which was later raised to 35 per cent, along with the increase in the purchase price from Rs 1.75 to Rs 1.90 per kg.

Oilseeds futures in Bombay which had developed a slightly easier tendency under the influence of highly beneficial rains have again turned firm following the renewed strength in groundnut oil. Castor seed April which had been marked down from Rs 88 to Rs 85.75 is up again to around Rs 88.50 (per 100 kgs). Linseed April had eased from Rs 111.25 to Rs 108 but it has again risen to Rs 110.50. Cottonseed futures have continued to be neglected around Rs 56.50.

Export houses reported fairly good business in groundnut extractions, with U K mentioned as an important buyer. There was also a good deal of buying for export to Communist countries, presumably against previous sales. Groundnut expeller and extraction prices showed distinct firmness last week. Export activity in cottonseed cake continued to be normal. Castor oil continues to be neglected by exporters, but domestic demand, mainly for mixing it with other edible oils, is large enough to sustain its price well above the world parity. Nobody seems really bothered about the export prospects for castor oil which has been a very valuable foreign exchange earner in the not-distant past.

COTTON

Weather Obliging

ALMOST all the cotton growing areas which had begun to feel uneasy on account of the prolonged dry spell have reported quite satisfactory rains over the past few days. Good luck. The prospect of a poor harvest is extremely disturbing. Cotton prices are already quoted higher than the revised ceilings for the 1965-66 season which are nearly Rs 75 to Rs 100 per candy over the present ceilings. And the disparity between

Indian and foreign cotton prices has continued to widen year after year; indigenous cotton is reported to be 35 to 40 per cent costlier than comparable foreign cotton after making necessary allowance for spinning values. Nobody seems much bothered about the rising trend in cotton prices, presumably because consumers of cloth have to satisfy their needs anyhow and exports of cloth have to be subsidized anyway. As against this, high cotton prices have the political advantage of securing for the Government the support of the agriculturalist community.

The production of cotton will have to be considerably higher than in the 1964-65 season if prices are to be contained within the revised ceiling prices in the new season because consumption of cotton is on the increase. Output of cloth and yarn during the first seven months of the current year at 3,000 million yards and 1,228 million lbs shows an increase of 69 million yards and 22 million lbs over the corresponding figures for 1964. Consumption of cotton is bound to increase with the sizable increase in spindleage. And if the Government were to implement quickly its proposal for the setting up of 50 to 55 spinning mills in the cooperative sector, the gap between the supply and demand for cotton will widen considerably unless cotton production is stepped up to take sufficient care of the increased demand resulting from additional spindleage. Considering the ridiculously low average yield of about 120 lbs an acre, the scope for increasing cotton production is immense. And yet, if one goes by past experience, the prospect does not appear very promising.

Apart from the favourable turn in the weather, there has been very little to report about the developments in the cotton market over the week. Turnover in cotton remains restricted. Arrivals of the immature crop in Punjab and of new early maturing crop in the Baramati tract have been very slow and prices are reported to be on the very high side. Fresh inquiries for Deshi cotton from Japan have also been restricted recently and the prices quoted by the Japanese importers are considerably lower than the prices prevailing here. Export performance this year has been quite encouraging; despite a smaller Deshi crop, exports have been well maintained. The recent announcement of the global quota has revived inquiries for imported cottons and moderate

business has been reported during the week.

Activity in cotton futures continues to be at a standstill, with the August contract firm between Rs 795 and 797. It can go hardly any further because of the ceiling at Rs 798 per 3 quintals. Efforts are being made to start hedge trading in the new crop contract at the earliest and it is quite likely that all the differences would be thrashed out within a few days and the new contract will make its appearance on the board before the end of this month.

STOCK EXCHANGE

'To Hell With Stock Markets'

WHILE dealing with the question of revival of the capital market in the course of his talks with newsmen in Bombay on Saturday, August 21, the Union Finance Minister asked "Is it to be argued that industry will not get the necessary resources if the stock market close down?" and declared angrily "to hell with the stock markets". Apparently, T T K had been annoyed with the stock market's reaction to his Supplementary Budget. He saw no justification for share prices to fall when he had given incentives for higher production. But the stock market's reaction to a Budget which seeks to mobilise some Rs 100 crores in the course of the current fiscal year could scarcely have been bullish.

In fact, it is somewhat surprising that the stock market did not turn panicky over the unexpected announcement of additional import and excise levies. The lows recorded in kerb deals on Thursday evening following the announcement of the Supplementary Budget were not seen again during the week. Not only that, the market recovered most of the ground that had been lost through hasty selling, indicating that it was not unaware of the concessions that the Finance Minister had offered to the industry by way of increased development rebate for certain priority industries, extension of tax holiday to new undertakings, removal of the import surcharge and abolition of the import deposit scheme. But the steadiness that has been noticed after the Budget seems to be more due to technical considerations and hopes of fresh support from the Life Insurance Corporation than to the belated realisation of the incentives that the Finance Minister has provided while raising sizable additional

funds through the Supplementary Budget.

Not much need be made of the modest recovery in equity prices over the past few days. The market had been declining for a long while and it had seen a new low only on August 20. No explanation is really necessary for occasional spells of steadiness which are caused mainly by technical considerations — the oversold position of the market from time to time. With the Kashmir situation continuing to cause serious anxiety, the stock market cannot be expected to put up a firmer appearance. Certainly not when the food situation also continues to threaten peace within the country.

Many will share Finance Minister Krishnamachari's view that mere tax relief will not help revive the capital market, though for different reasons perhaps. The capital market is in bad shape because the country's economy is under severe strain. But if T T K were to concede this point he would not feel intrigued over the stock market's disappointing performance. T T K does not need to say "to hell with the stock markets" because the conditions obtaining there are not any better. Very few stockbrokers are really able to make their both ends meet. Activity on the stock market has been declining year after year despite the impressive increase in the number of companies listed on the exchange.

MONEY AND BANKING

Comfortable Conditions Prevail

CREDIT conditions in the Bombay short term money market during the week to August 26 displayed an all round comfortable trend. Demand for funds during the earlier part of the week was strong due, largely, to drawals for subscription in Government loans. Supply was good with customers able to find accommodation. Rates of interest were more or less maintained at the previous week's level of 5 per cent but some transactions at 5½ per cent were also recorded. In Calcutta business was restricted as both demand and supply of funds were limited. Demand during the earlier part of the week was slightly lower but firmed up towards the week end. Rates of interest was unchanged at 6½ per cent.

During the week to August 13 deposits of the scheduled banks improved from Rs 2788.96 to Rs 2795.69 crores according to the latest statement of affairs of the scheduled banks

issued by the Reserve Bank of India. There was, however, a decline in the total credit granted by the banks by Rs 6.51 crores at Rs 2025.95 crores. Cash in hand was slightly lower by Rs 30 lakhs at Rs 68.34 crores against Rs 68.64 crores during the previous week. Balances with the Reserve Bank moved down from Rs 95.80 crores to Rs 94.75 crores. Investments of scheduled banks declined by Rs 5.57 crores at Rs 829.04 crores. Money at call and short notice increased modestly by Rs 35 lakhs at Rs 59.03 crores.

Notes in circulation during the week to August 20 showed a decline of Rs 33.80 crores at Rs 2580.58 crores, according to the latest Statement of Affairs of the Reserve Bank. Reserve

Bank holdings of rupee securities were lower as well by Rs 44.99 crores at Rs 2294.37 crores. Foreign securities continued unchanged at Rs 68.35 crores while balances held abroad showed a small improvement of Rs 12 lakhs at Rs 7.93 crores. Central government deposits advanced by Rs 18.09 crores at to Rs 89.37 crores but State government deposits declined from Rs 21.40 crores to Rs 10.61 crores. Scheduled bank deposits increased by Rs 9.40 crores to Rs 107.65 crores. Loans and advances to governments were higher by Rs 10.42 crores at Rs 57.37 crores. Advances to scheduled banks moved down from Rs 3.83 crores to Rs 1.92 crores. Investments during the week are better by Rs 16.30 crores at Rs 314.55 crores.

Big Advance in Cooperative Banking

THE inauguration last week in Bombay by the Finance Minister, T T Krishnamachari, of the mutual arrangement scheme initiated by the All-India State Co-operative Banks' Federation marks a new phase in the history of co-operative banking in India. This scheme places co-operative banks in the same position as joint stock banks so that transfer of funds or remittance facilities are made available to constituents at reasonable cost, as also collection of cheques, bills and hundies. With the growth of banking habits and increase in inter-State business, the need for such services and facilities is assuming greater importance in banking transactions. There is no co-operative bank of a federal type at the national level. We have instead 21 State co-operative banks, one in each State and the Union territories, and central co-operative banks at district level and at taluka or tehsil level in some States. All the central co-operative banks, which number 387, are affiliated to the state co-operative banks in their respective State. Now all these participating banks will transact business of issue of demand drafts and mail transfers, collection of bills, cheques and hundies as if they were part and parcel of a single institution.

What is more, this scheme may pave the way for laying the foundation of an integrated approach to numerous other problems confronting the co-operative banking sector which is fairly widespread in the country. The volume of co-operative credit is of considerable significance in the economy as is indicated in the Government's proposal

to bring co-operative banking under fuller regulation and supervision of the Reserve Bank of India. The Finance Minister has already recognised the need to extending the deposit insurance scheme to the co-operative banking sector as it will help in deposit mobilising of a high order.

The development of co-operative banking has been rapid during the last 10 years. The working capital of the State co-operative banks expanded from Rs 47.6 crores in 1954-55 to Rs 281.5 crores in 1962-63. Progress in the subsequent two years is also expected to be equally encouraging. Whereas ten years ago the spread and development of co-operative banking was fragmentary and uneven, the position has undergone visible changes since then. State co-operative banks have been established for each State as the apex of the co-operative banking structure, with central banks for every district or part of a district in almost all the States in the country. At the base are the primary village credit societies or service societies. The co-operative banks at the district and State level do not deal with individuals; their main function being to supply finance other co-operative societies. In 1962-63, the State co-operative banks gave loans to individuals amounting to Rs 5.7 crores only against Rs 208.4 crores to societies. The corresponding figures for the Central banks were Rs 3.4 crores and Rs 288.7 crores respectively.

As on June 30, 1963 there were 2,11,000 primary agricultural societies in India with a membership of 217,00,000 and 12,850 non-agricultural

credit societies with 55,00,000 members. They had deposits of over Rs 115 crores and the loans advanced by them to members during 1962-63 amounted to Rs 166 crores. In 1963, commercial banks in India had 5,495 offices located at 1,860 places, the corresponding figures for co-operative banks were 2,360 offices at 1,864 places. The number of places served by co-operative banks were larger even though number of their offices was almost half that of commercial banks. If co-operative banking spreads all over the country with the same full coverage as within States like Maharashtra, it is estimated that within the next decade nearly 5,000 to 6,000 places will be covered by offices of co-operative banks. Moreover, if the primary credit societies further extend their field of service and begin to cater to the needs of the weaker sections of the society, at present not included in any institutional service, the bulk of the population will be within their fold.

The legislation regarding co-operative banks passed recently by the Lok Sabha would enable the co-operative banking institutions to be put on a more sound footing, and these institutions will help in spreading the banking habit in rural areas. The co-operative banking sector has to mobilise resources needed for economic development and to substitute the unorganised credit sector.

India Steamship

A RAMASWAMI Mudaliar, Chairman, India Steamship, has pleaded for increase in the freight rates of liner services which suffer on the one hand from rising expenditure and on the other, limitation on earnings. In his annual statement circulated to shareholders with the latest report of the company, Ramaswami Mudaliar says that apart from increase in wage bill, amenities and staff welfare expenses and port charges, shipping companies have been faced with certain extraneous factors which have a bearing on consideration of the freight rates and on the normal earnings of shipping lines. Both the Governments of Great Britain and India, with whose trade India Steamship is most concerned, have had to face the serious problems of balance of payments during the past year. In September last year, the Government of Great Britain imposed a surcharge of 15 per cent on all imports which, however, was reduced to 10 per cent in April this year. The Government of India

has recently put an embargo on practically all imports, though Ramaswami Mudaliar hopes that a relaxation of this drastic cut may come about shortly.

The effect of such fiscal policies is to reduce the volume of international trade, and it gravely affects the earnings of shipping lines, in the liner trade particularly. The difficult balance of payments position induces Governments to export goods and encounter competition in international markets. This fact in turn prompts Governments to rely on freight reductions for enabling goods being sold in extremely competitive markets abroad. Ramaswami Mudaliar argues that Governments have to appreciate that shipping companies also have to sustain themselves by earning a reasonable amount of profit on their stock, and this cannot be achieved unless freight rates are increased.

While other Conferences have increased their freights considerably time after time, there has been undue emphasis on maintaining low freight rates in the India/U.K./Continent Conference, possibly, because Indian trade in this route forms the largest percentage of its external trade. If the level of service has to be maintained by liner companies, freight rates both eastward and westward should be increased simultaneously and at the same level. Bearing in mind the necessity of export promotion, however, Ramaswami Mudaliar has suggested that there should be two levels of freight, whether eastward or westward; one, a general level which will be fixed by the Conference concerned taking all factors into consideration, and the other, a lower level which can be constantly reviewed for certain specific commodities called 'sensitive commodities' which may not move without a certain amount of lowering of freight rates. He adds that the clamour of some shippers who want very low freights without examining diverse factors which militate against their ability to compete with like goods abroad, should not form the main criterion for inclusion of commodities in the list of 'sensitive commodities'.

During the year to March 1965, India Steamship completed 50 voyages of which 40 were liner voyages and 10 coastal voyages, as against 68 voyages in the previous year, of which liner and coastal voyages were 43 and 25, respectively. In spite of the increased cost of operation in every direction and strikes and go-slow tactics of dock workers in various

ports in U.K., freight earnings were slightly better at Rs 8.30 crores compared to the previous year's Rs 8.28 crores. After charging depreciation of Rs 1.08 crores (Rs 1.29 crores), the working resulted in a profit of Rs 32.36 lakhs (Rs 9.57 lakhs). Of this, Rs 31 lakhs have been set aside for development rebate for which no

amount could be provided during the last few years owing to unfavourable trading results. A sum of Rs 10.65 lakhs is to be transferred from general reserve and Rs 1.99 lakhs from dividend equalisation fund in order to pay the usual dividend on preference shares and dividend at five per cent on ordinary shares.

IT NEEDS YEARS OF EXPERIENCE...

to make pipes durable enough to serve generations. Our vertically cast pipe foundry makes cast iron pressure pipes up to 48" diameter—and larger, on special order. The two spun pipe foundries—among the best in the East—make centrifugally cast pipes from 3" to 30" diameter, to an annual capacity of 160,000 tonnes. Prosaic details perhaps, but what's more important—at Kulti experience marches with nearly a century of tradition, and knowledge adds depth to know-how to make it an incomparable asset in the manufacture of pipes and fittings for India's many projects and utilities.

SEVENTY-FIVE PAISE

When do I get my Ambassador? When would it be my turn?

These are the questions you put to our dealers. Their supply depends on our production. Though we have doubled our production in the last five years, we can't cope with ever-increasing demand. Orders pour in day after day; the rate of booking for Ambassador far outstrips our production.

Why not produce more? You may say.

Yes, we do. As much as we can. Have a look at the record: 1954-55—2,500 Ambassadors; 1959-60—7,000 Ambassadors and 1964-65—16,000 Ambassadors. This year production is being further stepped up. We are, however, handicapped by the scarcity of foreign exchange which is required for pressing national needs, particularly for the defence of the country. Aware of the critical position, we have been relying less and less on foreign exchange by increasing the indigenous content of the Ambassador. Yet some imports are necessary for the present.

Hence, production can't cope with demand. So, the waiting period. Irritating, yet unavoidable. Beyond our control. We are doing our best to meet your demand, and certainly not hiding our face.

Aggression Will Not Pay

THE sequence of response and counter-response in Kashmir has developed dangerously, bringing India and Pakistan to a state of undeclared war. As we go to press, a regular aerial war is raging in the Chhamb sector and also perhaps at other points along the cease-fire line in which India has lost four planes and Pakistan two. Pakistani troops have advanced six miles into Indian territory in Chhamb, having crossed not only the cease-fire line, which both Indian and Pakistani troops have breached at innumerable points, but also, for the first time, the international boundary between the two countries. The objectives of this operation may well be to gain control of the road which connects Akhnoor to Poonch near the cease-fire line and, further away, the Pathankot-Srinagar road which is the vital link connecting Jammu and Kashmir with the rest of India. Whatever its tactical objectives, the massive Pakistani drive into Indian territory in Chhamb is a direct response to the capture of Pakistani posts by Indian troops across the cease-fire line in Kargil, Tithwal and Uri.

This deliberate escalation of the war situation by Pakistan is a desperate attempt to cover up the failure of the planned infiltration of armed raiders into Kashmir to stir up turmoil which could be given an air of a popular revolt. Now Pakistan has thrown in regular troops and its commitment becomes irreversible. India's duty is clear and its position unequivocal. Not only are the infiltrators being mopped up and hunted down, all the possible inlets of further infiltrations on the cease-fire line have also to be sealed. This is an elementary security measure and could not have been avoided. The action of the Indian troops, however, has been purely defensive and beyond the cease-fire line no incursion has been made than what was strictly necessary as a measure of security. The large scale armed attack by regular Pakistani forces in Chhamb sector has escalated the conflict and as Defence Minister Chavan rightly pointed, India has to take an overall view of defence.

What has driven Pakistan to desperation is the failure of its attack on Kashmir, its naked claim to that part of Indian territory being based on nothing more substantial than the two-nation theory. The manner in which Delhi has responded to the challenge, the cool determination, competence and efficiency with which it has been acting has not only greatly heartened the Indian people but, what is more, it has brought forth unity and resistance among the Kashmiri people themselves who have been the object of the Pakistani attack. Having staked everything, even war, on this one gamble over Kashmir, whatever the consequences of this mad folly even for his own people, President Ayub Khan can be made to see reason only by the use of the language which he as a soldier understands. India is replying to him in that language. At long last, India has painfully learnt that the only way to stabilise relations with Pakistan is to make Pakistan realise that aggression will not pay.

There are as yet few signs of a deceleration of the war in Kashmir. Unlike at the time of the Kutch hostilities, no definite international initiative for peace has emerged so far. The U N Secretary-General has called for an end to violation of the cease-fire line by both sides, withdrawal of the armed forces of each side from the positions occupied on the other and a halt to actual fighting. Both the US and the UK have supported this appeal and the Soviet Union has separately appealed for talks. However, the task of discovering grounds on which hostilities can be ended and some kind of talks initiated will be no easy one, to put it mildly. The withdrawal of Pakistani troops from the Chhamb will depend on evacuation by the Indian army of the Pakistani posts captured by it elsewhere across the cease-fire line. But while India has no intention of occupying these posts indefinitely, the purposes for which they were occupied—to prevent further infiltration into Kashmir and to make the operations against infiltrators already in the State more effective—have by no means been fully achieved. At the very least, their evacuation will call for an

assurance from Pakistan that there would be no further infiltration—an undertaking which it will find it difficult to give, at least publicly, in view of its pose so far that it had nothing to do with the “alleged infiltrators”. And taking the situation as a whole, it is not amenable to the kind of arrangement which put an end to the fighting in Kutch. Even then India had rejected Pakistan's attempt to bring the Kashmir question within the purview of the Indo-Pak talks provided for in the agreement. India's position all along has been that all that there is to talk about Kashmir is Pakistan's aggression there—which Pakistan is hardly likely to be anxious to discuss.

In short, therefore, as long as Pakistan refuses to accept the *status quo* in Kashmir there can be no end to

the recurrent outbursts of Indo-Pak hostility. Pakistan is realistic enough to know that she cannot annex Kashmir by war and, after the latest adventure, that it cannot even hope that with the help of its agents it can provoke a revolt of sufficient dimensions to seriously worry India. However, what it can try for is to prevent the *status quo* in Kashmir from freezing through long inactivity and to periodically bring the Kashmir question into the focus of international attention. In view of India's determination to block all debate on the subject in the United Nations, Pakistan will try to achieve this by military action, the extent of which will depend on the sequence of response and counter-response which, in the present case, has brought the two countries to the state of undeclared war.

Crack in Fund's Theology

THE International Monetary Fund is now at the cross-roads in its chequered career as its latest report proves conclusively. Though there is much rethinking going on in the Fund about its future policies, the indications about their directions are vague. The two strands which run through the report are the tricky problem of international liquidity and the payments problem of the developing world. While in respect of the first, the discussion in the report is in general terms and on familiar lines, the discussion of the difficulties of the developing countries in their quest for rapid economic growth shows refreshing signs of new awareness in the councils of the Fund, which is all to the good.

The Fund has clearly acknowledged a slow-down in the accumulation of international liquidity in the recent months. International resources increased in 1964 by \$2.5 billion which was lower by \$0.9 billion than that in 1963. The main reason for this was the growing reluctance of most of the rich countries to hold their reserves in dollars. This declining trend has continued even in 1965. As things stand, it is gold alone which can fill the gap in reserves. However, the rate of gold production in the non-communist world is not adequate to meet this need and hence the pressure on international liquidity.

How does the Fund get round the problem? Suspicious of any radical change and orthodox in its philosophy, the Fund has resorted to quota increases. The latest resolution of the

Executive Board has provided for a general increase of 25 per cent in members' quotas, together with additional increase for 16 countries whose quotas were considered to be out of line with their present state of economic development. After the proposed increases, total quotas in the Fund would rise from the current figure of \$16 billion to about \$21 billion. While raising quotas, the Fund has adopted other policies to prevent gold subscriptions from attenuating unduly the resources available to individual member countries and to mitigate the impact of the subscription of other members on the gold stock of the two major reserve centres.

All these, however, are mere palliatives and the basic problem of international liquidity persists with force. The Fund report does give out the liquidation of dollar balances by countries such as France as one of the reasons for slower expansion of international liquidity. But what is far more disturbing is that even if these countries desire to hold their reserves in dollars in the future, supplementing their gold holding, they may not be able to do so, in view of the slow but perceptible improvement in the payment situation of the United States. If that happens, the world may lapse into a period of dollar scarcity as in the immediate post-war era. The growth in international liquidity would then be constricted further. And if in such a situation the Fund wants to implement some of the suggestions for augmenting international reserves such as those put forth

by Triffin, or Bernstein, or Stamp, it would be firmly resisted by the United States. Politics would again be a deciding factor. It is for this reason that Triffin has pressed that the Fund or, for that matter, those deeply concerned with the problems of international liquidity should strike the iron while it is hot — that is to say, while the U S payments position is vulnerable.

And yet the Fund is hesitant in the extreme. All that it proposes to do is to extend quasi-automatic drawing facilities beyond the gold tranche up to some part of the credit tranche and to undertake operations whereby the Fund simultaneously would offer assets and assume additional liabilities. But aren't these only a truncated version of the proposals put forth by Triffin and Stamp? The intractable problems require bold tackling not merely tinkering if the world is not to be faced with a new crisis in the immediate future.

The second issue on which the Fund is showing a welcome awareness is the payments problem of the developing countries. It has been succinctly argued that this is not a mere consequence of general monetary inflation. It is partly the off-shoot of the basic weaknesses in the trading structure of these countries and partly of the conflict between the requirements of growth and the compulsion of internal stability. The external deficits of developing countries are linked up with an “inadequate rise in the purchasing power of their exports” and they can be remedied by “international measures to improve their export earnings, including reinforcing their access to markets in the industrial countries”. The thin end of the wedge is discernible in the realisation that “By and large, the developing countries, hampered by structural problems, notably the unsatisfactory development of their export earnings, have found it difficult to achieve simultaneously the goals of rapid growth and internal and external stability”. This is all very reassuring but is the Fund willing to refashion its policies in regard to developing countries? Or is it passing on the baby to Prebisch and his new set up in Geneva? The advice it tenders to developing countries — to India for example — is on the same old lines: if external deficit occurs, reduce it through scaling down investment. If internal inflation arises reduce quantity of money and throttle the new industries. The latest report of the Fund, however, shows a crack in the Fund's theology.

Facts without Light

OVER the years the Reserve Bank's annual “Currency and Finance Report” has assumed formidable proportions. The latest Report, covering the financial year April 1964 to March 1965, has just been released. There is no doubt a wealth of information and statistical data in this Report. Thus, in Part I the major economic developments of the year are reviewed, and in Part II developments in the various sectors of the Indian economy are treated in considerable detail—especially output and prices, money and banking, capital market, budgets and public debt, and trade and tariff developments. All this is supplemented by a large statistical section. It is perhaps mean to complain when there is such a feast of facts. The blurb states that all these data and information are “for the benefit of all those who are interested in these developments”. Our complaint is, however, only this—is not the manner in which these developments are portrayed capable of modifications so that they become more meaningful and reveal not only the inter-connections that exist between developments in different spheres but also the connection between the kind of steps taken by Government and the Reserve Bank to influence particularly sensitive sectors of the economy through fiscal and monetary measures.

The Report starts off by pointing to three basic features of the economy in 1964-65, viz, the rise of prices, difficulty in raising adequate resources for investments, and the alarming fall in the foreign exchange resources of the Reserve Bank. While discussing these key features practically every important facet of the economy has been covered. Considerable space has been devoted to narrating a “major” revision in the credit policy of the Reserve Bank “against the background of renewed inflationary pressure and a marked deterioration in foreign exchange position”. But has anyone stopped to think what particularly insidious connections there may be between balance of payments troubles and credit control in a situation where drafts on foreign exchange are severely controlled? Secondly, how much success this major revision in credit policy was able to achieve has not been indicated. The fact that 1964-65 witnessed an extraordinarily large in-

Weekly Notes

crease of prices may, conceivably, point to the relative ineffectiveness of the measures, particularly in the limited period over which they were operating. One is also entitled to know if the Reserve Bank has formulated certain criteria to assess the impact of its credit policy measures.

In other fields as well the developments of the last year make dismal reading. Agricultural production, in 1963-64 was stagnant and the growth rate of industry was slow. National income grew at a disappointingly slow rate. One of the measures that Government took towards the end of the year for containing the foreign exchange difficulties was to impose the regulatory duty on imports. This is said to be favourable to import substitution, revenue raising and a mop-up of excess profits. A wonderful panacea—if only these objectives could be made mutually consistent.

A confusing picture of an almost hopelessly confused position perhaps sums up the total impression of the Report. Why is it that a publication like this cannot give a crisp and analytical presentation of the major economic developments in the country? Why resort to heavy pseudo-academic language which is an unfortunate by-product of planning in India? One could point to numerous instances where language has been used which is certainly not conducive to clear thinking. The opening sentence “The Indian economy was under considerable pressure during 1964-65” barely conveys anything substantial. Then again, in reporting on the rise in the lending rates of IFC, ICICI, SFCs, etc, after the Bank Rate went up to 6 per cent in February, it is stated “...consequent on the rise in the Bank Rate from 5 per cent to 6 per cent in mid-February 1965, there was an upward revision of the cost of financial accommodation of the term lending institutions towards the close of the year”. Merely “to assist investment” must be too prosaic as compared with “with a view to aiding investment activity in the economy”!

Growth Rate, No Worse

THE “quick estimate” of national income for 1964-65, released by the Central Statistical Organisation, shows a sharp rise in the rate of growth of real national income during 1964-65. Though doubly welcome,

coming at a time of so much misgiving about the progress of the Plan, it should not surprise anybody. All other sectors of the economy are so much overshadowed by agriculture and allied industries that such an upward turn was expected ever since it was known that foodgrain production had reached the peak of about 88.6 million tons. Wide fluctuations in agricultural production hide from view the trends in the rest of the economy which are not equally exposed to the vagaries of weather and which are more responsive to the promotional activities of planning and development.

The extent to which agriculture imparts a fluctuating character to the rate of growth of income is seen from the rate of growth during the first three years of the Plan—2.6 per cent, 1.9 per cent and 4.5 per cent reflecting rates of growth in agriculture of 0.2, -2.0, 2.0 per cent — and the sudden jump in the rate of growth of income to 7.5 per cent following a rise of 10.2 per cent in agricultural production!

Mining, manufacturing and small enterprises have been meanwhile growing at a steady rate of around 5 per cent per year (4.7, 4.0 and 6.1 per cent in the first three years; the last year's figure is not as yet known). This rate is probably an under-estimate, for there are reasons to believe that the contribution of small scale industries to growth is not correctly measured in our national income statistics. If we take large scale manufacturing industries along with mining, an average rate of 7.4 per cent has been achieved during the first four years. The last year's growth rate of this group is however only 5.9 per cent, which shows a decline from the rates achieved earlier. As a matter of fact, judging from the index of industrial production, the rates of growth of production in the large scale industries were 7 per cent in calendar year 1961, 7.5 per cent in 1962 and 9.3 per cent in 1963.

The decline was not unexpected. As a matter of fact, a slowing down of the rate was forecast in the “Economic Survey” this year which had given up the Third Plan target of 11 per cent per annum as unattainable and did not expect for the Third Plan as a whole a rate more than 8 per cent or 9 per cent. It appears now that the actual performance may be even worse:

If one takes all the non-agricultural sectors together, one notices a more or less steady rate of growth of around 5 per cent per annum — 4.6, 5.1, 6.5 and then 5.2 per cent. This goes to show that the slow rate of growth of income is not all due to the tardy growth of agriculture; the rest of the economy too has not been growing at the rate required for the growth rate of about 5 per cent for the whole of the economy which was the Third Plan target.

The most striking feature brought out by the analysis of the national income figures is the continuity and near uniformity of the rate achieved during the decade 1951-61! The average rate of growth during that period was around 3.5 per cent and it appears more than likely that the Third Plan will end up with a rate of growth no better than 4 per cent. With food-grains production expected to be 92 million tons, agriculture will not record a growth of more than 4 per cent during the last year of the Plan, and rest of the economy is not likely to improve upon its past average of 5 per cent. There is little indication therefore that the growth rate of income during the last year would rise much above the average rate of the last four years.

Unavailing Vigilance

THOUGH the Central Vigilance Commission was set up over a year ago, not many seemed to be aware of its scope and functions if not of its very existence. But for a meeting at Bangalore of the Central and State Vigilance Commissioners, nothing much was heard about their activities. At the Bangalore meeting the Commissioners had complained of lack of powers and cynics had promptly drawn their own gloomy conclusions about the efficacy of the whole arrangement. They were not far wrong either. For, the statistics presented in the first annual report of the Central Vigilance Commission hardly add up to a promise of break-through in the fight against corruption. The Commission did receive a large number of complaints of corruption among public servants — 3,514, to be exact. To those who have some idea of the dimensions of corruption in the country and who are aware of the statistics of cases handled by the various anti-corruption agencies, including the Special Police Establishment in Delhi, even this large number comes as something of a disappointment — either people are not aware of the role of the Vigilance

Commission or they do not have confidence in its ability to set matters right.

An analysis of the statistics indicates that the more plausible reason may be the latter one. As many as 58 per cent of the companies were anonymous. Many of these anonymous complaints were perhaps accusations based on malice and little proof. But the predominance of anonymous complaints could also indicate the complainants' lack of trust in the Commission. Employees of the Government or people having dealings with officials are not likely to reveal their names lest they should be victimised. This apprehension seems amply warranted. For, the report points out, as many as 436 complaints were forwarded to the Ministries or departments concerned for appropriate action. In doing this, the Commission has functioned as a post office, a far cry from the concept of the ombudsman which many had hoped the Commission would evolve into. This abdication of responsibility needs to be adequately explained by the Chief Vigilance Commissioner. Lack of confidence on the part of complainants might also explain a large proportion (783) of vague and unverifiable complaints.

Of the 1,482 signed complaints, as many as 624 were against gazetted officers and 487 against non-gazetted officers in the Government and 371 against officials of public undertakings. Twentyseven complaints were referred to the Central Bureau of Investigation and 236 to the Chief Vigilance Officers of the Ministries or departments concerned for inquiry. This practice is again open to criticism. Vigilance officers of the department cannot have the appearance of independence and impartiality which is essential if the public is to have confidence in the anti-corruption machinery; they raise suspicion, often unjustified, of matters being hushed up. What is necessary, therefore, is that the whole vigilance set-up should be centralised under the Central Vigilance Commissioner to give it independence, as well as the appearance of independence, from departmental pressures.

Soviet - American Condominium

THE next move towards a closer Soviet-American detente waits upon the West German elections on September 19. Both powers have, however, continued to tiptoe in order not to provoke the other to hostility, not least on Vietnam. Russia did not

summon the Security Council over the bombing of North Vietnam; America did not reply to Russia's relatively mild criticisms; Russia sent aid, but complained it was held up by the Chinese in transit; when it arrived, in the shape of anti-aircraft missiles, US bombers on raids to within 45 miles of Hanoi, refrained from bombing these most obvious targets. Friction threatened certainly when a US plane was downed, allegedly by a missile, but US retaliation on the site demonstrated that it, and its immediate neighbour, were only dummy missile sites.

On the positive side, the US has continuously invited Russia to resume disarmament talks at Geneva, to resume the path of collaboration summarised in the 1963 Test Ban treaty. Russia replied that America's efforts to defend NATO from French sabotage by creating the Multilateral Defence Force (with collective control of nuclear weapons for the NATO powers) made any suggested new treaty to prevent nuclear proliferation to non-nuclear powers impossible — the one flatly contradicted the other. From February, Russia added to this basic objection the demand that the bombing of North Vietnam cease before more disarmament talks — a superficial objection, since it was dropped as soon as Washington changed its line on 'non-proliferation'.

This change of line is the most dramatic shift this summer. Seven months ago when the Gilpatric Committee on a non-proliferation treaty reported to President Johnson, he suppressed the report, but on July 1, the late editions of the *New York Times* reported that this report has recommended an agreement with Russia on non-proliferation as superior priority over any efforts to salvage NATO. William Foster, Director of the US Arms Control and Disarmament Agency, then wrote an article, presumed to have been vetted by the President, making the same point and noting that a non-proliferation treaty might cause an

"erosion of alliances resulting from the high degree of US — Soviet co-operation which will be required if a non-proliferation pro-

A Correction

In the issue of August 28, the date on pages 1331 to 1350 and on the front and back inside covers was printed wrongly. The error is regretted. Ed.

gram is to be successful. Within NATO there could be concern that the detente would lead to a weakening of our commitment to Western Europe. The problem will be particularly acute in Germany where there will be added concern that the amelioration of the East-West confrontation could lead to an increased acceptance of the *status quo* in Central Europe" (*Foreign Affairs*, July, 1965).

To back up this apparently major American concession to Russia, the President despatched Averell Harriman to Moscow on July 25 where he met Kosygin and renewed the invitation to Geneva. Russia accepted the invitation, despite the massive US build up in Vietnam.

But Foster's warning on West Germany was opposite. Adenauer promptly accused America of trading with Russia at the expense of Europe, and Dr Schroder, West German Foreign Minister, warned Washington that West Germany would have to acquire nuclear weapons of its own if it was not permitted to participate in NATO nuclear control. West Germany, torn economically between expansion through full integration into the Common Market (resisted by France), and expansion through freer trade outside the Market through the Kennedy Round, thus becomes the crucial variable in the equation. Russia has already said that a non-proliferation treaty which permits West Germany any sort of nuclear say is out of question. France supplies the other pole of attraction, and the current crisis in the Common Market will perhaps decide West German loyalty one way or the other. On its side, Washington has now to decide between a detente with Russia and NATO, without promoting more damage to its interests than any agreement is worth. Its strategy to contain Gaullism and weld West Germany to Washington now directly confronts its attempt to neutralise Russian power through a detente.

For the moment Geneva is at a standstill (although publicly mulling over proposals for a treaty) until after September when the West Germans pronounce on Erhard's government, and the monsoon ends in Vietnam, so bringing to bear US air power against the Vietcong (a preliminary to negotiations). However, the drift is clear: Russia, despite the biggest type of Cold War provocation by Washington in Vietnam, despite its exposure to full Chinese attack (at hysterical pitch at

the Helsinki Congress for Peace in mid-July), despite the strongly asserted nationalism of its former satellites (both Russians and Chinese amicably tiptoed at the Rumanian Party Congress, July 19) has opted to accept American hegemony of the world. Russia can ill-afford a sustained clash with the West at the moment. Its economy is still weak after the 1963 agricultural crisis, and it needs Western trade. Khrushchev's policy, which partly cost him his job, is back as the orthodoxy of Moscow.

The implications of this return to collaboration are manifold, not least as an encouragement to European nationalism and Gaullism. Competition to give aid to the neutral powers is likely to wane. The Afro-Asian bloc as a whole tends to lose its identity in the fragmentation of nationalisms. The old ring of alliances — CENTO and SEATO as much as NATO — are likely to grow increasingly redundant. A world of myriad nationalisms, surmounted by the unprecedented power of the United States, freed of the last main restriction on that power, the Soviet Union, seems the pattern that will increasingly replace the bifurcation of the Cold War.

Non-Asian 'Asian' Bank

THE Philippino Chairman of the Committee of Officials appointed by the ECAFE to draw up a Charter for the Asian Development Bank stated in a press interview in Manila on his return that during the Committee's visit to France, the French official had dubbed the Asian Bank as mainly an American proposition and that this was a "misconception". If it is a "misconception" it is one which is widely shared in many countries in Asia. This view has been expressed in these columns long before Batmaceda took the Manila public into confidence on the French view about the proposed Bank (*The Economic Weekly*, July 31, 1965). That it is not a misconception will be clear from a comparison of the proposed Asian Development Bank with the African Development Bank. The capital of latter is provided in its entirety by the African countries unlike the Asian Bank which is being organised as another International Bank with equity participation open to USA and the countries of Europe. In this respect, the African Development Bank has acted much more wisely. Paragraph (1) of Article 65 of the Constitution of the African Development Bank and para (2) lay down the conditions of

membership which is open only to independent African States. This does not exclude the Bank from drawing additional resources from outside Africa either as loans or grants but such outside capital is to be obtained without giving to the lenders or aid givers any share in the Bank's management.

To begin with, the African Development Bank has aimed at a modest capital of \$ 250 million so that it could all be subscribed by the African countries. For a bank, after all, the vital part is not the equity capital but the resources that the bank can mobilise by pursuing sound and practical policies. A bank not on sound lines will not succeed, however large may be its equity capital to begin with.

The amount of capital, it will be noted, is too large to be taken up by the Asian countries alone and it is by no means true that for its success the bank should start with a capital of this magnitude. As has already been indicated in these columns, of the billion dollar equity, USA and Japan will take up 200 million dollar each. As they will be able to count not only on Australia which comes in as a shareholder, among others, but also on Asian countries like Philippines and Thailand, not to speak of European members like the Netherland and others, the Bank will be Asian only to the extent that the USA collaborates with Japan. The preponderant role of the USA will thus be fully assured.

There is of course nothing to be said against Japanese participation as such. What can be objected to by the other Asian countries is that USA and Japan will between them exercise absolute control over the Bank which will be an undesirable feature of its management. In that case, what is the particular need of an Asian Development Bank? Is not the International Bank sufficient? As an industrialised country, Japan has acted and voted far more conservatively than even the European and American delegations in the many of the United Nations Committee on Trade and Development in Geneva. There is little assurance that Japan will not be more inclined to sympathise with the US policies rather than with the policies of the developing countries in Asia.

A Lesson from Africa

ON the subject of outside participation the position taken by the African Development Bank ("Report of the

Commission on Capital Subscription and Other Technical Matters", pp 229) may be commended to those who will be called upon to ratify the Asian Bank Charter: "It was realised that in a financial organisation of this nature (The African Development Bank) there should be some differences between the voting power assigned to large contributors as compared with small subscribers, the aim, of course, being that no single country or group of countries should be able to exercise undue influence on the policy organs of the Bank."

This is a viewpoint which needs to be pressed. Every provision in the Asian Bank's Charter should be carefully examined in the light of the healthy principles enunciated by the Technical Commission of the African Development Bank in order to ensure that USA and Japan, Europe and Australia, along with their Asian satellites, do not dominate the management of the Asian Bank. If Western domination is the price to be paid for it, it should be seriously considered whether it would be worthwhile having an inferior version of a World Bank merely because it is located in Tokyo, Manila or Bangkok.

It cannot be a mere accident that the ECAFE's Technical Adviser for the preparation of the Charter of the Asian Bank happens to be an expert from Costa Rica and a member of the staff of the Inter-American Development Bank; that its legal consultant is a Philippino; and that the Chairman of the Group of Officials who prepared the Charter is a civil servant from the Philippines. There are many countries in Asia which have a lot of experience in national and international banking and it is surprising indeed that the ECAFE should have gone all the way to the Inter-American Development Bank and picked an expert from Costa Rica to advise on setting up the Asian Bank. If Asians must look outside for expertise, the time has come for them to look to Africa and learn how to deal with the West in setting up the right type of institution to serve regional interests.

The Ministerial Conference which will be called upon to ratify the Charter of the proposed Asian Development Bank must see to it (a) that non-regional powers do not have a share in the bank's management; (b) that the share capital is kept to a reasonable level, — say \$ 500 million at the outset — in order to ensure effective participation by the Asian

countries; (c) that the voting rights are so adjusted that no single country — whether it be Japan or India — has the decisive voice in management; and (d) that the Bank becomes an efficient institution, reasonably non-political rather than one likely to get involved with regional political aid programmes of any of the powers engaged in the cold war in Asia.

This is not being suggested in a spirit of narrow parochialism. Asia, and South Asia in particular, is passing through difficult times and anything which helps to bring in the influence of large non-regional powers into the operation of the regional institutions will spell their doom.

It is by no means too late yet. There is still a lot of time to act and rectify the situation if only the Asian countries concerned will take off their blinkers and learn to trust one another. Needless to say, India as a non-aligned power, is freer to act than some others and has a very special responsibility in the setting up of the Asian Bank. In an institution sponsored by and established under the guidance of the United Nations, India can greatly help even if she may not lead the others in resisting the political manoeuvres of the big powers. To be able to act effectively, however, she must first see through the move that is afoot. There has been warning enough.

Delivery Contract in Groundnut

A Market Correspondent writes:

DESPITE a substantial increase in oilseeds production this year and the ban on exports and imports of soyabean oil and tallow, edible oil prices have continued to rise to unprecedented levels. Government has tried curbs on bank advances and restraints on Hedge contracts in oils and oilseeds through margins and price ceilings. These restrictions, however, have been easily evaded through the misuse of Non-transferable Specific Delivery Contracts. Government has now brought these contracts under regulation. It is through Non-transferable Specific Delivery Contracts that industrial consumers and wholesale dealers ensure smooth flow of supplies for maintaining their production or re-sale trade. Delivery of goods of the prescribed quality at the agreed time are the essence of such contracts. The Forward Contract Regulation Act, however, empowers Government to undertake regulation of Non-transferable Specific Delivery Contracts in

specific commodities at its discretion when they are abused. Some time ago Government enforced regulation on such contracts in mustard seed, cake, etc. Now groundnut and groundnut oil contracts will also be regulated by the Forward Markets Commission.

All forward contracts do not necessarily provide scope for speculation. Any contract which requires delivery of goods or payment after 11 days from the date of the contract is a forward contract. To ensure that genuine trade in groundnut and groundnut oil is not adversely affected, Government has recognised a number of Associations. Among them is the Vanaspati Manufacturers' Association of India for groundnut oil. The vanaspati industry is the largest single purchaser of groundnut oil, buying annually about 30 per cent of the total groundnut oil production in the country. Vanaspati manufacturers have used their own contracts for the purchase of groundnut oil since the beginning of the industry in 1930's. To enable manufacturers to continue purchases on all-India basis on the same terms, the Vanaspati Manufacturers' Association has been asked to regulate the purchases of the industry. Similarly, Bombay Rice and Oilseeds Merchants' Association which traditionally regulates actual trading in oilseeds has been recognised for groundnut. The recognition of different Associations for Hedge contracts and for specific delivery contracts correctly reflects their different functions in the oilseeds trade. Through recognition of a chain of such Associations for specific delivery contracts the Commission will be able to prevent abuse of the non-transferable specific delivery contracts for speculation.

By regulating Non-transferable Specific Delivery Contracts, the Commission does not wish to disrupt the normal channels of trade. Since it is common practice for oil millers to indent tank wagons and despatch the oil to terminal markets like Bombay, Delhi or Calcutta and pass on the Railway Receipts to the commission agents for sale, the Commission has permitted one transfer of Railway Receipts. It does not permit transfer of the rights under the contract for delivery of goods in other forms. Therefore, the attempt to create confusion between N-T S D contracts and the speculative hedge contracts by interested parties should not mislead the public about the distinctive roles of the different contracts and the objectives of their regulation.

CAPITAL VIEW

Our Intelligence Service

Romesh Thapar

IF there were a public opinion poll to locate the most damaging failure of these last few years, I am convinced that millions of fingers would point to our so-called intelligence network. So unreliable has been the information gathered that even on a rare occasion when a good job has been done no one has bothered to take note of it. Indeed, we seem to have lost faith in our capacity to undertake this kind of work—for, we now tend to entrust it to the most lazy and ill-equipped of the personnel at our disposal. It is a state of affairs which persists despite declarations to the contrary.

Nehru's Distrust of Espionage

Perhaps, our neglect of this vital arm of government, and the very visible tendency to hamstring it with petty rules and regulations about the expenditure of funds and such things, was rooted in Jawaharlal Nehru's deep antipathy to the idea of espionage. Politically, too, he viewed the growth of organisations like the CIA, the FBI, MI 5 as a constant threat to the democratic process. He saw espionage, internal and external, as the equipment of an authoritarian State and did not want his dream of an enlightened India subverted by morose undercover agents. Only after many years of persuasion was his open hostility even to the CID and policemen curbed.

The shock of the 1962 events in NEFA, the realisation that military intelligence was literally non-existent, that the army was relying solely on the intelligence operations of the Home Ministry and that these were of the most rudimentary kind, cleared the way for the build-up of co-ordinated intelligence services, civil and military, to cope with defence problems. However, our attitudes have remained incoherent. Defence Minister Chavan, for some strange reason, has failed repeatedly to explain the continuing lag in military intelligence. The conflicting summaries of the still secret Henderson-Brooks Report on the NEFA battle might have confused him. Or, maybe, he and his colleagues, civil and military, in the Ministry do not have the energy to do what is expected of them.

There is little point in referring to

the so-called Joint Intelligence Committee set up recently by the Cabinet as proof that we are moving at last in the direction of co-ordinated intelligence services. This body has all the flavour of a bureaucratic get-together from various departments of the GOI to avoid the contradictory and embarrassing postures so typical of the Kutch and Kashmir crises. Basically, the problem is to organise civil and military intelligence services which ensure efficiency and effectiveness—and under the guidance of men specially chosen for their skills. The intelligence services—and, for that matter, the Joint Intelligence Committee—are based upon those antiquated notions which hold-up for months even the indent for hammers and nails in a museum. We need a new breed of men for this work, not the comfortable gentlemen who live by the book of rules and regulations.

Failures of CBI

It is necessary to stress this rather obvious assertion because we cannot afford to take any more chances with the security of the State. During the NEFA crisis, the civilian Central Bureau of Intelligence could not tell the difference between three battalions and three divisions of Chinese troops. Later, prior to the Kutch developments, the same civilian body was surprisingly enough able to give warning of Pakistani movements—but the army, once bitten, did not pay attention. In Kashmir, the less said the better. All the now confident talk of Home Minister Nanda and Defence Minister Chavan about being fully informed at the end of July about Pakistani infiltrator tactics is suspect and, what's more, is belied by the sequence of events.

Similarly, when we test the capacity of the intelligence services in terms of the internal threat, we are surprised at the gullibility which prevails. Whether it is in dealing with Congress factionalists, Communist adventurers, Akali fanatics and Hindu incendiaries—or with those who would pull the whole structure down into a sea of chaos—the intelligence arm of the GOI is seldom ahead of events. The recent eruptions in Bihar for instance, are indicative of a massive failure to understand what is afoot.

And if Fateh Singh and his Subaists are permitted to rock the Punjab, it will represent another failure to act in time. Political agitations in the States have become highly ramified. It is no longer possible to rely on easy formulations as to who threatens and who does not. In other words, our intelligence services have to develop a sophisticated and perceptive approach.

The knowledge that those hostile to us—Pakistan, for instance—are as badly serviced by their intelligence agencies provided small comfort. These minor powers, despite all their pretensions, do not face the related challenges which an India has to cope with. We need to possess information of a special kind which assists us in assessing the threats to our national interest. This information cannot be picked up cheap at cocktail parties and via the gossips. Nor can it be analysed, when skillfully collected, by dull bureaucratic minds, unable to comprehend the subtle shadings of the changes taking place around us, minds conditioned by the illogical system of promotion and reward which prevails in our administrative system. Professionals are called for—and these are lacking at every level.

Professional Body Needed

When Foreign Minister Swaran Singh indulges in what amounts to irresponsible gossip about the so-called differences between Ayub and Bhutto, he shows that he is not only unaware of diplomatic norms but is publicising unconfirmed rumours provided by an intelligence service which functions at the gossip level. A professional approach would demand intensive study of the repercussions of Pakistan's present policies on the political set-up in Rawalpindi. Rumours could perhaps be released through appropriate sources, but surely not through the mouth of the Foreign Minister. What was the cumbersome Joint Intelligence Committee doing? If this is a sample of its work, it will earn the nickname of 'Jokers In Committee'!

There is nothing wrong with the idea of the Cabinet being served by a committee which co-ordinates significant analysis of intelligence prepared by the civil and military organisa-

tions, but the committee cannot be what it is at the moment—a mix of various heads of government department and intelligence networks. What is needed is something more high-level, more professional, non-civil service, able to sift materials and co-

LETTER FROM SOUTH

Ministry Making in Andhra

THE recent Cabinet reshuffle and expansion in Andhra has gone largely unnoticed. This is all to the good in so far as the reason is that the factional squabbles in the ruling party in this State have nowhere reached the spectacular level of Congress in-fighting elsewhere, e.g., U P or Punjab. The other reason is not at all flattering. Andhra still does not count on the national scene. It is still regarded as something of a backwater and without much all-India weight to throw around. This attitude is the usual superficial one that besets most political commentators who do not seem to have either the time or the perspicacity to attempt to probe beneath the surface in order to discover underlying currents. Andhra is reaching a point where its potential will soon enough be displayed to the surprise of many and the consternation of some.

Signal from Sanjeeva Reddy

Brahmananda Reddy had taken a great deal of time before venturing on the remaking of his Ministry. He had waited, for obvious reasons, till the Election Tribunal had decided in his favour. It was not at all certain that the verdict would have gone the way it has. The charge of corrupt practices at the time of the 1962 elections was fairly well substantiated, though not in a fool-proof way as the learned judge pointed out. Though the respondents have gone on appeal to the High Court, it is rather unlikely that anything upsetting will take place before the 1967 elections. Barring the very unexpected, the Andhra Chief Minister is now quite secure.

There was another reason for delay. Sanjeeva Reddy had resigned dramatically enough, following the strictures passed by the Court on the motivations of his decision to extend the nationalisation of the bus services to Kurnool. After Nehru's death he had become an important all-India figure and one of the top king-makers.

relate them. The present approach is haphazard, without perspectives. The Prime Minister must apply his mind to this urgent business which is likely to become quite critical in the coming months when one alarum follows another.

But he was by no means confident whether this importance would last, whether he would be able to retain his position for long. Consequently, he did not relinquish his detailed control over local Congress politics. Fairly frequent trips were made to the State often enough to decide upon changes in various Zilla Parishads and Panchayat Samitis. He was not inclined to give his successor too much elbow room, despite the extremely cordial relations between the two. It now appears that the Union Steel Minister is more confident that he will continue to count in the Central Cabinet as well as in the Congress High Command. The prospects of moving up the ladder and, who knows?, becoming the first Southern Prime Minister, do not seem utterly unattainable. Thus the control over Andhra, though not relaxed significantly, will be exercised more remotely and through trusted intermediaries, among whom the present Chief Minister is pre-eminent.

Tussle for Foothold in Nellore

With the way clear, Brahmananda Reddy did the job in as diplomatic a manner as possible. The changes have sparked off some trouble but this was inevitable. Ministerial posts are scarce goods compared to the very large number of those not only eligible but who vociferously feel themselves to be so. This is itself a sociological fact of considerable significance. There is nobody, or very few, so outstanding, that his inclusion would seem to be a foregone conclusion. At the same time, the average level is high enough to tackle the responsibilities of Ministership and the average is a considerable number. The Congress in Andhra has few, if any, "stars" but the "extras" are to be had in abundance. Competent mediocrities are what the situation requires and provides. When challenging times come there may be serious difficulties. But not now.

The inclusion of a Harijan in the Cabinet was long awaited following Sanjeevaiah's departure. The man

chosen, T V Raghavulu, comes from the cobbler caste and is a leading lawyer in one of Andhra's richest districts, West Godavari. His appointment is yet another indication that the Union Labour Minister's group has more or less disintegrated and that he has practically ceased to count in State politics. Perhaps he has had his day. The other newcomer is a dark horse. N Chenchu Rama Naidu appears to have little to recommend himself beyond the fact that he is a Kamma by caste and comes from Nellore, where Brahmananda Reddy wants to secure a foothold.

This attempt to consolidate himself as the second man in Andhra would seem to be the reason behind the cutting down of A C Subba Reddy, the boss in Nellore and the only possible challenger. The trifurcation of the powerful Public Works Department and the removal of Power and Irrigation from Subba Reddy has clearly reduced his strength and indicated that the Chief Minister is confident to tackle his most powerful rival. The battle, however, is not over and A C might retreat for the moment only to launch a strong offensive at the time when election tickets are about to be handed out. He must have enjoyed the scene of 30 MLAs from the Rayalaseema region staging a demonstration in the Chief Minister's room in the Assembly and felt even more pleased when a different assortment of 30 MLAs kept away from the swearing-in ceremony, among whom Sanjeeva Reddy's newly-elected son-in-law was a conspicuous absentee.

Chief Minister Strengthened

Trouble there is bound to be in the future but, on balance, the reshuffle has strengthened the Chief Minister. He has now a bare year in which to establish himself and project his image. It is not yet clear what sort of image he would like to create.

This would not have been much of a problem had the Communist movement in Andhra not been split. The Swatantra hardly counts except in some pockets, largely due to the personal hold of Ranga over sections of the Kamma peasantry. The SSP is no force at all. But the Communists were in quite a different category. The debacle of 1955 had not been able to demoralise them for long. Skilful tactics, combined with solid mass work, had provided good results in the 1962 elections. If this had been consolidated and followed

up there was quite a chance of 1967 giving them some 100 seats and Andhra an opposition that the Congress would not have been able to ignore. With this type of opposition the Andhra Congress might well have been pushed to the Left, especially in matters of industrial and national policy. (On the question of land the resistance would have been much more difficult to overcome.) Now this prospect has dimmed considerably. Joint mass campaigns would, perhaps, take some of the edge off the bitterness but the elections are too near

for the realisation of the aim of a single Communist ticket, though on a two-party basis.

Groping in a Radical Direction

There are, however, indications that the Chief Minister and some of his colleagues are groping in a radical direction. The Communist motion recommending the nationalisation of banks was powerfully supported by Chenna Reddy, the Finance Minister, even though he urged its withdrawal so that the "sense of the House" might be conveyed to the Centre.

LETTERS TO EDITOR

In Lieu of Thinking

I AM moved to write this letter to you after reading the issue of July 3 and the article "In Lieu of Foreign Policy". Some of the comments therein seem to call for an answer.

Apropos of the postponed Afro-Asian Conference, you make the following remarks:

"There is scarcely any cause for expressing jubilation over the postponement. Rather, it is a set-back for the whole of Afro-Asia..."

"...the antics of a number of Indian diplomats and journalists over the postponement of the Conference seem bizarre. It is an index of how much we worry about relatively inconsequential matters of foreign policy..."

"True, in Algiers, Indian diplomats have been outmanoeuvred by the smart Pakistanis. This has been a continuing story for some years... doing the reverse of whatever China and Pakistan do might be exciting cocktail talk, but it cannot constitute foreign policy...petulant immaturity has obviously taken over our external policy making..."

May I examine each of the paragraphs one by one for the sake of clarity of thinking?

The second Bandung Conference was to have been held to mark the tenth anniversary of the first meeting held in Indonesia under special circumstances. The first meeting was an occasion for stressing Asian unity; you may remember that as one of the more active sponsors, India played a notable part in bringing China to the meeting. The question was whether the second Bandung would have been useful to bring about that unity so

essential to the welfare of the Asian people. That question has never been answered.

As long as India and China remain at loggerheads, as long as China, Indonesia and Pakistan insist on continuing on the warpath, any talk of another Bandung must only be regretted. If the Algiers meeting had been held, the occasion would have been chosen by China especially, to launch an ideological tirade against India that would have served no purpose. The hope of unity would have been ill-served by that conference. Of necessity it had to be postponed in the larger interests of Asia and Africa.

From the very beginning, China had made it clear that it intended to use the Algiers platform for purposes other than promoting Asian unity. The Algiers meeting would have ended in shambles with China accusing India, with Indonesia attacking Malaysia and Pakistan in its turn seeking to introduce controversy that was, at best, kept for bilateral talks with India. And what good would that have served the peoples of Asia and Africa?

Even if there had been no political coup in Algeria, even if Ben Bella had not been overthrown, even if arrangements for holding the conference in Algiers were pluperfect, it would have been wisdom not to hold the meeting. As it turned out, events conspired to postpone it.

A second Bandung is necessary, but not before most of the intra-Asian disputes have been settled at bilateral talks. In my opinion, India must strive to get the conference postponed *sine die*. It evokes no response from the French African States, and if the meeting had indeed been held in June,

The bigger Fourth Plan concept, with an expanding public sector in industry, has been firmly backed. As a matter of fact, the Andhra recommendations to the forthcoming National Development Council meeting are likely to be startlingly radical. The exigencies of the States development, the desire for industrial take-off and the lack of powerful local industrial-financial groups, impel even the present Congress leadership in the State in that direction. Given a powerful socialist education and mass action drive, a good deal might still be achieved.

it would have been a disaster, if only on this count. We have, therefore, every reason to feel jubilant that it was postponed, even temporarily.

The issue is important. It is not, if I might say so, a "relatively inconsequential matter of foreign policy". On the contrary, India did very well indeed to seek the postponement of the conference. To refer to the good work of the Indian diplomats as "antics" reflects poor understanding of the basic issue which is that no international conference should be held without first making sure that seeds for understanding have been sown earlier. If those "seeds of understanding" have been lacking, it is not India's fault. Are you suggesting that it is India that is responsible for the border conflict with China and Pakistan? If that is what you sincerely believe, then your readers demand a certain amount of intellectual honesty from you.

India's fault has been that she allowed herself, for sentimental reasons, to agree to the holding of a second conference to commemorate Bandung. And yet, it is not a fault. To hope for peace, for mutual understanding in a world grievously lacking both, is not a fault. But India, surely, has a right to change her mind, if that is called for? India did a signal service to the cause of Asian unity by trying to get the Algiers conference postponed. If India is to be blamed, it is for not trying still harder.

Your remarks about Indians being outmanoeuvred by the "smart Pakistanis" in Algiers not only shows an abysmal ignorance about the events in Algiers but a total lack of understanding of either manoeuvres or smartness. Pakistan was in league with

China and Indonesia and with Algerian leaders who were not necessarily sympathetic towards the Pakistanis but, for their own reasons, desperately wanted to keep the conference going. When the Algerians realised that the conference could not possibly be held, they asked the Chinese and the Indonesians what to do. Neither could suggest a postponement without losing face. Pakistan was, therefore, asked to do the honours, which it did, clumsily.

Hostility to Pakistan from the international press was so great that when Zulfikar Bhutto held a press conference he was smothered by hostile questions from the international press to a point where he finally lost his temper and insulted, among others, a Japanese correspondent and an Indian correspondent. If it is smartness to lose temper at a press conference, then obviously we have been studying two different dictionaries.

The Pakistanis, in fact, were isolated, though, when the host country is in league with Pakistan, its leaders may appear to be having more influence. At the meeting of the Standing Committee when the decision was taken to get the Prime Ministers' meeting postponed, Pakistan's diplomats were practically under orders from the Chinese and every comma of the final resolution had to get the Chinese leaders' approval. If this is what you call great diplomacy, then there is an urgent need for you to define words.

I had always thought that it was Pakistan which used to do the reverse of what India did, but obviously you are making very important discoveries of late. Can you cite instances of India doing the reverse of what Pakistan and China have been doing? That would be far more convincing—and constructive—than to talk about "petulant immaturity" or even "the antics of a number of Indian diplomats and journalists". This kind of writing does not reflect highly on the standards of your editorials, which in the past have been informed for their sobriety and dignity. For Christ's sake, attack the Government of India with might and main, but have a regard for the use of language.

India's foreign policy admittedly has not been sharp and clear in recent months. Those who make foreign policy, no doubt, are equally aware of this. But foreign policy is not something that is shouted at from house-tops. Neither can it be consistent—except that it should be in the national interests.

India is finding herself in a situation where the lines are not clearly drawn, where she has to tread very warily and not commit herself to positions that she cannot sustain. It was a different story when India first came to adopt her policy of non-involvement in the cold war. That attitude was comparatively easy to adopt and in the circumstances the only attitude that India could adopt. Today alignments are hard to define. The United States and the Soviet Union are no more at loggerheads; in fact, they are both themselves trying to re-fashion their foreign policies and the process is painful to watch. And when it is remembered that it is primarily these two world powers that act leaving it to other nations to re-act, then India's dilemma can well be imagined.

There are times and occasions when it is prudence not to talk, not to act, but to wait and watch. It is easy for China or Indonesia or Pakistan to make great pronouncements, for they have played most of their cards against India and been trumped. After having tried to trip India through American and British assistance and failed, what is more natural than to expect Rawalpindi to fall into the arms of Peking? India has not alienated the Soviet Union; on the contrary, the Soviet leaders have received Prime Minister Shastri with pleasure and honours. India has not alienated the United Arab Republic; on the contrary, Nasser has kept his friendship with India. Prime Minister Shastri has been received at the airport by President Tito, a great honour, not prescribed by protocol. It does not have to be stressed that Canada maintains the most cordial relations with India and even Britain has ceased to tease India on the Kashmir question. This is something to be applauded.

And what is it that either China or Pakistan have gained in Africa? Can you say with any kind of certainty that China has won friends in Kenya or Uganda or even in Ghana? Or, for that matter, Pakistan? On the contrary, Indian leaders have been heard with respect; they have been received with courtesy.

It is true that Indian leaders have ceased to talk out of turn; for which, thank God. It is also true that we have stopped trying to "lead" Asian and African nations at the United Nations for which again, thank God. No nation wants to be "led"; it irritates them. It irritates them even more when word goes round that it is India that is doing the "leading". It is wisdom to

stand on the sidelines and mind the national interests. So long as these interests are safe, we have no reason to complain.

And what are our national interests? First, the safety of our borders. We have now some sort of assurance from the United States and Britain against further Chinese depredations. China may still attack us: but the fact is, she has not. This is an important factor.

Then there is aid to our five year plans. Considering what a snub Pakistan has been administered to by the United States, there is no need for us to seek one. Let those with Jocrinaire views on non-alignment shout: in politics—even the most exalted politics—concessions have constantly got to be made. What is at stake is not just prestige, but the happiness and welfare of the people. India remains non-aligned, but those in power must know the limitation of their power. It is a matter of pride that we now have a Prime Minister who puts the people's welfare above doctrines. Haven't we done enough shouting in years past about our virtues? And where did that get us?

He-manship in foreign policy may make good editorial copy, but is not necessarily consistent with India's best interests. Mr Swaran Singh may or may not be a good Foreign Minister, but he has not made any mistakes so far. He very sensibly kept away from Algiers: that was as it should be. The situation there did not call for his presence. As long as he keeps silent and lets others do the guessing, we shall be doing very well. May it be remembered that India for all her many virtues is not a power in the military or economic sense. It is a wise Foreign Minister who knows both his and his country's limitations.

India's model should be Japan; and Japan, lest it is forgotten, is a major economic power and a major industrial power and could be a major military power if it wants to be one. Have you ever heard the Japanese making great pronouncements of policy on international affairs? They do not: and that is their greatest strength. The Japanese wait and watch; they listen, they seek answers. But they will not talk. Their interests are in business, trade, economic activity. India could do well to concentrate on the same front instead of on leadership. We do not have to feel called upon to give our judgments on disputes, when we have no power to impose them on the

disputants. In politics only power counts. Politics is strictly amoral. Our sense of morality did not prevent the French from attacking Suez or the Soviet Union from taking Hungary by the neck. It was not John Foster Dulles' presbyterian morality that finally induced the British and the French to retract, but Moscow's threat of retaliation and Washington's negative threat of not giving any aid.

Foreign Policy is most effective when it is least publicised. Take France. France recognises Israel, but there is quiet Arab-French collaboration. The Arabs talk a great deal, but do you think that is great diplomacy? The Arab nations have been able to strangle only the weak Asian nations. The strong get away with recognition of Israel and with no blood-curdling speeches.

It is therefore uncharitable, to say the least, on your part to condemn India for her alleged "petulant immaturity" or inactivity.

A READER

August 10.

[The letter is a example of the 'petulance' the editorial had commented upon: it reveals an attitude of mind which pervades current Indian foreign policy making. Despite what the writer contends, Indian officials are happy that the Algiers Conference was postponed because (a) China and Pakistan wanted it to be held, and (b) they were scared stiff that they would be outmanoeuvred by the Chinese and the Pakistanis and the Indonesians in case the Conference was held. It is the view of this journal that there might be some contributory negligence on our part which would account for our present alienation from the three most populous nations of Asia. Our unseemly haste to embrace Malaysia, which has annoyed Indonesia no end, has now been rendered an infructuous exercise by last month's development. And if we are that much loved and respected in Asia and Africa, why this reluctance on our part to face a Conference. Even President Nasser, the one 'who has kept his friendship with India', has pressed us to resolve our quarrel with China.

The philosophy which the writer of the letter thinks should guide our foreign policy is reflected in his statement: 'Considering what a snub Pakistan has been administered by the United States, there is no need for us to seek one'. This journal holds other values—Ed.]

Make Liquor Pay for the Plan

A SMALL news item in the London Times of August 20 may give us the clue for solving the problem of financing the Fourth Five-Year Plan. In a very wet June, the British beer drinker contributed more than a million pounds a day to the National Revenue. The Chancellor has estimated that in a full year the beer duty alone (leaving aside that on whiskey, etc) will yield £326 million or about Rs 450 crores, from a population of 50 million people.

It is not to be supposed, of course, that an Indian population of 500 million would therefore yield Rs 4,500 crores, which is equal to the annual budgets of the Centre and all the States, but the magnitude of the figure does indicate the potential of drinks as a revenue earner. The Tek Chand Committee estimated that the total additional revenue if Prohibition were removed would come to Rs 146 crores per year. Its estimates are no better than mine or of the readers, as any estimate of this nature is pure guesswork; on the whole, however, it is not unreasonable to suspect that this is an underestimate, especially if one looks at consumption figures of food-stuffs, particularly energy giving food-stuffs like sugar which has gone up from one million tons to 3 million tons in 12 years. At present duty on beer in India is frankly prohibitive; when a bottle of beer costs Rs 5 you do not expect large scale consumption; it is out of the reach of most families. If duties on alcohol were reduced to more reasonable levels, there is no reason to suppose that the revenue would be only Rs 146 crores; it could be very much more — perhaps even double the figure suggested by the Tek Chand Committee, which would be equal to twice the revenues levied by the supplementary budget of the Finance Ministry.

At this stage the Economist drops the argument to the moralist. Is it right, is it proper to make money out of the poor by pandering to their weaknesses? Horror stories come out, husband spending the major portion of their income on alcohol leaving his poor wife and child to starvation and hunger. The duty of the State, therefore, is clear; rescue the poor from themselves; make them really free by taking away their right to drink what they want to. As Rousseau said it is a State's duty to force the people to be free.

These subtle contradictions no doubt amuse the intellectual social reformer,

the ordinary social worker is only interested in telling some one else what is good for him; the point has therefore to be made over and over again that you are not stopping people from drinking by Prohibition nor are you assuaging the hunger of our children by not taking money from their evil fathers. To the drinker there is an every-ready source of supply from the boot-legger, from the illicit distiller, from the gangsters who run this racket. Social and personal responsibility does not come through edicts from Delhi, but through education; self-restraint comes not from listening to unrestrained platitudes endlessly delivered by ministers, but from experience.

The question before the Government is not whether prohibition is good or bad, most intelligent people think it is bad. The question is, does the Government have the courage to drop a basic tenet of Gandhiji in the name of the Fourth Plan? That would require more courage than the Congress has displayed since independence.

First Compressed Airline Equipment Plant

A NEW Company, Shavo Norgren (India) Private Limited, has been registered to manufacture world-renowned Norgren Compressed Airline Filters, Regulators and Lubricators, with technical and financial collaboration of C A Norgren, U.S.A. The Government's approval for the collaboration has already been obtained, and the plant and machinery is being supplied by the American collaboration against their equity participation in the new company, saving considerable amount of foreign exchange for India. The company will be obtaining

The land for the new factory has been secured in the new industrial area of Thana-Belapur Road, Maharashtra, and the factory is expected to go into production in early 1966. Vital requirements of Indian industry for compressed airline equipment which is solely dependent on imports, will be met in full by the new company, saving considerable amount of foreign exchange. The Indian factory will be the seventh overseas unit of the 40-year-old Norgren, U.S.A., who are the world's largest manufacturers of pneumatic filters, regulators and lubricators.

Students and Social Change

Karuna Chanana

Social Change and College Students of Gujarat by B V Shah; M S University of Baroda, 1964

B V SHAH'S book is one of the first systematic studies concerned with the form assumed by social change among Indian students. The book attempts to study the impact of social change on the behaviour of and values held by students.

The purpose of the study is to examine, what the author considers to be, a few relatively important aspects of the changes taking place in Indian social life. The aspects selected are: joint-family organisation, caste endogamy, caste commensality, adult boy-girl relationship, married women's outdoor employment, time of marriage, bride selection and selection of occupation and of the place of livelihood by the students. The first two are the most important or the central areas of Indian social life because the Indian social structure rests on them. The remaining seven are but peripheral. The author concludes that change in the first two constitutes social change whereas change in the other areas, independently of the first two, does not amount to social change.

The study is based on field-work undertaken in 1958 among the undergraduate male students of the M S University of Baroda. A random sample of 200 college students was selected for interview and analysis. This formed 20 per cent of a total of 990 Hindu (including Jain) students. All the students selected had Gujarati as their mother-tongue and belonged mainly to "high-caste and high and medium class" urban families.

The proportion of students from low castes and from rural areas is very low. This indicates that the principle of the equality of educational opportunity is still not operating in reality. Various factors such as intellectual ability and achievement, rural/urban residence, caste, income, and educational and occupational background obstruct the actual realization of this principle. Therefore, there will be little change in the occupational structure of India in terms of its caste composition.

On the theoretical plane, Shah makes a meaningful distinction between action, attitude and mere verbal behaviour (p 9). He emphasises the point that the first two are more relevant and important for his study.

Another positive contribution on the conceptual level relates to his

treatment of society as a system, various parts of which are closely inter-related. He tries to relate the behaviour, attitudes and opinions of students (towards the selected aspects of Indian social life) to their social background, i.e., to their family and also to the wider social set-up. Thus, he views the students in their social context. The term 'social background' denotes the income, educational and occupational levels and the rural/urban residence of the family. The rural/urban background and the education of the parents are the most decisive criteria in determining their preferences and views.

The approach in this analysis is comparative inasmuch as change in the present century is measured with reference to the behaviour pattern and values of the 18th century. To this end, the author constructs a model or an ideal type of the 18th century urban Hindu society. Accordingly, the joint family is the norm and caste endogamy, caste commensality and the strict segregation of the sexes are all traditional forms of behaviour. In addition, women do not have rights to education, inheritance and employment, the son follows the hereditary occupation of the father and the parents select marriage partners for the children.

The students' actions are divided into three categories depending on the ends pursued by them. By fitting their responses (vis-a-vis the nine aspects of social life) he divides them into 'Traditional' and 'Non-Traditional' or 'Fully-Deviated' according as they conform or do not conform to his model. Those coming in between are called the "Partially-Deviated". As a result of this analysis Shah concluded that notwithstanding some change in the seven peripheral areas, the hard core remains unchanged and is likely to remain so (p 195).

Both rewarding and revealing as his conclusions are, it is difficult to accept his model as a basis for comparison, because no model, however sound, can replace reality. Shah, however, identifies his model with reality and tries to fit in the various responses therein, recognising no exceptions.¹ Moreover, this model is not based on any historical material. A study of change should be undertaken over two points of time or alternatively, a previous

study can serve as the first point in certain cases. In the absence of either of these, Shah has had recourse to an imaginary model.

Secondly, in trying to construct a model, the author seems to have gone a bit too far in drawing a generalised picture. As it is, there is no evidence of a universal pre-British pattern. The pattern varied from region to region and from group to group. But he assumes that the joint family was the ideal and the most prevalent form of social organisation especially in the rural areas. Exceptions to it were possible only in the urban areas (p 53). To say the least this is a mere reiteration of an ethnographic myth about the traditional Hindu society at a time when it is a well-known fact that, at least, in the rural areas the joint family was related to land and property ownership as well. This basic weakness of his model has considerably affected his study.

Shah's work also suffers from his predisposition towards tradition. He believes that the behaviour pattern and the values of the students remain unchanged notwithstanding change in society at large. His keenness to demonstrate the validity of his opinion makes him ignore all the contrary data collected by him. For instance, 80.5 per cent students state that they would set-up separate families (p 62), 78 per cent of them have friendly relations with non-kin girls (p 110); only one per cent of the students would not like to exercise individual choice in bride-selection (p 85). But Shah passes over these in silence.

No wonder, he shifts his stand from opinion to attitude, from action to opinion, as required. As is already mentioned, 80.5 per cent of the students would like to settle away from their family, but for the author this is not important because "the separation in residence and settlement in a different place does not necessarily mean a separation of minds also" (p 78). Thus the actual separation of families is much less important than the joint-family mindedness. Besides this last term is a purely subjective category which the author determines by the students' "interest" in family matters, "considerations" behind settlement in occupation, and by the "ideology" behind their intentions. We need not add that his understanding of "ideo-

logy" as the students' desire of expecting their own brothers to be similar-minded, is somewhat restricted as an interpretation of the term in question. Sociologists working on family organisation have considered two levels of jointness, structural and functional. It almost seems that Shah adds a third, the joint-family-mindedness.

Not only does he ignore the distinction between action, attitude and mere verbalisation, he also emphasises the third to the detriment of first two. In other words, he rejects the concrete evidence in favour of the vague inasmuch as he insists that the behaviour and attitudes of students are not an indication of change since "actual relations may not be indicative of ideological deviation" (p 110).

Ideas, intentions, desires and ideology carry more significance for Shah than actual behaviour or attitudes. Admitted that thought and action are not mutually exclusive categories, it is the social scientist's task to decide which of the two is more relevant for his study. Shah's failure to do so lends an inconsistency to his approach. This lack of consistency in his analysis gives one the feeling that either his model is faulty or that his data is unworkable or that his conclusions are not fully based on the facts collected by him.

It is also difficult to agree with his method of quantitatively measuring change. In the absence of an appropriate index or technique to measure the same, Shah arrives at wrong conclusions. His scale has the 'Traditional' and the 'Non-Traditional' as two ends. Firstly, these are not clear-cut categories. What is 'Non-Traditional' in one situation may not remain so depending on intentions, ideas etc. For example, even though one selects an occupation different from that of one's father, (which is 'Non-Traditional' according to Shah's model) one remains 'Traditional' if this choice is conditioned by family considerations. This also shows that the opposite of 'Traditional' may not necessarily be 'Non-Traditional'. This leaves the reader wondering if the author does have any distinct criteria of differentiation. Secondly, he tends to merge the 'Partially-Deviated' with the 'Traditional'. Probably he views the scale as something static and merges the two because of the lesser gap between these two as compared to that between the 'Partially-Deviated' and the 'Fully-Deviated'. But the process of social change being continuous,

the movement of the 'Partially-Deviated' from the 'Traditional' end of the scale is significant in that it indicates further movement. Therefore, this merger of the two appears to be a marriage of convenience to negate change. Lacking as it does an objective basis, it justifies the feeling that his argument is one-sided. He seems to accept whatever conforms to his traditional pattern and brushes aside the non-traditional responses. At best he labels them as "temporary accommodation to certain specific situations in those spheres" (pp 200-201, 110).

This apart, the value of the work lies in the fact that it is the first of its kind in the field of sociology of education and on Indian students. Although quite a few studies are available on Indian students and social change² this one far excels those in many respects. It is an intensive study based on the use of sociological techniques of field-work. It easily stands out from other works which have been surveys of one kind or another. Moreover, this is the first systematic attempt to view students in their social context, instead of viewing them as units *per se*, isolated from the families they belong to and the society they live in.

It also makes an important contribution by highlighting the role of education and urbanisation in the changing social and economic set-up. One may suggest, in passing, that the author could have fruitfully utilised his data to denote the relationship

between education and occupation of the parents on the one hand, and students' behaviour and values on the other, at one point in time.

Notes

- ¹ This reminds one of Claude Lévi-Strauss: "*le but est de construire un modèle, d'étudier ses propriétés et les différents manières dont il réagit au laboratoire, pour appliquer ensuite ces observations à l'interprétation de ce qui se passe empiriquement et qui peut être fort éloigné des prévisions.*" *Tristes Tropiques*, Paris, 1955; p 49-50. Indian Army in Second War

A Roll of Honour: The Story of the Indian Army, 1939-45 by Maj-Gen J G Elliot; Cassel; pp 392, 36s.

WHEN the second world war broke out and the Indian National Congress was caught in the dilemma of wanting to oppose Nazism and Fascism but wanting to do so only as representative of a free people, it became the prevailing view that those Indians who joined the Indian Army were "rice soldiers". In some quarters there was resentment that any Indian should join the Army of the Occupying Power, namely, Britain. There is no doubt that a few Indians took service under the British flag simply because there was no other avenue of employment open to them. But undoubtedly many joined the Indian Army either out of a sense of adventure, or a desire to follow an ancestral profession, or to keep up with a martial tradition or out of loyalty to Britain. There must also have been

quite a few who wanted to fight Hitler out of a sense of idealism. It is never too easy to guess what made so many thousands join the Indian Army in the days following 1939 and especially when the Congress was at odds with the government. It has been said that many joined to gain fighting experience for future use. Perhaps. But the fact remains that the Indian Army covered itself with glory. Even if it was made up of "rice soldiers", it gave a first class account of itself.

The story of the Indian Army has never been fully told, but now a major attempt has been made by an Englishman, which is as it should be; the tribute to the Army and the officers and men who led it, has been fulsome. To the tributes paid by the author is added another by Field Marshal Sir Claude Auchinleck who

Reserve Bank of India

APPLICATIONS are invited for the posts of Banking Officers in the Department of Banking Operations and Development in the Bank in the scale of Rs 430-430-55-815-EB-55-925-60-1045.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scale.

In addition to pay, the selected candidates will be eligible to draw local pay at 10% of grade pay (at centres where it is admissible) and allowances mentioned below as may be admissible from time to time. The present rates of allowances are as under:—

- (a) *House Rent Allowance* : At 15% of pay with a maximum of Rs 300.00 per mensem.
- (b) *Dearness Allowance* : At 20% of pay on basic pay of less than Rs 500.00 per mensem and thereafter at 16½% of pay with a maximum of Rs 125.00 per mensem.
- (c) *Temporary Ad-hoc Allowance* :
 - (i) *For pay under Rs 700/- per mensem* : 15% of pay with a maximum of Rs 100.00 per mensem.
 - (ii) *For pay of Rs 700/- per mensem and above* : 12½% of pay with a minimum of Rs 100.00 and a maximum of Rs 125.00 per mensem.

The continuance of the Ad-hoc Allowance is subject to review before the end of September 1965.

QUALIFICATIONS:

Applicants should

- (a) have a minimum of five years' commercial banking experience out of which not less than three years should be in a responsible position. Preference will be given to applicants with high academic qualifications who have made a special study of Economics, Banking, Commerce or Accountancy, OR (b) be Chartered Accountants with a minimum standing of five years.

Note: Candidates who had applied for the posts in response to the advertisements issued during the last three years need not apply again.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY THOSE CANDIDATES WHO POSSESS HIGH ACADEMIC QUALIFICATIONS AND/OR ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

AGE LIMIT AS ON 1ST AUGUST 1965:

Candidates should not ordinarily be over 35 years of age but the age limit may be slightly relaxed in the case of candidates with exceptionally good qualifications and/or experience of value to the Bank.

2. An applicant must remit with his or her application a fee of Rs 7.50 by cheque or bank draft on a *Scheduled Bank* payable at Bombay or by Postal Order in favour of Reserve Bank of India. *The application fee is in no case refundable.* In the case of candidates belonging to Scheduled Castes/Tribes, the fee is Rs 2/-. Bonafide displaced persons who have migrated from East Pakistan on or after the 1st January 1964 and who are not in a position to pay the application fees are exempted from payment of any application fee.

3. Applications in the *candidates' own handwriting* in the prescribed form obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Hyderabad, Trivandrum, Lucknow, Patna and Jaipur accompanied by copies (originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the graduate and post-graduate degree examinations and two testimonials should be sent to the Secretary, Central Recruitment Board, Reserve Bank of India, Department of Administration and Personnel, Central Office, Post Box No. 406, Bombay No. 1, so as to reach him *on or before the 18th September 1965.*

4. Candidates already in service will be required to produce a proper discharge certificate from their employers (in the event of their being selected) at the time of their appointment in the Bank's service.

5. Candidates belonging to Scheduled Castes/Tribes and bonafide displaced persons from East Pakistan should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

6. Candidates must be prepared to serve in any office of the Bank in India, and to undertake tours when required.

7. For the purpose of selection, the candidates may be required to appear for interview before the Selection Board at any of the Bank's offices. Such of the candidates as are called for interview will be reimbursed single first class railway/bus fares by the shortest route from their places of residence to the office/s of the Bank where they are called for interview and back.

8. Appointments will be subject to the candidates being declared medically fit for service in the Bank by the Bank's Medical Officer.

9. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

10. Canvassing in any form will be regarded as disqualification.

says in the preface: "It is well that we should remember our debt to them and try to retain that mutual affection and esteem which was so steadily built up through two centuries of service in many parts of the world".

A happy feature of the book is its refusal to engage in controversy. An Englishman may well have been excused if he had sought to question the rights and merits of the "Quit India" resolution passed by the Congress or to denigrate the Indian National Army built by Subhas Chandra Bose. Maj-Gen Elliott has sensibly desisted from such temptation, which, in the circumstances, must be considered wise as that would only have taken away from the essential purpose of the book which is to give praise where praise was due.

By steering clear of controversies, the author has enhanced the value of his record. His understanding of the Congress case is sound. Congress abstention from current war efforts, according to him, was "regrettable". "It is difficult" he writes, "to assess the result of this abstention". And he adds: "It certainly had an adverse effect on the recruitment of officers, particularly for the medical services. The educated were the most politically conscious and, in sympathy with the stand taken by their leaders, many who might have made good officers did not come forward".

Maj-Gen Elliott's chapter on the growth of the Indian Army, however, is only by way of introduction to the more exciting story to come. That story is as exciting as any that has been written. It is necessary to ponder over it if only to answer those who have taken upon themselves the task of questioning the fighting qualities of the Indian soldier.

The Indian Army, let it be known, fought practically on every battle front. It fought in North Africa, in Iran, in Syria, in Italy, in East Africa, in Burma and the Far East, against Rommel's panzer divisions and against the cream of Japanese warriors. The exploits of the men brought unsought praise from friend and foe. One French officer was reported to have said: "*Ce que vous avez fait, c'est incroyable. Vos Indiens sont vraiment formidable*". Truly formidable. Indeed they were.

There is the story of young Kamal Ram, a 19-year old Jat who won the Victoria Cross, one of the youngest probably to get that coveted honour. The locale is Italy, the time, September 1943. Two leading companies of

3/8 Punjab Regiment had crossed a river, but had suffered terribly; one platoon of Sikhs had been wiped out to the last man. The support companies now crossed to make good the ground won. As the author recounts the story:

"The advance was pinned down by a sheet of fire from front and flanks. Movement meant death. A volunteer was called for to deal with a gun firing from the right flank. Kamal Ram, a nineteen year old Jat sepoy, in action for the first time, crawled through the wire and leapt upon the crew single-handed. He shot the gunner and bayoneted his leader, swinging to kill a German officer who sprang at him from a slit trench firing a pistol. With the post silenced, he pressed on. Having sniped the gunner of a second nest, he bombed the remainder of the crew into submission. Together with a havildar he attacked a third machine gun post and dealt with it in a similar fashion. The line was open. The Punjabis moved forward to secure their objective. Later, in a forward reconnaissance, Kamal Ram wiped out a fourth machine gun nest, an unsurpassed day's work which earned this gallant youngster the Victoria Cross".

There were other times when gallantry ended in death, as in the case of Naik Yeshwant Gadge of the 3rd Mahrattas who won the first V C for his regiment but who died in the process after having single-handedly saved his company by a brave charge upon the enemy. There is the fantastic story of Havildar Umrao Singh in the Arakans who, though twice wounded by grenades, kept fighting the Japanese till they were within five yards range. He was seen fighting in hand-to-hand combat to the last; when his body was recovered he was found beside his gun "almost unrecognisable with seven severe wounds and ten dead Japanese beside him". He was the first and only Indian mountain gunner to be awarded the V C and the only other rank of the Royal Regiment of Artillery to be so decorated in the years 1939-45.

It is impossible not to be impressed by the bravery of men such as, for instance, Sepoy Namdeo Jadhao of the 3rd Mahrattas in battle against the year Germans in Italy. Sepoy Jadhao found himself on the banks of the Senio with two wounded comrades. As is reported: "In the face of pelting fire, he half-dragged, half-carried the men

back across the stream, struggled up the inner slope and deposited them in safety. Having saved his friends, he resumed the battle single-handed. He dashed at the nearest machine gun and wiped out the crew. A bullet tore his hand, so he dropped his Tommy gun and closed with bombs. Two more enemy posts were silenced in quick succession. Standing on the lip of the bank he shouted his war cry and waved his comrades forward. Three company commanders had fallen but the Mahrattas, responding to such dauntless leadership, swarmed back across the river. With both hands clear they pushed on into the night, to deal with the obstinate garrisons of a number of houses in fields adjoining the river..."

Sepoy Jadhao won his V C as did another soldier of the Indian Army, a Pathan, within a few hundred yards of each other, "twin feats of arms" says Maj-Gen Elliott, "for which it is hard to find a match".

There were occasions of bravery and humour. We have the story of company commander Damar Singh trying to capture a hill occupied by the Japanese. At 3 in the morning, Damar Singh proceeded with his men to charge the hill and for a time there was no news of him. There was only the sound of firing. Time passed slowly and his comrades at headquarters began to worry seriously about his fate and that of his platoon. Then, as dawn began to break out, came the cry of "ayo" from the hills. Had Damar Singh been killed? Amidst the sound of continuous firing, Damar Singh's Commanding Officer called him on the air to ask if there was anything he wanted. "No" came the answer, "only breakfast!" And well he might have asked for it. He and his men had killed 40 Japanese and captured seven guns.

"A Roll of Honour" comes at a time when the Indian Army is again being tested in the thick of battle. It is good to remember that it has a great tradition of fighting behind it and that when it comes to valour, it is second to none. The story of Damar Singh, of Sepoy Jadhao, of young Kamal Ram and of Havildar Umrao Singh deserves to be repeated. We have the right kind of men; if only politics is kept out of the Indian Army, if only the Army is kept well-equipped and officered, India does not have to fear any enemy. Maj-Gen Elliott does not analyse all the causes that left the Indian Army so weak in 1939 in detail. But we have to take

our lessons from what happened in 1962.

Field Marshal Auchinleck's acknowledgment of the help of the Indian Army in saving Britain must be acknowledged in return. Sometimes, reading the novels and books written about the second world war, one gets the impression that it was only the Soviet Union, the United States and Great Britain that did the fighting. They fought and fought very bravely, of course. But on occasions one

wondered when the tribute to the Indian Army would come. It has at last come.

"For many years now" writes Auchinleck in his preface to the book, "I have wished that the story of the old Indian Army in the second world war might be written, so that the people of this country (Britain) could learn what they owe to those soldiers who fought for them against the Germans, the Italians and the Japanese. Without their aid, the war

could not have been won".

"Without their aid the war could not have been won". For this unequivocal and categorical statement, the Indian Army would be grateful. India can even afford to forgive the Churchills and the Amerys, and the many *koi-hais* in the civil service who wanted to keep India enslaved, after this straightforward acknowledgment of a debt that was never before acknowledged from so high a quarter in so fulsome a manner.

Leadership in a Community Development Village

K. Ranga Rao

The development of responsible village leadership and village organisations and institutions is accepted as vital for the success of development programmes in village communities. Accordingly, with the introduction of Panchayati Raj local leaders have been entrusted with more responsibilities besides being vested with certain powers.

But the devolution of powers is bound to create a new situation by introducing a new method of evaluation of individuals and their status in the present caste-dominated social structure besides having its impact on the pace of social progress through Community Development.

An attempt is made here to analyse the present pattern of leadership vis-a-vis development of a village community with special emphasis on the three elements of leadership:

- the way individuals rise to leadership;*
- their qualities and affiliations; and*
- the nature of their goals.*

THE village under study is situated on the road-side four miles to the west from the Pendurti Panchayati Samiti headquarters in Visakhapatnam district, Andhra Pradesh. It has a population of 1,400 distributed over 14 caste groups consisting of 348 households. The panchayat consists of one hamlet besides the main village.

In the village the Velama Caste is numerically very strong with about 2/3rds of the entire village population. Out of the remaining 13 caste groups all, except Padmasalis, Harijans and Gollas, are negligible in number. About 2/5ths of the entire land cultivated is irrigated and 4/5ths of the land is owned by Velamas alone. On the whole 90 families do not own land (8 Velama families and others non-Velamas). While the average size of land owned per family is about 2.25 acres, the size of land owned per family ranges between 50 cents and 8 acres. Because of the general backwardness of the area and mounting unemployment, about 110 individuals from about 100 families (including 70 Velamas) every day go to the Port and other industrial centres at Visakhapatnam by train or cycle, to work as industrial labourers.

Present Leadership Pattern

Currently the village is known to be faction-ridden. A Cooperative Milk society (now split into two societies) is working since 1959 with a membership of about 200. Except this there is no other association of any type in the village. The present Panchayat was unanimously elected early in 1964. But it is very inactive. Its members were selected from among the so-called neutrals keeping the active leaders out of the Panchayat. Out of the nine members of the Pan-

chayat all except two, the vice-President and one member, are illiterate. Except the president no one has any recognition as a leader in the village. As against this the previous panchayat (1959-63) consisted of five active leaders in the village and seven of the members were literate. Interestingly, while the average age of the previous panchayat members was around 42, in the case of the present members it is around 50. As it is, the present panchayat feels unable to undertake any developmental activity — even repairs to roads — for want of support from the active leaders of the village who are split in two rival groups since early 1961. At present the two rival groups are headed by two primary leaders in the village: the Village Munsiff and the ex-president of the panchayat.

Almost up to fifteen years ago the main village was dominated by a Vysya businessman-cum-money lender and two village officers, the Karnam (Brahmin) and the Munsiff (Velama). With the demise of the Munsiff and the emigration of the businessman the son of the former became the Munsiff (the present V M) of the village and began to wield authority assisted by the then Karnam and the then Panchayat President (Velama). When the Panchayat President also died in 1952, the Munsiff managed to make the son of the deceased the president. In the following year the then Karnam relinquished his post because of old age and the present one succeeded his father. Thus by the end of 1953 the present village Munsiff virtually became the undisputed leader of the village. The Karnam, a poor and mild Brahmin, and the president, well off but new

to his post, followed the footsteps of the Munsiff.

In the year 1958 the Munsiff, with active support of the Panchayat and one big land owner (the present Panchayat President), collected Rs 10,000 for donations from the village and also from a number of neighbouring villages and constructed a temple. This act gave additional prestige to him. That is why when the Panchayat elections were to take place in early 1959 the Munsiff could make the President continue in the same capacity by selecting all members of the Panchayat uncontested. Then in the year 1959, in association with the

Table 1: Number of Households in Each Caste Group.

Sl No	Name of the Caste	No of Households
(1)	Brahmin (Priest or Karnam i.e. Accountant)	1
(2)	Vysya (Businessmen)	3
(3)	Kamsali (Smiths)	4
(4)	Telaga (Agriculturist)	1
(5)	Velama (Agriculturist)	233
(6)	Golla (Shepherd)	20
(7)	Padmasali (Weaver)	21
(8)	Telaka (Oil crusher)	1
(9)	Baliya (Toddy Tapper)	8
(10)	Chakali (Washermen)	14
(11)	Mangali (Barber)	3
(12)	Muslims	6
(13)	Harijans (Leather workers)	32
(14)	Sachary (Fruit seller)	1

No of caste groups = 14;
No of Households = 348;
Population = 1,400.

Note: The above serial order roughly approximates the ranking of the Caste groups in the village. Traditional occupation of each caste is given in parantheses.

Munsiff and leaders of a neighbouring village, the Munsiff could start a Co-operative Milk Society of which the Panchayat President was Secretary, and the Vice-President and one member of the Panchayat were two of its directors. The society made a very good start with about 100 members from the village itself. Subsequently the Panchayat laid two village roads and constructed a school building in the village.

External Political Influence

It is important to note here that while the Munsiff continued to have added prestige in the village, the President, the Vice-President and the above said member of the Panchayat gradually came to be trained in the arts of leadership and ways of influencing people as well as officials. Further, since the Panchayat came to assume more powers from the year 1959 and consequently got involved more and more in construction of Community Works these leaders also got more and more acquainted with the work-contracts. Virtually it was the Panchayat leaders and the Munsiff who were actually in charge of construction of works even though someone else used to be appointed a sponsor, for official purposes, for each work. But gradually misunderstandings developed between the Munsiff and the Panchayat leaders over the sharing of profits made out of these works and these misunderstandings went a long way in creating among the Panchayat leaders a desire to be independent and free from the influence of the Munsiff. At the time when this was the thinking process of the Panchayat leaders, there developed some domestic trouble between the President and his paternal aunt's son who was also a member of the Panchayat. The Munsiff seized the opportunity to denounce the President. Then ultimately when a meeting of the villagers was called on January 15, 1961 to discuss the problem of building an extension to the school building, there took place an exchange of words between the Munsiff and the President over the names of the sponsors and allegations and counter-allegations of corruption were made in public. This was the beginning of active group rivalry and factions in the village. Subsequently, the Panchayat got split into two groups: one group of five members headed by the President and the other group of four members headed by a Panchayat member (who had a quarrel with the President) but

guided by the Munsiff himself. During this process the Panchayat President rose to the level of a primary leader from that of a secondary leader while a few Panchayat members rose to the level of secondary leaders.

It may be recalled that about 100 members from the village were working as labourers in the Port of Visakhapatnam. The labourers were members of two rival labour unions: the INTUC and the AITUC. The President, on account of his quarrel with the Munsiff, had to have some support at the block and taluk levels to get contracts sanctioned. He, therefore, decided to take the help of the INTUC labour leaders through the local port workers. Having had the support of the labour leader the President committed himself to support the leader who was contesting on a Congress ticket for the Assembly in the general elections. Consequently, the Munsiff supported a rival candidate who was supported by the Communists as well as the Village Officers' Organisation. This candidate for the Assembly also had a good reputation in the area. Therefore, for all these reasons, the village Munsiff gained more popularity and with the result more and more local backing.

On account of all these changes 60 members belonging to the President's group withdrew from the Milk Society and formed a separate one (unregistered). The main society with a membership of about 120 is dominated by the Munsiff. The effect of the split is that village factions came to be well defined with clearcut membership from the Velamas, who were mainly the members of the Milk Societies.

Unanimous Panchayat Elections

As the Panchayat elections approached in early 1964, each group was ready to set up its candidates for all the seats. Meanwhile a group of neutrals emerged under the leadership of the present Panchayat President. Their interest was to avoid any open conflict between the rival groups and also to secure Rs 5,000 as a grant as announced by the government for unanimously elected panchayats. Now that the neutrals were about 40 Velama families, leaving about 90 Velama families in each of the rival groups, they could become a potent blanching force and therefore the rival groups had to concede and give in. Even though the Munsiff was supposed to have more influence among the non-Velamas yet he could not completely depend upon them since their voting

behaviour was quite uncertain for various reasons.³ Ultimately, when no compromise could be arrived at regarding the selection of the candidates from the rival groups for all but two seats, all the seven were filled up from among the neutrals including the leader of the neutrals who subsequently became the President of the Panchayat. All the members were new entrants without any experience of public work before and most of them belonged to lower classes. Even so, the factions continued to be present and no group gave active support to the new panchayat. Hence the present inaction on the part of the Panchayat. However, of late, the illiterate President appears to be leaning on the ex-president for purposes of looking after the day-to-day business of the Panchayat.

Caste and Class Affiliations

By comparing caste-wise membership in the past and present Panchayats, it could be seen that while the ex-Panchayat consisted of 6 Velama members, one Golla, one Padama Sali and one Harijan, the present Panchayat also presents the same picture. The only change is that while the former had a Velama as vice-president the present vice-president is a Padama Sali. However, one difference is visible between the group of castes represented in the Panchayat and the group of castes which is not. While in the latter group the caste heads continue to have hold as in the past, in the former there is gradually developing a parallel leadership along with the caste heads because for certain reasons⁴ members other than the caste heads were selected for the Panchayat. This trend ultimately may undermine the status of the caste heads. However, there seems to be no immediate threat to the caste heads because the representatives of these poor castes in the Panchayat do not, as yet, have any considerable influence. In fact, the active leaders are those who belong to Velama caste and to those who are comparatively well off.

The following are some of the opinions⁵ of the villagers regarding the village leadership:

- 65 per cent of the respondents wanted that representation be given to each caste group in the Panchayat (at least by rotation), while 20 per cent opposed the system of caste representation. The other 15 per cent however were indifferent

- to the question of caste representation.
- (b) While 75 per cent expressed their agreement with the present arrangement of giving compulsory representation to one Harijan, only 30 per cent supported the idea of a Harijan becoming Panchayat president.
 - (c) While 35 per cent only opposed special representation to women in the Panchayat, 85 per cent opposed a woman becoming president.
 - (d) While 50 per cent wanted youth leadership, 26 per cent wanted old leadership. The other 24 per cent did not bother about the age.
 - (e) Finally, while 75 per cent of the villagers think of the present leaders as being uninterested in the village development, only 40 per cent feel that the village troubles were due to them.

Opinions of the Leaders

All the leaders generally expressed their appreciation of Community Development activities and each blamed the other group for the present state of affairs in the village. But they were one in expressing themselves strongly against such activities of the Community Development Programme as construction of latrines and starting of protected water supply scheme. The ten latrines constructed in the village have been demolished and the protected water is not being made use of. The leaders felt that the Government could more profitably spend the amounts on irrigation schemes, construction of schools and the like which were of immediate use to the village and avoid asking for contributions from the public.

At this stage it is necessary to touch on the problem of money making and profit sharing by the leaders. The active leaders expressed the opinion that they as leaders were forced to spend much money on a number of items like receiving officials and non-officials, visiting towns and the like which could not be accounted for in the Panchayat accounts and such expenditure had to be met by other means. Further, now and then the leaders are forced to purchase bonds like 4 per cent loan bonds and prize bonds, etc, and all such amounts have to be ultimately recovered by various means — legitimate and illegitimate.

Conclusions

On the basis of the above analysis the following conclusions may be drawn:

- (1) Leadership pattern in the village, since the inception of the Community Development blocks and more particularly since the establishment of Panchayati Raj, has been undergoing considerable change. Even though still only one or two primary leaders dominate the village, there is a gradual growth of multiple secondary leadership.
- (2) While the old authoritative leadership is giving way to some new leadership, the former is still strongly working against the growth of democratic leadership as such. In fact, the village officials and others who have been holding authority for a long time are becoming more and more 'benevolent despots' and are taking to different methods for holding their influence over the masses. The democratic leadership has not as yet emerged for various reasons: two of the important reasons being poverty and illiteracy of the masses who feel unable to take any active interest in village affairs and face the dominant people. Some of those who have few opportunities are trying to hold power or take to con-

tracts and thereby become rich as quickly as possible.

- (3) The present day leadership is not in position to create confidence and encourage group morale among its followers. The public doubt the sincerity of the leaders to help the poor. Frequent rivalries and change of loyalties on the part of the leaders is strengthening this feeling. In fact, it has to be noted that as it is "low income groups tend to have indifferent or negative attitudes toward any situation which seems to create their low estate." Therefore, unless special efforts are made to improve the economic conditions of the public at large and the poor sections in particular, there cannot develop group morale and a well defined democratic leadership as such. It is also important to note that "morale is that pervasive attitude of voluntary, enthusiastic and effective mobilisation of a group's efforts for the accomplishment of some purpose. And that attitude is called out and sustained by a good leader." It is because of the lack of the morale that the voting behaviour of the public or its support for the leaders at present is determined purely by exigencies of the situation and nothing else.

Table 2: Number of Households from Each Caste Group in the Fraction Groups in the Village

Sl No	Caste	Number of Households				Total
		Number of Panchayat Members	Ex-President's Group	Munsiff Group	Neutral Group	
(1)	Brahmin	...	...	1	...	1
(2)	Vysya	...	...	...	3	3
(3)	Kamsali	...	...	4	...	4
(4)	Telaga	...	...	1	...	1
(5)	Velama	6	99	96	38	233
		(including two women)				
(6)	Golla	1	3	17	...	20
(7)	Padmasali	1	2	13	6	21
(8)	Telaka	...	1	...	...	1
(9)	Baliya	...	...	7	1	8
(10)	Chakali	...	...	14	...	14
(11)	Mangali	...	...	3	...	3
(12)	Muslims	...	...	6	...	6
(13)	Harijans	1	2	27	3	32
(14)	Sachari	...	...	1	...	1
Total		9	107	190	51	348

Note: Majority of the Munsiff's group are sympathisers of the Communists; while majority of the Ex and present Presidents' groups are Congress sympathisers. About ten from the ex-President's group are also members of the Swatantra Party.

- (4) Quite naturally the present-day leadership is concentrated in the numerically and also economically important caste group. This supports Professor Srinivas's theory of the "Dominant Caste". The upper but minority castes do not have any hold over the village. Even though there is no evidence of overt caste antagonism as such, yet the upper castes do not seem to relish the idea of the lower castes and particularly the Harijans holding Presidentship of the Panchayat. There is no evidence of a strong political feeling either. The factions clearly cut across the upper and majority caste groups and also political groups. Even so, external political influence and internal kinship affiliations are made use of as and when necessary. The minority caste groups, particularly those which are not represented in the Panchayat, seem to have more caste solidarity and consequently more regard for the caste heads than others. (See Table 2).

- (5) Even though unanimity in the selection of the panchayat members seems desirable, it is not always so from the point of village development.

- (6) What is of immediate concern is the increasing tug-of-war between the leaders. This by itself may not be bad. But the problem is that individuals without any experience whatsoever in any organisation are straight-away aspiring to panchayat membership mainly with a view to holding power. In fact, this is the greatest weakness of the Panchayati Raj with special reference to its relation to Community Development. It is not appreciated that the opportunity to lead in a democracy is hardly confined to the panchayat; "the opportunity to lead fairly shouts aloud for its chance in every organisation and institution which brings the citizens of a democratic community together." In fact it was with a view to give scope for the emergence of as many leaders as possible to take part in Community Development activities that the "Guide to Community Development" strongly recommended the establishment of special committees of Panchayats "with the powers to co-opt additional members from among the villagers...and encourage associate organisations like Mahila Mandal, Yuvak Mandal and utilise them for Panchayat activities". Because of the absence of such associations the potential leaders instead of participating in constructive programmes and there-

by getting trained in arts of leadership are dissipating their energies. Once such organisations become effective they are sure to become active agencies of extension as well as centres for the growth of democratic local leadership.

- (7) Undue pressures from government officials (as pressing the leaders to purchase all sorts of bonds) with a view to get things done easily and quickly, and indiscriminate support by the political parties, are also responsible for forcing and encouraging local leaders to take to various malpractices at the cost of the community as a whole.

- (8) In spite of such shortcomings it is to be noted that without the active support of the local leaders the Community Development activities will go waste as happened in the case of latrines and protected water supply scheme in the village. Whatever might be the demerits of the present leaders, they are the only effective 'opinion leaders' in the village who can mould the opinions of the public. We have to work with leaders as they are, besides trying to locate potential democratic leaders and help them grow. Extension agents trained in social skills can involve leaders of different factions in constructive activities. The Social Education organisers and V L Ws need to be intensively trained in the principles of community organisation and working with groups.

Notes:

- ¹ In fact, up to the middle of the year 1959, i.e, the establishment of Panchayat Raj, neither Panchayati membership nor Presidentship attracted anybody, for the Panchayat prior to that date did not have such powers as at present.
- ² See Table 2.
- ³ Two important reasons being: the patron-client relationship and the possibility of purchasing votes.
- ⁴ The Golla caste head was opposed by the Munsiff while the Padama Sali caste head was opposed by the ex-president. The Harijan caste head being a Barrka, a Government servant, could not be taken as a member of the Panchayat.
- ⁵ Based on opinion survey of 75 individuals (males) other than Harijans.
- ⁶ Even today only 120 children from 348 households attend school.

Campaign to Boost Tea Sales Among British Youth

AN advertising campaign to boost tea sales among teenagers is to be launched throughout Britain on October 1 by the London advertising agency, Mather and Chowther. The campaign is financed by the Tea Board Committee, whose members include the tea associations of India, Ceylon, Pakistan and Indonesia, besides British tea distributors and brokers. The campaign will cost approximately Rs 80 lakhs annually and will run initially for three years.

India and Ceylon, who supply about three-quarters of the world's tea, have promised to provide Rs 40 lakhs annually and this sum will be exactly matched by British firms like Brooke

Bond, Lyons and CWS. Each firm has agreed to set aside one farthing for every lb of tea they import; last year, 500,000,000 lb of tea was imported.

The majority of the advertising will appear on television, but there is also to be poster and newspaper advertising and a big merchandising campaign to help retailers sell more of the product.

Mather and Chowther is responsible for the British Milk Marketing Board's "drinka pinta milk a day"—regarded as one of the most successful advertising campaigns ever launched in Britain. The slogan was taken up almost overnight—and milk sales soared.

KOTHARI'S ECONOMIC GUIDE & INVESTORS' HANDBOOK OF INDIA

(INCORPORATING THE INVESTORS' ENCYCLOPAEDIA)

1965 (26TH EDITION)

26 years of useful service to the investing public, financiers, economists, students and the lay man—a Book with an International circulation among the men who matter in industry and government.

Financial and other particulars on more than 4500 industrial establishments—taxation measures—incentives and relief factors for foreign collaborators—surveys of economic development—special articles by industry's leading men and persons in authority—information on licensing and collaboration, Gold Control, personal savings, per capita and national income, employment statistics, profitability of industrial undertakings etc.

Classification of Sections with thumb index :

Construction of National Accounts for the Indian Union An Example

Uma Datta Roy Choudhury

It is the purpose of this paper to explore the possibilities of constructing national accounts for the Indian Union with independent data on consumer expenditure, savings and investment available from three independent sources, viz, National Sample Survey, Reserve Bank of India and Central Statistical Organisation respectively, and to examine the extent to which they give mutually consistent results.

The exercise gives sufficiently encouraging results though there is, as expected, no exact balance between revenue and expenditure in the accounts. These differences are, however, within reasonable limits, except for the first year of the study, and one would be justified in assuming that they can be explained as also reduced to a great extent by further detailed examination of the estimates themselves.

It is hoped that the present study which highlights the marginal differences between related aggregates would lead to a further careful examination of the individual aggregates and preparation of balanced accounts in the near future which is the first step towards national budgeting in the perspective of plan formulation and balanced economic development.

ECONOMIC analysts and planners in India work with the great handicap of absence of reliable estimates of even such broad aggregates as capital formation, savings and private consumer expenditure, leave aside finer classification and more detailed economic measurements. The present assessment of India's performance in the economic field is merely in terms of national income by industrial origin. This makes national income statistics practically superfluous for plan formulation as also for other economic policy considerations. Thus national income serves no purpose other than measuring the overall growth of the economy.

In India plan formulation is primarily in terms of fiscal and monetary policies and resource allocation within the broad framework of a set of objectives quantified in terms of physical targets. This process of plan programming however is not accompanied with a co-ordinated picture of the economy as it is likely to emerge from the interplay of the various economic factors and the planning process as such. National budgeting is one of the most effective means to this end. Besides, since in India, government takes an active role in the different allocation of resources in the course of plan formulation, national budgeting would ensure a balance between available resources and the competing claims, given the demands on resources which follow from specific policy decisions already taken and the extent of control found to be acceptable. Such a balanced presentation of the economic system would not only give confidence in the objects laid down

but would enable a satisfactory assessment of the achievements as also of the failures and suggest ways of adjustments. In spite of these and many other uses which could be listed, so far no attempt has been made to present, in the process of plan formulation, such a comprehensive picture of the economy and show the interplay of the various factors as a result of the policies laid down and decisions taken.

The first step towards the preparation of this national budget is the availability of national accounts for judging the actual economic position and the ways in which the various economic factors are related to one another. Volumes can perhaps be written on the gaps in statistical data which stand in the way of a comprehensive analysis of the economic system and the construction of national accounts. These have been repeated too often to lose most of their originality. This is not to say that no gaps exist or that the available estimates have no limitation but only to emphasize that careful and critical examination of the existing material might throw light on the interactions between various economic factors about which very little is known now and also help in improving the existing estimates themselves. Also, the basic data to be used for estimating these economic aggregates would primarily be the same as for national income and the errors in these estimates would not be substantially different from those of national income. Moreover, it is not always that no estimates exist but often they are either not final or are available

from more than one independent source. To cite a concrete example one might consider the components of domestic product/expenditure viz, private consumer expenditure, capital formation and saving measuring financing of investment.

Estimates of consumption expenditure of households and individuals can be prepared by any one of the following methods (a) Direct analysis of family budget sample enquiries, (b) censuses of total retail sales of goods and services of current consumption and (c) commodity flow approach. Of these, the last is most involved demanding large mass of data on details regarding the distribution of each individual commodity between different types of final consumers as well as their intermediate use in the course of production. This also requires details on distributor's margins at every stage to obtain the values at the stage of final use. On the other hand, details of retail sale censuses or family budget surveys, if available over a number of years give a convenient method of measuring private consumer expenditure. In India surveys on household consumption expenditure form a regular feature of the multi-purpose National Sample Survey (NSS) initiated in 1950 and carried on since then in the form of successive rounds with an all India coverage. Besides information on other aspects of Indian economy, NSS collects data on household consumption expenditure from a sample of households by the interview method and the data on per capita expenditure are published both by items and by size classes. Attempts have been made in the past by individual research workers also to prepare

independent estimates of private consumption expenditure¹ using 'Commodity flow' method. But, neither have the consistency of these estimates with other related aggregates been examined carefully nor are they available over a number of years. The NSS estimates on the other hand, are available over a number of years more or less on comparable basis. In the earlier rounds there have been differences regarding the reference period and duration and time of each round.² From the seventh round (October 1953 — March 1954) onwards, 'month' preceding the date of enquiry has been adopted as the period of reference for the collection of expenditure data for all items. Similarly standard methods regarding evaluation of home-grown produce, duration and timing of the survey etc, have been adopted in the more recent rounds.

All these changes introduced from time to time are likely to have affected the comparability of the data over rounds. However these points of difference have not been of significance particularly from the seventh round onwards and one would be justified in using these results for an overall measurement of levels of household consumer expenditure. Besides, the results are available separately for two (or more) independent and interpenetrating sub-samples and the comparison between the two sub-sample estimates give a broad measure of the sampling and non-sampling

errors of the combined estimates. A broad examination shows that the variability between the sub-sample estimates are within reasonable limits as compared to the combined estimates. As regards the non-sampling error, these can be expected to be to some extent, consistent between rounds and comparison over time may not be affected.

Internal consistency and comparability with other independent data are the alternative means of judging the validity of the results. It would be useful therefore to compare the results on household consumption expenditure available from the NSS with the estimates of national income both from the points of view of the consistency of the levels of the estimates as well as the trends. The most convenient way of making such a comparison is to use these estimates along with the independent estimates of capital formation, savings and other related macro-economic aggregates to present the national accounts for the Indian Union. Household consumer expenditure form a very large proportion of the total national expenditure of the country and without any independent and reliable estimates of consumer expenditure any attempt at construction of national accounts would be futile. The present exercise would give an indication as to whether NSS data could be used for the purpose. As already indicated, methods of

collection, concepts etc, were more or less standardised from Seventh round (October 1953-March 1954) onwards and for the present study NSS data on household consumer expenditure from the Seventh round onwards only have been used. The estimates of total consumer expenditure have been worked out separately for rural and urban areas using the data on per capita expenditure and the estimates of population used for national income aggregates.

For simultaneous use of independent aggregates for analytical studies, it is necessary to ensure comparability of basic concepts and scope of the different estimates. Between the estimates of national income and household consumer expenditure, the only major point of conceptual difference is with regard to the treatment of house rent. Where as NSS data includes no imputed expenditure on rent by households, for national income estimates the rental incomes of owner occupied houses are imputed. It would be reasonable to assume that such imputation would be much larger for the rural sector than for the urban sector and would form a very large proportion of total rural rental income. Assuming that the total value rental income estimated for national income purposes would cover the imputed rent (for both rural and urban sectors) which is not included in the NSS household consumer expenditure data, these have been added to the NSS aggregates and the adjusted totals used for the present study.

Besides household consumer expenditure, capital formation and savings are the other two aggregates of prime importance for which estimates should be available before presenting the national accounts for the Indian Union. While the Central Statistical Organisation (CSO) alone have so far made attempts to measure the annual levels of capital formation in the country, National Council of Applied Economic Research (NCAER) and Reserve Bank of India (RBI) have primarily put their attention to measurement of savings simultaneously determining the levels of investment after adjustment for net inflow of capital. These estimates are not very satisfactory and several mentions have been made in research papers³ regarding the limitations of data and the unsatisfactory nature of these estimates. In view of these limitations

—about which the estimators themselves are fully conscious—these have been continuously under revision along with the availability of additional data. It is true that inspite of these improve-

ments from time to time, the estimates of both capital formation and savings are far from satisfactory and one is not sure of even the annual levels of investment and savings, leave aside

1960-61: Sixteenth (July 1960 — June 1961)

their actual measures. In spite of these limitations for the present study use has been made of the most recent estimates of investment⁴ and savings⁵ primarily with the object of highlighting these differences and focusing attention on the fact that no estimates are of much use unless they are consistent with other related aggregates as well as between themselves.

Similar to household consumer expenditure, estimates of both capital formation and savings need to be adjusted to ensure their comparability with the national income estimates. Capital formation estimates prepared by CSO are comparable with the revised estimates⁶ of national income and not with the official series⁷ released annually. It would therefore be necessary to adjust these estimates before using them along with the official series of national income for constructing national accounts. The estimates of overall capital formation are prepared by the 'product flow' method. The estimates for the public and the private corporate sectors prepared independently—by the analysis of budgets for government administration and departmental undertakings and the balance sheets and profit and loss accounts for public non-departmental undertakings and private corporate sector — are deducted from the total to obtain the estimates for private non-corporate sector. It would appear therefore that points for adjustment are with regard to (a) estimates of public administration where changes have been introduced in the analysis of the budgets in the revised estimates for purposes of capital formation estimation and (b) value of output of such capital goods which change as a result of revision of method of national income estimation. The figures of public administration capital formation in the estimates by Tiwari and others⁸ have been replaced by the estimates available in the official annual publication on national income⁹ to make them comparable. One point of departure, however, needs to be mentioned. According to the revised method of national income estimation "what was shown earlier as gross capital formation was actually 'gross gross capital formation.' It was, therefore, decided to drop the item 'maintenance' altogether and to retain the other expenditure as gross capital formation." This is an improvement which removes the possibility of over-estimation of gross capital formation in public administration and it was consider-

Note: Basic source are estimates prepared by CSO except for private consumer expenditure which are from NSS.
* NSS data adjusted to include expenditure on imputed rent by households
** includes expenditure under 'maintenance' in government administration under capital account.

ed desirable to adjust the conventional capital formation series on this account by excluding 'maintenane' on its being an item of current expenditure, and considering the estimates of 'capital outlay' (excluding net purchase of assets) as a more satisfactory measure of gross capital formation in the sector. According to the Central Public Works Department, because of heavy expenditure on current repairs and maintenance, depreciation forms a very small proportion of total gross capital expenditure of public administration. Following the CSO method¹⁰ therefore, depreciation in public administration capital formation has been taken as 2 p c of gross capital expenditure viz, capital outlay. The estimates of capital formation for departmental undertakings¹¹ and non-departmental government companies¹² have been added to obtain total public sector capital formation.

The non-comparability of the estimates of capital formation with the estimates of conventional series of national income because of revision of estimates of value of output of capital goods is likely to arise in a small way in 'Small enterprises' sector only. No adjustment has been made on this account because not only would the difference be of very small order but would not also lead to more precise estimates of capital formation as the estimates in this case are very approximate. The series of capital formation, thus adjusted, follows the trend evident in Table 2.

Having obtained the estimates of capital formation on comparable basis, the net savings series prepared by the Reserve Bank of India are also adjusted with respect to the estimates for the public sector. The analysis of budgets are undertaken in a much greater detail in the CSO than in the case of the series used for the RBI estimates. For the non-departmental undertakings the RBI series use the estimates for three years only viz, 1959-60 to 1961-62 and these also had been prepared by the CSO in connection with a study of public sector undertakings. The Reserve Bank of India estimates for the public sector are therefore revised as follows. For Government administration and departmental undertakings the estimates from the conventional series of national income¹³ have been taken while for non-departmental government companies, the figures from an earlier CSO study¹⁴ are used for the period 1950-51 to 1958-59. As regards the estimates of savings for domestic corporate and

household sector, the RBI figures remain unchanged.

Most of the other information required for construction of national accounts are available from the official sources¹⁵ only 'domestic product accruing to private sector' having been derived as a residual. The purpose of the present study is more demonstrative from the point of view of consistency of independent aggregates rather than analysis of annual structural changes. Firstly, the series is not long enough for a fruitful study of structural changes. Secondly, unless the margins of difference, particularly between capital formation and savings are either reduced or explained, analytical studies may not be very helpful. In view of this, no elaborate system of accounts have been used for the present study but only a simplified system¹⁶ which would present study but only a simplified system which would present the details for more important transactions only and for which the necessary data are readily available.

The national accounts have been presented for only four years within the period 1953-54 to 1960-61. This is only to save space particularly because no analytical study has been undertaken on the basis of the accounts. However if desired, the accounts can be prepared for all the eight years. The years picked up for the purpose are of no special significance but cover the end years of the first two five year plans and two mid points viz, 1953-54 and 1957-58. For a clearer picture of economic behaviour over the whole period, annual details of expenditure on net domestic product have also been presented for the years 1953-54 to 1960-61.

The system presented consists of only five accounts viz, domestic product account, appropriation account for private sector and government (admn), consolidated resting account and rest of the world account. Of these, domestic product account, private appropriation account and consolidated resting account have items of 'statistical discrepancy' which give a measure of the order of difference between the independent estimates of national product and capital formation, on the one hand and private consumer expenditure and savings on the other. It is true that the magnitude of the difference between the aggregates may not mean much but still it is worth mentioning that the difference either in domestic product account or private appropriation account or consolidated

resting account is not very large except for the year 1953-54. In this year gross capital formation estimates prepared by the CSO is as much as Rs 391 crores or 29.5 p c higher than the estimates of saving prepared by the Reserve Bank of India. An examination of the detail by components makes it clear that from the point of view of savings, this difference is primarily due to estimates for household and private non-corporate sector and perhaps to some extent for inventories. Such a large difference certainly demands further investigation and would not be beyond remedy particularly when they are limited to given sectors. The orders of difference between NSS estimates of household consumer expenditure and the domestic product estimates was also high in 1953-54 compared to the subsequent years but is not of such a large magnitude—the difference is of the order of 8 p c for domestic product account and 12 p c for appropriation account. The order of difference both for consumer expenditure and savings varies between 3 to 7 p c for the subsequent years. This suggests that a detailed and careful examination of the estimates might help to explain the differences and this will give one enough confidence to use these estimates for analytical studies. However, such examination is possible only when the details of the estimates are looked into carefully and can be undertaken only by one who is not only familiar with the method of estimation but has enough details for each of the independent aggregates to go ahead with the task. Such an endeavour is absolutely beyond an independent research worker who has no access to the necessary details.

The distribution of expenditure on net national product are presented next for the years 1953-54 to 1960-61, both in absolute terms and in percentages.

As already revealed by the set of national accounts, the margin of difference between national income and expenditures was of the order of 10 p c in 1953-54 and 4 p c in 1959-60. The difference in other years lies between them. If it is assumed that the level of national income in India has been measured more or less correctly in the present official series, this difference would mean under-estimation of either both or any one of the two important aggregates viz, household consumer expenditure and capital formation. A revision of the national income series¹⁸ would require a re-examination of the distribution itself. However such a re-

vision would mean simultaneous changes in the estimates of government current expenditure on commodities and services, public (admn) capital formation and the like and the overall difference as revealed in Table 5 might still be maintained.

In view of fluctuations in 'Statistical discrepancy' which introduces uncertainty, it is not possible to draw very definite conclusions regarding shifts, if any, in terms of shares in national expenditure. The broad conclusion that follows from an examination of the results is that there has been no substantial structural change over the period except that the share of investment as increased to some extent as also of government current expenditure as proportion of national income. However these shifts are of very small magnitude and occurs particularly for investment as a sudden jump at the beginning of the Second Five Year Plan with very little subsequent changes. Some changes have however, occurred in distribution between components of major aggregates. The most

significant of these is the gradual gain in position of the public sector in the country's investment. Thus against only around a third of total capital formation in 1953-54 and 40 p c at the end of the first five year plan, public sector capital formation was more than half of the total in 1960-61 and was at the level of Rs 949 crores against Rs 287 crores in 1953-54. Public current expenditure also increased substantially over the period from Rs 684 crores in 1953-54 to Rs 1211 crores at the end of the Second Five Year Plan. As a result the total share in expenditure of the public sector increased from 9.27 p c in 1953-54 to 15.27 p c in 1960-61. There has been slight increase in share of rural household expenditure also but the shift is only marginal.

Since the data are presented at current prices only, the series cannot be used for any study of changes over time except in terms of structural shifts. The presentation of the data at constant prices would require the de-

flation of a number of aggregates. The prices applicable to each of these are different depending on the items entering the aggregates. Thus, while index of cost of living or consumer price index would be the most appropriate indicator for deflation of household consumer expenditure, capital formation at constant prices requires the use of either 'capital cost index' or 'investment cost index' covering mainly prices of capital goods and machinery as well as unit cost of construction. Similarly exports and imports would require other series of prices relevant to each of these. For simplification all these related aggregates are often adjusted by the overall national income deflator to obtain the series at constant prices. Besides not being a very satisfactory method, such series would present the same trend and technical relations between aggregates as the current prices series. Such constant price series of several aggregates only have the technical refinement in the theoretical sense of being additive over time. However they might pre-

Table 6: Expenditure on Net National Product, 1953-54 to 1960-61

	1953-54	1954-55	1955-56	1956-57	1957-58	1958-59	1959-60	1960-61

9. net national product = national income	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

* includes expenditure on imputed rent by households.

** includes expenditure 'current repairs and maintenance' under capital account.

sent not too realistic a picture of the economy if the movement of prices relevant to individual aggregates are not similar or do not move in the same direction. No attempt has therefore been made to obtain the series at constant prices in the absence of detail price structures relevant to each of the aggregates.

In conclusion it might be stated that the primary purpose of the present analysis has been to explore the possibilities of constructing national accounts for the Indian Union with independent data on consumer expenditure, savings and investment available from three independent sources viz, National Sample Survey, Reserve Bank of India and Central Statistical Organisation respectively and to examine the extent to which they give mutually consistent results. The exercise gives sufficiently encouraging results though there is — as expected — no exact balance between revenue and expenditure in the accounts and items of 'Statistical discrepancy' measuring the overall differences have been introduced. These differences are within reasonable limits except for the first year of the study and one would be justified in assuming that these differences can be explained as also reduced to a great extent by further detailed examination of the estimates themselves. It is worth mentioning that the order of difference in the consolidated resting account i.e. between savings and investment is generally very much larger than that in household appropriation account i.e. between consumer expenditure and personal income. Since the household consumer expenditure data are based on Sample Survey results, it is but expected that a margin of difference with national income estimates would exist. This however is not true of savings and investment estimates. It is therefore reasonable to expect that these differences are not beyond remedy and in not too distant future it would be possible to present reasonably balanced accounts which can be used for study of interaction between important aggregates and also for economic policy formulation. The data at present are not available over a sufficiently long period to enable a detail study of structural changes. The only broad conclusion that follows from the limited data over eight years presented above is that public sector has a more prominent place in total national expenditure in 1960-61 than in 1953-54. Besides the usual problems of relevant price data, preparation of

national accounts at constant prices are beset with many conceptual and methodological problems and requires consideration as an independent study. No attempt has therefore been made here to derive the constant price series. However even if presented only at current prices it would not be too much to expect that the present exercises have paved the way for construction of reasonably balanced national accounts which would not only help in bringing forward the interactions between the various economic factors at any given point of time but also studying the structural changes in the long run. It can be hoped that the present study which highlights the marginal differences between related aggregates would lead to a further careful examination of the individual aggregates and preparation of balanced accounts in the near future which is the first step towards national budgeting in the perspective of plan formulation and balanced economic development.

- ¹⁸ Rest of the World Account includes an item of "errors and omissions" which is from the original source material of the Reserve Bank of India and has been explained therein. For example see, "India's Balance of Payments, 1948-49 to 1961-62", Reserve Bank of India, 1963.
- ¹⁹ For example, "National Income Statistics: Proposals for a Revised Series of National Income Estimates for 1955-56 to 1959-60". Central Statistical Organisation, 1961. However, these are again under revision now, in view of the subsequent release of 1961 Population Census data on number and distribution of workers, besides other material which has become available subsequently. It was, therefore, thought advisable at this stage to limit the analysis to the conventional national income series only.

AROUND BOMBAY MARKETS

Turn in Sentiment

Wednesday, Morning

AFTER striking a new low, Dalal Street staged a quick come-back and regained all the ground it had lost earlier in the week; this is the pattern the stock market has been following for quite some time. Early weakness was due mainly to anxiety over the developments in Kashmir. The crossing of the cease-fire line by the Indian security forces in search of the Pakistani armed infiltrators was welcomed in market circles but fears of a possible open conflict with Pakistan induced considerable nervous bull liquidation and bear selling which pushed the market to a new low on Thursday, August 26.

Dalal Street which was at its worst on Thursday—end-account day—presented a very different look the same evening. The turn came with the Prime Minister's statement that the Government had decided, in principle, to decontrol cement, except for the quantity required for Government purposes. The stock market did not wait for the details of the scheme of partial decontrol which have still to be worked out. It responded quickly and the very slow moving ACC shot up from Rs 144 to Rs 151 in a matter of a few hours. The spurt in Cement shares had a tonic effect on the entire market. The decision in favour of partial decontrol was interpreted to indicate a significant change in official thinking and it encouraged hopes of further decontrol of cement. The market did not have to wait for long to hear from the Union Finance Minister that the Government was considering decontrol of flat steel production.

Indications of a distinct change in the Government's policy conceding the need for a higher return to key industries like cement and steel have had a profound effect on the general market psychology. The Finance Minister's hints about simplification of corporate taxation and suitable modifications in the fiscal policy for promoting industrial growth further helped trading sentiment.

The market has staged an all-round recovery under the lead of Cement and Steel shares and it looks as though the market might take a pause to allow technical forces have their play. But since trading sentiment is still

dominated by the uncertain situation in Kashmir one cannot be sure about the market's behaviour. While technical considerations seem to favour a rally, the market will find it difficult to edge its way up in face of political uncertainties.

COTTON

New Hedge Contract

NEW season's hedge contract — Vidarbha/MP Virnar 27/32" March — made its first official appearance in the trading ring of the East India Association on August 31 at Rs 881.25 (per 3 quintals) — Rs 55 below the revised ceiling for the 1965-66 season but Rs 32 higher than the previous season's ceiling for this variety. Never has any hedge contract started a new season at such a high price. In fact, hedge trading would not have become possible but for the upward revision of ceiling prices. And that is perhaps about the only benefit the cotton trade is likely to derive from higher ceiling. For no one really believes that higher ceilings are going to stimulate cotton production if only because farmers have in any case been getting the highest possible prices for their produce, statutory control notwithstanding.

If the new hedge contract has started its career at an unusually high level it is not because something has gone wrong with the weather. Nor can it be attributed to the general inflationary psychology in commodity markets where prices only go up and rarely go down except by way of a technical correction. The current high price for the new hedge contract merely reflects the remarkable strength in the spot market where almost all varieties of cotton — be it short staple or long staple — are commanding fancy premiums over their statutory ceilings and in a number of cases current prices are higher than the enhanced ceilings for the new season.

Though by no means ideal, weather conditions so far this season have been fairly satisfactory. The crucial period is, of course, still ahead. How the weather will fare in coming weeks is anybody's guess. But there

can be little doubt that cotton production will have to show a very appreciable increase over the previous season's poor crop of about 57.5 lakh bales before one can expect any big decline in prices even from the current high levels. This is because of the growing imbalance between supply and demand resulting from a near static production and growing consumption of cotton.

As against the installed capacity of 13.73 million spindles at the beginning of 1961, spindleage had risen to 15.63 million by the end of June 1965. The increase in spindleage is far behind the Plan schedule. This is good in a way. Where is the sense in creating capacity when raw material supplies cannot be stepped up to feed this capacity. Mill consumption of cotton has increased from 53.73 lakh bales in 1960-61 to around 64.50 lakh bales during the 1964-65 season. Such a big increase in cotton consumption has been possible because of the continued large imports from abroad. Consumption of foreign cotton during the past five years has averaged around 8.89 lakh bales a year. The carry-over at the end of August which marks the close of the cotton year is estimated at 20.27 lakh bales of Indian cotton and 2.8 lakh bales of foreign cotton making a total of 23.07 lakhs. The corresponding figures a year ago were 22.62 lakh bales, 2.40 lakh bales and 25.02 lakh bales. Because of the further increase in spindleage, cotton consumption can be expected to set a new record in the new season if there is to be no decline in machine activity. Needless to add, consumption of cotton depends on its availability rather than on the mills' ability to consume the raw material or on the demand for cloth which is always there because of the growing population in the country.

OILSEEDS

Futures At New High

THE oilseeds market made big news last week. It was not because of the inspired and uninformed criticism of the Forward Markets Commission's recent decision permitting the Vanaspathi Manufacturers' Association and the Grains, Rice and Oil-

seeds Merchants' Association to conduct trading in non-transferable specific delivery contracts in groundnut oil and groundnut respectively. The market made news because linseed and castor futures were rigged up to new high levels for the season. Linseed April contract was marked up to Rs 119 and castorseed April to Rs 100 (per quintal); these rates were recorded in kerb dealings late in the evening. About a week earlier, linseed futures were quoted around Rs 108 and castor futures around Rs 86. Such a steep rise—about 10 per cent in linseed and 16 per cent in castor—in a matter of days can neither be satisfactorily explained nor easily understood except in terms of reckless speculation. The rise has occurred despite reports of fairly satisfactory weather in nearly all the oilseeds producing areas.

The market authorities seem to be virtually unconcerned about the violent movements in oilseeds futures which have become quite a normal feature of trading. There have been quite a few occasions recently when a week's range in linseed futures has been as wide as a full season's range in the not-distant past.

A possible explanation for wide fluctuations in linseed and castor futures lies in the diversion of entire speculative activity to these relatively small commodities because of the absence of any facilities to speculate in groundnut and mustardseed whose production is substantially larger than that of linseed or castor. Hedge trading in mustardseed is banned while trading in groundnut, though officially allowed, continues to remain at a standstill because of the ceiling of Rs 105 per quintal.

Will the Forward Markets Commission please explain where lies the sense in prescribing a ceiling of Rs 105 per quintal for groundnut future when linseed is allowed to be traded at a much higher price? The Commission cannot be unaware that the position is just the other way round in ready and that it is groundnut which is quoted substantially higher than linseed, the price difference being of the order of about Rs 25 per quintal. If the Commission thinks that futures trading in groundnut is not advisable and that the absence of hedge trading facilities does not in any way affect the marketing of the crop, why does it not apply the same logic in respect of linseed and castorseed. It is perhaps high time that the Government conducted a competent

inquiry into utility of futures trading in commodities in a planned economy characterised by strong inflationary pressures and physical shortages. Speculative tendencies need to be curbed in every possible way. Ban on futures trading in commodities might go a long way in reducing the speculative pressures on demand.

Groundnut oil has continued to hold firm around Rs 32.50 per 10 kgs due to scarcity of offerings. The ban on the movement of groundnut oil, including solvent oil, outside the State by the Gujarat Government is reported to have created a very difficult situation for the manufacturers of groundnut extractions. A good many plants in Gujarat are said to have been closed down because of the difficulty in disposing solvent oil within the State. Vanaspati manufacturers in Gujarat State are the main beneficiaries of the export ban on groundnut oil.

MONEY AND BANKING

Signs of Stringency

CREDIT conditions in the Bombay short term money market during the week to September 1 displayed signs of stringency despite the fact that pressure of demand, which persisted during the previous week, had more or less abated. Stringency could, however, be attributed to the heavy contraction in notes in circulation during the week. Demand for funds was good though not as good as during the preceding week. Supply was lower as well but enough to meet demand. Interest rates were maintained around the previous levels at 5 per cent.

Aggregate deposits of scheduled banks showed a substantial advance at Rs 2809.90 crores against Rs 2795.69

crores according to the latest statement of affairs of scheduled banks issued by the Reserve Bank of India. Credit contraction was also higher by Rs 17.18 crores at Rs 2,008.71 crores against Rs 6.51 crores at Rs 2025.95 during the preceding week. The contraction of credit during the current season at around Rs 110.28 crores is far below the Reserve Bank's earlier expectation of Rs 200 crores. Cash in hand at Rs 68.65 crores showed a small increase of Rs 31 lakhs. Balances with the Reserve Bank increased substantially, from 94.75 crores to Rs 106.40 crores. Scheduled bank advances declined by Rs 15.28 crores to Rs 1777.87 crores. Investments in government securities at Rs 847.29 crores showed an increase of Rs 18.25 crores. Money at call and short notice improved by Rs 2.99 crores to Rs 62.03 crores.

Notes in circulation during the week to August 27 declined sharply from Rs 2580.58 crores to Rs 2538.63 crores according to the latest Statement of Affairs of the Reserve Bank of India. Rupee coins were better by Rs 2.61 crores at Rs 103.69 crores. Deposits of the Central government advanced by Rs 5.54 crores to Rs 94.91 crores. State government deposits were better as well by Rs 1.63 crores at Rs 12.24 crores. Scheduled bank deposits, however, showed a marked decline at Rs 101.94 crores. Foreign Securities continue unchanged at Rs 68.35 crores but balances held abroad are better by Rs 47 lakhs at Rs 8.40 crores. Rupee Securities at Rs 2279.72 crores declined by Rs 15 crores. Loans and advances to governments improved by Rs 12.75 crores. Loans to scheduled banks have increased as well by Rs 7.89 crores to Rs 9.81 crores.

Kirloskar Electric

A FAST expanding concern, Kirloskar Electric Company is further widening the scope of its manufacturing activity. It has been recently given two letters of intent to undertake the manufacture of larger size alternators and an expansion capacity of two lakh HP for production of electric motors in the range of 1-10 H.P. With a view to modernising the manufacture of electric motors, it has decided to switch over to the manufacture of 1-10 H.P. motors with class 'E' insulation. The company has already been permitted to manufacture electric motors at Hubli for which a licence has been received from

the Government. The Hubli unit is to be put up shortly.

In view of the present acute foreign exchange position, the company has persuaded two foreign collaborators to invest in its share capital in order to enable it to meet the foreign exchange requirements of these projects. For the larger size alternator project, Brush Electrical Engineering of U.K. has agreed to subscribe in the company's equity shares of the nominal value of £100,000 at a premium of Rs 3.50 per share of Rs 10 each. And to enable the company to modernise and switch over to the manufacture of class 'E' motors, ASEA of Sweden

will invest Rs 27 lakhs in equity shares which too will be issued at the same rate of premium as to Brush Electrical. ASEA has agreed to give the company the technical know-how and all the information including the latest designs for the manufacture of class 'E' insulated motors on a royalty basis. It is stated that this type of motor has a large export potential. The company has appointed in South Viet Nam a sole distributor for its products to promote sales in that territory.

Shareholders' approval to these proposals is to be sought at an extraordinary general meeting called for on September 10 at which will also be considered another resolution, authorising the company to subscribe to the extent of 30 per cent of the share capital which may be issued by Kirloskar-Asea, a company in the same Group. This company manufactures motor control gear, switchgear, etc which are of vital interest to Kirloskar Electric.

Aluminium Industries

NOT only has Aluminium Industries pioneered the manufacture of covered/insulated aluminium cable, but it has been also doing its best to spread the aluminium cable cult. The company's engineers have been holding classes all over the country for the benefit of electricians and wiremen giving practical demonstration of correct methods of tapping service drops, making terminal connections, joints and tees by soldering and other methods. In its endeavour to keep abreast of the latest technological developments, the two-decade-old company has been constantly adding new equipments to its modern laboratory. To the series of testing equipment already in use at its factory in Kundara has been added recently a 20-metre, 60-tonne tension testing machine.

The company's existing schemes of expansion and development have shown satisfactory progress during the year ended March 1965. The construction of the Solidal cable factory has been completed, the aluminium rod rolling mill at Kundara is expected to start operations during the last quarter of 1965 and expansion of bare conductor manufacturing facilities at Kundara and Hirakud is well in progress. The management is considering further diversification of the company's manufacturing activities with suitable foreign collaboration.

Better raw material availability and satisfactory market conditions during 1964-65 helped the company to scale new production peaks in every line of manufacture and achieve considerably higher sales of Rs 7.67 crores against the previous year's Rs 6.22 crores. What is more, a substantial improvement is recorded in the export performance. The new product, Solidal underground cable, has met good response in the market.

Gross earnings in 1964-65 however, could rise at a relatively slower pace, from Rs 80.10 lakhs to Rs 84.79 lakhs, due mainly to higher costs of raw materials and borrowings. After providing for depreciation Rs 21.40 lakhs (20.42 lakhs), for taxation Rs 30.30 lakhs (30 lakhs) and for development rebate reserve Rs 4.83 lakhs (4.91 lakhs), equity earnings amount to Rs 28.26 lakhs (24.95 lakhs), of which the maintained total dividend of 18 per cent, including a half by way of interim, claims Rs 24.30 lakhs (22.70 lakhs). The new equity shares issued on the basis of one-for-two rights will rank for dividend in the current year. The managing agents have been re-appointed for a period of five years from August this year.

Mysore Electrical

THE products of Mysore Electrical Industries comprise the means to control and utilise electric power. In keeping with the projected increase in the generation of power, the demand for various items of switchgear and controlgear products manufactured by the company is expected to rise further in future. In order to meet this demand, the company is expanding and modernising its plant. With a view to securing a part of the foreign exchange for the import of necessary plant, machinery and high voltage testing equipment required for the manufacture of existing items as also for other types of high tension switchgear, it is proposed to allot equity shares of the value of Rs 2.5 lakhs at par to the collaborators, SAPAG of Geneva, against the import of capital equipment.

Meanwhile, in the year to March last, the company has recorded further fair progress in the direction of modernisation and rehabilitation which cost it Rs 3.58 lakhs. Additional plant worth Rs 12 lakhs is on order, and is expected to be installed in the course of the next 12-16 months. The additional bay of factory No 2 at Yashwanthpur was completed and

occupied during the year, and further building construction work is in hand. Efforts to rationalise the diversify the range and improve the quality of products are continuing with a view to utilising the available raw materials and manufacturing facilities to a greater advantage.

The 1964-65 results show further satisfactory growth in turnover and profits despite the drastic cuts resulting in inadequate supplies coupled with shortages even in indigenously produced materials. Sales advanced to a new peak of Rs 2.39 crores against Rs 2.08 crores previously, gross profit jumped more briskly from Rs 38.84 lakhs to Rs 48.48 lakhs. Of this, depreciation has taken away Rs 3.82 lakhs (3.28 lakhs), taxation Rs 25.90 lakhs (20.65 lakhs) and development rebate reserve Rs 0.62 lakh (0.65 lakh). Adding to the residue Rs 1.03 lakhs (0.12 lakhs), being excess provisions in prior years, the disposable profit amounts to Rs 19.37 lakhs (14.30 lakhs) out of which the dividend raised by one point to 13 per cent claims only Rs 4.59 (4.20 lakhs). Obviously, the directors' decision to effect only a meagre increase in dividend has been influenced by the need for conserving resources for schemes of development and expansion.

Thana Electric

IN order to finance power development so as to meet the accelerated demand for electricity in its area of supply, Thana Electric Supply Company is raising additional capital of Rs 9 lakhs. The company's licenced area of supply comprises portions of the Greater Bombay Municipal Corporation covering Powai, Bhandup and Mulund and of the Thana District in and around the city municipal limits, an area where industries are fast springing up and population increasing. In the five-year period ended March 1964, for which statistics are available, sales of energy and meter rent expanded substantially from Rs 15.80 lakhs to Rs 30.23 lakhs. The electric energy distributed by the company to consumers is received in bulk from the Tata Hydro-Koyna interconnected system at its receiving stations which have an aggregate installed capacity of 13 M.V.A.

Incorporated in 1928 and made public only this year, the company is now managed by Killick Industries who are also managing agents of Ahmedabad Electric, Bombay Subur-

ban Electric and Surat Electric. The authorised capital is Rs 1 crore and paid-up capital Rs 11 lakhs, Rs 8 lakhs in equity and Rs 3 lakhs in 6.5 per cent tax-free cumulative preference shares, both of Rs 100 each. The additional capital is to be issued in equity shares of Rs 100 each at par. Of the total issue, Rs 7 lakhs have been underwritten, and the managing agents will apply for the balance shares worth Rs two lakhs though there is no firm reservation in their favour. The subscription list opened on August 25 and will close on September 8 or earlier, but not before August 28.

B O A C

BOAC put up its best performance in its history in 1964-65. A record operating surplus of £16.8 million was made during that year by BOAC and its subsidiary company BOAC-Cunard, an improvement of £8 million over the previous year, which was the record till then. Of this surplus £9.2 million went towards providing for interest, taxation and other matters leaving a net profit on operations of £7.6 million—an improvement of £6.6 million over the previous year.

The growth of revenue which actually started last year continued its upward trend. Passenger revenue was up by 13.7 per cent (£9.6 million) and freight revenue by 18.2 per cent (£1.8 million). Mail revenue, however, registered a marginal fall of 0.7 per cent. Revenue earned abroad increased by £8 million compared to the previous year to a total of £78 million.

Yet another noteworthy feature in the performance of BOAC during the year under review was the remarkable increase in productivity. Although there was a reduction in the strength of staff by 704 it never had an adverse effect on the standard of services to passengers and shippers. There was better utilisation of manpower and mechanical and electronic aids. Output measured in terms of ctns per employee was 58,547 ctns compared to 50,004 in the previous year. A three-year wage agreement was also aimed at in which pay increases were given in return for positive and potential measure for improved efficiency.

BOAC-Cunard also increased its operating profit from £2.95 million to £4.51 million in the year and declared a dividend of six per cent. Similarly, BOAC Associated Companies Limited

registered a profit of £167,000 inclusive of the company's investments in other companies and after paying interest of £150,000 to BOAC and BOAC-Cunard. A sum of £250,000 was set aside as a reserve with a view to meeting the possible political and economic contingencies in the territories in which some of the subsidiary and associated companies are located.

In the sphere of passenger traffic, the year witnessed further consolidation on the Western routes. Total seat

miles increased by nearly four per cent. As a result of fares reduction on the Atlantic routes and also of the favourable economic conditions in both the US and North America, the load factor considerably improved. BOAC sold 63.4 per cent of its North Atlantic seats compared to the average of 56.9 per cent achieved by all other operators. Cargo operations on Western routes accounted for nearly 56 million load ton miles, an increase of 36 per cent over the previous year. The performance on the Southern routes was also not different.

Want to increase your overseas profits?

Here are 17 ways we can help you.

1 Our World-Wide Marketing Service personnel can help you find new markets. We have specialists in 124 world trade centres. Let them analyze your profit potential, show you where your product is needed, where you can ship to and sell most easily.

2 We can advertise your needs. Do you want to buy something? Sell something? We can spread the word. Our monthly magazine, "Clipper Cargo Horizons," published in 6 languages, can place your listing before more than 176,000 top executives around the world. No charge.

3 We can develop new contacts for you. Our professional marketing experts can make your first new overseas sales approaches for you—free.

4 We can find you additional suppliers. Want to buy for less? Get a special design? Get higher quality? Let our specialists discover new sources for you... see that you get catalogues and prices.

5 We can cut your packing and crating costs. We don't require the heavy, expensive crates of surface shipping.

6 We can lower your air Cargo rate. Pan Am's AirPak Savings Plan employs newly-introduced corrugated containers that can earn you a discount of 12%. And remember, Pan Am has reduced rates in recent months on many products, perhaps yours.

7 We can help you cut warehouse expenses. Because we can deliver overnight almost anywhere in the world, you don't have to maintain costly warehouses overseas.

8 We can lower your inventory cost. Our rapid delivery means you can order direct from the factory as needs arise... you won't have to maintain costly inventories.

9 We can help you match a local producer's delivery time. Don't let foreign competitors take business from you because they can deliver faster. Our rapid delivery makes you, in effect, a "local producer"

anywhere in the world, lets you cash in on unexpected opportunities overseas.

10 We can solve distribution bottlenecks. When you have to produce more than your regular distribution facilities can handle, call us. We'll see your customers get their orders on time, every time.

11 We can help you bank your profit sooner. The sooner your goods are delivered, the sooner you get paid. Our rapid delivery often means you get paid several weeks sooner.

12 We can reduce obsolescence losses. Could a newly introduced model or a change in public taste cut into your sales? Or even destroy your market? Minimize this risk... with our overnight delivery.

13 We can slash wharfage, docking, trucking costs. Call us. We'll be glad to show you how and how much.

14 We can reduce clerical expenses. For example, one Pan Am airway bill will take your shipment anywhere in the world. Let us rid you of use-

less, expensive, time-consuming paperwork.

15 We can greatly reduce insurance costs. Did you realize that shipping with us can save you in insurance as much as 90% of your surface shipping insurance costs? We'll be glad to show you the proof.

16 We can cut or eliminate spoilage, breakage, pilferage. The longer a shipment is in transit, the greater the likelihood of damage. To get your goods delivered fast, in factory-fresh shape, call us.

17 We can cut or eliminate disassembly-reassembly. No need to take large items apart and put them back together when you ship with us. You save time, trouble and cost.

Profit from these 17 ways Pan Am can help you.

We'll be glad to have one of our cargo experts help you make a thorough analysis of your supply and delivery system. No charge, no obligation. Call your Pan Am Cargo Agent, or ring us up. Do it today. (Tel. 211083/64)

Where there is oil, there is prosperity

Oil has revolutionised man's life, by adding to his comfort, giving him leisure for fruitful occupation, and raising his standard of living.

In India, the entire range of petroleum products, vitally essential in every aspect of our daily life, is now refined, transported through a network of pipelines and marketed by INDIANOIL. Every effort is being made to ensure a continuous supply of these essential products to Transport, Agriculture and Industry.

Initiative with India

THE war with Pakistan passed out of its tit-for-tat phase with the three-pronged attack on West Pakistan launched on Sunday. The international frontier between the two countries had been breached earlier by Pakistan in its thrust into Chamb in Kashmir, but in other respects the Indian offensive was distinctive. First, it carried the war beyond Kashmir. Second, the forces thrown into the attack, judging from available reports, were more formidable by far than anything used till then by either side. To what extent these developments upset President Ayub Khan's calculations it is difficult to say. Of course, a really serious threat to Indian forces in Kashmir, such as posed by the Pakistani advance towards Akhnoor after capturing Jaurian, was bound to be answered sooner than later by a direct attack on Pakistan herself. And in such an attack India would naturally exploit to the maximum the almost three-to-one numerical superiority of her forces on the wide plains of Punjab. The advantage has been pressed home with the two subsequent offensives launched on Wednesday, from Jammu towards Sialkot and from the Barmer region in Rajasthan towards Hyderabad (Sind). Upset calculations have not been all on one side, however. Even official accounts of the course of the war indicate that the drive on Lahore has not proceeded with the expected despatch, though the immediate objective of arresting Pakistan's advance towards Akhnoor has been achieved and the threat to Kashmir's life-lines lifted.

More important, by the series of offensives launched since Sunday, India has definitely wrested the initiative in the war. Much will now depend on how this advantage is exploited. The Defence Minister has told Parliament more than once that the aim is not to occupy Pakistani territory but to cripple her military capability. The reasoning, it seems, is that since short of total defeat Pakistan is not likely to formally undertake to leave Kashmir alone and since, in any case, no one, not the UN certainly, can ensure that such a commitment will be honoured, the best guarantee for India is to emasculate Pakistan militarily. The sustained attacks on Pakistan's air bases like the one at Sargodha and the emphasis on destruction of armour and equipment in the official reports on the war suggest that this objective is being pursued above all, though with what success and at what cost it is not clear. But assuming that the objective can be achieved given enough time—a not entirely unrealistic assumption considering Pakistan's many strategic disadvantages and smaller military and industrial base and, of course, the difference in sheer size—the question is can we settle down to a long war, and should we?

A remarkable circumstance attending the war so far has been the virtual unanimity abroad that it should be ended as soon as possible. Few countries, if any, have shown an interest in involving themselves in the conflict, even to fish in troubled waters. The exceptions are perhaps China, Indonesia, Turkey and Iran. The latter two, Pakistan's partners in the Cento, are at the moment considering her appeal for assistance. Indonesia has rallied to Pakistan's support in her customary manner, by providing demonstrators to ransack the Indian embassy in Jakarta. As for China, her aim, immediately at any rate, seems to be to prevent India from moving troops from the India-China border to the Punjab region; the threat of opening a second front, she hopes, will also keep India from striking at East Pakistan which is so poorly defended by Pakistan herself. None of this really amounts to active intervention in the war in such a manner as to take away the initiative from our hands.

It is really the moves for peace which will test the skill with which we exploit the military advantage we seem to have gained. At the moment of writing U Thant has just completed his first round of talks with Pakistani leaders in Rawalpindi; by the week-end he will be in New Delhi. The Security Council resolution calling for a ceasefire has been, not unexpectedly, disregarded by both countries. Pakistan insists on a UN commitment to a plebiscite in Kashmir. India has specified her own pre-conditions—the branding of Pakistan as the aggressor, removal of all Pakistani infiltrators from Kashmir and an assurance that a similar attempt will not be made again by Pakistan to upset the status quo in Kashmir. Given these respective positions, obviously, neither country can agree to any conceivable peace formula, whether produced by U Thant or by the Commonwealth peace mission which may follow him, without loss of face. In fact, both appear inevitably headed for some (or

considerable) loss of face. For, the alternative to a voluntarily accepted peace seems to be one imposed by countries which are in a position to do so. Both India and Pakistan it need hardly be said, are uniquely ill placed to withstand such pressure. Significantly, the US, the Soviet Union and the UK have all urged immediate end to the fighting. The US and the UK have suspended arms supplies to India and Pakistan and the latter's

CAPITAL VIEW

Ayub's Costly Miscalculations

Romesh Thapar

THE cease-fire line in Jammu and Kashmir belongs to the dead past. Our armed forces have before them a single objective—the decimation of the Pakistani forces which attempted to seize the territory of Jammu and Kashmir. The battle will continue until the Government of India is convinced that the threat to our security has been smashed and adequate guarantees are given that there will be no repetition of the events we have been witness to during these recent weeks. These few sentences summarise the prevalent mood in the leadership of the ruling party. And, judging from the quiet decisiveness with which the Emergency Committee of the Cabinet has acted, there is little likelihood of any backsliding. Too much is at stake.

All the bluster of Ayub and Bhutto, now supplemented by the cynically opportunist agit-props in Peking and Jakarta, cannot hide the fact that Pakistan was attempting a major military take-over in Jammu and Kashmir. The attack in the Chamb sector, massively supported by armour and mechanised units, was a closely co-ordinated follow-up to the activity of the infiltrators. True, the refusal of the valley to respond complicated the stratagem. But Rawalpindi believed that its thrust through the Chamb sector would exploit the advantages of terrain and soon cut the vital strategic roads to Poonch and to Srinagar.

Apparently, the military junta which rules Pakistan, basing itself on the Kutch experience, assumed that India's leaders would hesitate to order the crossing of the Punjab frontier, would not remember the old declaration by Jawaharlal Nehru that an attack on Jammu and Kashmir would be considered an attack on India. This probably explains why Pakistani armour had been heavily concentrated for the assault on Jammu and Kashmir, even at the risk of denuding the defences of Lahore which is crucial in Pakistan's

appeals to the Seato and the Cento have been turned down, apparently on technical grounds, but really out of a genuine conviction that induction of fresh arms on either side can only aggravate the conflict whereas a denial of them may hasten its end. Extension of the same logic may ultimately pave the way to peace. So far only Jo Grimmond, the British Liberal Party leader has openly advocated an embargo on economic aid, but there are

THE ECONOMIC WEEKLY

straws in the wind which cannot be ignored.

For India wisdom seems to lie in a ceasefire voluntarily accepted while the initiative in the war is with her. This may involve the minimum loss of face and may, it is just likely, enable us to avoid, albeit temporarily, being confronted with the substantive political question of Kashmir immediately in the wake of ceasefire.

ramified business of the inevitable cease-fire. The escalation is dictated largely by the strategic objective of destroying the aggressive potential of the Pakistan army. The destruction so planned must take place in the shortest possible time because there is no advantage to be gained in a prolonged operation. And, within the next few days, the pressure from international opinion will mount rapidly to compel a cease-fire. These are related issues and will have to be resolved — possibly by a single decision.

If the Pakistan army, and particularly the armour it has received from the USA, is dealt a grievous blow within the next few days, there is no reason why our military formations should not withdraw over the international frontier while at the same holding the recently captured Pakistan positions along the cease-fire line which will ensure the insulation of the Kashmir Valley from infiltrator invasions. A grave problem will arise, however, if we are unable to deliver the punishing blows within the limited time available to us. Such a situation could escalate the war to the point of no return. The next few days could decide the future of Indo-Pak relations.

The GOI has yet to realise fully that the confrontation with Pakistan is a confrontation with the West. The manipulations at the UN, despite the reports submitted by General Nimmo and U Thant, the attempt by the USA to imply that both India and Pakistan are misusing (*sic!*) the equipment supplied to them under various agreements and treaties, and the farce sought to be enacted by the British who demand that we return the hardware 'leased' to us after the NEFA clear the muddled thinking of two collisions in 1962, have done much to years. However, we have still to comprehend the implications and our response to them.

The Soviet position on the war that has developed between India and Pak-

THE ECONOMIC WEEKLY

istan continues to baffle those who expected a Khrushchovian gesture. Clearly, Soviet policy in this part of the world has yet to evolve. The bureaucratic approach in Moscow, which in a mechanical sort of way sees the USSR replacing the US militarist presence by an economic presence, apparently continues to dominate thinking. India is seen as the friend who has to be given all aid, economic and military, but it is considered politically puerile to make a public demonstration of this commitment. There must be many in Moscow who are perturbed by this ambivalence. Hence the Soviet Union's offer of its 'good offices' to India and Pakistan — the beginning of what might become a major involvement.

Far-reaching and deep changes are bound to take place in the power balance in South Asia whatever the ultimate outcome of the present Indo-Pak war. They will affect foreign relations, the direction of economic policy and the political organisation of the people.

One of the most significant side-results of the destruction of the Pakistani militarist posture will be a radical alteration in the balance of Indian and Chinese military strength along the Himalayan border. Peking must be taking note of these developments.

Although the Chinese leaders have offered full verbal support to Pakistan's aggressive tactics in Jammu and Kashmir and have denounced Indian 'imperialism and colonialism', the fact remains that no suspicious military movements have occurred in Ladakh or NEFA. There has been some diplomatic needling about patrolling and the like in the Chumbi Valley which just southward between Sikkim and Bhutan. Probably, the Chinese are quiet for the moment because they believe that whatever the result of the Indo-Pak conflict they can make propagandist capital out of it. But it would be a gross error to ignore the impact on the Chinese of the events now taking place. It may help matters. It may not.

Of course, there is still a great deal of talk in the Capital about the shattering silence of what are called our friends, particularly some of the Arab States and certain non-aligned nations. Apart from Marshal Tito, no one has stirred. But, fortunately, we seem to have at last pulled ourselves out of the sterile obsession which demands public declarations of support. We are wiser now — and fast recognising that only policies based upon self-reliance can give us the strength we need to cope with the related challenges of defence and development. This new spirit has to be nurtured and helped to grow through more purposeful commitments by the ruling party.

Meanwhile, the Capital seems ready to take everything in its stride — and is convinced that the rest of the country is as confident. All the more reason that our leadership be mature, far sighted, able to distinguish between jingoism and national interest. To this end, we must work in the weeks ahead.

Weekly Notes

A New Fourth Plan?

DELIBERATIONS on the Fourth Plan have always had an air of unreality about them, as we have had occasion to observe more than once before. The unreality reached its height at the last meeting of the National Development Council which authorised the Prime Minister to "re-orient, alter and amend" the Fourth Plan to give it a defence bias. The Council was supposed to give a final shape to the proposals for the Fourth Plan and the Draft Plan was supposed to be prepared on the basis of its recommendations.

The Fourth Plan was obviously conceived under an evil star. Ever since work was begun on it, conditions in the country have been increasingly turning unfavourable to its acceptance and implementation. From the highest and most responsible quarters came hints about the Plan being given up altogether or postponed; we interpreted this in some of our editorials as signs of important changes to come. The final blow has now been dealt by the hot war that has suddenly flared up in the sub-continent. Such a development was, of course, not even remotely taken into account as a possibility in for-

mulating the Plan proposals. It can therefore be taken for granted that the Fourth Plan will be very different indeed from what has been proposed till now.

The National Development Council, understandably, did not do any business at all; the entire matter of changing the Plan has been left to the Prime Minister, which is just another way of saying that the Plan would have to be formulated *de novo* after the smoke of the war clears up a bit. One thing is certain: the difficulties that were being anticipated in the matter of foreign aid would be now accentuated manifold. There is no doubt at all that the role foreign aid was playing in our development effort would be henceforward entirely different, both quantitatively and qualitatively. In an earlier editorial we had urged that we should go ahead with planning "without aid if necessary". This is not to be treated as an exhortation but as a serious programme and thinking must be done as to how exactly one can go ahead with planning for the double purpose of defence and development — with much greater emphasis on defence than hitherto — and yet depend substantially less on foreign aid.

Cleaning Up Business Practices

A RELATIVELY small price has been paid for the smooth passage of the Companies Amendment Bill through the Lok Sabha. The age limit for retirement of directors in public companies which was sought to be fixed at 75 has been removed, and so also the mockery of special resolutions to re-elect retiring directors who pass the age of 65. The time limit for the validity of blank transfers of shares has been liberalised. These two concessions are in addition to those made in the Select Committee which, among other things, deleted the provisions relating to declaration of the beneficial ownership of large holdings registered in the names of nominees, and released existing companies from the obligation to distinguish their main and subsidiary objects of business.

The main proposals for strengthening the regulation of corporate finance and management and for removing the procedural hardships caused by some petty irritants in the law have remained intact. These concern the powers of Government to inspect company documents and order cost audit of industrial companies, to regulate inter-corporate loans on the same basis as inter-corporate investments,

and to make itself a party to court sanction of amalgamations. Take-over bids and liquidation proceedings would be more closely supervised and the Company Law Advisory Commission abolished. All powers to grant approvals for appointment and remuneration of managerial personnel, etc., would now vest exclusively in the Company Law Board, which will be advised by an advisory committee "on such matters as may be referred to it".

The Finance Minister has also informed the informal consultative committee of MPs attached to his Ministry that the Company Law Administration's 'policing' activities would be confined in general to investigation and special and cost audits. It is proposed to make major offences against Company Law cognisable under the Penal Code and to hand over further proceedings against offenders to the Fraud Branch of the Home Ministry. This move is welcome in so far as it places company frauds — which are of much larger magnitude than the petty ones dealt with in the normal course of law — on par with other frauds. If Parliament accepts this amendment of criminal law, a major step would have been taken towards the cleaning up of business practices. The anti-fraud activities of the Home Ministry's special police establishment would have to be considerably strengthened if this move is to be successful. There is no doubt that the Company Law Administration is not equipped to handle criminal and semi-criminal prosecutions; at the same time there is a possibility that the Home and Finance Ministries might work at cross-purposes and the preliminary investigations undertaken by CLA might be frustrated by a fragmentation of investigation and prosecution authorities.

Albert Schweitzer

IF there ever was a man who lived out fully the philosophy he advocated that was Albert Schweitzer. We in this country take it almost for granted that one advocates a set of ideas and practises an entirely different one. But even among the greatest leaders of thought of any age and any country, there are very few who know quite clearly the best way they could spend their lives. In most cases it is a search for the truth, never quite attained, never quite lived out. But Schweitzer, relatively early in his life, strictly as a result of his philosophical explorations came to the conviction that the best way he

could spend his days was to help as many of his kindred beings as possible to suffer less from physical ailments. A rising star of a philosopher, who had before him a comfortable and satisfying academic career, with the promise of great eminence, joined a medical college, took a degree in medicine, started a hospital in the heart of Dark Africa and spent a continuous stretch of half a century diligently and painstakingly taking care of the ill and diseased. Until his very last day he never turned back. The philosopher who rejected Indian philosophy for its emphasis on world denial denied himself the worldly success that would have been his for the asking.

Born in 1875 into a family of priests, Schweitzer himself took orders in 1900. At the same time, he continued his studies in theology and music. In 1906 Schweitzer published "The Quest of the Historical Jesus"; this book aroused great controversy and also put him in the forefront of academic theologians. Widely known as a theologian and philosopher, Schweitzer was also becoming famous both for his organ-playing and for his analytical writings about music.

In 1905 when Schweitzer abandoned his brilliant academic career in order to study medicine, his family and friends were astounded. Little did they know that the decision had been taken years before, in 1896. "There came to me, as I awoke, the thought that I must not accept this happiness as a matter of course, but must give something in return for it". Schweitzer decided then to devote himself from the age of thirty "to the direct service of humanity". In 1904 he read a monthly report of the Paris Missionary Society concerning the needs of the Congo Mission; he decided at that moment that he would become a Jungle Doctor. In 1913 he completed his medical studies, and set sail with his wife for Africa to begin, what he considered, his life's mission.

The work at Lambarene did not prevent Schweitzer from continuing his musical and literary career. Among his well known books are the autobiographical "My Life and Thought" (1931) and "On the Edge of the Primeval Forest" (1921). He maintained an interest in philosophy and theology and extended his enquiries on these subjects to Indian philosophies. It was during his first trip to Africa that Schweitzer found his answers to the problem of the "elementary and universal conception of

the ethical". The phrase "Reverence for Life" became the cornerstone of Schweitzer's philosophy of life. All creatures have a will-to-live; only Man, through his process of thought, can recognise this. Unfortunately, in the world today men think only of their own will-to-live and fail to respect others' will-to-live. Not until men, through thought, practise "Reverence for Life" (which means recognising the will-to-live of all other creatures) will they become truly civilised.

Cement: Profits for Expansion

CEMENT has been in short supply in India since 1939, a short period in 1958-1959 excluded. The response to this situation so far has been typically short-sighted. The Government clamped down price control and administratively allocated available supplies among users. However justified this arrangement was during the war—a temporary emergency situation when there were no immediate possibilities of expanding supplies—it had little meaning in the post-war period. The system gave an unjustified subsidy to the user of cement, encouraged waste and exaggerated demand, and prevented adequate returns to the manufacturer. The bureaucratic solution of price control and physical allocation tended to perpetuate, rather than eliminate, the shortage.

Production expanded at a compound rate of 9.2 per cent per year. However, as mentioned above, given the initial starting position of shortage and the rate of growth of demand, it has throughout the period been less than requirements—a situation which has been used to justify the continuation of controls.

The first dent in the system came in the form of the excise duty rebate on increased production of cement, allowed only about a month back; it implied a recognition that supplies could be responsive to higher profits. Soon after the Prime Minister announced in the Parliament that the Government would remove the controls on the price and distribution of cement after taking about half the output at the existing fixed price. This is a fair solution in that a monopolist buyer of 50 per cent of the output (equivalent to the production of 25 200,000 tons/year factories) should be able to dictate the price at which he would buy. At the same time, the industry would be free to dispose of the remaining output

The implications of the move are interesting. Following the caustic soda decontrol precedent (and perhaps because industry is too attuned to cartel arrangements for distribution—so far, of course, under the aegis of the Government), representatives of the cement industry have chalked out a price-holding arrangement, under which the industry would seek to limit the price rise to Rs 20 to 25 per ton. On a free sale of 4 million tons a year, this would provide the industry immediately Rs 8 to 10 crores extra profits. Even after allowing for cost increases and the Finance Minister's cut, this is a substantial windfall to the producers.

The immediate effect has been not only to raise the prices of cement shares, but to interest the industry in expansion plans and to encourage new parties to enter the industry. Cases of cement companies are not unknown where they have not commenced paying dividend seven years after starting. Why cement shareholders were required to do this public service one fails to understand. But it may be expected now that such examples, together with the cement shortage, will be matters of the past.

Fertilisers: From Distribution to Marketing

THE Sivaraman Committee on fertiliser distribution appears to have done a thorough job, though its estimates of the foreign exchange required to make up the supply deficit bears little relationship with realities. The Committee has blessed the demand for entry of private trade into the distribution system, which has so far been the monopoly of co-operative agencies, who have not come up to expectations—owing to several reasons. These are listed as lack of marketing experience, inadequate distribution margin, low volume of credit facilities and small turnover. Since turnover would remain small in the absence of adequate supplies and the private agencies entering the trade would not be flustered with credit either, the indictment of co-operative agencies is obviously based on their high overheads, organisational incompetence and inability to build up marketing as distinct from mere distribution.

The entry of private trade would come about in any event since private producers as they go into large scale

production are not likely to be satisfied with entrusting sales to co-operatives. Fertilisers and Chemicals Travancore showed the way a long time back by opening its own demonstration centres and soil analysis and marketing organisation. It is a pity that other public sector plants have not (and could not by policy fiat) take up the same promotional role. The Committee has suggested that when production reaches 1.2 million tonnes the need for the Central Fertiliser Pool will disappear. Two years before this achievement, factories covered by the Pool arrangements should make their own arrangements to market one-third of their production in the first year and two-thirds in the second year. Thereafter, they will be responsible for the entire distribution.

The Committee has pointed out that the Central Fertiliser Pool which was intended to serve as an equalisation fund for balancing high domestic prices against low imported prices has been made to earn a profit of Rs 43 crores. This profit, it suggests, should be utilised for an active promotion programme. It is against giving a subsidy to the users of fertilisers, except in hilly and inaccessible areas so long as minimum prices are assured for agricultural products. For larger and more effective use of fertilisers, it prefers to rely upon better marketing, freight and tax concessions for raw materials and larger credit facilities. Retention prices to producers should be determined on the basis of Tariff Commission inquiries and the Pool arrangement should continue so long as there are wide disparities between domestic and imported prices and between various ex-factory prices. The Committee has also recommended continuation of the competitive market in phosphatic fertilisers, but at uniform prices, broadening of the retail network and building of buffer stock godowns.

Honesty through Accreditation

ONE further step has been taken by the Union Home Ministry in the campaign against corruption in administration. Acting on one of the recommendations of the Santhanam Committee, it has asked the various Central Ministries and Departments to deal only with "accredited" representatives of business houses.

Government regulation of industry

and commerce has inevitably led to the private industry having to approach government officials for permits and licenses. Even in the best administered countries a sudden increase in such regulation puts a great burden on the administration's integrity as well as efficiency. Only the high sense of purpose and responsibility generated by a serious war (as in Britain during 1939-45) is something like a guarantee that the controls would be worked to serve their social purposes faithfully. We have had a war with China and now have one with Pakistan. Any beneficial effects on the efficiency and integrity of the administration of the first did not prove durable; durability of the results in this respect of the current war remains to be seen. In the meantime, any steps to prevent corruption are naturally welcome.

It seems that under the present system, no matter how unsavoury the past record of somebody he could go on approaching government officials on behalf of a firm or even a number of firms. Since corruption is to some extent contagious, it is necessary that once somebody has been known to offer temptations to public officials, he should be barred from further personal contact with the administration. This is the main purpose behind the rule which has been introduced now. Business firms will now have to apply for accreditation to the Ministry or Department with which their business is mainly concerned.

Applications will contain some details about the person who is to be the accredited representative. It is to be hoped that the government will look into the past record and reputation of the would-be representative. Once a person has become the accredited representative of a firm for some Ministry, he will be allowed access to other Ministries also without having to apply afresh. If a firm desires to have more than one representative, it will have to obtain special permission. The proprietor-manager or the resident director will continue to be allowed to see the officials without accreditation. This is a possible loophole. What if some of these proprietors and resident directors have "unsavoury reputations"? This loophole cannot perhaps be plugged without the government undertaking to decide which firms are to be allowed to do business with it and which are not. Yet the government does have the

power to blacklist contractors, etc, and it is to be hoped that the kind of screening which will be used for representatives will also be applied to proprietor-managers and resident directors, etc.

If controls are not working well, they breed further controls—which may or may not work well. Perhaps the most effective method of making controls work well is to have a system of especially severe penalties for their misuse. It is to be regretted then that no new measures have been taken to multiply the fear of punishment for corruption. The Home Minister has recently said in the Lok Sabha that there is absolutely no change in his resolve to give up

LETTER TO EDITOR

The Need To Be Moral

THIS may not be the ideal moment to comment on our foreign policy, but the interchange between one of your readers and the Editor (*The Economic Weekly*, September 4, 1965) certainly provokes argument. You have objected to our "unseemly haste to embrace Malaysia" on the grounds that it has annoyed Indonesia. You have blamed India's foreign policy makers for negligence because she has alienated the three most populous nations of Asia — China, Pakistan and Indonesia.

It may not have occurred to you but it should have that one reason for our present alienation from these three nations is that they are dictatorships; and proletarian, military or nationalist, a dictatorship calls for its own brand of diplomacy which no democratic nation can easily supply. One reason why it is difficult to appease dictatorships is their irrational ways. President Sukarno, for instance, is supposed to have been annoyed with India because our Government did not provide him with the entertainment that he considers essential. In public speeches in Jakarta he is reported to have commented on the "inhospitable" ways of Indian women. What brand of diplomacy would you advocate in these circumstances?

Of China and Pakistan, the less said the better. No country had tried harder to appease China, no country had wanted as keenly an understanding with China as India under Nehru; yet when the time came it was as easy for China to rebuff India, as it was difficult for India to accept a rebuff. As for Pakistan, it would be naive to sup-

pose that the alienation could be cured by a better foreign policy. The popular response to the current military confrontation shows the depth of bitterness on both sides, built up not in a day, but over years of constant bickering; nothing that we could have done would have prevented the alienation, and particularly after a military dictatorship had taken over in Pakistan. Dictators understand dictators; they can be fickle alike, forming new alliances as their moods change. Democracies do not depend on the wishes of one man, or even a group of men, however influential. No Indian leader could tomorrow decide on friendship with China or Pakistan, and get away unscathed. Democracies are slow to move at any stage. Therefore, one reason for our friendship with Malaysia is that she is a democracy and there are not very many of them left in Asia. It is surely a sign of the greatest weakness not to support those ideals abroad that we consider paramount at home.

Whenever we have fallen short of our ideals we have failed in our foreign policy. We have denied plebiscite in Kashmir, and we have a situation on our hands which has done more harm to us than any other single issue in the last 18 years. The voice of reason does not call for a political settlement with Pakistan—with unreasonable military dictators, like Ayub Khan, and fanatic Muslim landowners, like Bhutto, there can be no settlement—but the voice of reason does call for a settlement with the Kashmiris, and that is not possible so long as Sheikh Abdullah is not released. Kashmir does

have a right to decide and determine its own affairs, the right to do what its people consider best in their own interests. Democracy has a logic of its own (unfortunate though it may seem to us); a nation cannot be democratic in certain matters and not in others.

We are also supposed to be anti-colonial, but in Africa we advocate restraint (Nehru at Belgrade) to the thousands who look forward to freedom. What is "restraint" but a colonial expression for "delay"? Have we not seen in India that greater the delay the worse a situation becomes? Would Pakistan have come into existence if India had been given independence 15 years earlier?

It is because we have fallen so far below our own ideals that when we had a genuine conflict of ideals we were let down by the world. We believe in non-violence; but we could acquire Goa only by violence. To throw off colonial rule should be a positive mission, and certainly Portuguese rule in Goa had to be removed; yet would we have earned the criticism of so many countries had we not the history of Kashmir behind us? Would we have been accused of hypocrisy had we stood four-square on the ground that we will not tolerate a colonial rule on this sub-continent?

The remarks of your reader "In politics only power counts. Politics is strictly amoral", is to say the least trite. If one knows the history of 19th century Europe one is terribly impressed by clever expressions of power politics; today there is no such game to be played; there is no "balance of power" whereby we can throw our weight decisively in one camp or another. Nothing could be further from Palmerston's England than modern day India. Today there are only two groups, those who are militarily strong and those who are militarily weak. The strong, apart from China, have not been very successful in power politics; even America has dithered along.

If we believe that our independent military strength is limited (and defeating Pakistan will not alter this belief) then we must look to other weapons to protect ourselves and our image. The only other weapon could be our moral authority and that can only be built up by following the principles of civilised behaviour. We do not have to be moral to show we are good; our self-interest lies in being moral.

SUDHIR MULJI

Bombay,
September 8.

FROM THE LONDON END

Labour with the Shine Off

THE unexpected death of the Speaker has now faced Harold Wilson with the possibility that the Government's majority in October may well be reduced to only one. Despite this really precarious position, the Prime Minister has made it perfectly clear that he is not going to call a General Election. "The Government are determined to carry on with the job".

While many believed that the Labour Government would find it hard to carry on with its slender majority of three, Wilson himself has never been in any doubt that a majority, however small, is sufficient for a determined Government. It is known that he sees little basic difference between a majority of three and that of one to which it may possibly drop. In some ways, indeed, there are certain advantages which the Government derives from this knife-edge majority because it acts as a restraining influence on restive back-benchers who, terrified by the thought of bringing down the Labour Government, can go no further than signing motions opposing Government action over Vietnam, immigration and other policy issues. So the slender majority helps to muzzle the discontented elements in the Party.

While this dauntless policy has, it is true, kept the Labour Party in office, it cannot be said that there is now any great passionate enthusiasm for the Government. What, for example, has become of the "national crusade" to raise productivity and get rid of restrictive practices and so raise production, so inspiringly initiated in the Prime Minister's speech during the censure debate in July? Where is the new and efficient Britain that was promised? So much of the idealism which was associated with the Labour Party has been destroyed by Government policy over the war in Vietnam, the White Paper on Immigration, the Tory "stop-go" measures adopted to deal with the economic situation, and now the threat of a Selwyn Lloyd-type wage freeze.

The goodwill which brought in the Labour Government seems in large measure to have been dissipated, and the general picture of Wilson's Government is that of one which has continually to keep a weather eye on foreign bankers and adjust domestic policies to suit their needs; a Gov-

ernment which seems to shy away from socialist solutions to Britain's problems, which is not prepared to tackle the balance of payments problems by drastic cuts in overseas military expenditure.

Obviously, against this background it would be foolish for the Labour Party to go to the electorate now. On the other hand, Wilson believes that there is a real chance that the country may well turn the corner soon and that the long sterling crisis, which has so far hampered Labour's programme, may also be overcome. In these circumstances, if the Party can hold on a little longer, there will be solid results to show to the country which will restore faith in the Labour Party. In a long speech to a large audience in Bristol last week-end, Wilson stressed that the year ahead would be the year of the great break-through to a just and powerful socialist Britain. He also drew attention to the large number of bills that the present Labour Government had carried through, despite their slender majority and "next summer or autumn we shall virtually have completed the whole of the programme we submitted to the British electorate a year ago".

Although a distinct note of optimism about the economy has crept into official statements in the past few days, it is unlikely that there will be any early relaxation of the restraints introduced by the Government which are now beginning to take effect. The Prime Minister himself does not believe that the restrictions will have any very dire consequences and sees no reason to fear any widespread growth of unemployment. The aim, as he has pointed out, is redeployment not unemployment. The Government also likes to point out that although the deflationary measures taken by it are very similar to those adopted by the Conservatives, they are not as crude.

Wilson's determination to carry on must be read as a challenge to the Liberals and the Conservatives to accept the responsibility for defeating the Government on a major item of policy. While there has been much talk of an alliance with the Liberal Party in order to tide over the difficulties of a minute majority, no feelers have so far been put out by Wilson. He does not expect the Liberals to defeat him on any major

issue, and it is perhaps for this reason that there was no mention of the steel nationalisation bill when he outlined the measures to be introduced in the next session of Parliament.

In the present situation, therefore, the line taken at the Trade Union Congress which is meeting this week could well be crucial. The Government's attempt to put teeth into its incomes policy and get the Trade Union Congress to accept the latest proposals on wage restraint made by the General Council, which would involve an "early warning" system on wage increases and give the General Council the right to sit in judgment on wage claims before they are submitted, could well lead to fierce opposition. The implied threat that the Government intends to resort to legislation to compel Trade Unions to act in certain ways, if they will not agree voluntarily to do so, can hardly be popular. The way the voting goes at the T U C Congress will have a very sharp impact on the Government's standing.

The Transport and General Workers' Union declared quite categorically in the Spring, that although a majority of Unions had voted in favour of the Government's Incomes Policy, this was a symptom of intellectual dishonesty. The subsequent batch of wage claims has proved this to be true. The Trade Unions must be aware that the Government's right to interfere, with the force of law behind it, in the process of wage negotiation, could well be the thin end of the wedge; even more dangerous, there is the distinct possibility that the machinery set up by a Labour Government would be inherited in the not too distant future by a Conservative Government.

The Department of Economic Affairs, and certainly George Brown, seem to pin all their hopes for Britain's economic revival on the success of their Prices and Incomes Policy. But if there is to be an incomes policy with teeth in it, it would have to be accompanied by detailed and specific powers to fix prices and control profits, and so far there is no indication that measures of this type are contemplated. Surely it would be wiser for the Department to concern itself with efficiency and raising productivity and thus deal with the causes, and not the symptoms, of the economic malaise facing Britain.

Vietnam War Helps the Economy

PRESIDENT Johnson continues to perform domestic miracles while the situation in Vietnam worsens. The most recent of the miracles is the postponement of the imminent steel strike. While the prospects for a steel strike continue, tremendous pressure is being put on both sides by the government, and if Lyndon Johnson's past techniques of arm-twisting are any indication, he may succeed in preventing a costly strike with implications for the entire American economy. The strike was called off only hours before the deadline, when the blast furnaces were already in the process of closing down, showing the importance of government involvement in the negotiations.

The Administration's role in the steel dispute indicates the trend in government economic thinking. The concept of guiding the economy in its important aspects is not a new one in America. In recent years, particularly during the Kennedy and Johnson administrations, it has become accepted that the federal government has a responsibility for the health of the national economy. While words like "planned economy" and "socialism" are strictly taboo in the United States, there are definite planned sectors of the economy which though still in the hands of the private sector are subject to strong and increasing government guidance. The Council of Economic Advisors has taken an increasingly important role in stimulating economic growth, through manipulation of credit rates and, most important, by the recent series of tax cuts. These economic strategies have succeeded admirably in recent months, and the economy is now operating at its highest level in history.

The threat of a steel strike is an important economic factor in the United States, although the influential *Wall Street Journal* has stated that a strike at the present time would not be as disastrous as the long strike of years ago. Steel producers have been stock piling material for several months and a direct threat to steel using industries would not be serious for several months at least. Yet, a strike by one of the nation's major industries is always a serious matter. Not only are 400,000 workers immediately out of work, but allied industries such as mining, railroads, and chemicals are also affected. Moreover, the psychological effect of a steel strike on the stock market and the economy

as a whole is grave, even if the actual facts of the situation do not warrant such strong reaction.

Modern labour negotiations in the United States have little resemblance to traditional struggles between labour and management. In the larger industries negotiating practices have been reduced to a science, and well trained lawyers participate on both sides in addition to the union and management spokesmen. The unions, which have grown to be large scale organizations, have strike "war funds" which run into millions of dollars for emergencies. Both sides often take their cases to the public, and place statements in newspapers and on television. Government also has an automatic role in major labour negotiations through the provisions of the Taft-Hartley Act. Under this law, the President can, if he sees a threat to the national economy, delay a strike for 80 days and call for negotiations during this period. The invocation of this law severely hampers the bargaining position of the unions, and is therefore rather unpopular and is used with discretion. In the present steel crisis, it is still possible for President Johnson to invoke this "cooling off period" as it is called, if the present negotiations fail.

As a counterbalance against the effects of a steel strike is the stimulus which the Vietnam crisis has given to the economy. Some analysts have claimed that America's economic prosperity, which has been virtually uninterrupted for the past two decades, is a result of a war economy. While this is probably something of an oversimplification, there is a good deal of evidence to support this contention. The present Vietnam situation has provided important stimulation to the economy. President Johnson has already asked for and received from Congress an extra one billion dollars for the war, and reliable Congressional sources have stated that the cost will probably reach seven billion dollars annually. This is a massive figure, and it has already spurred the aircraft industry, which was in something of a slump, and has provided an impetus to electronics, steel, autos, and allied industries.

Representatives of the aircraft and electronics industries, which spend large sums of money on applying pressure to the government each year, are always among the most vociferous supporters of an increased arms programme, and of an aggressive American foreign policy. At the present

time, they are reaping the rewards of the Vietnam war. These groups, and other "patriotic" elements, always make it difficult for government officials to take a "soft" line in foreign affairs.

Despite the impressive gains in the economy, however, there are a number of danger signs which are becoming clear to the Administration. In spite of a decline in unemployment generally and a rise in average wages for factory workers, the Negro unemployment rate has actually risen in recent months to an alarming level. The causes for this paradoxical situation come not so much from discrimination, which is being slowly eliminated in employment, but from lack of skills. Negroes, due to educational disadvantages and social dislocation, do not usually possess the skills needed for an increasingly complex industrial system. Negro educational opportunities are not increasing as fast as the demands of the job situation.

The maritime strike, which tied up American shipping in most U S ports for a record three months, has finally been ended, but with a realization that the American merchant marine is both inadequate and in a serious financial mess. The seamen's unions have demanded, and now receive, fairly high wages, and as a result U S flag ships have been priced out of world shipping. Only with subsidies from the government is American shipping able to survive. The recent costly strike may move the government to take further action in this area.

A little publicized yet important incident, also refers to American shipping. A number of foreign flag vessels, including ships from Mexico and Greece, have refused to carry U S war material to Vietnam, indicating international disapproval of American policies in Southeast Asia. The U S government has been embarrassed by these incidents, and has moved to substitute American ships whenever possible.

Thus, the American economy, according to most observers, remains in a very healthy state, spurred on by the Vietnam war. The American dilemma of imaginative and progressive domestic policies combined with foreign mistakes and declining prestige continues. President Lyndon Johnson, an enigma at home and abroad, remains firmly in the saddle, with many Americans unsure of the direction of national policy.

A CALCUTTA DIARY

Atulya Ghosh Rides Again

ON Saturday last Atulya Ghosh, M P and a many-splendoured man in West Bengal today, completed his sixty-first year and stepped into his sixty-second. There is some special meaning attaching to "stepped into", for he recently had a fall and was rendered immobile for quite a while. He could not, for instance, attend the Bangalore session of the All-India Congress Committee, although this did not prevent his men from going to Midnapore for activities which Ajoy Mukherjee, President of the West Bengal Pradesh Congress Committee, considered rather unfriendly; in fact he privately said that he had barely escaped grievous assault. Atulya Ghosh's relatively minor fall has been interpreted variously, some going to the extent of saying that Humpty-Dumpty has had a big fall and may never be put together again. This probably is a wildly exaggerated and optimistic view.

There are, however, reasons to think that, politically, Atulya Ghosh may have suffered a setback or two. The State Congress, for instance, may not be the "pocket borough" it used to be; it seems certain that Prafulla Sen can now look after himself and take care of his chief ministership, without Atulya Ghosh's support if necessary. It is no doubt true that leaders at the all-India level are the stronger for their strong local bases; it seems equally true that a known lack of all-India influence impairs the local "image" more than somewhat. Atulya Ghosh's deficiencies at either level are not easy to identify and measure with precision.

Twice Non-President

Atulya Babu will not admit it; but there may be considerable truth in the widely held view that he would not have minded being President of the Congress next year. Some say that the Bangalore resolution, making Kamaraj's re-election a virtual certainty, broke Atulya Babu's heart as surely as the earlier fall had injured his ankle. That soon after Bangalore S K Patil came all the way to Calcutta to hold Ghosh's hand is on record. It may also be significant that Congress President Kamaraj himself flew to Calcutta on Saturday, only for a few hours, to offer Ghosh his birthday felicitations. They embraced each other; the photographs say so.

There is little doubt that Atulya Babu has in recent years developed all-India ambitions. Until someone said that there was no such thing as a "Syndicate", he was believed to be among its top three members. Many called him a "king-maker", not always as a joke. While President of the Congress, Indira Gandhi once met the "ginger group" of the West Bengal Congress; and many thought she was not particularly fond of Atulya Babu which attitude seemed to reflect her father's. This year birthday greetings came from Indira Gandhi too. But something may have happened.

The Deluge Now

On Sunday Atulya Babu addressed the Congress Municipal Association, of which he is Chairman. This was his first semi-public appearance since his illness. On the same day it rained in Calcutta intermittently but very heavily for more than three hours. Atulya Babu spoke of the need for discipline among Congress councillors. Totally undisciplined was the water on the streets, which were waterlogged in almost every part of the city. In some places the water was four or five feet deep; and adamantly it stood on the streets for hours, bringing even a Sunday's life to a standstill. That standing water was the measure of the uselessness of the Congress Municipal Association, of which Atulya Ghosh is not ashamed and Prafulla Sen is not tired. Everyone else is, both.

Atulya Babu retains his association with and control of all the cells of power he ever laid his hands on. Yet the top positions, either in the party or in the Government, appear to have eluded him so far. He has never been a Minister; and he will not be anything but a Chief Minister, if even that. He has not been Congress President to date. He is, indeed, at last a member of the Congress Working Committee; but the "High Command" of yore is not very high today and its command is frequently ignored. And Atulya Babu is 61 and more, with his health far from robust. When, then, is Atulya Babu going to "arrive"?

Waiting Gadi

Some never do. (Rab Butler in Britain, for instance, never made it—in spite of his undoubted qualities and high intelligence.) It is too early to

write Atulya Babu off; but his present limp is definitely as political as it is physical. He probably curses his luck; and luck is important in a political career. It may also be that Atulya Babu is not the chief, nor was meant to be. Old men sometimes accept jobs they had earlier spurned. A Cabinet Ministership at the Centre, with a powerful or profitable portfolio, is not something to scoff at; and there is no reason to think that Atulya Babu will make a poor Minister. Or will Atulya Babu wait for a top job—until it is too late? He may have to decide soon, for like all of us he is getting on.

For the limited character of Atulya Ghosh's achievement to date, he will be unwise to blame only extraneous factors. For a soberer assessment of his prospects, he must look within and also at the State and the people he represents. His personal inadequacies are apparent from any comparison between him and almost any of Bengal's past leaders—right down to Sarat Bose and Bidhan Roy. Then there is the stature of Bengal; it has diminished in every relevant respect. With all his organising and other abilities, therefore, there may be definite, built-in, insurmountable limits beyond which Atulya Babu's ambitions may never reach. These are not agreeable birthday thoughts; but these are the only ones that occurred to this writer over the week-end; and he was perhaps thinking more of Bengal and the Bengalis than of just Atulya Ghosh.

Request to Readers

As there is demand from new subscribers for the following back issues of *The Economic Weekly*, it will be much appreciated if readers kindly mail back these copies to the Business Manager, The Economic Weekly, Co-operative Insurance Building, Sir P M Road, Bombay-1.

Volume XVII: Nos 1 to 3, 5 to 7, 8, 14 and 15 dated January 2, 9 and 16, Annual Number, February 20, April 3 and May 15, 1965 respectively.

The copies will be paid for.

Input-Output Analysis

Report on a Seminar

By a Correspondent

At least since the days of the formulation of the Second Five Year Plan the need to collect detailed statistical information relating to the various aspects of the Indian economy is being keenly felt so that we might formulate our developmental programmes on a sturdier statistical scaffolding. In spite of this long realised necessity one gets somewhat disappointed to find the inadequate and shaky nature of the statistical information we have. Such was the feeling of several participants gathered in Poona during the week beginning August 24 for a Seminar on Input-Output and related techniques. During the week-long discussions this aspect of inadequate information relating to the structure of the Indian economy came up a number of times. In view of this it was appropriate that the gathering decided to organise a small body of professional people engaged in input-output work to help judicious use of available information as also to provide a direction for the collection of data.

In a sense, the tone of the Seminar was set by D R Gadgil in the course of his inaugural observations wherein he outlined the tradition of empirical research in Poona. He briefly traced the history of empirical studies conducted there from the days of the Sarvajanik Sabha. The accent of the deliberations of the Seminar was also mainly on the empirical aspects. Even when capital matrices and models dealing with technological transformation came up, there was no intensive discussion on theoretical issues. Thus out of the twentyseven papers, eleven dealt with statistical information relating to the flow and capital coefficients structure of the individual industries and the economy as a whole; eight papers were devoted to the application of the input-output method to problems of regional and industrial studies. The remaining papers discussed theoretical models of varying degrees of generality.

W W Leontief who was invited to preside over the Seminar began the technical session by presenting a paper on "Open dynamic system for the long range projection of economic growth". The chief purpose of his paper was to present a model which would enable the planner not only to determine but also to display the limitations imposed by the particular (changing) structural relations on the possible growth path

over the envisaged horizon. His model, which rests on the knowledge regarding the changing structural relationships in terms of the input-output and capital matrices relevant to each time-period for the entire horizon, seems to be more useful to analyse the historical growth paths of the economies rather than to project the future. For, the planners should know not only the technologies of the future but also their sequence as the growth path would be sensitive to the particular choice of the sequence of technologies. Hence some optimising principle needs to be explicitly introduced if the question regarding the appropriate sequence is to be settled. And, this raises all the problems relating to the type of optimising considerations in a dynamic context. Another paper on an allied topic, dealing with the application of the dynamic input-output model for planning was presented in the later part of the Seminar by P N Mathur. In this he considered, beginning with the specified rates of growth for the different elements in the final demand and initial availabilities, the problem of reinvestment of the residual outputs in such a way as to maximise the rate of growth.

Among the papers dealing with the construction of input-output tables, both regional and national, the computation of capital and flow co-efficients for individual industries, the inter-industry transactions table prepared by the Economic Division of the Planning Commission came up for detailed discussion. Presenting the Table, Bawa gave an account of the economic classifications adopted in the Table indicating how the original 106 sectors square matrix was condensed into a 29 x 29 Table. For want of information they had to aggregate the small scale and the large scale sectors. With regard to the sources of information, while the position respecting the manufacturing sectors was considered not so unsatisfactory, our knowledge about the cost structure of agriculture and trade and transport sectors was clearly inadequate. They had to rely in the case of agriculture mostly on the Farm Management Studies and some IARS studies on jute, cotton, etc. As the period of coverage of the various sources of information are different (ranging from 1954 to 1961) it was difficult to obtain information relating to any one

particular year and, as such, price variations have got compounded. The situation regarding mining was even more difficult. For want of up to date and detailed information the coefficients of the ISI 1953-54 table had to be used. These and similar issues, such as the treatment of trade and transport margins, of public and private consumption and of competitive and non-competitive imports came up for detailed scrutiny.

In the field of international trade, Wiesskopf's painstaking attempt to analyse the structure of imports implied by alternative patterns of growth within a multi-sectoral framework and Panchmukhi's efforts at evolving a model with a view of planning import substitution in the various sectors of the economy were found to be interesting and stimulated discussion. Both the papers were in the nature of progress reports as empirical work is yet to be completed. A theoretical exercise on "Trade and Excess Capacity in the Indian Economy" was prescribed by Krishnan, Sengupta and Travis. Even though the theoretical formulation did elicit lively discussion, the participants were somewhat sceptical about the possibilities of using the model to derive meaningful empirical results.

Two of the papers were devoted to surveying the literature. While A Ghosh reviewed some of the papers dealing with multisectoral models of planning constructed in India, M Mukherji traced in a brief but compact way the history of inter-industry research in this country.

On the conceptual and methodological side, the issues that recurred rather frequently during the Seminar were: (a) the question of using natural versus money units for measuring various magnitudes; (b) the advisability of borrowing coefficients from other countries; (c) the use of coefficients computed on the basis of model projects (which are more in the nature of marginal coefficients), rather than taken from the published information pertaining to the industries in operation (which are aggregative and average in character) and (d) the general problem about the merits of the stochastic versus deterministic approach to quantitative economics. Of course, no definitive conclusions on these ticklish issues could be arrived at.

Urban Women Workers

A Preliminary Study

Kamla Nath

Women constitute nearly a third of the working force in India. In 1961, out of a total working force of 188.4 million, 59.4 million or 31 per cent were women.

The great majority of women workers (55.4 million) live in rural areas and work in agriculture and allied occupations. But in the urban areas, the occupational structure is more diversified and we see the slow emergence of the new class of educated working women whose numbers should progressively increase with economic development.

This preliminary study of urban women workers is based primarily on analysis of Census data*. It describes the variations in work participation rate (proportion of workers to total) of urban women by States and by level of education, and the distribution of workers among the principal occupational categories. The secular trend in work participation rate of women has been analysed for the period, 1901 to 1961, for 13 major cities of India which had a population of 500,000 or more in 1961.

In the urban population of 78.8 million in 1961, there were 26.4 million workers — 22.4 million males and 4.0 million females. The male workers formed more than half (32.4 per cent) of all urban males, but the corresponding proportion among the females was only 11.1 per cent. In other words only one out of nine urban women works. The proportion of workers is much higher (31.2 per cent) among the rural women.

Age Specific Work Participation Rate

Of the 44.4 million urban persons in the age group 15 to 59, which may be called the working age group 24.9 million were males and 19.1 million were females. But whereas 83.0 per cent of the males of this group were classified as workers, the corresponding proportion for females was only 18.2 per cent. However, the 3.5 million female workers of this age group constituted nearly 90 per cent of all urban female workers. This shows that only a small number of female children (below 15) or old women (above 60) work in the urban areas. The work participation rate of female children shows a variation from 0.2 per cent to 3.5 per cent in different States with an average of 1.6 per cent for the country (Table 1). The age specific work participation rate is a better indicator of work participation

- *Sources: (1) Census of India, 1961. Paper No 1 of 1962. Final Population Totals. (2) Census of India, 1911. Vol I Part IIA. Primary Census Abstracts. (3) Census of India 1961. Subsidiary Tables BIII 3 (4) Census of India 1961 Subsidiary Tables BIII Part A.

than the crude work participation rate. But the latter has been used in this paper because data on the age specific rates are not available by States, cities or by level of education of the workers.

Inter-State Variations

As will be seen from data of Table 2, there are large inter-State variations in the work participation rate of urban women. The maximum rate for any State, 18.7 per cent, is in Andhra and the minimum, 4.3 per cent, is in Delhi. The States fall into the following four groups on basis of variation in this rate:

Work Participation Rate	States
Below 6%	Delhi, Punjab, UP, West Bengal, Jammu and Kashmir
6-11%	Gujarat, Rajasthan, Bihar, Assam
11-16%	Maharashtra, Madhya Pradesh, Mysore, Madras, Kerala Orissa.
16% and above	Andhra Pradesh.

In order to see whether the work participation rate has any correlation with the level of economic development, the States were ranked according to the following three indicators of development:

- (i) literacy, (ii) proportion of urban population to total population, and (iii) proportion of workers in manufacturing industries to total workers.

Each State was given a score derived from simple averages of the figures of the three indicators. The results given in Table 3 do not however reveal any correlation between the

work participation rate of urban women and the development score, or any of the individual indicators. In

Table 1: Age Specific Work Participation Rate of Urban Women Age groups 0-14 and 15-59.

State	Age Group	
	0-14	15-59
Delhi	0.3	8.0
Punjab	0.5	8.1
Uttar Pradesh	0.6	8.9
W Bengal	0.2	8.9
Jammu and Kashmir	1.0	9.8
Gujarat	0.9	12.9
Rajasthan	1.7	16.9
Bihar	1.2	17.0
Assam	1.3	18.1
Orissa	2.0	20.9
Kerala	1.8	21.6
Maharashtra	1.5	22.1
Madras	2.2	23.5
M P	1.6	24.2
Mysore	2.8	24.6
A Pradesh	3.5	29.9
India	1.6	18.0

Table 2: States Grouped According to the Work Participation Rate of Urban Women

State	Percentage of Women Working
Group I: Below 6 per cent	
Delhi	4.3
Punjab	4.7
West Bengal	5.1
Uttar Pradesh	5.3
Jammu and Kashmir	5.8
Group II: 6-11 per cent	
Gujarat	9.2
Assam	9.9
Rajasthan	10.1
Bihar	10.4
Group III: 11-16 per cent	
Kerala	13.0
Orissa	13.1
Maharashtra	13.4
Madhya Pradesh	14.5
Mysore	14.9
Madras	14.9
Group IV: 16 per cent and above	
Andhra Pradesh	18.7

KOTHARI'S ECONOMIC GUIDE & INVESTORS' HANDBOOK OF INDIA

(INCORPORATING THE INVESTORS' ENCYCLOPAEDIA)

1965 (26TH EDITION)

26 years of useful service to the investing public, financiers, economists, students and the lay man—a Book with an International circulation among the men who matter in industry and government.
