West Bengal, which has the highest score (29.0), the work participation rate is among the lowest (5.1 per cent) in the country. In Gujarat and Maharashtra, the two other States with similar scores (27.9 and 28.6 respectively), the work participation rates are much higher—9.2 per cent and 13.4 per cent respectively. More detailed work on this subject is obviously needed in order to determine the relation between the level of economic development and work participation rate of urban women.

Inter-State variations in the work participation rate do however show a geographic pattern. All the States with every low rates (below 6 per cent) are in the north; the southern States have considerably higher rates, 13 per cent and above. It is interesting to note that 60 per cent of the urban women workers are in the five States of Maharashtra, Mysore, Madras, Kerala and Andhra Pradesh, which have only 44 per cent of the urban women. The reasons for these striking regional differences need to be investigated.

Distribution by Industrial Categories

One-fourth (25.5 per cent) of the urban women workers are engaged in agriculture and other primary industries (industrial categories I, II and III of the 1961 Census); 30 per cent work in industries and 34.3 per cent work in 'Other Services' (Table 4). These three groups of occupations provide employment to nearly 90 per cent of all women workers. The popular association of urban women workers with construction labourers on the one hand and educated girls working in offices, stores or telephone exchanges on the other, is not supported by the Census data: the numbers of workers in both these categories of occupations are rather small.

The proportions of urban women engaged in agriculture and other primary occupations, household industries and other services (industrial categories I, II, III, IV and IX) are larger than the corresponding proportions of urban male workers in these occupations. But their proportions in manufacturing industries, trade and commerce and transport and communications (industrial categories V, VI, VII and VIII) are considerably smaller than the corresponding proportions of male workers.

Level of Education

Nearly two-third (65.5 per cent) of all urban women are illiterate; 19.2 per cent are barely literate, 12.4 per cent

are educated to primary or junior basic level, and only 2.9 per cent are matriculate and above. In the last category, which totals 1.02 million, there are 49,000 women with technical and non-technical diplomas, 128,000 with University degrees, 39,000 with teaching degrees and 7352 with medi-

Gujarat	36.6	1.6
Rajasthan	22.5	1.4
Orissa	27.6	1.2

The highest proportion of women, matriculate and above, is in Delhi (8.1 per cent). Other States with comparatively high proportions are Punjab (7.7 per cent) and Kerala (4.7 per cent). The figures are between 3 and 5 per cent in West Bengal, Maharashtra and Assam; but are much lower in the other States (Table 5).

These figures point to the concentration of women educated up to matriculation or higher level, in cities or in areas with comparatively high female literacy.

Nearly 1/7th (13.7 per cent) of the illiterate urban women are workers (Table 6). But the work participation rate is much lower among women

INDIAN COTTONS LABELLED

SANFORIZED
REGD TO MK

carry the identical assurance of quality
and shrinkage control anywhere in the world

All fabrics bearing the label 'SANFORIZED', in India and the world over, carry the same assurance of a reliable, uniform standard of shrinkage control recognised and trusted by millions wherever cottons are sold.

Last year, many of the 56 registered users of the trademark in India recorded an impressive rise in exports—five, seven, eight and even nine times above their 1963 figures. Even more significant, India's exports for the first nine months of 1964 of cloth labelled 'SANFORIZED' exceeded the total of similar

exports for the whole year of 1963 by over 30%! A positive indication that use of the trademark helps our fabrics to earn more and more foreign exchange.

Such a spectacular increase in exports is proof enough that Indian fabrics labelled 'SANFORIZED' can compete successfully in world markets. They are in demand because they conform to the same shrinkage standard as cloth bearing this trademark anywhere in the world.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A., with limited liability) proprietor of the registered trademark 'SANFORIZED'. The proprietor uses this trademark or permits its use by registered users, only for tested fabric which meets its strict residual shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2

mae SAN. 4437

who are barely literate (4.6 per cent) or are educated up to the primary level (4.7 per cent). The rate rises steeply with level of education, being 17.3 per cent among matriculates and as much as 71.3 per cent among holders of technical degrees.

The State-wise data given in Table 7 show a similar trend—sharp decline in work participation rate on the transition from illiteracy to literacy and progressive rise with rise in the levels of education of urban women.

The illiterate urban women workers are distributed almost equally among the three occupational groups—agriculture and other primary occupations, household and manufacturing industries, and 'other services'—mentioned above. Among those who are literate or are educated upto the primary level, the proportions working in agriculture are smaller, and those working in industries or 'other services', are larger. But the great majority of the educated women (those educated upto matriculation and higher) work in 'Other Services'. (Table 8)

Secular Trend

Comparison of work participation rates over time is rendered difficult by changes in definition of 'worker' in the different Censuses. However, data for the 13 large cities of India for the period 1901 to 1961 presented in Table 9 show a downward trend in work participation rate of women which is too marked and too consistent to be affected significantly by definitional changes. The downward trend is observed in all cities and consistently from decade to decade in most. The average participation rate for all cities shows a decline from 17.6 per cent in 1901 to 6.9 per cent in 1961. In case of several cities, Delhi, Kanpur, Lucknow, Ahmedabad, the decline is even greater. The rate for Kanpur declines from 20 per cent in 1901 to 4.5 per cent in 1961, and that for Ahmedabad from 25.0 in 1901 to 5.1 per cent in 1961. The southern cities, Madras, Bangalore and Hyderabad show less steep declines. As the southern States have generally higher work participation rates of urban women it would be interesting to study the relation between work participation rates and the secular trends in participation rate in the cities.

As the data of Table 10 show, this period has also seen a decline in the work participation rate of the men in the cities and of the population as a

whole. But the decline is most marked in case of the women.

Conclusion

Very few urban women work in India. In an international comparison of work participation rate of urban women in 38 countries made by Collier and Langlois, India was fourth from the bottom: the rates were much higher in U S A, countries of Western Europe, Japan and other developed countries.* Summary data, in which the countries have been classified by level of development, are given in Table 11. Higher work participation by urban women will undoubtedly make a contribution towards India's economic development and social advance. It is probable that after some time economic development will lead to progressive increase in work participation by urban women. But from the facts brought out by this preliminary study—much lower work participation among the urban women than among the rural women and among the literate urban women than among the illiterate urban women and secular decline in work participation rate of women in the cities—one would expect a further sharp decline in work participation rate of urban women and of all women in the coming decades, which will see a marked increase in both literacy and urbanisation.

An adequate understanding of these facts, which are probably inter-related, will require much detailed work—more detailed analysis of Census data, examination of data of the various city surveys and other socio-economic studies, specially designed field investigations—which was not possible in this preliminary study. Such work should be undertaken for obtaining more adequate understanding of the implications of the transformation of Indian society from a predominantly rural-agricultural tradition-oriented society to a significantly urban non-agricultural modern society. As the findings of this study show, some of the effects of this transformation may, in the initial stages at any rate, be very different from what one would be led to expect from experience of the developed countries or from comparisons of the developed and the developing countries.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Measurement of Aggregate Productivity of Factors

Some Recent French Contributors

Paresh Chattopadhyay

THE discussion on the notion of productivity in France is at least as old as Quesnay. In the twentieth century the first serious attempt at a precise statement of the notion was made by Aftalion. But it is only after the Second World War that some French economists and statisticians have tried to make it rigorous and statistically measurable. The most important contributions in this respect have been those of L A Vincent,¹ Inspector-General of the National Institute of Statistics and Economic Studies (INSEE) who, in collaboration with Mrs Cahen, has published a series of papers on the different notions of productivity and their intertemporal and interspatial comparison. Quite recently the service of Economic Studies of the Electricity of France (EDF)² has published a study on productivity measurement which is not basically different from the ideas of Vincent and Cahen.

At least four different notions of productivity appear in these writings—aggregate productivity of factors, net productivity of labour, gross productivity of labour, physical productivity per hour or per head. The subject being vast, we have chosen only the notion of aggregate productivity of factors for our present paper. It applies either to the national economy as a whole or to a particular branch of activity. Moreover we shall discuss only the theoretical aspects of the question leaving aside the interesting numerical results obtained for different countries and different branches of activity. Finally, following E Malinvaud³, we shall discuss the relation between the rate of technical progress and the aggregate productivity of factors through time. The account below tries to give a rough idea of the whole thing. As such it is highly imperfect and must in no way be taken as a substitute for the original contributions which are very rich indeed. (We are grateful to Professor Malinvaud for his help.)

Productivity is defined as the ratio of the quantity produced to the quantity of factors giving rise to this production. Productivity is generally considered in physical terms. Indeed,

if one considers it strictly in terms of value, no measure of productivity is possible. The reason is very simple. The total value of production is equal to the total cost of production, at least if one includes entrepreneurial profits in the last category. It follows that productivity in such a case is always equal to unity. At the same time the production and the factors being heterogeneous one cannot have a simple physical notion of productivity. Through various devices one has to introduce prices to get out of the difficulty. These devices are broadly called "Conventions". These conventions will be described successively as we discuss productivity through time and space.

Intertemporal Comparison of Productivity

Comparison of productivity through time is generally made by the method of "constant prices" which enables us to measure the production and the factors by their "volumes". These volumes are nothing but a kind of "shadow values" obtained by multiplying the current quantities by the uniform prices, the prices prevailing in the "base" year. This suggests the following definition:

The productivity index is the ratio of two ratios: the first is the ratio of the volume of production to that of factors in the final year and the second is the ratio of the value of production to that of factors in the base year.

Let q_0 and q be the quantities of products, f_0 and f the quantities of factors corresponding respectively to the initial year and the final year, and let p_0 and p , s_0 and s be respectively the product and factor prices.

Then we have the production index

$$\frac{\sum p_0 q}{\sum p_0 q_0}$$

and the factor index

$$\frac{\sum s_0 f}{\sum s_0 f_0}$$

Consequently we have the productivity index:

$$\frac{\sum p_0 q}{\sum s_0 f} : \frac{\sum p_0 q_0}{\sum s_0 f_0}$$

In this connection the following should always be kept in mind. First, a base year of weight must be selected. Changing the base year means *ipso facto* changing the definition of productivity leading to different results for the same period.

Secondly, the same base year cannot be indefinitely preserved. Base year should be changed every five or ten years so that important structural changes of the economy can be taken account of.

Thirdly, the adoption of successive bases for the purpose of long-term comparisons can be carried out only by the procedure of "Chain-indexes" in spite of some of its inconveniences.

We can now enunciate the following important rule:

The volume and the price indexes must not be established on the same system of weights.

As a matter of fact this follows immediately from the necessary equality:

$$I_{\text{volume}} \times I_{\text{price}} = I_{\text{value}}$$

where I signifies Index.

With our symbols already introduced we can write the index of the value of production as

$$\frac{\sum p q}{\sum p_0 q_0}$$

and the index of the value of factors as

$$\frac{\sum s f}{\sum s_0 f_0}$$

The index of the volume of production and that of the volume of factors in terms of the prices of the base year are respectively,

$$\frac{\sum p_0 q}{\sum p_0 q_0}$$

and

$$\frac{\sum s_0 f}{\sum s_0 f_0}$$

which are the well-known Laspeyres indexes. It follows at once that the price index necessary to pass from the value to the volume can only be the Paasche index:

$$\frac{\sum p_1 q}{\sum p_0 q} \text{ for production, and}$$

$$\frac{\sum s_1 f}{\sum s_0 f} \text{ for factors.}$$

The following proposition can now be laid down:

All the products and all the factors of an economic unit (nation or branch) being taken into consideration, the index of productivity of the unit can be measured equivalently either by the volume index or by the price index.

By hypothesis,

$$\sum p_0 q_0 = \sum s_0 f_0$$

$$\sum p_1 q = \sum s_1 f$$

We already know that the index of productivity can be written in terms of the ratio of indexes of volumes, the prices being those of the base year:

$$\frac{\sum p_1 q}{\sum p_0 q_0} = \frac{\sum s_1 f}{\sum s_0 f_0}$$

It follows at once that the same result can be obtained by the ratio of indexes of prices based on a different system of weight according to the rule given above:

$$\frac{\sum p_1 q}{\sum p_0 q} : \frac{\sum s_1 f}{\sum s_0 f} \text{ or } \frac{\sum s_1 f}{\sum s_0 f} : \frac{\sum p_1 q}{\sum p_0 q}$$

The way is now clear for an account of the aggregate productivity of factors of an economic unit.

The aggregate productivity of factors is a fraction where the numerator is the final gross product of the unit and the denominator is the sum of labour, the amortisation of capital and intermediate consumption, the summation being done by the method of shadow values as indicated above. No element of the denominator is to be subtracted from the numerator. The intermediate consumption of a branch consists of its purchases from other branches, domestic or foreign. In the case of a nation it consists of imports.

It is now easy to establish the formula that can measure the progress of productivity of an economic unit through time.

The progress of productivity is equal

to the quotient of the relative increase of the quantity produced by the relative increase of the aggregate consumption of factors, both being calculated at constant prices.

$$\text{In symbols, } \pi = \frac{\sum p_1 q / \sum p_0 q_0}{\sum s_1 f / \sum s_0 f_0} - 1$$

where π is the rate of growth of productivity.

Interspatial Comparison of Productivity

We shall now try to compare the aggregate productivities of factors of different units in the same period but spatially separated. The economic units can be the different national economies or the branches of activity belonging to different nations.

First we discuss the international comparison of productivity. We already know that the value of production is always equal to the value of the factors of production, if one includes all the cost items — including the entrepreneurial profits — in the evaluation of factors. As one cannot measure productivity by excluding some factors, it follows that the measure of productivity as a simple ratio of values is meaningless.

In the case of intertemporal comparison the way out of the difficulty was found by having recourse to the method of shadow values corresponding to the quantities of one period and the prices of a different period. A similar method can be employed in international comparison.

We confine our discussion to the two-nation case. We define.

$$P_1 = \sum p_1 q_1$$

$$P_2 = \sum p_2 q_2$$

$$F_1 = \sum s_1 f_1$$

$$F_2 = \sum s_2 f_2$$

where the subscripts 1 and 2 signify respectively the first and the second nation.

We get the shadow values by multiplying the quantities of one nation (say the first) by the prices of the other (say the second). Let these shadow values be denoted by P_{12} and F_{12} . Then we get the productivity index

$$r = \frac{P_{12}}{P_2} : \frac{F_{12}}{F_2}$$

It follows that the relation $r \geq 1$ is of crucial importance in comparing the productivities of two nations.

An important qualification should be added here. The basic structure of a national economy remaining, in general, unchanged in course of a few years the method of shadow values could be employed without much difficulty to measure productivity in course of time. But the structures of two national economies may be so different as to render meaningless any comparison of productivity between them. Only in the case of analogous products within the limits of fairly similar economic structures can the method of shadow values be employed to give an approximate comparison of their productivities.

The formula of aggregate productivity of factors for the purposes of interspatial comparison is basically the same as that considered above for comparison in course of time, if shadow values are interpreted appropriately.

The rule considered earlier about establishing the volume index and the price index on different systems of weight is fully applicable here. As a matter of fact the application of this rule leads to the calculation of average purchasing power of two currencies, in international comparison of productivity.

Taking into consideration only the final products of the two national economies we define

$$K = \frac{\sum p_2 q_1}{\sum p_2 q_2}$$

and

$$V = \frac{\sum p_1 q_1}{\sum p_2 q_2}$$

It is clear that K can be obtained by dividing V by

$$Z = \frac{\sum p_1 q_1}{\sum p_2 q_1}$$

Z being the ratio of product prices of the two economies. Thus K can be interpreted as giving the "rate of exchange" between the two currencies.

If we turn to the comparison of productivities between two branches of activities, each belonging to a different country, the formula for international comparison, properly interpreted, is also applicable here. Some additional qualifications should however be added. The first requirement obviously is that the two branches must produce analogous products. Even then there may be serious limitations arising from the existence of different socio-economic structures in

the two countries. This is specially so when one tries to compare the productivities of the branches belonging to countries unequally developed or when the branches even though belonging to countries with similar socio-economic structures, use different factors of production for the same products. It follows that the field of inter-branch comparison of productivity is quite limited.

The equivalence relation between the ratio of volume index and that of price index established above in connection with intertemporal comparison of productivity is equally valid in the case of interspatial comparison under the following assumptions:

- The two national economies have analogous socio-economic structures and the two branches are similar.
- The products are final.
- All cost elements — including profits — are included in the valuation of factors.
- The ratio of aggregate quantities and the ratio of average prices are established according to the method of shadow values.

Then using different systems of weight for quantities and prices we have

$$\frac{P_{12}}{P_2} : \frac{F_{12}}{F_2} = \frac{F_1}{P_1} : \frac{F_{12}}{P_{12}}$$

and

$$\frac{P_1}{P_{21}} : \frac{F_1}{F_{21}} = \frac{F_{21}}{F_2} : \frac{P_{21}}{P_2}$$

Technical Progress and Aggregate Productivity of Factors

Following Malinvaud³ we now establish the proposition given below:

Under a homothetic law of production⁴ with substitution between factors and with neutral technical progress the rate of technical progress is approximately measured by the aggregate productivity of factors.

Indeed the proposition is intuitively evident.

Let Q be the gross final product, L labour, K capital, C intermediate consumption. Then we postulate the aggregate production function in the following well-known form

$$tQ = t^q t^L \alpha t^K \beta t^C \gamma \quad (1)$$

where $0 < \alpha, \beta, \gamma < 1$ and $\alpha + \beta + \gamma = 1$

By oQ, oq, oL, oK, oC we designate the base year values of these variables.

Then the equation (1) implies

$$\frac{tQ}{oQ} = \frac{t^q}{o^q} \left(\frac{t^L}{o^L} \right)^\alpha \left(\frac{t^K}{o^K} \right)^\beta \left(\frac{t^C}{o^C} \right)^\gamma \quad (2)$$

Assuming very small values of

$$\frac{t^L - o^L}{o^L}, \frac{t^K - o^K}{o^K}, \text{ and } \frac{t^C - o^C}{o^C}$$

and neglecting the terms higher than the first degree of these expressions we have, by a limited expansion

$$\begin{aligned} & \left(\frac{t^L}{o^L} \right)^\alpha \left(\frac{t^K}{o^K} \right)^\beta \left(\frac{t^C}{o^C} \right)^\gamma \\ &= \left(1 + \frac{t^L - o^L}{o^L} \right)^\alpha \left(1 + \frac{t^K - o^K}{o^K} \right)^\beta \\ & \quad \left(1 + \frac{t^C - o^C}{o^C} \right)^\gamma \\ &\approx 1 + \alpha \frac{t^L - o^L}{o^L} + \beta \frac{t^K - o^K}{o^K} \\ & \quad + \gamma \frac{t^C - o^C}{o^C} = \alpha \frac{t^L}{o^L} + \beta \frac{t^K}{o^K} \\ & \quad + \gamma \frac{t^C}{o^C} \end{aligned}$$

Under the usual marginal productivity assumption we have

$$\frac{f_L L}{Q} = \alpha, \quad \frac{f_K K}{Q} = \beta, \quad \frac{f^C C}{Q} = \gamma$$

f^C standing for the partial derivative of the production function with respect to the particular variable.

so that for the purposes of calculation the shares of wages, of the income from capital and that of intermediate consumption can be substituted respectively for α, β and γ . We define,

$$\frac{t^A}{o^A} = \alpha \frac{t^L}{o^L} + \beta \frac{t^K}{o^K} + \gamma \frac{t^C}{o^C} \quad (3)$$

where $\frac{t^A}{o^A}$ is the index of aggregate

input of factors. It follows that

$$\frac{t^q}{o^q} \approx \frac{tQ}{oQ} / \frac{t^A}{o^A} \quad (4)$$

Thus the rate of technical progress can be approximately measured by the ratio of the index of gross final product to that of aggregate input of factors. As we already know this ratio is the aggregate productivity of factors.

Notes

Policies for Drawings from the IMF

S L N Simha

While many solutions have been suggested to the problem of expanding international liquidity, there is general agreement that expansion of the facilities available at the IMF is an important element in the reform of the international financial system. Expansion of the IMF's resources involves:

- (i) the quantum of drawings;
- (ii) the ease of or automaticity with which drawings can be made;
- (iii) the repayment schedule; and
- (iv) the charges to be paid on drawings.

In this article it is proposed to consider the first two and, in particular, the question of automaticity — i.e. the extent to which members can have automatic access to the Fund's resources.

It is demonstrated here that while *de jure* automaticity in the use of the Fund's resources is perhaps out of the question, there has been steady progress towards *de facto* automaticity; and there is scope for further progress in this direction. The flexibility of the Fund's Articles of Agreement is a helpful factor in this context. If, however, amendments to the Fund's Constitution are necessary, there is no reason why they should not be made. In any case, whether Articles of Agreement have to be amended or not, in any scheme of reform of the international monetary system, the I M F must occupy the pivotal position.

IT looks as if there will be further active consideration of ways and means of expanding international liquidity. The current series of studies which began about two years ago have borne some fruit. There has been a further, though rather modest (25 per cent general plus selective increases in the case of 16 countries), general increase in the quotas of members of the International Monetary Fund though it is a pity that very little was done to relax the requirement of payment of gold subscription.¹ Many issues in the international liquidity debate have been clarified and areas of further work have been defined; in this connection the Ossola Committee of the Group of Ten has done very useful work. The United States Government is reported to be keen to have an international conference to discuss the subject exhaustively. While there are many solutions to the problem of expanding international liquidity, there is general agreement that improvement of the facilities available at the IMF is an important element of reform. There are four things involved in expanding the facilities available from the IMF, namely, the quantum of drawings (i.e. borrowings), the ease or automaticity with which 'his can be done, the repayment (or 'repurchase' according to the termino-

logy of the Fund) schedule and payment of charges. In this article, it is proposed to consider the first two aspects and, in particular, the matter of automaticity, that is, the extent to which members could have automatic access to the Fund's resources, so that the Fund's lending may create unconditional liquidity.

Articles Flexible

As in many other matters, the Articles of Agreement of the IMF are extremely flexible with regard to the use of the Fund's resources. Under the Articles, members have an inherent right of access to the Fund's resources; but the Fund has to ensure that the drawings (which is the term used in the Articles to denote what is in fact borrowing of other currencies) are in accordance with the basic purposes of the Articles of Agreement and that the assistance is made available 'under adequate safeguards'. There are also quantitative limitations to the use of the Fund's resources, namely, (i) drawings in any 12 month period should not be more than 25 per cent of the quota (plus such amount as represents the member's creditor position) and (ii) aggregate drawings should not be in excess of quota plus gold subscription — that is to say, such that the Fund's holding of the member's currency does not exceed 200 per cent of quota. But the Fund's Executive Board of Directors can give waivers, in respect of both the limitations, at its discre-

tion and on terms which safeguard the Fund's interests. Of course, a general limitation is set by the availability of the currencies required by members. With increase in quotas, the quantum of assistance available increases. The Fund Board has given waivers freely in respect of the 25 per cent limit on drawings in any year, but it has been chary of going beyond the 200 per cent limit for aggregate drawings except for the compensatory financing tranche (ordinarily to the extent of 25 per cent of quota) instituted in 1963. We shall now give an account of the evolution of the Fund's policies with regard to the use of its resources by member countries.

It might be useful to present at the outset the statistics of drawings. The data are set out in the table for every country during each of the 18 years of the Fund's active operations. It will be seen that since 1956-57 there has been active use of the Fund's resources. In the last fiscal year (1964-65), the largest number of countries, viz, 29, made drawings though the total amount drawn, at \$1897 million, was below the record level of 1961-62 when 22 member countries drew on the Fund's resources for a total of \$2243 million. It will also be seen that in recent years a number of countries, especially the developing ones, have made drawings practically every year.

There is no doubt that increased

WE ARE THE

We represent a tradition almost a century old, command a management service going back to 1892. Over the years too we have acquired an understanding — of a basic industry, and developed an attitude — towards the challenge of its expansion... When the nation needs better iron, more steel and more diversified end products they must come first from the more efficient working of existing installations which new plant and equipment should balance and supplement at a comparatively low investment cost. Expand, consolidate, expand. Aim assuredly at impact — but not by sacrificing in-phase economies. This then is the principle to guide us in our assigned role to take production to 2 million tonnes of ingot steel through another two-phase expansion programme.

* Includes \$ 281.6 million by way of repurchases not connected with drawings. Besides, there was an aggregate sale of currencies for \$ 1058.5 million which had the effect of repurchases. So on April 30, 1965, total purchases outstanding was \$ 2789.3 million.

use of the IMF's resources by member countries in recent years reflects partly the payments imbalances of member countries, but, to a very considerable extent, this would appear to be due to a policy shift both on the part of the IMF itself and on the part of member countries. Gradually, the Fund has been more ready to lend and members more ready to use the Fund's resources. The increasing willingness of the Fund to let its resources be used by members is not perhaps brought out strikingly in any formal policy declaration but the actual operations of the Fund reflect the steady progress in this direction. In fact, year after year, the Annual Reports of the International Monetary Fund repeat the principles governing the use of the Fund's resources, enunciated formally in February 1952. The latest recapitulation of the comprehensive statement on the use of the Fund's resources occurs in the 1963 Annual Report and it is useful to reproduce it:

"It may be useful to restate the policies which guide the Fund on the use of its resources. Members are given the overwhelming benefit of the doubt in relation to requests for transactions within the 'gold tranche', that is, for drawings which do not increase the Fund's holdings of the currency beyond an amount equal to the member's quota. The Fund's attitude to requests for transactions within the 'first credit tranche' — that is, transactions which bring the Fund's holdings of a member's currency above 100 per cent but not above 125 per cent of its quota — is a liberal one, provided that the member itself is making reasonable efforts to solve its problems. Requests for transactions beyond these limits require substantial justification. They are likely to be favourably received when the drawings or stand-by arrangements are intended to support a sound programme aimed at establishing or maintaining the enduring stability of the member's currency at a realistic rate of exchange.

"Any drawings or stand-by arrangement exceeding 25 per cent of a member's quota within any 12-month period (except to the extent that the Fund holds less of the member's currency than 75 per cent of its quota), and any drawing or stand-by arrangements

which would increase the Fund's holdings of that currency to more than 200 per cent of the quota, require — under Article V, Section 4, of the Articles of Agreement — the grant of a waiver in favour of the member."

Pragmatic Policies

Prior to the February 1952 decision, there does not appear to have been any clear policy decision on the part of the Fund with regard to the use of its resources by members. Apparently, the Fund had difficulty with regard to ensuring the repurchase of currencies within a reasonable period, in order to preserve the revolving character of the Fund's resources. This quotation from the 1948 Report of the Fund is significant:

	Exceeding 75 per cent but not exceeding 100 per cent	Exceeding 100 per cent but not exceeding 125 per cent	Exceeding 125 per cent but not exceeding 150 per cent	Exceeding 150 per cent but not exceeding 175 per cent	Exceeding 175 per cent but not exceeding 200 per cent	Exceeding 200 per cent
Number of members	16	7	9	7	4	43

"There is no formula which could be used to ascertain the probable duration of a disequilibrium in a member's balance of payments. Inevitably, therefore, judgment is involved in attempting to determine whether any particular drawing on the Fund will be outstanding for a relatively short or a relatively long period of time."

The February 1952 decision, however, resolved this difficult problem. It set an undertaking by member countries to complete the repurchase within a period of 3 to 5 years regardless of the provisions in the Articles of Agreement for mandatory repurchase. The charges to be paid by members on transactions with the Fund had been revised suitably earlier in November 1951 in order to provide, among other things, for consultation between the member country and the Fund at an early date to work out a schedule for repurchases. It is, however, very important to note that the Fund's February 1952 decision also contained the significant proviso that when unforeseen circumstances beyond a member's control made it unreasonable for repurchase to be completed within the periods involved in this procedure, the Fund would consider extension of time.

In actual practice, the Fund's policies have been extremely pragmatic and over the years there has been a steady liberalisation. In recent years, in the good majority of cases, drawings or stand-bys have been for amounts exceeding 25 per cent of a member's quota and the Fund has granted waivers liberally. The Fund does not appear to have given a waiver in respect of its holdings of any currency going beyond 200 per cent of the member's quota. But, latterly the percentage of the Fund's holdings of debtor members' currencies appears, on an average, to be higher than it used to be in the few years after the enunciation of the 1952 drawing policies. At the end of May 1965, for instance, the tranche-classification of members in debtor position to the Fund (i.e. Fund's holdings of the currencies being in excess of 75 per cent of quota) was as under:

	Number of members
Exceeding 75 per cent but not exceeding 100 per cent	16
Exceeding 100 per cent but not exceeding 125 per cent	7
Exceeding 125 per cent but not exceeding 150 per cent	9
Exceeding 150 per cent but not exceeding 175 per cent	7
Exceeding 175 per cent but not exceeding 200 per cent	4
Exceeding 200 per cent	43

The four members with the highest percentage debtor position as of the same date were:

Syria	179 per cent
U A R	197 " "
U K	198 " "
Chile	200 " "

Second Line of Reserves

A great deal of the credit for activating the Fund should go to the last Managing Director, the late Per Jacobsson. His dynamic policy is being pursued with intensified vigour and imagination by the present Managing Director, Schweitzer. The sympathy with which the needs of the member countries—developed as well as developing—are being considered is very heartening. Ten years ago, it would have been extremely difficult to imagine that in the course of about five months even a reserve currency country like the U K could draw from the Fund as much as \$2,400 million, or practically the whole of the normal borrowing limit of 125 per cent of the quota. A number of countries which have drawn on the Fund have had continued inflation of a serious magnitude and the Fund's attitude again has been one of understanding and hope that appropriate policies would be

implemented. The Fund is fulfilling ably the role of a second line of reserves which it was intended to be.

In 1961, the Fund, in 'clarification' of a previous decision, announced that its resources could be used for capital transfers. In 1964 the Fund took an important decision to broaden the access to its resources, by giving discretionary authority to the Executive Board to permit drawings by countries which have not yet established par values, whenever such transactions furthered the purposes of the Fund. Besides, in 1963 the Fund created a new facility to draw from the Fund to finance deficits arising from fluctuations in export receipts of primary products. The new facility will not *normally* (italics added) exceed 25 per cent of the member's quota. To the extent drawing is permitted under this scheme, the total drawing could be in excess of 125 per cent of quota.

Automaticity, How Much?

In this context of more active use of the Fund's resources, the suggestion that is often made that there should be automaticity with regard to the right of members to draw from the Fund, may now be examined. Automaticity means really that when a request for drawing is made, the Fund is ordinarily under an obligation to permit the drawing forthwith. As already mentioned, it is possible to quote from the Articles of Agreement of the Fund authority for such automaticity except insofar as any member country is declared ineligible to use the Fund's resources. However, a little reflection will make it clear that in the case of a lending institution, whether national or international, automaticity becomes difficult though there is no doubt that there must be well-established conventions with regard to grant of assistance, in the case of an international institution in particular. It would seem that the question is not so much whether there should be automaticity or not, but whether there could be *de jure* automaticity. It is extremely difficult to provide for *de jure* automaticity because there is always the question of determining whether the request for the use of the Fund's resources is consistent with the Articles of Agreement and no automatic formula has been provided for in the Articles for this purpose. Therefore, there has to be *de jure* a case by case examination, but, in practice, increasing automaticity

in the use of the Fund's resources should be provided for and in fact it appears that this is being done.

Naturally, the higher the tranche of drawing the less automaticity there will be. In fact, even in the case of what is called the 'gold tranche drawing', i.e., a drawing equivalent to quota minus the Fund's holdings of the member's currency, complete automaticity has not been possible. For a long time past, the Fund talked of 'giving the overwhelming benefit of the doubt' to the member making the request for a gold tranche drawing. It is only in August 1964 that the procedure for gold tranche drawing was formally simplified, whereby discussion by the Fund's Executive Board on requests for gold tranche drawings is eliminated except when a request for discussion is made by an Executive Director or the Managing Director himself desires a discussion. This is a welcome, procedural change. In fact, this would appear to be the first time when the concept of automaticity has been used officially; in the 1965 Annual Report, the Fund Directors have stated that the above decision was taken "in order to strengthen the confidence of members in the *de facto* automaticity of drawings in the gold tranche". If *de jure* automaticity is not yet possible for gold tranche drawings, naturally in respect of drawings in the credit tranches, there could be even less of *de jure* automaticity. Apart from the inherent difficulties in providing for such automaticity, one has also to take into account the views of creditors in the Fund. Any marked *de jure* automaticity might make it difficult for the Fund to mobilise large-scale resources for its operations.

Liberal Use of Waiver

It is, therefore, best to make further progress in the direction of *de facto* automaticity for drawings in the credit tranches too. As already mentioned, in the case of the waiver on 25 per cent limit for drawings during a year, the Fund's attitude seems to be liberal and in fact the Fund is emphasising the normal character of the grant of a waiver. As far back as 1954, in the Annual Report, the Directors said:

"The use of the waiver indicates the increased flexibility with which the Fund now feels that it can carry on its operations, and shows that the Fund is an instrument that may be used effectively for helping

its members to deal with their extraordinary problems whether individual or general."

Again, in the 1956 Report, there is a similar statement:

"The comparatively frequent use of the waiver in recent years may be taken as evidence of the Fund's readiness to consider all aspects of a member's position. It has shown that granting a waiver is not to be regarded as something so exceptional as to be of little practical importance to members."

Again, in the 1957 Report, it is said that waivers are given "sufficiently often to make it clear that this is not to be regarded as an extraordinary procedure."

So far, there does not appear to have been a waiver in respect of the other limitation on the drawings, namely, that the Fund's holdings of the member's currency should not exceed 200 per cent of the quota except in respect of the compensatory tranche drawing. But, as already mentioned, there appears to be comparatively little reluctance now in granting assistance up to the 200 per cent limit. This was not so, some years back. There is perhaps scope for procedural changes to make drawings in one or two credit tranches also automatic in practice. If quotas are adequate, drawing beyond the 200 per cent limit may not be necessary, except in very special cases and if the need arises it may be hoped that the Fund would respond to requests favourably.

Repurchases

The Fund would also appear to have been pragmatic in the matter of repurchases. Formal extensions of repurchase agreements have been granted though the extensions have not been beyond the five year limit. On the other hand, what amounts in practice to some refinancing of a repurchase obligation by a new drawing has been permitted. There is nothing wrong in this. This is analogous to the refinancing by commercial banks of a maturing short-term loan by a new short-term loan. At the time of lending, the loan is for a short-term period and the fact that it is rolled over from time to time does not render the loan a long-term one.

An area where there is scope for improvement is with regard to repurchases of drawings made under stand-by agreements. At present, the repurchase has to be made within

three years. If the system of stand-by arrangements is to be continued, then it is desirable that these drawings should be reversed within a period of five years, as in the case of ordinary drawings. Incidentally, it is this writer's view that the system of stand-by agreements is redundant in view of the trend to make the use of the Fund's resources increasingly automatic in practice.² It is beyond the scope of this article to argue the matter again, but in any review of the Fund's policies, this matter too requires to be examined.

To conclude, while *de jure* automaticity in the use of the Fund's resources is perhaps out of the question, there has been a steady progress in the direction of *de facto* automaticity and there is scope for further progress in this direction. The flexibility of the Fund's Articles of Agreement — as R A Buttler once remarked, "The Fund has the merits of the American Constitution in that it is written and the value of the British Constitution in that it is ever evolving" — is very helpful for progress in this direction and in others. If, however, amendments to the Fund's constitution are necessary, there is no reason why they should not be made, more than twenty years after the original enactment. It would take us far beyond the narrow scope of this article to go into the question of the directions in which international liquidity could be expanded through the IMF; many bold ideas are coming from the Fund management itself. But, there is no doubt that in any scheme of reform of the international monetary system, the IMF must occupy the pivotal position. Here is an international agency which has demonstrated dynamism and adaptability to the growing requirements of the world economy, of developed and less developed countries, and so priority should be given to improving the resources of and credit facilities available from this institution. This is not to say that the Fund alone should be the channel of increased liquidity. In this matter, as in many others, it is useful to have a variety of arrangements, bilateral, trilateral and multilateral. The situations are so complex and the need for quick action is such that a variety of arrangements makes for a much smoother and surer system than dependence on any single arrangement.

But, as it has been said of the position of British Prime Minister vis-a-vis the other ministers of the cabinet, the Fund will be 'the first among equals.'

LIC Comes to the Rescue

POLITICAL developments dominated market thinking throughout last week. The previous week-end rally on the stock market inspired mainly by the partial decontrol of cement and a possible decontrol of flat steel production and partly by technical considerations fizzled out almost as quickly as it had come about. Because of the serious developments in the political situation, Dalal Street was unable to derive any comfort from the various assurances given by the Finance Minister Krishnamachari in regard to simplification and rationalisation of the corporate tax structure, reconsideration of the new levies imposed in the supplementary budget after studying their impact over a period of time and lightening of burdens on coastal shipping and copper based industries resulting from the higher duties on furnace oil and copper. The market was forced to retreat under pressure of nervous bull liquidation and some bear selling. On September 7, Dalal Street touched a new low level — lower than what it had seen on August 26.

With the Kashmir conflict escalating into a full-scale war between India and Pakistan, the stock market's performance could have been much worse. And the market would surely have suffered a sharp break — the low level notwithstanding — if the Life Insurance Corporation had not come to its rescue. Massive buying by the L I C — country's largest single investor — of a number of scrips which included a few of the speculators' favourites checked the rot and imparted a feeling of distinct steadiness to the market. The support has been timely and very substantial indeed. According to market men, the Corporation purchased shares worth about Rs 5 crores in a matter of few days. It appears that the L I C had been tipped by New Delhi to carry out extensive operations in order to keep up the morale of the stock market which has been in an awfully bad shape since long. How the market will behave in the immediate future will depend both on political developments and the size of L I C operations.

COTTON

Futures Recede

THE cotton market too has been affected by the serious developments in the political situation. The

hedge contract — Virnar 27/32" March — which had touched a high of Rs 882.75 on the very first day of its trading on August 31 was marked down to Rs 861.50 on September 7 but it rallied to Rs 870.75 the next day. Despite this decline caused essentially by the break-out of open war between India and Pakistan, the hedge contract is still quoted well above the ceiling price of this variety in the previous season.

The setback in futures did not have any noticeable effect on the spot market. Turnover in ready was very poor but prices did not register any noticeable decline because the available stocks are just enough to meet the bare minimum needs of spinners. With the outlook for the new crop still uncertain and mill consumption continuing to increase, stockists are not eager to part with their goods in spite of the serious threat to security because of Pakistani air attacks.

Cotton consumption by mill in the first 10 months of the 1964-65 season which ended with August is placed at 53.23 lakh bales made up of 46.84 lakh bales of indigenous cotton and 6.39 lakh bales of foreign cotton. The corresponding figures for the previous season were 50.25 lakh bales consisting of 45.20 lakh bales Indian and 5.05 lakh bales of foreign cotton. Consumption of cotton can be expected to keep rising because of the progressive expansion of spindleage.

OILSEEDS

Prices Fall

OILSEEDS prices suffered an all-round sharp decline last week. Linseed futures which had been bid up to Rs 119 in previous week's kerb dealings were sold down to Rs 106.50 (per quintal). Castor futures fell from Rs 100 to Rs 87. Short covering and modest replacement buying induced some steadiness at the week-end with linseed rallying to Rs 109 and castor to Rs 91. In ready, groundnut oil declined from Rs 33 to Rs 29.25 (per 10 kgs), linseed oil from Rs 27.50 to Rs 25.25 and castor oil Commercial from Rs 19.25 to Rs 18.

Bulls who had been dominating the market for a long time and had been rigging up prices despite fairly encouraging weather reports and a reasonably satisfactory overall supply position of vegetable oils rushed to lighten their commitments because of the

open war between India and Pakistan. Commodity prices are known to soar on war ideas, but not when war endangers the very security of the country. And the threat to security has increased with air attacks. Spot prices have declined without much business coming through. War has scared the prospective buyers. Stockists who have long been sitting tight on their goods would very much like to dispose of their goods only if they could find the buyers.

How the market will behave in the immediate future will depend entirely on developments in the political situation. Prices will decline further if the situation worsens but in the event of an early cease-fire, oilseeds prices are likely to shoot up again. Export activity has come to a virtual standstill because of the serious situation created by the open war between India and Pakistan.

MONEY AND BANKING

Rates Rise Sharply

STRINGENT conditions continued to prevail in the Bombay short-term money market during the week to September 9. Supply of funds was tight and during the initial part of the week many borrowers were denied funds. Demand was strong and caused interest rates to increase substantially. Rates spurted from 5 per cent to 9 per cent on Wednesday evening. Conditions were similar in Calcutta. The rate there was one per cent higher at 10 per cent.

During the week to August 27 scheduled by Rs 23.58 crores to Rs 2,833.54 crores, according to the weekly statement of affairs of scheduled banks. Bank credit, which during the previous week declined sharply, advanced by Rs 2.19 crores to Rs 2,010.96 crores. The expansion in credit could be attributed to the additional demand for financing subscriptions to government loans. Scheduled bank investments in government securities increased by Rs 11.29 crores to Rs 859.24 crores. Borrowings from the Reserve Bank have risen by Rs 7.15 crores from Rs 2.18 crores to Rs 9.33 crores. Balances with the Reserve Bank fell from Rs 106.40 crores to Rs 101.01 crores and cash in hand was also lower by Rs 2.27 crores at Rs 66.38 crores.

Active notes during the week to September 3 rose from Rs 2,538.62 crores to Rs 2,554.12 crores, according to the Statement of Affairs of the Reserve Bank. Rupee coins were lower by Rs 1.27 crores at Rs 102.42 crores. Rupee securities were placed at Rs 2,272.72 crores, same as in the previous week. Foreign securities at Rs 68.35 crores also remained unchanged. Balances held abroad, however, increased substantially from Rs 8.40 crores to Rs 12.86 crores. Central Government de-

posits showed a large increase from Rs 94.91 crores to Rs 158.25 crores. State Government deposits were slightly better by Rs 7 lakhs at Rs 13.31 crores. Scheduled bank deposits increased by Rs 2.28 crores to Rs 97.19 crores. Loans and advances to Government declined by Rs 18.47 crores to Rs 51.65 crores and loans to scheduled banks increased from Rs 9.81 crores to Rs 24.63 crores. Investment at Rs 228.78 crores were more or less around the previous week's level.

BUSINESS NOTES

Greaves Cotton

THE current accent on import substitution provides a stimulating challenge to Indian manufacturers to expand both the range and volume of the products. Realising that success in future depends on meeting this challenge, the directors of Greaves Cotton hope that the manufacturing units of the various associated and subsidiary companies as also the independent manufacturers, whose products are sold by the company, will fully utilise their production facilities.

Commenting on the company's prospects for the current year, L M Thapar, Chairman, is understandably hesitant in making a forecast in view of the "many very real difficulties" the company has to encounter. He, however, adds that on considerations of productive capacity established, the position of order books and indications of demand for products of associated and subsidiary manufacturing units, the year should hold out promise of "substantially increased production and profits." Thapar feels that against the uncertain background of severe shortages of raw materials and rising costs of labour and services, the company stands as good a chance as any comparable organisation of triumphing over the heavy odds.

The year to March last was an exceptionally difficult period for almost every type of trading and manufacturing business, but Greaves Cotton was able to improve its turnover and profits. This was made possible by the persistent efforts to increase the flexibility of its organisation. On the import side of its business, it had to counter shrinking imports in established lines by developing sales and service of more sophisticated equipment necessary to support the growing industrialisation of the country. On

the manufacturing side, the associated and subsidiary companies are constantly extending the range of their products in an effort to substitute equipment formerly imported from abroad. There has also been a similar improvement in the production of independent indigenous manufacturers for whom the company acts as sole distributors.

The financial results show total turnover up from Rs 10.93 crores to Rs 12.80 crores and gross earnings from Rs 63.64 lakhs to Rs 74.15 lakhs. The gap, however, is considerably narrowed on account of higher necessary provisions, and equity earnings stand at Rs 32.11 lakhs to compare with last year's Rs 29.07 lakhs. With the unchanged dividend of 12 per cent requiring as before Rs 16.20 lakhs, the cover is strengthened from around 1.8 times to nearly twice.

Both Crompton Parkinson (Works) and Greaves Cotton and Crompton Parkinson have ambitious expansion programmes. Ruston and Hornsby (India) is currently half way through its programme for doubling the output of aircooled vertical engines. Another range of engines is contemplated to be introduced. The company expects to earn substantial foreign exchange through the growing exports of its manufacturing units.

CIMMCO

THE demand for indigenous automatic looms and high speed winding and warping machines has slumped due partly to the persistent financial stringency experienced by the textile industry and partly to the continued import of foreign looms. The demand for plain looms has also been low because of the restrictions on new installations. These factors forced Central India Machinery Manufacturing Company to utilise only 40

per cent of its Gwalior factory's capacity. In such difficult conditions, manufacturing activity in other fields has stood the company in good stead. More attention is, therefore, being paid to the wagon and structural divisions in order to maintain the momentum of expansion.

The wagons division has stepped up its production. By introducing some changes in the manufacture of bogie bolsters and side frames, the company has helped the railways to effect economy in the price of wagons. New lines of manufacture are being added to the structural division established at Bharatpur, primarily for production of all types of bridges, sand wagons and mine-cars. Both the steel foundry and its machine shop have gone into production. With a view to securing additional finance for expansion and for redeeming the existing debentures of the face value of Rs 30 lakhs by the end of 1965, the company proposes to issue new debentures worth Rs 1.25 crores.

During the year to March last, sales turnover rose from Rs 4.94 crores to Rs 7.95 crores. This spectacular jump, however, was due in part to a turnover of about Rs 2 crores on account of Hind Cycles which the company took on lease from October last. The cycle business has yet not proved profitable; rather there has been a slight loss on this account. The gross earnings, therefore, have improved only modestly from Rs 63.64 lakhs to Rs 66.27 lakhs. With all the necessary provisions taking away bigger slices, equity earnings have slumped to Rs 6.75 lakhs from the previous level of Rs 29.03 lakhs. The unchanged dividend of 10 per cent is short earned, and a part of it is to be paid out of past reserves. Over the year, gross block has increased from Rs 2.60 crores to Rs 3.48 crores and net block from Rs 1.79 crores to Rs 2.44 crores.

Jaipur Metals

FAIRLY good results have been produced by Jaipur Metals and Electricals despite a "cut-throat competition" in the house service electricity meter due to over-production in the country. What has helped the company is the continued good demand for A C S R. Besides, all the components required in the manufacture of cyclometer and magnet are being produced in the company's factory, thereby bringing down overall costs. The new line of production

viz cadmium copper catenary wire added a few months ago holds promise of good prospects in view of the Railway Board's big electrification programme. The company has already on hand orders for about 350 tonnes.

The latest report from the company covers a period of 15 months ended March last because of the change in the accounting period; the previous one covered 12 months ended December 1964. The financial results are, therefore, not strictly comparable. But worked out on a proportionate basis, these show that even though sales turnover has been relatively lower than in the preceding period, earnings have shown a welcome, though modest improvement. The turnover for 15 months to March last of Rs 3.06 crores compares with Rs 2.56 crores in the preceding 12-month period. Gross profit of Rs 38.28 lakhs stands against Rs 28.52 lakhs and equity earnings of Rs 7.88 lakhs against Rs 6.58 lakhs. The dividend rate is maintained at Rs 6 a share and absorbs, as before, Rs 3 lakhs, reflecting ample earnings cover.

International Tractors

At the instance of the Government, International Tractor has proposed a programme to increase production to 10,000 tractors per annum in two stages. But Keshub Mahindra, Chairman, is understandably pessimistic about the company's ability to implement this expansion in view of the critical position of foreign exchange. Commenting on the prospects for the proposed expansion, Mahindra says in his annual review circulated to shareholders with the company's second annual report that it is "inconceivable" to add additional equipment to the existing plant in the absence of any knowledge as to whether necessary exchange will be made available even to utilise fully the present installed capacity. International Tractor is licenced to produce 3,500 tractors per year of the 25-35 H P range and, with a small allocation of foreign exchange to import raw materials and components, it was able to make only 225 tractors during the year ended March last. The company has in hand import licences materials which would enable it to produce 400 tractors in the current year. The ability to produce additional tractors is completely dependent on the foreign exchange that is made available for raw materials and components.

Mahindra has urged that, with

the accent on agricultural based industries in the Fourth Plan, priorities need to be reshaped and wherewithal made available to tractor manufacturers to proceed with local production. The demand for agricultural tractors by the year 1970-71 is expected to go up to 40,000 tractors per annum, according to official circles. As against this, production in the past year was a little over 3,000 tractors. Besides, about 2,300 tractors were imported.

Laxmi Starch

THE starch industry passed through a period of acute crisis during 1964-65 when, due to delay in issuance of authorisation for imports of PL 480 maize, all maize starch factories in India had to close down for nearly four months. Prices of tapioca ruled at all-time high levels raising production costs. Being the only important manufacturer of starch in operation then, Laxmi Starch Factory, Kundara, voluntarily requested the government to examine its cost structure and to certify the price charged by it. The company allocated starch to consumers at substantially lower rates when it was being sold at much higher prices in the market.

The company is engaged in implementing a project to manufacture maize starch involving heavy capital outlay. This expansion would ultimately firmly consolidate the company's position and further push up its earning capacity. Meanwhile in order to conserve funds, the directors have skipped dividend for the year to March last despite higher earnings. With the demand for products continuing at a high level, sales rose from Rs 86.85 lakhs to Rs 112.17 lakhs and even after making higher necessary provisions, net profit amounted to Rs 3.80 lakhs to compare with the previous year's Rs 3.05 lakhs. This represents an earning of 21 per cent on the paid-up capital of Rs 18.75 lakhs which should be considered fairly satisfactory. These results look more impressive when viewed against the background of the power cuts enforced by the Kerala State Electricity Board resulting in suspension of all manufacturing activities for about 58 days in the year.

Imperial Tobacco

GOOD results have been produced by Imperial Tobacco, manufacturers of cigarettes and smoking tobaccos, in the year to March last with sales up

from Rs 55.43 crores to Rs 59.36 crores and net profit, after deducting all charges and expenses, providing for taxation, and transferring Rs 4.47 lakhs to development rebate reserve, considerably higher at Rs 1.58 crores against Rs 94.92 lakhs in the preceding year. These improved results have prompted a two-and-a-half points increase in the total dividend to nine per cent requiring disbursement of Rs 1.36 crores compared to Rs 98.54 lakhs paid a year ago. Besides, Rs 21.42 lakhs, against only Rs 1.38 lakhs, have been allocated to fixed assets and stock replacement reserve for the purpose of financing the increased cost of replacing fixed assets and stocks. As at year-end, reserves and surplus amounted to Rs 11.52 crores (11.35 crores) against the subscribed capital of Rs 15.16 crores.

Air India to Overhaul I A C Caravelle Engines

EARLY this month the first Rolls-Royce Avon engine from an IAC Caravelle jetliner is scheduled for overhaul in Air-India's Engine Overhaul Plant. About Rs 10 lakhs have been spent on additional equipment and tooling including modifications to the Engine Test House. Several Air-India engineers and technicians were sent to the Rolls-Royce factory in Glasgow for training.

IAC at present sends its Caravelle engines by air freight to Glasgow for overhaul. By having this work done in India, IAC will save considerable foreign exchange. Under the agreement, signed earlier this year, Air-India will overhaul the engines for a period of three years. The spares for the engines will be supplied by IAC.

IAC Caravelles are powered by two Rolls-Royce Avon Mk 531/21 jet engines each developing 12,200 lbs minimum thrust. Their present time between Overhauls is 2,800 hours.

War Risk Insurance

The War risk rating committee of the Institute of London Underwriters have raised the war risk insurance rate for cargoes to and from India and Pakistan. The revised rates stand at 7s 6d per £100 against the previous rate of 9d per £100. Rates for coastal voyages are left to the discretion of individual underwriters until a standard rate is fixed.

FROM THE CHAIR

New Standard Engineering Co Ltd

Speech of the Chairman, Shri R G Saraiya

THE following is the speech of the Chairman, Shri R G Saraiya at the Annual General Meeting of New Standard Engineering Co Ltd held in Bombay on Monday, September 6, 1965:

Gentlemen,

It gives me great pleasure to welcome you to the Seventh Annual General Meeting of our Company. The Audited Statement of Accounts for the year 1964-65, together with the Directors Report, have been circulated to you, and, with your permission, I shall take them as read.

Rise in Sales

I am sure you are all glad to note from the Accounts that our Company has continued to maintain the steadily rising trend of sales, witnessed over the last five years. Sales touched the record level of Rs 3.07 crores as against Rs 2.40 crores in the previous year. Against the increase of Rs 0.57 lakhs during the past year, there has been a slightly higher increase in sales of Rs 0.67 lakhs during the year under review. Part of this increase is accounted for by rise in prices, which is the result of an upward spiral of costs. The maintenance of a steady pace of progress, even at increasingly higher levels of operations, is a matter of some satisfaction, especially considering the recurrent raw material shortages and other difficulties, which had to be faced by the Company throughout the year.

Profits and Dividend

Apart from the satisfactory development on the sales front, your Company's profit performance during the year can also be considered as gratifying. As against gross profit of Rs 26.87 lakhs in the previous year, there has been a marked increase in the year under report, taking the gross profits to the record level of Rs 42.70 lakhs. While this increase reflects returns on investments made in previous years as well as better utilisation of manufacturing facilities, it is also due to vigorous efforts of management to control costs and to improve operational efficiency. The ratio of the manufacturing expenses to production costs shows a welcome reduction of 2% during the year under report, as compared to the previous year. Establishment expenses have also been held at the same level, viz 13% of total production value. However, this marked increase in gross profits is not reflected in the corresponding figures for net profits, as the prior

charges on account of depreciation, development rebate and provision for Taxation have increased from Rs 16.81 lakhs in the previous year to Rs 28.58 lakhs in the year under review, leaving, disposable profits of Rs 14.12 lakhs as against Rs 10.05 lakhs in the last year. With this increase in profits, your Directors have thought it fit, after careful consideration, to absorb the Silver Jubilee Bonus Dividend @ 1% on Equity Shares paid last year, and to recommend payment of dividend at the rate of 10% on Equity Shares. The dividend on Preference Shares is being maintained at 9%. With the increase in total dividend distribution of Rs 83,203, it has also been possible to transfer Rs 5.50 lakhs to general reserve, as against Rs 2.75 lakhs only in the previous year. It is necessary to build up our resources and reserves in the context of present conditions of tight money, high interest rates on borrowings, higher import and excise duties imposed in the supplementary Budget and the possibility of a setback in factors beyond our control.

Capital Expenditure

The fixed assets of the Company increased during the year by Rs 59.75 lakhs as against the previous year's increase of only Rs 15.88 lakhs. This has been the highest amount spent for the acquisition of fixed assets during the last five years, during which we have spent in all over Rs 1.75 crores on this account. As stated in your Directors' Report, the current year's capital expenditure has largely gone towards the completion of the foundry project at Goregaon. There is now only a small marginal amount of about Rs 10 lakhs, which remains to be spent in the current year before the foundry project is completed.

While on this subject of capital expenditure, I must make here a reference to the deliberate slowing down of the tempo of further investment to build the Goregaon project, as visualized earlier, which has been forced upon the management in view of extremely tight money market conditions, stagnation in the investment market and high cost of raising funds. As you will observe from the Directors' Report, we have sold our assets at Poona and Santacruz in order to realise cash resources to complete the expansion programme already under way. We may resort to this source of funds in the current year by disposal of other properties, keeping in view various relevant considerations. One of the important factors discouraging resort to this

source, is the heavy tax on capital gains arising out of such disposal of assets. Government have recently revised their general policy in this regard and now exempt certain transactions from the levy of this tax. This exemption is sought to be given to encourage the economic and social objective of industrial decongestion in large cities and to promote dispersal of industry in rural centres. It is desirable that this policy is extended to cover other genuine cases of disposal of assets, which are meant to finance acquisition of new assets, even in the same urban centres. The choice of location in such special cases is dictated by overriding considerations of economy and efficiency, especially for units which have already established some new facilities on a different site in the same urban centre. It is true that companies do realise what appear to be windfall profits on such sales. However, it should be recognised that the acquisition of new assets has to take place at the present inflationary level of costs. The actual profits therefrom are not real but only apparent. In view of this, one fails to understand why industry should be penalised by capital gains tax on such transactions, thereby discouraging what may be called rationalisation of location.

The next major phase of our expansion relates to the establishment of a new large Machine Shop at Goregaon, to house the various machine tools at present installed in different locations. We have a detailed Project Report for this purpose, but the funds required for putting up these new modern buildings are not available at present. The project will therefore have to wait and we will have to do with make-shift arrangements.

Problems Facing the Industry

Analysing the increase in our sales, it is observed that while there has been considerable rise in the sale of textile machinery, the increase in the structural and foundry units has not been so very marked. While the foundry situation is partly explained by the fact that the Goregaon foundry, though commissioned, is still under construction, the performance of the structural unit is largely explained by problems of steel shortage. The partial decontrol of steel, following the recommendations of the Raj Committee, was designed to ease this particular problem of the Engineering Industry, who are the major users of steel in the country. Unfortunately, experience belies this expectation. I do not wish here to go into an analysis of this problem,

which has many complicated and controversial facets such as steel production planning, administration of control, permitting import of urgently required matching steel sections, etc. Government, I am sure, will take suitable remedial measures to solve this problem in the interest of full utilisation of steel structural capacity, established in the country at considerable cost in capital investment. In this connection, it is difficult to understand the reason for proposals to establish new structural units, as part of the Bokaro Project and otherwise, in the Public Sector, supposedly to meet the urgent requirements of steel structurals for new construction of public undertakings. If Government were to assist established units in the structural industry by meeting their requirements of steel sections and, in some cases balancing equipment, they would be able to serve this objective more effectively and quickly. I know there have been complaints about delayed deliveries of steel structurals for Bhilai and other State-sponsored steel projects. These delays have been due to shortage of steel sections, lack of effective and timely liaison between the customers and the suppliers, etc. The structural industry in the country would be able to meet in large measure, and also in good time, the real requirements of Public Sector units, if serious efforts are made to overcome these difficulties.

The Company as Pioneers

In the national drive to build the country by building machines, you will be glad to note the pioneering efforts and significant successes achieved by your Company. We are the first and so far the only manufacturer of blowroom lines for the textile industry in the country. The 29th of July 1965 witnessed an important land-mark in this field of endeavour. On that day, Shri G K Devarajulu, President, Indian Cotton Mills Federation, commissioned the 51st Truetzschler-NSE Blowroom line, manufactured by us. We have now been licensed to expand our manufacturing capacity from 24 to 36 Blowroom lines per year. We are also the first and so far the only manufacturers of Pneumatic Power Hammers and Drop Forges in the country. As you will see from the Annual Report, the 101st Massey-NSE Forging Hammer was released for despatch at an informal function at our Goregaon Works on 25th March 1965 at the hands of Mrs Phyllis Massey, during her first visit to India accompanied by her husband, Mr Keppel F Massey, Managing Director of our collaborators in the machine tool line, M/s B & S Massey Ltd, England. We are also the first manufacturers in India to take up the production of Disc Filters for Coal Washeries. In this impressive array

of "firsts", I should add Threading and Screwing Machines, Trimming Presses and most upto date models of Shot Blasting Equipment. The last item is being manufactured in our associate company, Indabrador Limited, which has been promoted by your Company.

Collaboration with Truetzschler

As you will see from the Directors' Report, there is at present under consideration of Government our new proposal for technical licence agreements with M/s Truetzschler & Company, West Germany, for the manufacture of Blowroom Machinery. This proposal visualizes enlargement of scope of manufacture to cover production of most upto date and modern machines for processing man-made fibres as well as blended/mixed fibres, combining cottons and synthetics. We are convinced that our proposal is in the best interest of the country. An economic weekly recently stated that the patience of mills is exhausted because the machinery manufacturers are tied down to obsolete models under the collaboration agreements and have enjoyed their monopolistic position too long but not improved their quality and selling policies to suit mills' requirements. The manufacturers, however, now feel that import entitlements and Japanese credits have eroded their protected shelter. It is provided that Truetzschler & Co. will share with us the up-to-date know-how and technological developments in the field of manufacture of blowroom machinery both for cotton and man-made fibres.

Depressed Economic Climate—the Way Out

We in this country are passing through very difficult and trying times. When I say this, I do not refer only to the problems of industry, which have recently multiplied on account of foreign exchange crisis, credit squeeze, stagnancy in capital market, general decline in the rate of economic growth etc. I have more in mind the serious problems of rising prices, food shortage, language controversy, increasing indiscipline in political parties, and, above all the external threat to our frontiers and our security. It is a matter of great tragedy that there is growing divergence between Government and industry at this critical juncture. It is a pity that Government has imposed a steadily mounting burden of regulations and levies on industry, forgetting the essentially dynamic, and at the same time stabilising role of industry. In this context, it must be recognised that science and technology belong to the world today. This necessitates continued co-operation with collaborators, so as to ensure adoption in India of techniques advanced abroad. We cannot pursue and welcome pri-

vate foreign investments and at the same time try to discard foreign technology. On the other hand, we should be able to develop our own processes, discoveries and inventions to suit Indian conditions and even carry forward in some cases the work done abroad, so that we can play our full part in the development of technology. With a little more ability to pool our own resources, a little more confidence in the Indian industry on the part of Government, it would not be long before the depressed climate is improved. At the same time, I would like to appeal to my colleagues in industry to have larger awareness of their social responsibility. We should also assist the Herculean efforts of the Government to control the price line by submitting to monetary discipline and consolidation before further expansion on borrowed resources.

Management and its Continuity

Before closing, I should like to draw your attention to the reference made in the Directors' Report concerning Government's approval of the Company's proposal for payment of pension to its Managing Director, Shri J V Patel. This is a welcome, although somewhat rare, instance of Government's view on the matter of managerial remuneration. It is, of course, a fitting recognition of Shri J V Patel's pioneering role and devoted efforts to build up this Company, so to say, from scratch to its present stature. Shri J V Patel has ahead of him many more years of active stewardship at the helm of affairs. I have to say this particularly in order to remove any misgivings which may be caused by this reference in the Directors' Report. At the same time, may I add here that we on the Board are well aware of the basic need of management continuity and stability as reflected in the programme of management development. It has been aptly stated that "in the beginning a company is as good as its Managing Director, later it is as good as its professional Managers. The building of these professional Managers becomes the prime responsibility of the Managing Director". In this important task, your Managing Director carries the full support and help of his colleagues on the Board.

In conclusion, I should like to record here our grateful appreciation of the good work of our officers, staff members and workers, under the able leadership of Shri J V Patel, which is well reflected in the successful results of the year under review.

I have now pleasure in moving the adoption of the Audited Statement of Accounts and Directors' Report for the year ended 31st March 1965.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Kirloskar Oil Engines Limited

Speech of the Chairman Shri SL Kirloskar

THE following is the text of the speech delivered by Shri S L Kirloskar, Chairman, at the 19th Annual General Meeting of the Company, held in Poona, on Saturday, the 28th August, 1965.

Ladies & Gentlemen,

It is with pleasure that I welcome you to this meeting. You must have, by now, gone through the Directors' Report and the audited Accounts of the Company for the year 1964-65. With your permission I shall take them as read.

Accounts

I am once again pleased to be able to report another successful year. The working results for the year reveal a steady progress in your Company's activities. The accounts show a profit of Rs 1,02,50,576 (as against a profit of Rs 81,88,996 during the previous year) after providing for depreciation, remuneration to Managing Agents and the amount set aside for bonus to the employees. Your Directors have indicated in their Report, their recommendations for the allocation of the profit under various heads.

Production & Sales

Increased production and sales, marked the results for the year under review. The continued pace of growth has been well maintained. With the increase in production of standard engines, the development of several special versions of the same, suitable for special applications by original equipment manufacturers, has been an additional feature during the year. I wish to make special mention here, of the marine version of our engines, which is becoming more and more popular.

The production in our Bearing Division too has increased appreciably. The development of bearings for more and more types of automotive and industrial stationary type of engines, has considerably widened our market and accounts for the increase in sales. One serious bottleneck in increasing our production of bearings has been, short supply of bi-metal strips, on account of import restrictions. So, as I had reported before, we planned to put up a bi-metal strip plant, in our factory.

It gives me pleasure to report to you, that this strip plant will be put in operation, within a few weeks. This will not only facilitate increase in production, but will also save considerable foreign exchange.

Export

You would, indeed, be pleased to know that your Company has earned for itself the distinction of being the largest exporter of engineering goods from India. Our exports rose from Rs 54 lacs during 1963-64 to Rs 98 lacs during 1964-65. This represents about 15% by value and 30% by numbers, of our total production during the year. So our export has virtually doubled itself, during the year under review. In addition to consolidating our position, in markets where we have established ourselves, we are continuously exploring new foreign markets. This year marks the introduction of our engines into Central and Latin American countries. We have been able to establish distribution links in distant parts of the world, like Jamaica, Panama, Costa Rica, El Salvador, Ecuador.

Export has not been a profitable proposition to engineering industry all along. Then the question that immediately comes up in our mind is, if that be the case, why export at all? Are we not increase jeopardising the interest of the shareholders by exporting, if export does not bring any profit? Can we not increase our profit by selling in the inland market, the engines we now export? At first blush, these questions do look quite pertinent and logical. But the situation is not so simple. Our country is not as yet self-sufficient in the requirements of the engineering industry. We need machinery and many critical items, which are not available in the country, without which we can neither maintain our present production nor undertake any expansion. So, these have to be imported if the industry is to keep going or if it wants to undertake expansion. Import needs foreign exchange and the Government is not in a position to give us any foreign exchange unless we earn foreign exchange by exports. So, the importance of export, even at a loss, comes in here. Even the production we made during the year, would

not have been possible, if we had not exported. So, whether there is profit or not, under the existing conditions, we have to export a portion of our products, if we have to keep our factories working.

However, no engineering industry in India under today's conditions can afford to export more than 30% of its total production, without seriously endangering its finances. From this it is obvious, if we have to increase our present export, we have to increase our total production commensurately, on this basis. At no time in the history of Independent India, was the necessity for export more keenly felt. To increase exports, the increase of overall production is essential. Is the time propitious for any industry, to increase its production on a large scale, is the question. The cost of production is increasing by leaps and bounds. On account of severe restriction on imports, availability of machinery and critical raw material is becoming difficult. Due to the new policy adopted by the Government, finance for industries is also becoming a serious problem. In the face of these strong odds, how to increase production with a view to increase exports is the problem facing all industries. A suitable solution has to be found out to tide over this difficult situation. It should be recognised that it is the private enterprise that has to shoulder most of the responsibility of developing foreign trade. In the ultimate analysis, it is the effort of the private agency, that will determine the success or failure of the ambitious export programme, now undertaken by the Government. Government has done much to stimulate export trade; but more remains to be done. A pragmatic appraisal of the problems confronting export alone can help us out of the present difficult situation.

Credit Squeeze

I would like to refer in the passing, to the recent Reserve Bank of India policy, to restrict credit to trade and industry. The duration of this scarce money policy was not clearly indicated, when the policy was conveyed to the executives of the Commercial Banks on 4-5-1965, by the Governor of the Reserve Bank of India. However, officials have been hinting since,

that this policy will continue, for quite some time.

This policy applies ostensibly only to trade and distribution. At first blush private industry seems exempt from it. But this is at best a delusion; for, when the credit squeeze operates against suppliers and distributors, the repercussions of that would obviously be felt by manufacturers. When the bank credit to distributors shrinks, their offtake of our products for distribution also will fall. Their capacity to make prompt payment for what they may buy also suffers. Similar would be the case with suppliers. Their capacity to keep stocks of goods and raw material, for being supplied to industries, also would be affected; consequently supplies to industries would suffer. Thus, as a result of this credit-squeeze, pressures on manufacturers are bound to emanate from supply and distribution. Further, it is indicated, that hereafter, bank credit would cover raw materials and indirect stores and may not extend to finished products. Since no credit may be granted against finished products, manufacturers have to see that their products move faster, out of the factory. Some concerns may well find themselves having to unload their products on the market at a price sacrifice.

A possible effect of this policy would, therefore, be a cutback in the existing scale of turnover, not to speak of the slow down in expansion. This would mean rising overheads, resulting in a rise of unit cost of production. This is not a desirable position.

Issue of Capital

The allround expansion programmes, the Company has taken in hand, need progressively more and more finance. The Industries Finance Corporation of India has granted to the Company a loan of Rs 99 lacs, partly in Deutch Marks, partly in U S Dollars and partly in Rupees. In addition, the Company will be issuing immediately 2,50,000 equity shares of Rs 10 each, at par, to the present equity shareholders of the Company. The shares are issued at par, even though they can be sold in the market at a sizeable premium, so that the shareholders may have the full benefit of the prevailing market value of the shares. I would request you to extend to us your helpful co-operation, in subscribing to the shares now being offered to you.

Subsidiary

The working results of Shivaji Works Ltd a subsidiary of the Company too has been satisfactory. It has been able to declare dividend of 9.3% on its preference shares and 9% on equity shares, for the year ended 31-12-1964.

Prospects

You would be interested to know, what are the prospects for the current year. As for the Company, its activities in stepping up its production, and its expansion and development programmes are proceeding as per schedule. But, as a result of the credit squeeze, increase in bank rate, import curtailment, and the impact of

the Fourth Five Year Plan, it would be difficult to predict what turn the events will take. We cannot say, when we may have to trim our production to suit the conditions. We are proceeding rather cautiously in this matter.

Before I close, I wish to convey to the staff and workers our sincere thanks for their excellent team work, and the management for steering the affairs of the Company, with skill and efficiency, to which we owe the excellent results, the Company could produce during the year.

Note: This does not purport to be the proceedings of the Annual General Meeting.

THE JAIPUR UDYOG LIMITED

Regd. Office : SAWAI MADHOPUR (W. Rly)

NOTICE

THE Annual General Meeting of the shareholders of The Jaipur Udyog Limited will be held at the Registered Office of the Company at Sawai Madhopur on Thursday, the 30th September, 1965 at 12 Noon to transact the following business :

1. To receive and adopt the Directors' Report and the Audited Statement of Accounts for the financial year ended 31st March, 1965,
2. To declare dividends.
3. To elect a Director in place of Shri Ramnath A. Podar who retires by rotation and is eligible for re-appoint.
4. To appoint Auditors for the current year and to fix their remuneration. The retiring Auditors, Messrs. R. D. Joshi & Co., Chartered Accountants, being eligible, offer themselves for re-appointment.

Register of Members of the Company will remain closed from Saturday, the 25th September, 1965 to Thursday, the 30th September, 1965, both days inclusive.

By Order of the Board,
For THE JAIPUR UDYOG LIMITED,
For SAHU JAIN LIMITED,

A. K. Jain

Director,
Managing Agents

Calcutta

5th September, 1965.

N.B. A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

— You'll find that shipping with us couldn't be easier. All you have to do is make one phone call and describe your shipment. We'll give you full information, including costs.

You expect shipping with us to be fast. But you may be pleasantly surprised to find out that it can save you substantially on packing (no heavy crates needed), on insurance (because there's far less breakage, spoilage, or pilferage), on inland shipping (air freight can deliver your goods just

about anywhere). And you can eliminate the cost of overseas warehousing (as you can now make overnight delivery of factory-fresh goods almost anywhere in the world).

Let us show you. Ship with us now, and we think you'll want to make us a permanent part of your shipping system in the future. Call your Pan American Cargo Agent. Or call us at Bombay, Calcutta, New Delhi, Madras, Colombo (Ceylon).

World's Largest Air Cargo Carrier • World's Most Experienced Airline

in India's service

With a heritage of over a century we lay claim to a creditable record of service in promoting India's economic development. The watchword is one of endeavour in the service of the

ALL GONE! not a paisa left

This could happen to you if you carried cash on your travels. For cash can get lost or stolen... not so Bank of Baroda Travellers' Cheques, which cost you nothing. The Bank of Baroda issues Travellers' Cheques free of charge!

They are safe and convenient. Nobody but you can cash them. They can be cashed anywhere in India at any branch of the State Bank of India and the offices of many other accredited agencies. All you have to do is to sign your Bank of Baroda Travellers' Cheques in the presence of the Bank official on duty.

Travellers' Cheques are available in denominations of Rs. 25, Rs. 50 and Rs. 100 AT NO EXTRA CHARGE from your nearest Bank of Baroda Branch.

Don't carry cash... carry

BANK OF BARODA Travellers' Cheques

Issued free of charge.

THE BANK OF BARODA LTD. (Estd. 1908) Head Office: Barod.

Write for our free booklet 'May We Help You?' which gives details of all our services.

Peace-Makers Must Act Now

THE still screaming headlines notwithstanding, there is evidence of a lull in the war. This may indicate nothing more than that the fierce battles of last week-end and earlier have left both sides in need of a breather to recoup before pitching in again. Or, more hopefully, the two Governments may have decided to recognise the dangers of getting into the next stage of escalation and may have deliberately chosen to give a chance to those who are trying to save them from further disaster. Whatever the explanation, the lull cannot last for ever, or even for long. Unless a ceasefire is achieved and the two armies withdrawn from positions of active contact with each other, with the best of intentions on both sides the next round of battles will not be long in breaking out. Peace-makers, all of them and not the U N Secretary-General alone, must act now using all the influence they wield on the two countries to prevent this.

Chances of a ceasefire just now are by no means hopeless. Neither side has any overwhelming reason for carrying on the war. India has done enough to impress on Pakistan that neither by infiltration and subversion nor by open military attack can she force a settlement of the Kashmir question. At the same time, it does not appear that last week's battles were so decisive in any of the sectors as to make it imperative for Pakistan to strike back desperately to retrieve lost prestige. It is not surprising, therefore, to read in U Thant's letters to Shastri that he found that "both sides have in common a genuine desire for peace" and that the replies he had received to his appeal to the two Governments "have shown clearly the desire of both for a ceasefire". As for India we know from Shastri's letters to U Thant that he was prepared to order a ceasefire effective from the evening of Thursday. It is not known what Ayub Khan's response was but there is evidence in the U Thant-Shastri correspondence that it was not wholly negative.

Given this basic acceptance of the futility of further warfare on both sides, it is necessary to identify the obstacles to a ceasefire. Pakistan insists that a ceasefire must be accompanied by a commitment to a plebiscite or "the substance of a plebiscite" in Kashmir. India cannot obviously accept a ceasefire with this condition attached since that would amount to conceding to Pakistan her very objective in starting the war by sending infiltrators into Kashmir. The only condition that India seems to have set for a ceasefire is that she should be allowed to keep the posts she has occupied across the ceasefire line in Kashmir, particularly in the Uri-Poonch sector. At his press conference in New Delhi on Wednesday Sardar Swaran Singh somewhat overstated our requirements when he said that a ceasefire meant troops of both countries holding on to the actual line of control, other things to be left to be settled later. Surely, we can have no interest in maintaining our present positions in the Lahore-Sialkot area and elsewhere in West Pakistan provided the threat to our lines of communication in Kashmir posed by the continued presence of Pakistani forces in Chhamb is removed. A more precise expression of our needs is to be found in Shastri's letter of September 14 to U Thant: "when consequent upon ceasefire becoming effective, further details are considered, we shall not agree to any disposition which will leave the door open for further infiltrations or prevent us from dealing with the infiltrations that have already taken place".

In other words, India is asking for safeguards to prevent Pakistan from attempting again to subvert Kashmir. This is not too much to ask for. If the safeguards are provided to our satisfaction the need to occupy a couple of hundred miles or so across the present ceasefire line in Kashmir will not exist. A guarantee to India to this effect by those who can give it will be, therefore, a vital step towards a ceasefire. Of course, in the long run the only guarantee that India and Pakistan will not have to go to war over Kashmir a third time is a solution acceptable to both countries. U Thant and those who have lent him their support in his peace-making efforts will stand a much better chance of success if they could convince India and Pakistan of their resolve to work for such a solution even as they strive for an immediate end to the war.

Bounty for the States

FEDERAL finances in India have been marked from the outset by a growing gap between the requirements of the States and what they are able to raise on their own. The Fourth Finance Commission, whose report was presented to Parliament last week, has made its modest contribution to narrowing this gap. The recommendations of the Commission, which have been mostly accepted, will, according to present indications and on the basis of the 1965-66 level of taxation, involve an additional transfer of resources to the States of the order of Rs 780 crores over the five years of the Fourth Plan compared to what the States would have got under the Third Finance Commission's award. The Commission has assessed the revenue receipts and non-Plan revenue expenditure of the States during the period 1966-67 to 1970-71 and has estimated the total non-Plan revenue gap at Rs 2,427 crores. This would be covered to the extent of Rs 2,191 crores by the States' share of Union taxes and duties and of Rs 609 crores by grants-in-aid of revenue to ten States. This would leave a surplus of Rs 374 crores in six States, namely Bihar, Gujarat, Maharashtra, Punjab and West Bengal.

Two recommendations of the Commission have the effect of raising the proportion of Union taxes and duties going to the States. First, the States' share of income tax has been raised from 66.75 per cent as at present to 75 per cent. The last Commission, it will be recalled, had raised the proportion from 60 to 66.75 per cent. No change is, however, recommended in the manner of distribution of the States' share of income tax among the different States. The share of each State will continue to be determined on the basis of 80 per cent on population and 20 per cent on collection. Second, the Commission has decided to give the States a share in the proceeds of Union excise duties on all commodities instead of only 35 commodities as at present. (The Third Finance Commission had expanded the list from 8 to 35 commodities.) Though the States' share has been maintained at 20 per cent, the effect of the increase in coverage is, according to the Commission's estimate, equivalent to an increase in the States' share on 35 commodities to 30 per cent. For distribution of the States' share of excise duties among the different States, the Commission has de-

cided to increase the weightage given to population. The distribution will be made on the basis of 80 per cent on population and 20 per cent on "relative economic backwardness". The last Commission had not specified the exact weights attached to population and relative economic backwardness in its dispensation but the effect of the change made by the present Commission is evident from the changes in the percentage shares of different States. The shares of Jammu and Kashmir, Madras, Maharashtra, U P and West Bengal have gone up—those of the last three quite sharply—while those of Andhra, Assam, Bihar, Gujarat, Kerala, Madhya Pradesh, Mysore, Orissa, Punjab and Rajasthan have gone down. This change follows the general principle adopted by the Commission that "if any State is in need of specific financial assistance because of large deficits that cannot be covered by uniformly applied principles of tax-sharing, such assistance should appear explicitly as grant, rather than being disguised as shares of taxes." This approach has had the effect of raising the total amount of grants-in-aid from Rs 64 crores annually under the Third Finance Commission's award to Rs 122 crores even though the number of States qualifying for such grants by virtue of having non-Plan revenue deficits has been reduced from 12 to 10. The change in procedure does not, of course, alter the amount of resources transferred from the Centre to the deficit States but it does increase the total transfer of resources from the Centre to all States.

Two of the tasks entrusted to the Commission have been left undone, and for no fault of its. First, the Commission had been asked to consider the creation of a fund out of the excess (over a limit to be specified by the Commission) of the net proceeds of estate duty on property other than agricultural land accruing to a State for the repayment of the State's debt to the Central Government. Whoever thought of such the extent of the States' indebtedness to the Centre. Even the total proceeds of estate duty on property other than agricultural land would be too little in relation to the existing and prospective debt of the States. The Finance Commission points this out and, instead of recommending the creation of a fund of the sort suggested under its terms of reference, it has suggested an exa-

mination of the soundness of the present system of inter-Government borrowing in the light of the fact that "most of the objects of expenditure and investment by State Governments are determined by joint consultation either directly or through the Planning Commission" and that "at least in some cases the Centre is keen on offering an inducement to a State Government to undertake a fresh responsibility".

The other task which the Commission has been unable to perform is that of assessing the effect of the combined incidence of State sales tax and Union excise duties on the production, consumption and export of commodities and to recommend adjustments in the States' share of excise duties if there is an increase in State sales tax on such commodities over a limit to be specified by the Commission. In the first place, the Commission was unable even to determine the proportion that the money burden of the two taxes bears to the total price of a commodity. And even if this had been done, it would not have taken the Commission far in its main task. For, "unless we are in a position to undertake for each excisable item detailed cost-analysis studies of the type that are usually undertaken by the Tariff Commission, we would not be able to determine whether its production, consumption or export is being hampered because of the excessive burden of some other factors. In order to recommend any ceilings on sales taxes we have not only to determine the combined incidence of the two taxes, but also the separate incidence of each" (italics in original). The Committee naturally did not attempt these detailed studies.

Interest in the Finance Commission's report centres as much on what it has recommended and hasn't as on the views, expressed mostly in the minute appended to the report by the Chairman, on the scope and functions of the Commission. Ever since the inception of planning the functions intended to be performed by the Finance Commission have been duplicated by the Planning Commission; in practice, the overlapping of functions has been avoided by clipping the wings of the Finance Commission. By far the larger part of federal financial relations, those connected with the State Governments' expenditures under the Plans and the grants from the Centre to meet these expenditures, have passed out of its sphere. The Third Finance Commission was form-

ally asked to make recommendations on grants to States keeping in view the requirements of the Third Plan, but its suggestions in this respect were rejected by the Government. The Fourth Commission was kept severely off the sphere of Plan finances and was restricted to the non-Plan revenue budgets of the States. How small a part of federal finances the Finance Commission now affects can be seen from the fact that in 1965-66 whereas statutory grants by the Centre to the States are estimated at Rs 77 crores, other grants, the size and distribution of which are determined by the Central Government and the Planning Commission with the State Governments, are put at nearly three times that amount, at Rs 211 crores.

The Fourth Finance Commission, like its predecessor, is acutely aware of this loss of importance. But unlike the latter which had suggested that either the Finance Commission's functions should be enlarged to cover all financial assistance from the Centre

to the States or the Planning Commission should altogether take them over, the chairman of the present Commission has merely called for a formalisation of relations between the two Commissions involving clear definition of the scope and functions of the two "by amending the Constitution" and by making the Planning Commission also a "statutory body independent of the Government". There is no doubt much to be said for and against giving the Planning Commission a formal status and making it "independent" of the Government, but those are larger issues which have to be considered against the totality of the Commission's functions. The question to be asked in the present context is whether it would be advisable to assign larger revenues to the States on a statutory basis. This problem has to be examined in the light of the States' known unwillingness to exert themselves to raise resources while simultaneously wanting to spend as much as possible and lobbying for as large State Plans

as they can get. Any statutory allocation becomes binding on the Centre while in the case of non-statutory allocations, the Centre can, if it likes, relate their magnitude to both the developmental needs as well as the revenue efforts of the respective States. The Centre cannot enforce any standards once the allocation becomes statutorily binding. There is also the danger that such larger allocations may be spent away by some States on non-Plan schemes, because it is not always that the priorities laid down for the Plan as a whole are in accord with the priorities of the State Governments.

These were among the reasons which led the Government to reject the Third Finance Commission's recommendations regarding statutory grants to meet a part of the States' Plan expenditure. There is considerable practical wisdom in leaving the size of Central assistance to the States under the Plans to be decided by bargaining from year to year.

Weekly Notes

The New Hoarder

AMONG all the damages the war is likely to cause to the economy by draining away scarce resources, there may be one or two resultant developments of a welcome nature. The decision to impose with almost immediate effect rationing in all urban areas with a population of one lakh and above is one of them. Earlier, the decision was to implement a phased programme, starting with cities with a population of a million and above, then turning to towns with a population of 3 lakhs and above, and only finally to towns with a lakh and above. Food Minister Subramaniam has now announced in Parliament that in anticipation of possible holdups of imported wheat, the programme is to be immediately implemented without any phasing. There is every opportunity now of introducing an effective and workable system, for the public mind could never be more prepared to accept draconic measures causing general inconvenience and involving harsh punishment of anti-social elements.

While welcoming the measures announced, we cannot but note the grim warnings contained in the Minister's speech about still further difficulties on the production front. The official view has always been optimistic

about solving the production problem once for all so as to end the precarious dependence on foreign assistance. That increased production is the long-run answer to the problem is accepted by all, but nobody seems to stop to analyse the reasons for our sad performance on the production front. The target of self-sufficiency which was set for the Third Plan has now been pushed to the final year of the Fourth Plan. Foodgrains production did not increase at all during the first three years of the Third Plan. In the fourth year there was, according to official figures, a rise by 10 per cent in a single jump. It has been argued till now that undue importance should not be attached to the stagnation of the first three years; the last two years would largely compensate for the shortfall. Now the prospects for the last year's harvest are also not all that bright and there seems to be doubt whether even the figure of 92 million tons will be achieved.

Another curious phenomenon on the food front is that market arrivals and market prices do not seem to have been affected in any significant way by the sharp rise in production of 8 million tons in a single year. Market arrivals of grains have been, it is reported — and this has been now

confirmed by the Minister — steadily going down. This was understandable during the first three years of the Plan, when production did not rise. Increased prices could have prompted farmers to sell less to make the same amount of money income. But it is paradoxical that the trend of rising prices and dwindling market arrivals should continue even after the record harvest of 87 million tons. If such an increase in production in one spurt does not lower prices or at least arrest the rise in them and result in the increased market supply of grains, then among the possible explanations one cannot leave out the one that the production figures themselves may be seriously in error. It is now being said even officially that the role of trade in withholding stocks is not so important. The real culprits are the producers themselves. Subramaniam has announced that his new procurement drive will be directed at the producers rather than the traders. However, this is not the first time that there is talk of doing something to release supplies withheld by producers. But at no time has any concrete scheme been outlined. What precisely will be the weapons the procurement agents will be given to compel the hoarder-producer to disgorge his suppressed stocks? Of crucial significance in this matter seems to

be the fact, not often mentioned, that the class of producers who are supposed to be withholding supplies constitutes the greater part of the new class of owner-cultivators that has been created by the land reforms. They represent the greatest electoral support of the ruling party. Not only the party in power, but no other party that aspires for any electoral support in the countryside would dare to do anything that would alienate the support of this electorally preponderant class.

IDB's First Year

IN its first year of operations the Industrial Development Bank has sanctioned assistance of Rs 63 crores and disbursed Rs 24 crores. About two-fifths of the sanctions and most of the disbursement were on account of refinancing of banks and State Financial Corporations, which represents the continuance of the business of the Refinance Corporation for Industry which was merged with IDB in September last. The assistance of Rs 63 crores was distributed as follows:

	(Rs crores)
Refinance	25
Direct loans	16
Underwriting	7
Subscription to issue of SFC's	2
Rediscounting of bills	8
Guarantees of loans and deferred payments	4
Total:	63

One single enterprise, Gujarat State Fertilisers, has been given Rs 14 crores of loans and Rs 2.75 crores of underwriting, all out of the Development Assistance Fund, in addition to a loan guarantee of Rs 1.57 crores. Other loans varied in amount from Rs 5 lakhs in two cases to Rs 133 lakhs in one, and underwriting from Rs 4 or 5 lakhs in several cases to Rs 76 lakhs. Guarantees, one of Rs 163 lakhs and another of Rs 126 lakhs, were extended on behalf of concerns assisted by other means. Most of the loans and underwriting operations were, thus, in small amounts and were meant to assist projects which had already received assistance from other financial institutions but were left with a small gap. Of the 27 issues underwritten by IDB, 11 had participation from ICICI, 18 from IFC, and 16 from LIC. A change of policy concerning the size of assistance is expected shortly and assistance to relatively small projects in traditional industries would be handled exclusively by other institutions. IDB will, however, continue to render necessary

assistance to small units in specially deserving cases, particularly to units promoted by technician entrepreneurs. Share brokers are being associated more closely with underwriting operations by giving them a share in the commission and liberal terms for sub-underwriting.

The Development Assistance Fund (the operations and accounts of which have to be statutorily kept apart from those of IDB itself) was set up towards the end of March this year with a token loan of Rs 1 lakh from the Centre. This Fund will act as a special government agency to assist high priority industrial concerns which due to their size of investment or low return on capital or long gestation period are unable to raise adequate funds from banks and other financial institutions. Since IDB itself carries out more or less similar functions, the dividing line between the two sets of operations cannot be sharp. It has, therefore, been decided that projects which receive assistance in the normal course, including from IDB, would not be debarred from recourse to DAF. The annual report of IDB makes it clear that, in the initial stages, decisions to utilise DAF resources would have to be *ad hoc*, but they would broadly cover:

- projects in the private or public sectors (though the latter is practically left out for the time being) which are potentially risky or low profit yielding or which have a long gestation period but which are of strategic importance; IDB would take care of their expert scrutiny and follow up; and/or
- projects covering the IDB's statutory functions in relation to planning, promoting, and developing industries to fill up gaps in the industrial structure where this involves enterprises which are unlikely to receive any or all assistance from other institutions in the normal course.

The schemes for deferred payment assistance for sales of domestic machinery and for refinancing of medium term export credits have made little or no progress so far. Limits in respect of the first aggregating Rs 8 crores to 7 banks were sanctioned but actual re-discounting was Rs 9 lakhs only, and was confined to cotton textile and silk machinery. As for the second, the effective sanction through June was Rs 29 lakhs to two applicants and the amount outstanding then

**"Uneasy lies
the head
that wears
a crown"**

No wonder! A crown is the symbol of responsibility. But as an exporter of engineering goods your responsibilities are no less than the wearer of the crown. You are competing with industrially advanced countries in a field where precision and quality are in the greatest demand. The nation is anxious to see that the reputation earned by her products abroad is maintained, if not improved upon, and the flow of foreign exchange to the country is consistently increased.

The nation's anxiety and uneasiness on this score can be overcome only if every manufacturer endeavours to introduce quality control in production and raw material selection, conforms to high standards and specifications, employs modern techniques of manufacture, adheres to promised schedules of delivery and offers after-sales service.

This Council is equipped to render engineering goods manufacturers every help and assistance in promoting their export.

Slack Demand for Assistance

AGGREGATE data on the performance of all term financing institutions (IDB, IFC, ICICI and SFCs) during fiscal years 1963-64 and 1964-65 indicate that total assistance sanctioned declined from Rs 96 crores to Rs 94 crores (foreign currency loans from Rs 21 crores to Rs 18 crores) but disbursements rose from Rs 58 crores to Rs 70 crores (foreign currency loans from Rs 8 to 10 crores). The decline in sanctions has taken place mainly under loans, both rupee and foreign currency, from Rs 85 to 78 crores, while underwriting and direct subscription have risen from Rs 11 to 16 crores, though IFC has curtailed its activities in this field. According to reports from reliable sources, the pace of inquiries and applications at IFC and ICICI has definitely slackened further this year and the volume of business put through is expected to be even smaller. This is in striking contrast to the situation in 1960 on the eve of the Third Plan. How has this slack come about?

The capital market is, of course, sluggish, though the increase in the number and size of fresh capital issues

give a contrary impression. Financial institutions are carrying the load in the absence of public support, but they cannot do so indefinitely. The burden of taxation is not the principal factor responsible since it has been amply demonstrated that fast growing companies have a much lower tax liability due to various concessions and rebates. The fact appears to be that the investing public has been hit by rising prices and both investors and promoters have been rendered illiquid by slower turn-round of investment than anticipated, caused by delays in completion of projects and, when completed, by delays in achieving production targets due to shortages of materials and power breakdowns in some areas. Promoters' equity is acutely strained owing to these delays and their over-extension into several lines of activity simultaneously. Most of the new entrepreneurs are in trouble due to cost overruns and shortage of own funds. The big houses, too, are stretched to the maximum with the numerous projects they have undertaken, rise in costs and tight bank credit.

We have to live with these problems for some time to come because the shortage of materials will remain in the near future. All that can be done is

to expedite the solution of problems by more selective allocation of materials and where gluts have appeared by improved marketing. Mere relaxation of credit curbs will not help — if it is intended mainly to enable certain influential industries to keep their inventories of finished goods at high levels or to help them build up large inventories of raw materials at the expense of other sectors of the economy.

Watered Down Gold Control

THE revised income-tax rules relating to expenditure on advertising have been published for eliciting public opinion at about the time that the trailing end of the gold control order was passing on from the shelter of Defence of India Rules to its final resting place in the Statute Book through a bill in the Rajya Sabha. Meanwhile, the belated measures for rehabilitating goldsmiths and finding alternative employment for them having served their purpose, were being wound up. True, demonstrations for cancelling the order and the demand of the goldsmiths to be licensed as small scale industry still go on, but gold control no longer excites much interest. It never

* Data for 1963-64 relate to the operations of R C I. The figures for 1964-65 cover the operations of RCI for 5 months (prior to its merger with IDBI on September 1, 1964), the refinance operations of IDBI for the subsequent 7 months as well as the direct financial assistance of IDBI during the first 9 months since its inception on July 1, 1964. Figures in brackets relate to the operations of IDBI for a full year period (July-June), which include the refinance operations of RCI for 2 months (July-August 1964). To avoid double counting, refinance extended to SFCs has been excluded throughout as this is already covered under their loans. No refinance was availed of by IFC and ICICI during the period.

** Disbursements on account of guarantees are included under loans.

did from the moment the sting was taken out of it by allowing re-making of old gold ornament of any fineness. The order will get into the Statute Book all right, but thereby will hang a tale, a sad tale of the abandonment of the first attempt to turn gold into base metals.

Nothing can be had just for the asking. Social change can never be painless for those who benefit from or are sustained by the existing order, however miserable it may be. In retrospect one can be wise and lay down the correct manner in which gold control should be put into operation and the proper sequence. Ornaments made from 14 carat gold could have been popularised to start with, with the latest aids of popularising a new product and creating a new fashion for them, and with high level sponsorship and all that. One could even suggest at what stage programmes could be set in motion for finding alternative occupations or those among the goldsmiths who were young enough to be retrained, use could be found for the skill and craftsmanship of the others who were too old to learn an entirely new trade, and in between at some point when rehabilitation had made some headway and ornaments of a lower carat begun to catch on, legal restraints could be brought in to under-pin, stabilise and put on a firm footing the changes that had already been initiated. But that is not how things are done or can be done in the sort of administrative and political set up that we have.

Those who genuinely believed in the desirability of weaning away the Indian people from their traditional attachment to gold ornaments of the highest purity can therefore legitimately complain that though things were not done in the most desirable manner to soften the blow and make the change less harsh, the basic idea of it was unexceptionable and that even enlightened public opinion in the country failed to give the gold control order the unreserved support that it deserved, and that it is lack of such support which enabled the politicians to do what they did in the end, succumbing to the pressure of the hide-bound who would not see how costly their indulgence in traditional age-old ways was in terms of the country's economic development.

Curb on Advertising, Why?

THE function of advertising in an economy of shortage may be questioned on sound social grounds, particularly where socialism is accepted

as the goal, however distant that goal may be, and however perfunctory the attempts to achieve it. The Finance Ministry rules for governing the expenditure on advertising are for calculating the assessable income for taxation, and the ostensible purpose is to raise the yield of such taxation by disallowing excessive or unjustified expenditure under this head. No wider social purposes are claimed for this measure. In fact under the powers which the Government had taken under the Income Tax Act to issue rules restricting expenditures, restraints are to be imposed not only on expenditure on advertising but also on travelling allowances, maintenance of guest houses, plane bookings, etc, in order to check what the Finance Minister termed "the abuse by companies of certain types of deductible expenditure affecting the computation of their taxable income". To repeat, no wider social objectives are claimed for this measure.

The first set of income-tax rules on advertisement expenditure published in March raised such a howl of protest from the companies affected, from advertising agencies and from the newspapers *en bloc* that the rules were hastily withdrawn without much ceremony and after months of cogitation, a new set of rules have now been issued. This paper, among a host of others, may justly be castigated for taking a very narrow view of the matter and confining itself only to the impact which the restriction on advertising would have on the economics of newspapers in general and of small periodicals in particular. In fact, the first set of rules published showed such crass ignorance of the economics of advertising which has been studied in great depth in other countries and of the relation between advertising and the economics of the newspaper business that it was difficult to believe that the Central Board of Revenue really had any research department, cell or unit, which studied seriously any tax proposal before it was sought to be put on the Statute Book. One does not know how reliable press reports on this subject were, but if they were to be credited, the Finance Minister was willing enough to bow down to the power of the press and was in favour of an immediate suspension of the rules. But at a conference of officials involved in the matter, it was decided not to make any change in the rules or in their implementation. At the conference, the press report goes on to say, the offi-

cials tried to dismiss the criticism and the analysis of the rules as sheer propaganda and the Finance Minister is believed to have replied that if what appeared in the press was propaganda, there should be convincing rebuttal of it by the officials concerned.

That was in March. No such rebuttal has come and a cursory examination of the new set of rules published this week will show why. If there is a research unit in the C B R, it does not function. The main point about these rules is that they have no other objective than to improve revenue collection, which is fair enough, so long as nothing more is claimed for them. It is right and proper that tax avoidance should be checked when it takes the form of deliberately swelling up expenditures under any head. But those who are not specialists in the job will wonder if the income-tax authorities really need any fresh powers for the purpose, considering the sort of questions they ask even ordinary people of very modest means, when they submit their returns and the gumption with which the ITO discharges his duty by making token but quite arbitrary cuts under whichever head happens to catch his fancy, just to leave some evidence that he has performed his duties with due diligence and probity.

A layman's reading of the draft rules relating to advertising causes considerable puzzlement. Take for example the following sentence which appears under the sub-head 'Exemptions':

"No limits will be applied to expenditure on advertisement for promotion of sales or services or fostering the goodwill of the business or profession".

Now, advertisements are either for selling goods or they are institutional, for fostering goodwill of the business. Which advertisements then come under the ceiling of allowable expenditure of 4 per cent of turnover? The sentence quoted may be just legal jargon. There are many others, however, equally puzzling, such as that "the assessee may have paid Rs 1,000 for an advertisement in a newspaper ordinary charge is only Rs 500, but the excess amount will be disallowed". Is it because the genuineness of the payment is doubted? But if the advertiser wants a special position for which the charge is Rs 1,000, what happens? In some of the other limits proposed also, such as Rs 2,000 in respect of a single advertisement in a

souvenir, or that a payment exceeding Rs 2,500 shall not be allowed as a deduction unless it is made by crossed cheque, the intention obviously is to disallow payments about the genuineness of which there is reasonable suspicion. Is it such cases that call for special powers? When because of the high tax rates or inflationary pressures there is a general tendency of business to be less watchful about costs and there is high level pressure for advertising — accompanied by offer of large discounts under the counter at times — situations are conceivable where the expenditure should not be allowed as a valid one. Is that the sort of thing that the rules have primarily in mind?

This suspicion is further strengthened when the ITO is empowered to disallow expenditure on advertising in the following circumstances:

"(i) where the payment is made to a person who has a substantial interest in the business of the assessee or it is made to a relative of such person;

"(ii) Where the payment is made to a person who carries on business or profession as a publicity or advertising agent and the assessee or a relative of the assessee has a substantial interest in that business or profession." In either of these cases "substantial interest" will cover a director of a company or partner of a firm and a person will be deemed to have a substantial interest in a business if he owns not less than 20 per cent of the capital employed or the same percentage of equity capital of the company which owns the business.

If the Finance Ministry is really serious in pursuing this line, it has to attack not only the common or garden variety of tax evasion of passing on advertising to parties who pay back in some way but also look closely into advertising agencies in which the advertising firms may have proprietary or other interest. This sort of thing had hitherto been regarded as unethical practice in the advertising world, unethical but not illegal. But is the Finance Ministry really willing or able to pursue this to the bitter end?

The main operative part of the rules is the limit of 4 per cent of turnover, with generous exceptions for new products or new companies. (If the same ad is both for new and old products, how much exemption?) This will not affect the large body of advertisers at all, not even the very big ones. It will only affect the trades

in which the percentage of advertising is much higher. The relevant data for this country are not available at the moment, but British experience shows that advertising in particular items of processed foods go upto as much as 14 to 41 per cent as against an average of 2.9 per cent for the food industries as a whole. For tobacco the percentage of advertising was 8.8 of the total turnover; for household stores it was even higher, 9.1 per cent; and some particular items of household equipment also had a very high rate ranging from 9 to 22 per cent though the average was only 2.9 per cent. The highest average rate of advertising as a percentage of the total turnover was, as could be expected, in the toilet goods viz 25 per cent, while for some items under this head e.g. shampoos it was as high as 51 per cent. [The figures are rather old, being taken from "A Statistical Analysis of Advertising Expenditure and of the Revenue of the Press" by Nicholas Kaldor and Rodney Silverman, published by the Cambridge University Press in 1948. But the picture of the relative importance of advertising in different industries they present should be still substantially true.] So as a broad general principle, if it is intended to tax toilet and luxury products, the 4 per cent limit may have a social pur-

pose, assuming that the limit has been set with due consideration and not just arbitrarily so as not to touch those who can make noise. Films and entertainment have been given a much higher limit, viz 25 per cent.

The crux of the matter is that excessive advertising of fancy consumer goods is socially undesirable, specially in an economy of shortage and some restraint on it is, therefore, to be welcomed. But the 4 per cent formula, if it achieves that purpose will do so only by accident. From the wider standpoint, far more objectionable is the wastage of newsprint which results from the lack of any convention observed by the newspapers in regard to distribution of space between advertisement and reading matter. Just putting a limit to half page for any single advertisement does not serve any purpose. What does is restricting advertising space to 40 per cent of the total space which is a fair compromise. This used to be the convention at one time but it has been dropped by the biggest of newspapers. Will the Finance Ministry be imprudent enough to touch them? It will not achieve anything significant by way of raising income tax collections. But such a rule will achieve something far more desirable—conserve scarce foreign exchange by economising the use of imported newsprint.

LETTER TO EDITOR

Aligarh University

YOUR note on the Aligarh Muslim University (August 21) misses the point that Article 30 of the Constitution of India guarantees to all minorities, whether based on religion or language, "the right to establish and administer educational institutions of their choice". Article 30 further provides that the State shall not, in granting aid to educational institutions, discriminate against any such institution on the ground that it is under the management of such minority.

Recognising that minority cultures richly contribute to the growth of the entire nation (as Indian history amply demonstrates) enlightened democracy rules gently over the minorities in matters of religion, education and culture. This conduces to tranquility because it allays feelings of insecurity that are ever the most potent cause of unrest.

Indian Muslims are a minority based on religion entitled to protection solemnly pledged to them.

When the University was incorporated by the Aligarh Muslim University Act 40 of 1920 its first possessions became "all the property, moveable and immoveable" of the Muslim charities known as the Muhammedan Anglo-Oriental College, Aligarh (the nucleus), the Muslim University Association and the Muslim University Foundation Committee. The Government of India had stipulated for an endowment fund of Rupees 30 lakhs, as guarantee of stability, before it would agree to the establishment of a Muslim University. This fund was voluntarily contributed by 'the Muslim community throughout India'. (See Gazette of India, Part VI, September 11, 1920). The University, incorporated by statute was the successor to all the properties and assets of the Muslim charities and funds that it replaced and was by the terms of the same statute charged with fulfilment of all obligations, legal and equitable, of those charities and funds.

The foundation Act constituted the University Court, elected from donors, alumni and Muslim institutions throughout India, as the "Supreme governing body" of the University. The Chancellor, Vice-Chancellor, Pro-Chancellor and all other Officers of the University were elected by the Court. Every member of the Court had to be a Muslim. Only a minimum power of inspection and superintendence to prevent maladministration was retained by the Lord Rector who was the Governor General (later the President).

Special features of the University were the imparting of Muslim religious instruction to Muslims and the inclusion of departments of Islamic studies. The general terms of the Bill and the original Statutes of the University (declared fundamental to the scheme) had been settled by the Government of India in discussions with representatives of the Muslim University Association. (Gazette of India, 1920, Pt V, P 147.)

All in all, it is difficult to escape the position that this was an educational institution established by the Muslim minority, and administered by them. Aligarh cannot be compared

with the Banaras Hindu University established by the majority community, whose rights of administration, under democratic Government, require no special protection.

Deplorable as were the disturbances at Aligarh, the violent language used by some of those attacking the University foundation is just as obstructive of an understanding of the truth as the physical violence of misguided students.

There is nothing unpatriotic, unsecular, undemocratic, reactionary or fascistic in a minority, whether based on religion or language, demanding its just rights in a democratic society. Fascism was not the creed of a religious minority in the State.

It should give food for thought that even veterans like Dr Syed Mahmood have joined the almost unanimous protest of the Muslim minority against the expropriation of their right to administer the educational institution established by them. Some of the new 'nationalists' who would impugn the standing of such veterans may congratulate themselves that the public have had time to forget their respective contributions in the national freedom struggle.

Those who are inclined to discount the role that Muslim culture has played and may yet play in national reconstruction may profitably ponder on the wise words of a bygone revolutionary, M N Roy, who wrote:

"Unfortunately, India could not be fully benefited by the heritage of Islami culture... Now in the throes of a belated Renaissance, Indians, both Hindus and Muslims, could profitably draw inspiration from that memorable chapter of human history. Knowledge of Islam's contribution to human culture and a proper appreciation of the historical value of that contribution would shock the Hindus out of their self-satisfaction, and cure the narrow-mindedness of the Muslims of our day by bringing them face to face with the true spirit of the faith they inherit."

Many streams must merge in the India of tomorrow. Though grievously disrupted the Muslim stream has yet to make its richest contribution. Its authentic identity should not be obliterated.

FROM THE LONDON END

Pyrrhic Victory on Incomes Policy?

THE outcome of the voting at the Brighton Trade Union Congress on the attempt to make an incomes policy bite on a voluntary basis can hardly be described as a resounding vote of confidence. In the event, after a bitter debate the delegates finally passed the General Council's resolution by only 5,251,000 votes to 3,312,000 — a majority of 1,939,000 votes. The voting shows quite clearly the strong feeling that still prevails against wage restraint and interference with Trade Union independence. At best, the approval was a very grudging one, and was brought about by the sense of loyalty that the Trade Union Congress has to the Labour Government combined with a dislike of legislation to control wages. The irony of the situation is that despite the acceptance of an "early warning system" on wage increases and the possibility of voluntary restraint from the side of the Trade Unions themselves, there is no guarantee that the Government will not finally introduce the legislation to prevent which the motion was carried.

It was only loyalty and the appeal of George Woodcock to give practical support to help the Government win the breathing space over sterling and so make its survival feasible, that prompted the delegates to support this measure.

There was little doubt in the minds of the delegates that this action had to be taken so that the Labour Government could win the support of outside powers, and thus guarantee the stability of the pound. Woodcock himself said that the Government's incomes policy needed teeth in order "to get support from people who do not belong to this country and who have no loyalties to it". Most of the delegates in Brighton felt that by demonstrating that the Trade Unions were prepared to sacrifice their historic rights, bankers and Governments abroad would be given solid evidence that Britain was in a position to provide an incomes policy that worked, and a demonstration of this type would give support to a new international loan to defend the pound and thus help to restore Britain's economy.

get, not even in war-time.

Hoodcock's own position on this issue is perfectly clear. He is firmly opposed to any legislative control of wages, and is positively enthusiastic about a strong centralised TUC modelled on the Swedish pattern.

How Will It Work?

Will this paper victory on an incomes policy really be effective? There is only a vague idea of how the process will actually work, and discussions at the Congress revealed only too clearly the diverse divisions of interests and experiences that stand in the way of success. Other points that remain unclear are the relationships that will be worked out between the TUC, the Department of Economic Affairs and the National Board for Prices and Incomes. All that can be said for certain is that one inevitable result will be to cause longer delays in settling claims, and it is the existence of these delays that have been at the back of many of the recent strikes. Does it then mean that this new voluntary control system will only lead to more frequent industrial disputes and unofficial strikes?

The application of any incomes policy will create difficulties among Trade Union members because it will inevitably discriminate between different categories of workers. For example, those who are paid by piece-rate will not be greatly affected by the policy, nor will those Unions operating on a sliding scale agreement. The opposition to the incomes policy which came chiefly from the Transport and General Workers' Union, the Electrical Trades Union, the Boiler Makers Union, the National and Local Government Officers' Association, had a much clearer case. They simply rejected the idea of both centralized Trade Union control over wage demands and legislative control.

The incomes policy, as it stands, suffers from a number of defects. To begin with, it does nothing about the whole problem of Union structure which is one of the most important fields which require reform, nor does it attempt to tackle the question of the wage drift. Even more serious is the fact that the basic problem of

Legislation Not Ruled Out

After hearing the result of the resolution George Brown said: "The Government must accept its responsibilities and, if the circumstances require it, legislation will be brought into force. But I repeat that this step would be taken only in the light of the experience we gain from here on of the working of the strengthened voluntary system and after further consultation with Unions and management".

It is interesting to note that the opposition to this incomes policy at Brighton was nearly double the opposition to the original incomes policy at the Conference of Union Executives in April of this year. Since then, many Unions have had cause to regret their support of an incomes policy which seems, in many ways, a veiled form of Selwyn Lloyd's old wage freeze.

There is no doubt at all that there was much disillusionment among the delegates who attended the Conference. The threat of legislation to put teeth into an incomes policy was hardly the sort of action that Trade Unions had expected from a Labour Government for which they have been working loyally for the last thirteen years. Indeed,

U S "Impressed"

It is not without interest that Henry Fowler, the U S Secretary of the Treasury, who is busy sounding opinion to negotiate a new loan to support the pound should it be necessary, described Britain's new wages and prices policy as "promising". While he was not familiar with it in detail "it is clear in our experience, and in the experience of others, that an effective wage-price stabilisation policy is always helpful and desirable in giving a competitive thrust to the economy".

In the final analysis, there is no doubt that it was only the generations old political loyalties which lie at a very deep level which finally tipped the balance to give support to the wage restraint. Only a Labour Government could have succeeded in persuading the Trade Unions to act in this way, but the general uneasiness of the movement was evident by the loud cheers which greeted the warnings from Harry Nicholas of the Transport and General Workers' Union, that Congress was being asked to hand over a future Selwyn Lloyd powers that the Tories could never

I.O.B. is big enough to serve you..

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

productivity has not been tackled. The only real support for increasing economic prosperity and rising wages is through increased productivity. Holding down wages can, at best, be a short-term policy which will bring no long-term benefits to the country. For the moment, the Government has won some breathing space but only time can show how effective the half-hearted backing for a voluntary system of wage control will be.

Necessary evil?

Yes—and understandably. An FAO Survey reports one-third of India's food crops go waste.

No one likes to queue up for anything. Least of all for food. And yet when food is not plentiful, restricted but equitable distribution is the only answer. Worthy of everybody's support.

Basically the problem is that the nation does not produce enough food. Worse still, as much as a third of what is produced rots away before it can be consumed.

The permanent solution is to grow more food. And growing more food has been given top priority in the Fourth Plan, by the end of which a 50% increase in food production is envisaged.

But more food produced may mean more food wasted. Unless we lower the rate of spoilage.

One way to prevent spoilage is to process and preserve more food and more varieties of food. A recent report issued by the Food and Agriculture Organisation of the United Nations says, "Practically all the spoilage of food that

now occurs...could be eliminated by known methods of preservation."

That's why the consumer packaging industry must grow fast.

We at Metal Box believe that this growth must be made to happen. And to this end all our know-how in packaging, all our research and development facilities and our access to the mainstream of international packaging technology are at the service of the packers.

At Metal Box we can't grow more food. But we certainly can help save more of it. And that, you will agree, is almost as important.

Nationalism and Social Reform in India

Vijay Nambiar

Indian Nationalism and Hindu Social Reform by Charles H Heimsath; Oxford University Press, 1964; pp xiii + 379, Rs 27.50.

TO the student of Indian social history, the intellectual movements of the nineteenth century present a fascinating subject for study. Never before in India's chequered past had there occurred a social and political transformation of the magnitude such as was initiated as a result of the impact of Western ideas. Uptil now, Hinduism had responded to efforts at cultural penetration by wrapping itself more closely in its own Ivory Tower. Muslim domination, like earlier influences, left the general basis of Hindu beliefs undisturbed. The presence of the British in India, however, brought about a radical change in the entire social perspective. Apart from the introduction of the idea of equality based on a conception of the individual as a repository of values and rights, this contact with the West gave to India, for the first time, a doctrine of social progress — the belief that man can himself, through collective action, change the structure of society.

Professor Heimsath's purpose in this book is to attempt a historical analysis of this intellectual movement, more particularly as it related to organised efforts at social reform. Not content with providing a purely chronological account, he tries to see the social reform movement in the broad perspective of Hindu India's intellectual response to the West. The interaction of social, religious and political forces and the gradual weaving of the complex motif of Indian nationalism are studied with an insight as sharply penetrating as it is coldly impartial.

Social Reform in India did not ordinarily mean, as it did in the West, a reorganisation of the entire structure of society with a view to the alleviation of the conditions of the underprivileged; rather, it meant the infusion into the existing social structure of newer ways of life and modes of behaviour. Generally such change was gradual and was initiated only by the upper classes. Social change in India was, for a very long time, based on the 'filtration theory' — the filtration of attitudes and modes of behaviour from the upper layers of society to the lower ones. It was only at the beginning of this century with the growth of organised reform groups

that the social basis of Hinduism, the caste system, came to be questioned. Various social service institutions took up the cause of the less fortunate groups in society and sought to lift India from the morass of caste tyranny.

What was unique about the social reform movement initiated in the nineteenth century? Heimsath notes that even prior to the nineteenth century, there were movements aimed at reform especially in the field of religion. The entire Bhakti cult was in a way a revolt against orthodox Hinduism. However, this was more a negative or *sannyasin*-renunciative type of movement than one of positive social action. For all its spiritual egalitarianism, the Bhakti movement failed to cure the 'diseased condition' of the Indian social system. Its appeal was more emotional than rational and individual salvation rather than social salvation was stressed. Even in the nineteenth century, one finds Bhakti-type movements, as in the Swami Narayana Sect and the Sanmargha Sangha of Mahatma Ramalingam and, Heimsath maintains, in the immediate effects of Shri Ramakrishna's mystical preachings.

The Motivating Force

The approach of the modern social reform movement was not one exclusively of religious dedication. Conceived under the influence of Western methods of organisation, propagating and recruiting support mainly from the English educated, and maintaining as its basic premises western concepts of individualism, natural rights and social efficiency, the principal motivating force was sober rationalism and positive social ethics. Heimsath traces the stimulation of modern social reform to two main sources: the introduction of English education and with it the transmission of Western knowledge and experiences and secondly the activities of the Christian missionaries.

Broadly considered, the uniqueness of the Social Reform Movement in India lay in the inspiration, the ideas and the motivations of the reformers themselves. While earlier reformers were prompted by a love for the underdog, these modern reformers

saw the incompatibility of particular practices with the total progress of society. Furthermore, in their attempt to 'rationalise' the Hindu religion, these reformers sought to distinguish the essential aspects of Hinduism from the nonessential ones, to separate the pristine religion from the subsequent accretions.

Throughout the period surveyed, one notices that the movement for social and religious reform and the political movement, though interacting, constituted separate and clearly distinguishable traditions and were together to lay the intellectual foundations for the emergence of nationalism. Heimsath, discussing the course of the Social Reform Movement till the First World War, sees it as a three stage development. The first stage was marked by efforts on the part of individuals to order their personal lives in accordance with standards adopted from the West. The archetype of such individual revolt and reform was Raja Rammohan Roy. The onset of the second stage was marked by the formation of subnational groups and the growth of a new desire for unity between the scattered and culturally diverse social groups. Politically this was the period when the first glimmer of nationalism appeared on the subcontinent. With the turn of the century, social reform came to mean a regeneration of the traditional spirit of the nation — a regeneration founded on religious revival and cultural xenophobia.

This review will concentrate not so much with the actual reforms effected as on the close interaction of practical and social movements over the last century and a half.

The modern social reform movement properly begins with Raja Rammohan Roy. More than any other Indian of his generation, Roy saw the need for a rational social basis for Hinduism. Combining deep erudition with uncommon wisdom, Roy tried to synthesise the age old Hindu values with the rational elements of the Christian and Islamic traditions.

In his effort to attract the educated Bengalis of his time, Roy founded the Brahmo Samaj — a monotheistic religious body that drew much from

the Christian doctrines but which had as its avowed purpose the restoration of the Hindu faith to its pristine purity. Even before the establishment of the Brahmo Samaj, however, Roy had initiated a social reform movement of the first order. Through a succession of polemical battles waged both during discussion in the Atmiya Sabha (later the Brahmo Samaj) and in the pages of the *Samvad Kaumudi*, Roy was able to enlist support for such reform measures as the abolition of 'sati' and 'kulinism' and the introduction of widow remarriage.

With Roy began the rationalising of the Hindu tradition and the clearing of the underbrush of social evils. The thread was taken up by other enlightened individuals in Bengal, Bombay and Madras. In Bengal, Ishwarchandra Vidyasagar shattered the very core of orthodoxy by his monumental crusade for widow remarriage. In Bombay Vishnu Shastri Pandit sought governmental sanction for the same, while in Madras the cause was taken up by Viresa Lingam Pantulu with the formation of the Rajamundhry Social Reform Association. To mention some of the leading lights of the social reform movement in Western India, there was Balgangadhar Shastri Jambhekar, the founder of the Bombay Darpan and a prominent champion of social reform, the Gujaratis Mehtaji Mancharam and Narmada Shankar and that ebullient literary social critic Gopal Hari Deshmukh 'Lokahitwadi'. On the practical level, there was Jyotiba Phule, an ardent reformer and social worker, and Karsondas Mulji of the Maharaja Libel case fame. Even the Prarthana Samaj, formed in 1867, devoted itself to the reconstruction of Hinduism along more rational lines.

Different Patterns

An important characteristic of the activities of the reformers of Western India was their conscious effort to imbue public opinion with their rationalism. As against the dramatic unconventionality of the Bengali Reformers, in Bombay there was no complete break with traditional society; rather what was sought was a practical adjustment of religious convictions and social behaviour toward a more open and egalitarian basis.

Totally different was the impact of Swami Dayanand and the early Arya Samaj on Northern India. Dayanand combined in himself several paradoxical elements. Extremely conservative in his thought and beliefs, sometimes to the point of obscurantism, yet

astonishingly revolutionary in his attitudes and actions, Dayanand typifies a complex reaction to Western influence. Rejecting the existing caste basis of society, the interior status of women and the system of child marriages, he called for a vigorous programme of social reform aimed not so much at westernising the Hindu religion as in reviving the glory of the Vedic religion. What Dayanand sought was not to help individuals attain personal salvation by isolating themselves from society; he was interested in the salvation of society by means of individual self-assertion and the amelioration of social evils.

Of considerable relevance was the effect of Dayanand's militant spiritualism upon the emergence and development of extremist nationalism in India. By bringing the dynamism of the past to vivify the modern mould, Dayanand blazed the trail for the extremists in two significant respects: (1) His own deep-rooted xenophobia was carried on to the subsequent generations and served to inspire the militant anti-British temper of extremist politics at the turn of the century. (2) Connected to this was Dayanand's idea that history could be interpreted in order to justify social action. This attitude was closely followed by Tilak in his interpretation of the Geeta and Savarkar in his interpretation of the 'Indian War of Independence'.

Genesis of Nationalism

By the 1870's already there had emerged a new stage in the modern development of Indian intellectual life. No longer was social protest confined to individual revolts against established patterns of conduct. With the building up of the infra-structure of social mobility — a rapidly growing system of communication, the expansion of educational facilities and the increase in the number and circulation of newspapers — a new set of group loyalties began to sweep over the various sections of the educated populace. Thus it was that the first glimmer of national consciousness began to appear on the Indian intellectual horizon.

Discussing the emergence of nationalism in India, Heimsath refuses to give credence to the assumption that it was a logical-historical outgrowth of 19th century political reform activities. Nor is it accurate, he believes, to suggest that Indian rationalism was a single and unified movement. In fact, the author maintains that what we term Indian nationalism consists

actually of a congeries of several separate nationalisms. The reason for this, Heimsath says, was that the sub-continent had few if any of the pre-conditions which bring a single nation into being.

What developed as Indian nationalism, Heimsath says was actually a myth based on consciously propagated ideas and one which was more a product of the personal preferences of the so-called nationalists than an enunciation of social realities. He believes that once this was done, through a process of rationalisation, an attempt was made to relate this myth to shared religious, linguistic and geographic identifications. In short, the author suggests that there was nothing spontaneous about the appearance of nationalism in India; it was consciously and carefully contrived by an "eminent company of intellectuals" (p 135).

New Set of Group Loyalties

Such a conception of nationalism is undoubtedly stimulating. However, one should not be led by this interpretation to believe that the genesis of nationalism in India was uniquely different from that in other countries. In essence, nationalism results from the confrontation and interaction of two distinct levels of group solidarities. There is, on the one hand, the solidarity that covers a whole continent, civilisation or culture. This we shall term Culturalism. On the other hand, there is a smaller, more chauvinistic kind of solidarity based on the identification of local customs, habits of living and social attitudes. This we may term Localism or Parochialism.

Now, if nationalism is an artificially inducible stimulation resulting from consciously propagated ideas, this requires the manipulation of certain deep-rooted social symbols. Nationalism thus becomes a matter primarily of social communication. According as these symbols are derived from the wider or the narrower of the above-discussed solidarities, the ambit of nationalism extends toward culturalism or toward localism. This interpretation applies to the development of nationalism as much in the West as in the newer nations.

In a consideration of the emergence of India nationalism, therefore three important factors have to be analysed: who were the agents for such stimulation? what is the character or type of the solidarity desired? and what are the types of symbols manipulated?

Answers to these questions ultimately would provide the clue as to the actual nature of the nationalism that would evolve.

Several scholars date the emergence of nationalism with the founding of the Indian National Congress. The early Congress idea of nationalism was elitist and gradualist in conception. Broadly it was based on the theory of filtration of ideas from the top to lower layers of society. "The dominant nationalist group, which was responsible for the founding of the Indian National Congress, supported the creation of conditions that they felt, from their knowledge of the West, should exist before a nation embodying all of India's people could make its identity felt. Those were mass education, economic advancement, social reform, and a unity of a kind that Western nations enjoyed. Having at its base an anti-traditional, liberal-democratic, secular and politically oriented concept of the nation, the nationalism of the early Congress could properly encompass all Indian cultures and religions". Though, conceptually the Congress had a clear notion of nationalism, the precise strategy for the mobilisation of popular support was not carefully worked out by the early Congress nationalists.

Parochial Nationalism

However, almost alongside this there had emerged another distinct effort at stimulating "national feeling." First initiated by Rajnarain Bose in the 1860's, later taken up by Nabagopal Mitra, that zealous organiser of the Hindu Mela, this movement sought to develop ties on the basis of religion. "The Hindus are destined to become a religious nation" (p 137). The most brilliant advocate of this type of nationalist-parochial sentiment was Bankim Chandra Chatterji. Though Bankim thought in terms of a parochial nationalism — his evocation in 'Bande Mataram' was to Bengal not to India — no one realised more clearly than him how this solidarity was to be evoked. To Bankim, social solidarity could be achieved primarily by stirring religious and cultural loyalties and by working out a close identification of the individual with a particular community. What this ultimately amounted to was that the basis of nationalism was to be religious revivalism. No longer was nationalism viewed as a theoretical concept; it became a vibrant collective consciousness. Another important noticeable feature was the stress on the vernacular as the vehicle of this nationalism.

The relevance of this extremist — moderate conflation for the development of the social reform movement was nowhere more dramatically evident than in the debate over the Age of Consent Bill. The background of the Age of Consent controversy is common knowledge. Consciously advocated by moderate reformers like Malabari and Gidumal the movement against Infant Marriage grew in vigour and evoked the active response of the reformers of the Social Conference. However, when Gidumal suggested a legal remedy in the amendment of the Age of Consent Act, opposition grew extraordinarily fierce. In Bengal, the controversy centred on the religious question of the 'garbhadhana', while in Madras both reformers and anti-reformers were equally active. The vernacular press viewed this unwarranted interference in religious affairs with suspicion and mistrust.

Tilak and Ranade

It was in Bombay, however, that the debate took on the magnitude of a national issue. This was largely due to the publicity given to it by Tilak. Though Tilak recognised that this was primarily a religious issue, he was concerned rather with strengthening the political forces at that time moving in the direction of extremist opposition to British rule. What was most important for him was not any particular programme of social or political reform, but the awakening within the masses of a political and social consciousness. Accepting Bankim's idea that nationalism could only be based on a solidarity that was deep-rooted in the consciousness of the masses, Tilak saw that such consciousness could only be developed through the evocation of religious and cultural loyalties. Only in this way could India be liberated from the yoke of foreign tyranny. Admittedly, these social evils to be curbed; but to argue in favour of legislation of social reform seemed to imply acknowledgement that India's advancement was dependent upon the British (p 165).

Few reformers could counter this argument advanced by Tilak. Even Ranade, who formulated the classic moderate argument for social reform had to seek conciliation with Tilak at the Fourth Social Conference in 1890. The ultimate passage of the Bill was, however, interpreted as a victory for the Sudharakas. The Social Reform movement itself gained, for the first time, a national recognition. Yet, it was no more than a phyrrie victory.

The growing xenophobic reaction to Governmental interference in social and religious affairs came to be steadily harnessed by the extremist political leaders and, by the first decade of this century, extremism had reached its peak.

In his assessment of the Age of Consent controversy, Heimsath maintains that the real issue was the confidence of Indians in Western inspired political and social change, and to a lesser extent, their faith in the British Government. In 1891, he says this confidence and faith outweighed the desire to define and manage India's advance along traditional lines. One is curious to know what the term "Western inspired political and social change" exactly means in this context. If it means Government initiated social reform, this is patently incorrect: as Heimsath himself admits (P 174), no major social reform legislation was passed between 1891 and 1929. As for political change, this controversy marks the beginning of the transition of nationalism from an elitist movement to a popular mass movement; relying not so much on Western liberal ideas as on the manipulation of indigenous cultural symbols. As for restoring faith in the British Government, it was with Tilak that the idea of 'Purna swaraj' crystallised and found popular acceptance.

Emphasis on Social Reform

One of the most urgent questions the nationalist movement faced in its very early stages, was whether social reform should precede political reform or vice versa. The earlier moderates tried to bypass this problem by assigning social reform to private action on the local level, while political reform was considered on the national level and through public discussion. The Indian National Congress deliberately kept aloof from social questions. However it was Ranade who sought to give national recognition to the social reform movement, by attaching the National Social Conference to the Indian National Congress as its counterpart.

The National Social Conference itself was soon to split into two distinct schools. On the one side, there was the Ranade-Telang school which adhered to the doctrine of "progress along the line of least resistance". According to them, reformers must "flow with the tide of social change". For Telang, this meant a greater emphasis upon political reform, which he felt

was easier to achieve in his day. This approach sought to effect change only in "constructive channels" and rarely sought to undermine the foundations of Hindu society. The opposite school of reform, led by Chandavarkar and the Madras reformers (particularly the *Hindu* and the *Social Reformer*) called for a vigorous campaign of social reform, Chandavarkar appealed to men and women to act from a free conscience and stand up against social evils.

Such divergences naturally affected the overall efficacy of the movement for social reform. This was further vitiated by the fact that the social reformers themselves failed to live up to their high precepts. They yielded in the face of precisely those elements against which they should have stood up (e.g. Ranade's 'praya-schita', his second marriage to a child of eleven; Raghunatha Rao's reluctance to attend the marriage of a widow, etc). It is against this background that one sees the strength of Tilak's insistence that social reform should be completely set aside and that the all important task was that of invigorating the political movement. (p 210).

The early moderate nationalists tried to define a new India in terms of categories derived from European political and social experiences. These efforts failed inasmuch as the general mass of people were unaffected. What was needed was a completely new alignment of political and social forces.

The formation of the Muslim League and the theory of two separate streams of cultural consciousness cut at the roots of the earlier Congress stand on nationalism. Slowly, nationalism in the early years of this century became Hindu and adopted Hindu symbols and traditions on a mass scale. The pathfinders of this new religio-political movement were the practitioners of political extremism like B C Pal, Tilak and Aurobindo. The basic requisites for the reconstruction of nationalism, the extremists believed, were: (a) the incorporation of the masses into the political movement and (b) the identification of the nation with religious ideas. These were linked together and gave to the movement a strong militant and revivalist character. As Aurobindo said (p 313) Swaraj was "the fulfilment of the ancient life of India under modern conditions, the return of the 'Satyayuga' of national greatness...". If the national spirit was to penetrate beneath the English-educated intellectual groups, and be truly Indian, only

a cultural and religious awakening could effect this.

In the field of social reform, Annie Besant, after an initial attempt to bolster the orthodox position, came out in her book "Wake Up India: A Plea for Social Reform" with a vigorous plea for all the major planks of the social reformer's programme including remarriage of virgin widows and the emancipation of the depressed classes. Further, the Theosophical Society carried her concern into endeavours of a social service or educational nature. Another figure on the intellectual horizon was Swami Vivekananda. Vivekananda was profoundly struck by the malaise of his own society. Much of the country's tragedy, he felt, could be ascribed to the hopeless quest for mukti. Vivekananda wanted to go to the very root of this malaise and effect a radical reformation. This he felt was possible only by means of a spiritual rejuvenation. "Put the fire there (at the level of the masses) and let it burn upwards and make the Indian nation." "Vivekananda condemned the so-called reformers as having done no good "excepting the creation of a most vituperative, and most condemnatory literature." Rather than endorse the ornamental reforms advocated by the Social Conference, he sought to bring a new life for 'all' of India's women and for the lower classes. Vivekananda's thought marked the culmination of the 19th century social revolt. As Heimsath says:

"The challenge Vivekananda presented to Indians to reform totally their religious and social life was not accepted, because on the one hand it called for too great a sacrifice from the still complacent educated and privileged groups and on the other hand, demanded an uprooting of traditions, customs and beliefs unacceptable to the general populace"

Revivalist Nationalism

The impact of this new revivalist nationalism upon the social reform movement is of much significance in that the new nationalists stimulated the reformers belief that all groups in society must benefit from the advances modern India was making. Even the National Social Conference responded by enlarging the scope of social reform by expanding it to cover housing, education of the masses and other welfare activities and objectives.

In a very important sense, Mahatma Gandhi synthesised the two approaches

(the moderate and the extremist) and evolved an altogether new response to the British influence. Like the social reformers, sometimes even more vehemently, Gandhi insisted that social progress, especially for the untouchables, was a condition for political progress. However, Gandhi's method of evoking popular response and of social communication differed radically from the traditional methods of the social reformers. His emphasis was not always on reason and empirical evidence but rather on an ethical imperative. Further and most effectively, he impressed by the strength of personal example. Yet, again, he refused to accept the moderates' stand that true national unity could only be achieved by the complete removal of caste barriers.

Even in the political field, Gandhi emerged as the most successful synthesiser. While he wielded the xenophobic spirit that had been roused by the earlier extremist, his rejection of violence in politics changed the very strategy of the national movement. Gandhi thus was able to rouse the masses but he taught them to wield a different weapon. Again, though he appealed to the masses through the conscious use of symbols borrowed from Hinduism, he was prompt to stress his universalism and prevent the national movement from becoming a mere communal congregation. Gandhi's success in the mobilisation of the nation was very evident so long as the predominant aims of the movement were negative. The precise utility of these very same weapons and symbols for the purpose of positive action and reconstruction of the nation is, however, being questioned today.

Heimsath concludes his study with the assertion that Social Reform and nationalism are irrevocably linked as living processes and as organised movements in India as well as elsewhere. Following Lerner, he believes that nationalism and social reform emerge as a result of transformation of traditional societies and the transfer of individual loyalties from the family and caste groups to larger societies of the city, region and nation. It is basically from this social perspective that Heimsath views change and reform in India.

Written with extraordinary breadth of vision and sensitivity, Heimsath's analysis is as refreshing in style as it is original in interpretation. The author combines painstaking research with the intellectual simplicity that goes with true scholarship to provide us with a definitive work on the subject.

An Experiment in Voluntary Repatriation of High-Level Technical Manpower

The Scientists' Pool

S P Awasthi

A debit item on the manpower balance-sheet of India during the last decade has been the non-return of a considerable proportion of students going abroad for higher studies in science and technology.

To deal with the problem of a two-pronged policy has been evolved. Large-scale development of facilities for education and training in science and technology has been undertaken in the country itself and, secondly, measures have been taken to promote repatriation of Indian scientists in foreign countries.

The present article attempts to study and evaluate the efforts made so far for encouraging the return of Indian scientists abroad with special reference to the Scientists' Pool Scheme.

AT the end of the First Plan period it was found that while the shortage of high-level scientific and technical manpower constituted one of the major obstacles in the successful execution of the development programmes, an appreciable number of our scientists¹ was being absorbed in the economies of the countries where they had gone for higher studies. According to one estimate, there were over 5,000 Indians holding scientific and technical qualifications in foreign countries.² More than half of them were engaged in "paid service". They constituted a valuable reservoir of high-level skills with varied experience precious to a developing country like India. It was necessary to pool and classify the academic qualifications and experience of these scientists before formulating incentives for their return. For this purpose, it was decided to add a special section to the National Register.³ Known as the "Indians Abroad" Section, it started functioning soon after the Second Plan was launched.

Registration in the "Indians Abroad" Section, harmonising with the pattern of the main register, is voluntary, which is only proper considering the futility of pressing those not interested in returning in the foreseeable future to get themselves registered. However, mere registration would be of little value even to those interested in returning or planning to return unless it improved their prospects of obtaining employment. Arrangements were, therefore, made for the circulation of the relevant particulars of the registrants to various prospective employers in the public as well as in the private sector. They were also requested by the administrative authority of the National Register, viz, the CSIR, to contact directly registrants whom they might wish to employ. It was decided, in addition, to treat all registrants as "personal contact candi-

dates" for purpose of employment for posts under the Government of India. Most of the State Governments also took similar steps in regard to posts under their jurisdiction.

These measures, however, were found inadequate. An analysis of the response to the registration drive has indicated that duly completed registration forms were received from barely 18 per cent of the Indian scientists abroad.⁴ The lukewarm response to the scheme was not surprising. Entry into a large chunk of employment avenues existing in universities and research institutions, private industry, state undertakings and other quasi-government organisations was possible only after interviews, and registration in "Indians Abroad" Section was of little avail in such cases. Even those who returned to India for improving their chances of quickly finding some suitable posts faced uncertain prospects. The inelasticity of the recruitment procedures strained the patience of some of them far too much. They left India to seek employment in other countries.⁵

Such a situation was far from satisfactory especially when a considerable number of posts in India were lying vacant for want of suitably qualified candidates. Evidently, there were gaps in the policy for registration of high-level man-power abroad. Was it easier to negotiate a suitable post from abroad after registration? Did registration guarantee a permanent job immediately on return? A host of such questions were bound to be asked by well-qualified scientists abroad before formulating plans to return. To allay their apprehensions it became necessary to offer a more positive inducement. Earmarking suitable jobs for them either well in advance or immediately on their return would have involved a good deal of advance mapping of fields where foreign-trained

manpower was required. The situation could hardly await such a time-consuming solution. The next best alternative was to evolve a scheme which would guarantee temporary placement to the high-level talents abroad on their return as a *pied-a-terre* so that they might get some breathing time to explore various avenues of employment in the country.⁶ Concerned with the mounting loss of precious high-level manpower, the Manpower Committee of the Cabinet, in late 1958, decided to constitute a pool for temporary placement of well-qualified scientific and technical personnel returning from abroad. The relevant resolution read:

"The Government of India have had under consideration the question of establishing a pool for temporary placement of well-qualified Indian scientists and technologists returning from abroad until they are absorbed in suitable posts on a more or less permanent basis. In consultation with the Council of Scientific and Industrial Research and other authorities concerned, they have now sanctioned, the constitution of the Pool..."⁷

The introduction of the scheme for constitution of the Scientists' Pool had the desired effect on the volume of response to the "Indians Abroad" Section. The scheme envisaged that all registrants returning to India in the immediate future would be automatically considered for selection as Pool Officers. This inducement was surely an attractive one. In addition, a berth in the Pool ensured a relatively easy access to all possible avenues of employment, whether in public sector or in private industry. Not unexpectedly, therefore, the coverage indicated improvement.⁸ In order to ensure efficient coordination between registration in the "Indians Abroad" Section and the process of selection to the Pool, the

administrative responsibility for the working of the Pool was also entrusted to the CSIR.

Selection Requirements

However, registration in the special section of the National Register is not a necessary pre-requisite for selection to the Pool. Non-registrants are also entitled for consideration if they furnished their full particulars in the form prescribed for registration in the "Indians Abroad" Section. Besides, eminent scientists holding important positions abroad are considered for selection on recommendations of Indian Embassies, Departments of the Government of India, etc. Experience of the working of the Pool, however, indicates that cases of selection of non-registrants are few. Facilities extended to non-registrants, nevertheless, reflect the keenness of the Indian Government to facilitate the return of well-qualified Indian scientists abroad; registrants as well as non-registrants.

The scheme is primarily intended to offer temporary placement to well qualified scientists returning from abroad. It cannot, however, be denied that the inelasticity of the recruitment procedure may create difficulties even for those with high Indian qualifications. Provision was, accordingly, made to provide shelter to scientists with outstanding Indian qualifications to the extent of 25 per cent of the Pool's authorised strength. Consideration for the Indian qualified personnel was guided, perhaps, by the desire to apportion the benefits accruing from the scheme in as equitable a manner as possible. Their intake in the Pool has, however, been much below the stipulated limit. The experience during 1964 may be cited as a typical illustration. Just over 25 per cent of the candidates forwarded for selection to the Pool during the year possessed Indian qualifications. But their share among those actually selected was barely 2 per cent. This trend, has, in fact, persisted all these years. Evidently, the best among them did not require the Pool's assistance. This may be partly attributed to the universities and other centres of education and research absorbing talented students in some research or teaching capacity as soon as they complete their studies. To some extent, the low intake may also be considered to provide a reliable yardstick to measure the success of the various research scholarship/fellowship schemes instituted by the University Grants Commission, CSIR and other Government

and professional agencies to the more promising students.

The scope of the Scientists' Pool has been recently enlarged to include persons with high qualifications in humanities and social sciences as well. The total number of berths available in the Pool for persons with foreign or Indian qualifications in these fields has been fixed at forty.

The practice of earmarking a definite number of posts to others may appear to look restrictive to the foreign-trained scientists desirous of returning. The constraint, however, is more apparent than real. The authorised strength of the Pool has never remained static. On the contrary, it has been steadily increasing with the growing utility of the Pool. At the time of its inception, provision was made for review of the initial capacity of 100 as often as necessary. It was raised to 500 by stages. Even this was found to be inadequate. It was consequently decided that even this limit could be exceeded if at any time competent persons were available for appointment to the Pool. The working strength of the Pool crossed the limit of 500 soon after this decision was taken and touched an all-time high on January 1, 1965. The total number of persons working in the Pool on that date was 562.

Recruitment Procedure

The pragmatic approach of the framers of this scheme is equally discernible in the procedure for selection. It is specially designed to avoid delays. To this end, the Union Public Service Commission has delegated its authority to a specially constituted body called the Special Recruitment Board. In order to ensure selections strictly on the basis of merit, experts in different subjects of specialisation are associated with the Board when necessary.

Any attempt to assess merit will be of doubtful validity if there is an exaggerated emphasis on educational attainments. This is particularly true of developing countries like India where broad-based technical education is of comparatively recent origin. By insisting on outstanding academic record a number of persons in India are disqualified from selection to the Pool although they may have, what J B S Haldane called, "the makings of a first rate scientist". Haldane was of the view that the Pool should provide a kind of backdoor for entry of such persons who may not possess a high degree but have a couple of scientific papers of real merit to their

credit. This suggestion for improvement is worth consideration provided a fairly accurate measure of the quality of such talents could be evolved.

The suggestion, however, does not vitiate the basis for assessing merit in case of foreign-qualified scientists, who constitute the bulk of those selected so far. Selections are made, as far as possible, on the basis of academic record conjugated with research experience and output. The elaborate formality of interviews is avoided to the extent possible. Only those candidates are called for interview about whom particulars available are insufficient. During the period from 1961 to 1964, for example, only about 18 per cent of the persons considered for selection were called for interview.

Until 1960, selections to the Pool were made once a year. The practice of bulk-selections, however, exposed well-qualified scientists returning from abroad to unnecessary hardship during the intervening period. To ensure that deserving scientists do not have to wait for any length of time after their return, arrangements have been made to select them on an almost continuous basis. On an average deliberations for selection are being conducted every third day. Interviews are also arranged frequently, more or less every month.

Fixation of Emoluments

The minimum salary payable to Pool Officers is equivalent to the initial salary of Junior Class I Officers of the CSIR who start on a salary of Rs 400 per month. The Special Recruitment Board is authorised to fix the salary of the candidates selected between the range of Rs 400 and Rs 700 per month on the basis of individual merit. In exceptional cases,

Table 1: Foreign Qualified Candidates Selected to the Pool
(As on January 1, 1965)

Category	Number	Percentage
With Foreign Qualifications		
(a) Repatriated	2,016	61.9
(b) Abroad	1,166*	35.8
Sub-Total	3,182	97.7
With Indian Qualifications	76	2.3
Total Selected	3,258	100.0

* Includes 52 persons who left India after joining the Pool. It is assumed that these 'expatriates' had earlier returned from abroad on selection.

salary in excess of Rs 700 may also be paid. During the period of their stay the officers are paid other allowances admissible to their counterparts in CSIR.

The salary fixed by the Special Recruitment Board is not intended to be the market-value of the scientists concerned. Its fixation is unrelated to the job assigned while working in the Pool. In fact, the salary paid to the Pool Officers resembles somewhat a "return-scholarship".⁹

Every effort is made to accommodate the preferences of the candidates selected in regard to their temporary placement. Particulars of the selected candidates are forwarded to suitable organisations in the light of candidates' preferences and a formal appointment order is issued after the consent of any one of the concerned organisations is received. Efforts are made to arrange the placement as expeditiously as possible and in many cases it is finalised even before the arrival of the selected candidates in India.

Placement on temporary basis, as the scheme stipulates, is arranged in two ways, viz, by attachment or secondment. When a Pool Officer is attached to some organisations, his pay and allowances are paid out of the budget of the CSIR. On the other hand, when he is seconded to an organisation, his salary, etc, are paid by the organisation, concerned. The secondment-method has failed to gain the support of employing organisations. This may be mainly due to its financial implications. But, no difficulty of this nature arises when a Pool Officer is attached to some organisation. Over 200 organisations in the country including national laboratories, universities and scientific institutions, Government departments and State and Central enterprises have Pool Officers attached to them.

Although they are considered to be officers of the CSIR, the Pool Officers work under the administrative control of the organisation to which they are attached. There is also a practice that the organisations keep the CSIR informed about the performance of the Pool Officers through half-yearly assessment reports.

Duration of Stay

There is no limit to the duration of stay in the Pool. However, the Pool Officers are expected to make efforts on their own and secure regular em-

ployment without much delay. For this purpose, the scheme provides for unrestricted freedom to Pool Officers to apply for any post in India. Besides, there is a built-in disincentive for an indefinite stay in the Pool in the decision not to give annual increments in salary to Pool Officers. Their efforts to secure regular employment are kept under close scrutiny. In addition to the efforts made by Pool Officers for finding suitable employment, their names are referred against suitable vacancies and their qualifications, experience and employment preferences are circulated widely among employing agencies in the public and private sectors by the CSIR.

The purpose of formulating these measures was to ensure quick and continuous turnover of the membership of the Pool with older entrants making room for newer ones. This, however, is not happening. The stagnation-ratio is showing a rising trend. During the beginning of 1964 the proportion of those who continued working in the Pool for a period beyond twelve months was nearly 30 per cent; it rose to nearly 40 per cent during the year.

The growing concern about the dormant constituents of the Pool is well reflected in the decision of the CSIR to consider the Pool Officers who have stayed in the Pool for over a year for appointment in supernumerary posts.¹⁰ While the full impact of supernumerary appointments on the rate of offtake from the Pool is yet to be felt it may be observed that the attempt to provide a monetary solution to make good the lack of suitable openings may not succeed fully unless there is work besides pay in these appointments.

Indian scientific and technical personnel abroad may be divided into two groups; those who have registered themselves in the "Indians Abroad" Section and those who have not. The size of those not registered is not precisely known though, as indicated earlier, their proportion in relation to those registered is falling. The non-registrants are mainly those who are assured of employment on return of those who do not propose to return immediately. It is probably for these reasons that the response from non-registrants has been negligible.

The selection to the Pool has been mainly from registrants. It is estimated that about 10,000 persons were enrolled in the "Indians Abroad"

Section at the beginning of the current year.¹¹ Almost one-third of them were selected as Pool Officers. Actually, the ratio is much higher because all registrants do not fall within the consideration-zone of the Pool Scheme. It is meant to attract only that segment which is (a) highly qualified and (b) planning to return or already in India.¹² The percentage of selection to the Pool from this category of registrants has been significantly high. During the two-year period from 1963 to 1964, for which relevant data are available, between 80 per cent to 85 per cent of those considered for selection as Pool Officers were offered appointments.

But how many of them have returned? How many have not? Is a further break-up of these numbers possible? How many of those returning joined the Pool? What is the direction of off-take from the Pool? An attempt is made in the following paragraphs to answer these questions.

Out of 3,258 persons selected to the Pool upto the beginning of 1965, as many as 3,182 were from abroad. The remaining candidates were selected against the quota earmarked for Indian qualified scientists. As indicated in Table 1, more than 60 per cent of the candidates with foreign qualifications have returned.

Table 2 indicates the position of candidates selected in relation to their entry to the Pool. For this purpose, they have been classified in three categories. The first category includes those scientists who have indicated their non-acceptance of the Pool offer. The second category includes scientists who are in various stages of joining. These stages are (i) offers to be made, (ii) acceptance awaited, (iii) placement to be finalised, and (iv) joining reports

Table 2: Position of Candidates Selected to the Pool
(As on January 1, 1965)

Category	Number		
	In India	Abroad	Total
Did not join	494 (23.6)	199 (17.1)	693 (21.3)
Yet to join	362 (17.3)	915 (78.5)	1277 (39.2)
Joined	1236 (59.1)	52 (4.4)	1288 (39.5)
Total selected	2092 (100.0)	1166 (100.0)	3258 (100.0)

Note: Figures in parenthesis are percentages.

awaited. The third category consists of Pool Officers.

The following observations may now be made :

- (1) Less than one-third of the candidates who did not join found the inducement to return inadequate. These persons did not return to India. The rest did not join the Pool because they obtained regular employment on return. In this respect, the Pool offer served as an insurance against hardships of unemployment.
- (2) The significant size of "Yet to join" category appears to be the direct result of the practice of selection on an almost continuous basis. Almost 79 per cent of the selected candidates abroad are in various stages of joining. A considerable proportion of this number is likely to return on completion of procedural formalities for entry to the Pool.
- (3) More than half of the candidates who returned have joined the Pool. The number of those who left the Pool for abroad is, by no means, alarming although the trend calls for close scrutiny.

An analysis of the direction of off-take from the Pool (Table 3) indicates that over half of the Pool Officers have left the Pool on obtaining employment in the country. The majority of the remaining were working as Pool Officers.

It will be seen from the foregoing that, within the ambit of its operation, the Indian experiment in voluntary repatriation of its high-level manpower has achieved significant success. At least three out of every five scientists

Table 3: Direction of Offtake from the Pool.
(As on January 1, 1965)

Category	Number	Percentage
Left on obtaining employment in the country	659	51.3
Left on obtaining supernumerary appointments	10	0.8
Left for abroad	52	4.1
Working in the Pool	562	43.8
Total Joined	1283*	100.0

* Excludes 5 Pool Officers who died.

selected to the Pool have returned. (Even if 50 per cent of those constituting the "Yet to join" category returned from abroad, the ratio will improve to 3:4). An equal measure of success has, however, not been attained in respect of their absorption in regular employment. Broadly speaking, a little over 50 per cent of the repatriated scientists have obtained regular employment in India. Most of the remaining scientists are still in the Pool looking for suitable openings. The situation calls for a closer integration of the policy of voluntary repatriation of scientists abroad with the national manpower policy relating to optimum utilisation of scientific talents in the country.

Shortcomings notwithstanding; the Scientists' Pool Scheme has made considerable impact on the repatriation policy of some of the developing countries. It may be relevant, in this context, to refer to the Greek policy of restricted repatriation of its competent scientists abroad which has been influenced, in no small measure, by the Scientists' Pool Scheme. The Consultative Committee of Colombo Plan countries on Co-operative Economic Development in South and South-East Asia at its 15th meeting held at Bangkok in 1963 has commended the Scheme to other countries of the region for retaining "highly-trained personnel within the country pending the availability of suitable job opportunities for them."

Notes

- ¹ The term "Scientists" is also intended to include doctors, engineers and technologists.
- ² Council of Scientific and Industrial Research (hereafter referred to as CSIR), "Indian Scientific and Technical Personnel in Foreign Countries", New Delhi, August 1958, p 3.
- ³ The National Register was started by the CSIR in 1948 for registration of academic qualifications and related particulars of high-level scientific and technical manpower in India. For a detailed description of the National Register, see *Technical Manpower*, monthly bulletin of the CSIR, Vol V, No 1, Jan 1963, New Delhi, pp 1-3.
- ⁴ CSIR, "Indian Scientific and Technical Personnel in Foreign Countries", *op cit*.
- ⁵ Many Indian students from abroad waited an average of a year before securing a permanent job,

Less than 10 per cent could find employment appropriate to their qualifications and training. About 25 per cent of the foreign-returned, young Indians interviewed considered leaving India for employment in foreign countries. In this connection, see John and Ruth Hill Useem, "The Western Educated Man in India," Dryden Press, 1955, especially pp 81-83 and 123.

⁶ The idea gained popular currency when the First Conference of Scientists and Educationists meeting in New Delhi on July 18 and 19, 1958 to consider the implementation of the Scientific Policy Resolution of the Government of India recommended that "a pool of scientists and technologists should be created by recalling young Indian scientists and technologists working abroad. Until such time as they found suitable employment, they should be given fellowships and employed on research in universities, national laboratories and institutions of higher learning and industry". In this connection, see *Minerva*, Vol II, No 2, Winter 1964, p 246.

⁷ Ministry of Home Affairs (Directorate of Manpower), Government of India, Resolution No 8/4/57-MP dated October 14, 1958.

⁸ For instance, a comparison of data published by the Institute of International Education, New York and the CSIR regarding Indian students and scholars, etc, in U S A in fields of science and technology indicates that over 45 per cent of them have been registered in the "Indians Abroad" Register upto early 1965.

⁹ A comparison of the senior and junior fellowships awarded by the CSIR with the number of offers made to Indian scientists abroad since the inception of the Scientists Pool may be revealing. A total number of 4,546 fellowships were offered to scholars in India as against 3,182 offers of appointment to the Pool to Indian scholars abroad.

¹⁰ Under this scheme introduced in late 1963 the Indian Government has authorised all approved scientific institutions and state undertakings to create a certain number of supernumerary posts to which temporary appointments can be made quickly from scientists working, or studying abroad as also

Reliance on Rich Farmers for Development Its Implications

A R Desai

A proper study of the impact of change in agriculture in the non-socialist developing countries of Asia should begin with an examination of the implications of the policy of relying on the rich farmer which is the starting point of all government attempts to develop agriculture in these countries.

By making the rich farmer the lynch-pin of agricultural development, the leaderships in these countries have set in motion "involutionary trends" which will lead in course of time to tension and explosions.

Proper understanding of the implications of the policy of relying on the rich farmer is also important because the richer landowning groups in many Asian countries come from certain castes or regional, racial or religious groups. The efforts to underpin the richer landowning classes may, therefore, have far-reaching consequences in terms of strengthening certain castes or religious, regional or racial groups in these countries. Economic tension may as a consequence be heightened by social, regional or religious tension.

THE present paper attempts, in a very broad manner, to analyse the character of changes that have been taking place in under-developed developing countries of Asia after the end of the World War II. It attempts to locate the trends of changes revealed in those countries which have liberated themselves from European colonial rule and have been trying to refashion their economies and their social structures with a view to accelerating their overall development. The analysis is restricted to those countries which after liberation have chosen to develop broadly on capitalist lines through the operation of national plans and not on the basis of centralised structural plans and on socialist lines. Thus the paper excludes the analysis of changes that have been taking place in countries like China, North Korea, North Viet Nam and others.

With a view to appreciating the nature of changes that are taking place in the countries of Asia it is necessary to have, as a starting point, some preliminary background of these countries to locate and assess the changes.

II

Basic Features

The countries of Asia, barring Japan, at the end of the Second World War exhibited following characteristics:

(A) All these countries were either directly ruled by European Imperialist countries like Britain, France, Holland, Belgium, Spain, Portugal and others or were indirectly regulated by these European powers. These countries were kept predominantly as appendages of the western powers, operating as agrarian, raw material producing areas subserving the interests of the colonial masters. Some of the countries were turned into colonies round some important commodity like oil. The extraction, refinement and final

processing of this commodity were largely the preserve of foreign oil monopolies. Some of the smaller countries produced certain commercial products like tea, coffee, jute, sugar, rubber or some mineral products. These products were grown mostly through large European estates organised in plantations. Barring a few plantations, which introduced improved, modern techniques of production, most of the estates carried on operations through small cultivators who were expected to grow the products and supply them to the plantation owners. The third group of Asiatic countries like India, Pakistan, Burma, Indonesia and others produced a wide variety of crops, basically food crops, and operated on the basis of non-mechanised, primitive, inefficient family-farm methods. These countries also included a small but growing sector of agrarian production concentrating on non-food commercial crops like cotton, jute, tea, coffee, oilseeds and a few others.

(B) The second feature of the colonial and semi-colonial Asiatic countries lay in the fact that they were deliberately kept agrarian and underdeveloped by the European rulers. Industrial development was not merely not permitted in these countries but was deliberately hampered by the foreign rulers. Development was permitted only in those sectors which either supplied the requirements of the foreign rulers or did not fundamentally challenge their commercial, industrial or financial empires. The limited commercial, financial and industrial development that was permitted was basically owned and manned by the branches of some of the important corporations of the European countries. Indigenous companies had a very subordinate position in the commercial, industrial and financial set-up of these countries. They were more in the nature of feeder groups attached to the giant European companies, or com-

peted very unfavourably with them. The distorted and lopsided development of these countries, under the direct and indirect impact of foreign rulers, created a unique pattern of social development, exposed these countries to the influences of the western capitalist mode of social relationships, destroyed the peculiar type of equilibrium which existed, introduced capitalist economic relationships but only to a limited extent, created an indent on the agrarian social structure which disfigured it and made these countries a wild agrarian hinterland of foreign industry and foreign capitalist organisations and thus brought them into the vortex of modern economic relations without allowing the consequences of these trends to mature in the form of a fully industrialized society, with the agrarian sector as a healthy but subordinate part.

This feature has to be noted by scholars for two reasons. (1) The underdeveloped countries on the eve of their independence were not backward in the sense that they exhibited characteristics of old feudal traditional society. These countries were a part of the world capitalist colonial system and hence they had acquired distinctly new features. Their development now depended on different approaches and forces than the ones which operated to transform feudal Europe into capitalist industrial Europe. Unfortunately this distinction is ignored by a large number of scholars under the influence of the Rostow model of development. (2) This feature has to be noted for another reason: Many scholars try to discuss the problems of development of these underdeveloped countries on the assumption that forces like private incentive for profit, "betting on the richer sections" to take initiative and then spreading the improvement like an 'oil stain' are the only way to lift them to a developed stage. Their basic analysis operates within the framework of a concept of

unilinear-evolutionary development. They presume that these countries are only lagging behind the developed countries in terms of time. They will pass through the same stages of development which Europe did during the last three hundred years.

These two major assumptions have coloured the approach of a large number of scholars and have made them oblivious to the fact that the underdeveloped countries are not the same as pre-capitalist underdeveloped feudal countries, but are the distorted, agrarian counterpart of the world capitalist system. They forget that these colonial and semi-colonial underdeveloped countries have been and are in a qualitatively different phase where the normal path of industrial development, as was pursued in West European countries, cannot be adopted as a means to bring them to a developed stage.

(C) The third feature of the underdeveloped colonial and semi-colonial countries is summed up in the observation that "in many non-western countries, the protracted colonial or semi-colonial expansion has not furthered, but retarded economic development". As Prof Wertheim has indicated in his work "East-West Parallels", "for many of those countries, the traits mentioned by Sauvy still apply: one-sided economic structure, high percentage of agriculturists, low standard of living and nutrition, low degree of mechanisation". Further this colonial and semi-colonial expansion has generated numerous currents which have upset the old pre-industrial sets of interactions. By not permitting industrial growth in those countries, it has "petrified" many social institutions. However, by introducing money economy and exchange it has also disrupted many traditional bonds and values. It has transformed land into a commodity and thereby initiated a new stratification system by "mobilising landed property", thus destroying the traditional protection and security surrounding the individual. It has further led to the process of atomising and proletarianizing peasant population, with the consequent ferment among them in the competitive-capitalist matrix unparalleled even in their past histories. The colonial and semi-colonial expansion by the European capitalist powers also led to the ruination of handicrafts and artisan industries. It has brought the agrarian economy and society, though lop-sidedly, into the vortex of the world market.

By preventing the growth of alternate occupations it has brought about excessive pressure on agriculture, leading to subdivision and fragmentation of land, transforming cultivable lands into tinier and tinier plots. It has forced agriculture to remain technically inefficient, incapable of utilising technological and scientific improvements, and operated predominantly by small peasants, tenants or landless labourers on uneconomic units of operational holdings. These processes, in the context of land becoming a commodity and the agrarian population being brought in the network of monetary transactions both for payment of revenue in cash and for other purposes, created a peculiar type of stratification, which was new to these countries and which had a tremendous impact on the trend of development in the agrarian sectors. Colonial and semi-colonial expansion had thus created problems of technical and institutional improvements in agriculture and also of removing the increasing pressure on agriculture. It also made rapid industrialisation of the countries imperative as a basic pre-requisite for absorbing a big proportion of rural population into secondary and tertiary occupations.

The above characteristics of the underdeveloped countries are the result of colonial and semi-colonial expansion of the western capitalist countries and therefore have to be viewed as peculiar to modern underdeveloped countries.

(D) The emergence of a new pattern of stratification in the agrarian area was another feature which developed in these countries as a result of these countries being shaped as colonial or semi-colonial territories. The colonial and semi-colonial policies created a peculiar class configuration in agrarian areas, composed of the following:

(1) A class of proprietors of land (landlords) composed of the following categories: (i) old feudal tribute gatherers transformed into absentee landlords; (ii) a new group of moneylenders and traders, who extended their grip over the crops, land and even persons of the agrarian population by providing loans and credit so necessary for farmers in the new setting. (iii) a small group of companies, or persons operating as plantation or mine owners, mostly composed of Europeans; (iv) a small group of rich farmers, which emerged in the context of growing market economy. However, it should be noted that the

majority of even rich farmers, operated on small farms on the basis of family labour or by utilizing the cheap abundant labour of tenants or the agricultural proletariat.

(2) A class of small peasants, the majority of whom hold tiny, uneconomic holdings. The members of this class have been in the process of becoming poorer and poorer and of being transformed into tenants or landless labourers. They have been perpetually in debt. Having hardly any resources, or sufficient land, they could not undertake improvements in agriculture. This class of petty-peasants operating on small-uneconomic farms slowly grew into nearly eighty per cent of the total proprietary class in agrarian areas of Asia.

(3) A class of tenant farmers, operating as tenants on the land of proprietors. The majority of this class was composed of small, inefficient cultivators working on uneconomic holdings.

(4) A growing class of agricultural labourers, composed of those whose sources of livelihood was predominantly selling their labour, a class which has been growing during this period.

(5) A fifth category of agrarian population was composed of ruined artisans and others who eked out their livelihood in agrarian areas by methods which defy imagination. This category also contained a large section of unemployed in the agrarian areas, who finding employment neither in rural areas nor in urban areas constituted a floating vegetating population.

This stratification developed as another peculiar feature in all colonial and semi-colonial countries of Asia on the eve of their independence from European powers. The proportion of small farmers, tenants, agricultural labourers and ruined artisans may vary from country to country, but they constitute the majority of the rural population in all the colonial and the semi-colonial countries. The group of big landlords or rich farmers constitute a very small minority in Asiatic countries. Within this group, the proportion of big absentee landlords, composed of feudal tribute gatherers, moneylenders or traders, has always been larger than that of rich farmers who cultivate or supervise cultivation and who in some cases make use of modern technical and scientific inputs.

All the Asiatic countries exhibit the above mentioned features in various degrees. These features have to be borne in mind if the changes in the

character of agriculture after the Second World War, particularly after these countries secured independence from foreign rule are to be understood. We will now observe the changes in the character of agriculture taking place in the underdeveloped but developing countries of Asia. As pointed out earlier, we will restrict our observation to countries which have not taken the socialist path of developing their economy.

III

Major Approaches to Change

The leaderships of these underdeveloped countries have been trying to adopt various measures to bring about changes in their economic and social set-up. They are trying hard to elevate the state of their economy and social structure from one of underdevelopment to one of development. With a view to achieving this they have started various measures to bring about transformation in agriculture.

We will briefly indicate the types of changes that are being introduced. We will then take India as an illustration for pointing out how far these changes are being effected and with what consequences to the social structure.

The changes that are being brought about can be listed as follows:

(1) Changes brought about by making the technical basis of agriculture scientific and efficient. For instance, improved seeds, fertilizers, irrigation facilities through various major hydro-electrical projects and minor irrigation projects, supply of electricity, improved ploughs and other implements including even use of tractors where possible and other measures are being adopted in these countries, to raise the productivity of land and increase the quantity and improve the quality of agricultural production.

(2) Efforts to eliminate the subsistence orientation of production and to bring agricultural goods to wider and wider markets, by building roads, marketing facilities, standardizing weights and measures and creating facilities for marketing. Efforts are also being made to protect the agriculturists by price regulation.

(3) Efforts to change the class-relationships in the agrarian area, by land reforms and other institutional means. Measures to remove absentee feudal landlords, eliminate tenancy and curb the moneylenders are being adopted.

(4) Efforts to provide various agencies like co-operative societies, land mortgage banks and other institutions to enable peasants to combine, and to provide them with the necessary credit and marketing prerequisites for making their agriculture efficient.

(5) Efforts to introduce educational facilities as well as public health measures to improve the skills and general health of the population, in agrarian areas. Efforts to regulate the birth-rate by spreading ideas of family-planning and birth control techniques.

(6) Efforts to evolve new voluntary institutions and associations to generate a new approach and atmosphere in the traditional rural setting and to counteract the effects of petrified old social institutions and values.

(7) Efforts to industrialize the countries to supply alternative employment to the already surplus population as well as to the population that will be rendered superfluous as a result of improving technical efficiency of agriculture. In order to transform the agrarian colonial and semi-colonial underdeveloped countries into a developed one, it is necessary that the percentage of population dependent on agriculture be drastically reduced. At least fifty per cent of the population of the country must depend upon non-agricultural vocations. It means relieving agriculture of nearly 20 to 30 per cent of its operators and provision of alternative employment for them. Industrialisation, demanding heavy machinery and other capital goods, is dependent for such capital goods on more advanced countries. This implies creating a surplus of agricultural production for export to discharge the interest and capital liabilities upon these countries as a result of importing these capital goods.

The leaderships of the countries we are concerned with here are trying to reconstruct the economies and societies of these countries on the basis of private enterprise, operating with the profit incentive as the motive of production. State intervention and participation in the economy and social life is more to create adequate facilities or generate a regulative mechanism which would soften the ravages of unrestricted operation of the market mechanism in the context of imperfect and unequal competition. The object of the state intervention is not to supplant the competitive system.

The rich farmer is conceived as the lynch-pin of agrarian development by the leaders of these countries. According to these leaderships the progressive

rich farmer would initiate the great transformation in agricultural production. The fundamental strategy in all the underdeveloped countries, is to create conditions for helping rich farmers as the key figures of agrarian transformation. The rich farmer is the pivot round which the entire strategy of agrarian reforms has been developing. Even in the context of the total developmental schemes, the rich farmer is depended on to usher in new technical scientific agriculture as well as generate capital formation in the countryside. The leaderships of these countries, who are worried about the take-off problem, tend to look upon rich farmers as specific agents for introducing the innovations wanted. As Professor Wertheim has pointed out. "It is the advanced farmers who are almost automatically being selected as such. It is they who show a greater responsiveness to all kinds of innovations and technical improvements, and who are much easier to approach for governmental agencies and special services. Such an approach starts implicitly from the assumption that advanced farmers will set an example to the poorer sections, who are expected to follow the model which they are able to observe from close by. The innovation is intended to spread like an oil-stain, to other layers of rural society. It is this approach which could be called 'betting on the strong'."

"The 'progressive rich farmers' is the agent through whom agrarian innovations have to be launched. This is the fundamental strategy in all underdeveloped countries like India, Indonesia and others under the leaderships of non-communist governments. We will observe the changes in the character of agriculture in Asia that have been taking place during the last fifteen years by taking India as the example. India is among the most densely populated of these countries. She contains nearly half the population of this part of Asia. She is conducting experiments to change the rural areas on the basis of an organized conscious effort reflected through its plans. We will observe the changes that have taken place in India after independence and draw a few conclusions of a sociological nature for further discussion.

IV

India is second most populous country of the world. According to the 1961 census the country's population is 43,90,72,893. The average density of population was 312 per

square mile in 1951 while it has become 370 per square mile in 1961. "The births have occurred at an average rate of 40 per thousand per annum, deaths at an average rate of 27 per thousand per annum and the natural increase of population at an average rate of 13 per thousand per annum." Out of the total population of India in 1951, 82.7 per cent lived in rural areas and 17.3 per cent in urban areas. In 1961, after 10 years of planning, 82 per cent lived in villages and 18 per cent in urban areas. It can be easily seen that a decade of planning has not made a major indent on the percentage of population living in rural areas. About 70 per cent of the people depend for their livelihood on land and agriculture and ancillary activities account for half the country's national income.

India ranks first in the world in the production of groundnuts and tea and enjoys a virtual monopoly in the production of lac. It is the second largest producer of rice, jute, raw sugar, rapeseed, sesamum and castor seed. Out of the total geographical area of the country of 80.63 crore acres the net area sown in 1950-51 was 29.34 crore acres and in 1958-59 it was 32 crore acres. Out of this area 3.25 crore acres were sown more than once in 1950-51; this proportion rose to 4.87 crore acres in 1958-59. The area irrigated is 16.1 of the total area in cultivation. Between the period 1951 to 1959 there was an increase of 68 lakhs acres in net irrigated area. That nearly 84 per cent of the area sown was unirrigated and dependent mainly on rains deserves to be noted. The decade of planning has increased the proportion of irrigated area to a very small extent. This is another feature worth noting. About 75 per cent of the total sown area is under food crops. It is also interesting to observe that the area growing non-food crops generally enjoys greater irrigation facilities. This point needs to be stressed because even after a decade of planning cultivation of crops remains largely on the same inefficient level. To meet the increased demand for food India has to import food from other countries. This is a peculiar situation. India, and probably most of the Asiatic countries, are increasingly becoming more and more dependent both for industrial goods and food supply on the industrialized countries.

That an agrarian country is unable to produce enough cereals for the population is itself indicative of the inefficient and backward modes of

production in agriculture. The growing dependence for even cereals on foreign countries reveals that agriculture is not becoming efficient. Efforts to improve agricultural production by introducing improved implements, fertilizers, better seeds, irrigation facilities, insecticides and other methods have been to some extent extended. But the increase is comparatively negligible and affects only a very small area of cultivated land and the facilities are used by a small sector of rich farmers. We have observed how limited has been the spread of irrigation during the last fifteen years. Similarly the other modern inputs in agriculture are also applied on a very small scale. Further they are utilized more in the growth of commercial crops and by richer farmers who can afford to purchase them.

These observations are borne out by the following data gathered by the tenth and twelfth rounds of the National Sample Survey conducted during 1955 and 1957.

"In about 97 per cent of the villages tilling was done with the help of animals. Only 0.4 to 0.9 per cent of the villages had the power-driven system, whereas in 1.3 to 2.3 per cent of the villages the mixed system prevailed. Non-chemical manures (cow dung, green manures, composts, etc) were used in 64 per cent and 75 per cent respectively of the villages in the twelfth and eleventh rounds whereas chemical manures were used in only 0.1 per cent villages for each round.

"Chemical as well as non-chemical manures were used in 29 and 21 per cent, respectively, of the villages of these two rounds. As regards irrigation about 22 per cent of the villages received water from wells, about 10 to 12 per cent of the villages received canal and river water, about 6 to 8 per cent from tanks and a few others from tube wells and anicuts. In about 21 per cent of the villages, the mixed system of irrigation was in vogue. Thirty-four to 36 per cent of the villages had none of these systems of irrigation and probably had to depend on rains for watering the fields."

The above figures indicate that, technical improvement of agriculture is proceeding at a very slow rate. A decade of planning has not made a very appreciable indent on the technical efficiency of agricultural production. With a view to understanding the character of changes in agriculture we should also take note of the peculiar type of stratification which has been growing under the Plans.

According to the eighth round of the National Sample Survey "over one-fifth (23 per cent), that is about one and a half crores of households, did not own any land. About a quarter of all rural households (24 per cent) had land less than one acre. A little less than half of the rural households had thus either no land or owned less than one acre, their share being only a little more than one per cent of the land owned by all rural households. About three-fourths of all households had either no land or less than 5 acres and their share was about one-sixth of the area. At the other end, about one-eighth of the households had more than 10 acres each, with a total share of about two-thirds of the whole area, and about one per cent of the households owned more than 50 acres each and together accounted for nearly one-fifth of the area."

That nearly half the cultivators of India have become almost landless destroys the image created of India as a land of peasant proprietors. Nearly 75 per cent of the cultivators own less than 5 acres of land and the fact that a large proportion of the cultivated lands are dry lands having single crop and limited irrigational facilities means that even the 25 per cent of cultivators who own between one and five acres are uneconomic peasants. Even among the 25 per cent of the cultivators who own more than 5 acres of land, hardly 10 per cent could come within the category of groups having sufficient land to produce profitably.

V

Implications of Relying on the Rich Farmer

The leaderships in the underdeveloped countries of Asia are adopting various measures to improve agriculture. But these measures have benefited and strengthened only a small rich section of the agrarian population. This class has been thriving (in the context of the competitive, profit-oriented, market-based framework) at the cost of the uneconomic farmers. This class has been benefiting by ousting the rest of the poor peasants. This class is pushing out a large section of poor peasants and even landless labourers from the ambit of profitable economic relationships. The Plans, by strengthening the rich farmers, by relying upon these farmers to improve agriculture, are actually generating a process of disintegration, ruin, and

pauperization and proletarianization of the vast majority of agriculturists. The presence of the large numbers of unemployed makes labour abundantly cheap, and in the context of the family farm as the unit of agriculture leaves little incentive even to the rich landlords to introduce technical improvements in production. Thus the plans by helping the rich farmers have been indirectly creating the very condition for preventing the use of technical innovations. During a decade and a half of planning on the basis of making rich farmers the lynch-pin of agrarian development, the leaderships in these underdeveloped areas have started not developmental currents in their economic and social systems but what Prof Wertheim calls "involutionary trends" which are likely to inaugurate a new epoch of tensions and explosions. A developmental pattern based

on "betting on the poor" is essential if this involutionary trends are to be halted.

A proper sociological understanding of the various aspects of change in the character of agriculture in Asiatic countries is possible only if the implications of reliance upon richer farmers are appreciated. In the context of an ocean of poor peasants operating on miserably uneconomic holdings an ever growing number of landless labourers and ruined artisans and a vast backlog of unemployed and underemployed, the significance of strengthening the rich require more careful scrutiny. This is the crucial sociological inquiry that is needed.

Proper understanding of the implications of relying on rich farmers is necessary for another reason. The richer landowning groups in various

Asiatic countries come from certain upper castes or certain regional, racial or religious groups, while landless labourers, small farmers and ruined artisans belong to lower castes or specific regional or religious or racial groups. The efforts to boost the richer landowning groups may have far-reaching consequences in terms of strengthening certain castes or religious, regional or racial groups. The economic tensions may as a consequence lead to social, religious, regional and racial tensions.

A proper study of the social impact of the change in character of agriculture should begin with examination of the implications of the major assumption of "relying on rich farmer" which is at the centre of all efforts to develop agriculture in the developing countries of Asia.

Rally. Peters Out

MASSIVE buying by the Life Insurance Corporation near the previous week-end of leading speculative counters like Century, Indian Iron, Tata Steel, Tata Locomotive, Voltas and Gwalior Rayon, helped the market to stage a fairly impressive recovery from the lowest level reached on September 7. Within just three days Century moved up from Rs 496 to Rs 522, Kohinoor from Rs 260 to Rs 274, Standard from Rs 349 to Rs 368, Indian Iron from Rs 24 to Rs 25.85, Tata Steel from Rs 146.50 to Rs 150.75, National Rayon from Rs 363 to Rs 393, Tata Locomotive from Rs 209 to Rs 218, Hindustan Motor from Rs 15.80 to Rs 16.52 and Scindia from Rs 12.88 to Rs 13.44. Never perhaps had the LIC made such heavy purchases — certainly not of speculators' favourites in a matter of days as it did near the previous week-end. Finding themselves no match for the country's largest investor bears rushed for a cover despite the intensification of war between India and Pakistan and the extension of the area of hostilities.

It was frantic bear covering and scarcity of fresh offerings which led to the brisk rally earlier in the week. The market was at its best on September 10—the end-account day. The 'budla' charges at the turn of the settlement indicated a clear shortage of floating stocks. Carry-forward charges in Century, Steel, Tata Locomotive and ACC were about the lowest for a very long time and the 'budla' charges turned against sellers in Indian Iron, Kohinoor and National Rayon — a very rare phenomenon so far as Indian Iron is concerned.

With anxious short covering over and LIC keeping aloof for the time being, Dalal Street turned cautious again because of the deteriorating political situation. Equities gradually drifted lower due more to lack of support than to any important selling. Apart from the extension of hostilities and frequent air raids by Pakistan, market sentiment during the latter part of the week was affected by the rise in the inter-bank call money rate to 9 per cent, uncertain outlook for US economic aid and the Government's decision to put off decontrol of cement for the time being.

By the week-end, most of the shares had shed quite a significant portion of

their earlier gains and ACC were back again to the level prevailing before the announcement of partial decontrol. Activity on the stock market continues to be entirely professional and is of a purely speculative type. The immediate outlook for equities depends on developments in the political situation and the extent of LIC support to the market.

COTTON

Futures at New High

COTTON futures last week not merely recovered the ground lost in the preceding week's panicky sell-off induced by war news but scaled an altogether new peak. The March contract which had been marked down to Rs 861.50 on September 7 and had rallied to Rs 870.75 by the close of the previous week was bid up to Rs 885.50 on September 14—well beyond its previous high of Rs 882.75 recorded on August 31. Last week's spurt was due both to renewed bull support and short covering. Apart from the strong fundamental position of cotton resulting from the chronic imbalance between supply and demand, firmer sentiment last week was to some extent attributable to fears of damage to the standing crop of cotton both in Punjab and Rajasthan on account of persistent Pakistani air raids at various places.

While futures shot up to a new high, the spot market held steady around the previous levels without much activity. The turnover in the spot market which is always restricted at this time of the season has shrunk further due to serious developments in the political situation. Fresh purchases are restricted to the irreducible minimum. Nobody wishes to take the risk of buying for stock-building. Financial stringency and continued slack off-take of cloth are the other restraining factors. Even so, cotton prices are only a little below the highest levels ever recorded.

With a few more crucial weeks still to go, it is rather premature to express an opinion on the new crop. Informed sources, however, are of the view that if the weather continues to be reasonably satisfactory the new cotton crop would turn out to be around 61 lakh bales. It might well be one or two lakh bales more if the

weather is very obliging. This means that even at best production of cotton in the last year of the Third Plan is not likely to exceed 63/64 lakh bales which is far short of the target of 70 lakh bales. It is, therefore, obvious that with spindlage on the increase, pressure on cotton is likely to increase further. The shortfall will have to be made good through imports if cloth production is not to be allowed to suffer. Year after year it is the same story, production lagging far behind the Plan targets even when the weather is reasonably satisfactory. And the target can by no means be said to have been fixed on the higher side. The plain truth is that the average yield of cotton in India is miserably low around 120 lbs an acre which is less than even half the world average, let alone the leading countries like the USA, USSR, Egypt and the Sudan where yields ranging up to 586 lbs an acre.

OILSEEDS

Futures Rally

DESPITE the intensification of the war between India and Pakistan, oilseeds futures recorded an impressive recovery last week. Castor April and linseed April which had been marked down to Rs 87 and Rs 106.50 (per quintal) at the previous week-end were up again at Rs 96.75 and Rs 113.50 respectively and the week-end quotations were only a little lower around Rs 94.87 and Rs 111.25. Apparently, bulls who had been dominating the market for a long time were in no mood to give up their control without a fight. To some extent, perhaps, bulls were emboldened by the prospect of an early cease-fire following the UN Secretary-General's peace mission. The recovery might not have been so very quick and sharp if the market were not thin; manipulation becomes easier when the public participation in the market is relatively small.

While futures did stage an impressive recovery, the spot market continued to display a subdued tendency. Spot prices hardened a little in sympathy with futures but later they again drifted lower and moved below the previous week's lowest levels. After rallying to around Rs 30.75, groundnut oil is again quoted around Rs 29.25 (per 10 kgs). Linseed oil and

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now freely available from our factory at Kota for a wide range of applications such as :

- WIRES AND CABLES
- FLEXIBLE SHEETINGS
- RIGID SHEETINGS
- CORRUGATED SHEETS
- TUBES AND PIPES
- FOOTWEAR
- UPHOLSTERY
- TILES
- CRYSTAL CLEAR ARTICLES

castor oil are quoted around the previous week's lows of Rs 25.25 and Rs 18 respectively. Spot groundnut and linseed have been distinctly subdued. The easier tendency in the spot section is due both to reduced off-take and anxiety to reduce stocks because of the increasing political uncertainty following the extension of the area of conflict between India and Pakistan. There is now a greater disposition to convert stocks into cash.

Though the trading sentiment recently has been guided mainly by political developments, reports about the progress of the groundnut crop have also been fairly satisfactory and these could have induced caution among bulls and stockholders, especially when conditions in the money market continue to remain very tight. While the armed conflict between India and Pakistan has still to produce a strong impact on prices, export activity has come to a standstill.

CAPITAL VIEW

DESPITE the fact that the wise reticence of the Defence Ministry over the journalistic trumpeting of victories and advances has now degenerated into a wooden refusal to intelligently explain what is happening on the western front, it is clear to observers in the Capital that our enveloping, destructive thrust into the plains of West Punjab to smash the Pakistani armour and fire power was held. We now appear to be facing a war of attrition with all its consequences. We may still break through to free the pincer movement, but the war with Pakistan looks very much as if it is going to be a fight to the finish.

Politically, too, U Thant, the UN Secretary-General, must have come to very much the same conclusion following his discussions in Rawalpindi and Delhi. The essence is that Pakistan makes the cessation of hostilities dependent on the opening of the Kashmir question while India refuses to accept that any such question exists. In both countries, the realisation is general that the rapid escalation of the conflict — now threatening the eastern frontiers, too — makes the future dependent entirely and irrevocably on a decisive military result.

In the absence of proper briefings, and in the gloomy atmosphere of a

MONEY AND BANKING

Stringency Continues

SUPPLY of funds in the Bombay short term money market during the week to September 15 was stringent even though demand was not substantially larger. The trend could be attributed to the decline in the volume of floating funds. The rate of interest continued at 9 per cent though some transaction were reported at slightly higher rates.

Deposits of scheduled banks during the week to September 3 declined by Rs 40.69 crores to Rs 2792.85 crores according to the latest statement of affairs of scheduled banks issued by the Reserve Bank. This decline follows an increase of Rs 23.58 crores during the preceding week. Bank credit on the other hand advanced by Rs 11.55 crores to Rs 2022.51 crores. Borrowings from the Reserve bank were

higher by Rs 12 crores at Rs 21.33 crores and investments fell by Rs 75 crores. Investments in government securities fell by Rs 3.84 crores to Rs 855.40 crores.

Active notes expanded substantially during the week to September 10 from Rs 2554.12 during the previous week to Rs 2591.95 crores, according to the latest statement of affairs of the Reserve Bank. Rupee coins declined by Rs 1.31 crores to Rs 101.43 crores. Deposits of the Central Government were down by Rs 48.70 crores to Rs 109.55 crores. State Government deposits were lower as well at Rs 11.16 crores against Rs 13.31 crores during the preceding week. Scheduled bank deposits, however, advanced from Rs 97.19 crores to Rs 97.72 crores. Foreign securities remained unchanged at Rs 68.35 crores but balances held abroad were better by Rs 3.28 crores at Rs 16.14 crores.

A Fight to the Finish?

Romesh Thapar

rather over-organised black-out (in certain areas it has turned into an unofficial dusk-to-dawn curfew imposed by self-appointed, lathi-carrying, civil defence guardians!) the war has its own imaginary ups and downs. The more serious, and perhaps better informed, have been watching the development of the second 'right-hook' in the Sialkot sector; the first apparently was to have been delivered via the Dera Baba Nanak bridge in the Gurdaspur sector which the Pakistanis re-captured and destroyed before our armour was ordered across.

Bitter battles are being fought right down to the Ferozepur sector. We are told that we are progressing. No details are offered or known. Suffice it to say that until the capture of vital communication junctions is announced, it is impossible to assess the plight or the fighting potential of the Pakistan army.

Foreign missions in the Capital, startled by the suddenness of the developments, continue to stress the limited 'staying power' of the two armies. It is argued that if the intensity of the battle is what it is made out to be crucial shortages will begin to influence the result. Meanwhile the literal massacre of the much-vaunted

Patton tanks is the talk of NATO and SEATO circles.

The experts claim that the Pakistan army is either over-mechanised (muscle-bound!) or it doesn't know how best to exploit its undoubted advantage in armour and the fire-power superiority provided by its self-propelled guns. Much the same kind of theorising can be done about the failure of the Sabre jets — even in combat with the Bangalore manufactured Gnats. While the progress of the battles has pushed much of this discussion into the realm of history, the question of the 'staying power' of the two armies remains very relevant.

On this matter, there is very little expertise available outside informed Defence Ministry circles. It is, however, a matter of some satisfaction that the plans for indigenous defence production and a much enlarged oil refining capacity were well laid. We know today the meaning of that effort. But we have yet to rouse ourselves to ask why the undoubted talents of the two men who made this possible — V K Krishna Menon and K D Malaviya — are allowed to be wasted by a political party urgently in need of competence. Make no mistake about it, when this painful and costly business of war is over, the country will

demand leadership from men who make self-reliance their political compass.

Meanwhile, what worries is the lack of diplomatic initiative in a situation in which we do not seem to be able to convince international opinion that Pakistan's well prepared thrust into the Chhamb area was aimed at seizing Kashmir in the belief that India's armed forces were inferior and incapable of delivering a counter-blow. Apart from the two major nuclear powers, the USA and the USSR, who know the facts and cannot minimise the dangers of an international conflict within the sub-continent, the rest continue to close their eyes to reality deliberately or for the sake of convenience. India has to find some way of energising the diplomatic front following U Thant's return to New York — if only to compel the leading members of the Security Council to recognise that Pakistan has by its own acts forfeited the right to be heard on Kashmir.

This process cannot be confined to the talks U Thant has had in Delhi or the argumentation of Union Minister Chagla at the United Nations. There must be a parallel effort to reach out to the people of Pakistan and the more enlightened of her leaders to explain the origins of India's crossing into the plains of West Punjab and our intention as to the future. No one doubts the final result of the battles now going on, but clearly we have to tackle the inevitable political task more imaginatively. By radio, by leaflet-dropping, and by any other means available to us, we have to convince the people of Pakistan that we are a secular, democratic State, that we intend to remain so, that Kashmir is a crucial part of that secular democracy, and that this is the only way to lasting peace in the sub-continent.

There can be various stages in a fight to the finish — stages which are dictated by a careful balance of military, economic and political considerations. The Emergency Committee of the Cabinet must weigh the issues and lead thinking on this matter if it wishes to control and discipline the pressures of lobbyists and the like. The Prime Minister cannot allow these issues to be settled in *ad hoc* fashion. We must be coherent about our aims and must begin to project them, internally and externally. In this respect, time is not on our side. But statesmanship can isolate our adversaries of whom there are not a few.

The Soviet warning, obviously to China, that "those whose inciting statements, whose policy help fan up the conflict must be warned by the entire world, by all States, that they assume a heavy responsibility for such actions", and the efforts of some influential circles in the USA to disentangle themselves from political and military commitments to Pakistan, are significant and positive factors in the present situation. If we are able to sharpen these expressions, there is every likelihood that the damaging paralysis of our Afro-Asian friends would be ended. Non-alignment as such has not weakened us diplomatically. The attempt to rob it of a meaningful assertion of national interests has.

Internally, too, we need to begin planning for a long period of austerity. The cost of the war has still to be calculated, but we can reduce

it by immediate steps to assess the needs of the future and how they are to be met by a co-ordinated internal mobilisation. Institutional supports will be required to achieve this. In the Capital, the feeling is that we have little to lose in a general toughening up. The only question mark is the state of the political front.

The Prime Minister has done well to maintain consultations with parliamentary leaders. Soon Parliament will adjourn. Perhaps, it is advisable to establish a permanent committee of Parliament to be in continuous session for the duration of the war. Such a body could usefully apply itself to neglected political tasks, particularly if it includes men who should be making their impact on the formulation of policies. A prolonged war, a war of attrition, a fight to the finish — call it what you will — demands this.

ROHTAS INDUSTRIES LIMITED

Registered Office: Dalmianagar (Bihar)

NOTICE

THE Thirty second Annual General Meeting of the Share-holders of Rohtas Industries Ltd. will be held at the Registered Office of the Company at Dalmianagar on Thursday, the 7th October, 1965 at 11 A.M. to transact the following business:

1. To receive, consider and adopt the Directors' Report and the Audited Accounts for the financial year ended 31st March, 1965.
2. To declare dividends.
3. To elect a Director in place of Shri E. R. Meyer, who retires by rotation and is eligible for re-appointment.
4. To appoint Auditors and fix their remuneration. The retiring Auditors, Messrs K N Gutgutia & Co, Chartered Accountants, are eligible for reappointment.

SPECIAL BUSINESS:

5. To consider and, if thought fit, to pass with or without modification, the following resolution which will be proposed as a Special Resolution: "Resolved that the words 'Rs 32' occurring in between the words 'the sum of' and 'per meeting attending by him' be substituted by 'Rs 100 in Article 103 of Articles of Association of the Company.'"

Register of Members of the Company will remain closed from 25th September, 1965 to 30th September, 1965, both days inclusive.

By Order of the Board
For Sahu Jain Ltd.,
A. K. Jain

Director.
Managing Agents.

Calcutta,
2nd September, 1965.

- N.B. 1. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself. Such proxy need not be a member. Proxies in order to be effective must be received by the Company at its Registered Office not less than 48 hours before the meeting.
2. The dividends, if declared, will be payable to the Share-holders registered in the Books of the Company on 30th September, 1965.

Note: Explanatory Statement in respect of the above item of Special Business is being forwarded to the members of the Company along with the notice convening the meeting.

Where in the world do you want to go?

Great! That's where we go.

You name it. The U.S.A.? The Middle East? Asia? Africa? The Pacific? Latin America? Pan Am can take you there. Pan Am lets serve over 100 cities in 86 lands on all 6 continents.

Whether you're bound for Buenos Aires or Alaska, Tokyo or Trinidad, Helsinki or New York, better check with Pan Am. You fly for the same jet fare as on any other airline—but that's *all* that's the same. Pan Am has more nonstop flights. More no-change-of-plane flights. More frequent flights, better connections. One Pan Am ticket will take you anywhere. And Pan Am's 900 offices throughout the world are your home away from home.

When you fly Pan Am you have superb meals en route—delicious cuisine inspired by *Maxim's of Paris*. And the service is friendly and generous.

Best reason of all for flying Pan Am—the good feeling you have knowing you've chosen the very best there is: the world's most experienced airline.

For reservations, see your Pan Am Travel Agent or the nearest Pan Am Office at

Winning the Peace

THE war is over. Through the claims and counter-claims of tanks and planes destroyed and casualties inflicted the somber fact stares the two countries in the face that at considerable cost in human and material terms they have achieved nothing. This had begun to be plain well before the cease-fire on early Thursday morning. A cease-fire looked inevitable even a week ago and Pakistan's seeming last-minute hesitations could not possibly last; and they didn't. Bhutto called the emergency session of the Security Council only to rub in Pakistan's demand that cease-fire and withdrawal of forces must be followed by action on the Kashmir issue, adding this time the threat that Pakistan would quit the UN if such action was not forthcoming.

While the war has benefited neither country, it has had two general consequences: on the negative side, it has embittered feelings and hardened attitudes on both sides; on the positive side, it has forcibly drawn the attention of the world to the fragile quality of peace on the Indian sub-continent and to the fact that the basic causes of this cannot be left to be taken care of by passage of time. In the Security Council's resolution the major powers have as good a basis as they can hope for to follow up this awareness with action.

India's own response to the Security Council resolution has to be measured but positive at every stage. The withdrawal of forces to the positions of August 5 will be no easy matter. There is the question of the Pakistani infiltrators who are already in Kashmir. The resolution which calls for withdrawal of "all armed personnel" could be taken to cover them. However, how is their withdrawal to be secured? The abandonment of the strategic passes captured by the army across the cease-fire line in Kashmir will present another difficult decision. In his speech in Parliament on Wednesday announcing the cease-fire Prime Minister Shastri clearly stated that India will not agree to an automatic withdrawal by both sides to the positions of August 5 without adequate safeguards against recurrence of armed infiltration into Kashmir. What safeguards will the U N give?

It is, however, the part of the resolution which refers to steps to be taken to settle "the political problem underlying the present conflict" which will present us with the hardest decisions. It is no use pretending that the sense and purpose of this reference do not conflict with our position on Kashmir. The possibility of a negative response to this part of the resolution is, therefore, very great. It is particularly likely that a miscalculation of the extent of international support for our position may lead to false steps. It will not do to formulate our response to the U N resolution on the assumption that the West has written off Pakistan. It is a sobering thought in this context that this is the first time in years that a Security Council resolution has made a reference to the Kashmir question, which we have always tried to prevent and in the past succeeded in preventing with the help of the Soviet veto. That the present resolution had the support of the Soviet Union would seem to indicate that the big power agreement over ending the war is likely to extend to finding a solution to the Kashmir problem.

There is no need, however, to view this as a development unfavourable to our interests. What is necessary is to subject to rigorous scrutiny—reappraisal, if necessary—what our interests really are. The need to bend all energies and resources to the tasks of development and to maintain and strengthen the secular character of the nation as also the emerging pattern of power relations in Asia dictate that friendly relations with Pakistan are important to our interests. This is certainly not to say that we ought to accept Pakistan's demands on Kashmir or on any other matter. To be convinced that there is no alternative to sticking fast to our positions short of giving in altogether is to betray a sad want of faith in the possibilities of diplomacy.

As Prime Minister Shastri said in his broadcast on Thursday night, let us not mistake the cease-fire for the dawn of peace. At the same time, let us not hamstring our efforts to win a peace with inflexible attitudes and rigid postures.

What Does Defence Orientation Mean?

IT is too early yet to know what the amended and altered Fourth Plan is going to look like, but there is reason to be alarmed at many of the measures reported to be under consideration by the Government because of the woolly thinking that they reflect under the surface enthusiasm. Thus a three-point plan to give a boost to defence production is, according to press reports, being considered by the Ministry of Industry and Supply. Two important aspects of this plan are a marked increase in agricultural production through rapid mechanisation and achievement of self-sufficiency through import substitution. That mechanisation is the means of rapidly and markedly increasing production in agriculture is startling news: have we at last found the clue as to what has been causing the failures on the agricultural front? Again, while it is obvious enough that import substitution is the process by which one achieves self-sufficiency, can the process be speeded up at will? In either case, one feels tempted to ask: if these possibilities were there, why did one have to wait for a war with Pakistan to realise them? Had not the country been subjected to the greatest difficulties by the shortfalls in agriculture and by the ever-recurring foreign exchange crises?

Another major decision that is said to have been taken is to withhold maintenance imports from all industries that are not defence-oriented. Free foreign exchange allocations to non-defence-oriented industries has been frozen. What industries qualify as being defence-oriented has not been announced. As the Vice-Chairman of the IDBI said, almost every industry has been claiming to be defence-oriented and, indeed, it is not easy to think of many industries other than those producing luxury consumer goods which could not directly or indirectly meet one or other of the needs of war. (Even luxury goods are not easy to define. Lipsticks for army wives, are they luxury goods or do they serve war needs, like cigarettes for the Jawans?) In any case, it is clear that some of the industries are going to suffer from the stoppage of maintenance imports and it is difficult to share the complacent view of the Industries Ministry that this should not lead to any fall in production in any part of the economy since there would be "import substitution". This is almost school-boy economics, all the more frivolous

in the context of the deceleration of industrial growth last year for which the annual report of the Central Board of Directors of the Reserve Bank puts the prime responsibility on foreign exchange shortage.

The IDBI has announced that priority would be given to defence-oriented industries which indicates that the differential treatment is to be a part not merely of import policy but of industrial policy as well. The extent to which the Government is prepared to go to throw overboard the investment allocations made during the last two years of deliberation on the Fourth Plan is seen from the reported decision of the Planning Commission to give full freedom to the States to divert resources from one sector to another. It is difficult to appreciate the wisdom of these hasty and sweeping moves which make nonsense of all calculations of balance that have been made. Whatever might be claimed now by official spokesmen in support of them, there is no doubt that these measures would, by lowering production in certain sectors and scaling down exports and further aggravating the foreign exchange crisis, ultimately slow down the rate of growth of industries in general and even of the so-called defence-oriented industries.

Similar hasty thinking marks the Government's actions on the distribution front as well. While proposed de-control measures have been postponed and rationing of foodgrains announced on a large scale, the Government has

gone out of the way to assure the business community that controls or compulsive measures are not contemplated in a general way. Appeals have been made to the business community to ensure price stability and prevent artificial shortages. The Home Minister has been meeting representatives of the private sector and the latter, duly infected with the spirit of the times, have made warm declarations of total loyalty to the Government. However, the record of the business community in preventing artificial scarcity and price rise in this country is not an encouraging one: one might have thought that they had not a little direct responsibility in bringing them about and the fact that the war has resulted in a slight fall in the prices of foodgrains as well as in the general wholesale price index is certainly no proof of the co-operative and self-sacrificing spirit of the trading community. It only points to panicky de-hoarding.

One need not doubt the sincerity of the offers of co-operation made when the actual shooting war was on: but to judge by past experience, such expressions of public spirit do not outlast the very short periods of actual crisis. To build upon voluntary control of prices by the business community to bring about market stabilisation might lead to chaotic conditions in the market once the war enthusiasm starts to wane and the more serious economic difficulties resulting from diversion of resources to defence starts to make their appearance.

Balance of Payments Ambiguities

IT remains to be seen whether like the Cheshire cat the figure of our exports last year will disappear altogether. In the March 1965 volume of the "Monthly Statistics of the Foreign Trade of India" the Director General of Commercial Intelligence and Statistics gave it at Rs 838 crores. Then it was discovered that goods worth Rs 23 crores had been short shipped or shut out. This reduced the figure to Rs 815 crores which was accepted as the "final revised total". But not for long. The compilation of India's balance of payments in 1964-65 in the August issue of the Reserve Bank of India Bulletin now takes exports at Rs 803 crores. Of course, we have been told that there are differences between the recording pro-

cedure of the DGCI & S and those of the RBI; exactly what they are and what difference they make to the figures have never been clearly explained. The RBI study of balance of payments at any rate does not consider the attempt necessary. It uses the figure of Rs 803 crores as if it were the only one in existence. Nor is even this total above suspicion. For, dominating the balance of payments table is the huge figure of minus Rs 71 crores standing against the item "errors and omissions". In 1963-64 "errors and omissions" were Rs 47 crores and in the previous year only Rs 4 crores. What has been happening to balance of payments statistics, really?

Such as they are, the statistics

show that in 1964-65 external reserves were subjected to the heaviest draft since 1960-61—Rs 56 crores against an accretion of Rs 11 crores in 1963-64 and an outflow of Rs 2 crores in the year before. "The large adverse swing in payments position as between the two years", according to the RBI study, "is traceable to a rapid increase in the import bill accompanied by growing service payments on the one hand and the absence of any growth in exports on the other". Exports at Rs 803 crores were just a crore over last year's figure. Imports, on the other hand, went up by as much as 13 per cent, for the second year in succession. And, as in the preceding year, the entire increase was on Government account; private imports, in fact, declined slightly. Of the rise of Rs 173 crores in Government imports, food accounted for three-fifths (Rs 102 crores) and capital equipment for over one-third (Rs 58 crores). This leaves one guessing about defence imports; without doubt, a part of the increase in non-food imports must be really imports of defence equipment and materials.

The net surplus on invisibles account rose impressively by Rs 47 crores, but mostly on account of higher rupee grants from the US under Title I of PL-480. The growing burden of debt servicing is reflected in the increase of Rs 21 crores in outflow under the head "investment income" repres-

enting mainly interest charges on foreign loans.

Net capital inflow in 1964-65 increased by Rs 59 crores to Rs 452 crores. On the face of it, there was a striking improvement on private capital account—a net inflow of Rs 12 crores as against an outflow of the same order in the previous year. The achievement, it turns out however, is only statistical: from April 1964 drawings and repayments on account of World Bank and foreign official loans to the private sector are shown under the head 'private' instead of 'official' as earlier. Since the source of these funds is official, even though the funds flow to the private sector, the rationale of the change is not quite clear.

One important development during the year which stands out in the capital account is the large net outflow of banking capital of over Rs 10 crores against only Rs 3 crores in the previous year. In fact, the outflow in the first two quarters of the year amounted to Rs 16 crores before the Reserve Bank imposed from December 1964 a ceiling on short-term borrowings or lendings by authorised dealers from or to their branches and correspondents abroad.

Net receipts of official capital (meaning, under the new definition, receipts of the official sector) were Rs 450 crores, Rs 43 crores more

than in the previous year. Official loans showed a rise of Rs 146 crores though two-thirds of this increase represented rupee loans from the US out of PL-480 counterpart funds. Drawings on loans from West Germany, the IDA and the Soviet Union were higher by about Rs 20 crores each and on those from Japan, UK and Canada by about Rs 6 crores each. Loans from the World Bank as well as dollar loans from the US were, however, lower. Net amortisation payments, as in the previous year, increased by an identical sum, Rs 5 crores, to Rs 62 crores.

At first sight, a striking change in the capital account is the net outflow of Rs 77 crores under the head 'miscellaneous' as compared to an inflow of Rs 45 crores in the previous year. This large swing was, however, just the result of the liquidation of short-term liabilities arising out of PL-480 transactions. This raises the question whether it would not be useful to indicate separately in the balance of payments statement transactions arising out of US assistance under PL-480. Similarly, transactions with the rupee payment countries which have no effect on the exchange reserves could be shown separately. Sticklers for form will no doubt resist any change in the time-honoured pattern of presenting the balance of payments, but there can be no doubt that the statistics will become more meaningful with a few changes.

Weekly Notes

West German Elections

THE results of the general elections in W Germany show a shift to the Social Democrats: while the Free Democrats' representation has gone down from 67 to 49, the Social Democrats' has risen from 190 to 202 and Christian Democrats' from 242 to 245. If one considers the fact that electoral positions change only slowly as young people enter the electorate and old ones leave it, the results are not at all discouraging for the Social Democrats. In particular, there is no justification for reports which talk of a "landslide" victory for Erhard, who will again have to form a ministry in coalition with the Free Democrats.

Nevertheless, there are reasons why the Social Democrats are downcast. The chief one is that they have for many years been thinking of and pre-

senting themselves as the alternative government. In 1959 they radically changed their policies, dropped nationalisation from the party programmes and from opponents turned supporters of the NATO. After the 1961 elections they could console themselves that the change was not of long enough standing to carry conviction with the electorate. But this time they stood or fell by the new programme — and by the new leader, Brandt—and they failed to win. Further, their share of the vote has remained about the same. They are not attracting a larger proportion of the electorate.

The election will cause much concern to the Free Democrats. In a democracy a large party can succeed only by combining a wide spectrum of views, while a small party can succeed by reflecting and giving force to the feelings

of a minority. The Free Democrats have made themselves popular by opposing the dictatorial tendencies of Strauss, the former Defence Minister, and by taking a less blinkered attitude on the East-West question. In this election Strauss has been leaning over backwards to present himself as a sweet and reasonable man; and the position of German politicians on the East-West question has become less hidebound. So the Free Democrats have lost their mission. They might well find another, but they will have to look for it, being a junior partner of the Christian Democrats in the government is not a good enough qualification.

The election will prove even more momentous for the Social Democrats. Quite a few socialist parties in Western Europe — among them, those of Bri-

tain, Germany and Italy — have adopted a pragmatic approach recently, and everywhere the new look has failed to have a significant electoral effect. This must evoke either rethinking or a relapse: pragmatism by itself is not enough. And the new look of the Social Democrats is so closely linked with the look of the new leader, Brandt, that their rethinking might extend to him also. His career hitherto has been remarkably similar to that of Adlai Stevenson, and one wonders if the similarity will not last. It might not, perhaps, because no leader with more youth and fight in him is available to replace him. In fact, the lack of younger talent should be the most serious concern of the Social Democrats.

Aden: Speeding UK's Exit

BRITAIN is passing through difficult times in her self-appointed task of ensuring the 'containment of China' East of Suez. She has had to watch in embarrassment while her anti-communist bulwark Pakistan openly turned to China for support against India; she has seen the Malaysian Federation begin to break up overnight with the secession of Singapore; and even in the Middle East the Adenis don't seem interested in her benevolent presence in their country.

The trouble in Aden has been going on for some years; the political scene is similar to most in the Middle East, with the additional complication of the presence of the British. The struggle between a feudal (usually royalist) dominant minority and some kind of revolutionary group is the pattern; at present however Aden itself is wedded to a motley collection of 16 sheikhdoms each ruled by a reactionary tribal leader and forming the South Arabia Federation. The revolutionary element is provided by the proscribed National Liberation Front, a terrorist organisation backed by Egypt, which 9 battalions of British and local troops are unable to suppress. The Chief Minister of Aden, Abdul Mackawee, hasn't much truck with his tribal co-leaders; however all are combined for the moment in demanding early independence (promised by the British by 1968). Meanwhile the Opposition parties are quite prepared to use NLF terrorism as a stick to beat the British within their demand for early independence.

Britain has always based her strategy East of Suez on the need for a line of

military bases spaced across the Middle East, which can be used as staging posts to the Far East. However, Aden is one of the few remaining ones, and sees no reason why it should continue to be so. Even when independence is granted, the forging of reactionary sheikhs and more liberal Adenis into some kind of federation is bound to have dire consequences. Britain, having lived by the principle of 'divide and rule' now believes in keeping the federation 'united at all costs to protect British interests'. Britain's interest in the Middle East is in her oil supplies, as the Adenis know; to this end she has a base in Bahrain for the ridiculous rental of £ 250 per annum. Bahrain is already beginning to replace Aden as a staging post; moreover there has been talk of setting up a base somewhere in the Indian ocean. After 6 carefully planned murders in the last few months, culminating in the assassination of the Speaker of the Legislature, none of them solved by the administration, it is clear that Britain must leave Aden quickly and with a good grace.

What Happens to Newspaper Profits?

THE trend and pattern of growth of the press in 1964, as outlined in the annual report of the Registrar of Newspapers, do not provide ground for enthusiasm. The circulation of dailies and periodicals rose by 6.2 per cent (dailies 5.9 per cent) over the year, which was slightly higher than in 1963. Newsprint, which continues to be extremely scarce, remains a severe bottleneck, largely because the targets of domestic production have not been fulfilled, in both quantity and quality. Nine principal dailies owned by large chains or groups increased slightly their share of total circulation from 42 per cent in 1963 to 43 per cent in 1964. The two top groups, *Express* (Goenka) and *Times of India* (Sahu Jain), accounted for 11.6 and 7.2 per cent of total national circulation of dailies — 19.9 and 15.2 per cent, respectively, if only metropolitan circulation is considered.

Ten of the well known dailies allot fifty per cent or more space to advertisements. These include six belonging to large units: *Times of India*, Bombay, (60-40), *Statesman*, Calcutta, (56-44), *Hindu* (55-45), *Statesman*, Delhi, (53-47), and *Evening News*, Bombay, (51-49). These high ratios for advertisements are attributed to the curbs on newsprint supply to the larger units and the pressure of advertisers on them

resulting from their relatively lower rates per thousand copies sold. The resulting prosperity has not, however, been put to the same use. The *Times* has, over the years, utilised its booming profits to start new dailies and a large number of periodicals and to remunerate its shareholders and staff generously. It is difficult to make out from publicly available information the response of other winners of the advertisement sweepstakes. The *Statesman* has not brought out a single new publication, the *Hindu* added a sports weekly many years back; neither pays its staff as well as the *Times* does. That advertisement revenue is not the only, or even the main, stimulant to growth and diversification is apparent from the fact that the *Express* Group with a total circulation of 11 lakh copies in 1964 (of which English editions account for a little more than 3 lakhs) has a much lower proportion of advertisements — and also a lower price per copy — and its growth over the last ten years has been quite impressive, in spite of comparatively low scales of remuneration to staff. The growth of oligopolist giants or the 'jute press' cannot be attributed solely to their disproportionate share in advertising outlay. The root causes lie elsewhere.

Newspaper circulation is almost wholly confined to the principal urban areas. The metropolitan cities account for one-half of total circulation and most of the remainder is in State capitals and cities with a population of more than one lakh each. Moreover, about three-fifths of the circulation of dailies published from Bombay, Calcutta, Delhi and Madras, is outside the respective metropolitan cities; the small decline in this ratio over the last three years is due to ceilings on newsprint quotas and growth of population and incomes in metropolitan cities. Most mofussil towns have no local newspapers and those which have them often tend to value outside news more than local news and are then understandably outbid by metropolitan papers. Local newspapers have limited sources of advertisement revenue and find it difficult to secure printing machinery on easy terms; at the same time, they have not been particularly distinguished in tapping local advertisement sources, such as courts, shops, cinemas and tender invitations or, for that matter, in training reporters to handle local news. The cry of small newspapers for protective safeguards has still to be re-

THE ECONOMIC WEEKLY

inforced with adequate enterprise in different aspects of the business.

Pattern of Newspaper Circulation 1964 (percentage of total circulation)

	Dailies	All
(1) Metropolitan areas	48	51
(2) State capitals excluding (1)	13	12
(3) Other cities above 1 lakh population	32	26
(4) Places with population less than 1 lakh	7	12

Area-wise Circulation of Metropolitan Dailies

Year	Metropolitan Areas	Within State of Publication	Outside State of Publication
1962	40.0	22.5	37.5
1963	41.8	21.6	36.6
1964	43.4	23.0	33.6

The Unhappy UNCTAD

THE United Nations Trade and Development Board has been in session in Geneva. The 30 members of the Board have been displaying a lack of imagination and united purpose both as regards the big issues and the minor details. The central purpose of the UNCTAD Board, of course, is to start a steady process of implementation of the principles regarding trade between rich and poor countries which were accepted after much debating at last year's 77-nation United Nations Conference on Trade and Development in Geneva. Broadly speaking, these principles were that trade is at least as important as aid; that the developed countries should increasingly relax restrictions against imports—particularly of new manufactures—from the developing countries; and that in their liberalisation of imports from the developing countries, the developed countries should no longer insist on the principle of reciprocity.

Some months ago even the GATT was modified to take account of what had happened at the Geneva conference: an additional chapter was written to incorporate the new principles. It was indeed an important revolution in GATT. The paper preliminaries are over now, and the time has come for some actual generous changes by the developed countries. Instead, at the just concluded meeting of the UNCTAD Board the developed countries have been trying to go back on the accepted principles. It has been clear from the wranglings of the Kennedy Round of Tariff talks that

the process of getting any actual trade concessions from the developed countries is going to be painfully slow; but the reported *volte-face* of the delegates of the rich countries has come as a real surprise. Western developed countries would, of course, indignantly deny any allegations of economic neo-colonialism, but their conduct on this matter is in sharp contrast to the reported behaviour of the delegates of the six communist countries on the Board; they have shown continued enthusiasm for liberalising trade with the developing countries.

The only progress at the recent session was to pass a resolution which authorised the Secretary-General, Raul Prebisch, to start a post office which would review and collect data to be gathered from the various member countries and organisations on the action being taken by them in implementing the principles adopted at last year's Geneva conference and now included in the GATT. Even regarding this, the Western countries refused to accept any obligation to report regularly on how well they were implementing those principles. Their stultification of the earlier imaginative response could not have been more complete.

It seems that at this session the developing countries, for their part, displayed in ample measure the usual lack of a united approach. There seems to have been heated controversy among them where the UNCTAD Secretariat should make a home. Earlier, Geneva had been selected; but now Geneva does not seem too keen to have another international secretariat. Now at least Rome, Lagos and Addis Ababa are contending for the position. Along with the postponement of all the important issues regarding trade to the next session, the choice of a site for the headquarters has also been shelved for the moment. Indeed this time the Board was unable to agree even on a general report to be sent to the U N General Assembly. The developing countries need to learn from this session and unite in their efforts to put the maximum pressure on the ex-colonial powers to yield trade concessions which are a necessary compensation for the mistakes of omission and commission on their part in the past.

Cotton Textile Exports

IN the first eight months of this year exports by the cotton textile industry were worth only Rs 55.5 crores as against Rs 63.35 crores

in the first eight months of 1964. The fall was mainly in cotton piece-goods which declined from Rs 34.5 crores to Rs 29.4 crores. This was, apparently, partly because of the very heavy shipments to the UK in April-May last year which meant borrowings from our quota for 1965, and partly because of the very poor season this year for cotton textiles throughout the world. Exports of yarn too fell from 8.6 million kg to 5.3 million kg. And though exports of apparel and hosiery have been cheering, in that apparel exports brought in Rs one crore more and hosiery exports were three times better than in the corresponding period of 1964, exports of other manufactures have declined. Though our shipments to various regions of the world have fluctuated, we seem to have gained firmer ground in the East European countries, thanks to bilateral arrangements. Our pattern of textile trade has meanwhile undergone some change. From only 41.4 per cent of textile exports in 1962, finished goods now account for 50 per cent of such export. The total impression created is not of a particularly happy record.

But Neville Wadia, Chairman of the Cotton Textiles Export Promotion Council, in his speech at the eleventh annual general meeting of the Council, was nevertheless hopeful. The final result for piece-goods might be little different from that of last year; we are also negotiating a new agreement for trade with the UK for 1966 on, and with our long association with Lancashire and Her Majesty's Government, the results should prove favourable. This is limited ambition with a rather tenuous basis. The hope and the need for action must surely lie elsewhere.

Above all, the equipment of the industry badly needs modernising. Out of 287 composite mills some 48 alone are capable of producing export quality textiles in increasing quantities, but even so, some of these do not export even 10 per cent of their production. Indian cotton is of poor quality, and to save on costs—since cotton accounts for 50 per cent of total production costs—mills very often resort to over-spinning. Weaving faults are for this reason more frequent. Industrial technology has made spectacular advances in textiles over the past 15 years. By contrast, our blow room machinery, our carding and combing methods, our drawing and ring frames are outdated, and we use little automation or continuous high-

speed processes or shortening processes. There is a shortage of trained and disciplined workers. The net result is revealed in some studies made by the US Department of Commerce and the UK Cotton Board: the productivity of the Japanese worker is twice that of the Indian worker, while the productivity of the US worker is 4½ times better and that of the UK worker 60 per cent better than that of the Indian worker. The market the cotton textiles industry faces abroad is already highly competitive and protective, and likely to become more so. First of all, competition will increasingly be offered by Japan, Hong Kong, Pakistan, and the synthetic substitutes from industrialised countries that appear on the foreign markets. The other emergent countries are likely to protect their own industries. Commonwealth preference seems unreliable since we are just now questioning the advisability of our membership of the Commonwealth. Britain too has been thinking of a joint quota for India, Pakistan, and Hong Kong which will very likely mean greater competition for us within the quota. The Long Term Agreement under GATT has shown few signs of being capable of actually adjusting the pattern of textiles trade to the production possibilities and the needs of the developing countries and of apportioning certain kinds of textiles for export by these countries. We cannot, therefore, bank too much on the LTA meeting in November or on the agreement with Britain. Competitiveness in cost and quality is therefore the only go.

IMF and Developing Countries

THE International Monetary Fund's approach to payments problems of developing countries seems to be changing, albeit slowly, judging by the hints thrown out in the Fund's annual report for 1965. The strongest of these is the Fund's new emphasis on reducing the burden of debt-repayment on the developing countries. It has recognised the grave problem of increasing international debt. Some of the developing countries have approached the Fund to assist in an advisory capacity in their negotiations for refinancing of debt.

The Fund, of course, cannot commit its resources to refinancing of repayment liabilities by the developing countries. Yet it can take a sympathetic view of the balance of payments position of the debtor countries. In this respect the Fund is well placed to study the impact of debt-servicing

on their payments position and help them to get the necessary assistance from the aid-giving countries or the World Bank. This surely lends a new dimension to the role of the IMF, and one which shows great possibilities of fruitful exploitation in future. This together with the Fund's scheme for assistance to compensate fluctuations in export earnings from primary commodities could well mark the beginning of a move towards a solution of international liquidity problem which will take into account the needs of the developing countries. The Fund may even undertake to extend medium or long term assistance in some of the developing countries, overburdened with repayments — a line of approach with some similarities to the Stamp and Triffin proposals on international liquidity.

Backsliding on Decontrol?

A Correspondent writes:

THE sentiment in favour of selective and partial decontrol has never been very strong in official circles. The conflict with Pakistan has led to second thoughts about the advisability of partial decontrol of cement, which the Prime Minister had announced last month. It was made quite clear that Government would continue to get its requirements at controlled rates but whether these would be the same as at present or somewhat higher was not specified.

A shortfall of as much as 5 million tonnes in both capacity and output in a basic commodity is not something to be dealt with leisurely nor is it something which can be left to narrowly circumscribed bureaucratic thinking. Cement had not received till recently the priority attention it deserved in terms of prices, tax concessions, financial assistance and realistic industrial licensing. Prices were kept below adequately remunerative levels, tax concessions were no more than for other, including less essential, industries and they were often difficult to utilise owing to insufficient profits, financial assistance threatened to create problems of servicing and the units which could expand quickly were given licenses only with great reluctance. Over the last few months some relaxations have been effected: the controlled price has been raised to offset cost escalation, development rebate and excise concessions for larger output have been extended at the maximum rates, licensing has become more realistic and assurances of adequate finance have been given. All these are moves in the right direction

THE ECONOMIC WEEKLY

but, to make full use of them, the industry must have adequate owned funds and these can hardly be raised or built up without better prices and more flexible distribution arrangements.

There is no justification for denying cement the treatment which has been extended of late to pig iron and most varieties of steel with considerable success — and easing of tensions all round. The emergency has in no way taken away the basis of the argument for cement decontrol. Rather the contrary. More cement is required more urgently than ever before. It is idle to pretend that the public sector Cement Corporation will achieve the desired increased production at or around the present controlled prices. Its costs, when it goes into production, are bound to be higher than those of existing units due to higher prices of equipment and other initial expenditure. So long as all defence and other high priority requirements are met by the industry at regulated prices and as a first charge on output — and these may well come to one-half or two-thirds of total production — decontrol will not endanger price stability. *De facto* price increases and serious delays in projects caused by acute cement shortages have, on the other hand, already manifested themselves and would become more obvious if New Delhi chooses to remain hide-bound. The risk of partial decontrol is definitely worthwhile.

LETTER TO EDITOR

More on Foreign Policy

MAY I have your indulgence in replying to your editorial comment on my letter that you published on September 4?

I am *not*, repeat *not*, part of the Indian Establishment and do not feel called upon to defend what is not defensible. I could not agree with you more that our haste to embrace Malaysia was "unseemly". This is not to justify President Soekarno's reaction, but simply to state that it was not in keeping with the "wait and see" attitude that I have been championing. I am also in total agreement with you that there must have been "some contributory negligence" on India's part which could account for our "present alienation from the three most populous nations of Asia". Nowhere in my letter did I beat the jingoist drum that India is always right.

Having said that, may I point out to you that India has done more for seeking the friendship of "the three most populous nations of Asia" and

THE ECONOMIC WEEKLY

stuck her neck out countless times only to get rebuffed for her effort? Who was it that gave Indonesia aid and comfort when it was fighting for its independence? Who was it that championed Indonesia's cause year in and year out at the United Nations on the West Irian issue? And what did Indonesia give us in return? Again who was it that championed Peking at the last Bandung conference and who was it that championed Peking's claims to the Security Council seat at the United Nations year in and year out at the gravest risk of alienating the western power?

Perhaps you have guessed the answer.

As for alienating Pakistan, is it India's fault that Pakistan wishes to remain alienated? It is Pakistan's entire philosophy. You cannot be friends with some one whose basic philosophy is one of not wanting to be friends. And India has tried to be friendly.

I never said that India is "much loved and respected" in Asia and Africa. Respected yes. I do not expect everyone who respects India to agree with her on all issues. And what is wrong with President Nasser pressing us to resolve our quarrel with China? Is that inconsistent with friendship?

Your reading of the Establishment's mind may be true; I do not claim to be privy to the thinking of Indian officials, nor am I desirous of being their apologist. I am sure they are quite capable of speaking for themselves. Even if what you say about them is true, their decision is right, *despite them*. We may agree on the outcome for entirely contradictory reasons. My reasons why India should not participate in another Bandung are explicitly stated. Any Asian African Conference must be an occasion for constructive thinking and harmonious working for a better social order all around and *not* for trying to outdo each other in mudslinging. My opposition to the Algiers conference has nothing to do with the Government of India's alleged reasons.

As for your last paragraph you do me an injustice by misinterpreting my contention that there is no need for us to seek a snub from the United States. By that I meant that we have to be both independent and strong so that we can truly remain non-aligned. We do not become strong by putting up false fronts. This is a slow process and during that period it is wisdom to mind our business and don't get

into others' hairs. No one suggests that India should give up her values or that *The Economic Weekly* should. But India does not have to shout her principles from the house tops. Sometimes, quiet whispering into the right ears may do wonders. Proclaiming our virtues and our righteousness may sound wonderful, but what is it that we should aim at: results or smug self-satisfaction?

That *The Economic Weekly* holds "other values" is known; though you

may not realise it, they agree with mine. It is precisely because you hold high values that you are read, respected and sometimes when you stray from the right path—questioned. If I have been petulant, it is the petulance of a reader who feels hurt because his favourite magazine does not sometimes give the kind of informed comment for which it has long been distinguished.

The Facts of Peace

Romesh Thapar

PEACE returns to the sub-continent, but a confused, uncertain peace. The facts which condition the confusion and uncertainty, and which we need to chew upon, are as follows:

(a) It is still unclear whether the military decision in the plains of the Punjab, and in the air, has been decisive. Official army circles claim that the teeth have been taken out of the Pakistan army, that it is no longer an offensive weapon. The opposite view is that Pakistan has the reserves with which to re-equip its armoured formations literally battered by our army in battles which turned into physical combats between Indian jawans and Pakistani armour; seldom has such deathless courage been witnessed. Politically, the considered opinion is that for some years at least the Pakistani army will not dare to challenge India's frontiers.

(b) Established alignments and commitments have also received a heavy battering. The United Kingdom has replaced her double-talk with a crude, cynical assertion of Pakistan's claims on India even at the risk of endangering the Commonwealth structure. The USA, conscious that its system of military pacts is in a state of disarray, knows that it will be difficult to sustain its military commitments to Pakistan but hopes to use its influence to obtain for Rawalpindi a favourable political settlement. The USSR, the only friend India can claim among the big powers on the Kashmir issue has taken the decision to intervene in the Indo-Pak problem as a mediator—a role which dictated the warning to China to face the nuclear consequences of her involvement and compelled a withdrawal of Peking's 'ultimatum'.

(c) Diplomatically, India will have to tread warily. Her non-aligned friends, who have been so ineffective during the course of the hostilities, have to be persuaded to stir, to intervene in the interests of progress and peace in South Asia. Several Arab States, and Indonesia in particular, have permitted religion to dominate their thinking about events on our sub-continent and they have to be energetically tackled. The influence of activated non-aligned nations will be needed in the coming months to discipline the opportunism of the big powers. Our neglect of the diplomatic front during the last month has been one of our most massive failings.

(d) Economically, too, all the signs point to a deliberate attempt to put the squeeze on India in order to balance the advantages she may have gained over Pakistan in the course of the last month. Apart from our heavy indebtedness, we will need friendly assistance in vital sectors if the cost of the war is to be met. This is in addition to the sacrifices which the people will have to undergo in the coming months.

All Trumps with Soviet Union

Keeping these military, diplomatic and economic facts in mind, it is clear that the Soviet Union holds nearly all the trumps. This is, in a sense, a rather startling development for the West. How London and Washington view the future is not known, but there must be a vague sort of feeling that the USSR as 'mediator' is going to burn her fingers just as they have done in the past. Peking and Jakarta are obviously pushing Rawalpindi to keep one step ahead of the mediation; the threat to withdraw from the United Nations if the follow-up action on the cease-fire is not satisfactory is indicative of the kind of tactics to expect. The Peking-Jakarta-Rawalpindi combine will undoubtedly strain every diplomatic resource to bend the Soviet Union to a compromise on Kashmir. For, they know that such a compromise can only be at the expense of India.

The Soviet desire, now expressed more openly and consistently, to expose the incendiary character of the western presence in South Asia will certainly motivate the mediation of Kosygin. The Soviet faith that all explosive international problems can be settled peacefully so long as 'imperialist' interference is removed will sustain the mediation. The Soviet conviction that China will not expose herself to nuclear attack, a conviction now shared more widely in South Asia following the withdrawal of Peking's ultimatum to Delhi, is expected to influence the attitudes of both India and Pakistan during the mediation. It is at this point that we enter the realm of uncertainty.

The collapse of CENTO, the repercussions of this collapse on SEATO and more indirectly on NATO, the possibility of a rapid change in the balance of power in South Asia, and the impact of these developments on

the political structures of India and Pakistan, will inevitably determine the treatment that is to be given diplomatically, economically and militarily to Delhi and Rawalpindi. To imagine that we can now begin from where we left off would be the height of folly.

Detailed Plan Needed

It is necessary to stress these rather obvious implications of the present situation because, despite the praise being lavished on the GOI by a conformist press, the facts tell us that the *ad hoc* approach continues to hinder our efforts to seize the diplomatic initiative. A detailed plan of action has still to be worked out to win the peace. V K Krishna Menon, at last mobilised, sets off to meet with Nasser, but there is unthinking reluctance to let him rove more widely in Africa and Asia. No one moves in the direction of Moscow, or for that matter, Washington. An MP who attempts to raise a discussion in Parliament on our continued membership of the Commonwealth—widely challenged, even within the Cabinet—is persuaded to withdraw. And when the local US Embassy worries about the display of a captured Patton tank in the Capital, this too is withdrawn! Prime Minister Lal Bahadur will have to do better than this if he wishes to preserve the new image he has been given.

The depression following the cease-fire in natural. A whole people had been led to believe that a knock-out blow was to be delivered to Pakistan's army, that there was no other way to peace. Now they ask whether it was not possible to achieve the same result without the grim business of war. It is the job of the political leadership of the country to educate and to take forward the understanding of the people who must remain as united and dedicated to the task of winning the peace as they were in meeting the challenge of the war.

The Congress Party cannot afford to leave this job in the tired hands of the incompetent, and the play-safers within the ruling party. A new and relevant national consensus must be sought—and with dynamic men. The time for a political shake-up at the top is now. And it is part of the effort to dispel confusion and uncertainty, to win the peace and to secure our frontiers.

Term of Trial

THE impact of Pakistan's aggression and of the incendiary opportunism of China on the South has been far greater than even the shocked anger which convulsed the people towards the end of October 1962. The cynics who had thought that the overplaying of the emergency theme had killed all national enthusiasm are totally non-plussed. A fresh seriousness and new intensity are abroad. The first national crisis after Nehru has found the people rallied. The foundations of national unity, indeed the beginning of India itself, have been well laid.

Before attempting to analyse some of the more important features of this rallying, one cannot resist the frustrating statement that the biggest failure of the Congress since Independence has been its inability to rouse this kind of solidarity on a mass scale around the adventure of making India, economically and politically. An external challenge, consequently, has had more of a stimulating effect than the compulsions of internal development. The people seem to have greater awareness of any threat to Indian sovereignty than of the possibility of using this sovereignty to build a radical democratic nation. This only serves to underline the truth that the movement for social change is impelled by a greater degree of internal contradictions than the sheer effort to maintain the physical aspects of Independence.

This should not lead to any underestimation of the significance and value of what has happened. The very Tamilnad youth who were ready to burn themselves and policemen to protest against what they considered to be domination by the North, have now rallied in their thousands to offer themselves for any work of defence that the Government may feel necessary to give them. The bitter and outraged Left Communists in Kerala, together with all other opposition parties, have placed themselves behind all efforts of national defence undertaken by the Government, whether it be directed against Pakistan or China or a combination of both. There is no question that China will have now to look for "true revolutionaries" outside the ranks of the Left Communists in their strongest mass base. It is tragic shortsightedness that Nanda's detention dementia still keeps so many stalwart Left Communist leaders in jail. It appears as if quite deliberately

a chance is being thrown away of manifesting a militant national consensus. In Andhra the big mass movement of the entire opposition around the food issue has overnight converted itself into a movement for solidarity in the cause of national defence.

A most encouraging aspect of this mood of mass resistance is the infusion in it of a degree of positive content. This is most clearly marked on the question of food. Top Congress leaders, including some Chief Ministers, have been openly talking of the need to avoid reliance on PL 480 to overcome our food shortage. One Chief Minister went so far as to admit to the Leader of the Opposition in his State that India had erred in relying so much on the West for food as well as for arms. Serious rethinking, he added, was not only necessary but going on at the highest levels.

An indication of this new awareness is the greater stress being placed on the problems of internal procurement. Overcoming long resistance the Andhra Government has decided to go in for procurement of foodgrain from the producer on the basis of a graded levy with necessary exemptions for those cultivating land of one acre and below. It has come to the conclusion that it would be wrong to impose a levy on the rice millers alone and that it was essential to go straight to the point of production. If properly and equitably implemented what this would amount to would be a truncated type of agricultural tax in kind and the removal of the wholesale trader from a vast market area. The Government has also decided that any purchase of grains in the State for export to other States should be done strictly on a Government-to-Government basis, with a ban on all private transactions. For obvious parochial reasons it has, however, decided to undertake all these operations on its own rather than bring the Food Corporation into the picture. An admirable opportunity now presents itself to the democratic opposition in the State to exert its utmost to see that these measures do get implemented according to official proclamations of intention.

It was equally significant that the Andhra Chief Minister has reportedly agreed to accept the resolution moved in the last session of the Legislative Assembly by the Communist MLAs recommending the nationalisation of banks. Earlier the attitude had been one of agreeing with the proposal in

principle but urging its withdrawal so as not to embarrass the ruling party. It is quite obvious that this changed attitude cannot be merely the personal quirk of a single Chief Minister. On the contrary, it testifies to the new possibilities for social advance engendered by the exigencies of the national emergency itself.

It is true that the paramount emotion and thinking of the people is concentrated today on the single issue of national defence. This is as it should be. Anybody who mistakes this mood or imagines that national dignity is a matter of upper and middle class concern would soon enough run his head against a massive wall. At the same time, it would be quite wrong to imagine that the period of acute national awareness is also the time for a social freeze, for retention of the *status quo*. The very concept of a national emergency is that it is a period of strain, of tension, of challenging moves to meet a serious menace. Nothing would be more demoralising for the national will than to carry on business as usual. Nobody who cares for India as she ought to be can overlook this point. The time is not merely to fare well but fare forward.

Another extraordinarily creditable feature of the present situation is the state of Hindu-Muslim amity. It is often forgotten that all the four Southern States not only have sizable Muslim minorities but a background of tension stretching back as far as in the North and with closely similar historical roots. But there has been no eruption whatsoever. Not that the danger has totally receded. Nor that all the underlying antagonisms have disappeared. All this is very much there and the possibility of more Poonas cannot be ruled out. But there is a tangible change. There are numerous instances not only of public statements by Muslim leaders, which are only to be expected, but of genuine pride in the success of the Indian Army. The Central Government has shown a most imaginative approach in this regard which is not only to be fully commended but relentlessly followed up at all levels. The impressive record of Kashmir, thanks to the wind of change brought about by the Sadiq leadership, has to be broadcast to every mohalla and village as should the deed of mortal valour by Abdul Hamid. Indian secularism is taking shape during this term of trial. If it congeals into a composite nationalism this will be one of our great contributions to the evolution of an universal civilisation.

U S View of Indo-Pak War

AMERICANS have been notably unaware of events on the Indian subcontinent. Yet in the past few weeks, newspapers in the United States have emphasised the conflict between India and Pakistan to the extent of relegating news from Vietnam to inside pages. Although detailed news from the battle lines has been scarce, the American people are becoming very much aware of the situation on the subcontinent, reflecting the deep concern of the Johnson Administration. The influential *New York Times* has featured the war on its front pages almost every day for weeks, and has tried to analyse the present situation from both military and diplomatic points of view.

No Pro-Pakistani Bias

The reporting in the *Times*, which usually reflects the liberal wing of the American Establishment, is indicative of the confusion which is evident in American thinking concerning the conflict. The Kashmir crisis was at first not taken seriously by the press. The outbreak of full scale hostilities seems to have caught most observers, as well as the State Department, by surprise. The *Times* has carefully avoided placing any blame for the outbreak of hostilities, and has dispassionately tried to analyse the political issues involved in the Kashmir problem. It is evident that the generally pro-Pakistan attitude of the American press, which was very much evident before Pakistan's flirtations with China, has ceased, and most commentators have bent over backward to present India's case impartially if not favourably. Hanson Baldwin, the *New York Times'* military analyst, has stated that the war could last for only a little more than a month, due to the lack of supplies on both sides.

Most commentators have hailed the U Thant mission to Karachi and New Delhi, and much hope has been placed on United Nations efforts to restore peace. Apparently, both the United States and Britain, which are capable of exercising powerful if not overwhelming pressure on both India and Pakistan, have agreed to rely on the United Nations, at least for the present. The American press has noted with some regret that both sides have responded coolly to peace overtures, and there is still general bewilderment in most circles as to why a major con-

flict is being fought over a seemingly minor issue by two nations who have much to lose by prolonged military action. There is little effort to examine the issues from the points of view of the warring nations, and one gets the general impression that the developed nations (perhaps including the Soviet Union) should simply intervene and demand that the fighting stop. There has been almost no discussion of the important communal and strategic issues which are involved in the dispute.

The provincial American press, which is read by the vast majority of the American public, has presented the conflict in highly oversimplified terms, although it has attracted sustained front page attention. Little concrete news has been available, and editorial writers, wholly ignorant of the situation on the subcontinent, have expressed their amazement at the expansion of the fighting, while at the same time not explaining the key issues involved.

Deplorable Publicity

In addition to basic ignorance about India and particularly about the Kashmir situation which is evident from the State Department on down, the paucity of information available in the United States has other causes. The attitudes of both the Indian and Pakistan governments towards dissemination of news and background material about the fighting have left much to be desired. New York Times reporters have noted that it is next to impossible to get hear front lines, and that obtaining information from government officials on both sides is a frustrating process. The fact that large doses of propaganda are added to news reports is obvious, since the official statements change from hour to hour, often contradicting each other. Indeed, it is possible to listen to American radio stations and hear a number of conflicting and clearly false reports about the fighting during the course of a given day. As a result of government bureaucratic procedures and possibly deliberate false statements by both sides, the situation is even more confused than necessary.

To date, the reports which have come from New Delhi have been more complete than those from Pakistan, perhaps due to the fact that American reporters have been stationed in India for a long period of time. In-

dian authorities also seem to be somewhat more interested in presenting a favourable image than are the Pakistanis. The Indian public is pictured as strongly supporting the government, and it has been stated that the present emergency will probably strengthen Congress control over the government. Indian government officials are pictured as confident of victory, and rather unwilling to engage in peace talks at the present time.

In the various analyses of comparative military strength which have appeared, the general impression is that while India's armed forces are superior in size and supplies to those of Pakistan, President Ayub Khan has the advantages of superior training and more modern although inadequate American arms. Much stress is laid to the suspension of military aid to both sides by Britain and the United States, which can, it is stated, play a crucial role in shortening the conflict.

U S Stakes in the War

Several key Senators have suggested that all American aid be withheld from both sides until the fighting is stopped. While this proposal is not now taken seriously by the Administration, if all else fails it remains possible that this threat will be used. Fear of China's increased influence in South Asia is an overriding element in the determination of American policy, and there is no doubt that whatever has to be done to keep China out of the area will be done by the Americans. It is unlikely that the key Western powers, as well as the Soviet Union, will let the conflict continue at its present level indefinitely. They simply have too much to lose from a prostrate India and defeated Pakistan. At present confusion seems to prevail in Washington, London and Moscow. The efforts of both India and Pakistan to gain support have been rather unsuccessful in the Western capitals, who have ceased to take official statements with much seriousness.

American reaction to the present conflict has been one of both sympathy and confusion. For perhaps the first time, the American people are keenly aware of events on the subcontinent, and the deep concern of the American government is evident in its statements.

— Philip G Altbach

BOOK REVIEWS

Indian Kinship Systems

Christoph von Furer-Haimendorf

Kinship Organisation in India by Irawati Karve, Second revised edition; Asia Publishing House, 1965; pp 389 Rs 30.

WHEN in 1953 the first edition of Irawati Karve's book on Indian kinship systems was published as a volume of the Bulletin of the Deccan College Postgraduate and Research Institute it did not arouse as much interest as it deserved. Anthropologists and sociologists certainly realized its importance as the first systematic comparative study of the numerous aspects of kinship behaviour in India, but the very fact that it appeared in a small edition as one of a series of learned monographs limited its impact on intellectual circles inside and outside India. Since then Karve has addressed herself through various channels to a growing public interested in the functioning and recent development of Indian society, and there can be no doubt that the new revised and enlarged edition will meet with a very different and far more lively response. Some parts of the book have been rewritten, many have been improved by minor corrections and an entire chapter on Ownership of Property, Succession and Inheritance has been added.

Command of Sanskrit Sources

Karve began her analysis of Indian kinship systems as early as 1938, when she investigated the kinship organization of the various castes of the Marathi-speaking culture-zone. She then discovered a discrepancy between the kinship terminology which, like that of Northern India, is of purely Sanskrit origin, and the marriage—and kinship—rules which link the people of Maharashtra with the Dravidian populations of Southern India. Over the years the author extended her study of kinship terms as well as of the conduct between kinsmen to many parts of India, travelling widely in her search for data, and while doing so comparing the usages of each area with those of many other regions. Her comparisons, however, were not limited to a synchronic plane. An excellent command of Sanskrit sources enabled her to extend her investigations diachronically to the earliest periods of recorded Indian history. In this way she demonstrated the extraordinary

continuity of Indian family organization and kinship behaviour throughout the subcontinent's long and varied history. Situations now depicted in popular literature and even the plots of cine-films have close parallels in stories and legends of the Vedic age. Attitudes then formed persist even nowadays in the villages of Northern India, and our understanding of contemporary conditions can be greatly deepened by reference to the early Sanskrit literature. Yet, Karve is not content with emphasizing the remarkable continuity of the Indian social tradition, but she traces above all the changes in kinship terms and explains how they reflect changes in practices and finally even ideals.

Similarities and Contrasts

Starting with the kinship organization of the Northern zone, which resembles closely the pattern known from the classical Sanskrit literature, the author investigates the kinship systems of all the main cultural and linguistic zones of India. Besides some similarities she finds contrasts in fundamental attitudes as well as a blending and dovetailing of the individual systems. The continuity of Indian traditions is probably unique, and there is no other part of the world where ideals and attitudes evolved as much as three millennia ago have determined social behaviour so powerfully and lastingly. On the other hand, there are greater and far more basic regional differences in kinship systems than there are in other subcontinents dominated by a single leading civilization. Whereas in European countries the family and marriage system rooted in Christian ideals evinces certainly some considerable local differences, there are within the European culture sphere no such drastic and fundamental contrasts as that between the patrilineal family of Northern India based in its structure and ramifications on strictly enforced local exogamy and, on the other hand, the matrilineal family pattern of some South Indian societies, where cross-cousin marriage favours the concentration of kinship ties in small

clusters.

The effects of the attempts of present Indian legislatures to impose from above a uniformity which conflicts with the diversity of traditional regional patterns can be judged only by those who have a full appreciation of the many-sided implications of old established local usages. A scholarly and detached book such as the work by Karve should therefore be of the greatest interest and value to all those concerned with the implementation of acts likely to revolutionize the structure of the Indian family. It should also counteract the all too common assumption that certain forms of family organization are intrinsically better and more "progressive" than others. At present patrilineal succession and inheritance are being more favoured than the matrilineal system of such regions as Kerala, but value judgements of this type are usually based on considerations other than an objective analysis of the positive and negative attributes of the two conflicting systems.

Illuminating Hypothesis

Karve's book is so rich in factual information as well as intuitive insight that a review cannot do more than outline the main trend of her arguments. Interspersed with the detailed description and interpretation of kinship usages are illuminating, even though partly rather tentative, hypotheses regarding problems of Indian prehistory. Thus Karve believes that the speakers of Munda languages represent the oldest still traceable ethnic group, and tends to support the theory of an expansion of Dravidian languages from a centre in South India discounting the hypothesis of the gradual displacement of Dravidians from Northern India and their slow retreat to the southern part of the peninsula.

The many additions to this work which has already become a classic of Indian anthropological literature show that Karve continues to be active in research. Her's is not a temperament to be easily satisfied with an

achievement, and there is little doubt that when a third edition of this book is due, she will again add some new discoveries and interpretations drawn from her comprehensive and deep knowledge of Indian social systems.

A Congress Stalwart

S Joseph

Rafi Ahmad Kidwai: A Memoir of His Life and Times by Ajit Prasad Jain; Asia Publishing House, 1965; pp X + 130, Rs 14.

THIS is a short memoir of Rafi Ahmed Kidwai written by a friend, colleague and admirer. In this book Ajit Prasad Jain has chosen the happy technique of presenting a number of anecdotes and incidents from Kidwai's life and letting the events, on the whole, speak for themselves. For instance the chapter called 'Some Rafian Episodes' consists of the juxtaposition, without much explanatory comment, of a number of terse anecdotes which show up different and sometimes startling aspects of his character. It appears from these that Kidwai had a taste for fast driving, was extremely gregarious, outspoken sometimes to the point of rudeness, open-handed in his generosity and a lover of practical jokes. In addition to that he did not hesitate to use his office to help those who appealed to him and publicly announced (as a joke) shortly before his death that he could, if necessary, successfully replace Nehru as Prime Minister. Fortunately no attempt is made to trim Kidwai down into consistency by omission or explanation.

A few important events in the history of the Congress Party and government in which Kidwai played a part are also described. They are the UP Agrarian Reform Movement, the gradual alienation of Muslims and the Muslim League from Congress, and the manouvres which took place within the Congress party after Independence and which culminated in the resignation of Kidwai from the party and eventually the replacement of Tandon by Nehru as President of the Party. The analysis of events is generally fair but one must question the statement that the Congress alliance with the Khilafat movement was "the finest hour of the nationalist struggle" because Hindus and Muslims were for once united. Gandhiji, he says, would go to any length to create confidence among minorities. But even in the Congress there were people like Motilal Nehru who were doubtful about the Congress support for such "a moribund institution even the Turks were sick of it" (Nanda). It was the

Moulvis and Ulemas who dominated the Khilafat movement, not the middle class Muslims who eventually came to power in the Muslim League. At any rate this Hindu-Muslim Unity lasted only until the Khilafat was dissolved by the new Turkish government.

In another chapter Jain defends the Congress decision to refuse to accept the Muslim League as sole representative of Indian Muslims for the purpose of division of seats in the U P cabinet of 1937. Maulana Azad has pointed to the decision as being largely responsible for the demand for a separate Muslim State. Jain says that the formation of Pakistan could only have been the result of certain deep-seated and long-term causes; it could not be due to one isolated incident. But even long-term causes can be intensified and latent fears brought to the surface by more immediate events and unfortunately the U P incident seems to have given Muslim League leaders the opportunity to demonstrate to their followers the potential dangers of Congress rule.

Another episode described in some detail is the series of events leading to the resignation of Kidwai and the author from the Congress in 1951. Kidwai had long been associated with the left of the Congress and with socialist groups outside consisting mainly of defected Congressmen. His aim we are told, was to persuade Nehru to leave Congress and become the leader of a new Socialist Party. It is fascinating to speculate what might have occurred if he had succeeded. But without Nehru, Kidwai was unwilling to leave Congress; whether this was due to his emotions which would not let him leave an old friend as Jain says, or due to his reason which must have told him that he could never succeed without Nehru is not clear.

A quaint touch is added to the book by Jain's choice of verse for his chapter headings. The split between Muslim League and Congress is headed by

"Two lovely berries moulded on one stem.

So with two serving bodies but one heart"

and the U P Agrarian Reform struggle with

"Ring in the nobler modes of life With sweeter manners, purer life".

Only the chapter entitled 'Father of Civil Aviation' is left verseless; perhaps even the Oxford Book of Quotations could not rise to the occasion.

Foodgrains Prices and Costs of Cultivation

Some Observations

N K Thingalaya

N S Shetty

The relationship between the prices of foodgrains and their costs of production has not been adequately studied. The paucity of empirical data about costs of cultivation has been the main obstacle to any systematic study of this nature. Now, when the Government is engaged in evolving a policy of fixing prices of the important foodgrains and a few other crops on the basis of costs of cultivation, analysis of the price-cost relationship becomes even more important.

The following is a preliminary attempt in that direction using the available data, meagre as they are. The purpose is merely to indicate very roughly the relationship between the prices of a few foodgrains and their fair costs of cultivation and not to suggest any policy conclusions.

THIS study is based exclusively on the data available from the Farm Management Reports for six States for three years 1954-55, 1955-56 and 1956-57. The foodgrains studied are (1) paddy in Madras and West Bengal, (2) wheat in Punjab, Uttar Pradesh and Maharashtra, (3) jowar in Maharashtra, and (4) gram in Maharashtra and Uttar Pradesh. In using the cost of cultivation data given in the Farm Management reports, no attempt is made to readjust or re-

assess any of them even though admittedly the Farm Management reports have resolved some of the important problems involves in the allocation of costs to various items when the crops are grown together by making assumptions that are purely arbitrary at times. And of the two methods used to calculate costs, the cost accounting method and the Survey method, the first method has been relied upon primarily on the ground of its apparent superiority to the survey method.

The price data relevant for our purpose are the wholesale prices prevailing during the harvest period within the villages as they represent the actual prices received by the producer. The Farm Management reports provide the monthly average prices of different crops prevailing in the villages in which the costs of cultivation are calculated. In what follows, we have compared the cost per maund

Table 1 Paddy Harvest Prices and the Cost of Cultivation

of paddy and other foodgrains with their respective harvest period prices for three years.

Paddy

The available data on the cost of cultivation of paddy reveal wide disparities in the cost structure of Aman and Aus paddy in West Bengal and of the three crops of paddy grown in Madras. Table 1 provides these data for Hooghly and 24-Parganas and the average for Salem and Coimbatore districts.

For the Bengal farmer it costs less to produce a maund of Aman paddy than Aus paddy. For the latter the labour requirements being more, the imputed value of family labour raises the total cost by as much as 25-30 per cent. Similarly the harvest prices of the paddy are invariably higher than of Aman paddy. This is due to the timing of the harvest period of Aus paddy which comes to the market when the stocks of Aman paddy are depleted and the prices rule high in the village markets. Since the quantity of Aus paddy produced is comparatively small it does not depress the price immediately after the harvest as severely as Aman paddy does. It is also interesting to note that the prices prevailing in the village markets during the sowing season of Aus paddy are higher than those for Aman.

The price that the paddy cultivator of Hooghly obtains when his produce is sold within the village, does not cover all the costs incurred by him in producing it. It covers only Cost B (all costs except family labour charges). In the neighbouring district of 24-Parganas the situation is different. The market offers to the paddy cultivator a price higher than his cost of cultivation. The year 1954-55 is the only exception. It may be noted here that this year was one of all-round price decline in the country following bumper crops. The prices of paddy during this year are, therefore, lower than those during other years. The cost of cultivation was, however, the same and hence the price of paddy in 1954-55 did not cover its cost of cultivation.

Turning to Madras, the other important paddy growing State in the country, we have the data (average) for Salem and Coimbatore districts where three crops of paddy are grown in a year. Roughly, the second

crop costs less than the other two crops and the prices prevailing in the villages immediately after the harvest of this crop are relatively higher. The share of family labour charges in the total cost of cultivation of a maund of paddy remains at Rs 3 for all the three crops. The variations in the cost of cultivation during the three years are due to rise in Cost A—the

cost incurred in cash or kind to purchase material inputs.

The harvest prices for the three crops during the three years are higher than the cost of cultivation leaving a margin of roughly Rs 2 per maund of paddy sold. Thus the Madras farmer who obtains one of the highest yield rates in the country has a net margin of Rs 2 on every maund

of paddy disposed of in the village. This margin varies considerably when the cost structure of different farmers operating in different size groups are examined.

As given in Table 2 the cost of cultivation of paddy varies widely when the subsistence farmers', the medium farmers', and the large farmers' cost structures are compared. In the case of Aman paddy in West Bengal farmers in the smallest size groups and in the medium size group (say 3.75-7.50 acres) incur losses of about Rs 2 per maund. For Aus paddy the position is quite different. The smallest or the subsistence farmers have a margin of about Rs 3 while the farmers in the 5 to 7.50 acre-group incur a loss as high as Rs 5 per maund. In Madras on the other hand farmers in most size groups are able to earn a margin over their cost. A strange exception seems to be farmers in the 10-15 acre-group who produce the first paddy crop at a cost of Rs 21 per maund while the harvest price is hardly Rs 15.

Wheat

The cost of cultivation of wheat in irrigated and unirrigated farms in Amritsar and Ferozepur districts of Punjab, Ahmednagar and Nasik districts of Maharashtra and Meerut and Muzaffarnagar of UP are given in Table 3. A striking feature of wheat cultivation appears to be the difference in the cost of cultivation in irrigated and unirrigated farms. The cost of production per maund of wheat is

lower in the former with only few exceptions. Family labour costs form a significant item in wheat as in paddy.

The Amritsar farmer appears to operate in a situation of unduly high costs and low prices compared to his counterpart in Ferozepur. In Maharashtra though wheat is costlier to produce the price is relatively higher. The range of variation in the cost

Note:- Figures in brackets are Cost/price ratios

of cultivation is Rs 10 to 20 in Punjab while it is Rs 13 to 23 in Maharashtra. The Nasik wheat grower with scant irrigation facilities available incurs a cost which is about Rs 5 higher than the price his produce fetches in the market. In U P where the available data relate to Cost C only, the differences in the cost of cultivation for the irrigated and unirrigated wheat crop are quite significant. The unirrigated crop appears to be unremunerative to market as the prices are considerably lower than the cost. The irrigated crop, however, leaves a small margin to the producer, hardly a rupee or so per maund.

The glaring disparities in the costs of cultivation of farmers in different size groups are shown by the data provided in Table 4. The small farmer whether in Punjab, Uttar Pradesh or Maharashtra produces at very high cost. Partly the imputed value of family labour is responsible for this and partly the lower outturn that does not permit the unit costs to be low. The small farmers are placed in a precarious position where their costs of cultivation are higher than the prevailing market prices. They incur losses if their produce is marketed.

Jowar

For Jowar the relevant data are culled for only one State, Maharashtra, where it is the important food-grain next only to superior foodgrains like rice and wheat. The data for Ahmednagar district and the averages for Akola and Amravati districts are presented in Table 5.

It is not possible to say with the data available whether the irrigated crop of Jowar is costlier than the unirrigated crop. But it is evident that the yield per acre of dry Jowar is as low as 1.69 Bengali maunds while that of irrigated crop is 11.70 Bengali maunds in Ahmednagar. The price of a maund of Jowar was higher than the cost of producing it both in irrigated and unirrigated farms, except in the year 1954-55. As already said, that year's price was exceptionally low and hence unremunerative to the Jowar cultivator. The available data for Akola and Amravati tell the same story.

Observation of the costs of cultivation of jowar in different size-groups reveals that cultivators in practically all the size-groups produce Jowar at costs lower than the market prices.

The cultivator in the smallest size groups (0.5 acres) who grows Jowar with irrigation has a margin of Rs 6 per maund over his total cultivation costs. Strikingly different is the position of the farmer growing dry Jowar. He incurs the highest cost resulting in a net loss of Rs 9 per maund.

Gram

Among the pulses only gram has been included in this study and the data pertaining to its costs of cultivation in Ahmednagar and Nasik and also in Meerut and Muzaffarnagar are given in Table 6. The cost of cultivation of gram was the highest in 1954-55 in both the districts of Maharashtra and tended to decline in the next two years. Contrary is the movement of prices which rose significantly from the low level in 1954-55 by over 60 per cent in the next two years in both the districts. The difference between the cost per maund of gram and its price were so large in 1964-55 that the prices covered lesser than 50 per cent of the total cost. Even the material cost of cultivation could not be recovered from the price. In 1956-57 the Ahmednagar farmer could obtain a margin of a rupee per maund of gram while the Nasik farmer's position remained unfavourable. The

farmer in Uttar Pradesh appears to have been growing gram at costs slightly higher than the price during all the three years.

The fragmentary data on the cost of cultivation available from the Farm Management Studies are certainly too inadequate to say something on the nature of the cost-price relationship in Indian agriculture with a reasonable amount of confidence. However some features of the cost structure in various size-groups of operational holdings which they reveal may be noticed here.

The small farmer emerges as having a high cost structure for the food grains he grows while farmers in the larger size groups, who have a surplus to sell, are placed in a favourable position as regards costs. Disparity in the cost structure varies not only among the regions for any foodcrop but also within the region, for irrigated and unirrigated crops. As a corollary of this the relative importance of the different cost components in the cost structures of different crops in different farms varies over a range which however is not very wide. The cost of family labour in the total cost of production per

maund of foodgrains appears to be interestingly uniform for all regions.

The seasonal fall in the prices of foodgrains after the harvest is a characteristic phenomenon of Indian agriculture. The producers have no influence over this fall in prices. Immediately after the harvest prices of foodgrains reach their lowest and gradually rise as the pace of market arrivals decreases. The monthly variations in wholesale prices of some of foodgrains during the year as given in the Farm Management Studies provide an interesting picture. Prices slowly rise a few months after the crops are harvested and marketed. Thus if the producer of Jowar in Maharashtra disposes of his produce immediately after the harvest (in 1955-56) he obtains a price of Rs 11.69 per maund within the village. If he can delay his sale by a month the price in the village market goes upto Rs 12.81. Similarly if he is capable of withholding his stock for a month more, the village market would offer a price of Rs 14.15. Thus farmers who have storage facilities and can get credit to enable them to adjust the timing of their sale, can earn a margin of Rs 2 or 3 per maund of Jowar. The substantial farmer who has a surplus to sell and who has the storage and other facilities can gain a margin of Rs 6 or 7 per maund by selling his produce in the lean season. The present market price mechanism thus places the small farmers, who form the bulk of the producers in the country, at a relatively disadvantageous position. For the large producers, who have the ability to hold some or all the product, the market mechanism extends the privilege of selling dear.

From the set of price data available from the Farm Management Studies the difference between the village price and market price are found to be negligible. Under these circumstances it is clear that the market price does not provide an incentive for the farmer to bring his produce to the market. Further as it involves an additional cost of transporting and marketing it does not favour the sale of his produce at village market. He therefore prefers to sell, if he has a surplus to sell, within the village after the harvest.

The cost-price relationship in Indian agriculture eludes any precise empirical quantification due to the multi-

plicity of factors—economic, geographic and climatic—that affect the production process in different size groups in different regions of the country. The differences in the crop rotation and crop combination in different parts of the country also severely limit any effort in that direction. However the observations that can be made with data available are of some practical importance. In Table 9 the cost-price ratio for four foodgrains in different size groups in the selected States are presented.

The paddy cultivator in the country appears to be working with favourable cost-price ratios as compared to the producers of other crops. Paddy cultivator in all size groups have margins over costs varying from one per cent to 18 per cent (except for Aus paddy in West Bengal). Wheat cultivators of only the larger groups have margins over their costs. The unfavourable cost-price ratio of wheat cul-

tivators is mainly due to the relatively high cost of cultivation compared to paddy, despite relative prices being favourable to the former. Like the paddy cultivator the jowar cultivators in Maharashtra on all the size groups have a favourable cost-price ratio. Their margins range from 35 to 48 per cent. Gram cultivation in Maharashtra both in the irrigated and unirrigated farms appears to be uneconomic.

With these few observations based on the limited empirical information available it is not possible to come to any concrete conclusion regarding the price-cost relation in foodgrains production in the country. This is intended to be only a preliminary peep into the intricacies of the farm price-cost structure. A more rigorous analysis based on better and more sufficient data is necessary before conclusions relevant to fixation of foodgrains prices can be drawn.

The Economic Growth of Gujarat

Deceleration in the Third Plan: Some Reasons

Mahesh Bhatt
V K Chawda

In the Second Plan the rate of growth achieved by Gujarat was appreciably higher than that of the national economy. In the first three years of the Third Plan, however, there has been a marked deceleration in the pace of growth in Gujarat. The rate of growth of State income and of industrial production in the State have been lower than that of national income and industrial production in the country as a whole, modest as the latter themselves have been.

An attempt is made here to examine in some detail this tapering off of growth in Gujarat and to suggest some possible explanations for it.

THE Techno-Economic Survey of Gujarat carried out by the National Council of Applied Economic Research largely deals with the economic position of Gujarat at the time of its inception, in May 1960. Hence it would be useful to examine the performance of Gujarat's economy since then. Such examination should help the public as well as the policy makers in planning the future course of action, particularly during the Fourth Plan.

According to the NCAER Survey the net output of Gujarat increased at the annual rate of 5.3 per cent during the Second Plan period, compared to the 3.8 per cent rate achieved by the country as a whole. Thus in the Second Plan the rate of development of Gujarat's economy was higher than that of the country as a whole. However, in the first three years of the Third Plan (1960-61 to 1962-63) the average rate of growth in the state income was 2.61 per cent compared to the rate of 2.94 per cent achieved by the country as a whole. Similarly average rate of growth in per capita income of Gujarat was 1.28 per cent compared to 1.33 per cent for the country as a whole (see Table 1).

Thus the rate of development of Gujarat's economy during 1960-61 to 1962-63 has been slower than that during the Second Plan period and also slower than the rate of development of the country as a whole during 1960-61 to 1962-63. State income which was Rs 765 crores in 1961-62 declined to Rs 749 crores in 1962-63, i.e. a net decline of Rs 16 crores. Agriculture accounted for 50 per cent of this decline (see Table 2).

It is true that the decline in the contribution of agriculture to State income may have been due to seasonal factors. However the decline in the contribution of the other sectors cannot be ascribed to the seasonal factor. What is noteworthy is that the

major decline was in the industrial sector (Mining, Manufacturing, and Small-enterprises). Its contribution to State income declined by Rs 18 crores and this is only partly compensated by an increase of Rs 5 crores in Commerce, Transport and Communication and of another Rs 5 crores in other services. In the country as a whole the industrial sector has progressively expanded year after year. For example the contribution of this sector which was Rs 21.1 abja in 1960-61 increased to Rs 23.0 abja in 1962-63 and Rs 24.4 abja in 1963-64.

It would be interesting to study the performance of the industrial sector in Gujarat in a little detail. The contribution to the State income of manufacturing activities alone is 15 per cent. Table 3 gives the performance of this sector over the period of 1959 to 1962. Total number of factories increased from 734 to 987 or by 34.47 per cent. What is more important is the number of reporting factories. These increased from 724 to 960, i.e. by 32.5 per cent. As far as the number of factories is concerned the performance of Gujarat as compared with the all-India record is undoubtedly encouraging. In the case of the country as a whole number of factories and the number of reporting factories increased only by 13 per cent over the same period. The contribution of this sector to State income is higher than its contribution to national income. Here it is necessary to note that the information in Table 3 relates to those factories only which are included in the Census Part of the Annual Survey of Industries. Every registered factory is included in the Census Part of the ASI, if it (i) employs 50 or more workers if aided by power or (ii) employs 100 or more workers if not aided by power. The difference between the number of factories given in the State Government publications and

in ASI is mainly due to the difference in definition of factories. State Government publications include all factories which are registered under the Factory Act irrespective of the number of people employed.

If we take ASI data regarding factories in Gujarat and the information in Table 4 together it can be seen that out of the total of 3,994 registered factories in Gujarat in 1962 only 987 factories employed 50 or more workers with power or 100 or more workers without power. The remaining 3,007 factories were of small size giving employment to 68,730 persons out of the total factory employment of 3,70,982 in 1962.

A further analysis of these data shows that the largest increase in factories (64 per cent) has taken place in factories which are classified as "others". We do not know what types of factories this category includes; but it is clear that it does not include industries of any substantial significance as all important industries worth mentioning are separately classified. The smallest increase i.e. 4.5 per cent, is in the number of electricity, gas and steam factories followed by engineering (5.38 per cent). Thus it is clear that most of the increase in the number of factories has taken place in these years in Gujarat in industries which have very little significance from the view point of the industrial growth of the economy. Analysis of data for factories included in ASI reveals the same fact. The increase in gross output (ex-factory value) of basic industrial chemicals was only 10.3 per cent and of machinery (including electrical machinery) only 2.1, while that in gross output of consumers goods industries like textiles, food, animal oils and fats and grain mill was 70 per cent.

To measure industrial growth in terms of increase in number of reg-

istered factories—as is done by the government—would be misleading. The number of registered factories may show an increase because factories which already existed but which had failed to get themselves registered earlier under the Factory Act get registered for one reason or another. When a factory is in need of some financial assistance or some raw-material, such registration becomes necessary. It may also happen that a factory which is registered in one name, may be divided on paper and given four different names in order to obtain assistance as a small-scale unit. Extension of the effective coverage of the Factory Act may also increase the number of registered factories.

Employment in Industries

Same is the trend as regards the other indicators of industrial growth. For example, employment in factories covered by ASI decreased from 3,07,770 in 1961 to 3,02,252 in 1962. The increase in productive capital was 175.2 per cent over the period 1959 to 1962 as compared with all India increase of 77 per cent. The gross ex-factory value of output increased by 41.1 per cent as compared with 43.7 per cent in the case of country as a whole. Similarly value added by manufacturing increased by only 24.9 as compared with the all-India increase of 41.63 per cent.

Amongst the several indicators of industrial growth value added by factories is the most important one and here not only is Gujarat falling behind as compared with India, but we

find an actual decline of 8 per cent in 1962. The share of Gujarat in the total productive capital of the country in 1962 was 7.2 per cent, while that of Maharashtra was 20.2 per cent,

West Bengal 17.4 per cent, Madhya Pradesh 10.2 per cent and Bihar 9.4 per cent. The share of Gujarat in the gross output of the country was only 5.5 per cent which is much lower

Table 1: Comparison of Movement of Net National Output and National Per Capita Income with Gujarat State Income and Per Capita Income

Year	Net National Output at Current Prices (Rs 100 crores)	National Per Capita Income at Current Prices (in Rs)	Gujarat State Income at Current Prices (Rs crores)	Per Capita Income in Gujarat at Current Prices (in Rs)

than the shares of Maharashtra 25.0 per cent, West Bengal 21.4 per cent, Madras 7.9 per cent, Bihar 7.8 per cent and U P 7.3 per cent (see Table 5).

One indicator of the tempo of industrial development is licences issued under the Industrial (Development and Regulation) Act 1951. Since the inception of the Gujarat State to March 31 1965, out of the total 1,479 applications received for licences, only 439 licences were granted. This means that only 30 per cent of the applicants were successful in obtaining licences. Again, out of the total licences issued only 205 had been implemented in the sense that some actions had been taken to execute them. This obviously does not mean that all of the 205 have reached the manufacturing stage. It should also be noted that out of 205 implemented licences, 141 licences (69 per cent) were for the expansion of existing undertakings and only 64 were for new undertakings. The largest share, i.e., 47 per cent, of the licences given for the expansion of existing undertakings went to textiles. Out of the 234 non-implemented licences 70 were revoked and 164 remained non-implemented for one reason or another. In percentage terms, out of the total licences issued till March 1965 only 49 per cent were actually implemented, which comes to 14 per cent of the total number of applications received.

An analysis of the licences revoked shows that out of the total 70, 54 were in the case of new undertakings and 16 were in the case of expansion of undertakings. What is more revealing is that out of the total licences revoked about 41 per cent were in

the case of engineering undertakings. Between January 1962 and January 1964 out of the total licences issued by the Centre, Maharashtra got the highest, 548, West Bengal 360 and Gujarat 213. Between February 1964 and January 1965 Maharashtra got 137, Madras 104, West Bengal 87 and Gujarat 57. Thus Gujarat which was third during January 1962 to January 1964 came down to fourth position. The above analysis indicates that there is a clear need for investigating the reasons for the very high proportion of applications for licences which are rejected and also for the high proportion of licences which remain non-implemented and are revoked.

A well-known reason for the low industrial growth of Gujarat is the inadequacy of certain basic facilities like power, water, roads and technical personnel and, perhaps, entrepreneurship. According to the second Annual Electric Power Survey of India, the per capita energy consumption in Gujarat was 62 kWh which was much lower than that in many States as indicated in following table:

	Per Capita Energy Consumption (kWh)	
	1962-63	1967-68
Delhi	192	400
West Bengal	99	166
Maharashtra	87	164
Punjab	84	136

Power Survey of India

The position of Gujarat in this respect is going to remain relatively the same even at the end of the Third Plan, as will be seen from column 3 of the above table.

Similarly, as regards rural electrification the position of Gujarat as on March 31, 1964 was also not very favourable as compared with that of many other States. This is indicated in the following table:

	Percentage of Villages Electrified by March 31, 1964
Madras	43.9
Kerala	37.1
Punjab	23.5
Andhra	13.9
Mysore	12.7
Bihar	7.8
Gujarat	6.5

Source: The Financial Express, May 2, 1965.

In spite of the fact that per capita consumption of electricity in Gujarat is much lower than in many other States and that out of the total of 18,376 villages only 1,700 villages (9 per cent) are expected to be electrified by the end of the Third Plan, the installed generating capacity in Gujarat will increase from 316.2 mW in 1960-61 to 618 mW only at the end of the Third Plan (1965-66). The requirement of electricity in Gujarat by the end of the Third Plan has been estimated at 742 mW so that there will be a net deficit of 124 mW. There is likely to be a tremendous growth in the demand for power during coming years as the proposed gigantic petrochemical complex and the discovery of some important minerals like lignite, bauxite, etc., has opened a vast scope for starting several new industries in the State. According to the Second Annual Power Survey, the demand for power in Gujarat during the Fourth Plan will be 1050 mW, in the Fifth Plan 1960 mW and in the Sixth Plan 2,600 mW.

Here it should also be noted that electricity rates in Gujarat are perhaps the highest in India. The rate in Gujarat varies from 17 P to 21 P per unit while in Punjab it varies from 5.93 P to 6.04 P, in Madras from 2.01 P to 7.63 P and in West Bengal from 6.35 P to 7.89 P.

Another important factor which has retarded the industrial growth of Gujarat is the inadequacy of roads. In 1961, there were 14,055 miles of roads in Gujarat out of which 6,905 were metalled and 7,150 miles non-metalled. The target fixed for road construction in the Third Plan is 3,474 miles, out of which till 1963-64 only 1,236 miles of metalled roads and 827 miles of non-metalled roads were built. This means that only 56.5 per cent of the target had been achieved in the first three years. The position of Gujarat in respect of roads per sq mile remains unsatisfactory as compared with many other States. This is indicated in the following table :

States	Roads per 100 sq Miles (As at the end of 1964-65)
West Bengal	120
Madras	71
Uttar Pradesh	56
Punjab	43
Gujarat	23
All India	36

The inadequacy of water supply for industries has also played its part in retarding the industrial growth of Gujarat. The Dhuvaran Power Project was delayed for some time due to inadequacy of water. Many industries depend for their manufacturing process on water supply and sweet water. At the same time, much of the irrigation facilities remain unutilized for one reason or another. This can be seen from Table 7.

The percentage of utilisation to potential was lowest, i.e, 33 per cent, in

Gujarat. This is indeed surprising as irrigated area in Gujarat is only 6.04 per cent of total against the all-India average of 17.65 per cent. Whatever the reasons for non-utilisation by farmers, there is obviously a case for allowing industries which can make use of this facility for industrial purposes.

Another important factor responsible for retarding the growth of industries in Gujarat is the inadequacy of finances. The following table shows the position of Gujarat as compared

Table 6 : Lags in Utilisation of Potential of Irrigation Projects

State	Potential created 1961-62	Utilisation 1962-63	Lag	Percentage of utilisation to potential
Andhra	664	701	-37	100

The industrial growth of any region depends not only on the

physical facilities and resources available but also on the availability of technical personnel. Here also the position of Gujarat is unsatisfactory as revealed by the recent study by the Institute of Applied Manpower Research. The position of Gujarat in this respect is indicated in Table 7.

Besides these factors, delay in granting licences, in acquiring land or loan and in obtaining essential raw materials, particularly non-ferrous metals, are other factors which retard the industrial development of Gujarat. In fact one is surprised to note that the quota fixed for essential raw materials like non-ferrous metals, pig-iron, hardcoke, etc., by the Government of India is on the basis of the

capacity which existed before Gujarat came into existence. This is obviously inequitable to new and expanding industries.

We have analysed above the performance of Gujarat's economy since the inception of the State. The emerging picture is definitely not very encouraging. We feel that unless sufficient awareness of the problems responsible for retarding industrial growth is shown both by the Government and by the private sector the target of per capita output of Rs 445 by 1975-76, implying a 54 per cent increase in the net output of agriculture and 170 per cent increase in the net value of industrial output, would be impossible to achieve.

FROM THE CHAIR

India Steamship Company Limited

Address of Sir A Ramaswami Mudaliar, KCSI, DCL (Oxon)

THE following is the Address delivered by Sir A Ramaswami Mudaliar, KCSI, DCL (Oxon), Chairman, at the Annual General Meeting of the Shareholders of the Company held on September 20, 1965:

GENTLEMEN,

The Audited Accounts and Directors' Report for the period ending March 1965 have been in your possession for some time and, with your permission, I shall take them as read.

The Directors' Report shows that the freight earned during the year was Rs 8,30,47,416 as against Rs 8,28,05,846 in the previous year. The total number of voyages was 40 in the Liner service and 10 in the Coastal service compared to 43 and 25 respectively in the previous year.

After meeting all expenses and providing for depreciation of Rs 1,08,01,095 and interest on Government loans amounting to Rs 28,91,144 there was a trading profit of Rs 32 lakhs of which Rs 31 lakhs has been transferred to Development Rebate Reserve. The Directors feel that, in the circumstances of the trading results, a sum from the General Reserve may be appropriated for the payment of the 5% dividend on preference shares grossed up and a dividend of 5% on ordinary shares.

The Directors' Report records with some satisfaction that the optimistic note struck in the last Report has been justified by the results of the year under review. These results would have been more satisfactory if several adverse factors beyond the control of your Company's management had not affected the operation of your fleet and influenced its earnings. The course of events during the year illustrate the many handicaps that the industry had to encounter, some of them quite unforeseen, particularly in the trade that your Company's fleet is normally engaged in. Conditions of work in most ports, both in India and overseas, degenerated further during the year. Disciplined work by port or stevedore labour was a rarity in most of the ports. Accustomed as we are to some of these conditions in Indian ports, it was an unpleasant surprise to find that the position in the ports of the United Kingdom and even in some of the Continental ports had unexpectedly

degenerated and labour became very intransigent and not amenable to the guidance even of its union leaders. The ports of London and Liverpool in the United Kingdom, Genoa in Italy and sundry other ports in the West were unworkable on many days and the loss that shipping companies sustained by the intransigence of labour was heavy. Your ships had to wait sometimes over a month for a comparatively small amount of cargo to be discharged, even berthing proving difficult. Refusal to do overtime work, lightning strikes, strikes without even union authority, continued for some months in the ports of the United Kingdom and one or two Continental ports and I regret to say that conditions have not yet become normal.

In Indian ports, though the labour situation was not quite so serious, the port of Calcutta was gravely affected by an unexpected and unprecedented strike of Assistant Harbour Masters for over a period of 50 days. Ships could not be berthed or moved from anchorage to anchorage; and virtually the work in the port came to a standstill for some days. It was due to the resourcefulness and ingenuity of the port authorities and the co-operation of certain officers other than the Assistant Harbour Masters that a skeleton service was maintained for some time. Shipping companies had patiently to suffer the loss and chaos resulting from this strike and were greatly relieved when the strike was lifted.

I need not catalogue the delays and difficulties which shipping had to encounter and the congestion that resulted therefrom. Owing to berthing delays in India and abroad, your Company lost 696 days in the year, out of which 548 days were in Indian ports. All this had been aggravated, as I said, by lightning strikes including the strike of Assistant Harbour Masters in the port of Calcutta. The total days lost by your Shipping Company, apart from the normal holidays, was over 1000 days.

In fairness to the authorities concerned, the various Chairmen of Port Trusts and the Transport Department which is in charge of the national harbours and their expansion, it should be stated that worse conditions have

been avoided by timely and tactful action on the part of the Port Trust authorities and increased berthing facilities in some of the ports were organised through the Transport Department and the National Harbour Board Committee.

Increase In Expenditure and Limitation in Earnings

I have referred to delays caused to shipping by factors described in the previous paragraph. These have not prevented an agitation for increase in wages either of the floating staff or of workers on shore, whether they be stevedore labour or port workers. The wage bill of your Company has gone up considerably by such increases from Rs 97 lakhs in the previous year to roughly Rs 1 crore and 12 lakhs in the year under review. Amenities by contributions to Provident Fund and staff welfare expenses have further added to the costs. Port charges have been increased practically in every port in India to meet the demands for higher wages and the cost of development of port facilities. In Indian conditions, with fiscal policies as they are and inflationary conditions resulting from excessive expenditure, it is not easy to suggest that these increases are unjustified. The situation, however, becomes extraordinarily difficult for shipping companies and, in fact, may result in paralysing the Liner services at least, if by meeting all this additional growing expenditure, the shipping companies are denied the right to increase freight rates to a reasonable extent. I trust that such an impossible situation will not be allowed to arise and that Governments—we are concerned with more than one Government at the time—realise more clearly that shipping companies also earn foreign exchange and that Liner services are essential to the economy of the countries concerned.

Extraneous Factors

Shipping companies have been faced with certain extraneous factors which have a bearing on consideration of the freight rates and on the normal earning of shipping lines. I referred, in my speech last year, to the problem of earning foreign exchange facing

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now freely available from our factory at Kota for a wide range of applications such as:

- WIRES AND CABLES
- FLEXIBLE SHEETINGS
- RIGID SHEETINGS
- CORRUGATED SHEETS
- TUBES AND PIPES
- FOOTWEAR
- UPHOLSTERY
- TILES
- CRYSTAL CLEAR ARTICLES
- RAINWEAR
- BRIEFCASES
- TOYS
- HANDBAGS
- BOOK BINDING PAPER

G.R.V.7

Governments and the consequential issue of balance of payments. I had not anticipated then how much more seriously these problems will face Governments in the coming months. The Governments of Great Britain and India, with whose trade your Lines is most concerned, have had to face the problem during the year under review and will have to face it also in the current year. In September last year, the Government of Great Britain imposed a surcharge on all imports of 15 per cent. During April of this year it has been reduced to 10 per cent. The Government of India has recently put an embargo on practically all imports though a relaxation of this drastic cut in imports will, it is hoped, come about shortly.

These fiscal policies of Governments are no doubt dictated by high economic considerations and we have to accept them, though perhaps there may be a doubt whether these could have been avoided by careful husbanding of resources at earlier stages. The effect of this policy is to reduce the volume of international trade and it gravely affects the earnings of shipping lines in the Liner trade particularly. I need not repeat the obligations which the Liner companies undertake to keep a fair amount of regularity of service, to call at practically all ports from which international trade emerges, and take whatever cargo is offered, small or large, and more often, small than large, to various destinations.

The balance of payments position which faces the Governments results in a desire by Governments to export goods to various countries and encounter the competition in international markets. This fact again induces Governments to rely on freight reductions for enabling goods being sold in extremely competitive markets abroad. The dilemma that faces both Governments and shipping companies in these conflicting situations has to be resolved; and it cannot be resolved by ignoring the still small voice of shipping companies addressed directly to the Government concerned or indirectly through parliamentary representations. It seems to me that the time has come when Governments have to appreciate the fact that shipping companies also have to sustain themselves by earning a reasonable amount of profit on their stock and this cannot be achieved unless freight rates are increased.

There has already been a great deal of delay in the freight increases in the India/U K/Continent trade. Other Conferences have increased their freights considerably time after time. But in the India/U K/Continent Conference, possibly because Indian trade in this route forms the largest percentage of its external trade, there has been undue emphasis on maintaining low freight rates. I have no doubt whatsoever in my mind that if the level of service has to be maintained by Liner companies, freight rates both eastward and westward should be increased simultaneously and at the same level. I do not wish to ignore the necessity of export promotion and therefore, where it is absolutely inevitable, a reasonable rate of freight for these exportable commodities has to be considered. Hitherto, however, the need for the latter has resulted in an objection to any increase in freight rates or in a scaling down of the whole of the freight rates, and thereby seriously affecting the earning capacity of the shipping lines concerned.

It seems to me that the time has come when a radical review of the logic of this position should be made. There are many commodities which can bear a freight increase and whose export or import would not be seriously affected. It is not logical to bring down the level of freights generally to enable those commodities whose export will be affected to find a place in competitive markets. I suggest that the general level of freights increase need not be questioned by Governments. The controlling factor is the shipping companies' desire to get as much cargo as possible and companies are generally considerate enough to see that, if there is any fall in the movement of cargo owing to freight rates, they should be reasonably adjusted. But where what are called 'sensitive commodities' are concerned, which may not move without a certain amount of lowering of freight rates, a different pattern of freight rates may be considered. I suggest that there should be two levels of freight, whether eastward or westward; one, a general level which will be fixed by the Conference concerned taking all factors into consideration, and the other, a lower level which can be constantly reviewed for certain specific commodities described as 'sensitive commodities'. It is of course essential that the list of sensitive commodities should be as short as real necessity demands. The clamour

of some shippers who desire very low freights without examining diverse factors which otherwise militate against their ability to compete with like goods abroad should not form the main criterion for inclusion in the list. I hope the suggestion will be considered by shippers primarily and by Governments thereafter.

Thanks

I must record our grateful thanks to the Minister of Shipping who has, in various ways, showed his interest in the development of Indian shipping and in its prosperity. While sharing the difficulties as a member of the Government, he has as far as possible tried to understand the problems of Indian shipping particularly and to be of assistance to them. To the Ministry of Transport and its official, and particularly to the Secretary and the Director-General of Shipping, his deputies and assistants, we owe a debt of gratitude for the wise guidance and useful advice they have given to us from time to time. I would like to specially thank the Chairman of the National Shipping Board for the interest he has taken not merely in the development of Indian shipping but in its welfare and prosperity; and I trust that his influence as a prominent Member of Parliament and the detailed knowledge he has attained as Chairman of the Board will enable the Governments in general and Parliament in particular to understand the problems facing Indian shipping and to accept the recommendations that the Board may make from time to time.

Tribute

The last and not the least important of my duties is to pay a tribute to the officers and staff of the Company. The financial result of the Company for the year does not sufficiently reflect the hardwork and devoted attention which officers, both ashore and afloat, and staff of the Company have rendered during the year. Owing to conditions mentioned earlier, their responsibilities have been far greater and their work much heavier and I should like to express my and the Board's appreciation of their services. I should also like to convey the thanks of the Company to the Shippers who have extended their continued and firm support to us and to the Brokers and Forwarding Agents who have shown confidence in us and in the quality of our shipping service.

Machinery Manufactures Corporation Limited

Statement of the Chairman, Mr A K Mitra

THE following is the Statement of the Chairman, Mr A K Mitra, circulated to the members in advance with the Company's working results for the year ended March 31, 1965:

Instead of making a speech at the Annual General Meeting, I have taken the liberty of deviating from the past practice by circulating to you in advance a statement dealing with the Company's working for the year ended 31st March, 1965. I regret the delay, partly intentional, in circulating the statement—as I wanted to bring you upto date with the present position of the Company, particularly in respect of its expansion programme.

The Directors' Report and accounts for the year ended 31st March, 1965, which have been in your hands for the last few days, show improved working results. This has encouraged your Board to recommend a higher dividend of 17½ per cent (2½ per cent in the form of Bonus) after putting into reserve Rs 16.50 lacs as against Rs 12 lacs last year. Our General Reserve now stands at Rs 55.80 lacs against subscribed capital of Rs 69.71 lacs including Preference Shares. Your Company has also been able to reduce its indebtedness to Industrial Finance Corporation of India from the original figure of Rs 69 lacs to Rs 13 lacs. Our production for the year was 1316 Cards—exceeding our installed capacity of 1200 Cards a year.

Production Better

Although there was an appreciable increase in the production of diesel engines during the year under review, the plant was not able to reach its rated capacity mainly because of the difficulties encountered in substituting imported items by local manufacture. I am pleased to inform you that diesel engines manufactured by your Company have earned excellent reputation for their quality and the demand continues to increase.

In the field of Carding Engine which is the principal product of your Company we continue to hold the premier position and for the statistical minded, we have produced over 70 per cent of the total Carding Engines manufactured within the country. Having kept in touch with the latest

developments in carding technology your Company was the first to develop and market Semi High Production Cards which, when clothed with metallic wire, yield almost 100 per cent increase in production. By and large the cotton textile industry has accepted high production cards and orders are coming in.

The Semi High Production Cards are undergoing extensive tests at Textile Research Institutes at Bombay, Ahmedabad and Coimbatore from where we have received excellent co-operation and helpful suggestions. The member mills of these Institutes, after studying the evaluation test results, would have a clear idea of the best manner in which to harness the Crosrol-Varga High Production Technique to meet their individual requirements. It is my conviction that only by this method i.e. through a process of close collaboration between the Textile Machinery Manufacturers and the Textile Research Institutes that we will be able to improve the quality of our products and incorporate technological innovations to suit Indian requirements. The setting up of a separate Research Institute for Textile Machinery Manufacturers by drawing on the resources of individual manufacturers will not, to my mind, achieve the objective. I would, therefore, urge the authorities to discard the proposal of setting up a separate Research Unit for Textile Machinery Manufacturers and instead, give more direct help and assistance to individual manufacturers and to the Research Institutes mentioned above who have and are to my mind doing excellent work for the country.

Turning to the expansion programme of your Company, I am pleased to inform you that manufacturing licence for Crosrol-Varga High Production Units and letter of intent for High Production Draw Frames have been received. We have also received the licence for the import of tooling from Carding Specialists, UK. Under the expansion programme which is phased over a period of three/four years—your Company propose to manufacture two new products (1) Cross-Varga High Production Units (2000 Nos) and (2) High Production Whitin Draw Frames (200 Nos) Additionally, the manufacturing capacity in respect of the

following products will be expanded (1) Speed Frames to 90 which is the licensed capacity and (2) PH diesel engines from 2400 units to 5000 units. For implementing the programme the Company applied to Industrial Finance Corporation of India for a foreign exchange loan of Rs 138 lacs and a rupee loan of 25 lacs. I am pleased to inform you that the loan has been sanctioned in full. I should like to record our appreciation of the help and assistance we have got from Industrial Finance Corporation of India and I should like particularly to refer to the exemplary promptness with which they dealt with our application.

Diversified Expansion Programme

With the expansion programme mentioned above your Company will have diversified into a multi-product unit with a heavy bias towards textile industry. It was the promoter's intention to be able to service the largest industry in India with indigenously manufactured machinery. As one of the pioneers in this field your Company had substantially contributed to the building up of the textile machinery industry and we propose to continue to work towards the basic objective of manufacturing quality machinery which will meet their requirement. In the past your Company has had full co-operation from the industry and I hope they will continue to give their co-operation which is essential and necessary if the country has to attain the state of self-sufficiency in the field of textile machinery. I earnestly hope that the textile industry will bear with the manufacturers in their effort to build complete indigenous machinery and give their constructive suggestions. Our machinery industry has made rapid strides during the last few years and it has not only improved in quality but also, wherever possible, introduced latest technological improvements. Take for example, our High Production Carding Engines. By introducing the units in the market we have reduced the total requirement of cards in the country by at least 50 per cent. We expect that the manufacturing facility thus made available will be utilized for producing such other types of machinery which are not presently being manufactured in the country. I would appeal to the Government that before agreeing to the import of machinery from abroad

they should take the machinery industry into their confidence. In the past ad hoc import of machinery from abroad retarded its progress and if today when the industry is doing its best to supply quality machinery, imports were allowed under foreign credit arrangement, it will only again retard the efforts that the machinery industry is making.

Capacity for manufacture of diesel engines will also be increased and it will be possible for your Company to make available a larger number of diesels for agriculture which has high priority in the Fourth Plan.

I should like to add a note of caution. The increase in duty on machinery and excise duty on steel material announced in the Supplementary Budget will affect our expansion programme as the total capital outlay will undoubtedly increase. These issues are receiving your Board's careful attention.

I should like to mention in this connection that in the Supplementary Budget proposal whilst there are certain redeeming features like increased development rebate and removal of import deposit scheme, resultant increase in the excise duty on raw materials and custom duty on imported raw materials and components will, in effect, further increase the price level of indigenous products. In view of this your Directors may be reluctantly compelled to revise upwards the price list of your Company's products.

The order book remain full in respect of Carding Engines and production and despatch during the first 5 months of the current year continue at the same level as in the corresponding period of 1964/65. Recently, however, some of the mills are asking for postponement of delivery of capital goods. It is rather difficult to relate this phenomenon to a precise cause; the present economic scene is a little obscure to provide clear inferences. One can, however, see that the credit squeeze and the several other fiscal restraints imposed by the Supplementary Budget bear some measure of responsibility for the hesitant stance in the corporate sector. The textile industry has an important role in closing the gap of trade balance and there are some indications of this recognition in certain specific

measures recommended in the Supplementary Budget. I should like to think therefore that the incidence of postponement referred to earlier is no more than temporary.

I should like to conclude by placing on record on your behalf, the thanks of the Management and the Directors for the ungrudging work and loyalty of your staff throughout the year.

It is time now to start a FESTIVAL ACCOUNT for the next Diwali.

Monthly deposit of Rs. 5/- over the next year will yield Rs. 61.75 in time for the next Diwali.

Deposits of higher amounts in multiples of Rs. 5/- are also accepted.

"Indian Economic Growth: Performance and Prospects"

Rejoinder

Ashok Rudra

I HAD no difficulty in recognising that the 5 per cent rate of growth for agriculture and the 7 per cent rate of growth for income were the targets of the Planning Commission for the decade 1965-75. However, I wondered whether any normative significance could be attached to these targets which could justify K N Raj's making such a statement as "Failure to achieve the higher rate now required can be fatal in its consequences". Raj has replied by saying that the figures are estimates of the Perspective Planning Division and since the details have been published I "should have had no difficulty in understanding the assumptions on which they are based" (*The Economic Weekly*, August 28, 1965). Now let me repeat for clarification's sake: I am not wanting to know the assumptions underlying the Perspective Planning Division's calculations, but the rationale, if any, of its targets which could lend them any normative significance.

In the "Notes on Perspective of Development India, 1960-61 to 1965-76" it is stated that the perspective plan has been drawn up with, among others, the following two objectives:

- "(a) to ensure a minimum consumption of Rs 20 per capita per month to the entire population by the end of the fifth five year plan; and
- "(b) to ensure that the economy will be capable of sustaining an average annual rate of growth of the order of 7 per cent even after 1975-76 without depending on foreign aid." (italics added)

The minimum consumption target has got indeed the air of being a normative objective but it is not really one such. For Rs 20 has no more normative significance than any other figure, say Rs 22 or Rs 17.50. The only minimum consumption objective that could have any normative significance is to provide to the poorest classes a level of living that would ensure them the physiological minimum requirements of nutrition, clothing and housing. The requirement works out to around Rs 35 per capita per month at the prices of 1957-58 according to my own calculation.

The second objective, that of arriving at the stage of self-sustaining

growth by 1975-76, is indeed one that is of crucial significance; but the significance cannot be passed on to the targets of 5 per cent for agriculture and 7 per cent for income, as nowhere in the "Notes" is it explained how the rates are derived from or based on this particular objective. It is about this particular argument that a 7 per cent rate of growth would lead the country to the stage of self sustaining growth within a decade that I have said that it has to be based on a plausible mathematical model to be convincing. I have not wanted that Raj should develop his arguments in his lectures with the help of a model. But I did expect that if he talks about certain targets as being "the minimum that needs to be achieved in the coming years", he should be convinced about the arguments that establish the rates to be the minimum in some sense. As I have said, no such arguments are to be found anywhere in any Planning Commission document. I wondered whether Raj had any of his own. The only systematic examination that has been undertaken of the possibilities of doing without foreign assistance by 1975-76 is that of Arjun Sengupta, published in this journal in the issue of August 14, 1965. His conclusions, I am afraid, would not lend much support to the Planning Commission in its wish-fulfilling attitude.

It is unfortunate that Raj confuses issues by referring to my results regarding the relative rates of growth of agriculture and industry, presented in an article and in some seminars. The problem examined there, among other things, was whether a 5 per cent rate of growth for agriculture is in balance with a 12 per cent rate of growth for industries, and if not what were the consequences of imbalance. The point I made in my comments on Raj's lectures has, however, nothing to do with inter-sectoral balance. I was merely asking why one should consider a 5 per cent rate of growth for agriculture as of such special significance that a failure to achieve it should be regarded as fatal. The question "what is minimum about the target of 5 per cent for agriculture" is certainly altogether different from the question, "is the

combination 5 per cent for agriculture and 12 per cent for industry balanced?"

I concede that I was less than fair to Raj in implying that he is not concerned about the increasing inequality in the distribution of income, for he has indeed expressed his dissatisfaction with this aspect of our economic growth on page 27. I also agree that the conclusion of increased inequality does not necessarily follow from the fact of the marginal saving rate being much higher than the average rates at the beginning and the end of a period. But I began my statement with, "To the extent that the pattern of income distribution determines the rate of saving...". Now it appeared to me that according to Raj the extent was very high indeed. I did understand him to mean that the high marginal rate of savings in India is primarily to be explained by the fact that "income distribution in India is perhaps more skewed than in many other countries."

Raj thinks that I have assumed "a priori that rates of growth of this order (of the order of 5 per cent) cannot be achieved". He also talks about my "apparent presumption that a higher rate of growth cannot be achieved in agriculture". Raj seems to think that rejection of a hypothesis is the same thing as the acceptance of a contrary hypothesis. However, in science the statement "data do not justify the acceptance of hypothesis A" is not at all equivalent to saying that "data justifies the acceptance of hypothesis not-A". Data can be neutral between the two hypothesis A and not-A. Of course, I do not have any stronger grounds to believe that a 5 per cent rate of growth in agriculture cannot be achieved than Raj has for believing that it can be achieved. I have not questioned Raj's assertion in order to advocate the negative view that no increase in agricultural rate of growth is possible. My position is that the evidence on which Raj is relying is too flimsy to sustain any hypothesis whatsoever, and one should not build up presumptions on such basis and gave them wide publicity. Presumptions about likely rates of growth should be based on countrywide diagnostic surveys carried out by competent experts who

will examine the performance and prospects of agriculture with adequate ing to scientific principles. No such number of observations made accord-facts have been gathered though there is no dearth of official research organisations that could have done it. The need for it cannot also be gainsaid, given the difficulties arising from the slow rate of growth of agriculture during the recent period. In the absence of any such objective collection and analysis of facts, all optimistic and pessimistic views about future performance of agriculture are to be regarded as equally baseless.

The point about an upward sloping curve for production and a downward sloping curve for market-supply has got unnecessarily confused due to a fatal misprint in my article. What I wrote was that given suitably chosen elasticities "increase in price, increased production, increased self consumption and decreased market supply may be shown as consistent". The word *decreased* was misprinted as *increased*, completely changing the meaning of the sentence. The error was pointed out in the issue of July 10, 1965, but Raj has not obviously noticed it. It should be clear now on re-reading the entire paragraph with the correction that I was not taking the aid of "suitably chosen" elasticities to conceive of a logical possibility different from the one defended by Raj but was asking that while Raj's position could conceivably be a logical possibility, was it anything more than that? Of course, Raj has initially disposed of the entire matter by describing it as "one of the elementary propositions of economic theory". But in so far as economic theory would aspire to lay any claims to scientific method, its propositions, elementary or otherwise, ought to be based on or confirmed by empirical evidence. I would like to know what empirical support one could provide for the so-called elementary proposition that non-monetised self consumption does respond to *imputed* income changes in the same way as monetised consumption to changes in monetised income when the income change, in either case is due to price change. I would like to know what it means to talk of "income effect of a price change" when one is talking of such part of production that is not brought to any relationship with prices.

Now that Raj has quoted the actual index numbers which have been the basis of his conclusions that prices remained at around the 1960-61 level

till 1963-64, it is possible to explain the differences between his figures and mine. It has caused me a little trouble to find out the explanation as he did not indicate the source from which he has taken his figures. However, the reader can check from Table No. 40, page 413 in the March 1965 issue of Reserve Bank of India Bulletin that the index numbers quoted by him refer not to the financial years 1960-61, 1961-62 and 1962-63 but to the last weeks of those years. The yearly averages are to be found in Table No. 40A page 414 of the same issue. While Raj's figures are 127.5,

122.9 and 127.4, the yearly averages are 124.9, 125.1 and 127.9. The explanation, therefore, is not that Raj has used financial year averages whereas I have used calendar year averages. What Raj has used are the prices of *single weeks* representing each year. Surely, no price comparison over time should be based on one week's figure to represent the whole year. In any case, for 1963-64 the last week's figure is 139.0 and the yearly average 135.3 so that even according to his own statistics it is not true that the prices remained in 1963-64 around the same level as in 1960-61.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

AROUND BOMBAY MARKETS

Equities Spurt on Cease-Fire

Thursday Morning

TRADING sentiment on the stock exchange last week was guided entirely by political developments. Dalal Street which had managed to put up a fairly steady showing in face of the Indo-Pakistani conflict was forced to seek a new bottom—the lowest for nearly six years—following the threat of Chinese attack on the Himalayan borders. The market kept distinctly subdued until September 21 but staged a spectacular recovery the next day when it became known that both India and Pakistan had agreed to accept the Security Council's resolution on cease-fire. Century which had been sold down to Rs 506 on September 21 were marked up to Rs 528.50 the next day. National Rayon improved from Rs 382 to Rs 401.50, Tata Locomotive from Rs 201.25 to Rs 210.50, Indian Iron from Rs 24.36 to Rs 25.25, Tata Steel from Rs 138.25 to Rs 141.75, Hindustan Motors from Rs 16 to Rs 16.48 and Tata Chemicals from Rs 17.64 to Rs 19.28. Wednesday's rise enabled the market to recover the losses suffered in the past few weeks. The rise was due both to short covering and renewed bull support and a good deal of buying was said to be against options.

Prospects of Chinese invasion have receded with the cessation of hostilities between India and Pakistan because the latest reports from Peking give the clear impression that the Chinese move had been mainly aimed at exerting psychological pressure on India in its conflict with Pakistan. Improvement in the political situation should impart strength to the stock market, particularly when technical considerations seem quite favourable for a recovery. The recent decline in equity prices had pushed the average yield on equities to around 8.2 per cent which is probably an all-time low for Dalal Street. Of course, even this high yield cannot be regarded as very attractive in the context of the prevailing structure of interest rates. The marked decline in floating stocks of many market leaders following massive purchases by the Life Insurance Corporation should also help the process of technical recovery.

While prospects of a technical recovery seem fairly encouraging, it is doubtful whether this recovery could develop into an important uptrend. There are no indications of any easing

of pressures on the economy; the strains are likely to increase because of the likely increase in defence effort. Defence-oriented development need not be a 'bull' factor from the view-point of the stock exchange.

COTTON

Futures Hit New High

WHILE activity in the spot cotton market was virtually at a standstill most of the time, bulls and bears continued to have fairly good fun in the futures market—fun, because futures dealings do not have any really worthwhile economic function to perform though there are quite a number of people who live purely on fluctuations. Sentiment in futures was guided mainly by war news. After easing from Rs 884.50 to Rs 875.50, the hedge contract moved up to a new high level of Rs 888 on September 22. Earlier setback was due partly to corrective profit-taking and partly to some anxiety over the heavy concentration of Chinese forces on the Himalayan borders. The week-end spurt was attributable mainly to the announcement of cease-fire, putting an end to the armed conflict between India and Pakistan.

Apart from the normal seasonal slackness, activity in the spot market has recently been affected by disturbing political developments which not merely increased the risk of movement of goods to and from the border areas but also led to curtailment of credit facilities in the war affected areas. The Deshi cotton harvest is ready in the Punjab but its picking has been seriously affected by frequent Pakistani air raids. The end of hostilities should facilitate the marketing of the new crop both in the Punjab and Rajasthan. In the absence of any reliable estimates it is difficult to say to what extent the standing crops in these two border States have been damaged by Pakistani air attacks and the movement of land forces.

Despite the general disposition to convert stocks into cash and reduced spinner inquiry due to various factors such as financial stringency, accumulation of cloth and yarn stocks with mills, partial closure of several units and setback in cloth production, there has been no noticeable decline in ready cotton prices from their all-time high levels. This merely underlines the chro-

nic imbalance between supply and demand necessitating large imports of foreign cotton despite difficult foreign exchange position. If the country were to be unable to meet the shortfall in domestic production through adequate imports, the textile industry in India would be faced with a cotton famine even though the country has the largest area under cotton in the world.

Arrivals of foreign cotton into India during the 1964-65 season (September to August) totalled 824,514 bales against 627,481 bales in the previous season. These imports consisted of 394,402 bales of American cotton and 430,112 bales of global cotton, the corresponding figures for 1963-64 being 249,860 bales and 377,621 bales. Cotton exports during 1964-65 totalled 254,606 bales against 271,279 bales. As usual, Japan ranked first among the buyers of Indian cotton and accounted for 194,992 bales (205,616 bales). The USA was a distant second with 25,585 followed by the Continent 18,214 bales, Hongkong 10,759 bales, UK 4,272 bales and others with 784 bales.

OILSEEDS

Mixed Showing

THE oilseeds market made a mixed showing last week. While the spot section was distinctly subdued under the lead of groundnut and groundnut oil, futures held remarkably steady on strong bull manipulation and shot up at the week-end following the announcement of cease-fire by both India and Pakistan. Groundnut oil was marked down to Rs 27.90 (per 10 kilograms) and groundnut ready Khandesh variety declined to around Rs 67 per 50 kgs; not many weeks ago, groundnut oil had touched a high of Rs 33 and groundnut ready had been quoted around Rs 77. Linseed oil eased from Rs 25.50 to Rs 24.75 during the week and castor oil from Rs 18.40 to Rs 18 in sympathy with the weakness in groundnut oil.

But castor and linseed futures displayed remarkable firmness. After an early setback from Rs 94.87 to Rs 91.75 castor April shot up to Rs 97.25 in kerb dealings on September 22. Linseed April which had eased from Rs 111.75 to Rs 109.75 were up again at Rs 114 on September 22. The week-end spurt in futures was caused by nervous short covering and renewed bull support. The spot market also

turned a little steadier at the week-end mainly in sympathy with futures though sentiment was aided by the news of the cease-fire.

The recent setback in spot groundnut and groundnut oil prices has been attributed to a large extent to the general disposition on the part of stockists to convert their stocks into cash because of the anxiety over the political situation and frequent air raids by Pakistan. But sentiment has also been affected by the arrival of new summer crop and reports of a fairly satisfactory new crop of groundnut. Fresh buying by vanaspati manufacturers in the past few weeks has been restricted to the minimum because of the uncertain political situation.

Despite the recent decline, groundnut and groundnut oil prices are still on the very high side. While the movement of the new crop in the next few weeks should normally impart an easier tendency, prospects of any significant fall in prices are generally discounted because of the continuing inflationary pressures in the economy and the overall scarcity of edible oils and fats in the country. Oilseeds production continues to lag behind the country's growing requirements. Here again, as in the case of cotton, the problem is one of the stepping up of the miserably low yield. Export activity in recent weeks has been seriously affected by disturbing political developments which has made loading and unloading of cargoes difficult and risky. The situation should improve with the cessation of hostilities between India and Pakistan.

MONEY AND BANKING

Interest Rates Down

THE Bombay short term money market relaxed during the week to September 22. Though during the earlier part of the week the market continued to display some tightness, conditions eased as the week progressed. Demand slackened and the rate of interest fell. Supply continued to be ample with funds flowing freely into the market. Rates of interest on Wednesday were placed at between 7 and 6½ per cent.

During the week to September 10 scheduled bank credit advanced by Rs 1.59 crores to Rs 2,024.09 crores, according to the statement of affairs of scheduled banks issued by the Reserve Bank. Bank credit a year ago stood at Rs 1,728.71 crores. Aggregate deposits of the banks, however, declined from Rs 2,792.86 crores to Rs

2,781.37 crores during the week. The decline follows a Rs 40.69 crores decline during the preceding week. Borrowings from the Reserve Bank fell as well from Rs 21.33 crores to Rs 19.36 crores and balances with the Reserve Bank came down by Rs 4.59 crores to Rs 97.89 crores. Cash in hand with the banks were lower by Rs 1.18 crores at Rs 65.51 crores. Investment in government securities at Rs 830.61 crores declined by Rs 24.90 crores. Money at call and short notice, however, improved by Rs 3.82 crores to Rs 55.62 crores.

Foreign securities with the Reserve Bank during the week to September 17 increased by Rs 2.28 crores to Rs 70.63 crores according to the Statement of Affairs of the Reserve Bank. Balances held abroad, however, declined slightly from Rs 16.14 crores dur-

BUSINESS NOTES

Dyer Meakin Breweries

THE name of Dyer Meakin is known in India since 1855, when it started a brewery and a distilling plant on a small scale at Solan in Simla Hills. Since then it has expanded to its present size, and is now the only single unit of its kind in all Asia. The distillery at Kasauli is one of the oldest in Asia and its maltings are regarded to be one of the biggest in the East. They provide the vast quantity of malt required for the production of malt whisky. The Lucknow distillery is responsible for producing quality liquors. Apart from the expansion at the old units, an industrial township, named Mohan Nagar, was established in 1962 to house a chain of factories of Dyer Meakin. Already under operation here are a number of units — a yeast and malt plant, brewery and distillery, cold storage, ice factory, soft drinks unit and breakfast food factory. The expansion plans are still continuing.

The company is the first to manufacture malt extract and brewer's yeast in India. By manufacturing malt extract, the company not only meets the country's demands for the pharmaceutical and food industries but also saves the much needed foreign exchange. Dyer Meakin is today making over two dozen alcoholic products and an equal number of non-alcoholic ones. Its beers are amongst the best in the world and are exported. It has recently received an order for whisky from Scotland, a place where the world's best whisky is produced.

ing the preceding week to Rs 15.19 crores. Notes in circulation at Rs 2,580.40 crores showed a drop of Rs 11.55 crores and rupee coins declined from Rs 102.96 crores to Rs 101.43 crores. Rupee Securities stood at Rs 2,302.44 crores against Rs 2,304.72 crores the previous week. Central Government deposits fell sharply from Rs 109.55 crores to Rs 67.66 crores. State government deposits, however, improved from Rs 8.50 crores to Rs 19.66 crores. Deposits of scheduled banks at Rs 102.98 crores show an increase of Rs 5.26 crores. Loans and advances to governments declined from Rs 67.08 crores to Rs 40.24 crores and advances to scheduled banks were also lower by Rs 4.11 crores at Rs 17.38 crores. Investments were better by Rs 1.47 crores at Rs 155.01 crores.

The company has expanded its malting activities at Mohan Nagar by setting up a new modern malt house which not only enables it to meet the requirements of its various units, but also to make supplies in increased quantities to other consumers. A Rs 1.5 crores glass factory is under construction. The first phase of the manufacturing programme having started, the normal production is expected to being by the end of this year. The glass factory will produce bottles, containers, crystal glass, glassware for households and fancy glassware. It is proposed to set up many other ancillary units with the glass factory. Negotiations are in progress with a Japanese firm for securing technical know-how in the manufacture of fancy glassware. Besides, there are plans to treble the capacity of the glass factory to 300 tons per day.

During the year to March last, the company well continued its growth as is reflected in a 39 per cent jump in sales to Rs 9.13 crores followed by more than 26 per cent advance in gross earnings to Rs 2.18 crores, an impressive achievement notwithstanding the all-round rise in costs. The directors have proposed an increase in the dividend of four points to 25 per cent, which has followed a three-point rise in the preceding year. What is more, the enhanced distribution finds a bigger cover of 5.5 times, against less than 4.9 times a year ago. Not only that. A bonus issue in the ratio of 1:14 is also proposed. The scrip is fancied by

investors for its growth potential and very sound financial position.

Titaghur Paper

VARIOUS difficulties and misfortunes combined to affect the working results of Titaghur Paper Mills during the year to March last. The closure of No 3 mill for 4½ months due to labour trouble and acute steam shortage at No 2 mill resulted in a drop of some 10.5 per cent in production compared to the preceding year. After the prolonged closure, there were also a number of process difficulties which seriously delayed completion of some important engineering jobs. Besides, the company was obliged to pay profit sharing bonus of Rs 13.78 lakhs to workmen in respect of five years ended March 1964, apart from the minimum bonus for the year 1964-65. Pran Prashad, Chairman, has held out a hope of better performance in the current year. In his statement circulated with the 1964-65 report, he expects the year's profit position "more in keeping with the past record of this company, notwithstanding increases in labour and other costs."

During 1964-65, Titaghur's total production was 51,850 tonnes compared to 57,822 tonnes previously. Net sales of paper were substantially lower at Rs 9.88 crores (11.74 crores) and movement of stocks was restricted due to wagon difficulties resulting in accumulation of stocks. The accounts shows a loss of Rs 6.81 lakhs, as against a profit of Rs 13.65 lakhs in the previous year. A sum of Rs 16.40 lakhs has been withdrawn from reserves to wipe off the deficit and pay usual dividends on preference shares and at the rate of 2.5 per cent on 'A' and 'B' equity shares.

Rohtas Industries

THE financial results of Rohtas Industries, manufacturers of a wide variety of products such as paper and boards, cement, sugar, vanaspati and caustic soda, show a sharp setback due mainly to the payment of arrears of bonus, dearness allowance and wages for the previous years which demanded a fairly large amount. While production of paper and boards, asbestos cement, caustic soda and sugar showed an increase, that of cement and vanaspati declined. The impact of continuously rising costs was reflected in the lower profits of the paper unit. The company has ordered equipment required for modernisation of its soda

recovery plant. The modernisation scheme will cost about Rs 45 lakhs and will be completed in 2-3 years. The production of vulcanised fibre increased from 4.2 lakh kgs to 6.5 lakh kgs due largely to the use of base paper produced in the paper factory to supplement imported supplies.

The intensive cane development measures adopted by the company contributed to the substantial increase in sugar production. The vanaspati factory, however, could produce less because of shortage of groundnut oil and delay in the arrival of soyabean oil from the U.S. Production has since gone up with the receipt of this oil, and the current year's working of this unit should show significant improvement. Additions were made in the machine shop for creating extra machining capacity. The cast iron foundry is being modernised. This unit will now be in a position to undertake outside engineering jobs on a larger scale.

As to the future profitability of the company, much will depend on the Government's price policy, since most of the commodities manufactured by it are subject to rigid price control by the Government. The increase of seven Paise per kg in the price of Duplex board with effect from September this year and the increase of Rs four per tonne in the cement retention price from June should help improve the earnings.

The working results for the year to March last show a small decline in sales from Rs 18.90 crores to Rs 18.42 crores followed by a sharp fall in after-tax profit from Rs 43.44 lakhs to Rs 21.59 lakhs. After setting aside Rs 3.65 lakhs (Rs 5.95 lakhs) for transfer to development rebate reserve, there remains a surplus of Rs 17.94 lakhs compared to the previous year's Rs 37.49 lakhs. The usual preferential dividends and the reduced equity dividend of six per cent together demand Rs 36.52 lakhs, against Rs 46.72 lakhs a year ago. A part of the shortfall in the disposal profit is made up by writing back Rs 12.49 lakhs being depreciation provided in previous years.

Jay Engineering

THE financial results of Jay Engineering Works, makers of sewing machines and fans, for the year to March last show a notable recovery following a five-and-a-half month long strike that ended at the close of May

1964. No manufacturing operations could be carried on in the Works for the first two months of the year, but later the workers put in greater efforts to overcome the consequences of strike and helped produce distinctly improved results as reflected in sales which at Rs 12.16 crores were over 16 per cent more than the preceding year's and gross profits more than 63 per cent higher at Rs 89.13 lakhs. The provisions for depreciation and development rebate reserve are slightly lower at Rs 34.33 lakhs and Rs 2.75 lakhs compared to Rs 35.20 lakhs and Rs 3 lakhs, respectively, in the previous year, but the tax liability has mounted to Rs 29.25 lakhs against only Rs 8.60 lakhs. Even then, net earnings have risen three-fold to Rs 22.80 lakhs from the previous year's Rs 7.64 lakhs. Of this, as before the preferential dividend requires Rs 5 lakhs, and the unchanged equity distribution of eight per cent on a capital enlarged by a three-for-ten bonus issue demands Rs 15.80 lakhs as against Rs 12.15 lakhs. What is more impressive, these results have enabled ploughing back of a couple of lakh rupees to general reserve whereas in the preceding year as much as Rs 9.50 lakhs had to be withdrawn from that reserve for disbursement of a smaller total amount of dividend.

The management is optimistic about the outcome of operations in the current year, for the relationship with the rank and file of the workmen continues to be good and "the workmen are applying themselves sincerely" to normalisation of production activity. In line with the general trend, however, Jay Engineering's operations have lately been affected by the difficulties in imports and by the further financial squeeze recently initiated by the government. Costs, too, continue to rise.

The other two favourable factors which may influence this year's working are (1) operations at the Hyderabad factory have stabilised and (2) export earnings are expected to further look up on account of the continued efforts being made to promote exports. The company's products enjoy a world-wide market.

The Ceylonese subsidiary, Usha Industries Ltd, incurred a small loss of Rs 0.39 lakh during the year to March last. Production has now been started there of those parts which hindered operations last year owing to import difficulties.

Poysha and Lubecawerke

make a nice package...

India's packaging industry takes a big step forward as Poysha, the nation's second largest container maker, joins hands with one of Europe's leading packaging companies: Lubecawerke, West Germany. Lubecawerke is renowned in every field of scientific packaging, with 9 subsidiaries and 7 associates all over the Continent. All their technical know-how and valuable experience are pooled in Lubecawerke's Central Laboratory, which will be made available to Poysha. Poysha will now have the benefit of Lubecawerke's expertise. The technical collaboration agreement covers an extensive field: from advice on food preservation and quality control to assistance in setting up new production lines and training Poysha engineers in West Germany. It will also use Lubecawerke's many patented features. With all this, Poysha will soon move into new fields of packaging: plastics, paper, aluminium... This will mean a wider choice of packaging materials for Indian users and for exports, too. Most important of all, the specialised knowledge of Lubecawerke will now be at the service of Indian industry, through Poysha, and its subsidiary, Kaira Can Company Limited.

**WE
LOOK**

Forward planning has always been a part of management thinking at IISCO. This made it possible for us to complete by 1960 a two-phase expansion programme to take production to 1 million tonnes of ingot steel well ahead of schedule.

With the challenge there again to provide more steel for the nation produced efficiently, we are on the edge of another two-phase expansion

programme to reach a target of 2 million tonnes. Research and the constant application of new techniques will win better iron, more steel and more diversified end products from Burnpur's existing installations which new plant and equipment should ideally balance and supplement—at an investment cost *considerably less* than that required for an entirely new plant of the same tonnage.

Outlook for Aid

THE World Bank and its two affiliates — the International Development Association and the International Finance Corporation — provide something like one eighth of total official international development assistance, but their annual meetings provide the occasion for a general dialogue on aid and allied problems between the donor countries (excluding the Soviet group and China, of course) and the beneficiaries. The former, very rightly, permit themselves some modest self-congratulation and, equally rightly, lecture the aid-receivers on the need to husband their own resources more effectively. Also, inevitably though less rightly, they extol the virtues of private enterprise and bid the governments of the developing countries to make every effort for its encouragement. The developing countries, in their turn, are grateful for the assistance they receive, but air their many problems: fluctuating or declining export earnings, widening balance of payments deficits and insufficient aid to cover them, leading to their inability to plan for satisfactory rates of growth.

The complaints should be if anything more insistent this year, though not against the World Bank and its affiliates themselves. The year ended June 1965 was the most active in the history of the World Bank group, with total loans, credits and other commitments amounting to \$1,358 million or over a fifth higher than in the previous year. Almost the entire increase was on account of the World Bank whose commitments exceeded \$1,000 million for the first time — being \$1,023 million against \$810 million last year. The comparatively small increase of \$26 million in the IDA's assistance, however, is a warning that the organisation is once again approaching the limit of its resources.

The distribution of assistance will no doubt cause some dissatisfaction; African countries in particular are not likely to regard the Bank's munificence to our country, Nigeria, as having made up the neglect of their continent against which they had angrily complained at Tokyo last September. The developing countries as a group may justifiably question the generosity to Japan and Italy who between them got slightly less than one-fourth of all World Bank assistance last year. Japan got three loans totalling \$125 million and was thus the second largest beneficiary after India, and Italy was only just behind with \$100 million. Neither is a 'developing' country and both have strong enough payments positions to have accepted the obligations of Article VIII of the IMF Agreement and rendered their currencies freely convertible. Technically there is nothing to prevent the Bank from financing whom it pleases, yet it needs to be asked why it chose to allocate so considerable a chunk of its resources last year to two countries which, relatively speaking, can very well take care of themselves — and this at a time when, according to the Bank's own reckoning, international development assistance is running well below what the genuine developing countries need and what they can profitably use.

However, it is not these errors of omission and commission — if they can be so described — which should most claim the attention of the aid givers and receivers assembled this week at Washington. What should be the fact that the proportion of the developed 'countrise' national product which is devoted to international assistance seems to be actually diminishing, instead of increasing. As the World Bank's annual report notes, the major industrial countries recorded very satisfactory rates of growth in 1964. The United States, enjoying the fourth year of continuous prosperity, increased its total output by as much as 5 per cent; in the UK output rose by over 5.5 per cent — the highest rate on record in the post-war period; in Europe the long-sustained expansion continued without interruption and aggregate output rose by more than 5 per cent; and Japan achieved a growth rate of 10 per cent demonstrating that the expansionary forces of the last decade still retain much of their momentum. Against this picture of rapid growth of their resources, financial assistance from the developed countries after a substantial rise in the latter part of 1950's has increased very little over the last four years. Official bilateral assistance from the developed

countries, other than the communist countries, remained at \$6 billion both in 1963 and 1964. This amounted very roughly to less than one-half of one per cent of the national product of these countries. Obviously, the injunction of the Economic Committee of the UN General Assembly at the beginning of the Development Decade that the developed countries should allocate at least one per cent of their national product for aid has been forgotten completely.

And as the flow of new assistance shows signs of having reached a plateau, the burden of debt which the developing countries have already accumulated is beginning to exact its toll. In 1956 their outstanding international debt was estimated at just under \$10 billion; in 1964 it reached \$33 billion. The annual service burden grew even faster, because of rising interest rates and accumulation of short-term debt. From 1956 to 1964 it rose over four times, from \$800 million to \$3.5 billion. As a result, these countries must now devote more than a tenth of their foreign exchange earnings to debt service; and the proportion will rise further. According to the World Bank's calculations, amortisation, interest and dividends are offsetting the current gross flow of capital to the developing countries from all sources by half, and will continue to offset it at an accelerating rate.

To forestall this catastrophic eventuality two things need to be done. First, steps have to be taken to reduce the burden of servicing existing debt. Here an adequate progressive increase in the annual gross flow of aid will serve the purpose as well as a rephasing of interest payment and amortisation, but since the aid-authorising agencies in the aid-giving countries are less likely to miss what they haven't got, a moratorium on debt servicing will be the surer way of helping developing countries. Second, fresh development assistance must be on such terms as will not add unbearably to the burden of debt servicing. Under a proposal advanced by the Governor of the Bank of Israel funds would be borrowed in private capital markets by the IDA or some other international agency and re-lent to the developing countries on concessional terms, made possible by a system of guarantees by the industrialised countries in support of such borrowing and the establishment of an 'interest equalisation fund' to which they would contribute amounts required to subsidise the difference

between the borrowing and lending rates.

Whatever the artifice adopted it is clear that if net transfer of resources from the developed to the developing countries is to be even maintained at the present inadequate levels without raising the gross flows required to

Magic Words—without Arsenic?

THE news reports that one gets from New Delhi about the Government's deliberations on the so-called defence orientation of the economy read more and more as original contributions to the literature of absurdity. Thus one learns from the Congress Working Committee that relentless efforts should be made on two fronts—on the production side, a quick rise in output through crash programmes, and on the consumption side, implementation of an austerity plan to restrain demand. The Committee, after deliberating for three full hours over these two lines of action ended by deciding to issue a call to the nation to forgo a meal a week as a part of the austerity drive! Its other suggestion is that the Centre should despatch teams of experts to the different States to work out on the spot programmes to increase production of food. This is not a very fresh or original proposal; as a matter of fact is it not one of the first things thought of and done every time there is some crisis or other? Again, it is reported that the Defence Ministry has been asked to estimate its requirements during the Fourth Plan. The assumption obviously is that it is possible to make such estimates. Why, one may wonder, were not these estimates made while the work on the Fourth Plan was originally undertaken? After all, the present situation with Pakistan is not at all something that has appeared out of nowhere. If it was not possible to anticipate in 1964 what might be the country's defence requirements in 1965, how is it possible to estimate in 1965 what they will be in 1966 or in 1967?

Yet another press report informs us that the Central Government is greatly impressed with the idea that one way of offsetting the likely inflationary effects of increased defence expenditure is to ask the public and the private sectors to curtail expenditure and to expect restraint on private spending. Characteristically, there are no concrete programmes, excepting hints about deferred payments in terms of defence savings certificates. The naive

unrealistically high levels (unrealistic not by the capacity of the developed countries but by the experience so far) the terms of future development assistance will have to be very different from those governing the bulk of it so far. Right now the terms are just not easing fast enough.

observer cannot but wonder again and again: if all this scope was there for increased production, decreased private spending and increased public expenditure without price rise, why were they not taken advantage of in the name of economic development and why are they now found so easily implementable when the task is defence?

Apart from news reports of this type there is very little that is as yet known about the final shape of the Fourth Plan. The National Development Council which met on September 6 authorised the Prime Minister to reorient the Fourth Plan according to his own discretion. On September 24 the Prime Minister is reported to have sent a note to the Planning Commission asking it to work out a reappraisal of the country's plans and policies. If anything got done during the 20 days that the Prime Minister took to ask the Planning Commission to take up the work, nothing of it is known to the public.

Apart from the series of announcements to anything, about the preference to be shown to defence oriented industries, the only official announcement of importance is that the outlay during the first year of the Fourth Plan would be cut by 10 per cent. Enthusiasm for the idea mooted after the Chinese aggression of 1962 that defence and development are mutually complementary and development should not slow down because of defence orientation has obviously given place to the more realistic, if fatalistic, acceptance of slower economic growth.

A step seems to have been taken in the matter of defining the defence-oriented industries. The criteria, it has been stated, is to secure an urgent increase in the supply of goods which are required for (a) purposes of defence including civil defence; (b) maintenance of essential requirements of the civil population, and (c) conserving foreign exchange by import substitution and increased exports. Vague though the first two objectives are, they are at least identification as tasks. How the conservation of foreign ex-

change could be a criterion is difficult to understand, especially in view of the fact that no suggestion has been made that the indirect effects due to

CAPITAL VIEW

The Stalemate Must End

Romesh Thapar

IT is one thing to make bold declarations in public about what India will do to secure her frontiers and national interests. It is quite another to hammer out a political and economic plan of action which will give India the strength to implement the public declarations. Already the peddlars of plan 'holidays', of 'reciprocity' and 'equi-distance' in foreign relations, of the opium that is free food and free military hardware, are busy breaking the urge towards self-reliance within the ruling party. The situation changes from day to day and, in the absence of a political-diplomatic lead, these elements are on the rampage.

Over a week ago, the position was that Pakistan had accepted Soviet mediation while our acceptance had been inexplicably held up somewhere in the Secretariat. When the position was corrected, and Soviet mediation apparently accepted, the friends of the USA within the Congress Party expressed their anxiety to assure President Johnson that India appreciated his helpful attitude—an exercise in equi-distance, no doubt! Even as the emissaries to Washington were being selected, news reached the Capital that the USA had persuaded Ayub Khan to wriggle out of Soviet mediation on the understanding that the gaps in his armoured divisions and air force would be filled. A full circle, but the GOI hasn't moved, diplomatically—unless, of course, going round in circles is understood as movement!

If the first reports about a fresh US military commitment to Pakistan are even broadly indicative of thinking in Washington, we might as well prepare ourselves to face even graver challenges in the future. I say this because now the assessment is fairly general that although the Pakistani army was punished the actual result of the campaign is a military stalemate. What's more, they sit on our territory and we on theirs. Such a result finds reflection in the political stalemate. The USA, however, views the stalemate as a threat to the stability of the Ayub Khan regime; apparently, Pakistani

inter-industrial linkage are also to be studied. It would be indeed a great achievement if the move for defence orientation somehow or other leads to

increased exports and import substitution—however, to kill sheep, we need not only magic words and ceremonies but also a sufficient quantity of arsenic.

politicians and armymen, are active exploiting the embarrassment of those who talked of "strolling to Delhi".

A fresh commitment to Pakistan by the USA would of course be dictated by the psychopathic desire of the Pentagon to possess a reliable base against the communist world on the sub-continent and also by the political objective of preventing a link-up of Pakistan with China. There could be a division of opinion on the matter of a commitment, whether it should be predominantly military or economic. But it looks as if the military commitment is inevitable, if only to repair the damage done to the Pakistani army and to Ayub Khan's prestige. And here is the rub. Any such 'repairs' will be viewed as a hostile act by India—unless, of course, the Johnson Administration still believes that it can produce the medicine to take the sting out of the hostility.

If western experts on India and Pakistan have gained new knowledge of the sub-continent during this last month, they do not seem to be making much use of it. The diplomatic grape-vine is again quivering with news that the West is putting finishing touches to a new formula on Kashmir which will make its independent status palatable to both India and Pakistan. Obviously, the unsuspecting Swaran Singh is going to get the formula thrown at him in the course of the UN General Assembly session. The political tacticians in London and Washington are probably living in the fond hope that the present circumambulation of the GOI will remind the Soviet Union that there is solid sense in watching from a distance.

If the talk we hear these days about self-reliance is seriously intended as the anchor of future policies, then the GOI will have to take the plunge very soon. The armed forces, who have had to pitch their courage against massive Pakistani superiority in armour and fire power, know at last that there is only one source which will give us the sort of help we need to make our military capacity effective in the immediate future. That source is the Soviet Union. The USSR can also provide the basic

material for building self-sufficiency in military hardware. Moscow's generous response to our demands, made always after our failure to obtain such hardware from the West, has convinced all but a tiny minority of diehards—and they no longer matter. The fear that such a step will upset our economic links with the USA and Britain is ill-founded as the experience of other countries shows. Anyhow, the fear must be fought energetically if the call for self-reliance has to be enforced.

This is the only way to end the present stalemate, to recognise the need to establish a balance of power which guarantees existing national frontiers, to establish relevant perspectives for both South Asia and South-East Asia in the context of China's traditional ambitions, and to discipline those who attempt to divide and rule this region on the pretext of fighting communism. This clarity in objectives is lacking in the GOI. The ruling party can become a leaderless mob unless this clarity is achieved. The danger signals are out: a hundred MPs demanding nuclear weapons; ministers talking loose about internal and foreign policy; and the continuing incapacity of the Cabinet to get the full military information on the recent conflict with Pakistan in order to draw the appropriate lessons.

Political and diplomatic fumbling at this juncture will delay and splinter the drive for economic self-reliance. The remarkable patriotic spirit kindled by recent events could also be suffocated by a haphazard tackling of the problems spawned by the war which will surely come to the surface in the coming months. We will continue to spend some Rs 3 crores per day on our defence and will also have to meet the cost of the war—anything between Rs 50 to Rs 100 crores. This burden of defence can become crippling if we postpone the intensive search for the answers to our problems.

Meanwhile, we must be prepared for all eventualities, even the possibility that we may have to guard a cease-fire line (hotted up every now and then) all along our western borders, from Kashmir to Kutch. But the stalemate—economic, political and diplomatic—must end.

Weekly Notes

IFC Emerging from Tutelage

THE Industrial Finance Corporation has entered its eighteenth year of operations but this is the first year with effect from which direct Government assistance to it would be progressively withdrawn. Refinance (not straight loans) would now be provided by the Industrial Development Bank, which has been entrusted with control over policy and 50 per cent of the share capital. Such refinance would be of a relatively limited order since IFC is expected to find the resources itself, mainly through the issue of bonds. The prospect of cultivating this source to a much greater extent than before (it has raised Rs 31 crores in this manner) under present capital market conditions has understandably not enthused the Chairman. He has drawn rather pointed attention to the fact that his resources are no longer perfectly elastic. This is a sobering thought indeed after net sanctions during seventeen years of Rs 227 crores and disbursements of Rs 156 crores. The change places the IFC on par with the ICICI which has had no readily tappable source in the Government, but it still has a favoured position insofar as its bonds and shares carry a Government guarantee and are, therefore, approved trustee securities.

Conditions in the capital market made a considerable impact on IFC in 1964-65. The demand for rupee loans went up and the ratio of their disbursements to net sanctions improved. Underwriting commitments proved highly onerous; given its built-in conservatism and the dubious benefit of intermittent Parliamentary scrutiny, it is hardly surprising that the IFC intends to limit its activities in this field. With the IDB around to take on major underwriting burdens, this reluctance should not prove too damaging to the capital market. Interest paid (and establishment expenses) have increased more steeply than earnings since the rate of interest on borrowings increased while that charged on loans given earlier was kept constant. There have been some defaults in payment of interest and discharge of guarantees but those in repayment of principal have been at previous year's level of less than 1 per cent.

The disbursement of foreign currency loans has been very slow: through June

1965, it was Rs 6 crores against net sanctions of Rs 22 crores, of which Rs 4 crores awaited clearance by other authorities. The Chairman attributes this delay in utilisation to the time taken by borrowers in finalising their orders and changing their equipment lists; utilisation of the French credit has been particularly slow. While the Chairman does not go further into this problem in the published statements, this curious phenomenon is, in large part, the result of tied credits, cartelisation by suppliers in aid-giving countries, prospects of expansion before the projects are fully worked out and fears of not getting adequate and timely licenses for maintenance imports after the equipment is ordered and erected.

IFC continues to take an active interest in the financing of sugar and other co-operative factories. Their share in total assistance extended has come down slightly from about 22 per cent in 1962 to 18 per cent now but this is partly due to the diversification of its business into guarantees and underwriting. So far Rs 40 crores of loans have been given to 52 sugar mills, 4 spinning mills and 1 vegetable oil extraction unit in the co-operative sector. Experience in this field has been, on the whole, encouraging and more applications are being received.

The procedures for processing applications and finalising loan formalities are being streamlined. Conditions for the registration of agreements have been liberalised, the burdens of periodical reporting reduced and, above all, completion of legal formalities is being expedited through strengthening and decentralisation of the legal division.

While the two traditional industries, textiles and sugar, continue to dominate the industrial pattern of assistance, it is clear from the appendix (provided for the first time) to the annual report that IFC has played a notable role in the financing of new industries, too. The concerns assisted in fertilisers, hardboard, general machinery, automobiles, bicycles, cement and chemicals, account for a considerable part of output in their respective industries.

In terms of its statutory powers, the Industrial Development Bank has instructed IFC to continue to carry out the directives previously given by Government till such time as these are modified or rescinded. The new rules

laid down by Government in consultation with the IDB, in substitution of the 1957 rules, represent no major change in the mechanism of its functioning. One curious rule stays as a reminder of past faith in the efficacy of industrial licensing. Rule 5 states that assistance should be extended for objectives which are approved by Government and consistent with the plans. In explanation, it is clarified that "any industrial concern for which a license has been issued under the Industries (Development and Regulation) Act 1951 shall be deemed to be established for a purpose which has the approval of the Central Government".

Coal Industry's Problems

SOME of the gnawing problems of the coal industry seem to have been virtually ignored in the recent discussions of fixing targets for the public and private sectors and for coking and non-coking coal. These are the questions of mechanisation, higher productivity, setting up of carbonisation plants, wider differentials for various grades and provision of rupee finance. Considerable emphasis has been placed over the last few years on mechanisation. For this purpose, fairly liberal foreign exchange allocations have been made for the industry, from World Bank and British credits and in trade agreements with Poland; the Durgapur mining machinery plant has also made progress. These allocations have produced results in the new public sector mines and those private mines which have large areas under exploitation. Except in open cast and difficult or deep mines, however, mechanisation has still to be proved a fully economic proposition. Most mines are much too small to benefit from mechanisation or to think about it—and some of the small mine-owners are sitting on valuable reserves. Even where it has been successful in speeding up operations, mechanisation has created problems of maintaining the quality of coal and also of full utilisation of equipment. The failure of moves to rationalise the industry through amalgamation of small collieries and increasing private sector doubts about the profitability of mechanisation are serious portents which threaten future investment as well as prevent deriving of full benefit from investment already undertaken.

The Central Fuel Research Institute has almost completed its experiments

THE ECONOMIC WEEKLY

with the carbonisation process which is in several respects more economical than washing for upgrading and blending of coal. Its pilot plant operations have given good results. Since washeries require substantial foreign exchange and high and varying ash content of coal is keeping down steel-making capacity, carbonisation plants offer a relatively easier way out, especially now when foreign aid prospects have become dim. Utilisation of coke oven gas, middlings, and thermal ash have still to receive the priority attention they deserve. Progress in the use of gas and middlings for power generation and for industrial purposes is tardy. In spite of the present extreme shortage of cement there is an almost complete indifference to the utilisation of thermal ash and steel slag for the manufacture of pozzolona cement which is a cheap and satisfactory substitute in non-structural construction.

Price differentials for higher grades have been widened considerably since 1961 but they are still inadequate. Further differentiation of prices would, however, have to await more careful—and honest—grading. The problems of rupee finance are not so simple as have been made out by the spokesmen of the industry. This is probably the only industry in which the offers of foreign exchange credits exceed the demand for them. Most of the procedural hurdles which blocked the utilisation of the World Bank credit have been removed since 1962. What makes both borrowers and lenders hesitant is the uncertain prospects of demand and the frequent inability of borrowers to produce a satisfactory project report.

Wilson Will Not Bite

Our London Correspondent writes:

THIS is the season of political conferences in Britain. The conferences take on particular significance in view of the Labour Government's paper thin majority. Last week's Liberal Party Conference, held in the intoxicating atmosphere produced by the important role the Liberals can now play in keeping the balance of power between the two major parties, was naturally dominated by discussion of the terms on which the Liberals will support the Government. The purpose of Grimond's oratory was to try and urge the Prime Minister to divorce the Labour party left-wing and espouse instead the Liberal Party and thus bring into being a new radical, but non-socialist, party.

Of course, Grimond would have liked it better if the Liberal Party Conference had been held after the Labour Conference at Blackpool. He could then have seen what line Wilson would take to meet the growing demands from the left-wing of the party for more full-blooded socialist policies. In the event Grimond had to insist that the Liberals will judge all issues critical for the survival of the Labour Party in office by the test of national, not partisan, interest and if on that basis the government is defeated, that is something that must be faced.

Although the Liberals seem obsessed by their new-found position of strength, this has not impressed the Labour Party overmuch. Dennis Healey contemptuously dismissed Grimond's rhetoric by saying that "Grimond is so busy trying to run the policy of the other two parties that he has given up trying to find one for his own. He is drunk with Walter Mitty dreams of power in Westminster. There is nothing behind that noisy rhetoric last week except a fumbling opportunism."

On the other hand, the Liberal threat to refuse to join in any rescue operations on Labour's behalf may well have strengthened Wilson's hand in dealing with his own left-wing rebels. On present showing Wilson's line will obviously be to carry on despite his wafer thin majority at least for another twelve months, by which time he hopes that he will be able to introduce some measures more palatable to the majority of his followers; but should the government be defeated he will not hesitate to appeal to the nation—both the latest opinion polls show Labour in the lead again.

In a sense Grimond was chasing paper tigers when he demanded that the Labour Government should drop its socialist programmes. Surely, whatever else Wilson's government may have been, it has not been particularly socialist? Even the steel nationalisation bill has now conveniently been relegated into the limbo of matters to be taken up at a future date.

With the future of the Sterling to secure, and international bankers breathing down its neck, the Labour Government has little socialist orientation to show in its policies. On the contrary, socialists see the Land Commission as a cowardly retreat from the election promise of nationalising urban land. Brown's Incomes policy has a pseudo-Tory ring about it and

the much vaunted National Plan certainly bids farewell to Clause Four. Describing the nature and purpose of planning, the introduction to the National Plan says: "Most manufacturing industry and commerce, is, and will continue to be, largely governed by the market economy...care will be taken not to destroy the complex mechanisms on which the market economy is based".

And what can one say of the Government's White Paper on immigration where it appears to have let itself be stampeded by Smethwick into a vicious racist scheme?

Is it any wonder, then, that there is a profound sense of disillusionment among the rank and file of the party—particularly among the left-wing members? So far the voice of the left-wing has been muted, in no small measure by Wilson's clever strategy of taking in the more militant and vocal members into the Cabinet. At Blackpool, however, Wilson will have to face the onslaught of the left on the incomes policy, Vietnam and immigration, among other issues. On the last issue, in fact, opposition can be found throughout the Labour party. For his part, Wilson will give warning to the party not to rock the boat at this critical moment. Appeals will be made to the loyalty of the members to keep the government in office. It will be particularly interesting to see how Harold Wilson will handle this tricky situation, and maintain the support of his disillusioned left without, in fact, making any significant concessions to them.

Aden Crisis Deepens

THE current crisis in Aden is largely a product of British intransigence. Since her supra-national ambitions dictate the necessity for a chain of military bases across the Middle East and Aden is a vital link in this outmoded defence line, Britain is determined to grant independence strictly on her terms; but the Adenis see no reason why it shouldn't be on their terms. Last week the British finally suspended the Constitution and placed Aden under the administration of the High Commissioner. The purpose is to force Aden to accept independence only within the South Arabia Federation (a ramshackle collection of Aden and sixteen neighbouring Sheikhdoms), and to maintain the military base there at all costs. The British would like to foist a unitary Consti-

tution on the Federation; then in Parliament the progressive Adenis would be outnumbered by the reactionary sheikhs, who would support the maintenance of the base in Aden in return for non-interference with their despotic rule. Meanwhile, the Adenis (backed by the NLF terrorists) demand repeal of the Emergency laws, removal of the base, and independence on the basis of a referendum to be held under UN auspices. The ostensible reason for the suspension of the Constitution was the increasing terrorist activity in Aden; thus the British have once again chosen not to recognise the right of a colony to self-determination because it is against British commercial and military interests.

The suspension of the Aden Constitution ill befits a Labour Government. It is clear, however, that all British political parties labour under the delusion that Britain requires a string of bases to protect her interests, and to protect the East from the menace of communism. The Aden base is a staging post to the Far East; there is another base in Hong Kong. If the Aden base is lost, another is needed fairly near, preferably on the Indian Sub-Continent. India will never agree to a base on her territory, hence the need to woo Pakistan sufficiently to obtain a base there. But the British government would also like to nurture the UK's rapidly expanding trade with China. Hence it finds itself playing down the Chinese threat to India and at the same time claiming that Britain must act as a watchdog against possible Chinese aggression. Moreover, for the moment it is equally expedient to dismiss Sino-Pakistan collusion as something minor until Britain has established a base on the sub-continent. Meanwhile, until Britain has achieved this, she must hold on to Aden, preferably until 1968 (the date set for independence).

Reserve Bank's Platitude

THE latest report of the Central Board of Directors of the Reserve Bank of India contains the usual platitudinous and rambling description of conditions in the Indian economy during 1964-65. The public is advised by the Bank that in its "Report on Currency and Finance" they should look only for facts while the views of the Bank should be sought in its Annual Report. Reading through the latest Annual Report one fails to see

any difference between the two reports.

The Annual Report opens with the expected references to inflationary pressures, expansion of money incomes outstripping growth of real output, stagnation in agriculture and so on. The remedies suggested are general; "the magnitude of plan outlays... has to be determined with due regard to the realities of the situation", "exports must be allocated a fairly large share of additional output", "growth of bank credit must maintain a proper relation to growth of real output" and so on. These recommendations are all as unexceptionable as they are obvious; surely, from the country's chief monetary authority we are entitled to a more incisive treatment of the problems of the economy?

In places, what the authors of the report intend to convey is not exactly clear. For instance, it is stated that "liquidity in the economy continued to expand at a slightly reduced rate" and then in the very next sentence that "it is also significant that the rate of accretion of bank deposits has increased". Since bank deposits constitute an important part of the liquid assets of the community, it would have been useful if the report had made clear what exactly it meant by "liqui-

LETTERS TO EDITOR

Without Aid, if Need be

THE opposition to a big Plan is nothing new as you try to make out in your editorial in the issue of August 7, 1965. Actually many people been warning Government that planning on a scale which is beyond our capacity or beyond our resources is disastrous. While Jawaharlal was alive criticism of planning was simply brushed aside by Government. After his death a little more democracy seems to be coming in and therefore more vociferous and more forceful opposition to planning beyond the resources which we can muster is heard.

I do not think it is right to say that people who should know better are losing their nerve and succumbing to the spirit of defeatism. In my opinion nobody is succumbing to defeatism. What is actually happening is that an effort is being made to bring in a sense of reality into this whole process of planning. I wonder as to what you mean when you make the statement, "But now the task, it is made

THE ECONOMIC WEEKLY

dity in the economy".

A similar confusion appears conspicuously in the discussion of public finance. In the beginning of the Report it is stated that "as fiscal resources grew there was less need for the government to finance its deficits through the banking system", but later on in para 29 we find the statement that "Government indebtedness to the banking system comprising investments in government securities by the Reserve Bank and other banks (excluding PL 480 and PL 665 funds) and ways and means advances adjusted for Governments' cash balances with the Bank continued to be the major expansionary factor". Isn't there a contradiction between the two statements? And this is not all. In para 16 while discussing the finances of the Government an entirely different concept of budgetary deficit is used. It is stated that "in the revised estimates for 1964-65, the overall deficit of the Centre has been estimated at Rs 30 crores". This is "deficit" in the narrowest sense: *ad hoc* treasury bills and change in cash balances. It would certainly have helped comprehension if the authors of the Report had not used concepts to mean different things in different paragraphs.

out, is that of resource-based and not of need-based planning. How far can any under-developed country go if it bases its aspirations on free, existing resources?" Is not this differentiation between resource-based and need-based planning a futile one? After all, our needs are much greater than even a Rs 21,500 crores plan can fulfill. Why do not we plan on something like Rs 50,000 crores? What is preventing us from doing so if planning is to be based only on the needs of our country? Granting that planning should be based on need, who is going to provide the resources? Obviously for a country like ours we have to muster all resources and after having done that we have to be realistic and say: thus far and no further. If we try to plan beyond our resources then we will be living in a fools' paradise hoping that somehow or other resources are going to fall from heaven. Can this ever happen? If so, I should be very much interested in knowing how this can happen? After all, in

THE ECONOMIC WEEKLY

Iyoti Limited, I want to plan in a big way and want to have an investment of Rs 10 crores or, why not, Rs 20 crores. The requirement of Pumps, Turbines, Switchgear and Switchboards is far more than what I can produce. However, I know that the resources I can muster are not as much as my aspirations. Therefore, I have got to limit my planning to what I can collect with all the possible efforts that I can put in.

Please do not misunderstand me. I am not at all advocating a holiday from planning. Planning must continue. However, we must plan in a little more intelligent way, taking into account that the various multipliers which the Planning Commission or the wise men in Delhi have arrived at for converting physical production targets into investment requirements are not as right as they imagine. A happy blending of indicative planning with a positive push in given directions should be practiced more and more.

We have seen that in the process of mustering resources we have created an unprecedented inflation in the country. Government goes on collecting resources with the avowed purpose of mopping up surplus funds so that they can be diverted into a more productive and desirable channel instead of allowing the people to use them on commodities which are scarce in supply and thus pushing up their price. However, in my opinion after collecting the funds they are again utilized for non-productive administrative purposes. Not only this, but a great deal of money is spent by various Government Departments which does not bring in the production the Departments expects and they end up with their estimated capital requirement by anywhere between 50 per cent and 100 per cent. Therefore, I certainly do not agree with you when you make the statement that "the Centre had in the last budget, chosen the easy path of winning cheap popularity with minor tax concessions in preference to the unpopular fiscal measures that were needed to contain the inflationary pressures". You yourself admit that "this is not because the programme itself is mis-conceived but its execution has been half-hearted, slack and halting, particularly in an area of heavy industry, heavy electricals and chemicals, including fertilizers." It is only because at the Government level they are not able to do these things and they are not able to run the plants in which

very heavy capital investment has been made both of foreign resources as well as rupee resources that people like me would like to advise the Government to stop experimenting further with incompetent bureaucrats as its advisors. Let people have a little breathing period and let them try and do something without imagining that wisdom lies only in Delhi and particularly in the Finance Ministry and Yojana Bhavan. Beyond any doubt it has been proved that if there is any wisdom in this country it certainly is not in the Finance Ministry and in Bhavan.

You mention that "If aid ceases to be as freely available as in the past, we have to gird up our lions and face it... After three five-years plans, if the present leaders are not prepared to face the prospects of doing with less aid, there are others to take up the challenge." I would like to know how is this to be done if the foreign exchange content of the Rs 21,500 crores plan, is not reduced? On the one hand you do not want to reduce the size of the plan. On the other hand you want to do without aid. How are these two contradictory statements to be reconciled? As far as frittering away of foreign exchange is concerned, I think the bureaucrats are to be blamed far more than others. They have constantly encouraged buying of know-how from abroad even for very simple things. Even now so many of the public sector organizations insist on importing either components or raw materials or machinery simply because they are available cheaply abroad.

I personally feel that we have to learn to live within our means. Not only this, but we will also have to learn to utilize these means more wisely than we have done. One way to do this is to enlist more co-operation and put more confidence in the people instead of in bureaucrats.

The Need Not to Moralise

WITHOUT agreeing with all the points he makes about India's foreign policy, let me warmly congratulate Sudhir Mulji for the stand he takes in favour of morality and his courageous and lucid denunciation of the immoral aspects of our foreign

policy. I would like, however, to make one point which Mulji does not touch upon. I hope he will agree with me that while we should be moral, we should eschew our moralising postures. It is not so much our lack of morality which has made us lose friends all the world over. We are certainly not the most immoral of the lot. However we have managed to appear to be concerned more about other peoples' morals than our own, which has earned us the reputation of being not the most immoral but the most hypocritical. Recently there has been a large volume of opinion in the country against this moralising attitude: unfortunately however it has often gone together with support for immoral policies. If one had foreign policies based on principles, one could take morally correct stands in international matters without appearing merely to stand on moral pedestals.

Newspaper Profits

A PROPOS your Weekly Note "What Happens to Newspaper Profits," may I point out that the *Times of India* is not the only group which has used "its booming profits to start new dailies and a large number of periodicals"? Since 1950 the *Times* group has started 12 new publications—five dailies, one weekly, three fortnightly and three monthlies. Compare this to the performance of the *Express* group which has since 1950 started 21 new publications—11 dailies, 10 weeklies. And since 1955 the *Times* group has started two dailies two fortnightly and three monthlies and the *Express* group seven dailies and seven weeklies.

In discussing the use of newspaper profits for expansion, reference has to be made to the policy of the Government not to allow newsprint for new papers brought out by newspaper groups (or "common ownership units" in the language of the Registrar of Newspapers). The contrary results of this policy can be seen from the experience of *Maharashtra Times*, the Marathi daily of the *Times* group from Bombay started in 1962, whose circulation stays pegged for want of newsprint, to the advantage of *Lok-satta*, the competing Marathi paper of the *Express* group!

UN's Failure in Kashmir

A Factual Survey

THE outbreak of fighting between the armies of India and Pakistan in August reminded the world of one of the signal failures of the United Nations. For eighteen years the UN Security Council has debated, passed resolutions and appointed commissions, mediators and representatives without getting near a solution of the Kashmir problem. Now with its resolution of September 20, the Security Council has, so to say, re-assumed responsibility for Kashmir. Whether it will succeed any more this time it is, of course, impossible to say, but a survey, even a brief one, of the UN's past efforts may yield some pointers, besides being interesting in itself.

The United Nations was formally introduced to the Kashmir problem on December 30, 1947 when the Government of India announced its decision to bring the dispute before the Security Council under Article 35 of the UN Charter. This Article provides that any member-state can bring to the attention of the Security Council or the General Assembly any situation which it considers likely to lead to international conflict. In its reference, India complained that Pakistani nationals had taken part in the invasion of Kashmir and that the invaders had been actively assisted by Pakistan with equipment and supplies, training and guidance and bases within Pakistani territory from which to operate. India called upon the Security Council to take steps to prevent Pakistani nationals from participating in the attack on Kashmir and Pakistan from rendering assistance in any form to the invaders.

The Security Council took up the matter for consideration on January 15, 1948. India and Pakistan were represented by Gopalaswami Ayyangar, Minister without Portfolio in the Government of India, and Sir Muhammad Zafrulla Khan, Pakistan's Foreign Minister. The two countries agreed to the appointment of a UN Commission to mediate between them. A resolution moved by Belgium for a three-member Commission was approved by the Security Council. The Commission was to consist of one nominee each of India and Pakistan and a third member agreed upon by both. It was directed to proceed to India and Pakistan to ascertain the facts of the

Kashmir situation. Differences cropped up almost immediately about the role of the Commission. Pakistan insisted that it should supervise the withdrawal of Indian forces from Kashmir; this was naturally rejected by India who argued that her forces must stay in Kashmir to ensure its internal and external security.

Finding India and Pakistan unable to compose these differences, a resolution was moved on April 18, 1948 in the Security Council by seven members, including the UK and the US. The resolution, which was passed despite protests from both India and Pakistan, expanded the size of the UN Commission on Kashmir from three to five and directed it to place its services at the disposal of India and Pakistan to restore peace and order in Kashmir and, when this was achieved, to hold a plebiscite there to determine the wishes of the people. To this end it directed Pakistan to withdraw all her personnel in Kashmir and to deny help to the invaders; when the Commission was satisfied that the invaders had started withdrawing, India would withdraw her forces leaving behind only a minimum necessary for maintaining law and order. The plebiscite was to be conducted by a Plebiscite Administrator to be appointed by the UN Secretary-General.

UN Commission on Kashmir

The Security Council nominated Belgium and Columbia to the Kashmir Commission; India nominated Czechoslovakia and Pakistan Argentina. India and Pakistan could not agree over the fifth member and so the Security Council President nominated the US. The Commission arrived in Karachi on July 8, 1948 and within five weeks presented its report to the Security Council. It called for a cease-fire in Kashmir. It recognised the presence of regular Pakistani troops in Kashmir and called for their withdrawal as well as of all Pakistani nationals and invading tribesmen. On this being accomplished India was asked to withdraw the bulk of her forces. India and Pakistan were asked to affirm that the future of Kashmir would be decided through a plebiscite after the cease-fire and truce and to create conditions which would make a plebiscite possible.

India and Pakistan accepted the

cease-fire call, Pakistan with the condition that her views would not be binding on the so-called Azad Kashmir Government which alone, she said, had the power to order a cease-fire and which would continue to administer the territories under its control. In its report to the Security Council, submitted on November 23, 1948, the Kashmir Commission pointed out that the conditions attached by Pakistan made a cease-fire and solution of the problem impossible. The Security Council, however, asked the Commission to continue its work.

India and Pakistan voluntarily agreed to a cease-fire in Kashmir from the midnight of December 31, 1948. That being achieved, the UN Commission adopted a resolution on January 5, 1949 directing that the future of Kashmir would be decided by a plebiscite to be held when the conditions regarding withdrawal of forces contained in its earlier report were fulfilled and arrangements for a plebiscite completed. It called on the UN Secretary-General to appoint a Plebiscite Administrator.

The Kashmir Commission announced on March 12, 1949, that India and Pakistan had agreed to convert the cease-fire line into a truce line. On March 21, Fleet-Admiral Chester Nimitz, the US Naval Commander-in-Chief during the Second War, was appointed Plebiscite Administrator with the consent of India and Pakistan. However, on June 6 the Commission issued a communique stating that differences between India and Pakistan on the withdrawal of troops remained uncomposed and after another six months it presented its third interim report to the Security Council pointing out that a five-member commission was not the best agency for bringing India and Pakistan together on the issues which remained to be resolved, particularly the withdrawal of troops; it suggested instead the appointment of one person to tackle the job. On December 17, 1949 the Security Council appointed its current Chairman, General McNaughton of Canada, to hold talks with India and Pakistan. It, however, took less than two months for General McNaughton to report back to the Security Council that his efforts had failed. On March 14, 1950 the Council adopted a resolution moved by the UK, the US,

THE ECONOMIC WEEKLY

Norway and Cuba providing for the appointment of a UN Mediator on Kashmir and for the dissolution of the Kashmir Commission. It called on India and Pakistan to agree, within five months, to a programme of demilitarisation under the supervision of the UN Mediator who would decide when the demilitarisation had proceeded enough for a plebiscite to be held.

On April 12, 1950 Owen Dixon, a judge of the Australian High Court, was appointed UN Mediator. Dixon presented his report on September 19, 1950. He stated in his report that he had proposed that the first step in demilitarisation should be the withdrawal of Pakistani regular forces to be followed, after the lapse of a "significant number" of days, by withdrawal of Indian forces and withdrawal and disarming of Kashmir State forces and Azad Kashmir forces. Ultimately only minimum forces would be left on either side. According to Dixon, Pakistan accepted these proposals while India rejected them on the ground that the continued presence of Indian troops in Kashmir was necessary to guard against a renewed Pakistani attack and to maintain internal security.

Dixon's Proposal for Partition

He was convinced, Dixon said in his report, that "India's agreement would never be obtained to demilitarisation in any such form, or to provisions governing the period of the plebiscite of any such character, as would in my opinion permit of the plebiscite's being conducted in conditions sufficiently guarding against intimidation and other forms of influence and abuse, by which the freedom and fairness of the plebiscite might be imperilled. Having come to this conclusion, I thought, must either abandon all attempts to settle the dispute or turn from the plebiscite—by which the destination of the whole State would be decided—to some different solution". He had therefore suggested, he said, a partition of the State either outright or combined with a plebiscite limited to an area which would include the Valley of Kashmir. In response to the suggestion he had found that India would agree to a plebiscite in the Valley of Kashmir, to the part of Jammu lying east of the cease-fire line going to India, and to the Gilgit area and the part of Jammu to the west of the cease-fire line going to Pakistan. Pakistan, on the other hand, was prepared to accept partition only if the

Valley of Kashmir went to her. This India rejected.

These differences led Dixon to the admission that "there no longer existed any possibility of my bringing the parties to any composition of the dispute". A plebiscite covering the whole state was not possible because neither he nor the Kashmir Commission had been able to secure the agreement of India and Pakistan to the steps necessary to make an impartial plebiscite possible. The alternative of a partition hinged on the question of the disposal of the Valley of Kashmir; since the Valley could not be partitioned its future could be determined only through a plebiscite. "The difficulty of using the expedient of a plebiscite (for the Valley) appears to lie entirely in the conflict between, on the one hand, the necessity of ensuring that the plebiscite is held in conditions which make it an effective means of ascertaining the real will of the people, independently formed and freely expressed and, on the other hand, certain conceptions and pre-conceptions of the Indian Government. These are based in part on what India conceives to be the origin and course of the fighting in 1947 and 1948, and in part on her unwillingness to have any interference with or restriction of the powers of government in the state, whether in reference to the use of armed forces or in reference to the civil administration".

When the Security Council resumed consideration of the question on February 21, 1951, the UK delegate introduced a joint Anglo-American resolution proposing the appointment of a UN Representative for India and Pakistan to succeed Dixon. The resolution proposed that after consultation with India and Pakistan the UN Representative should effect the demilitarisation of Kashmir on the basis of Dixon's proposals and get the consent of both Governments to a detailed scheme to hold a plebiscite. In the event of differences between the two countries, these should be submitted to an arbitrator or a panel of arbitrators to be appointed by the International Court of Justice. This resolution was totally unacceptable to India and to meet Indian objections, the UK and the US introduced a modified resolution on March 21. The principal changes made were that demilitarisation would be carried out according to the resolutions of the UN Kashmir Commission and not Owen Dixon's report; the proposal that

the UN Representative would present India and Pakistan with a detailed scheme for a plebiscite was omitted and he was asked only to report to the Security Council on the points of difference between the two countries. The revised resolution was passed by eight votes to nil, with the Soviet Union, Yugoslavia and India abstaining.

Graham's Four Reports

The Security Council appointed Dr Frank P. Graham of the United States as the UN Representative to India and Pakistan on March 30. After visits to the two countries extending over two and a half months Graham presented his report to the Security Council on October 16. The report highlighted the differences on demilitarisation. Pakistan, he said, wanted forces on either side of the cease-fire line to be reduced to four infantry battalions (4,000 men); India, while agreeing that the bulk of her forces should be withdrawn, wanted that she should be allowed to keep 16 infantry battalions in Kashmir against a Pakistani civil armed defence force of 4,000 men. On November 10, the Security Council adopted an Anglo-American resolution asking Graham to continue his work and report back within six weeks.

Graham submitted his second report on December 18, 1951. It stated that while agreement had been secured on a number of points, differences remained on the scope of demilitarisation, the date for completing demilitarisation and the size of forces to be left on either side after demilitarisation. Once more the Security Council asked Graham to continue his efforts and report to it by March 31, 1952. Graham visited India and Pakistan again from February 26 to March 25 and presented his third report on April 25, stating that there was still no agreement on the size of forces to be left on either side after demilitarisation and suggesting continuance of negotiations.

Within five months, on September 24, Graham submitted his fourth report, once again reporting lack of agreement on demilitarisation. On November 16 a joint resolution was moved by the UK and the US urging India and Pakistan, *inter alia*, to "enter into negotiations at the UN headquarters in order to reach an agreement on the specific number of forces to remain on each side of the cease-fire line at the end of the demilitarisation period, this number to

be between 3,000 and 6,000 remaining on the Pakistani side of the cease-fire line and between 12,000 and 18,000 remaining on the Indian side". The resolution requested Graham to continue his efforts and asked India and Pakistan to report to the Security Council within 30 days. The resolution was passed by the Security Council on December 23 with the Soviet Union abstaining.

Graham reported to the Security Council on March 31, 1953 that discussions between the two countries had been fruitful and that differences, while they remained considerable, had been somewhat narrowed. He suggested that India and Pakistan should negotiate directly instead of through the UN Representative. Accordingly, the Prime Minister of Pakistan, Mohammed Ali, came to India in August 1953 and the two Prime Ministers held discussions between August 17 and 20. At the end of the talks a communique was issued stating that the two countries had agreed to appoint a Plebiscite Administrator by the end of April 1954. Pandit Nehru wanted the Plebiscite Administrator to be from one of the smaller countries and indicated that General Nimitz, the Plebiscite Administrator appointed by the UN, was no longer acceptable to India. General Nimitz, therefore, resigned on September 4, 1953. Joint committees of Indian and Pakistani civil and military experts met in Delhi towards the end of December to discuss the preliminaries to holding a plebiscite, including the vexed question of demilitarisation. From a statement issued at the end of the meetings it appeared that satisfactory progress had been made.

US Military Aid to Pakistan: The Fateful Development

This was perhaps the most hopeful point in the search for a solution to the Kashmir problem. Subsequent developments were sharply retrograde and differences between the two countries widened into a chasm. The publication of the long correspondence between Pandit Nehru and Mohammed Ali between August 1953 and September 1954 showed Pakistan's decision to accept US military aid as the fateful development which obliterated all hopes of a settlement in Kashmir. India now maintained that it was imperative for her to maintain sufficient forces in Kashmir to guard against attack by Pakistan emboldened and strengthened by US military aid. Subsequent contacts between the two countries inevitably led to a deadlock

and Pakistan's Prime Minister declared that the issue would have to be referred back to the Security Council.

However, simultaneously with the possibility of a direct settlement between the two countries receding, the UN's ability to solve the Kashmir problem had also been seriously undermined and for the same reason: Pakistan's involvement in Western military pacts and her decision to accept US military aid and permit US bases on her territory. The Soviet Union was naturally concerned at these developments and from now on she took anti-Pakistan and pro-India positions in discussions of the Kashmir question in the Security Council.

Soviet Support to India

Though negotiations between India and Pakistan had broken down in 1954, it was not till January 1957 that the Security Council resumed consideration of the Kashmir question. The Foreign Minister of Pakistan had asked for a meeting of the Council in view of the coming into force of Jammu and Kashmir's new constitution from January 26, 1957 and the State's integration into India from then. At the Council meeting five countries, including the UK and the US, moved a resolution calling attention to the earlier resolutions of the Security Council and the UN Kashmir Commission and reaffirming that the "final disposition of the State of Jammu and Kashmir will be made in accordance with the will of the people expressed through the democratic method of a free and impartial plebiscite conducted under the auspices of the United Nations". The resolution stated that the Security Council would continue its consideration of the Kashmir question. The resolution was adopted by 10 votes to nil, with the Soviet Union abstaining.

On February 15, another resolution was moved in the Security Council by four countries, including the UK and the US, empowering Gunnar Jarring, the Swedish representative to the Council, to hold discussions with India and Pakistan on proposals for settling the Kashmir dispute. It requested Jarring to examine proposals "likely to contribute to the achievement of demilitarisation in Kashmir or to the establishment of other conditions for progress" with the two governments, keeping in mind "the proposal for the use of a temporary UN force". India objected to the resolution, and though it was passed by the Security Council by 9 votes to one, since the dissenting vote was that of the Soviet Union it was

rendered inoperative. This was the first time that the Soviet Union had vetoed a resolution on the Kashmir dispute.

The UK, the US and Australia then submitted a revised resolution. It made no reference to a plebiscite or to a UN force and asked Jarring only to examine with India and Pakistan any proposals which may lead to the settlement of the Kashmir dispute having regard to the earlier resolutions of the Security Council and the UN Kashmir Commission. The resolution was adopted with the Soviet Union abstaining. Jarring arrived in India and Pakistan in March 1957 and submitted his report within five weeks, expressing his inability to make any proposals likely to lead to a settlement.

The Security Council took up Kashmir for consideration next in September 1957, and on November 16 five countries, including the UK and the US, moved a resolution asking Graham to work out within three months "an early agreement on demilitarisation procedures". The Soviet Union, however, threatened to veto the resolution and so a revised version was submitted which omitted reference to demilitarisation and asked Graham to make recommendations to India and Pakistan for a peaceful settlement and for implementing the earlier resolutions on the subject. This resolution was adopted, the Soviet Union abstaining. Graham submitted his report on April 3, 1958. His major proposals were for the evacuation of Pakistani forces from Kashmir, stationing of UN forces on the Pakistani side of the ceasefire line, discussion between the UN Representative and the two Governments on the possibility of a plebiscite and a meeting between the Prime Ministers of the two countries. These proposals were, however, unacceptable to India. This was virtually the last serious attempt by the UN to solve the Kashmir question.

UN Shelves Issue

The Security Council met on Kashmir in February 1962 at the request of the Pakistani representative but agreed to postpone discussion till after the Indian General Election. Discussion was resumed in April and on June 22 a draft resolution was introduced reminding India and Pakistan of the principles contained in the Security Council's and the UN Kashmir Commission's resolutions of 1948 and 1949 and asking the two countries to enter into negotiations to settle the question. The resolution, though passed, was vetoed by the Soviet Union. Subsequently,

the Security Council held a series of meetings in February, March and May 1964 on Kashmir without, however, adopting any resolution. During the last of these meetings on May 12-13 1964 all members of the Council urged direct negotiations between India and Pakistan. Since there was no earthly prospect of direct negotiations producing any results, this was plainly an admission of the Security Council's inability to do anything about Kashmir and an excuse for shelving the issue.

The above account of the UN's efforts on Kashmir, as well as its performance in respect of other problems, make it quite clear that the UN can be effective only if the US and the Soviet Union do not take up antagonistic positions—unless, of course, one

The Aftermath

S K Nath

THE large-scale Pakistani infiltration of Kashmir and her powerful armoured thrust through Chhamb towards the life-line of Kashmir made inevitable all the military actions which we took. No matter how willing some Indian Government might have been to negotiate for a permanent and mutually agreed solution of Kashmir, it could never let Pakistan annex Kashmir by force. Granting that our response was inevitable, it is perhaps not useless to examine the likely aftermath of this war.

The immediate effects on the economy are nothing but unfavourable. There has been some destruction of life and property; the civil defence measures have interfered with production, as also have the measures to move military men and material to the front; and of course the demand for food-stuffs, etc., of the armed forces has also gone up. These are comparatively minor effects. The serious (and the long-term) effect will take the form of increased diversion of foreign exchange and other resources from civil to military purposes. It is estimated that the expenditure on the armed forces is already about 40 per cent of the annual budget of the Central Government. Moreover, the recent foreign exchange crisis (one of the severest so far) was largely due to a steep rise in imports on government account during the previous months; imports on private account hardly rose; and of exports there was a sub-rose. It is possible that the steep rise of government imports was largely of arms and ammunition.

of the two is prepared to go the whole hog to push the UN into action in spite of the opposition of the other, as happened in the Congo. Since the second possibility can be ruled out in the case of Kashmir, the UN can hope to play a useful role in settling the dispute only if the US and the Soviet Union do not act at cross-purposes. The prospects of this are as yet uncertain, though the Security Council resolution of September 20 calling for a ceasefire and withdrawal of Indian and Pakistani forces and deciding to "consider... what steps can be taken to assist towards a settlement of the political problem underlying the present conflict" was passed unanimously with the Soviet Union for the first time ever voting in favour of a Security Council resolution on Kashmir.

Paradoxically, a war can also have some beneficial effects on an economy—especially an economy like ours where there is more than one kind of excess capacity only waiting for a change in the human factor. There is the excess capacity in agriculture: the yields per acre on the best farms are five to seven times the local average in a number of regions. These higher yields are mostly the result of introducing simple improvements in techniques which a large number of other farmers could also adopt if they had enough initiative and awareness. A national emergency can sometimes introduce initiative and awareness in the hitherto apathetic rural areas. There were high hopes on this account after the Chinese attack, but they proved wrong. It remains to be seen if the new emergency can spark off a mental revolution. It has been a much more serious war, with a large number of men fighting and dying, and with a lot of damage to civil life and property; therefore, there is greater hope of people being reminded of the nation and the national needs.

There is also excess capacity in industry. Businessmen complain that it is due to their not being able to import enough raw materials and components; but government spokesmen often say that there could be lot more import substitution regarding these intermediate goods. During the last world war, belligerent countries on both sides invented a number of import substitutes; the effects of the war were particularly beneficial on the development of man-made fibres. It is possible then that the

new emergency may have some inspiring effect on our inventors and innovators. To some extent it is true even in an underdeveloped country which has various important shortages that demand creates supply.

The net effect on the economy of a war, or the preparation for a likely war, is then the result of these two opposing tendencies. It must always be very difficult to say in advance with confidence which of the two will be stronger; it is easier to make a judgement after the event. One can say with full confidence that the British economy in 1945 was much weaker than it would have been if there had been no war. I think one can also say with substantial confidence that any prolonged war, or the preparation for one, will do the Indian economy a great deal more harm than any incidental good.

What about the other elements of the aftermath? Once this war had been forced on us, our aim was to give a crushing blow to the Pakistani armed strength. Three important elements in that strength were: American tanks, American jet fighters and bombers, and American radar equipment which most effectively covered not only the approach to West Pakistani borders from our side but also all our advance air bases. We seem to have more or less achieved our purpose in crippling a substantial number (possibly half or even the majority) of the American tanks with Pakistan. We have also destroyed a number of their fighters; but the toll of their bombers does not seem to have been substantial. And as for their radar installations, the only time it has been clearly reported that we destroyed some such station was on the penultimate day of fighting; we seem to have destroyed then the radar station near Kutch. In short, our objective of thoroughly crippling Pakistan's borrowed armour does not seem to have been fully achieved, even though our armed forces have demonstrated that their valour and skill are second to none; it is just that Pakistan has had much superior equipment.

It is to our advantage that the cease-fire resolution of the U.N. recognises that the hostilities began on August 5, when Pakistan sent her armed infiltrators into Kashmir. But if the cease-fire is going to mean that we shall not exercise our rights to continue rounding up these raiders, then this agreement is greatly to our disadvantage, because Pakistan may withdraw about 200 infiltrators and say that there are not any more

while, in fact hundreds of others lie low only to harass the Kashmir authorities later. Lastly, the Security Council has talked of settling the underlying political question. Once we have accepted one part of their resolution (the one about the cease-fire) it will be difficult not to co-operate about this other part. In any case, if we do not co-operate, we shall be running a risk of the Security Council being driven to favour Pakistan much more than it might otherwise. Indeed, some degree of give and take about Kashmir through the Security Council seems inevitable, and our aim should be to co-operate with its efforts, to plead our case with the best arguments, to persuade Pakistan to climb down from total demands, and thus reach a mutually agreed permanent solution of Kashmir.

Yet another element of the aftermath is the knowledge on our part of the lengths to which China is willing to go to create difficulties for us; we have in fact had a proof that China is in a mood to open as severe hostilities against us as our distraction on other fronts as well as her involvement elsewhere would permit her. Though we have known of her hostility since 1962, the recent events give still greater support to the belief that China is only waiting for an opportunity. To face her with equal strength, we shall need to have much more armaments than we have now; to produce or buy them all is bound to place a very heavy burden on the economy — in effect on the poor majority, for, the slower the growth of civil production, the slower the rise in their standard of living. Even China has not paid for all her present armour; in the years which mattered she had a great deal of military aid from Russia.

The aftermath of this war, above every other thing, poses the question for us: Shall we arm in a big way, and shall we pay for it all ourselves? In some countries there is plenty of spare armour of the kind we shall need. Shall we take greatly increased military aid? (Incidentally, getting gifts of the most expensive defence equipment from abroad need not be inconsistent with self-sufficiency in armaments of that degree which is consistent with not sacrificing the other aims of development policy.) Which block is the aid to come from? And talking of blocks, with the emergence of China as a major threat to us, and as a country which is unfriendly towards Russia, is there

not one more block in the world today than there was a few years ago? If it is so, what is the exact nature and significance of non-alignment for us today? Indeed, the most important element in the aftermath of this war is the emergence of a world situation which, from the standpoint of India at least, is fundamentally different from what it was

in the early 1950's. The new pattern was already visible in 1962, but now it has been confirmed. In this new situation we must examine whether the foreign policies formulated in the bygone era are still rational and moral; if they are not, then we must not waste too much time in formulating alternative policies and in cleverly and actively furthering them.

Let this modern, versatile machine take over the various accounting functions of your business. It makes possible accurate, speedy calculations and helps effect a substantial saving in time and manpower.

- Especially suitable for banks and industrial establishments.
- Automatic handling of complete accounting procedures, invoices, sales/purchase journals, ledger accounts, payrolls, statements, etc.
- Foolproof system of "Control Number" ensures correct posting of every entry
- Interchangeable control panels enable quick change for different bookings
- Many models available to suit all requirements

BOOK REVIEWS

Comecon's Progress

Surendra J Patel

Comecon: Integration Problem of Planned Economies, by Michael Kaser, Oxford University Press, 1965, pp 215 + viii, 25 sh.

MICHAEL Kaser's study is a valuable contribution towards an understanding of intra-regional economic co-operation in an important area. The socialist countries constituting the Comecon (the Eastern European Council for Mutual Economic Assistance) account for some three hundred million people; their combined Industrial output is, as the author suggests, as great as that of the countries in the European Common Market and in the Commonwealth together, comprising over a billion persons; the per capita industrial output is nearly three times higher in the former, and the differences in its level among countries within the group much narrower. Despite their economic significance, very little so far has been known to western scholars about the attempts of these countries, bound by common ties of socialist ideology and operational practice of overall economic planning, to foster mutual economic co-operation among them for their accelerated development. According to the author, there are only two books on the subject in German, and one in French is soon to appear: his work is the "first study in English" (p 2). The descriptive aspects of his study supplement S Dell's work on "Trade Blocks and Common Markets" (London, 1963).

With seventeen years of specialised studies on the area, Kaser is admirably suited to the task of providing the facts of Comecon's evolution. His competence in the languages of the countries, his wide and frequent travels, twelve years of his work with the ECE, a pioneer in studies of eastern European economies—all these come out clearly in his sound command of the material at hand.

The study is divided into two parts. Part I deals with the history of the formation of the Comecon, and Part II with its achievements and prospects, though a more adequate phrase (as the author puts in his Introduction) would perhaps be "current problems". It also contains nine appendices, including three of Comecon's major documents — extracts from its Charter, from the

The views expressed here are the author's own and should not be taken as those of the ECAFE with whom he works.

act of establishing its Secretariat, and from its declaration of principles; it also lists its agencies conferences and major decisions. For those to whom Russian still remains a forbidding language and even for those who may know the language but have limited access to well-equipped libraries, this study should prove a valuable source material.

Part I opens with the Chapter "Circumstances of Birth" in 1948 characterised by Kaser as "a marriage on the rebound" ("alleged rebuff" from the "Marshal Plan" powers) and therefore involving less chances of success. In contrast to the trend of thought in early postwar western Europe, there was a clear emphasis "upon national sovereignty" in international co-operation among the centrally planned economies (p 12). From then on through the next four chapters, the author examines the bases for economic co-operation within the initial framework and traces the details of the relatively few conferences which were convened strictly on an *ad hoc* basis from the foundation of the Comecon until 1956. This was followed by a period of rapid strengthening of its activities between 1956 and 1960. The May 1956 session created twelve standing commissions "each allocated to a member country". Every capital was the headquarters of at least one commission, reflecting its major economic activity (p 67). A number of major projects are taken up, such as, the Iron Gates Project in the Danube, multi-lateral clearing arrangements, construction of a network of oil pipelines, and joint investment projects.

The widening of the planning horizon and the lengthening of the time perspective up to 1980 made it increasingly clear that the Comecon needed "commonly agreed guidelines on the international division of labour" in their perspective plans (p 83). Here was the basis for a conflict between emphasis on national sovereignty and need for supranational co-ordination. Kaser has dealt at great length with the reasons for dissensions within the Comecon since 1961. At the back of all these were the Soviet proposals "for a Central Comecon planning organ" which was to decide the most

"rational allocation of investment" (p 93).

Part II "Achievements and Prospects" begins with an analysis of the growth of industrial output and trade among the Comecon countries, emphasising that output increased faster than trade. By far the most important chapter for the developing countries is Kaser's treatment of technical co-operation among Comecon countries. To quote at length:

"The interchange of expertise has unquestionably been one of Comecon's most successful objectives: as just observed, the diminution of trade dependence can be regarded as the consequence of rapid industrialisation as much as of the slower development of trade. Comecon can take credit for the supply of knowledge which generated the new industries. The gratuity of this aid, under its 1949 recommendations, was a practical expression of the injunction of communism: 'from each according to his ability, to each according to his needs'. Comecon members have already done much to extend such service to other, poorer economies."

The social system of the countries had obviated trade secrecy: in fact, as the author put it, it made "a positive virtue of the exchange of advanced experience" (p 129).

Next chapter on pricing, perhaps the weakest piece in the study, describes the new thinking which is taking place within the Comecon countries. The final chapter on "Integration" serves as an epilogue which Kaser ends with a suggestion to the Comecon countries to pay special attention to the "economics of the 1960s" (a phrase left unexplained) in evolving new techniques for their domestic practice.

The author is at his strongest in description. The weakness of this otherwise very valuable study is at the level of generalising from description. Let me pick up a few points as illustrations:

(1) The European Common Market is taken as an advance guard in the field of international economic co-operation; the efforts of the Comecon countries are often shown as a feeble

Reserve Bank of India

APPLICATIONS are invited for the posts of Rural Credit Officers in the Agricultural Credit Department in the Bank in the scale of Rs 450—50—600—60—960—EB—60—1200.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given higher starting pay in the prescribed scale.

In addition to pay, the selected candidates will be eligible to draw local pay at 10% of grade pay (at centres where it is admissible) and allowances mentioned below as may be admissible from time to time. The present rates of allowances are as under:—

(a) *House Allowance:*

- | | |
|--|---|
| (i) When stationed at Bombay, Calcutta, New Delhi and Madras : | At 20% of pay (including local pay) with a maximum of Rs 300.00 per mensem. |
| (ii) When stationed at other centres : | At 15% of pay (including local pay where admissible) with a minimum of Rs 90.00 per mensem and maximum of Rs 300.00 per mensem. |

(b) *Dearness Allowance:*

At 20% of pay on a basic pay upto Rs 500.00 per mensem and thereafter at 16½% of pay with a maximum of Rs 125.00 per mensem.

(c) *Hill Allowance:* Rs 50.00 per mensem when posted at Srinagar.

QUALIFICATIONS:

The applicant should

- (a) be a first or second class graduate
- (b) possess a minimum of 5 years' experience in co-operative banks, commercial banks, co-operative institutions and/or in the co-operative department, out of which not less than 3 years should be in a responsible position.

Preference will be given to those with high academic qualifications, who have made a special study of Economics, Commerce, Accountancy, Co-operation or Sociology.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY THOSE CANDIDATES WHO POSSESS HIGH ACADEMIC QUALIFICATIONS AND/OR ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

AGE LIMIT AS ON 1ST SEPTEMBER 1965:

Candidates should not ordinarily be over 35 years of age but the age limit may be slightly relaxed in the case of candidates with exceptionally good qualifications/experience of value to the Bank.

2. An applicant must remit with his/her application a fee of Rs 7.50 by cheque or bank draft on a *Scheduled Bank* payable at Bombay or by Postal Order drawn in favour of Reserve Bank of India. *The application fee is in no case refundable.* In the case of candidates belonging to Scheduled Castes/Tribes, the fee is Rs 2/-. Bona fide displaced persons who have migrated from East Pakistan to India on or after 1st January 1964 and who are not in a position to pay the application fees are exempted from payment of any application fee.

3. Applications in the *candidate's own handwriting* in the prescribed form obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Hyderabad, Trivandrum, Lucknow, Patna and Jaipur accompanied by copies (originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the graduate and post-graduate degree examinations and two testimonials should be sent to the Secretary, Central Recruitment Board, Reserve Bank of India, Department of Administration and Personnel, Central Office, Post Box No. 466, Bombay No. 1, so as to reach on or before the 18th October 1965.

4. Candidates already in service will be required to produce a proper discharge certificate from their employers (in the event of their being selected) at the time of their appointment in the Bank's service.

5. Candidates belonging to Scheduled Castes/Tribes and bonafide displaced persons from East Pakistan should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

6. Candidates must be prepared to serve in any office of the Bank in India, and to undertake tours when required.

7. For the purpose of selection, the candidates may be required to appear for interview before the Selection Board at any of the Bank's offices. Such of the candidates as are called for interview will be reimbursed single first class railway/bus fares by the shortest route from their places of residence to the office/s of the Bank where they are called for interview and back.

8. Appointments will be subject to the candidates being declared medically fit for service in the Bank by the Bank's Medical Officer.

9. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates not will the Bank enter into correspondence with them.

10. Canvassing in any form will be regarded as disqualification.

"riposte" (the word is used too often in the text) by the Comecon. The evolution of actual international co-operation in both eastern and western Europe shows that it is easy to demonstrate the virtues of co-operation (or co-ordination, harmonisation or whatever name is chosen), but its implementation in a society full of independent nation states has remained a hard problem. In the West, the early euphoria is disintegrating in the face of France's insistence on national sovereignty. In his press conference on 9 September, President de Gaulle bluntly said that a crisis in the European Common Market was "sooner or later" inevitable because of "errors and ambiguities" in the original European treaties drawn up "when France was weak". Eastern European countries started at the other end: beginning with the recognition of national sovereignty they came to feel the need for long-term planned co-ordination; but their efforts began to be stymied by Rumania, speaking in an accent not much different from that of France in the west. One can hardly suggest that the experience of the European Common Market has proved a promising patent pill.

(2) Kaser to be irritated by the emphasis on "heavy industry" in planning (pp 16-20, 37-38, 50-51, 55) in the socialist countries. He shows relief with Stalin's death when at times it appeared as if the ghost of heavy industry was laid to rest, though real economic life seems to have given it nearly indestructible powers of survival. It is a pity that the simple fact that nearly everywhere — whether the countries were small or large, capitalist or socialist — heavy industry has expanded during the period of industrial transformation nearly twice as fast as light industry has so far remained beclouded in sterile controversy; that the gap in these growth rates has tended to narrow only when an advanced industrial economy was created; that the pattern of industrial investment in the post-civil War United States (where there was no Stalin) was not altogether different from that in post-1928 Soviet Union; that structures of industry in the advanced western or eastern countries now appear as identical twins; and that the perspective development plans of many a developing countries also reproduce carbon-copies of this historical experience. But we have now become familiar with frequent quarrels among economists about lables of empty boxes.

(3) The author's thoughts on the

pricing mechanism are not always clear. Much in the pricing system in the Comecon countries need a thorough-going revision. But to attribute rationality to the pricing system in the non-socialist countries (pp 1, 140-157, 159-161) would seem to suggest a sublime disregard for all the divergence of real economic life from the theoretical motions; it would seem as if the Great Depression, Cartels, imperfect or monopolistic competition (Robinson and Chamberlain), general and partial equilibrium and immobility of price changes (Keynes), public control of key prices in most western countries choice of techniques and shadow prices (Sen and Chakravarty), underdevelopment, cumulative causation and distortions of the price system (Myrdal), losses (not gains) from trade, terms of trade and UNCTAD and all that (List, Prebisch) were all aberrations of an inverted mind. That the planned economies have yet not satisfactorily resolved this problem is beyond dispute; but to say that the theoretical inheritance of an essentially unplanned political economy has much to contribute to the quest seems like unravelling the mysteries of the galaxies through the microscope, how-

ever powerful, rather than a telescope.

(4) Kaser's treatment of trade and autarky also suggests a not altogether dissimilar attitude. There is nothing unusual in the fact that since 1920's trade has expanded slower than industrial output (pp 111-118). Nor is there so much to be said about "gains" from trade between unequal partners; gains at a point of time have in fact turned out to be losses over a period of time. Insistence by the economists from the developing countries upon "cost comparisons...on a dynamic basis" is all the more necessary in determining not only the gains but also the losses from trade. It may well be that the success of the Comecon countries "in fostering the expansion of production" rather than trade (p 116) was less of a paradox than the author suggests; it was perhaps with minor qualifications an essential instrument.

The observations made above concerning some of Kaser's concepts are not intended to detract from the general merit of study—which is indeed a welcome addition to the growing literature on international economic co-operation.

In Quest of the Risk Premium

M G Pavaskar

The Theory of Futures Trading by L S Venkataramanan. Asia Publishing House, 1965; pp xi+115. Rs 16.00.

EVER since Keynes presented his 'Theory of Normal Backwardation' in his "Treatise on Money" (Vol II, 1930), many leading economists, both in UK and USA, have been in quest of the risk premium in commodity futures markets. Though their efforts have generally been in vain and largely resulted in discovery of a few more 'empty economic boxes' labelled "hedgers' aversion to price risk", "hedgers' risk premium," "speculators' profits", etc, they set at rest many misconceived traditional theories and concepts regarding hedging, speculation and prices in futures markets, and produced some important and interesting methodological contributions for testing empirically the economic usefulness of futures markets. In this small but interesting book, Venkataramanan has briefly surveyed these valuable contributions made by such well-known economists as Keynes, Hicks, Kaldor, Working, Telser, Houthakker and others, over the last three decades to explain the mysterious behaviour of the men who ope-

rate in the futures markets.

Although futures markets have been functioning in this country for over half a century, the subject of futures trading has never engaged serious attention of any of our leading economists. The few books that are available on the subject ("Futures Trading and Futures Markets in Cotton with special Reference to India" by H L Dholakia, "Commodity Exchanges" by P G Salvi and "Regulation of Futures Markets" by W R Natu) are entirely descriptive and deal mainly with the organisational and institutional aspects of futures markets. In the last few years, futures markets have come under repeated attacks from both the uninformed public and politicians alike. And yet, there have been practically no important methodological or empirical studies on the merits and the functioning of futures markets—which are verily the textbook examples of perfectly competitive markets—by even those individuals and institutions who tirelessly affirm their faith in the economic effi-

cancy of the competitive market mechanism in the allocation of resources. Venkataramanan's comparative survey of rival theories of futures trading is, therefore, most timely as it might stimulate serious research and empirical thinking on the working of futures markets in this country.

After briefly reviewing the origin and historical development of futures markets in many countries including India, Venkataramanan discusses in the early chapters of the book the role of futures trading in the marketing of agricultural commodities, especially in reducing the risk of price fluctuations faced by different functionaries in trade and industry. In the subsequent chapters, he successively deals with the intricate theories of hedging, speculation, storage and inter-temporal price relations presented by different economists. Although Venkataramanan claims no originality, readers gain valuable insight from his discussion of complex theories.

What forms the core of discussion in the various theories on futures trading is the basic Keynes-Hicks hypothesis that hedgers in futures markets pay risk premium to speculators for the service which the latter render to the former in assuming price risks. According to this hypothesis, as hedgers are generally 'shorts' in commodity futures markets, the risk-premium payable by them takes the form of 'backwardation' which results in futures price being quoted at any time at a level lower than the level of the expected spot price at the same time. Holbrook Working and others, however, have attempted to explain the 'backwardation' in the futures markets in terms of convenience yield on stocks which reduces or inverses the carrying charges. Empirical data on the subject are conflicting and cannot be accepted uncritically. Curiously enough, Venkataramanan finds confirmation of the Keynes-Hicks hypothesis of risk premium in the functioning of the cotton futures market at Bombay and infers from the large backwardation that is witnessed in the cotton futures price that "the Bombay market was used quite substantially for hedging purposes". Knowledgeable persons in the cotton trade who attribute the backwardation in the cotton futures market to such complex factors as the broad-based nature of the cotton futures contract, the system of fixing tendering differences at the East India Cotton Association, etc., could hardly accept this inference for they, more

than any one else, are aware that 'short' hedging in the cotton futures market at Bombay by dealers and stockists has been very small for the last over a decade. Far from confirming the hypothesis of risk premium, this reviewer feels that Table 7 (which gives data on cotton futures prices and cotton stocks) in Venkataramanan's book lends some support to the operation of the theory of inverse carrying charges in the Bombay cotton market. Nevertheless, what needs to be emphasised is that the factors which determine the basis between the ready and the futures prices are so varied and many and necessarily differ so much from commodity to commodity and market to market that any empirical inferences drawn from statistical studies must be interpreted and accepted with utmost caution.

To those who seek an answer to the question whether speculation *per se*

stabilises prices or not, Venkataramanan's book may be a little disappointing, for it gives no clear verdict. But this is as it should be. Both Baumol's and Telser's models are inadequate as they are based on certain assumptions about the behaviour of speculators, which are unfortunately not true in the real world with regard to all classes of speculators operating in the futures markets. Venkataramanan therefore rightly concludes that the question of the stabilising influence of speculation must be answered on empirical grounds.

This book is perhaps the first which surveys the major contemporary contributions to the theory of futures trading. It is superfluous to say that it should be read by all those who are interested in the subject. One must, however, voice a small protest against the very high price of the book.

Indian National and State Income Data

Some Aspects

Mahinder D Chaudhry

Bert F Hoselitz

This paper is devoted to a general survey of the state income studies available to us at the present time. Its purpose is not to test the accuracy of the national income estimates at the state or national level, but to identify areas where improvement is needed through comparison of national and state income data.

We place principal emphasis on the nature and type of discrepancies and the direction of differences in estimates rather than their magnitude. We are primarily concerned with inconsistencies, gaps, double counting, lack of explanation of the assumptions and omissions in income estimates. Above all, our aim is to improve the presentation of material so as to enhance the usefulness of the reports and to avoid any misuse of the findings by attempting to explain fully the validity of the data which form the basis of estimation.

We also hope to indicate how the inclusion of basic data in the reports can help other research workers on state incomes to duplicate the procedures adopted by some states and to show how this will aid efforts to reconcile national aggregates derived from state income estimates with those compiled at the national level.

[The preliminary findings of this study, based on the national and state income data then available to us, were presented at the Fourth Indian Conference on Research in National Income held at Gokhale Institute of Politics and Economics, Poona, in December, 1962. In the present, revised version, use is made of all the additional and revised state income estimates and income series now available. In the summer of 1964, one of the authors, Mahinder Chaudhry, visited the Central and State Income Units in India for collection of data and discussions with the officials engaged in the compilation of income data. The financial support for the field work received from the Research Centre in Economic Development and Cultural Change, University of Chicago, is gratefully acknowledged. We are grateful to the Planning Commission, New Delhi, particularly to Asoka Mehta and Tarlok Singh, for the help received in the preparation of this study. A word of thanks is also due to the National and State Income Units who made available the needed documents and also spared time for discussions. Of course, the responsibility for the views expressed is entirely ours.]

WE shall, first, compare the aggregate of State income estimates with national estimates compiled by the Central Statistical Organisation. The national totals will be subsequently apportioned among States and compared with the official State income estimates, wherever the required details are available. Finally, we shall attempt to indicate those areas in which the State income estimates need to be revised and how the methods of estimation may be improved.

The income estimates in this paper relate to 1955-56, i.e., April 1, 1955 to March 31, 1956. This choice has been dictated by the fact that the largest number of State income estimates were available to us for this period.

In this study, India has been divided into 17 units (14 States designated under the States Reorganisation Act of 1956, and six centrally administered territories which have been grouped into three units: Delhi, Himachal Pradesh, and Other Union Territories).

For reason of space this article is being printed in two parts. Detailed discussion of the areas in which state income estimates need to be revised and of how the methods of estimation may be improved will appear in the second part to be published next week. — Ed.

This last group includes Andaman and Nicobar Islands, Laccadive, Minicoy and Amindivi Islands, Manipur, and Tripura, Himachal Pradesh and Delhi are treated separately, since economic data are collected and published for these territories separately. For the Other Union Territories we have no information as to whether independent income studies are either in progress or under publication. For these regions data computed by us were used wherever this was necessary.

II

Comparison of National Totals with Corresponding Aggregates of State Income Estimates

In comparing the various measures of national income during 1955-56 for India as a whole and the different sectors of the economy, emphasis is intended on the nature rather than the extent of the differences to be observed in the various income estimates. It has not been possible to extend this exercise to the point of reconciling the State and national income data, since all the details needed for such analysis were not available in the State reports at our disposal. But given the limitations of reports available to us we shall try to indicate what attempts need to be made in order to reconcile the different measures of national income totals.

Three sets of national income estimates for the year 1955-56 are compared: (1) A conventional series compiled by the Central Statistical Organisation (CSO) and published annually;¹ (2) a revised series, also compiled by the CSO, published more recently;² (3) a series obtained by aggregating the findings of State reports compiled by various State Statistical Agencies. The currently available estimates, included in group (3), cover 99.32 per cent of the population and 95.17 per cent of the area of the country. The actual data and the estimates for sectors and subsectors, as well as the State total, are presented in Table 1.

In terms of availability of "firm" State income data for the year 1955-56, the sources used in compiling Table 1 can be classified as follows:

(1) "Firm" figures, that is, estimates pertaining to the fiscal year 1955-56: This group includes 15 States covering 94 per cent of the population and 89 per cent of the area of the country, i.e. Andhra Pradesh, Assam, Bihar, Bombay (Maharashtra and Gujarat), Jammu and Kashmir, Kerala, Madhya Pradesh, Madras, Orissa, Punjab, Rajasthan, Uttar Pradesh, West Bengal, Delhi, and Himachal Pradesh.

(2) "Contiguous" figures, that is, estimates for a period close to 1955-

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now freely available from our factory at Kota for a wide range of applications such as:

- WIRES AND CABLES
- FLEXIBLE SHEETINGS
- RIGID SHEETINGS
- CORRUGATED SHEETS
- TUBES AND PIPES
- FOOTWEAR
- UPHOLSTERY
- TILES

THE ECONOMIC WEEKLY

56: This group includes only the state of Mysore, which contains 5.38 per cent of the population and 6.30 per cent of the area of the country.

(3) A residual group of States and territories for which no direct or derived income data are available: Other Union Territories—this group contains less than one per cent of the national population.

In order to obtain 1955-56 income estimates for group (2) above, we have made extrapolations from the available income data for three years, from 1956-57 to 1958-59. The 1955-56 figures were thus estimated by deflating the 1956-57 income estimates in each subsector of the State economy (Table 1, col 16) by the average annual growth rate of each sector experienced over the period.

For territories included in group (3), shares based on allocation from national income during 1955-56 have been used.³ The total income of these regions makes up less than one per cent of the national income of India during 1955-56.

The income estimates, both at the national and at the State level, measure net domestic product at factor cost. The national income of a country is equal to the country's net domestic product at factor cost plus or minus, as the case may be, the net balance of income earned from, or paid to, foreign countries. Since in 1955-56 the net amount of income earned from abroad by India was nil, both sets of national income estimates are made up of the identical item.⁴

A comparison of national income estimates made at the central level with that obtained by aggregating independent State income estimates based on local data, shows substantial divergences in the total reached, mainly for two reasons:

One is the presence of variations in definition and scope of individual sectors and subsectors making up the national or State income total. Although the classification of economic activities into different sectors and subsectors employed in most State reports is the same as that used in the national accounts of India, some variations have been observed. For example, while in some of the State reports Banking and Insurance also comprises non-organised banking activities, these activities are included elsewhere in national estimates. Because of the lack of detailed break-

downs in most State reports, we could not make adjustments in the State income data to make them strictly comparable with the corresponding national totals.

The second serious difficulty was the lack of detailed information on the composition of the various subsectors of economic activity, particularly as regards the working force. If extensive working force data had been included in the State reports, it would have been possible to determine the scope of economic activity included in each subsector.

In some State reports, income estimates for various subsectors, especially for "services", are grouped together and no details are provided as to the contribution of each component activity. For example, in some reports "professions and liberal arts, domestic services, and government administrations" are combined in a single service sector. In these cases, the estimated income for a larger sector had to be allocated by us among the various component subsectors. In these cases we assumed that the shares of each subsector form the same proportion of the total for that sector as may be found in the corresponding estimates based on the allocation of the national totals. (See Table 4).

These limitations must be borne in mind in assessing the comparison attempted here. In Table 3, the three sets of estimates are compared and their differences in absolute terms and percentages are noted. In the first two columns the conventional and revised national estimates for 1955-56 are presented and each series is compared with the State aggregates presented in column 3. The data presented in this column are based on the 1955-56 data drawn from Tables 1 and 2, to which amounts for Other, Union Territories, equal to the shares of these territories derived from the allocation method (see column 18 in Table 4), have been added.

If the conventional national income estimates are assumed to be a relatively accurate measure of the level of economic activity in the country, then the aggregated State income data fall short by just 7 per cent. This is not likely to raise any serious doubts about the validity of the State estimates, since the national estimates themselves are reported to be subject to an over-all margin of error of "about 10 per cent for the aggregate domestic product."⁵ But closer analysis suggests that behind this over-all difference of 7 per cent there are much

larger differences at the sectoral and subsectoral levels which mutually offset each other when the sectoral data are totalled up. For example, in Agriculture and Allied Products, the sectoral difference is only 3.4 per cent, but for Agricultural Crops (a subsector of the former) the aggregated State estimates are lower by 7.5 per cent, and the difference in the evaluation of livestock products (another subsector of Agriculture and Allied Products) is 20 per cent. Similarly, the estimates of the value of output by forestry (a third subsector) differ by 23 per cent. Further differences between the conventional national income estimates and the aggregates of State income data can be found in columns 4 and 5 of Table 3.

Table 2: State Income of Mysore, 1956-57
Estimates Adjusted to 1955-56

Economic Sectors and Subsectors	(Millions of rupees)	
	Average Annual Growth Rate 1956-57 to 1960-61	Adjusted 1955-56
(1) AGRICULTURAL AND ALLIED	8.45	2,789
(2) Agricultural Crops	9.05	2,382
(3) Animal Husbandry	2.42	352
(4) Forestry	25.69	27
(5) Fisheries	8.33	28
(6) MINING, MANUFACTURING, AND SMALL ENTERPRISES	10.76	558
(7) Mining	4.74	55
(8) Factory Production	11.92	227
(9) Small Enterprises	10.92	276
(10) COMMERCE, TRANSPORT, AND COMMUNICATIONS	8.33	567
(11) Communication Services	4.69	15
(12) Railways	6.00	71
(13) Banking and Insurance	9.87	34
(14) Other Commerce and Transport	8.69	447
(15) OTHER SERVICES	7.66	648
(16) Professions and Liberal Arts	7.78	196
(17) Domestic Services	4.17	17
(18) Government Services	16.44	125
(19) Residential Property	3.71	310
(20) TOTAL	8.62	4,562

Source: Estimates of income for 1956-57 have been projected backward according to the average annual growth rates over the four year period, 1956-57 to 1960-61. For 1956-57 income data see Table 1, Col 10, and, for 1956-57 to 1960-61 estimates see Mysore Report.

In the same Table we also present a comparison between the revised national income estimates and the aggregates of State income estimates. According to the revised series which are based on fresh data made available by National Sample Surveys and other research studies, the national income of India during 1955-56 is estimated to have been Rs 92,071 million, as compared with Rs 99,773 million in the conventional estimates.

This downward revision of the national income estimate for the year 1955-56 has reversed the picture presented by the earlier comparison of the national and state aggregate estimates of national income. The aggregated state income estimate is higher by Rs 503 million, or .5 per cent, than the revised national estimates. The largest differences may be observed in two subsectors, namely (1) commerce, transport and communication, and (2) other services.

A very large difference also is found in the evaluation of animal husbandry products. Despite the fact that the

nationally computed figure for this subsector has been revised upward from Rs 7,040 million in the conventional estimate to Rs 8,132 million in the revised estimate, the aggregated state reports estimate stands at the higher figure of Rs 8,447 million. We must cite another example, where the aggregated state reports estimate is much lower in comparison to both national estimates: the contribution of railway services to national income. The revised estimates of national income show Rs 2,200 million for this subsector, whereas the aggregated State reports estimate comes to only Rs 1,723 million. It is highly likely that the national estimates for this subsector possess much greater accuracy since the railway system of India cuts across state boundaries and railway accounts are kept on a regional or national basis. This facilitates the estimation on the national level and hence the state estimates which, by necessity, are based on the estimation of each state's share in the national total, may be wrong. This point is discussed in greater detail below.

III Allocation of National Income Estimates Among States and Comparison with State Income Estimates

We shall now turn to another method of analysis, the apportionment of various sectors and subsectors of national income estimates among the states. The results of this process of analysis are presented in Table 4. The allocated shares of each sector and subsector of national income for each state are compared with the corresponding official state estimates. Attempts at apportionment of national income totals among states have been made by various scholars and organizations, among them: B Natarajan, K N Raj, Ravi Verma, and the Indian Institute of Public Opinion.⁶ These findings were not used in this paper for various reasons: (1) the studies do not relate to the period of 1955-56; (2) the regional units adopted by them do not coincide with those being used by us; (3) in some cases the principles by which allocations were made are not stated clearly in these publications:

and (4) in general the findings are only rough approximations. In order to obtain a reliable set of regional income data based on uniform methodology and assumptions, we have used a detailed allocation of national totals among 17 units made by one of the authors of this paper.⁷ The national income of Rs 92,071 million for the fiscal year 1955-56 (according to the "revised series" compiled by the CSO) is allocated among states on the basis of appropriate economic indicators available. For purposes of allocation, the national totals are initially divided into various economic sectors and subsectors (Table 4) and, in turn, each subsector total is further divided into a feasible number of homogeneous economic units.

The national income originating in the agricultural crops subsector, for example, is divided into 33 units consisting of one or two crop groups; similarly, in the animal husbandry subsector, the national totals are divided into 25 such units. Each unit national total is allocated among states with reference to the suitable available allocator for that unit. The output of rice for each state, for example, evaluated on the average prices of rice in that state, forms the basis of allocation for the national totals for rice. In some cases, where price data by state are not available, the basis of allocation is the physical output of the product concerned. For forestry, fishery, and mining, the gross value of annual output in each state, as reported in the official publications, is the basis of allocation. The national income from factory production subsector is subdivided in the four groups:

(1) The factories covered by the annual census of Manufacturing industries. The value added data according to this survey classified by states are available, and form the basis of allocation.

(2) Tea industry: In view of the fact that the tea industry is not covered by the above survey and is localized in two or three states, it is treated separately. The state wage bill for the tea industry, taken as a percentage of the corresponding national wage bill of all the national workers engaged in tea industry, forms the basis of allocation.

(3) Income from electricity: the basis of allocation in this group is the state distribution of electricity generated in each state as published by the Water and Power Commission.

(4) All the factory workers not

covered in any of the above three groups: With the help of employment data and average annual earnings per factory worker, by state, and following the procedure adopted for Group (2) above, we have allocated the national totals for this group among states. For allocation purposes, the small enterprises subsector is divided in the following seven industrial groups: (1) textile and tailoring; (2) leather and leather products; (3) wood, glass, stone and ceramics; (4) metals manufactures and engineering; (5) chemicals; (6) food, drink, and tobacco; and (7) other industries.

For a given state, the number of workers, rural and urban taken separately, in each of the industrial groups are multiplied by the corresponding rural and urban national average net-value-added per worker engaged in the small enterprises. Similarly, for a given state, the number of workers, rural and urban separately, engaged in the construction subsector are multiplied by the corresponding national average of value added per rural and urban worker respectively. Combined annual value added by the total workers in each state is taken as a percentage of the aggregated similar total for all the states together.

The national totals for this subsector are allocated among states according to the respective shares obtained above. In the professions and liberal arts, and domestic services subsectors, in each state the total workers engaged are divided into the following nine industrial groups separately for rural and urban areas: (1) medical and other health services; (2) educational services; (3) letters, arts, and science; (4) legal services; (5) religious and charitable services; (6) sanitary services; (7) barber and beauty shops; (8) laundries and laundry services; and, (9) domestic services.* With the help of state employment data, and assuming the differences in rural and urban average earnings in each of the above groups to be the same as estimated in the National Sample Survey report,⁸ the national totals are allocated among states following the procedures adopted for the construction subsector.

In the other subsectors, where national totals are based on income approach, namely, other transport, other commerce, railways, communication services, and government services, the procedures of allocation analogous to the above are followed. Income from Banking and Insurance subsector is allocated with reference to the percentage

share of each state in the national total of loans and deposits of commercial banks. Income from the residential property subsector is allocated on the basis of the number of urban and rural houses in each state; while allocating urban property income account has also been taken of the size-composition of the urban centers.

The preceding explanation of the principles of allocation used gives only a very rough and approximate indication of the complex computations which were actually made to determine the share of income of each state in each of the subsectors. The procedures followed are described in full detail in M D Chaudhry's publication. The allocated shares are, nevertheless, approximations which facilitate comparison between the two sets of state income estimates. The objective of suggesting allocated shares is not to propose "better" income estimates for the states, but rather to make a general enquiry into the state findings and to point out inconsistencies and limitations of state reports, on the assumption that the national estimates may serve as control figures. At the same time, it is also possible that the aggregates of state income estimates may indicate the need for new appraisals and some revision of existing assumptions and bases of estimation in some sectors of subsectors of national income.

In general, it is reasonable to argue that the state income data, especially if they are based on local data obtained through direct surveys, are likely to present a more realistic picture of the state economy than the allocated shares from national income estimates. But a survey of the state income reports shows that some of the state estimates are not based on systematically collected local data, but either on national averages or on very slender empirical evidence. This holds particularly for those sectors in which the income approach is employed to estimate state income.

Any differences observed in the two sets of measures of state income estimates, either for all the sectors or for any one sector, are taken as indicators of the need to examine more closely the underlying method of estimation, the sources of information used, and to question the validity of the allocator. Even if the income estimates arrived at by the two methods are fairly close to each other, there may be significant differences on the sectoral

Table 3: Comparison of National Income Estimates and State Report Aggregates

THE ECONOMIC WEEKLY

and subsectoral levels which compensate one another when all sectoral figures are added up. Therefore, in order to make the comparison more meaningful and to appraise the state estimates in greater detail, each sector and subsector has been analyzed separately. But as a result of the difficulties of finding detailed information in the state reports on some subsectors, and because of the lack of uniformity among income reports concerning the scope of economic activities included in the various subsectors, we are often forced to combine some of the subsectors. An example is provided by the combination of the following activities into one single sector: professions and liberal arts and domestic services.

The estimated national income (revised series) during 1955-56, as compiled by the Central Statistical Organization, is allocated among 17 administrative units (Table 4). The comparison here, however, is confined to 16 states only; the other centrally administered Union Territories are excluded for lack of information. The exclusion of this group does not materially alter the comparison since these areas accounted only for less than one per cent of the national income during 1955-56. For 15 out of the 16 states, income estimates based on local data for the year 1955-56 are available, and for Mysore state, data have been adjusted to 1955-56. The detailed reports for Rajasthan, Madras, Mysore, and Uttar Pradesh are in the process of publication and only summary tables of findings (in some cases, along with brief notes of methods of estimation) were available to us, and hence had to be used for purposes of analysis.

Broadly speaking, the allocations of national income totals among states reflect to a reasonable degree the differences in the agricultural-industrial mix of the various state economies. In seven states—Andhra Pradesh, Bombay, Kashmir, Kerala, Madhya Pradesh, Rajasthan, and Uttar Pradesh—the differences between the income estimates obtained by the allocation and direct state estimate approaches are less than 5 per cent; and in five states—Assam, Bihar, Madras, Mysore, and Himachal Pradesh—the differences range from 7 to 9 per cent. If Delhi, largely a city, is excluded because it is the seat of the central government and accounts for only one-fifth of one per cent of the national total population, wider discrepancies are observed

only in three states: Punjab (16 per cent), West Bengal (23 per cent), and Orissa (48 per cent). The Orissa state, with a difference of 48.4 per cent, is the only case in which the state report claims the state income to be higher than the corresponding allocated share by such a wide margin. It should be noted that serious discrepancies may be found in the *Orissa Report*, particularly in the evaluation of agricultural production which are at least partially responsible for this difference.

Among the states whose own estimates are lower than their allocated share, two states, Bombay and Madhya Pradesh, differ by less than 5 per cent; two others—Mysore and Himachal Pradesh—differ 8.9 per cent, and West Bengal differs by 23 per cent. It should be noted here that it is surprising that West Bengal, one of the economically most highly developed states in the country, should have, according to the state's own estimates, a level of economic development below that of the national average. It must be remembered that in West Bengal the share of the urban population of 26.8 per cent is not only the highest among states⁹, but almost twice the proportion of the nation as a whole. West Bengal also employs, next to Bombay, the largest number of factory workers, and harbored during 1955-56 one-fifth of the total industrial labour force in the country. A detailed examination of the state estimate of West Bengal, however, reveals that there are omissions, (particularly in the estimate of the size of the working force in several subsectors), and other doubtful assumptions which explain this wide difference.

The seven states in which the difference between the allocated shares of national income and the corresponding state estimates are less than 5 per cent account for 64 per cent of India's area of 56 per cent of its population. In addition, this group represents a fair sample of the cross-section of the country's economy—Bombay may be described as representative industrial areas; Uttar Pradesh, Andhra Pradesh, and Rajasthan are chiefly producers of agricultural products; and Kerala may be described as a comparatively underdeveloped region. Therefore, it may be assumed that the allocators adopted to determine state distribution of the national income do not appear to contain built-in bias.

The Mysore Paper Mills Limited, Bangalore 9

Speech of the Chairman and Managing Director, Shri M D Shivananjappa, I A S

THE following is the Speech delivered by Sri M. D Shivananjappa, I A S, Chairman and Managing Director, The Mysore Paper Mills Limited, at the Thirtieth Annual Meeting of the Company held at Bangalore on Thursday, September 30, 1965:

Ladies and Gentlemen,

I extend to you a most cordial welcome to the Thirtieth Annual General Meeting of your Company. The Report of the Directors and Audited Balance Sheet for the year ended 31st March 1965 have already been circulated and with your permission, I shall take them as read and would proceed to review the salient features of the year's operations.

We are, as you are all well aware, passing through critical times and facing a National Emergency caused by the unprovoked aggression of Pakistan and threats of China. At this juncture it is the sacred duty of every Indian citizen to rise to the occasion and to contribute his mite to make the War efforts of our Government a success.

I have the pleasure and the privilege to inform you that implementation of the scheme of expansion to step up production to 18,000 tonnes of paper has been successfully completed during the current year, thus raising the Gross Block of your Company, which stood at Rs 167 lakhs in 1961, to Rs 552 lakhs in 1965 (i.e., as on date).

It is appropriate that I should recall the objectives that your Board of Directors had in view while formulating the scheme of expansion. Your Mills are an integrated Pulp and Paper Mill which had a capacity to produce 8000 tonnes of paper and a capacity to produce sufficient quantity of bamboo, rag and waste paper pulp. Taking into account the capacity to produce only bamboo pulp it should be noted that the Paper making capacity exceeded the Pulp making capacity. It was considered advantageous to use only one kind of pulp namely Bamboo Pulp to maintain production and quality and hence it was decided to discard the use of Rag Pulp and Waste Paper and to step up Bamboo Pulp production. Again from an economic view

point, small size is a distinct handicap to an integrated Pulp and Paper Mill like yours. The financially significant saving that attaches to large scale operations is that of combined heat and chemical recovery secured by the installation of the Tomlinson Furnace. It is only production above 15,000 tonnes that justified installation of this kind of equipment. It is to correct this imbalance between Pulp and Paper making capacity and to increase production with a view to instal Modern Soda Recovery Unit for recovery of chemicals too valuable to be discarded and to increase production of paper to 18,000 tonnes which would diminish labour charges, and reduce overhead charges, and decrease cost of equipment per unit of output that the scheme just implemented was undertaken.

His Highness Sri Jayachamaraja Wadiyar, the then Governor of Mysore, graciously inaugurated the scheme of expansion and laid the Foundation Stone for the new Paper Machine on 17th December 1962 and I am happy to say that the new Paper Machine was commissioned in March 1964, within fifteen months and well ahead of schedule. This is an achievement of no mean value.

During the year under review Duplex Super Cutters ordered with Messrs Masson Scott were erected, installed and taken to service. All the other units ordered under the scheme of expansion, namely Pulp Plant, Soda Recovery Unit, and other equipment have all been erected, installed and taken to service during the current year. However, the erection, installation and commissioning of the Pulp Plant took much longer time than was anticipated, the main reason for the delay being the delay in the delivery of the equipment from the indigenous sources and also partly due to defective machinery parts. The Pulp and the Modern Soda Recovery Units are complementary to one another and for this reason, delay in the erection and installation of the Pulp Plant led inevitably to the delay in the erection and installation of the Soda Recovery Unit. This delay had considerable adverse effect on production and capital costs. However, it is a matter of great satisfac-

tion to your Directors now to be able to report that all the difficulties have been surmounted and all the units are now working satisfactorily.

Production for the year ended 31-3-1965 was 10,037 tonnes as against 9384 tonnes during the previous year. As is mentioned in the Directors' Report, our three Paper Machines could not be run concurrently and continuously for want of Pulp. Adequate quantities of foreign wood pulp could not be procured because of import restrictions and indigenous pulp was not available in adequate quantities though its price was high and uneconomic for us. There were interruptions to operations because of frequent power shut-downs, besides interruptions necessitated my erection work. These factors accounted for an increase only by 700 tonnes. Even this increase was obtained by the substitution of expensive wood pulp and indigenous pulp to our own pulp which has considerably added to our production costs.

I am happy to say that we are now comfortably situated in regard to Pulp production as our Units, Old and New, have capacity to manufacture sufficient pulp to feed all our three machines and satisfactory arrangements have been made with the Government of Mysore for supply of the requisite quantities of bamboos.

In this connection, I would like to emphasise that the Government of India should take necessary steps to provide adequately all materials necessary for the Paper Mills to utilise the installed capacity to the full instead of keeping the Machines idle during many days in the year. This would assume considerable importance in the context of expanding the existing units and starting of new Mills in Private or Public Sector. Shortage of foreign exchange to import necessary equipments and consumable stores has come in the way of better utilisation of the installed capacity of the Mills. I do hope that the authorities would appreciate the relevance and urgency of this aspect and see that full facilities are afforded to carry on un-interrupted operations in the Mills, and I would like to add that without such provi-

sion no useful purpose would be served by liberally issuing licences, as in many cases, licences would have to be cancelled as they could not be made use of for want of necessary facilities.

Now that all our units are satisfactorily working from this month, I expect that production of pulp and paper would very much improve and the benefits of increased production and economies incidental to chemical recoveries would accrue. In regard to higher earnings and profits, I should refer to one or two problems that the Paper Industry as a whole is facing i.e., the problem of marketing and price.

Ever since the Indian Tariff Commission fixed prices in 1960 (the slight increase given in 1962 being absolutely inadequate) the representatives of Paper Industry have been pleading with Government of India for a suitable revision of the prices, having due regard to the mounting costs of production. I am afraid the representations have not received due consideration and the case of the Industry is probably shelved. I would like to urge that it is not in the interest of expansion of Paper Industry or in the interest of the existing units that such an unrealistic and uneconomic price structure is continued. It should also be remembered that there is a limit for securing economies by increased production and operational efficiency. I am confident that the authorities concerned will take these factors into consideration and revise the prices so as to allow the Industry to plough back a part of their earnings for expansion and to make investment remunerative to attract capital. While holding out hopes of high production and operational efficiency I should like to bring to your notice that it is only high production and operational efficiency coupled with reasonable prices for paper that would help to improve our earnings and profits.

The demand for paper was dull during some months in the year. There was accumulation of stocks and consequent locking up of funds. This lack of demand was attributed to reduced or lack of purchasing power to some extent. This, I hope is purely temporary and a passing phase, and having regard to the development activities of the Central and State Governments under the Five Year Plans, the demand for paper will certainly increase and we shall not find much difficulty to market our products. The supply of certain varieties

of paper like printings and writings sometimes exceeds demand. There are certain 'speciality papers' like manifolds, coated paper, Tissue and Art paper etc., which will be in great demand. I strongly feel that at the present day, there is need for diversification of products. In our case, as I have stated earlier, the level of production was raised to 18,000 tonnes per annum to make the Unit economic by securing advantages of large scale production and economies of chemical recovery. Today, the economic minimum is considered to be 100 tonnes a day or 30,000 tonnes per year of 300 working days and in this context I am glad to inform you that your Directors are examining the question of expanding the production capacity of your Mills to 30,000 tonnes with a view to make it more economic and to diversify the products to meet the market requirements. As a preliminary step, your Directors are examining the availability of bamboos and the Government of Mysore have been approached in this behalf, and I shall be able to report progress made at our next meeting.

Though there was increase in production of paper during the year under review, there was decline in profits compared with the previous year, mainly on account of increase in the cost of raw materials, chemicals, coal and power and interest charges while the selling price remained the same. The crux of the problem has been one of mounting cost and fixed selling prices. As I have said before, everything possible will be done to keep the production costs under control by operational efficiency. But the real and substantial relief comes only by a revision of prices and I again assure you that we shall continue our efforts to secure a revision of prices and I hope the Govt. of India will appreciate the position of the Industry and afford the much needed relief without further delay.

Turning to the Balance Sheet, you would observe that depreciation of Rs 7.06 lakhs as against Rs 5.76 lakhs for the previous year has been provided. Depreciation on Fixed Assets has been calculated in accordance with the rates allowed for normal depreciation and E S A (extra shift allowance) as per Income-tax Rules in respect of Fixed Assets acquired before the commencement of the Companies (Amendment) Act, 1960 and on additions to Plant and Machinery under Expansion Scheme after commencement of the Companies (Amendment) Act, 1960,

depreciation provided is on the straight line method as per Section 205 (2) (b) of the Companies Act 1956 for the proportionate period the Machinery has worked.

Your Company is entitled to Development Rebate under Income-tax Act amounting to Rupees 120,657.00 on Plant and Machinery erected, installed and taken to service during the year and provision has been made in accounts to the extent of Rs 91,000.00 to secure the above benefit.

Your Directors have transferred from the Reserves to the Profit and Loss Appropriation Account as detailed below:—

From Dividend Equalisation Reserve	Rs 240,000
From General Reserve	369,000
	Rs 609,000

No provision is required for taxation as the Company has no assessable income for the year due to carry forward of loss on account of Development Rebate. Provision however has been made towards tax on dividend as per Finance Act amounting to Rs 56,250.

Your Directors have carefully considered the question of declaration of dividend in all its aspects. Having regard to the interest and wishes of shareholders your Directors have decided to recommend declaration of a dividend at 6 p c subject to tax or at the rate of 60 Paise (taxable) per Share of Rs 10 fully paid absorbing Rs 750,000 and to carry forward the balance of Rs 4,115. In the circumstances, your Directors hope that the proposal to recommend 6 p c dividend would meet with your approval.

I have said earlier that the capital cost went slightly higher because of delay in the delivery of Pulp Plant and in the installation of Pulp Plant and Soda Recovery Plant, which added to our capital cost by way of interest erection and other charges. To meet additional expenditure, arrangements have been made for a short term loan to the extent of Rs 40 lakhs with the Canara Banking Corporation Limited, against which a sum of Rs 20 lakhs was drawn during the year. To carry on operations without interruption, it is necessary to provide for the first set of spares and machinery clothings for the New Plant & Machinery and also for obtaining new Diesel Generator Set necessary to supply uninterrupted power to the new Soda Recovery Unit and for this purpose arrangements have been made with the

Industrial Credit and Investment Corporation of India Ltd, Bombay for an additional loan in foreign currency to the extent of Rs 12 lakhs. Further, the expanded Plant requires larger working capital for purchase of raw materials, chemicals and consumable stores etc, and your Directors have made arrangements for a cash credit accommodation upto Rs 80 lakhs with the State Bank of Mysore, on the hypothecation of floating assets.

I am glad to inform you that Labour-Managements relations continue to be cordial. The peace settlement with our Labourers' Association having expired, our Labourers' Association have placed a number of demands, chief of them being revision of wages and salaries, enhancement of D A etc, and these demands are receiving sympathetic consideration consistent with the capacity of the Mills to bear additional expenses.

On behalf of the Company, it is my pleasant duty to express my thanks to the authorities of the Common-

wealth Development Finance Co, Limited, London, the Industrial Credit and Investment Corporation of India, Ltd, Bombay; the Industrial Finance Corporation of India, New Delhi, the State Bank of Mysore (Trustees), the State Bank of India and the Canara Banking Corporation Ltd, for their support and assistance in the implementation of the Development Plans.

I take this opportunity to express our grateful thanks to Messrs J M Voith of Heidenheim, Messrs Escher Wyss of Ravensburg, Germany, Messrs Millspaugh of England, Messrs Bobcock and Wilcox, Messrs English Electric Company Ltd, and Messrs Ernest Scott, Messrs Masson Scott of London the suppliers of Plant & Machinery for their prompt delivery of equipments and for having deputed efficient technical officers for erection of various equipments at our factory. I should also express my grateful thanks to the Mysore Construction Co for their satisfactory execution of Civil Engineering Works and to Messrs Aswathanarayana

and Eswara our Consulting Architects for their technical advice and assistance.

I would also wish to express on behalf of the Directors and Shareholders our grateful thanks to the Central and State Governments for the continued interest they are evincing in the progress of the Mills.

I am very grateful to my colleagues on the Board for their whole-hearted support and valuable guidance.

I wish also to express on behalf of the Directors and my own warm appreciation of the willing and efficient co-operation of all our employees.

Ladies and Gentlemen, with these observations, I now move that the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31-3-1965 be APPROVED AND ADOPTED.

N B This does not purport to be a report of the proceedings of the Shareholders' meeting a copy of which shall be sent to the Shareholders separately.

The Jay Engineering Works Ltd, Calcutta

A Year of Progress

Export Performance Back to High Level

THE following is the Speech of the Chairman, Lala Charat Ram, at the 28th Annual General Meeting of the Jay Engineering Works Ltd, held in Calcutta on September 20, 1965:

Friends,

I have great pleasure in welcoming you to the 28th annual general meeting of the company.

Pledge To Meet The Emergency

We meet in the shadow of open hostilities between our country and Pakistan, aggravated by the ulterior interests of Communist China. The hostilities are not of our seeking, but now that they are upon us, it is our paramount duty to play our role as individuals, and as social groups, to support our Government, in seeing these hostilities to a successful conclusion in the country's interest. Our hearts go out to the men of our armed forces who are giving a gallant account of themselves. Our Prime Minister Shastri has shown his mettle, by accepting Pakistan's challenge, as indeed in the apt handling of many matters which in earlier years had been allowed to drift. We offer Shastriji our whole-hearted

support and offer the promise of our best endeavours, so that we may emerge from the present difficulties with our heads high.

Profit Performance

The annual report for the year's operations has been with you for some time now. You will observe that the profits for the year show a substantial increase, touching about the highest absolute gross profit level figure ever reached before. This is specially gratifying in view of the fact that there were no operations in the first two months of the year due to the continuing strike of the previous year, and the results therefore reflect the operations of only 10 complete months. This speaks of the improved effort, which all ranks of personnel of the Company have put in.

Bonus Shares Issued

During the year, the amount standing to the credit of the share premium account was capitalised by issuance of bonus shares. This has raised the equity capital of the company by over 30 per cent from Rs 1.52 crores to Rs 1.97 crores.

In view of the improved profit position, the Directors have been able to recommend an equity dividend distribution of Rs 15.8 lacs for the year, against Rs 12.2 lacs last year; this represents an increase of 30% dividend disbursement over last year.

Increased Costs

In the present stage of the country's economy, price maintenance is both an economic necessity and a social responsibility. Lately, however, all efforts at cost reduction have been more than neutralised on account of vastly increased governmental imposts, which have made selective price increases unavoidable, in order to maintain the economic viability of the Company. The burden of all taxation, direct or indirect, and that of consequential inflation, is in the ultimate analysis always borne by the common man, either in the form of increased prices of goods and services, or of lower return on his savings.

Pro-Production and Anti-Pro-duction Policies

The Plan-frame of the 4th 5-Year Plan is now on the anvil. The Government has wisely decided to eschew

deficit financing, and to emphasise food production in this Plan. The extent to which the Plan can be successfully executed without undue strain on the economy, will depend upon the efficiency of capital investment and the efficiency of operating costs. It is my submission, that a stage has now been reached in national economic affairs, when doctrinaire considerations need to be made subservient to economic considerations, and investment directed strictly through channels which will mean the lowest investment costs per unit of output and lowest costs of production. In this context, there is a need in my view for having a relook at what may be termed as the social philosophies. Here again one bane of our country seems to have been that doctrine has ridden rough shod over economic considerations. In a country like ours, in its present state of development, it is not a question of capitalism or socialism, or management or labour or the government. Every single policy, economic or political should be measured only by the simple yardstick of its being either "pro-production" or "anti-production". No social or economic or political action can do good to the country or

the people, if it is likely to affect production adversely in terms of quantity or costs. If this yardstick of evaluating decisions on the basis of their being "anti-production" or "pro-production" is used, then we might be able to avoid a great many pitfalls, which we have not been able to avoid so far.

A Call To The Workers

I have mentioned earlier, that we have been able to repair the economic damage done to the corporation by the labour strike of 1963-64. Our executives merit great credit for this. I shall be failing in my duty, however, if I do not unreservedly compliment the bulk of the rank and file of our workers, whose dynamism alone made the return to constructive endeavour possible, in the face of the hostility of a band of self-seeking labour leaders, having anti-national attachments, and echoing a foreign voice. I hope and pray, that the workers will in the coming time, withstand with greater courage the pressures of those whose interests and loyalties conflict with the productive system of the nation.

Export Earnings Revived

In our current operations, two things continue principally to claim

our attention. One is the strengthening of the fabric of the management structure at all levels, and the other is the improvement of liquidity position of the Company. I am happy to say, that we have made a fair progress in these fields, and these are reflected in the improved operations of the current year. I am hopeful, that unless some unforeseen developments occur, we should end the year on a considerably better financial showing, than even of the last year, which itself has been a year of good progress.

Our exports which had gone down to Rs 55 lacs in the year ended March, 1964, due to the strike, reached back to a level of Rs 90 lacs in the year under review. Efforts are continuing to enlarge our contribution to the national earnings in this sphere.

Friends, I hope that you find the results of the year satisfactory, and will join me in complimenting all the executives and the operatives of the company whose sincere and devoted efforts have made these possible.

Thank you.

Note: This does not purport to be a record of the proceeding of the annual general meeting.

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

Industrial Finance Corporation of India

Statement by the Chairman, Shri A Baksi

THE following is the Statement made by Shri A Baksi, Chairman, Industrial Finance Corporation of India, at the Seventeenth Annual General Meeting of the Corporation held in Delhi on September 29, 1965: Gentlemen,

I welcome you to this Annual General Meeting of the shareholders of the Corporation which is being held in a situation very different from that of past years.

Printed copies of the Seventeenth Annual Report of the Board of Directors and the Accounts of the Corporation for the year ended the 30th June, 1965 are in your hands and I shall, with your permission, take them as read.

During the year under review the Corporation sanctioned financial assistance totalling Rs 33.44 crores to 98 industrial units. The figure for the preceding year, excluding sanctions declined or cancelled, came to Rs 35.18 crores in respect of 88 units. After the establishment of the Industrial Development Bank of India the size of the demand for assistance on us has in certain cases been smaller than it might otherwise have been. This enabled your Corporation to spread its assistance over a larger number of industrial units. The total of Rs 33.44 crores was made up of rupee and foreign currency loans of Rs 26.03 crores, underwritings of Rs 4.59 crores and guarantees for deferred payments and for loans from abroad of Rs 2.82 crores.

The quantum of assistance disbursed during the year was Rs 31.92 crores out of which cash outgoings amounted to Rs 21.96 crores. The corresponding figures for the preceding year were Rs 21.88 crores and Rs 17.99 crores respectively. The improvement reflects the efforts made to shorten the period and the formalities between sanction and disbursement of assistance. The efforts will be further strengthened.

The gross income for the year was Rs 612.56 lakhs as against Rs 507.28 lakhs for the preceding year. Deducting interest of Rs 342.02 lakhs on borrowings and other expenses of Rs 28.33 lakhs, the gross profit was Rs 242.21 lakhs from which a sum of Rs 110.79 lakhs was set apart towards taxation. The net profit for the year came to Rs 131.42 lakhs as against Rs 125.44 lakhs for the preceding

year. You may like to know why the net profit was not still larger. The interest on our borrowings went up by Rs 80 lakhs and the provision for taxation by Rs 9 lakhs; our investment in shares of new companies increased sizably but dividends were rare; while there was no bond issue in 1963-64 we made one in 1964-65 and this naturally cost us some money; disbursements in the shape of dearness allowance and house-rent allowance to staff were larger and an ex-gratia payment equal to one month's salary was made to all members of the junior staff.

As appropriation out of the net profit, a total sum of Rs 107.24 lakhs has been transferred to Reserves which now aggregate Rs 524.17 lakhs against the paid-up capital of Rs 834.60 lakhs. The balance of Rs 24.18 lakhs is being distributed as dividend.

Gross financial assistance sanctioned by the Corporation during the 17 years upto the 30th June, 1965, totalled Rs 274.41 crores. The net figure for this period, after adjustment of cancellations and withdrawals, was Rs 226.96 crores. This consisted of rupee loans of Rs 152.25 crores, foreign currency loans of Rs 22.42 crores, underwritings and direct subscription to capital of Rs 18.10 crores and guarantees of Rs 34.19 crores. Out of the total of Rs 226.96 crores, Rs 154.16 crores (68 per cent) was for new projects and Rs 72.80 crores (32 per cent) for existing concerns for expansion, modernisation and diversification. The industries assisted cover a wide range: while sugar and textiles have been the two largest beneficiaries, industries like basic industrial chemicals and fertilisers, non-ferrous metals, electrical and other machinery, cement and paper have received substantial help. The equitable geographical distribution of assistance has been a constant care with us. Aware of the fact that industries located in the advanced regions have certain natural advantages for raising money we have consistently given all eligible applications from the less developed areas of the country the fullest and most constructive attention. In these respects, Appendices "C"(i) and "C"(ii) to the Annual Report and the map inserted in it for the first time may be of special interest to you.

As against the net sanctions of Rs 226.96 crores, assistance actually

rendered upto the 30th June, 1965 was Rs 156.37 crores of which cash disbursements totalled Rs 127.74 crores. The disbursements came to the extent of Rs 35.79 crores (28%) out of repayment of loans and sale of investments etc, Rs 31.48 crores (25%) from market borrowings, Rs 40.94 crores (32%) from Central Government loans, Rs 5.94 crores (4%) from foreign credits and Rs 13.59 crores (11%) from the paid-up capital and reserves of the Corporation. Total assistance outstanding on the 30th June, 1965 aggregated Rs 117.15 crores.

Dr B K Madan ceased to be a Director on the Board on the nomination in his place of Shri V G Pendharkar by the Reserve Bank of India on the 1st July, 1964. I take this opportunity to thank Dr Madan on behalf of the Board for his valuable participation in the affairs of the Corporation during his long association with it. Our thanks are also due to the members of the various Advisory Committees for the able and objective assistance they gave to the Corporation during the year. I would also thank the non-officials nominated by us on the boards of our assisted concerns for the interest they have taken in their work.

With the rise in the Bank Rate from 4½% p a to 5% p a in September, 1964 and from 5% to 6% p a in February, 1965 and the consequent increase in the cost of borrowing funds, the Corporation, with the prior approval of the Central Government, raised the nominal rate of interest on rupee loans with effect from the 5th March, 1965 from 7½% p a, which was the rate prevailing since the 17th July, 1962, to 8½% p a with the usual rebate of ½% p a for punctual repayment of principal and payment of interest. The revised rate was not charged in the cases of loans the disbursement of which had commenced prior to the 5th March, 1965. The effective rate of interest charged during the year on foreign currency loans continued at 8% p a.

Last year I had indicated that further efforts would be made to simplify the system of work of the Corporation. A few recent decisions taken in this regard may be of interest to you and the industrial circles. We have waived registration of bi-partite agreements. Our borrowers no longer have to send us annual lists of machinery stores and spares or copies of the agenda and minutes of their Board meetings. To

THE ECONOMIC WEEKLY

expedite completion of legal formalities, the work of engrossment of legal documents which was so far being done at the Head Office has been entrusted to the Branches.

Notwithstanding that the Annual Report with its Appendices contains a great deal of statistical information it is my duty to place before the shareholders certain facts of special interest about our underwriting operations, the use of foreign credits, the help given to co-operative societies, the dividend performance of our assisted concerns and their general condition during the year. A few words about our procedures and problems will also not be out of place.

Upto the 30th June, 1965, the Corporation had sanctioned underwriting facilities in 114 cases for a net aggregate of Rs 16.28 crores made up of equity shares of Rs 7.55 crores, preference shares of Rs 4.85 crores and debentures of Rs 3.88 crores. Out of these, 78 issues involving commitments on our part of over Rs 13.37 crores were placed in the market and shares and debentures of Rs 10.85 crores devolved on the Corporation. Shareholders need hardly be told that in the last two or three years the percentage of devolution in many cases has been very high. In the year under review, against a total of Rs 3.76 crores of shares and debentures which were placed in the market, having previously been underwritten by us, we had to subscribe to as much as Rs 3.17 crores. The demand on us for underwriting is growing. While we cannot take very large commitments in this field consistent with financial prudence, we are doing our best to act as a catalyst.

The net total of foreign currency sub-loans sanctioned by the Corporation upto the 30th June, 1965 in 88 cases was equivalent to Rs 22.42 crores, out of which the year under review accounted for Rs 6.60 crores, spread over 30 cases. Against the three loans totalling \$ 40 million from the Agency for International Development of the United States of America, the Corporation had committed itself upto the 30th June, 1965 to an aggregate of \$ 30.43 million. The first three lines of credit totalling DM 55 million from Kreditanstalt Fur Wiederaufbau of the Federal Republic of Germany have been fully committed and sub-loans of about DM 3.21 million sanctioned upto the 30th June, 1965, have been adjusted against a fourth loan of DM 20 million very recently allocated to us. The utilisation of the credit of 50 million Francs from the Banque Francaise

du Commerce Extérieur, Paris, has continued to be slow. We had, upto the 30th June, 1965, sanctioned six sub-loans aggregating 10.37 million Francs out of this credit.

While we have simplified the process of examination and sanction of applications for foreign currency sub-loans we are not satisfied with the actual pace of their utilisation. Disbursements of foreign currency sub-loans amounted to a total of only Rs 6.48 crores as on the 30th June, 1965. We recognise that the actual utilisation of these sub-loans involves conclusive action by a number of parties in different countries and can thus be inherently time-consuming. But we shall be helped considerably if our assisted concerns expedite the processes of selection of suppliers and finalisation of the specifications of equipment to be imported.

Net assistance sanctioned up to the 30th June, 1965, to industrial co-operatives comprising 53 sugar units, four spinning mills and one unit for extraction of vegetable oil amounted to Rs 40.45 crores, representing about 18% of our total financial commitments. Though a few of the assisted co-operatives have met with only indifferent or moderate success so far, many have done excellent work. Sugar co-operatives in particular have often brought to the farmers a steady income, given a fillip to the demand for goods and the habit of saving, led to the setting up of ancillary and small-scale industries and have, in a few instances, brought about a remarkable change in the country-side. It is not a matter for surprise, therefore, that the Government is receiving more and more applications for licensing of new sugar co-operatives and expansion of existing ones. We trust that while encouragement is given to deserving cases the essential prerequisites to success in the field e.g. an abundance of good cane in the areas concerned, a genuine co-operative spirit among the people, a willingness not to depend too much on the Government, and the formulation of a sound core of management will be actively borne in mind.

Coming to the question of the dividend-paying capacity of the Corporation's existing borrowers, our shareholders will be interested to hear that out of the 164 concerns which were in production before the 30th June, 1965, 78 had declared equity dividends during the year under review. While 39 concerns maintained the dividend at the rate of the previous year, 5 reduced the rate and 34 increased it.

Concerns which declared 10% or more numbered 41 and 12% or more 28.

A review of our loan accounts shows that no additional provision is necessary towards our Reserve for Bad and Doubtful Debts, the balance in which now stands at Rs 14.46 lakhs. The existing provision relates to two old accounts, action in regard to which is already in hand.

The credit record of our borrowers continues, on the whole, to be satisfactory. The Corporation received during the year Rs 18.40 lakhs from loanee concerns on account of premature repayments of principal. The total amount received in this regard upto the 30th June, 1965, was nearly Rs 7.80 crores which included Rs 1.74 crores from sugar co-operatives. No premium is charged on premature repayment of rupee loans. We welcome such repayment as it increases our ability to meet the needs of other industrial units.

Out of the 237 concerns to which the Corporation has disbursed loans, 46 have so far made full repayment. Loans were outstanding on 30th June, 1965, either wholly or in part, from the remaining 191 concerns of which 27 had not yet gone into production.

As the prosperity or adversity of our assisted concerns has a decisive impact on our own operations in the long run, a word will not be out of place here on some of the difficulties that industry has been facing recently. Shortage of imported raw materials like copper, zinc, lead, alloy and special steels, rubber, sulphur, rayon grade pulp, etc. has tended to inhibit production in a number of our assisted units and to increase their cost of manufacture. Recent additions to the duties on imported equipment and raw materials have necessitated recalculation of the estimates of cost of several projects which are yet to go into operation. Delays in the construction of factories and erection of plant and machinery owing to various cases ranging from alterations in specifications to shortage of cement have also added to the burden. Several of our assisted concerns find that the total capital cost to be incurred before they can go into regular production is much higher than what they had originally estimated. In some instances this has happened due to switchover from imported to indigenous equipment which may cost more and take longer to secure. Then again, some units in fields like paper and caustic soda notice, after going into production, that their size is too small and that

their earlier ideas of economic viability have been belied. A few units manufacturing refractories, sheet glass, household meters or certain grades of writing or printing paper find that the market prospects on which they had based their schemes are not likely to materialise in the very near future. In some instances, our assisted companies have resorted to heavy unsecured borrowings in the shape of short-term deposits from the public at rates of interest very much higher than they would normally like to pay.

The Central Government is not unaware of the difficulties that industry is encountering. In fact, the recent Supplementary Budget contains certain ameliorations and incentives which will be of help to entrepreneurs with initiative and foresight.

It is not unnatural that in a developing economy industrial concerns should find themselves exposed to certain hazards from time to time. Knowing this, our Corporation has to ask itself continually the question whether while sanctioning assistance to a project it has taken all possible care to foresee the hazards and provide for suitable insulation. If this self-questioning results in our standards of scrutiny of individual projects becoming stricter than before industry will, I hope, bear with us.

A strict scrutiny does not necessarily mean delay in the processing of an application. Assistance to a project, whether in the form of loan, or guarantee, or underwriting or a combination of these, involves a joint quest by the entrepreneur and the financial institution for all relevant data, a joint endeavour to eliminate intangibles to the extent practicable and provide for unforeseen contingencies, and an exercise in mutual accommodation. Our Corporation is not omniscient. We learn as we go along, examining new projects of increasing complexity. Nor are we guided entirely by altruistic motives. Unless we justify our operations by our annual balance sheet we should not be in existence for long. But once we get an application in reasonable detail, conforming to our standard questionnaire, we employ a team of financial and technical officers to go into the project, discuss all relevant questions with the entrepreneurs, their executives, and their collaborators, if any, pay a visit to the site if necessary and make a complete appraisal without delay for the Advisory Committee whose recommendation our Board needs before reaching its final decision. Our Board meets once a

month and, whenever there are cases to consider, the Advisory Committees also meet once a month, a few days before the Board. There are recent examples of complicated cases where, with the co-operation of the entrepreneurs, we have been able to take final decisions in less than two months from the receipt of the applications. In cases which are too large to be handled by ourselves alone we advise the entrepreneurs at the outset to ascertain which other financial institution would be interested. When the entrepreneurs have approached more than one institution we try to hold joint discussions with the entrepreneurs so that the latter do not have to face many overlapping questions at different times from different institutions. This practice, we expect, will be developed further.

All this, however, does not mean that every application will have a smooth passage and every entrepreneur will secure the sanction of the Corporation to his scheme in the shape in which he brings it up. The Corporation's financial resources are limited. Sales out of the shares and debentures we hold can hardly, in the present market conditions, be made except at a loss. We have loans of Rs 33 crores outstanding which carry an interest rate of 6½% and of Rs 34 crores which carry 7% per annum. The effective rate of interest we charge in cases where the first disbursement has been made on the 5th March, 1965 or later is 8%. Though under our agreements with the loanee concerns the rates of 6½% and 7% can be increased to 8% we have so far refrained from doing so. Consequently, the generation of internal surplus is not as satisfactory as it could have been, in spite of the fact that the dividends that we are able to pay to our shareholders in accordance with our law are very modest. As for sources of funds outside, our main resorts at present are to Government loans and market bonds. In addition to the Rs 3.5 crores it lent us in the months of April to June 1965 the Central Government has been good enough to assure us of an additional loan of Rs 10 crores upto March 1966. This is not, however, a large sum of money in the present-day context of Indian industrialisation. As banks and other financiers are aware, conditions in the capital market are not propitious at the moment for a large issue of bonds by our Corporation. The demand for funds from industry, on the other hand, is growing fast. There are schemes for many pro-

ducts like fertilisers, alloy and special steels, petrochemicals, pig iron, cement, sugar, textiles, paper, chemicals, synthetic fibres and machinery and equipment for diverse purposes. There are also schemes for the renovation and modernisation of established industries like cotton and jute textiles. And now a new dimension may emerge in the shape of industries specially oriented to defence requirements. Many of these will need large underwriting as well as loans. Our practice of assisting industries urgently needed by the country in accordance with the policy of the Government will continue. But unless we have access to much larger funds, and funds at an overall cost lower than what we now pay, it is impossible for us to adequately help all the schemes we would like to help. Inevitably, therefore, a structure of *inter se* industrial priorities has to be formulated and adhered to and our assistance rationed. These matters are receiving the attention of other financial institutions, too, and it is our hope that with the Government's cognizance a clear picture will emerge in the near future. Meanwhile, we have to examine each project that comes before us on its intrinsic merits, see whether the need it seeks to fulfil is basic or peripheral, whether the scale of operations visualised will be economically viable, whether the assessment of the market demand has been made realistically, whether the imports of raw materials etc necessary to maintain optimum operation of the unit are likely to be available over a period of years, to what extent the unit will be able to effect genuine export earning or import saving and, last, but not the least, whether the promoters are in a position to accept such a financial stake that with the contributions which the financial institutions and others interested can afford to make in the present circumstances the project will really be completed without undue delay.

The times ahead will be difficult ones, both for industry and the Corporation. But looking back on the long record of mutual co-operation and thinking of the lessons of the emergency we are passing through I have no doubt that we shall be equal to the tasks that await us.

Before I conclude I wish to express my gratitude to the Directors on the Board for their wise counsel. I would also like to express, on behalf of the Board, our appreciation of the devoted work of the General Manager, the other officers and the entire staff.

The Imperial Tobacco Company Limited

Speech by the Chairman, Mr C A Bone, at the Fifty-fourth Annual General Meeting of the Company on 23rd September 1965.

BEFORE commencing his speech, the Chairman expressed his grave concern at the serious events that had recently overtaken the nation, and to the universal pleasure with which the news of the cease fire agreement had been received.

He referred also to the effect of such events on the nation's economy and, incidentally, on the Company's affairs and the need for everyone to continue to work as purposefully and diligently as they can and in this way do their utmost in support of the country's economy.

Gentlemen,

Mr F A Collett and Mr R K Banerjee retired from the Board at the end of March this year. Mr Collett joined the Board in 1959 and became Chairman of the Company on 1st April 1960. Mr R K Banerjee joined the Company in December 1938. He was elected to the Board in April 1953 and served your Company as Deputy Chairman from April 1960. We wish them both health and happiness in their well-earned retirement.

I joined the Board in November 1964, and, following Mr Collett's retirement, was elected Chairman of the Company on 1st April 1965. It is my earnest endeavour to serve you in this capacity as zealously and effectively as my predecessor.

In his speech last year my predecessor intimated that he would expect moderately improved results during the year now completed. I am happy to report that his assessment has proved correct to the extent that, although not spectacular, results have shown a heartening recovery as may be seen from our published Accounts. The value of sales turnover increased by approximately 7 per cent and this reflects an increase in the volume of our business. However, I should mention in this regard that due to certain economic factors, the volume

increase during the year has tended to be greater in the medium and lower priced categories.

I am pleased to say that, although not yet reaching the level of that for the year ended 31st March 1963, our net profit shows a welcome improvement over that of last year. This has been achieved despite the higher prices of raw materials and it is satisfactory to note that we have been able to contain our overheads despite the incidence of rising costs. This is attributable to improved performance generally, streamlining of management and some reduction in the number of other employees through voluntary retirement schemes.

At a time of increasing volume of sales, we have been faced with considerable difficulties in procuring adequate quantities of some of our raw materials. Every effort is being made and I am hopeful that, in the coming months, durations of these materials will be restored to what we consider to be a desirable and economic level. In addition, the foreign exchange position has continued to be extremely difficult and we have not been able to obtain import licences to replace old machinery as we should have liked and, indeed, for which we had planned. We are now hopeful, however, that, with Molins of India Ltd already making arrangements for the building of machinery a substantial part of the plant we require will become available from Indian sources. We have now, therefore, re-planned and indeed extended the programme of modernisation in our factories. I mention these two points not only as an outline of our future plans but also to indicate the substantial sums that are required to be earmarked for the purpose of giving effect to these plans. The implementation thereof will certainly require considerable funds but I assure you that, as a result of our long-term planning, adequate resources have been built up.

Before proceeding to a general review of the Company's activities and future prospects I must mention the new Cigarette Excise Duty that was introduced in the 1965 Budget. You may be aware that the previous system had some disadvantages and, in particular, that it precluded economic pricing within certain sections of the overall price range. I am, therefore, very pleased that the new structure to a large extent removes these obstructions and facilitates a more flexible policy. Gratified as I am at this welcome change in the excise structure I must, however, point out that its introduction has been at heavy cost to the cigarette industry as a result of the adjustment in the rates of excise duty inherent therein. It was stated at the time of the Budget announcement that some Rs 40 lakhs per annum additional revenue was expected to result. Our own estimates, however, show that the cost to this Company alone is substantially in excess of this amount and other manufacturers must be similarly affected. So far as the scales themselves are concerned, unless a ceiling is fixed, the burden on higher priced brands is inequitable as these brands also bear a considerable customs duty and thus excise becomes payable also on the duty element. Your Company has shown willingness to give the new structure a fair chance and, at the same time, to do what it can to assist in the prevention of inflation by absorbing the increased cost. I do, therefore, sincerely hope that Government, in turn, will co-operate by allowing us an extended period of stability in excise rates which, I am sure, will result in a natural increase in volume and will, ipso facto, generate higher revenue and assist in Government's efforts to resist inflation.

The general stability in cigarette retail prices during the year under review has resulted in a welcome buoyancy in the cigarette business as a whole. This, I am glad to report, has

been shared by your Company in the face of intense and increasing competition. I might add that our famous SCISSORS brand which, as mentioned last year, was introduced in a new dress, has continued to give a good account of itself.

It is evident that the taste for filter cigarettes is growing in India in keeping with the trend in many other countries throughout the world. I am happy to report that your Company's filter brands have established a very equitable share of the filter business albeit against strong competition. The success of WILLS filter is particularly worth mentioning as one of the largest selling filter brands in India and this pays tribute to its high quality. Another of your Company's filter brands, PLAYER'S GOLD LEAF, was also warmly welcomed by consumers during the year.

We have continued during the year to make every possible endeavour to export our products but import tariffs levied by prospective customer countries to protect their own manufacture are a considerable stumbling-block. There are, however, indications of progress and we will continue to explore every avenue as vigorously as we can in the future. Principally with export markets in mind a filter version of our prestige brand, INDIA, was also introduced in June 1964, and this is finding favour with our Embassies abroad.

On account of a rather short crop, particularly of air cured types of leaf tobacco, the overall prices of tobacco purchased has shown some increase which will naturally be reflected in future costs. However, some consolation may be derived from the improved quality of the flue cured types of leaf that we have been able to acquire from this Crop. I might add that it is our leaf tobacco suppliers' (Indian Leaf Tobacco Development Co Ltd) constant endeavour to improve quality and they maintain extensive experimental centres and elaborately equipped laboratories for this purpose, which their experts are putting to invaluable use in the interests of the future of India's leaf tobacco industry. It is, I think, of interest to mention here that with the development of the Nagarjunasagar irrigation project certain areas previously under leaf tobacco cultivation will no longer be suitable for this purpose. However, it is gratifying to note that our suppliers, who also export sub-

stantial quantities of Indian tobacco, are putting the whole of their organization and research facilities behind efforts to maintain and even enhance future production and are working closely with Government to consolidate the position for the future. I have, as a result, every confidence that our leaf supply position will not only be safeguarded but improved.

I am happy to report that our long-standing policy of negotiation and collective bargaining with recognized Unions continued to contribute to our endeavours to put our industrial relations on a sound basis, although the growth of dissident Unions has been a discouraging feature. It was this policy that led to the formation of the Committee of Management and Union representatives referred to by my predecessor. The deliberations of this Committee in turn have resulted in long-term Agreements now being completed with some of our Unions. With improvements in our workers' emoluments resulting from these long-term Agreements, it is my earnest hope that our Unions will give us all their co-operation to increase productivity, for it is only with a steady and continuing improvement in productivity that it can be made possible to maintain the high standard of working conditions at which we have always aimed.

Consistent with this policy of increasing productivity and improving efficiency, still greater concentration is being given to the existing training programmes at our factories in order to develop the skills and know-how of our employees to the best mutual advantage. There is always scope for further improvement and it is hoped that, in this also, both employees and Unions, in realization of our mutual interests, will extend their full support and co-operation.

Regular training is equally valuable for more senior staff. This is so not only as far as technical skills are concerned but also in administration, leadership and management. Similarly, therefore, we have carefully planned development programmes for this purpose incorporating courses held in our own management development establishment, "Aldeen", here in Calcutta; at the Administrative Staff College in Hyderabad and at other Indian institutions. In addition, some 12 members of management have been overseas for training during the year, of whom 8

attended courses at our Associates' training centre in the United Kingdom and one at the Portsmouth College of Technology.

Looking now to the future, I have already indicated the more recent pattern of rising sales and, given an extended period free from further increases in tobacco and cigarette excise, I see no reason why this growth in volume should not be maintained. I have, however, made reference to rising costs, not the least of which is that of increased cost of living which, it follows, must have an effect on our manufacturing, selling and distribution expenses. As emphasised, such rising costs can only be met with increased productivity which I am confident, given the co-operation of our work force and Unions, can be achieved.

I have said earlier that I welcome the flexibility of the new excise structure. One of my reasons for this is that I am sure that it will develop the already intense competition between all manufacturers, and with the research and product improvements which are constantly engaging our attention, together with developments in the fields of marketing and distribution, I am confident that your Company's brands will continue to give a good account of themselves.

In the light of the results of the trading for the year under review, your Directors have felt justified in recommending a final dividend of 4% making a total of 9% for the year, thus restoring the dividend to the level of that for the year to 31st March 1962. At the same time, it is proposed to maintain the first interim dividend for the current year at 2½%.

NB This does not purport to be a report of the proceedings of the Annual General Meeting.

Alind's Nineteenth Annual General Meeting

Mr S Narayanaswamy Reviews Activities

ADDRESSING the Nineteenth Annual General Meeting of the Aluminium Industries Limited held at Registered Office, Kundara on 24th September 1965, Mr. S. Narayanaswamy, Chairman said:

In the last few weeks this country, which is engaged in a major programme of economic development, has been obliged by a trigger-happy and perfidious neighbour to engage in bitter battle with her. Foiled and frustrated in her effort to capture Kashmir through infiltration revolt, Pakistan decided on open aggression, breaking many solemn undertakings, the most important of which is one relating to non-use of American military equipment against India. The Indian Army and Air Force have displayed rare bravery and skill in the use of striking power and carried the battle deep into enemy territory. We have reason to be deeply proud of and grateful to our fighting forces and wish them even greater strength to their elbow. I desire to take this opportunity of telling Government that our hands and our hearts, our men and material are at Government's disposal, in their hour of anxious pre-occupation.

Solidal Manufacture

To come to domestic affairs, the year has again been a period of broadening activity and fresh achievements. As is to be expected, Sales touched a new high figure of Rs 7.60 crores. The new plant for the manufacture of 'SOLIDAL' low-voltage underground cable was commissioned by end of 1964. I am glad to say that this new and rather unconventional cable has been very well received by the consuming institutions and local bodies that constitute the main market for this product. Some who brought a professional eye to bear on the somewhat massive looking metallic cross-section embedded in multiple layers of insulation material that constitutes SOLIDAL had some misgivings about the degree of its flexibility, but after seeing its behaviour during installation, even fastidious power engineers were satisfied with its functional efficiency and compactness in handling. Your Directors are satisfied that SOLIDAL is well on the road to becoming a favourite. It would appear that the spread of its use is likely to be condi-

tioned more by our own machine capacity rather than by limits in demand.

New Share Issue

It is a measure of the magnitude and character of our expansion schemes, that during the year under review, your Board had to make an issue of share capital, the largest so far made by the Company, namely Rs 67.50 lakhs face value shares at a premium of 25 per cent; negotiate for a medium term loan of Rs 27 lakhs with the Company's bankers; apart from availing two foreign exchange Loans aggregating Rs 9.70 lakhs from the Industrial Credit and Investment Corporation of India. The Share Issue made during the year brings the paid-up capital of the company to Rs 202.50 lakhs, while adding Rs 16.87,500 to the Premium Reserve Account.

Unit For Cable-Making Machinery

The Company has received from Government the Industrial Licence for the manufacture of cable making machinery. It is proposed to set up this plant at Lingampalli, Hyderabad, alongside of our covered conductor plant there. The renowned firm of Miyazaki in Japan have agreed to collaborate with us and assist us in setting up this unit. An application for a foreign exchange-cum-rupee Loan has been submitted to the Industrial Credit and Investment Corporation of India to help the implementation of this project. Work on this project is just commencing. Manufacture of cable making machines is a logical follow-on of our present activities and should make for long-term self-sufficiency in the matter of machines required by new units and replacements by existing units, apart from making available spares and vital component to wire drawing and stranding machines that operate in the country. It is a matter of special gratification to us that the House of Miyazaki has agreed to help us with the design, erection and commissioning of this mother machine unit.

Expansion of Production Capacity

The new Properzi continuous rod rolling mill is under erection at Kundara and is expected to be commissioned before the end of the calendar year. This will bring the number of our rolling units to three, two operat-

ing at Kundara and one at Hirakud. This will substantially enhance our ingot converting facilities and obviate the need for importing rods. With the increase in indigenous sources of aluminium metal production, the need for converting ingots into rolled rods becomes larger.

The demands made on the Company's bare conductor producing capacity are getting larger every year and the back-log of orders are tending to get over extended. The strains imposed on our plant at Kundara and Hirakud are considerable. The company has therefore applied for and obtained a licence to add to existing capacity at Kundara as well as Hirakud and the enhanced capacity will be very shortly available to the company. Our production of covered conductors at Kundara and Hyderabad has been stepped up and this is reflected in a small measure in the consolidated sales figure in the Profit and Loss Account. We can claim to have made satisfactory headway in a market for covered conductors that is getting more and more competitive. It is however comforting to know that the consumer has shown a preference for quality material.

Switchgear Manufacture

Your company has been negotiating for sometime with a reputed firm in the United Kingdom for establishing a unit for manufacturing switchgear and allied products. If these negotiations are successful, a unit for manufacturing switchgear is expected to be set up in Kerala with foreign financial participation. This arrangement is expected to benefit your company. Since this activity may involve legal formalities and perhaps the raising of fresh capital, you will have an opportunity of obtaining fuller information in due course. That about summarizes our expansion achievements and blue prints.

Gentlemen, you are all aware of the credit regulation and import control measures introduced some two months ago and the wide-spread distress it had begun to cause to industry and trade. It is hardly necessary to discuss them, as Government have very thoughtfully abandoned those measures as both unworkable and ill-timed in an emergency like the present when production in

every sphere must be stepped up. I congratulate the Union Finance Minister for revoking these obstacles to unfettered production with promptitude. This brings me on to our own ways and means problems.

I have already referred to the capital issue we made towards the end of last year. There are a small number among our shareholders, who believe we are fond of making share issues on slender provocation, while on the other hand those who give us short term and long term loans, believe that we elect to operate on a narrow capital base, and that we prefer borrowed money even at high cost to enlarging the area of dividend liability. Ideas on the debt-equity-ratio even among our pundits are happily not any longer dogmatic or text-book inspired. In that Jerusalem of Corporate Industrial Enterprise, the USA, the debt-equity ratio has undergone such a transformation that the weightage in favour of debt will make the most unabashed of corporate borrowers in India lift his eyebrows. The debt-equity ratio is determined in terms of profit intensity, by the character of expansions, by the potentiality of accelerated amortization and by the degree of Federal Government's partnership in softening the expenses of borrowings. In India, the high incidence of corporate taxation makes the last of these motivations the primary one and indeed this very fact makes equity dividend an expensive luxury. I would like to assure shareholders that while there is no intention to plunge the company deep in long or short-term repayment obligations, it is not the Board's intention to widen the area of dividend liability by frequent share issues. Indeed your Management is keenly conscious of the strains imposed by large dividend payments after making statutory provisions towards depreciation and taxation. Our capacity to plough back profits has been grievously crippled by tax out-goings in the last few years—years during which no effort has been made to step up the dividend. I must commend the Managing Agents for the manner in which they have surmounted the ways and means problems in the last financial year, in making limited resources go a long way.

The two special Resolutions that await your approval at this meeting intend to increase the overall borrowing limit to Rs 700 lakhs and the Authorised Capital to Rs 500 lakhs. These are intended to facilitate the Company's activities in future years. I may assure you there is no proposal

to immediately increase the Subscribed Capital.

The new import and excise duties and the regulatory import duty of ten per cent inflate the bill of costs of our capital programmes and of raw material and in turn that of our end products. In our case the customers are overwhelmingly Government departments, Electricity Boards and Project administrations. They will be called upon to pay more for what we sell to them. It is a process of book entry inflation on both sides of a ledger, on which Government will do well to have a second and critical look.

Raw Material Position

The position of aluminium metal, high tensile steel wire and in a small way, zinc supplies has been causing us some concern, though currently we are reasonably well-stocked. It is a matter for gratification that the Madras Aluminium Company, the second metal reduction unit in the Southern region, has been recently commissioned, adding ten thousand tons of metal to Indian production. We welcome this addition to the small band of Indian producers. The statement by the Company's Chairman that arrangements are under way to double the capacity of the Mettur plant affords us great comfort, as the single largest consumers of electrolytic aluminium in the country. However, the technical position as to metal supply is not free from anxiety—considering the enlarging gap between indigenous metal sources and the industrial demand for the metal compelling us to look to distant countries for the not inconsiderable balance of our requirements, at a time of acute foreign exchange stringency and a national emergency. The news that the Indian Aluminium Company have finalized arrangements with Mysore Government for erecting a thirty thousand ton reduction unit in the Sheravathi Shimoga region, utilizing Sheravathi power is perhaps most important to consuming markets in India. This will probably be commissioned in three years' time from now. It is our hope that meantime Central Government will not deny to the cable industry its metal requirements from abroad to the extent of the shortfalls in Indian supplies—in the interests of power development under the Plan schemes. By the same token we hope until indigenous production of high carbon steel is established on a commercial scale, imports upto minimum requirements of the cable industry will be freely permitted.

Technical Consultant

Coming to administrative matters, I am glad to announce that Sri K P S Nair, who recently retired from the Central Water and Power Commission has agreed to be and has been appointed as Technical Consultant for this Company. Sri K P S Nair brings his vast fund of knowledge and experience in the field of electrical development to his assignment besides his own past association with this Company as Director representing Kerala Government. On your behalf, I would welcome Mr Nair to our midst. We look forward to his advice and guidance from time to time.

Sri Peer Mohammed, who was our Works Manager at one time and till recently Sales Manager has been appointed General Manager from January this year in place of Mr V G G Nayar who relinquished office. Sri Peer Mohammed brings to his new office his intimate knowledge of market requirements acquired over years of sales promotion effort and a zestful and sober approach to administrative problems. He was mainly responsible for the success of our export promotion efforts. At the executive level, the Company has drawn up a programme of "training within Works", which should equip our boys to fill middle-management positions with reasonable efficiency.

Employee Relations

In the field of personnel relations, we have entered into Long-Term Agreements with all cadres of employees at Kundara. The recent Bonus Ordinance limits the quantum of bonus payable to an amount substantially below what is laid down in the bilateral agreements. Nevertheless, the Company has decided to adhere to the provisions of these agreements and pay the bonus at the level covenanted. At the same time, the Company is determined to see that the employees honour the agreements for their part, as was demonstrated in the case of the steel wire plant employees who sought an upward revision of their term agreement through direct action recently. We are happy that negotiations resulted in an appreciation of the Company's stand in the matter. The Hiralakud Long-Term Agreement having expired, a fresh agreement has been negotiated with the Employees Union there. In the Hyderabad plant, the results of a works study are being examined with a view to negotiate a Long-Term agreement with the employees in Lingampalli.

I have reason to look forward with confidence to a future in which expansion and diversification of production will occupy a significant place. It is a future in which our employees whose unstinted labours in the past have helped us to build this impressive edifice give promise of sustained effort and enthusiasm in the bigger tasks

AROUND BOMBAY MARKETS

Equities Drift Lower

Wednesday, Morning

DALAL STREET last week was unable to move beyond its previous week-end high recorded on September 22. Apart from the fact that the rise following the announcement of the cease-fire had been rather too steep and the market needed time to consolidate its position, Dalal Street could scarcely be expected to ignore the Prime Minister Shastri's warning that the cease-fire did not necessarily mean the dawn of peace. And as the week progressed, trading sentiment was adversely affected by frequent reports about the violation of cease-fire by the Pakistani armies almost on all the fronts. Equity prices gradually drifted lower and most of the popular counters shed a major portion of their gains immediately following the announcement of agreement on the cease-fire. Century eased from Rs 528.50 to Rs 514, Standard from Rs 371 to Rs 356, Tata Steel from Rs 141.75 to Rs 138.75, Indian Iron from Rs 25.25 to Rs 24.80, National Rayon from Rs 402 to Rs 391, Tata Locomotive from Rs 211.50 to Rs 207, Hindustan Motors from Rs 16.48 to Rs 16.24, Indian Dyestuff from Rs 172 to Rs 162 and Scindia from Rs 13.68 to Rs 13.28—to mention a few counters.

The extremely uncertain political situation is by no means the stock market's only worry. Not many observers are inclined to expect any major recovery in equity prices even after the effective implementation of the cease-fire. This is because the economic prospect has been blurred by the likely increase in defence outlay. Diversion of scarce resources to defence production is bound to have far reaching effects on the economy which is already under serious strains. As rightly pointed out by the directors of the Reserve Bank of India in their latest annual report the imbalances generated as a result of rapidly mounting expenditures on defence and development in a situation of a relatively slow growth

that are round the corner.

I must express on behalf of you all my appreciation of the great work done by the Managing Agents and in particular by Sri B V D Menon, Managing Director, Seshasayee Brothers (Travancore) Private Ltd, who has piloted the Company's affairs with rare skill, dynamism and forbearance

of output and export earnings has caused intense pressures on the price level and the foreign exchange reserves and affected the country's capacity to undertake larger Plan expenditures commensurate with the needs of the economy.

The prospect of raising funds for financing the enhanced defence effort through additional taxation is quite disturbing from the stock market's point of view. Both the Industrial Development Bank and the Reserve Bank have emphasised the need for reviving the capital market. But the question is how can there be any significant revival of the capital market when the economy continues to be under serious strains.

COTTON

Futures at New Peak

THE cotton mill industry has long been complaining about the developing crisis of accumulation of stocks of both cloth and yarn which has now begun to tell on production because quite a number of ill-equipped and inefficient units have been forced to reduce shift working and some dozen-and-a-half mills have had to be closed down. Cloth and yarn output in August, provisionally placed at 420 million yards and 174 million lbs. is substantially down compared to July and cloth production is the lowest for several months, excluding February. Mills are also known to have been running down their stocks of cotton because of the acute financial stringency and fresh purchases have been on a comparatively restricted scale, especially during the past several weeks. Even so, cotton prices have continued to hold remarkably firm—well above their statutory ceilings. Cotton futures last week were bid up to a new all-time high. The March hedge contract—Virnar 27/32"—which had been sold down to Rs 861.50 on September

in a truly trying year. I must express the Board's appreciation of the splendid work put in by the General Manager, the Supervisory staff and all ranks of technical and administrative personnel during the year.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

7 rose to Rs 902 (per quintals) on September 28 which takes it fairly close to its revised ceiling of Rs 936.

In view of the stock accumulation with mills and the continuing slack off-take in the cotton piecegoods market, the spurt in cotton futures to a new all-time high might seem rather intriguing. But the rise in futures reflects essentially the likely deterioration in the supply position of cotton in the current season. The recent dry spell in almost all the cotton producing areas has led to a downward revision of crop estimates and it is widely feared that if the weather does not oblige soon enough the new crop might turn out to be only a little better than in the preceding season. Apart from some damage due to frequent Pakistani air raids, the cotton crop in the Punjab is reported to have been seriously affected by the 'Jassid' disease and against the earlier estimate of about 12.75 lakh bales the crop is currently mentioned around 16 lakh bales. Crop conditions in most other areas are also said to be rather unsatisfactory due to the absence of the much-needed rains towards the end of September. Some anxiety has also been expressed recently about prospects of importing US cotton under PL 480. Cotton is likely to prove to be industry's major problem in the current season.

Cotton consumption during the 11 months of the 1964-65 season—September to July—is placed at 58.64 lakh bales made up of 51.63 lakh bales of indigenous cotton and 7.01 lakh bales of foreign cotton. Consumption in the same period of the previous season amounted to 55.58 lakh bales consisting of 50.02 lakh bales of indigenous cotton and 5.56 lakh bales of foreign cotton. Stocks with mills at the end of July totalled 21.11 lakh bales as against 22.93 lakh bales at the end of May and 20.26 lakh bales at the end of July 1964.

OILSEEDS

Bull Manipulation

OILSEEDS futures made news last week. In kerb dealings on September 28 castorseed April and linseed April were bid up to Rs 101 and Rs 119.50 (per quintal) respectively—new high levels for the current season. Earlier in the month, castor futures were quoted around Rs 87 and linseed futures around Rs 107. The spectacular rise in futures cannot be satisfactorily explained in terms of developments in the political situation. Nor has there been any significant change in the overall demand and supply equation of vegetable oils. The plain truth is that speculation in castor and linseed futures has assumed serious proportions, with a few powerful operators dominating the scene all the time. The wide swings in castor and linseed futures noticed over the past several weeks have no parallel over the past many years.

The main reason why speculation in linseed and castor, the total annual production of which rarely exceeds 5.5 lakh to 6 lakh tons, is that there exist no facilities for forward trading in the other major and more important oilseeds—groundnut and mustardseed. Because of the very small production of castor and linseed, manipulation in these commodities is easy. That is precisely what has been happening for many months. It is time that the authorities realised this elementary fact. If the Forward Markets Commission is unwilling to allow forward trading in groundnut and mustardseed then it ought to ban futures trading in castor and linseed as well. If the major crops of groundnut and mustardseed can be marketed without the facilities for forward trading there is no sense in permitting futures dealings in the other and much less important crops. In an economy characterised by chronic shortages, speculation can serve hardly any useful purpose and it is bound to aggravate inflationary pressures. The sooner the authorities realise this, the better.

The steep rise in linseed and castor futures last week, resulting primarily from strong bull manipulation, imparted firmness to the general market sentiment. Groundnut and groundnut oil also hardened considerably. Groundnut oil which had been marked down to Rs 27.75 (per 10 kgs) in the preceding week improved to Rs 29.75. Linseed oil rose from Rs 25 to Rs

26.75 and castor oil from Rs 18 to Rs 19. Apart from the spurt in castor and linseed futures, sentiment was influenced by fears of a likely setback in groundnut production due to inadequate rains in some of the producing areas. Export activity was restricted throughout the week due to continued political uncertainties.

MONEY AND BANKING

Interest Rates Fluctuate

Conditions in the Bombay short-term money market during the week to September 29 showed a fluctuating movement. During the earlier part of the week interest rates held around the previous week's levels. Towards mid-week the rates fell sharply on weak demand and increasing supplies. The market, however, climbed back to the previous week's levels on Tuesday. Demand for funds increased while supply remained unchanged. It is expected that the rates will continue their upward trend during the coming weeks with the arrival of the busy season. The rates of interest on Thursday stood around 7 per cent.

Scheduled bank deposits during the week to September 17 increased by Rs 5.80 crores to Rs 2787.17 crores

THE ECONOMIC WEEKLY

according to the weekly statement issued by the Reserve Bank. During the corresponding period last year deposits stood at Rs 2506.56 crores. Credit issued by the banks, however, declined from Rs 2024.09 crores to Rs 2014.81 crores. There was a slight decline of Rs 58 lakhs in cash balances with the banks and borrowings from the Reserve Bank were lower as well by Rs 2.83 crores. Balances with the Reserve Bank increased by Rs 3.83 crores. Money at call and short notice were higher by Rs 5.47 crores to Rs 61.11 crores. Investments in government securities at Rs 829.83 crores showed a fall of Rs 78 lakhs.

Notes in circulation during the week to September 24 declined by Rs 17.70 crores to Rs 2562.70 crores, according to the Statement of Affairs of the Reserve Bank. Balances held abroad were lower from Rs 15.20 crores to Rs 12.78 crores. Foreign Securities remained unchanged at Rs 70.63 crores. Deposits of the Central Government increased by Rs 25.77 crores to Rs 93.43 crores, while those of State Governments fell from Rs 19.66 crores to Rs 11.06 crores. Loans and advances to governments were higher by Rs 12.24 crores at Rs 82.51 crores. Advances to Scheduled banks declined from Rs 17.38 crores to Rs 8.94 crores.

Machinery Manufacturers Corporation

AS one of the pioneers in the field, Machinery Manufacturers Corporation has contributed substantially to the progress of the textile machinery industry, during the last few years. It has not only improved the quality but also introduced latest technological improvements. Carding engine is the principal product of the company, and it continues to hold the premier position, producing over 70 per cent of the total carding engines manufactured within the country. Having kept in touch with the latest developments in carding technology, the Corporation was the first to develop and market semi-high production cards which, when clothed with metallic wire, yield almost 100 per cent increase in production. These semi-high production cards are undergoing extensive tests at Textile Research Institutes at Bombay, Ahmedabad and Coimbatore.

Speaking to shareholders at the annual meeting recently, A K Mitra, chairman, stated that by introducing high production carding engines the company had reduced the total requirement of cards in the country by at

least 50 per cent. He hoped that the manufacturing facility thus made available would be utilized for producing other types of machinery, at present not manufactured in the country. Mitra appealed to the Government to take the machinery industry into confidence before agreeing to the import of machinery from abroad. In the past ad hoc import of machinery had retarded the industry's progress, and if now, when it was doing its best to supply quality machinery, imports allowed under foreign credit arrangement, it would frustrate the efforts the machinery industry was making.

The Corporation has on hand an expansion programme which will make it a multi-product unit with a heavy bias towards textile industry. It has

Correction

The heading of the Company Chairman's statement published on page 1489 of our last week's issue should read "Machinery Manufacturers Corporation Limited" and not "Machinery Manufacturers Corporation Limited". The error is regretted.—Ed.

THE ECONOMIC WEEKLY

received manufacturing licence for Crosrol-Varga high production units and letter of intent for high production draw frames. It has also received licence for the import of tooling from Carding Specialists of the UK. Under the expansion programme, which is phased over a period of 3-4 years, the corporation proposes to manufacture two new products — Cross-Varga high production units (2,000 Nos) and high production Whitin draw frames (200 Nos). Besides, the manufacturing capacity of some other products is to be expanded — of speed frames to the licenced capacity of 90 and of PH diesel engines from 2,400 units to 5,000 units. The company has been sanctioned a foreign exchange loan of Rs 1.38 crores and a rupee loan of Rs 25 lakhs by I F C for implementing the expansion programme.

Raymon Engineering

SATISFACTORY progress is being made by Raymon Engineering in implementing its scheme for expansion of existing units and setting up of new lines of manufacture with foreign financial and technical collaboration. Final offers for the required machinery and equipment are awaited from abroad. Meanwhile, steps are afoot to purchase/acquire land adjacent to the existing works, and indigenous machinery is being purchased. The foreign participants, Garvey Grain of the U S and Phoenix-Rheinrohr and Handels Union, both of West Germany, have subscribed to the fresh equity capital of the company. A loan of Rs 21.4 million has been obtained from (ment). In addition, increased banking facilities have been provided by the company's bankers. The company has thus secured considerably improved USAID under PL 480 (Cooley amendment) financial resources. When this scheme is fully implemented, there would be a substantial improvement in the quality, variety and volume of wagons, forgings, pressings and structural fabrication, and the company would also undertake production of new items such large diameter spirally welded pipes, cranes and heavy steel construction. The future outlook for this growing concern, therefore, appears promising.

Meanwhile, the year to March 31 last has again been a period of "stress and strain" when, though the structural fabrication and forgings, stampings and pressing operations showed slight improvement, the wagon production operations received a set-back.

with the labour troubles continuing and hampering the work. The order for 1,000 'O' type broad-gauge wagons, however, has since been completed, and work on the two orders for 1,750 'CR' (covered) type wagon has been taken in hand under more favourable conditions. The large inventories of matching steel and other items which were procured in advance should stand the company in good stead in the manufacture of these wagons. The 1964-65 results show that, despite increase in the amount billed from Rs 60.27 lakhs to Rs 68.12 lakhs, the outcome was a bigger loss of Rs 9.70 lakhs (5.60 lakhs) due mainly to the increased interest charges on borrowings and higher wages paid to workers. Together with the previous losses of Rs 28.73 lakhs and miscellaneous expenditure yet not written off or adjusted amounting to Rs 7.01 lakhs, the total deficit has amounted to Rs 45.44 lakhs.

Bombay Suburban

WHILE the proposal to amend the Electricity (Supply) Act, 1948 to provide inter alia, for a measure of liberalisation of the rate of permitted "reasonable return" is still in suspense, this rate has undergone an upward revision following the two increases of one-and-a-half per cent in the Bank Rate during the past about a year. The basic proposal now pending before Government is to permit licensees to treat as operating expenditure the actual interest plus a half per cent on loan capital if a licensee is obliged to raise such capital at a rate of interest higher than the "standard rate".

Bombay Suburban Electric Supply intends to issue debentures of the face value of Rs 2.5 crores at a rate of interest not exceeding eight per cent for raising additional finance to cover capital expenditure required for further expansion. In his Chairman's review circulated to shareholders with the company's report for the year 1964-65, A N Haksar says that over the last decade system demand and energy off-take has been doubling itself every five years and that barring some temporary recession, demand for electric power will continue at the present pace for some time to come. Haksar has pleaded for prompt release of foreign exchange and quick issue of import licences for the very essential requirements of the electricity industry, which has been accepted as a basic industry.

Meanwhile, the company has well maintained growth in sales and earnings during the year ended March last when energy sales increased nearly 19.5 per cent to exceed the 300 million kilowatt-hours mark and revenue receipts over 19 per cent to top Rs 3 crores mark. The company earned a profit of Rs 48.83 lakhs, against Rs 34.09 lakhs, after providing for depreciation and taxation. Of this, the increased total dividend of 10 per cent requires Rs 21.01 lakhs (15.85 lakhs).

Hindustan Ferodo

IN order to keep abreast of market trends, Hindustan Ferodo has set up a market research department and plans to add during 1966, two new products to its manufacturing range; one is asbestos millboard, which is used for heat insulation and as an alternative form of gasket material, and the other is "Ferobestos" asbestos-based industrial plastic materials. This was stated by Kenneth Neve in his Chairman's statement read at the first annual meeting of shareholders held in Bombay recently. The demand for products of all the three main manufacturing divisions — friction materials, textiles and jointing materials has been at a high level, and extra plant is to be installed to meet anticipated demand.

During the nine-month period ended March last, the company's total turnover amounted to Rs 3.04 crores and profit before tax Rs 1.37 crores, exceeding the last year's comparative performance of Asbestos, Magnesite and Friction Materials, whose entire manufacturing business was acquired by Hindustan Ferodo from July last year. H D S Hardie, Managing Director, who presided in the absence of the Chairman, told shareholders that the current year's turnover was likely to be around Rs 4 crores and that the company could look forward with confidence to steady progress in the future.

Khatau Makanji

IN a year when things have not been pleasing for textile mills, erosion of margins revealed by Khatau Makanji Spinning and Weaving Company is scarcely surprising, particularly because nearly half of the company's production has been under statutory price control and costs have increased owing to continuous rise in dearness allowance, interest charges and prices of cotton, stores, chemicals and colours. Commenting on the current

year's prospects the directors say that unless prices of controlled varieties of cloth are suitably revised margins will continue to be under pressure. In addition, fresh increase in import duties and excises on various commodities announced on August 19 last is also likely to lower margins. The company continues to face the problem of getting its foreign exchange requirements due to the difficult foreign exchange situation, though new foreign markets continue to be explored for the company's products with a view to earning more foreign exchange.

The building for the Company's Borivli unit is nearing completion and the machinery is being installed. Some 1,500 spindles are expected to begin production by June next. The processing activities of Fashion Prints, the company's subsidiary, have been expanded to increase its earnings capacity. The financial results for the year to June last show sales slightly up from Rs 5.43 crores to Rs 5.51 crores and gross profit down from Rs 85.53 lakhs to Rs 74.53 lakhs. Of this, taxation absorbs a little more but there is a considerable saving in the provisions for depreciation and development rebate, with a result that equity earnings are a shade better at Rs 23.80 lakhs (23.36 lakhs).

Ashoka Cement

THE improved performance of the foundry division has helped Asoka Cement to produce better results for the year ended March 1965, even though production and despatches were almost at the same level as last year. Production of clinker and cement in 1964-65 stood at 1,59,822 tonnes and 1,66,006 tonnes as against 1,59,963 tonnes and 1,67,036 tonnes, respectively, a year before. Similarly, despatches totalled 1,65,104 tonnes compared to 1,66,218 tonnes previously.

The year's trading resulted in a bigger net profit of Rs 9.49 lakhs against Rs 5.61 lakhs, after making necessary provisions. Of this, the proposed dividend raised by one per cent to eight per cent requires Rs 4.80 lakhs (Rs 4.20 lakhs) and has a much better earnings cover.

Bradbury Mills

RISING costs of manufacture with no corresponding increase in realisation coupled with substantial increase in interest charges due to heavier borrowings on account of expansion programme, brought down

Bradbury Mills' gross earnings in the year ended March last to Rs 8.64 lakhs from the previous level of Rs 14.03 lakhs even though sales were up from Rs 2.36 crores to Rs 2.54 crores. After making necessary provisions, net profit is reduced to only Rs 0.49 lakh (2.53 lakhs). The usual dividend on preference capital and that on equity dividend lowered from 30 per cent to

20 per cent together demand Rs 3.48 lakhs (4.48 lakhs). The shortfall is to be made up by a sizable transfer from reserves. During the year, the company added new machinery worth Rs 32.37 lakhs. All the major items of machinery like bleaching, dyeing and processing plants and automatic looms have already arrived and are in the course of installations.

It is time now to start a FESTIVAL ACCOUNT for the next Diwali.

Monthly deposit of Rs. 5/- over the next year will yield Rs. 61.75 in time for the next Diwali.

Deposits of higher amounts in multiples of Rs. 5/- are also accepted.

A RAINBOW RANGE

The butterfly is nature's example of breath taking colour combinations. Similar eye-appeal is required for consumer products to arrest customer attention and keep them moving fast from shop-shelves. We, at India Foils, make it our business to dress a wide range of consumer products in colourful aluminium foil packaging. Playing with the seven colours of the rainbow our eight colour gravure printing process can produce varying depths of brilliance from dazzling gay to muted quiet tones on aluminium foil. And thus India Foils continue to create dream packs with the right eye-appeal and pure protection at all times, under all conditions for the home markets and abroad.

E.I.D.-PARRY IN THE HOME

The pottery section of the E. I. D.-Parry Group's Ranipet factory first began with the manufacture of earthenware jars for sulphuric acid—produced by the Fertiliser section. From plain jars for sulphuric acid, pottery progressed to plain jars for every thing else, to not-so-plain jars and finally cups, saucers, vases, ceramic ornaments and attractive and long-lasting vitreous "Parryware" which is now so popular. Parryware is made with the technical advice of Doulton & Co. Ltd., the premier sanitaryware manufacturers in the United Kingdom.

The E.I.D.-Parry Group leads in the manufacture and sale of sugar, confectionery, fertilisers & sanitaryware and in the formulation of plant protection products.

Today, the E.I.D.—Parry Group, fondly known as "Parrys", is one of the larger companies in India consisting of 9 subsidiary and associated concerns providing employment for more than 10,000 people.

E. I. D.—PARRY LTD. 177 years young and still growing.

Nine Lives of Sukarno

SUKARNO seems to have survived once again. Only this much is clear in a situation otherwise completely confused. He has not only escaped physical annihilation, he still seems to be in power, though how effective he is at the moment as the leader of the State apparatus and the armed forces is a matter of conjecture. The news reports on which one has to depend do not give the impression that he is fully in control of events; rather, one feels, he is a more or less helpless and passive witness. If he is still in power, that is because the real leaders of the situation, whoever they are, want him to be in power as a popular figurehead. According to this view, Sukarno would be much in the same situation as Imre Nagy was in the first phase of the Hungarian uprising of 1958 when he was issuing appeals over the radio against the rebels with bayonets pointed at his back. Only later on did one know that his sympathies really lay with the rebels and far from being the effective head of the State when issuing his radio appeals against the rebellion he was in fact prisoner in the hands of the Soviet army. In support of the hypothesis that Sukarno's position today is similar, one can point to the silence of Sukarno during the initial phase, the mystery surrounding his whereabouts and activities during that period, his admission that he had thought it safer to be near an airport—the Indonesian Air Force is still suspect as being sympathetic towards or even an accomplice of the rebellion—, his very brief radio announcements and the airs Maj-General Suharto has been openly giving himself as the "protector" of Sukarno rather than as one obeying his orders. Supporting this view are also the so-called diplomatic reports that go so far as to suggest that Sukarno not only knew of the coup plan in advance but in fact engineered it.

Against this much too pretty theory one has to argue that if indeed Sukarno wanted to get rid of some army generals too right wing for his liking it would be senseless of him to instigate some other army generals to organise a coup directed against the State which he himself represents. The expected and very much more efficient course of action for him would be to sack the army generals who meant danger to his position or his policies and install in their places those with whom he has allegedly conspired to bring about the present situation. This course might also lead to strife but in this situation the onus of defying the State authority would lie with the dismissed generals whereas his supporters would enjoy the position of the loyal and be able to command the support of the larger part of the army, now still under the right wing generals. A head of State would not have to take recourse to the devious technique of instigating a coup against his own regime unless he is really not an effective head of State, unless he is virtually a prisoner of other men wielding actual power though formally under his authority. Sukarno was not in such a position: there was no doubt at all about his supremacy.

However, the thesis that Sukarno himself engineered the coup becomes very much more plausible if it is modified by assuming that Sukarno was indeed contemplating taking steps against the right wing army generals and replacing them with some of his more trusted men. But before he could do it the right wing generals took over effective power, making Sukarno a prisoner for all practical purposes, and this in turn might have led to the attempted coup by the so-called left wing army men on whom Sukarno was counting. In support of this modified hypothesis one can cite the news report on the very first day of the rebellion that the initial spark was an attempted right wing coup. It may be recalled that when the rebel forces had control of the radio for a few hours it was announced that the "September 30 Movement" had saved the President and the country from a plot organised by the generals.

The hypothesis that the coup that had been organised was really a right wing one is further supported by the almost total inactivity of the communist party of Indonesia. The left wing rebels are described in press reports as "pro-communist" and the so-called leftist coup as "communist".

inspired". If indeed the communist party had plotted for insurrectionary seizure of power, it would not depend only upon the breakaway parts of the armed forces; it would also organise its own guerillas and also make full use of whatever other weapons it has got in terms of hold over trade unions and other mass organisations. However, there has not been any serious participation by the communist party. It has not tried to organise countrywide strikes; it has not indulged in sabotage and subversion; and the reports one gets of armed communist bands scouring some parts of the country indicate precisely a hurried and belated attempt to organise self-defence. Once again, we have to conclude that

if the rebel forces fighting under Lt-Col Untong are "communist inspired", the communists did not time the coup but were caught unawares by a rightist coup and reacted with an attempted counter-coup.

If this line of analysis is not all wrong, then the victory of the right wing generals should mean an end to Sukarno's authority and to his policy of a middle course; then one has to seriously doubt such reports as would have Sukarno firmly back in power and predict a leftward change in Sukarno's cabinet composition and in his policies. One should expect changes exactly in the opposite direction, with or without Sukarno.

Without P L 480

THE public has been busy counting the number of Pakistani tanks and planes destroyed; no one has been too eager to consider in any realistic fashion the damage caused to our men and equipment. It is, therefore, not surprising that the public has not woken up to the dire effects of the war on the economy. According to certain press reports, the war has ruined the harvests in the Punjab, Gujarat and Rajasthan; the stoppage of canal waters during the days of fighting has adversely affected the kharif and sugarcane crops in the border States; the military authorities had to cut down standing crops for miles around military installations for security reasons; the full impact of the dislocation of transport during the emergency is also likely to be felt in the near future.

The prospects for agriculture during the last year of the Third Five-Year Plan was not so bright even otherwise. What, however, is making the situation appear almost menacing is that the import of foodgrains under PL 480 is now seriously threatened to be interrupted or stopped. The Deputy Chairman of the Planning Commission did not hesitate to describe dependence on imports of grains under this agreement as part of our development strategy. It is, therefore, to be expected that uncertainty regarding PL 480 has caused much greater anxiety than the uncertainty regarding our harvests. The anxiety is not misplaced; the imported grains all go to the market whereas only a small part of the domestically produced grains is

traded. The degree to which we depend on PL 480 wheat for price stability in our urban markets is to be judged by comparing not the volume of imports with the volume of domestic production but the volume of imports to the marketed surplus of our domestic production. One might have to import several million tons of foodgrains on commercial terms and the prospect is made even gloomier by the reported shortage of rice in the world market tending to raise import prices which will affect domestic prices as well.

The Government has, of course, decided to put on a brave face and has declared in the voice of the Deputy Chairman of the Planning Commission that "if there is any attempt at using economic aid as instrument of exercising pressure on us, we have alternative plans ready to go ahead without such aid". It is, of course, a little bit of an exaggeration to say that one has got alternative plans ready. However, one does read in newspapers almost every day about various programmes that are being discussed and adopted. The suggestions that are emanating from government quarters are, however, far from being new or original. The idea of kitchen gardens is at least as old as the "Grow More Food" campaign of the Second World War days; the talk of compost as substitute for chemical fertilisers trails back to the days of the First Five-Year Plan; the enthusiasm for green manures had its day in the early years of the Second Five-Year Plan; missing a meal a day or diversion of resources

away from cash crops do not really amount to production plans. Talking about "crash programmes" does not amount to having a crash programme.

All the same, one need not be pessimistic. After all, it is infallible logic that the very low per acre yields of our crops leaves wide open the possibility of great increases in their production; also there is nothing very much wrong with all the different plans and programmes for solving once for all the problem of our agriculture that have been mooted at some time or other during the last fifteen years in a rotation of preferences. There is really nothing wrong with talk of increasing production with the help of better utilisation of irrigation water. The failures in the past were not of the proposals but of their implementation. If a determined effort is made now to implement them seriously, there is no reason why we cannot expect to get from them results that were not obtained in the past. After all, the war is a great booster of morale and whatever may be in short supply in the country at the present moment, this particular commodity is in abundant supply. One should, therefore, welcome all the talk of "defence plan for food", and "emergency plan for food", despite all the trite ideas and catch phrases in which they abound.

There are one or two encouraging signs. The government is reported to be considering a proposal for the direct procurement of wheat and rice from big producers. The proposal when earlier mooted was rejected on the ground that it would alienate the sympathies of this particular class of peasant proprietors that is the main electoral support of the Congress party. Similarly, one has dared to raise once again the idea of increasing land revenues — another proposal rejected earlier on the same grounds. There are, however, other signs which raise doubts as to the willingness of State Governments to take resort to unpopular measures even now. Only a few weeks back, while the shooting war was on, the Food Minister announced the immediate introduction of rationing in all cities with a population of one lakh or above. However, no sooner had the war stopped than news started to come from the States about their tardiness in the matter. One is perhaps waiting for the shooting war to start again to take any action.

The Danger Ahead

Romesh Thapar

THE Prime Minister would have us view the recent war as if it were an episode from the *Ramayana* and write the story of the last few weeks in 'letters of gold'. The Defence Minister would have us all become 'Kshatriyas'. There is talk of self reliance and self sufficiency. And a whole variety of politicians and publicists would have us 'quit' the Commonwealth or 'make' nuclear weapons or take-off on a path of 'national fulfilment'.

All this revivalism and modernism is indicative of the growing passion to forge new perspectives for the nation; but in the process there is a tendency to forget that Pakistan, who threatened us only yesterday, is merely bandaging its wounds, feverishly searching for the opportunity to take revenge.

At a special press conference, held soon after the cease-fire, the chiefs of the army and the air force could not but leave the question about Pakistan's capacity to attack unanswered. The campaign on the ground and in the air has yet to be carefully analysed, but it is clear that our estimate of the armoured strength and fire power of the enemy was far from accurate.

Foreign correspondents, obsessed with the desire to prove our claims about damage inflicted as false, pointed to the fact that we had declared as destroyed over 200 Patton tanks when in earlier briefings we had said that Pakistan possessed only 170. Now these correspondents 'believe' that on September 1 Pakistan had over a thousand tanks of various types, including some 400 Pattons. The same is true of the self-propelled guns which gave the enemy tremendous striking power. The defence system before Sialkot and Lahore was elaborate — and so were the radar-encircled fighter and bomber bases of the Pakistan air force.

When we total the US military aid which must have been invested cynically in Pakistan, the figure will startle observers. It is bound to be more than the much publicised figure of 1,200 million dollars.

It is, of course, possible that the punishment inflicted upon the enemy, who seemed unable to effectively use the equipment at his command, could start a political chain reaction which

loosens the grip of the military regime and sets in motion trends which caution the revenge-seekers in Pakistan. But it would be a grave mistake to imagine that there is no likelihood of fresh trouble for the moment. True, the Prime Minister speaks of the need to be vigilant. Can vigilance, or for that matter self reliance, be built without a detailing of the threat that Pakistan still presents and the sacrifices we must make?

Reports are current that the huge CENTO and NATO arms dumps in Iran and Turkey are being used to repair the damage done to the Pakistani army and to replenish its stocks. Fuel, too, will receive high priority in this operation to restore the muscle of the Pakistani armed forces. Meanwhile, the US Pentagon is most unhappy about the fate of its satellite army and is anxious to prove that it is not the useless machine it has been reported to have been reduced to.

These are ominous pointers—and diplomatically, through the cease-fire and other assurances, we do not seem to be able to prevent aid from reaching Rawalpindi at this critical moment in the history of the sub-continent.

The so-called cease-fire line, which now stretches from Kutch to Kargil and is difficult to discipline, could encourage the theocratic revanchists in Pakistan to attempt another thrust in the direction of Jammu, where the enemy holds a fairly sizeable 'bridge-head' on our territory. Such a plan would be, of course, based upon Pakistani confidence that the Sialkot and Lahore sectors could be held approximately along present alignments. Some such assessment apparently conditions the thinking of foreign military experts now busy analysing the results of the campaign.

Adventurism of this kind would naturally require the support and connivance of China. This should be available in adequate measure, if only to prevent Pakistan from depending entirely on the US alliance. Peking, facing growing isolation in Africa and unable fully to command events in South-East Asia, might well decide that the situation in South Asia must also be kept on the boil. Events in Indonesia would reinforce this thinking.

In a fast changing situation we

must continuously re-assess the tactics likely to be adopted by the Chinese — and we must project these assessments to our friends in Asia and Africa who still imagine that Peking is motivated only by a firm dedication to the battle against imperialism and colonialism.

Diplomatically, even as one section of the Pakistani leadership moves to restore its ruptured links with the US Pentagon, there is a show of determination to preserve the alliance with China. The sudden severance of Pakistan's relations with Malaysia is designed to underline how independent Pakistan is of western attachments, even of Commonwealth associations. This adventurism might well pay immediate diplomatic dividends in Asia and Africa, but we must be a hundred times more active to break this and related conspiracies. And, for heaven's sake, let us realise that the recent burning in the Capital of the effigies of Ayub, Mao, Sukarno and Ho Chi-minh does not help our cause.

More urgent than anything else is the need for co-ordinated direction of our efforts by the Centre. The military situation on our borders is closely related to the effectiveness of our diplomatic initiatives. Internal political strength is dependent on our capacity to distribute fairly the food resources we have within the country. Defence production is tied up with the problem of allocating scarce raw material and foreign exchange. The mobilisation of the people hinges on how we organise and inspire work throughout the country.

The Prime Minister and his colleagues will have to find the framework for this central co-ordination and direction without delay. To drift now would be unforgivable.

Weekly Notes

Undelivered Cloth

THE current phenomenon of cloth accumulation with mills is very similar to that in 1957-58. Stocks have piled up because traders are refusing to carry any more than the minimum inventories due to a number of reasons: credit stringency, disruption caused by the recent hostilities, and sluggish consumer demand in a traditionally busy period. At various levels and in different contexts, traders receive credits from mills and, in many cases, also extend credit to mills, especially the weaker ones in mofussil areas. These conventional relations have been upset by tight money. Demand from the north-western and eastern States normally reaches a peak at this time of the year but the hostilities, diversion of transport to defence uses, and continuing uncertainties in both these regions have accentuated trade unwillingness to extend commitments and have, correspondingly, increased the burden on mills. Exports, too, are disappointing this year.

Prices of raw cotton, dyestuffs and other materials have risen steeply and so has workers' dearness allowance which is linked to the cost of living index in nearly all centres. It has not been possible to shift these higher costs fully since almost one-half of mill cloth output is subject to price control—and some varieties also face competition from powerlooms and handlooms. So far as uncontrolled varieties are concerned, significant price increases had been effected during the period of voluntary price control and subsequently too. The scope for further increase is extremely limited, partly, because of consumer and trade resistance and partly because changes in the pattern of output have been extremely rapid over the last few years and many of the varieties are still in the promotional stages.

Bank credit limits, as in other industries, are under strain but the impact of this strain on cotton mills and trade is somewhat greater because profit margins are relatively smaller and the materials, labour and freight components of final prices are comparatively higher. Prosperous mills have extended their capital commitments in modernisation, diversification and investment in new companies; besides tapping banks and financial

institutions, they have been eager seekers of public deposits. The weaker mills have exhausted their resources in what little modernisation they have been able to achieve; both cloth wholesalers and cotton dealers who are their traditional sources of finance are cutting them dead.

Given its economic and political strength, long history of unsound financing and its propensity, when in trouble, to seek weird solutions, it is hardly surprising that the industry should have appealed to the Industrial Finance Corporation, among others, for assistance on special terms. The terms demanded—concessional rates of interest, easy procedures for disbursement, relaxation of security margins, non-levy of commitment charges on undisbursed portions of sanctioned loans, etc—from IFC were such that no financial institution could have accepted them, particularly coming from an established industry which should normally be able to look after itself.

Such heroic efforts aside, what should be done for the financial rescue of the industry? This slump should help to create the environment for cost-reduction and improvement of technical and marketing efficiency, though the demands of both capital and labour being what they are, one cannot have much hope in this direction. The immediate step taken by Government was to liberalise the flow of bank credit, for this month at any rate. But deliveries have to improve before the mills can consider themselves out of the woods. While further credit liberalisation may be in order, it should be clearly understood that this is no substitute for price reductions and greater exports.

The High Price of Cheap Gas

TO turn from the innumerable instances of failure of price control to one where control has been effective would be heartening if the results of success in this case were not so perverse. The State government has zealously controlled the price of piped cooking gas in Bombay, keeping it virtually unchanged between 1949 when control was first imposed and early this year. Consumers have thus got their gas at 1949 prices when prices of everything else multiplied manifold. They have much to be

thankful to the government for—not all those who today use gas for cooking but only the 18,000 or so fortunate ones who got their connections when the city's sole supplier of piped gas, the Bombay Gas Company, was still in a position to give new connections. Now it isn't any more—thanks to the success of price control! Bombay's population has grown rapidly and so has the demand for a clean, convenient fuel like gas, but price control has seen to it that the Bombay Gas Company cannot meet any of it, to the advantage of the two private oil companies with refineries in Bombay who, though much later entrants in the market, supply bottled gas to over five times as many families as does Bombay Gas. This they do because they are allowed to sell their gas at three times or more the price permitted to Bombay Gas under law.

That the hopelessly uneconomic price has prevented Bombay Gas from expanding and giving new gas connections has been so plain that one would think that the Government has had some weighty reasons for holding down the price. The purpose, one hopes, has not been to 'protect' the private oil companies. Is it, then, that in the Government's view, any increase in the price of piped gas would cause unbearable hardship to the 18,000 or so existing consumers in whose interest, therefore, further expansion of supply has to be sacrificed? However, this cannot be the reason either, since the present consumers are mostly people of much more than average means, living in the prosperous residential areas of Malabar Hill, Cumbala Hill, Fort and Colaba.

What deep social concern then underlies the Government's policy of denying an economic price to the Bombay Gas Company? It has been suggested that the intention has been to see that the company runs up huge losses so that it can be taken over at a very low valuation. The company's cumulative losses at the close of 1964 amounted to Rs 24.78 lakhs, being nearly one-half of the paid up capital of Rs 40 lakhs and free reserves of Rs 12.61 lakhs taken together. If the Government really wants to nationalise the company, the despicable procedure of achieving this through eu-

THE ECONOMIC WEEKLY

thanasia so as to save a few lakhs of rupees of compensation money deserves to be unreservedly condemned.

And why should the Government want to nationalise the company, anyway? It is unimaginable that the Government will be able to expand or even maintain supplies without raising the price of gas. Official spokesmen have admitted as much. If the aim is to nationalise an essential service—the supply of cooking gas—then taking over Bombay Gas will achieve nothing since by far the larger proportion of gas used in the city is supplied by the private oil companies. If it is none of these spurious objectives but really the expansion of gas supplies that the Government wants, Bombay Gas has repeatedly said that it has expansion plans ready which are held up just by the uneconomic price foisted on it.

True, the company has been allowed a price rise, from Rs 3.94 to Rs 5 per thousand cubic feet, from January this year. This increase was recommended by the Gas Advisory Committee which examined the company's cost structure in the first half of 1963. The Chairman of the company, N K Jalan, contends, with evident justification, that both material and labour costs have gone up in the two and a half years since the Committee's enquiry and that allowance must be made for this in the price. Cost-plus price fixing presents problems when there are many units in the industry with varying efficiency. These problems do not arise in this case and once the price of gas is fixed on the basis of costs for a base period, subsequent rise in costs can be taken care of by automatic adjustments in price made after consultation with the Government. The alternative to some such rational arrangement is continuance of the present stalemate between the company and the Government at the expense of Bombay's middle and lower middle class population which needs gas for cooking but cannot afford it at the prices charged by the oil companies for their bottled gas and to the advantage of the well-to-do consumers who have got piped gas connections and the oil companies—neither of whom deserve this bonanza.

The Admirable Corporation

EXPANSION of shipping tonnage has proceeded considerably faster than was envisaged originally in the Third Plan, to make this industry one of the few in which targets have been

over-fulfilled. The overall position remains, nevertheless, unhappy in many respects. Only 10 per cent of our foreign trade is carried in Indian bottoms and the net outflow of foreign exchange on account of freight, repairs etc, is Rs 155 crores a year. Our tonnage and its utilisation have to increase substantially to keep pace with the expansion of foreign trade and to raise our share in the freight carried. The net foreign exchange saving of shipping expansion is, perhaps, the highest among all industries. The foreign exchange cost of a ship is earned back within a period of 8 years or less, not counting the strategic advantages for defence and direction of trade.

Further expansion of shipping in which the public sector Shipping Corporation is playing an active and dominant role is, however, bedevilled by a number of adverse developments. International prices of ships (including second-hand) are going up and so are time rates for charters while cargo freights are in general pegged. The Visakhapatnam Shipyard has reached its lowest production in five years, for which inadequate foreign exchange allocations are alleged to be responsible. Coastal ships are over-aged and are in urgent need of replacement as well as assured dry cargo, 60 per cent of which at present consists of coal and salt, which are carried at somewhat uneconomic rates. Coastal tanker capacity (sadly deficient at present) required in future would progressively diminish as more coastal refineries come up. Port delays and inadequate berthing and handling facilities lengthen the turnaround time of ships. All these add up to a formidable list but no more formidable than that for most industries.

One of the curious features of recent tonnage expansion is the fact that apart from the Shipping Corporation and Jayanti none of the major shipping companies has added significantly to its fleet, in spite of large and easy credits available from the Shipping Development Fund. The slump in overseas freights which lasted a couple of years had something to do with this but its influence appears to have been somewhat exaggerated. Both the major private shipping lines, Scindia and India, give the impression of having reached the end of their managerial resources and enterprise for the time being. Scindia is expanding again but India Steam remains stagnant and still relies largely on foreign personnel. Great Eastern, once a prodigy in the industry, slowed down in the early sixties and

threatens to take things easy till there is a substantial revival in tramp business. New entrants have come in—among them, Birla, South India (P & O in collaboration with Tata, etc), Chowgule and Thakur—but these have still to make an impact. Only the Shipping Corporation has expanded and prospered through difficult times.

The merchant navy can do much better than was expected earlier and it must. For this, cheap loans and a limoing shipyard are not enough. Inadequate attention has been paid over the years to the training of personnel for floating crew and shore establishments, and the development of domestic repair facilities. Shortage of personnel could, in the end, prove a greater handicap than lack of foreign exchange.

Agricultural Refinance Goes Abegging

THE concluding observation of M R Bhide in his chairman's speech at the Second Annual General Meeting of the shareholders of the Agricultural Refinance Corporation is indeed a sad one: "... in the last two years of the Corporation's existence a large number of States have not taken advantage of its refinance facilities. It would indeed be a national waste if millions of acres of land remain unutilised even after big dams costing huge amounts have been constructed for providing irrigation facilities and other necessary aids such as fertilisers, improved seeds and technical personnel are made available." This is, of course, not to deny the advance that has been made so far. Thus in 1964-65 the Corporation sanctioned ten schemes of agricultural development involving a financial outlay of over Rs 20 crores, as against three for Rs 2.7 crores in 1963-64. Most of the schemes sanctioned are for reclamation and development of land under various major irrigation projects such as Nagarjunasagar and Parambikulam Aliyar. Others envisage development of coconut and rubber plantations and horticulture. All these schemes except one are to be implemented through central land mortgage banks. Bhide was perhaps understating the general feeling of disappointment when he said: "With all the efforts made so far in bringing scheduled banks into the picture, the planters are, by and large, still experiencing difficulty in persuading banks to finance them". He went on to say that considering the vast potentialities for development of plantation crops, which are among the main

foreign exchange earners of the country, and the great need for increasing exports, the schemes relating to plantation crops under the consideration of scheduled banks at present do not touch even the fringe of the problem. Without much greater support from all the scheduled banks or at least from those which are operating in the States that offer scope for development of plantation crops, the growth of this sector of the agricultural economy would greatly suffer.

It is not necessary to seek far to discover some of the reasons which may be holding scheduled banks back from this line of business, though one will read the Agricultural Refinance Corporation annual report and chairman's speech in vain to find any mention of them. Among the more important of these are: (1) the relatively long repayment schedule for loans in the agricultural sector as compared with loans in the industrial sector; (2) the risks to which agricultural operations are exposed due to natural factors like floods, draughts, insect pests, etc; (3) the risks of price fluctuations in the case of export plantation crops due to supply/demand changes in overseas markets, while in the case of industrial products such risks are of much less significance due to the protection which import restriction usually confers; and (4) in the event of default, realisation of assets is relatively more difficult in the agricultural sector than in industry. To these could be added such other factors as the lack of adequately trained staff to assist in the preparation of and appraisal of loan applications for agricultural operations where norms of assessment have yet to be set up and universalised, the absence of the same promise of developing normal banking business with the help of these long-term loans as there is with term loans to industrial projects, etc. It is possible to devise price and credit guarantees and crop insurance schemes to counter some of these factors — and also perhaps some positive incentives for banks. But these are old proposals on which no action has been taken for years. Will the Government do something now under the much-publicised "crash programme" for agriculture?

U K and the Indo-Pak Conflict

A Correspondent writes:

THERE have been some surprising elements in the British reaction to the India-Pakistan conflict over

Kashmir, yet her overall attitude has been consistent with her stand in this matter since 1948. Britain has from the beginning shown an exaggerated enthusiasm for a plebiscite in Kashmir. Even her present government—ostensibly socialist—has not stopped to contrast this enthusiasm with Britain's traditional reluctance to grant the right of self-determination to a colony (currently the Labour Government is cheerfully refusing this right to Aden) or to recall that the closest historical parallel to the Indo-Pakistan conflict over Kashmir is the American Civil War when the central government of the USA, in the name of high and truly democratic principle, refused the constituent states the pseudo-democratic right of self-determination.

Britain has, then, always supported Pakistan's propaganda, at the UN and elsewhere, for a plebiscite in Kashmir. This support emanates from three sources: malice, self-interest and misguided moral fervour. Malice was quite important in the immediate post-independence years. Then there was an active anti-India group of Conservative politicians and journalists who had earlier opposed the granting of independence, and who went on to specialise in maligning the Congress party, Nehru and India. This group has very rapidly dwindled in recent years, so that malice in Britain against India is no longer so important.

But self-interest is one of the strongest motives both for individuals and nations, and Britain is particularly a scheming and calculating country; it is not for nothing that the British have been called a nation of shop-keepers. We had come to expect the British Labour Party to be significantly different from the Conservative Party in this respect, but Wilson has proved to be as opportunist as the worst Conservative premiers; what is far worse, his interpretation of the British interest is struttily old fashioned, narrow and short-sighted. When SEATO and CENTO were formed, the Labour Party in opposition had at least an ambivalent attitude towards them, but now Wilson has become the custodian of Britain's self-chosen world-wide responsibilities. For fulfilling these responsibilities Wilson feels that Britain must have a chain of bases in the Middle East and South and South-East Asia. Unbelievable though it may sound, it does begin to seem that Wilson is wooing Ayub for a base somewhere in Pakistan, the

THE ECONOMIC WEEKLY

need for which—given the neo-Dulles philosophy of Wilson—will be greater, the more likely Britain's expulsion from Aden. Vijayalakshmi Pandit, who was our High Commissioner in London for seven years till 1961, also felt moved to say in the Lok Sabha during the last session that Britain is looking for a foothold in Pakistan. Again, both the old Conservative and the present Labour governments have been passionately interested in the Chinese market; there has been a plethora of trade delegations and fairs. (Needless to say, because it did not suit their interests, British governments have not cared in the slightest for the American susceptibilities about this.)

These considerations of British self-interest as seen by Wilson explain the partiality towards Pakistan of which there has been definite evidence. (Some politicians and highly important sections of the British press, of course, actively supported the Dulles policies and their descendants, and, therefore, though they have perhaps no active malice for India, they have always had greater sympathy for Pakistan and her allegations of not being treated fairly by her large bullying neighbour.)

A Religious War?

WE come now to misguided moral fervour. There is no doubt that Britain has had a tradition of nurturing eccentrics, reformers, pacifists and radical thinkers; one of the great qualities of her society is her ready tolerance of such people. The presence of such thinkers has meant that there has always been in Britain a large section of leaders of public opinion who have stood by moral principles as they saw them. It was the British leaders of this kind who supported us in our struggle for independence; our own national leaders drew a great deal of inspiration from them. One can in fact claim that Nehru's policy of non-alignment was based on principles which were partly derived from the philosophy of such British thinkers. To Britishers of this kind, our war with Pakistan has seemed greatly regrettable and unnecessary because they believe that there has been a lack on both sides of a sufficient amount of give and take. Therefore, such British commentators, with the friendliest feelings towards the democratic, secular and trying-to-be socialist India, have not been entirely on our side in their comments. Though this too has annoyed us, the justification for

THE ECONOMIC WEEKLY

our indignation against them is very slight.

Yet there is one respect in which these well-meaning commentators also have been seriously wrong; even they have called the recent war a religious war. This is utterly silly. Pakistan has dragged religion in to gain some illicit support from Muslim countries and from the Muslims in India; but from the Indian side, it is a fight between sovereign states over territory and over the principle that in secular India no sect has any *sectarian* rights. Muslims have fought with Hindus against Pakistan. If the Indian armed forces had consisted of only Hindus, and if there had been officially supported or condoned persecution of Muslims in India, then it would have been a religious war. Hardly any of the well-meaning commentators we are now considering would claim that the facts are such; they should, therefore, realise how silly (and inadvertently mischievous) they have been in calling this a religious war.

Should India leave the Commonwealth as a recent private bill in the Lok Sabha proposed? Our economic self-interest is better served by staying in it, even though the Commonwealth preferences in trade have been weakening. That these preferences are still very important for us is proved by the concern our government felt when Britain was about to join the Commonwealth. Then there are facilities offered by the Sterling Area, and, presumably, a certain additional attraction of India to a British investor due to our being in the Commonwealth. At the political level again there is the great advantage of having built-in closer contacts with a number of African countries; this is extremely important vis-a-vis China. There also are lesser and more commonly cited advantages. Vijayalakshmi Pandit has said that there is a certain division between the white and the black countries within the Commonwealth. This is certainly true. To expect it to disappear at once will be unhistorical: provided it is a division which is weakening, we need not leave the Commonwealth for this; it might then in fact be a very good reason for staying in it, so that a genuine multi-racial club of nations does get evolved.

Labour's Left Wing Muzzled

Our London Correspondent writes:

THE Labour Party Conference at Blackpool was dominated throughout by Harold Wilson whose two brilliantly conceived speeches not

only served to enthuse the rank and file but also succeeded in obtaining the endorsement of the Conference for all the Government's controversial policies, including those on Viet Nam, immigration and incomes. The left wing of the Party, which had been growing increasingly restive in the last few months as step by step the Government seemed to be walking away from a socialist programme, was surprisingly quiet and ineffective. Is it now Wilson's aim to convert the Labour Party into what has always been the Liberal dream—a non-socialist radical party? This is the gnawing doubt which the left wingers must have carried with them from Blackpool. Their leaders like Frank Cousins and Barbara Castle, through being in the Cabinet, are virtually Wilson's prisoners.

The general impression left by the Blackpool conference, the first after 13 years held with Labour in power, is that Wilson is determined to provide the country with a Government whose objective will be not to achieve socialism but to make a mixed economy work. The word socialism did not find even a polite mention in Wilson's speeches at Blackpool and the question of nationalisation of steel was left discreetly in the background.

Certainly the morale of the Party as a whole is high. The national opinion polls show that Labour is once more on top, and that there is no reason why it should really dread a general election now, if one is forced on it. If an election were held now, the results would almost certainly repeat the voting pattern of October last. This is also the main finding to emerge from a survey carried out by Research Services Limited for the *Observer* in 92 key marginal constituencies: the 20 seats carried by Labour last October with majorities of less than 1,000, the 20 Conservative seats won with similar small majorities, and a further 52 constituencies where Liberal candidates came second. With the sterling out of danger and the more unpopular measures out of the way, Labour can now look forward to introducing more popular measures and thus increase its popularity with the electorate.

All this, however, is small comfort to Labour's left wingers. The fact that they have to reckon with is that the life of the Labour Government hangs on a slender majority of three; a revolt against one of the more ob-

noxious of Wilson's policies may leave them with the guilt of having brought down the Government. Obviously, they are unprepared to take the leap. So they can do little but live with their disillusionment made the more bitter by the Blackpool conference. It is ironic that Harold Wilson has been the man to disillusion Labour's left wing considering that he gained his spurs in the party as the champion of the left, despising High Gaitskill's Atlanticism abroad and "revisionism" at home! At Blackpool Wilson used brave words to say that there was no connection between American support for the pound and his Government's support of American policy in Viet Nam, but no one was convinced. Indeed, hadn't Wilson himself told the TUC conference in 1964: "Yes, we can borrow... You can get into pawn, but don't then talk about an independent foreign policy or an independent defence policy".

The voting on the three supposedly explosive issues at Blackpool are a tribute to Wilson's political skill. Even in the case of Viet Nam, where feeling among the rank and file was strongest, the vote was still two to one in the Government's favour. On Commonwealth immigration, the vote was more comfortable, the Government's majority being no less than three to one. After the vote, however, 41 Labour MPs and 28 candidates issued a call to carry on the fight. The most surprising victory of all was perhaps that on incomes policy. Here the motion was carried by 3,625,000 against 2,504,000. Prominent in opposition was the Transport and General Workers' Union and the Amalgamated Engineering Union. That despite such formidable opposition the motion could get through shows how far the Labour Party has moved from its traditional image.

As the Labour Government enters the second phase of its term in office—a phase that it hopes to sweeten with more palatable measures now that sterling is momentarily safe—one is tempted to wonder what type of policy it will follow. For the left, steel nationalisation has become a major issue and it will judge the socialist credentials of the Government on the basis of whether nationalisation is to be taken up in the Queen's speech. But the left wingers will not be the only ones watching; the Liberals, and particularly Jo Grimmond, will also decide their attitude to the Government on the basis of whether steel nationalisation is pushed or shelved.

LETTER TO EDITOR

Illusion of the Student Revolution?

SOME comment seems required on P G Altbach's Letter from America "The Illusion of the Student Revolution" in the issue of July 3. I would take objection to his views on "lasting change in the campus". Indeed, "if history is any indication", the leadership coming from American universities and colleges during the past few years and heading infinitely into the future has never been so inclined toward a wide view of society's needs and a long perspective on international problems. The American student, especially at the better institutions, has seldom been an organisation man. The quality and pressure of education is such that extra-curricular activities are limited to those that can be kept to the campus and that will permit him to manage his own time. College and graduate education is usually built on the belief that the student will be a wiser and better-equipped citizen by building up a large body of knowledge from which he can deduce his generalisations than by demonstrations over the great issues of the day. Too often has a reform movement been fought on precisely the same pattern of dogmatism and unperceptivity as its antagonist.

Also: student reform activity, more often than before working from this broader base of understanding, has been directed into the summer vacation months where, instead of taking an hour from classes for shouting, students have given their full time to particular programmes, again becoming more knowledgeable and competent. Student groups still have their place in this work. They have, however, been overshadowed by the federal government and its combination of anti-poverty and urban and rural development campaigns. If you or Altbach would look for one outstanding explanation of why students seem less radical, I would point you to the fact of State and Federal Government participation in precisely those areas that students were concerned about. True, the government has political responsibilities of its own and thus appears less aggressive, but the fact is the work is being done and many young people are involved in it, more (I would venture) than were ever attracted to the exclusively student groups.

I might add: upon returning to New York from two years in India, I found a veritable revolution had taken place. That is, there were all sorts of government and private groups aimed at

the educational level of city poor: pre-school summer classes (a permanent fixture it seems), summer theatre groups performing on the streets in neighbourhoods where children had never before seen plays (the plays themselves being concerned with problems the children saw about them every day), teaching high school students to teach younger children, etc. Also: legalised rent strikes whereby tenants can now refuse to pay rent until landlords make repairs, voter education and adult education; all this with the active, person-to-person support of the

government. As new as these programmes are, (1) they have been accepted by the public with few reservations; (2) they are already proving effective; and (3) the long range results throughout the nation could prove far more disruptive of social structure than anything that has happened thus far. Hopefully the nation is preparing itself for that day.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

India's Decade of Development

Aloo J Dastur

India's Roots of Democracy by Carl C Taylor, Douglas Ensminger, Helen W Johnson and Jean Joyce; Orient Longmans, 1965, pp 694, Rs 18.00.

INDIA has fascinated, attracted or repelled foreign scholars, tourists and observers in various degrees. During the last two decades literature on India has covered the entire gamut from indiscriminate appreciation to overdrawn condemnation. Perhaps the lead it gave in the disintegration of western imperialism, the imagination it displayed in pledging itself to a democratic set-up, the boldness it exercised in extending the suffrage to all adults certainly evoked both interest and scepticism in the world. Was it possible for a huge population, steeped in traditionalism, ignorance, poverty and illiteracy in a big way to enjoy the expensive luxury and walk along the slow, sometimes sluggish, path of democracy? Was it again practicable to experiment with planning which had produced results only in totalitarian states?

"India's Roots of Democracy" is not an attempt at seeking answers to the questions. It is, as the subtitle reveals, "a sociological analysis of rural India's experience in planned development since independence." Eight of the twenty-seven chapters are given over to the delineation of the background. The caste system and the joint family, both institutions in a state of flux rather than disintegration, inevitably focus attention, but the authors have brought to bear an understanding and appreciation, so rare in these days, on both these age-old institutions. The great rise in population, pressure on land, low per capita income enter into the base which has to support planned development. The other obstacle to development planning and action was "the position of India's services in 1950 in the fields of education, health, and welfare as well as transportation and communication facilities".

It is against this dismal backdrop that the planners had first of all to create "the desire for a higher standard of living". This was no easy task. Community development and national extension schemes and more recently Panchayati Raj have been steps taken to give the villages a much required economic, social and

educational lift. A primary source of weakness is the absence of trained personnel, the training programme itself involves new concepts to satisfy new needs.

Rural programmes must be and are oriented towards increasing agricultural production. This obviously necessitates land-reforms. This issue is well clinched by the authors:

"For some time to come, millions of families will and must remain on the land. During this time, it can be expected that Indian leaders will justifiably continue to experiment with the evolutionary development of co-operative farming, village industries, and co-operative village management. Over this period of time, industrial development of the nation's economy will create increasing employment opportunities and thus alleviate the extreme population pressure on the land. Hopefully, the development of village industries will strengthen the whole rural economy. There will still be, for some time, the carry-over of old economic, social, and political status and influence of those who for generations have benefited from the old agrarian structure. But their status and influence will decline, and the status and influence of peasants will increase. All of which is to say that land reform will and must be part and parcel of the total economic, social, and political development of the country." (p 295)

A comprehensive view of development is taken, no aspect or problem related to such development is left out. The role of co-operatives is particularly emphasised because "there is a high probability that the necessity for, and effective organisation and operation of, service Co-operatives will do more than any other one thing to gradually remake the social structure of Indian rural society. We hasten to say, however, that this is not meant to imply that the development of co-operatives is or can be a substitute for all other facets of the community development-extension programmes. It is to say that co-ope-

ratives will have a more rapid development, as has been the case in other countries, when they are recognised as part and parcel of total community, and total social and economic, development, rather than thought of as some unique catalytic agent of total economic and social development." (p 328)

Programmes of education, health and social welfare have been analysed and critically appraised. Herculean efforts are made to meet the shortcomings, difficulties and realise the possibilities in these three spheres; the conclusion reached is not without hope:

"Looking back over these past years at India's enormous problem of promoting the general welfare, of providing elementary education, health, even food for its vast population, as the basic 'welfare' services needed by all its people, we must feel encouraged that India has at least made some gains and some beginnings, however small and marginal, in accepting and stimulating both private and governmental responsibility for the welfare of especially vulnerable groups." (p 475)

Never before has rural India been more thoroughly investigated by a team of sociologists and experts, who have brought to bear on their task an understanding of history, a sympathetic approach to regional disabilities and social weaknesses, and an appreciation of human endeavour. The sociological approach unfolds for the reader the various confusing factors that must enter into planned development. Written essentially for planners the tome is a veritable mine of information as also guide lines for political leaders, administrators, teachers, scientists and field-workers. It is a first-hand analysis resulting from study, observation and interviews with a wide spectrum of Indian society at all levels. It studies Indian efforts at development, underlines the pitfalls and enunciates the principles of further development. While several captious critics and superficial observers have been anticipating, even expecting, a collapse of the country the learned authors weigh the

THE ECONOMIC WEEKLY

Indian achievement in the balance and find it not wanting:

"India's progress in this task since 1947 stands as one of the historic examples of human advancement. Proceeding through a programme of planned social and economic development, India has increased her food and agricultural

production by some forty-two per cent, has raised her low industrial output by an average of ninety-three per cent, and has moved ahead with formation of the numerous policies and institutions, including education and community services, that are required for realizing her goals of future

growth. These achievements are monumental and deserve recognition. It is probably safe to say that no other great nation has ever before made so many and so great gains in the short period of time that has passed since India began her first planned 'decade of development' " (Preface).

Divide et Impera?

S P Aiyar

The Oxford History of India, 1740-1947, by Percival Spear; Oxford University Press, 1965; pp 426, Rs 16.50.
Advent of Independence, by A K Majumdar; Bharatiya Vidya Bhavan, 1963; pp 427, Rs 20.

ONE of the most significant features of modern India is the remarkable continuity which has been maintained in the political and constitutional history of the country. Whether one looks to the Constitution of India or to the administrative system, to parliamentary institutions or to the system of higher education, one is struck by the solid foundations of British rule on which India could build. For this reason, if for no other, the history of British India is one of perennial interest. But the history of modern India more than that of any earlier period, is one which rouses the emotions, thus lending itself to varying perspectives and interpretations. While lasting contributions of British rule to the making of modern India have generally come to be recognised, there is also a widespread belief that Britain was responsible for aggravating the Hindu-Muslim conflict in the Indian sub-continent, thus bringing about the partition of India. In the context of Indo-Pakistani conflict, the politician and the demagogue have exploited the theory that Britain played a diabolical role in India in cynical pursuit of the Roman strategy of *divide et impera*.

"The Oxford History of Modern India" has been issued at an appropriate period of Indian political development and it is to be hoped that it will be widely read by everyone concerned with public affairs in this country. In content, presentation and historical impartiality, Spear's work will be widely appreciated and there is no doubt that every teacher will now include it along with the "History of British India" by P E Roberts and the Cambridge History of India (vols V & VI) as the core reading in any course of modern Indian history. "The Oxford History of India" is not a new book; it is a reprint of Part III of the Third edition of the Oxford History of India by Vincent Smith. Professor

Spear had considerably recast the older work in the light of later scholarship and to this were added four chapters which he wrote for Roberts's "History of British India".

Professor Percival Spear has a standing among historians of modern India. He brings to his task an unrivalled mastery of the formidable literature of the period. As the tangled history of modern India unfolds itself, we see the characters play their part in all the complexity of the situations. The historian's judgement rarely falters; the facts are carefully weighed and assessed; and on every page one notices the anxiety to be fair. One has to turn to Spear's account of the controversial makers of British India from Clive to Curzon, to note the care with which their work is examined. Comparison and flash back technique are often used with a telling effect. Let me illustrate what I have in mind with a random example. Evaluating the work of Lord Dalhousie, Professor Spear writes:

"When we look at Dalhousie's administration as a whole we cannot fail to recognise the work of a masterly as well as a masterful mind. In some respects Dalhousie's was not an attractive personality. He seemed cold and unfeeling to some, harsh and overbearing to others; only rarely did the human warmth of a man eaten up by his passion for improvement emerge to inspire his closest confidants. He was almost morbidly sensitive to criticism and fiercely determined to dominate; he lacked imaginative sympathy with tradition and the Indian point of view. But for all that he was with a vision of the modern India that was to be; he exhausted his strength in the service of that India and did more, perhaps, than any single man to bring it about. Wellesley had acquired much territory and dis-

played singular drive and purpose but Dalhousie spent more energy in organizing than in acquiring. Bentinck had a vision of a westernized India, but while he could do little more than set up a few signposts, Dalhousie laid down the roads of progress. Curzon was a great systematizer but Dalhousie created what Curzon sought to perfect... His weakness was that of going too far too fast. He was a sick man in a hurry... He lacked sympathetic understanding, the intuitive knowledge of how his measures would appear to those they affected. For this he paid the penalty of the Mutiny disaster, but he had also provided the antidotes of a contented Panjab, of railways, and of telegraphs."

I make no apologies for this somewhat long quotation but I do not wish to give the impression that the reader is not likely to dissent from Spear's historical judgments. He might feel at times—probably not often—that Spear's assessment of some of the leaders of the nationalist movement is not quite fair. Occasionally, Spear seems to contradict himself. Thus on p 339 he says of Tilak that his "nationalism had *always* (italics mine) been provincial and sectarian rather than all-Indian". Yet on the same page, in the very next paragraph he writes: "Tilak who had been released in 1914 emerged from his retirement. He showed that he could now think both nationally and politically." Spear's remark that Tilak had never been a constitutionalist except from expediency is one widely shared by western scholars in the modern period of Indian history but it is one not altogether fair to Tilak. It must be said however, that existing evidence leads to diverse interpretations and an historian is free to draw his own conclusion in the light of his understanding.

There is one aspect of the "Oxford History of Modern India" which is unfortunate. The brief references at the end of chapters are riddled with errors which are not included in the errata slip prominently included in the beginning of the book. The proof reading seems to have been extraordinarily slipshod. Those who have been accustomed to regard the Oxford histories as the hall-mark of accuracy will undoubtedly be disturbed by this bibliographic carelessness. Occasionally errors are noticed in the body of the text itself. Thus "James Silk Buckingham" appears as "John Silk Buckingham".

Both in scope and treatment, A K Majumdar's "Advent of Independence" is a work of a different kind. It provides the historical background for the

Hindu-Muslim conflict and describes the political events which led ultimately to the partition of India. Majumdar's account emphasizes the "two-streams theory"—that there developed in India in the nineteenth century, two distinct nationalisms, the Hindu and the Muslim. This is a point of view elaborated by Majumdar's father, the distinguished historian, R C Majumdar in "Three Phases of India's Struggle For Freedom" (1961). By the 1930s the Congress had become, the author argues, a Hindu organization, its aims and objectives notwithstanding. For all its unconventional tone, this is a point of view for which there is ample evidence. What the British seem to have done is to search for a "counterpoise" in the existing situation; the Hindus and the Muslims provided just what the rulers were

seeking. It is unfair to denounce this as a ruthless pursuit of divide and rule. Partition came to the sub-continent because it seemed then to be the only solution to the communal problem. The inevitability of partition is now documented in a number of books—V P Menon's "An Outline of Indian Constitutional History" (Bombay: 1965) is the latest in the series. All this recent historical writing needs to be carefully read during the present period of Indo-Pakistani conflict. Majumdar's book contains some very interesting appendices. Unfortunately, this book also suffers from bad proof-reading. The author himself seems indifferent to proper names and grammatical niceties. One wishes too, that some attention had been paid to neatness of presentation and elegance of style.

Indian National and State Income Data—II

Some Aspects

Mahinder D Chaudhry
Bert F Hoselitz

This paper attempts a general survey of the state income studies available with the objective of identifying, through comparison of national and state income data, areas where improvement is needed. It is primarily concerned with inconsistencies, gaps, double counting, lack of explanation of the assumptions and omissions in state income data.

In the first part of the article, published last week, the aggregate of state income estimates was compared with national estimates compiled by the Central Statistical Organisation and the national totals were apportioned among the States and compared with the official state income estimates. In what follows an attempt is made to indicate in some detail the areas in which the state income estimates need to be revised and how the methods of estimation may be improved.

IV

Agriculture and Allied Products

THE difference in the value of agricultural and allied production between the revised national estimate and the corresponding aggregate of state estimates for India as a whole is only 2.5 per cent (see Table 3, p 1518), but the two estimates differ by a wider margin at the sub-sectoral level. Orissa and West Bengal, where the differences are largest, are discussed in detail.

Orissa. The state report evaluates Orissa's agricultural production during 1955-56 at Rs 2,156 million, whereas the allocated share from the national estimate is Rs 1,132 million. The following two factors appear to be responsible for most of the difference between the two estimates: (1) Output of paddy (uncleaned rice) has been evaluated at the price of rice in the state report.¹⁰ If paddy is evaluated at paddy prices, the average prices would have to be much lower than those now employed in the state report, and if rice output is evaluated at rice prices, output figures of rice have to be reduced from 3,054 thousand tons accounted for in the state estimate to 2,129 thousand tons.¹¹ If this overestimate is corrected the state estimate of the value of agricultural production will be much lower than at present, since rice is one of the major agricultural products of the state and accounted for 54 per cent of the gross value of agricultural production in 1955-56.¹² (2) The deductions of the cost of seed, manure, and marketing charges, etc, which were made to estimate the net value of the agricultural products in the Orissa Report. This is the lowest ratio among all state or national income studies (Table 6).

West Bengal. Against West Bengal's allocated share of Rs 2,891 million of

the value of agricultural production from the national estimates of income, the corresponding state estimate is Rs 1,826 million. Even if the estimated agricultural component of the tea industry¹³ is added to the state figure, the total does not exceed Rs 1,878 million. The probable reason for this difference appears to be that, according to the state report, the deductions made from the gross value of agricultural production for the cost of seeds required, dung manure, other chemicals and fertilizers, maintenance and repair of farms and implements, fencing, marketing, depreciation, and value of services rendered by livestock, to arrive at net value amount to 37.8 per cent of the total gross value of agricultural crop output (Table 6). This proportion is double that for all-India and many other states. A detailed examination of various items deducted for netting the value of agricultural production reveals that the estimate for the cost of feed for livestock required on farms in West Bengal appears to be out of all proportion to the corresponding figures in other national and state income studies. A comparison of these figures will be found in column (3) of Table 6, and it will be noted that the estimate of West Bengal is between two and three times as large, proportionally, as that of any other state.

Animal Husbandry. In a predominantly agricultural economy, like that of India, the cultivation of land and the production of livestock products, particularly milk and milk products, are very closely associated. The line of demarcation between these two sub-sectors drawn for income estimation purposes becomes blurred at times, particularly when estimates are made for the cost of feed for livestock required on the farms for purposes of cultivation and for livestock needed for the production of milk and other commodities.

If these two sub-sectors of agricultural production are combined, omitting the estimate for allied primary products, the difference for all-India between the aggregate of state income estimates and the national estimate comes to 0.8 per cent. But for purposes of analysis these two subsectors must be treated separately.

The aggregate state income estimates of the value of the output in the animal husbandry subsector is larger by 20 per cent than the corresponding national estimate. Among individual states the two estimates differ, from 14 per cent for Orissa to 60 per cent for Madras. Such wide differences as this last one may be explained partly by the fact that there are very wide differences among the state reports in the netting ratios, i.e., in the deductions made from the gross value of animal husbandry production for the cost of feed of animals not used for field services, and the cost of other materials used, as well as depreciation. For instance, Assam, with a netting ratio of 16.1 per cent, is at the lowest end, and West Bengal with one of 84.4 per cent is at the top end (Table 6). Another probable reason is that the national estimates of the value of output in the animal husbandry sector are underestimates. As many as ten state estimates are larger by a significant margin than the corresponding allocated shares. West Bengal would be added to this group, if it is considered that the netting ratio in the "West Bengal Report" is so high that the estimate of the net value of income in animal husbandry is much lower than it would be, if a more modest netting ratio had been adopted.

Forestry. According to the revised estimates the national income from the forestry subsector is Rs 1,338, as compared with the conventional series estimate of Rs 725 million. The aggregate

G.R.V.T

of state estimates falls short of the revised national totals by Rs 778 million, or 58 per cent. It appears that the state estimates are not based on the additional data collected through the State Forest Departments which form the basis of estimation of the revised national totals.

Fishery. The sum of state income estimates in this subsector is fairly close to that of the revised national totals, but for some of the individual states, particularly the maritime states of Kerala, Mysore, and West Bengal, the differences between the allocated shares from the national totals and the direct state estimates are significant. The CSO publication provides the state breakdown of net value of marine and inland fishing which could help in the revision of state estimates for this subsector.

V

Mining, Manufacturing and Small Enterprises

The sum of state income estimates is almost identical to the revised national totals in this sector of the economy. At the subsectoral levels, however, the two measures differ significantly. The chief source of the differences between the two sets of measures lie in the estimates relating to the small enterprises. But all the three subsectors, mining, factory production and small enterprises are examined separately.

Mining. The two principal producers of minerals in India are Bihar and West Bengal; the differences between the allocated shares and the state-report estimates are 7 per cent in the former and 5 per cent in the latter. In West Bengal, the probable reasons for the difference appear to be comparatively higher rate of deductions for netting to arrive at the net value of the minerals. As in the case of netting ratios for livestock products, those employed by West Bengal in the field of mining are more than twice as high as the all-India average and approximately three times as high as those of several other states (Table 6, Col 5). At times, significant differences have been noticed in the data available with the state agencies and those published by the central organizations. Mysore state's estimate, for example, of the gross value of minerals of Rs 58 million, "based on the data available in the Department of Mines and Geology, Mysore state",¹⁴ differs from the corresponding estimate of Rs 97 million

published by the Indian Bureau of Mines.¹⁵

Factory Production. For purposes of national income estimation, the manufacturing and processing activities are divided into two subsectors: (1) factory production covering organized industrial units; and (2) small enterprises composed of unorganized smaller handicraft type units and one-man units of independent workers. A factory, according to the Indian Factories Act, 1948, covers establishments employing ten or more workers using power, or twenty or more workers without the aid of power.

The aggregate of state estimates relating to income arising in factories is higher by 14 per cent than the national totals. Since it is one of the most organized sectors of the economy, the available data are comprehensive and relatively accurate. The national totals are based on census-type survey and are expected to possess greater reliability than the corresponding state estimates. If details were available of all the industrial groups included in the state reports, it would have been possible to identify the sources of the above differences.

Small enterprises. The aggregate of state estimates of income arising in the

small enterprises subsector differs from the national estimate for 1955-56, by about 12 per cent; for individual states differences range from 10 per cent in Bombay to 108 per cent in Assam. The chief sources of these differences appear to be the following: (1) The average value added per worker differs rather widely between states and also between states and the corresponding all-India average (Table 7); (2) The scope of the subsector, i.e., the occupational subdivisions included in it, is not uniform, at least in some state estimates, and does not correspond exactly to the coverage of the national estimate. The major difference, as will be discussed below and as can be seen from Table 7, is the inclusion or exclusion of construction activities. In the allocation procedure the scope of each subsector is identical with that of the national estimate. In addition to differences in the over-all scope of the small enterprise subsector, there are differences in its composition among industries. For example, in Delhi and Punjab 3 per cent of the small industry working force is in "food, drink and tobacco processing", whereas the share of the labour force of this industrial branch in Orissa is 25 per cent. Similarly the share of workers in textiles ranges from 18 per cent in Bihar to 40 per cent in Bombay, and that of workers in metal industries from 6 per cent

in Rajasthan to 21 per cent in Bihar.¹⁷ At the same time, productivity in the various industries, at least on the national level, varies greatly. For example, productivity per worker in the "metal and industrial engineering"

group is 53 per cent greater than in the "food, drink and tobacco" group and 41 per cent greater in "leather and its products" than in "textiles and tailoring".¹⁸ Because of the absence of detailed data on these matters in most state reports, we could not take account of variations in the value added in small enterprises among states, and this, in turn, is partly responsible for the wide differences observed between some state estimates and allocated shares of national income estimates in this subsector.

If the figures in the state reports of value added per worker assumed to be accurate measures of economic performance in the small enterprises subsector, then the corresponding national average of value added per worker needs revision, because only the three states of Kashmir, Punjab, and Delhi in which value added is higher than the national average (Table 7) cannot compensate for the states with figures well below the national average. On the other hand, if the national estimate is assumed to provide an accurate measure, then the corresponding state estimates need reappraisal. In view of the very wide difference in the two estimates, it is probable that both sets of estimates require extended further investigation and surveys. However, some state estimates themselves are based on somewhat unreliable and limited empirical information, as is indicated quite clearly in some of the reports.

For example, the "Orissa Report" states that figures for value added in the small enterprise subsector has been computed from findings of the National Sample Survey,¹⁹ a series of scattered data which does not form a sufficiently large sample for any findings relating to the state alone. In Assam a very rough estimate, essentially a barely informed guess was made,²⁰ and in Andhra Pradesh, earnings data were collected on an "ad hoc basis in respect of a few units in the state."²¹ The "West Bengal Report" frankly admits that the difficulty of estimating value added in this subsector has been due to the absence of regular statistics which would have been relevant,²² and the Punjab Report states that earnings data were collected "by personal inquiries from eleven centres".²³ Similarly, in Madhya Pradesh data on value added and earnings of workers were taken from available scattered information derived from a few "small scale and cottage industry surveys carried out in the

different regions of the State".²⁴ It is clear that all these methods of collection of data can scarcely be said to provide reliable and definitive figures for a state income estimate.

As we already mentioned earlier, one of the most serious sources for variations in state and national estimates in this subsector is the treatment of construction. But in some states, e.g. in West Bengal, the difficulties are even enhanced by inadequate attention to working force estimates in construction. According to the state estimate, there were only 40,000 workers engaged in construction activities in West Bengal in 1955-56,²⁵ whereas, according to the 1951 census, there were 104,599 self-

supporting persons engaged in construction in the state.²⁶ If the earning dependents who derive income from construction are added to the number of self-supporting persons, and, if the 1951 figure of total employment (self-supporting persons plus earning dependents) is projected to 1955-56, the likely employment in West Bengal in this subgroup would come to approximately 130,000 workers. It is not clear from the state report whether and where the remaining workers are included. If the income for this group has not been estimated or accounted for, then this would partly explain the wide difference observed between the allocated and the direct state estimates.

The growing importance of construction activities and their manifold forms of organization and varying kinds of technology is increasingly recognized and so is another important problem, that of the great difference in the value added and in earnings in small industry in urban and rural areas. It is very satisfying to see that these distinctions are clearly made in a new publication of the National Income Division of the Central Statistical Organization. This group is following the recommendations of the United Nations in classifying construction separately, and the small enterprise estimates of state income reports would greatly profit if they also adopted this procedure. A review of the

pertinent figures relating to the year 1955-56, based on the revised national income estimates published by the Central Statistical Organizations, shows that the national average of value added in construction was Rs 720, and in small enterprises Rs 678. But this last figure is further broken down into a rural and an urban portion, the former showing an amount of Rs 355 and the latter of Rs 636.²⁷ These are very wide differences which appear to indicate that average earnings in rural small enterprises are of the same order of magnitude as average wages of rural labourers, whereas in the urban areas they approximate the earnings of industrial and other urban workers. These differences indicate, however, that only a good deal of further research and study, not only of the occupational composition of the workers in small enterprises, but also of their residence in rural and urban centres will yield more reliable and accurate data for state income estimates.

VI

Commerce, Transportation and Communication

The over-all difference between the aggregate of state estimates of income arising in 1955-56 in the commercial, transportation and communication sector and the corresponding national estimate is 7 per cent. The aggregate state estimates are lower than the national estimate at the subsectoral levels; and the greatest difference of 22 per cent is encountered in the railways subsector.

Railway. It is surprising that, despite the availability of ample statistical information, there is such a wide gap in the aggregate of state estimates and the corresponding national estimates. The "NIC Final Report" states, on this point, that "for railways, apart from the Railway Budget and financial accounts relating to railways, the annual reports of the Railway Board provide a wealth of statistics relevant or national income purposes."²⁸ In view of the comprehensive statistical coverage of the national railway system, one is inclined to accept the national estimates as having greater validity than the state reports. Hence the difference of 22 per cent between the aggregate of state estimates and the national estimate as well as the differences between the allocated shares of national income and the direct state estimates by themselves must be attributed to vary-

ing underlying assumptions and sources of estimation in the state reports. In some cases the proportion of route mileage in a state has been used, in others a combination of the two measures for the apportionment of wage and salary income, on the one hand, and surplus derived from railway operations, on the other, has been employed. West Bengal used the first principle of apportionment,²⁹ Punjab and Bombay, the second,³⁰ and Andhra Pradesh and Mysore the combined measure.³¹ A procedure not

too different from the last was employed in the "Delhi Report", only that there the amount of wages and salaries of railway workers was obtained from local sources, to which was added the share of total surplus earned by the railways on the basis of the proportion of the state railway wage bill to that of all-India.

In the light of this evidence, it is clear that lack of uniformity in the method of estimation on the state level is the likely reason for the less than full apportionment of the total

national income earned in the railway sector. For example, the West Bengal estimates based on proportionate railway mileage within the state boundaries are not, perhaps, using the best possible allocation for the surplus because: (1) the railway traffic of passengers and goods is comparatively heavy for a small state such as West Bengal, due to the state's large mining and industrial complex and to the fact that Calcutta is an important import and export centre for the eastern part of India; (2) the number of railway workers employed in West Bengal was estimated by assuming that it bore the same ratio to all-India railway employment as the ratios of railway mileage; and by this procedure comes to 65,000 persons.³² According to the 1951 census, there were over 95,000 railway workers in the state of West Bengal. If this 1951 figure were to be projected for a likely increase by 1955-56, the state estimates of the railway working force differs considerably from what may be assumed to have been actual employment. It is not clear from the "West Bengal Report" where the other approximately 40,000 workers and their incomes are counted;³⁴ (3) another piece of evidence of the probable underestimation by the "West Bengal Report" of the contribution of railways to state income is a comparison with Bombay. According to the 1951 census, the number of railway workers in Bombay state is very close to that of West Bengal, but the Bombay estimates of income from railways in 1955-56 are Rs 459 million as compared with West Bengal's estimate of Rs 158 million (see Table 1, p 1516). According to this line of reasoning, the Uttar Pradesh estimate of an income of Rs 84 million for its 96,000 railway workers, according to the 1951 census³⁵—again, almost the same number as in West Bengal and Bombay—appears also to be too low.

Communication Services. The state aggregate of estimated income from this subsector, which includes the activities of Posts and Telegraph Departments and Overseas Communication service, falls short of the corresponding national totals by Rs 42 million, or 8.4 per cent. The principal reason for this difference appears to be the omission of state share of operating surpluses of these undertakings. From the available data of value added per worker for the five states, all except one are well below the national average (Table 7, col 5); even

Maharashtra figure is 20 per cent below the national index. It may be recalled here that Maharashtra is the highest urbanized state in India. In some states, e.g., Andhra Pradesh and Madhya Pradesh, the basis of estimating income in communications is the same as ours, i.e., by using the estimated number of persons engaged in communication services in each state. But in other states, such as Bombay, Punjab and Delhi, the estimates of total earnings were obtained by the use of local employment and average annual earnings data and the share of each state of the estimated national surplus earned by the communication services was apportioned in accordance with the number of employees. Separate income estimates for communication services are not presented in the "West Bengal Report" and the "Kerala Report", which appear to have included them with all or part of the transport sectors.³⁶ The average earnings per worker in these two reports are derived from surveys conducted in each state. Since it is not stated explicitly in the state reports that the state's share in the estimated national surplus from these services is taken into account, this omission probably crept in.

Organized Banking and Insurance and other Commerce and Transportation. The aggregate of state income estimates in these subsectors are higher than the corresponding national estimate by Rs 1,577 million, or 13 per cent. In the case of other commerce subsector, which accounts for over three-fourths of the total income in this group, the estimated value added per worker in all the states, except one, is significantly higher than the corresponding national estimate (Table 7, Col 9). The detailed examination of the methods of estimation and the sources of data in the various state reports reveals that much remains to be done before any serious confidence can be placed in them. The state estimates, in general, rely heavily on national estimates of annual earnings because of paucity of local data. For example, in Andhra Pradesh³⁷ the earnings data reported in the NIC Final Report were used, and the same data were used in Madhya Pradesh³⁸ and Bihar³⁹ for non-taxed income in the other transport and commerce subsector.

In Punjab a curious method has been used: "the contribution to State Income from this sector has been based

on the ratio of average earnings (annual) per engaged person in all sectors except this on the one hand and only this sector on the other, at the Union (national) level. The per head average earnings in all other sectors taken together in the Punjab, have been multiplied by this ratio to get the average per head earnings in this sector." It is observed that the average annual earnings per worker engaged in this subsector obtained for Punjab are not only the highest among all states in India but also 67 per cent higher than the corresponding national average (Table 7, Col 9). How much confidence can be placed in the findings of income estimates in this subsector in the Punjab Report remains an open question.

In Mysore some information available in the State Department of Labour relating to industrial and plantation labour was utilized. These data also included several establishments engaged in transport and commercial undertakings.⁴⁰ In the Kerala Report nothing is said on the method by which average earnings in this subgroup were estimated, and the Bombay, Delhi, Himachal Pradesh, Orissa and West Bengal data are based on local data collected through various surveys and investigations. The Bombay, Delhi, and Orissa estimates, as also the Madhya Pradesh estimates, as pointed out earlier, distinguish between taxed and non-taxed incomes in this sector. Hence, we see that a great variety of procedures was used.

We shall now turn to a brief discussion of some of the problems arising in using these different methods of estimation. The procedure used by the "Mysore Report" very likely produces misleading results, since the data available in the Department of Labour are probably obtained from highly organized industrial, transport and commercial companies, whereas a large share of the persons engaged in economic activities subsumed under this subsector fall into non-organized trade and transport. Within the non-organized part of this subsector, which is made up of hawkers, peddlers, street vendors, petty traders, rickshaw drivers and a multitude of similar self-employed persons, there is a large amount of underemployment, there are many earning dependents, and there are varying levels of low annual earnings, which differ greatly from those of the labor force in organized industry and commerce. Hence, the application of data collected in a survey of organized firms is likely to produce too high a level of

income for this subsector. In the "Kerala Report", in which, as we mentioned earlier, no explanation of the method of estimation is given, average earnings of employers are estimated to have been four times, and of independent workers twice, those of employees and earning dependents. On the other hand, the "Bombay Report" states that "the average income of an employer (or independent worker) engaged in trading activities... is about 20 per cent higher than the average earnings Survey."⁴¹ It is likely that, on the basis of this evidence from an actual survey, though carried out in another state, the Kerala estimate is too high. This impression is confirmed by the fact that, in the small enterprise subsector, average earnings in Kerala are only 46 per cent of the national average, whereas in this sector, which is composed largely of small and unorganized traders, it is 122 per cent of the national average (Table 7).

In two states, the difference between the state estimate for the income earned in this subsector and the allocated share of national income is relatively large. In West Bengal the independent estimate is more than 21 per cent lower and in Delhi it is more than 28 per cent higher than the allocated share. The reasons for these discrepancies may be explained as follows: the "West Bengal Report" accounts for the annual earnings of 94,000 workers in the communication and transportation subgroup whereas, according to the 1951 census there were 232,000 self-supporting workers engaged in transport other than railways in West Bengal.⁴² If the 1951 census figures of the working forces are projected to 1955-56 at a rate of growth of 16 per cent, which is the rate estimated in the "West Bengal Report", and if additions are made to account for the earning dependents who derive their income from activity subsumed under this subsector, the probable employment in the subsector in 1955-56 may have been nearly 300,000. The wide difference between the allocated share and the "West Bengal Report" estimate for other commerce and transport appears to be due mainly to this serious difference in the estimate of the working force. In Delhi the difference between the two estimates may be due (1) to the limitations of the taxed income data which form the basis of part of the state income estimate, (2) to the fact that Delhi, the commercial and financial hub of the northwestern part of India, and a heavily urbanized area, has a higher

level of average earnings than other states in India, and (3) to the inclusion in the state income estimate of the banking and insurance subsector, thus yielding a figure which contains economic activities additional to that resulting from the allocation method. If banking and insurance were excluded, the difference between the two estimates would be lower by approximately 10 per cent.

VII

Other Services

For purposes of analysis, the sector covering all other services may be divided into two parts: (1) government services, professions and liberal arts, and domestic services; and (2) income from residential property. The reasons for combining the three subsectors in the first group are as follows: (1) there is no conceptual uniformity in the delineation of the scope of government services and professions and liberal arts in several state reports. The working force estimates for the professions and liberal arts subsector are obtained from the census records, and, according to the 1951 census economic classification scheme, those government employees classifiable under other occupational subdivisions are excluded from the group of governmental employees. Government employees engaged in medical or educational services, for example, are classified under professional subdivisions, instead of being included in the group of government employees. (2) If government employment data are obtained directly from local sources, and the working force estimates for professions and liberal arts are obtained from the census figures, adjustments have to be made either in the census data or in the data obtained from local sources in order to avoid double counting, since many professional people employed by the government would otherwise be counted twice. (3) Some of the state reports, such as those of Madhya Pradesh and Uttar Pradesh, have not attempted separate estimates for these subsectors and have treated them collectively.

In view of these limitations, it is desirable to combine, for purposes of comparison, the three subsectors of government service, liberal arts and profession, and domestic services. The method of income estimation for these subsectors in several state reports is identical with that adopted for the allocation of national income among states. For either all or part of the

workers, income estimates are made on the basis of the number of workers engaged in these services in each state. The aggregate of state income estimates and the national estimates for the three subsectors differ only by 1.2 per cent. But inspection of Tables 1 and 4 yields the result that, in some states, the differences between the estimate based on allocation of national income and that produced by direct estimation in the state reports is large, in fact, they are among the largest, proportionally, of any subsectors. The explanation of these wide divergences tends to show clearly one important weakness of the method of allocating shares of national income among states on the basis of a rather inflexible formula. For the allocation method does not take account of differences in earning levels in different states, which, in some cases, may be substantial, especially in professional and related services. In addition, as concerns the government services subsector, some differences may be due, at least in part, to the fact that the state estimates are based on available local data for 1955-56; whereas the allocation of shares among states was done on the basis of data published in the 1951 census. These findings suggest one important point about the nature and validity of national income estimates, in general. They show that the difficulties in the economic sectors in which the income approach has to be used tends to produce much less reliable data than in the economic sectors in which the production approach can be employed. For, although the differences laid bare by the comparisons are probably due more to the shortcomings of the allocation method than to the direct estimates at the state level, quite a few of the state estimates in this field were made by procedures very similar to the allocation method; and even where direct estimates were made, a large number of points could only be approximated, which implies a high degree of inaccuracy. The result of this is that improvement of state income estimates depends, to a considerable extent, on improvement of estimates in those sectors of economic activity in which the income approach must be applied.

A few further shortcomings of some state estimates relating to these subsectors may be noted: (1) The state estimate of West Bengal does not include the annual income of defence personnel stationed within the state boundaries.⁴³ This omission is probably due to the fact that the employment data of defence personnel are not pub-

lished separately in the census reports for security reasons. But this difficulty has been overcome in other state income studies by using the 1951 census data in which army, navy and air force personnel have been included in the census occupational division 8.8, Employees of the Union Government.⁴⁴ (2) No account has been taken of house-rent allowances paid to government employees.⁴⁵ (3) Since the government employment data have been obtained by direct enquiry from local sources and the working force estimates for the professions and liberal arts and domestic services subsectors were obtained from the 1951 census, it is hoped that in the West Bengal Report the necessary adjustments were made to avoid double counting.

The estimates of average earnings in professions and liberal arts and in domestic services are based, according to the "Punjab Report", on "personal inquiries from ten urban centres and some forty-five villages." This sample is of limited validity for providing reliable data applicable to the entire state, a fact which is recognized by the authors of the Punjab Report themselves.⁴⁶ (2) The estimates of the income of army and air force personnel were made on "the basis of the ratio between the total population in the State and the Indian Union."⁴⁷ It is probable that this ratio results in too low an estimate, in view of the fact that the number of troops stationed in Punjab is likely to be rather large because of its propinquity to West Pakistan and the Ladakh area in Kashmir state.

VIII

Income from Residential Property

The national estimates of the actual or imputed annual rental value of residential property are made separately for urban and rural dwellings. In the case of urban houses estimates are made "... on the basis of average rental per house and on the basis of municipal collection of house tax and an assumed relationship between taxes paid and the gross rental."⁴⁸ From the estimated gross rental value of urban residential property, deductions are made for cost of repairs and maintenance and municipal taxes collected to arrive at the net contribution by this subsector to total national income.⁴⁹ The estimates of annual rental value of rural houses are made differently, i.e., "on the basis of rural interest rate."⁵⁰ The gross annual rental value of rural residential property is taken as 10 per

cent of the estimated current value of all the rural houses; deductions are made for annual costs of repair and maintenance to arrive at the net annual rental value. There appears to be an element of double counting in this procedure of estimation of the contribution of residential property to national income. In general, the houses in India, and, indeed, in any predominantly agricultural economy, are used not only for residential purposes, but also as work places. This is particularly true of rural houses, where the same structure is used as a cattle shed, a storage place for agricultural products, a store, or as a workshop in which cottage and handicraft products are manufactured. To the extent to which a house is put to other than residential uses, there is double counting, since the contribution of the structure has already been estimated in other sectors, depending upon the nature of the use. The difficulties of obtaining the necessary statistical information to avoid this type of double counting are doubtless great, but the fact remains that double counting is there.

The method of estimating the contribution to national income of urban houses by using the relationship between the municipal taxes collected and the gross annual rental value is not without limitations. The basis of taxation may differ from one municipality to another. In some places taxes may be based on (1) a flat rate on the rental value; or (2) a flat rate on the capital value; or (3) on different rates on different capital value groups. Another difficulty may arise because of "underestimation due to under-assessment of the value of property and poor collection of tax—both understood to be general features of the municipal house tax."⁵¹ The "Bombay Report", highlighting the limitations involved in this procedure, says, "It may be stated here that the receipt of taxes has no direct relation with the letting value because in case of a number of municipalities the actual collection of taxes falls short of actual demand of taxes due to heavy arrears. The correct procedure would be to estimate the letting value on the basis of the annual demand of taxes."⁵² The procedure followed by the state estimates is, in general, identical with that of the national estimates. The number of rural and urban residential houses, which forms the basis of estimation, is taken, like the national estimates, from the 1951 census. In general, the state estimates of the rental value of rural resi-

dential property are based on the national average as estimated in the "NIC Final Report", after making adjustments for changes from one year to another: whereas the estimates of urban property in some of the reports, e.g., those of Bombay, West Bengal, Delhi and Orissa, are based on local data, particularly data relating to municipal taxes. The limitations of some state estimates for which the necessary information on their underlying assumptions is available, are discussed below.

A few general remarks on the likely share of this item in the total state income may be useful. The share of rental value will be greater in more heavily urbanized states than in less urbanized ones.⁵³ The share of rental value, other things being equal, will be the higher the lower the general level of income in a given state, and the share of rental value, again other things being equal, will be the higher the better the quality and size of the residential structures. These three factors, i.e., degree of urbanization, level of average earnings and the size and quality of structures will affect the share of the gross rental value of residential properties in a state income. Their net value will also depend upon the magnitude of the netting ratio applied. Finally, if the estimated rental value in 1955-56 is based upon data from the 1951 census or other figures relating to a different year, the estimate for 1955-56 will also depend upon the price index employed. In the analysis of various state estimates of rental value of rural and urban residential houses all these factors will be considered, wherever their impact is discernible.

According to the findings of the "Assam Report", the income from residential property is only 0.6 per cent of the total state income in 1955-56. This ratio is remarkably low compared with the corresponding national average of 4 per cent. In Orissa, where the percentage of urban houses is almost the same as in Assam (4.0 per cent as against 3.9 per cent, see Table 8), the ratio of income from residential property in 1955-56 is 5.2 per cent. Even if we allow that the Orissa figures may be somewhat overestimated, a point which will be discussed below, they nevertheless indicate that the Assam estimates are probably too low. Some of the underlying assumptions in the state report supply most likely grounds for such a low percentage of income from residential property in Assam: (1) The state estimate does not include the annual rental of "25 per

cent of rural houses in the plains and the rural houses in the hills,"⁵⁴—on the assumption that these houses have no rental value. On the other hand, the national estimates of income from rural residential property include the imputed rental value of all the houses recorded in the 1951 census. (2) The annual cost of repairs and maintenance of the rural houses is assumed to have been 42 per cent of the imputed annual gross rental value⁵⁵ as against a national average of 28 per cent.⁵⁶ The "Assam Report", recognizing the unreliable basis of this estimate, says the "imputation of rental value of rural house property has been very roughly made in view of the absence of any data directly bearing on the rental value of rural houses."⁵⁷

The income from residential property in Kerala constituted, according to the state estimates, 5.4 per cent of the total state income in 1955-56. In explaining the basis of its income estimate in this sector, "the Kerala Report" says that, "the net value of houses in Kerala is estimated from all-India figures in proportion to the number of occupied houses",⁵⁸ but does not specify whether the separate estimates have been made for rural and urban houses. In the field of the rental value of residential properties, as in so many other areas (small enterprises, non-organized commerce and transport, domestic services and others), the separate treatment of urban and rural data is highly desirable. As we shall show, this reasoning applies with full force to the estimate of the rental value of residential property. According to the 1951 census, the percentage of urban houses to the total number of occupied houses in Kerala was 11.4, whereas the corresponding all-India percentage was 16.0 (Table 8). We suspect that the omission, to take account of this difference in the share of urban and rural houses, has resulted in the state estimates of income from residential property being rather high, and perhaps too high. It should be pointed out that in allocating national income in this subsector among states, account is taken of the proportion of rural and urban houses as well as composition of city-size in each state.

In Madhya Pradesh and in Andhra Pradesh the state estimates were obtained with the help of the national average of the gross rental values of urban and rural houses as estimated in the "NIC Final Report" for 1950-51. Adjustments for 1955-56 values were made on the basis of changes in the

wholesale price indices of food articles.⁵⁹ The estimated gross rental value per rural house in 1955-56 in Madhya Pradesh was Rs 37, whereas the all-India average was Rs 50 in 1950-51 (Table 8). No changes were made in the average annual rental value of urban houses and the national average of 1950-51 was assumed, in the Madhya Pradesh Report, to hold for 1955-56. The implied assumption is that there exists a direct relationship between the price of food and the rental value of a rural house, but no such relationship is assumed between prices and the rental value of urban houses. The national estimates show that income from residential property during the period from 1950-51 to 1955-56 increased by 15 per cent, from Rs 4,000 million to Rs 4,600 million.⁶⁰ But, according to the "Madhya Pradesh Report", estimates of the rental value of rural houses declined from Rs 286 million to Rs 266 million, or by 7 per cent during the same period.⁶¹

The state estimates of income from urban residential property in Orissa are computed "on the basis of information received from some municipalities in the State for the purpose."⁶² According to the "Orissa Report", income from urban houses increased by 93 per cent⁶³ from 1951-52 to 1955-56 as against an increase of only 12 per cent in the national estimates.⁶⁴ It is probable that the information furnished by "some" municipalities, which forms the basis of estimation, does not provide fully accurate data for the entire state. The estimates of the rental value of rural residential property are made by adopting the national average during 1950-51, "after being duly adjusted on the basis of change in the annual rental income per urban house during the corresponding period."⁶⁵ In the relatively low-income state of Orissa the national average is inflated by 46 per cent⁶⁶ whereas in the economically more advanced state, comparatively, of Madhya Pradesh, the same figure is deflated by 26 per cent for purposes of state income estimation.⁶⁷

Punjab is, comparatively, one of the more economically developed states in India, and, apart from Delhi, has the highest per capita income in the country. Yet, the income from residential property, according to the state estimate, constitutes only 1.9 per cent of the total state income in 1954-55. This is, excluding Assam, the lowest percentage (Table 8). The con-

dition of rural housing in Punjab is better than in other states, since the "Punjab Report" itself estimates the average value of a rural house to be Rs 1,447 in 1954-55⁶⁸ as against a national average of Rs 877 in 1950-51.⁶⁹ The percentage of urban houses to the total number of houses is also greater than the national average (Table 8). Hence, the main reasons for the low ratio of income from residential property exhibited in the "Punjab Report" are not the poor quality of housing or the low proportion of urban residential property, but appear to be the following: according to the "Punjab Report" the gross rental value per rural house was taken to be 8 per cent of its current value,⁷⁰ whereas the national estimates are based on gross rental value of 10 per cent.⁷¹ Deductions for the current year's depreciation from the estimated gross rental value of rural residential property amount to 54.4 per cent, or 4.4 per cent of the value of all rural houses. Additional deductions for repairs and maintenance amount to 20 per cent of the gross rental value of rural houses. In other words, about three-fourths of the estimated annual gross rental value is deducted to arrive at the net contribution of rural residential property to total state income. Similarly, from the estimated gross rental value of urban residential property, 43.6 per cent is deducted for depreciation; and 10 per cent for repairs and maintenance. For these reasons, the average annual net rental value of urban houses is considerably below that computed in other state reports (Table 8). Hence, Punjab data in this subsector are lower because of netting procedures and not because of poor housing or a preponderance of rural residences.

IX

Conclusions and Suggestions

This survey of state income reports may be concluded by suggesting some improvements of estimation procedures and presentation of findings. The general impression gained from the reports available to us is that the main objective of most studies is the determination of a single, often doubtful and little supported, figure of global state income. The details of how this global estimate is reached appear to be lost sight of in many cases. Though we do not wish to dispute the importance of this objective, we believe that the state income estimates may properly perform other functions at the

present state of planning and economic activity in India. In the first place, any state income study will reveal, if properly made, the economic structure of a state, the areas of economic activities in which it is strong and those in which it is weak. In addition, any state income study, if properly presented, will provide a guide for similar studies in other states. New approaches to income estimation made in one state may exert an influence on procedures used in others, with the result that the over-all set of practices in the estimation of state income by all states will be improved. If this improvement takes place, it will also help the general estimation procedures of national income.

Lack of Detail. The usefulness of state income studies lies in the methods of estimation used, the explicit identification of underlying assumptions, and the sources of the statistical information which form the bases of the estimates. The lack of exposition of these details does not permit the reader to appraise the methods used and the validity of the data employed. Adequate comparison of state estimates, either with one another, or with corresponding national totals, is very much limited in the absence of these details. If all the underlying detailed estimates were available in the central and the state income studies, it would be possible to identify the sources of any differences between the two measures of national income, one compiled on a national scale by the CSO, and the other arrived at by aggregating the incomes of all Indian states. The improvement of the income accounts at the central and state levels may be viewed as a two-way traffic: the central estimates, at least of physical annual output, may serve as control figures, and the state data of prices (assuming they reflect an accurate picture of local economic conditions) may serve to check the national valuations arrived at in the CSO's estimates. It is not suggested that either the central or the state findings are more accurate, but, in an attempt to reconcile the two estimates, one may find ways to improve both sets of figures. With the currently available information from the state reports, it is not possible even to check whether the data of annual physical output of agricultural crops in the national and the aggregate of state reports are the same or not.

Basic Data. The basic data of such items as annual production, prices, employment, and average annual earnings

employed in a state report, should be included, preferably in an appendix, even if these data are obtained from standard documents such as the "District Census Handbooks" or "State Statistical Abstracts". These documents are not readily available to other research workers.

Netting Ratios. Another source of under- or over-estimation in the state reports appears to be arbitrary and not well supported netting ratios applied to the evaluation of agricultural crop output, livestock production, and production in the mining subsectors. We have discussed some of the problems which arise in these subsectors in earlier part of the paper (Table 6). Though some netting ratios employed in some state reports may be based on inadequate samples, it is possible also that some of the ratios employed in the national estimates need refinement. This is an area of research in which substantial progress is still required.

Distribution of National Totals among States. In some subsectors such as railways, communication services, and organized banking and insurance, in which statistics are available on the national level, and separate accounts by states are not normally maintained, it is necessary to apportion national totals among component states. The basis of allocation of national totals will depend upon the availability of relevant information. As revealed by the state reports available to us, most state reports have adopted different bases of allocation. This had the result, in the case of railways for example, that the value of output of Rs 2,200 million by railways, is reduced to an aggregate income derived from the state reports of only Rs 1,723 million. Similarly, the two measures of income from communications services differ by about 8 per cent.⁷² These examples show that there remains need in the co-ordination between central and state agencies engaged in national income compilation work. Regardless of what basis of allocating national totals among states is used, a common procedure would ensure statistical uniformity among state and national data. At the same time, it is important to consider carefully which formula of allocating national totals is the best, since the adequacy of the formula selected will enhance the accuracy and reliability of state income totals.

Sectors and Subsectors. Frequently the state reports mention the lack of required data for state income esti-

mation purposes, particularly average annual earnings of various groups of workers, for example, those engaged in transport, commerce, and other services. The state income estimates for these subsectors are obtained either by using national averages derived from the "NIC Final Report", sometimes adjusted to local economic conditions, or by making use of locally available data. Some of the more enterprising state agencies have made efforts to collect fresh data for state income purposes. Whenever, because of lack of local data, use is made of national figures, the attempt should be made to form as many homogeneous subgroups of economic activity within each subsector as possible. This can be done by making the most extensive use of data available in census records. The present method, used in some state reports, of treating one large group, such as "other services, including construction workers, professions and liberal arts, domestic services, and government services", fails to reflect even the regional differences in the averages of earnings data upon which their estimates are based. We particularly wish to point out that the recent publication of revised national estimates (CSO) does not include the average earnings of all those sub-groups which are mentioned in detail in Appendix Table 12.1. For example, under the medical and other health services group, there are seven or eight other subgroups for which average annual earnings data are not published.⁷³ We further wish to add that greater realism would be injected in the national and state income accounts, if attempts were made to obtain separate income estimates for urban and rural workers engaged in non-agricultural occupations. No novelty is claimed for these suggestions, since some state reports are already employing them and we merely wish to stress the need of a fuller use of this approach in all state and national income reports.

Improvement of Classification of Sectors of Economic Activity. The currently used classification of economic activities in national and state income estimation studies needs a thorough re-appraisal to suit the growing needs of economic planning in the country. The recent introduction in the revised national income series of a separate subsector of construction under the sector mining, manufacture and small enterprises, is a move in that direction. But other changes, espe-

cially in the very cumbersome services sector are needed. In particular, the workers engaged in personal services, such as barbers, cleaners, and washermen need not be combined with highly skilled professional workers engaged in medicine, education, journalism, and others, because the two groups have nothing in common. Separate subgroups, one under the heading of Personal Services, and the other of Professional Services should be formed. Similarly, the Commerce, Transport and Communication sector may be divided into the following distinct economic groups: (1) Whole-sale and Retail Trade; (2) Finance, Insurance and Real Estate; (3) Transport—rail, road, water, and air; and (4) Communications and Public Utilities. These changes, as well as others, may often be difficult to make, but they are not impossible.

Time Lag in the Publication of State Income Reports. In general, there appears to be a three to five year lag in the publication of the state income data, and some of the studies have even taken a longer time; and still some (e.g. Madras, Mysore and Rajasthan) have not been published. As a result of these prolonged delays, these otherwise valuable findings are becoming to have chiefly an historical interest rather than forming an underpinning of economic planning. In this context, a well-known authority commented thus:

In national accounting, as in any other field, the statistician has a responsibility to ensure that his data reflect and do not distort, reality. At the same time, he must avoid being perfectionist. Information should not be withheld merely because it is approximate.⁷⁴

FROM THE CHAIR

The Bombay Gas Company Limited

Speech by the Chairman, Shri NK Jalan

Present Pricing Policy Deters Economic Growth—Opines Shri Jalan

FOLLOWING is the Chairman's Address by Shri N K Jalan at the Annual General Meeting of The Bombay Gas Company Limited, delivered on Thursday, the 30th September, 1965, at Bombay:—

Gentlemen,

It gives me much pleasure to welcome you to the Annual General Meeting and to present to you the Balance Sheet and the Annual Accounts, together with the Directors' Report, for the year ended 31st December, 1964. These have been in your hands for some time now and, with your permission, we may take them as read.

We have just passed through the gravest Emergency in the history of our young Republic because of a massive attack on its territorial integrity by an over-ambitious and unscrupulous neighbour. We, the business community, rose to the occasion as one man and solemnly pledged our all-out support to the Government's defence efforts. We wish to take this opportunity to express our heartfelt gratitude to our brave jawans who gave an excellent account of themselves by throwing back the aggressors and we are proud of them.

One More Year of Heavy Loss

We may now proceed with the business of this meeting. You would have found that the Accounts for the year 1964 reveal, once again, and for the fifth consecutive year, an extremely poor and disappointing financial result of the working of the Company, entailing an abnormal and unprecedented loss of Rs 16.53 lakhs as compared with the loss of Rs 10.31 lakhs for 1963, from its main operation, namely, the production and distribution of gas. This large increase of Rs 6.22 lakhs in the Company's loss resulted from a substantial increase in the costs on the one hand and a significant decrease in the total receipts from the sale of gas and by-products on the other. The increase in cost was largely on account of an increase in the cost and freight of coal and a substantial increase in the total payments to the workers and staff and higher contribution to the provident fund, apart from all-round increases in

the other costs. The average rate of dearness allowance for 26 working days jumped to Rs 115 in 1964, being an increase of Rs 19 per worker, in comparison with 1963. Incidentally, in July this year, it was as high as Rs 126. The decrease in the receipts from sale was largely due to a substantial reduction in the realisation from the sale of coke and other by-products, the amount of reduction being Rs 4.63 lakhs, as compared with a corresponding reduction of Rs 3.08 lakhs in 1963.

Findings of Government Auditors: Mounting Deficits

According to the findings of the Office of the Deputy Director of Government Commercial Audit, which carries out independent audit of the accounts of the Company every year, the Company had incurred recurring deficits in the reasonable return for all the consecutive years, from 1959 to 1964, the deficit for 1964 being as high as 978%, as against 619% for 1963, and the amount of deficit being Rs 19.38 lakhs for 1964 as compared with Rs 13.43 lakhs for the previous year. In this connection, it may be pointed out that, for purposes of calculating reasonable return from 1961 onwards, the Deputy Director of Government Commercial Audit, under instructions from the Government, arbitrarily and drastically reduced the capital base of the Company from that used for the previous 14 years, from 1947 to 1960. Thus, for instance, whereas the capital base used for 1959 was £875,396 (Rs 1.17 crores), the capital base for 1964 was taken at only £198,123 (Rs 25.76 lakhs), which meant an unjustifiable reduction in the capital employed by 78%. Again, whereas, in the years 1959 and 1960, the rate of return on capital was taken at 8.9%, the rate taken for the recent years, including 1964, was 7.5%. On this account, whereas the amount of reasonable return for 1959 was estimated at £77,910 (ie, Rs 10.30 lakhs), the corresponding figure of reasonable return for 1964 was taken at only £14,850 (ie, Rs 1.98 lakhs), the reduction arbitrarily made in the reasonable return being no less than 80%. Had the capital base and the rate of return

thereon for 1964 been calculated under the same principles and methods as had been applied for the earlier years upto 1960, the figure of deficit for 1964 would have become Rs 44.29 lakhs.

No Dividend Payment for Third Consecutive Year

Your Directors regret that, owing to this exceedingly unsatisfactory result of the operation of the Company, no dividend can be paid to the stockholders for the year under review, this being the third consecutive year for which the Company has been unable to declare a dividend. This must be a matter of very serious disappointment to the stockholders, but it is the unfortunate result of an ill-conceived and inequitable price regulation policy imposed by the Government over the years and about which I commented in my annual addresses over the past several years.

Substantial Cost Increases in the Current Year

As regards the current year, there have been already increases in costs on account of substantial increases in the cost of coal and freight and demurrage thereon, the total payment to the employees and cost of stores and all other charges. In view of the continuation of inflationary trends in most cost items, including heavy interest charges on loans and overdrafts, it may be assumed that there would be further cost increases over the remaining part of the year.

The Revised Price of Gas and Its Inadequacy

We are grateful to the Government of Maharashtra for sanctioning, in accordance with the recommendations of the Gas Advisory Committee, an increase in the price of gas from Rs 3.94 to Rs 5.00 per '000 cubic feet. The revised price was effective from 1st February, 1965. The Gas Advisory Committee based its findings and recommendations on the cost data as in the Company's Accounts for the year ended December 1962, together with certain further cost increases in the first half of 1963. The Committee, however, allocated the total costs bet-

ween gas and by-products, thereby reducing the cost of production and distribution of gas by a substantial amount. Moreover, the Committee did not provide for normal increases in the cost of wages and salaries based on incremental scales. Furthermore, although the Company had placed before the Committee the demand of the workers for increase in salary scales and other benefits, the Committee, unfortunately, did not see its way to provide for the same. The Committee, also, made no provision for payment of bonus. Most important of all, the Committee denied the Company the benefit of automatic adjustment of price to significant changes in costs, which is, in practice, enjoyed by the electricity companies and other public utility concerns and which is so important in a period of fast-rising inflationary costs. In this connection, it may be mentioned that although the Advisory Committee's recommendations had been submitted to the Government by 31st October, 1963, the Government sanctioned the recommended price fifteen months later (January 1965) without taking into account the cost increases which had taken place in the interval and about which submissions were duly made to the Government. Consequently, the revised price had already become inadequate by the date when the Government sanctioned it. In the intervening period of two years and three months that have elapsed after the examination of the cost of production and distribution of gas by the Committee, there have been further substantial increases in costs due to inflationary factors. On the other hand, there has been a sizable reduction in the realisations from the sale of coke and by-products. In consequence, the revised price of gas has proved to be inadequate to absorb the post-inquiry cost increases and eliminate the Company's losses, not to speak of providing for a minimum return on the capital invested, which must be considered also as an essential component of fair price.

It is, however, only fair and proper to acknowledge that the Gas Advisory Committee, in assessing the requirements of fixing a fair price for gas, had been guided largely by certain traditional ideas and principles of fixing a fair price. In that context and within the limitations imposed thereby, the Committee had tried its very best to be fair to the Company and to the consumers. In offering our comments on certain aspects of the determination of the new gas price, we only want to

say that some of the current practices on the subject of fixing fair price for purposes of control are outmoded and have increasingly proved to be inadequate and unsuitable for economic price formation, particularly in the context of an expanding national economy and in the setting of a highly dynamic world economy. Many independent thinkers in our country and abroad have commented rather strongly on the inadequacy and unsuitability of the current principles and procedures for the determination of control prices for the basic industries and services. Thus, for instance, the Raj Committee has drawn pointed attention to the inadequacy of the return provided for capital invested in the steel industry by relating such return to the original block. It has strongly urged that, from the economic point of view and in the interest of an expanding economy, the return on capital should be related to the replacement value of the fixed assets. For a similar reason, the National Council of Applied Economic Research has urged that it should be made legally obligatory to allow depreciation on the basis of the replacement cost of the fixed assets. In view of such authoritative criticism, in many quarters, of the current principles of price formation, it is suggested that the policy of control prices should be fully reviewed and re-oriented so as to bring it nearer to the principles of price formation in a free economy and thereby make it more suitable for the requirements of an expanding and dynamic economy.

Urgent Necessity of an Increase in Gas Prices

The Company's cumulative losses at the close of 1964 Accounts amounted

to Rs 24.78 lakhs, being nearly one-half of the paid-up capital of Rs 40 lakhs and free reserves of Rs 12.61 lakhs, taken together. As explained before, the revised price has already proved inadequate to absorb the cost increases, eliminate the Company's losses and provide for a reasonable return on the capital invested. In this situation, the Company cannot provide adequately for normal repairs and replacements, maintain the high quality of its service and carry out its legitimate and much-needed expansion programme. The Company, therefore, proposes to submit a Memorandum to the Government with an earnest request for an early and adequate increase in the price of gas.

Recent Increases in Some Control Prices at Short Intervals

As mentioned earlier, a period of over two years has already elapsed since the Gas Advisory Committee formulated its findings and recommendations regarding the revised price of gas. In a markedly inflationary situation, a period of two years is certainly a sufficiently long interval for a revision of a control price like that of gas. Indeed, there are many recent precedents where the prices of basic commodities and services have been revised at short intervals. This would be seen from the table below. It may also be noted that the price of coking coal was increased in 1961, 1962, 1963 and 1964. In 1965, its price has been already raised thrice—in January, May and June, respectively. In all these cases of frequent price revisions, increases were sanctioned to meet significant cost increases. Thus, for instance, the latest increase (dated

Recent Increase in the Rate of Certain Basic Services

Items	Date	Amount of increase Rs P	Date	Amount of increase Rs P	T O T A L			%
					Amount of increase Rs P	Interval (months)	of increase	
Bus fare in Calcutta (lowest stage — 7 paise)	29.4.64	0.01	1.2.65	0.02	0.03	9	43%	
Tram fare in Calcutta (lowest stage — 6 paise)	29.4.64	0.01	26.7.65	0.01	0.02	15	33%	
Bus fare in Delhi (lowest stage — 5 paise)	1.4.63	0.02	7.4.64	0.03	0.05	12	100%	
Tata Hydro-Electric charges	1.7.62	11%	1.5.63	26%	—	10	37%	

26.7.65) in the fare of the Calcutta Tramways Company was specifically sanctioned to meet increased costs of (a) Rs 14.5 lakhs annually on account of increase in dearness allowance, (b) Rs 6 lakhs annually on account of the increase in the cost of electric power, and (c) Rs 3.50 lakhs on account of increased costs of renewals and replacement. It may, also, be pointed out that the important electric companies, such as the Tata Hydro Electric Companies in Bombay and the Calcutta Electric Supply Corporation, frequently and almost automatically raised their rates for electricity on account of increases in the pit-head price of coal and freight thereon. It may also be mentioned that the West Bengal State Electricity Board has recently increased the rates for electricity for many categories of consumers, with effect from 31st August, 1965. This proposed enhancement of rates is intended to cover increases in its costs and eliminate its huge losses. The different rates for the several categories of domestic, industrial and bulk consumers were adjusted variously. Thus, for instance, the lowest rate for domestic power was raised by 44 per cent, the lowest rate for industrial power by 70 per cent, and the lowest rate for bulk consumption by 57 per cent. It is only fair that such frequent and semi-automatic adjustment of control price for gas should also be made by the Government to cover significant cost increases and eliminate the heavy cumulative losses sustained by the Bombay Gas Co.

Payment of Bonus Act

The Bonus Commission of 1964, which has taken an exceedingly generous attitude on the question of bonus payment, basically relates bonus payment to the earning of extra-normal profits. The Commission states:

"It is difficult to define in rigid terms the concept of bonus, but it is possible to urge that once profits exceed a certain base, labour should legitimately have a share in them. In other words, we construe the concept of bonus as sharing by the workers in the prosperity of the concern in which they are employed."

This definition accords, by and large, with the practices and conventions of the business world. In the widely accepted sense of the term, a bonus is an extra-normal or above-average reward to workers, in the event of abnormal or above-average or surplus profits being earned by the business

unit concerned. It is most inequitable and realistic that the Payment of Bonus Ordinance, as also the Act which is to replace it, makes it obligatory for an industrial unit to pay a minimum bonus to its employees, even though it may have sustained a loss in the related accounting year, instead of making any profit, not to speak of a surplus profit. And, what is even more unrealistic, the obligation to pay the minimum bonus would remain intact even though the unit concerned may have sustained losses over a number of consecutive years. This provision of the Bonus Law becomes all the more inequitable and unrealistic in the case of a public utility company, such as the Bombay Gas Co, because the price of its product or service is so rigidly controlled by the Government that it is allowed to earn only a minimum rate of return on its employed capital and that, for over a number of consecutive years, it may actually sustain heavy losses. It is obvious that the effect of the provision for minimum bonus payment by a loss-sustaining company would be that it would be made to suffer a heavier loss on account of the bonus payment. In other words, the erosion of its capital through ordinary business losses would be aggravated by the imposition of this further loss through the operation of the Bonus Law. In this view of the matter, for the loss-sustaining companies, this particular provision of the Bonus Law becomes confiscatory or expropriatory in character, in as much as it has the effect of taking away a part of the capital of the Company to make extraordinary payment, by way of bonus, to the employees. This provision for the payment of minimum bonus, even by loss-sustaining companies, runs counter to all prevalent ideas and conventions relating to bonus payment, which had been evolved through many pioneering experiments by progressive industrialists and through the learned judgments of the highest Law Courts and the Industrial Tribunals. I am certain that this provision of the Act is wholly irrational and arbitrary and is entirely unworkable. And I suggest that this provision of the Act be suitably amended at an early date.

Serious Deterioration of Discipline Among the Employees

We regret to report that there is a serious deterioration in the state of discipline among the workers and the staff over the past one year. There have been many and frequent cases of breach of discipline, some of them

being of a grave nature involving show of defiance and even threat of violence. This unfortunate trend had originated with the presentation of demands by the Workers' Union and the Staff Association, respectively, in 1963 and 1964, claiming revision of pay-scales, gratuity, dearness and other allowances, leave and certain other fringe benefits. On the Company's expressing its inability to meet the demands, the Government referred the dispute to the Industrial Tribunal constituted by Shri M R Meher. The Tribunal, after duly considering the evidence tendered by the Company and the employees, respectively, gave its decision in April, 1965, rejecting practically all the demands of the employees with some minor exceptions, e.g, those relating to gratuity, retirement age and sick leave. During the pendency of the Tribunal's proceedings, however, and even after the announcement of the Tribunal's Award, the employees indulged in frequent acts of gross breach of discipline, which interfered seriously with the working of the Company smoothly and efficiently. From June last, again, the employees started indulging afresh in gross breaches of discipline over the issue of payment of bonus for 1962, 1963 and 1964, when they attempted to force the management to pay the bonus. The claim for bonus payment for 1962 and 1963 was outside the purview of the Payment of Bonus Ordinance, because there was no pending dispute regarding bonus payment for those years. Hence, that claim had no basis whatsoever. As regards the claim for payment of bonus for 1964, the Company, in view of its having sustained substantial losses for three consecutive years, including the year 1964, and the expected losses in the ensuing years, had applied to the Government under Section 36 of the Bonus Ordinance for exemption from the payment of bonus and submitted a petition to the High Court for the issue of a Writ. At the same time, however, the Company agreed to pay the amount of the minimum bonus of 4 per cent as an advance, in two equal instalments, namely, in the first week of September and on the eve of the ensuing Diwali, respectively, subject to the condition that, in case the High Court decided in favour of the Company's contention, the amount would be refunded. Incidentally, the Hon'ble High Court, in considering the issue of an interim injunction, was pleased to observe that the Company's offer was very fair. The employees, how-

ever, in spite of the Government's appeal to them, ignored the Company's offer, and, without giving any notice, went on an illegal strike from 1st September, leading to a complete shut-down of the plant for a week and consequent cessation of gas supplies for public-lighting and for several thousand domestic and industrial consumers. In view of the Emergency in the country, the Government appealed to the management to restore industrial peace by paying the entire amount of minimum bonus at an early date, strictly as an advance. The Company accepted the Government's suggestion and the strike was called off. The normal supply of gas was fully restored from the morning of 7th September. We regret that, due to the above circumstances over which we had no control, complete cessation of gas supplies caused hardship to our consumers and the general public. In this connection, however, we would

like to observe that, unless the growing trend towards indiscipline is curbed, it would be impossible to conduct the Company's operations with normal efficiency. The Company would, therefore, invite the Government's kind attention to the need of discouraging indiscipline and illegal actions on the part of the workers.

Expansion Programme

As mentioned in the Directors' Report, the Company has already completed a programme of giving 1000 new gas connections. The Company is now actively exploring the ways and means of implementing a further substantial programme of giving 4000 new gas connections which is estimated to entail a capital expenditure of Rs 30 lakhs. The Company proposes to raise the amount through a medium-term Bank loan, for which negotiations are in progress. The servicing of the proposed loan would involve a recurring

expenditure of Rs 4 lakhs to Rs 5 lakhs per year. Consequently, in addition to the substantially increased costs of production and distribution of gas, referred to in earlier paragraphs, the Company would also have to meet this recurring expenditure on account of the service charges including repayment of the proposed loan and the Company's enormous current losses would increase further to that extent. In this situation, for the Company to be able to carry on its operations efficiently and implement its expansion programme, it will be unavoidable to ask for an upward revision of gas price at a very early date.

Plant and Machinery

During the year, the Company added plant, machinery and equipment, worth Rs 1,57,889, including Rs 28,304 for plant and machinery under construction and not completed at the close of the year.

The Fertiliser and Chemicals Travancore Ltd

Shri K Sreenivasa Karayalar, reviews activities

ADDRESSING the Twentyfirst Annual General Meeting held at the Registered Office, Udyogamandal, on 30th September 1965, Shri K Sreenivasa Karayalar said:

Gentlemen,

I am glad to welcome you to this, the 21st Annual General Meeting of the Company and to present to you the accounts of the Company and the Report of the Directors for the year ended 31st March, 1965.

As in the past few years, the company had to face a severe power cut ranging from 32% to 70% in the first three months of the year under review. This cost the Company a loss of production of the order of Rs. 10 million. In November last year an unfortunate explosion occurred in the Ammonia Synthesis Plant due to the failure of a high pressure pipeline. In addition to causing the death of three of the company's loyal workers, the accident also resulted in one of the ammonia stream going out of production for the rest of the year. The high pressure pipe that failed was a special chrome molybdenum alloy. New pipelines were ordered immediately from abroad. They arrived a few weeks ago and the ammonia

stream would be back in production in a few days. The families of the workers who lost their lives were granted liberal assistance. On account of this explosion the company lost Rs. 7.5 million worth of production during the year. In addition to these setbacks, there was also a shortage of imported raw materials in the last quarter of the year on account of the critical foreign exchange situation. Depreciation also went up on account of the need for making an extra allowance for the third shift working. The total depreciation charged for the year amounted to Rs. 6.74 million as against Rs. 5.63 million in the previous year.

Another difficulty arose on account of the arbitrary fixation by the Government of India of the retention price for ammonium sulphate, the major product of your Company. The price fixed for both 1963-64 and the year under review were well below the fair price the Company was entitled to. The matter was represented to the Government of India for reconsideration. Their decision is awaited.

As a result of all these adverse factors, the company incurred a net loss of Rs. 4.88 million. This loss can be

made up as the new plants installed during the third stage of expansion will be going into production shortly.

In these circumstances, it has not been possible to recommend any dividend for the year.

The current year also started badly as the ammonia stream referred to earlier continued to be out of commission awaiting the arrival of the special high pressure pipes. Power shortage also affected production adversely in June/July. Yet the company was hopeful of making up these losses in production as the new plants installed during the third stage of expansion were being got ready for commissioning. It was at this time that the Employees' Association decided to go on a strike.

For some months in the past, the Employees' Association had been taking a belligerent attitude. The Association started interfering with disciplinary proceedings initiated in the normal course. The Association leadership also carried on a systematic campaign advising the employees not to carry out the instructions issued by their superiors. Things came to a head when the new plants installed during the third stage of expansion

had to be commissioned. The necessary personnel for operating and maintaining the plants were posted and commissioning work was about to begin. The commissioning engineers had arrived from abroad. The Association leadership thereupon advised the workers to go on a tools down strike from the 2nd of August 1965. The Association also gave a notice of strike on the 4th of August. As a public utility undertaking, the company was entitled to a clear fourteen days' notice. Yet, the sectional strikes which started on the 2nd of August, even before the notice was served, continued to spread from one section to another during the currency of the notice period and at 1 a.m. on 24th August there was a complete stoppage of work. On the advice of the Association leadership the workers took possession of the plant and shut them down between 1 a.m. and 6.30 a.m. on the 24th. The Superintendents and other Managers could go inside the factory only at 6.30 a.m. under Police escort. The strike went on for thirteen days. A conciliation agreement was arrived on the 5th of September as a result of which the strike was withdrawn from the noon of 6th September. I am glad to say that the terms of the agreement are satisfactory from the company's point of view.

The strike staged by the workers on the advice of the Employees' Association was most untimely and ill-conceived. Whatever disputes were there between the Management and the Association were the subject matter of conciliation proceedings before the Labour Commissioner. For the past six years and more, all disputes that arose between the Management and the Employees' Association were arbitrated by the Labour Commissioner in accordance with the terms of the long term agreement and both parties accepted his decision. The Management was prepared to abide by the Labour Commissioner's decisions in respect of all pending items of dispute. Although the Labour Commissioner held several meetings with the Association leadership, no agreement could be arrived at as the Association started raising new issues every time. According to the settlement now arrived at, negotiations on the pending issues commenced on the 20th of September 1965, between the Management and the Association.

Commissioning work of the third stage plants has begun. It is expected

that all the plants will be commissioned by December this year. You will remember that the third stage expansion programme was taken up only in 1962. It is indeed gratifying to state here that the work has been completed with speed, enabling the commissioning of the plants well within the target dates. Once these plants go into full production your company will be producing 200,000 tonnes of ammonium sulphate, 135,000 tonnes of ammonium phosphate (16:20) grade, 25,000 tonnes of ammonium chloride and 44,000 tonnes of superphosphate in addition to being able to make and supply 350,000 tonnes of NPK Mixtures.

Full production however is dependant on two factors — availability of power and raw materials. The additional power required for operating the new plants is of the order of 20,000 KW. The Kerala State Electricity Board has advised us that they would be able to supply that power only in July 1966. Consequently we are forced to make some adjustments until such time full power is available.

The emergency arising out of the armed conflict imposed on us by Pakistan has had its effect on the availability of imported raw materials and spares. A ship carrying large quantities of material for us has been confiscated at Karachi. Every effort is being made to secure raw materials and to keep the plants in operation. It should be remembered that we are almost entirely dependant on imported raw materials like sulphur, and rock phosphate. Naphtha is also produced at present out of imported crude oil. Continued operation of plants to capacity will be therefore dependant on the conditions arising out of the emergency so far as imports are concerned.

Although the immediate future is beset with difficulties on account of the shortage of power and a possible lack of raw materials, the future promises an era of prosperity for your company. Modern technology demands a minimum economic capacity of 600 tonnes a day for single stream ammonia plants. All the new ammonia plants proposed to be set up in the country during the Fourth Plan period are of a daily capacity of 600 tonnes or more. When such plants come into being, units like the 260 tonne one belonging to your company at Udyogamandal will become uneconomic by comparison unless they can

be supported by larger plants of 600 tonnes capacity. Your company therefore has taken the initiative to investigate the possibility of setting up such a large unit at a site adjacent to the Cochin Refinery at Tripunithura in Ernakulam District and has submitted a Project Report to the Government of India. I am glad to say that the Government of India have approved of the project and authorised your company to proceed with its construction. The new unit which will be called the Cochin Fertiliser factory will have an annual capacity of 200,000 tonnes of ammonia as against 87,000 tonnes at Udyogamandal. The products proposed for the Cochin Fertiliser factory are urea, ammonium phosphate 20:20 and NPK complex fertilisers. The plant will also be capable of producing higher analysis compound fertilisers. It is estimated that the capital outlay on the Cochin Fertiliser factory would be of the order of Rs. 400 million. According to present plans, the factory should go into production in 1968-69 if the necessary foreign exchange is made available by the Government of India by October/November this year. The Udyogamandal and the Cochin units will be under the common management of your company. In this connection, I may be permitted to refer to the dynamic initiative and enthusiasm of your Managing Director Shri M. K. K. Nayar, but for which, the above mentioned scheme could not and would not have been conceived. On behalf of the Board I wish to record our sense of appreciation of his tireless efforts in promoting the many sided developments of your Company. To enable the company to take up this challenging task, proposals have been placed before you for raising the authorised capital and borrowing limits of the company. The additional funds required for this purpose are expected to be obtained from the Government of India.

Your company has continued to develop the market in South India according to plan. In Madras State, work has been intensified and from 1964 your company has undertaken the distribution of nitrogen on behalf of the State Government in the three districts of Coimbatore, Tiruchi and Tanjavur. Marketing activity in Mysore State has also been stepped up. A mixing centre has started functioning in Mangalore with effect from 14th January this year. The

company's agronomists have continued to do excellent work in the field rendering useful service to the farmers.

Before I conclude I should make special mention of the distinction conferred on your Company by the Indian Chemical Manufacturers' Association. In the citation made at the time of presentation of the first award of the ICMA by Professor Humayun Kabir, Minister for Petroleum & Chemicals of the Government

of India, the Association has commended the work of your company in maintaining its leadership in the fertiliser field, by being the first to introduce in the country the use of electrolytic hydrogen and naphtha for making synthesis gas and by the production of a compound fertiliser, ammonium phosphate. Another notable contribution made by the company which has come in for commendation is the development of process know-how for using byproduct gypsum from

the wet process phosphoric acid plant for the production of ammonium sulphate. Let me take this opportunity to congratulate the executives, scientists and workers of the company for their well-merited distinction.

I now move that the Directors' Report and the audited statement of accounts for the year 1964-65 be and are hereby adopted.

N.B. This does not purport to be a report of the proceedings of the General Meeting.

MMGI

is now within the first 10

Five years ago it was not even among the first 20

MMGI's gross premium in 1964 increased by 27% over 1963. Its claims cost in terms of premium income at 41% is the lowest among larger insurance companies.

It is the customer confidence in its prompt settlement of claims and personalised service that has made MMGI the fastest growing general insurance company in India today.

AROUND BOMBAY MARKETS

Equities Drift Lower

Thursday, Morning

DALAL STREET continues to have a difficult time. All the ground gained after the cease-fire agreement has been lost and the market is back again around its year's lowest level. All this has come about despite massive purchases of the leading speculative counters by the Life Insurance Corporation a few weeks ago. Excepting National Rayon which suffered mainly on account of heavy bull unloading, the setback in equity prices last week was due more to lack of support than to any important selling. The turnover continued to be extremely restricted and good corporate news had virtually no effect on the market. Tata Chemicals were unable to forge ahead despite the company's impressive performance and a two per cent rise in the dividend.

The stock market's current mood of despondency cannot be explained merely in terms of the uneasy peace following frequent violation of cease-fire by Pakistani forces. The market is realising that intensified defence effort will call for additional taxation thereby causing further strains on the economy and that larger utilisation of scarce foreign exchange resources by defence-oriented industries will aggravate the shortages of imported raw materials for several industries which are of considerable importance from the stock market's angle. Continuing financial stringency and the prevailing structure of interest rates are the other important factors which will make it very difficult for the stock market to stage a big recovery in the foreseeable future. And even if equity prices did recover appreciably, there seems little hope of any significant improvement in turnover on which depends the prosperity of the stock exchange community.

COTTON

The Dry Spell Tells

EXTREMELY inadequate rains in September and the continuing dry spell in the first week of October in almost all the important cotton growing tracts have led to a drastic change in the outlook for the 1965-66 crop. Very few observers now expect the crop to exceed 60 lakh bales; the general view is that the crop will be around 57/58 lakh bales and even this estimate will need to be revised if the

current dry spell persists for another fortnight or so. Cotton production in the last year of the Third Plan therefore will be far too short of the target of 70 lakh bales. How long the authorities will continue to blame the weather for the shortfall in production is anybody's guess. It might be mentioned here that the production target for cotton for the Second Plan had been originally fixed at 65 lakh bales.

Cotton production has miserably failed to keep pace with increase in spindleage which itself has been running behind the Plan target, thereby perpetuating the imbalance between supply and demand and pushing cotton prices to new high levels year after year. In view of the smaller carryover, poor crop and uncertain prospects about importing sufficient cotton to make good the shortfall in indigenous supply, it is scarcely surprising that cotton futures continue to seek new high levels week after week; on October 5 the hedge contract was bid up to Rs 909.75. The cotton bull is not the least perturbed by the accumulation of huge stocks of cloth and yarn with mills and the continuing slack conditions in the cotton piecegoods market despite the festival season. His argument is simple; mills will have to compete for the limited supplies of cotton. The industry's profit margin might be affected but cotton prices will keep high. Thanks to the upward revision of ceiling prices by Rs 75 to Rs 100 a candy for the new season, the cotton trade might be able to pull on for some time without any serious encroachment on its freedom. But if the weather does not oblige during the next fortnight or so and crop estimates have to be revised down further, the authorities might be compelled to announce various measures with a view to holding prices within the revised ceilings. Of course, nobody takes the control measures very seriously, not even the authorities themselves. It is common knowledge that the cotton control order has always been honoured more in breach than in observance.

Only the futures market presented a somewhat lively appearance. The turnover in the spot section continued to be extremely restricted. Mills are having a rather difficult time because

of the acute financial stringency aggravated by the accumulation of large stocks. The special credit facility provided by the Reserve Bank to relieve the textile mills in distress is too meagre to make much difference to the industry. The current indications about off-take of cloth and yarn do not hold out the hope of any material reduction in stocks, unless, of course, production is curtailed. Consumer off-take seems to have been affected considerably by the continuing political uncertainty. Needless to add that any improvement in the textile news is bound to boost cotton prices still higher.

OILSEEDS

Stiffer Margins

EMBOLDENED by the downward revision of groundnut crop estimates because of the continuing dry spell in all the major producing areas, bulls had little difficulty in pushing up linseed and castor futures to new high levels last week. On October 5, linseed April contract was bid up to Rs 123 (per quintal) and castor April was marked up to Rs 104.75. Cottonseed January contract was quoted around Rs 63. Anticipating that it might be accused of being a silent spectator to the runaway rise in futures, the Forward Markets Commission decided on October 6 to tighten the margin rules by enhancing the rates of margin and reduction in the free limits. The linseed April contract will attract margin at the rate of Rs 60 per quintal when its price exceeds Rs 121.50 per quintal and the free limit allowed to members will stand reduced from 50 tonnes to 20 tonnes. Margin at the rate of Rs 20 per quintal will become payable in respect of castorseed April contract whenever its price exceeds Rs 101.25 per quintal, subject to a free limit of 50 tonnes.

Nobody need have any strong objection to the imposition of rigorous margins which tend to restrain speculative activity. Though rarely effective in deflecting the course of prices, margins, if effectively enforced by the market authorities, do help in safeguarding the solvency of the market. Of course, one can question the very utility of forward trading if the rate

of margin is made equivalent to the rate at which bank credit is available against spot goods.

Corrective profit-taking and the announcement of stiffer margins produced a moderate setback in prices at the week-end, with linseed April receding to Rs 120.50 and castor April to Rs 101.75. In spite of the fact that the steep rise in linseed and castor has been due to a considerable extent to strong bull manipulation, few observers seem inclined to expect any important setback in oilseeds prices because of unsatisfactory reports about the new groundnut crop. The crop is said to have been seriously affected by the prolonged dry spell. September rains have an important bearing on groundnut production and there has been a virtual failure of these rains this year. If groundnut and groundnut oil have been relatively subdued recently it is because of the satisfactory flow of the early maturing crop in Khandesh and Karnatak areas. Apart from the fact that the prevailing prices of groundnut oil are very high—spot oil is quoted around Rs 30 and December delivery is mentioned around Rs 28.80 per 10 kgs—financial stringency and political uncertainty seem to have induced farmers to rush with the marketing of their produce. All estimates point to a smaller groundnut crop than in the previous season. Some of the informed market men place the new crop to be 10 per cent down compared to the 1964-65 crop. If the crop turns out to be really that bad, edible oil prices can be expected to touch much higher levels than in the current year so far. There is no hope of making good the shortfall in domestic production through imports of edible oils from abroad.

Export business in groundnut extractions has been seriously affected by the enforcement of the new policy with effect from October 1. Only manufacturers will henceforth be allowed to export groundnut extractions. But not all the manufacturers are fully conversant with the intricacies of export business; nor do they command the big resources at the disposal of many of the established shippers. Experienced observers are of the view that manufacturer-exporters will not be able to strike good bargains with the overseas buyers and unlike in the past, domestic prices will tend to rule below the world parity. Exports of groundnut extractions which have been establishing new records year after year are likely to show a substantial decline during the current fiscal year.

MONEY AND BANKING

Call Rate Steady

CONDITIONS were more or less unchanged in the Bombay short term money market during the week to October 6. Demand slackened slightly, but supply was also lower than in the previous week due to some withdrawals to meet upcountry demand. Interest rates hovered around 7 per cent with little or no change.

Aggregate deposits of scheduled banks during the week to September

24 increased from Rs 2787.17 crores to Rs 2787.60. A year ago deposits stood at Rs 2521.39 crores. Bank credit rose by Rs 16.17 crores to Rs 2014.81 crores against Rs 1703.03 crores a year ago. Cash in hand with the scheduled banks was slightly lower by Rs 2 lakhs at Rs 64.93 crores. Balances held with the Reserve Bank, however, improved by Rs 5.90 crores to Rs 107.62 crores. Borrowings from the Reserve Bank fell from Rs 16.53 crores to Rs 8.68 crores. Money at call and short notice was better by Rs 3.53 crores at Rs 64.64 crores. Investment in government secu-

rities at Rs 842.07 crores showed a rise of Rs 12.24 crores.

Notes in circulation during the week to October 1 advanced sharply from Rs 2562.71 crores to Rs 2616.24 crores according to the Statement of Affairs of the Reserve Bank. Rupee coins were slightly lower by Rs 69 lakhs at Rs 104.40 crores. Rupee securities improved by Rs 20 crores to Rs 2307.44 crores. Deposits of the Central Government were better by Rs 30.81 crores at Rs 124.24 crores while State Gov-

ernments' deposits declined from Rs 11.06 crores to Rs 6.30 crores. Scheduled banks' deposits improved by Rs 6 crores to Rs 110.24 crores. Foreign securities were unchanged at Rs 70.63 crores but balances held abroad declined by Rs 4.20 crores* to Rs 8.58 crores. Advances to governments were slightly lower by Rs 30 lakhs at Rs 82.21 crores. Advances to scheduled banks increased by Rs 7.10 crores to Rs 16.04 crores. Investments declined substantially from Rs 174.27 crores to Rs 147.74 crores.

BUSINESS NOTES

Tata Hydel Group

THE existing licences of the three companies belonging to the Tata hydro-electric Group, namely, Tata Power, Andhra Valley and Tata Hydro, are due to expire in 1980. Taking a long-term view, the management has thought it prudent to plan well in advance diversification of activities so that shareholders' interests are safeguarded in the event of premature nationalisation or non-renewal of licences. As a first step in this direction, it has been decided to make an investment of Rs 15 lakhs by all three companies in the share capital of Tata-Merlin and Gerin, a company being formed by the Tata Group of companies in collaboration with Merlin and Gerin of France for the manufacture of high-tension switchgear in India. This company will be in the market shortly with an equity capital of Rs 80 lakhs. Besides, possibilities are being investigated for future diversification in other ventures allied to the electric companies' work, such as manufacture and sale of electrical and electronic equipment. Meanwhile, the Tata-Ebasco, consulting engineering enterprise, undertaken by the Tata electric companies in partnership with Ebasco Services of the US, has continued to prosper. There is good scope for securing business in the engineering consultations field both from the public and private sectors.

N H Tata, Chairman of the Group says in his annual statement, circulated to shareholders, that, in spite of the rise in prices, additional cost of spares, increased import duties and larger contributions towards dearness allowance, the companies expect to obviate the need for an increase in rates in the Tata-Koyna area by effecting improvements in their operations. Tata looks to the future with sober optimism for better returns to share-

holders. He adds that the Group has undertaken a detailed study regarding development of load and availability of power, and preliminary investigations have indicated that there is likelihood of considerable shortage during 1967-68 and 1968-69. It is proposed to approach the Maharashtra Government for approval for increasing the Group's generating capacity.

Each of the three companies are paying total dividends of 12 per cent for the year to March 1965, against 10 per cent paid in the preceding year. Among these, both Tata Power and Andhra Valley have recorded further fair rises in revenue earnings from power supply from Rs 7.93 crores to Rs 8.66 crores in the case of former and from Rs 4.53 crores to over Rs five crores in the case of the latter. While Tata Power's equity earnings have looked up slightly from Rs 1.19 crores to Rs 1.21 crores, those of Andhra Valley have slipped from Rs 60.96 lakhs to Rs 58.82 lakhs. Tata Hydro's income from power supply is only a shade better at Rs 3.44 crores (Rs 3.43 crores) and equity earnings slightly lower at Rs 45.86 lakhs (Rs 45.99 lakhs).

The enhanced dividend distribution has lowered the cover in each case but it is still adequately protected by earnings. For the year 1965-66 the permissible reasonable return will be eight per cent of the capital base, against 6.5 per cent for 1964-65, since the Bank Rate at the beginning of this year was six per cent. The increase in the reasonable return provides a measure of stability to the companies' operations. It is expected that by installation of more modern equipment and improvement in the working efficiency, the companies can earn the full reasonable return this year also.

Shipping Corporation

SHIPPING Corporation of India, a Government of India undertaking, has achieved a fast rate of expansion of its fleet during the last few years. As against 20 ships owned some 3½ years ago, it now has 32 ships. In this period, the increase in fleet in terms of gross registered tons has been from 1,45,224 to 2,82,491 and investment from Rs 24.24 crores to Rs 40.29 crores. The expansion of the fleet would be even faster in the next few years, S C I having already placed firm orders for 21 vessels, totalling about 2,26,500 gross registered tons. The Corporation has fully booked the building capacity of Hindustan Shipyard till 1969, and the placing of more shipbuilding orders is under active consideration. Negotiations are now in progress to build two modern air-conditioned passenger-cum-cargo liners either in Japan or the UK to replace the two old vessels. It has also been decided to acquire at least 16 more dry cargo vessels, and the acquisition of more tanker tonnage and trampers is being considered. By the end of 1966, the fleet would be no less than 45 vessels of a GRT of half a million tons, and it is estimated that it would increase in 1969 to as many as 70 vessels of a GRT of over 7,50,000 tons.

The Corporation's Chairman R L Gupta, has pleaded for a fast and balanced development of the Indian merchant fleet which is important not only from the economic point of view but also from the point of view of the country's defence. In his speech at the Corporation's annual meeting, Gupta said that on present indications the foreign trade of India during the Fourth Plan period would be of the order of Rs 13,000 crores, and that Indian shipping has to gear itself up to undertake to carry its rightful share of upto 50 per cent of the total shipments of exports and imports. The country must find the necessary foreign exchange for acquiring suitable mercantile tonnage from foreign countries, because he says, all types of vessels acquired would be able to earn or save foreign exchange sufficient to pay back their purchase price within a period of eight years or less. Gupta has also called for a speedy development of ports and their mechanisation, expansion of shipbuilding and ship-repairing facilities within the country and increasing the training facilities for navigational officers and marine engineers.

During the year to March 1965, SCI carried 15,22,285 tons of cargo, against 13,27,076 tons carried in the preceding year. Its gross earnings were up from Rs 13.34 crores to Rs 17.04 crores, and net profit from Rs 1.40 crores to Rs 1.64 crores. Nearly one-half of the earnings were net foreign exchange earnings for the country. This result looks more satisfactory when viewed against the background of the rise in operating costs of the vessels and enhancement in salaries of and benefits for the employees during the year.

Mysore Paper

HAVING successfully completed the scheme of expansion to step up production to 18,000 tonnes of paper, the management of Mysore Paper is examining the question of expanding the capacity to 30,000 tonnes with a view to making the Mills more economic and diversifying the products to meet the market requirements. In his speech at the company's 30th annual meeting held at Bangalore some time ago, M D Shivananjappa, I A S, Chairman and Managing Director, stated that as a preliminary step in this direction, the management was examining the availability of bamboos and that the Mysore Government had been approached in that behalf.

Referring to the uneconomic price structure for the paper industry Shivananjappa has stated that every since the Tariff Commission fixed prices in 1960, the industry has been pleading for a suitable revision as the slight increase given in 1962 was absolutely inadequate and costs have been mounting. Another matter to which he has drawn the attention of the Government of India is the necessity of providing adequately all materials necessary for the paper mills to enable full utilisation of the installed capacity. He has rightly pointed out that without such provision no useful purpose would be served by liberally issuing licences, as in many cases licences would have to be cancelled as they could not be made use of for want of necessary facilities.

Hind Brown Boveri

FAIR improvement has been recorded by Hindustan Brown Boveri, formerly known as Hindustan Electric, during the year to April last, with turnover up from Rs 4.74 crores to Rs 7.56 crores and pre-tax profit from Rs 21.04 lakhs to Rs 34.55 lakhs, after charging depreciation of Rs 10.04 lakhs (Rs 6.33 lakhs). Even

after providing considerably higher amounts for development rebate reserve and the tax liability, disposable profit is about a half better at Rs 15.11 lakhs (Rs 10.39 lakhs). The equity dividend is raised by a point to five per cent, and is also payable proportionately on the capital enlarged by a

one-for-one rights issue. The proposed dividend on equity and preferred capital demands Rs 9.9 lakhs against Rs 6.51 lakhs previously, according to a preliminary statement released by the company. The working of the company in the current year so far said to be satisfactory.

Want to increase your overseas profits?

Here are 17 ways we can help you.

- 1 Our World-Wide Marketing Service personnel can help you find new markets.** We have specialists in 124 world trade centres. Let them analyze your profit potential, show you where your product is needed, where you can ship to and sell most easily.
- 2 We can advertise your needs.** Do you want to buy something? Sell something? We can spread the word. Our monthly magazine, "Clipper Cargo Horizons," published in 6 languages, can place your listing before more than 176,000 top executives around the world. No charge.
- 3 We can develop new contacts for you.** Our professional marketing experts can make your first new overseas sales approaches for you—free.
- 4 We can find you additional suppliers.** Want to buy for less? Get a special design? Get higher quality? Let our specialists discover new sources for you... see that you get catalogues and prices.

- 5 We can cut your packing and crating costs.** We don't require the heavy, expensive crates of surface shipping.
- 6 We can lower your air Cargo rate.** Pan Am's AirPak Savings Plan employs newly-introduced corrugated containers that can earn you a discount of 12%. And remember, Pan Am has reduced rates in recent months on many products, perhaps yours.
- 7 We can help you cut warehouse expenses.** Because we can deliver overnight almost anywhere in the world, you don't have to maintain costly warehouses overseas.
- 8 We can lower your inventory cost.** Our rapid delivery means you can order direct from the factory as needs arise... you won't have to maintain costly inventories.
- 9 We can help you match a local producer's delivery time.** Don't let foreign competitors take business from you because they can deliver faster. Our rapid delivery makes you, in effect, a "local producer" anywhere in the world, lets you cash in on unexpected opportunities overseas.

- 10 We can solve distribution bottlenecks.** When you have to produce more than your regular distribution facilities can handle, call us. We'll see your customers get their orders on time, every time.
- 11 We can help you bank your profit sooner.** The sooner your goods are delivered, the sooner you get paid. Our rapid delivery often means you get paid several weeks sooner.
- 12 We can reduce obsolescence losses.** Could a newly introduced model or a change in public taste cut into your sales? Or even destroy your market? Minimize this risk... with our overnight delivery.
- 13 We can slash wharfage, docking, trucking costs.** Call us. We'll be glad to show you how and how much.
- 14 We can reduce clerical expenses.** For example, one Pan Am airway bill will take your shipment anywhere in the world. Let us rid you of use-

- 15 We can greatly reduce insurance costs.** Did you realize that shipping with us can save you in insurance as much as 90% of your surface shipping insurance costs? We'll be glad to show you the proof.
- 16 We can cut or eliminate spoilage, breakage, pilferage.** The longer a shipment is in transit, the greater the likelihood of damage. To get your goods delivered fast, in factory-fresh shape, call us.
- 17 We can cut or eliminate disassembly-reassembly.** No need to take large items apart and put them back together when you ship with us. You save time, trouble and cost. Profit from these 17 ways Pan Am can help you. We'll be glad to have one of our cargo experts help you make a thorough analysis of your supply and delivery system. No charge, no obligation. Call your Pan Am Cargo Agent, or ring us up. Do it today. (Tel. 211063/64)

World's largest Air Cargo carrier • World's most experienced airline

QUIET EFFICIENCY

Behind us the tradition of nearly a century. With us a management service mellowed by about 75 years. Experience is our most important single attribute which makes us believe that steel plant efficiency is more than setting a few production norms and excelling them occasionally... that it is a continuous process tied to operational research and progressive integration.

Thus when the nation needs better iron, more steel and more diversified end products—our answer

is another two-phase expansion programme to double annual production to 2 million tonnes of ingot steel. We intend first to introduce the latest techniques, and balance our existing plant and equipment to increase output by 30%. We hope next to look around and decide on the shape of phase II. Our planning will ensure that each phase complements the other with the lowest possible investment costs for the country.

LATCH
To prevent accidental starting,
this latch keeps stop button
pressed when required.

WINDOW
Fool-proof ON/OFF indicator
is visible through
this window.

An expensive motor alone is no guarantee against production loss. What you need is a starter that is sure to protect your motor from burning out. An LT-LK starter gives that protection. How? When overloading occurs or supply voltage is low, you can be certain this starter will trip and disconnect supply to the motor.

Do you know why we are so certain the LT-LK will not fail? Because every overload relay is accurately calibrated and individually tested on an automatic test bench. Another thing about this relay is that it unmistakably indicates overload.

This one has all... the qualities a reliable starter should have!

ENCLOSURE
—is dust, weather and
vermin proof with cord
packing in the cover.

CONTACT SYSTEM
—tested for 29 million
operations without failure.
Made of robust silver
contacts of the double
break, bounce-free type.

SOLENOID COIL
—machine wound, taped,
vacuum impregnated and
baked. Also tested for short
circuit between turns
and undergoes a 4000 volts
impulse test.

THERMAL RELAY UNIT
—has accurately calibrated
bimetallic elements for
overload protection.

Uneasy Peace

THREE weeks after the Indian and Pakistani armies were ordered by their commands to stop the war, the guns continue to boom and men continue to be killed, often in large numbers. Every day brings reports of fresh 'incidents'. The personnel of the UNMOGIP and the UNIPOM have arrived, but for all the difference their presence seems to have made so far they might as well be at their homes in the many countries from where they are drawn. Of course, they—a hundred unarmed, powerless individuals—are not to blame for this; the cease-fire will be effective when India and Pakistan will it and this happy consummation is not yet. In a neat, tabulated statement released last week the Press Information Bureau gave details of no less than 251 cease-fire violations by Pakistan till October 7. Since then there has occurred on Monday what has been described as the biggest breach of the cease-fire in the Tithwal area which allegedly involved an attacking force of 1,500 Pakistani troops.

Reports of this particular incident seem to suggest that the attack was launched with the objective of making some substantial military gain, but what is holding up an effective cease-fire is not the expectation, on either side, of any worthwhile military gains. The way the war was fought rules this out. There were no rapid advances into enemy territory which left a large number of positions weakly or imperfectly secured which the enemy can now hope to reclaim. What we had were relatively immobile actions proof of which is that in some three weeks of battle on a wide front involving very large parts of the armed forces of the two countries all the territory that changed hands was less than a 1,000 square miles.

The motives for keeping the cease-fire fluid are not military, but political. Whether Pakistan's object in first sending armed infiltrators into Kashmir and later attacking in strength with regular troops across the Jammu border was to annex Kashmir or merely to reactivate the Kashmir question, the fact today is that she achieved only the latter. After the hectic activity of the years between 1948 and 1954, the UN's interest in the Kashmir issue waned sharply and quickly with the recognition of its ineffectiveness in view of the ever-present prospect of Soviet veto of any resolution unacceptable to India. Automatically the Kashmir question lost its place in the forefront of international disputes demanding the world's urgent efforts for settlement. As the protagonist of a change in the *status quo*, this was a profound setback for Pakistan. The Security Council's resolution of September 20, calling for a cease-fire and withdrawal of troops and deciding to "consider... what steps can be taken to assist towards a settlement of the political problem underlying the present conflict" was, therefore, a definite, though limited, gain for Pakistan. Obviously, her objective now is to ensure that this advantage is not lost, which she fears it will be if militarily the situation in Kashmir returns to normal and the threat of a resumption of hostilities between the two countries recedes. The seeds of the failure of the cease-fire are thus contained in the Security Council resolution which formally achieved it. Pakistan will not consider an effective cease-fire and withdrawal of forces unless action is simultaneously taken on the part of the resolution referring to steps to settle the underlying political problem. India, on the other hand, rejects that there is any political problem to be settled and so sees the UN's task as limited to ensuring effective cease-fire and subsequent withdrawal of forces, including Pakistani infiltrators from Kashmir.

The unrealism of expecting effective cease-fire and withdrawal of forces by themselves is, therefore, clear as also the unrealism of the Soviet Union's suggestion for direct negotiations between the two countries. Of course, the Soviet Union knows this but she has her reasons. In any joint international move, whether in the UN or outside, she will have to take positions which will inevitably seem hostile to either Pakistan or India or both. Clearly, the hopes of a determined international initiative raised by the Security Council's unanimity of September 20 seem at the moment doomed to the disappointed and the the peace wrought by it to remain an uneasy, if not short-lived, one.

Alternative Plan Drafts

THE Planning Commission seems at last getting somewhere in taking the decision to prepare alternative drafts of the Fourth Plan. Curtailment of Western aid has at last been taken seriously: The Bhoothalingam mission has all but failed. The United States has not relented—did anybody seriously expect it to so early, and without a political price? The suspension of the current year's aid programme is still on, the Indian request for a long-term agreement on PL 480 is being avoided and there is still no question of reopening discussions on the aid programme for the Fourth Plan. Patil's visit has also not yet resulted in anything better. Up till now there has been only brave talks of import substitution and of defence and development not being incompatible. At last, however, some decisions are emerging.

The most important of these is the one about alternative Fourth Plan drafts. Of course, one would wait to see the worked out alternatives. It is not at all important that they probably involve different outlay figures and also different physical targets in the non-crucial sectors. But if they have the same physical targets in most of the crucial sectors, the question could legitimately be asked why one should not prefer the variant involving the lower estimate of foreign aid even if more assistance is forthcoming later on?

News emerging from the Planning Commission is often contradictory—earlier we had been told that the Fourth Plan had been practically shelved and that the Commission was concentrating on specific emergency programmes to meet the requirements of the more vital sectors of the economy during the next one year to eighteen months. The emphasis now is on quick-yielding projects, particularly so in the agriculture sector. The war has thus unexpectedly won the case for those who have been for quite some time asking for postponement of the Fourth Plan, for an interim plan, for programmes promising quick results, etc. Whatever changes the present emergency approach to planning means for the basic strategy of planning and development in relation to industries that has been followed all these years, it will not at all be a bad thing if as a by-product we are able to put together some quick-yielding programmes for agriculture. Declarations that we will not starve even if

PL 480 aid is stopped are not very reassuring when there is official discussion of shelving the entire Fourth Plan in view of the uncertainties regarding foreign assistance in general. But nobody ever doubted the existence of unutilised potential for raising production from domestic sources and if at last the emergency quickens us into efficiency so much the better.

There are, however, some disturbing signs. Even in the annual plan for 1966-67 vagueness is allowed to persist by leaving open the question of finances for the State Plans. The Centre has indicated to the States that it would not be in a position to give assistance to the extent agreed to earlier. In this context the figure of financial outlay announced for the overall plan for next year, covering both the Centre and the States, showing a cut of 10 per cent over the estimates made earlier, means very little. Even then the States could be persuaded to accept the figures laid down by the Centre with great difficulty. Now they are expected to raise unlimited amounts in excess of what were considered feasible by the Centre but resisted by the States. When important Ministers and members of the Planning Commission declare the country's firm resolve to be self-reliant, the implicit premise is that the Government is prepared to take in hand whatever major institutional changes that are called for to enable the country to do without foreign aid. However, when it comes to taking practical decisions, one finds a shyness to face issues and a tendency to pass the burden on to other shoulders. What else does it mean to expect the States to raise resources, allowing the Centre to divert State allocations to defence needs, than that the States are expected to tackle the

problem of taxing agricultural income earners and introducing such changes in agricultural structure as will throw up more investible resources? Administratively the task may indeed fall in the States' sphere, but the institutional changes called for are of such major character as to require the Centre to move. That the Centre is more eager to talk but reticent in taking decisions does not encourage faith in the outcome.

While we welcome that there are alternative drafts to be prepared with different assumptions regarding foreign assistance, should there not be also different alternatives involving different degrees of defence orientation? Short of that, it seems extremely unlikely that there would be any planning at all. Targets are perhaps being set for certain amounts of defence production considered necessary in the particular context of today. The actual defence needs may turn out to be more or less. It is necessary that a certain flexibility is introduced in our industrial planning so as to allow of switching on and off defence production from the same installations of plant and machinery. Otherwise, every turn of our relations with our hostile neighbours would necessitate abandoning projects even when already taken in hand and working upon new ones. What we require is a type of industrial planning which would allow of a whole range of different production patterns with the same investment pattern, so that it should be possible to change production targets at short notice without involving capacities lying idle. As there seems to be a high likelihood of continuing and growing tensions, the only hope of planning lies in evolving an approach incorporating this flexibility.

CAPITAL VIEW

Our Diplomatic Offensive

Romesh Thapar

WE are at last embarked on the business of winning friends in foreign lands and wooing governments which hold the keys to a ramified international balance of power. This much-belated operation has been launched in a manner with which we are now exasperatingly familiar. No discussions at Cabinet level. No consultations with the experts within the GOI. No briefings by the Foreign Office to the hastily summoned emissaries. And, of course, no attempt at co-ordination. This 'style', more befitting a feudal autocracy, would not be so disturbing if the Prime Minister—or, for that matter, the bureaucrats who surround him—had a clear understanding of what has to be done.

In this way, we are running the risk of being treated like a chameleon, remarkably talented in changing its colours according to the background. V K Krishna Menon is our image in Cairo. Vijayalakshmi Pandit in Paris. S K Patil in Washington. TTK in Moscow. Deputy Foreign Minister Dinesh Singh in South-East Asia. Foreign Minister Swaran Singh at the U.N. Each representative speaks his own language, has his own pet theories as to how our future relations with the nations of the world are to be arranged.

Imagine the confusion. Krishna Menon speaks with Nasser, probably explains the meaning of the collusion between Pakistan and China, emphasises the independent role played by the Soviet Union to halt the escalation of war on the sub-continent. In Paris, a different tune is being sung—for, does not Vijayalakshmi Pandit announce that India is holding back the tide of communism (*sic!*)? S K Patil, en route to the Americas, also sees his country in some such role—and firmly allied to the USA. By the time T T Krishnamachari reaches Moscow he will have plenty of explaining to do about what India really intends!

The Prime Minister, master-minding this operation, has now decided to unleash a host of MPs on a number of countries not yet honoured by VIP visits. Lists have been drawn up in consultation, not with the Foreign Office, but with Parliamentary Affairs Minister, Satyanarain Sinha! Each group of travelling MPs is a minia-

ture Lok Sabha; we are keeping our fingers crossed and hoping that they do not speak in too many voices. If this happens, we might have to dispatch more emissaries to repair the damage.

Wisely, Swaran Singh has taken to the beaten track at the United Nations. He has left the argumentation to the surprisingly able Mir Qasim—'surprisingly', for so many cannot see talent in anyone who is not a member of the Congress top hierarchy. Swaran Singh is due back any day. He has to prepare for the Afro-Asian conference at Algiers due to resume in the first week of November. By then, presumably, our over-publicised diplomatic offensive will have been assessed by the irritated experts in the Foreign Office.

It is doubtful whether we will achieve anything in the course of these junkets. Whatever dividends are chalked up in our favour will come as a result of 'second thoughts' in the West about the grave consequences of an angry India and from the crudeness now discernible in the handling of the Sino-Pak propaganda offensive against us. When the UK High Commissioner begins an elaborate apology for the partisanship of Harold Wilson, when scurrilous foreign news weeklies and newspapers which are notorious for their psychopathic interest in falsehood make the first attempt at balanced comment on developments in the sub-continent, when the anti-India specialists in the local foreign press corps launch on anxious research to locate 'the causes' which have led to the distortion of India's stand, we should not assume that these developments are the result of our diplomatic offensive. Anger, openly expressed at every level, has placed our many tormentors on the defensive.

Many knowledgeable persons in the Capital believe that we need to use a little bit of this anger on the subject of food, particularly so-called free food from the USA for which we now have to beg every month. If the Prime Minister and his colleagues could be persuaded to depart from the clichés about self-reliance and self-sufficiency, and to concentrate on forcing the will of the Centre on States which are still reluctant to undertake

procurement and rationing of the food we grow, we would be in a better position to survive diplomatic blackmail. Anger coupled with internal organisation would not only loosen foreign purse-strings, but also rid our diplomacy of the inhibitions which have enveloped it for so long.

So far as one can judge, our critical weakness is the fear that the Centre has developed about disciplining the Chief Ministers of the States who refuse to view problems in an over-all Indian context. Parochial policy-making has got to be fought, and there could be no better time to do it than the present. We spend too much energy in groaning about the demand for new linguistic States—such as Punjabi Suba, Hariana, etc.—when our effort should be to strengthen the leading role of the Centre even as these States are formed. This is more than possible today, for the people now understand that Chinese and Pakistani aggression is aimed at India's unity and strength.

It is fairly obvious to any observer who wishes to observe that the Prime Minister and his colleagues only react when demands are coherently and energetically projected. If these demands link with the business of formulating an integrated policy for the nation they become tremendously powerful in their impact. To unleash such thinking is the job of the press. It must break with its conformist psychology, uncover the facts, correlate them, puncture bureaucratic self-satisfaction and reflect some of the patriotic anger which has sharpened attitudes during these last few weeks. Will it play this role or remain atomised as the agitprop of this or that leader?

In other words, what we lack is not public relations but a policy. The press, too, needs to understand this when it moans about the lack of friends abroad, about misunderstandings and miscalculations, and about missed opportunities. Our diplomatic offensive is an insupportable part of our internal commitment to a policy of self-reliance and self-sufficiency. To argue that we can function without foreign props is an evasion of responsibility. We must. If foreign aid assists the effort, so much the better.

Weights: Old and New

MOVEMENTS in the index of industrial production have become increasingly unsatisfactory indicators of both overall growth and sectoral achievements. The Third Plan postulated an annual growth rate of 11 per cent in industrial production. Measured by the official index (1956 = 100), actual growth over the period 1961 to 1964 was about 8 per cent. If, however, one substitutes 1961-64 weights in place of 1956 weights (based on value added), the annual growth rate comes to 10 per cent; and if 1956-61 weights are used, it rises to nearly 13 per cent. These differences are attributable to the diminishing importance of textiles and other traditional industries in industrial production and the faster growth of new industries. This play with figures is, of course, neither here nor there for the fact remains that plan targets have not been achieved on schedule, particularly in the basic industries.

While this exercise is useful and offers ample opportunities for some mundane calculations in depth, the moral is that target growth rates have little meaning, if they are based upon historical weights. The use of an official index, two-thirds of the weightage in which is given to traditional industries (textiles more than 40 per cent, food 14 per cent, to mention the leading ones), to indicate aggregate targets and judge their fulfilment leads to highly deceptive results and is, in any event, of no operational value. What one requires for matching performance against plan requirements is growth rates based upon expected and achieved weights, for only then can one find out at a glance the direction in which industry is expected to move and is actually moving.

These comments are prompted by the great concern which is being expressed over the slow rates of growth witnessed in 1964 and also in the current year—which are largely the result of stagnation in textiles and attainment of capacity output in cement and basic metals, though the shortage of maintenance imports is also an important factor in several industries. Sluggishness is particularly noticeable in cotton, silk and jute textiles, paper, soap and matches (in the last two, small scale production is not taken into account) but this need not cause as much concern as the slow growth also of basic metals, chemicals and petroleum which have a total

weightage of 16 per cent. On the other hand, growth in coal, power, general and electrical machinery and transport equipment, which have a total weightage of only 16 per cent (of which coal accounts for one-half) in the official index has been fairly satisfactory in the current year.

De-Khrushchevisation

WHEN Khrushchev was removed from power around this time last year, far-reaching changes were foreseen in the Soviet Union. These have, mostly, failed to materialise. In foreign policy, in particular, the expected 'hard line' has not emerged; nor has the Soviet position in the Sino-Soviet ideological dispute been very different since Kosygin and Brezhnev took over—both to the disappointment of the Chinese. However, in the field of planning and economic policy the recently-concluded plenary meeting of the Central Committee of the Soviet Communist Party saw a very big step towards de-Khrushchevisation, taken on the basis of a report by Kosygin "on improving management of industry, perfecting planning and strengthening economic incentives of industrial production".

In 1957 Khrushchev had basically changed the system of management of industries by ordering the disbandment of the central economic ministries hitherto in charge of different branches of industry and setting up over a hundred regional economic councils, "Sovnarkhozy", each to manage the economy of one of the economic regions into which the country was split up. This was a major act of de-Stalinisation since it dispersed the highly centralised system of control of the economy built up in the Stalin era. Now Kosygin has reversed the process and ordered the disbandment of the regional economic councils and a return to centralised control by central economic ministries which are to be resurrected. According to Kosygin, the result of the transfer of power to the regional economic councils was that "the management of our industry, which presented a single whole as regards production and technical features, was scattered throughout numerous economic regions and proved to be absolutely inadequate. The particular industries found themselves 'dissolved', as it were, in the economy of the economic regions".

The rehabilitation of the central ministries does not, however, mark a

return to stifling control of industry by Moscow's bureaucracy. Kosygin has been at pains to emphasise this. The other, and in some respects the farther-reaching, part of his reform relates to the relations between the central controlling authority and industrial production units. Here all the changes are intended to give the utmost initiative and freedom of action to plant managements. This is accompanied by emphasis on profits earned by an enterprise as the touchstone of its performance. To this end targets of performance will be set in future in terms of goods sold, not just produced. This, along with an overhaul of the structure of prices, to be undertaken by a new Price Fixing Commission, will, it is hoped, induce—indeed, compel—managements to pay attention to the quality of their output.

If it is proposed to give plant managements the head, it is also proposed to judge their performance stringently. Full utilisation of production facilities is to be insisted on. The norm of efficiency is to be fixed in terms of profits earned as a proportion of fixed assets. Similarly, the contribution of each enterprise to the State budget is to be determined in proportion to its fixed assets and working capital. So an enterprise which produces at full capacity and is able to sell all its output will make high aggregate profits and will pay a smaller part of these to the State and will consequently be left with larger resources which it will be able to use at its discretion for expansion and improvement of production facilities and for incentive payments to workers. In fact, earning such surplus profits (after payment to the State budget) will be imperative since it is proposed to sharply reduce State assistance to enterprises.

These are far-reaching changes. It is not known how much criticism there was of them at the Central Committee meeting. However, the decision to put off till next year the Party Congress is indication that Kosygin is taking no chances.

UK and S Rhodesia

Our London Correspondent writes:

AFTER the breakdown of the London talks between Harold Wilson and Ian Smith, the question is how soon and when Smith's Government will make a unilateral declaration of independence, and what action the British Government will actually take should this come about. Wilson has

made it clear that unlike in British Guiana and Aden, Britain does not intend to suspend the Rhodesian constitution which could be one very decisive way of dealing with the situation. In the view of Wilson and his colleagues, because of the special nature of the Rhodesian Government, and the fact that they have their own army it would be unrealistic to assume that British troops could take over in this particular British colony. The possible alternative of holding a special Independence Conference on Rhodesia, to be attended by Wilson, Smith, Nkomo and Sithole (the two rival African nationalist leaders) a representative of the African Chiefs, and the leader of the African Opposition in Parliament, put forward both by Wilson and Bottomley has been turned down by the Rhodesian Prime Minister. It will be recalled that this was the line of approach which was backed at the last Commonwealth Prime Ministers' Conference in July and has been welcomed in Salisbury by African parliamentary leaders, but Ian Smith has always refused to release the nationalist leaders for such a meeting.

Wilson, at the London conference, reminded Smith of the grave consequences of unilateral declaration of independence. "Having cut herself off from the Crown and from Britain, Rhodesia would find herself practically friendless in the face of the almost solid hostility of the world". However, warnings of this nature, combined only with the threat of economic sanctions and the possibility of United Nations' intervention, will not really succeed in deterring Smith from his objective of maintaining white supremacy in Rhodesia and preventing majority rule. Surely something more effective must be done to force Smith to free the detained African leaders and to insist that, in consultation with the African majority, a new constitution is drawn up, based on the principle of "one man one vote". Smith himself has admitted that under the new Rhodesian constitution which he has in mind, it could take up to fifty years before African majority rule is achieved, and it is no wonder that this is not acceptable to the Africans.

The Labour Government is certainly prepared to take strong economic action against Rhodesia should a unilateral declaration of independence be made. Wilson has already said that Rhodesia would forfeit all trade and financial privileges she enjoys in London and would be liable to a complete embargo on trade. The US and most of the

Commonwealth countries have endorsed the British standpoint and would almost certainly withdraw all special privileges from Rhodesia, even if trade were not entirely cut off. Organisations such as the IMF and the World Bank would also withdraw their facilities from Rhodesia.

Will Economic Sanctions Do?

BUT how effective will economic sanctions be? To be effective, Britain must not limit herself to applying sanctions against only tobacco or sugar. All trade with Rhodesia must be blocked and transfer of capital must be frozen, as was done in the case of Egypt's holdings in the Suez Canal Company. The use by the Conservative Shadow Cabinet of the words "gravest consequences" in its warning to the Rhodesian Premier would seem to leave it with little alternative but to support economic sanctions if they are imposed although Lord Salisbury has now entered the ring and will put forward an emergency resolution at the Conservative Conference which will probably plead for minimum sanctions against Rhodesia.

The possible economic sanctions may be summed up as follows: An automatic result of non-recognition of the Ian Smith Government would mean that the Ottawa preference system, as far as Rhodesia is concerned, would end. This would involve the Rhodesian tobacco industry with 1/6½d a lb loss on tobacco imports, and would cost approximately £9 million a year. Half the Rhodesian tobacco crop is sold to Britain. This means that the British tobacco industry will have to look elsewhere for half of its supplies, worth about £25 million to £30 million, but many countries, including India, Canada and the USA, would be only too happy to make up the deficit.

Rhodesia would forfeit her membership of the Commonwealth Sugar Agreement which would mean that the guaranteed price of about £46 a ton in the UK market would be lost, and only the unprofitable "free market" price of about £20 a ton would be open to Rhodesian sugar exports. This would seriously damage Rhodesia's rising sugar industry. A total trade embargo could also have a very serious impact. In 1964, Britain supplied one-third of Rhodesia's total imports of £110 million and took one-quarter of her total exports which were worth £120 million. A trade embargo with Zambia would mean the loss of another £6 million of imports and of no less than

£31 million in export markets, including food, coal and electric power and manufactured goods. Rhodesia's overall trade would probably have to be cut by half in each direction. It is unlikely that South Africa would ever be able to fill the gap left by the British and Zambian markets. In addition, the Rhodesian Government would have no right to float loans in London and British banks would be ordered to refuse exchange for the Rhodesian pound which eventually would weaken this currency, and British companies would be forbidden to deal with the Smith Government. Much of Rhodesia's seasonal export trade depends upon the supply of bank credit, and a cut in this could have damaging results.

The Rhodesians would then impose counter sanctions, and it is difficult to make any exact estimate of Britain's financial stake in Rhodesia, but since these interests are so interlocked with Rhodesian and South African interests, it would really be difficult for the Rhodesians to take action. In many cases, British companies in Rhodesia operate through subsidiaries of their South African subsidiaries, and in other cases, British minority holdings are combined with local Rhodesian capital. Therefore, Rhodesia would find it hard to take any action against a wide range of British interests, without alienating interests in South Africa. Estimates of the total value of British investment in Rhodesia vary between £40 million and £200 million.

The impact of economic sanctions on Zambia could be very difficult for the latter country. Zambia's vital copper industry could be cut off from Kariba Dam power, Wankie coal supplies and railway access to the South. But emergency action could be taken by Zambia. Power could be provided from the mines' own thermal station and the hydro-electric station at Katanga. Katanga and Benguela railways could carry all the copper to Lobito port. Rhodesia itself would suffer more from a complete break. The loss of copper and coal transport would bankrupt Rhodesia's railways, and she would have to find another market for its coal and would be saddled with the costs of Kariba running at half pressure. But the cutting off of general supplies would affect Zambia more. At present, Rhodesia accounts for 35 per cent of Zambia's total imports. In Rhodesia itself, business and commercial interests are certainly not completely sold on UDI. Chambers of Commerce and Industry, the Institute of

Directors and the Rhodesian Tobacco Association are very concerned about the economic consequences of UDI.

But economic sanctions are doubtful weapons and would take months or years to have punitive effect, and the South Africans will certainly have an interest in frustrating economic sanctions. Surely, in these circumstances, the British Government would be wiser to take drastic action now, than be involved later on in a more difficult situation which is bound to arise. The intransigence of the white minority Government in Southern Rhodesia means that, sooner or later, there will be another Algeria in Africa with all the disastrous consequences.

Steel for Defence

IN the pre-occupation with over-all targets of steel production, the urgent necessity of stepping up the output of alloy steels has often been neglected. Some varieties were produced under considerable strain by Tatas during the Second World War and limited production on a job basis has been undertaken by ordnance factories

for many years. In 1961, however, there was no commercial capacity for this purpose. The initial Third Plan target of 2 lakh tonnes was revised to 4.15 lakh tonnes but has been lowered, it is reported, to 3 lakh tonnes. The existing installed capacity is estimated at 62,000 tonnes; further capacity of 278,000 tonnes is covered by foreign exchange allocations. The latter does not include the new projects of Tata and Birla and a few smaller ones, which are still in the preliminary stages. Tata and Birla are reasonably well assured of foreign exchange from private sources and ICICI.

Domestic output of alloy steel in 1964-65 was 35,000 tonnes, and is expected to rise to no more than 50,000 tonnes in the current year. In spite of imports of 60,000 tonnes last year, about one-half of the estimated demand was left unsatisfied. The immediate prospects are not too rosy since both Durgapur and Bhadravati would be fully commissioned only towards the end of 1967. If there are no further delays in these two public sector projects, it can be presumed that the

position would improve substantially by 1970. Durgapur and Bhadravati would then be over the hump. Mahindra Ugin, Tata and Birla should be in full production, and Salem, too, should be ready to deliver, if its preliminaries are speeded up. In fact, the more conservative among the knowledgeable fear the possibility of surplus capacity and production in this specialised field within the next five years, unless the production of different varieties fully matches the pattern of emerging demand.

There are also reports that Government has decided to induce a change in the pattern of steel production in order to meet defence requirements and that the Defence Ministry has given an idea of the supplies required by it over the Fourth Plan period. The latter may be taken with a pinch of salt because if such an estimate could be made so readily, it should have been available earlier; at best, it must be a rough and broad outline of its needs. Steel production has been almost stagnant since 1962, by which year the Second Plan projects were delivering

near-capacity output. Further increases can be expected only towards the end of 1966 when new capacity at Bhilai and Durgapur will go into production. The small increase in production recorded in 1964 over 1963 was confined to black sheets, wires, strips, sleepers, and skelp; output of decontrolled varieties fell and so did that of plates, which are critically short, from 3.5 to 3.3 lakh tonnes. Defence reorientation requires mainly more

plates, sheets and certain billets and blooms, so far as direct idents are concerned. These have to come mainly from Rourkela and Jamshedpur and later from Bokaro also. The magnitude of the demand would be such as to require more attention to the quantity and scheduling of orders than has been the practice in defence procurement and steel plants hitherto; both orders and their fulfilment have often been uneconomical and bunched.

LETTERS TO EDITOR

UK and the Indo-Pak Conflict

THE daily press is in a pitiable state in a war: its clientele loses taste for all news but of war, and makes an insatiable demand for war news which has to be met out of what news or rumours the press officer of the government deigns to ladle out. In the circumstances, it was natural for it to seek and publish an endless series of tendentious psychoanalyses of British "partiality" towards Pakistan. But your readership, I am sure, did not ask for such trash. Your editorials on the war were the only evidence I found that anyone in the press was thinking of the larger implications of the war, and it was astonishing to see you stoop, so late in the day, and play host to anti-British hysteria in your last issue. The knowledge of psychology among our moulders of public opinion is pretty primitive, and their comprehension of political events little less so. But in the entire annals of the Indo-Pak war it is difficult to come across so factless and unthinking a piece as your correspondent's note on "UK and the Indo-Pak Conflict" (p 1544).

All articulate Britons still believe that there is a dispute between India and Pakistan. I say "still" because it is possible that we no longer officially recognise the existence of a dispute. It is so difficult to know, because our initial stand that there had only been an aggression and not a dispute found no acceptance abroad, and we have alternatively recognised this lack of acceptance and refused to recognise it. Even if we have decided that there is no dispute, we might not keep this stance for long; for the conflict is between sovereign nations, and cannot be unilaterally wished away.

Further, they believe that the dispute is one about the territory of Kashmir. We also recognise this *de facto*, for we took military measures in order to "defend the territorial inte-

grity of India, of which Kashmir is a part". When it comes to argument we start talking about theocracy versus secularism, democracy versus dictatorship, war versus peace, love versus hatred, and so on, which sounds somewhat irrelevant to the British; but even we would probably recognise that the territory of Kashmir is one of the issues in the Indo-Pak conflict.

There are certain customary ways of settling territorial disputes; and tossing of coins or making of unilateral declarations are not among them. One can settle a dispute by force, as we did in Goa, Junagadh and Hyderabad or the United States did in the Civil War. This a time-honoured method: the British wouldn't like it, for they do not think Pakistan deserves destruction any more than India; but they do not mind enough to interfere. And given the contiguity of Kashmir to India and Pakistan, the relative strength of their armies and the potential costs of occupation of such huge, hostile countries, they are also sceptical about the feasibility of a military solution. A dispute can also be solved by negotiations and agreement, for instance the dispute between Yugoslavia and Italy over Trieste; the British would be perfectly happy if the Kashmir dispute were settled this way, but the positions of the two parties are just too far apart. Finally, one can adopt some agreed procedure; a plebiscite is the most common one because the inhabitants of the disputed region are the people who would be the most affected by the settlement of the dispute. It seems just unfortunate to the British that the Pakistanis prefer a plebiscite and the Indians dislike it; how much simpler everything would be if both sides liked it.

The British view—and it is the view of a very large number of countries—is naive and uninformed; but to trace it to "malice, self-interest and mis-

guided moral fervour" tells more about the commentator's mental state than about that of Britain. It reminds me strongly of the fulminations of the German press at the time we took Goa—of the hysteric outbursts of people whose wartime sympathies for Portugal broke through the thin veneer of their abhorrence for dictatorships, who could find nothing but dirty words to express their impotent rage at fellow-Europeans being beaten up. And it pains me because it is such a mean, petty, unconstructive response to the splendid challenge this war has brought upon us. For the cessation of food and military aid has brought us great and difficult tasks; it has brought hope to the nationalists among us, those who have borne the galling contempt that Europeans and Americans show for a people who cannot even feed and defend themselves. Maybe we will fail, but let us at least make a better effort.

Bombay,
October 13.

ASHOK DESAI

II

DOESN'T your correspondent, the author of "UK and the Indo-Pak Conflict" in your issue of October 2, ever differ from anyone except out of "malice, self-interest and misguided moral fervour"—the only explanations he finds for the British attitude to the Indo-Pak war over Kashmir? Doesn't he have differences just because he sincerely feels that the other party is in the wrong? Well, a lot of people do.

Why should it be so difficult to believe that the British Government and press have taken the view they have by and large on the merits of the issue—of course, as they, not we, see them? In his carping attempt to establish that this is not the case, your correspondent has chosen to ignore many facts. To take just one instance: he writes with copious sarcasm of Britain's "exaggerated enthusiasm" for a plebiscite in Kashmir. Now, we have the record of eighteen years of discussion of the Kashmir question in the United Nations to show that most members of the Security Council have always taken the position that the dispute ought to be settled through a plebiscite. Really, there seem to be altogether too many governments in the world which are malicious to us, or want to do us out of Kashmir because it serves their self-interest, or are, at the very least, persistently misguided by moral fervour!

P. B. 671, NEW DELHI-1

The American "New Left"

DURING the past few months there has been a good deal of heated discussion in intellectual and academic circles in the United States concerning the emergence of a "New Left". Last year's ferment on university campuses sparked by the small-scale revolution at the University of California, the mounting protest against American involvement in Vietnam, and a small resurgence of various left-wing political groups has caused this discussion. There is no doubt that the radical movement in the United States has made substantial gains in the past few years. The civil rights struggle, which is both radical and moderate, has involved the Negro masses for the first time in a movement for social change and has roused the rest of the society. The students, not a particularly vocal group in American society, have organized several militant organisations and now constitute an important element in the movement for social change. And for almost the first time substantial numbers of academics have become involved in the various protests against Vietnam policy, from moderate teach-ins to more radical street demonstrations.

Despite this resurgence of social concern, and the creation of organisations to give voice to this concern, it is probably premature to herald the advent of an American "New Left". Yet, the roots for a substantial social movement do exist, and the various radical forces in the country are now trying to provide co-ordination and leadership to the rather diverse groups and movements. The nascent "New Left" is now searching for roots, for ideological tools, and for workable organisational methods. Whether it will achieve the aim of building a mass movement for social change in the United States is unclear. Certainly, historical tradition is against the "New Left" although many of the key issues of the day, both international and domestic, are more pressing than in the past.

American radical and protest movements have traditionally been marked by a pragmatism and a fear of ideological entanglements. One of the key elements of American politics is its pragmatic nature. The present revival on the left is no exception. Most civil rights activists have no clear ideological position, and try various methods to achieve equality within the context of established American soci-

ety. There is a tacit acceptance of the values of the American middle class in much of the civil rights movement. Only the militant students of the Student Non-Violent Co-ordinating Committee (SNICK) have a broader vision, based mostly on their negative experiences with the American "Establishment" at all levels.

The students constitute a key element in the new protest movements and exercise much influence on the entire movement. Students have sparked much of the civil rights movement, in both North and South, particularly in mass demonstrations and civil disobedience. Many of the recent Vietnam protests, including the recent "Assembly of Unrepresented People" in Washington (at which 190 were arrested) and the attempts in California to stop troops from embarking for Vietnam, have been spurred by students. The major student organisation, the Students for a Democratic Society (SDS) is now engaged in a campaign to convince young people to disobey the selective service laws and not to be conscripted into the armed forces.

Although there is a sprinkling of ideologically sophisticated leadership among the students, there is almost no commitment to the "old" ideologies of socialism or communism. The key word of the student movement is "participatory democracy", a rather nebulous concept which would involve individuals at all levels in planning and governing most aspects of society. The attempts of the SDS to apply this concept in various projects in urban slums, "depressed" rural areas, and in Negro ghettos have achieved only limited success, and several of the projects have ended in failure. Despite the expenditure of substantial effort, the attempt to build a "revolutionary movement of the poor" is still only a concept. Yet, the fact that young people are attempting to build a substantial movement and are going into the slums is a significant development.

The "teach-in" movement, which has extended to Japan, England, and Canada, was spurred by academics and intellectuals, a substantial number of whom have not been involved in the various American peace movements. Vietnam has caused more discontent among American intellectuals than any other issue since the economic depression of the 1930s. Like the other movements, opposition to involvement in Vietnam is based on moral convic-

tions and notions of practical politics, not on ideological considerations. The initial surge of protest has achieved no results, and the Johnson Administration has continued its policies. This fact has led many dissenting intellectuals to disillusionment and retreat into the Ivory Towers, while others have moved toward the left in the search for an effective approach. Thus, the future of the "teach-in" movement also remains unclear although there are signs a more radical approach is emerging.

Some key elements are missing from the coalition which may emerge as a "New Left". The American labour movement has been painfully silent on matters of foreign policy or has supported the actions of the Administration. It has also refrained from taking a leading role in the civil rights struggle. The mainstream of American liberalism, represented by men like Vice President Humphrey, the late Adlai Stevenson and others, while showing signs of bad conscience at its continuing support of the Administration, has made no move toward the "New Left." In the last analysis, without support from segments of these two powerful groups within American society, the students and some academics and intellectuals simply cannot build a movement of any significance.

At the present time, there is conflict going on within the ranks of the emerging "New Left" concerning co-operation with other elements in the society. Some spokesmen, notably Bayard Rustin, a key civil rights leader argued that it is necessary to move toward an alliance with less radical elements within American life, even at the expense of sacrificing some elements of "New Left" radicalism. Others have opposed this trend, stating that this would constitute a "sell out" to the Establishment and would render the movement meaningless. The direction of the "New Left" depends, to a substantial degree, on the outcome of this current debate. Many of the students and the civil rights militants tend to distrust any contact with the Establishment, and are resisting "coalitionist" trends within the protest movement.

Thus, the American "New Left" remains more of a promise than a real movement. Its roots are only tentatively established, and it remains almost directionless at a crucial time. Yet, it is the most substantial groundswell of political and social concern in decades, and holds the promise of a substantial movement.

—Philip G Altbach

Guarding Against Relapse

THE cease-fire this time has not yet led to a relapse into the bad old normalcy. Nor has it, however, pushed forward the sense of renaissance. There is a sense of waiting, of determination, but not yet of expectancy. The difference, of course, is that the cease-fire this time appears to be considerably more fragile than the 1962 one. There has been no unilateral withdrawal by anybody. The UN is said to be supervising, but no Colombo powers have emerged who could exert the pressure of goodwill from a sense of friendship for both contenders.

The other big difference is in the nature of the national response, which is partially reflected in Government thinking as well. This is not mainly the difference in reaction to what was a humiliating defeat and what is now a demonstration of the capacity for defence. It is much more a matter of a desire for real independence. In 1962 the clamour was all for alignment with one or another super power, particularly the United States. It required the strength and vision of Nehru not to yield to this clamour and the national mood of demoralisation. Now the overwhelming urge is for standing on one's own feet, of completing the construction of a suitable economic structure that would materialise this urge. It is now widely recognised that the turn accomplished in 1955 and through the new dimensions of the Second Plan has to be carried forward to a qualitatively new stage. And as then so now, the realisation is rapidly growing that in this arduous endeavour a break has to be made from our present international economic moorings and a decisive push accomplished in the direction of an enormously increased economic collaboration with the Soviet Union and other friendly socialist countries.

1962 and 1965: The Difference

One of the most striking manifestations of the radical difference between 1962 and 1965 is the national search for an international ally. The disillusionment with and anger against the UK and the US is extraordinarily widespread. The Chinese ultimatum and outrageous attempt to bully through the threat of a renewed ag-

gression has, it is true, somewhat blunted the edge of anger against the latter. It has induced a sentiment that one should not go too far in alternating the strongest anti-Chinese force in the world today in case of another push from across the Himalayas. But the US is scarcely hailed today as a good and true friend. It is this turn against the imperialist powers as a part of the national desire for self-reliance that augers well for the future and which can be built upon to make India again a real Afro-Asian power rather than a second-rate imitation of the West.

This aspect of the assertion of the Afro-Asian identity of India has not received adequate recognition or analysis. But it is likely to be of increasing importance in the very near future. The US drive to attempt to subjugate Viet Nam and the equally dangerous Chinese drive to establish its hegemony in the "world village" of Asia will necessarily require the alliance of the forces of genuine, autonomous Asian revolution and the Soviet Union. The breakdown in Indonesia only heightens the need for the quick build up of this alliance. The Soviet Union, the UAR and a radicalised India have to come together if the post-Vasco da Gama era Asia and Africa is to be firmly, even irrevocably, established. The groupings in this direction have to be replaced by a determined search for a coherent policy. In a sense, India's need being the greatest and her experience being the sharpest she is particularly well fitted to take the initiative in the matter.

Government Lagging Behind

But this is precisely where the Government is lagging behind seriously. Lagging behind not merely the popular mood but equally behind the imperative compulsions of the situation. The flurried despatch of somebody somewhere depending on the image he or she may have in the country to which they are being despatched, is a sign of relapse to bankruptcy. We need not unnecessarily antagonise anybody but we have to make quite clear that we are trying for a particular kind of alliance, a specific type of alignment. Otherwise we need not be surprised if those who could and should be our

allies remain somewhat ambiguous and neutral.

Similarly, in the sphere of internal policy. Old attitudes still persist, unsuitable at any time and quite disastrous today. It looks as if the somewhat brighter personalities in the planning brains trust are looking at the situation only from the angle of pushing through a bigger tax effort. Tax effort is undoubtedly needed but the orientation is a matter of supreme importance. The kind of flat increase in land revenue, with no system of grading and without a proper exemption limit, is not going to help either planning or the politicalisation of the people around the question of national defence.

The position is much worse when we consider the question of institutional changes. Not one of the enormous number of policy statements of the Government has so much as breathed a word about social change or given the least limit about any radical economic measure. The refusal to utter the word "socialism" has also been fairly conspicuous. It looks as if current thinking at the so-called highest level is in the direction of a freeze as far as the question of the pattern of economic development in this crisis period is concerned.

Danger of Communal Revival

While this is bad enough as far as economics and the popular mood is concerned, it is even worse when we consider what type of national appeal this signifies. If the appeal is not to be on the lines of a modernised, radicalised India facing the challenge of different inimical forces in the modern world, then inevitably the drift will be towards some form of revivalism. And revivalism can only mean Hindu communalism in the Indian context. It is quite evident that the Jana Sangh and the RSS, more particularly, are working strenuously towards this end. In the name of national consensus there should be no underestimation of the danger from this quarter.

The only antidote to relapse is renaissance, a fresh birth. The thoughts of India must increasingly turn towards this problem as the central one for us at this time of uneasy cease-fire.

BANK OF BARODA

It has been no ordinary growth. The Bank of Baroda has grown in a very special way: **It has grown in number:** from just one office in Baroda way back in 1908 to a total of 229 branches in India and 16 abroad.

It has grown in strength: Its deposits now exceed Rs. 170 crores.

It has grown in experience and knowledge: The Bank's activities range from Small Savings to foreign exchange business.

It has grown in the estimation of the people: a result of our friendly and efficient service. Drop in at your nearest branch of the Bank of Baroda and you will find out the reasons for our astounding growth.

BOOK REVIEW

Public Debt Management and Monetary Policy

Management of Public Debt in India, a study by the National Council of Applied Economic Research, 1965; pp xi+158; Rs 18.

PUBLIC debt policy in our country has so far been confined to its fiscal aspect, buttressing mainly the government borrowing programme. The monetary aspects of debt policy which concern cost and availability of credit through changes in the prices of securities (and thereby the yields) have largely been left unexploited. This is because the credit policy instruments at the disposal of the Reserve Bank of India are found adequate to influence the cost and availability of credit from the banking system and also because of the limited effect action in the form of changes in the prices of securities would have due to the narrowness of the capital market. Any argument for the use of debt policy with the emphasis on its monetary effects has to demonstrate that it would be superior to any action that can be taken on the basis of existing powers of the Reserve Bank of India. This is because we cannot build an entire institutional complex to increase the volume of transactions in securities and widen their market unless it is shown that this promotes the growth of marketable debt and strengthens the liquidity effect of debt policy.

Need Not Established

The growth of marketable debt or its holding outside the captive market depends on whether any uncovered classes of investors can be brought in. Outside the captive market, which includes government owned or controlled institutions, there are only the corporate sector and the household sector. The corporate sector by its very nature would be interested only in short-term securities. For the household sector, for which liquidity is not an important factor, we have an entire set of instruments under the small savings scheme. Actually it is not clear as to what is meant when the term "widening of the market" is used. Further, a mere increase in the volume of transactions would only increase liquidity and make it more difficult to maintain orderly conditions in the bond market. Finally, the fiscally oriented debt policy we have has been broadly consistent with the prevailing monetary policy. Any plea for a co-ordinated fiscal, debt and monetary policy, whatever its theoretic

validity and practical impact in the UK and the USA, has to establish whether it would increase its effectiveness given the limited use of such instruments in our economy. This the book under review does not attempt.

The book evaluates debt management policy from the standpoint of three objectives: (i) its efficiency in mobilising resources for financing the Plans; (ii) its adequacy in ensuring a desired level of liquidity of the financial institutions; and (iii) its contribution to economic stability. The first objective covers also an examination of the structure of the ownership-distribution of public debt to find out whether the present maturity pattern restricts or promotes the growth of marketable debt. Similarly, the second objective covers an analysis of credit policy and the structure of the investment portfolio of commercial banks to determine whether the liquidity effect of debt policy is reinforced by them or not.

In regard to mobilisation of resources through public borrowing it is concluded that under the given conditions the prospects of even fulfilling the Plan targets are slim. The book enumerates various steps to enlarge the prospects of successfully meeting the Plan targets. Among others, these are (i) the pattern of maturity should be biased towards the long-term; (ii) the entire range of yields should be raised to conform with the long-term upward trend of interest rates in India; (iii) the banking system should be strengthened; and (iv) active steps should be taken to promote trading in Government securities.

As for ensuring a desired level of liquidity of the financial institutions to influence the cost and availability of funds, the book concludes that this objective has not so far been realised fully because of the pre-occupation with the fiscal aspects of debt policy, and the gradual contraction of the securities market. Two measures are suggested to realise the monetary aspects of debt policy: (i) the Reserve Bank should conduct to a greater extent the sale and purchase of securities through the securities market; and (ii) the ownership of securities should be spread more widely.

As mentioned above, the case for a

debt management policy is far from established in our economy. No doubt, the superiority of debt management over monetary policy lies in that it not only affects availability but also the cost of funds. But when direct powers are taken by the monetary authority to affect interest rates on deposits and advances, the superiority of debt policy disappears. Given this broad orientation of monetary policies, open market operations which affect the level of reserves of the banking system have the effect of altering liquidity.

Debt Policy and Inflation

With regard to the role of debt policy in ensuring economic stability the book concludes that it has been a contributory factor to inflation because the Reserve Bank has been adding to its portfolio all unabsorbed new flotations. Apart from recommendations about the use of monetary policy to restrain inflationary forces, the book suggests that the Reserve Bank should not add to its security holdings to accommodate the Government. Although nobody argues about the inflationary impact of Government borrowing from Reserve Bank, the facts which gave rise to this addition are far from clear. First, the increase in Reserve Bank holdings of total funded debt since 1960 may be due to the advance purchase of securities approaching maturity. Actually the book itself suggests such purchases. In such circumstances it is difficult to see how the relative increase in the holdings of the RBI, which may be due to outright purchase of securities approaching maturity, are inflationary. Secondly, the securities are held by RBI on tap because of the absence of a securities market. The inflationary impact in such circumstances would be temporary and would depend upon the time lag between the use of funds by the Government and the sale of securities by the RBI to the public. To the extent that the securities held on tap are sold to public, there would be a contractionary effect, offsetting the initial expansionary effect of the addition of government securities to the RBI holdings. In the light of the foregoing one cannot assert that debt policy has been a factor contributing to the inflation.

India and Pakistan

The Other Half of Our Task

Dilip Mukerjee

Frustrating the aggressive designs of Pakistan's war machine is one-half of our task. The other, and perhaps the more important, half is to carry conviction to people in both wings of Pakistan that India has no quarrel with them, nor any designs upon their national integrity.

ABIDING peace in the Indian sub-continent is just not possible unless the fear of India is erased from the Pakistani mind. It is this fear that enables the rulers of Pakistan to win popular sanction for their adventurist policies. The sooner it is dispelled, the quicker we can move towards genuine and stable co-existence. The fear has, of course, been deliberately fostered and magnified to consolidate Pakistani nationalism. There was not really much else to bind the country when bits and pieces of undivided India were hastily lumped together to constitute the new State. Yet it does not help us at all to dismiss the fear as imaginary. As the bigger and more powerful nation, it remains our responsibility to do all we can to reassure the Pakistani people, so that they can call their own leaders to account. In other words, we have to counter adventurism on the military plane, but must at the same time endeavour to retain the friendship and goodwill of Pakistan's common people.

This is not a plea for psychological warfare, but for helping the two countries to rediscover their common values and their common interests. As the President, Dr Radhakrishnan, said even while bitter fighting was in progress on the battlefronts, we have to avoid any form of hatred of the people of Pakistan. They are, as he reminded us, "our own kith and kin". Some despair too readily of a response from the people of Pakistan. I see no reason to do so, and offer in evidence my experience as a private visitor to that country last February. Admittedly, this was long before the current phase of conflict but this does not necessarily diminish the relevance.

As I stepped out at Karachi's international airport after the short flight from New Delhi, almost the first person I spoke to was a police sub-inspector whose job it was to oversee the form-filling by holders of Indian passports. I was last in the queue, which may explain why the entries on my form registered on his mind. "So you were born in Etawah! I come from Fatehpur myself", he announced. Not knowing what to say in reply, I merely

smiled in polite acknowledgement of his interest. But the inspector was not quite done; he enquired about my people and searched his mind to see if he had ever met or heard of any. And finally, he made some entries on my form to help me short-circuit the red tape that was ahead of me.

Knowing the sub-continent's policemen as I do, I was agreeably surprised by the considerate and helpful manner of this former compatriot. But even before this had time to sink in, I was face to face with a money-changer at a bank counter. Before the small transaction was closed, I had to reassure this former South Indian about the language agitation in Madras. He seemed very worried indeed about his old home-town.

These encounters were typical of countless others with people in all walks of life, testifying to an astonishingly keen interest in India. Which is hardly surprising; at its start in 1947, every sixth person in West Pakistan was an emigré from India. And the interest is by no means hostile, one reason why the regime runs a non-stop anti-India campaign in the press. As a friend in Karachi remarked, Pakistan's comfortable newsprint situation was a terrible liability; it permitted *Dawn* and others of its ilk to go on and on with their venomous outpourings.

I particularly remember the encounter with a Pakistani shopkeeper in the older part of Rawalpindi. I was looking for a type of *chappal* which a kind uncle used to send me from Peshawar before partition. Intrigued by my request, the Pathan shopkeeper got into a long conversation which developed into an argument over India-Pakistan relations. The immediate provocation was provided by a news report from New Delhi suggesting that sacrificial killing of animals by Muslims for Bakr Id might be stopped. I frankly admitted that we had our religious fanatics much the same as they had in Pakistan. The answer turned away his wrath, and I was allowed to leave only after a cup of tea with the shopkeeper's father, specially summoned to meet a visitor from distant Cal-

cutta where the old man once had a shop.

It may be argued that these isolated instances of courtesy and friendliness at a personal level mean nothing at all in political terms. But there is no reason why a genuine India-Pakistan accord can not be built upon this promising foundation.

It is suggested at times that understanding would be easier to reach when a new generation, untroubled by the memories of partition, takes over. Free from the love/hate relationship of today, the successors on either side should be able to handle the problems between them with greater detachment. This is plain nonsense. In the first place, bitterness about the past has faded from most minds—both in India and Pakistan. It need not, therefore, come in the way of a reconciliation here and now if other circumstances were propitious. Secondly, it seems naive to assume that the next generation will find it any less difficult to overcome religious and national prejudices that plague the relationship today. These will be handed down unless effectively dealt with in the present. I am reminded at this point of a twenty-year-old who asked me searching questions about the growing influence of Jan Sangh in the UP, and its implications for the Muslim minority. I was later to discover that his grand parents still live there.

The thought that India and Pakistan must find a *modus vivendi* was voiced to me wherever I went, in differing ways and at different levels of sophistication. At a dinner in a university campus, talk turned to the Kashmir problem. I was anxiously asked whether India had really closed her mind to the possibilities of a settlement. The concern of this group of university teachers was not so much with Kashmir itself, but with the domestic consequences of the continuing India-Pakistan differences.

They argued that there could be no real democratic upsurge until Kashmir was got out of the way. The confrontation over it with India provided a very convenient means of diverting public attention from problems at

home. But while bitterly critical of the regime's manoeuvrings, every one in the group was convinced that the Indian position in Kashmir was morally untenable. It was, they argued, upto us to make amends, not merely to right the wrong done to Pakistan but also to deprive the regime of its sole justification for belligerent and adventurist policies.

This conviction about the validity of Pakistan's case on Kashmir seemed pretty nearly universal. Every one was equally agreed that a solution in Kashmir would have the effect of dissolving all the accumulation of bitterness and distrust between the two countries. Only one person—a very highly-placed Bengali Muslim—thought otherwise. He too supported the Pakistani position but had his doubts whether Kashmir was the only stumbling block. Quite obviously, the eviction issue loomed larger in his mind.

Misgivings over Kashmir not withstanding, I found widespread awareness of the advantages to be gained from India-Pakistan co-operation in various fields. For example, thoughtful businessmen and administrators readily conceded that Pakistan's plans for regional economic co-operation with Iran and Turkey were a poor substitute for economic collaboration with India. As several said over and over again, there is so much the two could do for each other on a basis of mutual advantage. At the political level enthusiasm for such ideas is taboo, but this is only to be expected.

More surprisingly, an Air Force dignitary expounded to me President Ayub's thesis of a common defence system for the sub-continent but with specific reference to the need for a counterpoise to China's immense might. But the same person also spoke of the alarm caused to Pakistan by India's growing military potential in the context, as he put it, of unresolved differences.

All this points to a dichotomy in the Pakistani mind. An identity of interest with India is recognised as also the many ties of language, culture and history that bind the countries together. These are stronger than the negative strands of fear and suspicion, or otherwise the regime would not be so anxious to limit contacts and exchange between the two countries. A member of President Ayub's secretariat said that he had stopped taking his holidays in India—many of his people still live here—because visits to this country might be misunderstood.

Indeed, as Dr Radhakrishnan said in

his recent broadcast, more things bind us together than keep us apart. Herein lies the longer-term challenge to Indian statesmanship; we have to find some way to reassert the common ties, overcoming the ill-will deliberately engineered for political ends. We have of course to search our own hearts too. The surer our own grasp

of the values of secularism and democracy, the easier it should be to carry conviction across the border. Our task, as we should keep reminding ourselves constantly, is not merely to win the war; much the more important goal is to win the peace. The should not be too difficult for the country of Gandhi and Nehru.

British Attitude to the Indo-Pak War

Stephen Hugh-Jones

London:

I DON'T imagine an American in London in September 1914 would have got much of a hearing if he had attempted to explain why his country had not instantly sprung to Britain's aid against the vandal hordes of the unspeakable Hun. Though I do not expect sympathy, I hope it is not entirely useless, however, to attempt to explain the attitude of the British press and the British government toward the recent war between India and Pakistan; I assume that readers of *The Economic Weekly* recognise the value of understanding the other man's point of view even if he is wrong.

First, what is "the British press"? It certainly is not a united front. Nor, I suggest, can it fairly be condemned for the attitudes of its least responsible members: I myself have been personally attacked for the colour of my skin in a widely circulated Indian weekly, but I should not therefore accuse the Indian press (or indeed the weekly concerned) of racialism. Nor is it guided by the government. Its leader-writers have a great many sources of information on Kashmir—my own views, for instance, were formed almost entirely in India—other than Whitehall, and they have repeatedly proved themselves capable of criticising the British government on issues where it was far more vitally concerned than this one. Lok Sabha backbenchers may like to imagine a gigantic Whitehall-Fleet Street conspiracy to do India down; but they are mistaken.

It might still be true that we are all possessed by dreams of former imperial grandeur, or by a desire to divide-and-rule, or by a political bias in favour of dictatorships, or respect for fierce and martial Muslims, or resentment at Nehru, or plain bloody-minded hostility to India for one obscure reason or another. I cannot swear that none of these is true of anyone—Mr Wilson's "east of Suez" fantasies seem to me to have strong ex-imperial overtones, but then they had nothing to do with his reaction to Kashmir—but I can say that they are not generally true of the people I know who are directly concerned. This is a matter of fact, not opinion, on which I would claim flatly to be better placed to report than anyone in New Delhi. This should not be surprising: Fleet Street just is not peopled with ex-North-West Frontier brigadiers or former ICS men.

In short, though I could name one significant group of papers whose attitude to the Kashmir war I can only explain in terms of bias, by and large it should be accepted that if we have taken mistaken attitudes we have reached them for honest reasons.

What were those attitudes? One can distinguish here between news reports of the fighting; editorial opinion on its immediate cause; and editorial opinion on the underlying causes and what should be done about them.

We are told that there is considerable resentment in India at one-sided British reporting of the battle. There is one simple explanation of this: it was, for most of the time, one side only that allowed foreign correspondents near the battle-front; and it was the same side that imposed the most severe censorship. India's defence ministry appears to have adopted the alternative routine of 'pre-censoring' the news by transmitting it through official spokesmen and letting correspondents transmit more or less what they liked. This was demonstrably less effective. Perhaps the fault was not entirely that of the British press. The same excuse cannot be offered for those reports, and there were some, which suggested that the writer had simply taken leave of his critical faculties and repeated as fact whatever some interested party told him. It is my impression that there were more of these from the Pakistani side. The general attitude, however, was one of considerable scepticism of the vast claims of tanks destroyed and planes shot down. Both sides' claims suffered from this scepticism. I am not sure that that is a proof of anti-Indian prejudice.

As for editorial opinion, most British papers fairly soon came round to accepting the Indian claim that the Kashmir fighting began because Pakistan sent infiltrators across the ceasefire line. But the same papers also blamed India for creating conditions that caused the Pakistanis to take this step, and urged that after a ceasefire there must be a political compromise. They also unanimously argued that the most important thing, whatever the merits of the case, was to stop the fighting. I imagine this is the basic Indian complaint against the British press.

Why did we take this line? Why do we "equate the aggressor and the vic-

tim"? I think the following is a fair summary of what British leader-writers think.

They think there is a genuine dispute about Kashmir, and that it is not closed merely because one side unilaterally claims that it is closed. They do not think "Pakistan should have Kashmir because Kashmiris are Muslims"; they do think there ought to be a plebiscite because a plebiscite was promised. They see that promise as differentiating Kashmir from any other part of India, and therefore do not accept that Kashmir would become a precedent for other claims to self-determination. They blame Nehru that no plebiscite was held years ago. They realise intellectually that there is a danger of communal violence elsewhere in India: they do not feel it as you who have been through partition do. Nor do they have the profound revulsion that Indians have to anything that seems to sanction the two-nation theory. They prefer secularism to theocracy: but, they would argue, Pakistan exists and if you can swallow that camel of two nation theory, why strain at the gnat of Kashmir? They are unmoved by suggestions that India stands for freedom and democracy against dictatorship; they agree that India is generally democratic but do not believe that this is true in Kashmir, where, they believe, most Kashmiris would opt for Pakistan and where the most popular leader is in detention, while all elections have been fraudulent. They think Kashmir is the key to all Indo-Pakistani problems, and that, unsolved, it represents a danger to peace and demands a useless diversion of resources to armaments. Some of them still dream of joint defence of the subcontinent; nearly all fear that the Pakistanis in desperation will turn ever more strongly toward China. Coming to immediate causes, they think the Pakistanis were driven to desperate measures by the growing strength of India's armed forces combined with a unilateral move to merge Kashmir constitutionally into India (several reputable British papers have written as if the extension of Articles 356 and 357 to Kashmir had been the first extension of the Indian constitution thither; and as if what had been done was, in effect, to abolish Article 370. Where they got these notions, heaven knows. The Pakistan High Commission?). In short they do not accept that the merits of the

case are by any means all on India's side.

I am not saying these ideas are correct: simply that they are believed, and honestly believed. Many of them are shared by the British government, though it is undoubtedly particularly moved by the practical fear of Pakistan being driven straight into the arms of China.

Like the papers, the British government was also horrified at the prospect of subcontinental war. This, I think, explains its very foolish decision to pick out the Indian drive toward Lahore from all previous acts of escalation as the occasion for condemnation. In London, war in Kashmir seemed to be one thing; war around Lahore was another, something that could set the entire borders aflame and perhaps bring China in too. And where would that end? Speaking for myself, I at the time thought Wilson's condemnation was unwise; I thought the Indian attack was the natural consequence of the previous Pakistani drive toward Akhnur; but I did not dissent from the judgment of the future that I suppose caused the British government to speak as it did. For the first time it seemed really possible that there would be a major war; and just faintly possible that there would be a world war, a war much more likely to destroy Britain than to destroy India. I think there was an element of simple fear—selfish too, if you like, but hardly unjustifiable in the British reaction to this particular attack.

It was the same horror of war that caused Wilson to suspend military aid to India, and, it appears, to interfere with shipments of commercially bought military supplies. Since for practical purposes Britain does not supply Pakistan, he had the choice of favouring India by sending more arms to the scene of war, or favouring Pakistan by ceasing to do so. Given that his aim was to see the war ended, and that the Americans were putting the corresponding squeeze on Pakistan, it would be surprising if he had decided other than he did.

You may still ask why the British press—granted it does not share your views on Kashmir and was not therefore likely to condemn Pakistan—should still have put such tremendous emphasis on a ceasefire and should now be so strongly urging that you must make concessions to avert the risk of a second round. Is this simply a high-sounding excuse for trying to prise Kashmir from your grasp? Is the British press not merely taking up an

offensive attitude of non-alignment but deliberately seeking to promote Pakistan's cause?

It could be. But there is an alternative explanation which you should at least consider possible: the simple one that those who are not directly involved in war see its dangers more, and its purposes less, than those who are. It was not after all merely the perfidious British who put more emphasis on stopping the shooting than on condemning those who started it. Russians, Americans, Egyptians, Yugoslavs, Nigerians, almost the world's press—China and a few friends dissenting—have taken the same line. The fault of the British press is that, not being government-controlled, it—like those sections of the American press that are not so obsessively anti-communist—suggests that Kashmir must be settled and to suggest that settlements must be made for exactly the same crimes as they

once blasted India for—has gone on are not usually reached without compromise (and the belief that there would have actually been a settlement long ago but for the Anglo-Americans is a comforting myth which will not survive a week spent in Pakistan).

Could it be that the British press is genuinely more concerned with the issue of peace against war than of India against Pakistan? That it genuinely believes peace is more important, even to you, than the *status quo* in Kashmir? You may well reply that even if this is the explanation, deciding what is important is your prerogative. So it is. Why then do we feel entitled to press our advice upon you? Perhaps because we remember not only the euphoria of August 1914, not only the "grim determination", the "up-surge of national unity", but the filth and blood of the four years that followed it. We, unlike you, have twice fought total war.

Private Institutions of Education

A R Kamat

A large number of institutions of secondary and higher education in India are run by private effort. According to an estimate of 1960-61 about two-thirds of the enrolment at the secondary stage and four-fifths of the enrolment at the college stage takes place in private institutions.

Private enterprise will continue to remain an important factor in these sectors of education for considerable time to come. Serious thought must be given, therefore, to the role they are expected to play in the educational development of the country.

THE private educational institutions may be classified into two broad categories: those which represent or cater for sectional interests and those which serve all sections of population. A large number of the institutions run by private enterprise belong to the second category. Most of these are secondary schools and colleges of liberal education; they do not belong to any specific community or section, religious or linguistic, and are essentially secular in character. Their management may be in the hands of non-profit educational associations like the Deccan Education Society or in the hands of profit-motivated groups or individuals. The first category although much smaller in dimensions is important otherwise. It consists of three main types of institutions: (A) institutions primarily established to provide religious instruction, (B) institutions of the public school type intended to provide education to the children of the well-to-do classes, and (C) institutions established as a privilege of religious or linguistic minorities. In this article it is proposed to consider the private educational institutions of this first category. (The institutions of the second category will be considered separately elsewhere.)

It will perhaps be useful to visualise more clearly each of these types, if necessary, by taking illustrations. Type (A) should properly include institutions which go under the name of Pathashalas and Madrasahs where the main aim is to impart religious instruction and to train for priesthood. Institutions like convent and mission schools or mission colleges which had compulsory religious instruction in earlier periods but where it is now voluntary or non-existent because of the conscience clause are of a different character.

Institutions of Type (B) are the counterpart of Public Schools (in England and elsewhere) and will cover institutions like the Scindia Schools in Gwalior or the Doon School at Dehra Dun or the new English-medium public schools which are being started in many other places. Colleges like the

former Raj Kumar College (where they still exist) will also come under this category.

There is some difficulty of classification in Type (C). Institutions of the proper linguistic minorities in a State such as Gujarati or Bengali schools in Poona or Bombay or Tamil schools in Bombay or Calcutta should be considered along with those in the second category because they are essentially similar to them in all other respects except the medium of instruction or special study of the language of the particular linguistic minority but which is nonetheless one of the regional Indian languages and is not associated or presumed to be associated with any particular religion or religious community. When they are excluded Type (C) will essentially consist of institutions run by the religious minorities such as the Muslim, Parsi or Christian schools and colleges.

Then there is an important and influential class of institutions, the convent schools and the mission schools and colleges. They may or may not strictly fall under Type (C) but it is convenient to consider them in this category as they have a clear sectional or denominational association and a part of their funds as well as the policy at the highest level may have its source and inspiration in foreign countries and/or in the hands of non-secular agencies.

II

The starting premises of this article are that the national system of education will be completely secular in its character, will cultivate a scientific outlook among the educated in order to achieve the country's general advancement and economic and industrial advance in particular, and will further the objective of a socialistic pattern of society. By national system is meant much more than a nationwide system of education; it means education which while keeping its eyes and ears receptive to the advanced thought and knowledge in other countries of the world outside is nonetheless oriented essentially to the conditions and pro-

blems of the Indian society and its transformation from its present backward state to a modern industrialised and egalitarian society. Such a system will increasingly provide educational opportunities at various levels to all deserving children without privileges of class, caste or community. By secular we mean that the educational system while respecting all religions of India will not propagate for or associate itself with or against any of them and leave religion as a matter of conscience to be pursued according to one's beliefs outside the educational institutions. Another premise from which we shall proceed is that there is no necessary connection between religion and language and the present linking of a religion with a particular language has to be given up in the secular system of education.

From this point of view institutions included under Type (A) of the type of Pathashalas and Madrasahs do not really come under the purview of the national system of education because the content of modern education in these institutions will be very little. The State may continue to aid them if this is being done at the moment and on grounds other than that of education. It is clear that the State should not undertake any obligation for their expansion (or continuation if they are gradually disappearing) which is clearly the responsibility of the particular religious community if it feels that this is necessary. (There does not seem to be any constitutional obligation in this respect either.) Other institutions falling under Type (A) but which impart substantial contents of modern education will have to be considered along with Type (C).

III

Public Schools of Type (B) and institutions of Type (C) which are run like Public Schools and institutions like the convent and mission schools will be considered together. Public Schools provide a good-quality education, invariably in the English medium, by having well-qualified teachers, smaller classes, good equipment and an

GOLD RUSH

The gold rush is on. As exports increase, dollars and sterling come pouring in. Makes us feel good, for we, at India Foils, have a part to play in this gold rush. The value of Indian products, including bulk tea, packed in Al Foil, exported in 1963 alone amounted to over Rs. 150 crores. And the figures increase every year as the silent salesmanship of the attractive and colourful packs on the shop-shelves arrest customer attention, and the products are found to be every bit as good as competitive ones. Their specialised protective aluminium foil packaging match up to internationally accepted standards too. And India Foils continue to develop a wide range of Al Foil packaging for a wide range of products.

efficient school administration. For this they charge high fees and in the process become exclusive institutions of the well-to-do classes. Convent and mission schools have most of these features and therefore to that extent are like Public Schools. There are two additional factors in the case of these latter, the particular denominational bias and the control of funds and high-level policy by a non-secular (and often foreign) agency. It is true that the number of these institutions is small in comparison with the institutions belonging to the second category, but their enrolment has rapidly increased during the last fifteen years. Their prestige and popularity has grown tremendously in the post-independence era and they wield considerable influence in the present educational situation. It is, therefore, necessary to have a closer look at these institutions and their product.

The exclusive atmosphere of these institutions gives them a kind of hot-house character isolating them completely from the common people, their thoughts and their aspirations, their problems and their solution. The adoption of the English medium from early stages of education and the consequent neglect of the Indian languages including the mother-tongue severs their alumni from the Indian thought, literature and culture both past and present and thus moves them further away from the life of the people. The teaching in these schools is frankly oriented towards the West and in particular towards the U K and the U S A. It is not uncommon to come across Convent Schools where the British royal family and leaders of the Western countries are held in far greater esteem and respect than the national leadership, and where anniversaries of national heroes like Shivaji and Tilak often go by default to accommodate minor Christian festivals. These schools do provide good education thanks to their smaller classes, well-qualified teachers, liberal supply of amenities and equipment and personal supervision which are possible mainly due to their affluence. The general emphasis in these institutions is on acquiring a good mastery over the English language and general smartness and the emphasis in classroom is on learning the techniques rather than on thinking or on cultivating a spirit of enquiry. The idea is to turn out a smart young man who can compete successfully for the jobs in the higher echelons of armed forces, civil services, managerial services in industry and

trade or the technological services in industry. It is hardly surprising that very few of their alumni have made any important original contribution to academic thought whether in scientific research or in philosophy or in the humanities or in literature (except perhaps in the 'Anglo-Indian' literature). But there is no doubt that this kind of education has a far greater job-securing potential in the sense mentioned above and that it also facilitates entry into upper social circles. In the prevailing conditions of selection, it is rapidly becoming a counterpart of the "old school tie" in England.

But this situation is far from satisfactory. Members of this new elite manning the important key-places in the country in spite of their acquisition of routine efficiency and technological know-how are thoroughly alienated from the common people and on account of their school environments and atmosphere are completely out of sympathy with them or their aspirations. The well-known British 'gentleman' from the public school had roots at least in the traditional upper class Tory culture in Britain; but the new Indian 'gentleman' vaguely oriented towards the West is just rootless in his own culture. He is only concerned with his skill and his prospects, his smart society and its so-called modern culture. He has no reason to feel any allegiance to the society at large and will have loyalty to no one except himself and perhaps his immediate employer. The concept of a socialistic pattern of society is hardly a part of his mental make-up and he is not likely to be moved by the great challenge of social change in this country except perhaps for the sake of rhetoric. This class is thus a most vulnerable section in the Indian intelligentsia so far as planning for a socialistic society is concerned and in a crisis caused by an attempt for a political shift to the right or the extreme right including a dictatorship he will not hesitate to transfer his loyalty to his new masters provided they keep intact his pay-pocket and relatively privileged social position.

This section of the rising intelligentsia should not be ignored because of its numerical smallness. It is occupying positions of strategic importance in the economic, social and administrative structure. It is closely linked with the emergent industrialists on the one side and with civil and military bureaucracy on the other. Moreover, it is being held as an ideal to the new generation of students.

It was inevitable that a new class of administrators and technologists should emerge after independence and as a result of rapid industrialisation. It was also understandable that the children of the Civil Servants and the rising rich should try to monopolise these new jobs and manage to have the necessary type of education. The political leadership which was supposed to curb this process instead of doing so is directly or indirectly lining itself behind it. Indecision on the question of language has helped this process. There is a characteristic double-think about the educational policy in this country in this respect. While public men go on making loud proclamations about the development of regional languages and Hindi little is done to implement them. This has resulted in an even greater stress on the use of English than ever before and a greater premium on English-medium education, and the same leaders who continue to talk about education through the regional languages, socialism and egalitarian society are careful enough to send their own children to English-medium public schools or Convent or mission schools. It is therefore not surprising that even the middle and lower middle class families are trying anyhow to send their children to these expensive schools by tightening the belts if necessary. It is necessary to devise measures which will halt this process and to adopt a policy which will curb at least the most undesirable features of the existing institutions of this category.

IV

It is true that the constitution has given rights to linguistic and religious minorities to establish their educational institutions and it is also true that any section of the people can start the educational institutions which they desire to have (such as the public schools). It is for the constitutional experts to suggest how the policy decisions in education can be devised to carry forward the objectives mentioned above at the beginning of Section II so that they do not conflict with these constitutional provisions. If this is found impossible there is no reason why the constitution should not be suitably amended in this respect. And in any case the policy of grant-in-aid, recognition and general exercise of control on all public institutions can and should always be utilized to the fullest extent to further the educational objectives.

SHBI-MI-20

Let us first consider the schools conducted by religious minorities. While recognizing the right of religious minorities to establish institutions for religious instruction there is no reason why this should be mixed up with educational instruction. Any religious minority (or majority) can arrange for religious instruction by establishing institutions like the Sunday Schools and it is not necessary nor desirable to mix it up with general education. In fact there should be a complete severance of modern secular education from traditional religious beliefs. It is high time that the linking of religion with language is also broken. It is perhaps understandable that purely religious instruction should be associated with languages of the scriptures like Sanskrit, Arabic, Latin or Hebrew. But one fails to see why there should be secular schools with Urdu medium for the Maharashtra Muslims whose mother-tongue is Marathi or have Christian or Convent Schools in English when Christianity as a religion has as such nothing to do with the English language. The situation borders on becoming ridiculous at present when the large majority of children in convent schools in Poona or Bombay speak the regional languages—Marathi or Gujarati—and not English. Along with the separation of religious instruction and secular education, and of religion of a minority and a language, two other important principles should also be laid down to govern the educational institutions of private educational effort. The management of every school or college should be in the hands of a public body (registered under the Public Charitable Trusts Act) and the control of funds and policy should be entirely in the hands of Indian nationals. These principles should be operative in the case of all institutions of education whether they receive government grants or not. Finally institutions like Public Schools catering exclusively to the children of the well-to-do classes and/or which charge fees higher than the limit prescribed by government for other institutions in the region should receive no grant from the government irrespective of whether they provide elementary, secondary or higher education.

The present government policy about Public Schools is another example of double-think. While professing the egalitarian and socialistic objectives the Education Ministry has not hesitated to start Public Schools and extol their so-called virtues. During

the last session of the Parliament the Education Minister is reported to have given a most amazing defence of Public Schools by saying that they cultivate the quality of leadership. So the Indian political leaders continue to accept the old British outlook of the Victoria era when it is no longer seriously professed even in Britain. To meet the obvious criticism that the Public Schools are exclusive schools for the well-to-do classes the Education Ministry came out with a sop that a few children of the not-so-rich parents will be given merit scholarships so as to enable them to have education in the Public Schools and thus allow them graciously to elevate themselves to the class of the old school tie. It is quite clear that government policy of running and/or supporting Public Schools (whether as Sainik Schools or under some other name) goes entirely against their proclaimed aims about the direction of social change.

We may consider at this stage the facilities for talented children. As implied in the preceding paragraph it is not in their best interests to award them merit scholarships and send them to Public Schools which may succeed in transforming them into the 'gentleman' elite but which are hardly the place to develop or channelize their talents into creative activity. The best way in which talent can be fostered is to make adequate special provision for it in some of the common schools and/or by founding special schools for talented children under the direction of National or State Councils of Education. Experience in other countries like the USSR and the USA may provide valuable guidelines in this connection.

The problem of encouraging the children from the underprivileged classes has to be tackled in a different and more comprehensive manner. At present a liberal number of scholarships, free places and other concessions are made available to them. But there is a prevailing feeling that the returns to this expenditure are far from satisfactory. The reasons are not far to seek. The main handicap from which these students suffer is the lack of educational background at home and this cannot be overcome merely by giving them monetary assistance. They must also be provided with close personal guidance both educational and general. A better plan would be to provide the talented children of these classes with all educational expenses (not merely fees),

good hostel facilities including close supervision of their work; and there should also be a method of elimination at definite academic stages of those who are found wanting in spite of all these facilities.

A word about the new schools which the Government is going to establish from this year for the children of the Central Government servants (who are liable to be transferred from place to place) for preparing them for the Indian School Certificate Examination. While some such provision is no doubt necessary it is hoped that they do not become another set of government-run public Schools for the perpetuation of the present upper classes. This is a real possibility because with the present language policy of the government the medium in the schools may be inevitably English for a long time to come and both the political and administrative thinking is heavily biased towards the Public School type of teaching and management. (Incidentally it is possible to introduce an innovation in these schools of charging fees according to the income of the parent instead of at a flat rate at present.)

V

We conclude this article by briefly stating the principles which in our opinion should be the basis of the State policy towards the private educational institutions of this category, that is, those associated with sectional interests. The State can and should influence the educational institutions of private enterprise by means of adopting suitable policies in respect of financial support, recognition and general administrative control. This is desirable not only in order to help them play their rightful role in the national system of education but also to see that their activity is consistent with and in furtherance of the educational objectives described above in Section II. As stated earlier all education should be secular, even in the institutions of the religious minorities like Muslim schools or in mission schools and Convent schools. The right to establish such institutions should never be so interpreted as to create doctrinal exclusiveness for a particular caste, community or religion. The right may be exercised by a minority group which feels that it is necessary for the protection of their (secular) educational interests to establish their own schools and which feels that they would otherwise be swamped or neglected. In these

schools they may reserve a certain percentage of seats for their children and encourage them otherwise by providing other facilities strictly out of non-government funds. Secondly, as mentioned earlier the management of every educational institution (whether minority schools or otherwise) must vest in a non-profit Public Society and must be registered under the Pub-

lic Charitable Trusts Act. (A model constitution giving ample latitude for variation but which does not contravene the principles enumerated above may be prepared for this purpose.) Thirdly, all matters of policy, management and control, must be in the hands of Indian nationals. This is especially applicable in the case of institutions like mission schools and

colleges where a part of funds comes from foreign sources. All financial contributions obtained in India or abroad should be in the form of plain charity with no strings attached (except perhaps the trivial ones such as giving the names of the donor). A comprehensive policy incorporating these principles is urgently needed in the present educational situation.

Economics of Stop-Go War

A Preliminary Outline

R K Hazari

The more one thinks of the implications of economic planning in the situation we are in today, the clearer it becomes that we have to move towards Soviet-type planning, but with four fundamental adaptations:

- greater reliance on the market mechanism on the pattern recommended by the Raj Committee on steel distribution;*
- greater incentives and supplies of inputs to the farmer;*
- further stepping up of the growth of merchant shipping; and,*
- getting foreign collaboration, on difficult terms, if necessary, for the next five to ten years in those basic industries the setting up and good performance of which would substantially reduce our dependence on foreign assistance.*

THE situation on our borders represents a peculiar and almost unprecedented kind of conflict. It is a stop-go war, which alternates between minor border skirmishes, intense hostilities of major proportions but limited in time and area, and uneasy truces. Increasing preparedness for a full-fledged war and the deterrent effect which this preparedness could have against actual war are the only perennial features. The past provides no guidance to indicate the line of military and economic action which should be adopted. The armaments race between USA and USSR during the active phase of the cold war is some kind of parallel but of very limited relevance since their resources are much larger and the few confrontations between them have taken place far away from their own borders. At the moment of writing, conditions are too fluid to allow firm conjectures about the course of future events. The exchange of angry words across the borders notwithstanding, it can be assumed with some reason that we have to be prepared more for a stop-go war than for a prolonged war to the finish against Pakistan and China. The conflict with Pakistan would, for quite some time, be restrained by Western and USSR interest in the prevention of large scale fighting. China's interest in weakening India would be satisfied by military activities along the upper reaches of the Himalayas and by straining the Indian economy to the point of uncontrollable consumer distress. What are the implications of this conflict for our economy?

The Objectives

Confrontation with Pakistan has practically no economic basis so far as we are concerned. We have no desire to hinder economic progress in

Pakistan, if for no other reason than because the pattern of development chosen by her does not represent any economic or military danger to us. Given our choice of the development pattern as compared with Pakistan, it should not be in Pakistan's interest to push us further in the direction of heavy industry, which would reinforce the potential military danger to her (though not to the same extent as to China). China has a definite interest in disrupting our economy, partly, for ideological reasons (military preparedness against China requires, as compared with Pakistan, much greater diversion of resources to defence and consequent pressure on consumer supplies) and partly, to increase substantially our dependence on foreign aid to a magnitude which would reduce its net economic content, thereby showing the rest of the world that her achievements are far superior to those of India. In dealing with Pakistan and China together, we have, in a word, to assert a decisive superiority of military potential against Pakistan and, at the same time, build up our economic performance to make it comparable with that of China.

How Much Defence?

Unlike Britain during the second world war, we have no massive lease-lend programme and Empire supplies to help us out; and we have much less room for manipulating our standard of living. If one leaves aside such intangibles of overwhelming importance as morale, discipline and technical training, defence and development go together only upto a point; beyond that their demands upon scarce physical resources render them competitive, a proposition which has been amply demonstrated since 1963. That makes it all the more essential to secure the

greatest military preparedness per rupee of expenditure and to mould development effectively to satisfy basic consumer demands and, at the same time, lay a strong base for future growth from internal resources. No information is available to the public on the effectiveness of defence expenditure, in terms of selecting the most economical among the various choices for given military requirements. One hopes that Government is making or will make efforts in this direction since defence absorbs directly about 6 per cent of national income and is no longer a negligible element in total expenditure. Here, attention is confined wholly to the economic implications of what has been forced upon us.

Integrating Defence into the Plan

The economics of a stop-go war differs in several respects from a full-fledged prolonged war. On the positive side, it inflicts less physical damage and does not require the same totality and intensity of mobilisation. Negatively, the objectives are not equally clear. The pace and pattern of requirements, both material and intangible, are uncertain. There is consistent and predictable demand for war goods: only rush orders, unevenly spaced in time, quantity and delivery schedules, more for stockpiling than for feeding a shooting war, can be expected. This has been the experience of industry since late 1962, when development and defence were declared to be complementary but practically no attempts were made to integrate defence and planning. For some time, the Department of Economic and Defence Co-ordination looked after such integration as there was but, later, its activities were confined to allocations of foreign exchange for defence equipment and supervision of defence sup-

plies. One may or may not deplore the keeping out of the Planning Commission from this attempt at co-ordination but the fact remains that no comprehensive studies were made to determine inter-industrial flows for defence purposes. The ordnance factories are self-sufficient in a number of goods and the more sophisticated equipment has to be procured from abroad (for which there is some kind of foreign exchange budgeting) but the ordnance requirements of intermediates, components and machinery from domestic sources will now cease to be marginal. Projections for such procurement have never been worked out in any detail, not because they are inherently more difficult than ordinary economic projections but because they require a firm decision about the kind and extent of preparedness and intermittent shooting that are expected. Once this decision is made (as part of the present mood to take decisions at last) its economic and, more precisely, its inter-industrial flow implications can be worked out within reasonable margins of error.

Prospects of Aid

Let us start with some assumptions on which this integrated programmes might have to be based. Present indications are that economic assistance in the pipeline, i.e. aid which has been sanctioned but is yet to be disbursed fully, from all sources will continue to be made available. Aid which has been pledged but not yet authorised by Consortium members can also be expected to come through. Fresh pledges of aid from this main source, which accounts for about 80 to 85 per cent of all assistance, are doubtful in the near future—though the next Consortium meeting is some months away in any case. P.L. 480 food imports, which are not part of the Consortium arrangements, will continue but the agreements will be such as to provide only for ship-to-mouth supplies. Economic (and military) aid from the Soviet bloc will remain and might even be enlarged; this would take care of a substantial part of our requirements for power and heavy engineering projects. Private foreign collaborations in force and/or in an advanced stage of negotiation should remain unaffected, particularly in such key sectors as fertilisers, petroleum refineries and petro-chemicals. It is also reasonable to presume further that (i) we will not enter into the manufacture of nuclear armaments, unless we are forced into an indepen-

dent prolonged stand against China, (ii) that the conflict with Pakistan would remain within limited proportions, and (iii) that the confrontation with China would remain one of bluff and bluster accompanied by patrolling and skirmishes with fighting, if any, confined to occasional thrusts. Finally, we would continue to honour our external debt obligations.

Given these assumptions and the background of recent events, the immediate impact on the economy can be broadly outlined. The *kharif* crop (which is fortunately not the main crop in that area) in Punjab and Rajasthan would be damaged to some extent by troop movements, security precautions, call up of army reserves, and mobilisation of transport. Imports from Western countries (including Japan and Australia) would be severely restricted: on the extreme assumptions listed above, imports from these sources would be reduced by at least one-fourth to one-third. Imports from the Soviet bloc might go up somewhat. Export performance would provide only marginal relief. It is difficult to assess the over-all impact of all these on investment and output. It is a safe guess that the growth of investment would be affected much more than that of output. The task of reoriented planning, therefore, is to see that these adverse effects are restricted to the relatively dispensable sectors.

Planning Flow of Materials

Reorientation of planning is not an easy task, particularly when the course of conflict and the attitudes of aid-giving countries in the immediate future are still largely unpredictable. A clearer picture of the emerging situation would take at least a couple of months and only then can Government proceed towards a really thorough recasting of the plan. In the meanwhile, it is useful to understand what reorientation implies and involves. Larger production of defence equipment and materials is readily understood but this has little meaning unless one knows the magnitude, pattern and phasing of such production. Once these are known, the next important step is to work out the inter-industrial and inter-firm flows of materials and equipment. It is important in this context to see that cuts in imports do not fall heavily on industrial units which (i) provide the components for defence and (ii) from the primary base of import substitution in capital goods and essential materials. Priority atten-

tion is required for as much self-sufficiency and ingenuity as possible in spare parts; foreign collaboration agreements should be amended if they impose avoidable burdens through continued import of spare parts. Mobilisation of technical manpower and intensive training of both defence and civil personnel in the handling and adaptation of machinery are no less necessary. In aggregative terms, private and public consumption expenditure has to be restricted, in order to attain a higher ratio of investment to national output. This higher ratio has to perform the two old task of filling up the savings gap, i.e. the difference between domestic savings and investment so far made up by import of capital, and the foreign exchange gap also made up from the same source. The rupee gap can, of course, be made up rather more easily than the balance of payments gap.

Soviet-Type Planning

What all this implies, in brief, is that defence orientation requires a plan which takes a much smaller credit for external assistance and places much greater emphasis on the production of food, capital and intermediate goods.

The more one thinks about the implications of such planning, the clearer it becomes that this country would have to move towards Soviet-type planning but with four fundamental adaptations: (i) greater reliance on the market mechanisms on the pattern recommended by the Raj Committee report on steel distribution; (ii) greater incentives and supplies to the farmer; (iii) further stepping up of the growth of merchant shipping; and (iv) getting private foreign collaboration on atrocious terms, if necessary, for the next five to ten years in those basic industries the setting up and good performance of which would substantially reduce our dependence upon foreign aid.

Defence-Orientation of the Chemical Industry

Its Implications

Ajoy Gupta

The chemical industry has a very important place in defence planning as supplier of two crucial needs: (a) jet fuels for the air force; and (b) chemical explosives for ammunition. An attempt is made here to examine the prospects of self-sufficiency in respect of both of these items, considering the present state of development of the chemical industry.

As for jet fuel, we should be in a position to meet most of the demand for JP 4, the standard fuel for military jet aircraft, from internal production provided civilian consumption of kerosene can be adequately cut.

The three basic chemicals needed for production of explosives—ammonia, toluene and formaldehyde—are very much inter-related and are the products of three basic industries: fertilisers, iron and steel and petrochemicals. A properly integrated complex based on raw materials derived from these industries can achieve self-sufficiency in explosives.

Of the three chemicals, two are being produced or can be produced immediately in fairly large quantities from existing sources. This, however, is not the case with the third, formaldehyde. The raw material for formaldehyde is methanol. The natural source of methanol—wood distillation—has very limited scope. Hence we have to produce methanol synthetically in our projected petrochemical plants.

DEFENCE-ORIENTED planning in a time of emergency has two aspects; first, planning of production of vital defence materials to meet the urgent demands of the armed forces and, second, long-term planning for achieving self-sufficiency in strategic materials. Stock-piling of these materials through imports is a possibility which is not open to us for obvious reasons and so there is no other alternative but to plan ahead for maximum possible self-sufficiency.

The chemical industry has a crucial place in defence-oriented planning; two vital defence needs are: (a) jet fuels for the air force; and, (b) chemical explosives for ammunition. Almost all modern aircraft—fighters, bombers and reconnaissance and transport planes—are fitted with jet engines because of the need for high speed and manoeuvrability. Since jet engines operate at high altitudes in low temperature, sometimes as low as 65°C, fuels like diesel fuel cannot be used since they solidify at low temperatures. Operation at high altitudes where the pressure is much lower than on the ground (almost about 1/10th) also rules out the use of light fraction gasoline by itself because it would evaporate away. Kerosene fraction (the middle fraction) was, therefore, selected as the most suitable fuel in the early jet engines.

The rapid increase in the use of jet engines brought the realisation that sufficient kerosene could not be produced from crude petroleum, particularly during a war when very large quantities would be needed. The problem became even more acute with spe-

cial kerosene (aviation kerosene) with special properties which yielded better jet engine performance. To provide a suitable fuel for military use, therefore, a jet fuel specification was drawn up which permitted the use of motor gasoline (without tetraethyl lead), kerosene and cracked gas oil boiling in the kerosene range. In times of emergency, about 50 per cent of crude petroleum can be converted into this widecut gasoline fuel. The vapour pressure of this gasoline is about 5-7 lbs/sq inch. Under some operating conditions at high altitudes, this relatively high vapour pressure causes excessive fuel loss due to evaporation. Therefore, an ideal fuel with a vapour pressure of 2-3 lbs/sq inch is now commonly used as military jet fuel. About 35 per cent of the crude petroleum can be converted into this widecut gasoline with a lower volatility. In the United States different types of jet fuels have been given the following designations, which are almost universally used: (1) aviation kerosene—JP1; (2) widecut gasoline (5-7 psi) — JP3; and (3) widecut gasoline (2-3 psi) —JP4.

JP4 is the standard fuel for military aircraft. Most commercial airlines use JP1, because under some conditions this has a lesser fire hazard. We now have seven refineries in operation and two are in the process of being erected with two more at the blue-print stage. Refining capacity in 1965-66 will be about 14 million tons which is estimated to go up to about 29 million tons by 1970-71. The table gives the throughput capacity of the different refineries.

The pattern of consumption of the

different petroleum products is quite different in India from that in the industrialised countries. In spite of the large deposits of coal available, the main domestic fuel in millions of homes in our villages is kerosene. According to the report of the Energy Survey Committee, the share of kerosene middle distillates in the total demand for petroleum products is as high as 29.3 per cent. However, kerosene middle distillates are only 13 per cent of the total output of all the refineries. Hence, a part of the demand for kerosene has to be met from imports. In the case of gasoline motor spirits, the position is just the opposite demand is only 12.9 per cent of total, but production is 20 per cent of total refinery output. There is thus a surplus of light naphtha fraction which is now used for fertiliser production and in petro-chemical projects.

Table : Throughput of Refineries
('000 tonnes)

	1965-66	1970-71
(1) Bombay (Burmah-Shell)	3750	4750
(2) Bombay (ESSO)	2500	3500

(12) Total	14010	29260

E. R. W. TUBES FOR ELECTRICAL EQUIPMENT

Highly suitable for use in a wide variety of electrical equipment, E.R.W. Tubes manufactured by Indian Tube can be employed to great advantage in Transformers, Condensers, Refrigerators and Air-Conditioning machinery. Close dimensional tolerances and a smooth finish are standard features of E.R.W. Tubes; in addition, their great strength combined with their light weight render them eminently suitable for electrical appliances.

INDIAN TUBE THE INDIAN TUBE COMPANY LIMITED
A TATA-STEWARTS AND LLOYDS ENTERPRISE.

The annual consumption of kerosene in 1960-61 was 20,90,000 tons against a production of only 9,45,000 tons. In 1965-66 the demand is expected to go up to 32,00,000 tons against an expected production of 25,13,000 tons. The deficit of 6,87,000 tons has to be imported from abroad, probably from the rupee payment areas. On the other hand, in 1965-66 the expected production of gasoline will be 23,14,000 tons against a consumption of 16,65,000 tons giving a surplus of 6,49,000 tons. From these figures it is clear that although we have a shortage of kerosene, we can still meet the demand for jet fuels from internal production—only civil consumption of kerosene will have to be reduced. In fact we are already producing some jet fuels. The estimated demand for JP4 in 1965-66 is about 5,00,000 tons and the Fourth Plan expected this to go up to about 5,27,000 tons in 1970-71. It is difficult to say exactly by how much these estimates will have to be revised upwards as a result of the war and heightened defence preparations.

Coming to explosives, three different types of chemical explosives are mainly used in modern conventional warfare.

(1) *Initiator or primary explosives (detonators).* These are sensitive materials which can be made to explode by means of a slight blow. They are dangerous to handle and are used in small quantities to start explosions. A few important detonators are: lead-azide, mercury fulminate, diazodinitrophenol, and lead trinitro-resorcinate.

(2) *Low explosives or propellants.* These are used mainly as propellants for projectiles and have a fairly limited use. Some propellants are: colloidal cellulose nitrate, black power, etc.

(3) *High explosives.* These are the

main explosives used in modern warfare and are needed in large quantities in the manufacture of all types of shells and bombs. A steady supply of these is absolutely necessary in war for munition production. The main types of high explosives are: (a) trinitro Toluene, commonly known as TNT (manufactured by the nitration of toluene); (b) cyclonite, commonly known as RDX (chemical name, trimethylene-trinitramine); and (c) pentaerythritol tetranitrate, commonly known as PETN. No estimate of the requirements of these items is available though as defence preparations are stepped up, or in the eventuality of a full-scale war, demand will no doubt run into a few million tonnes each.

(a) Trinitro Toluene (TNT) is one of the most important military high explosives used. Because of its low melting point (81°C) it is loaded into shells in molten state; the low melting point also makes its use advantageous from the standpoint of safety. It is made by nitration of toluene with mixed acids. Toluene is a product of coal tar distillation and is available from the coke oven plants of the iron and steel factories as a by-product.

(b) Cyclonite (RDX) is a very effective booster and high explosive and is 50 per cent more powerful than TNT. It is manufactured by destructive nitration of hexamethylene tetramine (hexamine) with concentrated nitric acid. Hexamine in turn is manufactured by the inter-action of ammonia with formaldehyde.

(c) Pentaerythritol tetranitrate (PETN) is an extremely powerful, sensitive explosive which was used in World War II in place of nitroglycerine. It is made by nitration of the four hydroxy groups of pentaerythritol

with concentrated nitric acid. Pentaerythritol is again manufactured from formaldehyde. Contrary to popular belief, nitroglycerine is very little used now as a high explosive for military purposes. It is mainly used in blasting and mining operations.

These three high explosives are chemicals similar to each other as they are all nitro derivatives. Three basic chemicals are necessary for their production. They are ammonia, toluene and formaldehyde. Of these ammonia and toluene are available in plenty; only formaldehyde is in short supply and will continue to be so till our petro-chemical projects come into operation. The technological pattern of production of these high explosives can be understood from the diagram below.

Ammonia: Nitrogen and hydrogen in a 1 to 3 ratio react catalytically at high temperature and pressure to produce ammonia. Nitrogen is derived from the air by means of liquefaction, producer gas reaction or by burning out the oxygen in air with hydrogen. Hydrogen is obtained from many sources, including water gas, coke oven gas, natural gas, naphtha, refinery gas or electrolysis of water or brine. Ammonia is converted to nitric acid by catalytic oxidation.

Nitric Acid: Our peace time annual production of nitric acid is rather small. It is estimated to be only 50,000 tons in 1965-66 and 160,000 tons in 1970-71 but we have the potential to produce much more. At least two of the five public sector fertiliser factories, i.e. Nangal and Trombay, can be converted without much difficulty to produce nitric acid from ammonia. Nangal alone produces 300 tons of ammonia per day and it has an installed capacity to convert 50 per cent of this ammonia into nitric acid.

Toluene: The main source of toluene is the coal-tar distillation of the coke oven plants. The present capacity for production of toluene is about 20,000 tons per year which is far greater than requirements which were estimated at about 4,000 tons per annum in 1965-66 and 6,000 tons in 1970-71. These figures will have to be revised in view of the present emergency. But we should be able to meet even much higher demand. On the basis of production of iron ingots our capacity to produce toluene may be estimated at 22,000 tons in 1965-66 and 44,000 tonnes in 1970-71. During the second World War the United States found it difficult to meet its army ordinance requirements of toluene from supplies from the oven plants and had to turn to the petro-chemical industry for additional supplies. However, as we have a surplus of toluene from the coke oven plants, it is unlikely that we will need to depend on toluene from the petroleum refineries at least for the present.

Formaldehyde: This is one of the basic chemicals production of which is mainly dependent on the development of the petro-chemical industry.

At present we have no unit in production. Recently construction of a plant has started at Kandla in Gujarat for the production of 14,000 tons of formaldehyde (37 per cent) per year. The pre-emergency estimate of requirement for the year 1965-66 was 30,000 tons and 70,000 tons for 1970-71.

There are two methods of commercial manufacture of formaldehyde: (1) by the catalytic oxidation of methanol; and, (2) by the oxidation of paraffin hydrocarbons from the petroleum industry. The first method is the most used one and about 75 per cent of world output is produced from methanol. Our present capacity for production of methanol is nil, though the Third Plan did estimate production of 30,000 tonnes per annum by its end; by the end of the Fourth Plan, it is now estimated, production would be 90,000 tonnes. In view of the much larger demand that is now expected to materialise in view of the projected defence build-up much larger capacities for production of both formaldehyde and methanol will have to be created. Formaldehyde has also many peacetime uses, such as in hexamine, synthetic resins and bakelite and in

the synthetic plastic and chemical industry.

From the foregoing paragraphs two points are quite clear:

(a) Out of the three essential raw materials needed for production of explosives—nitric acid, toluene and formaldehyde—two are being produced or can be produced immediately in fairly large quantities from existing sources. The third, formaldehyde, is urgently needed to be produced in India. The raw material for production of formaldehyde is methanol. The natural source of methanol in our country—wood distillation—has very limited scope (only a few tons are produced at the Bhadravati Iron and Steel Works, Mysore). Hence we have to produce it synthetically in the proposed petrochemical projects.

(b) The three basic chemicals needed for production of explosives are very much inter-related and are products of three basic industries—fertilisers, iron and steel and petro-chemicals. A properly integrated complex based on raw materials derived from these industries will achieve self-sufficiency in production of explosives.

Dull and Hesitant

Thursday, Morning

DALAL STREET continues to present a picture of unrelieved gloom. The cessation of hostilities between India and Pakistan has brought no relief to the market where turnover has dwindled to a mere trickle. The outside public seems to have developed a thorough dislike for the stock market and since professional operators live mainly on outside public money, they too are reluctant to extend commitments. The small day-to-day fluctuations seems to be guided mostly by the actions of a few big speculators who are finding it difficult to get away from the market much as they would like to because the market no longer holds the promise the big fortune.

In extremely slow dealings, even the popular speculative counters last week drifted idly in a very narrow range and showed only minor variations over the week. Dalal Street slipped to a new low level on October 11 but thereafter it steadied a little on scarcity of fresh offerings and modest replacement buying. The market's performance might have been worse but for the firmness in Tata Steel noticed near the weekend. Improvement in Tata Steel was due mainly to fresh large buying by the Life Insurance Corporation though sentiment was also aided by reports that the company had obtained a letter of intent for the manufacture of certain new items, namely, cast iron rolls, steel base rolls and cast steel rolls which are currently being imported.

Diwali is only a few days away but the festival spirit is just not there. This is because nobody expects Diwali to usher in a more prosperous year. The stock exchange community's difficulties are, in fact, expected to increase with the intensification of the defence effort. The Fourth Plan is being reshaped to meet the needs of defence and development and the Finance Minister Krishnamachari and Shri Asoka Mehta have been trying to impress on the States the need for mobilising resources to implement their Plans. The stock market can scarcely feel happy over the prospect of a further big draft on the already strained resources of the community.

COTTON

Prices at New High

HAVING prescribed stiffer margins for oilseeds speculators, the Forward Markets Commission could not

possibly have delayed similar action against speculators' in cotton without being accused of partiality, particularly when cotton futures had already risen fairly close to the higher statutory ceiling for the new season. Additional regulatory measures for cotton were announced on October 8—two days after the imposition of stiffer margins on oilseeds futures. These measures include a limit on the rise in price in any week to Rs 5 per 3 quintals whenever the hedge contract rules above Rs 910 and the payment of special margins at the rates of Rs 100 and Rs 150 per bale whenever the contract closes above Rs 910 and Rs 920 respectively. There already exists a special margin of Rs 200 per bale at above Rs 930.

After a small early setback from Rs 908.25 to Rs 905.25 the hedge contract moved up gradually to a new high of Rs 911.25 on October 13. However, in order to avoid the margin, the bulls preferred to keep the closing price just at Rs 910. Unless, of course, the bulls wish to scare their rivals by their show of financial might, there is little to be gained by the payment of such a heavy margin when the contract is standing only Rs 26 below its statutory ceiling so very early in its career. The April contract made its official appearance only about six weeks ago—on August 31 to be very precise.

The rise in the hedge contract fairly close to the ceiling reflects the generally anticipated decline in cotton production in the new season. Because of the continuing dry spell right up to the middle of this month, the 1965-66 crop is stated to have suffered both quantitatively and qualitatively. This is most unfortunate and it is bound to add to the cotton textile industry's difficulties. With the new crop estimated to be no better than the previous season's crop, cotton prices are expected to keep near the revised ceilings. And if the country is unable to secure sufficiently large quantities of cotton from abroad—a good deal will depend on supplies under PL 480—cotton prices could easily record new high levels, the financial stringency notwithstanding.

While the outlook for the new crop is disappointing, the Reserve Bank of India's decision to remove restrictions on bank advances against new crop

cotton will be welcomed as it would assist genuine marketing and trading activities in the current cotton season. The banks have, however, been requested to see that the aggregate levels of advances against cotton and 'kapas' at different stages in the 1965-66 cotton season are phased on the same pattern as in the 1964-65 season. The existing margin restrictions on old crop are being continued for the present. It might be pointed out that new season's crop has still to start moving in a big way. The Punjab cotton, which is the first major crop to move into the market, has not started moving because of the prevailing political situation. Arrivals from the Punjab are expected to pick up shortly. Because the Deshi cotton crop is not expected to exceed 4.5 lakh bales as against the earlier estimates of about 6 lakh bales, Deshi prices have already touched an all-time high. Export business has been restricted, with sales registered up to October 6 totalling 28,368 bales. Turnover in the spot cotton market continues to be restricted by the scarcity of good quality cottons.

OILSEEDS

Prices Soar

ON October 13, groundnut oil December delivery was marked up to Rs 32.50 (per 10 kilograms) and the spot quotation was slightly lower at Rs 32. Never has December delivery been quoted so high about the middle of October. Since new crop supplies become freely available after November, it is rarely that December position commands a premium over the spot quotation in October which is, the fag-end of the season. It is worth noting that the lowest price recorded by groundnut oil December delivery so far has been Rs 26.50 (this was early this month), whereas in October 1964, the December delivery had touched a low of Rs 18. Besides, spot quotation in October 1964 commanded a huge premium on the forward position.

The prevailing high prices of groundnut oil are attributable essentially to expectations of a serious fall in groundnut production in the new season due to the failure of rains during the most crucial period. The continuing dry spell has led to a drastic revision of estimates of the new crop which is cent below the previous season's figure, now generally placed at 20 to 25 per

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

The crop has suffered almost everywhere but the States where production has suffered seriously are Gujarat, Madhya Pradesh, Uttar Pradesh and Rajasthan. Groundnut Bold and Comandel crops could still benefit from rains in the next few weeks of which there are no indications yet, but this is unlikely to make any big difference to the total production. In view of the substantially lower crop estimates, one could hardly blame speculators for exploiting the facility of trading in non-transferable specific delivery contract for groundnut oil.

While the groundnut crop has already been seriously affected by the prolonged dry spell, the prospects for linseed, rapeseed, kardiseed and gingelly seed—rabi crops—are also beginning to be viewed with considerable anxiety. Rains in coming weeks will have a significant bearing on sowings of rabi crop. In any case, even under ideal weather conditions the shortfall in groundnut production cannot be made good by the rabi harvest.

Not unless the country is able to secure large quantities of edible oils from abroad—a remote possibility indeed—the overall supply of edible oils during the 1965-66 season will show a substantial decline compared to the current season. This is bound to push up oilseeds prices to altogether new high levels, depending on how firmly the authorities are able to deal with the situation.

In view of the anticipated shortfall in groundnut production and the none-too-promising outlook for the rabi crop, it is scarcely surprising that speculators should have rigged up linseed and castor futures to new high levels—well beyond the levels at which stiffer margins become applicable. On October 13, castor April were bid up to Rs 106.50 and linseed April to Rs 124 (per quintal). Cottonseed January also rose to a new high of Rs 67. Margins can at best eliminate the small fry, leaving the more resourceful operators free to exploit a thin market. Speculation in castor and linseed futures is known to have assumed serious proportions. It is really astonishing that the authorities should permit speculation in linseed and castorseed which have a combined output of no more than 6 lakh tons, when similar facilities are denied in the case of the major crops of groundnut and mustard-seed.

Export business continues to be slack, even in groundnut extractions. Because of the elimination of establish-

ed shippers from the line—only manufacturers are allowed to export groundnut extractions with effect from October 1—sales outstanding in groundnut extractions are reported to be disappointing small for this time of the year. In the past, experienced shippers used to negotiate substantial forward business in October. Of course, the failure of the groundnut crop has also affected forward sales this year.

MONEY AND BANKING

Conditions Turn Easy

CREDIT conditions in the Bombay short term money market during the week to October 14 displayed signs of unsteadiness. During the initial part of the week the market ruled tight with demand for funds outstripping supply. As the week advanced supply overtook demand and the market showed signs of easiness. Rates during the later part of the week fell $6\frac{1}{2}$ per cent against 7 per cent during the preceding week.

Aggregate deposits of scheduled banks during the week to October 1 declined again for the second successive week from Rs 2787.60 crores to Rs 2781.71 crores, according to the statement of affairs of scheduled banks. Bank credit on the other hand has increased substantially by Rs 9.22

crores to Rs 2007.86 crores. The increase in credit has been met by borrowings from the Reserve Bank which increased by Rs 5.98 crores to Rs 14.66 crores and a reduction in balances held with the Reserve Bank from Rs 107.62 crores to Rs 104.53 crores. Cash in hand has also declined by Rs 3.12 crores to Rs 61.79 crores. Investments Rs 849.29 crores show an increase of Rs 7.22 crores over the preceding week.

Notes in circulation during the week to October 8 advanced substantially from Rs 2586.64 crores to Rs 2540.66 crores, according to the Statement of Affairs of the Reserve Bank of India. Balances held abroad registered a small increase of Rs 67 lakhs to Rs 9.25 crores but foreign securities were unchanged at Rs 70.63 crores. Central government deposits declined sharply by Rs 61.42 crores to Rs 62.82 crores, state government deposits were lower as well by Rs 3.97 crores at Rs 2.33 crores. Deposits of the scheduled banks at Rs 92.61 crores showed a fall of Rs 27.63 crores. Loans and advances to government were better by Rs 28 crores at Rs 110.21 crores. Advances to scheduled banks declined from Rs 16.04 crores as during the preceding week to Rs 13.09 crores. Investments were lower by Rs 44.58 crores at Rs 103.06 crores.

BUSINESS NOTES

Industrial Finance Corporation

AS an institution providing financial assistance to industry, the Industrial Finance Corporation has to keep a watchful eye on the conditions in which the various industries have to operate, for the prosperity or adversity experienced by the concerns assisted by it has a direct impact on its own operational results. The institution's observations on this point, therefore, deserve attention of the Government authorities as well as entrepreneurs. Its Chairman, A Baksi, in his statement at the annual meeting, has brought into focus the various difficulties and handicaps industry has been facing recently. Baksi has said that shortage of imported raw materials like copper, zinc, lead, alloy and special steels, rubber, sulphur, rayon grade pulp, etc., has tended to inhibit production in a number of the IFC assisted units and to increase their cost of manufacture. Recent additions to the duties on imported equipment and raw materials have necessitated recalculation of the estimates of cost

of several projects which are yet to go into operation. Delays in the construction of factories and erection of plant and machinery owing to various causes ranging from alterations in specifications to shortage of cement have also added to the burden.

Among the other difficulties experienced by industries, Baksi says, several units find that the total capital cost to be incurred before they can go into regular production is much higher than what they had originally estimated. In some instances this has happened due to switchover from imported to indigenous equipment which may cost more and take longer to secure. Then again, some units in fields like paper and caustic soda notice, after going into production, that their size is too small and that their earlier ideas of economic viability have been belied. He has also pointed out that a few units manufacturing refractories, sheet glass, household meters or certain grades of writing or printing paper find that the market prospects

on which they had based their schemes are not likely to materialise in the very near future. Besides, in some instances, some concerns have resorted to heavy unsecured borrowings in the shape of short-term deposits from the public at rates of interest very much higher than they would normally like to pay.

Alind

IN his address to shareholders of Aluminium Industries at their nineteenth annual general meeting held at Kundara some time ago, S Narayanaswamy, Chairman, stated that the company had received an industrial licence for the manufacture of cable making machinery. The plant is to be set up at Lingampalli, Hyderabad, in collaboration with the renowned Japanese firm of Miyazaki. Manufacture of cable-making machines is a logical follow-on of the company's present activities and should make for long-term self-sufficiency in the matter of machines required by new units and replacements by existing units, apart from making available spares and vital components to wire drawing and stranding machines that operate in the country. Referring to the new Properzi continuous rod rolling plant, which is expected to be commissioned before the end of the calendar year, he said that it would substantially enhance the company's ingot converting facilities and obviate the need for importing rods.

The company has also obtained a licence to add to existing bare conductor producing capacity at Kundara as well as Hirakud. It is proposed to establish a unit in Kerala for manufacturing switchgear with foreign financial participation. Negotiations are in progress with a reputed British firm for this purpose. "Solidal," the new low-voltage underground cable produced by the company, has been very well received in the market, and is well on the road to becoming a favourite. Narayanaswamy's optimism about the future prospects for this cable was reflected in his comment that "the spread of its use is likely to be conditioned more by our machine capacity rather than by limits in demand".

Imperial Tobacco

SPEAKING to shareholders at their annual meeting in Calcutta some time ago, the new Chairman of Imperial Tobacco, C A Bone, welcomed the flexibility of the new cigarette excise duty introduced in the 1965 Budget, for, he felt that it would develop the

already intense competition between all manufacturers, and that, with the research and product improvements which are constantly engaging the company's attention together with developments in the fields of marketing and distribution, Imperial Tobacco's brands would continue to give a good account of themselves. Bone pleaded for an extended period of stability in excise rates which, he hoped, would result in a natural increase in volume and generate higher revenue and assist in the government's efforts to resist inflation. He stated that the programme of modernisation of factories had been re-planned and extended and that substantial sums would be required for giving effect to these plans, but he assured shareholders that the company had built up adequate resources.

Jay Engineering

IN his Chairman's speech delivered some time ago at the annual meeting of Jay Engineering Works, Charat Ram has pointed out the need to make doctrinaire considerations subservient to economic considerations and to direct investment strictly through channels which will mean the lowest investment costs per unit of output and lowest costs of production. He has argued that in our country in its present state of development it is not a question of capitalism or socialism, or management or labour or the government. Every single policy, economic or political, says Charat Ram, should be measured only by the simple yardstick of its being either "pro-production" or "anti-production".

Complimenting the rank and file of Jay Engineering workers on their constructive endeavour in the face of the hostility of a band of "self-seeking labour leaders having anti-national attachments and echoing a foreign voice", Charat Ram has said that their dynamism alone enabled the company to record an improved profit position during the year to March last despite the fact that there were no operations in the first two months of the year due to the strike continuing from the previous year.

Mysore Lamp

THE implementation of Mysore Lamp's expansion has been delayed because the company has not received import licence for capital equipment required for the glass plant. The company needs to produce glass shells and tubes in its own glass plant to avoid shortage of these raw mate-

rials due to which it has not been able to achieve higher production of GLS lamps and of the production of fluorescent lamps and other varieties of lamps covered in the licences granted to it. Meanwhile, the company proposes to issue 1,28,677 equity shares of Rs 10 each at a premium of Rs nine per share to existing shareholders to find additional capital for the purchase of equipment required for the glass and fluorescent lamp plants.

As foreshadowed in the directors' report a year ago that the company will have to go with "little or no profits at all" till the expansion programme is implemented, the accounts for the years to March last show a loss of Rs 3.48 lakhs, as against a profit of Rs 0.41 lakh last year, even though the company produced a bigger quantity of lamps, 29.31 lakh pieces against 25.27 lakh pieces and sales were higher at Rs 28.94 lakhs compared to Rs 22.69 lakhs. Obviously, increased prices of raw materials and the increased expenditure involved in the process of implementing the expansion programme have together contributed to this outcome.

Assam Sillimanite

WITH the installation of imported plant and machinery at the Sillimanite's Ramgarh refractory plant, not only the quality of refractories has much improved but the capacity has also been raised. While imported plant and machinery for Sillimanite refractories has been erected and is in operation, the production has had to be limited to the kiln capacity. After some initial delay, the erection of kilns is in progress which, on completion, should result in increased production in the coming year. The company has been able to increase exports to the extent allowed by the Government in spite of severe competition in overseas markets.

During the year to March last, production of Sillimanite at the mine was maintained at the previous year's level, and sales increased by 12 per cent to Rs 55.03 lakhs. Gross profit, however, was slightly lower at Rs 10.48 lakhs, against Rs 11.15 lakhs a year before, reflecting that margins were under considerable pressure. After making necessary provisions, the net profit, however, is a shade better at Rs 3.34 lakhs (Rs 3.18 lakhs), of which dividend raised by a point to five per cent demands Rs 3.45 lakhs (Rs 2.76 lakhs).

Jaipur Udyog

STEPS are being taken by Jaipur Udyog to increase production of cement. The company has been sanctioned for this purpose import of balancing equipment worth Rs 25.84 lakhs from the U S. Improvement and mechanisation of limestone quarries are also being carried out to ensure larger output of limestone for increased cement production. A new compressor house is being erected for supply of adequate air for drilling operations and a high tension electric line is being extended by about 14 miles to connect the new compressor house. Besides, the company has applied for an industrial licence for installation of a fifth kiln of 600 tonnes per day capacity at Sawai Madhopur.

During the year to March 1965, both production and despatches showed a fall. Out of clinker and cement fell from 7,43,861 tonnes and 8,28,900 tonnes to 7,16,234 tonnes and 7,03,651 tonnes, respectively, and despatches were down from 8,40,368 tonnes to 6,98,683 tonnes. The shortfall is attributed to inadequate allocation of foreign exchange for the import of essential spares required for maintenance and operation of plant and machinery both at factory and quarries. Production difficulties were also experienced as additional power supply from Chambal hydel grid was totally stopped for nearly six months. Output as well as despatches, however, have shown a significant improvement in the first five months of the current year, and it is expected that the full year's working will show good results particularly because of the increase of Rs 4 per tonne in the cement retention price from June last.

Meanwhile, the 1964-65 results show cement sales down from Rs 9.57 crores to Rs 8.06 crores and after-tax profit from Rs 53.11 lakhs to Rs 21.84 lakhs. Of this, Rs 2.25 lakhs (Rs 2.90 lakhs) are allocated to development rebate reserve. The unchanged dividends on preference and equity shares together require Rs 27.25 lakhs. A sum of Rs 3.47 lakhs is transferred back from contingency reserve and the rest from general reserve to make up for the shortfall in the divisible profit.

M S Co-operative Bank

CO-OPERATIVE industries committees have been appointed by district central co-operative banks in Maharashtra in their respective districts

to study the possibilities of establishing agro-industries and pass on the primary data to the Co-operative Industries Commission. The object is to promote and run agro-industrial activities simultaneously and evenly throughout the State. The establishment of sugar factories in the co-operative sector and their successful working have created enthusiasm amongst co-operative workers and proposals for setting up industries have been formulated. But efforts have been so far uncoordinated and there has been no proper planning of the use of resources. A high-power committee has, therefore, been appointed to undertake such planning. The committee has under preparation a long-term plan for industrialisation with appropriate priorities. It will also prepare feasibility reports, project reports, etc.

Another notable event in the co-operative sector was the appointment by Maharashtra Government of the Maharashtra State Co-operative Marketing Society as its sole agent for monopoly procurement of jowar for which purpose the Maharashtra State Co-operative Bank made available finance upto Rs 12.67 lakhs to the Society. Thus for the first time the operations from procurement to distribution were undertaken by co-operatives. After procurement, jowar stocks were transported to other consuming centres, with most of the marketing societies working as sub-wholesalers, and passed on to consumer societies and fair price shops for retail sales to consumers.

During the year to June 1965, the Bank's income by way of interest and discount rose from Rs 2.15 crores to Rs 2.80 crores and net profit from Rs 38.30 lakhs to Rs 46.47 lakhs. Of this Rs 12.01 lakhs are carried to reserve fund, Rs 25.35 lakhs provided for payment of dividend at five per cent pro rata, Rs 3 lakhs for building reserve, Rs 0.50 lakh for fluctuation fund, Rs 5 lakhs for bonus to employees and Rs 0.60 lakh for contribution to the education fund of State Co-operative Union. As at the end of the year, deposits increased from Rs 3,529.75 lakhs to Rs 3,914.33 lakhs, and borrowing from Reserve Bank were up from Rs 2,542.48 lakhs to Rs 3,097.43 lakhs but those from 1 D B were down from Rs 144 lakhs to Rs 108 lakhs. Total reserves and other funds amounted to Rs 156.76 lakhs, against the paid-up capital of Rs 530.51 lakhs.

Larsen and Toubro

Larsen and Toubro has increased its sales during the half-year ended September 30, 1965 by 30 per cent over the corresponding period of the previous year, according to a press release issued by the company. Sales during the half-year amounted to Rs 457 lakhs against Rs 353 lakhs in the half-year ending September 30, 1964. The company's workshop at Powai has reported an increase of 28 per cent in its output.

Hindustan Wire Products

ONCE again, Hindustan Wire Products, producer of winding wires, is providing cheer to its members. After paying maiden dividend of 10 per cent for the year to March 1963, the company stepped it up to 15 per cent in the subsequent year, and is now lifting it to 25 per cent for 1964-65. The year's financial results are equally cheerful, with net sales rising by 45 per cent to Rs 99.38 lakhs and gross profit at a more rapid pace, by over 83 per cent to Rs 20.57 lakhs, reflecting considerable increase in margins. What is more, the enhanced distribution is covered 2.2 times, as against a cover of 1.6 times last year. That such good results should have been produced in a year when costs were on the rise and the plant could not run to the rated capacity due to the shortage of electrolytic copper, bears testimony to the improvement in efficiency.

HWP products already enjoy a good market because of their quality and the demand can be expected to considerably increase in the future. The copper supply position, however, continues to be difficult, but the directors hope that more foreign exchange would be allocated to the industry, as enamelled wires are required for winding electric motors.

Jubilee Mills

BBETTER results have been turned out by Jubilee Mills, one of the big processing houses, for the year to June 1965, with processing charges fetching Rs 1.18 crores against Rs 94.30 lakhs previously and gross profit higher at Rs 28.85 lakhs (Rs 27.22 lakhs). After making necessary provisions and providing for preferential dividend, equity earnings are over 38 per cent better at Rs 7.88 lakhs (Rs 5.70 lakhs). Equity dividend stepped up 10 per cent to 60 per cent is cover-against 1.2 times year ago.

— You'll find that shipping with us couldn't be easier. All you have to do is make one phone call and describe your shipment. We'll give you full information, including costs.

You expect shipping with us to be fast. But you may be pleasantly surprised to find out that it can save you substantially on packing (no heavy crates needed), on insurance (because there's far less breakage, spoilage, or pilferage), on inland shipping (air freight can deliver your goods just

about anywhere). And you can eliminate the cost of overseas warehousing (as you can now make overnight delivery of factory-fresh goods almost anywhere in the world).

Let us show you. Ship with us now, and we think you'll want to make us a permanent part of your shipping system in the future. Call your Pan American Cargo Agent. Or call us at Bombay, Calcutta, New Delhi, Madras, Colombo (Ceylon).

World's Largest Air Cargo Carrier • World's Most Experienced Airline

GROWING BIGGER EVERY DAY

That's us. Always trying to do a little better than yesterday. Always doing it. Textiles, jute, dyes and chemicals. These are the interests we have today. Tomorrow? The possibilities are endless. The future is wide open.

SEVENTY-FIVE PAISE

Oil sows the seeds of prosperity.

Man's capacity to grow more food has been multiplied many times by the use of tractors, loaders, mechanical ploughs and various tools and machines powered by fuel energy from petroleum. With the aid of petroleum derivatives lands are made fertile and crops are protected against insects, fungus and weeds.

One of the prime tasks before the country is to grow more and more food, so that ultimately self-sufficiency is achieved. INDIANOIL helps the farmer increase food production.

INDIANOIL refines, transports through a network of pipelines, and markets the entire range of petroleum products. The increasing demand of Agriculture, Industry, Transport and several other nation-building activities for oil and petroleum derivatives, is being met with painstaking effort.

What Are We Defending?

IN its issue of June 8, 1963 this journal was constrained to express itself in the following vein:

"There is a state of emergency in the country and a nation-wide preparation of defence.... What is this defence effort for? To defend the country and the freedom and the democratic rights of the people which we hold so dear. It is not only our borders that we are to defend. The borders are merely a physical frame within which the people have inherited and built up something which they want to safeguard and preserve. It is the values they hold dear which people defend with their lives, not the rocks, stones and trees, acres or square miles of land.

"The things we want to safeguard and preserve, for which is this defence effort, form one indivisible whole, the content of which is individual freedom — the right to hold one's head high, the right to think for oneself and pursue the truth unafraid, unhampered by authority, freedom of thought and expression. The limits of freedom of action for an individual are well known; they are obvious and accepted. They begin with the restrictions on where we cross the path in a busy thoroughfare. But how far can they go without destroying the very content of freedom and diminishing man in the process? Constant nibbling of this freedom goes on all the time. The process is unending and will remain unending unless it is checked and checks can come only from protest, and prompt warning from those who are in the special position of custodians of this freedom — the legislators, the judiciary, the legal profession and the press. To repeat, nibbling goes on all the time — there has been a noticeable lack of vigilance and timely action if not inertia and apathy on the part of those who are charged with safeguarding of freedom, protesting and averting encroachments upon it."

This was, let us repeat, in 1963, and the context was provided by the several manifestations of arbitrary State action, under the guise of the Defence of India Rules, in the wake of our reverses against the Chinese. It was to be hoped that we would have learnt a little more poise in the intervening two years. Our performance in the recent clash with Pakistan has not been at all discouraging; we should possess by now a fair amount of self-confidence and should be able to dispense with nervousness at high places. Unfortunately, the indications are otherwise.

Naturally, at present the major target of our wrath is Pakistan, although there is the accompanying theory that the Chinese too are in collusion with the Pakistanis. The general mood — as reflected in the speeches of most political leaders as well as in editorial articles and comments carried by the newspapers — is one of unrelenting opposition to a compromise with Pakistan over Kashmir. Any person or organisation suggesting a different approach will obviously not be very popular in the country at this time.

But that does not mean that such suggestions are treasonable. Political parties of various shades — and their leaders — have on and off discussed alternative solutions to the Kashmir imbroglio over the last eighteen years. They were being discussed when Pandit Nehru died last year, shortly following Sheikh Abdullah's release from prison. They were again discussed later last year when Lal Bahadur Shastri, after being installed in office, met President Ayub Khan. Several proposals, each somewhat at variance with the formal stand that Kashmir is an integral part of India, have since been advanced, and that by personalities as diverse as Jayaprakash Narayan, Minoo Masani and C Rajagopalachari. Even after the recent series of incidents, which finally culminated in open warfare, started in August, quite a number of newspapers and journals have discussed the pros and cons of possible solutions which would be acceptable to both the countries.

Nothing has changed in the juridical sense during the last six or seven weeks. We have not formally declared war on either Pakistan or China, nor have diplomatic relations with them been severed. Also, we have taken scrupulous care to declare to the world that we have offered battle to Pakis-

tan only because it wanted to alter the *status quo* in Kashmir by force. Our stance till very recently has been that, while we abhor the use of force and will always resist any Pakistani attempt to bring about a solution of the Kashmir problem through the deployment of force, we are always prepared to listen to proposals for a peaceful settlement, whether they emanate from U Thant or Harold Wilson or Kosygin, or are directly broached to us by the Government of Pakistan.

That being the case, any citizen of India — C Rajagopalachari, Jayaprakash Narayan, E M S Namboodiripad or one who is much less known — will be perfectly within his rights to differ from the current view of the Government regarding the constitutional-political aspects of the Kashmir problem. In the present temper of the country, it is but natural that such dissident opinions on Kashmir would be rather unpopular, and will invite the opprobrium of the Government. Nonetheless, India is a free country and a democratic country, and it is no Government's business to assert that a particular opinion must not be aired because it is a minority opinion. A democratic regime, in contrast to an authoritarian one, should in fact take particular care that minority opinions are allowed to be expressed and to be heard, if not with respect, at least with tolerance.

It is in this context that it is necessary to take issue with a statement reported to have been made by Prime Minister Shastri last week. A news agency report quotes Shastri's reference at a public meeting at Aurangabad to the position taken by EMS Namboodiripad and other members of the Left Communist Party on Kashmir. The attitude of the Left Communists, according to the Prime Minister, "was totally opposed to the national policy and the united opinion in this country". Shastri is reported to have followed up with the polemical question, "If they (the Left Communists) persist in this attitude of questionable loyalty to the motherland, why should they at all stay in the country?"

What are the facts? Namboodiripad has supported the Government in its war effort against Pakistan in no uncertain terms and has praised the valour of our troops. But having affirmed that it is the duty and the prerogative of our Government and people to resist aggression from Pakistan, he still maintains his Party's position that in no way can the Kashmir issue

be regarded as closed. Now that a formal ceasefire has come into operation, he feels that our Government should explore the possibilities of coming to an understanding with Pakistan. This is a point of view which, one presumes from their statements and writings in the past, has the support of Jayaprakash Narayan, C Rajagopalachari and Acharya Vinoba Bhave, to name a few of our more prominent countrymen. To hold this view is not to go against national policy, but only against the Government's latest policy. By no stretch of reasoning can holding this view be considered as going against "the united opinion of the country".

There is a difference between opinion held by a majority — even an overwhelming majority — of the people and *united* opinion. It is no crime to express an opinion which varies from the opinion of the majority, at least not in a free democracy. It is only when the majority opinion has been enacted into the law of the country that it is not permissible to act contrary to this law. Since no ordinance has been proclaimed making it an offence, under the Defence of India Rules, to discuss proposals for

a negotiated settlement of the Kashmir problem is not *lese majeste*.

The limits to tolerance are obviously getting narrower and narrower with every day. In this context the Prime Minister's runaway conclusion that those who differ from the Government's Kashmir policy are disloyal to the motherland is most unfortunate and distressing. Loyalty to one's motherland can hardly be said to be co-terminous with adherence to the opinion of the Prime Minister or the Government. It is only in an authoritarian climate — such as obtains in Pakistan — that this sort of identification is sought to be enforced. Those who seek to enforce the identification here are, unwittingly, equating India with Pakistan.

The real danger to the country lies in succumbing to the tyranny of emotions. Does the Prime Minister suggest that Jayaprakash Narayan and Acharya Vinoba Bhave are lacking in patriotism and should leave the country because they hold views that are different from those of the Government about the ultimate solution of the Kashmir problem? Where does the apologia of national cohesion end and authoritarianism take over?

Not Patriotism Alone...

THE Prime Minister produced his Solidarity Day-even packet of defence bonds, gold bonds and the defence remittance scheme appropriately with stirring references to the glitter of a new vision he had seen in the eyes of lakhs and lakhs of people coupled with the confidential aside, delivered, as it were, with a palm over his mouth and a not-too-discreet wink that "no action will be taken against subscribers on the ground that the provisions of the Gold Control or the Income-Tax Act have been infringed. The identity of the subscriber will not be disclosed". The patriotic appeal is to the honest citizen who is being asked to buy defence bonds at interest rates of 4.25 and 4.75 per cent per annum for parting with his savings for three and seven years, respectively, when he can do better by just leaving the money with his bank.

But crooks and tax-dodgers have little use for patriotism and so, since the defence remittance scheme and the gold bonds are largely intended for such gentry, the appeal is different. In the black market for foreign exchange the pound sterling and the dollar have recently begun to fetch

nearly twice as many rupees as at the official exchange rate—a marvellous circumstance taken advantage of by an increasing number of those sending money to India, as reflected in the declining official remittance earnings. Now the Government is setting up shop to compete with the black market operator. If the proposed import entitlements of up to 60 per cent of remittances fetch a premium of 150 per cent the remitter will get a price for his pounds or dollars roughly equal to what he can get in the black market today. There are some snags, however. The recipients of remittances from abroad are to be exempted from income tax but will the exemption also apply to the profits made from hawking import entitlements? On the whole, the Government may still not be able to pay the equivalent of the black market rate, but with the defence remittance scheme it is in effect offering an exchange rate handsomely higher than the official one and to that extent some impact should be felt on remittances sent into the country through official channels.

For tax-dodgers and gold smugglers there are the new gold bonds. Of

course, patriotic housewives may subscribe to the bonds with their *man-galasutra*, but the 'no questions asked' provision and the immunity promised from the consequences of violation of tax and customs laws and the Gold Control Act make it clear that the bonds are really intended for a more select clientele. And consider what they are being offered! The honest citizen who has no need to salt away his savings in gold bars is offered 4.75 per cent per annum and the badge of patriotism for use of his money for seven years at the end of which, if prices rise the way they have recently, its worth may have depreciated by a third or so. By contrast the happy possessor of smuggled gold bars bought with tax-evaded income and in breach of Gold Control is to be paid back in gold in 1980, so that the poor fellow hasn't to worry about inflation and such nasty things. In addition, he is offered exemption from almost every conceiv-

able tax — income, capital gains and gift — and estate duty, and paid interest at about 1.5 per cent per annum to boot. This is not to mention that he is being saved from the stiff penalties and possible years in prison which should have been his desert if the Government had better ability and lesser reluctance to enforce its tax and other laws.

Such pampering of crooks can be justified, if at all, only by the results achieved. The figure of Rs 500 crores has been mentioned as a measure of official expectation from the gold bonds, but if not even Rs 50 crores at the least is raised, the Government would have brought its laws into disrepute for nothing.

Some other implications of the gold bonds need to be mentioned. It has now been clarified that the bonds will be negotiable. Now, if the 'no questions asked' clause and the immunities offered to the first subscriber are to be available to every subsequent own-

er, the bonds will be a most wonderful instrument indeed for painlessly converting black money into white through a chain of sales and purchases between now and 1980. The imagination boggles at the thought of what efficient use tax-dodgers will put them to. On the other hand, if the immunities are restricted to the original subscriber, there will be the problem of distinguishing him from subsequent owners without violation of the secrecy clause. In any case, this would severely restrict the negotiability of the bonds. They may still be pawned with the banks, but here another problem arises. In January 1963, in the euphoria over gold control, the Reserve Bank issued a circular advising banks to value gold, including ornaments, offered as security against advances at the international price. At what rate are the banks to value the gold bonds? At the international price? or will the Reserve Bank rescind its earlier advice?

Weekly Notes

Giants Turn the Corner

THE operations of larger Government industrial companies have turned the corner, financially at any rate. The Reserve Bank's annual review of the working of selected Government companies (published in the September issue of its *Bulletin*) now covers 47 companies which account for 97 per cent of the share capital of all fully operating non-financial government companies as in March 1964. These are divided into two categories, one consisting of five giants, Hindustan Steel, Fertiliser Corporation, National Coal Development Corporation, Shipping Corporation and Hindustan Aircraft, and the other of the remaining 42. At the end of 1963-64 the five giants had total assets of Rs 1,134 crores (gross fixed assets Rs. 970 crores) while the other 42 had only Rs 281 crores (gross fixed assets Rs 148 crores).

It is the giants which have improved their results substantially. Their gross fixed assets expanded by 12 per cent in 1963-64, inventories by 21 per cent, while sales rose much more, by 34 per cent. Increase in turnover brought them to the break-even point: gross profits (i.e., profits after depreciation but before interest and tax) of Rs 20 crores sufficed to meet the interest liability, and came to nearly 8 per

cent and 2 per cent of sales and total assets, respectively. Earning on net worth has reached zero from negative figures. Accumulated net loss stands at Rs 43 crores on a total fixed investment (paid up capital and borrowings) of Rs 1,032 crores but there is a depreciation provision (the only source of internal finance) of Rs 185 crores.

As indicated in the table on the next page, there has been some, but not very remarkable, improvement in turnover of capital. Sales as percentage of net fixed assets have gone up from 25 in 1962-63 to 31 in 1963-64 but there has been no change in the turnover of working capital. Inventory, one of

the key factors in profitability, still leaves much to be desired. Stocks of finished goods and work in progress have been reduced from roughly one-fifth to one-seventh of sales but other inventory, mainly tools and spare parts, remains constant at 37 per cent of the value of production. The proportion of raw materials inventory to raw materials consumed went up from 44 to 57 per cent which, too, is not an encouraging indicator. True, there is some justification for this stockpiling in view of various bottlenecks, surely these levels are high even when all possible allowances are made for bottlenecks? The principal hurdle to be crossed for proper inventory control is not shortages, uncertainties and bunched allocations of foreign exchange but the system of budgeting and budgetary control, which is permeated with government departmental practices.

The other 42 companies also have done fairly well, though there has been some falling off from the previous year's performance. Their gross fixed assets expanded in 1963-64 by nearly 27 per cent, and sales by 18 per cent. Gross profit declined in terms of sales from 8.4 to 7.5 per cent and in terms of total assets from 7.7 to 6.7 per cent. They have built up total gross reserves of Rs 77 crores (includ-

Greetings

We wish all our readers and well-wishers a happy Diwali and extend to them the greetings of the season.

There will be no issue of "The Economic Weekly" on October 30, on account of Diwali holidays. The next issue will be on November 6, 1965.

Business Manager

ing accumulated depreciation Rs 42 crores) against paid up capital and borrowings of Rs 169 crores. Borrowings remain their major source of finance for expansion but about one-half of their fresh borrowing of Rs 33 crores in 1963-64 came from banks.

A word in conclusion about the *Bulletin* article itself. The Reserve Bank has been justifiably proud of its studies of company finances but it has perhaps not cared to notice that the format has remained almost unchanged for more than ten years and is indiscriminately used. For instance, what is the significance of "managing agents' remuneration" and "current ratio" in the case of government companies? And who, to mention a point which the high-powered editorial committee of the *Bulletin* may take note of, permitted the article to end with "The ratio fell deeply..."?

Selected Key Financial Ratios of 5 Giant Government Companies

	1963-64	1962-63
Sales as % of net fixed assets	31	25
Sales as % of net working capital	113	113
Finished goods and work-in-progress as % of sales	15	22
'Other' inventory as % of value of production	37	36
Raw materials inventory as % of raw materials consumed	57	44

Import Promotion!

THERE has recently been a lot of talk about 'import substitution' but no practical suggestions have as yet emerged from the Government as to how to go about the matter. It has been left to an association of private industries, the Engineering Association of India, to come out with a number of eminently sensible ideas. From a reading of the memorandum submitted by the Association to the Government, it would appear that while the Government has been talking about import substitution not only since the recent war with Pakistan but from long before as a general planning policy, it has been pursuing a policy in the matter of promoting collaboration between foreign and domestic private capital which has been aggravating our dependence on imports by systematically giving rise to "excess imports" in the sense in which the term was used by Michael Kidron in his article published in this journal in

the issue of April 24, 1965. What a private investigator reported in that article as the multifarious ways in which collaboration has been leading to much unnecessary import of capital and know-how has been largely borne out by the representative organisation of the engineering industries themselves.

Among the important recommendations regarding industrial planning in general made in the memorandum is one for the setting up of design offices to make available designs of plants and machinery to all Indian entrepreneurs, and another to set up about a dozen tool rooms for manufacture of tools, dies, jigs and fixtures through which a saving of Rs 30 crores of foreign exchange could be effected. In the matter of collaboration, the memorandum recommends limitation of the number for any one item of manufacture; it also marks its strong opposition to licences being issued to import complete plants and machinery. The latter practice is one of the several wasteful results of collaboration. The foreign collaborators insist upon such imports, being distrustful of or having an interest against indigenous parts and fabrications. In this respect the Soviet Union has also been not very unselfish, as was seen by its insistence on dispensing with the designs made by Dasturco for the Bokaro Steel Plant.

It is perhaps characteristic of the inefficiency with which the economy is

planned, guided and administered that collaboration with foreign capital has been increasing our dependence on imports (at least in certain aspects) rather than reducing it. There is indeed a case for collaboration and the fact that the number of joint ventures have sharply increased during the last seven years is not at all an unwelcome development. According to a survey conducted by the *Economic Times*, the number of agreements in 1957 was only 81; it reached a peak of about 400 in 1961 which it reached once again in 1964 after a relative decline. The country is short of capital and short of technical know-how and private collaboration should in theory be just as much desirable as foreign assistance on government account. However, given that the declared aim of our planning is to reach the state of self-sufficiency as early as possible, the policy in the matter of collaboration should be to promote such agreements as would result in our acquisition of technical know-how in the shortest possible time so that this particular form of dependence on foreign private capital may be dispensed with ultimately.

Our declaration of intentions with regard to self-sufficiency sound particularly hollow and lacking in purpose when compared with the policies actively pursued. Yet we have got spectacular examples of import substitution before us. The Soviet Union and

Japan have become the mighty industrial powers that they are not through our type of import of know-how; and China's achievements in the field ought to have had even greater effect on our lethargy. Every now and then we declare that we could manufacture the atomic bomb if we wanted to; but it is not only in the matter of the bomb that China has proved its superiority over us in self-reliant development.

Support Prices for Foodgrains

A participant in the seminar on foodgrains prices writes:

ARE discussion papers necessary to seminars? If we are to go by the seminar on the fixation of support prices for foodgrains held last weekend at Vallabh Vidyanagar, they are not. Apparently, the inflow of papers was very slow initially, and though nearly fifteen papers were presented finally, the discussion as it was organised did not refer to the papers at all. Not that it suffered much as a result; in fact, the level of discussion was somewhat better than in the annual economic conferences.

The first two days' deliberations were diffuse and lackadaisical. Economists tended to get messed up in conceptual conundrums; farmers' representatives had little use for the concepts, and were for price support only in so far as it meant higher farm prices. And the problems that worried them had little to do with prices: what they were interested in was income insurance for farmers in the face of annual crop fluctuations. Minimum support prices as insurance against price falls would not meet the problem of crop fluctuations at all. Further, they pointed out that the expansion of foodgrain cultivation required higher relative prices for them. Relative prices have an important effect on crop patterns. An illustration of their importance was given by T A Pai of the Food Corporation who pointed out that the introduction of minimum prices for rice in Andhra led to a shift away from minor grains.

And yet there were no concrete proposals as to how relative prices might be taken into account. Price fixers concerned themselves entirely with justice. Prices had to cover the costs of production of farmers. But costs varied by a factor of seven or more, and prices were always below the costs of some farmers. Prices that would cover the highest costs would be shockingly high; so we should fix

them on the basis of average costs, or bulk-line costs, i.e., marginal costs of 80 or 90 per cent of the output. Why should we? Well, reasons did not matter; what was needed was resolute action.

The concern for farmers' costs and income might seem odd in the context of the steady improvement in agriculture's terms of trade over the last two years and the record agricultural output last year. The problem that worries us is the inadequacy of the marketed surplus for feeding the towns. In fact, this question attracted most of the discussion; and apart from a fragile fringe of free traders, everybody seemed to think that it was serious enough to justify compulsory procurement. The concern for 'fair' farm prices stemmed from fears about the response of the farmer to such procurement. In a way, high farm prices were expected to provide an incentive to farmers to co-operate in compulsory procurement.

There were differences over the extent of compulsory procurement necessary to supply the major cities. The procurement requirements depend on commitments; in the absence of information about the magnitude of commitments if towns of different sizes were to be provided, it remained unclear what proportion of the surplus would have to be procured for any particular scheme of rationing. In the event, the possibility that even procurement of the entire surplus, as it is known, might be insufficient for a comprehensive rationing system remained undiscussed.

Not a Secular Act

SECULARISM is a word with different meanings in different contexts. Though it has never been clarified exactly in what sense of the word we claim our country to be a secular democracy, the importance we attach to this particular description of our polity, especially in all official references, is not to be minimised. Of the image of India which we are struggling to create in the eyes of the world, secularism and democracy are the two aspects which are being quite rightly emphasised. In our dispute with Pakistan especially, we expect the sympathy of the countries of the world for our being a parliamentary democracy whereas Pakistan is a military dictatorship and for our being a secular state whereas Pakistan is an avowedly religious state.

Given all this, could the Prime Minister choose a less suitable moment

to perform "bhoomipuja" of a river valley project and be photographed for newspaper publicity? The interpretation of secularism that most nearly conforms to the theory and practice of the Government is, of course, not of equal indifference towards all religions but of equal tolerance of and support for all religions. But is the Prime Minister not giving the impression of state patronage of Hindu rituals in a partial fashion by participating in rites which he has every right to believe in as a private individual, but not as a Prime Minister and not in connection with a project built with public funds?

Let's face it: there has never been an example nor can we imagine there would be of a public work being inaugurated with a Muslim or Christian ritual. If Pakistani propaganda wants to describe India's claim to secularism as so much hypocrisy could it be supplied with more useful material?

The Peasant in Debt

THE Reserve Bank's survey of rural debt and investment in 1961-62 cannot be criticised for not having produced information; the results published in the latest *Bulletin* contain 26 tables and 12 statements. But the tabulation and analysis are mechanical. Loans are classified by size, purpose, security and source; households are classified into cultivators and non-cultivators, and figures are given by States. The information, thus organised could be put into one seven-dimensional table. So 38 two-dimensional tables represent only a small sample of all that could be obtained from the primary information, and it is not clear what principles have governed their selection, or what questions they are meant to answer.

Nearly two-thirds of the loans was given to about a third of cultivators with assets over Rs 5,000. While this is not surprising in itself, it makes one wonder how correct the picture of the Indian farmer sunk in debt due to poverty is. No cross-classification of loans by asset group and purpose is given; but about half the total amount was borrowed for household expenditure and two-fifths for business expenditure. So we have, apparently, two roughly equally important groups of loans — those obtained for profitable investment and those required for consumption. Thirty-eight per cent of the value of cultivators' loans was outstanding for less than a year, and

47 per cent of it financed household expenditure. So about a third of the value of loans for household expenditure financed consumption from one harvest to the next.

More detailed information on consumption loans, and especially on the two-thirds which was outstanding for more than a year would be welcome. One would expect *a priori* that much of it was borrowed in years of bad harvest. While most people adjust their level of expenditure to their permanent income, they find it difficult to adjust it to sudden falls in income. If consumption loans are due to crop failures, their proper remedy is co-operative crop insurance societies, and not the co-operative credit societies on which there has been much emphasis hitherto.

Interesting conclusions could also have been obtained by meshing in the previous study on agricultural investment, published in the *Bulletin* for June, with the present one. It can be established, for instance, that a quarter of the borrowings for farm capital expenditure went into the purchase of land. Since agriculturist money-lenders provided nearly half of the loans, it is possible that a good part of the loans are direct or indirect hire purchase arrangements on land deals between substantial landholders. Further, a half of the borrowings were for livestock, which thus constituted the main form of rural capital investment.

Nanda's Confession

A Correspondent writes:

THE Union Home Minister declared war on corruption two years back. In a defiant mood, he half promised and half threatened to resign if corruption did not disappear within the two years which have just expired. By his own assessment, his efforts have made sufficient impact not to disillusion him. The dividing line between illusion and un-illusion is after all a subjective one and there is only a shift from one illusion to another. "Statistics apart", says Nandaji, "there is an impact from what has been done to root out corruption." The non-statistical image is no doubt a part of experienced reality. One salient factor was overlooked. "I should have been wiser", the Home Minister adds regretfully, and secured the co-operation of "important persons".

Good intentions are useful but not enough. Temptations have to be resisted, especially when they are offered by disguised angels. The more heroic,

like Nandaji, can rush in and emerge unscathed. Witness his dash to Calcutta some months back to soothe the ruffled feelings of leading industrialists who had seen visions of heads rolling. Witness, also, his efforts to put out the minor fires lighted by the Vivian Bose Report. Ordinary men and women with less courage and less self-righteousness might have hesitated, but not Nandaji. The mistake of not

securing the co-operation of important persons, it is gathered, is being undone. The Sadachar movement has disassociated itself from income tax and foreign exchange enforcement raids. The Government itself will handle the task in future without asking any questions or seeking the help of unimportant persons. On this front peace talks started before the cease-fire!

It is time now to start a **FESTIVAL ACCOUNT** for the next Diwali.

Monthly deposit of Rs. 5/- over the next year will yield Rs. 61.75 in time for the next Diwali.

Deposits of higher amounts in multiples of Rs. 5/- are also accepted.

CAPITAL VIEW

The Return to Politicking

Romesh Thapar

BACK from a land now forbidden to us — for that is what Pakistan has become—members of the foreign press corps cannot but be amused by the bewilderment of Indians when they are told that the Pakistanis believe most firmly that they won the war. This conviction is backed up by contemptuous references to Indian claims, even with regard to the extra acreage occupied by us in the course of the battle. Politically, too, they appear to be as united as can be behind the Ayub-Bhutto combination — although ideologies and alignments are in a state of flux.

One significant fact, however, is emerging. The 'staying power' of the Pakistani army and air force was severely limited by the stocks of ammunition and fuel. If the war of attrition had continued, somewhat more energetically than during the last few days of the conflict, it is possible that Pakistan would have found itself in a desperate position in course of the next fortnight. Ayub played the moderate because he was aware of this grave weakness. Now, it is Rawalpindi's main aim to replenish the stocks which have been expended.

While Turkey is playing the role of major supplier of munitions, and Iran is anxious to assist, the USA is fearful of the political and diplomatic consequences of any resumption of direct military aid to her bruised ally. This explains Bhutto's attempt openly and crudely to blackmail the USA into permitting more generous support from various CENTO and NATO members. The prospect of Soviet mediation in the problems of the sub-continent is held out as a threat. Pakistan is in a fix; the equipment possessed — and it is still considerable — has to be serviced either by the USA or by the members of CENTO and NATO.

Sitting in Delhi, listening to these reports, one is reminded of the suspicion expressed in certain quarters in the Capital that the Prime Minister and the Defence Minister were not fully aware of the plight of Pakistan's satellite army. The stalemate, political and military, which now disturbs us could have been avoided by a more purposeful handling of diplomacy in the UN and in various capitals. A more decisive military result would have had a profound effect on the future of the sub-continent.

However, there's little point in stressing these rather obvious failings. What needs to be assessed are the sources of Pakistan's present weaknesses, diplomatic and military, so that our actions and counter-actions during the critical months ahead are calculated and precise. In other words the efforts being made by Rawalpindi to alter the cease fire line must be thwarted, if necessary, by fresh punishment — that is, if the UN observers continue to look on apathetically. To play it soft now would be to place ourselves at a serious disadvantage later when Pakistan might attempt bigger adventures.

We don't seem to be on the mark, as it were. Apart from the mess that has been made of our so-called diplomatic offensive by the Prime Minister's office — highlighted by S K Patil's 'special mission' to the Americas when our Foreign Minister is already available in the area for such activity and by the sudden postponement of the tours planned for groups of MPs because the foreign ministers of the countries to be visited are already at the UN — various Congress Party chieftains have been kite-flying on the question of holding a quick 'khaki' election. Report has it that Kamraj launched the kite, but only after encouragement from the Prime Minister. The report is, of course, denied!

Apparently, the 'khaki' election proposal was justified in higher political circles as one method by which the present political leadership would be able to establish its control over the ruling party, particularly in the States. Such control, it is argued, is necessary if we are to face the problems now taking shape. Lal Bahadur knows that, victorious tours notwithstanding, he is still unable to discipline the States and compel them to follow the directives of the Centre. In this context, a snap general election would have had meaning. But, clearly, the fear is widespread, both within the Congress hierarchy and among leading opposition elements, that the mechanics of organising such an election might place too much power into the hands of a junta which would exploit somewhat opportunistically the patriotic sentiments of the people.

One does not have to research very deeply to see what is happening. The crude attempt to present Lal Bahadur as 'the leader' in the course of his

tour in Maharashtra could not have gone unnoticed. Various descriptions as 'the hero of our finest hour', as 'a gift of God', and as 'the little Gnat', Lal Bahadur took it all in his stride, participated in non-secular ceremonies and more or less blessed this new style of politicking. This is unfortunate because the opposition will be compelled to counter the tall claims being made, and the broad national cohesion, so vital in the coming months of stress and strain, will be endangered.

Another disturbing development is the manner in which the Defence of India Regulations are being used to stamp out dissent on the plea that it is subversive. Home Minister Nanda cannot possibly take all the decisions on his own. He has enough experience of punitive legislation to realise that it can be grossly misused. Yet, from the evidence available he is reluctant to set up machinery speedily to review DIR actions. It is a failure which encourages the belief that the unlimited powers assumed by the Centre will be used against determined political opponents and that certificates of political health will only be given to those who conform to the new order.

In fact, only the other day much heat was expended among a group of publicists on the question of 'the state of war' declared by Nanda on TTK, a conflict which now threatens to involve the ministries of Home and Finance. Power vesting in these departments of the GOI has been used, it is said, in a political tussle between two Cabinet colleagues — a strange and deplorable affair which underlines the lack of checks on unlimited, specialised, executive powers enjoyed by certain ministries. If the Prime Minister is content to permit these battles for reasons of his own, this does not detract from the demand that a genuinely independent control commission should be constituted to review these and other aberrations.

This return to familiar Congress politicking, even before the Pakistani threat has been properly dealt with, cannot but disrupt the chance we have of mobilising the people to meet the crisis of food. The moment the opposition parties come to the conclusion that their support to the GOI is

being exploited for the ends of the ruling party, there will be a splintering of the unity behind the moves to make this country self-reliant and self-sufficient. The enlightened in the Congress leadership will have to find the means by which national cohesion can be sustained and made the weapon of social and economic transformation.

That this is the most dominant sentiment in the country no one at the Centre denies. The problems, it is argued, are too many and too ramified to permit the old kind of poli-

ticking. Indeed, even those who know that the Prime Minister is not the master strategist he is being made out to be feel that he now enjoys enough popular prestige to lift our national effort to a new and challenging level. Not without significance is the theorising in the Capital, still unexpressed in public, concerned with the need for a government of national unity. Image building is hopelessly barren when divorced from dynamic purposeful perspectives. This is a fact which will have to be repeatedly emphasised during the months ahead.

FROM THE LONDON END

Towards a Capital-Owning Democracy?

THE Conference season of Britain's political parties, now drawn to a close, has proved beyond doubt that the "personality cult" on the American model is rapidly penetrating the British political scene. Grimmond dominated the Liberal conference at Scarborough, the Blackpool Conference was very much the slave of Wilson and the Heath era of Tory leadership was launched enthusiastically (*albeit* after a somewhat doubtful start) at Brighton. Perhaps the most significant feature of the Conservative Party conference at Brighton last week, whose opening was dominated by Wilson's dramatic dash to see the Queen (with chilly portents of the possibility of a General Election now that Labour has an 11 per cent lead in the National Polls) and the fear of a split in the party over the Rhodesian issue, was the Party's new propaganda planks which emerged.

In recent years there has been the greatest similarity between the policies of the two parties. The differences which have now begun to emerge have an ironic quality about them. For instance, while the labour government is determined to hold on to Britain's bases in Asia, Enoch Powell in his much applauded speech at Brighton made it clear that as shadow defence minister, he has no belief in the necessity of Britain's role East of Suez. In general, however, there are many areas of agreement between the two parties. Both are in favour of modernizing Britain and making the country more efficient. Both seem at one in pressing the need for some sort of incomes policy. Even on the basic issue of Europe, Labour now seems in favour of some sort of rapprochement, though naturally not with the single-minded devotion that Edward Heath brings to this policy. What did,

however, emerge from the Brighton conference was the Conservative Party's new ideas on taxation and investment. It is likely that these will be the main issues of political debate between the two parties, particularly in view of the fact that Wilson has now made it clear that there is no possibility of introducing steel nationalization in the next session of parliament since there are many other important Bills which have to be introduced.

In these circumstances, it is worth while examining the new catch-phrase "a capital-owning democracy" which is to be the stirring successor of the earlier Tory slogan coined by Anthony Eden of a "property-owning democracy". The basic ideas were outlined in a brilliant speech by Iain Macleod who has now resigned his editorship of the *Spectator* in order to devote more time to his political activities. He received an ovation fit to mark the return of a prodigal son!

There is now a fundamental difference on the principles and purposes of taxation as seen by the Labour and Conservative parties. While, if only for electoral popularity, both parties would like to see the present rates of taxation reduced, the Conservatives would like to encourage the accumulation of capital in private hands. According to them, company profit "should be used for the provision of new plant and machinery, and if it is not required for this purpose, it should not be allowed to remain idle. It should be redistributed to institutions and to shareholders so that it can flow into the growth industries of our country". It should be the aim of taxation to see that corporate profit is in fact so deployed.

Private enterprise occupies the central place in the economic reform which

THE ECONOMIC WEEKLY

Heath wants to bring about. Competition and incentives are to be the motive forces and success is to be the reward. In order to be an effective Opposition, the alternative the Tories are putting forward is that of individualism and private responsibility. The taxation system should encourage small business to expand and large business to distribute their profits. Again, the Tories would not leave too much to the Welfare State; instead employers themselves would be expected to make bigger contributions to their employees' insurance etc.

In his first speech as shadow Chancellor, Macleod emphasised that the Conservatives would bring down taxation. "There is a limit, and we are already beyond it ... to the burdens that one can put on personal taxation without a dramatic drop in efficiency and enterprise". He also undertook to repeal the parts of the 1965 Finance Act which discouraged overseas investment.

The new Tory Policy Statement is, however, ominously silent on how the Conservatives will tackle the central task of managing the economy. Would they use deflation, devaluation, import controls, export subsidies, an incomes policy, or what? As Wilson has pointed out, while the words and clichés in stating objectives are unexceptionable, no specific statement of policies have yet been made. The only hints are threats to Britain's social services. How the Tories will combine great increases in expenditure with reductions in taxation is still unknown. Scrapping the present system of farming subsidies and pensions may relieve the Exchequer, but if they are replaced by higher food prices and insurance premiums, the community will still have to find the money.

Whatever the methods, one factor is becoming increasingly clear. One of the chief means by which the Tories will try to capture the votes of the white-coated workers to whom Wilson appealed last year — the group so pithily described by Macleod as the "new and politically unattached salariat" — is a campaign for wider share ownership and lower taxation. The Conservatives are making a great point of the fact that it is now exceedingly difficult for salary earners, however successful they may be, to build up a worthwhile capital out of income. They are, therefore, busy studying schemes for wider share ownership, and in this context two subjects to which they are devoting particular attention are contractual savings

THE ECONOMIC WEEKLY

schemes and schemes for tax option. The party Conference was informed that a detailed examination was being made of the various methods of stimulating share ownership, and a study is being made of methods used in the United States and Western Germany. Discussions have already taken place with officials in Bonn and Washington, and the investigation is soon to be extended to other Common Market countries and to Japan.

Emergency Plan for Food Production

Andhra's Lead

C V H Rao

IN two seminars held in Andhra Pradesh almost at the same time, in Hyderabad and in Vijayawada, one organised by the Pradesh Congress Committee and the other by the State Agricultural Department, problems of augmenting food production in the State came under close scrutiny. This is, first, an indication of the current awareness among official and non-official agencies in the State of the great urgency of increasing food production, and, second, an intimation to the country as a whole about the prominent role that Andhra Pradesh can play in fulfilling this most urgent need as an integral part of the nation's advance towards self-sufficiency in food. Andhra Pradesh has established its surplus status in regard to rice by exporting 5 lakh tons of the cereal to deficit States this year. It is proposed to collect 8 lakh tons of rice in the next harvest season through the grain levy to operate the rationing system.

If the awareness of the State's role seeps down to the vast number of agriculturists and if it can be effectively harnessed for national purposes by the combined efforts of Government and non-official agencies like the Pradesh Congress Committee and other political organisations, Andhra Pradesh will be entitled to the gratitude of the rest of the country. As a prominent agricultural State and with an agricultural community which has the tradition of invariably displaying a forward outlook in agriculture, the State will most likely pass the test to which it is willing to submit itself and help the nation as a whole to face the challenge that the emergency has posed on the food front.

But this predicates the fulfilment of some essential pre-conditions. No

The Conservatives now realize that an immediate General Election would certainly not be of benefit to them, and one of the keynotes of the Conference was Heath's caution about the need for patience and hard work. "There is no easy way. Let us face this fact realistically. The Government to-day is still on trial by the people of this country." This means that Heath is now gearing his policy to remaining the leader of the Opposition for some

time to come, with the main purpose of fighting Harold Wilson and attempting to discredit both him and his Government's policies. On the positive side, with the security provided by the welfare services and a steady rise in standards of living but with capital still out of the reach of most people who do not inherit it, the slogan of a "capital-owning democracy" could prove to be a powerful bait in the next election.

worker, however skilled and competent, can produce the goods he is expected to without the necessary tools and instruments. No agriculturist and no section of agriculturists can produce the additional food or other essential agricultural commodities they can without being assured of the requisite 'tools'. The nature of the 'tools' in this case does not call for elaborate description. They are timely and adequate credit through co-operatives or other sources; ample irrigation facilities ensuring adequate supply of water; good seeds which will bring in a correspondingly good crop; adequate supplies of manure to strengthen and renovate exhausted soils and provide the requisite nutrients to ensure larger crop yields; and continued assistance in combating crop pests and diseases.

The need for these pre-requisites for augmenting the yield of crops is well known but still if their significance has to be repeated time and again, the obvious inference is that the need for them has not been adequately realised in practice and measures to provide them to the farmer have not received the priority they deserve. Efforts are no doubt made to provide them: for example, 87 new strains of paddy have been discovered in the State's research centres and distributed to the farmers and production of improved seeds had reached a total of 2,057 tonnes in 1961-62. Acreage under plant protection schemes increased from 28.77 lakh acres in 1961-62 to 60.40 lakh acres in 1964-65. But, unfortunately, progress has not been sustained or effective in all directions, partly because of the delays in arriving at policy decisions but much more on account of the tendency of the bureaucracy to

function by fits and starts and to lag behind after making a heroic start. Thus the production of improved paddy seeds declined to 1,726 metric tons in 1963-64. Inordinate delays in the completion of major irrigation projects started in the State and difficulties in getting the fertiliser plants sanctioned for the State started are additional factors impeding rapid progress and the attainment of the target production of 98 lakh tons by 1966. It is extremely doubtful if the shortfall in production of nearly 20 lakh tons can be made up in the current year.

It is a tribute to the Andhra farming community that despite these handicaps agricultural production has progressively increased from 54.21 tons in 1956 to 63.19 tons in 1961 and to nearly 75 lakh tons in 1965. Union Food Minister Subramaniam's commendation of the Andhra agriculturists' industry, his willingness to resort to improved and scientific agricultural practices and make practical use of new strains of paddy as, for example, the Taichung Native I variety, at the Seminar held in Vijayawada was, therefore, appropriate.

Among the seminar's principal recommendations were measures for the elimination of long-standing defects in the distribution of scarce resources like chemical fertiliser by the introduction of a card system, large-scale production of green manure through Central subsidy, adequate supply of unadulterated pesticides and fuller utilisation by the ryots of the facilities for soil testing provided in the soil testing laboratories.

It was a different atmosphere that prevailed at the Hyderabad seminar. In a down-to-earth speech, P Thimma Reddi, President of the Pradesh Con-

gress Committees, who presided over the seminar, criticised the implementation of agricultural development schemes in the formulation of which the actual cultivator, the central figure in the process of increasing food production, has practically no say. This drawback even C Subramaniam accepted by implication when he said that schemes in this regard must be (and will be) more and more farmer-oriented hereafter. There is ample justification for Thimma Reddi's complaint, to support which a few instances can be mentioned. For example, it has been a longstanding complaint that apart from the supply of chemical fertilisers being wholly inadequate, there are deplorable lapses in the distribution of available supplies. There is a similar complaint about the supply of pesticides, another essential requirement of the cultivators. Pesticides, it is complained, are badly adulterated. Nothing is more important than to evolve a foolproof machinery for sale and distribution of these essential requirements of the cultivators. Official policy is similarly in a state of confusion with regard to the agency for executing minor irrigation schemes and for the provision of agricultural credit.

One of the resolutions adopted by the Hyderabad seminar called for the institution of a Rs 200 crores revolving fund by the Centre for financing the execution of food production programmes in Andhra Pradesh and in particular minor and medium irrigation and lift irrigation schemes, all of which get held up in execution. The resolution may be regarded as asking for too much for a single State, but when along with it goes the assurance that the provision of the facilities to the cultivators which the fund is designed to create would help the additional production of 10 lakh tons of rice, it acquires legitimacy.

Among other recommendations of the non-official seminar, one which deserves careful consideration relates to foodgrains price policy. After some careful calculation of the per acre cost of cultivation in the delta and non-delta areas, the proposal was made that in deciding the maximum procurement prices of paddy for the next season the production costs incurred by the farmer should constitute an important consideration. The prices should give an 'incentive' to the cultivator and not merely be remunerative. The maintenance of a balance between the sacrifices demanded of the producers and of the consumers is obviously

essentially essential in an economy which is subject to over-all shortages. But apart from that, since larger food production is the paramount need and the targets to be achieved are rather formidable the demand for an incentive element in procurement prices cannot be evaded, provided, however, that at such prices all available surpluses with the producers are made over by them to the procuring agency. This guarantee should be available from the producer agencies.

The calculations of production costs which include expenditure on diverse items beginning with the preparation of the soil for seedlings and ending with the harvesting and threshing of paddy, and water rates and land tax, revealed that per acre cultivation expenses in the delta areas of Andhra Pradesh with assured irrigation facilities come to Rs 572 and in non-delta areas depending on minor irrigation sources, lift irrigation and so on, to Rs 511. With that rate of inputs the average output is estimated at 10-12 quintals and 8-10 quintals of paddy in the delta and non-delta areas, respectively. On that basis, the seminar resolved that procurement prices for paddy should be fixed at Rs 52 and Rs 45 per quintal in the delta areas and at Rs 53 and Rs 49 per quintal in non-delta areas respectively for fine and coarse varieties of rice. With producers' prices for paddy fixed at that level retail price of rice for consumers would have to be correspondingly enhanced. It was suggested that the need for this can be avoided by the State Government subsidising sale prices of rice to the extent necessary to keep them at reasonable levels. The calculations made and the averages arrived at are obviously rough and ready, but in the absence of any more authoritative calculations in recent years of the cost of inputs and other items of investment, the official agencies cannot challenge the figures.

Between the attitudes and outlooks of those participating in the two seminars there are obvious differences. But they are not essentially irreconcilable and unadjustable, especially as the recommendation recorded by both of them are identical in purport though not in detail. It is now the State Government's responsibility, therefore, to examine the two sets of recommendations and to evolve co-ordinated schemes which will induce purposeful and active co-operative action to implement them. Implementation, however, is the basic and fundamental desideratum and to that the administrative ma-

chinery must now be geared.

Apart from implementation at the administrative level, the realisation of the basic objectives which the two seminars had in view is interlinked with two other factors: first, a clear acknowledgment by the Central Government of the cardinal role of Andhra Pradesh in augmenting food production in the short term and in the long run, and, second, the provision of financial assistance to the State Government for completing the big irrigation projects in hand and provision of credit to the agriculturists in substantial amounts if possible through co-operatives and if necessary by bringing in the assistance of commercial banks. The second is a corollary of the first and the *raison d'être* for it is the enthusiasm with which the State Government on the one hand and the farming community on the other are inclined to approach their tasks at this crucial moment.

It is essential that awareness of the vital significance of stepping up agricultural production in the circumstances created by the emergency should become a permanent facet of our economic thinking. Much will depend on the extent to which the average producer is indoctrinated with this kind of thinking and how far the administration becomes attuned to it. As V K R V Rao of the Planning Commission said at another seminar in Poona, agriculture should be treated as an industry and operated on the lines of an organised business and not treated merely as a "way of life" of the rural areas, which the agriculturist can pursue at his own leisurely pace.

If immediate action is taken on the principal recommendations of the two seminars by the Centre, and if simultaneously the construction of the Nagarjunasagar project is speeded up and if facilities are provided for the completion of the fertiliser projects at Kothagudam and Visakhapatnam, an atmosphere favourable to the achievement of higher food production targets will be created in Andhra Pradesh. A beginning can be made with the emergency food production plan under which about 8 lakh acres of land would be brought under food production schemes, a part of them for the first time and a part for growing an additional crop of rice or maize. The additional acreage brought under cultivation under the emergency scheme can become a part of the area available hereafter for food production.

BOOK REVIEW

Learning to Teach

Ashok V. Desai

The Dynamic University by Zakir Husain; Asia Publishing House, 1965; pp xii+119; Rs 10.00.

WHILE reading this book I never ceased to be amazed by the optimism of Dr Zakir Husain in the face of facts. There is no doubt that he has a very concrete idea of the state of our universities, and since he thought it fit to mention all its unsavoury features in convocation addresses, where euphemism would be considered least blameworthy, it is evident how serious a view he takes of them. And yet he says (p 20):

"The great national edifice will not spring forth from India's soil for wishing of a few persons, however great. It would represent the fruit of the sustained and united lifelong effort of those who are young today. Will the young generation strive to generate these moral qualities? Will it, given these qualities, know how to combine and to co-operate, completing and being completed one by the other? One has to be a great optimist to answer these questions in the affirmative. I am such an optimist. First, because I have never felt the necessity nor seen the utility of being a pessimist and, secondly, because something deep down in me seems to furnish me with the belief that Providence has destined India to be the laboratory in which the greatest experiment of cultural synthesis will be undertaken and successfully completed. India's mission in world history seems to me to be the evolution of a distinct type of humanity, combining and harmonizing in itself the virtues of the diverse types which history has produced, all blended together to form a new type that might evolve a characteristic and, perhaps, more satisfactory pattern of civilised existence than those in vogue at present."

One meets some people in India today who manage to remain optimists by carefully doctoring their view of reality; one also meets many pessimists who find facts dark enough to suit their despair. But this combination of realism and optimism is rare. The realism commands respect, the optimism invites envy and admiration.

However, the two together make the

book difficult to review. One can either appraise Zakir Husain's idea of education: in fact, the ideal of the educated man that he puts before us is the most valuable feature of the book, an ideal which will give it a permanent place in educational literature.

Alternatively, one can deal with the shortcomings of our universities that he describes, their origins and ways of tinkering with them. But how are we to bridge the gap between the ideal and the actual? Zakir Husain neither does nor, could in the context, be expected to deal with the question; or rather, being an individualist, he tells his student audiences to think about the problems, to improve themselves and in the process to improve the universities. But the possibility of self-improvement depends, not only on a person's will to improve, but also on the intellectual equipment that he receives from educative institutions right from his family to the university. Nor is the responsibility entirely the educators'; their equipment and the environment in which they work matter. So there is no getting away from questions of organisation; and when one faces actual academic organisations, it is difficult to avoid a sense of defeat at their monolithic immovability, at the dead hand of tradition and fear of change.

The Idea of Education

Zakir Husain's idea of education is very clear (pp 28-29):

"Education is the process of the individual mind getting to its full possible development. This development is possible only by contact with goods of culture which are the products of mental effort of similar mental structures. The mind of the student at the stage of development when he comes to the university has, besides the initial vital physical and psychical functions of the human mind, also developed intellectual and spiritual functions whose satisfaction makes him experience what may be termed the absolute, timeless, objective values of, say, the True, the Beautiful, the Good, and the Holy. When experienced, they bring with them a characteristic

satisfying sense of validity and permanence and absolute worth. One gets committed to them, one strives to realise them. They become a determining factor in a person's scheme of life, its structure of values, its choices and preferences. Education, in the true sense of the word, is helping the individual mind to experience these absolute moral and spiritual values, so that they in turn urge him on to be committed to realise them, as best he may, in his life and in his work. Whatever else the university may or may not do, education, in this sense, should be its first concern."

The language might be somewhat foreign to a younger, anti-idealistic and anti-metaphysical mind, but I think the import is clear. The emphasis of the education must be on the individual; it should broaden the range of his aesthetic experience and enable him to find such experience in learning and in working; and it should make of him a better-behaved, more useful member of the society.

This concept of education indicates the tasks of universities. The chief of them is to mediate between the individual and the culture, to exhibit the attainments of the arts and the sciences to students so that they may pick whatever suits their inclinations. Further, these arts and sciences are themselves the result of human thought and work; so the universities must also show how they are created, how they can be created. In other words, they must teach the students to advance the state of the arts. And as communities they must also educate students in the task of living together.

Our Universities

There are many other ideals scattered in Zakir Husain's lectures (for instance, "science without presuppositions"; "passion for excellence"); we should not, however, go further in our summary. The ideas above are enough food for thought; and any summary would do injustice to the beauty of Zakir Husain's presentation.

From the standpoint of these ideals, the picture of our universities is sin-

gularly depressing. Zakir Husain mentions a number of features. The expansion of school education and a decline in its quality has led to a rapid increase in the demand for places in universities, which have acquiesced to it and debased their standards to meet it. University education limits itself to the conveyance of information and

dogma, and inhibits creative thinking. The students are incapable of independent judgment and an easy prey to mass hysteria.

Some suggestions for improvement are latent in the addresses. Thus, interdisciplinary education might be made easier: university lectures might be made open to students of all facul-

ties. This would require smaller, more compact universities which could hold all lectures roughly in the same place and at the same time. This is the system of German universities. But if it were to be effective, students would have to be chosen who are interested in and capable of learning a number of subjects at the same time. At the

THE ECONOMIC WEEKLY

present time one gets scholars in our universities who know little of the literature of their own subjects, let alone other literature. Unless the selection of students becomes more rigorous and its principles change, interdisciplinary teaching will be ineffective and wasteful.

If the objective of teaching is individual development, Indian universities are ill-organised to serve it, for no effort is made to adjust the quantity and quality of teaching to individual receptivity. Given the large classes, the lecturer cannot easily judge the pace required and adjust it; and owing to the great differences in rapidity of comprehension, lectures are wasted on most students who find them either too fast or too slow. This vast majority has no interest in lectures unless they give fairly accurately what is to be written in examinations. Thus lectures become an integral part of the miseducation of the Indian student and the more precocious find no substitute or supplement.

German seminars and British tutorials have entered some Indian universities, but their point has been forgotten. Seminars are the best medium for a fairly bright student to put his skills to the test of criticism of his peers while a teacher supervises the proceedings. In India, however, the attendance of seminars is indiscriminately free and criticism cannot develop in the presence of the dogma that is imparted in lectures. And utter travesty is made of tutorials, which are a labour-intensive and potentially most fruitful way of teaching. They are also given indiscriminately to all students; as a result, they are spread too thinly, and they are given to groups whose average degree of interest and participation is very low. They are given by the juniormost, least skilled staff whose level of knowledge and thinking is little higher than of their students. No wonder both find it a tiresome chore.

Question of Organisation

But the major difficulties are organisational—they reside in the interrelations between individuals and between institutions.

Take the question of creative thinking and research. Every year we get back hundred of students who have done fruitful research abroad; they are absorbed in our academic organisations, and yet their research output thereafter is negligible. Does our climate affect them? Or our food? Or

are they frauds? No; it is the organisation of research that is at fault. In all our universities, teaching takes primacy. The status hierarchy runs through teaching; pure research jobs, if any, are subordinate or outside the pale. Professional teachers guide research without any comprehension of how research is done. A good guide of research would throw up questions, criticise ideas, suggest new hypotheses and sources. He would ensure that there is no break in the flow of resources into research, that workers can devote long, continuous chunks of time to research. Professional teachers are incapable of doing these things; their view is that the output of research should be maximised and the input into it minimised. Their efforts achieve just the opposite.

On the other hand, the input-output approach is not applied in the vast fields where it would be useful. Thousands of man-hours are wasted every year on keeping doubtful roll records and calculating whether students have attended a minimum number of lectures; many more thousands are wasted in lectures which students who have been forced to attend render impossible. Labouring hands sift letters to see if they contain unofficial matter, write out details of destination and postage on letters in bound volumes, keep records of library books issued and salaries and wages paid in long hand; the use of index cards, the printing of repetitive features is quite unknown. Bills of expenses pass through the hands of innumerable clerks, each more lethargic than the other; invitations are sent out after the event. Requests for leave are made in triplicate; eight copies of applications must be enclosed. One university saves money by recovering from every employee 10 paise for the revenue stamp on which he signs receipt of his salary, another by using semi-brown rough paper for stationary, a third by declaring articles sent out for publication personal letters, a fourth by keeping a record of pencils issued and recovering a stub for every new pencil. The money so saved is squandered on the labour of clerks, peons and heads of departments.

This inefficiency could be excused if the job of teaching students were done competently. But "democratic" pressures dictate expansion of college admissions, and university limitations on fees ensure that colleges that wish to make profits should employ the minimum number of teachers per student. So college lecturers carry im-

possible lecture loads, and they have no alternative but to teach by rote. Democratic pressures also demand a high proportion of passes; so examination standards are debased

Pockets of Excellence

Democracy is here to stay, and so are low standards. The best we can hope to do is to create pockets of excellence. Hence it is necessary to decentralise control—to reduce the power of universities and to set up more research institutes with some autonomy. Such institutes may teach and guide research as an auxiliary activity. But they must not shelter teachers who are nothing but teachers; and they must be small enough to dispense with red tape and hierarchy.

Research workers would be useless without research facilities. Libraries, laboratories and equipment should be an integral part of institutes; but there is, besides, a powerful need for good libraries in our cities. Every city of 100,000 people should have a good library. Library science is highly developed, and if our libraries are badly run, it is entirely due to their poverty and the ignorance of book selection committees. The most painful instance is that of the Asiatic Society Library in Bombay: while it has been made a copyright library it has not been given the resources even to catalogue the books it receives. Libraries should have unlimited resources, and they should have outfits for automatic ordering of books.

Even if competent research organisations are created, their impact on the rest of the educational structure will be very limited in the present circumstances. Besides, if undergraduate teaching remains substandard, research organisations will find recruitment difficult, and will be dependent on imports in the way many existing ones are.

The first step in the reform of the educational structure would be to equalise the salaries and working conditions throughout from schools to post-graduate organisations, and to make them comparable to those in non-educational occupations. Education ought to attract the best talent in the country, and the competence required in teaching children is, if anything, greater than what is required further down the ladder.

The (logically, not chronologically) next step would be to dispense with professional school-teachers. Most school subjects—modern languages, mathematics and science—are of use

in professional practice, and people in employment of various sorts can teach them quite competently, and perhaps more imaginatively than school-teachers. If they are paid for school lectures at rates comparable to their own salaries they are hardly likely to grudge part-time teaching. Besides, high teaching standards can be ensured because their number is large and there is scope for selection. The less practical subjects

like Sanskrit, if they must be taught, can be left to housewives who would thereby acquire some non-domestic interests and financial independence.

Will these reforms bring us nearer to Zakir Husain's ideal university? I think so. For Zakir Husain's aim is to create a student who delights in learning, who is unhappy in stagnation; and it is schools that can serve this aim. If a student's curiosity is killed

by the age of seventeen or eighteen, he is unlikely to develop precocity later; if, on the other hand, he has experienced the adventure of learning by then, no amount of university mis-education will curb him. In fact, he will force the university to mend its ways, for there is nothing more frightening to a bad teacher and more delightful to a good one than a student who excels him.

A Foreign Policy to Meet the Sino-Pak Threat

Contributed

Both the USA and the Soviet Union are likely, under propitious circumstances, to help India become militarily and economically strong without asking for the price of a military alliance. What they would expect is a much greater measure of collaboration than hitherto in those spheres of world affairs where between them there are no acute conflicts. This India should be able to give.

A policy of carefully cultivating US and Soviet friendship in certain exclusive spheres will not only benefit this country but may also be a contribution to world peace.

THE Indo-Pakistani war has been described by some pressmen abroad to have ground itself to a stalemate. This one fears is a superficial view. The battle has been decisive. It has decided that Pakistan cannot annex Kashmir by force. It has further decided that India has the potentiality in a longer war of destroying Pakistan, that is if the two countries are left alone to slog it out. But they have not been and will not be left alone, and therefore the significant consequences of this battle are a number of political issues which, however, remain undecided. The armed truce has in fact introduced a situation in which Indian leadership is likely to be more severely tried than it was in war which was comparatively a simple business; the possibility of losing the peace in the near future is a real one. Political adroitness is required; so is statesmanship, certainly in a greater degree.

We have first to realise clearly what our national objectives are, or ought to be. First, of course, is not to give up Kashmir, not so much because we call it a part of India as for other reasons which will be more acceptable to the majority of the nations. This writer believes that if India lost Kashmir it may not immediately lead to the dissolution of the Union though there is no doubt that another amputation of India after 18 years may have serious repercussions on communal stability and may strengthen the centrifugal forces inside the country. This may indeed eventually break up the Union. Kashmir has united what was thought to be a loosely knit federation yet unable to accept one national language; loss of Kashmir may well encourage fissiparous trends. But the positive aspect of having Kashmir in India is more significant from the world point of view as well as ours. By keeping Kashmir India can save her multi-community state. And its example may eventually set in motion healthy federating forces in many parts of the world, where the ancient regime is crumbling into many

not-so-visible states, baffling cartographers and the accommodation department at the United Nations.

Our second national objective obviously is to oppose and stop Chinese expansion in South Asia. China is historically expansionist; the trend is reinforced by communism which Mao considers exportable. India happens to be the only country in South Asia with potential capacity to stop her, and create with the help of smaller nations an effective bulwark against China. Between the two objectives keeping Kashmir as a part of India must have priority. That is essential for integrating the country and a disintegrated India cannot stop the Chinese drive southwards.

II

Unfortunately for India, the two problems at the moment have to be faced simultaneously. In other words we have to contend with the classic disadvantage of having enemies on two fronts. It is not avoidable. It is arguable that granted an opportunity of ceaseless toil for five years, India can be on its own militarily and economically strong for a two front defence. But contemporary history has not granted the opportunity. It does not seem possible to buy off China for that length of time by conceding her demands. If it were, the wastes of Aksai Chin, which in any case is now in Chinese occupation, are not to be equated with Kashmir Valley. But since a clash of interests with India in South Asia is inevitable, why should China let up pressure on account of India giving away what she has already got? Therefore, India is obviously forced to look for support from other quarters, for in the last analysis without support it will be extremely hard for us to retain Kashmir as well as restrain China at the present moment.

The obvious quarters are Soviet Russia and USA. Unfortunately, however, it is not a simple matter of helping India against Pakistan or against

China, but a more complex problem of helping her against both. How far at any rate is USSR prepared to back India against Pakistan? Pakistan is under the Ceto alliance a potential enemy of Russia. And Russia herself is a multi-nation state, having on her south-eastern fringe a people ethnically close to Iran and Afghanistan, some of whom are still Islamic in faith. Therefore, she is unlikely to support the principle of self-determination on religious or ethnic grounds. It is true that the recent cooling off of Pak-American friendship might tempt Russia to try to wean away Pakistan from her formal American alliance. Yet the political brinkmanship Pakistan has recently demonstrated cannot enhance her value as a potential ally. It is at the same time true that Soviet Russia would not like to see India crack up under Chinese pressure and see Chinese hegemony established in South Asia, which will gravely upset the present balance of power within the Marxist world. Yet it is unlikely that she will accept any formal military understanding with India against Pakistan, for a pact against Pakistan may eventually be a pact against China — Pakistan is likely to ask China for formal military support against India (if she has not already done so) and China is likely to give this to her. After all Soviet Russia may be travelling towards affluence but she is still communist. Khrushchev's fall showed that Russians do not think that the ideological quarrel has gone beyond the point of no return — and in the last analysis, China's enemy India is avowedly non-communist. Nor will India be safe in accepting such an understanding, for a bridging of the Soviet Union's rift with China and a lessening of tension between her and the USA both historically possible, will reduce in Soviet calculations the value of an alliance with India.

Should then India turn to USA for a military alliance? And would she get one? When we in this country criticise USA for supporting Pakistan we forget that the latter is still a for-

JWT-AL/27

Air-India offers you the choice of 10 Boeing flights a week through Cairo, Beirut, Moscow, the Continent of Europe, to London. Seven of these services terminate at New York. In addition, Air-India operates three weekly services to Bangkok, Hong Kong and Tokyo, two weekly services to Aden and Nairobi, and two to Singapore. And a weekly service to Perth, Sydney and Fiji.

mal ally of USA with clear cut mutual commitments. For dropping an ally, what price can India offer the US? It is true in an all out nuclear war, the Pakistani bases are of little value to USA. Yet in a conventional war, Pakistan can be useful to the Cento alliance. Further, while Bhutto's brinkmanship has weakened American confidence in Pakistan, yet USA is unlikely to consider that Pakistan is lost forever to the opposite camp. To the American mind chastisement may not appear to be the only method of mending Pakistan's teen-age political behaviour. On the other hand USA would be more interested in India being an affective sea wall against the Chinese tidal wave. In the matter of Kashmir also USA may now sympathise more readily with India's minority problem, she herself having on her hand an increasingly complex one. Yet it is not easy for India to openly accept an American military alliance even if one is offered. It is true by offering bases in Assam we may demonstrate that our military objectives are not against Asiatic Russia. On the other hand by openly siding with USA, we may jeopardise the collaboration with USSR in military and economic matters. It would, therefore, seem that the position of USA in regard to the Indo-Sino-Pak conflict is similar to that of USSR; the difference is that while USA would less readily support India against Pakistan, Russia may not be too enthusiastic in having with us a formal military pact against China.

III

A safe conclusion is that both USA and USSR are likely, under propitious circumstances, to help India become both militarily and economically strong, without asking for the price of a military alliance. Nor does it pay India to accept such an alliance — perhaps by such tie-ups we shall render ourselves less useful to these great powers in the large uncommitted tracts of the globe. On the other hand they would expect something in return — perhaps a much greater measure of collaboration in those spheres of world affairs where between the two giants there is no head-on clash. Even where there is, India can be as she has been in the past a kind of less direct yet effective "hot line". Much will be achieved in this direction if India publicly acknowledges the useful work done by USA in South Asia against the Chinese influence. USSR

will not necessarily take that amiss if elsewhere, say in Afro-Asian gatherings, India's solid backing is available. Nor would India's potentiality of assisting both powers from gracefully withdrawing from the strife in Vietnam be underestimated by Russia. In fact India can go a little further with USA. Military talks for defence of North-East India will be no direct threat to USSR, but may appear to Pentagon a substantial compensation for the loss of Pakistan as a military ally.

So rather than political brinkmanship or opportunism what we require is careful cultivation of Russian and American friendship in certain exclusive spheres, a policy which will not merely benefit this country but may be of some use to the whole world. Such realistic diplomacy will help achieve national objectives only if the

economic and military assistance so gathered is utilised to the full in equipping the country for a conventional two front war and at the same time in making it self-sufficient in food. The perfectly legitimate impression abroad that a poverty-stricken country like India should not indulge in the luxury of a shooting war mars the image of India even when she takes up arms under compulsion. For building up on the home front the careful chess moves in South Asian power politics are far less important than unity, purposefulness determination and indignation. Emotion must play a large part in the integration of the country and in the national effort. But the most exacting problem for the Indian leadership will be to ensure that emotional forces, otherwise essential, do not dominate the cold-blooded rationality required at least for the

next few years in shaping our foreign policy. Our foreign policy must be the means to the end of acquiring economic and military strength which in its turn will give a new significance to our foreign relations. Our Foreign Service is probably far from an able organisation, but let us not forget that they do have the back-breaking task of having to sell a country which is very nearly broke and was about three years ago soundly beaten by China. After all, what help

can the small South Asian nations, quivering under the evergrowing Chinese threat, expect from a country lacking the sinews of industry and war? Strength at home will inevitably change the attitude of the smaller powers around us, with whom our friendship is only natural. And after the first national objective, the one in regard to Kashmir is achieved, our mature leadership should hold out friendship to Pakistan — if by then its politicians have not already com-

mitted national suicide by selling out to China. For having a Pakistan capable of defending herself but without the capacity of committing mischief, fits in with our second national objective — that of stopping China. Pakistan also will do well to seek our friendship, for every passing year will weaken the Central Government's hold over East Pakistan, and Rawalpindi's securities offered to the West against the loan of weapons and gold may soon be without worth.

Cost Price Relationship in Indian Manufacturing Industry

S Hajra

In examining the cost-price relationship in industry this paper challenges the view that rise in prices of industrial products has anything to do with rise in wage costs.

The evidence for the industries studied here suggests no relationship between unit wage and material costs and prices. Nor does it suggest that growth of labour productivity has lagged behind rise in wages. On the contrary, in most of the industries productivity has risen faster than wages.

THIS paper has been divided into three sections. The first section reviews Sidney Weintraub's theory of inflation in India contained in his book, "Growth without Inflation" (National Council of Applied Economic Research, February 1965). The second examines the variations in unit material cost, unit wage cost and wage and labour productivity in relation to variations in prices for selected industries. The third section is a statistical study of the cost-profit relationship in manufacturing industries.

I

In "Growth without Inflation" Sidney Weintraub has offered an analysis of inflation in India. He has used a simple model to explain his theory which he has tested with Indian data. For the convenience of readers the model is reproduced here. Weintraub's is a single equation model, formulated on the assumption that "sales proceeds are some multiple of wage payments" (p 55). In equation form:

$$PQ = kW_N \dots (1)$$

where P = average price per unit of goods sold;

Q = physical volume of real output;

N = number of employees;

and w = average wage per employee. Following equation (1)

$$P = k \frac{wN}{Q} = k \frac{w}{A} \dots (2)$$

where A = real productivity of labour, (N)

In another form

$$P = K.U \dots (3)$$

where $U = \left(\frac{wN}{Q}\right)$, i.e., labour cost expressed in current money wage per unit of real output.

From the model Weintraub concludes: "So long as k is constant or

nearly so and A, average productivity of labour, changes slowly or not at all then it must follow that every change in w, the average money wage per employee, must lead to a direct and proportional change in the level of prices" (p 56). Weintraub defines k in his equations as the mark-up factor, which is the "reciprocal of wage-share" (p 56), and calls his theory as the wage-cost mark-up theory (WCM). His results from Indian data are summarised in Table 1. The empirical evidence has led Weintraub to argue:

"The definite rise in w, the slow steady rise in A, the mild trend in k, and the somewhat undue rise in unit labour costs represented by w/A are very apparent. The rise in labour cost of some 13 per cent over the full period and some 23 per cent since 1955 can be alleged with little fear of contradiction as responsible for inflation" (p 62).

His conclusion is that: "the inflationary problem in India has

involved a wage and salary inflation ... income payments have been growing at an undue, if not alarming, pace relative to the movement in labour productivity ... this has been the growing stream of individual income payment rampaging over the dam of productivity" (p 67).

What is required, then, is that: "India will have to face up to this question of holding individual income payments in check and instituting a wage-income policy, if it is serious about its endeavours at economic stability and inflation control" (p 67).

P S Lokanathan, Director General of NACAER, in his introduction to the book mentions a few limitations of Weintraub's policy recommendation for India. He points out that in the agricultural sector whatever be the labour productivity a living wage must be paid and, second, that as a result of market imperfections profits and rents may not be stabilised simultaneously with an income policy. He also

EVERY $2\frac{1}{2}$ HOURS
A KAMANI TOWER
GOES UP SOMEWHERE!

An impressive pace to maintain. Consider what erecting a tower entails: the excavation and extensive concreting for the foundation, the transportation of water, sand, and nearly 500 tower components! Often, the terrain over which these essentials must be carried is gruellingly difficult: deserts, jungles, swamps, mountains, rivers. Lorries are used if possible, but there are places where only a donkey can thread its way, and sometimes even elephants are pressed into service. The last resort is man himself; often head-loading is the only way. And the arduous journey has to be made again and again. Yet, every $2\frac{1}{2}$ hours, Kamanis erect a tower.

ON YOUR
MARK...

It is time to get off to that long-awaited holiday. It could be as happy and memorable as you choose to make it. Of course, in your Mark II. Not for you then the fixed itineraries and rigid time tables. Nor the bother of railway reservations. You'll be really independent. Your holiday kit stored in its spacious luggage boot. Free to go wherever you please. Visiting out-of-the-way places known for their exotic charm. Going in your own time. Stopping where you choose to. This is the pleasure of travelling. This is really going places. With all your family. In your roomy family favourite—Mark II, known for its long-distance cruising speed and power for acceleration.

mentions that government deficit and increases in money supply are also responsible for aggravating the situation so that it is difficult to label any one factor as the culprit (p vii).

To the present writer it seems that Weintraub's conclusions are not adequately supported by his evidence. Unit wage cost has increased in manufacturing by 1.5 per cent and has declined by 8 per cent in Government enterprises, whereas money income in these two sectors have increased by 131.5 and 50.25 per cent, respectively. In the manufacturing sector productivity has increased by 128.5 per cent. The wage-productivity disparity is nowhere as large as Weintraub's expression "growing stream of income payment ... rampaging over the dam of productivity" suggests. What is this "growing stream of income payment"? Does it refer to (i) rise in wage rates of the existing employed or (ii) additional employment?

Obviously (i) and (ii) cannot have the same effect on P (prices). If the increase in income payments is due to (ii) and the larger part of the additional employment created falls in the (non-productive) tertiary sector (that is, increase in employment and income payments are not accompanied by an increase in Q) then it will definitely be inflationary. But the cure for this type of situation is not res-

traint of all money wage.

Weintraub suggests "an alternative formulation of the WCM truism that is more apt for the studies of economic growth that give weight and a stress to the capital-output ratio and to the amount of capital per employee" (p 66). This formulation he presents as

$$P = \frac{kw}{A} = \frac{NQ}{KQ} = kw \frac{K}{K/N}$$

where K=capital; K/Q=capital output ratio and K/N = capital labour ratio. Weintraub argues that "Data could be fitted to this equation, but in view of the truistic nature this is superfluous at this stage ... neglecting the changes in wage share as relatively unimportant and as the capital-output ratios do not vary greatly in short periods, the money wage will rule the price level roost" (p 67).

However, in India during the Five-Year Plans the capital-output ratio has shown changes and the assumption of secular constancy of the ratio is also contrary to the evidence of other countries. As regards the short-period movement, of the capital-output ratio, we may quote here Kaldor: "It is of the essence of the acceleration principle that it regards the ratio output capital determined by technical factors, which cannot undergo any significant alternation even in the short period; while it is the

essential feature of the cyclical movements that this relation is subject to continuous changes in the course of it".¹ Hicks suggests a series of partial coefficients instead of a single one, each applicable to a different period.

Weintraub's model of inflation is a single equation one, which includes (a) a real part with Q and N and (b) a monetary part with P and w. His equation, further, is an identity which deals with *ex post* quantities. Single equation regression models which consider data as stochastic to the extent that an error term and its random distribution are assumed have been neglected by Weintraub. And the specification of the money wage rate has helped him to draw all his conclusions. A conclusion that the rise in price has led to the rise in money wage is equally possible from his equation if the price is identified rather than the money wage. One further limitation of Weintraub's analysis is that he has used his productivity index in constant prices and wage index in current prices. What does such a comparison mean? The appropriate comparison should take either both in current prices where marginal revenue productivity is compared with wage, or both in constant prices where 'real' productivity is compared with 'real' wage.

II

We now proceed to examine how far price movements in manufacturing industries can be explained by movements not only in money wage and unit wage cost but also by variations in unit material costs since raw material prices have increased during the period and raw material cost forms a large proportion of total operating cost. Twenty three manufacturing industries are covered here. This section examines the movement of unit material cost, unit labour cost, wage and labour productivity for individual industries. The data are given in Table 2.

Total cost of production has been classified as: (1) wage cost; (2) material and other input costs; and (3) capital cost. Prices has been defined as equal to the cost of production plus entrepreneurial profit. With this definition of price there are two sources of price variation: variation in cost and variation in entrepreneurs' profit expectation. In this paper we will consider the first, taking only wage cost and material cost, since data on capital cost are not available.

The data used are from the Census of Manufacturing Industries and the period, 1947-58. The relevant data, as compiled from the Census, are given in Table 2 to 4. The concepts used are similar to those used by the Census and are briefly discussed below:

(a) Value-added is the measure of output used here; it is equal to ex-factory sales value of output less cost of material, fuel, electricity, etc, consumed and depreciation.

(b) Unit wage-cost is wage-cost per unit of value added where wage cost includes wages, salaries and other benefits paid to workers.

(c) Unit material cost is total input cost per unit of value added, where input cost includes cost of raw material, fuel, electricity, lubricants, etc, consumed and payments to other concerns for work done by them.

Table 3 gives wage cost as a proportion of material cost as defined above. Table 4 gives percentage increase in money wage, percentage decline in unit-labour requirement (1952-58), percentage increase in labour productivity (1952-58), percentage decline in unit labour cost (1952-58) and percentage increase in money wage (1952-58). Table 5.1 gives the price-index (base 1947) and Table 5.2 the price index (base 1952). A small comment is called for here about the price indices. Both the price indices are published

by the Ministry of Commerce. One cannot be sure that the industry classification in the Census and that in the price indices are the same, but in the absence of any other price indices these have been used. The first index covers 14 industries and the second one 18 industries. Cost-price relationship study has been, therefore, limited to these industries for which data are available.

It can be seen from Table 4 that during 1947-58 wages have gone up in all industries. Percentage increases in wage between 1947-52, 1952-55 and 1955-58 are given in the Table. With rising wage, unit labour cost (see Table 2) also increased during 1947-52 in 18 out of the 23 industries, but since 1952 the trend of unit labour cost has been almost reversed. Although wages continued to rise, unit labour cost declined during 1952-55 in 19 out of 23 industries and in one it remained constant. The trend was similar in 1955-58. In 1952-58 unit

labour cost declined in 20 industries; in 1947-58 it declined in 17 industries. The evidence for most of the industries for the period as a whole points to a consistent rise in money wage and decline in unit labour cost.

Table 2 shows that unit material cost increased in 16 industries during 1947-52, but since 1952 the trend has been almost reversed. During 1952-55 unit material cost declined in 14 industries and during 1952-58 unit material cost declined in 17 industries.

Comparing unit material cost and unit labour cost, it can be seen that during 1952-58 the trend of the two is very similar. During this period both unit labour cost and unit material cost have declined for 17 industries. Table 3 gives the relative movement of wage cost and material cost, where wage cost has been expressed as proportion of material cost. It can be seen that during 1947-58 wage cost as proportion of material cost declined in 21 industries, jute

(19)	All manufacturing	100	99.4	108.2	127.2

and matches being the exceptions. During 1952-58 the proportion declined for 17 industries with biscuit-making, soap, cement, plywood and tea-chests, cotton textile and jute textile as the exceptions. For most industries, therefore, the evidence is that wage cost has declined faster than material cost so as to depress the ratio.

From Table 3 it can also be seen that wage cost forms a quarter of material cost or in other words wage cost is less than a quarter of the total cost in the manufacturing sector as a whole. Inter-industry variations in the proportion of wage cost to material cost are wide: it is much below 10 per cent in industries like wheat flour, rice-milling, vegetable oil and soap, and as high as 90 to 100 per cent in ceramics. The coefficients of variation of the proportion of wage costs to material costs are 73.29 per cent, 82.63 per cent, 84.78 per cent and 76.48 per cent, in 1947, 1952, 1955 and 1958 respectively.

Rising wages accompanied by declining unit wage cost is not very difficult to explain. Unit labour cost is the product of unit labour requirement and wage rates. If, therefore, unit labour requirement declines rapidly because capital is being substituted for labour due to a change in the relative prices of capital and labour then the product of unit labour requirement and the higher wage rate in alternative situations may decline even in the absence of technical progress. In the language of economic theory, when wages rise capital is substituted for labour and when the elasticity of substitution is greater than unity labour cost declines.²

The decline in unit material cost (in the face of constant or rising raw material prices) cannot be explained unless a further assumption is made. The assumption is one of technical progress, i.e. rising technical efficiency which makes possible efficient use of raw materials and hence decline in unit material cost. The declining trend of unit labour cost and unit material cost in Indian manufacturing industries may be, therefore, attributed to:

(a) elasticity of substitution of capital for labour being greater than unity; and

(b) technical progress, i.e. rising technical efficiency.

Unit Material Cost and Price: The 1952-53 based price-index (Table 5.2) shows movement very similar to that of

unit material cost. It shows decline over 1952-55 for 14 out of 18 industries. The exceptions are cotton textile, woollen textile, aluminium, copper and brass and general and electrical engineering for which the unit material cost increased during 1952-55. Comparing the movement of unit material cost and price during 1952-58 it can be seen that the movement of material cost and prices are not similar for rice-milling, soap, matches, cement, paper, sugar, cotton textile, woollen textile, chemicals, bicycles, aluminium and general and electrical engineering (tools and implements in Table 5.2). If the 1947-based price index (Table 5.1) is compared with movement in unit material cost it can be seen that prices increased for all the industries during 1952-58, except glass and jute, whereas unit material cost declined for all industries. The evidence, therefore, does not support similar movement of unit material cost and prices.

Unit Wage Cost and Prices: With the 1952-53 based price index (Table 5.2) it can be seen that prices are higher in 1958 for 13 out of 18 industries. However, of these 13 industries unit labour cost increased during 1952-58 in soap and cement only. With the 1947-based price index (Table 5.1) it can be seen that prices in 1958 are higher for 13 out of 15 industries. In most of these 13 industries unit labour cost declined during 1947-58. The evidence, therefore, is that move-

ment of unit wage cost and prices are also not similar.

Labour Productivity, Wage and Unit Labour Requirement: Table 4 gives the variations in labour productivity and wage (both in current prices) and unit labour requirement during 1952-58. From the table it can be seen that unit labour requirement has declined in almost all industries. The extent of variation is not uniform. Labour productivity has increased in all industries except soap and cement and in most cases the increase in productivity is higher than that in wages. The exceptions are soap, cement and plywood. It is, therefore, also not true that wage-productivity disparity is a general phenomenon.

III

The movement of costs (wage and material cost) in the different industries has been examined above. Movements of costs and prices have also been compared. The comparison do not suggest any unique relationship between cost and price for every industry. In this section the findings are summarised by a simple statistical technique.

The data used in this section are: (a) index of wage and material costs combined with 1952 as base; (b) wholesale price indices with 1952-53 as base; and (c) index of rate of return with 1952 as base — we call this

Table 6: Indices of Prices, Costs and Rate Return

	Price Index 1958 (1952-53=100)	Cost Index 1958 (1952=100)	Rate of Return Index 1958 (1952=100)
(1) Wheat flour	96.3	71.80	267.95
(2) Ricemilling	107.5	91.71	164.87
(3) Sugar	119.8	105.90	96.91

(6) Cement	129.2	116.67	39.13
(7) Glass	102.8	91.47	212.13
(8) Plywood	94.5	91.31	88.44
(9) Paper	114.9	91.54	107.91
(10) Matches	131.6	97.33	153.25
(11) Cotton textiles	113.0	86.69	102.51
(12) Woollen textile	104.9	84.06	230.74
(13) Jute textile	87.7	80.71	71.43
(14) Chemicals	103.8	83.03	199.13
(15)*Aluminium, copper and brass	109.3	74.41	271.52
(16) Bicycle	102.7	94.33	195.63
(17) General engineering and electrical engineering *	135.0	104.21	174.37
(18) Tanning	87.7	96.62	131.95

* This is the same as tools and implements in Table 5.2.

the profit index (this profit, however, is profit before taxes, i.e., gross profit). Table 6 gives (a), (b) and (c).

Inter-industry variations in cost-price-profit relationships are examined with the following alternative hypotheses:

- (a) price varies directly with cost;
- (b) variation in prices are cost elastic;
- (c) variation in prices are profit elastic; and,
- (d) variation in prices are both cost and profit elastic.

Hypothesis (a) is tested by examining the significance of the regression of the price index on cost index with the following regression:

$$P = a + bc + t \dots (i)$$

Hypothesis (b) is tested by examining the significance of the regression of price index on cost index with the following regression:

$$\log P = \log A + B \log C + t \dots (ii)$$

Hypothesis (c) is tested by examining the significance of the regression of index of price on index of profit with the following regression:

$$\log P = \log a + d \log S + E \dots (iii)$$

Hypothesis (d) is tested by examining the significance of the regression of cost index and price index on profit index with the following regression:

$$\log P = \log m + n \log C + r \log S + E \dots (iv)$$

P here is price index, C is cost index and S is profit index. Functional relationships assumed in regressions are:

$$P = Ac^B; P = AS^\alpha;$$

and $P = mc^n s^r$ respectively;

Results of the regressions:

$$(i) P = 49.2 + 0.6315C \quad (R^2 = 0.32) \quad (0.6928)$$

$$(ii) \log P = 1.9107 + 0.0612C \quad (R^2 = 0.36) \quad (0.0831)$$

$$(iii) \log P = 2.0013 + 0.0139 \log S \quad (R^2 = 0.0025) \quad (0.0025)$$

$$(iv) \log P = 1.5854 + 0.1952 \log C + 0.0289 \log S \quad (R^2 = 0.3374) \quad (0.0600)$$

Both the regressions (i) and (ii) of price on cost are not significant since the standard errors of the coefficients are as high as the regression coefficients. First regression suggests that only 32 per cent of variation in price can be explained by variation in cost; the second regression suggests that only 36 per cent can be explained by cost; the third regression of profit on price suggests that variation in price is not at all significantly related with variation in profit; and the fourth regres-

sion suggests that 34 per cent of the variation in price can be explained by cost and profit together.

None of the four functional relationships of cost and profit with price is statistically significant. The cost-profit-price relationship, therefore, remains largely unidentified for the cross-section of 18 industries discussed here. The cost-push theory of inflation and the profit theory of inflation do not seem to hold good for these industries. Since price is not significantly related with cost and profit, some factor which is not included in

the present model and which does not influence either cost or profit but influences price seems relevant. One such possible factor is 'taxes'. Taxes imposed on industries which are shifted on to prices may be the factor influencing movement in prices. Further research is necessary to examine this possibility and assess its significance.

Defence and Planning

Arthagnani

THE second aggression on India's borders has come at a time when India is in the midst of the process of formulating her Fourth Plan. It has led to considerable discussion on giving a "defence-orientation" to the Plan, and the National Defence Council, at its last meeting, has given a free-hand to the Prime Minister to make such changes as might be required to strengthen the country's defence preparedness.

It would be facile to deduce from this that all that is required is to set up a few factories to make armaments and defence equipment (including fighters and bombers), and accordingly to provide for a larger allocation for this purpose. Calculations are even being bandied about showing the re-arrangement in plan allocations that can be made to achieve this aim.

However, as I have stated above, this is a facile view. First of all, even though the first three plans were not overtly defence-oriented, they had made for defence-preparedness (in the field of providing equipment), as the recent fighting showed. Secondly, as the events after the Chinese aggression showed, an attempt to increase defence-preparedness, if not backed up by well thought-out economic policies, might even cripple normal economic growth. Thirdly, as the defence budget increases, it is difficult to keep up the fiction that defence and development are complementary or that we can have one without paying the cost in the other.

While the first three plans were not essentially defence-oriented, they did involve a bias in favour of heavy industries, particularly in the engineering field. The amount of investment in industry, in the second and third plans alone, amounted to Rs 4,000 crores out of a total investment outlay of Rs 17,000 crores under these plans. This has helped, among other things, to increase our steel production capacity from 1.7 million tons in 1955-56 to 7.5 million tons (estimated) in 1965-66. What is more important to note is that there has been corresponding rise in steel-fabricating and machine-tool manufacturing capacity. If defence-preparedness in the narrow sense were the goal, it need not imply any great shift from the investment pattern followed so far.

Greater defence-preparedness has to be differentiated from carrying on, and meeting the cost of, a long war.

In a long war, long-term economic considerations take a second place to the requirements of mobilising and using available resources to arrive at a conclusive war decision at the least immediate cost to the exchequer. For defence-preparedness, the strategy of a long haul is required, and necessarily the considerations relate to the raising of smaller resources each year (than in a war) over a continued period with the least adverse impact on the economy. Proper economic policy is, therefore, essential to a strategy of longhaul in defence.

What does this long haul consist of? I present here some strictly money calculations of its cost. In the first ten years of planning, that is, from 1951-52 to 1960-61, India spent on defence Rs 2,074 crores and invested a sum of Rs 10,100 crores out of a national income of Rs 112,200 crores over the period. The Chinese aggression almost doubled the defence, expenditure from Rs 343.37 crores for 1962-63 to Rs 708.51 crores in 1963-64. In fact, the defence budgets for the five years 1961-62 to 1965-66 have already amounted to Rs 2,884 crores against an investment during the same period of Rs 10,400 crores and national income of Rs 82,850 crores (both approximate). On a rough calculation, the recent Pakistani aggression is likely to raise the defence budget from Rs 717.8 crores in 1965-66 to about Rs 1,000-1,050 crores from 1966-67 onwards.

Such a defence budget raises clearly the dilemma between defence and development. In fact, this is already evident in the fact that development outlay for 1966-67 (the first year of the Fourth Plan) in the public sector has been reduced by about Rs 200 crores to a figure below the current year's.

Plan Implications

It is necessary, therefore, to examine the long-term implications of an annual defence budget of Rs 1,000-1,050 crores. The previous rise in defence budget in 1963-64 had an adverse impact on the economy, partly because the Finance Minister treated it "purely as a problem in raising resources and partly because he failed to support it with complementary economic measures — particularly, an appropriate monetary policy. T T Krishnamachari has shown much greater resourcefulness in meeting the econo-

mic problems, and, despite the pressures from various quarters, he should continue his measures in the field of greater use of the price mechanism and monetary policy.

It is necessary to recognise that while a sudden and large war effort over, say, four or five years can stimulate industrialisation (though at the same time, pre-empting a substantial part of the national production for war purposes), a large defence budget, in an economy which is already stretched, would, while pre-empting a smaller proportion of the national output, reduce the resources available for investment and, therefore, retard the development effort. While in the peaceful 1950-60 decade a small defence budget enabled us to increase investment, the militant 1960's are likely to have an adverse effect on development.

Some of the resources required for the additional expenditure on defence would have to be found through taxation. The measures taken to do this would reduce the resources available in the private sector for its programmes; moreover, if these measures are not properly thought out, they would have a disincentive effect on investment and production which would reduce investment further. This was clearly what happened after the Chinese aggression, and the Finance Minister would need to avoid this in determining his tax proposals for the next year.

There is an evident reluctance to recognise the fact that the demands of defence and development have become competitive with, and not complementary to, each other, as is obvious from the fact that the cut in development outlay for 1966-67 is sought to be dressed up as a temporary phenomenon — in fact, one which is promised to be made good in subsequent years to bring the total outlay to Rs 21,600 crores over the five years of the Fourth Plan.

Secondly, even while the Fourth Plan was being formulated, a gap of Rs 3,000 crores was estimated in the resources needed for the Plan, which was proposed to be made up by additional taxation, better collection under taxes and public sector profits. To this must now be added a sum of Rs 1,500-1,750 crores, being the amount that would need to be devoted additionally to defence.

It has, therefore, to be recognised

that the first implication of defence orientation is a reduction in the plan size — an implication which has been ignored so far. However, there has been considerable play with a second concept — namely, "defence-orientation" of the plan pattern.

This is, however, hardly a relevant concept in the context of modern defence effort. For, today, defence in technology-based. Except in the very short run, an armament industry by itself is not sufficient; what it needs is to be backed by sufficient industrial capacity to feed it.

As the recent fighting has shown, we have over the first three plans built considerable industrial capacity. If so required, this capacity can be diverted to the task of being a complement to the armament industry. For defence-orientation does not imply so much a change in the investment pattern as the output pattern in the economy. Changes in investment pattern can only influence marginally the output pattern, and larger results must be sought from moulding the existing investment to the requirements of a defence-oriented economy. Perhaps the only industry requiring special development would be the alloy steel industry. Alloy steels were produced by Tata Steel and by ordnance factories during the Second War and, since then, have been neglected till recently. The demand for them will rise as our armament needs increase. It is, therefore, unfortunate that recently decisions have been taken to cut alloy steel targets in the process of pruning the plan outlays. If a cut had to be imposed, it could more appropriately have been in mild steel targets.

But there is a deeper sense in which there is need for change in the investment pattern of the Fourth Plan. It is not towards a greater emphasis on industry but on transport — particularly road transport — and communications. For while we have built up a strong industrial base over the first three plans we have neglected relatively the transport factor. The value of an industrial base in a war situation is only to the extent it can be mobilised to serve the defence needs.

The Indian army is numerically a large army, and would have to fight on an extensive and difficult land border. Adequate support to it over a period would require good communication lines for supplying it food, arms and materials. These again in their turn would have to be obtained from all over the country. At present

the Indian economy is relatively immobile in its supply routes. While in normal times a delay in supplies might not be important, in an emergency delays can have serious consequences. Unless we build up a sound transport and communication system for all parts of the country, the industrial base, so painstakingly built up over the last fifteen years, would have little value.

"The Memorandum on the Fourth Plan" had provided for an outlay of Rs 7,750 crores on agriculture, irrigation, transport and communications out of a total outlay of Rs 22,600 crores on the Fourth Plan. Even if the outlay on the Fourth Plan is reduced by a minimum of 10 per cent, there is a case for not reducing in any way the outlay (Rs 4,100 crores) on agriculture and irrigation and increasing the outlay (Rs 3,650 crores) on transport and communications by a half (to Rs 5,500 crores). Almost the whole of the additional outlay should go to roads, road transport and communications.

This would imply, in concrete terms, a considerable build-up in road-building and supporting activity. The opportunity should be used to build up truck-manufacturing and self-sufficiency in the communication equipment industry. The real aim should be to ensure that by the quickest means of available transport and communication, no place should be

more than 24 hours distant from another. Such a policy would incidentally have the advantage of increasing central control over the economy and unifying the country physically. It would, therefore, act as a base for greater common effort towards increased investment and production in future.

The tyranny of old ideas and theories, as Keynes said, is pernicious. Planners in India have clung too long to big plans and to a bias in favour of heavy industry. In the process, they have neglected to take into account the mechanism for implementing the plans (*vide*, for example, "The Content of Planning", by Arthagnani, *The Economic Times*, May 27-28-30, 1965).

The temptation for the planners to revert to the investment pattern followed in the past will, under the present emergency, be too great to resist. It would be easy to put up the same ideas, dressed up in a lot of defence jargon. It would be easy to adopt this path of least resistance.

However, the essence of planning is to foresee the problems of an economy and be prepared to meet them. While some lacunae in production capacity might be visible today, there are much larger gaps in our system of mobilising the existing resources and making them available when and where needed. Planners should seek to mould the Fourth Plan to fill these gaps.

The Present State of Defence Production

DEFENCE production in the context of this article cannot refer to all the different supplies required by the defence forces, but only to supplies of a distinctly military nature — arms and ammunition, transport and communication equipment, etc. An attempt will be made below to catalogue the facilities that have been built up for production of defence requirements. While ideally such an attempt should lead to some judgment about the extent of self-sufficiency we have reached, it must be admitted at the outset that with the available information about what we produce and what the army needs no such judgment is possible.

Self-sufficiency has a qualitative and a quantitative aspect. It goes without saying that we do not produce a very wide range of arms and other defence equipment for which we have to depend entirely on imports. That is the qualitative aspect. The quantitative aspect refers to the adequacy of the production capacities which have been established. The requirements of the defence forces for stores and equipment during active hostilities are several times those during peace-time. The ratio of war-time consumption to consumption in peace-time may be sometimes as high as 100:1. Whether, even in the items we do produce we can meet the full war-time demand of our entire armed forces, and for how long, is a question which has to be answered before we can talk of being self-sufficient in these items. Finally, the fact that we make certain types of finished equipment does not necessarily mean that we are not dependent on imports in respect of them — they may have varying import-contents. To take an instance, one-tonne trucks and patrol jeeps are now produced in our ordnance factories but each truck and jeep is made up with about two-third imported components so that even if we did manufacture enough finished jeeps and trucks it would be misleading to talk of being self-sufficient.

The bulk of defence production takes place in the ordnance factories and in the industrial undertakings of the Defence Ministry. The latter are Hindustan Aeronautics, Bharat Electronics, Mazagon Docks, Garden Reach Workshops, Praga Tools and Bharat Earth Movers. There are at present 24 ordnance factories, four of them set up after 1962. Their output has expanded impressively

in the last few years, from Rs 42 crores in 1961-62 to Rs 111 crores in 1963-64 which is the latest year for which information is available. Besides arms and ammunition, the ordnance factories produce trucks, jeep and tractors. Among the relatively modern arms and ammunition produced are semi-automatic rifles and ammunition, an improved version of carbines, a tank gun, a heavy mortar, 30 mm aircraft gun ammunition, a new mountain gun and an improved variety of anti-tank ammunition. Ammunition for the new heavy mortar is now under development. Production of solventless cordite for rockets has been started at the new plant commissioned at Aruvankadu in March 1964. A new ordnance factory was commissioned in October 1964 at Varangaoon. It will manufacture small arms and ammunition. Another factory is being set up with US assistance at Ambajhari and is expected to go into production, towards the end of next year. Work is also in progress on a new filling factory at Chandrapur; it is expected to go into production about the same time as the Ambajhari factory. A small arms factory is also being established at Tiruchirappalli without foreign assistance, its planning being done exclusively by the Ordnance Factories Organisation. Two important projects, one at Burla for manufacture of high explosives and the other at Panvel for the production of propellants, which were expected to cost Rs 62 crores, had been shelved on the ground that it would be cheaper to stockpile imported high explosives and propellants. It is to be seen whether this decision will be reviewed in view of the war with Pakistan and the changed outlook for defence imports from the western countries.

The manufacture of a medium tank has been taken up at the heavy vehicles factory at Avadi. The first tank 'Vijayanta' assembled at the factory has been successfully tried. The first batch of imported and indigenously assembled tanks is expected to come out of the factory soon.

Ordnance factories now produce trucks, jeeps and tractors. Two types of trucks are in production — the three-ton Shaktiman and the one-tonne Nissan. According to the latest figures available, 5,900 Shaktiman trucks and 11,200 Nissan trucks have been so far manufactured. Annual production of Shaktiman trucks is

currently running at just over 1,100 and that of Nissan at about 4,000. The Shaktimans have an import content of about 30 per cent and the Nissans about 65 per cent. The ordnance factories manufacture patrol jeeps, also named Nissan. About 4,500 of these jeeps have so far been delivered to the army and the Border Roads Organisation. Annual production of Nissan jeeps is now running at about 1,200. Production of tractors suffered a setback last year and it is now proposed to transfer their manufacture from the ordnance factories to the heavy earth-moving equipment plant of Bharat Earth Movers, a public sector undertaking of the Defence Ministry. Bharat Earth Movers started with the rail-coach division of Hindustan Aeronautics which was transferred to it. The division assembled some 55 motorised scrapers from imported equipment in 1964-65. The heavy earth-moving equipment is to be manufactured under licence from Messrs Ie-Tourneau-Westinghouse. The plant will be located at Kolar Gold Fields.

Field cables are manufactured at the ordnance factory at Chandigarh. The capacity for production of field cables is to be expanded, and manufacture of other advanced types of cables is proposed to be undertaken. The ordnance factories also expect to shortly commence bulk production of a new type of a man-dropping parachute. Production has been started of a special type of pack plaster for paratrooping jeeps.

Any account of the work of the ordnance factories must mention the fact that the equipment at the majority of them is utterly old and obsolete. The oldest ordnance factory is 164 years old; eight were established before the first war and another eight during the second war. A five-year plan for modernising the ordnance factories at a total cost of Rs 33 crores with a foreign exchange component of Rs 15 crores was drawn up last year. The plan covers especially metal-making and shaping, filling and explosives, apart from certain special equipment for armaments production.

Among public sector undertakings engaged in defence production Hindustan Aeronautics has a pre-eminent position. Aircraft manufacturing facilities were first established in India in 1940 when Hindustan Aircraft Limited was set up in Bangalore. HAL's original programme was the assembly of Harlow trainers, Curtiss

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now
freely available from our factory at Kota for a wide
range of applications such as :

Hawk fighters and Vultee bombers. During the second war, however, its manufacturing programmes were suspended and it was transformed into a large repair/overhaul base. In 1948 HAL undertook the design and development of a basic jet trainer HT-2 and this was completed in 1953. Among the other manufacturing projects carried out by HAL were the assembly and manufacture under license of the Prentice trainer and the Vampire jet fighter. It was in 1957 that it was decided to manufacture under license the Gnat fighter which played such a prominent role in the recent war and the Orpheus jet engine. In 1959 when the manufacture of the Avro-748 was undertaken in the Aircraft Manufacturing Depot at Kanpur, the production of the Dart engine for the Avro-748 was assigned to Hindustan Aircraft. In 1962 HAL undertook manufacture of the Alouette helicopter and its engine under license. On its own the company designed and developed light aircrafts like Pushpak and Krishak in addition to the HT-2 developed earlier. The Basic jet trainer named Kiran designed by the company had its inaugural flight in December 1964. The value of HAL's production in 1962-63 was Rs 14.68 crores and in 1963-64 Rs 15.22 crores. In 1964-65, the value of production up to the end of December 1964 was Rs 10.46 crores.

The Soviet Union agreed in 1963 to help set up facilities for manufacture in India, under license, of the MIG-21, a single engine supersonic fighter. The aircraft is to be manufactured at two factories to be set up at Koraput and Nasik while allied electronic equipment for it will be manufactured at a factory proposed to be set up at Hyderabad.

In August 1963 a new public sector company designated Aeronautics India Limited was formed; it was to be responsible for the establishment and management of the three MIG-21 factories. In March 1964 it was decided that a single public sector organisation should be formed to undertake production of aircraft and allied equipment in order to ensure the maximum utilisation of our limited resources in manpower and management. As a result Hindustan Aircraft Limited was merged with Aeronautics India in October last year and the new company designated Hindustan Aeronautics. The Aircraft Manufacturing Depot, Kanpur, was also transferred to Hindustan Aeronautics.

Apart from the MIG-21 and the

Gnat fighter, production of which may now be sought to be stepped up after its very satisfactory performance in the recent war, the major task engaging Hindustan Aeronautics is the design and development of a supersonic jet fighter, HF-24.

Mazagon Dock and Garden Reach Workshops constitute the Defence Ministry facilities for building and repairing ships for the Navy. Mazagon Dock was taken over by Government in 1960. It has two separate ship repair yards on adjacent sites and there are two large dry docks — 495' and 426' long — and a small dry dock 152' in length. There are also four building berths for the construction of vessels. The biggest ship so far built at the Mazagon Dock is a 1,500-ton passenger-cum-cargo boat. Vessels now under construction include two mine-sweepers, two 150-men ferries and a dredger for the Navy.

A programme to expand the facilities at Mazagon Dock is under way. It envisages the construction of additional slipways and the impounding of the Kasara Basin to provide better berthing facilities both for fitting out and repair of ships. The completion of the programme will result in considerably increased ship construction and repairing capacity and will make possible building of frigates for the navy. Under an agreement concluded in 1964 the UK has agreed to extend aid to meet the foreign exchange costs of the construction of Leander class frigates for the Navy. An agreement with Vickers-Armstrongs and Yarrow for the construction of these frigates was concluded towards the end of last year. According to the present programme, the first frigate will be completed by the end of 1971.

Like Mazagon Dock, Garden Reach Workshops was taken over by the Government in 1960. The Company has five jetties equipped with electric cranes, five slipways and two dry docks designed mainly for inland watercraft up to 2,000 tons and building berths for shallow draft vessels up to 1,200 tons launching weight. Vessels up to 320' in length can be accommodated on the slipways and the two dry docks are 510' and 386'.

The company has collaboration agreements with shipbuilders in the UK, West Germany, Holland and Japan and has specialised in the design and construction of shallow draft vessels including tugs, light naval craft, river steamers, etc. New construction work has increased from Rs 14 lakhs

in 1962-63 to Rs 78 lakhs in 1963-64. In 1964-65 out-turn on this account was Rs 79 lakhs up to the end of December 1964. The value of repair work undertaken has also increased from Rs 92 lakhs in 1962-63 to Rs 145 lakhs in 1963-64. In the first nine months of 1964-65 the value of repair work done amounted to Rs 88 lakhs. The company is considering undertaking new lines of production including high altitude air compressors, road rollers and marine diesel engines.

Bharat Electronics was set up with French collaboration in 1954 for manufacture of electronic equipment including vacuum tubes, components and radar. Subsequently, it has entered into agreements with British, Dutch, American, Swiss, German and Japanese firms. At present Bharat Electronics manufactures over 70 different types of equipment ranging from tiny transmitters for upper air observation to high power transmitters and sophisticated radars and also various components like valves, transistors, capacitors and crystals. The value of output was Rs 6.21 crores in 1963-64 and about Rs 7.5 crores in 1964-65, including defence equipment of the value of Rs 5.1 crores. The import content of the total output is roughly estimated at about 15 per cent.

Praga Tools makes practically no finished defence equipment itself, but produces a wide range of dies and tools for use in defence production. It manufactures dies and tools for 7.62 mm ammunition and gauges for naval armament. It will also assist in increasing the manufacture of some important components of carbines and 25-pounder guns developed by the ordnance factories. These apart, the company specialises in the manufacture of small tools and precision instruments like lathe chucks, machine vices, drill chucks, drilling machines and tool and cutter grinders. The turnover increased from Rs 75 lakhs in 1962-63 to Rs 106 lakhs in 1963-64 and further to Rs 125 lakhs in 1964-65.

The above makes impressive reading and in fact does represent impressive performance in the last five years or so. But compared to the needs of equipping an 8,25,000 strong army, a 45-squadron air force and a navy adequate to the task of defending the country's long coastline, the defence production capacity achieved so far is really marginal. A beginning has been made, but talk of self-sufficiency is years too soon.

Steadier Near Week-End

Thursday, Morning

DALAL STREET will hold its special session for 'moorat' trading for the New Samvat Year 2022 from 2-30 to 3 pm on Sunday, October 24. Never perhaps, not in living memory any way, has 'moorat' trading fallen on a Sunday. Nor has the session ever been so short as this time — just 30 minutes — and rarely has 'moorat' trading been conducted so early in the day which looks quite contrary to the spirit of the festival of lights. That Diwali should have come on a Sunday is of course a pure chance. But the decision of the stock exchange authorities to restrict 'moorat' trading to just half an hour clearly suggests that the market is being kept open to exchange formal greetings — "Saal Mubarak" — rather than to transact business. The few ceremonial orders that might flow on the occasion can be easily put through in a few minutes time. Turnover on the stock exchange now-a-days has shrunk to such negligible proportions that a week's entire business could be easily put through in a single two-hour session without causing even mild excitement in the market. This is what is worrying most the stock exchange community.

Conditions obtaining on the stock market last week were not much different from those prevailing earlier, though the general tone appeared to be a little steadier due more to scarcity offering than to any revival of fresh bull support. It was only near the week-end that the market developed a distinctly steadier sentiment on the argument that the new schemes announced by the Prime Minister Lal Bahadur Shastri to mobilise rupee and foreign exchange resources were so attractive that they were bound to evoke response. And if the Government is able to obtain fairly substantial quantities of gold under the Gold Bond Scheme and there is a good response to the National Defence Remittance Scheme. These could go a long way in relieving the pressure on the tight foreign exchange position and considerably improve the supply of scarce raw materials, spare parts and components and capital goods.

The stock market's optimism may not prove ill-founded. The highly attractive terms offered under the new schemes to encourage the hope that the Government may succeed in raising substantial additional resources to

finance defence and development and it may not therefore have to make as big a tax effort as would have seemed imperative otherwise. The stock market dreads taxation more than anything else.

COTTON

Self-Restraint

THOUGH there have been reports of some rains in certain cotton growing areas, there are no indications of an improvement in the overall position of the crop. In fact, crop estimates continue to be revised downward. While most observers place the crop around 57 lakh bales, there are quite a few who do not expect the crop to exceed 55 lakh bales. In any case, it is quite clear that in view of the expected shortfall in indigenous crop and uncertainty about imports, both the trade and industry are likely to have a difficult time during the current 1965-66 season.

The other day, the President of the East India Cotton Association, Madanmohan R Ruia, called upon the trade to exercise self-restraint in the marketing of the new crop within the limits imposed by the control measures. That is about the only way to ensure that there is no occasion either for the banking authorities to withdraw the concessions recently granted and for the Government to impose additional restrictions. Leading cotton merchants who recently met under the auspices of the Bombay Merchants and Muccadams' Association also agreed that it was necessary for the trade to take initiative in introducing measures which would help marketing of the crop within the ceiling prices. A sub-committee of 11 members has been set up to formulate a scheme designed to achieve the objective in view. Traders have been urged to give a solemn undertaking not to do business at above the basic ceilings. All this sound very pleasing. But how could one seriously believe that traders will suddenly begin to behave better when the new crop begins to move into the market. Are not current prices of old cotton quoted well above their statutory ceilings? Neither the Textile Commissioner's office, nor the trade and industry seem much bothered about the control order. Could it be that the pre-

sent emergency has brought about a transformation of character?

Current indications of demand and supply point to a difficult period ahead. And it might not be too long before the authorities decide on reintroducing the quota system for allocation of indigenous cotton for mills in order to stagger purchases over a period of time and also to ensure equitable distribution of quality cotton to all the mills in the country. These measures will need to be supplemented with other steps if prices are to be kept within the revised ceiling prices.

Turnover in the spot cotton market continues to be restricted by the availability of good quality cottons. Trading in futures also was a dull affair last week. After a further early rise to Rs 913.50 and keeping above the marginal line for two days or so, the March contract drifted lower to Rs 908.75 (per 3 quintals). While the outlook for cotton is known to be distinctly bullish, speculators do not see much fun in accumulating big positions in view of the graded margin above Rs 910.

OILSEEDS

Technical Correction

OILSEEDS prices made new highs right in the beginning of the week. But prices soon reacted on profit-taking induced mainly by technical considerations though some selling was also provoked by fears of margin on non-transferable delivery contract in groundnut oil. Reports of rains in some of the oilseeds producing areas, more particularly in Rajasthan and Uttar Pradesh, also induced caution among bulls. Castor April which had been bid up to Rs 107 in kerb dealings declined sharply to Rs 102.25 but it rallied again to around Rs 105 at the week-end. Linseed April moved down from Rs 126.50 to Rs 121 before winding up the week around Rs 123. Groundnut oil December delivery declined from Rs 33 to 30.25 but it firmed up latter to around Rs 31. Cottonseed January contract was neglected around Rs 65. Linseed oil moved between Rs 28.25 and Rs 27.50 and castor oil firmed up to Rs 20 on sector shipper buying.

Latest reports indicate that the new groundnut crop might well turn out to be as much as 30 to 35 per cent

less than in the previous season. New crop arrivals are picking up at the main terminal markets in Khandesh and Karnatak but these are being readily absorbed at rising prices because of substantially smaller crop this season. Last week's rains have improved prospects for linseed sowings in Rajasthan and Uttar Pradesh. Of course, more rains are needed and at far too many more places to encourage hopes of a normal linseed crop. The outlook for the rabi crop depends mainly on the weather in coming weeks. The new castorseed crop is expected to be below the average because of the unsatisfactory weather conditions.

Export activity remains virtually at a standstill. Cottonseed cake is moving in a small way and business in groundnut extractions is expected to pick up only after the factories commence production after a fortnight or so following the improved supply of groundnut expellers with the increased tempo of groundnut arrivals.

MONEY AND BANKING

Comfortable Week

THE short-term money market in Bombay had a comfortable week to October 20. The inter-bank call money rate remained more or less unchanged at 5 per cent. Demand for funds was firm at around the previous week's level while supply gathered a little strength. In Calcutta conditions were easy as demand moved down slightly while supply showed a slight increase. The rate was placed at 6 per cent though stray lots were done at lower rates.

Bank credit during the week to October 8 increased by Rs 21.17 crores to Rs 2,029.03 crores according to statement of affairs of scheduled banks. Deposits with banks increased by Rs 4.47 crores to Rs 2,786.18 crores. With increased deposits banks were able to reduce their borrowings from the Reserve Bank from Rs 14.66 crores to Rs 12.77 crores. Balances held with the Reserve Bank were better as well by Rs 2.32 crores at Rs 168.64 crores. Investment in government securities swelled by Rs 13.96 crores to Rs 853.25 crores. This compares favourably with the previous week's increase of Rs 7.22 crores. The credit-deposit ratio during

week was better at 72.83 per cent against 72.18 in the preceding week. The ninety-one day Government of India Treasury Bills on tap evoked better support. Bills sold between October 11 and 16 amounted to Rs 32.24 crores compared to Rs 25.69 crores during the previous week.

The statement of affairs of the Reserve Bank for the week ended Octo-

ber 15 reveals a fall in note in circulation by Rs 16 crores to Rs 2,624.66 crores. The week's contraction plus a slight increase in total notes issued have been absorbed by the banking department. Rupee coins have risen slightly by Rs 87 lakhs to Rs 103.11 crores. Foreign securities remain unchanged at Rs 70.63 crores. Balances held abroad are better by Rs 1.17

crores at Rs 10.42 crores. Deposits of the Central Government fell by Rs 8.67 crores to Rs 53.15 crores. This follows the fall of Rs 61.42 crores during the previous week. State Government deposits, however, were better by Rs 5.66 crores at Rs 8.09

BUSINESS NOTES

Fact

ADDRESSING the twentyfirst annual meeting of Fertilisers and Chemicals Travancore at Udyogamandal on September 30, K Sreenivasa Karayalar told shareholders that Government of India had approved of the company's project of setting up a new unit with an annual capacity of two lakh tonnes of ammonia as against 87,000 tonnes at the existing unit at Udyogamandal. To be called Cochin Fertiliser Factory, it will be located at a site adjacent to the Cochin Refinery at Tripunithura in Ernakulam District. The factory will produce urea, ammonium phosphate (20:20 grade) and N P K and complex fertilisers. The plant will also be capable of producing higher analysis compound fertiliser. The capital outlay is estimated at around Rs 400 million, and the factory should go into production in 1968-69 if necessary foreign exchange is soon made available to the company. The additional funds required for this purpose are to be obtained from the Government. The need for establishing a bigger unit has arisen because all the new ammonia plants proposed to be set up in the country during the Fourth Plan period are of a daily capacity of 600 tonnes or more. When these plants come into being, units like the 260-tonne one belonging to the company will become uneconomic.

Meanwhile, the commissioning work of the third stage plants has begun and it is expected that all the plants will be commissioned by December this year. Started in 1962, the third stage expansion programme has been completed with fair speed, enabling commissioning of the plants well within the target dates. When in full production, the company will be producing two lakh tonnes of ammonium sulphate, 1.35 lakh tonnes of ammonium phosphate (16:20), 25,000 tonnes of ammonium chloride and 44,000 tonnes of superphosphate in addition to being able to make and supply 3.5 lakh tonnes of N P K mixtures.

Loans to governments declined from Rs 110.21 crores to Rs 107.77 crores. Scheduled bank deposits have increased by Rs 9.07 crores to Rs 101.68 crores. Bank borrowings have declined by nearly the same amount, Rs 8.75 crores, to be exact.

Hyderabad Allwyn

MAKERS of diverse product, ranging from refrigerators to furniture and bus bodies and from hydraulic hoists to tipping gears and trailers, Hyderabad Allwyn is adding another new line to its manufacturing activity. A letter of intent has been received by the company for manufacture of power tillers, and for this purpose collaboration of some foreign firms is being sought. Meanwhile, production of hydraulic hoists, tipping gears, heavy duty trailers and semi trailers is expected to be in full swing before April next.

The working results for the year to April 1965 show that production of both bus bodies and defence requirements could not reach the previous year's level, and though that of refrigerators well exceeded if there was no appreciable increase in their sale, with the result that total turnover shrank by some 13 per cent to Rs 4.52 crores. But this was more than offset by a sizable improvement in margins as reflected in expansion of gross earnings from Rs 63.95 lakhs to Rs 72.75 lakhs. Even though necessary provisions have together taken a bigger slice of profits, equity earnings are higher at Rs 18.22 lakhs (Rs 16.45 lakhs). The cover for the dividend raised by a point to 11 per cent is a shade better at 1.38 times.

U P Electric

THE management of U P Electric Supply Company intends to put before shareholders proposals concerning the future of the company after arriving at a settlement with the U P State Electricity Board as to the price finally payable to the company for the acquisition of its Allahabad and Lucknow undertakings and after suitably assessing the company's contingent liabilities. It may be recalled that these undertakings were taken over by the State Electricity Board from September 16 last year. The company has received an on-account payment of Rs 1.04 crores, but no details have been furnished as to the breakdown of the amount paid. The company is getting the market value of the fixed

Of the profits, depreciation and taxation have chopped off much bigger slices but with a useful saving in prior charges equity earnings stand at Rs 21.64 lakhs (Rs 15.58 lakhs), with the result that the unchanged divi-

assets computed, and the Board has been asked to give details of its own valuation. If a satisfactory agreement on the market value of assets is not reached, the matter may be referred to arbitration.

The accounts for the year ended March last show a fall in revenue from light and power loads from Rs 1.79 crores to Rs 99.30 lakhs. After charging depreciation of Rs 7.05 lakhs (11.42 lakhs) there is a profit of Rs 9.18 lakhs against Rs 7.79 lakhs. To the year's profit is added the net sum of Rs 24.65 lakhs transferred debenture redemption reserve, and Rs 25.80 lakhs (2.25 lakhs) are allocated to general reserve. The maintained rate of dividend of 10 per cent takes Rs 5.60 lakhs (same), and 2.41 lakhs are provided for bonus for previous years.

Investment Corporation

DESPITE a slightly higher income by way of dividends on shares and interest on securities, Investment Corporation of India has reported a lower pre-tax profit of Rs 28.16 lakhs or th year to June last compared to Rs 30.33 lakhs a year before, according to a preliminary statement. After providing for the tax liability Rs 8.25 lakhs (nine lakhs), a sum of Rs 2.36 lakhs (2.69 lakhs), being the amount of foreign dividends, is allocated to general reserve 'A' and Rs 17.65 lakhs (17.50 lakhs) to dividend reserve out of which are to be paid the unchanged dividends on preference and ordinary shares together absorbing, as before, Rs 17.62 lakhs. The rate of dividend on the latter class of shares is Rs 8.50 a share.

Dawn Mills

RISE costs and increasing tax burden with no corresponding increase in realisation have diminished Dawn Mills margins during the year to March last as is reflected in a sharp decline in gross profits — over a third lower at Rs 24.33 lakhs against Rs 37.27 lakhs previously, despite a small increase in sales of yarn, hosiery and waste from Rs 2.48 crores to Rs 2.56 crores. Even though the necessary provisions have taken away considerably less than in the previous year, disposable profit is markedly lower at Rs 5.86 lakhs compared to the preceding year's Rs 9.90 lakhs, and the unchanged dividend of Rs 15 a share, requiring Rs 8.40 lakhs, is short earned by a wide margin.

An extensive scheme of modernisa-

tion and expansion of the Mill has been undertaken by the company as per recommendation of Gherzi Eastern Ltd, well-known textile consultants.

Burhanpur Tapti Mills

DESPITE various adverse factors Burhanpur Tapti Mill has fared very well during the year ended March 1965, with sales improving a little from Rs 2.42 crores to Rs 2.53 crores and gross earnings rising sharply from Rs 5.72 lakhs to Rs. 9.60 lakhs reflecting impressive increase in margins. As a result, the unchanged

dividend of seven per cent, which was short earned last year, is now covered 2.26 times. With costs continuing to rise in all directions, however, profitability in the current year may be affected. Efforts continue to be made to enhance earnings potential through modernisation and expansion. The amended modernisation scheme as approved by N I D C is expected to be implemented soon, and a licence is expected for adding 5,000 spindles and 100 looms. In order to find additional finance, it is proposed to issue preference shares worth Rs ten lakhs carrying interest at 9.3 per cent.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

THE CHANGING

Kulti. Neighbour to a steel town. Precursor of a proud tradition. It all really began at Kulti way back in 1870. Here was the oldest successful unit in India producing pig iron by modern methods. With production upgraded at Burnpur the blast furnaces closed down in 1958. But obsolescence never overtook Kulti. Its integrated iron, steel and non-ferrous castings foundry is still one of the largest in the East—the spun pipe foundry one of the best. Kulti's present consumption of pig iron exceeds 20% of that for the whole of India; it can, in fact, take in more, if available.

Thus Kulti continues in a career of planned growth. Serving Burnpur, serving other steel plants—and India's railways, chemical and sugar industries with complicated castings. Spinning out pipes as well by full train loads for the projects and utilities as no other unit does. And Kulti today is confident of adding on to its achievements.

(Established in 1943)

Registered Office: Eloor, Udyogamandal P. O., Alwaye.

Telegrams: "FACT", Udyogamandal. Telephones: 48, Alwaye and 474, Ernakulam.

Capital Authorised: Rs. 10,00,00,000

Capital Issued: Rs. 6,95,97,740

PRODUCTION: At present FACT has an annual production capacity of 100,000 tons of ammonium sulphate, 8000 tons of ammonium chloride, 33,000 tons of FACTAMFOS (Ammonium Phosphate 16 : 20) 44,000 tons of superphosphate, 100,000 tons of sulphuric acid and 3,500 tons of liquid sulphur dioxide.

EXPANSION: In 1964, the Company launched a multi-phased expansion programme. The first and second stages of this expansion programme, involving respectively Rs. 3 crores and Rs. 2 crores, have since been completed. The second stage, completed in 1962, ushered in the Company's new oil gasification complex, the first of its kind in India.

FACT is at present engaged in putting through its third stage expansion programme estimated to cost Rs. 12 crores — a programme which will more than double its present production capacities.

Which End of the Plough?

WHAT has the emergency or even the difficulty, most probably temporary, over PL 480 imports of foodgrains to do with the agricultural plan? Very little, really. If one ignores inconsequential gimmicks like exhorting city-dwellers to grow vegetables in flower-pots, the Third Plan had already given the first priority to increasing agricultural production and one of its basic objectives was to achieve self-sufficiency in foodgrains by the end of 1965-66. Yet, when the Food Minister revealed on Tuesday that next year it was proposed to step up the allocation to the States for agricultural programmes by no less than 43 per cent over that in the current year—even though the total Plan outlay next year will be lower—no eyebrows were raised and it was accepted as a natural concomitant of the emergency.

The Food Minister's sketchy account of how the higher allocation to agriculture was to be spent contained no surprises. Expansion of the area under multiple-cropping, improving utilisation of irrigation, preparation of farm manure in compost pits, cultivation of subsidiary crops—these are not new programmes. That, of course, is no criticism of them. Yet, did not the Memorandum on the Fourth Plan state that "the setback in agriculture since the end of the Second Plan is a cause of deep concern and has, in turn, led to fresh consideration of the assumptions, methods and techniques as well as the machinery of planning and plan implementation in the field of agriculture"? What one would like to know is whether the so-called "crash programme" in agriculture is the product of such reconsideration of the assumptions, methods and techniques of agricultural planning which have been the cause of very large investments hitherto yielding very much less than the expected results or whether it is merely based on misconceptions such as that the absorptive capacity of the agricultural sector for fresh investment is virtually unlimited or that in agriculture the results of investment can be expected to emerge almost without any time-lag.

Our past experience is enough evidence that there are definite limits to the pace at which investment can be effectively made in agriculture even though there may be none to the cumulative total. Apart from the limits set by availability of physical inputs, there is the overriding fact that increases in agricultural output have to come about mainly through a very large number of individual farmers being induced to adopt better agricultural practices. On this score the Planning Commission's own assessment of the achievement so far is worth nothing: "there has been a marked lag in the application of the results of scientific research, in the adoption of better implements and more scientific methods of agriculture and, generally, in the extension of improved agricultural practices. The proportion of cultivators who have taken to scientific agriculture is still quite small. No doubt due to the slow implementation of measures of land reform, the structure of the rural economy has not changed to the extent postulated in the earlier Plans".

The fate of the land reform programme is too well known to need repetition. It has been conceded by one official study after another that land reform legislation in most States is riddled with gaps and loopholes, that the administrative arrangements for enforcing even such legislation as exists have been deplorably inadequate, that records of rights of tenants do not exist in many States and, where they do, they are often incomplete and out of date, that as a consequence, there are vast numbers of 'informal' tenants who are not recorded in the papers and enjoy no security of tenure.

Land reform is a basic desideratum if cultivators are to be induced to invest in better agriculture; so are stable and remunerative prices for agricultural produce, an adequate extension service, in terms both of number and quality of personnel, and a co-ordinated organisational set-up to administer the different rural development programmes. A recent official review, made only months ago, concluded that "our agricultural extension services are weak both in quality and numbers and suffer from dispersal over unmanageable areas". Though a decision was taken three years ago that the village level worker should be assigned only one set of tasks, namely, organising extension and supplies for agricultural production programmes and helping

panchayats and co-operatives to draw up and execute village production plans, it has almost nowhere been possible to implement this decision.

If the extension services are inadequate, the higher official administration responsible for agricultural programmes is unco-ordinated and ineffective. Study teams sent out by the Planning Commission to the States have emphasised the harm done by the multiplicity of agencies responsible for agricultural programmes and the lack of co-ordination among them. As the not infrequent recriminations between the Planning Commission, the Ministries of Agriculture and Community Development and the State Governments show, it is impossible under the present set-up to fix responsibility for failure. This is true at all levels of the administrative hierarchy, starting from New Delhi and the State capitals right down to the village. It has been suggested that each village should be collectively committed to its annual farm production target and that all financial assistance should be

channelled through the village body which should be made responsible for achieving the target. But made responsible to whom? And how, when the dispensers of Government assistance are so numerous and so unco-ordinated?

It is in this context that the decision to increase the financial outlay on agriculture has to be judged. A short-term "crash programme" at this stage can make sense only if it is part of a perspective plan covering the above-mentioned basic factors which will to a large extent determine the pace at which agriculture can absorb investment productively. However, the temper of the Government at the moment appears to be inimical to such an approach, being weighted in favour of *ad hoc* measures which seemingly hold out the prospect of immediate returns. But, unless the experience of the three Plans is completely misleading and holds no lessons, to proceed in this manner is to grip the plough at the wrong end.

All Semantics and No Facts?

THE one great achievement of the Monopoly Commission which no critic will dispute is that it has submitted its report within the scheduled time—a feat for any committee or commission in India. What else it has achieved it is too early to say. The report has not yet been placed before Parliament and we have nothing more than vague press reports to go on. There is, however, no indication that the fears that were expressed by several correspondents in the columns of this journal have been belied. Not unexpectedly, the Commission has, it seems, devoted a considerable part of its labour to semantic analysis of the term "monopoly"; and also not unexpectedly has it concluded that there are no monopolies in India "in the accepted meaning of the term".

However, problems cannot be liquidated by such semantic processes: monopolies in the "accepted meaning of the term" probably do not exist anywhere; in any case they constitute a small part of the whole complex of problems given rise to by individual decision-making units in trade reaching a size when they can unilaterally or conjointly with others influence the entire market.

If press reports are correct, the Commission has tried to highlight the fact that since the beginning of planning scores of new entrepreneurs have successfully entered the industrial field. One would wait to see what the Commission exactly means by "new entrepreneurs"; one would also eagerly, if somewhat skeptically, wait to get further details of the Commission's alleged findings about the increasing proportion of share holdings by investors belonging to the lower and middle classes. R K Hazari who has looked rather closely into such matters has found on the contrary that institutional ownership of capital has been

becoming increasingly significant, mainly because subscriptions to share-capital of companies from the controlling interests increasingly comes from companies and trusts, not individuals. This conclusion has been confirmed by the Reserve Bank which has found that new companies are raising the major part of their capital from companies.

It is not at all surprising that the Commission should tend to take a reassuring view and decry that there should be so much alarmist propagandist nonsense and loose talk by politicians about the economy being dominated by monopolists. After all did anybody know what ultimate purpose the Commission was supposed to serve? Such a definite purpose can be based only on a clearly defined political-economic stand. But India is a socialist country when we are replying to a toast at a Kremlin dinner and a capitalist country when negotiating for American aid in Washington. The "socialist pattern" of our planning does not specify either the institutional pattern of ownership or the economic pattern of competition. Nor has it been stated that our brand of socialism involves "free competition". Was the Commission to find ways and means of perfecting imperfect competition or making imperfect competition a little less imperfect? Joan Robinson in an article in the Special Number of this journal of July 1964 squarely termed the whole attempt as absurd. She expected that the only useful purpose it would serve would be to educate the economists working in the Commission. We have to find out whether the report lives up even to this limited expectation. Its glorious predecessor, the Mahalanobis Committee report took very much longer to produce and contained neither any new facts nor any new conclusions.

Code of Trading Practices

THE Committee on the Code of Trading Practices between Manufacturers and Exporters, it would seem, has interpreted its terms of reference rather narrowly. It was asked to frame a code of trading practices as between manufacturers and exporters in order to ensure regular supplies of stipulated quality exports. What it did was to concentrate on the first part of this task, and, finding that a code had already been formulated by the 1962 Committee on Fair Trading Practices and by the Commerce Ministry, it recommended a procedural remedy in the form of a standard 'written contract' between manufacturers and exporters according to the already formulated code and containing specifications regarding quality, quantity, delivery periods, and packing and, significantly, a penalty clause and a clause for arbitration in case of dispute. Such a contract would certainly help regularise and clarify relations between manufacturers and exporters. But will it help eliminate all the causes of irregularity? It is through its somewhat facile location of these causes that the Committee seems to have limited itself.

In its report it claims that relations between manufacturers and exporters are generally cordial and well-systematised, and it is only because the odd case of irregularity gets 'undue' publicity that a review of mutual practices is at all called for. Evidently the Committee thinks that a significant reason for the mutual complaints of manufacturers and exporters is the unpredictable changes in the Government's export promotion policy, for, the need to stabilise that policy on a long-term basis, not to make changes retrospectively applicable, and to offer Government help to manufacturers to fulfil existing foreign orders should the policy changes effect those orders, is much stressed by the Committee.

But is this the whole story? Of course, a stable export and incentives policy is important for a sustained export promotion drive in competitive world markets, to programme and provide for extensive market research studies or for product promotion measures. It might even happen that merchant exporters occasionally do discover that a particular change in policy or incentives makes exports not worth their while, or that manu-

facturers find they cannot fulfil orders to specification. However, the Committee itself suggests that the majority of manufacturers and exporters are not led to irregularities, whence the cordiality of their relations. Why then, are the marginal few? Could it be that they really are not viable in the foreign markets either competitively or by way of adequacy of resources? At times too, these irregularities might arise because the existing system of incentives can be abused for short-term profit. Hence, possibly, some of the cases of below specification quality or packing. Might it not be also that the present incentives schemes encourage — or at least do not discourage — a not-so-serious, free-lance attitude to exports, so that export commitments and delivery dates are not too scrupulously kept? These are, after all, some of the corollaries of the import entitlement scheme as it has operated in the past and the entitlement's free sale in the market at a premium. The abuse may be marginal. But these are questions it was relevant to answer in explaining cases of breakdown of relations between manufacturers and exporters and the non-fulfilment of contracts to specification.

Perhaps the Committee's methods were responsible for the limitation. Its questionnaire got a response from 31 organisations, and the Committee did not think it necessary, after the easy answers the replies provided, to take subsequent oral evidence. Had it taken verbal evidence it could have gone into these questions rather more closely and possibly with more interesting results.

Premium on Inefficiency

THE Sugar Enquiry Commission toiled for over a year and produced its formidable 350-page report only to have its face resoundingly slapped. Underlying all the ailments of the sugar industry, which led to the appointment of the Commission, is the basic one of almost chronic instability with the alternation of sharp increases and decreases in production. While, as the Commission points out, the Government's method of dealing with each situation, whether of shortage or of surplus, as it arose without a long-term policy has aggravated it, the basic cause of the industry's instability has to be sought in the fluctuating supply of cane from year to year. To bring stability to

the sugar industry regular supply of sugarcane is a *sine qua non*. This may require measures, such as those recommended by the Commission, to prevent diversion of cane from sugar factories to gur and khandsari producers, but what is necessary most of all is a steady increase in cane production. This has to be achieved without diversion to sugarcane of land under foodgrains and other crops, through increase in the per acre yield and improvement in quality in terms of recovery of sugar.

The present system of fixing the minimum price of cane payable by sugar factories, however, gives no incentive to the majority of cane cultivators to improve the quality of cane. The basic minimum price is related to a specified level of sugar recovery and for this, or a lower level, of recovery a uniform price is fixed for the whole country. For every 0.1 per cent increase in recovery above this level, a premium is allowed on the basic price but there is no discount on a recovery rate below it. Up to this level of recovery, therefore, the price is the same irrespective of differences in sugar recovery.

It follows that the higher the basic recovery level the smaller will be the range of recovery rates for which farmers will earn a premium and, therefore, lesser the incentive for improvement in quality. An idea of the extent of incentive provided by the present pricing system can be formed from the fact that the basic minimum price is fixed for a recovery level of 10.4 per cent which is well above the average all-India recovery level and higher than all but the highest recovery rates in any of the States, with the exception of Maharashtra. For the vast majority of cultivators, therefore, it is a matter of indifference what quality of cane they grow. To quote from the Sugar Commission's report: "if the level of recovery for which the basic minimum price of cane is fixed is too high, as it presently is at 10.4 per cent, it destroys the incentive on the part of the growers to take to sugarcane varieties with a higher sucrose content, in regions whose recovery falls short of this level by a wide margin".

In its interim report the Commission had recommended that for the 1964-65 season the minimum price should be linked to a recovery level

of 9.4 per cent. The Government rejected this and fixed the minimum price for 10.4 per cent recovery at Rs 5.38 per quintal. In its final report, presented to the Government in September, the Commission again suggested that the basic recovery level should be reduced to 9.4 per cent in 1965-66 and to 9 per cent in 1966-67. For 1965-66 it recommended a minimum price of Rs 4.96 per quintal for 9.4 per cent recovery with an increase of 4 paise per quintal for every 0.1 per cent recovery above this level, thus bringing the price for 10.4 per cent recovery to the current level of Rs 5.38 per quintal. For 1966-67 it recommended an increase in the premium for higher recovery over the minimum of 9 per cent from 4 paise to 5.36 paise per quintal for every 0.01 per cent.

However, not all the arguments of the Commission for giving greater incentive to cane cultivators to improve the quality of cane seem to have made the slightest impression on the Government. On Wednesday it decided to retain the existing basic recovery level of 10.4 per cent with the minimum price at Rs 5.38 per quintal for 1965-66 — obviously under pressure from States, particularly those where the average recovery rate is lower than 10.4 per cent so that if the basic recovery level had been fixed at 9.4 per cent the minimum price for a majority of cane growers would have been cut.

The difficulty, let it be stated, is not that the growers would not have got a remunerative price. In the Commission's judgment the minimum prices recommended by it would have been high enough to prevent any significant diversion of land from sugarcane. In any case, if the Government felt that the Commission's minimum price for 9.4 per cent recovery was too low, it could have permitted a higher price while maintaining the price differential for cane with higher recovery. However, this would have led to pressure for higher sugar prices to grant which would no doubt appear unpopular. Between protecting the inefficient cultivator and concern for the consumer, there is evidently no room for an incentive-oriented pricing system for sugarcane.

Kerala: Search for a Leader

Our Correspondent in the South writes:

THE war and the extremely uneasy cease-fire have had serious repercussions in Kerala. Political alignments are likely to undergo significant changes and the mass electoral

preference may also mutate in important ways. At the moment everybody has taken President's Rule for granted. True enough, the Left parties have protested and demanded quick fresh elections. But it is quite obvious that this is not one of the demands they are pushing with crusading zeal, not even the Left Communists. At present the situation is still too fluid for anyone

to very confidently state that the result of the elections will not be the same instability as produced by the last one.

The Congress, however, hopes to cash in on the generally increased respect for the Central Government and the still more widespread feeling that as yet only the Congress is in a position to provide that stability which

the dangerous situation so urgently demands. There continue, of course, anger and indignation that the Congress seems quite incapable of initiating any deep-going social change or taking any radical measures to close the gap of inequality.

The piquancy of the Congress situation in Kerala is, however, that this great advantage of the stability-offer is denied it. The dissident group within Congress is powerful. The State Congress leadership is not only corrupt but has a well-deserved reputation for inefficiency and factionalism. It has no leader of any stature who could become the builder as well as leader of a team. Kamaraj had, at one time, proposed that Krishna Menon should take over the job. But, evidently, the prospects of re-entry into the Central Government and the reassumption of an international role have proved too alluring. In Kerala the task would be far less spectacular and would involve detailed work, suffering fools as well as the possibility of not getting back to power in the immediate future. Such a course would have been good for Kerala and even better for Krishna Menon but it seems it is not to be.

A different plan is now being proposed, i.e., to bring back Pattom Thanu Pillai, the octogenarian Governor of Andhra. This amiable gentleman has had a very long political history, indeed. And of surprising consistency, too. He has hopped from one party to another, changed ideas, policies and friends with gay abandon but the single-minded purpose has been clear — to somehow reach the Chief Minister's post and remain there. Incidentally, it was Lal Bahadur Shastri who performed the conjuror's trick of first kidnapping Pattom from the PSP and making him a Congress Chief Minister and then later whisking him off to Chandigarh as Governor. Barkis is certainly willing this time to change from Governor to Chief Minister.

The Congressmen who have come to Hyderabad on deputation and who publicly beseeched the press at a Raj Bhavan press conference to help "persuade" Pattom to return to save his home State are not as foolish as might appear at first sight. They are banking on Pattom smoothing over the ruffled feelings of another Nair octogenarian, Mannam. The two have been quite close in the past and there is no reason why they should not manage jointly to bring the dissidents back to the Congress. It will be ex-

tremely awkward for Mannam to paint the official Congress as an Ezhava show if such a fiercely communal Nair as Pattom is its father figure. Further, he has the added advantage of being regarded as a very safe anti-Communist which would placate the Catholic bishops. Finally, he has proved quite acceptable to the Muslim League in the past and a section of the SSP will also not be unfriendly. A grand coalition could thus be built which would safely guarantee the Congress its passage back to power. As for Kerala, its development and its future — *park-kalam*, as Kamaraj would say, let us see!

Students for National Service

LAST week at the annual meeting of the Central Advisory Board of Education at Chandigarh the Union Education Minister pleaded for making "education defence-oriented and production-oriented" and for "new priorities". He added: "we must be self-sufficient in food and our students can play a vital role in achieving it". At this meeting the Board enthusiastically approved a proposal to enlist students passing the S S C examinations in the country for a year of "national service" during which they will help in raising agricultural production, eradication of illiteracy and the defence effort.

This move resurrects a proposal that has been discussed several times and has never been tested even on a small scale. The recent estimate of costs involved suggest an annual outlay of Rs 500 per student in a plan that envisages an enrolment of about 100-125 thousand students and a total expenditure of Rs 5 to 6.2 crores. Presumably, the estimate refers only to direct expenditure on students and assumes exemption from the scheme for a certain proportion of eligible students on medical and other grounds.

The wasteful character of the scheme sticks out a mile. Most of the students passing S S C have no training whatsoever to undertake the tasks that are proposed for them. The problem of providing the right training is complex and its financial and real burden would be considerable. Besides, if some two or three months are spent in training, the period over which this investment may bear fruit would be very short and, therefore, the return would be low. Also in countries where the law provides for conscription, the average age of the conscripts tends to be at least three to five years

higher than that of SSC graduates in India. As a result, the receptiveness and maturity of the young conscripts abroad tend to be far superior to what can be expected from the Indian students passing out from high schools, who will not carry any weight with the rural folk amongst whom they will have to work to improve agriculture. And the free labour that they might contribute would hardly help since Indian agriculture surely does not suffer from labour scarcity.

All these considerations make the proposed project of 'national service by SSC students' an unrealistic scheme which holds every promise of proving a fiasco. Even the scheme of compulsory rural service by medical graduates in Maharashtra has failed to make any substantial contribution to meeting the health and medical needs of the people. Because of the lack of proper organisation the doctors find it a waste of time. The much-publicised 'Village Volunteer Force' scheme, initiated after the Chinese attack in 1962, has few real achievements to show except perhaps on paper. True, there is scope and need for tapping public enthusiasm for national service and for channelling it in the right directions, but to do it in a manner that would avoid waste and unnecessary frustration, some hard thinking and proper organisation are required. A 'national youth service' modelled on, for example, the Peace Corps in USA in which relatively mature and trained persons voluntarily contribute their skills for various developmental projects will prove much more useful and effective than the project enthusiastically but thoughtlessly sponsored by the Central Advisory Board on Education.

Textile Imports by UK

Our London Correspondent Writes:

THE recent Cotton Board Conference held at Harrogate celebrated what can be regarded as a major victory for the vested interests in the textile industry of Britain who have been striving to contain imports of textiles from the developing countries. The announcement by Douglas Jay, President of the Board of Trade, that the Labour Government intended to impose a global quota on cotton imports from low-cost producing countries for the next five years is just the sort of protection that Lancashire has been pressing for. Whether this type of feather-bedding is good for the industry as a whole or whether it will serve only to protect and keep the

less efficient textile firms in business, remains to be seen. The whole object of the reorganisation of the industry which started in the 1960s was to provide the basis for a new, smaller, more efficient and more viable textile industry with emphasis on modernization, integration and re-equipment. The type of protection that is now offered is hardly intended to speed up the elimination of the less efficient concerns.

The British cotton textile industry is now a much more viable organisation than it was five years ago. Something like £30 million of public money, and a similar sum from the industry itself, has been spent on reorganisation schemes to scrap old plant and re-equip and modernize the industry which is now operating from a modern vertically integrated framework. A further step to make the industry operate from more modern production units has been taken with the intervention of man-made fibre producers. The many small firms have been largely replaced by four major combines. The industry is now becoming far more capital-intensive than the average run of British industry. Despite a shorter working week output per head has risen by 6 per cent a year since 1963. There are however, still some inefficient firms and, as was pointed out at Harrogate, the traditional sections of the industry are still over-manned and the growth sections under-staffed. The quota system will permit the less efficient units to stay in business.

Full details of the new system of global quotas that are to be introduced have not yet been made clear. The size of the global quota has not been revealed, but Jay has said that it will be lower than the 1964 total which is regarded as exceptional.

No Commonwealth Asian country will be allowed to carry over unused quotas for exports to Britain. There is understandable anger in Hong Kong as the unused cotton textile quota to the U K for 1965 up to October 13 was about 82 million square yards. It is understood that the industry in Hong Kong is now suggesting that the agreement under which Hong Kong limits her cotton textile exports to 185 million square yards a year should be abrogated.

The policy of placating the Lancashire industry is justified by the Labour Government with the much-used argument that Britain is carrying more than her share of imported

low cost textiles among the industrialised country. The solution to the developing countries problem lies not in further relaxations by Britain but in more constructive efforts by other industrialised countries to increase their imports. The British never tire of reminding the world that at present Britain imports about 35 per cent of her home needs, compared with 9 per cent in the case of America and the European average of about 7 per cent.

The most promising solution to the problem is through a revision of the GATT textile pact which is only a half-hearted attempt to liberalize textile markets as it provides for a growth in imports by industrialised countries (excluding Britain) of only 5 per cent a year. The British view is that industrialised countries should take at least 10 per cent of their cotton requirements from the developing countries; this should rise gradually to 25 per cent which, it is pointed out, is still 10 per cent below the current British performance.

The only hope for textile exporting countries in the developing world now seems to lie in the pressure that Britain can bring to bear on other importing countries; the British market is not going to be allowed to expand. At Harrogate, Wyndham White, Director-General of GATT, spoke about the possibility of a "package deal" for cotton textiles in the "Kennedy Round", but refused to give further details of the scheme. The GATT agreement itself is already vitiated by Article III (or the market disruption clause) which has frequently been invoked. The U S A is using the agreement as an umbrella to shelter its own cotton textile industry, while it proceeds with investing large sums to enable the industry to stand up at some future date to low-cost imports. In many ways, under the new global quota system, Britain seems to be following the same policy.

LETTER TO EDITOR

What are we Defending?

I CONGRATULATE you on the courage with which you have restated the social values for which we stand in peace as well as in war, and whole-heartedly agree with your editorial "What Are We Defending?" (October 23). But to be fair, it may not be non-pertinent to point out that E M S

Namboodiripad's views on the Kashmir question cannot be viewed in the same light as Vinoba Bhave's. It is true that Namboodiripad promised to support our Defence efforts (for the purposes of your editorial does it make much difference even if he did not? patriotism is perfectly compatible with non-support of the war) but he always took care to qualify it with the demand for freeing the detenus. For weeks the left-communist daily in Kerala was picturing the situation created by the Pakistani infiltrators in Kashmir as a people's revolt. Throughout the period of active hostilities it was devoting more space to exposing black-marketeers and whipping up popular fury against rising prices than to news from the front.

The existence of Peking-Pindi collusion (since you to choose call a Peking-Pindi 'axis' a theory only) from the start of the war is no longer a theory but a fact which is recognised as such even by British left-wing circles. But Namboodiripad's speeches do not betray any suspicion of this. Events like the burning down of our embassy by Indonesian hooligans and the Chinese ultimatum, which did not increase China's anti-imperialist prestige or reputation for love of peace, were solemnly described by Namboodiripad as 'unfortunate'. He chided the peaceful procession in Delhi before the Chinese embassy as childish.

Again, in his speeches Namboodiripad goes on repeating that his party will not support a war for winning Azad Kashmir or Aksai Chin. One suspects naivette or hypocrisy. Except for a lunatic fringe in the country, no responsible politician has advocated a war to regain these territories. It is really incomprehensible what makes Namboodiripad assume imaginary positions on the part of his opponents and then proceed to demolish them as untenable, when perfectly logical lines of argument can be found against the continuance of war and for the peaceful settlement of the Kashmir issue.

But I entirely concur with you in demanding freedom for unpopular or exceptional views. Democracy will perish if it does not extend its benefits even to persons who wish to destroy it. The point is to make such views appear irrelevant and pointless to the majority. But will we ever grow that mature?

G NARAYANAN

Muvattupuzha, Kerala.
October 27.

Case for a Kashmiri Speaking State

Romesh Thapar

NOW that our vast and sprawling land frontier with Pakistan and China has been turned more or less into a cease-fire line, and the bulk of our army committed to forward positions, we have little reason to be content with government by slogans. 'Jai Jawan — Jai Kisan — Jai Hind', 'Grow two grains where there is One', 'Miss a meal on Monday' and 'Three paise contributed by every Indian gives Rs 500 crores for defence' are about the most inadequate attempts made of late to cope with the challenges which face us. Either the Prime Minister is wrongly-advised or he has made up his mind that the challenges will always be met with foreign assistance, that only an elaborate demonstration of self-reliant postures is required.

'Victory Tours' Not Enough

There are magic words in the vocabulary of the world's languages to help the Prime Minister double food-grain production, to change the fact that nearly 50 per cent of our urban population is living on PL 480 food, to deny the need for a serious tax-gathering effort to meet the cost of defence and to create the basis for the steady growth of industrial capacity. The sooner he realises that image-building is not a matter of 'victory tours' and easily-mouthing slogans the better for him and the country. His agit-prop will have to provide a more solid programmatic diet to sustain the stance he has come to adopt on public platforms.

These sentiments, widely held among those familiar with the true state of affairs within the Cabinet, the government and the ruling party, have to be recorded in cold print because we are in grave danger of destroying the essential preliminary bases of our socialist, secular democracy which we have been able to build during these eighteen years of freedom. The dishonest, tortuous, subtle attack on the stewardship of Jawaharlal Nehru, now being encouraged even by those who owe so much to him, can break the cohesion of the Congress Party. Already, the Jan Sangh is taking advantage of the erosion in the perspectives of the ruling party.

Members of Parliament, now gathered in the Capital, are being urged to take serious note of these trends, comprehend the extent to which the much-

publicised collective responsibility of the Cabinet has become non-existent, demand a full picture of the conduct of the ground and air operations against Pakistan and of what is being done to prevent a repetition of the serious errors made in the political and military conduct of the campaign, consider the steps necessary to forge a relevant framework for our policy-planning and insist on institutional supports to implement the policies agreed upon. These are the normal functions of a Parliament, but in the prevailing atmosphere of moronic conformism legislators could be persuaded to become eager *claqueurs*.

A Kashmiri-Speaking State

While these initiatives are pushed, particularly in the context of formulating an economic and foreign policy which can withstand embarrassing pressures, it is being realised in the Capital that we can no longer procrastinate over the most immediate of all problems — Kashmir. The recent eruptions in certain urban centres of the Valley, and the rather drastic decision to arrest important opposition leaders, is a reflection not so much on the Sadiq government's failure to politically discriminate between the disparate elements allied against it but a pointer to Delhi's inability to act up to its categorical assertion of sovereignty over this strategic territory in the North-West. If UN resolutions are no longer valid, then obviously we are free to organise our affairs in this area as we think fit.

Serious students of the problem are beginning to understand that the present set-up in Jammu and Kashmir inhibits and hamstring healthy political initiatives in the Valley, particularly at the level of the newly-enriched urban middle class. This vocal Kashmiri-speaking section, dominantly Muslim, sees itself for ever at the mercy of complex communal equations with the Dogras of Jammu. Also, not without reason do we see the unmistakable crystallisation of inflexible political attitudes in the two sections of the State, a development which was witnessed in other parts of India prior to the linguistic reorganisation of boundaries.

This, it appears, is the crux of the problem. The State of Jammu and Kashmir was historically an artificial

creation of Dogra hegemony. In today's situation, the State is an anachronism. The independence urge of the Kashmir-speaking people takes on a secessionist flavour because of the despair, widely felt, that the Kashmiri will be denied a State within the Indian Union in which he is master. Earlier, involvement with UN resolutions prevented a proper review of this problem. Now, there should be no blockage to redrawing the boundaries of our States in the North and North-West.

Punjabi Suba and Hariana Prant

Already, the old demand for Punjabi Suba is under active consideration and the betting is that it will be conceded. The effort of the supporters of a Hindustani-speaking Hariana Prant, including areas of Punjab, Rajasthan and Uttar Pradesh, cannot for long be resisted even by the political power based on the Gangetic plains. What then prevents consideration of the proposal that Jammu become a part of Vishal Himachal, that the Kashmiri-speaking areas be constituted into a separate State with Ladakh coming directly under the control of the Centre? There is no logical argument against some such redrawing of the borders of the States of the Indian Union in the North and North West.

Indeed, the decision to carry out this belated linguistic reorganisation would mark a decisive step in the direction of strengthening the secular character of the Indian Union — for, in the process, two minorities, the Sikhs in Punjabi Suba and the Muslims in Kashmir, would achieve a dominant position in two new States. This act of faith, as it were, by the present leadership of the Hindu majority within the all-India context would also help blunt the thrust of militant Hindu revivalism which sees the threat to our frontiers as the opportune moment to sabotage the India of Gandhi and Nehru. This is an aspect of political self-reliance which has yet to be comprehended.

Kashmir Will Not Wait

For some weeks now, at the highest levels, some such proposition has been touched upon. There is little understanding of its connection with the question of consolidating the secular structure of the Indian Union, but the

compulsion is great to de-link the controversy over Kashmir from an involved past. The proposition does not endanger the security of the North-West, for military investment would continue on the same scale as before. Politically, too, the debate with the world would be conducted at a healthier, clearer and more persuasive level. And, economically, on the basis of a crash programme, a more fundamental impact could be made on the development of the Valley.

It is strange that we are so apathetic about the need for political initiatives on Kashmir when so much time and energy is expended in accommodating the Nagas — or, in fact, Phizo. Or is our apathy based upon our confidence that the Kashmiri will for ever remain docile? It would be most shortsighted to allow angry demonstrations to force the peace of political change. The agitation now confined to a few urban centres could spread to the rural areas. We should certainly not lag behind developments. Given political courage, there is no reason why Kashmir cannot become the real cornerstone of our secular unity — and, possibly, a bridge in the future with an enlightened Pakistan.

Admittedly, many problems are pressing on us. Military observers, studying the details of the conflict just concluded, are now inclined to dismiss the claim that the Pakistani army's teeth have been taken out. Economists, more acutely aware of the consequences of so-called free food and free aid, are disturbed by the tendency in the GOI to accept the inevitability of dependence on US PL 480 supplies despite the talk about self-reliance. Planners, studying the budgetary position and the foreign exchange crisis, have been startled by the reluctance of the Cabinet to impose any fresh tax burdens in what will be an election year. Political pundits, conscious of the existence of a serious political vacuum, cannot but take note of the attempt being made to purge the Congress Party of all ideology. Against this background, it may seem unreal to underline the unfinished business of linguistic reorganisation in the North and North-West. Yet, this business will have to be given high priority — if only in the interests of secular consolidation and security.

The Prime Minister skilfully rationalises his own lack of commitments and perspectives by preaching the need for pragmatism. But pragmatism also demands a proper programme linked to tactical and strategic objectives. It is not something fashioned on stray ad-

vice and hunches, nor does it become purposeful by exhortation through slogans. The millions who flock to listen to the Prime Minister are looking for a policy which makes good sense. They are lost in a political vacuum and hope for a lead. The patriotic upsurge of the last few weeks is a pointer.

FROM THE LONDON END

EFTA and European Integration

HOPES of bridge-building between EFTA and the European Economic Community raised by the British at the Vienna meeting of EFTA have been dimmed by the crisis in the European Common Market. This was made abundantly clear at the recent meeting of EFTA. Although the main aim of EFTA is to keep the door open, no step forward can be taken until the Common Market crisis has been resolved, and it is now becoming increasingly clear that the French are unwilling to make any move until after December 5, the date of the presidential election.

The latest EFTA meeting passed off smoothly enough. The members have come to accept the necessity of the British import surcharge. The statement by the British delegation that no guarantee could be given as to when it would be removed and that there was no intention of reducing the surcharge at present, was taken comparatively calmly by the other members. In any case, the surcharge will have to be removed by the end of 1966.

From Britain's point of view, an important fact was the announcement by Portugal that it would make a 20 per cent reduction in the import tariff on "completely knocked-down" British cars, a step that the UK has been pressing strongly for a long time. Britain has requested an all-round cut in duties on British cars imported into EFTA countries. The urgent need for this is shown by figures of foreign cars sold in one EFTA country, Denmark, where German and Swedish makes are overwhelmingly in the lead, with only one British car listed in the first ten.

The only new move at the meeting was the application by Yugoslavia for possible association with EFTA. A high Yugoslav Government official came specially from Belgrade to make the request. Yugoslavia has already made a request to the Common Market for some form of trading arrangement. She has also applied recently for full mem-

bership of GATT and is already associated with COMECON. Therefore, not too much significance can be attached to this approach.

EFTA itself has now practically reached the end of the road. Founded in 1959 by those countries that could not, or would not, accept the political obligations of the Treaty of Rome, their sole common interest has been the threat to their exports posed by the high external tariffs of the Common Market. This set in process a motion to establish a free trade area among its members. So effectively has this limited organisation worked that by the end of 1966 tariffs will disappear among member-countries and free trade will have been established.

While economic considerations make some form of integration between the two tariff blocs in Europe a necessity, there is little enthusiasm at the moment on the part of the Common Market countries. In EFTA itself, while the British were originally enthusiastic the other members are by no means unanimous in their support. Switzerland, for example, has no desire to be integrated with the Common Market, particularly in view of the political implications of the Rome Treaty. Sweden too, with her own policy of neutrality, is not anxious for any very close ties. On the other hand, Denmark is in favour of full integration between the two blocs. Austria has already made its own approach to the Common Market, having applied for associate membership; and should Britain draw closer to ECM, it is more than likely that Norway would follow suit.

But the basic problem of Common Market tariffs which act as a serious barrier to the development of trade remains. This is the reason why, despite unfavourable conditions, feelers were still put out at the EFTA conference to the Common Market. At the conclusion of the meeting, the Chairman of the EFTA Council of Ministers, handed over to the Ambassadors of the six Common Market countries,

an *aide memoire* whose object was to bring formally to the notice of the Six that EFTA was ready to start some form of discussion on specific problems and that EFTA Governments were convinced that the prospect of achieving their final goal—a wider European market—would be considerably improved if a dialogue were established between the two trading blocs "at all possible levels".

At the meeting of the Western European Union at The Hague on November 4 the British Foreign Secretary is to report to the Common Market countries on EFTA's desire for further contacts with the Six. This is a problem which cannot be shelved too long. Some action will have to be taken by other European countries, whether the Common Market overcomes its current difficulties or not. EFTA's only hope of expanding is to annex the Common Market, without France, in an extended European Free Trade Area. It is understood that the Common Market Five are meeting to work out tentative plans for going it alone without France, if General de Gaulle boycotts EFTA's latest invitation for him and the Six to examine the predicaments of the European communities.

In marked contrast to the British enthusiasm for bridge-building in Vienna, the British delegation at the latest Copenhagen meeting of EFTA was quietly back-peddalling to avoid any open affront to French feelings which might prejudice a number of joint Franco-British projects at this moment of crisis in the Common Market. General de Gaulle has seized on the agricultural issue for a fundamental reappraisal of the Common Market as it now stands. France also is quite unwilling to accept the system of qualified majority voting due to start on January 1, 1966 and it looks as if France will boycott the Common Market until this issue is resolved. De Gaulle is seeking a fundamental revision of the Rome Treaty which will fit in with his own philosophy of Europe which eschews any supranational authority. So, he believes, the EEC must be rescued from becoming a sort of economic European government. His main opponent in this context is Dr Hallstein who is said to have referred to himself as the first European Prime Minister. It remains to be seen whether the crisis will have a positive result in opening up new vistas to the outside world for the ECM. Is Europe ultimately to have a market of 100 million or 280 million people?

BOOK REVIEW

The Road to Partition

M V Pylee

An Outline of Indian Constitutional History by V P Menon: Bharatiya Vidya Bhavan, 1965; pp 84, Rs 3.50

"AN Outline of Indian Constitutional History" is the book-form of the Birla Endowment Lectures for 1963 delivered by V P Menon under the auspices of Bharatiya Vidya Bhavan. It is a kaleidoscopic account of constitutional developments in India under the British culminating in the transfer of power in August 1947. The first part of the book deals with the British conquest of India, its consolidation and the events leading up to the Montagu-Chelmsford reforms; the second part with the constitutional developments up to the second World War; and the last part with the transfer of power in 1947.

V P Menon was not just an onlooker or a witness of some of the most momentous scenes of the constitutional drama. Nor was he merely an academic interested in the subject. He was indeed one of the actors or, more appropriately, one who had an important job to do in the green-room. Naturally, the account that he renders is not only authoritative but most fascinating. Students of India's Constitutional history are already familiar with Menon's *magnum opus*, "The Transfer of Power in India", and its companion volume, "The Story of the Integration of the Indian States." They are both voluminous. In comparison this is a brief essay. Yet it is a significant contribution to the literature on the subject.

The survey of constitutional developments up to the second World War, a very brief sketch, is full of observations, interesting and valuable. For example, Menon throws much light on the calibre of the early administrators of the East India Company who built up the British empire in India, men like Robert Clive, Warren Hastings and Cornwallis; Metcalfe, Munro and Elphinstone. He has interesting observations on Diarchy under the Act of 1919. Also he has traced the growth of the Muslim League and its demands for partition of the country. According to Menon, the Congress-dominated governments in most of the Provinces between 1937 and 1939 reminded the Muslim Community in a forcible way of its minority status under *swaraj*, which could not now be long delayed, and led to a great change of Muslim feeling in favour of

the League. "We may at this distance of time", he says, "feel that it was irrational, but it is an indubitable fact that this period of Provincial autonomy which in most provinces lasted barely two years, was an important turning-point in communal relations." (P.42) Among the other factors he lists the Nehru (Motilal) Report (1928) which adopted "the straight secular attitude": it virtually ignored the Muslims' fears and proceeded as if the communal question did not exist. Then in the thirties, the growing Congress movement in the Indian States, which were largely Hindu in population, began to suggest that the idea of the 'States as a third force, which would hold the balance between Hindus and Muslims in the federation, would eventually prove to have no validity.

With all its grave defects, the central provisions of the Constitution Act of 1935, the author feels, had the merit that they ensured the unity of India, and would sooner than later have ensured full democracy throughout India. It is regrettable that the all-India federation envisaged under the Act was not brought into being. The unification of India was the greatest achievement of the British regime. If the all-India federation had materialised, it would have been the coping-stone in this achievement, and it would have made partition impossible.

In the fateful years during the second World War and the years immediately following its termination, Menon's role as constitutional adviser to the Governor General gave him the rare opportunity to watch political developments from a position of exceptional vantage. Hence his observations on the happenings of that period merit even greater attention. He is firmly of the view that the Congress committed a "monumental error" in 1939 with the resignation of the Provincial Ministries. It is a supreme example of that unrealistic, negative politics in which we are all too prone to indulge, and the outcome of which is, sometimes, very disconcerting, and even disastrous. The control of eight Provincial Governments, covering half the country, had put the Congress in a position of great strength and bargaining power. The Congress should have

thought many times before voluntarily abandoning such an advantage." One of the more serious consequences of this monumental error was the later partition of the country.

From that time, a conviction grew among the British that the Hindus were their irreconcilable enemies, and this feeling was only intensified by all that happened later — the Individual Civil Disobedience in 1940-41, the rejection of the Cripps Offer in March 1942, the Quit India campaign in August 1942, and the formation of the Indian National Army by Netaji Subhas Chandra Bose.

On the other hand, the Muslims took advantage of the Congress being in the wilderness, supported the war effort, and made the British feel that they were reliable friends. Of course, if Germany had won the war, things would have turned out differently.

In a sense both the Congress and the League were gambling on the outcome of the war, and the League backed the winner. Not that the Congress leadership ever wished for or banked on British defeat and framed its policy accordingly, though no doubt Subhas Chandra Bose did so. The Congress leadership held an exaggerated notion of the efficacy of negative policies, and what it did would have been realistic and justifiable only on the assumption that Britain was going to be defeated.

In a brief but most remarkable manner the author discusses the birth and the growth of the two-nations theory, how Jinnah capitalised on the blunders of the Congress and how the British pampered the Muslim League. The doctrine of the two-nations and the demand for partition were, according to him, mere political slogans advanced for tactical purposes, but they proved to have such fascination that, in the end, they dominated their author, Jinnah, as well as the emotions of the Muslim masses. The Congress was incapable of grasping what was going on in the minds of the Muslims and of the British and this naturally helped the transformation of Jinnah's dream into reality. While the Congress was busy with the Quit-India movement, the League succeeded in gathering under its banner the Governments of Assam, Sind,

Bengal and the North-West Frontier Province. The only Muslim-majority province left was the Punjab. As a result, the League as a political party had suddenly attained great stature. If the Simla Conference of 1944 was a failure from the point of view of constitutional progress it was a tremendous success from that of boosting Jinnah's views and plans. The point of no return on the fatal road to partition was reached at that Conference.

There was perhaps still a chance, however remote and narrow it was, to save the country from partition—in the Cabinet Mission Plan. At first both the Congress and the League accepted it but soon after, Nehru, who had just become Congress President, gave what was, as events have proved, a most unfortunate press interview in which he impulsively stated that the Provinces would be free to refuse to enter the sub-federations or "groups" of provinces. The upshot of this statement was that a few days later the League Council met and withdrew its acceptance of the Plan and decided to launch 'direct action' for achieving the declared aim of partition. It boycotted the Constituent Assembly when the Assembly met for the first time in December 1946. If the League had in the meantime entered the Interim Government, it was not to work it but to wreck it from within. And indeed it succeeded in doing so. The political developments moved inexorably to the partition of the country.

Lord Wavell who was found unequal to the situation was replaced by Mountbatten who had instructions to try and obtain a Unitary Government for British India and the States through the Constituent Assembly. But he soon found that it was an impossible task and as an alternative proposed the immediate transfer of power to the existing Provincial Governments, leaving them to come together to form a Central Government, if and when they chose.

It was at this crucial juncture that V P Menon played his decisive role. He could clearly visualise the disastrous implications of the Mountbatten Plan. It was an invitation to sheer anarchy. He was able to convince Mountbatten that the Congress would be uncompromisingly opposed to it and produced an alternative plan which had the approval of Sardar Patel and which envisaged the partition of the Punjab, Bengal and Assam, creation of two central governments of India and Pakistan, the immediate conferring of the dominion status on

both of them and the complete transfer of power by the British. This was the plan that ultimately became acceptable to all the parties concerned and paved the way for the dawn of Independence.

As one concludes the reading of the last part of Menon's fascinating account one gets the unhappy feeling that freedom could have been won

without Partition and the unity of the subcontinent could be preserved if there was greater imagination, tact and a spirit of accommodation on the part of those who led the freedom fight. But this may be mere wishful thinking or an exercise in hind-sight in the context of the most complex political situation that existed in the subcontinent.

PIPELINES TO PROSPERITY

Another pipeline being laid. Another job nearing completion. And with it Dodsals will have laid over 3,500 kilometres of pipeline all over India. Pipelines that will feed crude oil to refineries and transport the finished products to distribution centres. Pipelines that will carry gas to consumer and industry alike. Pipelines that are, in fact, the very life-lines of the Nation... quickening its progress... hastening its prosperity.

Dodsals are truly proud to be doing their bit in building up the Nation. Proud to have the technical know-how and modern machinery that made them the first Indian organisation to lay pipelines at the rate of a kilometre a day or more! After all, Dodsals have been associated with international pipeline construction companies on every major pipe-laying operation over the last 8 years.

So, when it's a matter of pipeline construction, whatever the diameter, working pressure or terrain, Dodsals is the name to remember!

Export Promotion through Tax Incentives

I S Gulati

Of the three tax concessions currently available to exporters, one, i.e., the general rebate on income tax, is linked to profit, and two, i.e., the special rebate and the tax credit, are linked to export turnover.

It is too soon to say to what extent these concessions have contributed to the enlargement of India's export earnings. However, the analysis attempted here leads to certain conclusions:

(a) the outlay on the special rebate and the tax credit should yield higher dividends in the form of higher export earnings than the outlay on the general rebate on income tax;

(b) since the underlying objective is to increase net export earnings, both the special rebate and the tax credit should be so recast as to link the subsidy to the net value added in India; and,

(c) as regards export based on Indian raw materials, the subsidy given should as far as possible be made to increase with the degree of local processing that an export item undergoes after allowing for the differential burden of local taxation that various export items may be carrying.

PROMOTION of exports through suitable incentives is well known. Even advocates of free world trade who would otherwise condemn export promotion as amounting to overt or covert subsidisation are beginning to recognise that underdeveloped countries are justified in giving tax concessions to their exports, especially of manufactured products, to be able to compete in the world market with similar products from industrially advanced countries. The most compelling reason for the underdeveloped countries to expand their exports is that unless their export earnings grow at a rate fast enough to meet the expanding import demands of development their economic progress has got to slow down. And in the short run, at least, import substitution not only offers no solution but even aggravates their problem. It is in this context that the efforts currently being made to promote exports in India through various measures have to be viewed.

I
The average annual exports during the First and Second Plans remained stagnant at around Rs 610 crores in value. Part at least of the reason for this stagnation in export earnings was that the Government and planners took from the very outset a defeatist attitude with respect to the scope for the expansion of export earnings. It is only lately that it has dawned on our Government and planners that in the process not only has India been made more dependent on external assistance but also her rate of economic growth has been possibly retarded. Hence a new awareness now of the need to promote exports.¹

As the 1964-65 Report of the Ministry of Commerce puts it: "Against this virtual stagnation during that period (i.e., 1951-61), the exports in 1964 have ... touched a record figure of Rs 835 crores (revised to Rs 815 crores in subsequent reviews), and the total increase in exports in 1963 and 1964 has been of the order of Rs 150

crores over the total exports in 1962." While this recent expansion in exports has been satisfactory, it will not be possible to sustain this rate of increase in exports unless, in the words of the same Report, "dynamic, dependable and realistic measures" are taken "to tap further increases from the existing stage of the economy".

II

In these past few years a number of measures have been taken to encourage exports. The objectives of most, if not all, of these measures is to make exporting a more remunerative business than it was in the absence of these measures. A business becomes more remunerative when either one is able to cut down one's cost or one is in a position to increase one's revenue or also when one is able to increase one's profits after tax. Any measure that reduces the exporter's cost, as for instance should be the case when an exporter avails himself of the railway freight rebate of between 25 per cent and 50 per cent on export consignments, should make exporting more remunerative than before. In the same category would fall any measure taken to reduce the cost of export credit or to provide insurance against export risks.

Likewise, a measure which serves to increase the exporter's revenue from exporting is bound to make it more attractive than before. In this category fall concessions made in taxation. But here a distinction must be drawn between two types of concessions: (1) the exemption from domestic commodity taxation, be it levied at the point of production or, at the point of sale; and (2) subsidisation and/or reduction in the liability to income tax. The first type of concessions are now generally accepted as the right ones to make because they enable the exporters to compete on the world market without carrying a differential burden of domestic commodity taxation. In fact, measures taken

to exempt exports from or compensate them for, local commodity taxation have ceased to be considered as concessions.² In India, too, there exists a drawback scheme under which the exporters are entitled to refund of customs duty paid on imported materials and excise duty paid on excisable materials produced locally.

It is only with respect to the second type of measures — subsidisation and/or reduction in the liability to income tax — that there goes on considerable argument about their justification and choice and then the extent of concession involved in each of such measures. It is to this second type of measures taken recently in India for the active promotion of exports that it is proposed to devote the rest of this paper.

III

Concessions to exporters in the second category may take the form of a subsidy per unit or unit-value of exports (we shall call this, price subsidy) or of a reduction in the tax on profit from exports (we shall call this income subsidy). No doubt, the same amount given away in either form will increase the profit on total exports equally but the increase will not be the same for various items of exports unless it can be assumed that profit-turnover ratio is the same for all items of exports.

Interestingly, in India the Government is now offering tax concessions of both the price-subsidy type and income-subsidy type to exports, all through income tax. The Finance Act of 1962-63 introduced a rebate of one-tenth of income tax (including super tax which is now merged with income tax) attributable to income from export.³ Thus an Indian company engaged in export business paid income tax on profits from exports at the rate of 45 per cent, if the effective rate of tax payable otherwise on its profits was 50 per cent. This tax concession is clearly of the income-subsidy type, linked not to the quantum of

One of the world's outstanding cigarettes

Wherever in the world cigarettes are smoked, the name Player's stands for quality—the outstanding quality that has made Player's Gold Leaf Filter Tipped one of the world's great cigarettes. Here's a filter cigarette rich in tobacco, rich in taste and with a reputation that matches its good looks. Try it—you'll agree that it is quite the most satisfying cigarette you have ever smoked.

export but to the income or profit made on exports.

Under the Finance Act of 1963-64, an additional special rebate of income tax was offered to essential industries, i.e., industries listed in the First Schedule to the Industries (Development and Regulation) Act of 1951, subject to certain exclusions, on their exports. This additional rebate of tax is allowed to a manufacturer who exports himself, or where the first purchaser from him exports, and is calculated on 2 per cent of the value of such exports subject to the limit of the income tax payable by the manufacturer on his total profits.

Let me illustrate how this additional rebate accrues to a manufacturer-exporter belonging to the category of industries eligible for this rebate. Assuming total sales (local as well as export) of Rs 1 crore, let export sales be put at Rs 10 lakhs, and total profit (i.e. on total sales) also at Rs 10 lakhs. Thus profit 'attributable' to export sales works out to Rs 1 lakh. Now, the effective rate of company income tax being 50 per cent for 'non-basic' industries, the tax on export profits will be payable at the rate of 45 per cent under the 1962-63 scheme of general rebate on all export profits. This means a general rebate of Rs 5,000 in this case. As for the special rebate, this is calculated on 2 per cent of export sale, i.e., on Rs 20,000, at the average rate of income tax payable on such income. Since the average rate of tax on export income is 45 per cent the total relief in this case through special rebate should be 45 per cent of Rs 20,000, i.e., Rs 9,000.

The important thing to note is that this additional special rebate, though given in reduction of an exporter's liability to income tax and subject to the constraint that the total income tax liability of the exporter as determined on the basis of his total income, i.e., including profits from non-export operations is calculated not on the basis of the tax-payer's profit but with reference to his turnover. Therefore, this special rebate is in the nature of price subsidy to export.

In the Budget for the current year, the Finance Minister offered a still further tax concession to exports. But this again is not available to all exports. According to this latest measure, exports of specified items are entitled to tax credit at rates ranging from 2 to 15 per cent of the value of exports. The tax credit certificate is to be issued by the Reserve Bank

and the amount of tax credit is adjustable against the existing income tax liability or against liability to income tax arising in the next 12 months. But in case there is no such liability or the amount of the tax credit certificate exceeds such liability, the exporter is entitled to refund payment in cash.

Tax credit resembles the special rebate in that both are linked to export turnover and not to profit. They can, therefore, be clarified as price subsidies to exports. I must hasten to qualify this statement because the Finance Minister justified the introduction of the tax credit scheme as a measure to compensate exporters for "the variety of taxes ... for which relief from taxation on exports is not available at present". In other words, the credit represents a drawback of tax already paid on exports. To the extent this is correct, the tax credit cannot be regarded as a subsidy. But the incentive aspect of tax credit is not reduced thereby. To the extent tax credit does not amount to a subsidy, it can be taken to remove the disincentive that

existed until now. Considered as providing relief against local taxes, it is important to note that the amount of tax credit does not attract income tax. Now the fact that local taxes are deductible for calculating taxable profits means that at 50 per cent income tax half the burden of these local taxes is shared by the Central Government. By the same token, non-taxable tax credit at the rate of 15 per cent turnover is tantamount to an offset against local tax burden of 30 per cent.

But while the special rebate (together with the general rebate of income tax on exports) cannot exceed the total income tax on all profit, in that very year of assessment, the tax credit will accrue to the exporter regardless of whether or not he is liable to income tax to at least that extent whether in the same year of assessment or the year following that or even both the years. This is quite an important difference.

Special rebate can be claimed only when one is making at least as much profit on one's total business operations, whereas tax credit is obtained

Table: Schematic Illustration of Tax Concessions given to Basic Industry Exports

Assumptions: (1) Profit to Turnover Ratio is 20 per cent, 10 per cent and zero per cent respectively to turnover of Rs 500, Rs 1,000 and Rs 1,000
(2) The basic industry is entitled to not only 'the basic industry rebate' on all income but also to the special rebate (as an essential industry) linked to its export turnover. But an 'essential industry' is entitled to only the latter rebate
(3) The firm is an Indian company

	(In rupees)		
	Profit 20%	Turnover 10%	Ratio Zero%
(1) Turnover (export)	500	1000	1000
(2) Profit	100	100	0
(3) Basic tax (without any rebate) @ 50% of	50	50	0
(4) Rebate as basic industry @ 5% of income	5	5	0
(5) General rebate on export profit @ 10% of the rate of tax applicable i.e. @ 10% of 45%	4.5	4.5	0
(6) Special rebate on 2% of export turnover at the average rate of tax, i.e. (50%-5%-4.5%) = 41.5%	4.15	8.3	0
(7) Tax Credit as a percentage of turnover :			
(i) Zero%	0	0	0
(ii) 2%	10	20	20
(iii) 5%	25	50	50
(iv) 10%	50	100	100
(v) 15%	75	150	150
(8) Net tax payable (3-(4+5+6+7))			
(i) at Zero tax credit	36.35	28.05	0
(ii) at 2% tax credit	26.35	8.05	-20
(iii) at 5% tax credit	11.35	-21.95	-50
(iv) at 10% tax credit	-13.65	-71.95	-100
(v) at 15% tax credit	-38.65	-121.95	-150
(9) Total Export Subsidy (5+6+7) :			
(i) at Zero tax credit	8.65	12.8	0
(ii) at 2% tax credit	18.65	32.8	20
(iii) at 5% tax credit	33.65	62.8	50
(iv) at 10% tax credit	58.65	112.8	100
(v) at 15% tax credit	83.65	162.8	150

Special Rebate is taken to be Zero on the assumption that the firm (in this illustration) manufactures only for export. If, however, the firm were to be manufacturing for both domestic sale and export and were making profit on the former, such that it is at least equal to the rebate of income tax on 2% of its export turnover, the figures would be 8.3 for basic industry and 9 for essential industry

BUY NATIONAL DEFENCE GOLD BONDS 1980

Subscriptions will be received in gold, gold coins and gold ornaments.

Bonds will be repaid in gold after 15 years.

Interest will be allowed at Rs. 2 per 10 grammes, free of income tax.

Bonds exempt from wealth tax and tax on capital gains.

Special concessions in respect of gift tax and estate duty.

No action will be taken against subscribers on the ground of violation of Gold Control or Customs Regulations or Income Tax Act.

Applications received at offices of Reserve Bank and Branches of State Bank and its subsidiaries.

on the strength of one's export business irrespective of the level of one's profit. To new comers, it can make quite a difference whether they are entitled to special rebate or tax credit. They can be sure of obtaining the latter but not the former. Of course, as far as the general rebate is concerned, it is directly linked to profit and is, therefore, available to exporters only if they are making profit (but, not necessarily on export business because no distinction is sought to be made between profit actually made on exports and non-export profit).

Let us demonstrate schematically how these three tax concessions which have evolved since 1962-63 operate in the case of a corporate firm engaged in manufacture and export. The firm in question is supposed to be engaged in what is classified as 'basic industry' (as, for instance, manganese ore mining) and is therefore, entitled to the 'basic industry rebate' of income tax of 5 per cent of income. At the same time, its exports are assumed to attract both the general and the special rebates. A firm engaged in non-basic but essential industry pays income tax at the rate of 50 per cent but is entitled to not only the general rebate on export profits but also the special rebate on 2 per cent of its export turnover. As for tax credit, calculations are made for each of the five possible cases, (i) no tax credit; (ii) 2 per cent tax credit; (iii) 5 per cent tax credit; (iv) 10 per cent tax credit; and (v) 15 per cent tax credit. The results are shown in the table on the previous page.

It can be observed from the table that for concerns entitled to tax credit the reduction in tax liability through tax credit can be quite substantial and exceeds other export rebates (general plus special) put together, even when tax credit is given at the rate of 2 per cent of export turnover. This is true for both a firm engaged in basic industry and one engaged in essential industry. At rates exceeding 2 per cent tax credit would be the most important of the tax concessions available to exporters. Of course, as things stand to-day, while all exporters are entitled to the general rebate of income tax, most items entitled to tax credit are not eligible for special rebate. In most cases, it is either tax credit or special rebate to which an export item is entitled. But items not eligible for tax credit might be entitled to bonus import entitlement because it appears from the list of items declared eligible for tax

credit that items entitled to bonus import licences are excluded.

In the table we have considered cases of 3 types of firms, those with a 20 per cent ratio of profit to turnover, those with a 10 per cent ratio and those with zero per cent profit. The 10 per cent ratio appears to be typical of the organised industries in India on the basis of the Reserve Bank's study of public limited companies,⁴ and it is through this sector that most exports in India can be said to pass, be it tea, jute or engineering goods.

It is interesting to observe that the total export subsidy for the 10 per cent ratio of profit to turnover works out to nearly twice the total subsidy for 20 per cent ratio when tax credit is given at 15 per cent and as one moves upward the gap narrows down until we reach the no-tax-credit position where the subsidy for 10 per cent ratio is higher than that for 20 per cent ratio by 48 per cent. (Even this is accounted for entirely by the special rebate on export turnover). On the other hand, the gap in subsidy between 10 per cent ratio and zero ratio narrows down in relative terms as one goes down from zero tax credit to 15 per cent tax credit. The explanation is simple. Since tax credit is based on turnover, the higher the rate of tax credit the greater is the significance of subsidy through tax credit in the total subsidy.

IV

Of the three tax concessions available to exporters, one, i.e., the general rebate of income tax, is linked to profit and two, i.e., the special rebate and tax credit, are linked to export turnover. Elsewhere, I have argued and attempted to demonstrate that when the objective is to promote exports the same amount of Government revenue given away by way of a price subsidy should yield greater exports than if it were given away in the form of income subsidy.⁵ If the firm is maximising profit, an income subsidy should leave its marginal revenue and cost schedules undisturbed and, therefore, the firm's output (in this case, export) and price will not be affected by income subsidy. The price subsidy will, however, affect the cost schedule and, therefore, output and/or price, assuming no inelasticities. If we drop the profit maximisation assumption, but concede differences in profit-turnover ratios, the subsidy related to turnover favours those with lower profit-turnover (or higher turnover-profit)

ratios and the subsidy related to profit does the opposite with the result that the same amount of revenue given away in the proper subsidy should secure a higher turnover than if it is given away in the latter type of subsidy. Since the objective of export promotion is to secure higher net export earnings (i.e., after meeting the cost of imported inputs of exports), the right thing to do would be to relate the subsidy to the value of export *net of import cost* involved (i.e. to the net value added in the country.) Thus exports of higher import-content will attract a lower subsidy than export of lower import-content.⁶ Of the two price subsidies now being given in India, one i.e., the special rebate on 2 per cent of export turnover is available at the uniform rate of income tax on the gross value of turnover of the items eligible for it. Under the tax credit scheme however, different rates of tax credit are laid down for different items of export. Could it be that the rate-schedule has been so devised as to favour items with lower import-content as against those with higher import-content? The rate-schedule for tax credits has reportedly been drawn up by the Advisory Board on Tax Credits for Exports in the light of the principles enunciated by the Finance Minister in his Budget speech. The Finance Minister, as we have observed above, defended the introduction of tax credits not as a measure to subsidise exports but mainly as a step towards reimbursing the exporters for a variety of local taxes with respect to which relief is not given to exports because of the difficulties involved in making refunds. Now almost all the items chosen for tax credit are either raw materials or simple manufactures based on Indian raw materials and it is difficult to say that manganese ore should get 15 per cent tax credit and iron ore 10 per cent because the former has lower import-content than the latter. But it could possibly be true that loose tea carries a lower tax credit (2 per cent) than tea in consumer packs of 1 kg and less (5 per cent) because the latter might be carrying a bigger burden of local duties. The differentiation in local tax burdens may have been found to arise because while export of loose tea might be escaping sales tax altogether (since actual exports are exempt from sales tax), that of packets of tea might be paying sales tax. In fact, one can almost generalise and say that the higher the degree of processing an export item undergoes lo-

cally, the greater is the chance of its carrying higher local tax burden.⁷ On the whole, it appears that the criterion of import-content has not been taken into account in the fixation of the rate schedule for tax credits.

Of course, there are valid grounds also for relating the rate of tax credit to the degree of processing of local raw material, the rate increasing with the degree of processing both as a counter-measure to the time-worn western practice of imposing higher import tariff on more highly processed imports from primary producing countries and also on balance of payments and infant industry considerations. But none of these considerations, however worthy, were advanced for the introduction of the tax credit scheme probably because it was felt that a measure like this on any of these grounds would be difficult to "sell" to GATT.

V

On the basis of the 1964-65 level of India's exports, the annual cost to the exchequer on account of the three tax concessions to exports would work out as under:

	(Rs Crores)	(Per Cent)
(1) General rebate	4.5 — 5.5	17
(2) Special rebate	2.5 — 3.5	11
(3) Tax credit	22.0 — 23.0	72
Total	29.0 — 32.0	100

It is too soon to say whether or not these concessions have, and if so to what extent, contributed to the enlargement of India's export earnings. But it does follow from our analysis above: (i) that the outlay on special rebate and tax credit should yield higher dividends in the form of higher export earnings than the outlay on general rebate on income tax; (ii) that since the underlying objective is to increase net export earnings of the country, both the special rebate and tax credit should be so re-cast as to link the subsidy to the net value-added in India; and (iii) as regards exports based on Indian raw materials, the subsidy given should, as far as possible, be made to increase with the degree of local processing that an export item undergoes, after allowing for the differential burden of local taxation that various export items might be carrying.

The additional demands imposed lately on the country by defence makes export promotion even more urgent than before and it becomes important that not only should we spare no effort in expanding our exports to the

maximum possible but at the same time we should endeavour to secure maximum results from every rupee of outlay on export promotion. If this is accepted, our export tax incentives must be recast.

Notes

¹ See Manmohan Singh, "India's Export Trends" (1964), pp 337-400.

² As early as in the early twenties J Viner said that the drawback system and allied devices conferred no special advantages on the exports in their competition in outside markets but merely mitigated the handicap the export trade was subject. See his "Dumping: A Problem in International Trade" (1923), pp 13-4.

³ It is important to note, that this is not the same thing as income actually arising from exports. The

term 'attributable' is interpreted as implying the proportional division of total profits among export and non-export business on the basis of respective turnover.

⁴ See Reserve Bank of India Bulletin for July, 1964.

⁵ See my 'Income vs. Price Subsidy to exports' in *Economia Internazionale*, November 1963, Pages 1 to 11.

⁶ See my "Export Promotion through Import Entitlement", in the *Economic Weekly* of May 22nd July 15, 1965.

⁷ One cannot, however, overemphasise the need for detailed studies with respect to local-tax-burdens which exports from India have to carry so that our exports can be fully relieved of the burden.

The Marketable Surplus Function for a Subsistence Crop

Reply to Comments

Raj Krishna

In this paper I discuss some of the issues raised in the comments made by C H H Rao, I N Krishnaji, Manoranjan Majumdar and B Prasad ("The Economic Weekly", April 17 and May 15, 1965) on my paper ("The Economic Weekly", 16th Annual Number, February 1965.)

IT is obvious from the title and contents of my paper that all my "inferences" relate only to a single subsistence crop. The words "a subsistence crop" occur even in the passage quoted by Rao. But he seems to assume that I am generalising my findings into propositions about the marketable surplus of all crops, or all food crops. Since my paper contains no propositions at all about the marketable surplus of all crops, or all food crops, I find many of Rao's comments interesting but not very relevant to my paper.

Market supply relations pertaining to individual crops, all crops, and groups of crops, need to be sharply distinguished, and analyzed and estimated separately, for there is no *a priori* reason to expect that they should be similar. They are often mixed up in the literature and, I am afraid, in the comments on my paper which was explicitly confined to single-crop relations.

As for my conclusion regarding farm size policy, Rao omits the following important sentences in the passage he has quoted:

"There may be important reasons for altering the farm size structure. But in areas of constant sale propensity the necessity of increasing the marketable surplus need not be one of them." (The marketable surplus referred to here is that of a single crop.)

We do want changes in the farm size structure. And it is likely that the output elasticity of the marketable surplus of *all crops* will depend critically on the structure. The point made in the passage is only that *one* of the reasons for changing the structure, viz, an increase in the surplus of *a single food crop* may be weak *if and where* the marketable surplus relation for *this crop* is linear.

Rao says that I have "overestimated the elasticities of marketable surplus because the number of hired labourers and consequently the amount of kind payments increase steeply with the increase in farm size." But my elasticities relate to the marketable surplus as I

have explicitly defined it in the beginning of my paper. Pertaining to marketable surplus so defined they are what they are. The statement that they are "overestimated" with reference to this definition is meaningless. What Rao has in mind is that the elasticities of marketable surplus, differently defined, will be different—with which I agree.

Rao says that I "could not hold the family size factor constant." On this point I have to invite his attention to footnote 5 of my paper. In this, I have reported that "experiments revealed that if it (family size) is specified as a variable in addition to output, it turns out to be non-significant in most cases". Rao surely knows that specifying a variable in addition to others in a multiple regression is one way of "holding it constant" for estimating the coefficients of others. Deflation of the market sales as well as output by family size could be another way. The choice between these two specifications depends *inter alia* on the form in which estimated coefficients are more useful. I preferred the former specification because the change in the coefficient of output when family size is specified as an additional variable would be very informative. Now, we have reason to believe that the output (of a single food crop) and family size will be positively correlated. But in any given year family size determines output rather than being determined by output. And since the coefficient of output does not change significantly when family size is also specified as a variable, there is a strong case for inferring that output alone is a sufficient explanatory variable.

Rao insists that any hypothesis about "the marginal propensity to consume (or sell) would be meaningful only if it can be shown that the crop under study is the only crop grown in these areas or is at least the predominant crop." This insistence, as indeed his whole comment, boils down to the view that only relations about the marketable surplus of output as a whole are worth study; the study of single-crop relations is useless. This view is under-

standable because in the literature on marketable surplus most writers have been consciously or unconsciously pre-occupied with the marketable surplus of all crops. Rao merely conforms to this orthodoxy. But I suggest that the analytical basis of this exclusive pre-occupation with the surplus of all crops needs to be critically examined.

The relation between the value of sold output and the value of total output (of all crops) is considered important for many reasons. (When many crops are involved we can only talk of aggregate money values—aggregated at market prices.) The ratio between the two can serve, first of all, as an index of the monetisation of the agricultural economy.

Secondly, the total marketable surplus can be linked to the potential for capital formation in a developing economy. But the relation between the two has to be clearly understood. The total marketable surplus is *not* equal to the saving or investment of the agricultural economy. (I am neglecting, in the Indian context, the direct taxation or confiscation in kind of all or most of the marketable surplus for investment.) Only a part of the cash received by the farmers is likely to be saved; the rest is likely to be spent on manufactured goods or paid out in the form of rent, interest and taxes. We do not know much about the proportion of the value of sold output that is finally saved by farmers, landlords, moneylenders and the government. In addition, of course, some saving is directly generated by retained output in the form of farm improvements by extra labour.

When the sold output moves into the urban sector, its gross value, again, is not equal to potential saving. The saving is merely equal to that proportion of the profit from the sale of this output—earned by traders and/or the State—which is, in fact, invested.

Therefore, the total saving in the rural sector and the urban sector, taken together, bears a very tenuous relation to the gross value of sold output. We can only say, generally, that the corre-

lation between the two is likely to be positive *ceteris paribus*.

A third reason why we may be interested in the value of the total marketable surplus is that it represents the total flow of foodgrains and raw materials from the rural sector to support the growing urban, industrial sector. Insofar as this is the reason for our interest in the total marketable surplus, what we need is not merely a balancing of urban demand and the marketed supply of all agricultural commodities but of each commodity separately. The adequacy of the total agricultural outflow is not enough for smooth growth; the imbalance in the urban market for each commodity must be minimized.

Therefore the behaviour of the market supply of each of the foodgrains is a matter of as much importance from the point of view of growth as the behaviour of the market supply of all agricultural commodities. And it is the farmer's behaviour in respect of the sales of foodgrains which presents difficult problems because in the case of foodgrains the proportion of retained output to the total output usually exceeds 50 per cent, whereas in the case of non-food crops, it is negligible.

Hence the need for studying separately the marketable surplus relations pertaining to individual food crops. Their study cannot be subsumed under, or rendered superfluous by, the study of relations about the total marketable surplus, though the latter is, of course, important. To say that only the study of marketable surplus relations for all crops is important is like saying that after estimating a Keynesian consumption function we need not estimate elasticities of demand for individual commodities.

M Majumdar has spelled out the implications of the linear cross-section marketable surplus function about the consumption behaviour of the farmer. If the output elasticity of marketable surplus falls as output increases, the output elasticity of consumption increases. Majumdar finds this unacceptable because all consumption studies show that the income elasticity of consumption falls as income increases.

His difficulty arises from his assumption that a rising output elasticity of the consumption of a single food crop necessarily implies a rising income elasticity of consumption. He makes his assumption on the ground that "farm income is an increasing function of farm output." But he misses the fact that the total farm output of all commodities does not enter my equations. Only the

output of a single food crop is specified as a variable. Income is, of course, positively related to total farm output but its relation to the output of a single food crop (say, wheat) is not systematic enough to be easily specified. Wheat output can increase without total income increasing; and total income can increase without wheat output increasing. Since wheat income is only a fraction of total income, it is quite possible that the elasticity of wheat consumption with respect to wheat income may increase and at the same time the elasticity of wheat consumption with respect to total income may be falling.

It is easy to see that if non-wheat revenue is independent of wheat output, the income elasticity¹ of wheat consumption equals the output elasticity of wheat consumption divided by the ratio of wheat revenue to gross total revenue.² If the output elasticity increases (say, from .2 to .25) as wheat output increases, the income elasticity can nevertheless decrease (from .6 to .5) if the ratio of wheat revenue to total revenue rises (from .33 to .5).

Thus the apparent contradiction between a linear marketable surplus function for a single crop and the generalisation that income elasticity of consumption falls as income increases is not real in many cases. However, the two elasticities will increase together (1) where agriculture is monoculture (subsistence farming) so that wheat revenue is nearly the gross total revenue; or (2) where farmers are so resourceful that as wheat output increases by a certain proportion, their non-wheat revenue increases by a larger proportion so that the ratio of wheat revenue to total income falls substantially.

Perhaps that is why at the lower and upper extremities the "general marketable surplus function" has curvature. Where the farm size structure is characterised by the dominance of extreme sizes, the function was found to be quadratic.

I do not understand why anyone should insist that it must be linear or quadratic everywhere in a complex dual agriculture. A continuously increasing marginal propensity to sell (after a point) will be a very convenient result. But in the real world we do seem to have situations in which it is constant over some ranges of output. If many different forms fit different parts of the real world the researcher must live with the diversity.

The new form of the marketable surplus function proposed by Shri Majumdar is very interesting. But it needs to

be tested with data. *A priori* it seems likely that this function will be a better specification for the relation between marketable surplus and total income rather than the relation between marketable surplus and the output of a single crop.

As for Majumdar's last point, I do not see why in a cross-section analysis (of data for a single year) we need to specify production functions (of each of the farmers?). We do not specify how the income of every person is determined in estimating the income elasticity of consumption of individual commodities from cross-section data. In time series analysis, however, it will be necessary to write the output function (of the single crop) and other relations to derive a marketed supply function. In any case it is very important to estimate the relation between the marketable surplus and different (given) levels of output.

I agree with Krishnaji that in the case of purposive samples the result of the usual test of linearity is open to doubt. But in column 5 and footnote (b) of Table I, I have explicitly stated the nature of every one of the 23 samples. I noted that 12 samples were census samples—comprising every family growing the subsistence crop in a village; 2 were random samples; and 9 were purposive samples. In the case of the purposive samples, the sources of data inform us that big, medium and small farmers were included in the samples, though strictly stratified sampling was not undertaken. In the case of the 14 census and random samples the tests will apply. In the case of purposive samples, they would not; but since some attempt was made by data collectors to include farms of all size groups (without knowing that someone would use the data for estimating marketable surplus relations) it can be argued that though the results may be biased, the bias would not run in any particular direction because of intentional sampling to produce it.

B Prasad finds errors in my "selection" of samples. I have to remind him that I have not "selected" them at all. My paper is an initial exercise to get some clues about the nature of marketable surplus relations with whatever cross-section data I could lay my hands on. (All the sources are indicated in the Appendix.) My bias or prejudice is irrelevant to my results which were surprising even to me.

Representativeness of the samples for India as a whole has nowhere been claimed by me. My numerical findings

will hold strictly only for areas to which they relate. Even in the passage cited by Prasad I have cautiously said "in the areas covered by these samples..." And, as I reported, linearity was found in the relations for some and non-linearity in the relations for other areas. I set out the empirical and policy implications of both. I have no investment in linearity! I would agree that for firm all-India generalisations more work should be done with data for more regions or representative sample data for the country as a whole.

Prasad demands that "there should be no underlying differences between areas from which data are selected." But the linearity (or, for that matter, the non-linearity) of the M-Q relation will be an interesting general hypothesis only if it is found to exist in many otherwise divergent areas.

He also asks that "conditions must be the same for all items in the sample." I suppose that since every sample includes farmers from the same area, this condition is satisfied in the broad sense in which it is meaningful. But taken literally this condition would imply that only one item would suffice!

Prasad accuses me of ignoring the

price variable. But he surely knows that in a cross-section study the price variable cannot be dealt with. And time series data about marketable surplus are indeed not available. But I have discussed an indirect method of estimating the price elasticity of marketable surplus in an earlier article. (*Indian Journal of Agricultural Economics*, July-September 1962). This elasticity is negative in some but not in all circumstances.

Prasad objects to the inclusion of farms of different sizes in the samples. I do not know what purpose would be served by including only farms of a given size class or only pure subsistence farmers who sell nothing. From a study of this subclass alone we could get no knowledge about the sale behaviour of those millions of "dual" farmers operating farms of various sizes, who consume as well as sell a part of their food output and whose behaviour determines the aggregate marketable surplus. Prasad would certainly agree that we do need this knowledge.

Notes

- ¹ We may neglect for our immediate purpose the distinction between income and gross revenue.

- ² Let wheat consumption C be a function of Y , the gross revenue from all commodities produced by the farmers. The gross revenue from wheat is PQ , at the given price P of wheat. If the non-wheat revenue is called R , then

$$Y = PQ + R$$

Differentiating $C = f(Y)$ we have

$$dC = f'(Y)(PdQ + dR)$$

$$\frac{dC}{dQ} = f'(Y) \left(P + \frac{dR}{dQ} \right)$$

$$f'(Y) = \frac{dC}{dQ} / \left(P + \frac{dR}{dQ} \right)$$

$$e_{CY} = e_{CQ} \cdot Y / Q \left(P + \frac{dR}{dQ} \right)$$

On the simplifying assumption that non-wheat revenue is independent of wheat output ($\frac{dR}{dQ} = 0$)

$$e_{CY} = e_{CQ} / \frac{PQ}{Y}$$

If $\frac{dR}{dQ} \neq 0$, the income elasticity may increase or decrease following an increase in e_{CQ} depending on the magnitude of changes in Q and R .

Oscar Lange's Contribution to Economics

A Brief Survey

Krishna R Bharadwaj

OSCAR Lange enjoys the unique distinction of having been an active and practising socialist who won recognition for theoretical rigour and scientific objectivity even outside the socialist world. As an economist he realised that economic theory was essentially a technique of reasoning with its own objective scientific structure. He was neither apologetic for making use of the analytical techniques developed mostly by the neo-classicists, for he did not deem it heresy to borrow useful scientific techniques, nor did he indulge in aggressive defence of outworn tools under the misconception that clinging to obsolete tools was part of establishing one's socialist convictions. As a socialist, he realised the importance of organisational and institutional factors in determining the course of the evolution of an economy.¹

The administration of scarce resources is influenced by the institutional and organisational structure of society. In the first place, the wants which the resources are directed to satisfy are determined by the standards of civilisation evolved historically. Secondly, the way in which scarce resources are procured, utilised and distributed among different persons is also influenced by prevalent organisations and institutions. Thus, economic laws can be understood and interpreted in the context of a given institutional set up. However, Lange emphasised again and again that this did not rule out the universal applicability of a logical system of analysis. For any given set of social objectives and with specified assumptions regarding empirical conditions, conclusions could be drawn by using the rules of logic and verification which have inter-personal validity.

Without totally rejecting "bourgeois" economics on ideological grounds, Lange assessed dispassionately the relative merits of the Marxian mode of analysis and the "bourgeois" economics systematised by Marshall.² The latter had failed to build up a consistent theory of economic evolution and tended either to deny the existence of historical tendencies (like that towards the creation of oligopolies) or gave only a historical description. Its excellence, however, lay in being able to develop a formal theory of economic equilibrium for an exchange economy

which could describe the day to day operation of a capitalist economy more or less satisfactorily. Marxian Economics, however, had a broader temporal vision in that it developed a theory which purported to investigate the causal mechanism that seemed to guide the evolution of a capitalist economy. Lange clearly recognised that this was due not to any inherent superiority of the concept of labour theory of value but to the exact specification of the institutional datum which demonstrated the "necessity" and the "inevitability" of economic change, and that the theory of exchange and the pricing process based on formal principles of economic equilibrium had a general applicability even though the concrete results of the economic equilibrium process would be modified by the mode of ownership of resources, etc. As a guiding principle of allocation "the law of value" was as much relevant to a socialist economy as to a capitalistic one even though the mode of its operation was bound to be different in the two systems.³ Lange was objective enough to point out that the labour theory of value was not adequate to the task and that, therefore, the methods and techniques of marginal analysis could be profitably used.

From the point of view of methodology, then, Lange's masterly contribution lay in judiciously discriminating the objective elements from the normative, the essentials from the inessentials, the objective rules of logic from the specification of empirical historical conditions. As a scientist, his merit was that he was not carried away by the universality and generality of analytical techniques to reach fallacious conclusions about the universality of the concrete results obtained from applying those techniques to given historical situations; nor was he overwhelmed by the importance of institutional factors to conclude that "bourgeois" economics was completely irrelevant to the management of a socialist economy.

His uncanny knack of sifting and synthesising and his ability to see the inherent similarities of logical structures and to explain differences in results is evident in many of his theoretical contributions which appeared in the forties. His thorough schooling in the Walrasian system proved to be a valuable asset to him. Thus in his well-

known article "Say's Law — A Restatement and Criticism"⁴ he investigated the relationship of Say's Law to the general theory of prices and to the theory of money and showed how the proposition that there could be no excess of total supply of commodities (since the total supply of commodities is identically equal to demand for all commodities) held only under the special assumption regarding the nature of demand for money that money functions only as a medium of exchange and that there is no desire to change the total cash balances in the economy except to adapt them to changes in money supply. With this special assumption, the proposition, he demonstrated, was only a simple corollary of the Walrasian formulation of the theory of prices. Lange exposed the contradiction in the classical treatment of the theory of money: Either Say's Law could be accepted, leaving money prices indeterminate or prices could be made determinate at the cost of discarding the assumption of neutrality of money and hence Say's Law. The analysis of money, he thus showed, had to be built into the general theory of relative prices and not treated independently and later plastered upon it.

In his "The Rate of Interest and the Optimum Propensity to Consume"⁵ he demonstrated more positively how the Walrasian theory could accommodate money and that, so far as monetary statics is concerned, most of the propositions about money and monetary processes are either contained in the Walrasian system or could be derived by making additional assumptions. In this sense, both the traditional and Keynesian analysis were a special case of the more general Walrasian system.

The same integrating vision, bringing together a number of propositions within the framework of a more general analysis, is also evident in his "The Place of Interest in the Theory of Production"⁶ where he restated many of the fundamental propositions in the theory of rate of interest in the context of the general theory of production and pricing. Also his "Complementarity and Interrelations of Shifts in Demand"⁷ made clear the notion of complementarity in demand and showed how the Keynesian and the classical analysis concerning the effects of changes in the desire to hold

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

cash could be brought together. The classical theory had thought exclusively of substitution between cash and commodities and the Keynesian analysis mainly of that between cash and securities. However, since the desire to hold cash could lead to a substitution of cash for both commodities and securities, the increase in liquidity preference could affect commodity prices and/or employment, not only indirectly *via* the rate of interest but also directly through a downward shift in the demand for commodities.

Among his more well known theoretical contributions is his book "Price Flexibility and Employment" which appeared as a monograph of the Cowles Commission. There he put to remarkable use the apparatus of the general equilibrium theory. The genesis of this work was the long-drawn controversy regarding wage flexibility and unemployment between the Keynesians and the neo-classicists. Lange examined the problem of price flexibility and employment in the wider context of the processes which upset equilibrium and which prevented its automatic restoration *via* flexible prices, such as the tendencies towards oligopolisation, the growth of technological unemployment, worsening of investment conditions, etc. Even though some of his conclusions were in line with Keynesian thinking on wages, employment and monetary policies, his policy recommendations were strongly anti-monopolistic and more staunchly socialistic in orientation. With the tendencies towards oligopolisation of the economic structure he feared that the anti-crisis policies of Keynes working through the multiplier effect of investment would not be sufficiently strong.

Lange will also be remembered for his contribution to welfare economics. In his much referred to article "Foundations of Welfare Economics"⁸ he lucidly presented two sets of propositions in welfare economics: the one, based on maximization of a vector of utilities, permitting increase in one individual's utility only when it does not diminish another individual's utility without concerning itself with the problem of the optimum income distribution; and the second, based on maximization of a social value function where maximising conditions are specified directly in terms of commodities and incomes allowed to different individuals or in terms of marginal utilities. These propositions did not require that utility be measurable.

Lange was, of course, no mere theo-

rist. He could rise to great heights in theoretical abstraction but he was also intensely aware of one of the essentials of economic theory, namely, its operational validity. His widely acknowledged piece of creative contribution, the essay "On the Economic Theory of Socialism", carried forward the analysis of Taylor in demonstrating the applicability of the trial and error procedure implicit in the competitive market pricing mechanism to decentralized decision-making in a socialist system. The parametric function of prices was fully exploited here in order to evolve a procedure by which efficient decision-making under centralized socialist management could be undertaken in a manageable fashion. The rules of optimization to be followed were similar to those under competitive markets — in fact, the trial and error procedure was to mimic the competitive mechanism in its method of successive approximations. This well-known paper of Lange, together with A P Lerner's excellent work "Economics of Control" opened up a new field in welfare economics and the theory of planning. No doubt, Lange's exposition left many loose ends like the possibility of convergence of successive approximations, the exact magnitude of adjustments required at every step, etc. These problems have since been taken up for more rigorous and exact formulation.

Lange saw in econometrics, linear programming and cybernetics the possibility of evolving efficient planning techniques. Himself a statistician, he had papers in both theoretical statistics and in econometrics to his name. He devised a simpler and a direct method of deriving elasticities of demand and supply.⁹ His paper on "Some Observations on Input-Output Analysis"¹⁰, which he wrote during his stay at the Indian Statistical Institute, Calcutta, in 1955-56 contains an excellent exposition of input-output analysis as a tool for planning. He wrote also a book, "Introduction to Econometrics" to bring out the relevance of econometric techniques to planning. His interest in planning was not just methodological. He himself assisted plan formulation in India (during the Second Plan period), Ceylon, UAR and Iraq where he was specially invited for the purpose. In his home country, Poland, he was continuously associated with planning. What brought freshness to his approach was his constant awareness that the methods of planning and economic management themselves were influenced by the growth of productive forces and new procedures would have to be evolved

to suit the nature and pace of the changes in productive forces.

In 1957, Lange began work on a monumental project—a systematic account of political economy, which he planned in three volumes. The plan was born out of the conviction that "individual economic problems are bound together in a whole and it is difficult to grasp them in isolation. To resolve these problems it is also necessary to bear in mind the current state of scientific literature and contemporary historical experience. It is only in this way that Marxian scientific thought in the field of political economy is possible". The first volume, which has been translated into English, dealt with the more philosophical problems of methodology—the connection between political economy and the materialist interpretation of history, the nature of economic laws, the relation of political economy to sociology, the problems of social conditioning and the social functions of economic knowledge. The second volume dealt with the theory of reproduction and accumulation, market production and price formation. The last was to be devoted to a detailed analysis of the mode of operation of the law of motion of capitalist and socialist formations.

Lange's contribution thus ranged from abstract theory to practical problems of planning, from discourses on methodology to the formation of plans for development. The wide range of his intellectual interest, however, did not mar the excellence of his work; in fact, awareness of reality lent direction and purpose to his theoretical efforts and the theoretician in him restrained him from casual and imprecise generalisations.

A Normative Index of Industrial Production

Ashok V Desai

A normative index of industrial production can be constructed with a notional set of weights based on a desired or planned pattern of output. The difference between the planned and the current outputs will then give the increases in the production of different goods that are desired; and given a set of prices, weights in terms of value of output or value added can be derived. The index so calculated will permit the comparison of the actual growth of output with the target rate of growth. The present official index is useless in the context of judging the fulfilment of Plan targets.

An attempt is made here to calculate a normative index of industrial production. As compared with the official index, the normative index gives higher weights to industries for which a higher rate of growth is planned. Almost consistently it shows under-achievement of Plan targets. But the under-achievement is far less than the official index would suggest.

AN index of industrial production reflects the change in industrial production over a period and must, therefore, be a weighted average of changes in the output of particular industry. By taking an average, one expresses information about a number of magnitudes in terms of a single quantity and thereby inevitably loses a lot of information contained in the original figures. The information lost will be insignificant if the output of all industries changes at the same rate; in this case, the general index will accurately portray the output changes in each industry. The more dissimilar the proportional changes in the output of different industries, the greater will be the information lost in the general index.

Hence a general index is an unsatisfactory source of information wherever there are systematic changes in the

structure of industry. This is reflected in the fact that the Laspeyres indices that are calculated officially become "unrepresentative" within a few years and a change in weights is required. However, the unrepresentativeness has nothing to do with particular weights; it would remain whether the index used base-year weights, current-year weights, chain weights or any combination of them.

It might be thought that a chain index would take adequate care of structural change by incorporating a frequent change in weights. But movements in a chain index owe partly to changes in production and partly to changes in structure, and there is no unequivocal way of defining the latter. A forward-looking chain index, i.e., one which uses weights of the preceding year, will give different results from a

backward-looking one; if it uses the average value of output over a period as weights, a change in the length of the period will yield a different index. And where changes in industrial structure are persistent, different chain indices will give different trends. In these circumstances it is difficult to say what exactly a chain index is measuring.

A stable set of weights can in some cases be derived by classifying commodities into groups of substitutes. If rates of substitution can be established between competing commodities on the basis of their relative efficacy in use, a single index of their outputs can be derived by weighting them in proportion to the rates of substitution. If changes in relative outputs are primarily due to substitution, it may turn out that the relative outputs of groups of substitutes are fairly stable and a re-

Table 1: Index of Industrial Production

presentative set of weights for them can be derived. However, the possibility of determining *technical* rates of substitution is essential here: the supposition that subjective rates of substitution exist and are equal to relative prices is just a part of economists' folklore and does not have a strong enough empirical base to be of any use.

It is possible that this method of grouping substitutes together might enable us sometimes to obtain a satisfactory index of the output or use of consumer goods. When we come to materials and capital goods, however, their division into groups of substitutes is almost impossible. The number of purposes that they can serve simultaneously can be quite large, and patterns of substitution between them correspondingly complex. Even the theoretical problem of establishing rates of substitution in such circumstances is frightfully difficult. If we observe the fact that technical progress entails systematic substitution of goods, it becomes evident that the substitute group approach must be abandoned at least for the present.

The difficulty arises because we look for a set of weights in the actual figures of output or value added, and it can be overcome by giving up the search. In other words, the solution lies in a notional set of weights; and a notional set can be derived if we are given a desired or planned pattern of production. The difference between the planned and the current outputs will then give the increases in the production of different goods that are desired; and given a set of prices, weights in terms of value of output or value added can be derived. The index so calculated will permit the comparison of the actual growth of output with the target rate of growth. Such an index has been calculated here.

Indices of production by industries are given in the *Monthly Statistics of the Production of Selected Industries of India*.¹ Value added by them in 1960-61 and target value added in 1975-76 are given in "Notes on Perspective of Development, India: 1960-61 to 1975-76".² We have used the difference between the two, i.e., the target increase in value added from 1960-61 to 1975-76 as the basis for weights.³ The weights thus derived are given in Table 1, along with the current official weights based on value added in 1956.⁴

Use has been made of the estimates in "Notes on Perspective" because they are the only sufficiently detailed figures

of planned increases in output that are available. Differently weighted indices might become possible if other equally detailed plans become available; their significance will then depend on the quality of the underlying plans. There can be as many indices of this type as there are norms; and each such index would be meaningful only in the context of its norm.

As compared with the official index the normative index gives higher weights to industries for which a higher rate of growth is planned (Table 1). One way of describing the procedure would be that the normative index is a Laspeyres index which uses shadow prices instead of base-year prices: the shadow prices being equal to the base-year price multiplied by the ratio of the projected growth rate of the particular industry to the projected growth rate of all industry. This index, thus, incorporates a simple device to assign higher prices to those industries whose output it is planned to increase rapidly, and gives a better idea of plan achievement.

The relevance of the normative index to plan fulfilment is brought out in Table 2. This table presents annual rates of growth of output in different industries from 1956 to April 1965; besides, it gives the annual changes in

the official and in the normative index, and the exponential rates of growth envisaged in the "Notes on Perspective". Almost consistently, the normative index shows under-achievement of the perspective plan targets. But the under-achievement is far less than the official index would suggest: in fact, the official index is useless in the context of the fulfilment of the perspective or any other plan.

Looking at the detailed growth rates, it is evident that the under-achievement is common to almost all industries. The only industries that grew in 1956-61 at the rates envisaged for 1960-75 are tobacco and electricity generation; this promises to hold in the Third Plan period also. Under-achievement is general and persistent, and in this respect there is no difference between, say, consumer goods and other industries or import-dependent and other industries.

It seems likely, therefore, that either there are some general factors retarding industrial growth in this country or there are mechanisms which spread the influence of bottlenecks widely. Further light on these issues cannot be thrown by output indices; an analysis of industrial investment and capacity utilisation is called for. It is proposed to undertake this in a further study.

Notes

¹ Published by the Central Statistical Organisation, Calcutta. We have used the May 1965 issue where the figures are given on pp 298-326.

² Published by the Perspective Planning Division of the Planning Commission, April 1964; Tables B-2 and B-3.

³ While the correspondence between

the industries in *Monthly Statistics* and in "Notes on Perspective" is clear in most cases, the following observations are necessary to explain what we have done. Orders 1 to 3 and 5 in the "Notes" are taken to form the food manufactures group. Orders 21 to 23 are put in the textiles group. Order 16 is taken to cover the apparel and footwear group and the leather and fur products group, and its value

added is divided between them in proportion to their weights in the official index. Orders 19 and 24 are taken for manufactures of wood, and order 31 (matches) is put into chemicals. Orders 27 and 28 are put together as petroleum products, and 25, 26 and 29 to 31 as non-metalliferous mineral products. Metal products are taken to comprise orders 89 to 93 and '60. ⁴ See *Monthly Statistics*, pp 280-297.

MMGI

is now within the first 10

Five years ago it was not even among the first 20

MMGI's gross premium in 1964 increased by 27% over 1963. Its claims cost in terms of premium income at 41% is the lowest among larger insurance companies.

It is the customer confidence in its prompt settlement of claims and personalised service that has made MMGI the fastest growing general insurance company in India today.

The Life Insurance Corporation of India

Statement by the Chairman, Shri B D Pande

THE following is the Statement by Shri B D Pande, Chairman, at the Hundred and Thirteenth Meeting of The Life Insurance Corporation held in Bombay on November 1, 1965:

The draft of the Annual Report and the Statement of Accounts for the period 1st April 1964 to 31st March 1965 have been circulated and are now before us for consideration.

Before I proceed with my observations on our working for the last year, I have, with deep regret, to report the sad and sudden demise of my predecessor, Shri B K Kaul, who was the Chairman of the Corporation from 1st March 1962 to 28th February 1965. Associated with the Corporation from its inception, he rendered valuable services to the institution, both as a member and as a Chairman. A Resolution, placing on record the deep sense of sorrow of all within the corporation, was duly passed and conveyed to his family.

I also regret to report the sad and untimely death of Shri P R Gupta, Zonal Manager, Northern Zone, on 23rd February 1965 after a long period of service in the insurance industry.

The country has recently faced a serious aggression on its frontiers and has emerged stronger and more united under the firm leadership of our Prime Minister, Shri Lal Bahadur Shastri. The Government is at the moment vitally engaged in re-appraising the country's resources to ensure that we can face the future with determination and self-reliance. The cease-fire has for the present brought a temporary cessation of actual hostilities but defence preparedness has to continue with redoubled vigour. Problems on the food and economic front also need to be solved with the determination that we must rely on our own resources for so doing. There is, now, more than ever, the need of husbanding and increasing our financial resources and it is here that the Corporation will be called upon to make an even bigger contribution that could normally be expected from it in the face of general shortages and rising prices which have their own impact upon the small margin of savings available at the best of times. Along with the nation as a whole all the workers within the Cor-

poration have pledged themselves to the task. I am happy to report that even when the hostilities were at their height, our men in the offices in the border areas stood at their posts and manfully carried on their duties, at the same time taking all precautions in the matter of Corporation's properties and records. In all parts of the country, there have been voluntary offers from our employees of contributions to the National Defence Fund, of blood donation and assistance in civil defence work.

New Business

During the year under review, our new business amounted to just above Rs 701 crores under 14.44 lakhs policies as against Rs 703 crores under 16.46 lakhs policies in the previous financial year. The deficit observed is nominal from the sum assured point of view, although there has been a noticeable fall in the number of policies issued.

Apart from the possible difficult economic conditions responsible for this, was added the disturbed attitude of Class I and Class II Officers during the latter half of last year concerning their terms and conditions of service. This dissatisfaction unfortunately culminated in a slowing down of activity in the most critical period when business is normally at its highest. Fortunately these differences have since been resolved.

First Insurances

In the year under review 10.42 lakhs policies, being 72.65 per cent of the total number of policies issued in India during the year, were taken by persons insuring for the first time, the corresponding figure for the previous year being 10.54 lakhs policies forming 70.5 per cent of the total policies issued during that year. From the sum assured angle, the amount assured under the first insurances was 63.8 per cent of the total new sums assured in India during the year as against 62.2 per cent in the previous year.

Rural Business

Based on the classification of urban and rural areas as adopted in the 1961 census, 5.20 lakhs policies, being

36.2% of the total number of policies issued in India, assuring over Rs 197 crores were issued to people in rural areas as against 5.85 lakhs policies, being 35.7% of the total number of policies issued in the previous year, assuring Rs 209.40 crores.

I am happy to mention that the scheme for collection of premia through selected Post Offices in rural areas, where bank facilities do not exist, has been found operating successfully wherever it has been applied. The actual collections made during the year under review amounted to Rs 19.63 lakhs under this scheme. In view of its success, the Post and Telegraph Board have now agreed to extend the scheme throughout India. The scheme has been already under operation in the States of Rajasthan, Andhra Pradesh, Kerala, Madras and Mysore. Steps are being taken to further extend it to the other States.

The Corporation has also experimented the scheme of collection of premia through Block Development Offices in the State of Madhya Pradesh and, as mentioned in the report, the amount collected by these Offices during the year was Rs 2.02 lakhs.

Non-Medical Business

During the year 5.90 lakhs policies assuring Rs 144.59 crores, being 21% of the total new sums assured in India, were issued under the Non-Medical Schemes. Of these 1.88 lakhs policies assuring Rs 29.04 crores were under the Non-Medical General Scheme and 4.02 lakhs policies assuring Rs 115.55 crores were under the Non-Medical Special Scheme.

Salary Savings Scheme

Under the Salary Savings Scheme, we issued during the year under review 2.22 lakhs policies assuring Rs 76.86 crores as against 2.71 lakhs policies assuring Rs 81.47 crores during the previous year. Our efforts to popularise this scheme amongst the working classes continue.

Our efforts also have been continued to make arrangements with various State Governments for introduction of the Salary Savings Scheme amongst their employees. The scheme has been operating for the Government

employees in the States of Rajasthan, Punjab, Kerala, Orissa and West Bengal. The Maharashtra State Government also agreed to introduce the scheme for their employees. Due, however, to certain difficulties that the Auditor General of India faces in regard to the maintenance of accounts, the State Government could not start the scheme. The matter has been taken up with the Government of India.

Group Insurance and Group Superannuation Scheme

We have been successfully extending the scope of our business through the Group Insurance and Group Superannuation Schemes. New business amounting to Rs 16.35 crores was written during the year under these Schemes as against Rs 12.30 crores during the previous year. Life Annuities of Rs 72 lakhs per annum were also granted under the Schemes during the year.

Foreign Business

During the year the Corporation issued 8751 policies assuring Rs 11.05 crores in the foreign countries where it has been operating as against 8532 policies assuring Rs 10.21 crores during the previous year. This shows a satisfactory progress in view of the conditions that exist in some of the countries. Apart from the progress of business, it is our endeavour to see that more and more of the local citizens participate in the management of our offices. To achieve this, we are evolving a scheme of recruitment and training of officers from the local citizens. It is hoped that this move will be appreciated by the local people in these countries.

Size of Policy

The average sum assured per policy during the year was Rs 4854/- as against Rs 4269/- for the previous year.

Business in Force

The total business in force as at 31st March 1965 was Rs 3,887 crores under 108.68 lakhs policies as against Rs 3,571 crores under 103.28 lakhs policies as at 31st March 1964. The increase in the total sum assured during the year under review amounted to 8.8%.

Lapse Ratio

The ratio of lapses to mean life assurance business in force was 7.5% during the year as against 8.2%

during the previous year ending 31st March 1964.

Premium and other Income

The premium income for the year under review amounted to Rs 162.25 crores as against Rs 146.73 crores in the previous year.

The total net income for the year under review was Rs 205.09 crores as against Rs 179.60 crores during the previous year.

Life Fund Investments and Total Assets

The Corporation's Life Fund as at 31st March 1965 was Rs 901.61 crores, registering a rise of Rs 93.25 crores over the adjusted Life Fund at the beginning of the year.

Of the total investments in India of Rs 779.98 crores, the Public Sector accounted for 74.5%, the Co-operative Sector 5.2%, the Joint Sector 0.9% and the Private Sector 19.4%.

During the year, the Corporation adopted a scheme for granting loans to State Electricity Boards for Development Schemes and, accordingly, advanced loans aggregating Rs 5 crores.

The Corporation agreed to underwrite during the year 84 new issues to the extent of an aggregate sum of Rs 17.54 crores.

The total assets of the Corporation as at 31st March 1965 amounted to Rs 986.64 crores as against Rs 880.57 crores as at 31st March 1964. The net increase in the assets of the Corporation, since its inception, has amounted to Rs 572 crores.

Rate of Interest

The income from interest, dividends and rents in respect of our Life business before deduction of income-tax was Rs 43.96 crores during the year as against Rs 38.25 crores during the previous year. The gross rate of interest realised on the mean Life Fund was 5.27% per annum as against 5.11% per annum during the previous year.

The net rate realised was 4.90% per annum as against 4.07% per annum during the previous year. The increase in the net rate of interest is mainly due to the refund of income-tax of nearly Rs 3 crores taken into account in the current year, the rate of deduction of income-tax at source reduced to 20% as against 30% in the previous year and the increased proportion of interest on income from which income-tax is not deducted at source, such as interest on loans, etc.

Expense Ratio

The overall expense ratio for the year was 27.55% as against 27.46% in the previous year, while the renewal expense ratio was 14.09% as against 12.46% in the previous year. One of the reasons for the increase in the expense ratio is the revision of the terms and conditions of service of employees at all levels.

Claims

During the year the claims inclusive of bonus additions, amounted to Rs 40.46 crores under matured policies and Rs 12.36 crores under policies becoming claims by death. The total claims for the year amounted to Rs 52.82 crores as compared with Rs 44.66 crores in the previous year. The outstanding claims as at 31st March 1965 amounted to Rs 17.04 crores as against Rs 14.91 crores as at 31st March, 1964.

The percentage outstanding claims as at the end of the year under review to claims intimated during the period has come down further from 33.4% in the previous year to 32.3% for the year under review. All Offices of the Corporation have been constantly reviewing their outstanding claims and, where necessary, direct contacts are established with claimants for early settlement of claims. This service to claimants has been found helpful and bears good results.

General Insurance Business

The financial year 1964-65 was the first year of operation in respect of our General Insurance business. The results of the year's operation have shown a gross direct premium of Rs 46.52 lakhs. The breakdown thereof shows a premium income of Rs 15.74 lakhs under Fire Insurance, Rs 12.47 lakhs under Marine Insurance and Rs 18.31 lakhs under Miscellaneous Insurance class.

The net claims during the period has been Rs 73,000/- under Fire Insurance, Rs 1.53 lakhs under Marine Insurance and Rs 2.88 lakhs under Miscellaneous Insurance.

The claims experience has been quite satisfactory.

This being the first year of our General Insurance working, the expenses were on the high side. With increasing business, however, the expenses are bound to come down.

I may mention here that in order to provide capital for this non-Life section of the business, the Corporation decided to allocate a sum of Rs 1 crore with effect from 1st April 1964

out of the capital of Rs 5 crores provided by the Central Government under the LIC Act.

Profit and Loss Account

As a result of the working in the General Insurance field, a sum of Rs 11.06 lakhs is carried forward as the net adverse balance in the Profit and Loss Appropriation Account of the Balance-sheet. This adverse balance has arisen as a result of the loss of Rs 11.77 lakhs incurred during the year in the general insurance business comprising of the underwriting loss of Rs 8.60 lakhs to which the excess of income-tax payments, transfers to reserves etc. over the interest and other sundry income have been added.

Mortgages

The Own Your Home Scheme continued to operate in the 77 centres mentioned in the last report. It was extended to 12 more centres during the year under review and to 29 further centres from 1st September 1965. The scheme is thus now operating in 118 places thereby covering all the cities and towns in India having a population of one lakh and above and some other centres having a population of less than one lakh. During the year, 939 loans amounting to Rs 246.75 lakhs were sanctioned to the policyholders under this scheme.

The Corporation continued to advance loans to State Governments for

financing various housing schemes and Land Acquisition and Development Scheme. Loans were also granted to Co-operative Housing Finance Societies in various States, to Public Limited Companies for the purpose of providing houses to their employees and to Co-operative Housing Societies of employees of Public Limited Companies and those formed by the employees of the Corporation.

The total assistance given by the Corporation to the Housing development in India under these various schemes upto 31st March 1965 amounted to Rs 76.18 crores.

Offices

As at 31st March 1965, besides the Central Office and five Zonal Offices, the Corporation had in all 750 Offices including Sub Offices and Development Centres. With this set up, we have either a Branch or a Sub Office in 253 out of 318 Districts of various States and in 5 out of 10 Union Territories in India. We have also Development Centres in 31 of the remaining Districts and in one of the remaining Union Territories.

Publicity

Since insurance is not bought but sold, more so in a country like India, where insurance consciousness is still low, vigorous propaganda has to be carried on to spread the message of insurance. The Corporation continued

its publicity efforts with this aim in the urban and rural areas through press publicity as also outdoor publicity with the help of Field Publicity Vans, extensive display of posters, participation in fairs and festivals and production of films and slides on life insurance and their exhibition in about 2500 theatres. The Corporation won an Award from the Ministry of Information and Broadcasting for the lay-out of one of its advertisements entitled "The Clasp".

Before closing I should take this opportunity to record my appreciation and thanks of the sincere co-operation and valuable advice from my colleagues on the Board, on the Investment Committee and various other Committees. I also record my appreciation of the services rendered by the officers and staff at all levels. But for their services, the Corporation would not be able to continue to achieve the progressive results. With their problems relating to their terms and conditions of service having been settled through negotiations, I expect more close co-operation and sincere devotion to duty from them, which should enable the Corporation to mark a further substantial progress by the time we celebrate the tenth anniversary of its formation next year.

I must also thank all the agents spread all over the country who have done such excellent work in spreading the message of insurance to the people.

AROUND BOMBAY MARKETS

Improved Sentiment

Thursday, Evening

FOR the first time in many weeks, Dalal Street presented a somewhat livelier appearance last week. The volume of business was by no means large but there were some indications of a broadening of interest, more particularly in the long-neglected cash section. Equities recorded widespread gains which were quite marked in certain scrips. The performance of cash shares was in some ways more impressive than that of the speculative counters, though the improvement in most cases was due to bear covering and scarcity of offerings rather than to any significant revival of fresh bull support. Dalal Street's recent performance, though by no means decisive, suggests that it is likely to edge its way further up unless there is some unexpected development in the political situation.

There has come about a noticeable change in the mood of the market. The feeling seems to be gradually gaining ground that in order to meet the grim economic challenge posed by Pakistani aggression and the menacing posture assumed by China, New Delhi is now trying to be more practical than before. The stock market is not altogether unjustified in taking such a view. The Deputy Chairman of the Planning Commission has recently spoken about pushing back of social welfare programme in order to rush through with priority plans. The Planning Commission has suggested that no new industrial projects should be taken up in 1966-67 unless they are related to defence production and essential civil supplies; completion of existing projects is to be given priority. The Prime Minister has stated that he is against imposition of new taxes to meet increased defence and development expenditure. Market sentiment has also been aided by the British Government's reported decision to resume full economic aid and restore normal flow of commercial supplies of defence equipment, which, it is hoped, will have a favourable impact on the U S attitude in regard to economic aid to India.

Reports that the stock exchange authorities are trying to make a joint plea to the Government for the removal of margins and other suitable relief in order to revive activity in the market have also had a steadying

effect on sentiment. The belief is also gaining ground that the Government is likely to reduce the Bank Rate with a view to improving business psychology.

Improved sentiment and technical considerations should aid the process of recovery in equity prices that is now underway. But the market cannot be expected to have an easy going. The political situation continues to be uncertain and the power cut in certain States will also adversely affect industrial production. No less disturbing is the continuing pull on prices as a result of poor kharif harvests and the none-too-promising outlook for the rabi crops. The difficult foreign exchange position, restricted supplies of imported raw materials, rising trend in commodity prices, power shortage—all these factors have obscured the economic outlook.

OILSEEDS

Disturbing Trends

ON Wednesday November 3, groundnut oil shot up from Rs 34 to Rs 35 per 10 kilograms and groundnut (Khandesh variety) rose from Rs 162 to Rs 166 per quintal. These prices are a record high not only for this time of the season but they are also all-time highs. While Wednesday's spurt could be attributed to the Gujarat Government's decision to continue the existing ban on the export of groundnut and groundnut oil outside the State, record high prices so very early in the season reflect essentially fears of a serious reduction in the total availability of vegetable oils during the 1965-66 season because of the failure of the groundnut crop and the unpromising outlook for rabi crops, namely rapeseed, mustard-seed, linseed and castorseed. The groundnut crop is estimated to be 30 to 40 per cent smaller than in the previous season. Rabi sowings have been considerably affected by the failure of September rains and the continuing dry spell during October in most of the oilseeds producing areas. Reduced sowings apart, the outturn of the rabi oilseeds crops will depend very largely on the winter rains. It is extremely difficult to say how the weather will oblige the rabi crops.

Since it seems extremely unlikely that the shortfall in groundnut production and a possible decline in the output of other oilseeds will be made good through imports under P L 480, the upward trend in oilseeds prices is likely to get accelerated in course of time as the season progresses. There is a real danger that prices might get out of control unless the authorities take effective measures to deal with the situation. It would be foolish to think that the Forward Markets Commission can keep prices under check through the system of penal margins, which can at best bring about a decline in speculative business. There is little that the Commission can do to ease the situation when prices soar due to serious physical shortages.

Notwithstanding shortages, it should be possible to check the rising trend in prices if the Government really means business. The action to be taken will naturally depend on what view the authorities take of the price situation. Vanaspati industry being the single largest consumer of edible oils, especially groundnut oil, strict control over vanaspati prices is essential in order to keep oil prices under check. Vanaspati prices must be pegged at some reasonable level for a fairly long period of time. That is about the only way of discouraging vanaspati manufacturing from paying almost any price for the raw material. Vanaspati should be packed in suitable containers and its supply should be rationed along with other food-grains. The existing policy which links vanaspati prices with groundnut oil provides no check on manufacturers' paying higher and higher prices for oil. Restrictions on the inter-State movement of goods must be removed in order to ensure a more equitable distribution of the available supplies throughout the country. It is very unfair—to say the least—that the Gujarat Government should be permitted to ban the export of groundnut and groundnut oil when its internal consumption does not exceed 2 lakh tonnes of groundnut seed as against its estimated production of 7 lakh tonnes this season. The disparity of about Rs 1,000 per tonne in groundnut oil prices in Ahmedabad/Rajkot and Bombay looks fantastic. The absence of any restriction on the movement

YOU ARE A SOLDIER TOO—

What are you doing to meet the challenge?

DA 65.F1

of vanaspati outside the State provides a huge windfall gain to the few vanaspati manufacturing units situated in the State. One really wonders whether the policy in regard to the movement of groundnut and groundnut oil is intended primarily to benefit vanaspati manufacturers within the State. Strict action also needs to be taken to discourage holding and hoarding of stocks at all levels — including the co-operative societies and farmers. This is possible only when heavy penalties are imposed on those found guilty of holding stocks in excess of their requirements for more than a specific period of time. Really speaking, it should be possible to control prices almost at any level provided the administration is honest and efficient.

Linseed, castor and cottonseed futures touched new high levels last week. Linseed April were bid up to Rs 127.50, castor April to Rs 107.50 and cottonseed January to Rs 71. The week-end quotations were only a little lower. Bulls continue to dominate the market, margins notwithstanding. The Forward Markets Commission has prescribed very heavy margins in the event of prices rising still higher. The margins are so heavy that only operators with huge financial resources can afford to take a position in the market. Speculative activity has shrunk considerably as a result of the margins but it cannot be said to have had any significant impact on prices, unless, of course, it is argued that prices would have risen still higher but for these margins. It is indeed time that the Government decided to ban forward trading in commodity markets which only helps to aggravate bullish trends

COTTON

Crop Estimates Down

ESTIMATES about the 1965-66 cotton crop have been revised further down. Not many observers now expect the crop to exceed 55/56 lakh bales and there are quite a few who place the crop as low as 50/51 lakh bales. Even on the basis of optimistic estimates, the supply position of cotton will present a very difficult problem for the industry. While there has been quite a considerable expansion in spindleage in recent years, cotton production in 1965-66 will be about the lowest. The gap between the industry's requirements and indigenous supply will be too wide to be made good through imports. With the foreign exchange situation be-

ing what it is, the supply position would become very critical if the country is unable to secure sufficient cotton under P L 480. Anticipated shortage has already pushed cotton prices to the revised ceiling prices for the new season and a few varieties are said to be commanding small premiums. The short-

age of cotton will naturally affect the production of cotton textiles next year. The textile industry might take some comfort from the idea that the likely decline in cloth production will help solve the problem of stock accumulation, but the industry cannot escape the impact of higher cotton prices and reduced capacity working.

ACCOUNTING
MACHINE

Let this modern, versatile machine take over the various accounting functions of your business. It makes possible accurate, speedy calculations and helps effect a substantial saving in time and manpower

- Especially suitable for banks and industrial establishments.
- Automatic handling of complete accounting procedures, invoices, sales/purchase journals, ledger accounts, payrolls, statements, etc.
- Foolproof system of "Control Number" ensures correct posting of every entry
- Interchangeable control panels enable quick change for different bookings
- Many models available to suit all requirements

It is encouraging to hear that the trade has expressed its earnest intention to observe self-discipline and refrain from putting through business at above the ceiling prices. One can only hope that the trade's performance this season will be better. The Indian Cotton Mills' Federation too had devised a code of self-discipline last season but it was unable to implement the scheme for long. What amuses one most is that the Government should fail to enforce its price control order every time prices tend to move beyond the ceilings.

Apart from the unfortunate downward revision of crop estimates, there have been no significant market developments to report. Business in ready continues to be extremely restricted and the state of affairs in the futures market is much worse. The daily turnover in futures is very often less than a thousand bales and the hedge contract continues to hold firm fractionally below the margin level of Rs 910. It does not really pay to bull cotton futures around Rs 910 when one has to put up a big deposit of Rs 100 per bale.

MONEY AND BANKING

Comfortable Conditions Prevail

COMFORTABLE conditions prevailed in the Bombay short-term money market during the week to November 4. Demand for funds was more or less the same as in the previous week but supply was strengthened due to the return flow of funds from Calcutta. The previous two weeks had witnessed an increase in the flow of funds to Calcutta to meet the demand arising due to the festive season. This is but a temporary phase as the busy season is to start soon and the rates of interest will more higher. The rate as on Thursday evening was placed at 4½ per cent.

The latest statement of affairs of the scheduled banks indicate a decline in the amount of credit advanced by banks during the week to October 22 from Rs 2,024.70 crores to Rs 2,017.85 crores. Deposits have declined by Rs 8.58 crores to Rs 2,802.86 crores and borrowings from the Reserve Bank have moved down from Rs 5.91 crores to Rs 3.22 crores. Balances with the Reserve Bank at Rs 96.14 crores shows a fall of Rs 5.44 crores. Cash in hand is lower by Rs 3.96 crores at Rs 66.89 crores. Investment in Government securities has risen by Rs 10.88 crores to Rs 864.85 crores. The credit-deposits ratio is lower at 71.99 per cent

against 72.02 per cent during the previous week.

Notes in circulation declined by Rs 8.43 crores to Rs 2,612.40 crores during the week to October 29, according to the Statement of Affairs of the Reserve Bank of India. This contraction plus a small increase in total notes issued has been absorbed by the banking department. Rupee coins have increased slightly by Rs 9 lakhs to Rs 103.87 crores. Foreign securities in-

creased by Rs 2 crores to Rs 72.63 crores but balances held abroad declined by Rs 45 lakhs to Rs 11.37 crores. Central Government deposits moved down by Rs 66.33 crores to Rs 56.85 crores while the State Government deposits increased by 3.45 crores to Rs 6.67 crores. Loans to governments at Rs 129.45 crores shows an increase of Rs 9.57 crores. Scheduled banks increased their borrowings slightly by Rs 18 lakhs to Rs 3.37 crores.

BUSINESS NOTES

Tata Chemicals

J R D TATA has strongly urged the Government to take timely action, through legislation or by other means, to protect the country's limited resources of chemical grade limestone and reserve them exclusively for the chemical industry. In his Chairman's statement circulated with the latest annual report of Tata Chemicals, Tata has pointed out that, as things stand today, the Ranavav deposits in Kathiawar constitute the largest and most important source in the country for the supply of this variety of limestone. The limestone used in the soda ash industry is of chemical grade which is of greater purity than that required for, say, the cement industry and is relatively scarce in comparison with the abundance of ordinary limestone. Limestone is the second main raw material in soda ash manufacture. The company's reserves are adequate for its present rate of production, but it will require larger sources of supply as and when the production of soda ash increases. It is intended to raise the rated capacity of the plant from the present 400 tonnes to 600 tonnes per day and thereafter to 1,000 tonnes per day.

During the year to June 1965, the company increased its production of soda ash by 10 per cent to 1.68 lakhs tonnes and that of dense soda ash by 29 per cent to 40,200 tonnes. The higher production was once again achieved in a year of severe drought when the two lakes, from which the factory draws its fish water requirements, were virtually dry. Sodium bicarbonate output was raised by well over a half to 10,400 tonnes, but the output of electrolytic caustic soda could be only maintained at the previous level of 4,000 tonnes. Benzene hexachloride production increased by over a third to 3,500 tonnes following a sharp rise in demand due to the Government's emphasis on crop protection programmes as also to substantial exports

of formulated B H C to the U S S R. Output of salt at the Mithapur plant scaled a new peak at 3.04 lakh tonnes, but at Okhamadhi the output of salt at 37,000 tonnes showed a setback. The company has been granted an industrial licence to expand production of benzene hexachloride from 3,600 tonnes to 5,100 tonnes per annum. A second application for further expansion to 9,000 tonnes per year is pending with the Government.

The stage of self-sustaining growth reached two years ago gathered further momentum and consequently there was good improvement in the financial results for the year 1964-65. Sales reached a new record level of Rs 8.49 crores, representing an increase of 12 per cent over 1963-64 and 19 per cent over 1962-63. The operating profit registered an increase of Rs 50.58 lakhs over the previous year. This increase was brought about by making the fullest use of existing production facilities in the year, when for almost the whole of the period the pre-decontrolled prices of soda ash and caustic soda were maintained in spite of the inflationary pressures bringing about significant increases in costs of materials and labour. Even though depreciation, taxes and interest charges were Rs 27.75 lakhs more, the disposable profit at Rs 92.21 lakhs was Rs 22.83 lakhs higher than in 1963-64. Equity dividend raised by 20 P to Rs 1.60 per share requires Rs 48.38 lakhs (Rs 42.33 lakhs). Earnings per ordinary share work out at Rs 2.91 and book value at Rs 15.52. The balance sheet as at end-June last shows gross block at Rs 10.86 crores and net block at Rs 6.43 crores.

Fertiliser Corporation

A NET profit of Rs 2.63 crores, the Trombay Fertiliser Factory being brought to the commissioning stage, steady progress in the implementation of other projects and achievement of a

substantial measure of self-reliance in the planning and building from indigenous resources of new fertiliser plants are some of the high-lights of the operating results of the Fertiliser Corporation of India during 1964-65.

The Corporation's Sindri Unit showed a net profit of Rs 1.19 crores and Nangal Unit Rs 1.69 crores, apart from the profit from the Rourkela contract with Hindustan Steel amounting to Rs 65 lakhs. The net operating profit of Sindri and Nangal Units was Rs 66 lakhs higher than in the previous year. Out of the net profit earned, Rs 1.40 crores have been appropriated for Development Rebate Reserve, Rs 50 lakhs for Repairs and Renewals Reserve and the balance of Rs 88 lakhs have been transferred to General Reserve. The Corporation's internal resources arising from the revenue surpluses and the amount allocated for Depreciation Reserve during 1964-65 add up to Rs 6.61 crores against Rs 8.74 crores during the previous year. The higher amount of internal resources available in the previous year was due to retrospective revision upward of fertiliser prices with effect from 1st April 1962. Since the inception of the Corporation's oldest unit at Sindri, the total internal resources generated by way of revenue surpluses and contributions to the Depreciation Reserve amounted to Rs 49.94 crores up to 31st March 1965.

The Trombay factory has now reached the commissioning stage. Ammonia production has already started and it is expected that production of urea will start shortly. Urea is a more concentrated nitrogenous fertiliser with 46 per cent nitrogen content. This will be followed by production of nitro-phosphate, a complex fertiliser containing two major plant nutrients—nitrogen and phosphate—before the end of the calendar year. The Trombay plant, which is estimated to cost nearly Rs 34 crores, will be the third operating unit of the Corporation.

The methanol plant at Trombay, which is part of the Trombay complex, is estimated to cost over Rs 4 crores. The construction of the plant has progressed according to schedule and is expected to go into production by the end of 1965. Methanol, which is a volatile and inflammable liquid is popularly known as "wood alcohol". Methanol and its derivatives have many uses. Its largest use is in the synthesis of formaldehyde which is used for defence and other industrial purposes.

The Namrup factory, the fourth in the chain of the Corporation's projects,

will go into production by the end of 1967 and the Gorakhpur factory, the fifth, by the middle of 1968. The project report and estimates of the Durgapur project have been completed and submitted to Government.

The Planning and Development Division, the central technical organisation of the Corporation, continues to play an important role in research and development of fertiliser technology, particularly connected with the planning and development of new projects. The Division is currently handling the detailed designing, engineering, and procurement of the ammonium sulphate plant for Namrup and is actively associated with the departmental erection of all the main plants in that project. It is also engaged on the designing and engineering of some of the ancillary plants for Gorakhpur project. It has also been decided that this Division will be responsible for designing and engineering of a group of plants for the Durgapur project. The Division is currently functioning as general consultants to Gujarat State Fertiliser Company and the Orissa Industrial Development Corporation. It has also developed and produced on pilot plant scale a number of costly catalysts, which are directly used in the fertiliser factories of the Corporation, and is saving a substantial amount of foreign exchange. It is exploring the possibilities of stepping up production of these catalysts for domestic consumption as well as for export to earn foreign exchange.

Great Eastern Shipping

THE marginal increase in Great Eastern Shipping's dividend from Rs 1.08 to Rs 1.10 a share, being fully payable on the enlarged capital, has enhanced the total distribution by well over a third compared to the previous year's. That the directors should have decided to pay more in a year when gross profits actually fell by 15 per cent, reflects their confidence in the improved outlook for the current year. Two factors have in the main contributed to the expectation of better financial results this year. Firstly, the management hopes that a substantial refund of income-tax will become available as a result of the decision of the Central Board of Direct Taxes on the company's petition in respect of the assessment year 1959-60 whereby relief would be recomputed in the same manner as is done in the case of other newly-established industrial undertakings. Secondly, freight earnings are on the rise. It is estimated that freight earnings, including those carried for-

ward in respect of incomplete voyages from the previous year, would amount to Rs 3.56 crores by the end of November this year, as against Rs 2.82 crores in the corresponding period of the preceding year.

Coastal shipping, however, still continues to be in the doldrums. The recent 10 per cent increase in freight is likely to be mopped up by the increase in excise duty on oil bunkers and the rise in wage bill. But there are hopes that the Government may exempt coastal shipping from the levy of excise duty on oil bunkers. The company's Rs 3-crore expansion programme under which five ships were to be acquired has yet not materialised, as the terms of the loan offered by foreign bankers have not been acceptable to the government. Meanwhile, the gross value of the company's fleet has declined from Rs 11.85 crores to Rs 11.25 crores, as one vessel has been discarded and another sold. The value would, however, go up by about Rs 4.12 crores on delivery of bulk carriers, expected between February and July next year.

The financial results for the year to June 1965 show a decline in gross profits from Rs 1.20 crores to Rs 1.06 crores, of which depreciation has taken away a slightly lower amount of Rs 74.32 lakhs (Rs 75.32 lakhs), but prior charges have claimed more at Rs 41.50 lakhs (Rs 36.30 lakhs). As before, there is no tax charge owing to unabsorbed development rebate. The proposed dividend distribution requiring Rs 16.50 lakhs (Rs 11.92 lakhs) is to be made by withdrawing Rs 26 lakhs from reserves. Operating earnings (turnover) have been maintained at Rs 5.25 crores despite a decline in cargo carried from 11.78 lakh tonnes to 10.62 lakh tonnes.

Tomco

THE value of sales of Tata Oil Mills Company's products and other income for the half-year ended September 1965 was Rs 778 lakhs, the turnover for the corresponding period in the previous year being Rs 696 lakhs (an increase of about 11 per cent). The Company's production in this period increased by approximately 10 per cent over the corresponding period of the previous year.

Correction

The heading of the Company Chairman's statement published on page 1566 of our issue dated October 9, 1965 should read "The Fertilisers and Chemicals Travancore Ltd" and not "The Fertiliser and Chemical Travancore Ltd." The error is regretted.—Ed.

BINNY'S D318
designed to go to school

BINNY'S D318 is a hard-wearing material perfect for school uniforms. Available in pleasing colours to suit different schools. Your child will be proud to wear it, and you'll be impressed with its durability.

Buy your requirements of BINNY fabrics at controlled rates from authorised BINNY Stockists who display this sign board.

With us food is a major consideration.

We've been thinking of it from various angles.

That accounts for the wide range of equipments we manufacture for the food industry.

Think of tractors that plough an acre an hour, bulldozers, scrapers, traxcavators essential for building dams, canals and clearing forests; super-phosphate plants important for the manufacture of fertilizers; a mill that grinds 1,000 tons of grain a day, cattle and poultry feed plants, bulk handling equipment, a silo that stores as much as 100,000 tons of food grain... These are not just ideas we're sowing. They are realities.

Thanks to our principals Caterpillar, well known for earthmoving equipments; Chemiebau, builders of chemical plants, and Buhler, manufacturers of plants and equipment for the food industry.

yes
we'll
admit it

We think a lot about food. But man does not live by bread alone. That's why we contribute to other vital industries like cement and steel, chemicals and pharmaceuticals, paper and pulp, drilling and mining, irrigation and power...

Highest homage to a hero "for most conspicuous bravery"

"ADVANCE!" a dying soldier's last word to his men symbolises our people's sacrifice and selfless devotion to duty in defending India's honour and freedom. Company Quartermaster Havildar Abdul Hamid of the 4 Grenadiers destroyed three enemy tanks single-handed, with only a recoilless gun, on the Kasur front in the Lahore sector, before he was killed. He was posthumously awarded the nation's highest decoration for valour, the Param Vir Chakra.

This 32-year-old youth from Dhamupur village (renamed Hamid Dham in commemoration) in Ghazipur, Uttar Pradesh, is just one of the countless heroes who laid down their lives in the service of their country. The nation rose as one man—all differences of community and creed forgotten—to fight aggression. Today, we are united as never before. Like Abdul Hamid we shall, indeed, advance—to greater strength and all-round self-sufficiency, determined to preserve our ideals of peace and friendship towards all.

PARAM VIR CHAKRA: the highest decoration for valour awarded for 'the most conspicuous bravery or some daring or pre-eminent act of valour or self-sacrifice in the presence of the enemy, whether on land, at sea or in the air'.

Credit Policy

ANOTHER busy season has commenced — at least in terms of official statistics even though not as yet in terms of market pressures — and this is the time of the year to assess the prospects in the months ahead. There is considerable apprehension in the minds of bankers regarding the shape of things to come — apprehension born out of the tighter liquidity position in which the banking system finds itself today and the prospect of another large credit expansion in the season ahead. The apprehension has been heightened by the uncertainty regarding monetary policy, for unlike last year when it outlined its busy season policy a full month ahead of the commencement of the season, the Reserve Bank is yet to show its hand this year. If this delay is deliberate one wonders what purpose it serves; if it is not, does it suggest that the central banking authority is itself yet to make up its mind on the policy consistent with its assessment of the situation?

In talking about busy season prospects and the policy appropriate to it, a convenient point to start from is a review of the slack season. At the outset of the slack season the Reserve Bank was reported to have indicated targets of Rs 200 crores each for deposit growth and credit contraction. Deposits have risen by not much less — by Rs 195 crores — but the magnitude of credit contraction has been — at about Rs 95 crores — significantly below the figure set. Even at that time it was the opinion of many bankers that the target figure was on the high side but one did not bargain for credit contraction much lower than even that of the slack season of 1964. The target figure was presumably presaged on a near complete reduction of seasonal commodity advances against which had to be set off an increase in credit against those commodity groups not subject to seasonal variations.

In the absence of statistical data regarding the actual behaviour of advances against the various commodity groups, it is not possible to say whether this shortfall in slack season credit contraction represents a "failure" of policy. If indeed the Reserve Bank felt that the contraction against the seasonal commodities was tardy it could have tightened selective controls further which it did not. On the contrary, there was some loosening of the rigours of the raw cotton control, the withdrawal of the directive on clean credit and a positive attempt at augmenting the flow of credit to the textile mills. One has the impression, therefore, that not merely was the target of credit contraction itself considered flexible but that as the slack season progressed the Reserve Bank did not feel unduly concerned with the slow pace of contraction. This is not to suggest that monetary policy was passive in this period. Perhaps more than in any other comparable period, the central banking authority kept the market taut as many bankers ruefully admit. The Reserve Bank's 'advice' to the banks to invest their surplus funds in treasury bills may not have been carried out to the extent indicated, but the pressure on the market as reflected in money rates was not any the less. Credit has been kept on a tight rein which is the important point to note in considering the shortfall in credit contraction.

The slower rate of contraction has, however, added to the banks' problems of financing the seasonal needs now. The financing requirements will naturally depend on the level of production — more on industrial production (including agriculture-based industries) than directly on agricultural output. Even assuming a moderate credit expansion of 20 per cent over the level now a figure of Rs 465 crores or about the same as last year would be needed. It may well be larger and some bankers put it as high as Rs 450 crores. Even this would be below the rates of expansion of last year and the year before despite a price level 5 per cent higher than last year. To finance this expansion banks would need to turn to the Reserve Bank in greater degree and ultimately the question boils down to how much credit the Reserve Bank will allow to be financed.

In the last busy season the Bank gave commendable evidence of flexibility. Though the panic measures of February suggested a surrender of judgment to the monetary experts of the I M F, the actual conduct of the

busy season policy indicated that the central bank did not shrink from its responsibility of financing the genuine needs of productive activity while keeping credit tight. Similarly in the slack season there has been no blinkered pursuit of a credit contraction target at the cost of hurting production for there is growing indication that the tight policy is beginning to bite. The Bank, one hopes, will continue to be mindful of the economy's interests in promoting finance for production without submitting itself to dictates emanating from the IMF and the World Bank, and based on crude monetary theories.

It is in this light that the remarks of the Governor of the Reserve Bank

made recently at Madras and the Planning Minister's replies to questions in Parliament assume significance. The Governor is reported to have hinted at the possibility of selective liberalisation of credit restrictions and a tightening of other types of credit. The priority sectors at the moment choose themselves and on any reckoning must include food production, export, import substitution and defence production. On the other hand credit for less essential activity calls out for greater control. The exact form in which the element of selectivity is going to be worked out remains to be seen and from the point of view of bankers who have begun to entertain seasonal loan applications, the decisions should come early.

UDI and After

SO two weeks after Prime Minister Harold Wilson left Salisbury claiming that his much-publicised visit might succeed in preventing a declaration of independence by South Rhodesia, 'Prime Minister' Ian Smith has proceeded to do just that. In 1907, by when white settler control over the territory was firmly established, the idea was mooted from London that Rhodesia should become South Africa's fifth province, but the move was defeated in a referendum by white Rhodesians. Now more than half a century later Rhodesia has become, not a province of South Africa, but a second South Africa insofar as the latter term has come to stand for unabashed racialism, white minority rule and suppression of the African majority.

The Prime Minister of Britain may "still find it incredible that this action should have taken place at all", but a very large number of people all over the world, who are no more privy to Ian Smith's thoughts than he, knew all along that this was coming. Starting with the Constitution of 1961 Britain had stood by and watched developments which step by step made it possible for the white government of Rhodesia to do what it has now done. The 1961 Constitution gave the Africans, constituting 95 per cent of the population, less than 25 per cent of the seats in the legislature, reserving the rest for the 5 per cent whites. Of course, the constitution promised eventual majority rule, but the Africans' ability to secure more seats in the legislature was made to depend, *inter alia*, on their acquiring higher educational qualifications. How can they do this when control of the edu-

cational system is in the hands of men who have nothing but contempt for the Africans and who will never countenance making any concession to them, however slight? To hope for progress towards majority rule along constitutional lines is, therefore, senseless. In fact, it would not be surprising at all if in course of time the white government amended the constitution to actually tighten its control over the Africans. This it can do since the white membership of the legislature is comfortably more than the two-thirds majority required for a constitutional amendment to be passed.

Even less can the Africans expect from extra-constitutional political struggle. The white government's repressive laws and well armed and ruthless police will no doubt prove quite capable of taking care of most eventualities of that type. The government has equipped itself with wide powers to arrest and indefinitely detain without trial political opponents. Nor is there reason to believe that these laws will not be used ruthlessly. At the head of the white government today is a man who had considered even the 1961 Constitution as marking a "sell out to the Africans" and had, on that score, resigned from the government and formed his own party to stop the rut. It is this man and this party whom Prime Minister Harold Wilson seriously wanted the world to believe he could talk into accepting independence on terms acceptable "to the people of Rhodesia as a whole".

And what can the African people of Rhodesia expect from the UK? Harold Wilson has talked of the declaration of independence as a "challenge which it would be unworthy of

this government to let go unanswered". Britain has called for a meeting of the UN Security Council to ask for world wide support for economic sanctions against Rhodesia. Yet all these years she has resisted every move by the United Nations to secure a more humane and democratic government in Rhodesia on the ground that it had no right to intervene in the affairs of the white government there. Even after Ian Smith's "high treason" when the General Assembly met on Thursday to pass a resolution asking Britain to implement earlier Assembly and Security Council resolutions on Rhodesia and put an end to the rebellion by the unlawful authorities in Salisbury Britain refused to participate in the voting. Wilson has already gratuitously assured Ian Smith that Britain will never consent to the use of force against the white Rhodesian government *under any circumstances*. A powerful section of opinion in Britain would not even press economic sanctions too far.

The two forums of possible collective action against Rhodesia are the United Nations and the African countries organised in the Organisation of African Unity. But the prospect of resolute action by either is, frankly, dim. The OAU at its recent meeting in Accra passed two resolutions, one of them a secret one adopted at a closed session, envisaging action, including withdrawal from the Commonwealth and economic sanctions against Britain, to meet a negotiated independence agreed to by Britain. About the steps to be taken against Rhodesia itself there was no clear understanding. As for the United Nations, the Security Council is yet to meet at the time of writing, but there are enough parallels in recent history to indicate what steps it might recommend and with what effectiveness.

In all these moves there is, then, little for the Rhodesian African to take heart at. His life promises to continue, as far as one can see, to be one of poverty, illiteracy and humiliation, unequal struggle, suppression, imprisonment and an occasional Sharpeville. The OAU Secretary-General's report to the Accra Conference obviously pointed out that the liberation situation was getting worse instead of better in Mozambique, Angola and South Africa. Rhodesia can now be formally added to the list, though really it has belonged in it through all the years when technically Britain was responsible for the condition of its African population.

Weekly Notes

PL — 480 at Any Price!

ON Monday the Food Minister was telling Parliament in reply to questions that S K Patil did not have "any brief to negotiate for food" in the United States; on Thursday one of the first things Patil told newsmen at Bombay airport was that while in the US he had tried to impress on the Administration the need to conclude a long-term PL-480 agreement with India to replace the present month-to-month arrangement and that he felt he had succeeded in convincing the Administration. The Food Minister will not like this, but there is nothing he can do. He and his Government need PL-480 foodgrains desperately and Patil can, with justification, claim to get a better hearing in Washington even though he may have nothing to do with the food portfolio.

If the Railway Minister's apparently unauthorised efforts in the US have advanced the possibility of a long-term PL-480 agreement, Subramaniam is in no position to look this gift horse in the mouth. Of course, last month he was confidently telling a press conference in Calcutta that his Ministry had prepared two "alternative food plans" for 1966: one assuming that PL-480 imports would continue at the current level and the other that there would be no such imports. The second plan, he claimed, contained the basic mechanism to enable the country to meet its food needs entirely from internal supplies if need be. But at the meeting of the Congress Parliamentary Party's executive committee this week he was far less confident. While every effort had to be made to reduce dependence on food imports, he said, there was *no alternative* to imports of PL-480 food. What happened to the alternative plan which he had flourished only weeks ago at Calcutta? There was no mention at all of it at the Congress Parliamentary Party meeting.

The Food Minister has estimated that foodgrains output this year will be three million tonnes lower than in 1964-65 and that there may be serious shortfalls even in some of the surplus States. Also, it is unlikely that there will be any significant carryover of stocks. How serious the situation is can be judged from the fact that with a harvest of 88 million tonnes in 1964-65 and with wheat imports of 6 million tonnes wholesale food prices have

been barely held at the levels to which they had risen after the crop failures of the first three years of the Plan.

Simultaneously with the food prospects becoming grim, the State Governments begun to wriggle out of their commitments about procurement and rationing. The Maharashtra Chief Minister wants three months stocks of foodgrains in hand before he will consider statutory rationing in Bombay and the bigger cities! No doubt other States are no less cautious since all the Governments are anxious not so much to prevent starvation but to ensure that the responsibility for it should not be pinned on them.

No wonder Subramaniam has made up his mind that no strings are attached by the US Government to PL-480 foodgrains. If this was known all along, why has the Prime Minister been warning us that we would have to do without PL-480 imports and why did Subramaniam himself take the trouble of formulating his two alternative food plans for next year? And what stands in the way of a long-term agreement in place of the present monthly shipments which are obviously giving the Food Minister sleepless nights? Perhaps a more factually correct statement from the Food Minister would have been that, given the food prospects for the coming year, the Government has to have PL-480 imports, strings or no strings. 1967 is election year and further rise in food prices, acute shortages, and possibly famines over extended areas on the eve of the election are a frightening prospect which the Government must avoid at any price. To set the price is for President Johnson.

LIC: Another Lacklustre Year

THE Life Insurance Corporation's sales organisation and operating methods need close looking into. For two consecutive years in which national income has grown steadily, a little more than 4 per cent in 1963-64 and 7 per cent in 1964-65, its new life business in India has remained stagnant at about Rs 690 crores. In the latest year ending March 1965 the number of new policies issued was 14.35 lakhs, which is 2 lakhs less than in the previous year and slightly less than in 1961. The Chairman, B D Pande, attributes the stagnation to

"rising prices which have their impact upon the small margin of savings available at the best of times" and "possible difficult economic conditions" but also admits dissatisfaction of officers with their terms and conditions of service "culminating in a slowing down of activity in the most critical period when business is normally at its highest." These differences have been resolved since the end of the financial year but the impact of this settlement along with the concessions granted earlier to junior staff is clear from the steep rise in renewal-expense ratio from 12.46 per cent to 14.09 per cent. Rising costs are not peculiar to insurance but their impact upon other business is cushioned to a large extent by increasing turnover. This relief has been denied to LIC.

Staff discontent is not a recent phenomenon in this organisation. It erupted soon after nationalisation in 1956 when the personnel and grades of a large number of erstwhile private units were integrated. Since then the emoluments of junior staff have been improved fairly consistently but those of officers were increased only this year. The demoralising effect of officers wearing protest badges and going slow at work has told on new business. It is easy to be wise after the event and deplore the prolonged stiff resistance which LIC management put up against staff demands but in fairness it should also be conceded that the management received no clear guidance from the Government in the matter and when some preliminary decisions were taken, the then head of LIC suffered for them. With 50,000 persons on its payroll and about 140,000 active agents to canvas business, LIC has still to frame a personnel policy and build up an image for itself among its own staff — in what other large and expanding organisation would there have been such thoughtless opposition to the installation of computer systems?

There has been a fractional improvement in the settlement of claims arising from death and maturity. The ratio of outstanding claims to total claims during the year came down from 33.4 to 32.3 per cent. No separate ratio is given for claims arising from death but one can presume it to be higher; there are no data on the average time taken to settle such claims.

LIC's investment of Rs 4 to 5 crores in the last two months to support stock exchange prices without asserting its bargaining position was highly creditable and useful indeed; in the long run, it would be profitable too. But in the final analysis, LIC has to be judged by the expansion of its life business.

Jute Industry's Problems

FULLY eighteen years have passed since Bengal was partitioned, along with the Punjab, when India won independence in 1947. Nevertheless we are still deficit in raw jute which supplies the raw material for India's premier export commodity—jute manufactures. Much progress has been achieved in growing more jute in India but even in 1964-65 we had to import almost three lakh bales to supplement our own crops which had suffered due to bad weather. The balance sheet of the performance of jute goods exports in 1964-65 must include this import to arrive at the net contribution to India's export earnings.

In the early summer of this year there were misgivings about the 1965-66 crop too, because of weather conditions in the sowing season. While these anxieties are now somewhat less, the recent countrywide emphasis on growing food crops must have its impact on jute. Earlier the Government of India had fixed a target of 11 million bales of raw jute for the Fourth Plan—to be achieved by 1970-71. In August last the Government set up a high-powered committee under the chairmanship of B. P. Patel, Chairman, State Trading Corporation, to suggest measures to increase supplies of raw jute. This committee is composed of senior officers of the Government of India and concerned State Governments. It has also been asked to examine the quality of raw jute produced in India.

The problem of productivity will assume very serious proportions in the drive to increase jute production as there is the competing demand for land to grow foodgrains. Obtaining higher per acre yield is a problem which has been examined in detail by several expert panels in the last decade or so. But from the actual progress made it appears that in the implementation of the various schemes formulated and experiments made, much remains to be desired. The total effort needed is of very substantial dimensions, and unless that is put in, no progress can be expected. An illustration of this is the recently report-

ed decision of the Government of West Bengal to multiply at least 5,000 maunds of improved jute seeds in its district farms when the State's requirements are nearly sixteen times as much.

At a recent meeting of the Jute Textile Consultative Board at Calcutta, the Government assured the industry that in order to step up the tempo

of modernisation, expansion and diversification of the jute mills it would be prepared to consider the self-financing scheme of importing such machinery and equipment as are not indigenously manufactured, to the extent of Rs 10 crores. Further the Jute Commissioner has been entrusted with working out a scheme in consultation with the IJMA and jute mill machinery manu-

facturers in India for a five-year hire purchase scheme under which banks would advance a five-year hire purchase loan to the industry for purchasing indigenous machinery. Such schemes are already in existence for cotton textile, cement and certain other types of machinery, in the production of which Indian enterprise has made notable advances. Banks too can obtain certain refinancing facilities for such business from the Industrial Development Bank. An extension of this facility to jute mill machinery should not prove too difficult.

Prospect of Administrative Reform

THERE is much for the proposed high-powered commission on administrative reforms to do. The Hoover Commission's labours in the US have had far-reaching impact on the American administration and have attracted considerable attention outside the US. But if it is to produce worthwhile results the commission must proceed with a clear understanding of the key issues to be tackled. The Home Minister has informed Parliament that the commission will make a "deep and comprehensive" inquiry into practically all aspects of administration. It is, however, possible that armed with a wide mandate the commission might plunge into irrelevant details like, for instance, reduction in staff of government departments, a task that legitimately belongs to O and M experts. In fact, there is a good case for farming out detailed studies, whenever these are called for in view of their bearing on larger issues, to academic men and professional consultants on an *ad hoc* basis. This approach will be preferable to entrusting such work to the Administrative Reforms Division of the Home Ministry, which one may expect is what will be done. The A R D lacks the appearance of being objective which is necessary for public confidence in the deliberations of any administrative reforms commission.

Coming to the vital issues on which the commission will do well to concentrate, two aspects of administrative procedure bearing on the citizen's dealings with the administration need emphasis. First, common red tape or administrative delays—in the absence of any statutory safeguards, the citizen now manages to get his work done by payment of what has come to be known as speed money or by resorting to other expedients. In the US the Administrative Procedures Act of 1946 sets down the guidelines for dealing with

the citizen's demands on the administration. For instance, the Act lays down the outer time limit for dealing with a request from the citizen. It puts the responsibility on the administration to explain any delay beyond the prescribed limit. In India there has been much discussion on this subject, one section of opinion favouring a general Act applicable to all Acts and another advocating specific provisions incorporated in each Act. This is clearly an issue which the commission ought to take up in the interests of eliminating one of the breeding points of corruption.

A second issue is that of providing an independent appeal system in the administration. At the moment, except in very few cases, there is no provision for appeal to an independent higher authority against the decisions of the administration. The citizen has, of course, the facility of appealing to a higher authority within the department. This is a procedure which Lord Denning has rightly dubbed as a system of appeal from Caesar to Caesar. It lacks the appearance of impartiality which is necessary if the administration is to have the confidence of the citizen. Too often, the higher authority within the department is more anxious to protect and justify the action of his subordinate than to mete out justice to the aggrieved citizen.

In this context, it is welcome to note Nanda's assurance that the administrative reforms commission will also deal with the question of setting up an ombudsman to hear public grievances against the administration. The ombudsman's role as a grievance-man has rightly attracted wide publicity, but there is another aspect of his working which is not widely known. The ombudsman can act as a standing one-man administrative reforms commission. This he has done in countries where he has been functioning by constantly drawing the attention of the administration to defects brought out in the course of his working. His close study of the working of different agencies of Government has been of much value in improving departmental standards in these countries. This is the sort of function the Comptroller and Auditor General performs with regard to financial administration in India and elsewhere.

Indian Publicity Abroad

A Correspondent writes:

EVERY time the foreign press criticises Indian policies or actions such as on Goa, Kashmir or in the

recent war, we attribute it to the failure of Indian missions abroad to perform well their job of presenting the correct image of the country. Recently, after the Indo-Pak hostilities, an expert committee has been appointed to investigate the working of the Indian missions. The Prime Minister has, however, sought to exonerate the missions of the charge of failure and has attributed the unfavourable reactions abroad to the prejudices of the various countries.

In all this discussion the very important issue of the relations between Indians abroad and our diplomatic personnel is forgotten. The former are frequently eulogised as the "unofficial ambassadors" of India but their dealings with the Indian embassies and consulates are generally marked by a complete absence of cordiality and a good deal of mutual disgust. As a result, the so-called unofficial ambassadors who can potentially be a very effective channel for expounding the Indian point of view are completely isolated from the Indian diplomats, and are denied adequate information on developments at home.

This handicap arises partly from the fact that no Indian daily issues an air mail edition. Some publish weekly air mail editions but they reach Indians abroad days after crucial events take place at home. And, most unfortunately, Indian embassies supply virtually no factual information to Indian nationals. A recent experience during the early stages of the conflict with Pakistan illustrates the point. At least a majority of the non-official Indian delegates who were in Yugoslavia for two international conferences in September found the Indian embassy in Belgrade unable or unwilling to acquaint them with the situation at home. The teletape made available to them was edited to remove all war news. The diplomatic bag was said to arrive only once a week and so no Indian newspaper giving news of the developments since September 1 was available. While the Press Officer was reported to be "on tour", the embassy staff itself was said to be depending on the B B C broadcasts for its information!

On the other hand, the full teletape could be read at the American embassy; and the Pakistani delegates received all available details from their embassy. Perhaps in this contrasting behaviour of the embassies of the two countries is the explanation for a British cor-

respondent's report that at BBC interviews on a special programme Indian students in London performed very poorly compared to their Pakistani counterparts. The information supplied by the Pak embassies may all be mischievous propaganda, including stories of Bombay having been bombed, but rumours thrive most when no facts are made available.

There is thus urgent need for asking Indian embassies to establish close rapport with Indian nationals abroad and to supply the latter with all available information. Such a policy can at least partly offset the harm done by the crimes of omission and commission of the foreign press and their correspondents stationed in India. At least the daily press releases that at present go only to diplomatic colleagues or to unhospitable newspapers

should be made available to Indian nationals.

A measure of equal, if not greater, importance would be to send Indian newspapers, including the leading dailies, to important public and university libraries abroad, gratis and by air. Foreigners interested in our country (as well as Indian nationals abroad) will thereby be able to know our point of view at first hand. (At present, even the reading rooms in Indian chanceries display dailies which are at least a week old, and most libraries get them only after two months.) The expenditure on air postage would hardly exceed a few lakhs of rupees and would prove much more fruitful than that on sending 'delegations' to dozens of countries to do a job for which most of their members are hardly trained or qualified.

LETTERS TO EDITOR

Food Stocks with Consumers

AT the recent meeting of the Congress Working Committee, an interesting statement was made by the Chief Minister of Gujarat. He said that although the output of cereals in the State is expected to be only 13.85 lakh tons against 23.66 lakh tons during the last year, "this shortfall is being offset partly by many people voluntarily surrendering their ration cards and others managing without cereals".

It is possible that the normal tendency of deficit States to exaggerate their deficit and of surplus States to under-estimate their surplus might be operative even now. But it is indeed surprising that the reported movement for voluntary surrender of ration cards in Gujarat has failed to attract attention and emulation elsewhere. The rationale of the movement lies in the fact that many consumers can afford to, and habitually do, stockpile foodgrains for their anticipated needs for a year or so. If all such stocks could be drawn upon the severity of the food crisis now haunting the country can be mitigated a good deal. The crucial issue, of course, is the willingness of consumers to overcome the considerations of uncertainty of food crops next year and to abstain from making any claims on the stocks available with the Government that are distributed through the fair price or ration shops.

It is most unlikely that the habit of stocking up is confined to consumers

in Gujarat only and, therefore, the movement for voluntary surrender of ration cards can usefully spread to other States as well. Such a movement will also help cut down further stockpiling and if a substantial number of urban consumers adopt it there will be fewer opportunities for producers to get higher prices on sale of their crop to non-governmental agencies.

There is also an urgent need for a firm drive to detect bogus cards for foodgrains and sugar. Several of the inspectors appointed for the purpose in Greater Bombay are reported to be avoiding the task of visiting individual households to check on the actual number of family members. In fact, at least one conscientious person I know resigned within a fortnight of his getting a job as an inspector, because he was disgusted with the current practices. The long run solution perhaps lies in issuing identity cards with photographs of members to all households, as is proposed, on a voluntary basis, for Indian citizens in Assam. The scheme can be confined to urban areas to be brought under rationing and can, in the first instance, be tried out on a small scale. The cost would be relatively negligible and the identity cards would have manifold uses. If properly organised, the scheme can lead to population registers such as are maintained in Japan and Sweden and several other countries in Northern Europe. It would also enable the Government to make

a much-needed distinction between the ration quota for sedentary white-collar workers and that for manual labourers whose consumption needs tend to be higher.

Finally, the miss-a-meal movement is unlikely to make any impact on the food situation unless it is accompanied by a cut in the foodgrains quota allotted to each individual. Its psychological value is perhaps exaggerated, although if the movement catches on in the rural areas some impact may be produced on the marketed surplus.

Methanol

IN his excellent article on "Defence-Oriented Orientation of the Chemical Industry" (*The Economic Weekly*, October 16) Ajoy Gupta states that "our present capacity for production of methanol is nil". This is true, but in this context it should be mentioned that a methanol plant is currently under construction as part of the Trombay fertiliser project. This plant will produce refined, technical grade methanol for the first time in India. According to the latest report of the Fertiliser Corporation of India, which is responsible for the Trombay fertiliser project, the methanol plant will go into production in the next two months. When in full production, it is expected to produce about 33,000 tons of methanol annually.

Not a Secular Act

THE Weekly Note 'Not a Secular Act' in your issue of October 23 doubts the wisdom of the public performance of "bhoomi pooja" by the Prime Minister of a country which places great faith in the concept of a secular state. Towards the end you have also stated that it is hard to imagine the possibility of any public work being inaugurated with a Muslim or Christian ritual. I feel that such a possibility may and perhaps will materialise if one of our future Prime Ministers belongs to the minority community. Surely, if our Vice-President can be from the minority community, then some day in the future our Prime Minister may also be either a Christian, a Parsi or a Muslim since our constitution guarantees equality of opportunity and does not recognise any distinction based on caste, creed or colour.

CAPITAL VIEW

Homework Needed on Military Affairs

Romesh Thapar

PAKISTANI infiltration into the Kashmir Valley, likely to be pushed vigorously during the winter months, is being supplemented by a large-scale grabbing of desert lands along the Rajasthan border. This cynical violation of the cease-fire is made necessary because of Rawalpindi's desperate need to prove that as a result of the recent hostilities Pakistan had occupied more of India's territory than India of Pakistan's. The 'claim' being popularised in diplomatic circles is 1,600 square miles!

That we consider ourselves free to expel the Pakistanis from areas occupied after the cease-fire has been stated in categorical terms, but again we seem to be making the error of withholding detailed information on the infiltrations because some wooden bureaucrat in the Defence Ministry imagines that he knows better and there is no one with the sense to correct him. This inexplicable secrecy over matters which are known to the enemy provides Pakistan with the opportunity to state that its forces were all along in these illegally-occupied areas.

The more perceptive observers in the Capital are beginning to express a certain anxiety about the situation along the so-called cease-fire line. The Pakistanis appear to be determined to remain firmly entrenched on our territory in Chhamb and Khemkaran, the two points which they consider the most vulnerable sectors of our frontier. Unless, our military command is able vigorously to punish the Pakistanis for every cease-fire violation — and punishment must be strictly localised — there is danger that we will become victims of a prolonged and undeclared war of attrition.

The fact that we are in the vicinity of Lahore and Sialkot should not blind us to the advantages Pakistan enjoys in the present diplomatic situation, advantages which permit greater flexibility in military blackmail. Admittedly, Ayub and his colleagues have been startled by the fighting capability of the Indian jawans despite the odds faced in armour and fire power, but they are also convinced that certain rather fortunate and unexpected factors helped Indian com-

manders in the field to turn the tide. The 'hawks' in Rawalpindi might well be persuaded to try again.

What gives the Pakistani 'hawks' the gumption to play with the idea of another foolhardy adventure?

True, the vital Chhamb-Jaurian-Akhnour sector which is ideal 'tank country' and protects our lines of communication to Kashmir and Ladakh was inexplicably denied defence works in depth, and had the Pakistanis used their air force in support of their armour on September 1 they might well have achieved what we set out on September 6 to prevent them from achieving. But it is equally true that our thrust in the Lahore and Sialkot sectors was weakly conceived and organised by Army Headquarters, conducted with inadequate strength and hopelessly short of air support to provide decisive results. After all, the Pakistani 'hawks' know that the advance formations of the Indian army did cross the Ichhogil canal by the evening of September 6 only to be thrown back subsequently — and, what's more, if the 'right hook' had been more boldly launched from Dera Baba Nanak the entanglement with the unmapped defences before Sialkot would not have been all that damaging to a decisive result. The attempted invasion of the Punjab by Pakistan's First Armoured Division via Khemkaran almost succeeded, but the command tactics courageously adopted by our jawans with devastating effect in this sector against the enemy armour did become the 'style' in all the battles which took place later along the front — and these tactics paid handsome dividends. If our intelligence services failed miserably to detail the enemy's armoured strength, fire-power and elaborate defence system — failures which could have compromised us gravely — our army staff is now at least more experienced in handling the kind of situation which might develop if hostilities are resumed following the erosion of the cease-fire. Moreover, in a future flare-up, air support to the ground forces will be solid and sustained. And, next time, two-thirds of the Indian Air Force will certainly not be kept in reserve and uncommitted — a decision which some experts argue probably

robbed us of a more decisive result.

What then encourages the Pakistani 'hawks'? From the information that trickles in, the assumptions in Rawalpindi are as follows:

(1) The Paks hope to infiltrate over enough mileage in Rajasthan to create the impression of a military victory when the UN observers demarcate the so-called cease-fire line. This, it is presumed, will cause demoralisation in India.

(2) Soon it will be made known that the Pak army is fully reorganised and replenished. An attempt will be made to create the semblance of three armoured divisions poised for battle. Proof will be advanced that the Pak army has ensured its supplies despite the ban by the USA, and this will cause further demoralisation in India.

(3) The build-up of the Sino-Pak alliance will see further strengthening, particularly after the setback to Chinese interests in Indonesia. Moreover, the need to restore Peking's prestige after its damaging projection during the recent hostilities will encourage China's leaders to adopt more threatening postures towards India, destroying her confidence to cope with so many fronts.

(4) The hope continues to be expressed that India will not be able to resolve her political problems in Kashmir. These will fester and provide the Pak pockets in the Valley the chance to create disorder — even revolt — in the coming months.

(5) The uncertain cease-fire is expected to strengthen the hands of communal groups within India. These groups are seen as working towards a collision with the Muslim minority, a collision which could further weaken and splinter the resolution of India to resist Pak pressures. The more impatient would even use the exodus of Hindus from East Pakistan to fan the flames of communalism. Significantly, the most impatient are the die-hard Punjabis who see such an exodus as marking the end of the eastern wing's numerical preponderance in Pakistan.

Want to increase your overseas profits?

Here are 17 ways we can help you.

1 Our World-Wide Marketing Service personnel can help you find new markets. We have specialists in 124 world trade centres. Let them analyze your profit potential, show you where your product is needed, where you can ship to and sell most easily.

2 We can advertise your needs. Do you want to buy something? Sell something? We can spread the word. Our monthly magazine, "Clipper Cargo Horizons," published in 6 languages, can place your listing before more than 176,000 top executives around the world. No charge.

3 We can develop new contacts for you. Our professional marketing experts can make your first new overseas sales approaches for you—free.

4 We can find you additional suppliers. Want to buy for less? Get a special design? Get higher quality? Let our specialists discover new sources for you... see that you get catalogues and prices.

5 We can cut your packing and crating costs. We don't require the heavy, expensive crates of surface shipping.

6 We can lower your air Cargo rate. Pan Am's AirPak Savings Plan employs newly-introduced corrugated containers that can earn you a discount of 12%. And remember, Pan Am has reduced rates in recent months on many products, perhaps yours.

7 We can help you cut warehouse expenses. Because we can deliver overnight almost anywhere in the world, you don't have to maintain costly warehouses overseas.

8 We can lower your inventory cost. Our rapid delivery means you can order direct from the factory as needs arise... you won't have to maintain costly inventories.

9 We can help you match a local producer's delivery time. Don't let foreign competitors take business from you because they can deliver faster. Our rapid delivery makes you, in effect, a "local producer"

anywhere in the world, lets you cash in on unexpected opportunities overseas.

10 We can solve distribution bottlenecks. When you have to produce more than your regular distribution facilities can handle, call us. We'll see your customers get their orders on time, every time.

11 We can help you bank your profit sooner. The sooner your goods are delivered, the sooner you get paid. Our rapid delivery often means you get paid several weeks sooner.

12 We can reduce obsolescence losses. Could a newly introduced model or a change in public taste cut into your sales? Or even destroy your market? Minimize this risk... with our overnight delivery.

13 We can slash wharfage, docking, trucking costs. Call us. We'll be glad to show you how and how much.

14 We can reduce clerical expenses. For example, one Pan Am airway bill will take your shipment anywhere in the world. Let us rid you of use-

less, expensive, time-consuming paperwork.

15 We can greatly reduce insurance costs. Did you realize that shipping with us can save you in insurance as much as 90% of your surface shipping insurance costs? We'll be glad to show you the proof.

16 We can cut or eliminate spoilage, breakage, pilferage. The longer a shipment is in transit, the greater the likelihood of damage. To get your goods delivered fast, in factory-fresh shape, call us.

17 We can cut or eliminate disassembly-reassembly. No need to take large items apart and put them back together when you ship with us. You save time, trouble and cost.

Profit from these 17 ways Pan Am can help you.

We'll be glad to have one of our cargo experts help you make a thorough analysis of your supply and delivery system. No charge, no obligation. Call your Pan Am Cargo Agent, or ring us up. Do it today. (Tel. 211063/64)

World's largest Air Cargo carrier - World's most experienced airline

JWTPAA 2515

(6) And, finally, the confidence is widespread in Pak army circles that India will not be able to replenish her stocks of ammunition and spares within the context of the ban imposed by the USA and UK on the delivery of such supplies. It is argued that the equipment being received by India from the USSR can only become effective in the long-run, that during the immediate period India has to rely on western sources which will not respond unless certain geopolitical surrenders to Pakistan are accepted. Then, in the event of Indian reluctance to bend, the stage will be set for another adventure.

It is clear even from this summary of Pakistani attitudes that a crucial error was made in agreeing hastily to a cease-fire which was viewed as a 'breather' by the enemy. It was the duty of political and military leadership to assess the staying power of the enemy. If this assessment had been done, a short prolongation of hostilities would probably have given us the decisive result which the military campaign failed to yield for various reasons. It does not need a genius to appreciate how skilful tactics in the UN could have delayed the cease-fire until such time as our objectives were gained.

It is incredible how our political and military leadership continues to harp on the fact that it was not intended to 'occupy' Lahore and Sialkot. 'Occupation' has many variations. It does not always involve a street-by-street control. Lahore's railway marshalling yards at Moghulpura and the waterworks near the Ravi would give control over the city, particularly if the bridges over the river had been cut. As for Sialkot, the city had been more or less abandoned; its fall, alone, would have psychologically clinched the operation to punish the aggressor. Or were we playing with the notion that the punishment delivered was enough and that Ayub, a moderate, was better to deal with than some Punjabi revanchist like Kalabagh?

Perhaps, it is far-fetched to imagine that any kind of sophisticated reasoning was brought to bear on the timing of the cease-fire. The Cabinet was certainly unaware of the nuances of the situation. If Defence Minister Chavan believed that he understood the ramifications and kept the Prime Minister informed, then it has to be stated that his understanding was off

the mark. Indeed, many knowledgeable persons, while welcoming the Prime Minister's decision to leave, for good or for worse, the conduct of the campaign in totality to the army staff are now of the opinion that in future political control over strategic objectives, both political and military, will have to be strengthened. It is for the Prime Minister to find the mechanism to do this without endangering the control of the army staff over the day-to-day conduct of a campaign.

It is in this context that the irrepressible Dr Lohia has been agitating

for the publication of the still secret (sic!) report on the clash with China in NEFA and for a serious study of the lesson of the recent hostilities with Pakistan. For once, he is right. A democratic State, in which Parliament is sovereign, cannot be content to base its thinking on obviously slanted — and often contradictory — hand-outs from the Defence Ministry upon which newspapers have unfortunately come to depend. A closer involvement with military affairs is demanded. If this involvement is possible in the USA despite all the security risks, surely our Defence Ministry can open up.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

LIONEL EDWARDS (PRI)

Everywhere in the Capital, and possibly all over the country, a troubled questioning of the defensive and offensive capability of our armed forces has begun. The military stalemate on the Pakistan front, seen at one stage as a victory, has compelled this questioning. It is a reflection of a

people's growth to maturity. If we have to live with land frontiers reduced to cease-fire lines, and have to make the sacrifices which such a situation calls for, then it is high time that Parliament be called upon to do its belated homework on military affairs. After all, we are at the

moment in peace spending Rs 3 crores per day on this activity. Yes, Rs 3 crores per day excluding the cost of a clash, a fracas, limited hostilities or a prolonged war! Our members of Parliament have been known to take an obsessive interest in less.

INVEST IN DEFENCE LOANS HELP DEFEND THE COUNTRY

NATIONAL DEFENCE LOAN 1968

will carry interest at $4\frac{1}{4}\%$ and will be repaid after 3 years.

NATIONAL DEFENCE LOAN 1972

will carry interest at $4\frac{3}{4}\%$ and will be repaid after 7 years.

BOOK REVIEW

Agriculture and Econometrics

Amiya Bagchi

Agricultural Production Functions, Costs and Returns in India by C H Hanumantha Rao; Asia Publishing House, 1965; pp xi+99, Rs 12.

IN the first essay of this book Hanumantha Rao has fitted Cobb-Douglas productive functions with land and labour as the inputs to a set of data, derived from A M Khushro's study "Economic and Social Effects of Jagirdari Abolition in Hyderabad State" (1958). He omits capital from the list of the inputs entering the production functions, "as the estimated elasticities relating to this input when included were found to be non-significant, due to certain gaps in the data relating to this item" (p 4).

Rao derives certain conclusions from this study which are obviously important: (a) "the marginal product of labour is positive and significant" (p 24); (b) "as between different regions and types of farms, wherever the functional significance of labour is greater and the per acre labour inputs relatively lower over a considerable area comprising large-sized farms, the elasticity of output with respect to labour input is higher relatively to that for land" (p 25); (c) "... apart from the regional differences in soil fertilities, the regional disparities in the pattern of land holdings are an important factor in explaining the regional disparities in productivity" (p 25); (d) "... with the labour-intensive technique, productivity of land and total output can be raised best under a more even distribution of the ownership of land which would work for a greater identity between these three factors" (viz, ownership, management and work) (p 26)

Rao also draws contrasts between the elasticities of output with respect to land and capital in irrigated or partially irrigated and unirrigated areas. Briefly, it is contended that the elasticity of output with respect to land is lower in the former and higher in the latter (i.e., unirrigated) areas than the elasticity of output with respect to labour.

Some of these seem to be quite sensible conclusions and the last one is very important and not at all obvious. The trouble is, however, that these conclusions are erroneously arrived at. Rao's analysis suffers from two basic defects: first, he fails to specify in any

detail the set of economic relations and institutions from which the data are generated;¹ secondly, he fails to realise that long-term policy prescriptions cannot be based on a static model mirroring some aspects of the working of a farm economy within a short period of time. The total indifference to technological and agronomic considerations that the book displays is related to this second defect.

What Does a Good Fit Mean?

Even in advanced industrial economies with malleable capital and mobile factors of production, it is not very clear what precisely a good fit of a set of data by the Cobb-Douglas function implies.² Furthermore, there is a dilemma involved in the specification of the competitive conditions under which the Cobb-Douglas production function can be estimated from observed experimental data. On the one hand, it is well-known that a set of data relating to inputs and outputs at a moment of time can represent points on a production function *only if* the firms generating those data can be supposed to be maximizing profit under purely competitive conditions. On the other hand, in long-period equilibrium if all factors and products are bought and sold under conditions of long-period equilibrium, then all the firms will have the same endowments of factors and the data relating to all the different firms will be the same, so that no estimate can be made. In these circumstances, it has been concluded that the only data on the basis of which unbiased estimates of production functions can be made are engineering or experimental data.³

If this is the prospect of estimation of Cobb-Douglas production functions on the basis of data relating to firms in advanced economies, the prospects of estimating production functions of a simple nature in Indian agriculture on the basis of non-experimental data are even more bleak. It is well known that the mobility of land among different cultivators is extremely restricted. Then there is the phenomenon of joint family and the running of the

farm on the basis of family labour. There is the season-bound character of farming operations: the distribution of labour, rainfall and other inputs among the different phases of cultivation can be a critical factor in determining the productivity and profitability of farming operation. Associated with this season-bound nature of cultivation is the high degree of uncertainty surrounding all the calculations of the farmers. And finally the vast differences between the farmers as regards wealth, income and the prospects of employment influence their choice of inputs, can be summarised in the two exponents of labour and land in the Cobb-Douglas production function.

When one tries to interpret these exponents as the elasticities of output with respect to the two inputs, as Rao has tried to do, one gets into even greater trouble. Rao's estimates would imply that independently of the extension of acreage or the increase of capital, an increase in labour alone should increase agricultural output in India by a substantial proportion. Anyone who has studied the history of agriculture in Eastern India during the period 1900-1940, or anyone who pauses to consider the poor level of productivity in the lateritic regions of West Bengal suffering from soil erosion will find it hard to credit this message of hope.

The fact of the matter is that even without any basic innovation in the methods of cultivation a growing pressure of population on the soil will dictate new patterns of land use, new crop rotation systems, different ways of using water and other scarce plant nutrients. When we add the effect of increase in the factor that is missing from Rao's scheme — viz, capital, the effects are even more far-reaching. When the amount of fertilisers applied grows, when dry areas are irrigated, when improved seeds and strains of cattle are introduced, or when fodder is raised on cultivated grasslands instead of natural ones, the changes can rarely be considered as just a change in the quantity of capital; they will involve the introduction of new *types* of capital, new techniques, new crop-

ping patterns, and new alignments between workers, owners and managers. An intensification of cultivation will also necessitate a higher level of education for the farmers.⁴ It is clear, as the Ladejinsky report and other studies show, that in many cases new techniques can be fully exploited only if the system of absentee landlordism in its various forms can be abolished in India. But Rao does scant service to the cause of effective agrarian reforms by badly prescribing a more egalitarian distribution of land on the basis of a study which assumes the techniques of cultivation to remain unchanged.⁵

Wrong Emphasis

In the second essay the author compares farm costs and returns of different states. He takes "net income" per acre which is arrived at "by deducting from the gross value of output the input values of seeds, manures, fertilizers, irrigation charges, feed of bullocks and the depreciation on fixed equipment, e.g. bullocks, implements, machinery and farm constructions", (p 29) as the index of efficiency of farms. It is not clear why the wages of hired labour are not deducted from this measure of net income. Rao arrives at the interesting conclusion from this study that "farms which lease in some area invariably show lower costs on bullocks and implements. Indeed, it is not without significance that regions where area leased is relatively large, e.g. Punjab, Andhra, West Bengal and Madhya Pradesh show relatively lower costs on bullocks and implements" (p 61-62). The data used for this study are derived from Farm Management Studies sponsored by the Research Programmes Committee. Rao does not indicate the tremendous (and often, unknown) margins of error involved in these data. If he had taken account of errors involved in the data, he would probably have paid less attention to a subtle analysis of the differences between 'net incomes' between different size-groups, and more attention to such blatant facts as the differences between the average sizes of farms in Punjab or Bombay and West Bengal, and the differences between the states of water supply and land use between Madhya Pradesh and Madras. That the study would have benefited from such a shift of emphasis is abundantly clear from the many illuminating comments Rao offers as disdainful asides at the end of each of his essays.

The third essay analyses the relative profitabilities of different crops measured by net income per acre in different regions, again on the basis of the Farm Management Data. His conclusion is, in his own words, "the present inquiry reveals a remarkable correspondence between the net income per acre (after deducting variable costs excluding family labour from gross output) from different crops and the area under them" (p 90). What is this "correspondence" supposed to reveal? That the farmers are "rational"? Would the lack of such a correspondence have revealed them as being "irrational"? If farmers were free to choose their crops entirely on the basis of the net income they would derive from them, and soils were homogeneous within regions then only the crops yielding the highest marginal returns per acre would be selected. Even then the figures of average profitability correlated with the figures of distribution of land among the crops would not reveal anything. As it is, farmers are limited by their subsistence needs, by their debt positions, by the cycle of the seasons, and by the nature of the soils in the choice of crops to be cultivated. In such a situation a bald analysis of the data relating to average profitability for different crops will reveal nothing about the rationality or irrationality of farmers, if no other background information is provided to support such an analysis. As it is, the conclusion of the author might mislead the unwary into thinking that, by and large, all is well with our crop pattern and land use in different States, whereas nothing can be further from the truth.

The above comments are by no means a critique of econometric analysis in Indian agriculture in general; nor are they to be interpreted as a criticism of all production function studies. Production function studies based on experimental data or on a proper specification of the institutional and technological background can still serve a valuable purpose in bringing out certain implications which are not obvious from unprocessed data. But if Indian agricultural economists continue to ignore the findings of soil chemists, agronomists and geographers bearing on Indian agriculture, their policy recommendations can only be considered irresponsible or irrelevant. It is sad that with all the detailed knowledge of Indian agriculture that Rao obviously possesses, he should be

tempted to play up to the conventions of a professional coterie which may have little bearing on the problems of the real world.

Notes

- ¹ See in this connection, the review by Zvi Griliches of Heady and Dillon: "Agricultural Production Functions" (Ames, Iowa, 1961), a book to which Rao repeatedly refers for guidance.
- ² E H Phelps Brown: "The Meaning of the Fitted Cobb-Douglas Function", *Quarterly Journal of Economics*, November 1957.
- ³ A A Walters: "Economies of Scale: Some Statistical Evidence: Comment", *Quarterly Journal of Economics*, February 1960.
- ⁴ See Rene Dumont: "Types of Rural Economy" (London, 1957).
- ⁵ There may be a conflict between an immediate increase in productivity per acre through redistribution of land on a more egalitarian basis and the long-term increase in productivity if the richer farmers do tend to save and invest a much greater proportion of their incomes than smaller farmers. But this conflict will in effect vanish if the State provides most of the scarce inputs and the growth of output is limited by the demand for new techniques and new inputs by farmers.

Lakshmiratan Engg Forges Ahead

AN all-round increase was recorded by Lakshmiratan Engineering in production of ring frames, Lister diesel engines, Freedom range engines, sealed compressors, spindles and high drafting equipment in the year ended September 1964. Value of sales and job work done was higher by 20 per cent to Rs 1.95 crores. But the net result was a loss of Rs 10.04 lakhs, as against a profit of Rs 1.09 lakhs earned a year ago. This is attributed by the management to the higher cost of production which, it says, could not be compensated by a corresponding increase in the sale prices of products, as a major part of the production had been sold in advance. Both equity and preferential dividends are, therefore, again skipped.

Growth of Calcutta's Business District

Meera Guha

This article examines briefly the historical developments leading to the displacement of the Bengali population from large commercial enterprise in Calcutta by trading castes from Uttar Pradesh, Rajasthan and Gujarat and the spatial changes which have followed this.

THE chief commercial concentration of Calcutta is located in an area lying along the Hoogly River, covering wards 17, 19, 24 and 26. In the immediate neighbourhood, where commercial functions are also present to a lesser degree, the density of population rises as high as 761 (ward 25) and 586 (ward 20) per acre. The tradition in the region which has always been one of trade and commerce has attracted various communities of differing origins and composition. The geographical character of the area formed one of the bases of this tradition. In a marshy deltaic setting, the high levee banks of the river formed the site of several villages, while the river itself provided an easy means of communication. Some of these villages were religious centres or centres of Brahmanical learning, while some were centres of trade or of manufacture by artisan castes. Upon one portion of this levee, Sutanuti, a reputed cotton yarn market of the 17th century was located. This place became the famous 'mid-

day halt' of Jub Charnock, and later developed into the city of Calcutta. It was around this nucleus that the central commercial functions of the city evolved. In the north lay the old village site of Sutanuti, later known as Hatkhola and Beniatola (ward 17); while to the south were Jorabagan-Pathuriaghata (ward 19 and 24), and Burrabazar (ward 26). At the time of Plassey in 1757, Jorabagan-Pathuriaghata lay between the villages of Sutanuti in the north, and Kalikata to the south. The latter was the site of the English settlement, which lay to the south and west of the Dalhousie square of present times. There was a bazaar north of Kalikata, known as Bura-bazar (Bura is said to be the pet name of Siva). The old name of Pathuriaghata came from a jetty or wharf (ghaut), where building stones and fodder for draught-horses were unloaded. Originally residential in character, these together were known as the 'native quarter' in the 18th century.

la-Beniatola was composed chiefly of the trading and artisan castes of Subarnabanik (banker), Gandhabanik (spice merchant), and Tantubanik (weaver), who followed their traditional hereditary callings. Most of these people had migrated from Hooghly, in the north, to Calcutta, in the 18th century. This was when, because of silting in the river, Saraswati the famous port of Saptagram was on the decline, and the new centre at Sutanuti offered fresh opportunities of trade and commerce under British patronage.

Southwards, in Jorabagan, Pathuriaghata and Burrabazar, the original resident population was defined in separate wards belonging to castes like Kayastha (scribe), Brahman (priest), Suri (distiller), Subarnabanik and Tantubanik. Several of them are said to have been residents of the village of Govindapore, from where they were displaced during the construction of Fort William in 1757, and were given compensatory land by the Company to the north of the English settlement.

THE ECONOMIC WEEKLY

Several members of these groups began to participate in commercial activities with the East India Company, as agents or 'banians'.

By the 18th century, fresh historical developments took place which led to a number of significant social changes. Revenue collection in Bengal under the Mughals was made through indigenous zemindars in charge of specified districts. When the East India Company came into power in the 18th century, proprietary rights were given to these zemindars by the Permanent Settlement Act of 1793, and the revenue demands of the landlords' assets were fixed in perpetuity. But in order to ensure immediate payment, the Sunset Law was adopted. By this, the lands of the estates were sold to meet arrears if the revenues were unpaid by sunset on a fixed date, the 30th of Asvina of the Bengali year. Several of the old zemindar families became defaulters through the operation of this law, and the new citizens of Calcutta, already engaged in trade, began to buy up these estates when they were offered for sale. Moreover, at the peace under British rule helped in the extension of agriculture, hitherto neglected in an unsettled atmosphere investment in zemindari became a highly profitable enterprise. Thus the group of absentee landlords resident

in Calcutta emerged as a new class altogether. Such were Butto Kristo Paul (Gandhabanik), Brindaban Chandra Basak (Tantubanik), Baisnav Charan Sett (Tantubanik), Sovaram Basak (Tantubanik), Lakshmikanta Dhar (Subarnabanik), Ramlochan Ghosh (Kayastha), Darpanarayan Tagore (Brahman), who were residents of the area under discussion.

The Bengali landlords, once diverted from trade, began to seek opportunities in other avenues of occupation. They had already taken readily to western education by the beginning of the 19th century, and their familiarity with the English language made it easy for them to move into the services in European mercantile firms as well as under the administration. Many families consequently left the field of commerce to which their grandfathers had been attracted. This change took place more rapidly among the Kayastha and Brahman families. For we find that among the other castes, the Subarnabaniks have till today, maintained their original banking occupation besides making new investments in shipping, textiles, jute and coal industries. Only a very small fraction of these caste groups has moved into the 'bureaucratic and learned professions.

Thus the field of large commercial

enterprise was left open to a new group which gradually moved in. These were the trading castes from Uttar Pradesh, Rajasthan and Gujarat. This transfer received further incentive by the construction of railways, when the north-western provinces of India were brought within the trading range of Calcutta. To-day the non-Bengali population is a dominant group in the economic life of Calcutta.

Spatial changes also have been initiated by this replacement. The new commercial groups who have concentrated in the Burrabazar area are gradually spreading out in a distinct pattern all over the city. Whenever old localities are redeveloped, the rich non-Bengali businessmen purchase land along the new traffic arteries and build many storeyed structures. The original resident Bengali families are moving out to give place to the new settlers; so much so, that, as in the case of the central business district, only a small fraction of the original core remains, maintaining an oyster-like existence. In consequence, to-day, Burrabazar is populated mainly by non-Bengali businessmen from Punjab, Uttar Pradesh and Rajasthan. Jorabagan-Pathuriaghata, lying between this area and the northern Bengali locality of Hatkhola-Beniatola, has a mixed population of both Bengali and non-Bengali popula-

Area under discussion

Predominantly commercial

Mixed residential & commercial

Residential

tion. Thus certain social peculiarities are noticeable in the region described above. Here, in spite of the predominance of commercial activity, the different communities maintain discrete concentrations. They are apparently marked off from one another by differences of language, dress, living habits and occupations.

There has also been an invasion of commercial functions in a once predominantly residential area. Occasionally abandoned palatial residences have been converted into ware-houses. This is greatly in evidence on the northern fringes of Jorabagan and in Beniatola. The market functions of Burrabazar have extended along the Hooghly bank on its inner side, and also eastwards. This is of wholesale trade in non-perishable foodstuffs and other commodities. Consequently, heavy motor traffic has encroached upon the area, giving rise to car-repairing and motor ancillary trades. The wholesale commerce of Burrabazar has also brought in a floating population of coolie labour, which finds refuge on the pavements every night, while a few rooms in bustees are collectively rented by them for storage of personal belongings. The river front is in addition lined with timber depots.

There has been a decline of residences in those localities where the advancing commercial functions make demands upon space. Prosperous residences as a result are being replaced by others of a poorer quality, while land values have arisen tremendously. The table on page 1695 bears out some of these features of change between the years 1911 and 1961.

We find that although there has been an increase in total land use, in the nucleus of wards 26, 37 and 39, the increase of commercial functions is considerably larger than that of residential ones. Thus it is possible to define a zonal arrangement of functions lying around the core of Burrabazar. The latter is extending outwards into a zone which now forms the transition between advancing commerce and retreating residence. Still farther away is an area which is still mainly residential in character.

What is more striking is the almost total absence of those functions which are associated with residence, namely educational amenities, clubs and public parks. This is also substantiated by a study of the voluntary communal institutions of the area. Interest in higher education is lacking among the residential commercial population. Except for one or two schools which cater to pupils from outside the region, all the schools are primary, either run by schoolmasters mainly as a means of

livelihood or free schools run by the Calcutta Corporation.

The changing spatial forms have resulted in a state of fluidity, so that social integration is feeble with relaxed social responsibilities. In many cases, where old recreation clubs, run by Bengalis, existed, they are now practically defunct. Similarly, social service organizations do not function properly. The only exceptions in this connection are those non-Bengali community organizations which function for the benefit of their caste groups spread over the whole of Calcutta. Such institutions are well organized and are founded in Trusts. Examples

are: Marwari Relief Society, Maheshwari Sava, Sri Kashi Visvanath Samiti, Svetambar Tarapanthi Sava, Punjabi Seva Samiti, Gujarati Seva Samaj. On the other hand, a different set of organizations cuts through these inter-communal differences. They are a number of trades associations like the Federation of Mercantile Employees Union, Bengal Bank Association, India Bank Employees Association and so on. But these have countrywide affiliations. It seems, therefore, that the social scene is characterized by an un-integrated group of distinctive communities, whose ties are extremely temporary.

Indirect Taxes, Profits and Prices

V C Shah

Indirect taxation has been increasingly accepted as a powerful instrument for both resource mobilisation and resource allocation in a developing country. It may also contribute to the objective of external balance. Excise duties, for instance, could help export promotion by restricting domestic consumption of exportables. In addition, indirect taxation may be harnessed to serve two other objectives—mopping up of surplus profits and giving relief to consumers—as stated in the budget for 1965-66.

This paper is mainly concerned with these two objectives and the choice of products in respect of which changes were made in indirect taxes in the 1965-66 budget.

IT may be pointed out that although the analysis will be in terms of the indirect taxes introduced by the budget for 1965-66, it has a wider significance and application. For, the underlying characteristics of the Indian economy and their implications for fiscal policy may well be shared by some of the other developing economies also.

One of the objectives of the indirect taxes imposed by the budget for 1965-66 was to mop up a part of surplus profits earned on the sale of scarce commodities whether imported or indigenous. The rise in indirect taxes was also expected to correct the existing distortions in the price structure of the commodities affected by the budget proposals.¹ With this end in view, excise duties on copper and copper alloys in crude form, steel ingots, plates and rails and sleeper bars, rods and structurals, black sheets, hoops, skelp, strips, galvanised plates and sheets, tin plates and tinned sheets were raised. In addition, there was an increase in import duties on stainless steel plates and sheets, steel tin plates, sodium hydro-sulphite, essential oils, perfumery not otherwise specified, and on paper not otherwise specified but excluding newsprint and printing and writing paper.

The second objective was to provide a measure of relief to consumers by lowering excise duties on commodities whose prices are at present high. The choice of products on which excise duties were reduced fell on those commodities whose supply position was such that "one may reasonably expect the relief to be passed on to the consumers".² Excise duties on footwear, cycle parts, cycle tyres and tubes, printing and writing paper used in the publication of registered dailies were removed, and those on price-controlled varieties of grey as well as processed coarse and medium cotton cloth, vegetable product, cheaper type of printing and writing paper were reduced.

The crucial question is whether the choice of commodities for increasing

and reducing excise and import duties is really consistent with the two objectives of the indirect tax measures. This is essentially a problem in the theory of shifting of tax. The partial equilibrium analysis in the following pages is mainly confined to the short-run effects of the indirect taxes with a view to finding out the consistency or lack of it between the choice of products and the objectives of the policy of indirect taxation. Obviously, it is not concerned with the problem of resource allocation through taxation.

The first step in the analysis is to spell out the assumptions and conditions under which economic theory would expect a rise in indirect taxes to mop up a part of the surplus profits and a reduction or abolition of such taxes to provide relief to the consumers. The objective of mopping up surplus profits essentially requires that the tax increase is not shifted wholly or partially to the consumers of the products. Similarly, the objective of providing relief to consumers requires that the tax reduction or removal is either entirely or partially shifted to the consumers. In other words, the conditions and assumptions for one objective would be diametrically opposite to those for the other objective. It would, therefore, be useful to concentrate on the assumptions and conditions necessary for fulfilling only one of the objectives.

Mopping Up Surplus Profits

Theoretically, an increase in the tax rate on a commodity will mop up profits of the producers to the full extent of the rise in indirect tax under two conditions: (a) if the supply is completely inelastic or (b) if the demand for the product is infinitely elastic. Under one of these two conditions, there would not be any shift in indirect tax, given certain assumptions. One of the assumptions is that there is perfect competition in the product and factor markets. The other is that producers follow a policy of profit maximisation.

If there is no perfect competition, several possibilities might arise. Under conditions of perfect monopoly, if the demand function is linear and the marginal and average cost are constant, the increased tax rate would be shifted to a lesser extent than under conditions of perfect competition. In other words, a rise in the indirect tax will mop up to a greater extent the profits of a monopolist under these conditions of demand and supply. If, however, the demand curve is convex to the horizontal axis, a monopolist will be able to shift completely the rise in the indirect tax to consumers. Furthermore, if the demand curve has a constant elasticity, the rise in the price as a result of the imposition of an indirect tax would be greater under conditions of monopoly than those of perfect competition.³

It is well-known that both the models, viz, perfect competition and monopoly are not to be found in reality. Therefore, it is necessary to examine the effects of an imposition of an indirect tax or an increase in the indirect tax on the prices of products under conditions of market imperfections such as monopolistic competition or oligopoly. Here again if oligopolists, for example, do not follow a policy of profit maximisation, the problem of shifting an indirect tax becomes more complex. There are various reasons why oligopolists may not maximise their profits. Their pricing policy may give rise to unliquidated monopoly profits under certain conditions.

Given the inflationary situation, there is a considerable timelag in the process of adaptation to changes in the demand conditions when the market structure for an industry is characterised by oligopolistic conditions. This would give rise to unliquidated short-run monopoly gains for various reasons.⁴ It is well known that any change in price under conditions of interdependence always takes time, since the collusion among the producers will not be perfect. Another reason is that there might be a conflict

S & L AND THE PETROLEUM INDUSTRY

Anyone who has seen an Oil Refinery is aware of the miles and miles of piping involved—piping that must be as perfect as possible if costly breakdowns are to be avoided.

The design, fabrication and erection of such complex systems is work for experts, and wise engineers call S & L., whose many years of experience in India enables them to tackle any piping job, big or small, with complete satisfaction to the customer.

S & L will also undertake plant erection, and are thus in a position to give a comprehensive erection service, saving many co-ordination problems, in addition to carrying out the design and supply of piping systems.

If you want pipework of high standard that will give you years of trouble-free service, then contact S & L.

between short-term and long-term profit maximisation. It is very likely that prices which would maintain profits at a maximum at any point of time might well defeat the goal of maximising profits over a long period of time because consumers might be induced to switch over to substitutes. There is also a danger that abnormal profits in an oligopolistic industry might quickly induce potential competitors to set up new enterprises.

In the case of India, there are other important factors which might support the hypothesis that producers in the 'growth' industries being developed behind the tariff walls and the industrial policy of the Government, might be following an administered pricing policy not designed to maximise profits in the short-run. In India, as in countries like the USA and the UK, manufacturers might be afraid of Government interference if they earn abnormal profits by exercising their monopolistic or oligopolistic power in the market. They would invite Government interference in the form of price controls particularly in a country like India where the Government professes to pursue policies aimed at bringing about a socialistic pattern of society and also at preventing concentration of economic power. Another factor which might discourage producers in India to maximise profits is the level of direct taxation. They might follow a policy of accumulating unliquidated monopoly gains rather than pay a very high rate of marginal tax on increased profits accruing from a profit maximising policy. Moreover, if such industries earn abnormal profits, there is all the likelihood that the trade unions would press for higher wages. And labour cost is irreversible. To avoid such an eventuality, management is likely to be inclined to follow a policy of not maximising profits in the short-run. In view of these considerations prices, in an inflationary situation as characterised by the Indian economy, would tend to be lower than those that would maximise current profits and would give rise to unliquidated profit margins.

The relevant question is whether or not the industries on which additional excise duties have been imposed are oligopolistic ones. It is true that the number of producing units in a given industry is not a necessary and sufficient conditions for considering it as an oligopoly. However, the market structure tends to be oligopolistic when the number of enterprises in a

specific industry is relatively small. So far as iron and steel products are concerned, it is well known that the main producers of finished steel products are 6 units—3 in the public sector and 3 in the private sector. Of course, there are secondary producers, as well as registered and unregistered rollers contributing a small proportion to the total output of finished steel products. Only one manufacturer produced copper in 1964-65. There were 24 firms producing brass copper sheets and circles, and 15 all other copper alloys. Sodium hydro sulphide was manufactured by 3 domestic producers. As regards the phenomenon of backlog of orders, the iron and steel industry has accumulated a large number of orders. Because demand exceeds supply, the Government has continued price controls of certain varieties of steel products. Again as the country depends considerably on import of copper and copper alloys, and as they are not imported in unlimited quantities, it is very likely that dealers in copper and copper alloys would also have piled up a backlog of orders.

This phenomenon of accumulation of orders itself indicates that the producers do not or are not allowed to charge prices that would maximise profits in the short run. In other words, it implies that there is 'unliquidated monopoly profit' in these industries. If this argument is conceded, it follows that the additional excise duties on these products would be passed on to the consumers. This is because the same considerations which induce them to preserve unliquidated monopoly gains in an inflationary situation, would now encourage them to shift the tax burden to consumers without raising their profit margin. Hence the additional indirect taxes would not succeed in mopping up the surplus profits earned by manufacturers and importers of commodities for which the market structure is oligopolistic.

So far, the analysis was confined to the supply conditions in order to assess the impact of additional excise duties on surplus profits. One should not, however, ignore the demand conditions. Even if the demand conditions are assumed to be constant, it would not be difficult to shift the excise duties to the buyers if the given demand curve is inelastic. This might happen in the case of important intermediate products of iron and steel industry as well as non-ferrous metals like copper and copper alloys. The

user industries which cannot substitute other inputs because of the rise in prices of steel products, copper and copper alloys and in which the cost of such inputs is a small proportion of the total cost of output would be prepared to pay higher prices. Thus the nature of demand also tends to indicate that the choice of some of the products does not seem to be consistent with the objective of 'mopping up surplus profits'.

Relief to Consumers

Economic theory tells us that a reduction in excise duties on certain products would give relief to consumers in the form of lower prices if the supply is perfectly elastic or the demand is completely inelastic. It was stated in the budget speech that the supply position in certain commodities might lead one to expect that the relief would be passed on to the consumers. However, by and large, the supply conditions in various industries in India would tend to be inelastic. Excess capacity because of unfavourable demand conditions would be rather unusual in the context of the Indian economy. The industrial licensing policy designed to match 'capacity' with demand targets at any moment of time and the low priority given to consumer goods industries would tend to make the supply of consumer goods rather inelastic. Moreover, existing units in the consumer goods industries, such as, vegetable products, cycle parts, cycle tyres and tubes, footwear and coarse medium cotton cloth might have stretched their production to the point beyond which marginal cost would become infinitely inelastic. If, so, there would be no need for such industry to lower their prices as a result of the removal or reduction of excise duties.

One should also consider the market structure for the products on which excise duty has been reduced or lowered. Except for cotton textile industry,⁵ the market conditions would tend to be oligopolistic. There were 45 producing units in the paper industry in 1964, 12 in Western type of leather foot wear and also 12 in indigenous type of leather foot wear. Bicycle tyres were produced by 11 companies and bicycle tubes also by 11 companies in 1964. Bicycle spare parts were manufactured by 51 units. There were about 45 manufacturers of vegetable products in 1964⁶. It may be emphasised that in the industries in which the number of manufacturers

seems to be large, the market conditions might be far from those of perfect competition. That is because in such industries like paper manufacturing and vegetable products, there are a few large producers who exercise a dominant control over the market and who can act as price leaders.

The oligopolistic market structure in the case of commodities on which excise duty is abolished or lowered would suggest that the relief would be passed on to the consumers because the oligopolists would like to maintain their profit margin by allowing unliqudated monopoly profits to accumulate. Here, however, one has to consider what really happens in the retail market. It is plausible that when the price of a commodity like vegetable products is lowered by the big manufacturers because of the cut in excise duty, their authorised wholesale dealers would likewise make the price reduction; but it may happen that the retail traders may not cut the price for the benefit of consumers because of the overall scarcity of the product. Thus the policy of reducing excise duty on products having an oligopolistic market structure might lead to an increase in the profits of retailers rather than to any real relief to consumers except when the manufacturer himself undertakes retail distribution through a system of chain shops or multiple shops as in the case of Bata Shoe Company.

The analysis thus indicates that on *a priori* grounds, the choice of products may not be consistent with the two objectives of the indirect tax proposals of the budget for 1965-66. By way of generalisation, it may be emphasised that in underdeveloped and overpopulated countries, it is useful to consider the implications of the market structure before determining fiscal or monetary measures. Import restrictions, the industrial licensing policy, the size of the market for growth industries manufacturing important inputs for other industries, all tend to create market conditions which would be far from those of perfect competition. Furthermore, while devising fiscal and monetary policies, one should bear in mind that supply conditions in the case a large number of commodities would be inelastic. In most cases, though not always, manufacturing units are likely to be working at full capacity in the sense that they would have stretched output to the point beyond which marginal cost would become prohibitive. Thus, sup-

ply inelasticity and oligopolistic behaviour of the new industries both in the capital goods and the consumer goods sectors should be regarded as two very important characteristics of some of the developing economies as represented by the Indian economy while determining fiscal or monetary measures.

Kargali Washery

A Review of its Working

A B Ghosh

Though the Kargali coal washery made a profit for the first time in 1963-64, the economics of its working still leaves much to be desired.

Some of the reasons for this can be traced to defects in the construction of the washery, which could have been avoided, had greater care been exercised at the time of entering into the contract with the Japanese collaborators.

However, other causes of Kargali's high operating costs can and should be remedied. An attempt is made below to identify these.

THE decision to set up the Kargali washery was taken in 1955 to meet the coking coal requirements of the then proposed Rourkela and Bhilai Steel plants. Located in the (East Bokaro Coalfield) Hazaribagh district of Bihar it has a special advantage in that the use of railway wagons has been eliminated as raw coal feed from Bokaro and Kargali Collieries (containing about 20 per cent ash) is carried by bi-cable aerial ropeway. The yearly input capacity is 2.2 million tonnes based on a washing unit of 463 tonnes per hour working two shifts of about eight hours a day for approximately 300 days in a year. It is a composite type of washery employing both heavy medium separators and Baum Jig. Contract for the supply, installation and commissioning was placed with M/s Eastern Equipment and Sales Ltd in collaboration with M/s Daiichi Bassan Kaisha Ltd, Japan, in March 1956. The scheduled date of commissioning was 1 January, 1958 but the washery actually went into operation¹ in November 1958. Capital cost of the entire project inclusive of ancillary works such as construction of residential buildings, water and electrical installations etc, was Rs 2.5 crores approximately. The destination of clean coal is Rourkela Steel Plant (70 per cent) and Bhilai Steel Plant (30 per cent); middlings are for the Bokaro Thermal Plant and rejects for back-filling the mines.

The rated capacity and output of washed coal of the washery since its inception are given in Table 1. There has been a steady decline in the idle capacity. This is reflected in the financial performance of the washery as shown in the Table 2 which gives a summary of its working⁵ expenses since inception.

In calculating operating cost [item (13)] items (1) and (2) have been excluded for obvious reasons. Items (10) and (11) have been excluded in calculating the operating cost of the relev-

ant individual years as they do not belong there; both have however been taken account of in estimating the average operating cost of washing per tonne [item (16)] for the six year period; this average portrays the picture more faithfully than the yearly data; for a plant has a normal period of development. The operating cost per tonne since 1960-61 is more or less the same if we exclude the cost of railway sidings; the corresponding average for six years is Rs 6.9.

Aggregate loss increased during the first four years, came down in the fifth year to a level lower than that of the second and was transformed in the sixth year into a profit of Rs 14.1 lakhs (Rs 12.1 lakhs if Rs 2 lakhs transport charges of middlings by ropeway to D V C are excluded). The Estimates Committee made the following observations on the growing losses during the first four years:

"In reply to a written enquiry... it was stated that it was not true to state that the washery had been running at a loss. In accordance with the agreement arrived at, the H S L (the only consumer of Kargali washed coal) had been paying the corporation at an ad hoc rate of the notified price for Sel B grade coal plus Rs 5 per ton with the understanding that once the final price was negotiated and settled, the difference, if any, between

the final price so settled and the provisional price would be made good by the HSL." (Para 62)

"A settlement was stated to have been reached with HSL in this regard during 1961. Under this, the HSL would reimburse the Corporation with the actual expenditure incurred upto 30th September 1961. For the subsequent period a standard cost is to be worked out on the basis of principles agreed upon between the two parties. The Committee consider that the standard cost should have been worked out from the very beginning. The system of payment at cost is not conducive to economy and efficiency. They hope that there would not be any further delay in arriving at the standard cost and that such arrangements would be made in similar cases in the future." (Para 63)

Even admitting that there was no loss from the point of view of the Kargali washery it must be pointed out that the possibilities of keeping down expenses were not fully explored. For example, though middlings are sold to the Bokaro thermal power station, situated at a distance of about seven miles, a considerable quantity is simply dumped on the site, there being not enough market for it. The Estimates Committee pointed out (Report Para 65) the desirability of issuing middlings to the employees

Table 1: Idle Capacity of Kargali Washery²

Year	Rated Capacity in washed coal (lakh tons)	Actual output (lakh tons)	Per cent of (3) to (2)
1958-59 (4 months)	1620	1.47	27.2
1959-60	"	8.40	51.8
1960-61	"	8.14	50.2
1961-62	1646	10.85	65.9
1962-63	"	11.02	
1963-64	"	12.73	77.3

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now freely available from our factory at Kota for a wide range of applications such as:

- WIRES AND CABLES
- FLEXIBLE SHEETINGS
- RIGID SHEETINGS
- CORRUGATED SHEETS
- TUBES AND PIPES
- FOOTWEAR
- UPHOLSTERY
- TILES
- CRYSTAL CLEAR ARTICLES
- RAINWEAR
- BRIEFCASES
- TOYS
- HANDBAGS
- BOOK BINDING PAPER

RAJASTHAN VINYL & CHEMICAL INDUSTRIES, P.B. 671, NEW DELHI-1

G.R.V.7

(as is the practice in many developed countries) who during two years 1959-61 were supplied free coal amounting to Rs 53.67 lakhs. This measure would have increased the utilisation of middlings and released substantial coal for industrial and other purposes. Again, it is remarkable that despite a fall in washed coal output in 1960-61 compared to 1959-60, expenditure on depreciation and miscellaneous items was considerably higher. Similarly, the provision for doubtful debts (item 10) to the extent of about Rs 15 lakhs in 1961-62 and Rs 8.7 lakhs in 1963-64 betrays insufficient concern for sound business principles.

Some other features relating to the performance of the washery are mentioned below to emphasise the urgent need for watchful care of its finances. Unsatisfactory performance in its early years led to the appointment in July 1959 a departmental committee which pointed out that:

- "(1) The designed capacity of the washery fell short of the expected input capacity of 2.2 million tons per annum.
- (2) There was excessive size degradation of coal during its transit from the colliery's end upto the washery.
- (3) The capacity of the bi-cable ropeway did not come up to the specific rate of 250 tons per hour for 20 hours a day.
- (4) Inadequate provision had been made for storage purposes at various stages.
- (5) There was excessive coal dust in the washing plant for which adequate arrangements for dust control were not provided."

Also, there were "maintenance and service difficulties due to lack of supply of coal, railway wagons, removal of rejects and middlings, shortage of power and water of spares."... An expert's description of the operation of the washery was that, "The plant stammers. It operates for ten minutes and then there is no coal; it shuts down for an hour and when coal arrives it operates for an hour when there is power failure. It shuts down again for half-an-hour or an hour. When power comes back, there is a failure in water supply. In fact often over 30 per cent of the working time is lost in this manner."

Table 2: Kargalis Working Expenses

	1.11.58 to 31.3.59	1959- 60	1960- 61	1961-62	1962-63	1963-64
(1) Coal consumed in production	40.1	221.5	216.0	302.6	342.4	423.5
(2) Opening stock of washed coal	0.0	0.5	0.8	0.5	1.98	1.36
(3) Consumption of stores, power and water	3.0	11.0	10.4	14.9	16.5	16.6

(22) Loss (—) or gain (+) per tonne of washed coal (Rs.)	—7.5	—3.8	—5.3	—8.0	—1.8	+1.1
(23) Average loss per tonne of washed coal for 6 years (Rs)			3.4			

* Aggregate of (21) for 6 years ÷ Aggregate of (14) for 6 years.

The majority of the Committee were of the view that contractors could not be held responsible for the washery's deficiencies. The Estimates Committee's dissatisfaction with the working of the washery is indicated in their following observations:

"It is thus evident from the foregoing that proper care and caution was not observed at the time of inviting tenders for this project as in the absence of project report complete data was not made available to the tenders. The contract entered into with the Japanese firm was also defective as it did not provide for the performance guarantee of the integrated plant and hence they could not be held responsible for ensuring the rated throughput. Repairs and maintenance costing as much as Rs 1.19 crores during the two years had to be carried out at the cost of the Corporation. It is significant to note that the total cost of the washery itself was Rs 1.72 crores only. In addition a period of over three years was spent in getting the defects and deficiencies removed, resulting in loss of production and earnings. Even after this the annual production is expected to be 3 lakhs tons less than the original rated capacity of 16.20 lakhs tons as admitted by the Managing Director. The Committee cannot help feeling that the acts of commission and omission in this case have proved to be quite costly. They hope that there will be no repetition of such mistakes in future. In this connection they were assured by the Managing Director that they had learnt a good lesson and that they had better facilities for testing the coal characteristics and that their own engineers had also better experience."

The staff of the washery was unnecessarily large. The estimated and actual staff in 1961-62 is given below:

Category	Strength as estimated by Japanese Contractors (revised)	Actual strength 1961-62
Unskilled Workers	32	243
Semi-skilled Workers	60	163
Skilled Workers	139	97
Total	231	503

The Managing Director admitted to the Estimates Committee the fact of

overstaffing and undertook to adopt corrective measures. In spite of this undertaking item (5) of the working expenses (salaries, wages, etc.) given above increased by about 60 per cent between 1961-62 and 1963-64 whereas the input of raw coal and the output of washed coal increased by 26 per cent and 17 per cent respectively during the same period. This is quite discouraging specially because of the urgency of the cost reduction measures underlined by Table 3 which gives the performance of the washery during the last few years exhibiting idle capacity in terms of raw coal input and increasingly difficult conditions of washing indicated by a fall in the proportion of washed coal to raw coal feed [item (5)].

As regards the adoption of a standard cost recommended by the Estimates Committee the annual report of the NCDC for 1962-63⁷ informed that for that year (i) the sale price of washed coal was based on the standard cost, (ii) any difference between the actual cost and standard cost during 1-10-61 to 31-2-63 was shared between the NCDC and HSL in agreed proportions, and (iii) the closing stock of washed coal was priced at standard cost as against the controlled rate for selected "B" grade coal plus an ad hoc rate of Rs 5 per ton in previous years. The 1963-64 Report stated that the sale price of washed coal was based on an agreed rate which was to be reviewed at the end of two-year agreement ending on 31-3-1965. The first

agreement covered the period 1-10-61 to 31-3-63. Standard cost for 1962-63 and 1963-64 can be calculated as in Table 4.

Standard cost for earlier years cannot be estimated from published data. The rise in the actual cost per tonne by about Rs 3 is due to larger salaries and wages, extra expenditure on coal transport and provision for doubtful debts; the need for economy on the first and third items has already been emphasised. If these are attended to and an earnest endeavour is made to run the washery at full capacity it will be able to bear comparison with the private sector washeries¹⁰ thanks to the searching scrutiny of the Estimates Committee, sincere acceptance of healthy criticism by the washery authorities and continuous attempt on their part to meet criticisms.

Notes

- ¹ The delay in commissioning was caused by the dilatory machinery of the State Government for dealing with applications for permission for a ropeway, completion of roads, foundation, drainage etc. Other possible causes are the cumbersome time-consuming procedure for entering into agreements with foreign collaborators and absence of a penalty clause in agreements in respect of timely supply of machinery, equipment etc. (Estimates Committee (1962-63) Thirty-second Report, Third Lok Sabha, Para 51)

Table 3: Kargalis Performance

(lakh tonnes)

	1961-62	1962-63	1963-64

⁹ See Table 2 above

¹⁰ TISCO's washeries are at Janadoba and West Bokaro and IISCO's at Lodna. The comparability of Kargali's latest performance with that of the three private sector washeries (for coking coal) has been demonstrated by the present writer (from washeries as direct evidence could not be secured) in his forthcoming publication (in Press) on "Some aspects of the economics of coal washing in India".

carry the identical assurance of quality
and shrinkage control anywhere in the world

All fabrics bearing the label 'SANFORIZED', in India and the world over, carry the same assurance of a reliable, uniform standard of shrinkage control recognised and trusted by millions wherever cottons are sold.

Last year, many of the 56 registered users of the trademark in India recorded an impressive rise in exports—five, seven, eight and even nine times above their 1963 figures. Even more significant, India's exports for the first

nine months of 1964 of cloth labelled 'SANFORIZED' exceeded the total of similar exports for the whole year of 1963 by over 30%! A positive indication that use of the trademark helps our fabrics to earn more and more foreign exchange.

Such a spectacular increase in exports is proof enough that Indian fabrics labelled 'SANFORIZED' can compete successfully in world markets. They are in demand because they conform to the same shrinkage standard as cloth bearing this trademark anywhere in the world.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A., with limited liability) proprietor of the registered trademark 'SANFORIZED'. The proprietor uses this trademark or permits its use by registered users, only for tested fabric which meets its strict residual shrinkage requirements.

For information: 'Sanforized' Service
95 Marine Drive, Bombay 2.

Monetary Policy for the Busy Season

Arthagnani

Before deciding on its policy for the busy season, the Reserve Bank must carefully consider the changing economic situation.

The position on the price and production fronts is critical and could well spiral into a runaway inflation. Industrial and commercial interests, used to operating with swollen inventories and to speculating on price rises, will not like a tight money policy.

It is necessary that the Reserve Bank does not give in to pressure from these quarters and instead meets them with strong measures.

THE start of the busy season must set for the monetary authorities some difficult decisions on monetary policy. The experience of the last busy season and the subsequent "slack" season is not so much a guide as warning.

Scheduled bank advances were about Rs 1706 crores at the end of October 1964, and rose to Rs 2119 crores at the end of April 1965. During the last busy season (roughly November 1964 to March 1965), bank advances expanded by Rs 407 crores and borrowings from the Reserve Bank (maximum) amounted to Rs 164 crores. This, despite the fact that the busy season started with a stronger liquidity requirement (at 28 per cent), and the introduction of a step-system in the interest rate charged on borrowings from the Reserve Bank whereby with each one per cent fall in the net liquidity ratio, the rate was raised by $\frac{1}{2}$ per cent on the whole of the borrowings from the Reserve Bank. The inefficacy of this requirement led to a rise in bank rate in mid-February 1965 (almost at the tail-end of the busy season) and a rise in the liquidity ratio to 30 per cent. The Reserve Bank's Annual Report for 1964-65 sums up the net impact of this policy in the following words:

"Borrowings by the scheduled banks from the Reserve Bank during the recent busy season have been at a much higher level than at any time in the past, the maximum being Rs 164 crores...; they have also had to pay considerably high rates of interest to the Reserve Bank, the maximum ever touched being 13 per cent...."

However, so liquid has been the economy that this tightening had little impact on the price situation, despite a record harvest. The general price index for wholesale prices (1952-53=100) showed only a nominal decline from 155.5 in November 1964 to 153.8 in April 1965.

Following this experience, the Reserve Bank laid down in May 1965 certain guide-lines for the subsequent slack season (April 1965 to October 1965); it was expected that the banks, besides repaying the borrowings from

the Reserve Bank, would reduce advances by Rs 200 crores and add to their deposits Rs 200 crores; the gain in funds should be invested in treasury bills so that the banks would be in a better position to meet the credit requirements of the following busy season (November 1965 to March 1966). According to the Reserve Bank, these adjustments would have provided a suitable starting point for the next busy season (November 1965 to March 1966) which is about to start. Unfortunately, like all exercises in targetology, this one has also gone awry. Net bank deposits have increased by about Rs 172 crores (from Rs 2641 crores at the end of April 1965 to Rs 2813 crores at the end of October 1965). Bank advances have contracted by an even smaller amount — Rs 101 crores (from Rs 2119 crores at April-end 1965 to Rs 2018 crores at October-end 1965). And the price-index (1952-53=100) which was 152 at the beginning of April 1965 has risen to 166 by mid-October 1965 (about 7 per cent higher than a year ago).

The banks, therefore, start the busy season from a weaker position than was envisaged by the Reserve Bank; this is also clear from the fact that the over-all liquidity ratio was about 33 per cent at October-end 1965 (against 37 per cent at October-end 1964), indicating that, under the existing system of access to the central banking authorities the banks have less scope to borrow at bank rate from the Reserve Bank than last year. This situation has arisen mainly because the State Bank which had considerable borrowing margin at bank rate last year used it up then — in fact, it was the major cause of the failure of monetary policy last year. This year, the liquidity ratios of individual banks appear to be more in line.

As at October 29, 1965, banks had total deposits of Rs 2813 crores (last year Rs 2531 crores) and advances of Rs 2018 crores (last year Rs 1706 crores). Given this situation, the pressure on monetary authorities to relax the dear and scarce money policy, always great, has increased. Defence requirements and the need to foster pro-

duction are used as arguments to bring about this relaxation. However, almost all the relevant facts indicate the need for maintaining, if not for further tightening, the monetary screw:

(1) The crop reports indicate a smaller harvest than last year. This would justify a smaller rise in bank credit to finance the crops at the same price level. In fact, these crop reports will encourage speculative hoarding — a tendency which would be strengthened by slow and graduated releases of P L 480 foodgrains. Seasonal rise in bank credit is intended to finance the increased inventory of agricultural crops after harvest; a tight-money policy cannot affect the harvest; it can only curb hoarding and price rise — which would be wholly desirable objectives in today's economic situation.

(2) Hoarding is now attributed to the rich farmer; if so, there is less of the marketable surplus coming to the market immediately after harvest, and the lesser the need for commercial financing.

(3) Defence expenditure is likely to increase the liquidity of the economy, and it is necessary to counter this by monetary measures.

(4) With the uncertainty regarding foreign aid and the stoppage of issue of import licences, the total inventory in the country is getting depleted, thereby releasing liquidity and reducing the need for funds.

It is, therefore, necessary that the Reserve Bank reviews the implications of the changing economic situation; the situation on the price and production front is critical, and it could easily degenerate into a runaway inflation. Monetary policy always takes time to be effective, and with the reduced leeway for bank credit expansion, is likely to have an impact on prices and hoarding this time, if the tight policy is continued. Industrial and commercial interests, used to operating with swollen inventories and speculating on price rises, would not like a tight money policy and the consequent pressure on prices. It is necessary that the Reserve Bank does not give in to this pressure and meets the emerging pressures with strong measures.

AROUND BOMBAY MARKETS

Dalal Street Off-Colour Again

Thursday, Morning

DALAL STREET is off-colour again. And the mood has changed all too quickly. The broadening of interest and the modest revival of inquiry in cash shares had encouraged the hope that the market would continue to edge its way up for some time. But the ground gained over the past few weeks has been lost in a matter of days. Dalal Street made a new low for the year on November 10—the lowest for some years.

Reports suggesting major relaxation in Government control over the private sector in respect of production, distribution, prices and industrial licensing in the near future have failed to impart strength to the market which is becoming increasingly worried over the economic prospect. The kharif crop has failed and the outlook for rabi crop is unencouraging. The serious setback in agricultural production will not merely accentuate inflationary pressures but it will also aggravate shortages of certain essential raw materials. The failure of the cotton crop is bound to add to the difficulties of the cotton textile industry which is already faced with the problem of stock accumulation. There is little hope that raw material shortage can be easily made up through imports because of the critical foreign exchange position. Failure of rains has not only caused serious anxiety about the food situation but it has also compelled several States to effect drastic cut in power supply even for industrial users. In order to conserve canal water for food production the Maharashtra State has decided to reduce the area under sugarcane by 25 per cent instead of 10 per cent as fixed earlier. This has led to marking down of Sugar shares.

With food situation looking grim, the economic prospect rendered obscure by power shortage and restricted supplies of essential raw materials and with the political situation continuing to be fluid, it is hardly surprising that the recovery on the stock market generated by the belief in liberalisation of Government's approach to the private sector and aided by technical considerations should have proved to be an extremely short-lived affair. Market sentiment has been further unsettled by the Prime Minister's warning about a heavy dose of additional taxation if the response to the defence loans, gold bonds and the national defence remit-

tance scheme is not adequate. The response so far has been extremely disappointing, the attractive terms of gold bonds and the remittance scheme notwithstanding. Trading sentiment at the week-end was adversely affected by suggestions of a one per cent levy on urban property.

COTTON

Restricted Turnover

THE cotton market continues to present an extremely dull appearance. Activity in futures has come to a virtual standstill and the average daily turnover is too small to feed even half a dozen cotton brokers. Few need regret the shrinkage in speculative activity because it has hardly any bearing on the marketing of the crop. Time was when facilities had to be provided for the smooth marketing of the crop. But now various restrictions have to be devised in order to market the crop within the statutory ceilings because of the continuing shortage of cotton in relation to the industry's growing needs. Lacking both the will and the ability to administer price control, the Government has been revising ceiling prices from time to time with a view to accommodating the unofficial premiums rather than providing remunerative prices to encourage cotton cultivation.

The 1965-66 cotton crop is varying by estimated between 51 lakh and 54 lakh bales. It is clear that indigenous production will be far short of the industry's requirements. It is extremely doubtful whether the shortfall could be made good through increased imports, particularly when imports have already been running at a very high level over the past many years. Quite a large number of mills would be faced with the problem of idle capacity unless suitable measures are taken to ration the available supplies in an equitable manner.

New crop arrivals are beginning to pick up and this led to some softening of prices during the past week. Prices of Punjab cotton have declined by about Rs 30 to Rs 40 per candy from their highest levels. The decline in prices has merely brought prices just within the statutory ceilings. The supply position being what it is, there is little scope of cotton prices keeping much below the ceilings even when the crop movement is in full swing.

The industry and the trade will have to observe strict self-discipline if they are to avoid official intervention.

Considerable interest centres on the outcome of the forthcoming discussions which the Government of India will be having with the Lint Marketing Board of Uganda for securing cotton supplies under rupee payment arrangements. The Sudan has already agreed to supply cotton to India against rupee payments. It is scarcely necessary to mention that the total availability of foreign cotton will depend very largely on the US supplies under P L 480.

OILSEEDS

Sky is the Limit

OILSEEDS and oil prices continue to seek new high levels week after week. There is no knowing how far the prices might go. Perhaps the sky is the only limit. Groundnut oil has already been marked up to a all-time high of Rs 37.50 per 10 kilograms and it is just the beginning of the season. Linseed oil is quoted around Rs 32 and rarely, if at all, has this price been exceeded before. And only during the Korea war boom has castor oil (Commercial) been known to have fetched a price higher than the present level of Rs 24.25. Coconut oil is commanding a fantastic price of Rs 60 per 10 kgs.

These are famine prices. There is little doubt that the failure of the major groundnut crop and the poor prospects for the rabi crops because of the continued drought conditions in all the important oilseeds growing areas will result in a serious shortage of vegetable oils in the 1965-66 season—the last year of the Third Plan. Since it is extremely unlikely that the total supply of vegetable oils would be augmented through imports, the Government will have to take very strict measures and implement them effectively if consumer discontent is not to be allowed to assume serious proportions.

While one can put up with a natural calamity, the situation becomes intolerable when different States pursue policies designed to benefit their own people without any consideration for the hardships to the people in other States. Widely different prices even for the very essential items of daily life

in different States cannot but undermine national unity. Imagine the prevailing wide difference of nearly Rs 1,000 per tonne in the prices of groundnut oil in Rajkot and Bombay. The difference exists simply because the Gujarat Government has banned the export of groundnut and groundnut oil and vanaspati from the State. Hitherto, the export ban did not apply to vanaspati which had exposed the State Government to the charge of being partial to the vanaspati manufacturers in the State. The Government has therefore done well in extending the ban to vanaspati.

New Delhi will be well-advised to formulate a national policy for the equitable distribution of edible oils which are going to be in acute supply in the 1965-66 season. It bears repetition that despite serious shortages, it is possible to check the rising trend in prices if only the Government means business.

The authorities can take little comfort from the thought that the Forward Markets Commission is taking all possible measures to discourage speculation through penal margins. Even at best, margins can only bring about a decline in the volume of speculative activity. There is little that the Commission can do when prices keep soaring on account of serious physical shortages. That is precisely the situation obtaining at present. And that is why futures have continued to seek new high levels. Last week, despite exorbitant margins, linseed futures were bid up to Rs 130 (per quintal), castor futures to Rs 112 and cottonseed futures to Rs 75. Oilcake prices also rose in sympathy with the remarkable strength in oilseeds. Reports from New Delhi indicate that the Government is thinking of banning the export of oilcakes as far as possible. Considering that oilcakes have been earning huge sums of valuable foreign exchange for the country, the ban on export would seem quite ill-advised under the present circumstances when all possible measures are being devised to boost export earnings.

MONEY AND BANKING

Conditions Unchanged

NO change was evident in the Bombay short-term money market during the week to November 10. Demand for funds continued around the previous week's level with minor fluctuations. Supply was well held at last week's level, keeping the interest rates stationary at 4.5 per cent throughout the week.

Scheduled banks increased their deposits by Rs 9.68 crores to Rs 2,812.54 crores during the week to October 29 according to the statement of affairs of the scheduled banks. Bank credit, however, increased very slightly by Rs 62 lakhs to Rs 2,018.47 crores. A major part of the increase in deposits was passed on to the Reserve Bank as balances and the remainder was held with the banks as reflected by the rise in cash in hand by Rs 3.32 crores to Rs 70.21 crores. Borrowings from the Reserve Bank moved down from Rs 3.22 crores to Rs 3 crores. The credit-deposit ratio was lower at 71.77 per cent against 71.99 per cent the week before. Investments in government securities declined from Rs 864.85 crores to Rs 857.34 crores.

Notes in circulation increased sharply during the week to November 5 from Rs 2,612.40 crores to Rs 2,683.46 crores. This increase of Rs 41.06 crores followed a decline of Rs 3.43 crores during the preceding week. It was

made possible by an increase in total notes issued by Rs 37.70 crores and a small withdrawal of Rs 3.36 crores from banking department. Rupee coins at Rs 101.87 crores were lower by Rs 2.30 crores than in the previous week. Government of India rupee securities, however, advanced from Rs 2,335.44 crores to Rs 2,375.44 crores. While the Central Government's deposits continued to move downwards State Governments further increased their deposits. Central Government's deposits declined from Rs 56.55 crores to Rs 50.61 crores while State Governments' deposits increased by Rs 5.63 crores to Rs 12.30 crores. This was higher than the increase of Rs 3.45 crores recorded during the preceding week. Scheduled bank deposits dropped from Rs 108.24 crores to Rs 103.69 crores. Loans and advances to governments at Rs 139.89 crores were up by Rs 10.41 crores and advances to scheduled banks increased slightly by Rs 32 lakhs to Rs 3.69 crores. Investments increased by Rs 14.88 crores to Rs 128.92 crores.

BUSINESS NOTES

Life Insurance Corporation

THE financial year ended March 1965 has proved fairly satisfactory for the Life Insurance Corporation of India. The average sum assured per policy increased from Rs 4,269 to Rs 4,854; new business amounted to just above Rs 701 crores under 14.44 lakh policies as against Rs 703 crores under 16.46 lakh policies. The noticeable fall in the number of policies is chiefly attributed to the slowing down of activity in the second half of the year due to dissatisfaction among class I and II officers over their terms and conditions of service. The total business in force as at the year-end increased by 8.8 per cent to Rs 3,887 crores. The ratio of lapses to mean life assurance business in force fell from 8.2 per cent to 7.5 per cent. The premium income rose from Rs 146.73 crores to Rs 162.25 crores and the total net income from Rs 179.60 crores to Rs 205.09 crores. The life fund as at the close of the year stood at Rs 901.61 crores, an increase of Rs 93.25 crores over the year.

Of the total investments in India of Rs 779.98 crores, the public sector accounted for 74.5 per cent, the private sector for 19.4 per cent, the co-operative sector for 5.2 per cent and the joint sector for 0.9 per cent. During the year, the Corporation ad-

vanced loans aggregating Rs 5 crores to State Electricity Boards for development schemes, and agreed to underwrite 84 new issues to the extent of Rs 17.54 crores. Total assets amounted to Rs 986.64 crores, as against Rs 880.57 crores a year before, the net increase in assets since its inception thus amounting to Rs 572 crores. Income from interest, dividends and rent before deduction of income-tax was Rs 43.96 crores as against Rs 38.25 crores in the preceding year. The gross rate of interest realised on the mean life fund increased from 5.11 per cent to 5.27 per cent and the net rate realised increased from 4.07 per cent to 4.90 per cent. The overall expense ratio rose from 27.46 per cent to 27.55 per cent, while the renewal expense ratio increased from 12.46 per cent to 14.09 per cent, the increase in expenses being due partly to the revision of the terms and conditions of service of employees at all levels.

During the year claims inclusive of bonus additions amounted to Rs 40.46 crores under matured policies and Rs 12.36 crores under policies becoming claims by death. In the first year of operation of general insurance business, gross direct premium amounted to Rs 46.52 lakhs and net claims Rs 5.14 lakhs. A sum of Rs 11.06 lakhs

is carried forward as the net adverse balance.

Of the policies issued in India during the year, 10.42 lakh policies, or 72.65 per cent of the total, were taken by persons insuring for the first time, and 5.90 lakh policies assuring Rs 144.59 crores, being 21 per cent of the total new sums assured in India, were issued under the non-medical schemes. Some 2.22 lakh policies assuring Rs 76.86 crores were issued under the salary savings scheme. New business amounting to Rs 16.35 crores was written under group insurance and group superannuation schemes. The Corporation issued 8,751 policies assuring Rs 11.05 crores in the foreign countries, as against 8,532 policies assuring Rs 10.21 crores, in the previous year.

Indian Hume Pipe

A **S**IZABLE erosion of margins is revealed by Indian Hume Pipe's financial results for the year to June last; sales and pipe laying bills at Rs 5.46 crores were 17 per cent better and gross earnings at Rs 72.63 lakhs were 14 per cent lower than in the preceding year. The gap further widened following increased provisions for depreciation and prior charges, but a good saving in taxation together with a bigger write-back has left equity earnings of Rs 23.96 lakhs to compare with last year's Rs 24.99 lakhs. The unchanged dividend of 15 per cent requiring Rs 9 lakhs is, therefore, again well protected.

The directors say that the company made satisfactory progress in completing the jobs of laying of prestressed concrete pipes and erection of penstocks at various places, and it has large orders on hand. Its factories at Vishakhapatnam, Pattencheru and Karari are in regular production, and the new factory at Talcher is to shortly go into production. The erection of the Benghazi factory has been nearly completed and it is expected to soon begin production. The company is awaiting the approval of the Company Law Board for investment in the proposed floatation of a subsidiary in Ceylon. The directors propose to incorporate a new subsidiary company in the name and style of "National Rifles Ltd" in which Indian Hume Pipe will invest Rs 10 lakhs.

Oriental Power Cables

The main difficulty faced by the power cables industry has been the shortage of lead due to insufficient import allocation. The prospect of the industry getting increased supply of

raw materials including lead has improved, as the Planning Commission has now accorded a high priority to the industry. This has been possible because the Government has obtained a special loan for providing additional raw materials to the industry.

Despite the shortage of lead, Oriental Power Cables, which began commercial production of paper insulated power cables in July 1964, has reported fair progress in the year ended May last. It has not only been successful in manufacturing all types of power cables, but it has also been the first in India to produce 22, and 33 KV power cables which till now were imported. The company's sales during the year were over Rs 97 lakhs (against nil). After providing Rs 18.74 lakhs (Rs 1.06 lakhs) for depreciation, however, there was a loss of Rs 13.55 lakhs which, together with the previous loss, makes a total loss of Rs 14.47 lakhs to be carried forward. The company is setting up another plant for the manufacture of PVC cables which will enable a better and fuller utilisation of some of the existing equipment. One distinct advantage of this plant will be that all the necessary raw materials will be secured from indigenous sources. The company has already obtained the necessary foreign exchange allocation, and has applied to two financial institutions for loans for financing the project.

B B Petrol

THE directors of British Burmah Petroleum have proposed that the company be wound up and put into voluntary liquidation, as it is carrying on no business and nearly the whole of its capital assets are invested in fix deposits with Indian companies. For a considerable time past it has continued to function in the hope of obtaining satisfaction for its claims against the British Government for destruction of its assets in Burma during the second world war. This prospect is now "completely and irretrievably ruled out" since the British Parliament passed a Bill indemnifying the Crown against all such claims past, present and future, thus putting an end to a "long fight" in which the company has lost by only a narrow margin. An extraordinary general meeting has been called for this purpose. Meanwhile, there are reports that some shareholders intend to oppose the directors' proposal; they want the company to continue by utilising its liquid resources in some profitable new line of business.

The accounts for the year to March last show a net profit of £9,472 which is adjusted against the previous debit balance of £29,289. For the third year in succession the dividend is passed over.

Bombay Burmah

AS in the previous year, a comparison of financial results of Bombay Burmah Trading Corporation for the year to May 1965 is again complicated owing to transfer of the Wallace Bay branch timber operations to Wallace Bay in the beginning of 1964. Because of its formation into a separate company, the preceding year's accounts included five months' trading results of that company. The accounts in respect of N V Indo-Java Rubber Planting and Trading Company for the year 1964 were not received from Indonesia. The information concerning this Company, therefore, could not be included in the latest report.

Gross trading receipts have slipped by Rs 2 crores to Rs 3.37 crores and gross earnings by Rs 20 lakhs to Rs 1.29 crores. With depreciation claiming a little more at Rs 19.08 lakhs (Rs 18.62 lakhs) and the tax liability lower at Rs 53.95 lakhs (Rs 60 lakhs), after-tax profits stand at Rs 55.87 lakhs (Rs 70.56 lakhs). After taking into account the write-backs of Rs 2.15 lakhs (Rs 0.80 lakh) and providing Rs 1.27 lakhs (Rs 2.80 lakhs) for prior charges, equity earnings of Rs 56.75 lakhs compare with Rs 68.56 lakhs in 1963-64. Of this, the unchanged total dividend of 18 per cent absorbs, as before, Rs 48.15 lakhs, reducing the cover from over 1.4 times to below two times. The balance sheet, however, continues to reflect a sound financial position; the capital of Rs 2.68 crores is supported by reserves aggregating Rs 3.08 crores. Net block stands at Rs 3.06 crores, as against Rs 2.99 crores a year ago.

Voltas

Although the final working results for the year ended 31st August, 1965, are not yet available, Voltas report an increase of 9 per cent in their total sales for the year, carrying the previous figure of Rs 41 crores to Rs 45 crores. At the close of the year, the order books shows orders in hand valued at Rs 13.27 crores as against Rs 11.32 crores at the end of the previous financial year. Despite the higher incidence of indirect taxation, credit curb and inflationary pressure on costs, indications are

that the net working results for 1963-64—which were the highest in the history of the company—will be repeated.

The major units of the Company's manufacturing works at Thana have reached completion. The Mining Equipment Shop has been in operation for the last 8 months, and production has now commenced in the Airconditioning & Refrigeration unit, which will produce vital plant and equipment for Defence and other essential projects. The manufacturing divisions contribution of Rs 2.42 crores towards the Company's total sales in 1964-65 is expected to increase by almost 80 per cent in the current financial year. Steadily increasing production is also becoming available to the Company from its various joint ventures, such as, Scottish Indian Machine Tools, International Tractor Co of India, Lakshmi Machine Works, and Lakshmi Card Clothing Manufacturing Co.

Window Glass

THE wired and figured glass industry has been suffering from "sizable" indigenous over-production resulting in considerable idle capacity. In order to help the industry, the State Trading Corporation has provided relief to manufacturers on particularly benefit producers, like the Calcutta-based Window Glass, whose products have been already well received in the export markets. In this context, the management of their exports. This measure should Window Glass is hopeful that "within capacity will be utilised for export a very short period" the manufacturers and that will considerably improve the overall sales position.

Meanwhile, in the year to March last the company was able to nearly double its sales from Rs 24.91 lakhs to Rs 49.20 lakhs, but the outcome was a loss of Rs 14.92 lakhs which together with the previous losses lifted the total loss to be carried forward to Rs 17.18 lakhs.

Phoenix Mills

SATISFACTORY working results have been reported by Phoenix Mills for the year to March last, with sales of cloth, yarn, surgical dressings and waste rising from Rs 4.11 crores to Rs 4.53 crores and gross profit up a little from Rs 50.13 lakhs to Rs 50.73 lakhs. After making necessary provisions, net profit is a shade lower at Rs 14.73 lakhs (14.90 lakhs). Of this, the unchanged dividend of Rs 20 a share demands Rs 9.60 lakhs, and is adequately covered by earnings. During the year, machinery of the value of Rs 31.10 lakhs was added to the mills.

WHERE THERE'S TRADE COMMERCE EXPORT INDUSTRY

THERE IS THE UNION BANK

Union Bank investments encourage industrial growth. Union Bank helps traders and businessmen by providing facilities for both industry and export. Helps the country earn valuable foreign exchange.

Paid-up capital		Rs. 1 crore

People of account at The Bank of Baroda

Smart Businessman :

Mr. V. N. Das, director of a leading firm, has a Current Account at the Bank of Baroda. He issues any number of cheques he wants while the Bank sees to the payment of his monthly bills, insurance premia, rent etc. and thus saves a good deal of his time.

Promising young man :

Young man of today—and of tomorrow, Sunil Mehta. Ambitious, conscious of prestige—he made sure he chose the right bank. That's why his first pay-cheque went straight to the Bank of Baroda.

Lively teenager :

This lively teenager is a fine example to the others—she's got a Minor's Account with the Bank of Baroda. She really likes the Bank! It's teaching her how to handle money—how to save. And she feels so important.

Active house-wife :

Meet Mrs. Shanker—enterprising social worker with a practical mind. Keeps her valuables and jewellery in a Bank of Baroda Safe Deposit Locker. Tells other house-wives : "This way I needn't worry about them, for I know they are in safe hands."

All kinds of people—today's people—have come to rely on the many facilities offered by the Bank of Baroda. Maybe it is because of the courteous, helpful service they always get. Or the well-reasoned advice—advice that only a Bank with so much experience could give... Or the convenience of over 225 branches in India and 15 abroad. Or the interest on Savings Account which is as high as 4% ! Perhaps it's all these things. Why not visit us and see for yourself !

Write for our free booklet 'May We Help You?' which gives details of all our services.

Miss How Many Meals?

THE sound and fury is over. Only a few weeks ago we heard bold declarations that the country will do without PL 480, that crash programmes for self-sufficiency in food were all but ready. The Food Minister himself has now admitted squarely that there is not going to be any forgoing of grain imports; that anybody who thinks of such a possibility is living in a fool's paradise. Of course, he has hastened to add that PL 480 food does not imply any American influence over our policy making. Ambassador Chester Bowles need not have given the bland patronising assurance about PL 480 wheat being non-political: the Food Minister himself has rebuked all those who suspect any such evil design in the State Department in Washington. Only, one wonders, why did everyone get so worked up over the issue only a few weeks back?

Have we, after all, discovered that no "crash programmes", however inspired, are going to increase agricultural production in the next few months? Have we been sobered by the continuing arrival of news of crop failures and near-famine conditions in different parts of the country? Or has the change, coinciding with the return to India of S K Patil, got something to do with any decisions taken in Washington or any discreet and tacit commitments given by Prime Minister Shastri's "special envoy" who, according to the Food Minister, did not have any brief to discuss food with the US Administration?

The change in attitude is not of the Food Minister alone; Congress MPs are reported to have vociferously advocated all-out import of food, as much as possible, from US and other countries. It is not that there is more wisdom in the matter among the Left parties; seven of them met in Delhi to discuss the Government's food policy but it cannot be said that they have come out with any new suggestions that could benefit the Agriculture Ministry. One supposes that Krishi Bhawan is not bereft of experts who could think of clearing forests and cultivating fallow lands and who know of the disincentive effect of loopholes in land reform measures. The Minister for Food and Agriculture is naturally not going to be a mere listener: as may be expected, he is constantly engaged in preparing plans to make the country self-sufficient in the near future. As late as on November 12 he announced on the floor of Parliament the impending finalisation of a comprehensive programme to that end.

It is no use harping on the theme of scepticism about such talk of revolutionising agricultural production: we are willing to wait patiently for the schemes to emerge and even more patiently for them to be implemented. But the problem, in the short run, is of distribution rather than of production, and the most excellent production programme, that might raise production by 25 per cent even in a single year, is irrelevant at the moment, with famine lurking round the corner, and here the failure of our food administration is staggering.

The only concrete programme that has emerged up till now is that of missing a meal—a programme that ignores the fact that if most people in India were to miss not more than one meal a week, the requirements of food would immediately rise by a staggering proportion! But what about statutory rationing, procurement and state trading? The latest position of the Food Ministry is that if any State wanted to resort to monopoly procurement, the Centre would not prevent it. The implicit assumption is that the Centre is willing and in a position to prevent a State Government from doing anything in the matter of food distribution. Experience in the past does not show that the assumption is correct—whether the inhibiting factor is more political than constitutional is irrelevant. Considering the way the Centre is engaged in the apparently endless process of persuading the States to come to some sort of a unified policy and the way it is still unable to take decisions on any issue, whether it be rationing or procurement or levies, it is to be feared that the slogan of "miss a meal" will lead the way to "miss two meals" and "miss three meals" and so on. After all, the food problem can *always* be solved if enough people miss enough meals. And that's probably how it will be solved in the coming months.

More Loyal Than the King

THE All-India Radio is not exactly unused to criticism. Apart from general inefficiency and the quality of programmes, it has been taken to task, often enough and very deservedly, for acting as the mouthpiece of the government and suppressing or playing down news and views unfavourable to the government. It must have been a new experience for the AIR, therefore, to be put on the mat in Parliament for permitting a speaker in one of its programmes to question statistics put out by the Government.

On Monday the Minister for Information and Broadcasting had to face what newspaper reports described as "a barrage of angry questions" in the Lok Sabha over a recent broadcast in which a speaker had expressed the opinion that the losses suffered by India in the fighting with Pakistan appeared to be much higher than the official estimates. Some of the more zealous members of the Congress Party one may have expected to pounce on the AIR for this; in fact, however, it was not they but "several opposition members" who took exception to the broadcast and criticised the Minister for allowing such a statement to be made on the radio. Hiren Mukerjee, the leader of the Right communists, characterised the AIR's lapse as "dangerous and mischievous".

This was strange behaviour indeed for members of the opposition in Parliament. Have they come to accept that the proper function of the AIR is just to disseminate government publicity? This they will stoutly deny, of course, maintaining that their stand in this particular case is dictated by the fact that the matter concerns the war with Pakistan which is, after all, a grave national issue. True, the war with Pakistan is a grave national issue, but so is the food situation, even more grave perhaps. For that reason is no one to be allowed to say over the radio that perhaps the Government is painting an over-optimistic picture of the food prospects in the coming months? If it is possible to present facts of food production and supply in a manner as to show the Government in a more creditable light than it deserves, the same is theoretically perfectly possible with statistics relating to a war.

In fact, it is accepted practice in a war to play down one's losses and play up those of the enemy — as much

because of considerations of the enemy's morale as because of any government's natural anxiety to convince its people that it is doing well and so deserves their continued support. In the last world war, for instance, the contemporary German and Allied accounts of the various battles couldn't well have been both true. Or, take again, the claims of the Americans and the South Vietnamese Government and the Viet Cong about the Vietnam civil war. Of course, it is possible that the Government of India is either too innocent or too truthful to take recourse to this accepted practice, but the point is, how do Hiren Mukerjee and the other members of the opposition who jumped to the defence of Government statistics of losses in the war know?

The AIR, everyone knows, is far from impartial even in its presentation of news, not to talk of its comments, and, surely, members of the opposition don't have to waste their spleen at rare, accidental departures

from these standards? The incident in the Lok Sabha, however, does not come entirely as a surprise considering that the opposition, with the exception of a few members of the Left Communist and Swatantra parties, has delivered itself bound hands and feet to the Government over the Indo-Pak war and the Kashmir question. In having done this the opposition parties may pat themselves on their patriotism but they are in fact making it easy for the Government to make glaring departures from the ways of a democratic society. Such departures have painfully multiplied since the state of Emergency was first proclaimed after the Chinese attack three years ago to give the Congress Government powers to put such of its actions as it wishes beyond the pale of judicial review. The fight with Pakistan has strengthened the trend, thanks both to clever exploitation of the situation by the Government and the Congress Party and the political ineptitude and irresponsibility of the opposition of which the "barrage of angry questions" on Monday was an excellent example.

What Next on Kashmir?

THE charge levelled by some members of the opposition in the foreign affairs debate in the Lok Sabha that in the war with Pakistan India had found herself friendless was as exaggerated as the Foreign Minister's attempt to meet it by making a list of countries like Cyprus, Singapore, Ethiopia and Czechoslovakia was irrelevant. Such arithmetic exercises are immaterial to the question what will be our next move on Kashmir. We may tell ourselves, as we have been interminably, that the Kashmir issue does not exist since it was settled eighteen years ago, but that is not the end of the matter. For one thing, there is the two-months old invitation from the Soviet Prime Minister to Shastri and Ayub Khan to meet for talks in Tashkent. Also, there is the prospect, ever so little brighter now, that sometime or the other the first two parts of the Security Council's resolution of September 20 may be implemented, bringing India, Pakistan and the world to face the resolution's call to "consider... what steps can be taken to assist towards a settlement of the political problem underlying the present conflict".

What to do when the last part of the Security Council's resolution is reached has not apparently begun to seriously engage the attention of the Govern-

ment yet. Though Shastri did say during the Lok Sabha debate that India was prepared to consider ceasefire and withdrawal "more or less simultaneously", no doubt the expectation is that it will be a long time before "steps... to assist towards a settlement of the political problem" will begin to be pressed on India, particularly in view of the ticklish problem of bringing the infiltrators inside Kashmir within the scope of any arrangement for withdrawal of the rival forces.

The Soviet invitation, however, has to be answered, especially since Ayub Khan has accepted it "unconditionally". The Prime Minister was, however, less than forthright on this matter, judging by newspaper reports of his speech in the absence of the full text. According to these reports, he ruled out any meeting with Ayub Khan if the subject of discussion was to be Kashmir since such a meeting could "never bear fruit". At the same time, however, he was prepared to accept the Soviet invitation to discuss ways to improve the "total relationship" between India and Pakistan. Now, it is plain enough that the Soviet Union has not taken the important diplomatic initiative of inviting the Prime Minister of India and the President of Pakistan at this critical moment to discuss the weather. Prime

THE ECONOMIC WEEKLY

Minister Kosygin's intentions were clear in his letter of September 18 to India and Pakistan: he began by expressing concern over the "conflict in Kashmir" before going on to urge that "acting in the spirit of the UN Charter and the spirit of the Bandung Conference, the two sides ought to enter into negotiations with a view to settling peacefully the differences that have arisen between them". Equally clear it is that the "total relationship" between India and Pakistan cannot be improved by

discussing border skirmishes, utilisation of Indus waters or settlement of refugees. Important as these problems are, they are more the consequences than the causes of poor relations at the root of which is the Kashmir problem.

To meet all attempts at getting India and Pakistan talking with the emphatic declaration that India will never submit to pressure from any country to make her "part with Kashmir" is irrelevant. As far as one can judge, no

country—with the exception of Pakistan, of course—wants to make India "part with Kashmir". But there is going to be little sympathy for our no-talks-whatever stand. We are certainly right to say that we would not have any particular solution foisted on us by force; however, in that event the world expects that we will make some moves on our own. Are we, then, embarked on a course which will put us in the wrong with almost every country in the world?

Weekly Notes

Import-Saving Possibilities

THERE has been a sudden increase in the number of reports of shortages of imported raw materials. These include such crucial materials as sulphur, rock phosphate and nonferrous metals, all of which are used directly or indirectly in basic industries. Indeed, sulphur and rock phosphate are connected with food production through their use in fertilizers. Industries dependent on these raw materials are now threatened by idle capacity, and some units by virtual closure.

We are wholly dependent on imports for our needs of sulphur, rock phosphate, and non-ferrous metals. Commonsense would tell one that it is strategically and economically inadvisable to depend on these imports, not only because of our chronic foreign exchange stringency which might constantly pose a threat to the basic industries connected with these materials especially as with the expansion of those industries our requirements of these materials will increase, but also because there is a world shortage of these materials. Tin is in perpetual short supply. The US has clamped strict controls on copper exports because of the material's current shortage. Sulphur is already in short supply with the world demand for it annually rising by 10 per cent and the supply of it by 2 per cent. We have been obtaining rock phosphates from Tunisia, the UAR, and Jordan on a barter deal basis, but generally short of requirements (this year 4.20 lakh tonnes against the needed 7.50 lakh tonnes, and next year the same quantity, with some luck, against the needed 9.38 lakh tonnes). Even so these sources have not proved reliable, and other countries such as the US, who are possible suppliers, would insist on hard exchange payment. That hard

exchange is going to get even scarcer with the accentuated uncertainties of aid following the recent hostilities and the prospective defence-oriented plan.

The greater, therefore, the urgency to effect early substitution of as many of these materials as possible. It might save subsequent scrapping costs. Is sulphur, for instance, all that indispensable? Its major users are the fertilizer industry, rayons and textiles, alums and other inorganic heavy chemicals, the iron and steel industry, and the petroleum refining industry. But nearly always it is the sulphuric acid manufactured from sulphur that is industrially used, either to act as a chemical agent as an acid, or for its hygroscopic qualities, or for pickling as in the iron and steel industry. Sulphuric acid is the agent for sulphate formation and for sulphonation, but is used abroad more frequently by virtue of being a rather strong and economically priced inorganic acid. Though it enters into countless industries it very infrequently appears in the final product. This is significant. Even in the fertilizers industry, which is the single largest consumer of sulphuric acid, the acid is used in the manufacture of superphosphates as a chemical agent, for its acid properties. And though ammonium sulphate which is another fertilizer has a sulphur content, it is only the nitrogen of the ammonium sulphate which the soil requires. As such, another ammonium compound might do as well. Nitric acid has strong hygroscopic qualities, and both that and hydrochloric acid might substitute sulphuric acid in many of its roles. Much greater use of hydrochloric acid might help in the utilization of by-product chlorine of the electrolytic caustic soda process. Today not only is that chlorine wasted, raising the apportioned costs of caustic

soda and the little hydrochloric acid produced, but non-utilisation of the poisonous gas is actually a hindrance in the expansion of electrolytic caustic. Producing off-colour sugar too will apparently save the country some 25,000 tonnes of sulphur.

How much effort has gone into working out the economics of such alternative substitution in the various industries? The rupee-cost of the alternatives, even if it is higher, may not be quite so crippling as the unreliability of foreign supplies and the foreign exchange burden. A high-powered technical group of Government officials and technicians from industry to work out chemical engineering and commercial possibilities appears very relevant as part of the emergency drive to be self-reliant. Foreign exchange so saved could be used for example to import, from hard currency sources, rock phosphate which is a direct component of an essential fertiliser.

The New Birds

THE enforcement of foreign exchange regulations has led to at least one strange but welcome transmutation of genes. The Benthall family which controlled Bird Heilger of Calcutta, one of the largest business groups in the country, has sold its interest at less than par value to the group's executives, whose ownership will vest in their pension and superannuation funds. The total share capital of the two companies, Bird and F W Heilger, amounts to Rs 110 lakhs; above 70 per cent of it is reported to have changed hands now. Whether this is in addition to the roughly 15 to 20 per cent which was earlier reported to have been sold at par to the present Indian chief executive is uncertain. The precise nature of the

transfer has not been revealed but, given the pattern of ownership as it was six years ago (it could not have changed significantly since then), the sale of the Benthall interest alone would suffice for transfer of control (see table below).

The significance of this deal lies not in its mechanics but in transfer of control of a leading business house to its professional executives acting as such. The group's interests are spread over jute, coal, paper, engineering, fire-clay, electricity, iron ore, investment, trading and miscellaneous business. Bird Heilger would now be the only business house in India to be controlled by executives, who would hereafter be responsible to themselves instead of to financiers, indigenous or foreign. The experiment will be watched with great interest because by the end of the next year the Company Law Board will have weeded out managing agents from most of the companies which still have them. Bird Heilger companies are fairly tightly held, i.e., the controlling block in most of them accounts for a considerable part of their equity and this proportion was raised in the fifties to avoid the kind of raids which affected Andrew Yule among others. One also awaits the reaction of banks which are addicted by tradition to ask for guarantees from managing agents (though these are somewhat different in Calcutta as compared with Bombay and Ahmedabad) to the installation of professional executives in positions of top control.

The Benthall family played a notable role in the industrial development of eastern India; Sir Edward Benthall

took a hand in politics too. Though the group fell foul of foreign exchange regulations and the Benthall family would have found it difficult to secure anything like a fabulous price for its holdings under these circumstances, it is to the credit of the family that it did not think of selling to the highest bidder.

Vanaspati Prices

THE dominant element in the cost of production of vanaspati is the cost of the oil used. Oil costs account for about 80 per cent of the cost of producing bulk vanaspati and about 90 per cent in the case of the small packs. Any change in oil prices is, therefore, bound to have a significant effect on vanaspati costs and prices.

During 1964 the Government and the industry agreed on a scheme of voluntary price control by the industry. This has been in force since then. Individual manufacturing units now charge a price based on a variable factor—the cost of the oil bought by them—and a constant factor, which is a fixed margin to cover overheads, process loss, processing costs and packaging, distribution, labour and excise duty, as well as profit. For the three vanaspati packs that are permitted to be sold, the price is fixed on the following basis:

16.5 kg: Oil price + Rs 738 per tonne
4 kg: Oil price + Rs 1173 per tonne
2 kg: Oil price + Rs 1331 per tonne

The trade margin is fixed at Rs 40 per tonne irrespective of the number of intermediaries and remains the same regardless of the price of vanaspati. There is, therefore, little difference between the prices of different brands except

THE ECONOMIC WEEKLY

because of marginal differences in the oil bought in any week by different concerns. But the margin for other expenses and profit is low leaving no cushion between manufacturing costs and consumer price. In the past, vanaspati prices though necessarily related to oil price fluctuations did not change frequently, because the manufacturer and the trade were able to absorb some of the increase in oil prices, for a while. This is no longer the case.

In fact, vanaspati prices would have been even higher this year if the industry had used only groundnut oil. Thus a leading bulk brand sold in September 1964 for Rs 3744 per tonne when the groundnut oil price was Rs 2921 per tonne; last month when the oil price was Rs 3155, this brand was selling at Rs 3845. (The vanaspati prices quoted include trade margins and all taxes in Bombay). The increasing tendency in recent years to use a proportion of cottonseed oil in vanaspati has helped enlarge the quantity of edible fats over what would otherwise have been available since cottonseed oil is not popular as an edible oil by itself. Also, it is cheaper than groundnut oil. In addition, the use of the cheaper PL 480 soyabean oil has also prevented vanaspati prices from rising proportionately to groundnut oil prices.

The fact of the matter is that there is a chronic shortage of oils and fats in India. This was aggravated last year by the failure of the castorseed crop and a general food shortage. It was inevitable that a product, the dominant element in whose cost is the price of oil, should be subjected to increases in price. If PL 480 oil does not come

THE ECONOMIC WEEKLY

through next year, one can foresee difficult times ahead for the industry in finding oil to meet the demand. It is easy to say that the solution is a rise in production. The problem here is, as with other food crops, one of increasing productivity.

The other aspect of the problem of edible oil shortage is to use more efficient methods of extraction. Solvent extraction leaves less than 1 per cent residual oil in the cake. Groundnut cake from ghanis can leave as much as 15 per cent residual oil. Even the most efficient methods of expelling oil still leave 5-6 per cent oil in the cake. Yet (except for soyabean oil this year) solvent extracted oil is not permitted for edible use by Government. The reason is that many small units use non-food grade solvents to extract oil and are also not very efficient in separating all the solvent from the oil.

However, this prohibition of solvent extracted oil from edible use has not prevented unscrupulous people from breaking the law and mixing solvent with expelled oil and selling it as edible oil. Detection of such mixing is in many cases well nigh impossible. All that the prohibition has achieved, therefore, is to prevent the vanaspati industry from using solvent extracted oil even when it can be certain that the oil is extracted with food grade solvents. The Government could immediately reduce the pressure on vanaspati prices by permitting solvent extracted oils to be used in vanaspati, if food grade solvents have been used in the extraction.

The long-term solution to getting maximum oil yields in extraction is to encourage the setting up of large solvent extraction plants and to ensure the availability of food grade solvents. One way of ensuring that solvent extracted oils are not injurious to health is to ban the use of all non-food grade solvents in oil extraction.

Mystery of Star Fighters

A Correspondent writes:

THE Star Fighters (F 104s) of Pakistan remained a mystery in the recent conflict. To go by news reports, they made an appearance early on in the Chhamb sector, did rather badly and then disappeared from the operations. Since they are the most advanced aircraft in the Pakistan Air Force, the inference was that there were difficulties of personnel or servicing. Recent reports from Western Germany

suggest, however, that the fault might be with the planes themselves.

A decision to use a slightly earlier version of the Star Fighter, F 104 F, as the basic aircraft of the West German air force was taken by Franz-Josef Strauss nearly four years ago when he was Defence Minister. Star Fighters were to be built in West Germany under licence from Lockheed Corporation to be used as fighters, interceptors and fighter-bombers. Their association with a controversial figure like Strauss was bound to bring them critical attention; and ever since Strauss went, Star Fighters have been obliging their critics with new troubles.

The production in Germany has itself been somewhat erratic. West German experience in building planes is extremely limited: as a result of post-war restrictions placed by the Allies, little planes for pleasure, business and spraying pesticides are about all the West German aircraft industry can make. The Star Fighter presents a further problem: it is a highly automated plane, and carries a correspondingly elaborate electronic system. The first reactions to difficulties were that the West German firms were at fault; the more recent view is, however, that the basic design is defective. Most faults can be traced to the elaborate electronic system or to the heaviness of the plane as a fighter. The introduction of a newer version, F 104 G, has not made much difference.

The most disturbing fault of the Star Fighter is its tendency to crash. Some twenty have crashed in the last year in West Germany; crashes have become so frequent that the village of Schortens, which is near a military flying school, has appointed a committee to protest against them and take steps for its protection. All 656 Star Fighters of the West German air force were grounded recently for the second time this year.

The Star Fighter is the first problem that the Defence Committee of the just-elected Parliament has taken up. The Committee will probably only emphasise what is known about the plane already — that its navigation system is inaccurate and its engine not powerful enough; it is difficult to see what further it can do. For the F 104 will remain the chief aircraft of West German air force right up to the 1970s, and its faults are too serious to be remedied piecemeal. The United States, insofar as it has any use for aircraft,

has gone over to the TFX, so no one — probably not even Lockheed — has much interest in keeping the Star Fighter alive.

Postal Savings Deposits

POST office savings bank deposits are large enough to make the institution a mass repository of small savings. Total deposits at the end of March 1964 were Rs 512 crores, not much lower than Rs 600 crores at the State Bank of India. The number of depositors has increased steadily from 84 lakhs in 1960 to 110 lakhs. The growth of deposits, however, has been rather sluggish; in 1962-63, in fact, withdrawals were almost as large as deposits. In spite of more attractive interest rates offered recently, deposits have not increased significantly and the average balance per depositor has hardly risen at all over the last 5 years. What is more, the fairly large amounts of withdrawals indicate that the deposits are more in the nature of current than long-term savings accounts.

The distinctive role of postal deposits in the broad spectrum of small savings schemes is no longer clear. This institution was built up at a time when banking offices were almost exclusively confined to the principal towns and there were practically no other small saving schemes. Both these conditions are radically altered now; there is a considerable variety of taxable and tax free, official and private, small savings schemes. The greatest scope for postal savings, one would imagine, is in areas where banking facilities are poor and public confidence in private banks has still to be built up. Actually, a considerable part of the deposits seem to be in areas which are fairly well provided with banking facilities. The magnitude of the accounting work involved in managing these accounts has become large enough to justify mechanisation in the principal centres. One of the greatest disincentives to opening a saving bank account at a post office is the 19th century formalities associated with it while the traffic is of modern dimensions. It would also be worthwhile to link up saving bank accounts with money order remittances. The latter involve and concern the great majority of postal customers who are exposed to great inconvenience and waste of time every month. Could not the Post Office evolve a transfer system for remittance from the principal towns to villages?

Ownership of Bird and F W Heilger

(As in September 1959)

	Bird			F W Heilger		
	Ordinary (Rs 100 each)	Preference (Rs 100 each)	Deferred (Rs 10 each)	Ordinary (Rs 100 each)	Preference (Rs 100 each)	Deferred (Rs 10 each)

Are We Going West?

Romesh Thapar

WHEN rumours circulate in the Capital, they have about as much coherence as the policies of the ruling party. Take a sampling from the week during which the Congress Working Committee was meeting and the State's chief ministers were in session. Gulzarilal Nanda, in a fit of frustration following his hot war with TTK, had lost his astrological aplomb and submitted his resignation to Lal Bahadur — but only after ensuring that Morarji Desai had been neutralised as head of the proposed administrative reforms commission. Subramaniam, failing to elicit any response from Lal Bahadur on compulsory procurement and rationing except meaningless slogans, was ready to throw in the sponge. Meanwhile, Asoka Mehta at the Planning Commission had discarded his aggressive armour of optimism and was preparing to emerge in sack cloth and ashes.

Rumours do not rest content with 'news'. They offer 'developments', too. The fact that so many 'Nehruists' were abandoning the grounded Ship of State had persuaded Lal Bahadur to devote a little more time to plans other than those connected with his visit to the USA. This visit, masterminded by talkative emissary Patil, had consumed so much of Lal Bahadur's disorganised time that all decision-making in the GOI had come to a halt.

Nehruism — For the Moment

Rumour says that the Prime Minister has after much cogitation decided to plug Nehruism on public platforms until he has got the USA to guarantee the free food and the foreign exchange he needs to keep the country ticking. Patil, it is said, approves of the stratagem. So do other confidants. But the boys at the US embassy take a dim view of Patil's irresponsible prattle about the rosy prospects before India once Lal Bahadur goes West.

Apparently, John Freeman for the UK and Chester Bowles for the USA had been projecting the image of an angry India determined to become self-reliant and now terribly hyper-sensitive about attempts to link aid and food to any set of conditions. This diplomatic drilling from Delhi was making some impact — even in newspapers hitherto critical. London and Washington were beginning to seek out ways of withdrawing from commitments on Kashmir.

But Patil's junket has made Freeman

and Bowles look as if they are comies, out of touch with Lal Bahadur's thinking — that is, if Patil's thinking is Lal Bahadur's. Patil has succeeded in reviving the almost exhausted lobbies in London and Washington which have always believed that aid and food can and should be used to strengthen India for the battle against communism. Lal Bahadur's skilful performance during the foreign debate in the Lok Sabha is seen as an attempt to repair the damage done by Patil even though the direction of his groupings remains unchanged.

Surprisingly enough, almost everyone believes that between Lal Bahadur and Patil it has been agreed that the news of the visit to the USA should be officially announced soon after Parliament adjourns in December and that it should take place before this year is out — and definitely before Parliament reconvenes. It is not possible to postpone the visit for very long as food and foreign exchange shortages will begin to loom large as 1966 is ushered in. Confidence that all will be well once LBJ meets LBS is fairly widespread, particularly, it is said, among the western-oriented bureaucrats who run the government for Lal Bahadur. But, and here's the rub, the facts being trotted out by the foreign experts in the Capital tell a different story.

It is said that although there is general agreement that efforts be made to de-link Kashmir headaches from the business of saving India's economy, Lal Bahadur will be told in no uncertain terms to commit himself to a detailed in-put plan for agriculture, to an opening up of the industrial sector to private foreign capital, and to a simplification and reform of administrative procedures. In addition, he will be told to take immediate steps to meet the criticisms and recommendations made some time ago by the World Bank — including devaluation.

Soviet Reactions

The gossip say that Lal Bahadur knows all about these demands, but he still wants to go a-visiting. This probably is the sum total of our self-reliant posture. After all, what has the gold bonds scheme produced? Some sixty lakhs of rupees in gold — that is, only thirty lakhs at international prices!

Speculation is ripe about Soviet reactions. Yes, TTK has been 'honoured' in Moscow and military supplies con-

tinue to pour in from the USSR, but the *claque* inside Parliament and outside which responds to the invisible strings which Lal Bahadur pulls is busy thrilling all over to the possibilities inherent in the visit to the USA. It's the old dream to get others to solve our problems, a dream that makes a tiny Establishment in the country rich, flabby and incompetent. And there is no one around with the power and organisation to challenge the no-changers and to say the problems cannot be solved this way.

Diplomatically, reports are current that Rawalpindi is being kept posted by the US State Department on thinking in Delhi. This explains the timing of Bhutto's sudden *volte face* on the Soviet desire to hold the Tashkent mediation conference. He now wants the mediation, it is suggested, because he has been told that Lal Bahadur feels that mediation will amount to skipping the phases in the UN Resolution and re-opening talks on the future of Kashmir. The foreign 'uglies' say that Lal Bahadur's manoeuvrings condition Bhutto's twists and turns. Some sensitive observers in the Capital are only hoping that he doesn't test Soviet patience to breaking point. Then it will be from the frying pan into the fire.

Kamaraj's Different Tune

Kamaraj, it is assumed, is very disturbed about what goes on. His speeches in South India, numbering over fifty, make interesting reading, for they show him to be out of step with Lal Bahadur — indeed, with all those who would go West. So far the Congress President has confined himself to educating the South about the lessons to be learned from the collision with Pakistan. He is now persuading himself that the North needs the same medicine. Frankly, he is about the only strongman in the Congress Party who talks about socialist objectives. Lal Bahadur must be wondering what's bitten him. He does not underestimate Kamaraj, for Kamaraj can be a very big thorn in one's side.

From all this speculation and conjecture, you might be on the verge of concluding that Lal Bahadur is probably riding the Syndicate which brought him to power. I would not bet on it. Permutations and combinations take place in the command centres of the ruling party. They reflect the strengths and weaknesses of those individuals who control the party machine in the

States. So far, there is nothing to suggest that we are united, willy nilly, behind any single leader. After all, at the apex of power it is not a servile, conformist press which moulds attitudes and opinions. No public showmanship can hide the truth that there is no leader, no collective, no firm grip on the jobs to be done today and tomorrow.

This is the essence of the crisis, but how is it to be diagnosed when public posture has no connection with actual commitment, when policy-making bodies like the Cabinet and the Congress Working Committee run away from policy-making, when there is no dialogue on the challenges facing us and the responses which have to be forged, when the little thinking that is done is *ad hoc*, from day to day, on the basis of hunches. In this paralytic situation, rumours dominate the Capital

— contradictory rumours, meaningless rumours, absurd rumours.

I have tried to record this mood, if only to caution those unfortunates who believe their daily newspaper and imagine that all is well. If something drastic is not done to make the country aware of the critical times ahead, we will begin to live almost entirely on foreign props — and that would mark the beginning of the end of the secular, socialist democracy we had tried to build. Exhortations about self-reliance cannot save us. We must plan our self-reliance. And this demands self-confidence to organise the maximum and efficient mobilisation of internal resources and manpower. Once we address ourselves to this task, the food and aid we receive from abroad can do no damage — and probably it will come in larger measure. But who is to convince those in power?

FROM THE LONDON END

A Possible Election Manifesto

THE crisis in Rhodesia has dominated the UK political scene, and as the sordid drama relentlessly unfolds, one wonders whether the moderate measures outlined by the Prime Minister, who, incidentally, is said to regard Rhodesia as his Cuba, will prevent the outbreak of a real conflagration on the Continent of Africa. The bipartisan unity of the two parties on Rhodesia now seems likely to be split over the issue of sanctions which certainly have a crucial role in Wilson's method of tackling the situation. While there is bound to be concern, particularly in the Left Wing of the Labour Party, with regard to the Government's Rhodesian policy, what is to be made of the policy on other matters outlined in the Queen's speech for the next Parliamentary session?

A careful analysis of the Queen's speech will reveal that the Labour Party has taken a significant move to the right, caught between the need to pacify the overseas creditors who have loaned Britain some £1,000 million in the last year and the slender parliamentary majority which makes some concession to the Liberals essential if Labour is to remain in power. These two factors have led to priority being given to a number of unpopular domestic measures to tackle the balance of payments position and the dropping of steel renationalisation from the present session.

Quite obviously, in order to pacify foreign lenders, who, indeed, made it a condition of their loans, first priority is being given to getting the balance of payments position right. Wilson was at pains to state that any programme of social reform, however desirable, must depend on the economic situation. "We must get the balance of payments right". The speech states quite clearly that "priority" will be given to ensure that external payments are in balance next year, and that sterling is strengthened. Because of this, top position in the list of the 24 major measures outlined in the speech is given to George Brown's incomes and prices policy. The aim is to put teeth into this policy by giving Brown's Department power to demand advance notice of price and pay changes, to defer the implementation of those he refers to Aubrey Jones's National Board for Prices and Incomes and to give Jones authority to call for information and witnesses. At the moment, the non-statutory early warning system is still being negotiated with the Trade Unions and employers, but the Queen's speech makes it abundantly clear that if no satisfaction is obtained from this, legislation will be passed to empower the Government to act against Trade Unions.

While the Conservatives and Liberals (particularly now that steel nationalisation has been dropped) will find lit-

An uncertain Lal Bahadur, a disgruntled Nanda, a confused Swaran Singh, a brittle Krishnamachari, a frustrated Subramaniam, an impatient Chagla, a demoralised Asoka Mehta, a worried Indira Gandhi, an unhappy Kamaraj, an opportunist Patil, and cynical, parochial *satraps* in the States, is the complex of leadership which today many a nation has to carry. This should not depress us. What is disconcerting, however, is the total absence of effort to forge a collective leadership to get the country moving. This effort has to be sparked, somehow. May be, once again, Kamaraj holds the key.

Tailpiece: Even as V K Krishna Menon warned against the 'militarisation of the mind' in India, news reached me of scholarships instituted for Indians to study the practice of non-violence in the USA!

tle to object to in the Speech, the Left Wing of the Labour Party is applauded by the omission of any reference to renationalisation and by the inclusion of what they deem "anti-Union" legislation. The basic fears of the TUC are quite understandable; once the precedent is set for new legislation on Trade Unions, later Governments will take advantage of this breach to push it further. The Tories are already proposing to do this. The *Daily Worker*, in commenting on the Queen's speech, summed it up as showing "tenderness to the steel tycoons, toughness to the Trade Unions". However, at the moment, the Left Wing of the Party is severely emasculated with their more dynamic leaders imprisoned in the Cabinet and the fundamental loyalty to the Party as a whole which prevents them from rocking the boat and making it sink at a moment like this. After thirteen years in the wilderness it is understandable that action at this stage which would bring the Government down is not contemplated by any section of the Party, however strong its feelings on nationalisation may be. Protest in plenty will occur and have, indeed, been made, particularly by Michael Foot, but secure in the knowledge of the fundamental loyalty of the left wing, Wilson can afford to ignore these. He has, of course, said, as a result of pressure from the Left, that although there is no time for nationalisation in this ses-

sion, the programme has not been abandoned and that it is a question of "not whether, but when". This is the only sop is he prepared to offer the Left Wing.

The nice calculation on this point made by Wilson takes the limitations on the Left Wing's freedom of action into account, as well as the fact that the Liberals would certainly have voted against steel and thereby brought the Government down. In order to stay in power to carry out other aspects of the Labour Party's policy it was necessary to abandon steel until such time as Labour can count upon a larger majority in the House. Maudling was at pains to point this out when he said: "So long as the Government's majority is so tenuous, Wilson can be sure that however hard his Left Wing may bark, they will not bite the hand that could possibly feed them".

Perhaps the session's most controversial measure is that relating to immigration. This Bill will reduce the number of work vouchers for Commonwealth immigrants to 8,500 a year. Certainly on immigration the Government faces opposition, not only from its own Left Wing, but from a number of Liberals and indeed some Conservatives too. Although the Government has refused to make major concessions to critics of its White Paper on Commonwealth Immigration, a small gesture has been made with regard to the question of deportation. An independent committee has been set up to consider the rights of appeal of aliens and Commonwealth citizens refused entry or facing deportation, but no concessions are to be made on the basic racist character of this Bill.

Should a spring election become necessary, the Queen's speech could do very well as a manifesto-like programme for the Labour Party. The speech includes Bills to help the ratepayer, the leaseholder, the sick, the unemployed, the widowed, as well as retired public servants. People do not generally vote against houses, and there are some six Bills to alleviate the housing problem, including increase of subsidies to local authorities providing rented houses for low-income families, rating reform to facilitate payment by instalments, rebates for people with low incomes and the transfer of more of the burden of the rates to the central Government. Another important feature is the Bill to provide leasehold enfranchisement. There is also the introduction of the new Land Commission. In the field of

earnings-related benefits, supplementary unemployment, sickness and widows benefits related to past earnings will be payable during the first months away from work, in addition to lump sums payable under the Redundancy Payments Act. As far as consumer protection is concerned, some of the Molony Committee's proposals on the misdescription of goods on labels and in advertisements will be implemented and this will help shopping housewives. All of these add up to a tidy programme of vote-catching social reforms. In addition, a Parliamentary Commissioner or "ombudsman" will be created to investigate complaints passed on by MPs about Whitehall's administrative actions. The Queen's speech also deals with implementing recommendations of the Devlin Committee to abolish the

casual system of dock labour.

Taken by and large, Parliament will have a full time getting through the Bills outlined in the Queen's speech. The major question that remains is whether the present swing to the Right in the Labour Party is a temporary feature or an indication of a permanent trend. In theory, steel nationalisation has not been abandoned, but is this one of the items that is going to be indefinitely postponed and, therefore, dropped discreetly from the programme? Is the Labour Party finally making up its mind to abandon socialism, and was Desmond Donnelly right when he said that the intentions reflected in the Queen's speech are the first stage towards the creation of a single, radical, classless, non-doctrinaire party of the British Left?

LETTER FROM SOUTH

A Deep Freeze?

IN Andhra there is an uneasy calm descending. Nobody quite knows what to do and what to expect. The cease-fire is so uncertain. The Americans are so tantalising. Will they send the food or won't they? And on what basis should one begin? Suppose the food comes after all the fuss and strain of the levy on farmers, storage and rationed distribution? Won't it all have been a foolish waste of time?

This is how many of the top Congress leaders in the State argue and keep themselves in a State of suspended animation. The days of seminars and tripartite meetings are the days of evasion, of a pretence at emergency. Much of the original enthusiasm has evaporated now that the realisation has dawned that the rationale of an emergency is radical social change.

There was a Food Seminar held the other day. Its fatuous nature was quite clear from the start since the Government had not even thought it fit to draw up an agenda. There was a general airing of views by all and sundry. The only piece of fun was provided by the squabble between the Pradesh Congress Chief, Thimma Reddy, and some officials, who knew that the Ministry was behind them. In any event the quarrel was over a minor point about the implementation of the shockingly inequitable land revenue system. Since there was a quiet determination that nothing concrete was to be achieved this petty quarrel was allowed to hold the centre of the stage. The only other point of interest was the proposal to have a drainage tax in the delta areas to deal with the financial side of a very long overdue measure.

Taxes versus Savings

There has been something of a battle in the wings on the question of taxes versus savings. Shastri's admonition has been taken quite seriously. If voluntary savings are not pushed up to a very much higher level then the only alternative would be to impose a stiff dose of taxes. As far as savings are concerned the biggest "donors" should be the Nizam and the temples—great hoards of gold and valuables are available with both these symbols of persistent feudalism. The Nizam shows absolutely no signs of relenting, apart from a grand donation of Rs one lakh! An Union Deputy Finance Minister flew down to Hyderabad to "persuade" the

very aged potentate but as it happened it was his birthday and the Minister was not given an appointment. He tried to explain it away as having been due to the old man's ill-health. The very next day there was a shrill protest of contradiction—the Nizam was well but, well, he couldn't and didn't see the point in seeing the emissary from New Delhi.

The temples, especially the Tirupati Devasthanam, are said to have agreed to weigh the Prime Minister in gold—a diminutive affair, after all. But even here second thoughts are on the way. Temple gold is "sacred" and would it be right to treat it in this way? Then, again, some devotees have been honest in the past few years and started giving the God 14-carat legal gold. Should this now be disposed off or should "real" gold be given? Nobody knows what to do. Tackling the Nizam would be difficult enough but the temples, especially Tirupati, are quite beyond the powers of our secular Ministers who rarely do anything before first making their *pranams* to the idol of Lord Venkateswara or Malikarjuna, as the case may be.

Land Revenue : A Suggestion

It seems to have been decided to impose savings, therefore, on those who cannot escape it—the civilians and the workers. A sliding scale is going to be fixed and the 'savings' deducted at source. Grumbling there may be but these two sections will have no choice but to comply. Obviously, however, the yield is going to be very meagre. Taxes cannot be avoided and, indeed, should not be.

It is true that as far as land revenue is concerned Andhra is perhaps the first among the States of our Union. But it is as iniquitous a tax as any that can be imagined and with the great jump in prosperity of the rural rich there is plenty of surplus to mop up still. The low rate of land revenue actually acts as a production disincentive. The landlords and kulaks of the delta districts just don't know what to do with the money they already have—how much can beer, whisky and women absorb after all? If they could be prodded into producing more to keep up their present vulgar standards of living Andhra should be able to double or even treble its present production. It has been estimated that a steeply

rising land revenue surcharge on just about some 3,000 persons throughout the State would give Andhra almost all the extra revenue she needs. It could even be that the land revenue could be reduced for the smaller farmers or even done away with altogether, considering the tremendous expense of collection. Would the Government dare, though? After all, somebody said, these three thousand are the real rulers of Andhra and how can the Congress government afford to touch them.

Popular Fervour Unabated

In the meantime, this criminal inaction on all fronts comes against the background of very severe drought, said to be the worst in living memory. The Rayalaseema region faces the prospect of a full-scale famine and even Khammam has been hit. All-party committees, including the local Congress leaders and MLAs, have been set up to provide adequate relief in these districts, comprising a good third of the entire State. No buffer stocks worth the name have been built up and Brahmananda Reddy will find it very difficult to keep his promise to Shastri to supply as much food as the latter asked for.

And yet all these depressing trends have not killed the people's fervour. Potharaju, the ack-ack hero from Amritsar, is given a lion's reception wherever he goes. His popularity, for the moment at any rate, is beyond even the film star's reach. The people still flock to political meetings in a way they have not done since 1955, not only in the towns but in the very depths of the countryside. This popular awakening will soon enough embarrass all those who wish to convert the emergency into a deep freeze of India as she is and should not be.

The Cult of the Personality Politics under Johnson

THE United States is slowly yet perceptibly moving into the "Johnson Era". President Lyndon B. Johnson already dominates Washington in a way that President Kennedy never did, even though Kennedy was clearly a more charismatic leader. He is a masterful politician with more than two decades of experience in the complexities of the American federal government. The presence of the President is felt in the Congress and in all of the various federal agencies to an unprecedented degree. Hardly a wheel turns without the knowledge and approval of the President. Under the American system of government, the presidency is a strong office, but the present occupant of the White House has taken steps to enhance this already powerful office. Many observers have applauded Johnson's impressive domestic achievements during this short period in office, but there has been muted criticism of his "style" and some fear expressed for the future of democracy under so strong an executive.

Important Changes since Kennedy

A number of important changes have taken place in Washington since the beginning of the Johnson Administration which will give some idea of the "new regime" on the banks of the Potomac River. The spirit of dialogue and open discussion which existed during the Kennedy years has disappeared, as have most of the well known intellectuals and academics. Kennedy attempted to convince the public before launching a legislative programme, too often neglecting the intricacies of Congressional politics. Johnson does just the opposite, assuring the success of his programmes by careful manipulation and persuasion of Congressmen and Senators, but permitting very little public discussion or debate even on important legislative matters. The refusal of the Administration to participate in an open discussion on the Vietnam war is one indication of this fact.

The Harvard intellectuals of the Kennedy Administration have, for the most part, been replaced by Texans with limited experience outside the world of pragmatic American politics. Furthermore, the spirit of discussion

of the Kennedy era has been replaced by a kind of subtle authoritarianism. The White House staff are no longer "idea men" but are more like presidential secretaries. Advisors in the State Department and other government agencies are much less free to openly discuss policy with the President. The focus of the Capital is on President Johnson, and every effort is made to keep the spotlight there.

Arm-Twisting: Many Ways

The Johnson Administration is particularly averse to criticism. The "great consensus" is one of the key elements in the Johnsonian "Great Society". Newspaper reporters who write articles critical of the President are put on the mat and lectured. More importantly, they find themselves unable to obtain news stories and are systematically excluded from White House functions. Government officials who publically disagree with the President are simply fired, and Congressmen who vote against Administration measures find that their home districts are without federal government funds for roads, schools, or the poverty programme. Outspoken critics of the Administration's foreign policies like Senators Fulbright and Robert Kennedy are out of favour at the White House, and their home states are losing government contracts. Federal patronage is denied to recalcitrant legislators. The federal "pork barrel" (the annual allotment of federal money to the states and localities) is effectively manipulated by the Administration to coerce co-operation from legislators.

Lyndon Johnson's mastery of the art of pragmatic American politics has paid dividends during the recently concluded session of Congress. An unprecedented number of measures have been passed by the Congress. The Voting Rights Bill helps to assure that Negroes in the South will not be denied the vote, while the Medicare programme firmly places the United States on the road to publically administered medical service. The Education measures provide, for the first time, substantial aid to higher education from federal sources. The war on poverty has been expanded and is beginning to take root in the depress-

ed areas of the United States. Thus, the recent Congress can claim to have the most progressive legislative record in recent decades. Critics of the Congress have stated that it has been a "rubber stamp" of the President, and there is a good deal of truth to this statement. Johnson has been charged with using his famous "arm twisting" techniques on legislators, effectively wielding the tremendous powers of his office. It is significant that many of the recent legislative measures, while important steps forward in the struggle for social justice in America, will also tend to increase the power of the President. In the War on Poverty, for example, the President has tremendous influence over which communities receive funds and how the several hundred million dollars are allocated. Naturally, political factors may become involved in the distribution of funds, thereby applying further pressure on legislatures and local leaders to follow the President's wishes. Federal money can be traded for conformity to the pattern of the "great consensus".

Foreign Policy Not Debatable!

The Achilles heel of the "Great Society" is foreign policy. The Vietnam war is essentially President Johnson's war (with assistance from Secretary of Defence, McNamara). There has been virtually no discussion of American Vietnamese policy in Congress, which under the Constitution has responsibility for declaring war, and many Congressmen are critical of the war. The powerful Senate majority leader, Senator Mansfield is reported to have privately opposed the present escalation, although he has not spoken out publically on the issue. Criticism of American Vietnam policy has been widespread outside of Congress as well. In addition to the Teach-in Movement and the recent protest demonstrations, which had the effect of bringing the opposition into the public eye, there has been discontent from the venerable *New York Times* and many moderate political and business leaders. Indeed, it is fair to say that the Vietnam war is the most unpopular war in which the United States has engaged since the War of 1812.

The intervention in the Dominican Republic has been even more openly criticized in the United States, while the Latin American reaction has been understandably hostile. Senator Fulbright, the influential chairman of the Senate Foreign Relations Committee and the most astute analyst in the American Establishment, has openly attacked the intervention. His sentiments are shared by most liberals within and outside of the government. The Administration has yet to defend itself on the issue, and it has consistently refused to allow foreign relations to be openly debated.

It would seem that President Johnson simply has very little understanding of foreign affairs, and that he prefers to concern himself with domes-

tic policy, where he is able to wield almost overwhelming power. His over-simplified views of foreign affairs and the impossibility of internal discussion and criticism gives many Americans cause for alarm about future trends in foreign relations. When issues such as Vietnam are discussed, the Administration's "facts" simply do not agree with those of independent observers, and meaningful debate is precluded. And of late, the Administration has refused to publically discuss the issues at all.

Living with the Texan

What, then, of the future? President Johnson is firmly in the saddle and most of Texas seems to be moving to Washington. It is likely that the President will be able to continue his

strong influence over the Congress, and increase his ability to manipulate the legislative branch and the administrative agencies to do his bidding. The President is clearly popular with the people, although he is not the sort of leader who arouses the kind of devotion which John F. Kennedy did. The prospects for a shift in foreign relations seems quite remote, with the Administration becoming "harder" in its views rather than more moderate. The American "cult of the personality" seems to be here to stay at least for the next three years, and probably for the next seven. The American people, and the rest of the world, will have to live within the Texan in the White House.

—Philip G. Altbach

Are the British Racists?

Taya Zinkin

THE first time I became aware that there is such a thing as colour was when I stayed in a seaside resort hotel in France. There was a commotion in the hotel. For days all the grown-ups talked about nothing else but the extraordinary way in which the British behave. The commotion was sufficiently great for me to remember it though I was barely 6 years old. A British Colonel and his family who had booked rooms for the season protested on arrival because there was a coloured family, probably from French Africa, staying in the hotel. The Manager told the Colonel that if he did not like it he could go elsewhere, that the hotel had no intention of getting rid of the coloured family. The Manager had been so shocked by the Briton that he told everybody about it. Colour bars in France were, and I am glad to say, still are, unheard of.

The British by contrast are racists. A trip to Brazil is illuminating about race relations in the United States. Had the French or the Portuguese or the Spanish colonised the USA, instead of it being the British, there would be no Watts, no segregation, no race riots. North America would be like Brazil, without colour consciousness. Indeed, I remember an American friend saying at the height of the Alabama riots, "We white Americans are what the British made us, and we then proceeded to make the negroes what they are because of

what the British made us. Look at Canada, even their Indians are treated differently from ours, that is because of the French tradition".

Working Class: Worst Racists

The British are racists; and the worst racists of them all are the British members of the working class. This was again reiterated by Desmond Donnelly, the Labour M.P., when he warned a club in Exeter University of the "fundamental, deep-rooted prejudice of the conservative working man". Donnelly said that very often it is the communist factory shop steward who does not allow the employment of coloured people. He went on to complain that the Government White Paper on Immigration was an insult to Commonwealth immigrants because of the ceiling of 8,500 allowed in every year when there is no ceiling on other immigrants — he must have had Ireland and the continent in mind. The Immigration Act has caused much heart-burn amongst some liberal minded Labour and Liberal M.P.s because it is a really racist Act which gives wide powers of deportation without redress to a special tribunal, and because it discriminates between blacks and whites, and because it lowers the age of dependents. The Tories were far more liberal than Labour since they are not so dependent for support upon foremen and shop-stewards of the kind Donnelly had in mind.

Racism takes many forms; some of them however are due, not to the evil in man, but to his environment. Thus the mothers of a school in Birmingham have petitioned the local authorities to move their children out of the school to turn it into a reception centre for immigrants. Their reason was not colour prejudice but common sense. There are over 80 per cent coloured children in that school. The mothers did not object to so many children being coloured but to their scant knowledge of English. Their own children were being kept behind; a matter of the greatest importance when at the ripe old age of 11 a child's career is set according to how that child does at the Eleven Plus. The Headmistress of that school had been pressing for a long time for extra teaching staff in order to get over the initial difficulty the immigrant children have in following the classes.

Speaking of racism on the BBC, Robert Gardiner who is the Executive Secretary of the UN Economic Commission for Africa, and the first coloured man to deliver the Reith Lectures, said some very interesting things. He pointed out that it is natural for people to feel more at ease with their people and to believe that their own people are superior. When colour comes in the way of underlining the difference it becomes easier still to be racist, especially when peo-

ple have been conditioned to be so. For example nobody is anti-Eskimo; the Eskimos are too remote and too few to excite anything but curiosity. Racists often take cover under the difference in cultural behaviour, etc, to explain why they consider themselves better than others; but this is merely an alibi. German Jews and American negroes are culturally German and American. This did not stop Nazism or segregation. As Gardiner saidly points out "A negro remains a negro first". In England racism applies to all non-white Commonwealth immigrants; Indians and Pakistanis are often lumped together with Africans, if they do not belong to the professional classes or are not students, but are bus drivers or shop assistants or unskilled factory labourers. There is a threshold beyond which colour prejudice creeps into industry and business. Thus if in the department of a business there are two or three coloured (African or Asian) clerks nobody minds; but at a certain stage if about half the staff of that department is coloured then it becomes impossible to recruit white people for it; indeed the whites in it will ask to be transferred because it has become infra dig for them to work in what has become a coloured department. The Personnel Director of a big organisation therefore explained to me that it seems in the interest of the immigrants themselves to disperse, not only as far as housing, but in jobs too.

A brave and honest attempt is being made amongst politicians to evolve an election code for the burning issue of immigration. Whether this code will be adhered to is to be seen; in India even Congress agents sometimes distribute toddy before elections. The projected code has seven points.

Point I: moderate language should be used when talking of immigrants. Point II: there should be no general critical statements about immigrants. Point III: candidates who have to criticise immigrants must do so constructively. Point IV: candidates should discourage divisions in local communities. Point V: candidates must accept responsibility for statements made by their agents and canvassers. Point VI: candidates will be held responsible for the views of those who support them. Point VII: copies of election literature mentioning immigration must be given to the press on the date of issue.

The way to hell is paved with good intentions. I have no doubt that with the best goodwill in the world, when it comes to winning a marginal constituency, underhand exploitation of racism will be resorted to to win these last critical extra votes.

Watching the development of racism in Britain as I have been doing for the past 5 years I cannot but help feel worried. The problem is going to be very acute as soon as a lot of youngsters, children of immigrants, who have been educated in Britain and have grown to expect British standards of living and opportunity come into the labour market. Their expectation will be higher than those of their white counterparts. Many a white dock-worker or factory-worker is quite happy, unless the child is exceptionally bright, for his son or daughter to follow in parental footsteps.

This, however, is not true for most Commonwealth immigrants. They emigrated not only because the pay was better than in their native place but because they hoped for a better life for their children. They did what the British and the Continentals did when

they migrated to the United States: they ran after a better life. Like these European immigrants to America they are content to do menial jobs so long as the door of equal opportunity is open to their children. In Britain there is no prejudice against Commonwealth nurses and doctors; but there is a terrific prejudice against most other white collared jobs. One reason is that potential employers are afraid that if they hired a coloured person existing staff will resent it; another handicap is the prospect of having to promote a coloured person over a white one, a problem every bit as tricky in the employers' mind as employing women in positions where they have to be in charge of men.

As with everything else it is the first step which counts. If the first coloured employee fits in well, then more will follow. But if too many follow, then the whites will opt out. From the very start the coloured people are damned if they do and damned if they don't. How British society will meet the challenge which lies ahead is anybody's guess. So far the future is not bright.

Arab Nationalism and British Intrigue

Aloo J Dastur

Jordan: A Political Study, 1948-57 by Aqil Hyder Hasan Abidi; Asia Publishing House, 1965; pp 251, Rs 25.00.

JORDAN exemplifies the position and role of Great Britain in the Middle East between the two World Wars. Having made secret treaties during the war of 1914-18, which conflicted with each other, Britain and France parcelled out the Turkish Empire between them. In this nefarious task Britain found able aides in the sons of Sheriff Hussein. The elder, Abdullah, was created Amir of the area east of the Jordan river and Transjordan became a British Mandate.

Abdullah was sustained in power by lavish financial grants by Britain and assisted by British officials. Arab notables who previously detested Turkish imperial rule now disliked British imperialist control over the budget, finances, army, economic development and foreign affairs. The little desert country formed an important link in Britain's imperial lifeline. The strongest Arab armies were the Arab Legion and Frontier Force trained by the British. British policy paid off during World War II when Abdullah proved a steadfast friend.

He earned his reward in 1946 when he was recognised as king of Transjordan and became a little less dependent on Great Britain. Yet he was strongly criticised by the Arab League for continuing in subservience to the British. This blocked the country's entry into the United Nations. Abdullah himself never became popular in the other Arab countries specially Egypt and Saudi Arabia because of his ambition to rule over greater Syria.

Entry of Palestinian Arabs

If he could not translate his dream of Great Syria into reality he created the Hashmite kingdom of Jordan after the Palestine War. When his Arab Legion alone of Arab armies successfully resisted the Israeli attack he incorporated what remained of Palestine into his enlarged kingdom; with a small area he had also to take in nearly a million people, half of whom were without shelter or means of support. The Jordanian Parliament confirmed the union in April 1950.

Till then Abdullah had had a rather easy time; thereafter his troubles started. Challenges were thrown at him from several directions — his relationship with Britain, attitude towards Israel, the general economic si-

tuation in the country, and above all, his disinclination to share power with the Parliament. He regarded Great Britain as his benefactor and protector; the Palestinian Arabs now in Jordan held Britain responsible for their fate and misery. Of all Arab rulers he was the only one who harboured lurking recognition of Israel and even made secret peace overtures surrendering the Rutenberg region to the Israeli army: all the while he maintained the strictest secrecy and even indulged in subterfuge and falsehood when the surrender leaked to the people. The economic situation deteriorated with the large refugee influx. Political conditions developed a fluidity because of the clash which arose between the incoming Arabs who were better educated, more politically conscious and more ardent in their nationalism than the Jordanians. Abdullah's patriarchal superciliousness did not and could not impress them. He also clashed with his Chamber of Deputies. His softness towards Israel incurred Arab wrath and on July 20, 1951, he was murdered.

Dr Abidi brings into bold relief Abdullah's policies running counter to the prevalent Arab mood. He delineates the impact of the character of the king on his desert kingdom and without conscious effort shows how he could not fit into the conditions created by the second World War. He could not reconcile himself to the new world of the Arab League and a militant Arab nationalism; he paid the price with his life.

The Talal interlude is well delineated. The world was led to believe that he was not in his proper frame of mind; he was compelled to be "a king on holiday" by going to Europe "for rest and convalescence". The facts were that Talal unlike his father had the makings of a democratic king, and hence was kept in the background during the long spell of Abdullah as Amir and King. As king he gave a new constitution to his people, which sought to make the government function on the twin bases of responsibility and responsiveness. The Chamber of Deputies was given wider powers. A Workers' Bill of Rights was introduced in the legislature. Talal sought greater co-operation with the Arab world and a little less reliance on the British. The people were

with or for the new king. All this was "not to the taste of some of the interested foreign powers. Nor were they liked by the local oligarchs". If the father was murdered for his autocracy the son was deposed for being a democrat.

His son and successor, Hussain, educated at Harrow and Sandhurst, had been impressed by British institutions but not deeply enough to work them in his country inspite of Talal's effort. The nationalist fervour which was unleashed by Talal could not be curbed. This became increasingly evident when the Cold War projected itself in the region. Always under British control and influence the monarchy and the oligarchy favoured joining the Baghdad Pact; but effective opposition by political leaders prevented Jordan's entry. The revolution in Egypt and the abolition of the monarchy there had its own reaction in the country. It intensified the feelings of Arab nationalism — a force under-estimated by both Britain and France.

Hussain's Troubles

Hussain's troubles have been many and varied; but a single undercurrent is the conflicts created by the incorporation of a part of Palestine. Abidi analyses cogently the problems and prospects of integration which is not yet complete. Diversities exist in the social, economic, political and above all emotional spheres, but gradually the kingdom is being knit into a single whole, the lead being taken by the Palestinians. They are again waiting to form a political opposition in the legislature something not known before the union. The contrast between the pre-union and post-union politics is sharp. The place of Jordan in the Middle East and in world affairs depends not only on how the country conducts its affairs; it depends rather on how the Arabs as a whole shape their future and how far Jordan can loosen the chains that bind her to Great Britain.

Jordan shares with other Asian countries the fluid politics of having too many political parties. These fall roughly into four categories: pan-Arab, parochial, pan-Islam and Marxist. Since Abdullah's days there is a ban on the propagation of Communist literature although the Communist Party as such exists. The constitution

VINYLS

recognises the right of forming parties, but in practice the government must grant a licence to form a party! In spite of these handicaps the parties are playing their role in gradually drawing Jordan into the Arab fold and releasing the British economic and military hold.

Abidi's treatment is historical and analytical. He has relied in the main

on primary sources and his documentation is as perfect as can be. Starting out with sympathy he has pinpointed the weaknesses in the political structure and functioning, and their causes; he has disclosed the long and ill-disguised aim of Great Britain in sustaining the monarchy and controlling the army; he has revealed the efforts at bringing the

country more in to the political and economic vortex of the Arab world; in short, he has succeeded in projecting a true image of the little desert kingdom.

To put the finishing touch to a wellknit doctoral dissertation Abidi furnishes an excellent bibliography which will certainly be the envy of all Ph D Students.

Problems of Raising Agricultural Production

Report on a Seminar

C V H

AT last the cobwebs that enveloped thinking on food production problems in Andhra are being cleared up. The two-day seminar on food production convened by the State Chief Minister, K Brahmananda Reddi in Hyderabad, on November 1 and 2, contributed to this result by throwing into prominent relief the factors that stood so far, and that stand even today, in the way of augmenting the food production potential in the State in the immediate future and later. Many of the bottlenecks disclosed by the deliberations could have been eliminated earlier; that they were not is a sad commentary on the absence of administrative initiative and lakadaisical execution. We may assume that urgent follow-up action will follow now, and that the tempo generated will be a lever for achieving the objective of national food self-sufficiency at least by 1971. The action programme for the short-term discussed at the seminar is designed mainly to clear the ground for raising a second rice crop on an additional acreage and to remove obstacles to increasing the yield of the rabi crop.

Inter-State Dispute Settled

The raising of a second paddy crop in an extra 1 to 1.5 lakh acres (if other steps had been taken the acreage could have been presumably substantially increased) is interlinked with the availability of adequate irrigation facilities and other essential inputs. The major proportion of this acreage will have to be in the Krishna and Godavari basins and in the area served by the Tungabhadra canal system, the Nizamsagar reservoir and Pennar basin.

So far as the Krishna basin is concerned, the problems of supply of water from the Tungabhadra reservoir, which is the main source of irrigation for the

second crop, have now been satisfactorily settled between the Andhra and Mysore Governments, eliminating the earlier uncertainty on that account. It is gratifying that the Centre has agreed to shoulder responsibility for supplying fertiliser, seeds, implements (including diesel engines and drilling equipment for wells) and plant protection equipment urgently needed in this connection. Assured of these inputs (one can only hope that all these will be available in time for this year's rabi crop) farmers would be able to expedite transplantation of seedlings for rabi sowing immediately, to avoid the prospect of shortage of water supply during the summer months.

While many of the issues raised at the seminar (there were only a few on which what may be considered firm recommendations were made) are beneficial from the standpoint of increasing production, their effectiveness will naturally be realised only later. Surprisingly, one heard that routine activities such as the removal of silt in the Krishna and Godavari canal beds and improvement of drainage facilities in the delta area had been either held up for years or that work has been proceeding at a painfully leisurely pace. The excuse that funds and machinery for undertaking these urgent works are inadequate, may cover many sins and much lack of foresight, but it is not a convincing explanation why funds were not asked for in time or available funds were not utilised to the maximum advantage.

Somewhat more inexplicable, however, is why the proposal made by the Chief Minister, K Brahmananda Reddi, some time back for creation of a special drainage improvement fund, with initial capital provided by the Government, to be replenished by imposi-

tion of a cess on lands which will directly benefit from drainage schemes, which was an excellent idea, was not pursued so far. The drainage problem in the low-lying delta areas, which are subject to inundation by floods and from which flood water cannot be easily drained is a long-standing one and legislation, if necessary, has to be introduced to create the fund suggested. As proposed, it will not be a burden on the general revenues while on the other hand it can be utilised also to implement the recommendations for permanent control of floods that the Mitra Committee appointed by the Central Government is expected to make.

Supply of Inputs

Discussions at the seminar on the problem of supply of seeds, fertilisers, pesticides and agricultural credit disclosed serious drawbacks in the manner and methods of providing these essential inputs. Blackmarketing in and adulteration of pesticides was admitted by official spokesmen and also adulteration of fertiliser and underweighting of supplies sold in bags. Granting that fertiliser is in short supply, the principal problem was equitable distribution of the allocated quantities to all the farmers in an area. The co-operative societies, through which the distribution is now being made, have been habitually misusing their privileged position and blackmarketing the commodity. Plant protection material supplied by Government has been found to be adulterated and the spraying equipment faulty.

As for seeds, research farms in the State have been putting in some hard and intelligent work to develop hybrid strains of maize and bajra and conducting experiments on Taichung Variety

1. But it has been disclosed that these improved seed varieties can be made available to farmers in sizeable quantities only over the years. This is another instance of the age-old complaint about the wide time-lag between evolution of new techniques of cultivation or improved varieties of seeds in research farms and communication of the knowledge about them and their use to the farmer. This problem has become so well established that the per acre increase in food production will conceivably continue to trail behind expectations for quite a long time. A State seed co-operative is contemplated in the Fourth Plan, the benefits of which will be derived only towards the end of that plan. Similarly, a demonstration farm to carry out intensive experiments in the Japanese method of cultivation and the use of Japanese farm equipment under a team of Japanese agronomists has been set up only a few days back at Bapatla, even though the Japanese method of farming has been in vogue in sizeable areas in Andhra Pradesh for about half-a-decade.

The Hyderabad seminar evoked an immediate and helpful response from the Government about minor irrigation sources which are the main sources of irrigation in large tracts not served by protected irrigation works. On the one hand it was agreed that legislation would be introduced to vest authority in the State Government to take over the repair of irrigation tanks in erstwhile zamindari and jagirdari areas. On the other hand, it was agreed to increase the powers of executive engineers to accord technical sanction to minor irrigation works costing up to Rs 50,000 and to take up the restoration of tanks.

Not Enough Credit

The problem of credit for short, medium and long-term agricultural needs, in adequate quantities and at the appropriate time is again a long-standing and complex problem. On the one side while the demand for such credit has been rapidly growing, the co-operative agencies have so far been able to supply only about one tenth of that demand. The movement labours under both external and internal limitations, among the former being the restrictions imposed on advances by the Reserve Bank to co-operative banks which are the principal agencies for channelising funds for agricultural credit through primary co-operatives, and among the latter being the inability of co-operative institutions to mobilise savings, promote thrift and cut down

overdues. The growing overdues, amounting to between Rs 5 and Rs 6 crores, have been a standing blot on as well as a standing challenge to the movement and efforts to collect them have achieved only partial success.

A new procedure for disbursing short term credit to individual farmers, on the basis of the extent of land owned, the kind of crop grown and the anticipated return from it, is stated to be under consideration to facilitate the supply of farmer's needs. The change contemplated (it is proposed to issue pass books to individual farmers in which all entries about credit transactions will be noted) should answer the criterion that credit should be linked with productivity and the farmer's effort to augment production. It should also enable him to get credit from other sources besides the co-operatives. On the whole the seminar strengthened the prevailing view that the two major impediments to liberal extension of credit facilities are, firstly, the chaotic conditions in the co-operative movement and inefficient or corrupt management of societies and, secondly, the enormous overdues which indicate either the non-credit-worthiness of the farmers, inefficient operation of the co-operatives or the fact that credit facilities are being grabbed by a few privileged individuals.

In a State like Andhra Pradesh, where the average farmer is an intelligent participant in farming with a traditional bias towards improved methods, if agricultural production is not keeping up to the schedule, it can only be because the farmer is not getting all the assistance he should. On the other hand the present is not a situation in which increase in production can be left to take care of itself. In every

single direction in which the average farmer expects to be helped, he is either receiving only inadequate help, advice and encouragement or he is not getting them at the proper time. For this the blame should be laid partly at the doors of the official machinery and partly at the doors of the Government, which has permitted the official machinery to plod on, without inter-departmental coordination, without imaginative appreciation of the farmer's requirements and without the realisation that rules and regulations are not designed to hinder but help him in carrying on his vocation.

An Agricultural Commission

It is imperative that this situation must change. And if the bureaucratic machinery is invested with the requisite sense of urgency in this respect, the hope that the country's food deficit (amounting to 7 or 8 per cent) will be wiped out in the next 2 or 3 years, need not remain a pious one. The Andhra Pradesh farmer will be able to play a central role in that process.

Lastly, the suggestion put forward by the State Congress President that an Agricultural Commission should be set up to conduct a comprehensive enquiry into various problems of the agricultural industry requires to be given serious consideration by the Government of India. It is nearly four decades since such an enquiry into India's premier industry was made by the Linlithgow Commission. Much water has flown down the various rivers since then and many developments have taken place. The industry has now to play a predominant part in the nation's economy and a comprehensive and co-ordinated picture of its problems, its needs and of steps to meet them should be considered an urgent need.

ANNOUNCEMENT REGARDING PROPOSED ISSUE OF PREFERENCE SHARES

This Announcement is NOT a Prospectus. Persons interested in full details may obtain copies of the Prospectus and Forms of Application from the Company's Bankers, Brokers and Underwriters and at the Company's Registered Office.

Hindustan Aluminium Corporation Limited

(Incorporated on 15th December, 1958 under the Companies Act, 1956)

Registered Office :

'INDUSTRY HOUSE', 159, CHURCHGATE RECLAMATION, BOMBAY - 1

Existing and Proposed Activities of the Company

The Company was incorporated on 15th December, 1958 with the objects stated in its Memorandum of Association and in particular to carry on the business of producing aluminium and aluminium products and with that end in view an Integrated Aluminium Plant has been erected at Renukoot near Rihand Damsite in District Mirzapur in the State of Uttar Pradesh. The construction of the factory with an initial production capacity of 20,000 M Tons per annum of aluminium was completed in 1962 and production commenced in May, 1962. Shortly thereafter, the Plant went into full production and the annual output was over 22,000 M Tons. In early 1964, a Properzi Mill Plant was set up for production of redraw wire rods with a rated capacity of 6,000 M Tons per annum. This Plant has fully come up to expectation. Thereafter in early 1965 an Extrusion Press and Rolling Mill for producing aluminium extrusions and rolled products (Sheets etc) was installed with a rated capacity of 2,000 M Tons and 7,000 M Tons respectively, thus bringing the total capacity of the fabrication plant to 15,000 M Tons.

In view of the growing demand for aluminium products in the Country, it was decided to increase the licensed production capacity of the Company's Integrated Aluminium Plant from 20,000 M Tons to 60,000 M Tons of aluminium and of the Fabrication Plant from 15,000 M Tons to 37,000 M Tons.

For this expansion the Company has already obtained Industrial licences from the Central Government under the Industries (Development & Regulation) Act, 1951.

An Almost Consistent Intertemporal Model for India's Fourth and Fifth Plans

Joel Bergsman
Alan S Manne

The principal purpose of the model presented below is to compare the balance-of-trade time paths under alternative strategies for the Fourth and Fifth Plans. The analysis is also intended to be of use in estimating the absolute levels of foreign exchange requirements implied by a specific set of growth and performance assumptions.

"There was probably no other person in the whole country who had meditated so much on the question of interest. Margayya's mind was full of it. Night and day he sat and brooded over it. The more he thought of it the more it seemed to him the greatest wonder of creation. It combined in it the mystery of birth and multiplication. Otherwise how could you account for the fact that a hundred rupees in a savings bank became one hundred and twenty in course of time? It was something like the ripening of corn. Every rupee, Margayya felt, contained in it seed of another rupee and that seed in it another seed and so on and on to infinity. It was something like the firmament, endless stars and within each star an endless firmament and within each one further endless ... It bordered on mystic perception."

From R K Narayan, "The Financial Expert"

IN this paper we present a model intended to quantify some implications of alternative paths of economic growth for India. The model may be regarded as a "requirements analysis". The calculations are begun by postulating aggregate growth and import substitution targets. The implications for production, investment, and the balance-of-trade are then derived. The model itself does not specify what policy measures would have to be taken to implement one of these alternative programmes. We do not attempt to spell out the particular mix of quantitative controls, fiscal and monetary measures best suited to achieve the postulated targets.

The analysis is intended to be useful in estimating the absolute levels of foreign exchange needs implied by a specific set of growth and performance assumptions. The principal purpose, however, is to compare the balance-of-trade time paths under alternative strategies for the Fourth and Fifth

Plans. For this reason, no constraint has been placed on the magnitude of the balance-of-trade deficit in any year.

Because it takes machines to make machines, there is an immediate additional cost attached to import substitution or export promotion in the capital goods industries. The cost can be measured both in additional import requirements and in additional investment requirements. According to our calculations, the additional foreign exchange costs are more than recovered over the ten year period considered here.

In our calculations, an accelerated programme of capital formation during the Fourth and Fifth Plans implies a sharp immediate rise in the demand for such investment goods as machinery and construction. To the extent that this additional demand can be met through an increase in foreign aid and loans, there is no immediate domestic economic problem. But to the extent that the investment goods are to be provided for domestic sources of supply (e.g. construction projects employing manpower in large quantities), there is a domestic policy problem to be faced. An ambitious programme for the mobilization of domestic power and physical resources also implies an ambitious programme for raising taxes, private savings, and the earnings of public enterprises. If the mobilization of savings is less vigorous than is implied by the import substitution and physical output targets, then inflation — whether open or repressed — is a likely consequence.

Model formulation

In two previous reports, a 30-sector interindustry model was employed to construct an internally consistent set of output levels, investments and import requirements for a specific future year. Rudra and Manne (1965) deal with 1970-71, the terminal year of India's

Fourth Plan period; and Srinivasan, Saluja, and Sabherwal (1965) deal with 1975-76, the terminal year of the Fifth Plan. The present project is even more ambitious: tracing out alternative time paths for each of the 30 sectors over each year of the Fourth and Fifth Plans, starting from the expected condition of the economy as of 1965-66.

We believe that investigation of annual time paths is a useful extension of single-period analyses. Our model was designed primarily to explore balance-of-trade time paths under alternative growth and import substitution strategies. With a one-period model, such an analysis is impossible. Also, investment programme bottlenecks may be hidden unless year-to-year time phasing is explored. See Chakravarty and Lefebvre (1965).

In addition to the time phasing of imports, this model is designed to explore some specific effects of time lags between investment and output. The model calculates the structure of the economy for a target year five or ten years in the future, and works out the time paths that would get the economy "from here to there" — from the assumed base year position to the calculated target year position. The model operates as if the demand-supply gap for each commodity is to be filled either by imports (producers' goods), by consumption shortfalls (food and fibres), or by increases in domestic output (services). These "shock absorbers" are assured to be available for bridging the gap between domestic supplies and total demand. We take the 1965-66 levels of domestic output of each item as a datum, and we suppose that each sector's output expands at a constant growth rate during the Fourth Plan and at another rate during the Fifth. Because of the domestic service sectors, the model is "almost consistent" rather than fully consistent. In the service sectors; (notably construction), domestic pro-

duction could be a bottleneck during years too close to the base year for output to be expanded. See Appendix for details on the mathematical formulation.

Principal Assumptions

The calculations are based upon two alternative time paths of aggregate domestic expenditure. For each time path, three alternative assumptions concerning import substitution targets are considered. Each of the six possible combinations of aggregate growth and import substitution has been explored.

Table 1 indicates the two alternative aggregate growth paths. The figures for induced investment emerged from the calculations themselves. The other three items (i.e., exogenous investment, government consumption, and household consumption) were determined exogenously prior to running the model.

Case A represents what we believe to be the consensus at the Planning Commission for the Fourth Plan, together with the Perspective Planning Division's proposals for the Fifth Plan. Case B corresponds to a more pessimistic view than is being considered by the Planning Commission — hence slower rates of growth of agricultural development and of consumption, and a reduction in exogenous investment.

For each of the two aggregate growth assumptions, three cases are considered with respect to import substitution. These three alternatives differ in the assumed ratios of imports to domestic production for each sector. Table 2 indicates the ratios assumed for the target years of 1970-71 and 1975-76. Case 1 represents the most rapid programme. Case 2 is less rapid during the Fourth Plan, but reaches the same position as Case 1 by the end of the Fifth Plan. Case 3 is slower than Case 2 for both Plan periods. Table 2 contains the actual import coefficients for 1960-61, preliminary estimates for 1965-66, and the three alternative assumptions for the future.

The six combinations of assumptions will be identified as Case A1, A2, B1, etc.

Principal Results Import Substitution

We first turn to the results with respect to import substitution. Figure 1 is based upon aggregate projection A, and shows the trade deficit

corresponding to the three alternative targets for import substitution. Household and government consumption, exogenous investment, and exports are identical for all three curves in Figure 1. The curves represent our estimates of the time-paths of the trade deficit corresponding to the three different import substitution strategies—exogenous final demands being held constant. Case 1, the most ambitious import substitution strategy, has the highest deficit in the early years, but achieves the greatest reduction in future deficits. Over the eleven-year period considered, the present cost of the trade deficit for Case 1 is lower than that for Case 2, and that of Case 2 is lower than that for Case 3, discounting at either zero or 10 per cent per year.

Figure 2 shows similar results under aggregate projection B. Regardless of the aggregate projection considered, our calculations indicate that a rapid import substitution strategy pays off in terms of foreign exchange costs.¹ This payoff holds true over whatever range the capital and current input coefficients remain valid.

For those concerned with the overall balance of payments, Table 3 indicates both debt service and the bal-

ance-of-trade deficit for the six alternative cases. The total would have to be covered by gross foreign aid, foreign private investment, and net exports of other services such as tourism.

Domestic Savings

Cases A and B differ substantially in terms of growth of household consumption: 5.5% per year in A versus 4.5% in B during the Fourth Plan. (See Table 4a for a comparison of A1 and B1.) In order to satisfy the higher consumption demands, gross investment and the trade deficit are both higher in A than in B.

Now assume that just enough foreign financing to cover the trade deficit is always available. Gross domestic savings will then be identically equal to the difference between gross investment and that trade deficit. If foreign financing can be adjusted in this way, it turns out that the implied domestic savings ratios (whether marginal or average) are not significantly different as between Cases A and B. Even though A provides more consumption than B, the foreign financing of the trade deficit would enable India to get along with almost the

Figure 1: Alternative Time Paths of Trade Deficit: Case A

same savings ratios in either case.

If we continue to assume that enough foreign financing will be made available to cover whatever trade deficits are generated, it turns out that the implied domestic savings ratios are affected by the import substitution programme. (See Table 4b.) The more rapid the import substitution programme (i.e., in moving from Case 3 to 2 to 1), the less foreign financing becomes available and the greater the reliance upon domestic savings.

Case A1 (the most ambitious in terms of both aggregate growth and import substitution) would require that domestic savings be stepped up from an average 15% of gross domestic expenditures in 1965-66 to 22% in 1970-71. The implied domestic marginal propensity to save would be 39% during the Fourth Plan. The less ambitious import substitution cases (A2 and A3) would imply marginal savings propensities of 36 and 33% respectively. The less rapid the import substitution programme, the lower would be the requirements for domestic savings and for fiscal austerity, and the higher would be the continued dependence upon foreign aid.²

Construction Bottleneck

Cases A and B both imply an increase in aggregate growth rates from the Third Plan to the Fourth Plan. (The rate of increase of gross domestic expenditures would move from 4.9% to 7.1% for Case A and to 5.8% for Case B.) This implies an immediate rise in demand for producers' goods—particularly investment goods.³ Because it takes time to expand the capacity of the Indian economy, much of this sharp increase of demand would have to be satisfied by imports. (See Figures 1 and 2) Demand for services such as construction, transport, and electric power cannot, however, be met by imports. According to our estimates of growth in demands, present capacities, and time lags, this problem of excess demand would be serious only in the urban and industrial construction sector. The 1965-66 demand for this service implied by our growth assumptions is about 50% higher than our estimate of current supply. We have assumed that this sector's output can be expanded with only a one-year lag. Domestic supply could therefore rise to meet the demand by 1966-67; the required increase in output in one year would be between 50% and 75%.

The exact magnitude of this problem depends in several assumptions and

parameter estimates which are all subject to error. One does not, however, have to believe the precise specifications of our model, or the precise estimates of our parameters, to realize that an acceleration of growth requires a sharp increase in the supply of investment goods and services.

There will be wide differences of opinion as to the feasibility of providing the resource inputs needed for internal consistency within one or another of our six alternative cases. Our model is intended only to quantify the requirements to "get from here to there" under a given set of productivity assumptions. The efficiency implied by our estimates of capital and current input requirements, gestation lags, etc., is not fixed forever. Resource input requirements could be reduced either by reducing targets, or by increasing efficiencies.

Other Results

Table 5 contains selected output targets implied by our calculations for Case A1. Note that the growth rates for producers' goods (machinery, steel, petroleum products, and electricity) are all much higher during the Fourth than during the Fifth Plan. The output of consumers' goods, on the other hand,

grows more rapidly during the Fifth Plan. These results are reasonably close to the targets shown in Perspective planning division (1964). Output levels for all 30 sectors are listed in Table 6.

The Fourth Plan investment allocations proposed in Planning Commission (October, 1964) are shown in Table 7. Also shown are the investment allocations generated in our calculations for Cases A1 and B1. The Planning Commission is evidently counting on a more substantial gain in the productivity of investment than is implied by our capital coefficients.

All of the six basic cases have been premised upon merchandise exports growing from Rs 633 crores in 1960-61 to Rs 1,520 crores in 1975-76 (i.e., a growth rate of 6% per year). These six basic cases explored alternative import substitution strategies. We have also investigated a variant concerned with export promotion. Starting from the same initial position in 1965-66, this variant is premised upon an aggregate growth of exports at 9% per year, with most of the additional exports concentrated in the engineering industries. Since both the import substitution and the export promotion assumptions are rather arbitrary, a comparison of the absolute trade de-

Figure 2: Alternative Time Paths of Trade Deficit: Case B

ficits is not very useful. A more meaningful result is the ratio of reduction in the trade deficit to the additional export revenues. This comes out to about 75%. This means that 25% of the additional export revenues are offset by imports needed to produce the additional exports.

For each of the 30 sectors, a gestation lag of one or more years has been assumed. The particular estimates are listed in Appendix 2. One set of calculations was made which was identical to Case A1 except for these lags. The modification consisted of reducing the lags by one year. The most pronounced effect, as might have been anticipated, was a reduction in endogenous investment. This reduction was on the order of 5%. In a growing economy, a shortened lag has a similar effect to a reduction in the capital-output ratio. The reduction in investment in turn implies a corresponding reduction in machinery imports and in the balance-of-trade deficit.

Notes

¹ In earlier experiments we analysed a case with a higher aggregate growth rate than Case A. The results with respect to import substitution were similar.

² We have calculated the magnitude of this trade-off for the period 1965-66 through 1975-76. The

ratio of reduction in domestic savings to increase in the trade deficit, holding consumption and exports constant, can be regarded

as the rate of transformation of rupees into foreign exchange through the process of import substitution. For the import sub-

FRESH AND GLOWING...

Get that fresh and glowing complexion with daily Hamam care. Hamam's rich, fragrant and gentle lather actually refreshes your skin as it cleanses—gives you a radiant glow. Use longer-lasting Hamam—the toilet soap that keeps its shape, always. Hamam is a Tata Product.

CSM-2A

situation programmes we have analyzed, roughly two rupees of additional domestic savings would be needed to reduce by one rupee the requirement for foreign aid.

Note that this would make possible a corresponding increase in the employment of construction workers.

Appendix
Mathematical Formulation

This work has been carried out in two parts. First, a consistent set of output levels, imports, and induced investment was derived for each of two target years. Except for induced investment, these inter-industry calculations are similar to those discussed

in Rudra and Manne (1965) and Srinivasan, Saluja, and Sabherwal (1965), and we omit a detailed verbal description here. The target years were the ends of the Fourth and Fifth Plans, i.e., 1970-71 and 1975-76. In each case the base year was the last year of the Third Plan, 1965-66.

After calculating these output levels

Notes : a Output level for Case A1 : Rs 406 crores; for Case B3 : Rs 357 crores.
b Determined exogenously.

for the target years, the output levels, the input-output coefficients, and the exogenous final demands for the intermediate years (i.e. 1966-67 through 1969-70 and 1971-72 through 1974-75) were interpolated log-linearly. Inter-industry demands were then calculated by the input-output method.

In each year, the induced investment demands were generated through an accelerator relationship, i.e. through multiplying capital coefficients by future output increases. In order to calculate induced investment within the interindustry model of the two target years 1970-71 and 1975-76, the future output increases were derived from the current absolute levels of output by exogenously specified sectoral growth rates for the subsequent five-year plan. An iterative procedure was employed to insure that the output growth rates specified for the Fifth Plan would be consistent with the absolute output levels derived separately for 1970-71 and 1975-76. The computer was programmed to calculate the 1970-71 output levels, then revise the Fifth Plan growth rates, then revise the 1970-71 output levels, and so on. Fewer than 10 iterations were required in order to obtain a mutually consistent set of growth rates and output levels.

After calculating the demands and interpolating domestic production levels log-linearly for the first four years of each Plan period, the computer programme calculates the implied supply-demand gaps for each item in each year. It is supposed that these gaps will be bridged in one of three ways—depending upon the sector:

- imports of investment and producers' goods in sectors 3-10, 19-21, 23-27, 30.
- consumption shortfalls in the food and fiber sectors 11-18.
- revisions of the domestic output levels within the five service sectors: 1, 2, 22, 28, and 29. (Revisions above the log-linear trend line are not permitted during years for which this ment prior to 1965-66.)

As the calculations turned out, the consumption shortfalls were negligible, and so were the revisions of domestic output for the five service sectors. The only service in which a significant gap occurred was urban and industrial construction (sector 1) for the year 1965-66. It is because of this one major gap that our calculations are "almost consistent" rather than fully consistent.

The following characteristics of the computing procedure should be noted:

- 1) By postulating shock absorbers such as consumption shortfalls and producers' goods imports, this resembles an open-loop simulator rather than a fully consistent model. (In a closed-loop negative feedback simulator, these gaps would trigger policies designed to reduce their magnitude.)
- 2) Unlike a recursive dynamic input-output model, this interpolation procedure ensures that virtually all domestic output levels for the initial year 1965-66 will match the estimates of initial conditions. The five service sectors are the only ones in which this output matching cannot be guaranteed in advance.

3) Output during the Fourth Plan is assumed to grow along a loglinear trend line. This implies that the short-run accelerator is sufficiently flexible so that these output increases in the first years of the Fourth Plan are not constrained by the project starts that were underway during the final years of the Third Plan.

The model has the following variables:

- x_j^t annual rate of domestic production, process j year t .
- y_i^t annual import rate, item i year t .
- v_j^t annual rate of investment demand in year t for good j induced by output increase.

The superscripts t on the above three variables take on the value for each year from $t = 1965-66$ through $t = 1975-76$.

The model also has the following

parameters and exogenous data:

- a_{ij}^t current account inter-industry demands on item i per unit output of process j . Some of these norms change over time.
- b_{ij}^t fixed capital account demands on item i per unit increased in output of process j .
- c_i^T ratio of import to domestic production of item i , year T . The superscripts T take on two values: $T = 1970-71$ and $T = 1975-76$. Most of the non-zero c_i^T parameters drop from 1970-71 to 1975-76.
- J inventory demand per unit increased in activity level. (Set at zero for service sectors and .25 for others.)
- q lag in investment demand, varies with sector of destination.

Exogenous Data:

- x_j^{65} annual rate of domestic production, process j , 1965-66.
- $(h, g, e, o, k)_i^t$ annual rate of demand, item i , year t , by household, government, exports, others,

Table 7: Size and Pattern of Investment, Fourth Plan

Total net investment (Rs crores) ^d	20,000 ^a	26,700 ^b	22,800 ^b

^a 1963-64 prices.

^b 1959-60 prices.

^c Sectoral classification not strictly comparable between sources.

^d Includes Rs 1200 crores for increase in stocks; excludes replacement estimated at Rs 3000 crores.

and exogenously specified capital formation.

m^t = total value of exogenous imports, year t .

x_{20}^t, x_{24}^t = annual rate of domestic production of motor

(domestic production) + (imports) =

$$x_i^T + y_i^T = \left(\begin{array}{c} \text{interindustry} \\ \text{demand} \end{array} \right) + \left(\begin{array}{c} \text{exogenous} \\ \text{final demand} \end{array} \right) + \left(\begin{array}{c} \text{Induced investment demand:} \\ \text{fixed and inventories} \end{array} \right)$$

$$\sum_j a_{ij} x_j^T + (h+g+e+o+k)_i^T + v_i^T + J(x_i^{T+1} - x_i^T)$$

$$i = 1, \dots, 30$$

Induced fixed investment demand:

$$v_i^T = \sum_j b_{ij} r_j x_j^T (1+r_j)^{q-1} \quad i = 1, \dots, 30$$

Import levels:

$$y_i^T = c_i^T x_i^T \quad i = 1, \dots, 30$$

Note that we have eliminated the non-competitive imports specified in Rudra and Manne (1965), and Srinivasan (1965).

The investment demands and imports are expressed in terms of the domestic production levels. We are then left with a set of 30 equations, in 30 unknowns x_j^T .

x_j^t = log-linear interpolation between x_j^{65} and x_j^{70} for $t = 66$ through 69; between x_j^{70} and x_j^{75} for $t = 71$ through 74 ($j \neq 1, 2, 22, 28, 29$)

x_j^t outputs in the service sectors are set equal to total demand unless this value lies above

transport and crude petroleum year t .
 r_j annual growth rate of process j , subsequent Plan.

The variables are related through the following equations:

$$x_i^T + y_i^T = \left(\begin{array}{c} \text{interindustry} \\ \text{demand} \end{array} \right) + \left(\begin{array}{c} \text{exogenous} \\ \text{final demand} \end{array} \right) + \left(\begin{array}{c} \text{Induced investment demand:} \\ \text{fixed and inventories} \end{array} \right)$$

$$\sum_j a_{ij} x_j^T + (h+g+e+o+k)_i^T + v_i^T + J(x_i^{T+1} - x_i^T)$$

$$i = 1, \dots, 30$$

$$v_i^T = \sum_j b_{ij} r_j x_j^T (1+r_j)^{q-1} \quad i = 1, \dots, 30$$

$$y_i^T = c_i^T x_i^T \quad i = 1, \dots, 30$$

It has been our experience that the model is sufficiently well behaved to produce unique, non-negative values of the x_j^T .

Having calculated the x_j^T for each sector for 1970-71 and 1975-76, we then calculate the annual variables as follows:

x_j^t = log-linear interpolation between x_j^{65} and x_j^{70} for $t = 66$ through 69; between x_j^{70} and x_j^{75} for $t = 71$ through 74 ($j \neq 1, 2, 22, 28, 29$)

$$y_i^t = \begin{cases} -x_i^t + \sum_j a_{ij} x_j^t + (h+g+e+o+k)_i^t + J(x_i^{t+1} - x_i^t) + v_i^t & (i=3-10, 19-21, 23-27, 30) \\ 0 & \text{all other } i \end{cases}$$

$$v_i^t = \sum_j b_{ij} (x_j^{t+q} - x_j^{t+q-1}) \quad i = 1, \dots, 30$$

In calculating the trade deficit for each year, we include imports of commodities as well as additional exogenous imports. Since the export final de-

log-linear trend line during Fourth Plan, and additional investment would be required prior to 1965-66.

$$y_i^t = \begin{cases} -x_i^t + \sum_j a_{ij} x_j^t + (h+g+e+o+k)_i^t + J(x_i^{t+1} - x_i^t) + v_i^t & (i=3-10, 19-21, 23-27, 30) \\ 0 & \text{all other } i \end{cases}$$

$$v_i^t = \sum_j b_{ij} (x_j^{t+q} - x_j^{t+q-1}) \quad i = 1, \dots, 30$$

mand sector is valued at producers' prices, we allow for trade and transport margin on exports:

$$\left(\begin{array}{c} \text{trade} \\ \text{deficit} \end{array} \right) = \left(\begin{array}{c} \text{imports} \\ 17 \text{ sectors} \end{array} \right) + \left(\begin{array}{c} \text{exogenous} \\ \text{imports} \end{array} \right) - \left(\begin{array}{c} \text{exports at} \\ \text{producer} \\ \text{prices} \end{array} \right) - \left(\begin{array}{c} \text{margin on} \\ \text{exports} \end{array} \right)$$

$$= \sum_{i=3-10, 19-21, 23-27, 30} y_i^t + m^t - \sum_j p_j^e x_j^t$$

Pre-vocational Training

Agreement with Unicef

AN agreement for the implementation of a scheme of pre-vocational training for children of the age group 11-14 was signed in New Delhi on Monday last. The scheme is being implemented by the Union Department of Social Security in co-operation with three specialised agencies of the United Nations, viz, UNICEF, UNESCO and ILO. The scheme is designed to impart training in certain trades such as sheet metal work, gas welding, smithy, moulding and carpentry, to children who discontinue their studies after the primary stage. Basic general education will also be provided.

This is a pilot scheme under which 65 pre-vocational training centres will be organised by the end of Third Plan. Fifty-five centres including five regional centres have already been started so far, and the remaining ten centres are expected to commence functioning by February, 1966. The duration of the training is three years after which the pupils would be given a certificate of competence to enable them seek employment as semi-skilled workers or work on family farms, or enter industry as apprentices.

In the first three years, the scheme is estimated to cost Rs 67.95 lakhs, out of which UNICEF's share will be Rs 30.11 lakhs, the balance being borne by the Government of India. UNICEF will supply workshop tools, equipment, training aids and text-books for the schools and will bear all the expenditure on the training of craft instructors. The ILO will assign an expert to advice and assist in the preparation of the curriculum and the coordination of the participation of the various national and international bodies in the programme. UNESCO will provide an expert in general education for this programme.

Speaking on the occasion of the signing of the agreement, D C Das, Secretary, Department of Zonal Security, said that the scheme of pre-vocational training would provide technical training to substantial number of young men in our country who are not keen to have academic education. He hoped that once the scheme takes its roots, thousands of boys would become useful to their own families as well as to the nation.

Dalal Street at New Low

Thursday, Morning

DALAL STREET last week moved into new low ground with several shares touching new low levels for many years. The crisis of confidence has deepened with the further fall in equity prices. But for the fairly encouraging corporate news during the week, the announcement of cement decontrol from next year and possibility of early decontrol of sugar, the performance of the stock market could have been much worse. The stock market bull has been completely frustrated by the persistent deterioration in the economy and political uncertainties. The Deputy Chairman of the Planning Commission, who, not long ago, had accused the business community of propagating a sense of gloom and frustration, himself painted a very grim picture of the economic prospect at the recent meeting of the Informal Consultative Committee of Parliament for Planning Commission. He spoke of mounting defence expenditure, non-availability of non-project aid from the U.S., lower industrial output, setback in agricultural production and fall in Government revenues. President Radhakrishnan and Prime Minister Shastri warned the nation against the possibility of a concerted attack by China and Pakistan. Reports for power cut have been on the increase. Response to the gold bonds, remittance scheme and defence loans has so far, been extremely disappointing and if the Government is unable to mobilise sufficient funds through these measures, resources will naturally have to be raised through heavy additional taxation.

Cotton Mill shares were the worst sufferers, with India United Mills, Indore Malwa and Kohinoor striking new lows for the past six years. Selling in Textile shares has been provoked by the steady deterioration in the industry's position which is reflected in a record low production of cloth and yarn in October. Rayon shares fared only slightly better. Steels, Dyes and Chemicals were also distinctly subdued. Sugar shares were a little quiet. Only Cement shares recorded modest gains because of the increase in cement prices from the beginning of next year under the decontrol scheme. Premier Construction were another bright spot on substantial informed buying. Cash shares were depressed due to lack of support.

COTTON

Prices Recede

COTTON prices have come down by about Rs 25 to Rs 50 per candy from their highest levels during the past fortnight or so. This brings all varieties of cotton within the statutory ceilings. Lest one gets the impression that cotton prices have suffered some serious decline, it is necessary to point out that ceiling prices for the current season are Rs 75 to Rs 100 per candy higher than in the previous season. The recent setback in prices is not due to any upward revision of the crop estimates; few observers place the crop at more than 52 lakh bales which means that cotton will continue to be in short supply this season, unless, of course, the gap between mill consumption and indigenous supply is made good through imports the outlook for which can by no means be regarded as very promising.

Prices have eased because while new crop arrivals are gradually picking up, mill buying continues to be restricted. The fall in prices has been more pronounced in the case of Punjab cottons, especially Bengal Deshi, because the crop movement in the Punjab is getting into full swing which is quite normal for this time of the year. Apart from the fact that cotton prices have been pushed to their all-time highest, growers as well as merchants seem reluctant to hold large stock of cotton with them because of the financial stringency and political uncertainty. Few people would like to take the risk of carrying large stocks of cotton because of the uneasy truce between India and Pakistan.

Despite forecasts of a substantially smaller crop, market sentiment has recently been affected by the heavy decline in the mill output of both cloth and yarn during October. Cloth and yarn production at 377 million yards and 154 million lbs respectively is the lowest for a very long time. Apparently, the cotton mill industry seems convinced that reduced production is the only answer to the problem posed by heavy accumulation of stocks with mills. In any case cloth production is bound to be adversely affected by the reduced availability of cotton in the 1965-66 season.

The turnover in the spot market continued to be on the low side. It is not merely that mills are reluctant to purchase more than their bare minimum requirements in view of the acute financial stringency which has been aggravated by the piling up of huge stocks of cloth and yarn; but traders too are in no mood to extend their commitments because they are experiencing considerable difficulties in realising their dues from mills. Export business has been almost at a standstill for the past fortnight or so because Japan, the main buyer of Indian Deshi, has been purchasing its requirements from Pakistan which has been quoting 1 d to 1½ d lower than India for its Deshi cotton. Sales registered up to November 8 this season total 53,027 bales. Virtual absence of overseas demand has adversely affected Bengal Deshi prices recently. Cotton futures which had been sticky around Rs 909 for several weeks have declined to around Rs 902 in sympathy with the easier tendency in the spot section.

OILSEEDS

Prices React

OILSEEDS and oil prices have registered an all-round sizable setback from their previous week's record high levels. Groundnut oil ready has come down from Rs 37.50 to Rs 34.25, linseed oil from Rs 32 to Rs 30.50 and castor oil (Commercial) from Rs 24.25 to Rs 22.25—all per 10 kilograms. Groundnut ready is down by about Rs 9 a quintal and linseed by about Rs 5. Oilseeds futures have also moved down—castorseed April from Rs 112 to Rs 106 and linseed April from Rs 130 to Rs 125.50 (per quintal).

No market can keep rising indefinitely without occasional setbacks caused by corrective profit-taking. It is quite normal for speculators and traders to book their profits when the market has moved too far in any direction. Considering the fantastic rise in vegetable oil prices over the past four or five weeks, technical considerations alone could have produced a setback of the order that took place last week. But apart from technical considerations, increased flow of new crop groundnut arrivals, mostly from the south, and reports of beneficial rains in north India imparted an easier feeling to the market.

Trading sentiment last week was also believed to have been affected by persistent talks that the Forward Markets Commission was seriously considering the imposition of heavy margins on non-transferable specific delivery contracts in groundnut oil with a view to containing the volume of speculative business in these contracts. Whether or not margin can check the rising trend in prices is a very moot point. But it can certainly have a good restraining effect on the volume of business. It is rather intriguing why the Commission should go about consulting the associations entrusted with the conduct of trading in non-transferable specific delivery contracts in groundnut oil in regard to the action it intends to take when it has already imposed penal margins in the hedge contracts in castor, linseed and cottonseed. Being the major edible oil, groundnut oil should really have been the first to attract the Commission's attention. It is really amazing how the Commission has tolerated a rise of Rs 11 per 10 kilograms in groundnut oil in a matter of some five weeks and not taken any action whatsoever, especially when it had prescribed penal margins for hedge contracts in the far less important oilseeds—castor, linseed and cottonseed.

The Forward Markets Commission decision to impose a margin of Rs 100 per quintal in castor futures when its price goes beyond Rs 112 and a 100 per cent margin in cottonseed futures when the contract is quoted at Rs 75—which is its current rate—makes virtual nonsense of the facility of hedge trading. Instead of calling for such margins, why does the Commission not prohibit completely futures trading in these commodities. All facilities for speculative buying must be stopped when the commodities concerned are in acute short supply. And as for trading in non-transferable specific delivery contracts, the least that the Commission can do is to impose severe penalties on those found guilty of not being able to observe the terms of the contract. To allow parties to settle their contracts without effecting actual delivery of goods is to undermine the very sanctity of the non-transferable specific delivery contract.

The week's review of the oilseeds market will not seem complete without a mention of the further increase in vanaspati prices and of the Gujarat Government's decision to extend the ban on the export of groundnut and its products excluding oilcake to cover cottonseed. The ban on the export of

groundnut and groundnut oil has seriously affected the working of the solvent extraction plants. It is difficult for these plants to operate unless they can find a ready and profitable market for the solvent extracted oil the export of which is also banned. As for the further increase in vanaspati prices ranging from Rs 200 to Rs 270 per tonne by the manufacturers—the second rise in November—it is a strange irony that the increase in vanaspati prices should have been announced in a week which has registered a decline of nearly Rs 300 per tonne in the price of groundnut oil. The price of vanaspati would be revised downward in

BUSINESS NOTES

Indian Aluminium

SATISFACTORY progress is being made by Indian Aluminium in implementing its expansion projects. The main equipment at the new foil rolling mill at Kalwa has been erected. The construction work at Alupuram for further expansion of the smelter capacity to 15,850 tonnes per annum and for the installation of a 5,000-tonne per annum Properzi rod casting mill is going ahead. It is intended to start up these new facilities early next year. Necessary steps are also being taken for the early implementation of the West Coast project.

According to an interim report from the company, the financial results of the first half of 1965 show sales at Rs 74.4 million compared to Rs 71.3 million during the same period in 1964 and Rs 148.4 million during the whole of the past year and the Pre-tax profits of Rs 24.8 million compare with Rs 29.9 million and Rs 49 million, respectively. The provision for development rebate this year is substantially higher at Rs four million, as against only Rs 0.4 million during the corresponding period of last year consequent on the start-up of new production facilities at the Alupuram smelter and the Kalwa foil mill. With the tax liability estimated at Rs 10.3 million (Rs 12 million), net earnings stand at Rs 10.5 million, against Rs 10.6 million.

The results would have been still better but for the critical power supply situation in Kerala owing to which operations at the Alupuram smelter was once again seriously affected. A partial supply of electric power was made available to the new smelter from the middle of February last; the full contracted supply of 12,500 kilowatts was delivered only six months

December provided groundnut oil prices keep lower. But the question is whether under the present conditions of short supply the poor consumer will also reap the benefit of cheaper prices. The policy of revising prices too often must be discouraged and if prices are to be revised then the manufacturers should be compelled to stamp prices and the date of manufacture on the containers so that the consumer can know the correct price of vanaspati. This will bring into light traders who continue to withhold the goods from the market in the hope of realising higher and higher prices from consumers.

later. There were severe and repeated power cuts in June and July. The production loss attributable to these power cuts during the first half-year is estimated at 1,260 tonnes of aluminium metal. Alupuram now has a total metal-producing capacity of 10,850 tonnes.

Hindustan Aluminium

A Rs 21-crore expansion aimed at raising capacity to 60,000 tonnes has been undertaken by Hindustan Aluminium. It is stated that on completion of this programme towards the end of the next year, the company will be the largest manufacturer of aluminium in India. Nearly Rs 5 crores have already been spent on this Programme, and arrangements have been made for a long-term dollar loan equivalent to Rs 6.53 crores from the Export-Import Bank, Washington. The company will soon enter the capital market with a public issue of Rs 1.5 crores in 9.3 per cent preference shares of Rs 100 each. The entire issue is underwritten, one half by LIC and the other half by some other financial institutions and two firms of share brokers. After the proposed issue, the issued capital of the company will be raised to Rs 10 crores.

Meanwhile, the company has reported satisfactory progress in its working during the current year. The production in the first eight months of this year is placed at around 15,560 tonnes compared to 22,880 tonnes in the whole of 1964. The sales in the first half of 1965 amounted to about 11,779 tonnes valued at about Rs 4.5 crores, on which the gross profit is estimated at around Rs 2 crores. During 1964, the company sold 26,849 tonnes valued at Rs 11.12 crores and

earned a gross profit of Rs 4.47 crores. Out of the 1964 earnings the company cleared arrears of dividends on the existing preference shares upto the end of 1962. The arrears on this account amount to Rs 45 lakhs.

Indian Oxygen

INDIAN OXYGEN is now in the midst of a major expansion programme spread over four years ending September 1967. It includes several new projects covering additional facilities for production and distribution of gases, production of user equipment and electrodes, etc. It is proposed to increase the share capital by the issue of 9.80 lakh new ordinary shares of Rs 10 each as rights at a premium of Rs 4 per share. Of the proposed issue, the parent company, British Oxygen, will not only take up its due share comprising 5.88 lakh shares, but it has also agreed to take up any shares not subscribed for by other members. If, as a result, the percentage of the British Oxygen's shareholding in the company should exceed the existing percentage, then it will divest itself of such excess shares within a period of two years from the date of allotment of the excess shares, at a price not exceeding the issue price. An extraordinary general meeting has been called for to consider a resolution to this effect.

The new ordinary shares will not rank for any dividend in respect of the year ended on September 30, 1965, but will otherwise rank *pari passu* in all respects with the existing ordinary shares. The directors expect to maintain the existing rate of dividend, i.e., Rs 1.20 per share. They also anticipate that with the growth of the company during the coming years as a result of its Rs 6 crores expansion programme, and in the absence of any unforeseen circumstances, it should be possible for the company to maintain the dividend at a satisfactory level on the capital as increased by the proposed one-for-three rights issue.

Mysore Cement

DURING the year to June last Mysore Cement's plant increased to 90 per cent of rated capacity compared to 71 per cent in the preceding year. Since June 1965, however, the plant has been working at a little over the rated capacity, and it is felt that, given proper equipment and facilities, production can be kept above the rated capacity level. The company's expansion programme aimed at doubling production capacity was earlier expect-

ed to be completed towards the middle of this year; according to the revised estimate the expanded plant should be on stream before January next. A geological survey of the company's limestone deposits has revealed adequate supplies of quality limestone for the plant.

During 1964-65, the company sold 87,070 tonnes of cement, as against 74,708 tonnes in the preceding year, and sales brought in Rs 69.13 lakhs compared to Rs 57.49 lakhs. After providing Rs 17.32 lakhs (Rs 20.85 lakhs) for depreciation, however, the outcome of the year's operations was a loss of Rs 5.76 lakhs compared to a loss of Rs 21.68 lakhs previously. Together with the previous loss, the total loss carried to the balance sheet has risen to Rs 52.30 lakhs. The increase in the retention price of cement from Rs 79 to Rs 83 per tonnes with effect from June last is expected to improve the company's profitability. The proposed partial decontrol of cement, when it comes into effect, should further improve the company's earnings potential.

Saurashtra Cement

A LETTER of intent has been obtained by Saurashtra Cement and Chemical Industries for establishing a third plant with an annual capacity of 3.33 lakh tonnes of cement, and the company is negotiating for purchase of the necessary capital equipment for this purpose. Meanwhile, the second plant commissioned towards the end of August last has been working only on a trial basis due partly to the teething troubles and partly to the non-availability of regular and adequate power supply. During the year ended June 1965, the production of clinker was 2.10 lakh tonnes as against 2.05 lakh tonnes previously and that of cement 2.26 lakh tonnes as against 2.19 lakh tonnes. The Singach Salt Works achieved production of 35,456 tonnes of salt, and of the total sales of 6,766 tonnes, 6,200 tonnes were exported to Japan.

The financial results for the year 1964-65 show sales a shade higher at Rs 2.20 crores (Rs 2.18 crores) but gross profit considerably better at Rs 75.56 lakhs (Rs 66.64 lakhs), reflecting the benefits of increase in the retention price of cement as well as in packing charges granted by the Government from time to time. There is a saving of about Rs 8 lakhs in the provision for depreciation, but the tax liability has syphoned off Rs 16 lakhs more than in the previous year, leaving after-tax profits only marginally better

THE ECONOMIC WEEKLY

at Rs 31.96 lakhs (Rs 30.99 lakhs). What is more encouraging from the shareholders' point of view is that the company is not only clearing arrears of dividends on preference capital, but also paying a maiden dividend on ordinary capital at a handsome rate of 12 per cent.

Hindustan Brown Boveri

ALL-ROUND improvement in production, sales and earnings has been recorded by Hindustan Brown Boveri (formerly Hindustan Electric) in the year to April 1965. The company has sufficient orders on hand to ensure continuous production for the manufacturing units at Faridabad, Ghaziabad, Howrah and Gorva. The Howrah works has already reached its rated capacity for the manufacture of transformers, and the Gorva factory is expected to soon reach the licensed capacity. The management is negotiating for orders as well as necessary import licences for components for undertaking manufacture of extra high tension air blast circuit breakers.

During 1964-65, sales advanced from Rs 4.8 crores to Rs 7.7 crores and gross profit from Rs 27.37 lakhs to Rs 44.58 lakhs. Despite the increased provisions for depreciation, taxation and prior charges as also for preferential dividends, equity earnings have considerably improved from Rs 8.68 lakhs to Rs 12.24 lakhs, lifting the cover for the dividend raised by a point to five per cent from 1.67 times to 1.7 times.

Nepa Mills

AN expansion programme aimed at stepping up the factory's capacity by two-and-a-half fold to 75,000 tonnes, estimated to involve an investment of Rs 9.5 crores, is being actively pursued by National Newsprint and Paper Mills. The company has already concluded a contract with Wartsila, Finland, for the supply of certain equipment worth about Rs 1.5 crores, and the first consignment is expected at the factory site by the end of 1965.

Meanwhile, during the year to March last the company has reported lower sales and profits; the value of sales is down by about Rs 10 lakhs at Rs 3.10 crores and gross profit nearly Rs 7 lakhs lower at Rs 84.12 lakhs. Margins have suffered a setback due to the rise in costs of raw materials and chemicals. A higher tax charge of Rs 31 lakhs (Rs 20 lakhs) has further widened the gap at the after-tax level, and equity earnings are a third lower at Rs 34.54 lakhs. Accordingly, the cover for the unchanged dividend of six per cent has slipped from 1.73 times to 1.17 times.

What was once an ugly slum, is now a well-planned housing colony. All over the country, new residential colonies are springing up, bringing improved living standards and public health amenities to previously neglected areas. Much of this progress has been made possible through LIC investments.

Year after year, LIC aids housing progress through loans to State Governments for housing schemes, schools and other welfare projects. In other spheres of development too—transport, agriculture, and industry—LIC investments play a vital role. LIC invests Rs. 3 million every day to better the standard of living.

Life Insurance Corporation of India

These were some of LIC investments as at March 1965:	
Loans to State Govts. for Housing Schemes	Rs. 59,02,22,000
Loans to Co-operative Housing & Finance Societies	Rs. 15,09,34,000
Cement	Rs. 7,99,78,000
Electricity	Rs. 11,49,16,000
Iron & Steel	Rs. 10,59,02,000

Poysha containers

Not only fruits but also other foods as well as pharmaceuticals, vegetable and mineral oils, paints and dyes... they all come to you in protective Poysha containers. Poysha serves all the major industries catering to your daily needs.

Poysha's sales have increased eightfold in as many years: a phenomenal growth record indeed. Today, it ranks second among Indian container makers; but it is second to none in quality and service, thanks to its expert personnel, strict quality control and the most modern machinery.

To serve you even better, Poysha has joined hands with one of Europe's

bring it to you

leaders in packaging: Lubecawerke of West Germany. Now all of Lubecawerke's experience and expertise pooled in its Central Laboratory are available to Poysha for its large expansion programme. Its 3 new factories at Thana (Bombay), Ghaziabad (Delhi) and Cochin will soon be ready. Then it will make 5 containers for every 2 it makes today. What's more, it will offer comprehensive technical advice, better on-the-spot service and a wider choice of packaging materials to industries all over the country. For you, this will mean more and more of the better things you need... in Poysha containers — which even now run into millions every year.

Selective Restriction

THE Reserve Bank's credit policy announced this week contains few surprises. Speaking in Madras a few weeks ago the Governor of the Reserve Bank had indicated the broad lines on which the policy was likely to be framed and the latest announcement spells out the details. The Governor referred to the new policy as one of selective liberalisation: it is equally one of selective restriction — not in the sense of selective credit controls as we have understood the term in India but of specifying areas where credit will be made tighter and the cost higher.

The Governor, at his press conference called to explain the policy — incidentally, a practice to be commended — gave only the broadest indication of how much the magnitude of priority sector refinance would be, suggesting that of the Rs 200 crores or so of refinance, about 50 to 60 per cent may be for these sectors. It would have been useful to have had a breakdown of this into the three component categories of priority sector refinance.

One cannot seriously quarrel with the choice of the priority sectors themselves, but a few questions may be asked. Why does the scheme of defence supply advances not take into account the working capital needs of defence production industries during the stage of production? The anomaly is the greater as this principle is partly conceded by packing credit for exports obtaining refinance but not export bills. Rupee export bills will, however, continue to get refinance at the Bank Rate. The Chabiani Working Group on the cost of export credit had in fact recommended an extension of the rupee bills scheme to all export bills but the Reserve Bank appears to have decided against it. It would be interesting to know why. As regards food-grains advances to Governmental agencies the magnitude, of course, would depend on the procurement operations but if the scheme extends to all the agents of the State Government then its policing will present problems.

Unless one can be sure that the total of finance under the priority sector refinances is going to be greater than what banks might have obtained under the previous arrangement one cannot call this new policy one of liberalisation, even on a selective basis. On the other hand, the Reserve Bank has taken steps which clearly are in the direction of tightening. Thus all the priority sector borrowing will form part of banks' borrowing from the Reserve Bank for computing the net liquidity ratio. In other words, a bank with a low liquidity ratio will be induced to borrow only for the priority sectors and not for others while for a bank with a high liquidity ratio, the new scheme does not confer any tangible benefit unless its net liquidity position goes down to 30 per cent. Further the Reserve Bank has enhanced the rate at which the cost of borrowing goes up, to 1 per cent from 1/2 per cent for every 1 per cent decline from 30 per cent in the net liquidity ratio on the entire non-priority sector borrowing. This represents a real squeeze alongside the continuance of the 10 per cent ceiling on advances rates. For the banking system as a whole the cost of borrowing from the Reserve Bank bids fair to be significantly higher than last year unless one were to assume that refinance for the priority sectors will account for the bulk of the central banks' accommodation.

The net effect of this policy may well be to make credit not only costlier but tighter, though given the present economic situation — with the food position assuming greater gravity each day and budgetary operations adding to monetary pressures — such a policy is perhaps inescapable. At his conference with the press the Governor suggested that bank credit was expected to rise by about Rs 400 crores — or almost as much as last year. This would at first sight seem to be a larger figure than the situation warrants. There will be the usual protests from vested interests that the credit policy is unnecessarily harsh and will retard production. The fact, however, is that the impairment of production is more likely to come from a shortfall of raw material and other supplies. A free flow of credit under such circumstances can only worsen the situation. If the credit squeeze

should, however, hurt production there is the Reserve Bank's assurance that it will modify its policy if the situation warrants it.

Another interesting aspect of the new policy is the requirement regarding the Reserve Bank's prior authorisation for fresh limits of Rs 1 crore and above. In some predictable circles this has been described as "backdoor nationalisation"! The Reserve Bank's letter to banks describes this as an additional measure of credit regulation and as a step towards closer alignment of credit growth with the Plan's needs. There is no reason to assume that it is anything more than this. It is a pity the Bank has not indicated what the control will mean in dimensional terms but it seems clear that this would give the Reserve Bank considerable dimensional and direc-

tional control on lending. The French practice, which seems to have inspired the latest move, is used for this purpose and it remains to be seen how the Reserve Bank uses this new power. A natural query arises as to why this control has been limited only to fresh credit limits for, in the nature of things, it is unlikely that in any year there will be many new limits of Rs 1 crore or above. The position with regard to existing limits of Rs 1 crore and above (except where they are raised) appears to have been condoned. Is it the suggestion that these limits are sufficiently 'aligned' (to use the Bank's phrase) with the Plan needs or that credit regulation in this respect is sufficient? Surely this cannot be so. Why then have these been let off? For all its apparent ingenuity, the new policy leaves a number of questions unanswered.

The Plan Is Dead, Long Live Planning!

IT is not true that the Fourth Plan has been killed in the shooting war between India and Pakistan, though the average Indian, drunk with the sense of glory over the destruction of Pakistani Pattons does not require any persuasion that it is so. We concluded one of our editorials in the issue of August 14, weeks before the war, with the assessment: "The administration has been left to carry on to prepare a Fourth Plan and a Perspective Plan which nobody seriously wanted to implement. Hence the unreality of the discussions on the Fourth Plan and even more so on the Perspective Plan. A show had to be kept up for the benefit of the public. The show is still on but it may be called off soon. One is waiting for the politically opportune moment". This assessment was as much based on the spate of contradictory utterances about 'plan pause' and 'plan holiday' and what not that had been emanating from leading personalities of the Government representing all shades of opinion as on the fundamentally unsound way in which the Fourth Plan had been prepared all along the way without paying any attention to the realities of the economic situation as obtaining during the Third Plan period. The utterances represented an attempt at telling the nation that planning was to be shelved—but apparently the decision had been taken that the foreign exchange crisis, being largely

the result of the Finance Minister's ineptitude, was not a sufficiently convincing excuse for such an important change in Government policy as the scrapping of the Plan. Events have proved that the decision to wait was a very wise one; for within weeks came the shooting war and the announcement of foreign assistance being withheld.

What precisely is the state of affairs now? Some time back it was given out that two alternative outlines of the Plan were being prepared—one on the assumption of normal flow of foreign assistance, the other without it. There was in that the expression of a resolution—resolution is too strong a word but, say, just a wish—to do without foreign assistance if need be. But that phase is also over; no alternatives are being prepared—as a matter of fact, not even a single version is being prepared. The outline, it has now been given out, will be ready only by the middle of next year; by that time, it is hoped, foreign assistance will start to flow again. The current programme is to wait and hope.

This surmise is based on the spate of self-contradictory banalities and platitudes that are pouring out from important quarters. For the most extraordinary statement, the credit goes to the Prime Minister himself. In an address to Congress workers in Madras Shastri is reported as

having said, "Two months hence we may have to face special difficulties... As the situation develops we will take necessary decisions to counter them." He was referring to the difficult food and economic situation which he anticipates to deteriorate. There is thus an admission in his statement that at present no decisions are being taken: they will be taken! One of the situations that is likely to develop is that of a large number of factories grinding to a halt for want of imported raw materials. From Shastri's statement as well as from other news reports it is clear that nothing is being done in the matter apart from waiting for the US State Department to change its mind.

What will be done in two months' time when the factories have actually stopped, a large number of projects left incomplete, and industrial production fallen according to the predictions of Asoka Mehta? The latter drew before a meeting of MPs an all-round gloomy picture of the economy; the Minister for Planning talked in Parliament about the Fourth Plan requiring to be amended. Yet at the same time reports are emerging from the Planning Commission that it is not really necessary to do anything about the Fourth Plan; after all, it has been discovered, defence does not have much impact on most industries, and priority for agriculture—was that not all along incorporated in the Fourth Plan?

We also do not think that the waiting will be in vain; our leaders are quite right that the aid-givers are going to change their mind and foreign assistance will flow again. But surely the stoppage of the flow and its renewal are not unaccountable factors like the monsoon fluctuations: by the time the aid starts to flow in again, important changes would have taken place all along the line in economic policies and methods of planning. There is every reason to fear—or hope, if one likes—that the spokesmen of Big Business will have their way and there will be planning once again, but in the style of what is being called the 'French method of planning. Before the Fourth Plan is ultimately launched—it would be no doubt—there would very probably be, sitting in the Planning Commission, not only representatives of the Indian private sector but also of the aid-giving agencies and governments to guide us along the path of what we shall still call self-sufficient growth!

The Blunted Drive for Self-Reliance

Romesh Thapar

THE other day, I was reading a longish, thesis-type article in which a rather provocative attempt was made to systematise the business of political forecasting and to reduce the margin of error or errors to the minimum. Supposedly, such exercises are designed to prepare the 'in-puts' for complex computers which will tell us what to expect of our politicians. In the midst of this pleasant pastime I asked myself whether any 'system' or 'computer' could have tackled the perambulations of the Congress Party during these past few weeks.

Idle speculation needs discipline. Within the pages of a single newspaper, I learnt that Prime Minister Lal Bahadur's visit to the USA would be concerned with 'goodwill' and would not be linked with economic aid; Congress stalwart Raghunath Singh had urged that the word 'Hindu' should not be dropped from the name of Banaras University as in its wider connotation it does not denote communalism; Deputy Finance Minister Rameshwar Sahu had declared that the public response to the gold bond scheme so far "is satisfactory, but the figure is not very encouraging."

Left Language-less?

No 'system' or 'computer', I am afraid, could cope with this barrage of double-talk. Indeed, even the brains of acclimatised observers and political analysts are paralysed. The mental exhaustion is so complete that newspapers in the Capital—and, presumably, in the States—are content to record every bit of nonsense with unflinching devotion. Maybe, in the quest for a national language, we are now in the unique position of possessing no language at all in which to express what we really intend. This, of course, is an asset diplomatically—but only if the people of the country at least know what's cooking.

A fortnight ago, we were still in the midst of the passion for self-reliance and were fully determined that we would not be pushed around by those who would exploit our food and foreign exchange shortages. Today, we go around furtively, talking about a foodgrains deficit which might touch 10 million tons (15 million if distri-

bution breaks down!) and of a virtual closure, by March 1966, of some 40 per cent of our industry. The earlier passion, set against the facts of our shortages, should have sparked the internal effort to face the critical situation—an effort which would neutralise many of the ill-effects of dependence and help make it temporary. But the passion is being deliberately dissipated, for the feeling is widespread among those who rule that it is preferable to beg rather than to work, particularly if votes are to be collected democratically in 1967.

Waiting for Something to Turn Up

Even as this tragic defeat is being inflicted upon us, we sit around in the Capital merrily recounting tales of how the Army Chief does not protest when a *tikka* is planted on his forehead at a public function, of how the Home Minister wastes time ploughing his garden when he should be cleaning up the administration, of how business tycoons engage the services of foreign consultants despite a foreign exchange shortage and the availability of local expertise, of how the same kind of people engage foreign architects to plan buildings in Calcutta, of how crores of rupees worth of machine-tools are imported while HMT in Bangalore stockpiles tools which are not in demand, of the lavish foreign exchange made available by our normally vigilant Reserve Bank to our emissary MPs, of import entitlement licenses used for the purchase of the most ridiculous non-essentials (even toilet paper!) and of how it is how in the interest of the very very rich to convert their 'white' money into 'black' in order to purchase gold for bonds and enjoy the incometax-free, wealthtax-free and gifttax-free benefits offered by an indulgent GOI.

The achievements of eighteen years are in danger of being pulverised. Nevertheless, a communist joins the mob to call on the Ministry of Information and Broadcasting to silence those who controvert official facts, a Jan Sanghi rants in the style of the *Mahabharata* about the need to destroy Pakistan, a Socialist becomes the spokesman of an assorted

bunch of vegetarians who are demanding the manufacture of nuclear weapons, and a Swatantraist works overtime to persuade our confused politicians that the answer to our problems is to recognise Chiang Kai-shek's regime in Taiwan. Small wonder, then, that Congressmen fiddle—and wait for LBS to visit LBJ.

Non-Official Advisers for Ministers

The visit will soon consume all our faculties, but there are a few hardened optimists who continue to believe that once Lal Bahadur has ensured us against the impending crises he will move to build the self-reliance he has talked about. Frankly, I do not see the signs. The bureaucrats, thoroughly incompetent on economic and technical matters, seem relaxed and still able to quote rules and regulations for a do-nothing plan. Unless their self-reliance is broken, there's little hope. This may appear contradictory, but not for those who have had the opportunity to trudge the corridors of the sprawling GOI Secretariat. Ask the Punjabis, their economy disrupted by war, what they think.

In the kind of democracy we have bestowed upon ourselves, it is imperative that emergencies be tackled through the creation of all-powerful cells of experts whose decisions cannot be challenged. We have to use this approach to the agricultural and industrial crises—if only to save democracy itself. It is a technique frequently employed, even in Britain. The knowledgeable maintain that our troubles in food and foreign exchange are largely curable, that it is possible even at this late stage to get back on our feet without embarrassing supports. But it is the knowledgeable who are kept at a distance. There are too many scandals to hide.

Moves recently initiated to appoint advisers to ministers, selected by the ministers and serving at their pleasure outside the permanent bureaucracy, should do much to concentrate expertise where it is needed. This excellent US practice could be embodied in our system of government. Yet, there is a strange reluctance to implement the scheme. Surely the ICS is not all that powerful. Or are

November 27, 1965

we to wait for Morarji Desai to deliver the opinion of his administrative reforms commission?

Meanwhile, as we mark time and hope that all our problems will be revolved by a benevolent, understanding LBJ, the Soviet Union has thought fit to renew the call for the Tashkent meeting. The Prime Minister's mercurial responses to this particular initiative are becoming the talk of diplomatic circles. Now, it is assumed, that TTK, just back from Moscow, has underlined the necessity

for a more serious dialogue with the Soviet leaders on the problems of the sub-continent. Hence, Lal Bahadur's more constructive reaction to the Tashkent meeting. He is beginning to realise that we hurt only ourselves by a conditional, inhibited attitude to talks and discussions. We should be clear about our objectives — and talk.

The conviction is at last forming that we are saddled with more problems today than before the conflict with Pakistan, that we have to apply ourselves to finding solutions over

THE ECONOMIC WEEKLY

which we have a fair degree of control, that V K Krishna Menon's warning about the militarisation of the mind must be heeded. In other words, the realisation spreads that government by slogans is no panacea. This thinking is likely to crystallise during the coming weeks. It remains to be seen whether it will express itself sharply enough to steer us toward a programme of self-reliance. Let us hope that we will not be left at the mercy of those who imagine that the tenor of their speeches is the barometer of our independence.

Weekly Notes

Getting the Farmer to Spend?

ANY index of political activity, whether it be based on the number demonstrations organised, committees appointed, minutes written or official hours wasted, would correlate well with the trend of urban food prices in this country; in this sense food prices are the most important political barometer, the strongest galvanising force in the arena of politics. Behind every leap in food prices is a story of privation which, untold and unwritten though it remains, leaves a mark on those who hold power and assume responsibility.

And yet, those in power go on collecting these blots of shame as if they were rare stamps. In the last decade we had a serious inflation roughly every five years; now it promises to visit us every other year. What has brought us to this state of affairs? What has been done and what left undone?

A part of the story is familiar to us — the story of abdication of responsibility by sharing it. By introducing food zones the government assumed responsibility for feeding the deficit areas; by making the zones co-terminus with States it shared out the responsibility between the States; by leaving procurement to their sweet will it abdicated responsibility. For the consequences of irresponsibility we have to wait only till summer.

But this is not the whole story; there is the question of production. The UN Economic Survey of Asia and the Far East for 1964 is of the view that "Fundamentally the Indian food problem during the last decade was caused by the low level of production, which was below the demand and which tended to increase only just as far as the

rate of increase of demand, and by the large fluctuations in production which could not be offset by imports or by release of government stocks". Distribution, one might say, becomes a problem only if production is inadequate.

But what level of output would be adequate? The present level plus two million tons, five million tons, ten million tons? Who wants this additional produce? If it is the towns, the additional requirements can only be marginal. For the Survey estimates an increase of 2.5 million tons in the urban demand for food between 1951 and 1961 — a period in which production increased from 55 to 80 million tons. A tenth of the increase in output would have sufficed the towns, apparently.

Where did the additional output of food go? Partly to feed the additional population, which increased by over a quarter; partly to satisfy the demand of people who became better off. The Survey gives twice as much weight to the influence of population growth as to that of income rises; the effect was probably more equal in view of the low income elasticities the Survey assumes.

What do the agriculturists do with their additional incomes? The information the Survey gives is amazing. A rupee spent on agricultural goods generates only 12 paise of further demand, nine of which go to agricultural goods, one to food industry and one to mining and manufacturing. This is so amazing as to be incredible: if it were true, about the only use agriculturists made of additional incomes was to gorge themselves. Nevertheless, there is some truth in the picture: in particular, Indian farmers do not spend on services as Australian and Philippino

farmers do or on fertilisers as the Taiwanese farmers do.

The crux of the problem is, therefore, the high degree of auto-consumption in agriculture. As long as the preference of agriculture for its own goods remains so strong, an increase in agricultural output and incomes will increase the marketed surplus little. It follows that the solution of the problem of inflation lies in increasing agricultural taxation, compulsory procurement, provision of urban goods and services in rural areas and setting up industries (fertilisers is one of them) which generate little demand for agricultural good. In any case, increasing agricultural output will not by itself solve the problem.

New Look of Soviet Aid

FRESH ground has been covered in the strengthening of economic relations with the Soviet Union and Czechoslovakia. The Finance Minister who recently visited these countries has reported to the Parliament that they have agreed to examine, within the next few months, the feasibility of expanding economic and technical assistance for the Fourth Plan. The Soviet Union has agreed to give, and Czechoslovakia will consider giving, non-project aid on terms approximating those for project aid.

This represents a significant departure from Soviet policy hitherto. So far she had insisted that conventional 12-year loans would be confined to large public sector projects; for smaller public and eligible private projects they extended only deferred payment facilities which the Indian Government understandably restricted as far as possible within certain well defined categories. All non-project items, the Soviet bloc insisted,

THE ECONOMIC WEEKLY

should be looked after under bilateral trade agreements. The relaxation now envisaged would cover the maintenance requirements of Soviet-aided as well as other projects. A time limit has been set for completing the negotiations for additional project credit; the examination of technical feasibility and the availability of resources within the Soviet Union for determining the extent and direction of fresh aid would be completed by March next year. The amount and pattern of non-project assistance will be settled along with the new five-year trade agreement, negotiations for which will commence early next month.

In both Moscow and Prague the Finance Minister seems to have asked for financing of the entire foreign exchange component of assisted projects, especially Bokaro. Even before the position became critical, there was considerable difficulty in finding free foreign exchange to make up the deficiency in Soviet bloc credits. Completion of projects on schedule was held up in some cases and, of late, the taking up of new projects was ruled out till the entire foreign exchange cost of the project and of the ancillaries, which were to meet the portion kept aside for domestic procurement, was assured. This is what is intended in the request for additional facilities for Bokaro, the Korba aluminium plant and for the coking coal projects. Additional projects proposed to the Soviet Union are special steels and alloys, electronics, electrical stampings, mechanised farms, land reclamation and specialised post-graduate education and to Czechoslovakia plants for railway wheels and axles, cranes and structurals and machine tool accessories.

In over-all terms, the range though certainly not the magnitude of aid from the Soviet bloc is beginning to equal that from Western sources without losing its special emphasis on heavy industry. Aid for maintenance imports implies, moreover, that repayments on the earlier Soviet credits have been indirectly postponed.

States in the Red

IN formulating its credit policy for the busy season the Reserve Bank has reiterated that "the major objective of credit regulation must remain the maintenance of reasonable balance between aggregate money flows and the availability of real goods and services". This is its rationale for tightening the terms of refinancing of bank advances other than for defence, food and exports. There is, however, reason to sus-

pect that the Reserve Bank has not extended this rationale to its dealings with governments, particularly the State governments who have been getting themselves up to their ears in debt to it.

As on Friday, November 19, the Reserve Bank's advances to the States stood at Rs. 127.16 crores compared with Rs 39.56 crores on November 20 last year — or over three times as high! The State governments' borrowings have been steadily going up since March, in complete disregard of the Union Finance Minister's repeated injunctions to them to play their part in maintaining fiscal and monetary discipline. That something like this would be inevitable was foreshadowed in the States' budgets for 1965-66. It will be recalled that except for Rajasthan and Madhya Pradesh, none of the States proposed new taxation though practically every one of them had yawning deficits which totalled Rs 76.6 crores compared to Rs 39.7 crores in 1964-65 (revised estimates) and Rs 5.4 crores in 1963-64 (actuals).

A part of the increase in Reserve Bank loans to the States is likely to have been for food procurement and distribution, but how large a part one does not know. Similarly, how much of the borrowings are to be attributed to the demands, unforeseen at the time of the formulation of the State budgets, arising out of the war with Pakistan, is also not known. Nevertheless, one can be quite sure that not all, or even the bulk, of the State's borrowings from the Reserve Bank can be attributed to their activities in the priority sectors of defence and food. And what cannot be so attributed needs to be looked into critically in the context of the Reserve Bank's own ground rules about maintaining balance between money flows and real goods and services.

Not long ago the Centre had taken over a part of the overdrafts of some of the States in the hope that this would encourage them to mend their profligate ways, starting from a clean slate. Also, in the last few months the Union Finance Minister and the Deputy Chairman of the Planning Commission have gone round the States to impress on them the need to raise resources through fresh taxation and to exercise strict control over their expenditure. These efforts have clearly been in vain. Isn't it time that some sort of policy — a parallel credit policy — is formulated to regulate State governments' borrowings from the Re-

serve Bank? None obviously exists at present.

Without PL 480 Cotton

THE cotton textile industry is deeply concerned over T T Krishnamachari's statement at last week's meeting of the Parliament's Informal Consultative Committee attached to his Ministry that the Government wanted to stop altogether import of cotton under PL 480. The industry's anxiety is not surprising. The prospect of having to do without US cotton when there is going to be a serious shortfall in domestic supply due to the failure of the 1965-66 crop is indeed disturbing. Cotton imports under PL 480 have been very substantial in recent years. Out of the total volume of imports under PL 480 since September 1956 valued at Rs 1,444.2 crores, cotton has accounted for Rs 131.2 crores.

Imports of foreign cotton during the past six years — 1959-60 to 1964-65 — totalled 50.67 lakh bales, of which 21.87 lakh bales were accounted for by US cotton received under PL 480. Out of the 8.18 lakh bales of foreign cotton imported in 1964-65, PL 480 cotton accounted for 1.59 lakh bales and another 1.02 lakh bales were received from the US under barter agreements.

The 1965-66 cotton crop is expected to yield no more than 52 lakh bales, of which only 48/49 lakh bales will be available to the cotton mill industry, the rest being used for export and non-factory consumption. This will be far short of the normal requirements of the industry which consumed 56.12 lakh bales of indigenous cotton and 7.60 lakh bales of foreign cotton in the last season. Because of the tight foreign exchange position there is no hope of making good the shortfall in domestic production through larger non-PL 480 imports of foreign cotton: it is extremely doubtful whether these imports will be even maintained at the previous season's level. The gap between the industry's normal requirements and total availability of cotton will widen if imports of US cotton under PL 480 are stopped.

The PL 480 agreements stipulate the maintenance of normal imports of the commodity concerned from outside sources. It is possible that the Government is being obliged to stop or severely restrict import of cotton from the US as it is finding it difficult to maintain normal imports from other sources because of the foreign exchange situation. Or it might be that unable to persuade the US Government to provide sufficient aid under PL 480, New

To Keep Their Powder Dry GIVE-GIVE-GIVE

Cease fire is not cessation of hostilities. The threat is very much there.

Our valiant Jawans are still keeping vigil on our borders.

To keep our Jawans' morale up and powder dry, give all you can—with all your heart.

And keep on giving to the National Defence Fund—until the threat is eradicated.

Canara Bank's donation to the National Defence Fund so far exceeds Rs. 1,87,500/- and Canara Bank staff's donation is more than Rs. 37,000/-

Delhi has no choice but to cut out imports of less essential commodities and utilise as much of the available aid as possible for importing foodgrains.

The cotton mill industry's concern over any cut in the supply of foreign cotton is natural but this industry is not alone in having to suffer because of the restricted supply of imported raw materials. As a matter of fact, there is a section of opinion in the country which has always been critical of the huge sums of foreign exchange spent on import of cotton, particularly when the industry has been steadily losing ground in the international markets and its exports consist mostly of fabrics made out of indigenous cotton. The continued dependence of the industry on imported cotton when the country has the largest area under cotton in the world is a matter for concern. The Government and the industry must share the blame for not making the required effort to improve the yield of cotton which continues to be ridiculously low—around 100 to 120 lbs an acre, the lowest in the world. It is only very recently that the industry has started taking an interest in schemes for the development of cotton production.

Export Bills Credit Scheme

WITH the gradual tightening of Reserve Bank accommodation to banks, the problem of bank financing of exports has become an increasingly difficult one. The extension of the Bill Market Scheme in 1958 to cover usance export bills payable within 90 days did not, in spite of various relaxations introduced subsequently, prove to be of much value to the banks in securing additional resources.

The 1962 amendment of the Reserve Bank of India Act enabled the Reserve Bank to purchase and rediscount export bills maturing within 180 days and to lend to scheduled banks against eligible promissory notes arising out of export and maturing within 180 days. The introduction of Section 17(3A) authorised the Reserve Bank to make advances to scheduled banks against the security of their promissory notes repayable on demand and accompanied by their declaration of holdings of eligible usance export bills negotiated or discounted by them. The usance of the bills (which may be in rupees or foreign currencies) was not to exceed 180 days.

Effective from March 23, 1963 the Reserve Bank introduced the Export Bills Credit Scheme. Under the Bill Market Scheme the Reserve Bank

granted accommodation against demand promissory notes of banks accompanied by usance promissory notes drawn by exporters, involving a stamp charge of 0.2 per cent. The Export Bills Credit Scheme replaced the exporters' usance promissory notes by banks' declaration regarding their holdings of adequate usance export bills in their advance portfolio. Banks are granted Reserve Bank assistance at the Bank Rate provided they charge the exporter a rate not exceeding 1½ per cent per annum over the Bank Rate. All banks who are dealers in foreign exchange are eligible for refinance facility under this Scheme. Limits in respect of export bills are sanctioned for a period of one year from October 1 to September 30 of the following year.

According to figures published in the latest issue of the Reserve Bank of India Bulletin, the Export Bills Credit Scheme seems to have gained in popularity during the last two years. Between March 23 and September 30, 1963 limits sanctioned under the Scheme amounted to Rs 10.10 crores and advances were availed of by scheduled banks to the extent of Rs 5.21 crores. In the 1963-64 Bill Market year (i.e., October 1963-September 1964) assist-

ance aggregating to Rs 20.31 crores was availed of by the scheduled banks, and this figure went up to Rs 30.55 crores in 1964-65. The number of banks which availed of the refinancing facility also rose from 5 to 9 over the period.

It is worth noting, however, that out of the total utilisation of Rs 50.55 crores accommodation against bills in foreign currencies amounted to the trifling figure of Rs 1.28 crores in 1964-65, as against Rs 4.62 crores in 1963-64. This sharp decline underlines the reluctance of the banks to utilise the facilities offered by the Scheme in respect of foreign currency bills negotiated by them. The inference may be that the stipulation regarding charging a maximum interest of 1½ per cent over the Bank Rate makes the Scheme not remunerative enough to the borrowing banks who can obtain rediscounting facilities abroad and carry the advances earning better rates of interest. The fact that only 9 of more than 30 banks who are authorised exchange dealers have joined the Scheme also shows that the Scheme has far to go yet to achieve its objective, the rather substantial rise in the amount of refinancing notwithstanding.

LETTER TO EDITOR

British Attitude to the Indo-Pak War

I AM an Indian national living at present in Turkey. I have lived in various other countries including Britain and Australia for the past 16 years. Perhaps you may permit me to say a few words with reference to Stephen Hugh-Jones' article "British Attitude to the Indo-Pak War" in your issue of October 16, 1965.

We are committing a profound mistake in expressing our resentment at the British attitude in the manner we have done so far. We imagine that the British are influenced by our anger or resentment; on the other hand, it makes them happy. We must understand the inferiority complex from which the British are suffering since the end of the last World War. Financially bankrupt (they could not fight even a six days' war against Egypt in 1956 without causing a run on the sterling and a deficit of one thousand million pounds which was later on loaned to them by the US after the latter had forced a humiliating surrender on them), their main object after the War has been to create the illusion of still being considered a Great Power (hence their

interest in the Commonwealth). If they are the object of criticism and resentment from any quarter, they are happy because they feel they are somebody; only lack of criticism bothers them.

We can cut Britain down to size if we totally ignore her and exact reprisals, politically and economically, whenever feasible. If after calculating the balance of advantage and disadvantage we can strike at Britain economically (e.g. ending arms purchase on a permanent basis, etc) and thus set a precedent to other African and Commonwealth countries, then we may see Britain changing her tune. No doubt Britain will clothe its changed attitude in high principles as usual, but we won't quarrel with her so long as we get the substance. What matters to her (perhaps to some other countries as well) is not resentment but the actions we adopt towards her. It is high time India acted up to its size, population and resources.

Facing Up to Ian Smith

AS the Rhodesian situation relentlessly unfolds with the inevitability of a Greek tragedy, it is becoming increasingly obvious that the measures and tactics so far employed by Harold Wilson to deal with the situation will not be adequate to stop the rot and overthrow the rebellious Smith Government which, eleven days after its illegal seizure of power, has now overcome any lingering doubts and is increasingly confident of its ultimate success. There is no doubt that the manner in which the British Prime Minister made it quite clear that he would not contemplate the use of force, inevitably strengthened Ian Smith's conviction that in these circumstances he would be able to get away with Unilateral Declaration of Independence.

Crisis Helps Wilson

The most urgent question now is whether Wilson's strategy is going to pay off. On the face of it, his own standing in the U K has risen considerably with the latest *Daily Mail* opinion poll giving the Labour Party a lead of 18.5 per cent over the Conservatives, and this is undoubtedly a reflection of his handling of the Rhodesian crisis. The general impression is that Wilson has moved from being a mere Party leader to a national leader, unwilling to take military action against Britain's kith and kin in Rhodesia and yet determined to take every possible legal step to bring the rebellious Government to heel. But it is becoming more and more obvious that the measures so far taken are not by themselves sufficient, and disillusion is bound to creep in with its inevitable reaction on the opinion polls. At this rate, the struggle with the illegal Rhodesian Government will be a long drawn out one with little hope of an early settlement and with all the consequential bitterness which the existence of Smith's Government will bring to the African continent.

Wilson's gamble has been that as the sanctions imposed by Britain and now, as a result of the latest United Nations resolution, by the rest of the world, begin to bite, the unity behind Smith will break up and his party will be ousted, and there will be a new chance for Britain to set up a constitutional government in Rhodesia. This raises the whole question of how effective sanctions can, in practice,

turn out to be and whether, even with the United Nations' backing, they can be fully implemented in a way that will really hurt. It is in this connection that the argument that sanctions should not be punitive becomes really illogical. Surely what is wanted are sanctions that will work quickly and bite deeply, rather than long drawn out ineffectual sanctions which can only tend to increase bad feelings on both sides without achieving the object for which they were introduced.

A Showdown Inevitable

It is now beginning to look as if the bipartisan approach to Rhodesia will soon crumble because the Conservative Party has made it clear (as a result of severe pressure from its Right Wing) that it will not, necessarily, back "punitive sanctions". There have already been rumblings over the application of tobacco sanctions, and the imposition of oil sanctions is bound to bring violent opposition. At the same time, Wilson is being pressed very severely by his own Left Wing to take more effective action, more punitive sanctions, and indeed, not to rule out the use of force. It now seems possible that a showdown on Rhodesia between the two Parties cannot long be postponed. Heath will certainly have a difficult time preserving Conservative unity on this emotive subject. While Sir Alec Douglas Home, Maudling and Duncan Sandys have given a large measure of support to the Prime Minister, Heath has not been as unequivocal and downright in his statements on Rhodesia; so it still remains to be seen what the impact of Rhodesia will be on internal British politics.

Turning now to the question of sanctions, it must be admitted that even the most enthusiastic supporters of economic sanctions realise that it takes time to make them effective, and time is certainly not on the side of Wilson. Sanctions so far imposed will take some time to work, although theoretically Rhodesia with an economy heavily dependent on trade and financial relations with the outside world, and the Sterling Area in particular, is acutely vulnerable to economic sanctions. One-third of Rhodesia's national product is exported and more than two-thirds of her exports enjoyed Commonwealth preference. The table below shows

Rhodesia's main trading partners:

Per Cent of Total Exports to	
Zambia	25.8
U K	25.5
South Africa	7.5
West Germany	6.6
Japan	4.7
Malawi	4.7
USA	3.3
Others	21.9
Imports from	
UK	30.4
South Africa	24.3
USA	6.7
Zambia	4.9
Japan	4.0
West Germany	3.9
Malawi	1.4
Others	24.4

Tobacco and Sugar

Tobacco, on which a sanction has now been imposed, provided over one-quarter of Rhodesia's external earnings in 1964. Perhaps even more serious, it was the Rhodesian branches of London-based banks which provided nearly all the bank credit which financed local farmers, commerce and industry. How will the ban on tobacco and sugar affect Rhodesia? The country earns some £24 million from these two exports. The impact on tobacco cannot hope to take immediate effect, as the present crop has been sold and it will be many months before the next crop is up for sale. The position with regard to sugar is slightly different. Sugar is already in world surplus and Rhodesia will feel the pinch of having to sell at the world price of £18 a ton rather than the Commonwealth price of £47 a ton. Again, the American action in banning the import of this year's Rhodesian sugar quota will also hurt. 9,500 tons of Rhodesian sugar are already on the way to America, but these will now not be accepted. America also buys at a price higher than the world price—6.85 cents a lb as against the prevailing free market price of under 2 cents. As a result of the American ban, the Rhodesians now stand to lose almost \$1 million in sugar revenues.

So far, Rhodesia has been extremely sceptical over the whole question of economic sanctions, and even the United Nations resolution calling for oil sanctions has not affected the Ian

Smith Government, and indeed, with the exception of some of the more serious-minded businessmen, the general Rhodesian mood is excessively confident, particularly in view of the support promised to them by the South African Government which could make it difficult for sanctions to operate.

Zambia's Predicament

The United Nations resolution "calls on all States to do their utmost in order to break all economic relations with Southern Rhodesia, including an embargo on oil and petroleum products." The main supplier of oil to Rhodesia is Iran who will have to be asked to stop crude exports to Rhodesia which are only a minute fraction of her total exports. Most of Rhodesia's oil is processed at the refinery at Umtali which is owned by a number of international oil companies —

B P and Shell own 31 per cent and the bulk of the remainder is divided among Mobil, Caltex and other US companies. The refinery could be ordered to refine any crude oil it can get, even from sources other than its own parent company, under the threat of a possible Rhodesian takeover. Rhodesia already has a month's supply of oil, and has also arranged to obtain supplies from Portugal, and is, therefore, confident of being able to stand up to these sanctions. Moreover, Rhodesia only depends upon oil for one-quarter of her total energy needs, and with her Wankie coal and the Kariba hydro-electric power, industry could still carry on, and, of course, Rhodesia's trump card is the immediate impact that such sanctions would have on Zambia, particularly as Zambia is dependent on Rhodesia for Kariba power, Wankie coal, Umtali oil, and a

large proportion of her food and manufactured imports. In order to deal with the problem of Zambia, Malcolm McDonald, as Her Majesty's Government's special representative in East and Central Africa, is on his way to Lusaka. Norman Kipping, former Director-General of the Federation of British Industries, is also in Lusaka at the request of the British Government "to look generally at Zambia's economy". At the moment it therefore appears as if Zambia will have more to fear in the repercussions of sanctions than Rhodesia.

The logic of events seems to prove that nothing short armed intervention will really succeed in bringing down the rebel Government, and the sooner the British Government realises this and takes strong action, the better it will be.

De Gaulle's Rule By Referendum

(From 'a Correspondent)

EARLIER this month Georges Pompidou, the French Prime Minister, invited his cabinet to lunch for having set a record by staying in office longer than any other French Government in recent years. Till General de Gaulle ushered in the fifth Republic in 1958, Governments in post-war France rarely lasted more than nine months. Behind this new-found stability is the overshadowing figure of the General, rather than Gaullist trappings like the nuclear *force de frappe*. The General knows very well that without him, the future of Gaullism is in doubt. This partly explains his decision, announced on November 4, to run for re-election to the Presidency for another seven-year term. The 75-year old General is expected to win the election which is due to be held on December 5.

De Gaulle's decision to run for re-election is proof that his policies have not taken root in France and that he fears things will fall apart again in his absence. Here is a paradox — the man is accepted, but his policies are not, to the same extent at least. This is to be explained in terms of de Gaulle's special technique of power.

De Gaulle has abandoned Algeria; he has defied America, France's benefactor for many years; he has slammed the door of the EEC in the face of Britain; and he is spending record sums on defence now when France is not

at war. In all these controversial matters, de Gaulle has carried the nation with him. Any explanation of his strength in terms of the weakness of the French for military men and the General's war-time record as Resistance Leader are hardly adequate. They do not explain why General Salan was allowed to be tried as a common criminal, without much protest, except from the extremist SOA.

The real explanation has to be sought in de Gaulle's political skill. By his own Constitution the President is supposed to be "above the parties" and an "arbiter". But he has interpreted his constitutional position to suit himself. De Gaulle's "direct approach" to the people through the referendum, personal tours, the TV and the radio appearances and what is euphemistically termed as his "loud thinking", which is reported widely in the press, is the secret of his personal rule. Through these means he has managed to get his actions confirmed by the people.

He has used the referendum most effectively. He has resorted to it four times since he came to power in 1958. The first referendum, in October 1958, was to get his Constitution approved; the second, held in January 1961, was over the granting of self-determination for the Algerians; the third, in April 1962, was to approve the Algerian peace-terms; and the last, held in Oct-

ober 1962, was over the issue of popular Presidential elections. It is interesting to note in retrospect that the General who was called to power to save Algeria for France made the French confirm his decision to the contrary in two successive referendums.

De Gaulle has a knack of handling the referendums. Take the last one which approved the direct election of future Presidents: de Gaulle made full use of the State information media to deliver the message that he stands for order against the chaos that will be France's if they vote for the "unknown" as against the "known", meaning himself. Then there was the threat that unless the French electorate not only voted "yes" in the referendum, but did so by a massive margin "my task will be ended, immediately and irrevocably". "But if, as I hope, as I am sure, you answer me 'yes' once more, then I shall be confirmed by all of you in the burden I bear". If "the majority of 'yesses' is small, mediocre and uncertain", he would resign! As one of the political commentators said: "the threat has been made with such emphasis that a vote for or against the Constitutional changes is indeed a vote for or against de Gaulle. And although no one can foresee exactly what would happen should de Gaulle retire to Colombey-vote will be for de Gaulle and against Les-den Eglises, the odds are that the

the Government of the Fourth Republic". In the event 62 per cent of those who voted did vote "yes".

With his direct approach to the people, over the heads of the legislators, de Gaulle is trying to build a new form of democracy based on referendum. The device is not liked by the old politicians whom the General is trying to eliminate from effective power. According to the 1958 Constitution—drawn up under de Gaulle's own supervision—the President of the Republic does not govern, he arbitrates between Government and Parliament and inspires the broad lines of policy. Hence, the politicians argued, de Gaulle had no right to appear on television and announce a referendum. The correct procedure, they said, should have been for Pompidou, as Prime Minister, to submit the new proposal to Parliament and get a two-thirds majority for it, before consulting the electors.

Constitutional or otherwise, de Gaulle knew his trump cards. He knew that people would like to have a say in the election of the President instead of it being done by a college of 60,000 notables on their behalf. And he forms the crucial questions for the referendum with great care. As one writer put it:

"If a referendum is to be held tomorrow to decide whether France should have a nuclear deterrent the actual question would, I imagine, be phrased something like: 'Should General de Gaulle be given full power to raise your standard of living by 25 per cent during the next year and equip France with modern means of defence?'"

In the wake of the 1958 constitution two issues were prominently discussed among constitutional experts. On the first—the necessity of restoring the authority of the state—most were agreed. De Gaulle himself had said: "The French nation will flower again or perish, depending on whether the State has or has not the strength, steadfastness and prestige enough to direct it in the way it must take...". Michel Debre his Prime Minister from 1959 to 1962 echoed the same sentiments: "Because in France Government stability cannot result from making constitutional law, it must result from making constitutional rules, and it is just what gives this proposal its decisive explanation and its historic justification". Ministers and the Premier, but he cannot remove the latter and, despite his new powers he remains in his role as

arbiter, above political discussion. The Premier and the Government who determine and guide the policy of the nation are responsible for it only before the Assembly". De Gaulle decisively resolved this controversy. He unceremoniously dropped Debre and picked Pompidou to echo his policies.

As one commentator has pointed out, Gaullists have no policy—until de Gaulle announces them. With his referendum, his provincial tours, his T V appearances and radio talks de Gaulle approaches the people directly, by-passing the Parliament in the process. Should the legislature decide to obstruct him in carrying out his mission of restoring the grandeur of France, he will again appeal to the electorate. Characteristically, de Gaulle announced his decision to run for the Presidency in a radio-television address to the nation emphasising, above all, his service to France and France's greatness under his stewardship.

Yet there was controversy as to whether this authority of the State lies in the President or the Prime Minister. One expert said: "in our opinion, if the constitution is applied in the letter, the President of the Republic names the

BOOK REVIEW

Reform of the Educational System

Climbing a Wall of Glass: Aspects of Educational Reform in India Ed by J W Airan, T Barnabas, A B Shah: Manaktalas, Bombay, 1965; pp 176, Rs 14.00.

LIKE the food problem, educational reform is a subject that can be depended upon to appear unfailingly on every agenda. We know what is wrong. We know the answers. Reports and expert commissions have said them many times over and are still saying them. But as long as there is reluctance to face basic issues and take firm decisions can any real transformation ever come about? Such decisions are not likely to be taken when those who are in charge of our affairs find it convenient to side with those who have a stake in resisting change. In the meanwhile we will watch helplessly the explosion of numbers forcing out adjustments within the creaky old structure. The irresistible demand for education will not be denied.

Not a Matter of Minor Changes

After eighteen years a coherent national policy for a national system of education is nowhere in sight. Perhaps, the Education Commission on whom so much hope hangs, will provide us with one. It should, or it will too late. The time to have done this was at the dawn of independence when the mood was receptive to grand changes. What sense do our development plans make unless we know how and where our educational plans will fit it? The language issue is shelved repeatedly so that comfortable ambiguity on the medium of instruction saves us a lot of painful decision making. Till we decide once and for all through what language our children are going to be taught, how can the preparation of text books and instructional material on the scale needed ever get under way? If we do succeed in evolving a national plan how are we going to ensure its implementation by the State Governments? Have we agreed on the technical bias we are going to allow? These are not just details. Educational reform is not a matter of minor changes — "some alteration of the syllabus, some changes of method, some fresh statements of purpose, some reorientation of teaching personnel" as one of the contributors to the book open under review puts it. It implies change in fundamental attitudes. Let us first be clear on what it is that we want and expect our education system to achieve.

The present book is a collection of contributions to a symposium inspired

by the laudable objective of eliciting the views and opinions of eminent University men who have a deep interest in education. The papers, as befitting a symposium, cover a range of topics — the role of the university, the problems of higher education, the medium of instruction, the examination system, the relation between the State and university, etc. These are all valuable in themselves but one hoped for something that would have taken us nearer "a coherent and integrated educational plan" — about the need for which there is unanimous agreement. The papers have a general, airy, philosophical trend, and the authors by choosing to focus on higher education have not improved matters.

The dramatic title of the book is very appropriate in a sense not perhaps meant by the editors. It illustrates not so much the difficulty of implementing a programme of reconstruction as of evolving one. Not that very little is done, but a great many things have been done without any kind of consistent objective.

The book is disappointing not because the authors do not belong to the category of professional educators. As the preface asserts, education is the concern of all. (Ironically, almost all major educational reform has hitherto been inspired by eminent men outside the university departments of education). Nobody expected elaborate technical detail about educational practices from such a group, though a knowledge of improved educational practices among the public is essential if they are to co-operate sympathetically with the educators. Such knowledge does exist in the advanced countries. However, educating the parents as to what we are educating the child for can come only after we have settled the latter question first.

Education asserts A B Shah realistically, can achieve only some limited goals in a poor country like India but he loses his practical sense when he declares with poetic fervour that the universities should be thrown open to all and that the problem of numbers is a mere bogey and no conflict exists between quantity and quality. Instead one wishes he had pursued the hint he threw in the opening pages regarding the essential difficulty of educational

reform in a developing society. Let us stop blaming the "British system of education" that was imposed on us and which is supposed to have led to our eternal ruin. It is refreshing to find some one refusing to find solace in a scapegoat and willing to admit that the western system of education which brought in a modernizing influence and inspired social reforms in the nineteenth and early twentieth centuries, failed to liberate the Indian genius because India did not rise to meet the challenge of modernity.

Basic Dichotomy

If we find ourselves in an educational mire, the fault lies in the Indian situation. We are caught in a basic dichotomy — our sense of national identity is roused only through our tradition, while our educational efforts aimed at modernization hang rootless because the indigenous culture having given no shape to the objectives and producers of a coherent education system provide no roots from which the modernising can sprout. Without a meaningful correspondence to the sense of national identity, education cannot become a mass movement. We will continue to produce a few "Westernized individuals" rather than a genuinely "modern" society, to borrow J W Airan's phrase in the book. How can a modern educational system strike roots when the soil is clearly antithetical to modernization and rationality. P N Mathur's preoccupation with Eastern spiritualism, whose content he himself does not care to elaborate, is an excellent example of the neurotic fixation on the ancient past. We cannot both admire the cobweb and effect the spring cleaning.

The essence of the problem is that we are asking the educational system to perform a feat it has never performed before in history. Formal institutionalised educational agencies are by their nature followers, not leaders of social change. Schools have ever been the effective transmitters of tradition. They reflect the prevailing social values and attitudes and accommodate changes that take place in society. This has been the situation in the advanced countries. In a developing society we turn to education to provide us with an instrument for change and to assist in the difficult task of creating new values and attitudes. "These values have to

be realised in a social and economic context which requires that a process which took nearly three hundred years in the West should be telescoped in about one-tenth the period. Education in India has thus to function in a situation in which neither the cultural concomitants of a modern democracy nor the economic resources for its efficient working are yet available. In a society as status riven as the Indian, an egalitarian ideal is more easily written into the Constitution than translated into reality. Educational institutions can become the agency of change only when there exists an informed elite, passionate committed to progressive social change, which has the power and the willingness to use it for that purpose.

Fundamental institutional changes can be brought about only through political means. They can be achieved neither by a handful of dedicated people nor through the traditional machinery which has a built in mechanism to reject change. Any wonder, then, that we have a genius for reducing great reforms into administrative changes, as one author bemoans? Unless the political leadership implements a national educational plan committed to the ideals we have given ourselves in the Constitution, our educational machinery will faithfully reproduce the present pattern — viz that of educating a privileged few, alienated from their social milieu and having a stake in the *status quo*.

In this context, T A Earnabas and S K Huibe have in their paper on the "University and the Rural Community" given an illuminating example of how a meaningful relationship between the university and society can be forged. They describe the experiment conducted at Ahmednagar college in integrating the educated elite into the rural community. Their Rural Life Development and Research Project forms a part of the Social Science Department. The students participate in community development projects and simultaneously exploit the valuable scope field trips provide for enriching their sociological and economic studies. But one swallow does not make a summer.

Some of the other papers have some interesting suggestions. The functions of the university (which has in fact evolved into a multiversity) and the college must be reformulated, says one of them, making over to the college the task of providing the sense of participation in an intellectual community and the impact of modernity. Amlan Datta's

approach to the question of medium of instruction is persuasive. He would have us resign ourselves to a permanent bilinguism (regional language in the schools and English at the higher levels) and eliminate the Hindi-English controversy. Many would agree with him on the way the controversy has obscured real issues. H J Taylor deals with the examination system which he defines as "an instrument designed to reject at least half of any material presented to it". He pleads for a rational approach to the problem of measuring human attainments and recognition of education as "a technology which demands as such expertise as any other". Two papers discuss the importance of university autonomy and the creation of a corps of intellectuals, independent and free from any kind of external pressure. These will not emerge for the wishing. Some basic conditions have to be created and with that we come back to our starting point. The quality

of the product depends on the type of educational system we operate at all levels, and the objectives we seek.

Granted that the ultimate purpose of education is the development of every individuals' potentialities, it has, too, the mundane task of equipping each one with the necessary training and skills to earn a living. Not one of the papers have even casually noticed this aspect! What role is technical education going to play? The authors, all drawn from universities, understandably display a nostalgic attachment to the concept of the refined and cultured gentleman of leisure (though they take care to talk of social integration). Of the inescapable burden of education to train men for an industrialising, modernizing society they are significantly silent. Parents, too, certainly admire liberal education, but demand that first their boys get a job which will help them earn their bread!

India, Pakistan and the Englishman

Some Irreverent Thoughts

Libra

All over the world, says the author, the British are busy 'selling' Pakistan. It is not just that British newspapers and diplomats do it, but thousands of Englishmen wherever they have a chance to do so put in a good word for Pakistan and spread terminological and logical inexactitudes about 'the Hindus' by which they mean India.

This is a situation which Indian diplomats, mostly brought up in the 'gin and tonic' tradition, are rather diffident to tackle. It is time we took a lesson or two from countries, like the UAR, which do not suffer from the over-politeness and inferiority complex that afflict our diplomats when they deal with the British.

YESTERDAY while lunching at a restaurant in the capital city of a South-East Asian country, I was sitting within earshot of another table and could not help eavesdropping on some interesting conversation. At the other table was a group of about 10 people, all but one local officials military and civil—the one exception being a Englishman, obviously some kind of a functionary in a local military or a civil technical assistance job receiving an informal farewell from friends who were wine and dining him. After a couple of cocktails the Englishman became eloquent and started quite a talk on the India-Pakistan issue. The burden of his eloquence was simply this: "Kashmir" represented the one unfinished business of the British in India. Kashmir is predominantly Muslim, so it should have in all justice gone to Pakistan. But "Hindu" India grabbed it and is now bullying Pakistan to accept a *fait accompli*. The Hindus who pretend to democracy are against a plebiscite; and Pakistanis who are being libelled as undemocratic are asking for nothing more than self-determination!

A familiar stance—an all too familiar argument.

The story in that setting sounds so simple, so plausible. I have encountered this kind of scene in areas as wide as the British presence—in America, Asia, Africa, Latin America. I have heard myriad British throats selling Pakistan as they have taken to the denunciation of 'Hindu' India by innuendo and perversion of facts. It is not just that newspapers and diplomats do it, but thousands of little Englishmen wherever they have a chance to do so put in a good word for Pakistan and spread terminological and logical inexactitudes about "the Hindus" by which they mean India.

The little Englishman who has lost his colonies but not yet his colonial mind has an obsessive hatred of India and of the Hindus (may be an unconscious one) because these were the peo-

ple who spearheaded movements leading to the liquidation of the British Empire. He has a natural sympathy for the men who call themselves Pakistanis today because in his hour of peril in India they displayed their patriotism! by standing aloof from the freedom fight or even joining hands with the British reactionaries. The British never really liked the development of close relations between India and the USA.

The Americans, believe that it is the British who have thrust greatness on them before they were ready for it. With all their wealth and their fact-gathering capacity the Americans have an inferiority complex about their own diplomatic competence and their capacity to understand other people—especially the people of Asia. They saw a father image (perhaps I should say a mother image, the mom being the real boss in an American home!) in Winston Churchill and have a nervous apprehension of large power vacuums left behind by retiring imperialisms! They think they badly need some political and diplomatic crutches and they think that the British are such a crutch!

They have, therefore, developed special relations with the old lion of the United Kingdom even though it has lost most of its teeth and has grown thoroughly cynical with age. This special relation has cost the Americans dearly. In Europe it produced de Gaulle and in Asia it is losing them many friends but the Americans do not know how to run their responsibilities without the British uncle holding their hand in crisis situations. They look upon themselves as junior sheriffs unable to act without the old sheriff's guidance. In the UN, in Nato, in the World Bank and IMF, in SEATO, Cento and so on the two sheriffs sit and do business together. Not that they do not have their internal fights and jealousies (they are, indeed, countries which are so unlike each other in many ways) but in the presence of others they make up their little quarrels.

In this situation, the American dilemma is that even if America wants to build up an accord with "Hindu" India it is scared by the look of old Mother Hubbard who keeps nagging in the bedroom that Pakistan isn't all that lousy; that after all it has been a good mistress of all the western countries; that its flirtation with Mao is just the reflection of a love-hate complex, born of an excess of love for the west, which America has betrayed by too "speedy" rearmament of India; that the best way to deal with both these countries is the good old British remedy of starving them into submission; and that when this is not necessary anymore, Pakistan should be built up again by over-compensating aid so that the relative smallness of the country may be made up by the largeness of its equipment to help maintain a "balance" of power parity in the Indian ocean area. Otherwise "Hindu" India may interfere with the west's life-line to Australia and the Far East and Europe, and the British and the Americans will have trouble being sheriffs in this part of the world.

Old Mother Hubbard thought Pakistan should have submarines but was shocked when India asked for one, and wondered why non-violent India should have anything to do with submarines at all. She has been pulling uncle-Sam by the coat-tails to keep him away from giving wings and arms to India beyond the point that acutely displease Pakistan. A very influential British weekly once wrote a lengthy exhortation against India's foolish venture in buying submarines from Russia and ended with the silly sentence: "In any case, it is not good to do this because Pakistan won't like it". I am really serious; it said exactly that.

So the problem for us and for America is that that accord which is necessary is not so easy to achieve so long as uncle Sam maintains his special relation with Mother Hubbard. Our diplomats who are all junior lads brought

up mostly in the "gin and tonic" tradition hesitate to explain their aims with a punch. They are not much good in the language of the "Dry Martini" and "Bourbon on the Rocks" and endeavour to feed the diplomatic lions of Washington with tomato juice and peanuts. They, therefore, keep losing their way inside Mother Hubbard's diplomatic skirts and seldom does uncle Sam really get to see them or hear them except on matters of economic aid. (Both America and Mother Hubbard would want to give us aid so we may be available as a buffer between them and the devil across the Himalayas.) Our Embassy in Washington is still so small compared to the "teeming millions" in India House, London. So, you see, we have quite some problems with old Mother Hubbard who is gone, but still not quite gone either, and lingers over our life like the village ghost!

May be we should seek de Gaulle's advise and find out how he managed to get out of the tangles of Mother Hubbard's skirt! But, more seriously, in addition to striving hard for an accord with America, we should also:

Endeavour to see, if we cannot set-

tle the border problem with China on some realistic basis. Our people have never tried a real face to face confrontation with the Chinese who, like the old Chinaman selling silk in the streets, are given to playing a bluff game of bravado outwardly but may be more "willing" in a private chamber. After all, our longer-term interests in Asia are not terribly divergent once China gets moderated enough to co-exist which she well might do, if we also make an 'atom bomb.

Reach out without too much scruple over the heads of the Bhuttos and the Ayubs to the many frustrated and honest Pakistanis and try and build an accord with them. After all, blood is thicker than water and Pakistan will not forever be run by mad men. Let not hatred get so deep in us as to make rapprochement with the moderate moslems, of which there are many in Pakistan, impossible.

We should have some frequent heart to heart chats with Nasser and the Arabs. They know a thing or two about dealing with Mother Hubbard. They do not suffer from the overpoliteness and inferiority complex that haunts our dip-

lomats when they deal with the British. The King of Jordan, the British puppet, has been purchasing supersonic planes right and left even though Jordan hasn't money enough to feed itself. On matters like this President Nasser's intelligence and ours should collaborate to ascertain whether these are British inspired purchases to help Pakistan out.

In country after country Pakistan operates on the technique of the Big Lie and British diplomats, news services and newspaper chains obligingly circulate them with characteristic British discipline. We must make it clear in all countries time and time again in our diplomatic efforts that the British are not our friends where Indo-Pakistani problems are concerned. This is indeed necessary. We do our business with too much politeness towards British embassies in third countries.

But more than that we must establish efficient connections with non-British news services and spend some money on our All-India Radio. For the size of the country and its problems the radio's voice sounds feeble beyond description.

The Drugs and Pharmaceuticals Industry

Faulty Planning Cause of Raw Material Shortage

Ajoy Gupta

The present shortage of raw material faced by the drugs and pharmaceuticals industry is largely the result of the failure to plan for the development in time of a broad-based chemical industry.

For the engineering industry the foundation was properly laid with the development of the iron and steel industry. In the case of drugs and pharmaceuticals this was not done. The programme for manufacture of intermediate chemicals is hopelessly behind schedule and development of the petro-chemical industry is still at the planning stage.

THE pharmaceuticals and drugs industry in India has now reached a position from where it can be visualised that in the near future we shall be able to achieve an appreciable degree of self-sufficiency in the manufacture of essential drugs and medicines. Production has gone up many times since Independence. In 1947-48 production was hardly Rs 11 crores; in 1958 it reached Rs 54 crores; in 1961 Rs 85 crores and in 1962 Rs 100 crores. The estimated production in 1963 is about Rs 130 crores. The Third Plan target of production is Rs 175 crores, which in view of the rate of increase in the first three years of the Plan may be achieved.

Demand Estimates

The estimated demand for drugs and pharmaceuticals as visualised by the Perspective Planning Division of the Planning Commission is: 1965-66 — Rs 175 crores; 1970-71 — Rs 300 crores; and 1975-76 — Rs 400 crores. The estimated investment in the pharmaceutical industry today is about Rs 56 crores, of which Rs 38.6 crores is Indian capital and Rs 17.4 crores foreign capital. The investment target of the Third Plan is Rs 40 crores, including the private sector's share of Rs 10 crores. The present output of the industry virtually meets the needs of the country, since we do not import any medicines. The P P D's estimate of demand, i.e., Rs 300 crores in 1970-71 and Rs 400 crores in 1975-76 calls for quite a phenomenal rise in production from Rs 60 crores in 1960-61 to Rs 400 crores in 1975-76 — roughly an annual rate of increase of 38 per cent over 15 years. However, in view of the programmes in the field of health as well as the targets of improvement in standard of living and the consequent rise in health consciousness of the population, the demand targets are no more than modest as will be clear from the statistics quoted in the following paragraph.

India has at present one doctor (with a degree or diploma in modern medicine) for about 5,850 persons. How this

compares with the position in some other countries will be seen from Table 1. In 1961, when the population was 439 millions, we had about 75,000 doctors, comprising 41,000 medical graduates and 34,000 diploma-holders. In the Perspective Planning Division's report on the Fourth Plan it is envisaged that we should have 87,000 doctors by 1965-66, 1,13,000 doctors by 1970-71 and 1,75,000 doctors by 1975-76. The targets for qualified nurses are 58,000 by 1965-66, 1,16,000 by 1970-71 and 1,77,000 by 1975-76. The number of beds in public hospitals is expected to rise to 2,09,000 in 1965-66, 2,24,000 in 1970-71 and 5,20,000 by 1975-76. The P P D has provided for investment on health in the public sector at Rs 614.4 crores in the Fourth Plan. The recurring cost on health programmes is estimated at Rs 40 crores in 1965-66 and at Rs 149.5 crores in 1970-71. Taking into account a health programme of this order the estimate of demand for medicine at Rs 400 crores in 1975-76 is certainly not too high.

Enough Processing Capacity

The pharmaceutical industry has certain distinctive features not shared by other industries. First, it is not a basic industry, but is more or less entirely a finishing industry. The development of pharmaceutical production is dependent on other basic industries like the chemical industry, from which the drug industry draws its raw materials. Second, the pharmaceutical industry consists of two fairly distinct sections with different functions: (a) processing and formulation of drugs and pharmaceutical chemicals into dosage form for ready use; and (b) production of drugs and pharmaceutical chemicals from basic and intermediate chemicals or from natural, vegetable or animal sources.

Today we are almost self-sufficient in respect of processing capacity for all sorts of pharmaceutical preparations such as injections, tablets, oral preparations, ointments for topical application, etc. We also make the common

varieties of preventive medicines like seras, vaccines and anti-toxoids in sufficient quantity to meet the demand. In the field of pharmaceutical chemicals, we have made considerable headway in the last few years. Many of the important pharmaceutical chemicals are now manufactured in the country and manufacture of many others is under investigation. It is expected that we will achieve a degree of self-sufficiency in this line within a short period of time. The investment required for the expansion of the processing part of the pharmaceutical industry is much less than that required for the pharmaceutical chemical industry and it can be said with confidence that with some increase in the present installed capacity we shall be able to meet future demands for medicines. Moreover, much of the machinery and equipment required by the industry is now being manufactured in the country.

JWTGL 2614-2

Another aspect of the pharmaceutical industry is the need for strict quality control and a research-oriented pattern of development. Strict quality control is enforced by the Drug Control authorities and for this purpose up-to-date and well equipped quality control laboratories are absolutely essential. As for research-oriented development, medical research is perhaps the most active among research in all fields and every day new and improved drugs and remedies are being discovered for various ailments. A progressive pharmaceutical industry therefore has to keep itself abreast of new research and new developments because in many cases a popular drug becomes obsolete within a few years and has to be replaced by a new and more effective one.

At this point, however, it is necessary to mention that "research" and "development" in the pharmaceutical industry are often misinterpreted. Frequently the two expressions are used together and they have almost come to express a single broad process. Research and development are quite different and to present a correct picture the industry should indicate its efforts under either head separately. In practice, however, frequently items like planning, sales promotion, sales service, product development, market research and other non-technical activities are included under "research and development" in addition to basic and applied research conducted by research laboratories. True, all industrial or applied research is product or process oriented, yet it should be kept distinct from market development work which often costs very much more than research itself.

Small Units Have No Place

There are altogether 2,800 licensed units producing drugs and pharmaceuticals in India. Of these, only about 125 large units are licensed under the Industries Development and Regulation Act and come under the direct control of the Directorate General of Technical Development. The remaining units fall in the small scale industries category. To achieve the targets postulated for the Fourth Plan, there are two possible alternatives: (a) increase the production capacity of the large units; (b) issue licences to new manufactures. The smaller units have only a very limited role in the industry: they supply a limited market or manufacture only a few specialised items. Small units are not suited to large scale production of essential medicines and their mass distribution. The recent amend-

ment of the Drug Rules has stipulated certain manufacturing details as well as details of thorough standardisation and assay of the raw materials and finished products. To follow these rules properly it is necessary to have well-equipped chemical and pharmacological laboratories attached to production units. The smaller units cannot afford such laboratories. In fact, if the Drugs and Cosmetics Rules are enforced strictly and uniformly throughout the country, the very small manufacturing units will gradually cease to exist or will be forced to merge with other units. Also, administratively if too many small units are licensed it is difficult for the Drug Control authorities to check and supervise the quality of their output. The official policy in the pharmaceutical industry should aim at the enlargement of the large units and expansion of the relatively big ones among the small units to form economically and technically viable units.

The pharmaceutical industry like the

iron and steel and the fertiliser industries, is a mixed sector industry. The Government has established some factories in the public sector for manufacture of basic as well as finished pharmaceuticals. Notable among these are the Hindustan Antibiotics factory at Pimpri, near Poona, which manufactures penicillin, streptomycin and a few other antibiotics. There is a plan to manufacture vitamin B12 and vitamin C also at Pimpri. Three new pharmaceutical plants are being set up with Soviet collaboration in the public sector. These are the antibiotics factory at Rishikesh to manufacture all common antibiotics, including tetracycline; the factory for manufacture of synthetic drugs at Sanatnagar, Hyderabad; and the medical appliances and instruments factory at Madras. Hindustan Insecticides, which is also a public sector enterprise, manufactures DDT and BHC at plants in Delhi and Kerala. Manufacture of quinine and its salts has been, since its inception in 1860, carried on by the

Government. There are at present two factories—one at Mongpu in West Bengal and the other at Naduvattam in the Nilgiri Hills. With the increasing demand for quinine in the world market, these factories are being enlarged now to make available substantial quantities for export. Opium and opium products are manufactured at the Government factory at Gazipur. The Government has a monopoly in this field, opium being a narcotic drug. Most of the preventive medicines such as vaccines, seras and antitoxoids are also manufactured by Government and supplied to the public free for the prevention of epidemics. Some quantities of finished ready-to-use medicines are manufactured and distributed by the Government through their medical stores in Bombay and Madras. After meeting the internal demand, we export pharmaceutical goods worth about Re 1 crore.

Against the need for vast increase in production of pharmaceuticals and drugs, the problems facing the industry are also quite considerable. We are still dependent considerably on imported raw materials for drugs and pharmaceuticals. Imports are about 10 per cent of the value of production as is shown in Table 2. With the tightening of imports due to the shortage of foreign exchange, it has become very difficult for the industry to get supplies of these raw materials. Many pharmaceutical manufacturers have already taken up the manufacture of basic and pharmaceutical raw materials, but it will take some time to achieve complete self-sufficiency.

The targets of production for selected drugs and pharmaceuticals at the end of the Fourth Plan are given in Table 3. The present shortage of raw materials faced by the drugs and pharmaceuticals industry is to a large extent the result of the failure to plan for early development of a broad-based chemical industry. In the case of the engineering industry the foundations were soundly laid with the development of the indigenous iron and steel industry. In the case of drugs and pharmaceuticals this was not done. We had a plan of producing chemical intermediates in the public sector project of Hindustan Organic Chemicals at Panvel. But the whole plan has had to be reshaped and scheduled differently, which has set back the process of development of fine chemical industry in our country by years. The public sector project for manufacturing basic intermediates and drugs at Sanatnagar, Hyderabad, is also very much behind

schedule. The petro-chemical projects also need to be completed as early as possible to give a fillip to the basic and intermediate chemical industries. The time-scheduling and phasing of production programme is very important in

the chemical industry and even a slight imbalance can prove very costly in terms of avoidable imports of raw materials and outflow of foreign exchange for the finishing industries like drugs and pharmaceuticals.

Utility of the Futures Market in Cotton

M G Pavaskar

The futures market in cotton has been held responsible both for keeping cotton prices too low and thus denying farmers their rightful returns and for aggravating the rise in cotton prices. Surprisingly, neither allegation has been substantiated by evidence — statistical or other.

The examination of the utility of the futures market in cotton attempted below provides no evidence to support either allegation. On the contrary, the conclusion is that the closure of the market will, far from benefiting either cotton growers or consumers of cloth, only raise the cost of marketing cotton by denying the hedging facility to buyers and sellers.

DESPITE the long and chequered history of organised futures trading in this country, no business activity is so little understood and so largely misconceived as speculation on commodity exchanges. In the last few years, speculation has often been made a scapegoat for aggravating the rising trend of prices in many commodities. Thus, futures trading in gur came to be prohibited in early 1963, in gold and silver later in the same year and in rapeseed/mustardseed, groundnut and groundnut oil in June 1964. The expectations of the Government, however, were belied on all the three occasions, and the rise in prices in these commodities was not only not arrested but actually reinforced after the closer of the futures markets in them.

The futures markets in cotton have so far been spared this sad fate; but since last year they too have come under fire, albeit not for aggravating any rise in price of cotton but for preventing such rise and thereby denying the farmers their rightful return for the commodity they produce.¹ Doubts are also often expressed about the utility of the cotton futures markets, and occasionally, a section of the uninformed public have marched in procession demanding their closure. Amazingly, however, the various allegations against futures trading in cotton which have never been substantiated by any evidence—statistical or otherwise. It is, therefore, proposed to examine in this paper the utility of futures trading in cotton and its influence on ready prices with a view to assessing the real implications of such trading. The study has been confined to the futures market in cotton at Bombay as it happens to be the premier futures market in cotton in the country.²

Effectiveness of Hedging

The principal economic justification for establishment of futures market in any commodity is the need for hedging in it. Since commodity prices are continuously fluctuating, the risk in marketing commodities, especially those which involve considerable holding of stocks, is necessarily large. The buyers

and sellers of the commodity, therefore, enter into opposite sales and purchases in the futures market so that their loss in the one market due to adverse price change is offset by the gain in the other. Speculators, on the other hand, enter the futures market to absorb such hedge sales and purchases and in so far as they enable the buyers and sellers of physical commodity to transfer the risk of price fluctuations, they perform a useful economic function.

Curiously enough, no statistical data is available to indicate the extent of hedging activity in any futures market in this country. However, the need for hedging to the dealers and the stockists against either their forward purchases or stock accumulations, and to the processors and the mills against their forward sales of processed or finished goods can hardly be disputed. The risk of price fluctuations which different market functionaries face in the course of their trade is very much real even under conditions of short supply, and any step which seeks to avoid or reduce such risk is readily welcomed by them. The use of any futures market for the purpose of hedging can, therefore, be assumed if the futures contract traded therein is really an effective medium of hedging.

The hedging efficiency of any futures contract like the efficiency of any other business act depends upon the comparative relationship between the returns thereof and the costs therefor. A merchant would hedge his commitments in the futures market so long as the marginal 'net' return anticipated from hedging is more than the marginal cost of such hedging. The cost of hedging includes such fixed sums as brokerage, stamp duty, interest on margin deposits, etc. These are small in all organised futures markets. In the cotton futures market at Bombay, such charges altogether account for less than one-fourth of one per cent of the value of cotton to be hedged. An important element of cost, however, is the difference between the bid and the asked price in the futures market at the time of placing and lifting the hedge. This

difference varies directly with the volume of actual hedge and inversely with the volume of activity or turnover in the futures market. Such difference is large when the market is narrow and transactions are few, but is very small in more active and liquid markets. The cotton futures market at Bombay can claim to have a very high degree of liquidity, since the average daily turnover in it during the active marketing months is in the neighbourhood of one lakh bales or more. Hedgers can, therefore, place and lift their hedges with almost nil or little difference in the bid and the asked prices. So, normally, the total cost of hedging in the cotton futures market at Bombay would scarcely exceed one-fourth of one per cent of the spot price of cotton.

The anticipated return from hedging depends upon the extent to which hedging reduces the risk of losses in the ready market. A study³ of profits and losses from hedging in the cotton futures market for the six seasons viz, 1953-54, 1954-55, 1956-57, 1957-58, 1958-59 and 1962-63⁴ gave the results shown in Table 1 for hypothetical hedges of one and two month duration.⁵

During these six seasons, the long-basis hedgers (ie, those who hold stocks or make forward purchases for delivery and sell in the futures market) met with losses in the ready market on 55 per cent of the occasions on stocks carried for one month and on 66 per cent of the occasions on stocks carried for two months. Their average loss during these occasions on one month's holdings of stocks was Rs 24.65 per candy and on two month's holdings was Rs 36.12. Hedging reduced their loss on an average by 41 and 30 per cent respectively. As their average loss in the ready market was found to be about 3 and 4 per cent of the average value of cotton (carried for one and two months respectively), the net return from hedging was around 1½ and 1¼ per cent of such value which was obviously well above the cost of hedging estimated at one fourth of one per cent.

As against these hedges with losses in the ready market must be set the

hedges with gains in the ready market. During the six seasons, the long-basis hedgers earned profits in the ready market on their stocks or forward purchases on 45 and 34 per cent of the occasions of one and two month duration respectively. But hedging was unprofitable on these occasions as not only they lost their gains in the process of hedging, but incurred fresh losses amounting to about 1 and 1½ per cent of the value of cotton hedged. If account is taken of the profits in the ready market which would have accrued to them had they not hedged in the future market, the 'net' average loss to the long-basis hedgers on these was almost 6 and 8 per cent of the value of cotton hedged for one and two months respectively. On all the hedges (with both profits as well as losses in the ready market) therefore, the 'net' average return to the long-basis hedgers was found to be negative being approximately (—) 1 per cent. On the other hand, since losses to the long-basis hedgers are necessarily gains to the short-basis hedgers (i.e., those who buy in the futures market against their forward sales for delivery), the net average return from hedging to such short-basis hedgers was found to be positive by one per cent of the value of cotton purchased in the future market. In conclusion, therefore, it may be stated that while the cotton futures contract at Bombay provided adequate hedging protection to the short-basis hedgers (like mills and those merchants who make forward sales of cotton to mills on delivery contracts), it discouraged indiscriminate long-basis hedging on the part of cotton merchants and stockists.

However, though the average 'net' return from hedging to the long-basis hedgers was negative, it should be recognised that in the actual practice of hedging, it is futile to rely solely on such average 'net' return for assessing the expected return from hedging. The empirical validity of the average 'net' return derived on the basis of uniform hypothetical hedges is based on two assumptions, neither of which are true in the real world. Firstly, it assumes that the total volume of stocks held by the trade is always the same throughout the year. In fact, however, the unsold stocks with the trade vary from time to time, and the incidence of hedging losses is infrequent when stocks to be hedged are large. This is so because large stocks have always a bearish influence on the futures price of a commodity. Secondly, the concept of average 'net' return assumes that

hedges are placed and lifted indiscriminately without taking any view of the market. But in practice, hedges are always discretionary and selective, and are placed only when the stocks are large and the market is expected to move adversely to the detriment of the hedger. Though, the price expectations of hedgers may, at times, prove wrong, they are often correct, especially when the size of the cotton crop is known, for prices are then wholly determined by the trend in the mill demand for cotton and imports which can be estimated with a fair degree of accuracy. The more intelligent among the cotton merchants and stockists, therefore, do make effective use of the futures market from time to time for hedging their stocks or forward purchases particularly when they expect fall in the ready price of cotton. Thus, during 1963-64 season, the total tenders of cotton against the futures contract at Bombay amounted to over 45,000 bales. These large deliveries (which could not have been issued by pure speculators) comprising different varieties of cotton tendered at various upcountry centres illustrates the use of the futures market by the dealers and the stockists even at times when ready prices rule at ceiling.

Influence on Ready Prices

Although most of the critics of futures markets readily concede their utility for the purpose of hedging, they

nevertheless denounce such markets mainly because of their supposed adverse influence on the behaviour of ready prices. Thus, it is generally believed that since the futures price of cotton is quoted at a backwardation,⁶ the futures market imports a considerable bearish influence on the ready price of cotton. This belief is based on the oft-repeated assumption that future price is the expected spot price during the delivery month of the futures contract. A lower cotton futures price is, therefore, interpreted to imply that the consensus of market operators believes that the ready price of cotton is likely to decline till the delivery month. As such expectation discourages holding of large stocks, it is feared that the cotton futures market exports a bearish influence on the ready price of cotton.

This fear, however, is entirely unfounded. As commonly supposed, the backwardation in the cotton futures price is not the outcome of bearish market expectations, but is the compound result of many complex factors such as the broad-based nature of the cotton futures contract, the convenience yield on unsold cotton stocks, the system of fixing tendering differences at EICA, etc. For the purpose of this paper, it is scarcely necessary to discuss these various factors; suffice it to note that market expectations do not play any significant role in the discounting of the cotton futures price. Besides,

Table 1: Gains and Losses in Ready and Futures Markets to Long-Basis Hedgers
(Gains and losses are in Rs per candy of 355.616 kg)

The symbol that counts in every industry

from the data presented in Table 2 it may at once be realised that the lower cotton futures price does not precipitate any unloading of cotton stocks as expected; but, on the other hand, trade and industry generally accumulate stocks as the futures contract progresses towards its maturity. Evidently, the cotton futures market does not have any depressing influence on the ready price of cotton.

The question that may then arise is: Does the cotton futures market aggravate the rising trend in ready cotton prices? It is true that the futures price of cotton rises relative to the ready price over the length of a futures contract. But this rise is merely a technical corrective to the large backwardation that is witnessed in futures price at the commencement of trading in each delivery, and could not be termed as a price aggravating influence. Such rise in futures price is expected because the futures market must reach the level of the ready market before the futures contract eventually goes off the board. In so far as the cotton futures market follows this expected behaviour, the cotton futures price does not appear to influence the level of the ready price, but is itself influenced by the latter.

It should, nevertheless, be recognised that, at times, in a future market, some of the unscrupulous operators do attempt to manipulate prices through speculative excesses especially when deliverable supplies are scarce. But thanks to the vigilance and the regulatory curbs imposed by the Forward Markets Commission, such opportuni-

ties for manipulation are now few in all commodity futures markets. Moreover, in the cotton futures market, the fact that many varieties of cotton could be tendered against the futures contract itself deters the operators from accumulating heavy 'long' positions. Besides, the effect of all manipulative activities is necessarily short-lived and is generally restricted to only the delivery month. In fact, for last several years, the total outstanding business in the cotton futures market has rarely exceeded even 2 lakh bales and is usually less than one lakh bales when the futures contract enters its delivery period. In a commodity with an average crop of over 50 lakh bales (of which over 80 per cent is tenderable against the futures contract), such small outstanding business can hardly make any serious dent in the price level particularly when at no time the unsold cotton stocks in the country are less than 7 to 8 lakh bales.

As against its supposed adverse influence on the ready price, there is some reason to believe that the cotton futures market may have partly reduced the seasonal variations in the ready price. A recent study of seasonal variations in wholesale prices of certain commodities¹ indicates that the seasonal amplitude of wholesale prices (i.e. difference between maximum and minimum of seasonal indices) in commodities like cotton and raw jute which are served by well-knit futures markets is much smaller than in major food crops like rice and wheat which have no organised futures mar-

kets. In fact, amongst the individual commodities, the average seasonal amplitude of wholesale prices for the period from 1951-52 to 1964-65 was the lowest for raw cotton, being only 4.2 per cent. It is further significant that the actual seasonal band in cotton prices has steadily narrowed over the last 14 years from 4.5 per cent during the period from 1951-52 to 1955-56 to 3.7 per cent for the period from 1961-62 to 1964-65. Although several factors, besides futures trading in cotton, may account for the narrow seasonal swing in cotton prices, the available data clearly indicates that the functioning of the cotton futures market has in no way heightened the seasonal variations in cotton prices as is often alleged. Evidently, the conflicting suppositions that the cotton futures market functions against the interests of either the cotton growers or the mills are scarcely well founded.

Conclusion

As a hedging medium, the cotton futures market at Bombay offers adequate protection to all short-basis hedgers. The long-basis hedgers also receive some protection, provided their hedging is selective and discretionary. On the other hand, as commonly supposed, the futures market does not appear to have any bearish influence on the ready price of cotton and therefore can have no adverse impact on the price received by the farmers. There is also no evidence to indicate that the cotton futures market has aggravated the rising trend in ready prices during the last few seasons. Demonstrably, therefore, none can gainsay that the closure of the cotton futures market would, far from benefiting either the cotton growers or the consumers of cloth, only tend to swell the cost of marketing cotton through denial of hedging facility to the different market functionaries whenever such facility is needed by them.

Notes

¹ The Government of Maharashtra appointed last year a Study Group on Forward Markets in Cotton with M B Ghatge as Chairman to enquire into these allegations against the cotton futures markets. The report of the study group is still awaited.

² Besides Bombay, futures trading in cotton is at present also conducted at Ahmedabad; but the activity there is much smaller than that at Bombay. The futures market in cotton at Akola is inactive.

Table 2: Average Cotton Stocks at Bombay at the Beginning of Each month and the Average Backwardation in Cotton Futures Price for the Period from 1953-54 to 1963-64

Month	March Deliveries		May Deliveries		August Deliveries

* Expressed as percentage of the average ready price of the basis variety.

@ The average stocks for the same months differ from delivery to delivery because averages for each delivery do not represent the same years, but represent only those years in which the respective deliveries were actually traded.

³ The detailed report on hedging efficiency of the cotton futures market is at present under preparation in the Forward Markets Research Unit of the Department of Economics, University of Bombay. The data presented in Table 1 has been drawn from the said study.

⁴ The other intervening five seasons, viz, 1955-56, 1959-60, 1960-61, 1961-62 and 1963-64 were excluded because throughout these seasons or over a major part of them, either there was no futures trading or the ready prices ruled consistently unchanged at the prescribed ceilings. It is recognised that the need for hedging does not cease even if the ready prices consistently rule at ceilings. But such periods were excluded as cotton used to be then unofficially traded at premiums for which no accurate and reliable data is available.

⁵ For the purpose of the study, it was assumed that (i) all hedges are placed and removed in the same delivery, (ii) all hedging is done in the nearest delivery, (iii) all hedges are placed and removed at the closing futures prices of every trading day and the ready transactions which are sought to be hedged are likewise entered in to at the official rates of the same day, and (iv) all hedging is done in cotton of only basic variety. While the gain or loss in the futures market was worked out by calculating the actual difference between the two futures prices (one at the time of placing the hedge and the other at the time of lifting the hedge), the gain or loss in the ready market was estimated after making an appropriate adjustment for approximate carrying costs (i.e., cost of storage, insurance, etc) in the difference between the two corresponding ready prices.

⁶ A futures price is said to be at a 'backwardation' when it is below the corresponding ready price of the basis variety of the futures contract. In the converse case, it is said to be ruling at a 'contango'.

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

LIONEL EDWARDS (PRIVATE) LIMITED

FROM THE CHAIR

The National Newsprint and Paper Mills Ltd

Nepanagar

Speech by the Chairman Sir A Ramaswami Mudaliar

THE following is the speech of Sir A Ramaswami Mudaliar, K C S I, DCL (Oxon), Chairman of the Company, who could not be present at the Annual General Meeting. The speech prepared by him was read out by Shri S N Mehta, I.C.S., a Director of the Company, who was elected as Chairman of the Meeting held at Nepanagar, on the 22nd November 1965.

Gentlemen

I have great pleasure in extending to you a cordial welcome to the 18th Annual General Meeting of the Shareholders of the National Newsprint & Paper Mills Ltd. The Directors' Report, the Balance Sheet and the Audited Accounts for the year ended 31st March 1965, have been in your hands for some time and with your permission I shall take them as read.

I must once more apologise for my inability to be present at this meeting and to exchange greetings with you personally, but as I stated on an earlier occasion, it is due to my inability to undertake a somewhat arduous rail journey.

Production and Quality of Newsprint

Last year we were able to congratulate the Management on achieving the target of production and in fact exceeding it slightly by 78 tonnes. In the year under review, the production was slightly less than the 30,000 tonnes target. This is explained by the fact that the Mill was shut down for overhauling and necessary repairs for a period of 15 days, while in the previous year it was only closed for a period of 5 days.

The quality of the newsprint has steadily increased. Its tensile strength is better and it is hoped that with the utilisation of proper raw material and adequate quantity of chemicals, the quality may be further improved. I must, however, point out that the defect in the quality which is often emphasised by users is relative and if we compare our production with the Japanese newsprint rather than with Norwegian, Swedish or Finnish newsprint, it is not inferior in any manner. However, accustomed as we are

to high quality newsprint for a number of years, it will be the aim of the Managing Director and the technical staff to produce newsprint of a quality which will not be far inferior to that which the country has been accustomed to in the past.

Financial Results

As the Directors' Report states, the Company made a profit of Rs 65,54,440 after deducting Depreciation and Development Rebate Reserve.

For the year ended 31st March 1964, the Depreciation on plant and machinery was assessed on a sixteen years life and on the straight line method. During the year under review, there was a triple-shift working and according to Section 205 of the Companies Act, the life of additions to plant and machinery was reassessed on a fourteen years basis and the total Depreciation was thereafter arrived at.

Your Directors suggest that a sum of Rs 11 lakhs may be transferred to the General Reserve and a dividend of six per cent subject to tax may be disbursed on all equity shares for the year ended 31st March 1965. This would leave a small balance to be carried forward. As the Directors' Report points out, the cost of raw materials, of power and of wages have all gone up during the year and it is only through more efficient and economic management that the aforesaid financial results have been possible.

Caustic Chlorine Plant

In my speech last year I stated that the Caustic Soda Chlorine Plant which was then under construction may go into production and the Company would be in a position to avail itself of the production in the year under review. Though the Plant was ready for commissioning, as anticipated, it could not be commissioned for want of power. The necessary power was only released from 1st July and I am glad to state that from the very first day of operation, the Plant is running smoothly. However, the Plant could not obtain full production as the full extent of power

needed has not yet been made available.

Expansion

I referred last year to the expansion programme which was being considered by the Board and which had received the approval of the Governments concerned. Further progress has been made during the year and since the conclusion of the financial year, the expansion programme designed to increase the capacity of the Nepa Mills from 30,000 to 75,000 tonnes was approved by the Government. An order for a 125 tonne paper machine along with stock preparation plant and finishing equipment has also been placed with the well-known Finish firm, Messrs Wartsila, and it is hoped that this paper machine will go into production in the year 1967.

Negotiations are in progress for a semi-chemical pulping plant of 90 tonnes capacity and for the extension of bamboo chemical pulping plant. These extensions and the greater capacity production would likely need a much greater quantity of water than is now available and accordingly the project for a new waterworks has also been finalised. Negotiations are also afoot for the installation of a new 100 tonne recovery boiler along with black liquor evaporators and extension of causticising plant.

It is hoped that all these negotiations will be finalised as soon as possible.

Raw Material Committee

The great hesitation that the Board felt in 1963-64 when it was considering a plan to increase the production of the output in the Mill, was due to its concern about availability of the necessary kind of raw material and in adequate quantity. The Board itself, through its technical officers carried on the investigation but were not quite satisfied with the results of the investigation. Ultimately the matter was referred to the Government of India and a Committee was set up by the Government under the Chairmanship of my colleague,

Dr A Seetharamiah, to examine the availability of raw materials required for doubling the capacity of Nepa Mills. This Committee consisting of Experts in the field came to the conclusion that there was enough salai to meet the full requirements of the factory even after expansion for a period of 20-22 years, and there was never any question of the excess quantity of bamboo not being available. The Committee has also recommended the raising of plantations of Eucalyptus in Madhya Pradesh, so that the Mill may be adequately supplied with this raw material in future years also, and I am happy to say that the Madhya Pradesh Government is actually engaged in raising this plantation.

Industrial Truce

I referred last year with some satisfaction to the Truce Agreement which was signed on 11th November 1963, with the Nepa Mills Employees Union, an Agreement which was accepted would last for a period of three years. The Agreement was, however, denounced after the lapse of a year under a power exercised according to a local act of the Madhya Pradesh Government. I do not suggest that in the economic conditions prevailing in the country today, an employer could take advantage of an Agreement signed some time back, ignoring the increasing disadvantage caused by inflation and by rise in prices, but I feel that these adjustments could have been made without denouncing unilaterally an Agreement solemnly arrived at, even though justified by a legal enactment. The case of the workers and staff is being examined by the Board, and I trust a happy solution will be found so that normal and cordial relations will continue to prevail.

Public Projects and Government

By an order promulgated by the Government of India, Ministry of Finance, Department of Co-ordination, dated 6th April 1965, it is proposed to set up a Bureau of Public Enterprises in accordance with a recommendation made by the 52nd Report of the Estimates Committee of Parliament. The Committee had suggested the desirability among other things, of having a centralised co-ordination unit within Government to act as a service and evaluation centre. This centre will function with the hope of integrating and strengthening the present arrangements for co-

ordinating and examining the technical, economic and financial aspects of the projects and the working of enterprises. I welcome the setting up of such a Bureau of Public Enterprises, and as the Government order says, it will provide a central point of reference and consultation and also deal with matters of general interest, like personnel policies, training programmes, project planning, and economical, social and financial policies. A central unit of this kind, will, in my opinion, assist the Board of Directors of Public Sector companies in dealing with problems of management personnel, project expansion etc. It should also be recognised at the same time, and I hope it will by all concerned, both management and staff and workers, that it will curtail to some extent and in some direction the independent function of the Board on matters such as those mentioned above and to the extent that this is recognised by all parties. To that extent will the success of the co-ordination unit be ensured.

Thanks

I am not indulging in the language of convention when I state that my work as Chairman has been greatly facilitated by the help and advice which my colleagues on the Board of Directors, representatives of Government of India and of the Madhya Pradesh Government, have given constantly and I must express my very sincere thanks for such advice and for the continued interest that they have taken in the working of this Company. I must also express my thanks to the Representatives of

THE ECONOMIC WEEKLY

the private shareholders who have been assiduous in attendance at the meetings of the Board and have taken a long range view of the prospects of the Company and its utility to the Country. The Managing Director, Mr Kothari, has spared neither time nor trouble in coping with the work of the Factory along with his assistant from the factory site, but more than that he has had heavy duties and responsibilities in preparing the project report in negotiating with the various plant and machinery manufacturers, in facilitating the general progress of the existing units and in expediting the establishment of the units which are yet to come. Mr Singhanian the Deputy General Manager has been of very real help on the commercial side of the management; assisted as they have been by Mr Swamy the Finance Officer. To all three of them I would like to express publicly my real appreciation and my thanks for their devoted service and for the help they have given me. I should not forget to mention the faithful and loyal service of all the officers, the Assistant Works Manager for their help and co-operation in achieving the results that we had. To the workers in particular, I must express my appreciation of their co-operation and their responsible attitude in spite of the difficult times I have referred to and I trust that the happy relations which have generally existed throughout the period will continue for the prosperity of the Newsprint Mill, for the benefit of their country and ultimately for their own benefit also.

AROUND BOMBAY MARKETS

Downward Drift Continues

DALAL STREET last week was forced to beat a further retreat under pressure of tired bull liquidation though the bears were by no means altogether reserved. The turnover was poor and interest was extremely selective with a few popular counters accounting for the bulk of business. Intermittent short covering and some replacement buying failed to produce any noticeable rally and Tuesday's closing prices for most shares were only slightly above the week's lowest levels.

That the stock market should continue to present a picture of gloom is scarcely surprising. President Radhakrishnan, Prime Minister Shastri, Deputy Chairman of the Planning Commission and the Union Finance Minister Krishnamachari have all made gloomy forecasts about the economic prospect. It might well be that a sense of crisis is being created in order to mobilise national will and resources for meeting the requirements of defence and development. But there seems little doubt that the economic prospect is really distributing.

There are already clear signs of a slackening of the industrial tempo. Industrial production is bound to suffer seriously as a result of acute shortage of various essential raw materials and components on account of insufficient allocation of foreign exchange. The shortage of foodgrains and the shortfall in production of other agricultural commodities have aggravated inflationary pressures on the economy. The response to the gold bonds and defence loans has been so poor that a heavy dose of additional taxation is inevitable. Some of the States have already made known their proposals for additional taxes. And taxation is one thing which the stock market dreads the most.

Distributing as it is, the economic prospect is rendered even more obscure by political uncertainties. The Indo-Pakistani crisis could flare up any time; the implications of the uneasy truce with frequent violations of the cease-fire are serious enough. The Chinese troops also continue to make trouble on the Sikkim border.

The announcement of the eagerly awaited credit policy for the current busy season has failed to please the market. Selective liberalisation of credit for defence, export and food is welcomed but the stock market has a

much bigger stake in what might be termed as the non-priority sector and credit for this sector is likely to become costlier.

Since equity prices have suffered quite a steep decline recently and there have also been reports of a fair amount of distress selling, it is quite possible that the market might take a pause for necessary technical adjustments. But the market is likely to encounter considerable difficulty in pushing its way up in face of political uncertainties and the deteriorating economic situation. Several shares appear to be standing at fairly attractive levels but the general market psychology is not conducive to the revival of investors' confidence.

COTTON

Distribution Control

COTTON prices have eased further by about Rs 10 to Rs 15 per candy and for the first time in many weeks the hedge contract (Virnar March) has been marked down below Rs 900 per 2 quintals — the contract touched a low of Rs 898 on November 23. Political uncertainties, financial stringency, increased pace of arrivals, restricted mill buying due to accumulation of huge stocks of both cloth and yarn and introduction of distribution control — all these factors have contributed in various degree to the recent setback in cotton prices.

Despite the recent setback, cotton prices continue to be well above the previous season's ceilings. In the circumstances, far from being a cause for anxiety the fall in prices should be welcomed. The easier tendency in prices does not reflect any improvement in the overall supply position of cotton. The 1965-66 crop is estimated at no more than 52 lakh bales which is nearly 4 lakh bales less than the actual consumption of indigenous cotton in the previous season. There is little hope of making good this deficit through larger imports. In fact, it is extremely unlikely that the country will be able to import as much cotton as it did in the 1964-65 season when actual arrivals of foreign cotton totalled 8.18 lakh bales.

It is now fairly obvious that the textile industry will experience acute shortage of cotton in the current season. The Textile Commissioner's decision to introduce control over the dis-

tribution is essential in order to ensure a steady flow of supplies to the textile industry at reasonable prices.

Under the distribution control scheme, mills can buy and/or take delivery of Indian cotton up to the end of December not more than 25 per cent of the total consumption of indigenous cotton during the previous season. And the additional quantity which the mills can buy during the next four months, January 1 to April 30, is not to exceed 35 per cent of the total consumption of Indian cotton during 1964-65.

Mills situated in Bombay and Ahmedabad currently having stock of (either in their possession or held by other license holders on their behalf) Indian cotton exceeding a quantity equal to 15 per cent of their previous year's consumption will not be permitted to purchase or take delivery of any further quantity of Indian cotton until their present stocks are reduced to a level below this limit. In the case of mills situated at places other than Bombay and Ahmedabad this restriction shall apply if their current stocks exceed 25 per cent of their previous year's consumption of Indian cotton. Those mills which are unable to utilise their quotas for the period September 1 to December 31 owing to the limitation imposed on the total stocks will be allowed to carry forward such unutilised quantities in the next period.

Staggering of purchases by mills and restrictions on their stocks help to keep cotton prices under check. But the supply position of cotton being what it is, industry, trade and growers will have to observe strict self-discipline in order to keep prices within the statutory ceilings throughout the season. Not too much need be made of the recent decline in cotton prices from their record high levels which, in a number of cases, were above the statutory ceiling prices.

OILSEEDS

Prices Ease Further

OILSEEDS prices suffered a further setback last week, the decline being more marked in groundnut and cottonseed than in linseed and castorseed. Groundnut ready has come down by about Rs 13 per quintal from its highest level reached some ten days earlier and cottonseed is down by about Rs 11 per quintal. Groundnut oil which

had been marked down from Rs 37.50 to Rs 34.25 in the preceding week has eased further to Rs 32.40 (per 10 kgs). Linseed oil has declined to Rs 29.50 from Rs 32 less than a fortnight ago. Castor oil (Commercial) has eased from Rs 24.25 to Rs 21.75. Groundnut expeller cake has declined by about Rs 25 per tonne. Oilseeds futures have eased in sympathy with the setback in the spot material. Cottonseed January is down from Rs 75 to Rs 65.50, castor April from Rs 112 to Rs 104.25 and linseed April from Rs 130 to Rs 122.50.

The decline in prices is steep but the rise had been even more steep. The fall is an inevitable correction of the preceding runaway rise. Lest one gets the impression that oilseeds prices have suffered some serious decline, it is necessary to point out that despite the recent setback, oilseeds prices are around the highest levels reached in the preceding season. Since edible oils constitute a necessity in the daily life of the common man, the decline in prices is to be greatly welcomed. Unfortunately, the supply position of edible oils being what it is—the major groundnut crop has failed and the outlook for rabi crop is not very encouraging—it is quite likely that the recent corrective phases in the oilseeds market may prove to be a short-lived affair.

While the current decline in prices is essentially in the nature of a technical correction of the preceding steep rise, the reactionary trend has been accelerated by the increased pressure of arrivals of groundnut crop in the terminal markets. The prevailing high prices, financial stringency and political uncertainty have induced farmers and up-country merchants to rush with the

marketing of the produce. The recent setback in prices is not due to any upward revision of the groundnut crop estimates. But the recent rains in Uttar Pradesh, Punjab and Madras are believed to have improved the prospects for the rabi crops of mustardseed, linseed and castorseed. Market sentiment last week was influenced to some extent by the Maharashtra Government's decision to restrict the movement of cottonseed and cottonseed oilcake from the State; this has caused a sharp setback in cottonseed prices.

It is difficult to say how oilseeds prices might behave in the near future. This is particularly because of the uncertainty about the attitude of various State Governments in regard to the movement of goods outside their boundaries. A move is already underway for banning the export of groundnut and groundnut oil outside Andhra Pradesh which consumes nearly 2 lakh tonnes of groundnuts as against its production of 4.5 to 5 lakh tonnes. Restrictions on the movement of oilseeds and oil from one State to another have distorted the supply and demand equation and it is virtually impossible to take a proper view of the trend of prices.

Reports from New Delhi suggest that the Government is now having second thoughts on the question of oilcake exports. Earlier reports had hinted at the possibility of oilcake exports being banned in order to conserve supplies for cattle feeding. The Government has given up this idea and exports will continue to be freely allowed as at present. Export houses reported fairly good business in groundnut extractions last week. Communist countries were men-

tioned as the main buyers.

MONEY AND BANKING

Unseasonal Slackness

CREDIT conditions in the Bombay short-term money market were comfortable during the major part of the week to November 24. On the last day of the week the market eased slightly due to a rise in supply. Despite the commencement of the busy season, activity in the market is far from satisfactory. Supply of funds showed marked improvement with large amounts left unemployed at the end of each business day. Due to the slackness in business activity during the past few weeks demand for funds has dwindled. The rate was $4\frac{1}{2}$ per cent till November 24; on that day it fell by $\frac{1}{2}$ per cent.

Scheduled banks' deposits declined from Rs 2819.50 crores to Rs 2811.57 crores during the week to November 12. Credit granted by banks, however, increased by Rs 10.86 crores to Rs 2023.20 crores, thus raising the deposit-credit ratio from 71.37 per cent to 71.96 per cent. To meet the increased demand for credit, banks reduced cash in hand by Rs 24 lakhs to Rs 69.14 crores, balances with the Reserve Bank by Rs 2.51 crores to Rs 101.06 crores, and investments in government securities by Rs 2.32 crores to Rs 857.67 crores. Borrowings from the Reserve Bank were lower as well by Rs 1.35 crores at Rs 2.29 crores.

Active notes during the week to November 19 declined by Rs 2.82 crores to Rs 2661.48 crores, according to the lat-

est statements of affairs of the Reserve Bank. There was a decline in notes held with the Banking department by Rs 77 lakhs to Rs 13.33 crores and in total notes issued by Rs 14.60 crores to Rs 2674.81 crores. Foreign securities remained unchanged at Rs 72.63 crores while balances held abroad increased marginally by Rs 31 lakhs to Rs 12.17 crores. Deposits of the Central Government increased substantially by Rs 26.73

BUSINESS NOTES

Scindia Steam Navigation

SHIPPING has quite rightly been regarded as a second line of defence, but if our shipping is to play this role effectively, we must ensure its development in a planned manner. The expansion of our tonnage since independence has indeed been striking, but it has not yet enabled us to achieve our objective of carrying a fair percentage of our overseas trade in national ships. Dharamsey M Khatau, Chairman, Scindia Steam Navigation Company, is of the view that future expansion should be so planned that we are able not only to carry 50 per cent of bulk cargo in our own ships, but also to reserve the liner trade increasingly for carriage in our ships. During the present conflict with Pakistan, Indian cargoes worth crores of rupees have been either seized by Pakistan, or have had to be landed at neutral ports. Such loss and inconvenience could be avoided if the expansion of our tonnage in future is planned wisely so as to cover the carriage of both bulk cargoes as also of liner trade.

In his annual statement circulated to shareholders, Khatau has pointed to the various handicaps suffered by the Indian shipping industry and has made some useful suggestions. He says that one of the major difficulties is to find foreign exchange for the purchase and building of ships, old and new, for overseas and coastal services. Particularly, coastal operators wishing to replace or augment their tonnage are faced with an additional handicap because coastal shipping cannot earn foreign exchange. Indian shipowners have, of necessity, to purchase such second-hand ships as are available, and they cannot prescribe what the age of the secondhand ship under offer should be. The benefit of development rebate on ships, new or secondhand, was halved to 20 per cent from April 1964. Later on it was raised to 30 per cent in res-

crores to Rs 79.19 crores. State government deposits were lower from Rs 7.25 crores to Rs 6.52 crores. Loans and advances to Governments increased by Rs 9.97 crores to Rs 127.16 crores. Deposits of scheduled banks were better by Rs 30 crores at Rs 104.44 crores. Advances to scheduled banks rose by Rs 10 lakhs to Rs 2.42 crores and investments increased from Rs 192.80 crores to Rs 212.52 crores.

pect of secondhand ships which are not more than seven years old. Khatau has suggested the restoration of the original position as existed before April 1964.

In regard to the trade with U.S. he has urged the Government of India to secure for Indian shipping lines the continuance of the privilege of equal participation in the movement of 'Aid' cargoes to India. Khatau feels that American shipping circles are pressing their Government to revise the present policy with a view to reserving upto 100 per cent of such cargo for American flag vessels. He has also suggested that whenever bilateral trade agreements are negotiated with other countries, the question of utilising Indian shipping services on a 50:50 basis should be insisted upon.

Khatau has pleaded for the setting up of a suitable machinery for keeping under constant observation the variations in the cost of operating coastal shipping. He has pointed out that coastal freight rates continue to be uneconomic despite the increase of 10 per cent allowed from August last. Not only does the increase fall short of what the industry had asked for, but as the Government took a long time to arrive at its decision the cost of operations have gone up still further. The increase in the excise duty on fuel oil, for instance, from Rs 32 to Rs 72 has alone neutralised nearly half of the sanctioned increase in freight rates.

Khatau visualises a difficult period ahead for Scindia Steam. In the present conflict, Pakistan seized two of the company's good ships, one of which was an overseas liner. This loss will affect not only cargo-cum-passenger services but also services in the overseas trades. The country's economy has worsened owing to the conflict with Pakistan, and more severe restrictions have had to be imposed on imports.

The U.K., our biggest market abroad, has imposed a surcharge on imports resulting in a significant decline in the trade between the two countries. The trade between India and the U.S. also has become virtually stagnant; the position can further worsen if the foreign exchange facilities hitherto extended to India are drastically curtailed or even not decided upon on a firm basis for some months to come.

The financial results for the year to June last are rather unimpressive: the total income is up from Rs 17.65 crores to Rs 18.77 crores and after-tax earnings a shade better at Rs 1.13 crores (Rs 1.12 crores). With development rebate requiring Rs 115 lakhs (Rs 97.5 lakhs), there is a deficit of Rs 2.48 lakhs compared to a surplus of Rs 14.46 lakhs in the preceding year, necessitating a bigger withdrawal of Rs 75 lakhs (Rs 50 lakhs) from reserves for payment of the dividend of Rs 1.25 a share. Obviously, the continuous rise in operating costs and delays at ports in India and abroad, which increased almost by 100 per cent over the previous year, have together affected the results.

Waterfall Estates

ALTHOUGH the South Indian tea crop has not been quite satisfactory, the total production in the country has exceeded the 364 million kgs, the target fixed for the Third Plan. Exports during last year amounted to over 227.5 million kgs valued at Rs 126.96 crores, showing an appreciable increase in export earnings over the preceding year. In the first seven months of the current year, exports totalled 51.1 million kgs compared with 45.1 million kgs in the corresponding period in 1964. For the Fourth Plan, a production target of 455 million kgs has been fixed. But unless measures like expansion and replanting are implemented in full, it may not be impossible to produce the targeted quantity.

Owing to inadequate rains, the coffee was a little below expectations last year but prospects for coffee in the export market have been quite favourable in that coffee has continued to fetch satisfactory prices. The Chairman of the Coffee Board has expressed the view that this trend is likely to continue during the next five years. The average Indian crop being about 60,000 tonnes, i.e., about two per cent of the world production, it should not be difficult for us to market it abroad at good prices. The planters intend to

**WE ARE ALL INDIANS...
LET NONE DIVIDE US**

DA 0-1-65

press for a much higher quota for export than the 21,600 tonnes given by the International Coffee Council.

Considering these factors, D C Kothari, Chairman, Waterfall Estate, visualises a good future for the plantation industry. In his annual statement circulated to shareholders, Kothari has expressed the view that given the proper incentive and facilities, the industry will fare even better in the coming years than heretofore.

In the financial year ended June last, Waterfall's sales of tea and coffee fetched Rs 43.53 lakhs and Rs 24.42 lakhs against Rs 41.32 lakhs and Rs 17.95 lakhs, respectively, and its net profit increased to Rs 9.52 lakhs from the previous level of Rs 5.57 lakhs, after making higher provisions for depreciation, taxation and development rebate reserve. Of this, the usual dividend on preference shares and dividend at the rate of 12.5 per cent on the equity capital together demanded Rs 6.23 lakhs.

Indian Detonators

A LETTER of intent has been received by Indian Detonators for an annual production of 15,000 tonnes of cartridged NG explosives and NCN explosives. The company is negotiating with Hercules Powder of the US for collaboration in this high explosive project. Meanwhile, the detonating fuse plant is expected to go into production in early 1966. The company began first stage manufacture in December 1964 with the production of certain components and assembling of aluminium electric detonators with imported filled shells. The factory has already reached a capacity of 40,000 per day on a single-shift basis. It is proposed to start a second shift to achieve the rated capacity for the first stage.

During the year to June last, the company's sales were slightly higher at Rs 1.14 crores (Rs 1.13 crores), but after-tax profits showed a fair improvement, rising from Rs 3.08 lakhs to Rs 4.86 lakhs. Of this, Rs 0.23 lakh have been utilised to write off share issue expenses and Rs 2.03 lakhs for allocation to development rebate reserve. A sum of Rs 2.94 lakhs is ploughed back. No dividend has been proposed, considering the company's heavy loan commitments and the prevailing uncertain conditions, even though the disposable profits are enough to maintain, if not to raise, the dividend even on the enhanced capital.

Chas Pfizer

PFIZER has grown into a many-faceted organisation operating in a

variety of chemical-based industries — pharmaceuticals, chemicals, agricultural products, fragrances, cosmetics, toiletries and a great variety of other products. As part of work at Pfizer, there is constant study, research, probing, and planning in every area of the company's activity. The company has always been in the forefront in the battle against disease. In India, it has planned to make its contribution in the areas of national health, agriculture, chemical industry, exports, etc, thereby supporting the development of our nation's economy.

Chas Pfizer and Co had the best year in its history in 1964. Not only did it produce and sell more products and render greater service to more people than ever before, but it also achieved the highest sales and highest earnings in its 116-year history. It increased dividend payments to share owners to a new high. The company's customers — including pharmacies and hospitals, farm and livestock owners, governments, industrial plants and retail stores in more than 100 countries — purchased an all-time record volume of Pfizer products totalling \$480.1 million, about 15 per cent more than in 1963. Net earnings rose to \$44.7 million, an increase of about 10 per cent. This represents an unbroken record of increased earnings now spanning 12 years. Although more shares were outstanding in 1964 than in the previous year, the per-share earnings rose to \$2.27 last year compared with \$2.08 in 1963. Moreover, share owners in 1964 received larger dividends — \$1.15 a share, compared with \$1.05 in 1963 — to maintain a record of increased dividend payments in all but one of the past 14 years.

Morarjee Goculdas

HIGHER sales and earnings have been reported by Morarjee Goculdas Spinning and Weaving Company in the year to June 1965, despite all-round rise in costs. Sales of cloth, yarn and waste fetched Rs 8.21 crores (Rs 7.65 crores) and gross profit amounted to Rs 59.14 lakhs (Rs 50.16 lakhs). After making necessary provisions for depreciation and taxation, after-tax earnings have more than doubled to Rs 16.44 lakhs (Rs 7.54 lakhs). But the improvement is more than wiped off, since additional provision for bonus for 1963 has syphoned off Rs 7 lakhs (nil) and development rebate reserve Rs 6 lakhs (Rs 2.10 lakhs). The remaining surplus of Rs 3.44 lakhs is transferred to general re-

serve out of which are to be paid the proposed dividends on equity shares at Rs 15 per share and at the usual rate on preference capital, together requiring Rs 8.87 lakhs (Rs 11.46 lakhs). Last year, Rs 14.83 lakhs were withdrawn from reserves because the third shift depreciation for 1962-63 necessitated provision of Rs 11.52 lakhs.

Hingir-Rampur Coal

HINGIR-RAMPUR Coal has installed all the equipment imported under the World Bank Loan and has completed the project for the reopening of No 5 pit. But the output of this pit is restricted to about 5,000 tonnes per month, against the rated capacity of 10,000-12,000 tonnes per month, due to difficulties in selling its output. Further development work is being hampered owing to the acute shortage of underground cables and cement. During the year ended June 1965, output totalled 1.96 lakh tonnes compared with 1.89 lakh tonnes previously, and sales brought in Rs 49.81 lakhs against Rs 46.38 lakhs. After providing for depreciation, taxation and development rebate reserve, however, the net profit is lower at Rs 1.69 lakhs (Rs 2.56 lakhs). The dividend is maintained at 10 per cent, absorbing Rs 1.20 lakhs.

Shah Construction

FOR obtaining exclusive licence for whole of India for exploitation of the French Patent called "Puits Developpe a Drain Rayonnants", Shah Construction has entered into an agreement with its inventor, Monsieur Paul Clausse. The arrangements for import of the Pile Driving equipment to be supplied by a Paris firm are completed, and the equipment will be shipped in January next. The company has secured an additional import licence for about Rs 18 lakhs for construction equipments from the US and France out of a Rs 28 lakh foreign exchange loan made available by I F C.

The financial results for the year to June 1965 are fairly impressive, with work bills rising from Rs 1.88 crores to Rs 2.01 crores and gross earnings from Rs 17.39 lakhs to Rs 23.09 lakhs. Even after setting aside considerably more for the necessary provisions, equity earnings stand higher at Rs 5.59 lakhs compared to the previous year's Rs 4.30 lakhs. Dividend, raised by a point to Rs 11 a share, requires Rs 5.50 lakhs (Rs 4.25 lakhs).

* The production statistics relate to six 'A-Class' units only. Hence the index based on their production has been inflated by the ratio of production of all units in 1961 to production of six 'A-Class' units in that year.

! Due to non-availability of production data, July 1965 figure has been repeated.

Johnson's Talking Points

AS the Prime Minister negotiates the time table and agenda for his pilgrimages, first to Tashkent and then Washington or in the reverse order, President Johnson's talking points with Ayub and Shastri have been aired with Texan bluntness. There must be lasting peace in the sub-continent and effective common awareness of the danger to South Asia from "Chinese expansionism". If these are not forthcoming, there will be no economic aid from US nor, for that matter, from any member of the aid consortia for India and Pakistan. And military aid would be ruled out, of course. USSR shares the objective of peace on the sub-continent openly and perhaps the other one furtively but considers it politic to use aid as a carrot only.

India has desired lasting peace since partition. The late Prime Minister made a no-war offer to Pakistan many years back; the offer stands. Nothing would please and help us more than a demilitarised open border like that between US and Canada. This requires, as has been stressed for long and as Shastri has emphasised again, a desire or at least an effort on Pakistan's part to live in amity and co-operation with a neighbour who cannot help being bigger and stronger. It also requires—and this we have not always discerned with equal understanding—a convincing effort on our part to soothe the prickly emotions of Pakistan on the major issues which embitter her relations with us. Of these, to state the obvious, Kashmir is one. The recent conflict has demonstrated that, in spite of its great fighting potential, Pakistan cannot measure up to India's strength; she has no chance of wresting Kashmir from India by military or diplomatic force. At the same time, it is clear that a settlement on Kashmir, which is mutually acceptable to India and Pakistan, is one of the necessary conditions for peace and orderly development in the sub-continent. The vast difference between the nature and foundations of the two governments notwithstanding, the settlement has to be one which would meet the minimum demands of the majority of people in both countries.

The acceptance of this principle by the two governments would itself represent considerable progress. Signs of such acceptance are not completely absent. Ayub has agreed to discuss Indo-Pakistan problems in the whole perspective in Tashkent. Various formulas have appeared in the Indian press to re-arrange boundaries and administrative set-ups in such a way as to reconcile local demands and Pakistani feelings without allowing secession of Jammu and Kashmir. Merger of Jammu in Himachal, and retention of Ladakh as a Union territory, and grant of special autonomy to Kashmir Valley would, it is true, be a reorganisation somewhat different from that carried out in the rest of the country. The pace is being forced by international pressures, but local pressures in this direction are also not to be ignored.

In spite of her warmth for China, Pakistan, too, is aware of the limitations of a Rawalpindi-Peking entente and of the limited benefits it can bring her. Disengagement and a working peace, followed up with rapid economic growth, are the best guarantee which the sub-continent has against being dragged into the US-China-Russia power struggle. Assistance from the US and the Soviet Union, while necessary for growth has, therefore, its price which cannot be altogether escaped. President Johnson is naturally anxious to involve India and Pakistan in Viet Nam where, mercifully, some hopes of negotiations have emerged in the last few days. India is interested in the integrity and stability of her neighbours, but given our commitments on the northern borders, the Government's firm desire to maintain good relations with USSR and our consistent opposition to the use of troops on foreign soil, no active involvement can be visualised for us even by the US; Pakistan, on the contrary, as a founding and continuing member of SEATO, is less well placed to side-step US pressure. But, present economic difficulties notwithstanding, as a big power in the region and as the second largest Asian contributor to the Asian Development Bank, India has an important role, to be played firmly and independently, once a semblance of peace returns to the region.

Cracking under Pressure

SOME 6,000 'badli' workers have been retrenched from the textile industry in Bombay. Another 14,000 have been laid off in the Vidarbha area with eight mills closing down. This is disturbing. It is not improved efficiency and economics that have led to this action. It might be the less efficient mills that have been forced to take this course, but the factors that led to it may, unless tackled on a longer term basis, adversely affect even the existing soundness and growth prospects of the industry.

Retrenchment, moreover, is humanly painful, and appears legitimate by welfare standards of employer responsibility only if resorted to after every other principle of good shop-floor and financial management has been employed. What pressures have induced the mills to retrench and lay off? Have they fulfilled all the other criteria of efficient management before taking this step?

Stocks with the textile industry have been accumulating over the past few months. Stocks of cloth have increased from 2.62 lakhs bales of 1,500 yards each in January 1964 and 2.50 lakhs in June 1964 to 3.32 lakhs in January 1965 and 4.62 lakhs in September 1965. The accumulation, the result of consumer resistance with the inflationary rise in the cost of living, is expensive to carry with the increased cost of borrowing. Apparently, this burden is increased by the fact that wholesalers themselves are prepared to carry smaller stocks owing to the expensiveness of working capital.

Meanwhile, with the steep rises in the cost of living index, the average dearness allowance per worker per month has also been escalating, especially since the re-adjustment in the Consumer Price Index Series for the working class in Bombay. The index number for January 1964 shot up by 29 points. The average monthly D A for the industry meanwhile has risen from Rs 96 in 1963 to Rs 123 in the first six months of 1965, and to Rs 134 in October this year.

Just now stocks are once again beginning to move — a tendency which generally coincides with the end of the accounting year. But this is a short-term phenomenon. The increased cost burden of carrying stocks and of la-

bour is a more persistent problem, connected with the tendencies in the rest of the economy as well as with the inherent problems of the industry. It is on the latter that the industry itself can most fruitfully concentrate. The Millowners Association has in the meantime issued a notice of change in the method of computing dearness allowance that might mitigate the financial burden of the industry. This has still to be settled by conciliation under the BIR Act. Of course, just as mills, as commercial ventures, cannot be expected to be run as part of an unemployment relief scheme, it follows that any *ad hoc* cut and freeze in the D A cannot be expected for them. This, incidentally, was done by the Model Mills which for six years has been run as a State-owned unemployment relief venture. The mills has reduced its D A by Rs 1.03 and frozen it at that level.

There are, nevertheless, various fronts on which the mills can tackle their labour costs and strengthen their financial viability. One of the oldest industries in the country, the textile industry has generally had a comfortable indigenous market, not always conducive to efficiency. It is now badly in need of modernisation. Out of 187 composite mills only 48 are relatively well equipped, producing and increasingly exporting quality textiles; 60 others can produce quality goods and could export to a much greater extent.

However, modernisation can hardly go very far without efficient handling of the new equipment. And much effort is needed here to train workers. We have, for instance, too many men per loom. Studies by the U.S. Department of Commerce and the U.K. Cotton Board reveal that the productivity of a Japanese worker is twice that of the Indian worker, that of the U.K. worker is 60 per cent higher, and that of the U.S. worker is 4½ times that of the Indian worker. With such low productivity, our labour cost per unit of production is comparatively much higher, and the rising D A has merely accentuated this basic burden. The industry is thus labour-intensive and the share of the wage bill in the value added by manufacture is 58.09 per cent, next only to railway locomotives and rolling stock and jute textiles.

Again, while wage levels in Japan are high, the Japanese industry reportedly achieves a lot of short-term flexibility in its total wage burden by the employment of large numbers of sub-contractors and casual workers during extreme prosperity. The effective cost of such contracts is roughly half that of permanent employees. This advantage is additional to the Japanese industry's higher labour productivity. By comparison, in the Indian industry 88.4 per cent of the workers are permanent, 6.2 per cent temporary, 5.1 per cent 'badli', and 0.2 per cent casual.

On the labour front itself, therefore, there are at least two tasks to perform. One is the improvement and training of workers through the founding of training institutes along the lines suggested by the Joshi Committee this year. Possibly the ICMF could formulate a sustained training programme for its members. And secondly, various methods of introducing labour flexibility might be explored by individual mills with the help of the ICMF and its more efficient members. This might be best introduced as part of any programme for rationalization or modernization. Rising wage levels may not seem such a burden if productivity could be simultaneously improved.

But labour is only one of the fields of better management. There are several others. Concomitantly, a hard-hitting commercial policy through inventory control, planned cotton purchases, better financial management, better methods organization, and a competitive sales policy might reduce some of the weight of working capital, stocks-carrying, and higher cotton costs. There are several units within the industry itself from whose experience and performance the industry can learn many useful lessons.

Scrounging for Metals

WHEN the Government recently decided not to continue protection to the non-ferrous metals industry beyond December 1965, it was in effect recognizing that the present conditions have made a merely formal point of protection. As it pointed out, the new levies and higher rates of import duty make 'protection' irrelevant. There is another reason. The acute shortage of foreign exchange, entailing drastic import cuts, itself ensures *de facto* protection.

What should be worrying us at the moment is not the need for protection, but the overall shortage of the metals. The Scarce Industrial Materials (Control) Order which was reformulated following the emergency to regulate the supply, distribution, and consumption of non-ferrous metals such as copper, lead, zinc and tin, has merely accentuated the problem of shortage immediately by freezing stocks. But it is the acute underlying shortage, which necessitated the Order itself, that poses the serious long-term threat.

This overall shortage had already been reflected in the soaring prices last September. Copper ingot prices had shot up by Rs 300 to Rs 680 per 50 kg, and lead prices by Rs 200 to Rs 500 per 100 kg. The buoyancy of world demand and the fresh levies were only partly responsible for this. The new defence needs and the freezing of stocks have had their impact on the industries using these scarce metals. HSL, and battery and tube manufacturers are facing idle capacity. Of course, as the Tariff Commission has recommended, the non-ferrous metals industry can do much in the way of improving its selling and distribution network. This might reduce somewhat the hardship of the actual users who are hit by the shortage and have to pay prohibitively high prices for their supplies. But this procedural expedient, though important and fortifiable by Government help and inspection, can at best be a stop-gap arrangement. The shortage itself will have to be tackled, and the sooner the better, since so many vital engineering industries and insecticide plants require these metals.

Today we spend around Rs 50 crores every year on the imports of these metals, and imports have been static

for some years now at 200,000 tonnes per year. Since the current indigenous industrial demand stands at 514,000 tonnes per year, imports satisfy less than 50 per cent of this demand. By 1970-71, given the new defence needs and the industrial expansion programmes, this demand will rise to around 888,000 tonnes. Indigenous production is comparatively negligible. In the early sixties indigenous copper accounted for about one-eighth of our total industrial consumption of copper. Since exchange allocations are going to remain curtailed—and Government has been quite firm on this—there is no alternative to increasing production.

The crash programme for geological surveys for minerals and for a planned expansion of the non-ferrous metals industry is in this context most welcome. The programme is to have an outlay of Rs 250 crores and is expected to increase the indigenous supply by 400 per cent. For too long now various projects for the production of metals such as copper and zinc have been in an embryonic stage, and the Third Plan has made little progress on them. The Geological Survey of India has asked for an increase in its strength from 1,400 to 2,000 during the next five years. If training of officers and technologists will take time, one hopes that there will be no stinting on the import of geologists and prospecting officers.

The additional copper is to be produced by expanding the production of the Indian Copper Corporation and by developing new projects at Khetri, Rakhra, Darico and Kolihaan. Khetri will get French assistance and Rakhra Soviet assistance. For zinc, the Zawar mine producing zinc concentrates is to be taken over by the Government from the Metal Corporation of India, and the Government hopes to expedite the smelter project for the mine. In Visakhapatnam too, Government has plans to set up a unit to operate on imported concentrates with Polish assistance.

There are other short-term possibilities too. Most of our non-ferrous metals have been imported till now free foreign exchange sources, mainly the U.S., Canada, West European countries, the Congo and Malaysia. There is a case now for intensively exploring arrangements on a rupee-payment basis, with the East European countries and

with some of the Asian and African countries.

There is apparently scope too for substituting the scarce non-ferrous metals by aluminium and plastics in some processes and these could be included in the Fourth Plan programme for non-ferrous metals. Buying interests in ore mines in different parts of the world is another method suggested by the President of the Indian Non-Ferrous Metals Manufacturers Association. It would be interesting to know what possibilities there are in this direction.

The Last Throw

WHAT does our agricultural policy amount to? For one thing, we have a policy to increase agricultural inputs. We plan increases in the consumption of water and fertilisers. We have succeeded better in increasing water consumption because the equipment and materials for irrigation are more easily available at home; for some reason, we have not hitherto seen the need to produce enough fertiliser plants at home, and consequently the rate of increase of fertiliser production and consumption has been puny.

A policy to increase agricultural inputs is not necessarily a policy to increase agricultural output. Skillful combination of inputs is far more important in agriculture than chaotic increases in single inputs; and the larger proportion of output increases in the past fifteen years has been due to an extension of the cultivated area much of which was no part of government policy. But increases in inputs would normally result in some increases in production. Thus, we have tried, however inefficiently, to increase agricultural output; and, whether by luck or by design, we have succeeded. Even this year's disastrous harvest does not detract from the fact that there has been a trend increase in agricultural output over the last fifteen years.

The other part of agricultural policy is the panic measures that are taken in and following years of bad harvests. They would hardly justify being called policy but for the fact that they are becoming so frequent as to shape long-term thinking and to build up a permanent framework. There is no pattern or consistency in the levies, methods of procurement, methods of distribution and import policies that are adopted

every year; but they are becoming permanent features. Their *ad hoc*, inefficient and inequitable character is all the more deplorable because they threaten to last.

The chaotic nature of procurement and distribution policies could have been explained away by saying that the previous crises caught us by surprise; but not this time. We had a serious inflation last year, in a year of good harvest, which was a signal for action; even this year we had ample warning of a bad harvest as early as September. We knew that the flow of food to towns was going to suffer. The food requirements of towns are a matter of simple arithmetic, and it ought to have been possible to organise compulsory procurement of the necessary quantities from the peninsula and the eastern States.

And yet, procurement was left to the States; and the measures taken by States bear no relation to either their capacity or the total need. Assam, West Bengal, Maharashtra and Madras have resorted to compulsory procurement without working out whether it would furnish enough grain; the other States have imposed grossly unequal levies on farmers or millers.

The result has been wildly inadequate procurement. This year's procurement of rice is expected to be 1.6 million tons; the Centre will, therefore, have to make a drastic cut in deliveries to the deficit States, which in 1965 would come to about 2.4 million tons. The note of alarm that has crept into the Food Minister's speeches underlines the failure of procurement.

Unfortunately, there is little to suggest that the Minister is doing much beyond getting alarmed. In his statement to the Parliament on Thursday he gently exhorted States to procure from the farmer, little realising that the procurement season for kharif crops is nearing its end. In the Food Ministry's review of the food situation that was circulated on Wednesday the States were advised to cordon off the demand from towns by introducing rationing, but the Minister has done nothing to ensure that they will have enough grain for the towns. In fact, by saying that the quantum of the ration might have to be reduced to 10 or even 8 ounces Subramaniam has assured them that they will not. Hitherto we thought that the Minister was failing to exercise his authority over the States; now there is a possibility that he might fail even to think.

Meanwhile, the problem has ceased to be one of provisioning the towns; in vast tracts of rural Gujarat, Maharashtra, Madhya Pradesh and Rajasthan there will be a famine in the absence of public food supply.

The food has got to be found; and if it is not found by procurement, there will be only one way left to get it within the country: to requisition stocks. This way will be adopted, sooner or later, under the pressure of circumstances. In summer, police parties will go about raiding traders' shops and godowns and public efforts will be supplemented by those of private rioters. But even in this extreme and coercive measure there is scope for equity and efficiency. The stocks are easier to get at just now because they are still concentrated with farmers; and more can be got if requisitioning is uniformly extended to all States and districts. For all the missed opportunities, there is still something the Food Minister could do.

World's Industrial Giants

GENERAL Motors is well known as the world's largest enterprise; the next three largest, which are also American, are less well known—Standard Oil, American Telephone and Telegraph, and Ford. The sales of the four together are Rs 15,000 crores even at the official exchange rate—more than India's national income. The sales of the 25 largest exceed Rs 55,000 crores, the sales of the largest 100 are just about Rs 100,000 crores. However, the 25 largest employ fewer workers than the entire manufacturing labour force of India according to the 1961 census.

Of the 100 giants, 67 are American, 13 West German, 8 British, 4 Japanese, 3 French, 1 Italian, 1 Swiss, 1 Dutch and 2 British-Dutch. Lever and Shell, the two Dutch-British enterprises, rank fifth and seventh. All the first 18 enterprises apart from them are American.

Thus, representation in the giants is closely related to the extent of the home market. It is also related to economies of scale and hence to industry. 14 of the 100 giants are oil companies, 12 make steel, 11 chemicals, 11 electrical equipment, 9 vehicles, 5 aircraft, 5 machines, and 3 electronic equipment.

Larger firms tend to grow faster. The increase in sales between 1963 and 1964 was 8.4 per cent for the

THE ECONOMIC WEEKLY

first 25 against 7.2 per cent for the 100.

The Missing Millionaires

THAT the grinding poverty of the country's teeming millions has a contagious quality has been suspected for some time. It is difficult to uncover rich taxpayers. In the income-tax assessment year 1962-63 (which roughly corresponds to fiscal year 1961-62), only 76 individuals (26 of them salary earners) and 15 Hindu undivided families had assessed incomes of over Rs 5 lakhs each. Less than 3,000 individuals (including about 1,000 salary earners) and 300 HUFs earned more than Rs 1 lakh in that year. There has been little or no change in these numbers over the last decade or so, credit for which is due neither to the socialist pattern of society nor *sadachar*. This phenomenon is the result of deliberate and organised harmonisation of the interests and wealth of the rich with the tax system. Viewed thus, it is not a peculiar national achievement. Titmuss points out comparable if not more spectacular feats in U K, the land of our fiscal mentors.

Would this harmony be disturbed and the arrangements reversed, if the tax rates in the higher brackets are lowered significantly, as the Finance Minister would like to do? For one thing, there is a catch in his intentions; he is likely to reduce the tax rates and increase the compulsory saving element, so that in overall terms, there may be no appreciable fall in the tax-payer's outgo. For another, the people who have already made arrangements for tax avoidance to their — and the tax authorities' — satisfaction are not likely to give them up; only the consummation of fresh arrangements might seem less attractive and so postponed. The substitution of high income tax rates by steeper rates of expenditure tax is not entirely feasible so long as tax enforcement and preventive policing lag behind careful disposition of private income and expenditure. Lower tax rates would probably dilute the guilt complex of both tax payers and gatherers, making a greater impact on the propensity to pay taxes than on the actual payment. They would no doubt provide equitable relief to the few rich honest tax payers, mainly salary earners.

The Hindu undivided family remains the favoured child of the tax system. The number of such families assessed

THE ECONOMIC WEEKLY

to income tax has remained fairly constant over the last several years. How far this is a result of the high exemption limit and legal partitions following the birth of each son in business families cannot be judged from the scanty data available. From plain observation, there is no doubt that the HUF is the most commonly used 'legitimate' device for tax avoidance which further reinforces the traditional

desire for male progeny. Fear of the broader legal and religious complications has kept Government away from tackling this issue. That is no excuse for its neglect by academic economists.

Income tax revenue statistics are easily the worst of those processed by Government departments from data available to them internally. They are made available so late and in such form as to be of little use to anybody

Table 1 : Income Tax Assessments by Type of Assessee

	Assessment Year	No of Assesseees ('000)	Income Assessed (Rs cr)	Total Tax Assessed (Rs cr)
Individuals	1959-60	768	742	97
	1960-61	828	778	98

	1961-62	2.6	30	25
	1962-63	2.3	38	24
Over 500.0	1960-61	0.074	7	5.6
	1961-62	0.083	7	5.3
	1962-63	0.076	7	5.8

interested in the subject. Surely, there must be somebody in the Revenue Department who is not busy devising schemes for tax-credits and surrender of black money who can look into the arrangement and publication of these statistics?

LETTER TO EDITOR

India, Pakistan and the Englishman

THE tenor of the article by Libra (an unfortunate *nom de plume* in view of its meaning) in *The Economic Weekly* of November 27, 1965 is hardly in keeping with the high standards I have come to expect from your journal both in style and content. None will deny that British official thinking and attitudes have become more obvious to many during the course of this year as the conflict with Pakistan has opened out, but to tar "thousands of little Englishmen" with the same brush as their ruling establishment shows a lack of knowledge which ought never to find expression in your worthy paper. Apart from the fact that the average Briton is too interested in his dog and child, as also in his own relationship to the world, his main preoccupation has always been with domestic affairs. Has Libra not discovered also the other side of the medal, that there were and still are "Two Nations"?

Possibly I may have more experience of the "thousands of little Englishmen" than your contributor, especially those who live, work and play in the former empire. Let me assure Libra that the sentiments he ascribes to them are not those of the majority who now belong to a newer generation, untainted by the past. If Libra cares to live in the past it is his misfortune to be over-sensitive. How long are you going to go on flogging this dead horse, worrying yourself sick about non-essentials when the homestead needs repair? Possibly the feelings he describes are spoken by the *koi hai's* in their declining years in their declining clubs, but we regard them as amusing relics, a fount of ancient lore, in their amusing clubs. What Libra might have suggested was a taped record for posterity—think how valuable it will be to the scholar who pores over these unhappy days! I would have thought it better to ignore these types, rather than occupy valuable space and make no point in a journal.

V GRENFELL

Bombay
November 30.

Time for a Government of National Unity

Romesh Thapar

THAT shelf in the Prime Minister's office must be groaning; groaning with the weight of problems on which no decisions have been given. Seldom have we experienced such a state of affairs. And, now, we are also committed to visiting Washington and Tashkent, although we are not quite sure where to go first and what stand to take. If there is some plan concerned with the handling of these matters, then it must be lying buried deep down in one of those files on that shelf in the PM's office.

This lack of decision within the GOI is becoming so chronic that it intensifies the intellectual exhaustion which is noticeable at every level of thinking in Delhi. As one goes about the usual chores, people talk about the grave crises which are developing but are unable to present any clear or coherent plan of priorities to resolve them. A fatalistic feeling feeds the intellectual exhaustion, for now even the facts of our shortages and bottlenecks are variously interpreted by the experts. Every action which is contemplated sparks contrary opinion — and the result, unfortunately, is paralysis. In other words, there is no lead.

Putting Off Decisions Will Not Help

I have had occasion in the past to write about the need for associating outside expertise with the business of government, for building autocratic decision-making and implementing cells within the democratic structure, and for strengthening the writ of the Centre over the States. These notions prevail in various influential quarters within the ruling party, but today's situation has passed beyond the stage of minor repairs. A major overhaul will soon be demanded by the reformers.

Let me sketch the outlines of the thinking which is beginning to take shape. There is recognition that paralysis results from the belief that the solutions offered to relieve the crisis will be exploited not only by the disruptionist factions within the Congress Party but also by opposition groups anxious opportunistically to build their strength during an election year. This fear is particularly relevant on the food front where forcible procurement could ignite agitations of a violent kind. Even

in industry, measures to rationalise on the basis of indigenous resources could be challenged. Rapid mobilisation, on the basis of informed public opinion, might have denied anti-Congress elements the chance to ride the waves of the crisis, but there seems no chance of such a development in the present political confusion.

The feeling is also fairly general that the authority of the Centre has weakened so considerably over the past few years that no really decisive policy can be implemented. Regional and sectional interests come into play — and are often deliberately encouraged — to stifle central directives. What use, then, the experts, the technocrats, the high-powered cells to forge the details of policy and to order implementation? One weakness feeds the other. The longer the delay in decision-making, the more impossible the task of meeting the crises.

Food and Foreign Exchange Crises

The crises do not need underlining. Estimates of food deficit ranging from 6 million tons to 15 million. Industrial close-downs affecting anything from 40 to 50 per cent of capacity at present utilised. A hydro-electric and water famine. The possibility of large-scale unemployment. And a continuing threat along the land frontier of the country. Visiting the Capital, you would not think that this is the prospect in 1966. Uncomfortable, disconcerting facts — which we continue to imagine can be dissolved by food and foreign exchange from abroad.

As the crises take on sinister proportions, the earlier passion for self-reliance is beginning to revive here and there. It again gives strength to those who are continuing the search for political initiatives which would reinforce the role of the Centre. You might scoff at this after the disgracefully tame performance of the Union Cabinet over the Banaras Hindu University, controversy, but the search does continue — and it is possible that it may yield a tentative answer.

If the crises are of the scale that they can spell ruin, and if the Congress Party understands that food and foreign exchange aid from abroad cannot by itself cushion the shocks which are likely in 1966, there is only one

stratagem by which the Centre can be activated and strengthened to assess policies, make decisions and to carry out rigorous implementation. A government of national unity, based upon an agreed minimum programme and cutting across party labels, will have to be fashioned. Such an initiative would be resisted by those political groups which batten on national misery. However, it is the only method by which a healthy political break-through can be achieved under the present circumstances. And it is such a break-through, particularly at the Centre, which would create the sanctions for policies to deal with a crisis-engulfed situation.

Once a government of national unity is formed there will be no inhibitions about pushing through food procurement and industrial rationalisation as the bases of our self-reliance. The degree of autocratic decision-making and implementation required within the democratic structure could also be translated into practical terms. A new level of unity at the Centre would discipline the States, even persuade them to follow suit. Of course, the question of the general elections in 1967 creates complications party-wise, but it is widely feared that if the present drift continues the democratic election procedure itself may be severely damaged during the coming year by the operations of DIR.

Dangerous Tactics

The kind of stratagem being adopted by certain leading elements of the Congress Party to rally the people is most dangerous. Apart from the militarist posture, there is the tendency to exploit Hindu sentiments. This politicking will play into the hands of the revivalists, make of them the major pressure group in India. The sooner the more enlightened leaders of the ruling party realise this the better. The rapid erosion of Gandhian and Nehruvian concepts, upon which the solid achievements of eighteen years of freedom are based, crystallises the challenge which the democratic, socialist and secular elements within the Congress Party and outside must face.

If no visible and relevant consolidation of the enlightened within the ruling party takes place — and, frank-

ly, political quarters in the Capital are not very confident of such a development — the unfolding of each crisis in all its magnitude will either make us hopelessly dependent on foreign props or create a sharp political polarisation in the country. In such an atmosphere, and in the absence of any initiative towards a government of national unity, the need for a new political formation will be widely canvassed.

Indeed, the more perceptive in the national parties are wondering why this process has not already begun more energetically.

The annual jamboree of the Congress Party is due to be held in the middle of January. Kamaraj should have advanced the date in view of the impending conferences in Tashkent and Washington or postponed the confabulations to permit an informed de-

bate on the developments which will result from these conferences. The only decision taken so far has been the symbolic shifting of the venue from Jaipur to Chittor. When will the ruling party appreciate the need to give some solid base to these supposedly symbolic acts? Even now it is not too late to exercise the flabby Congress Party, to get it to act purposefully, to lead.

FROM THE LONDON END

Common Market Overtures

IS Britain now, once more, pursuing the possibility of trying to enter the Common Market? There have been a number of straws in the wind in the recent past to make it necessary to examine once more the possibility—admittedly not in the immediate future—of Britain's membership of the Common Market and the impact that this could have on Britain's trading partners in the Commonwealth and EFTA.

One of the factors in the situation is the new attitude taken by General de Gaulle on the possibility of Britain's place in the Common Market. It was, of course, the General's earlier veto which put a firm stop to Edward Heath's gamble to get into the Common Market, almost at any price, even if it meant selling the Commonwealth down the river.

The General's statement on this crucial question was made a few days after Heath visited him and discussed political, economic and military problems of Europe. It is understood that one of the main concerns of the leader of the Opposition was to pursue further the question of an independent and equal Europe to redress the balance between Europe and America. Obviously, any discussions on these lines would be dear to the heart of de Gaulle.

De Gaulle's statement, on the face of it, is certainly encouraging. "A certain number of signs indicate that the conditions which hindered Britain's rapprochement with the Continent, of Europe in the past are now beginning to weaken. The problem seems to be ripening in a positive direction and if this development should take more precise form it would be considered with sympathy by France."

However, one may be forgiven for wondering how serious the General

really is, and whether his remarks were not made more to deal with France's own personal problems, particularly the forthcoming French Presidential election and the Common Market crisis. Could it not be that by making what is no more than a conciliatory gesture, with no actual binding force, de Gaulle is hoping to undermine the negotiating position of the other five Common Market countries who, in view of the present French intransigence, might be tempted to approach Britain on their own behalf to take the place of France?

A Significant Move

It would, of course, be unwise to brush aside de Gaulle's statement merely as a tactical gesture. Perhaps the report given by Heath about the state of opinion in the Conservative Party, as shown at the party's Brighton Conference, and in the Opinion Poll results, may have induced the General to take a more positive approach to this question. Although de Gaulle made a number of friendly references to Britain when Wilson visited Paris, at that time he said nothing about British membership of the Common Market. Since that time, however, the General may have had cause to change his mind. An independent Europe, in the military field, would really involve British membership of the Common Market to give reality to a European nuclear strike force and an independent European aircraft and electronics industry. The growing urge within the Conservative Party for membership of the Common Market might also have persuaded the General that if a Conservative Government were returned to power in Britain, in exchange for the concrete advantages of Common Market membership such a Government might be persuaded to abandon the whole Sterling Area system, and thus pave the way towards the

type of reform of the international monetary system favoured by the French which is based on dealing with the problems created by the use of sterling as a reserve currency. The military argument, of course, carries the main weight, and it is as well to remember that Harold Macmillan's Nassau agreement with the United States is said to have been one of the factors which sparked off the veto by de Gaulle.

Obviously, Britain can do nothing about these feelers at the moment. While it is difficult to know the stand that the Labour Party would take today about joining the Common Market, despite the feelers that have been put out regarding bridge-building between EFTA and the Common Market, the official attitude seems to be that the Government is both ready and willing for Britain to join the Community, provided the five conditions set out by Hugh Gaitskell over three years ago are met. These are: (1) Proper safeguards for the Commonwealth; (2) Adequate arrangements for Britain's partners in EFTA; (3) Firm guarantees for British agriculture; (4) Freedom for Britain to pursue an independent foreign policy; and (5) Freedom to carry out national economic planning with effective powers to safeguard Britain's balance of payments.

The leader of the Opposition has also been careful to say that Britain cannot, at the moment, take any immediate initiative. Indeed, he stressed that it would be impolitic to do so until the European Economic Community had first sorted out its own problems. But there is no doubt that a future Conservative Government would pursue with great vigour the question of Britain's entry into the Common Market. That this is Conservative policy was made quite clear in the Party's new political statement "Putting Britain Right Ahead".

The statement relating to Europe says: "When the present uncertainties in Europe are resolved, we believe it would be right to take the first favourable opportunity to join the Community and to assist others who wish, in the Commonwealth and EFTA, to seek closer association with it".

One argument that does make it seem possible that the General's offer is more serious than some have imagined is the fact that the real difference that France has with her other Common Market partners is the question of the supranational rights of the Commission. France is firmly committed to the belief that the reconstruction of Europe should be organised on the basis of greater sovereignty for its members, and greatly reduced powers for the Commission. This view, of course, is directly contrary to the whole concept of the Rome Treaty, and the essence of the de Gaulle offer may well be a bait to tempt the Five away from the supranational objectives by relaxing on the question of British membership, and making this an excuse to renegotiate, on a looser basis, the Treaty of Rome. This would certainly face the Five with an awkward dilemma.

Need to be Prepared

France's overtures to Britain have not gone unnoticed by EFTA countries who regard this new trend with a certain amount of alarm. Commonwealth countries also have cause for disquiet, and both Australia and New Zealand have made their own points of view perfectly clear to Britain. Leslie Castle, a leading New Zealand economist, who advised the New Zealand Government during the earlier abortive British negotiations for entry into the Common Market, has stated that if Britain were now to join the Common Market, this would present "a pretty serious portent for New Zealand". At a Press Conference, the New Zealand Prime Minister pointed out that if Britain now decided to join the Common Market, New Zealand would have to take prompt action to protect the access of her products to the Common Market. New Zealand is already discussing with Britain the renewal from 1967 of the right of entry for her meat and dairy produce.

While it is true that no immediate action can be taken with regard to British membership of the Common Market, it is only right to be prepared for such a step which will certainly have a very serious impact, not only on British farming interests, Commonwealth trade and trade with EFTA

countries, but also on the whole multi-lateral trade structure under which international trade is at present organized.

Let this modern, versatile machine take over the various accounting functions of your business. It makes possible accurate, speedy calculations and helps effect a substantial saving in time and manpower

- Especially suitable for banks and industrial establishments.
- Automatic handling of complete accounting procedures, invoices, sales/purchase journals, ledger accounts, payrolls, statements, etc.
- Foolproof system of "Control Number" ensures correct posting of every entry
- Interchangeable control panels enable quick change for different bookings
- Many models available to suit all requirements

Six Countries in Search of Development

Arthagnani

Asian Economic Development edited by Cranley Onslow; Asia Publishing House, Bombay, 1965, pp xi + 243.

THIS is a compact collection of studies of six countries in quest of development. The country-studies are of Burma by U Tun Wai, Ceylon by Gamani Corea, India by V K R V Rao, Malaya by Lim Chong Yah, Pakistan by Nurul Islam and Thailand by Puey Ungphakorn. C Onslow provides, in a concluding chapter, a comparative analysis of the problems of Asia's economic development.

The Different Backgrounds

Burma started with considerable war damage, the level of the gross domestic product in the immediate post-war year being 60 per cent of that in the immediate pre-war year. She sought to meet the problem by a system of planned investment. The pre-war level of gross domestic product was reached early in 1957-58, and over the whole period 1947-48 to 1961-62 an annual growth rate of 4.3 per cent was achieved. Burma was fortunate in having favourable terms of trade (pp 23-24), with a particularly high demand for rice. Political instability — particularly the Karen rebellion — tended to complicate the economic problem.

Ceylon saw in the post-war period a considerable growth of the public sector and routing of a substantial part of the gross domestic product through the Government budget. A rather rapid growth of population (about 3 per cent per annum) — thanks to the success of a DDT campaign to eradicate malaria — tended to keep low the growth of *per capita* income at about 0.7 per cent per annum during the period.

In India, planning was introduced as a deliberate means of accelerating the growth rate (through a rise in the rate of investment) and raising the growth potential (through emphasis on heavy industries). The development effort was essentially based on an extension of the public sector, particularly in heavy industries. The average growth of national income over the first decade of planning was 4.1 per cent per annum, and the economy has in fact become more dependent on external sources than before.

In Malaya, exports are equal to half the gross domestic product, and tin and rubber constitute about four-fifths of the gross export proceeds. It is clear,

therefore, that tin and rubber prices have an overwhelming influence in determining the gross domestic product of Malaya. Along with the prices of tin and rubber, the gross domestic product of Malaya has risen by fits and starts — at three points, 1950-51, 1955-56 and 1960-61 — during the period under review. Growth in Malaya has been mostly left to private effort, and planning has essentially meant an orderly arrangement of Government's investment programmes, mostly in utilities.

Pakistan, inheriting the same bureaucratic machinery and ideology as India, also resorted to planning, though a little later. Essentially it attempted to foster economic development through private enterprise, local and foreign. The average rate of growth of national income was only 2.28 per cent per annum during the period covered, though, as reports some time back indicated, the Second Plan was a success.

Thailand, like Malaya, experienced a rather rapid rate of growth during the period, the average annual growth rate being 7 per cent in the decade 1951 to 1961. One of the favourable factors was the high demand for rice. The Government has relied on private enterprise for the development effort.

Diverse Paths

Behind their common quest and the similarity of the external influences (aftermath of the Second War, like rehabilitation and the impact of external trade relations), the paths the six countries have chosen and their particular responses to external events are fairly diverse; this is so not only in case of divergent economies like Burma and Malaya but also in the case of economies like India and Pakistan which were unified till 1947.

In many respects, this divergence arises from the different starting points of the various economies: Burma, Malaya and Thailand were over-run by the Japanese during the Second War, while the War had only a peripheral impact on the other countries. This, for example, meant that the first group of countries (which had undergone a scorched earth policy from both the sides) had to make good considerable physical damage (compensated for only

partly and late by reparations), while the second group of countries started with considerable volume of foreign assets (sterling balances) built up during the War (though they also had problems of inflation and of economic adjustment to face).

In addition, the countries started out with different resources and different problems. Burma and Thailand had no food problem; Malaya had two basic resources — tin and rubber — which have been in great international demand during most of the period covered. Ceylon's experiment in social security — subsidised supply of rice — has created not only economic but also political problems for it. Both India and Pakistan, born of the same nucleus, have started out in different directions and have gradually acquired an identity of their own.

Superficial Judgement

Both Malaya and Thailand have followed essentially a free enterprise philosophy, while the other countries have depended in varying degrees upon statism for economic development. In his comparative analysis, C Onslow tries to argue from this the superiority of the free enterprise system in accelerating development. In fact, his definition of the scope of State functions (p 183) almost compares with Adam Smith's in the "Wealth of Nations". This, however, is a superficial judgment and is certainly not justified by the experience of the countries covered by the study. Both Malaya and Thailand had natural resources which, combined with the post-war trends in demand, helped to increase their income rapidly. The problems facing the other economies were far more complex, and they had less natural advantages (Burma excepted) in meeting them.

The editor fails to examine one essential potential determinant of economic growth of these countries — namely, greater economic co-operation among the countries themselves. It is almost certain that preferential trade and investment agreements among the countries, with provision of mutual holdings of currencies within board limits, would not only have been a liberalising element in the more state-controlled economies but helped in the

EACH IS VITAL TO THE OTHER

At a frontier outpost a jawan keeps ceaseless vigil. He is the bulwark of defence against the aggressor, valourous, willing to pay the supreme price. Yet courage alone cannot earn victory in an armed conflict. For that he also needs another kind of strength—the strength of industries which give him both implements of war and implements to build in peace. □ Today we have beaten back the aggressor not only because our

jawan is the better fighter but because we are industrially stronger, more self-reliant. Long ago our planners realised this. That's why we undertook building a whole host of industries for peace which in times of stress could produce for defence. Now, in the hour of trial, it is more than ever necessary to step up the tempo of industrialisation—for industries along with the Armed Forces are our real impregnable shield of defence.

THE ECONOMIC WEEKLY

long-term growth of the market for the products of the two liberal economies. Even today, these economies, in many ways complementary, are far more integrated to the western countries than among themselves.

All the studies are very well written, and bring out the essentials of the post-war developments in the individual countries. However, all the authors with the exception of Nurul Islam hold responsible positions in national or international organisations. A choice of authors from more independent sources like universities would have brought to

the studies a more critical approach to the methods followed in fostering development and to the assessment of the results achieved. There is a tendency, if not to whitewash failures, at least to tone down the consequent criticism. Both Burma and Pakistan, despite agricultural advantages, have done less well than expected. V K R V Rao, in keeping with his new official position, puts on a statesmanlike (or more plainly, a pompous) show. In the study on Ceylon, there is a tendency to identify the requirements of a democracy with those of a mobocracy — as if politics does not exist in other countries. And

it remains to be seen how far Malaya and Thailand have taken advantage of the present sunshine to broaden their economic base.

C Onslow's comparative analysis, by concentrating on the merits of private enterprise and not taking into account the critical differences in the economies, fails to fill the gaps left by the individual authors or to provide an analysis of the nature of, and factors in, economic development. On the whole, however, the book provides a useful record and summing up of development effort during a decade in an important group of countries.

Women Workers

Kamla Nath

Women in the Work Force in India by D R Gadgil, Asia Publishing House, Bombay, 1965; pp 33, Rs 3.

“WOMEN in the Work Force in India” is the text of the inaugural lecture by D R Gadgil in the Kunda Datar Memorial Lecture Series. The lectures under this series are to be on some “social, economic or political problems concerning Indian women”. It was fortunate for the subject to have as the first speaker Gadgil, who is not only one of the top economists of the country but who is also “very closely associated with social movements for improving the economic and social conditions of the less privileged sectors of the society”. But when faced with the problem of women, Gadgil realised the paucity of data. To make the best of the situation, he just and foremost as an economist, has analysed the participation of women in economic activity in the country. He has drawn on the figures on participation of women in the work force in the Indian Census for general trends, and on the findings of various socio-economic surveys for data on attitudes to work of women of different regions and groups.

Work and Socio-Economic Status

Gadgil begins by commenting on the close relationship between social stratification and economic position, the attitude of society towards manual work and towards women working outside the home. He says, “One of the most persistent aspects of Indian socio-economic structure that has been impressed on me through a study of the results of socio-economic surveys is the usual close correspondence between economic position and traditional social ranking in Indian rural society. Ability to keep away from manual work has been an

important distinguishing sign of socio-economic status among us. Therefore non-participation of women in any work and particularly manual work outdoors is everywhere considered a value. It is clearer however that the practical force of this value differs widely from region to region.” The latter perhaps explains partly the wide regional variations in the work participation of women, which are brought out by the Census and the Bench Mark Surveys quoted by Gadgil. The 1961 Census shows that the proportion of women workers varies from 9.4 per cent in West Bengal to 44.0 per cent in Madhya Pradesh (excluding the predominantly urban Union Territory of Delhi where it is only 6.5 per cent). The great majority (79.6 per cent) of women workers are engaged in agriculture. They come from the families of cultivators and scheduled castes and scheduled tribes. As the number of women that seek work depends upon the social conventions relating to outdoor work by women in these groups, the supply of female labour for farm work in any area depends upon the traditional behaviour pattern of the most numerous castes.

Are Values Changing?

However Gadgil's remark that “nothing seems to have happened in these socio-economic norms which change the supply of female labour and the only thing that changes the supply of female labour is the increase in the population and changes in sex and age distribution” needs to be investigated further. The data of 1961 Census indicate that these norms may be chang-

ing. Gadgil makes a similar point when referring to the facts that the proportion of women workers is much smaller in the urban than in the rural areas and that urban women workers are concentrated in ‘household industries’ and ‘other services’. He explains these phenomena as being due to lack of opportunities for employment and does not give recognition to the fact that they may be due also to changes in social values or economic status accompanying migration from rural to urban areas. But the more detailed data of 1961 Census which have since become available would lead one to think that changes in values and attitudes relating to work may indeed be taking place and the rural-urban work participation differentials may not be due only to lack of opportunities. The secular data on work participation rate over six decades, 1901-61, show a consistent and cumulative decline in work participation of women in the cities of India. This decline was seen in cities in all regions of the country. In Delhi the decline was from 16.9 per cent in 1901 to 4.5 per cent in 1961. The corresponding figures for Bombay were 21.2 per cent and 8.8 per cent, for Madras 11.6 per cent and 6.3 per cent and for Calcutta 15.5 per cent and 6.1 per cent.¹

Secondly, within the urban areas, the work participation rate for literate women is much smaller than that for illiterate women — 4.6 per cent as compared with 13.7 per cent. The percentage of workers among the literate women increases with education; it is as large as 71.3 per cent among those with technical degrees. But since the pro-

portion of the highly educated is very small, this rise with education cannot effect the decline in work participation rate, which takes place on the transition from illiteracy to literacy.

These facts would lead one to think that important changes in values and economic status may in fact be taking place in the urban areas. The marked and persistent decline in the work participation rate of women in cities can only be explained on this basis. Lower work participation among the literate women than among the illiterate women shows clearly that the literate urban women are not prepared to work as their illiterate sisters are prepared to do. Some of this difference is undoubtedly due to the different caste and class composition of literate and illiterate women. How one wishes the census data were available by caste! But there is no doubt that within each caste, the percentage of literates is going up. Even in rural areas there may be changes occurring which need to be investigated further. In my own village studies among women of cultivator families in Punjab and scheduled caste families in Rajasthan, I found unmistakable signs of the desire of women to cease working.² In the Punjab group the change was due to actual rise in economic status of the group; but in the Rajasthan group the most powerful motive was the desire to seek higher social status. I explain this change only on the basis of the social value of ceasing to working with rise in socio-economic status to which Gadgil refers.

Further Investigation Necessary

These findings are but straws in the wind and cannot explain trends over any extensive area. But they point to the need for more detailed investigations. Perhaps some young workers will put together the data on the subject available in the enquiries of the various Agro-Economic Research Centres and the studies of the Gokhale Institute and other institutions to see if any pattern of change is emerging.

Gadgil would be quite right if one interpreted his remarks to mean that the work participation rate among urban women would be much higher if wider work opportunities were available to them. The occupational structure of India is still overwhelmingly traditional, and a modern pattern has yet to emerge. Large numbers of rural women continue to work on family holdings, but opportunities for non-agricultural employment have yet to be created. These opportunities are emerging in urban areas for the educated,

but their number is infinitesimal. In the meantime changes in secular values and other factors, such as the decline of household industries, about which we know too little, are closing the traditional avenues of employment for urban women. Gadgil has made a valuable opening contribution to the subject of women workers and I hope that the lead given by him will be taken up by others to illuminate one of

the less known, but potentially most significant, areas of our socio-economic transition.

Belgium's War of Languages

Taya Zinkin

The Congolese have a joke. "The Belgians", they say, "won their independence too soon. They still have tribal wars".

The two tribes are the Walloons and the Flemings—and the wars are over language.

THE other day there was a small item in the press about riots in Belgium; the press was too busy to go into much details because the very same day Ian Smith made his UDI. What lay behind the news from Belgium was a linguistic war which will sound quite familiar, in some of its aspects, to readers in India.

The Congolese have a favourite joke. "The Belgians", they say, "won their independence too soon. They still have tribal wars".

The two tribes are the Walloons and the Flemings. The cause of conflict is language. Over the chieftaincy they are at one. The monarchy is not particularly popular but it is not a cause of division. Nor is politics. The political parties, all of which have a Walloon and a Fleming wing which they try desperately to hold together. Religion is a source of unity; both tribes are Roman Catholic and they intermarry endlessly. One can never tell from a man's name which tribe he belongs to. Le Nain is Flemish, Van Den Drucken is Walloon.

It is over the question of language, and over language alone, that tribal feelings are bitter. The Walloons speak French, the Flemings speak Flemish. Flemish is not just a dialect spoken by some 5 million Belgians; it is essentially the same language as Dutch, and Flemings insist that, if one counts the Afrikaners of S Africa, it is spoken by 20 million people. The French speakers however, refuse to treat it as anything but a ridiculous dialect which "breaks one's ears", "*une langue avachie*" spoken only by the plebs, "*les bas fonds*", "*les coriaces*" (the indigestible), and they maintain on no particular evidence that the Dutch despise it too.

The Flemings outnumber the Walloons by 2 million, and they are not going to accept any French superiority; indeed, their own opposition is the more bitter because their own upper class, the "Fransquillons" as they rudely call them, speaks French. The weakness of the Flemish position lies in the immense attraction French has as a great world language. The leading French newspapers of Belgium continued to sell almost as many copies in the Flemish speaking areas as in the French, Flemish speaking areas as in the French, even when feelings had run so high that there was a riot in an Antwerp

church with chairs broken on heads because the sermon was in French. The Flemings have in the past backed their linguistic demands by action. They have marched on Brussels and torn down French signs on the sea-shore to claim their "sacred Flemish soil". Many Walloons in return are like that leading journalist who exploded "they are just good enough to sell us shrimps and take our money. Now, when my children want to go to the seaside for their holiday, I sent them to France".

The linguistic boundary in Belgium is old and has not changed substantially since Roman days. What has changed over time is the relative strength of the two languages. Between 1600 and 1900 French has got stronger. When Holland revolted against Spain in the 16th century and Belgium remained under Spain the speakers of Dutch and Flemish were cut in two. The Dutch upper classes continued to speak Dutch, but Flemish aristocrats and bourgeois learnt to speak French, much as their Russian counterparts did later on, because French was becoming the language of the educated over much of Europe. Fifty years ago, in Brussels, the capital, only the working class spoke Flemish, and French was the official language till after the first world war. French domination was further reinforced because the industrial revolution hit Walloon first, adding economic to cultural ascendancy.

The Flemish reaction goes back perhaps half a century, and has really come from universal suffrage and mass literacy. This was to be expected. It has happened everywhere. As people become educated and get the vote they want to be able to rise to the top without having to learn a foreign language. It is the same in Canada, where English overshadows French, in India where the regional languages have replaced English and where many people do not want to encumber themselves with Hindi when English is both so much more developed and attractive. But it is Ceylon which offers the most exact parallel to Belgium. In Ceylon the agitation for Sinhalese was led by those parts of the middle class who did not speak English: Buddhist monks, Village school teachers, Ayurvedic doctors. In just the same way, in Belgium it has been the local doctor, the village

teacher and the village priest who have fought for Flemish. After the first world war Flemish was given official status as the language of the Flemish speaking area, administratively as well as educationally, and at all levels; Brussels became theoretically bilingual; and the civil, though not the criminal code, was translated into Flemish.

Subsequently, an official linguistic boundary was drawn up on the map and it was decided that there would be parity in government recruitment between Flemings and Walloons—even to the Army—which ultimately should benefit the Walloons since they are less numerous) as well as total bilingualism for all senior posts (which in practice discriminates against the Walloons as many of them do not know Flemish). The boundary had to be drawn because of what is known as the "Francophone oil-stain". Brussels is Francophone rather than bilingual, but it is situated in Flemish speaking Brabant and it is growing like Jack's bean stalk, especially now that it is the capital of the Common Market. French speakers are spilling over into what used to be Flemish villages and are turning them into modern suburbia. They demand that their children be educated in French and there is considerable tension over schools.

The Flemings are not satisfied with what they have already achieved. They want Belgium to be truly bilingual. Emotions are so raw that one senior Belgian official exploded with despair when I saw him: "Let it be Chinese so long as there is only one language in Belgium!" However since it is not likely to be Chinese, true bilingualism may yet be the answer, but for this both languages will have to be learnt by everybody from the beginning. Some people talk of having lessons in French in the morning and in Flemish in the afternoon. This is a price French speakers are not likely to be willing to pay. Federation may be the answer, with Brussels playing the part of Washington D C. But, in that case, especially since Brussels may become the capital of Europe, Flemish will lose the battle, the more so that there is no chance of a Holland, evenly divided between Catholics and Protestants, welcoming 5 million Flemish Catholics.

Medical Sociology: Some Problems for Study

C Parvathamma

S Sharadamma

In India till now very little work has been done in the field of medical sociology. The social scientist so far has held no place in the field of medicine in our country.

In the Western countries, on the contrary, phenomenal growth of knowledge is noticed in every field that has a bearing on health problems. Many sociologists have done research on health problems independently and also in collaboration with medical scientists. Further, the tools of social science are being increasingly applied to analyse the medical social structure in the West.

In this essay an attempt is made to discuss some of the important problems of approach involved in the study of medical sociology.

SOME Western sociologists, notably Merton and Kendall have suggested a useful list of substantive areas of sociological research in medicine. They are: Social Etiology and Ecology of Disease, Social Components in Therapy and Rehabilitation, Medicine as a Social Institution, and Sociology of Medical Education.¹ The area chosen for a sociological study of medical undergraduates in Mysore comes under the last category (See Section II below).

It is important to substantiate further how a sociological investigation of the 'medical universe' will unfold several interesting problems. A student's choice of medical career, his inclination towards specialization, his process of learning and his reliance on teaching, the mode of his interaction with the faculty members, his method of acquiring values of medical culture, and finally, his emergence as a physician offer interesting areas for sociological research.

Who Chooses a Medical Career?

Further, a sociological study will throw light as to who chooses a medical career and why? From which socio-economic and professional group does he come? What are the mechanisms for generating and nurturing medical ambition? Does a student change over the five-and-a-half years he spends in a medical school? Are there students untouched by the medical setting? What are the modes of adaptation and which social strata find it a smooth process? Does the medical school prepare student-physicians for their institutional role inculcating values basic to its culture? These and many more problems are of immense interest to a social scientist.

The mind of an entrant to the medical school is yet to be moulded and his personality to be developed. He is partially socialised; his family, as 'a major transmission belt for the diffusion of cultural standards',² has transmitted only a portion of the culture

accessible to its social stratum. Now he is enrolled as a member of a new culture-setting, namely, the medical-setting consisting of its complex institutions, schools, hospitals and clinics, its personnel, its standards and codes, its recruitment policies, its relation with public and its mechanisms of sociability and control. Here socialization of recruits consists of induction into the common core of the profession, over a period of five-and-a-half years.

Medical education equips a student not only with the existing body of medical knowledge but also with informal attitudes and patterns of thought. Further it makes him conversant with the modern technology and scientific outlook in medicine. Basic medical values, important parts of medical culture are acquired by the students during this period of professional training. "Students are expected to develop the ability to live up to the norm of 'detached concern'; they are taught how to be interested in a patient without becoming emotionally involved".³ Blumgart calls the profession of medicine 'a house of many mansions', embodying numerous professions within itself, with different types of persons working in different capacities.

Selecting the Right Students

Here arise some further problems of interest to a medical educator as well as a sociologist. Medical educators are confronted with the most important problem of selecting a student "who will contribute to medical science as an art, who will be actively interested in the progress of medical research, and will be able to tackle successfully ever-

lasting problems in medicine".⁴ An aspiring medical student's mental equipment, in other words, should be such that he would become a scientist of precision while solving a problem, and an artist of immense skill while handling a sick person. The other and more important aspect of the problem is how to select students coming from different social backgrounds who could hold a promise of versatility as far as medical education is concerned. Till now medical educators have paid but little attention to this aspect of the problem.

The concept of medicine and health care as a social institution enlarges the scope of the sociological study of medical education. The medical student enjoys a particular status. He is engaged in a complex array of social relations with his fellow students and the faculty, with other health professionals, technicians, and with patients. These people too occupy definite positions and play well defined roles. Thus the student is involved in an organised network of role-relationships. The social structure of the medical school helps him to learn these patterned social relationships. Besides, he learns to perform his many roles as healer, 'chief' of a 'unit', Head of a Department, medical researcher, educator, member of a professional society, and also as a member of his local community.

Merton observes that "medical schools act as guardians of values basic to the effective practice of medicine. Their job is enabling the medical man to live up to the expectations of the professional role long after he has left their sustaining environment."⁵

Table 1: Sex and Class-wise Distribution of Student Population

Class	Men	Women	Total
Pre-professional	150	49	199
Pre-clinical	308	88	396
Clinical	294	89	383
Total	752	226	978

In the field of medical education much of the research done by Western sociologists has concerned itself with the generalised effects of medical education on the student. Mary Jean Huntington has shown that medical students gradually develop a "professional self-image" in the course of their medical training. R C Fox says that the medical student learns and assimilates the traits a student will need to play the role of physician once he has left the school. She says that students are thoroughly trained to deal with the many areas of uncertainty and to develop 'detached concern.' Becker and others are particularly concerned with the level and direction of academic effort of medical students. Nathanson, comparing interviews of freshmen with those of senior medical students, says that freshmen are oriented to the interest of the patient, while seniors emphasize the need for preserving the solidarity and protecting the interest of the professional group.

These and several other problems are there. Mysore is a semi-urban community and the student population is drawn from different religious, linguistic, caste and socio-economic groups. A study of such medical undergraduates in Mysore city will certainly highlight several interesting problems. Systematic collection of data so as to give sociological dimensions to the study of the medical universe is thus the first step towards building up medical sociology in India to-day.

II

In January 1965, a sociological study of the medical undergraduates in Mysore was undertaken. The study is confined to the undergraduates admitted to the pre-professional course leading to MBBS degree under the 'New Scheme' which has been in operation since 1959.

Table 2: Distribution of Teaching Staff by Sex, Designation and Courses Taught

Designation	Pre-clinical		Pre-professional		Clinical		Total	
	M	W	M	W	M	W	M	W
Professors and Associate Professors	—	—	5	—	24	4	29	4
Assistant Professors	—	—	3	—	18	3	21	3
Readers	2	1	1	—	5	—	8	1
Lecturers	12	3	15	3	32	8	59	14
Technicians	—	—	2	—	9	2	11	2
Total	14	4	26	3	88	17	128	24

The complex of the medical institutions is spaciouly situated right in the heart of the well-planned city. There is the Medical College occupying an area of 82,000 sq ft affiliated to the University of Mysore, the Government College of Indian Medicine (*Ayurvedic* and *Unani*) and the various hospitals attached to the Colleges.

Until 1930, the medical courses were held in Bangalore where 30 students used to be admitted every year to the MBBS class. From 1930 onwards the medical courses have been in Mysore. Nowadays, the number of students has increased greatly in the Medical College. For the last 3 years the number has ranged between 200 and 220. During 1964-65 academic year, there were 978 students; 752 men and 226 women. Sex and classwise distribution of the medical student population is given in Table 1.

There are 152 teachers of, various ranks on the teaching staff of the College. This gives a student-teacher ratio of 6:1. The distribution of the teaching staff according to sex, designation and the courses they teach is given in Table 2.

The student population is heterogeneous in the sense it consists of young men and women drawn from different socio-economic, linguistic, religious and cultural backgrounds. From the economic point of view, the students can be said to be drawn 55 per cent from low income group, 33 per cent from middle income group, and 12 per cent from high income group. The details are given in Table 3.

The high percentage (55 per cent) of students from low income group belies the popular notion that medical education is the privilege of the rich or that only the sons and daughters of the rich can afford medical education which is admittedly expensive. The high percentage of medical students from low income group has become possible because of several factors. The Government's liberal policy and incentives in the form of scholarships, fee concessions and loans have attracted many students from poor families who would, otherwise, not have turned to medical education. The 'liberalization' of admissions by the introduction of the 'quota system' for different economic and caste-groups has enabled many students to enter

Table 3: Composition of Students by Income Groups

		(percentages ^a)		
Class		Low Income Group	Middle Income Group	High Income Group
Pre-professional	M	70	25.3	4.6
	W	44.9	32.6	22.5
Pre-clinical	M	61.7	28.1	10.2
	W	38.8	35.4	25.8
Clinical	M	48.2	43.1	8.6
	W	44.6	28.6	25.4

Note: Rs 1,500 and below per annum low income group.

Rs 1,501 to 5,000 per annum middle income group.

Rs 5,001 and above per annum high income group.

* To be added horizontally.

medical institutions. In the absence of the 'quota system' students belonging to low economic groups or certain relatively backward caste-groups would have been elbowed out of the 'competition' for admission by the other students, not necessarily on the strength of intrinsic merit, but often on the strength of wealth, opportunities for development and significantly better family background and upbringing.

Further, the low income group students are enabled to be in the medical colleges because of their parents' preparedness and determination to muster all possible resources and make all possible sacrifices to see their sons or daughters through the medical courses. It is possible to argue that the poor parents look upon their wards' education as an investment which will bring dividends in future and raise the standard of the entire families. Whatever the reasons prompting the parents, they do encourage and help their wards through the medical courses. An analysis of our recorded data supports the above observations.

From the point of view of the occupational background of the parents, 11 per cent students come from the families of physicians, 6 per cent from the families of teachers, 6 per cent from

families of clerks, 11 per cent from business families, and 36 per cent from agricultural families. The remaining 30 per cent come from the families of engineers, lawyers, executives, artisans and those serving in the defence forces, the police department, railways and public works department.

From the point of view of regions to which they belong, out of the 978 students, 970 are Indians and 8 are foreigners. Of the foreign students, 2 come from Nepal, 2 from Malaya, 2 from Africa, 1 from Iran and 1 from Ceylon; of these some are 'nominees' of the Government of India and some have come under the Colombo Plan. Of the 970 Indian students, 722 are from Mysore State, 245 from Kerala and 3 from Goa. Table 4 gives the regionwise distribution of the Medical College students.

As the students come from different regions, they also speak different languages. The group consists of students speaking English, Kannada, Telugu, Tamil, Malayalam, Hindi, Urdu and dialects such as Tulu and Konkani.

From the point of view of religious and caste backgrounds, setting aside the 8 foreign students, 5 per cent of the students are Muslim, 3 per cent are Christian, while the remaining may be

broadly said to be Hindu. Among the Hindus 25 per cent belong to various subcastes of Brahmins, 7 per cent are Lingayats who constitute a dominant non-Brahmin Saivite group in Mysore State, 13 per cent are Okkaligas who are another dominant non-Brahmin group of the State. Twelve per cent of the students come from Scheduled Castes and Scheduled Tribes, 7 per cent are Bants mostly coming from South Canara. While 3 per cent come from artisan castes like Carpenter, Blacksmith and Goldsmith, the remaining 23 per cent come from Banajiga, Barber, Coorgi, Kuruba, Valmiki and Yadava caste-groups (see Table 5).

DA 55/449

We shall purify your gold. We shall purify it by refining the gold to 23.88 carats. We shall purify your gold by devoting it for fifteen years to the service of this sacred land of ours. Your gold will then be returned to you, blessed, burnished and brighter, purified on the altar of service.

Serve your country—get Gold Bonds

Never before has our country needed gold so much. We are desperately short of foreign exchange. More gold with the Government means more foreign exchange. We need gold, your gold, for the defence of the country, to buy food from abroad, and to get machinery and raw materials to keep our industries going. Our land, our jobs, and even our lives will be safe only if more gold is made available to the Government NOW.

The Government appeals to you to lend your gold to the country in its hour of need. The Government is not asking you to sell your gold or give it away. Gold Bonds will be issued when you tender gold, gold sovereigns or gold ornaments.

The Government will refine the gold to 23.88 carats (old ornaments have a purity of only 18 to 22 carats; sovereigns are made of 22 carat gold). The weight of the refined gold will be entered on the Gold Bond, and this purer gold will be returned to you after 15 years.

If you have subscribed to Gold Bonds in the form of ornaments, gold returned to you after 15 years can be reconverted into ornaments of any purity. If you tender gold ornaments, the

Government will give you Rs. 3 per 10 grammes of refined gold as compensation for making charges, along with your Gold Bond. (One tola is equal to 11.66 grammes.) Every year you will earn Rs. 2 per 10 grammes of refined gold. (A sovereign weighs 8 grammes.) This money is free of income-tax. A Gold Bond will not attract wealth tax. There are liberal exemptions from gift tax and estate duty also.

When you tender the gold, nobody will ask you how you acquired it. No action will be taken under the Income-tax Act, the Gold Control Order or Customs regulations.

You can borrow money from banks with Gold Bonds as security, just like gold. Gold Bonds are issued at the offices of Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi and all branches of the State Bank of India and its subsidiaries.

Exchange your gold, gold sovereigns and gold ornaments for Gold Bonds. Put your gold to work in the service of the country.

Case for State Production of School Books

Kamlesh Ray

Good text books for schools are as important as good teachers. We are short of both.

Considering the quality of school books at present, it is questionable whether production can be left any longer to the efforts of individual authors and publishers.

State monopoly of production of school books, it is suggested here, will improve their quality and, besides, bring other benefits.

GOOD text books are as important as good teachers. We are short of both. While some of the text books are written by competent writers and teachers, many are produced by indifferent authors. The difficulty generally stems from the fact that the text books are written primarily out of mercenary considerations. Acceptance of a book in a school is left to the persuasion of the author or the publisher irrespective of the merit of the book. Many text books have come under severe criticism. These are of sub-standard quality, full of inaccuracies. Many competent authors shy away from the venture as they are not sure of a square deal from the publishers, nor are they proficient in lobbying from school to school.

The prices of school books are generally very high in relation to the resources of most of the parents. A large proportion of the students cannot afford to buy all the text books prescribed. Sales and distribution sometimes involve undesirable practices.

Books of foreign authorship and publication are still in use in Indian schools. Most of such books are good, yet not quite suitable. Good, because they are attractively produced, and do not contain serious inaccuracies. Unsuitable, because of the foreign setting, illustrations and examples. For instance, a nine year old boy learns about the weather in terms of England. He also learns that most of our daily food like butter, cheese, eggs and ham comes from Holland, Denmark and Australia. These books may be produced in London; they are excellent, but are quite out of place in this country. The knowledge acquired through these books has often no bearing on our children's experience. The children may eventually come to believe that what is learnt through books must necessarily be beyond any tangible experience.

Tagore once made a pointed reference to such foreign traits in education. He wrote of a boy in Allahabad who learnt all about rivers through his English book. When he was asked if he had

ever seen a river, he said 'no'. How was it that the boy who read about rivers in his text book failed to connect them with the mighty Ganga and Jamuna which flowed by his city? The answer may be that his English text book illustrated rivers with Thames, Severn, Nile, Danube and Mississippi, but not with Ganga and Jamuna.

Book of Western origin, besides, are more expensive and require foreign exchange. Some of the books reflect derogatory undertones towards non-white peoples of the world.

Size of the Problem

We have to produce books which will fit our environment. The task seems to be stupendous. School enrolment has gone up from 24 million in 1950 to 67 million in 1965 (see Table 1). Even so, on the whole only about one-half of children of school-going age are actually going to school at present.

The schools need over Rs 100 crores worth of books (see Table 2). The number of books to be used by a student varies from half-a-dozen in Class I to a dozen in Class V, in the Primary grade. Through Middle and Secondary grades, each student is required to study about 20 books. We have to prepare for the present and growing demand for school text books at all levels and in all the languages prescribed. Three objectives are to be achieved: high standard, low price, and easy availability.

Considering the present state of affairs, one comes to doubt if the text books should be left to private enterprise. Educational authorities can mobilise competent writers and teachers to produce standard text books on a regional or national basis. All such books need not be fresh ventures. There are a few good books already produced by Indian authors. These can be further scrutinized and perfected. New books have also to be written. Generally, a group of authors should work on a particular book or title.

This means a kind of nationalization

of text books. Many indifferent authors will be eliminated. There is likely to be some opposition from private publishers. High profits and super profits in the text book business will have to be curbed. The state has as much right to enter this sphere as any other under our mixed economy, and has a serious responsibility in the matter of education.

A standard text book produced by a body of experts will have great advantages. The cost of production will also be low when the book is printed in large numbers. A good book can be translated or adapted, if necessary, into various regional languages.

One criticism, however, may be levelled against nationalized text books. The same book read by all students will tend to produce regimentation of thought. Different treatment of a subject in different books would give a wider perspective, and permit exchange of knowledge and ideas among students leading to wider comprehension. A few standard text books for each class on individual subjects can be produced.

Cost of production can be lowered by printing large numbers. There are other elements which enter into final pricing. These can also be lowered under state publication of text books. The sale price of a book is generally set at 2½ to 3 times the cost of production. Book sellers get 30 to 40 per cent of the sale price as commission. The author is normally contracted for 10-12 per cent, seldom 15 per cent. What is worse, the author is never sure of the number of copies actually printed or sold. The allocation for publicity is low for text books, for, the sale depends upon the acceptance of a book by school authorities. This is generally arranged through personal contacts. The publisher's profit ranges between 12-15 per cent, but since most of the publishers are also book sellers, their total profit is higher.

If the text books are published by the state the price can be reduced at-

most to a half. Government can buy paper at the factory rate which is substantially lower than the market price. Since the books do not suffer from the uncertainty of acceptability, large numbers of copies can be printed. This reduces the cost further. Then, the sales being assured, the book sellers would not have to be favoured with the high percentage of commission on sale. While the normal channel of distribution (ie the commercial book shops) can be utilized, it would be necessary to open book stores at every school to ensure convenient supply and sale.

Sales and Distribution

We may for purposes of illustration work out the relative cost and price of a book which is sold for Rs 5 under commercial publication and sale. As shown in Table 3 the sale price can be brought down to a half of the commercial price. Savings are effected on cost of production (due to the factors mentioned earlier) as also on profits. But

the low percentage of profits will not hurt any party, since little uncertainty or risk is involved. For sales through school campus book stores, the commission will cover the establishment costs. Commercial book sellers will also get the commission. The authors will get an apparently low percentage of royalty, but this will be well compensated for by the assured large sales. For instance, a book selling for Rs 2.50 would fetch Rs 20,000 at 8 per cent on a sale of 100,000 copies. As each book will be written by a group of authors, the amount will be shared between them. Even so, the amount will be attractive and assured. This should be better given in a lump sum. Honorarium in a lump sum would be more satisfying to the author, and would avoid protracted accounting. The profit to the Government will be constituted into a development fund for the book project.

Mere publishing by the Government will not help the students unless sales are also organised. School books should

be available at campus stores under school management. Besides the obvious convenience of such an arrangement, commercial shops may not do justice because of the low commission. Some malpractices may also creep in. An instance may be mentioned. A State Government published a standard text book at a low price for primary classes and left its sale to commercial book sellers. The book disappeared from the market. After a time, it came to be sold with an undeclared compulsion imposed by the book sellers that it could be purchased only along with their 'notes' which cost three times as much.

Supplementary Readers

Text books which have to follow the prescribed syllabi are necessarily somewhat rigid, yet, competent authors can write lively text books. It is, however, necessary to provide the children with books which would transcend the grooves of text books and give them wider perspectives of co-ordinated knowledge. Such supplementary reading material will mostly come from free-lance authors. The subjects can be many and varied. Not being formal text books, these can be generally sorted out on their merit. A few of the high quality books on general science, history, biographies, international affairs and the like, can be selected by the school books organization of the Government for publication as a supplementary series.

Guide books for teachers in various subjects are no less important. In fact, this is an essential item for improving the standard of teaching.

Taking an all-India view, school books are a Rs 100 crore undertaking. A few standard text books are being attempted by the National Council of Educational Research and Training under the Union Ministry of Education. The States can also be associated with the project in a suitable way. Education being a State subject, the States have a vital role to play in the matter. It is desirable that uniform standards should be maintained throughout the country. The success of a project of this kind will largely depend on proper selection of authors and members of the boards, and maintenance of a healthy academic atmosphere in their activities.

The question of school books should be taken up with the utmost urgency.

FROM THE CHAIR

Year of Achievements for Indian Oil Corporation

Chairman's Statement at the Annual General Meeting

FOLLOWING is the text of a Statement by Shri P A Gopalkrishnan, ICS, Chairman, Indian Oil Corporation Ltd, at its Annual General Meeting held in November 27, 1965.

Gentlemen,

Before I describe the phenomenal progress which Indianoil has been recording since its active participation in the economic life of the country for the past four years, I would like to dwell in brief upon the emergence of a strong public sector oil industry in the context of the over-all industrial development. One of the factors which has been contributing to the rapid industrial growth in the country has been the energetic participation of public sector oil.

Whether in exploration, refining or distribution, oil industry in the national sector began from scratch and now it has come of age.

The steady rise in the demand for petroleum products is caused by several factors such as the industrialisation, urbanisation, growth of the population and the rising standard of living.

The consumption of petroleum products was a bare 4 million tonnes in 1951. It increased to over 10 million tonnes in 1961 and now it stands at about 14 million tonnes. Probably by 1971, the consumption is likely to go up to 22 to 25 million tonnes.

Indianoil's participation has also been growing steadily commensurate with the demand for petroleum products in the country.

Merger of the Divisions

The Balance Sheet and Profit and Loss Statement of the Indian Oil Corporation have already been circulated to you along with the Annual Report. You will see that the Public Sector Refineries at Gauhati and Barauni as well as the Pipelines Projects merged with the Indian Oil Company on September 1, 1964 to form this giant Corporation. With effect from April 1, 1965 the refinery at Koyali in Gujarat has also merged with the Corporation.

The Gauhati Refinery processed 749,164 tonnes of crude oil during the

year 1964-65 and Barauni processed 249,918 tonnes, the different units starting on different dates in the year. Barauni's production was also made available for sale but the production had not stabilised by the end of the financial year.

The Corporation's sale went up from 1.17 million kilolitres in the previous year to 1.72 million kilolitres in 1964-65. The sale petroleum coke in the year was 35,501 tonnes, as against 26,748 tonnes in 1963-64.

The operational cost per kilolitre was Rs. 31.68 in 1961-62, Rs. 30.16 in 1962-63, Rs. 29.21 in 1963-64 and Rs. 31.99 in 1964-65. The reasons for the increase in operational cost during the year are explained below.

Tankages

The tankage at installations, port and inland, increased from 367,780 kilolitres at the end of March 1964 to 406,960 kilolitres at the end of March 1965. Similarly, there was a significant increase in the number and tankage of depots. Many satellite and relay depots were constructed during the year as also bulk petroleum installations at various airfields. The total tankage of the Corporation's Marketing Division was about 489,225 kilolitres at the end of 1964-65 besides tankages for products at Gauhati and Barauni Refineries of 86,000 kilolitres and 1,20,453 tonnes respectively. The total number of depots of all kinds commissioned by the Corporation all over India was 175.

The number of consumer and dealer pumps for motor spirit and high speed diesel stood at 795 at the end of March 1964. It increased to 1353 at the end of March 1965.

The sales of Indianoil form a bigger and bigger percentage of the consumption of petroleum products in the country. In 1962-63 Indianoil sold 6.3% of the needs of the market. In 1963-64 the percentage increased to 10.1. In the four quarters of 1964-65 the percentages were 12, 13.4, 13.4 and 15.6 respectively. The sales have increased by leaps and bounds in 1965-66.

1965-66 has been a year of challenges. The hostilities on the border and the need for increased food production in the country have been the challenging factors in meeting the requirements of petroleum products both for the defence and food production in the country.

Essential Service

The local shortages of kerosene and high speed diesel in certain parts of the country, early this year, brought Indianoil to the forefront. The remedial measures which were taken to meet the shortages were of a strenuous nature but the challenge was successfully met. Since then Indianoil has won plaudits for effectively ensuring the supply of petroleum products. Oil supplies have come to be deemed as part of the essential service in the country.

Two lube oil blending plants were commissioned during the year, one in Bombay and the other in Calcutta. These plants are run by Indian Oil Blending Limited, which is a joint venture of the Indian Oil Corporation and Mobil Petroleum Company of the United States. Mobil lubricants are blended in these plants besides other forms of lubricants and the blending is done electronically.

The Corporation has been doing quite well in spite of the fact that it is competing with other oil companies which have not only worked in India for a much longer time but are big international companies with immense resources of all kinds in the oil industry. As far as India is concerned, however, the Corporation is bound to become the biggest oil organization in the country in the next two or three years.

Severe Competition

The paid-up capital of the Corporation is Rs. 44.26 crores and the turnover for the year is Rs. 77.82 crores. The net profit after allowing for depreciation and interest charges is Rs. 75.64 lakhs. The profit would have been Rs. 179.76 lakhs if the Corporation did not have to bear under-recovery of rail freight and the non-recovery of Central Sales Tax from customers as explained in the Report. Even so the profit is about Rs 8 lakhs less than last year although the sales of the Corporation have increased from 1.17 million kiloli-

Table 1: School Enrolment

(Numbers in millions)

Grade and Class	1950-51	1960-61	1965-66 (estimated)
Primary (I-V)	19.15	34.99	51.0
% (6-10 age) enrolled	43.1	62.4	77.8
Middle (VI-VIII)	3.33	6.71	10.8
% (11-13 age) enrolled	13.7	22.5	31.7
Secondary (IX-XI)	1.22	2.89	5.2
% (14-16 age) enrolled	5.4	10.6	16.8
All (I-XI)	23.70	44.59	67.0
% (6-16 age) enrolled	26.0	39.5	51.3

Table 2: Demand for School Books

Grade and Class	Estimated Enrolment in 1965-66 (million)	Average Cost of Books per Pupil (Rs)	Total Cost (Rs Crores)
Primary (I-V)	51.0	8	40.8
Middle (VI-VIII)	10.8	35	37.8
Secondary (IX-XI)	5.2	70	36.4
Total	67.0		115.0

Table 3: Comparative Pricing

Item of Cost	Commercial		Nationalised	
	Rs	per cent	Rs	per cent
Production	2.00	40	1.70	68
Bookseller	1.65	33	0.40	16
Author	0.60	12	0.20	8
Publisher	0.75	15	0.20	8
Total (sale price)	5.00	100	2.50	100

tres to 1.72 million kilolitres. The main reason for this is the severe competition that the Corporation had to face from the other companies, leading to a lowering of petroleum prices, particularly of Superior Kerosene. Secondly, the duty payable on certain petroleum products was increased in October and November of 1964-65 with the result that the Corporation was obliged to have increased working capital and there was consequently an increase in the interest charges. Thirdly, there was increase in the rates of interest more than once in the year and this increased the interest payable to the bank.

I have a great pleasure in referring to certain achievements of the Corporation. Formerly, the essential components of floating roof tanks used for motor spirit were imported by all companies. The Corporation imported the components for one floating roof tank and for the others, the components have been manufactured in India. The Corporation has also built air-craft refuellers which are in service with both civil and military air-craft. Formerly these were imported. Other items developed locally and used are power take off units fitted on tank trucks and tachometres.

Lastly, I would refer to training.

The Corporation has established training courses for sales, lubrication, engineering, operations, accounts and other items of work and these courses are of a continuous nature. Fresh recruits are trained before they commence their work and refresher courses are also provided. The Corporation has also established training courses in petroleum products for military personnel.

Before concluding, I thank all the Directors of the Board for their co-operation and advice and thank all those officers and staff who have worked hard to make the year successful.

I.O.B. is big enough to serve you..

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

THE INDIAN OVERSEAS BANK LIMITED

Central Office: Madras 2 • Over 100 Branches in all important places in India
M. Ct. Muthiah, Chairman K. M. Naniappa, General Manager

**...and small
enough to
know
you**

AROUND BOMBAY MARKETS

Nothing But Gloom

Thursday, Morning

DALAL STREET's trading pattern last week was not any different from that in the preceding week. In extremely restricted dealings equities continued to drift lower with a few professional operators dominating the scene all the while. Although selling was never heavy, the market was forced to seek a new low level because of the virtual absence of fresh support. Several shares touched new lows for many years.

New Delhi's reported decision to assign a bigger role to the private sector in defence production and the Finance Minister's statement hinting at the prospect of additional credits from Russia and Czechoslovakia for financing non-project imports failed to impart any steadiness to the market even though its technical position has improved considerably as a result of substantial anxious bull liquidation and bear pressure in the past few weeks.

But the stock market's performance could scarcely be expected to be encouraging when responsible Ministers continue to paint a gloomy picture of the economic situation and the nation is being alerted almost every day against a possible combined attack by Pakistan and China. The grim food situation, acute shortages of essential raw materials due both to a setback in agricultural production in the country and restricted imports on account of foreign exchange difficulties, uncertainty about the flow of foreign aid, serious power shortage, additional taxation by most of the States—all these make a formidable list of adverse factors. The economic situation is indeed very difficult and the outlook has been rendered more obscure by political uncertainties.

While the market could take a pause any time to allow technical forces to have their play and in the process equity prices might record some gains but prospects of any marked and sustained recovery seem remote. The crisis of confidence is, in fact, deepening with time as equity prices continue to seek new low levels.

COTTON

Dull and Subdued

WHILE cotton futures recovered after a further initial setback and closed almost unchanged over the week, the spot market continued to display a subdued tendency with most varieties

further down by about Rs 10 to Rs 15 per candy. But it bears repetition that the market is subdued only in relation to the recent past when they had been pushed to the revised statutory ceilings for the current (1965-66) season. Despite the recent setback, cotton prices continue to be well above the previous season's ceilings.

Recent rains at various places which have raised hopes of slightly better rabi crops have hardly anything to do with easier tendency in cotton prices. There has been no change in estimates about the 1965-66 cotton crop which continues to be placed around 52 lakh bales. The import prospects being what they are—even with best efforts imports are unlikely to exceed the previous season's figure of 8.18 lakh bales—there can be no doubt that the supply position of cotton will be very tight this season.

That cotton prices should have come down by Rs 30 to Rs 70 per candy over the past few weeks despite clear prospects of an extremely tight supply may seem somewhat surprising. But the reasons are not far to seek. Because of the acute financial stringency and continuing political uncertainties, agriculturists as well as cotton merchants are anxious to dispose of the goods as quickly as possible, especially when prices are ruling well above the previous season's ceilings. Few are inclined to take the risk of building up stocks. This explains why the pace of arrivals has been very satisfactory despite a much smaller crop. On the demand side, mills are having a difficult time. The off-take of cloth continues to be poor and because of the piling up of huge stocks of cloth, and yarn, the industry was obliged to effect a drastic cut in production in October and its performance in November or in the months ahead is unlikely to be more promising. Mills therefore are restricting their purchases to bare minimum requirements. Even the most well-to-do mills are unable to accumulate big stocks of cotton because of the distribution control.

The market could remain subdued for some time despite tight supply. But if the political situation improves and cloth off-take picks up there is a distinct possibility of a virtual scramble for cotton in the months ahead. Prices are likely to develop marked strength

as the season advances. Quite a good deal will, of course, depend on imports and US supplies under PL 480. Meanwhile, overseas demand for Bengal Deshi continues to be poor mainly because of substantially larger supplies at cheaper rates by Pakistan. Sales registered up to November 26 are placed at 57,507 bales which is a poor showing indeed.

OILSEEDS

Steadier After Setback

THE reactionary trend in oilseeds prices which had been in evidence for some time made further progress early in the week following the announcement of certain curbs on speculative activity in non-transferable specific delivery (NTSD) contracts in groundnut and groundnut oil. Reports of beneficial rains in some of the oilseeds producing areas also aided bearish sentiment to some extent. But the market soon developed a steadier tendency and that too under the lead of groundnut and groundnut oil. After easing from Rs 32.40 to Rs 29.50 (per 10 kgs) groundnut oil recovered sharply to Rs 33.25 by the week-end; groundnut ready Coromandel variety which had declined from Rs 78 to Rs 73.50 was up again around Rs 78.75 (per 50 kgs). Fluctuations in linseed oil and castor oil were confined to a narrow range and they followed the trend in groundnut oil.

Oilseeds futures also rallied after a further early setback. Castor April which had eased from Rs 105.12 to Rs 102.25 early in the week improved quickly to Rs 106.75 and linseed April which had been marked down from Rs 122.75 to Rs 120.25 recovered to Rs 123. Profit-taking and modest bear pressure pared some of the gains near the week-end. Cottonseed January moved irregularly between Rs 65.50 and Rs 63. The turnover in futures was rather poor. Speculative activity in the official market shrunk considerably because of the heavy margins.

The measures taken by the Forward Markets Commission to curb speculative activity in NTSD contracts in groundnut and groundnut oil consist of margins on all purchases with specified free limits for genuine consumers like vanaspati manufacturers and dealers, the setting up of panels of buyers and sellers and restricting the duration of delivery

contracts to not more than 45 days. The margin has been fixed at Rs 1000 a tonne in groundnut oil and Rs 500 a tonne in groundnut in Bombay and at Rs 750 a tonne for oil and Rs 375 a tonne for groundnut in Gujarat. Purchases of groundnut effected by crushers and vanaspati manufacturers and purchases of groundnut oil by vanaspati manufacturers will be exempted from the payment of margin provided such purchases do not exceed their four weeks' average requirements calculated on the basis of actual consumption during the preceding season (October 1964 to November 1965).

Similarly, purchases of groundnut oil by dealers will be exempted from payment of margins provided such margins do not exceed their four weeks' average requirements calculated on the basis of actual purchases from upcountry markets which resulted in delivery during the previous season. While allowing such exemption the stocks held by the party and the outstanding purchases under ready delivery contracts will be taken into account along with the purchases under non-transferable specific delivery contracts. The Commission has also laid down that no association recognised for groundnut and groundnut oil will be permitted to conduct any NTSD contracts providing for delivery beyond December 31 unless it introduces a system of panel of buyers and sellers and allocates its members in the appropriate panels so as to conform to their normal function in the trade. Moreover the duration of the NTSD contract will not henceforth exceed 45 days.

While it is quite natural for the trade and industry to resent any measure which restricts its freedom of operations, the Commission's decision to control strictly business in NTSD contracts will be widely welcomed. At a time when the country is faced with acute shortage of edible oils, speculative activity must be checked in every possible manner. Whether or not it will help to bring down prices is another matter. Prices are bound to move up when a commodity is in short supply. But if speculators are allowed a free hand they are bound to exploit the situation to the detriment of the general public interest.

Although recent rains are likely to benefit the rabi crops, the overall supply position of vegetable oils as also of foodgrains will remain tight and the authorities will need to take firm action in order to ensure equitable distribution of limited supplies and also to prevent a runaway rise in prices. New Delhi

will be well-advised to ensure that actions taken by the various States restricting the movements of goods outside their boundaries do not accentuate scarcities and thereby increase mass discontent.

MONEY AND BANKING

Stringency Reappears

CREDIT conditions in the Bombay short term money market displayed divergent trends during the week to December 1. While the market continued easy during the earlier part of the week conditions towards the close were distinctly firm. At long last the busy season seems to have arrived with the demand for funds increasing every day. With income tax dues payable during the next few weeks there seems to be a run on the market. Demand from upcountry centres is reported to be good. The rate of interest, which was 4 per cent during the earlier part of the week, moved up to 5 per cent on Tuesday and further to 6 per cent on Wednesday.

Scheduled bank deposits during the week to November 19 improved from Rs 2811.57 crores to Rs 2817.28 crores. Credit advanced by banks, however, declined by Rs 2.22 crores to Rs 2020.98 crores. Borrowings from the Reserve Bank were higher by Rs 18 lakhs at Rs 2.47 crores. There was a marked improvement in balances with the Reserve Bank from Rs 101.55 crores

to Rs 112.17 crores. Cash in hand improved slightly by Rs 43 lakhs. Investment in government securities at Rs 858.26 crores shows an increase of Rs 59 lakhs. The credit-deposit ratio was 71.74 per cent compared to Rs 71.96 per cent the week before.

The Statement of Affairs of the Reserve Bank reveals a decline in active notes from Rs 2661.48 crores to Rs 2646.35 crores during the week ended November 26. This decrease and a small increase in total note issue, from Rs 2674.81 crores to Rs 2676.18 crores, were absorbed in notes held with the Banking department which increased to Rs 29.83 crores. Foreign securities increased by Rs 2.42 crores to Rs 75.05 crores but balances held abroad declined from Rs 12.17 crores to Rs 9.90 crores. Rupee securities at Rs 2363.03 crores were lower by Rs 2.42 crores. Rupee coins increased from Rs 102.98 crores to Rs 104.34 crores.

Deposits of the Central Government advanced slightly by Rs 98 lakhs to Rs 80.15 crores. State Government deposits were higher as well at Rs 6.84 crores by Rs 31 lakhs. Scheduled bank deposits at Rs 104.44 crores showed an increase of Rs 2.52 crores. Loans and advances to governments moved up from Rs 127.16 crores to Rs 138.38 crores. Advances to scheduled banks were marginally lower by Rs 84 lakhs at Rs 1.58 crores. Investments declined substantially from Rs 212.52 crores to Rs 194.19 crores.

BUSINESS NOTES

Delhi Cloth and General Mills

FAIRLY satisfactory progress has been recorded in the year to June last by Delhi Cloth and General Mills in its various units engaged in the manufacture of diverse products such as textiles, sugar, confectionery, chemicals, vanaspati, artsilk fabrics, caustic soda, P V C resin, tyre cord, etc. The company continued its policy of modernisation and renovation of textile units. In order to meet the increasing demand for mixed yarns, 18,000 additional spindles are being installed at the Hissar Textile Mills. Poor crop conditions, coupled with heavy diversion of available supplies of cane to the gur and Khandari industries, affected the working of the sugar factories. The distillery and confectionery sections, however, did well. The production capacity of the Daurala Confectionery plant is being increased. The chemicals plant in Delhi worked satisfactorily. The vanaspati unit faced problems of availability and high cost of oil, but the rate of output was well maintained.

The Rajasthan Vinyl unit, which had its first fully year of operation, worked satisfactorily; the performance would have been still better but for the heavy power cut for the major part of the year. The rayon tyre cord plant was commissioned in the beginning of 1965, and its products have been well received by tyre manufacturers. Notwithstanding adverse conditions, the company maintained its position in respect of textile exports. P V C resin was also exported during the year.

Despite all-round rise in costs, the financial results show advance in sales from Rs 42.38 crores to Rs 48.27 crores and in gross earnings from Rs 3.84 crores to Rs 4.35 crores. But the improvement is more than wiped off by the increased provisions for depreciation and development rebate, the former requiring nearly Rs 69.50 lakhs more at Rs 3.10 crores and the latter about Rs 6.80 lakhs more at Rs 1.02 crores. Even though there is a saving of Rs 11 lakhs in taxation which claims Rs 16 lakhs, the balance profit is only Rs 6.53 lakhs compared to the previous year's Rs 21.37 lakhs. The unchanged distribution of 17 per cent on the equity capital demands Rs 74.68 lakhs (Rs 74.40 lakhs) and that on preference capital Rs 10.50 lakhs (Rs 8.23 lakhs). The shortfall in the balance of profit is to be made up by a sizeable

withdrawal from reserves. What, however, is more significant from the shareholders' point of view is that gross retained profit, after taxes, provisions and proposed dividends, is higher at Rs 3.34 crores as compared to Rs 2.75 crores last year. Also, looking back one finds that over the five-year period ended June last, fixed assets (net after depreciation) have risen from Rs 6.81 crores to Rs 18.73 crores, share capital from Rs 4.11 crores to Rs 5.76 crores and reserves from Rs 6.33 crores to Rs 9.68 crores, lifting the net worth from Rs 10.44 crores to Rs 15.44 crores.

Orient Paper

THE existing capacity of the Brajraj-nagar unit of Orient Paper Mills is to be increased by 11,600 tonnes with the installation of balancing equipment, besides carrying out the modernisation and renovation programme. The Amlai Paper Mills having a rated capacity of 48,000 tonnes of paper per annum was commissioned in the record period of about two years from the date of arrival of the first consignment of imported machinery at the site. The paper machine and some other ancillary units went into trial production in February last, and the pulp section was partially stated in June. Normal production is expected shortly after overcoming the usual teething troubles.

During the year ended March last, the production and turnover of paper and board were nearly the same as in the preceding year, but there was further increase in the wage bill, power and fuel, general expenses, etc., with the result that gross earnings dropped from Rs 1.74 crores to Rs 1.19 crores. Of this, development rebate reserve alone requires Rs 1.15 crores; last year it had taken up only Rs 0.75 lakh. Depreciation charge demands Rs 91.97 lakhs (Rs 50.40 lakhs), and for this purpose Rs 89 lakhs have been withdrawn from general reserve. The tax liability is nil (Rs 47 lakhs), but for payment of usual dividend on preference shares and at Rs two a share on equity capital the company has to resort to transfer from dividend equalisation reserve. Of the proposed dividends, 63 per cent will be exempt from the tax.

New Standard Engineering

FAIRLY encouraging progress has been reported by New Standard

Engineering in the first half of the current financial year ending March next. As against sales of Rs 132.7 lakhs for the corresponding period in 1964, the sales this year were Rs 156.4 lakhs. The highest sales were for structural works, which increased by over 45 per cent. Foundry sales were better more than 99 per cent. The sales of textile machinery at Rs 57.1 lakhs were over 18 per cent more than those of the corresponding period in the previous year, but since then there has been a stagnation in the textile industry. Although the only manufacturer of blow room machinery in India at present, N S E has on hand blow room equipment worth Rs 20 lakhs which has as yet not been lifted by the mills. The extremely tight credit conditions and the surplus unsold stock with the mills have given rise to these conditions. But the stocks are expected to be lifted in a couple of months, as the company has secured deferred term facilities from I D B I.

The new machinery and equipment for the foundry at Goregaon has been practically set up and is expected to be completed by March next. The Goregaon foundry specialises in large castings and has recently commenced castings of 20 tonne anvil blocks for the Massey-NSE hammers. The company will shortly undertake single castings of upto 30 tonnes a piece. The prototype of the company's new line of manufacture, trimming presses, has already been completed, and the regular manufacture of 200 tonne, 120 tonne and 60 tonne trimming presses in collaboration with B and S Massey of the U K will shortly begin.

Bharat Ball Bearing

BHARAT Ball Bearing is continuing negotiations for technical collaboration for the manufacture of roller bearings. Meanwhile, the company's existing products are well received in the market, and in spite of difficulties of raw materials and untrained labour, production has been increasing steadily. In the fifth year ended June 1965 the company has produced encouraging results: sales have risen from Rs 33.88 lakhs to Rs 1.02 crores and gross earnings from Rs 8.53 lakhs to Rs 17.15 lakhs. This outcome has enabled the company not only to provide Rs 9.06 lakhs for depreciation and wipe off the brought forward loss of Rs 3.92 lakhs but also clear arrears of preferential dividends upto end-June 1964 absorbing Rs 3.77 lakhs.

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now
freely available from our factory at Kota for a wide
range of applications such as :

• WIRES AND CABLES	• TILES
• FLEXIBLE SHEETINGS	• CRYSTAL CLEAR ARTICLES
• RIGID SHEETINGS	• RAINWEAR
• CORRUGATED SHEETS	• BRIEFCASES
• TUBES AND PIPES	• TOYS
• FOOTWEAR	• HANDBAGS
• UPHOLSTERY	• BOOK BINDING PAPER

RAJASTHAN VINYL & CHEMICAL INDUSTRIES, P.B. 671, NEW DELHI-1

Coastal Shipping
COASTAL shipping continues to be in the doldrums in spite of the 10 per cent increase in coastal freight rates from August last; the increase in the excise duty on oil bunkers and other increases such as in wage bills and in stevedoring costs have largely offset the advantage accruing from the

sanctioned increase. The annual report of Great Eastern Shipping for the year to June last, however, gives an impression that the government may soon grant exemption from levy of excise duty on oil bunkers and may also agree to a freight rate structure which would cover cost and ensure a minimum margin to the coastal operators.

It is stated that some time ago a shipowners' delegation called on the Finance Minister and placed before him their problems and difficulties. The Finance Minister is said to have agreed to consider the waiver of excise duty altogether in respect of oil bunkers supplied to coastal ships on the same lines as those applicable to Indian Air Lines.

MAKE AN INVESTMENT FOR YOURSELF AND THE COUNTRY

The Unit Trust of India earns you attractive returns while it invests your money in industries vital to defence and development. Last year investors earned a dividend of 6.1 per cent, free of income-tax up to Rs. 1,000.

The Unit Trust offers other advantages too. Safety of capital, liquidity of investment and expertise.

It's easy to buy Units. They are available at about 4,000 offices of leading Banks all over the country. You can also buy Units through registered brokers on recognised Stock Exchanges.

Want to increase your overseas profits?

Here are 17 ways we can help you.

1 Our World-Wide Marketing Service personnel can help you find new markets. We have specialists in 124 world trade centres. Let them analyze your profit potential, show you where your product is needed, where you can ship to and sell most easily.

2 We can advertise your needs. Do you want to buy something? Sell something? We can spread the word. Our monthly magazine, "Clipper Cargo Horizons," published in 6 languages, can place your listing before more than 176,000 top executives around the world. No charge.

3 We can develop new contacts for you. Our professional marketing experts can make your first new overseas sales approaches for you—free.

4 We can find you additional suppliers. Want to buy for less? Get a special design? Get higher quality? Let our specialists discover new sources for you... see that you get catalogues and prices.

5 We can cut your packing and crating costs. We don't require the heavy, expensive crates of surface shipping.

6 We can lower your air Cargo rate. Pan Am's AirPak Savings Plan employs newly-introduced corrugated containers that can earn you a discount of 12%. And remember, Pan Am has reduced rates in recent months on many products, perhaps yours.

7 We can help you cut warehouse expenses. Because we can deliver overnight almost anywhere in the world, you don't have to maintain costly warehouses overseas.

8 We can lower your inventory cost. Our rapid delivery means you can order direct from the factory as needs arise... you won't have to maintain costly inventories.

9 We can help you match a local producer's delivery time. Don't let foreign competitors take business from you because they can deliver faster. Our rapid delivery makes you, in effect, a "local producer"

anywhere in the world, lets you cash in on unexpected opportunities overseas.

10 We can solve distribution bottlenecks. When you have to produce more than your regular distribution facilities can handle, call us. We'll see your customers get their orders on time, every time.

11 We can help you bank your profit sooner. The sooner your goods are delivered, the sooner you get paid. Our rapid delivery often means you get paid several weeks sooner.

12 We can reduce obsolescence losses. Could a newly introduced model or a change in public taste cut into your sales? Or even destroy your market? Minimize this risk... with our overnight delivery.

13 We can slash wharfage, docking, trucking costs. Call us. We'll be glad to show you how and how much.

14 We can reduce clerical expenses. For example, one Pan Am airway bill will take your shipment anywhere in the world. Let us rid you of use-

less, expensive, time-consuming paperwork.

15 We can greatly reduce insurance costs. Did you realize that shipping with us can save you in insurance as much as 90% of your surface shipping insurance costs? We'll be glad to show you the proof.

16 We can cut or eliminate spoilage, breakage, pilferage. The longer a shipment is in transit, the greater the likelihood of damage. To get your goods delivered fast, in factory fresh shape, call us.

17 We can cut or eliminate disassembly-reassembly. No need to take large items apart and put them back together when you ship with us. You save time, trouble and cost.

Profit from these 17 ways Pan Am can help you.

We'll be glad to have one of our cargo experts help you make a thorough analysis of your supply and delivery system. No charge, no obligation. Call your Pan Am Cargo Agent, or ring us up. Do it today. (Tel. 211063/64)

World's largest Air Cargo carrier • World's most experienced airline

With Only PL 480

IN less than ten days the Food Minister has made four major statements in the two houses of Parliament, answered numerous questions by Members and presented a detailed report on the food situation prepared by his Ministry without, however, succeeding in creating any confidence that the food crisis is being effectively tackled. In all the Food Minister's pronouncements the emphasis has been on the wonderful things he is going to do to increase production next year and in the years after, while what the country has been wanting to know from him is what precisely he is proposing to do to meet the immediate situation arising from the crop failure this year. The most ingenious "crash programmes", even ones which will miraculously double the production in a single year, are irrelevant just now.

Subramaniam's effort to focus public attention on agricultural programmes for the future is partly intended to sidetrack criticism of the Government's many sins of omission and commission which have brought us, after three Plans and a vast investment in agriculture and allied services, face to face with a countrywide famine. Partly, also, the brave and loud talk about self-sufficiency by 1971 is for the consumption of the US Administration which has made it clear that from now on PL 480 assistance will depend on the Indian Government's ability to carry conviction that it is taking effective steps to increase agricultural production within the country. But a third reason for the Food Minister's reticence about measures to meet the immediate food problem is probably that he hasn't many in mind.

Over the past several months the country has been periodically told that the Government is engaged in preparing a "national food budget" which will be the basis of steps to distribute equitably available food supplies, both internally produced and imported. When this budget will be finally ready one does not know, but it is plain enough that so far precious little progress has been made. To begin with, the Food Ministry hasn't an idea even of the extent of the fall in production this year. Within about a month, the Food Minister has revised his estimate of the shortfall in the kharif crop from 3 million tonnes to "over 8 million tonnes". The latter figure was mentioned in the Minister's statement in the Lok Sabha initiating the food policy debate on December 1; the Food Ministry's survey, presented to Parliament only the day before, had put the figure at "between six and seven million tonnes". In addition, there is the much higher figure of about 14 million tonnes which one gets by adding up the States' estimates, prepared no doubt with the objective of either, in the case of the surplus States, retaining as much of the production within the State as possible, or, in the case of the deficit States, wheedling the maximum supplies from the Centre—which, incidentally, speaks volumes for the spirit in which the different "tribes" of the Union approach a vital national question.

If there is a confusing plethora of estimates of the shortfall in production, about the quantum of foodgrains in Central and State Government stocks there is a discreet silence—and for good reason. The Government has been talking about, discussing and debating the need to procure as much of the internal production as possible since well before the 1964 kharif season. The Rs 100-crore Food Corporation has also been functioning now for more than a year. Yet it can be said without the slightest risk of being proved wrong that the stocks with the Centre and the States today—in spite of last year's bumper crop and six million tonnes of imports and this year's half a million tonnes-per-month imports—are not adequate to meet even a part of the demand which will arise if the decision, about the only one, to which the Government has committed itself, viz, to introduce rationing in cities with populations of over one lakh and in selected industrial areas, is to be implemented. No wonder, then, that with less than a month to go for the deadline for introduction of rationing, the Food Minister admitted in the Lok Sabha on Tuesday that "for diverse reasons" some of the States were still fighting shy of rationing.

For the Government's failure to procure enough grain to meet its responsibility of saving large numbers of people from starving it will not do to blame

the hoarding producer or trader. That, at a time when a food crisis was being shouted about from the rooftops, including by the Food Minister, producers and traders would want to hang on to whatever stocks they could lay their hands on was not unexpected. The Government was supposed to face this problem squarely. Nor can it be said that the Government's stocks are what they are because there have been no opportunities to buy up more. The Food Ministry's survey reveals that following the Indo-Pak hostilities there was a significant improvement in market arrivals of both rice and wheat as a result of which there was an unseasonal decline in the wholesale prices of cereals. Did the Central and State Governments take advantage of this fortuitous spell of dishoarding to buy up the grain that arrived on the market? They did not. In Punjab, for instance, the price of paddy was allowed to fall below even the minimum sup-

port price—only then did the State Government bestir itself to make some purchases and that too just to "protect the interests of the farmers"! Will the Food Minister explain why the Government let slip through this excellent opportunity to buy up some rice, in respect of which the situation threatens to be really desperate in the coming months?

Subramaniam is entitled to declaim that he will not allow considerations of national prestige to stand in the way of asking for American food to save the poor from starving. But it would have been easier to appreciate his touching humanism if it were true that before sending out the SOS to Washington the Government had done everything to make the best use of internal production so as to reduce the gap to be filled in by charity from abroad. This it has failed to do, completely and miserably.

Foreign Exchange Crisis

THE reported postponement of the Aid-India Consortium meeting and also of the visit of the World Bank team—both, on present indications, indefinitely—and the Finance Minister's projected trips abroad in quest of bilateral aid lend a new twist to the foreign exchange "crisis" in India. Whether these represent any re-appraisal, agonising or otherwise, of the extent and inevitability of our foreign exchange dependence remains to be seen.

We have been living with a foreign exchange "crisis" for the last eight years and the present phase itself is three years old. This alone should give rise to suspicion that the present crisis is being exaggerated. Take, for instance, the situation that has prevailed since April 1965. Apparently, it has been the Government's policy not to issue import licences except against foreign credits available. Assuming that this has been done (and, considering the horse-trading for which our bureaucrats are well-known, one is not sure of this), one would expect that the present should mark a favourable turn in our foreign exchange reserves position.

First, aid committed as on March 31, 1965 was Rs 3,577 crores, of which the amount utilised as on the same date was Rs 2,100 crores. This meant that aid of Rs 1,477 crores (including PL 480 and rupee payment

arrangements) was in the pipeline as on March 31, 1965. Much of this aid would be tied to projects; and much of it would be of a capital nature, the utilisation of materials (non-project) aid being much faster. However, the pipeline should last a considerable time—at least a year. Second, of our current earnings, only a part is committed to automatic use for imports—mainly earnings against export promotion schemes. The balance should be available for priority uses.

As against this, despite the fact that the present phase of foreign exchange tightness commenced in mid-1962, there had been no effective tightening of imports. Besides shipments on the way, there must have been a large quantity of import licences issued prior to April 1965 which must have continued to be used up. On this basis, it can be assumed that the effect of import curbs since April 1965 would begin to be felt on imports only now; as much is clear both from import trends during April-September 1965 and the recent admission of the Finance Minister that revenue from import duties is likely to commence falling below estimates.

The significance of imports in our total industrial production is marginal, though specific industries (superphosphate, cables, tyres and tubes, rayon yarn) are more vulnerable. However, industry, being wiser than the

Government, has generally carried large inventories, particularly of imported goods, in view of the uncertainties of import-licensing policy. The impact of reduced imports on industrial production is likely to be felt, at the earliest, after March 1966. (Incidentally, the reduction in inventories of imported goods should release a substantial portion, perhaps Rs 100 crores or more, of bank credit, and, to that extent, the credit stringency expected in January-February 1966 may never materialise.)

Given the above considerations, subject to defence imports, India's foreign currency reserves should improve in the following months. However, with an uncertain foreign aid situation, there is need for a selective import policy to maximise its impact on the Indian economy. For example, a concentration on imports of copper, sulphur, rock phosphate, rubber, fertilisers and alloy steel would appear to be most beneficial today. In the present crisis there would be justification for using another exchange-saving device, namely, a ban on all remittances to foreign investors. The Industrial Policy Resolution explicitly subjects such remittances to the exigencies of the foreign exchange situation.

However, it is time that the Government also tried to look beyond its nose. First, it is necessary that a long-term policy on the import of indigenously produced or producible commodities should be laid down, providing for a total ban on the import (including import against rupee payments, foreign credits and export promotion schemes) of such commodities after, say, two or three years. The immediate candidates for such a ban are rayon and paper pulp, caustic soda, mild and alloy steel, fertilisers, newsprint, all textile machinery and similar other items. This would enable entrepreneurs to take definite steps to manufacture these items and consumers of these goods to encourage their indigenous production (rather than, as at present, devoting their energies chiefly or solely to obtaining import licences from Delhi).

Second, it is necessary that we draw up a detailed plan on the implications of the foreign aid cut. After all, the amount of foreign aid promised by the Consortium group fell from \$1,295 million for 1961-62 to \$1,027 million (the "stopped" aid) for 1965-66, and the net aid, after allowing for repayment and interest payments, has

fallen still more steeply. With political differences with donor countries, future aid is still uncertain. At present, our exports are at the rate of Rs 800 crores, and payments due on existing external debt are likely to be at the rate of Rs 150-200 crores per year in the next five years. This would leave free foreign exchange earnings of Rs

600-650 crores. If the country were forced to live within these earnings how would she arrange her planning and her import budget? The recent controversy between the Finance Minister and the Food Minister on the exchange allocation for fertilisers has shown clearly the conflicting demands on limited foreign exchange reserves

Weekly Notes

Socialist? Who, India?

THE Monopolies Enquiry Commission has not, as inspired scoops would have us believe a few weeks ago, found that "there are no monopolies in India in the accepted meaning of the term". Quite the contrary. Setting about its task in textbook fashion it has made a study of 100 selected products to find that in 65 of them "a high degree of concentration exists in the sense that the share of the three top producers of a particular product is more than 75 per cent of the total production". As for concentration of economic power over the economy as a whole—what the Commission calls countrywise concentration—it finds that the top 75 business groups, the total assets of companies under whose control is not less than Rs 5 crores, account for 44 per cent of the paid-up capital of all companies in the corporate sector and for 47 per cent of their assets.

These are not startling revelations. R K Hazari's painstaking research into ownership and control of corporate enterprise had showed a high degree of concentration of power. And about concentration in particular industries the Commission draws its results from data regularly collected by the Office of the Director General of Technical Development. But while these facts may not be as commonly known as they might have been but for the tendency of "that section of the press that is under the control of big business" to "present too rosy a picture of the performances and practices of big business", it has been plain enough all along that the very logic of planned development of a predominantly private enterprise economy could not but lead to greater concentration. Rightly does the Commission mention among the main causes of the growth of concentration of economic power "the Government's programme of planned development which necessitated a system of indus-

trial licensing, control of capital issues and regulation of imports, as well as exchange control in the face of a difficult balance of payments position". Predictably, "big business groups with better resources found themselves in a more advantageous position to deal with the controls and to start new ventures than the smaller man who often found these controls too formidable to overcome".

No doubt R C Dutt is right to say in his minute of dissent that "planning and controls are by themselves neutral". Whether or not they result in the growth of concentration depends on the overall purposes conditioning their operation. In India a major such purpose has been to foster capital formation in the private corporate sector. If companies and business groups are to be important sources of capital formation, their powers and privileges have to be increased, not diminished. As D R Gadgil pointed out fully ten years ago in a note to the Panel of Economists, the fundamental inconsistency of our industrial policy has been that it has sought, on the one hand, to lean on modern private enterprise for capital formation and, on the other, to set itself the goal of preventing concentration of wealth and economic power.

It is quite pointless, then, to talk of the need to reduce concentration of economic power. Even if the Congress did not take a single rupee for its election funds from business groups, the Government will not be one jot more able or willing to curb the power of these groups. The financial support that it extends to the ruling party is more an expression of the power of big business, less its cause. The fact is, concentration of economic power involves control of large resources and also of large areas of production and those who have such control are in a position to influence policy in a large measure—including the decision whether or not

and the need to make hard choices. Rather than taking *ad hoc* decisions, it is desirable that we ask ourselves clear questions and take decisions based on full calculation of the necessary consequences. This is a task which Asoka Mehta and the Planning Commission should immediately address themselves to.

to curb concentration of economic power!

When the Monopolies Commission was set up the question was raised why such a commission was necessary in India. Joan Robinson, writing in the July 1964 Special Number of this journal, had asked: "Does a 'socialistic' society accept the view that private enterprise is the ideal economic system provided only that competition prevails?" But the point is, this is not a "socialistic" society. At any rate the Monopolies Commission clearly takes that view. It holds that "concentration of economic power has helped the economic betterment of the country" and that it "may be relied upon to make an important contribution to industrial development in the crucial years to come".

The Commission's task, then, is the limited one of doing something about the "widespread dislike for big business among the masses, disturbing the mutual goodwill among large sections of the community". Other capitalist countries have faced the same problem and the Commission can do no better than take a leaf out of their books. The United States has her Federal Trade Commission and the United Kingdom her Restrictive Practices Court and Monopolies Commission. Let us now have our own Monopolies and Restrictive Trade Practices Commission!

Gaullism: Beginning of the End

THE French political pattern has been a highly individual one. The right-left cleavage which emerged all over Europe in the latter half of the nineteenth century also found a reflection in France, but it did not mesh with the opportunist-idealist camps so closely as it did in other countries. France has for long had Rightist ideologues and Leftist opportunists: both Poujade and Mollet have a tradition behind them.

Thus, the French left and right are identified by their professions rather than by character and class, and their political parties have lacked cohesion. The tendency towards "one view, one party" was further accentuated by the electoral system introduced just after the war which, to reduce the influence of communists, favoured small parties.

But while keeping the communists out was an objective that attracted wide support, the need for executive authority and continuity was no less strong. The ephemeral rule of splinter parties which characterised the Fourth Republic was tiresome. France longed to be rid of it, and de Gaulle's first mandate was to remove it. True, only de Gaulle could have presided over the funeral of the Fourth Republic, for such a priestly role could only be bestowed on a national figure, and no one could become a national figure by strength of reason. Mendes-France might have given France a more solid and less arbitrary constitution if he had been allowed; but he could not be allowed, for there was no charisma about him. People want to think of their country in terms of a family; de Gaulle fitted into this family, Mendes-France would not, even as the family doctor. Only about de Gaulle could one say without fear of incongruity: he assumed power, and he gave France a constitution.

A constitution, however, which removed the need for de Gaulle. For the Fifth Republic simply must have an executive President; and since he would stay for seven years, the Republic is safe — unless it is overthrown. In all referenda up to the one on constitutional changes in 1962, over 60 per cent voted for de Gaulle, because the alternative was grim. With the new constitution, however, the alternative was Mitterrand, or Lecanuet, or Tixier-Vignancourt, and many people found this quite exhilarating. By insulating the executive authority from party opposition, de Gaulle has brought France back to its old political pattern. If there is any surprise in the results of the ballot of December 5, it is that 44 per cent still do not disperse into their erstwhile political coteries and prefer to vote for de Gaulle.

This is an important portent for the second ballot, for there will be no political issues in it: it will be a ballot on de Gaulle. So it is more likely than not that it will repeat the results of the earlier referenda.

The immediate prospect, therefore, is quite unexciting. De Gaulle does not like to share power; so his confrontation with the EEC is likely to continue, and it seems improbable that the EEC will go over to majority voting next year, and if it does, that it will on the more substantial issues. De Gaulle is likely to keep up mobility in foreign policy, but it is difficult to see what political dividends this will bring, for neither Western Germany, Russia nor China considers France important enough for her national interests.

The interesting possibilities lie further in the future; for like Nehruism, Gaullism will die with its progenitor. Then there will again be scope for the right to play against the left in France; and if the new constitution leads to the emergence of larger political parties, politics might again become important in a way it has not been for a quarter of a century.

Idle Machinery and Materials

THE speculative element influences decisions about how much inventory to hold not a little. In a situation of shortage inventories would be higher than in circumstances of easy supply. Of imports, since there is perpetual shortage, there is a case for stocking up as much as you can. These proclivities do not always emerge from statistics of inventories carried by industries as a whole; it is to the stock figures of individual enterprises that we have to turn. Those who can get the finance and can bear the cost of it and those who can get the import licenses will stock up.

Public sector undertakings are evidently no exception to this pattern of behaviour. In their case, if anything, the financial burden of carrying excessive inventories seems to matter even less and the prospect of being hauled up before Parliament should shortage of this or that material cause a break in production is apparently a strong inducement to carry as large inventories as possible. The figures of inventories which can be culled from the Finance Ministry's latest report on the working of public undertakings are really revealing. In the aggregate at the end of 1963-64 inventories carried by the 22 undertakings classified as "running" were equal to the value of 11 months' production. Hindustan Steel held inventories equal to nine months' production and the other 21 equal to 14 months' production.

The largest component of inventories held by public sector undertakings is raw materials, stores and spares which account for 70 per cent of all inventories. Raw materials, stores and spares with the 22 running concerns amounted to 14 months' production. Hindustan Aircraft and Indian Telephone Industries had stocks which on the basis of the year's consumption represented production requirement of 30 months and 24 months, respectively. Stocks of raw materials, etc., carried by Bharat Electronics and Fertilisers and Chemicals were sufficient to meet 15 months' production needs. Stocks held by Hindustan Shipyard represented 13 months' consumption, while those of Fertiliser Corporation, Hindustan Antibiotics, National Instruments, Praga Tools and Garden Reach Workshop were equal to 12 months' requirements. And, finally, to take the most ridiculous instances: stocks with the National Coal Development Corporation stood at Rs 16.7 crores at the end of 1962-63 whereas total consumption during the year had been just Rs 4 crores, or roughly stocks equal to four years' consumption! In the case of Travancore Minerals stocks amounted to Rs 5 lakhs whereas the year's consumption was just Rs 0.3 lakhs.

In addition to imposing an avoidable heavy financial strain on the undertakings themselves, idle stocks of raw materials, stores and spares represent waste of scarce resources which could have been put to productive use elsewhere. The latter consideration has now assumed particular significance in respect of imported materials in view of the drastic curtailment of imports. The report that the Government has set up a cell for controlling inventories in public undertakings has, therefore, come not a day too soon. The cell is expected to induce these undertakings to reduce inventories to minimum levels and direct the surpluses released to units in need of them. The considerable possibilities in this direction should be quite clear from the statistics quoted above.

Along with the reduction of inventories another task which calls out for urgent attention is that of achieving optimum utilisation of construction machinery and equipment used by various projects at the construction stage and subsequently left to lie idle. In the absence of any arrangements to transfer such machinery from one project to another, new projects flitely

place orders abroad for machinery even though similar equipment may be lying idle, and probably getting spoilt through disuse and poor maintenance, with some other project.

One way of tackling the problem would be to create a central pool which will lease out items of machinery to projects for as long as they need them and then take them back. In fact, some such scheme has been under the Government's consideration for the last two years or even longer. It is to be hoped that along with the cell to control inventories, the Government will also take necessary action to create a suitable agency for keeping equipment commonly needed by different projects circulating.

UK: Crystal Gazing

Our London Correspondent writes:

A SERIES of economic predictions on the outlook for the British economy have recently been published and, although there are small differences in emphasis, the general consensus seems to be that the rate of growth of the British economy in 1966 will continue at a slow rate of around 2 to 3 per cent — below the target outlined in Brown's National Plan and below the level of growth achieved by other industrialised countries.

The main organisations who have undertaken these forecasts are the National Institute of Economic and Social Research, the London and Cambridge Economic Service, the Business Economists Group and the Common Market economists in their Report on the "Economic Situation in the Community".

The National Institute has now built for itself quite a reputation for economic predictions. Its latest report is slightly more optimistic than the quarterly forecast it published in August. In its earlier report, it predicted snowballing stagnation during the coming year, but its latest report maintains that while there will be a slow-down in economic output in Britain next year, there will not be a recession. Output will probably rise slowly at a rate of about 2 per cent in 1966. The National Institute has also revised its estimate of the likely figures of unemployment. In their August review they suggested that in the attempt to right the balance of payments, Britain might well be faced with unemployment amounting to some 500,000. The Institute now be-

lieves that although unemployment will rise, it will not be above 2 per cent in the fourth quarter of 1966, as it had suggested earlier. A figure of approximately 1½ per cent would probably be nearer the mark.

The London and Cambridge Economic Service, which published its own report before the National Institute report came out, also predict a 2 per cent growth in the UK economy in 1966. A similar rate of expansion was also predicted by the Business Economists Group which met in London last week. While the Institute believes that the gross domestic product in the fourth quarter of 1965 is 1½ per cent higher than it was in the first half of 1965, the Business Economists believe that gross domestic product has stagnated.

The Common Market economists predict that Britain's rate of growth, which should reach about 3 per cent this year, is bound to decline next year if Britain's programme to re-establish equilibrium in external payments is fully realised. "At all events, some slackening of business in the United Kingdom is highly probable for the simple reason that the industrial investment cycle should, in any case, be entering upon a less expansionary phase".

Bleak Prospects for Exports

THE Business Economists Group is more pessimistic than either the National Institute or the London and Cambridge Economic Service. It differs mainly in that it makes much lower estimates for public spending. The Institute, which has had an excellent forecasting record, as far as Government expenditure is concerned, anticipates a higher rate of spending than do the Business Economists. While some economists keep asking why the Government's deflationary policies are taking so long to work, the Institute believes that the measures taken are already beginning to bite, and as evidence, points to the levelling off in personal consumption. The Institute also believes that private investment will decline and is inclined to treat the latest Board of Trade estimates of a rise of 5 per cent in manufacturers' investment intentions, as being unduly optimistic, although, of course, they believe that public investment will make up for the shortfall in private investment.

Perhaps the most depressing feature of the latest National Institute Review is that relating to Britain's ba-

lance of payments. Here, the Institute makes a slightly less optimistic forecast than it made three months ago. It now feels that there "may not quite be a basic balance in the second half of next year". It fears that a small deficit may result in the second half, instead of the surplus the Government has been confidently predicting. The main reason for this more pessimistic viewpoint is that the Institute now assumes no further drop in import prices. This slightly less optimistic view seems to be borne out by the statement by Callaghan in the Commons debate on the import surcharge last week.

The Institute is also rather pessimistic about the progress made so far in tackling the really basic issues which face the British economy. "The problem of combining an improving balance of payments with a faster growth rate does not, as yet, seem much nearer a solution — particularly when the improvement has to be such as to enable Britain to repay some £900 millions of debt in the next four years or so". If Britain is to cope with this problem, the Institute believes that it must either check its propensity to increase imports, or make exports more competitive, or do both.

In these circumstances, it might perhaps be interesting to examine how British exports have been faring. Recent figures published by the Board of Trade, show that Britain's performance as an exporter of manufactures in 1964 was a good deal worse than that of the rest of the major industrialised countries of the world. While British exports of manufactures in 1964 increased by only 5 per cent compared with 1963, Japanese exports rose by 23.4 per cent, US exports by 18.3 per cent, and German exports by 14.5 per cent. It is in the field of engineering goods that Britain has fared worst. UK engineering exports, half her total exports, rose by no more than 1 per cent in 1964, compared to the 14 per cent rise recorded by the main manufacturing countries in aggregate. "This rate of growth roughly in line with an average annual increase of some 4½ per cent over the past decade, was smaller than the 6½ per cent increase achieved in 1963 even though world demand was growing more rapidly in 1964 than in 1963". Since world trade is expected to be less buoyant in 1965, a further slowing down in UK exports is to be expected.

Although imports have not risen very greatly this year, the slower rise, according to the Institute can be fully explained by a combination of the effects of the surcharge, last year's good harvest and the lower figures for stockbuilding. For all these reasons, unless something more dramatic is done to expand British exports, the outlook for the economy is bound to be vulnerable.

The Business Economists Group,

CAPITAL VIEW

Too Much Secrecy

Romesh Thapar

ARE we growing up? I hope so. Chinese violations of cease-fire positions in Nathu-la and Thag-la have not generated the kind of embarrassing pressures which the GOI was compelled to succumb to in 1962. The fire-eaters of those days now adopt a patient and supposedly wise posture. This is not the result of some special magic exercised by the GOI. We are becoming a wee bit more practical about violations of disputed frontiers and realise that careful calculations have to be made before responses are formulated.

Living with the world's longest ever cease-fire line — at a cost of anything from Rs 4 to 5 crores per day — is not a situation made to order. The Prime Minister has thought fit to describe the Chinese operations as an attempt to colour the background to the Soviet-sponsored Tashkent summit meeting between India and Pakistan. Perhaps, he is right. But it would be a grave mistake to imagine that the Chinese do not intend anything more than 'needling'. It is possible that Peking may decide to re-occupy the disengaged zone along the Himalayan front on the plea that India has refused to settle the question of boundaries and is quietly infiltrating into this 'disputed area'. This would be the Maoist way of declaring that the Colombo proposals are dead.

Army men, more confident than before of meeting Chinese moves, are naturally anxious that their tactical freedom be ensured. While it is true that for the moment Parliament has accepted the Prime Minister's argument that military moves cannot be made a subject of public debate, we who observe the scene in the Capital wonder what would happen if the Chinese decided to push deeper into

however, takes a somewhat more optimistic view of Britain's foreign trade. A report drawn up by a special working party of 13 economists from leading U.K. companies, suggests that Britain's export performance will improve over the next twelve months to a point where international payments balance. This forecast of course has been based on the assumption that world trade continues to expand at about the same rate as in 1965,

that the import surcharge is reduced in the second half of 1966, and that investment allowances are strengthened during the year. It also assumes that monetary policy will be less restrictive and that fiscal policy will be broadly unchanged. Many of these assumptions, are, however, open to question, and one is forced to the conclusion that the Business Economists' Group is perhaps a little too optimistic about export prospects.

the disengaged zone. The Prime Minister and his colleagues need to be more coherent about explaining the implications of defending a sprawling frontier. It is not enough to talk tough. We must think tough. And the starting point of this toughening up is to get public opinion accustomed to the idea that effective defence often involves the giving up of undefendable territory in order to hit the enemy where it hurts. This understanding just does not exist among the politicians. It has to be drilled home in the interests of political stability in times of crisis.

It is unfortunate that the Prime Minister did not utilise his statement on the present situation in NEFA to explain these matters. His description of the 1962 decision as a mistake shows that he himself has yet to understand the choice that confronted Jawaharlal Nehru in those days. In October 1962, it was not clear that the Chinese would attempt a major push into NEFA. After the first assault, a withdrawal to the foothills would have given the Chinese their full claim line. The attempt to defend a position as far north as possible was correct, but the attempt to treat Se-la as a fixed bastion was disastrous. Plans should have been formulated for a fighting withdrawal to more favourable terrain in the event of the enemy out-flanking and cutting off the position. Mobility and flexibility are two qualities which the Chinese adventurers respect.

Again, for the same reasons, the secrecy which blankets the details of the campaign in West Pakistan prevents the education of public opinion. Nor does the Defence Minister help matters when he makes bland statements in Parliament to the effect that we knew what there was to be known

of the Ichhogil defences and the fortifications in the Sialkot area. This strange obsession to keep us uninformed about past events, even about the NEFA debacle in 1962, is most unhealthy. In this context one wonders whether the members of the National Defence Council have been properly briefed on the lessons learned from two armed collisions. Indeed, those who argue that U.S. Embassy personnel in the Capital probably know more about the details of these collisions than members of the Emergency Committee of the Union Cabinet might not be so wide off the mark!

Members of Parliament are aware of this sorry state of affairs, but have been persuaded to remain silent "in the interests of national security". This cult of self-censorship, now generally practised by publicists and commentators, is a miserable betrayal of their responsibilities and cannot be dressed up in patriotic clap-trap. It is buttressed by the official 'guidelines' offered as a mental straight-jacket to newspapermen and accepted without a whimper by them. The leading elements of the GOI may for the present rejoice in the conformism they have established but conformism in a basically democratic society is known to crack suddenly. And, then, the deluge.

We are being kept in the dark about almost everything. You can visit the power levers in Delhi and locate almost every possible interpretation of India's present situation, including the rather emphatically worked out opinion that the crisis is being exaggerated to facilitate the acceptance of unfavourable aid terms and to blunt the leftist opposition to a sell-out. This mass of conflicting opinions, however, finds agreement at several

points: that next to nothing is being done internally to assess our agricultural and industrial potential, to mobilise and organise it effectively; that urgent agricultural and industrial input demands, beginning with fertiliser production, will be exploited by western suppliers to open up the Indian economy for a deep penetration; and that the 'new orientation' of GOI policies is already taking place without fanfare and publicity, imperceptibly. If the Bechtel fertiliser deal is through, as report would have it, and on terms rejected earlier, then the 'new orientation' has certainly been launched.

Judging the mood of the Senators and Congressmen from the USA, and of foreign businessmen, who have suddenly adopted a more optimistic tone on India's future prospects, it does appear that commitments are being made which have yet to be publicly recorded. If this is an unfair comment on what is believed to have been going on behind-the-scenes, then the optimism is inexplicable. At this moment, our state cannot by any stretch of the imagination exude optimism — unless, of course, we are viewed as a potentially profitable 'take-over'.

Apparently, assessments of this sort are being made in various capitals of the world, particularly in Moscow and Washington. While it is true that mechanical ideological tests need no longer be treated as valid, political analysts will not be convinced of India's self-reliant posture unless the concessions now being envisaged are counter-balanced by a more solid immediate and perspective control over the direction of economic development. If concessions are necessary to ensure vital agricultural and industrial inputs, it is equally necessary for the State to take a firmer organisational grip over banking and foreign trade. Moreover, the public sector, dominant in key sectors, must be protected against the erosion which might take place as *ad hoc* commitments are made by a government increasingly functioning on the advice of senior bureaucrats.

A flexible internal economic policy, based on clear perspectives, is only possible on the basis of a continuous probing of the situation. An informed government and an informed public opinion are a guarantee that private lobbies will not have their way. The Planning Commission was designed to play this role. Today, this machine is in the doldrums. And soon it may

be put into cold storage. This is a development which is causing much uneasiness in political circles still able to think.

Another session of Parliament is ending, but we do not seem to have moved nearer to understanding what we have to do to survive the trials of 1966. A government which refuses to inform, which changes its statistics from day to day, which fails to lead, remains unchallenged. This is the reality which we have to contend with. The alarms on our frontiers, our hopeless dependence on foreign food

and aid, the apathy which paralyses the GOI, our incapacity to get down to the jobs which need to and can be done, have become a part of everyday living—and are, unfortunately, accepted as such. Until this mood changes, no challenge will crystallise.

Tailpiece: The Chanda Committee on Mass Communication Media has delivered itself of another profound judgment after months of investigation. Its 'consensus' is that Television is a highly sophisticated medium very different from broadcasting and cannot be developed as an adjunct to it!

n towards progress...

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in

1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America, and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

Governor's Politics

SINCE Kamaraj's recent visit something is afoot in Kerala. The Congress desire somehow to get back into the saddle remains a constant factor making for instability. What is new is that some quite mischievous attempts are being made to translate this desire into a damaging reality, regardless of the cost to Kerala. The most shocking part in all this is that of Governor A P Jain. He has now publicly declared his intention to return to active political life. The infighting in UP is probably calling irresistibly. So he would like to wash Kerala off his hands well before 1967 to enable him to contest either for Lok Sabha or the UP State Assembly. This personal ambition spurs on his natural partisanship for the Congress.

In Jain's view the situation now and in the next few months offers many advantages to the Congress which may not remain, at least in their present dimensions, till early 1967. The image of the Congress on a national scale is brighter than it has been for some time, thanks to the conflict with Pakistan and the Chinese and their withdrawn ultimatums. There is a feeling that if the nation is in danger and its vital stability is to be guaranteed, then the only party all over the country which can ensure this is the Congress. The elections in Kerala, if held soon, could be presented as a sort of vote of confidence in this, at present, only possible shape of national unity.

Similarly, there could not be a worse time to hold the elections, in his view, for the Left Communists, the biggest anti-Congress force in the State. There are very few, indeed, who would question the patriotism of E M S Namboodiripad and his colleagues but there are many who would wonder at his political attitudes and remain sceptical as to whether he has the united backing of his party. The acknowledgment by him of the letter of his party State secretariat criticising his stand and the dismissal of his private secretary have raised a great deal of dust in the State. Perhaps it could not be done, but if Namboodiripad had stuck firmly to his original statement on Pakistani aggression and based his agitation on the resolution passed by his party's Kerala State Committee in the middle of September, all the present embarrassment could have been easily avoided.

The further calculation of Governor Jain is that the Left Communists will not have the same manoeuvrability as they had early this year. Adjustments with the Muslim League would be extremely difficult, the SSP is much cooler towards the Left Communists than some months ago and the dissident Congress has shown itself more blatantly reactionary and anti-Communist than even the official one. Finally, the selective arrests and releases of the Communists have damaged their party apparatus more than the sudden swoop late last December.

The key to the situation, in his view, is the reconciliation between the two Congresses. And the central figure here is Mannath Padmanabhan. Hence it was that Kerala witnessed the disgraceful spectacle of its Governor going all the way to the octogenarian Nair chieftain's home to receive his donation to the National Defence Fund. What was even more sickening was the tribute paid by Jain to Mannath. He called him the "Gandhi of Kerala" since he had done for Kerala what the Mahatma had achieved for the whole country. A greater insult to Gandhiji could not have been conceived. Everybody knows that Mannath was a toady of the British as well as of the Maharajah and that he is a proclaimed communalist on behalf of the upper-class Nairs. Never, even by mistake, has he done anything that would help the modernisation, advance and deliverance of the Malayalees. Yet for bringing him round no limits on lying sychophancy were observed.

Governor Jain's strategy is well thought-out but it can be quite easily upset. Even today the Left in Kerala can come back to power if only it unites. As elsewhere in India, the people of the State have a wise resilience about them. When it comes to the defence of the country they are quite willing to rally behind the Government and to give it all necessary support. But when it comes to internal politics then the parties are judged according to their programmes, personalities and work insofar as the level of choice has been reached. The defence of their own needs of living quite obviously become matters of paramount importance. In the State the Congress has not been able to offer either advance or stability and the only force that can give both is the United Left. Kerala is the one place where a viable

progressive alternative to the Congress has arrived politically. If this can be projected challengingly, Jain's calculations will be upset.

Further, if Left unity is systematically rebuilt and consolidated the grand electoral coalition planned by the Congress leadership will be difficult to bring into being. The dissident Congress is not going to easily walk back into the parent body. Too many vested interests have developed. The official Congress is not so much more powerful than the rebels as to make the latter surrender unilaterally. If the Left rival proves its powerful existence this obstinacy of the dissident Congress will increase to the point of demanding a coalition rather than a merger — a coalition, moreover, on the basis of a clear demarcation of areas of influence. This might itself prove an impossible hurdle for the two Congresses, based as they are on a criss-cross of caste and regional affiliations. If the two Congresses are unable to come to some kind of organisational understanding, then other parties are unlikely to be responsive to the call for the grand crusade for the Restoration. Response apart, the Muslim League is in an unenviable position. Its hold has weakened somewhat in what were its former impregnable fortresses in Malabar. Alliance or adjustment with it would prove nationally embarrassing for the Congress, especially in the heartland of Uttar Pradesh where the Jana Sangh is on the offensive. It cannot find an ally nor can it do without one.

The prospects for Left unity are not too bad, either. The core of that unity is the rapprochement at the level of action, not of ideology or grand political strategy, of the two Communist parties. As at present this should not be too difficult to achieve. Despite the overwhelmingly better performance at the polls, the Left Communists have declared their readiness for an electoral pact. With the Muslim League out of the way, the Right Communists have no difficulty in giving a positive response. Indeed, Left unity has been achieved at the all-India level on the basis of some sort of charter of demands. This could find flesh and blood in the Kerala election battle. The possibilities are good. What is needed is a drive to get moving immediately rather than wait for the date of the poll. The lack of this drive is the dark lining in the silver cloud.

What Do We Know about Growth?

Ashok V Desai

Economic Growth in France and Britain, 1851-1950 by Charles P Kindleberger; Harvard University Press, 1964; pp xii+378; \$8.95.

LITERARY economics can best deal with bivariate relationships. Descriptions of relationships between three variables border on inelegance; more variables are impossible to handle. One can still manage if the partial relationships are additive — if the relation of one variable to another is independent of and additive to the relation of a third to that variable. In this case the marginal relations are bivariate. The achievement of marginal analysis is that it made possible the verbal treatment of multi-variate relationships. Its limitation is that it is often wrong.

Kindleberger takes bivariate theory at its own literary, qualitative level and shows that almost all of it is contradicted by some phenomena or other in British and French economic history of the last century. He chooses the hypotheses from those actually put forward by historians of the period, but his selection covers virtually all the theory of development that is taught today. The student of theory should read this book, not merely for the dose of scepticism it conveys, but also to learn the skill with which it brings facts to bear on theory.

Economics and History

How good is the book as history? Kindleberger denies being an economic historian, for "the badge of an economic historian is won by working with primary sources, not in making syntheses of already synthetic materials" (p 1). The value of this criterion might be questioned; it might be argued that the work of historians would gain in worth if it had more sweep, imagination and explanatory force. But such a debate would be academic, for the aspects of economic historians that are brought to light by Kindleberger are their tendency to make sweeping generalisations and their disrespect for or lack of skill in looking at facts. The difference between economic historians and Kindleberger does not lie in the depth to which they dig into facts, but in their inclination to suspend judgment: economic historians tend to be much more devout.

The quality that a layman associates with a good historian, rightly or wrongly, is literary style. This is per-

haps what attracts Kindleberger to history, for he recognises among social scientists "the lack of a felicitous prose style, with its possibilities of irony and paradox, which makes the subject so enjoyable in *belles-lettres*" (p 88). Maybe literary self-indulgence was one of the factors that led him to treat France instead of Germany. Judged by literary standards, Kindleberger's book is much more pleasurable to read than average economics; and he is master of economy. He also shares the historian's penchant for putting the choicest bits in footnotes. But he has less concern than a historian for flow and coherence. His interest is in theory-hunting, but he does not pause to finish off each theory. Once he sees it lying on its back, he loses interest and goes on to the next theory. This leads to a certain abruptness of transition; it leaves the reader breathless. The book is racy, but lacks finish.

Coal and Steel

The book begins with an outline of economic growth in the two countries and ends with an appendix on statistical data. It can be divided into four sections, dealing with factors of production, questions of organisation, sectors and industries, and philosophical questions.

The chapter on resources is mainly devoted to a rebuttal of two arguments: that the growth of French industry was inhibited by the high cost of coal, and that the British steel industry lost ground as a result of technological changes in the last quarter of the nineteenth century. Coal, Kindleberger argues, could have been imported by France, and its costs were high owing to high tariffs and underdeveloped transport, both man-made factors. This is correct as far as it goes, but is probably not the whole story. French protection was comprehensive and relied almost entirely on tariffs; it must therefore be expected to permit a higher general level of domestic prices and to reduce both imports and exports. This is Weiller's view, and Kindleberger seems to agree with it (p 280). But if that were the case, the protection given to coal industry as well as the high price of coal might have been illusory: the dif-

ference between the home and foreign prices of coal might not have been any greater than for commodities in general. Kindleberger does not say whether this was so or not.

Borrowing and Lending

Kindleberger takes capital chiefly to mean loan finance. Even in this sense, capital would be of interest if industrialists were indifferent between internal and external finance and lenders between loans to industry, governments and railways. But they were not; preferences between different kinds of finance and investment were even more marked in the nineteenth century than they are today. And for some reason there was, in all west European countries, a large volume of saving by people who were not directly managing industry. Whether they were people who had made money from family firms and then liquidated them, or had amassed wealth by serving the state or selling powers it conferred on them, we do not know; their savings are, however, an indubitable and conspicuous phenomenon. In Germany there were institutional innovations — banks, real estate companies, mortgage banks — which channelled these savings into industry, land development and buildings; institutions in France and Britain channelled the savings into international investment and state loans. This had nothing to do with relative rates of return, which were higher in home industry. Kindleberger would perhaps agree with this; in fact, he gives some interesting examples of parochial preferences for particular forms of investment. And yet he concludes:

"More savings insistent upon finding an outlet in domestic industry would have been better than the existing amount or less, unless by some chance the reduction in demand for consumption goods would have blunted investment incentives. But this is true only in the sense that more of anything is better than less in a world of positive prices. The supply of savings was adequate. It is possible to blame the greed of the financial community in France, though not in Britain, but it would still be necessary to explain why

J.A. 65/49c

You are looking at 2,000 grammes of gold. These ornaments can earn a tax-free income of Rs. 6,000 in 15 years. Unlock your safe and your bank vault where your gold lies idle. Unlock your heart and release your gold for the national good. We shall refine your gold to 23.88 carats. We shall purify it on the altar of service to our sacred motherland. The gold will be returned to you after 15 years, blessed, burnished and brighter.

Serve your country—get Gold Bonds

Gold locked up is *idle* gold. Gold invested in Gold Bonds is *active* gold—you earn Rs. 2 per 10 grammes every year. (One tola equals 11.66 grammes. A sovereign weighs 8 grammes).

No questions asked

When you exchange gold, gold coins or gold ornaments for Gold Bonds, nobody will ask you how you got them. No action will be taken under the Gold Control Order or Customs rules.

You get purer gold back

Old ornaments have only 18 to 22 carats purity. (Sovereigns are of 22-carat gold). When you exchange these for Gold Bonds, the gold will be refined to 23.88 carats. You get this purer gold after 15 years. Use this golden opportunity to earn an income on your old-fashioned ornaments; when these come back to you as purer gold, you can convert it into ornaments of any purity in designs that are more pleasing to your eye. The full benefit of any increase in the value of gold is also yours.

Compensation for making charges

If you tender ornaments, you get Rs. 3 per 10 grammes of refined gold as compensation for making charges.

Gold Bonds help business and industry

Gold with the Government means foreign exchange, badly needed for machinery, raw

materials and defence equipment. Lack of foreign exchange may disrupt business and industry and threaten your family's prosperity.

Gold Bonds as security

You can borrow money from banks with Gold Bonds as security.

Exemption from taxes

The earnings from Gold Bonds are free of income-tax.

Gold Bonds do not attract wealth tax. Profits from the sale of Gold Bonds are tax-free.

Gold Bonds are exempt from gift tax for the first subscriber up to 5,000 grammes (about 429 tolas) in a year.

No estate duty is leviable on Gold Bonds when they are inherited for the first time up to 50,000 grammes (about 4,288 tolas).

Where to get Gold Bonds

Gold Bonds are issued at the office of Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi and all branches of the State Bank in India and its subsidiaries.

Help the country

The future of the nation and of those who are close to your heart depends on how much gold you exchange NOW. Put your gold to work in the service of the country.

Issued by the Ministry of Finance, Government of India

KEEP YOUR GOLD IN TRUST FOR THOSE WHO LOVE

more opportunities for big profits were not forthcoming on the domestic front". (p 68)

The implication, that savings would have flowed into domestic industry if profits had been high enough, can be disputed. Intermediary institutions could have diverted savings into domestic industry even at existing profit levels; the story of British and French foreign investment is more often one of folly and disappointment than of high and secure returns, if we except politically insured investments like those in Indian railways. And even if it were a matter of profit levels, profits in industry would have been higher if the savings had been consumed or if the state had taxed them away and spent them on public works or war.

Sociological Determinants

The chapters on social determinants, entrepreneurship and technology are among the most interesting, not least because they contain more personal comment.

Kindleberger voices the doubts that arise in economists' minds regarding sociological determinants of growth. There are doubts regarding causality: "Is the public school responsible for Anglo-Saxon repression, or vice versa?" (p 105) The explanations are of a *post hoc* nature: because French economic growth was slow, one discovered or imagined all sorts of traits in French character to explain it; and when the performance suddenly improved after the last war, the explanatory traits also changed. "If national character can change overnight, and in particular respects, how far can it be used to explain historical events?" (p 111).

Kindleberger examines the Pitts-Landes thesis which attributes the slow growth of French industry to the dominance of aristocratic values in business dynasties, and offers what seem to be weighty rebuttals. The behavioural traits — "hesitation about innovation, high rates of saving, maintenance of liquidity" — could be explained by reference to the business environment and without bringing in values. Further, caution and conservatism were displayed by firms other than family firms.

The chapter on scale and competition is somewhat chaotic. While the author ends other chapters on a sceptical note, he seems to have begun this one without much hope. Perhaps the difficulties of definition are overwhelming: but it might have been

useful to look at the reasons behind merger movements. Many mergers aim to diversify the product-mix or bring together firms with good investment opportunities and those with liquid assets. Such mergers would increase the rate of growth at least immediately. The mere fact of change in concentration signifies nothing.

Structure of Agriculture

In the chapter on agricultural transformation, Kindleberger discusses Clark and Bellerby's view that French agricultural and industrial incomes were roughly the same, and concludes that agricultural wages at any rate were much below industrial. He could have reached firmer conclusions if he had noted that what goes under the name of French industrial wages is mainly craftsmen's wages, which are generally much lower than wages in organised industry. For the latter there are virtually no historical statistics in France.

Since relative wages in agriculture fell from the 1860s right down to the first World War, Kindleberger infers that industrial expansion was not slowed down by labour shortage. Though this evidence is not very strong in itself, the conclusion deserves to be accepted because it would be difficult to find contrary evidence. But the argument of physical labour shortage is too unsubtle: the really interesting argument to investigate is that owing to the small size of farms, the French marketed surplus was small so that the high prices of agricultural wage goods and the consequently high wage costs reduced the profit margins and the investible surplus of industry. This argument requires international comparisons, and is difficult to test because of the lack of profit data: but it needs to be looked into in the French context. The structural reasons for the slow improvement in French agriculture up to 1950 and for the failure of British agriculture to adjust itself to the Great Depression would have become clearer if Kindleberger had dealt with the last twenty years. Small farms in France have preferred wheat to animal husbandry in spite of strong price incentives, while in Britain, the output of beef and milk has gone up remarkably as a result of standardisation and organised marketing.

In the discussion of the relation between Britain's slow growth from 1870 to the first World War and its shift to the export of less highly processed commodities, Kindleberger

broadly follows Saul; but he goes on beyond the war to a new conclusion: that "the overvaluation of the pound sterling in 1924 may have sped British growth in the long run while it was hurting it at the time" (p 278). Earlier, Kindleberger writes, "In retrospect, the stabilization of the pound at par seems to have been inevitable, given the history of one hundred years of the pre-eminence of sterling. Economic discussion had little to do with it. The independent roles of the government, and of economic analysis, were in reality narrow. As on so many occasions, the task of economic analysis was a priestly one, to justify what was taking place for deep-seated reasons rather than to determine the direction of movement" (pp 206-207). There could hardly be a more severe judgment on economists, and in the context it seems unjustified.

Question of Response

Devaluation in 1925 could well have speeded structural change in Britain. Britain lost markets for staple products because of the growth of industry in underdeveloped countries, and would not have won them back by devaluation. On the other hand, it would have increased exports of engineering and metal goods. And economists did not play an entirely priestly role: there were eminent and vocal heretics.¹ The unfairness of the judgment becomes clear if we apply it to present-day Britain, which in this respect is exactly where it was forty years ago. The only opponents of overvaluation of the pound today are to be found among economists. Let not the sins of bankers and politicians be visited on economists.² It is more to the point to say that the exchange rate might not be frightfully important, and that "it is not the foreign trade that leads to growth — any stimulus can do it if the capacity to transform is present or can be drawn out of dormancy" (p 287). But even this is not very illuminating unless we can recognise and manipulate the "capacity to transform".

This "capacity to transform" is the heart of the matter. As Kindleberger puts it, "objective conditions count less for economic development than the nature and extent of response to them" (p 308); and all his positive comments are variations on this theme.

This problem of response is very perplexing, because one does not know how to go about solving it. All those who have something to say on it seem

to assume a priestly role. There are the doctrinaire views that the capacity of a society to transform depends on geographical factors, and that it is the same in all societies. Some people back education as the prime factor, forgetting that the requirements of education both as a consumer good and as an industrial input depend on the average real income. Others go and measure the strength of the "motive for achievement" in different societies, again mistaking covariation for causation. None of this gets one very far: one wants something less partial and more operational.

Kindleberger seems to think that the response depends a great deal on the nature of the organisation — its size, flexibility, power, distribution, etc. He gives instances of technical improvements which were not introduced because the resulting economies were external to the institutions which would have to invest (pp 143-147, 247). Larger, more integrated firms might have introduced the improvements; but as Hirschman might point out, large firms would have internalized the diseconomies also. And they might harbour inefficient departments by not making departmental cost calculations or adopting a let live attitude. There is little one can say at the level of generalities.

Besides, organisations shape in the image of their leaders. Technical progress on the Great Western Railways between 1830 and 1954 was concentrated in the regimes of two managing directors, Brunel and Churchward (p 138); and the difference noted by Kindleberger in returns to investment in British and French nationalised industries (p 160) has much to do with the top leadership and the chances given to it by the governments.

So the problems to think about are, how to create organisations that can be easily split up or amalgamated, how to take decisions regarding their size, how to choose their leaders, how to devise chains of authority so as to give the leaders freedom of manoeuvre, and what rules of financial management would be conducive to innovation and growth. Kindleberger does not tackle them, perhaps because the economic historians whom he takes as his text did not notice them, or because the historical information threw no light on them, or because it is difficult to make confident generalisations about them. But the difficulty does not alleviate the need. Whatever the level of generality at which one might tackle them, these

problems are the most urgent ones for economic development.

Notes

¹ Kindleberger would deny Keynes the role of a heretic because he wrote an article in the *Nation* supporting the return to parity. Keynes was much less devoted to his own views than most of us, and he can easily be accused of inconsistency; but I don't think he could be said to have played a "priestly" role regarding the return to gold.

² Kindleberger might feel like re-

versing this in the context of "Economic Consequences of the Peace" in which Keynes says, "the economist was profoundly ironic at the expense of the four statesmen and politicians and, on many matters of substance and colour, wrong" (p 202). The question of German reparations was a political one, and one's position on it depends largely on personal prejudice. Personally, I regard "Economic Consequences of the Peace" as a rare achievement, being one of the two readable books with an economic bearing that I have read.

SERVING YOU ON THE SEVEN SEAS

Tight, staunch and strong, JAG[®] Ships carry cargo across the seven seas. Whatever the merchandise, you can count on them to carry it with speed and safety. With steady growth and world-wide operations, JAG[®] fleet also promotes India's maritime trade.

Andhra's Plan for 1966-67

(From a Special Correspondent)

THE blue-print of Andhra Pradesh's Plan for 1966-67 as finalised in discussion between the representatives of the State Government and the Planning Commission in the third week of November involves an outlay of Rs 79.25 crores — a few crores less than what the State Government had asked for. Of this Rs 50 crores represents the quantum of Central assistance and Rs 29.25 crores the outlay by the State Government. The State Government expects to find Rs 22 crores out of this amount from next year's revenue receipts; so additional resources of about Rs 7 crores have to be found during the year. Tentatively in their talks with the Planning Commission the State's Chief Minister and Finance Minister had agreed to raise additional resources of about Rs 4 crores. It has now been decided that this amount should be raised by revising the sales tax structure in the State. A Bill has been made ready to implement the decision.

Vital Project

Out of the total approved outlay for the first year of the Fourth Plan the most important single project that will consume a large part of the proposed outlay is Nagarjunasagar. In fact a major portion of the outlay in the State Government's annual plans during the whole of the Third Plan period has been on Nagarjunasagar. It has been repeatedly emphasised that the earlier this project is completed the greater will be the national benefit in the vital sphere of food production. However, what the Planning Commission has agreed to allocate for the project during 1966-67 is only Rs 8.5 crores and this will form a part of the central assistance of Rs 50 crores.

The allocation is doubtless meagre and inadequate. It does not meet the repeated demand of the State Government for more substantial assistance for the project. The hope, however, is that later in the year, as the execution of the project gains momentum and as the situation vis-a-vis the emergency gets clarified and also as the prospects of the continuing availability or otherwise of food supplies under PL 480 from America and under arrangements with other countries become clearer, the Centre will take a closer and more sympathetic look at

the question of raising the allocation for the project. This, it would seem, is unavoidable in view of the fact that the accelerated execution of the project is essential also in the national context.

In the meantime, the obligation rests on the State Government to complete the construction of the dam and the canals to the requisite length to facilitate provision of irrigation facilities to 5.75 lakh acres by June 1966. While progress in these directions is reported to be satisfactory, the existence of roadblocks, such as the provision of long term credit to the would-be beneficiaries to prepare their lands for cultivation, to construct field channels and bunds etc., cannot be overlooked. Their removal, therefore, should receive high priority; and it is hoped, that the implementing agencies will not permit the apparent intractability of some of these difficulties to obstruct the completion of the programme.

Emphasis on Agriculture

When "defence orientation" of Central as well as State plans is the oft-repeated slogan, the agricultural schemes in Andhra Pradesh's 1966-67 plan assume particular significance, as the State is called upon to play an important part in increasing the food production in the country and contribute to the success of the national food policy. With the Rs 4.9 crore allocation for minor and medium irrigation, execution of schemes in this category should be expedited, especially minor irrigation schemes of the lift irrigation variety, repairs to minor irrigation tanks and others. Other agricultural schemes include development and supply, to which prompt attention is imperative, of new strains of paddy, maize, bajra and others and supply of fertilisers, pesticides and other essential aids. Fertiliser supply, on which augmentation of production so greatly depends, has not shown any noticeable improvement so far, despite assurances of its availability for the emergency food production programme between now and March next. The latest information indicates that only 1.75 lakh tonnes of fertiliser out of the estimated requirement of 6 lakh tonnes has so far been made available.

A gratifying aspect of the 1966-67 plan is that the outlay on power schemes has not been slashed substantially. The Rs 32 crore allocation for power is no doubt less by Rs 6 crores than what the State Government had provided, but on the whole it has not come out badly inasmuch as all the essential schemes in that sector now in progress have been taken care of. Not only will work on the Srisailem hydro-electric project proceed uninterruptedly but preliminary work on Lower Sileru project will be taken up as scheduled. Provision has been made for both of them, as also for the extension of Ramagundam thermal scheme and the completion of the Upper Sileru hydro-electric scheme. It is to be hoped that alternative arrangements will be made to substitute part of the essential equipment for the last mentioned project, impounded by Pakistan. The execution of the electricity schemes will have to be linked up and dovetailed to extension of power supply to the rural areas, with the accent on making power available for agricultural purposes on a priority basis. For rural electrification, an amount of Rs 3 crores is proposed to be spent during 1966-67 and 200 more villages will be electrified, thus bringing the total number of villages electrified in the State to 5,580.

Industry Gets a Pittance

There is reason for disappointment with the outlays agreed upon for some other sectors — especially industries, which receives a pittance of Rs 2.9 crores. Tempering the disappointment is, however, the consideration that establishment of new large-scale or medium-scale industries in general now involves a demand on foreign exchange resources which may not be available, except for the import of essential industrial raw materials, machinery and maintenance parts, besides of course defence equipment. The limited allocation for industries during 1966-67 should, therefore, prompt private entrepreneurs to set up a network of small-scale industries besides utilising existing installed capacity to the maximum extent. It should, at the same time, induce the State Government to give a fillip to such industries by providing all possible assistance to

entrepreneurs to step up production in directions for which indigenous raw materials and equipment are available. In any event, it is the State Government's declared policy to leave the large-scale industries sector to the Centre and the medium-scale industries sector to private entrepreneurs, restricting its operations to the provision of essential aids to industrial development like power, water, land, transport and communication facilities.

In social services, the allocation of Rs 9 crores during 1966-67 should be made to go as far as possible to ensure that no essential and basic programme like primary education, family planning or extension of rural water supply is starved of funds. Of particular importance is the maintenance of the tempo of primary and technical education and to combine progress in these spheres with improvement in the standards of instruction and extension of the programme of training teachers and technicians. Far too much time has already been lost in bringing the benefits of education to the masses of the people and to the growing generation of boys and girls. Andhra Pradesh stands pretty low in the list of States in respect of literacy. Furthermore, in the context of the national emergency which is a testing time for the nation as a whole, nothing is so important as to create among both young and old an awareness of their obligations and responsibilities as citizens. To this end unremitting attention to the extension of primary and adult education facilities is essential, taking care all the time that facilities in the primary education sphere should aim at establishing an equilibrium between boys' and girls' education.

Family Planning, a Failure

Whatever Plan programmes are, or may be, implemented, there looms in the background the frightening spectre of population increase, which in Andhra Pradesh has been in the neighbourhood of 1.8 per cent per annum. This means a progressive increase in the number of mouths to be fed, a larger number of children to be cared for, educated and provided the essential amenities for health and well being and a larger number of persons in course of time to be cared for under welfare schemes and so on. This should warn the State Government against relaxing its efforts to strengthen and energise the family planning programme to keep the birth-rate

under check. There has been a deplorable lack of imagination and competence in this State, as in others also, in devising methods and processes of educating the people on family planning, especially in the context of national development and the need to correlate propaganda and publicity for limiting population growth with food production. All efforts have yielded limited results so far. Official agencies entrusted with the responsibility for making a success of the programme and non-official agencies which have undertaken to help in that direction and receive substantial grants therefor, have failed to deliver the goods, except probably in the form of words.

Between maximisation of dividends from the different development programmes approved and included in the State's 1966-67 Plan and their effective implementation there is close inter-relationship even as there is close inter-connection between effective implementation and the efficiency of the administrative machinery. Two factors

which impede growth in administrative efficiency are the absence of purposeful inter-departmental co-operation and co-ordination in all spheres and in particular in increasing food production, and the general inefficiency of agencies like panchayat raj institutions, co-operatives, voluntary agencies like family planning organisations and other social welfare bodies.

The supreme importance of eliminating these deficiencies and drawbacks and of improving the functional efficiency of various institutional agencies is most readily accepted in theory but equally readily ignored in practice. Hope now centres on the recommendations of the Andhra Pradesh Administrative Reforms Committee, which is expected to prescribe appropriate remedies to these long-standing ills. If the Committee's report answers this requirement, its labour and the public funds spent on it would be justified. If it does not, its labours will be only one more exercise in futility like those of the many earlier bodies entrusted with the same task.

The Jats of Northern India Their Traditional Political System

M C Pradhan

This article describes the traditional political system of the Jats of Northern India based on the khap and the sarv-khap Panchayat system.

An attempt is also made to examine the impact on this traditional system of the social and political changes brought about by the new agencies of development and the new political set-up of Gram and Adalat Panchayats.

[For reasons of space this article is printed in two parts. Part one, below, discusses Jat kinship structure and the bhaichara system of land tenure and the traditional law of inheritance of the Jats and describes the history and structure of khap Baliyan. Part two will examine the functions of the different agencies of the traditional political system and the impact on them of contemporary social and political change. Ed.]

THE Jats are an ethnic group. They are at present divided into three sections, namely, Hindu, Muslim, and Sikh. The Hindu section does not have sub-castes but only clans. In northern India, particularly in the districts of Meerut, Muzaffarnagar, Saharanpur and Bijnor, which come under the revenue division of Meerut, each clan has a compact geographical area of its own. The villages inhabited by a clan are organized into a clan council, and the area under its jurisdiction is called the *khap*. Each clan has a headman who is called Chaudhry, and a Wazir who is called minister or secretary. Both the offices are hereditary. The clan Chaudhry is also the head of the *khap* Panchayat. The Wazir looks after the affairs of the Panchayat and keeps minutes of the cases decided by the *khap* council. Most of these *khaps* belong to the Hindu Jats. But some of them also belong to other castes like the Gujars, Rajputs, Tagas or Tiyaagi Brahmins, and one to Muslim Pathans. Some clan areas (*khaps*) of the Jats contain the Muslim section of the Jat population, which embraced Islam in the latter part of the 18th century. There are no Sikh Jats in Meerut Division.

Khap Baliyan

The various *khaps* of the Jats, as well as of other castes, are organized into a council of all the *khaps* of Meerut Division, called the *sarv-khap* Panchayat. This article describes the traditional political organization based on the *khap* and the *sarv-khap* Panchayat system of Meerut Division, and the effects of the social and political changes brought about by agencies of planned change and of the introduction by the government of a new political set-up of Gram and Adalat Panchayats (village committee and justice committee) upon the traditional political system.

For the purpose of analysis I have taken one of the clan areas of the Jats, namely, the *khap* Baliyan of the Jats of

Kashyap *gotra* in Muzaffarnagar district, as a focal point of study.¹ The Kashyap clan inhabits a tract of 84 villages covering an approximate area of 288 square miles. In all these villages the Jats are numerically important. They are in possession of most of the agricultural land, having driven out other castes from the land when they first came from Punjab late in the 12th century and conquered the present area. The villages of the *khap* Baliyan are multi-caste and multi-communal in composition, and are situated near one another which gives geographical compactness to the clan area.

Other castes like the Water-carrier, Carpenter, Black-smith, Chamar, Sweeper, Weaver, and some Muslim castes living in *khap* Baliyan, have also organized their caste councils on the same lines and having the same villages as those of the *khap* under their jurisdiction (cf Oscar Lewis, "Village Life in Northern India", University of Illinois, 1958; pp 26-31). Formerly, these caste councils came under the jurisdiction of the *khap* Panchayat of Baliyan, but now they function, more or less, independently of the *khap* Panchayat. The decisions or resolutions of the *khap* council now no longer become automatically binding upon the other castes of the *khap* area unless they are also adopted by the respective caste councils. But inter-caste disputes are still referred to and decided by the *khap* council, which will be discussed in detail later.

The history of the *khap* Baliyan, and indeed of the *sarv-khap* Panchayat forms a notable part of the Jat culture of Meerut Division. Various *khaps* and the *sarv-khap* Panchayat have written historical records going back several centuries. The chief historical sources are: (1) the chronicles of *khap* and the *sarv-khap* genealogists or bards giving detailed account of important historical events in which these organizations

took part; (2) royal mandates of Mughal emperors issued to various *khaps* from Akbar's time (1556-1605) to that of Muhammad Shah (1719-1748); (3) personal accounts left by Wazirs and Chaudhries of various *khaps*; (4) recorded minutes of *khap* and the *sarv-khap* Panchayat meetings from 12th century onwards; (5) letters of historical figures like Sada Shiv Bhau, the Maratha general and the hero of the third battle of Panipat against Ahmad Shah Abdali (1761), Nana Sahib Dhondur Pant, and so forth, written to these organizations for military help to fight the invaders and the British respectively; (6) and, finally, the *sakha* or oral account in verse of the settlement of a clan in its present place of habitation and the foundation of a *khap*. These historical records are available with the Wazir and the Chaudhry of the *khap* Baliyan, and the hereditary leaders of other *khaps* or clan areas of Meerut Division.²

Historical Background

According to the *sakha* of the Jats of *khap* Baliyan, a branch of the Kashyap clan (*gotra*) migrated from an ancestral village of Mehla, Gurgaon district in the Punjab, to the present area sometime in the second half of the 12th century. Territorial expansion, colonization or conquest of the villages which now comprise the *khap* Baliyan continued till the first quarter of the 16th century. It stopped at the establishment of Mughal rule in northern India, when law and order were established for a long time to come.

For defence, internal administration, and conquest, each *khap* had a militia. The leader villages of *khap* Baliyan, namely, Sisauli, Shoran, Pur-Baliyan, Harsauli etc, were the military strongholds. Several other villages of *khap* Baliyan were conquered by the *khap* militia at the beginning of 14th century.

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now freely available from our factory at Kota for a wide range of applications such as :

● WIRES AND CABLES	● TILES
● FLEXIBLE SHEETINGS	● CRYSTAL CLEAR ARTICLES
● RIGID SHEETINGS	● RAINWEAR
● CORRUGATED SHEETS	● BRIEFCASES
● TUBES AND PIPES	● TOYS
● FOOTWEAR	● HANDBAGS
● UPHOLSTERY	● BOOK BINDING PAPER

RAJASTHAN VINYL & CHEMICAL INDUSTRIES, P.B. 671, NEW DELHI-1

SHRIRAM
VINYLS

The *sarv-khap* Panchayat, according to local belief, was organized in 7th century by emperor Harsha in his last quinquennial assembly at Prayag (modern Allahabad). But from the written historical records it is evident that the various *khaps* of Meerut Division were organized into the *sarv-khap* Panchayat as early as 13th century.

Besides functioning as adjudicative bodies and institutions of social control, the functions of the *khap* and *sarv-khap* council during the mediaeval period were to defend the *sarv-khap* area from foreign invasions and to preserve internal co-operation between different clan areas so as to maintain military solidarity. For example, at the time of the invasions of Timur (1938), Babur (1526), Ahmad Shah Abdali (1761) and so forth, the armies of various *khaps* fought against these invaders. Each time the decision to defend the *sarv-khap* area was taken in a Panchayat meeting in the interests of common defence and freedom.

From Akbar's time (1556) various *khaps* were granted autonomy in judicial matters, and their hereditary leaders were recognized by the Delhi Court as the leaders of the respective *khaps*. This recognition came from a mandate of emperor Akbar issued on the 8th Ramzan, 987 Hijri or in 1578. The mandate was issued to Chaudhry Pacchumal of Shoron village and Chaudhry Ladsingh of Sisauli, the Wazir and the headman of *khap* Baliyan respectively. Other *khaps*, namely, *khap* Salaklain (Jats of Tomar clan), *khap* Kalaslain (Gujars of Bhatti clan), *khap* Daiya (also Jats), and *khap* Gathwala (Jats of Lal clan), are also mentioned in the mandate.

Impact of British Rule

Sometimes during periods of political unrest or revolt, certain Delhi kings such as Ibrahim Lodi (1517-1526), Muhammad Shah (1719-1748), and a few others, asked the Wazir of *khap* Baliyan and also of other *khaps* to provide military help to crush a revolt or to expel the rebels from the kingdom, or to keep peace within the *khaps*. Such help was provided by the *khaps* but only after it was decided in the meetings of the *sarv-khap* Panchayat; and the conditions on which the proposed help was to be given were discussed and agreed upon by the representatives of the various *khaps*. The political and military weakness of these rulers was exploited by the leaders of the *sarv-khap* Pan-

chayat to their own advantage. Thus, though the *khaps* and the *sarv-khap* Panchayat could not always succeed completely in defending the freedom of the area, they did succeed in getting some concessions in the field of internal autonomy, religious freedom, and freedom from various kinds of taxes levied on the Hindu population by the Delhi kings. The success of these efforts can be seen from a mandate of emperor Akbar. The text of the mandate is as follows:

"By the present *firman* [mandate] certain community Panchayats in India who during the reign of the Sultans [of Delhi] were charged certain taxes before my reign, are now being exempted from such taxes. Every community Panchayat has my permission and is free to carry out its traditional functions in my reign. Both Hindus and Muslims are equal in my eyes. So I give freedom [of action] to these Panchayats. The *jazia* [religious tax levied on the Hindus] and other royal taxes are waived.

"Issued in the reign of emperor of India, emperor Akbar, 11th Ramzan, 989 Hijri [1580]. *Firman* issued by the grand Wazirs Abul-Fazal and Raja Todar Mal".

The *khaps* of the Meerut Division, under the banner of the *sarv-khap* Panchayat, took a notable part in the Indian Mutiny of 1857 against British rule and fought the British armies. The revolt was crushed and important leaders of the various *khaps* who had taken part in the revolt were sentenced to death or imprisonment. They have now become martyrs and their names are still remembered. In 1957 all these *khaps* commemorated these martyrs by holding Panchayat meetings of their respective *khaps*.

With the establishment of British rule in northern India, the *sarv-khap* Panchayat fell into disuse. According to native belief it was discouraged by the British administrators for its part in the revolt of 1857. But the *khap* and inter-*khap* Panchayats continued to function, though shorn of their legal privileges or charter granted them by the mandates of Mughal emperors. No formal quinquennial meeting of the *sarv-khap* Panchayat, according to the old tradition, was held during British rule in India. After the independence in 1947 it was again revived in 1950. Since then formal meetings of the *sarv-khap* Panchayat are held every five years. Its work and resolutions will be discussed later.

The introduction of a new system of administration and the institution of law courts, however, brought another setback to the *khap* and the *sarv-khap* Panchayats, and reduced their political effectiveness to some extent.

Jat Kinship Structure

The political system of the Jat *khaps* is based upon segmentary kinship groups, namely, the lineage group structure of varying depth spans, and the clan. Various kinship units such as *khandan* or minimal lineage, sub-*thok* or major segment of a maximal lineage, *thok* or maximal lineage, and clan, have corresponding political councils of their own. Both kinship units and their Panchayats are complementary in that both tend to support each other and thus produce social cohesion within the Jat community. A brief description of the principles underlying this complementary interaction between these two aspects of the Jat social organization will show how such social cohesion is achieved and how the total political structure of the *khap* is maintained.

The Jats of Meerut Division are organized into localized, exogamous, patri-clans. Descent is reckoned from the ancestors who first came from the Punjab and settled in their present clan areas. There are other branches of these clans, with the same *gotra* or clan names in Punjab, Madhya Pradesh, and other parts of the state of Uttar Pradesh. These branches of a clan do not come under the jurisdiction of the *khap*-Panchayats of Meerut Division, but marriage is prohibited between them. The hereditary headman of a *khap* (Chaudhry) is not considered the descendant of the clan ancestor but only as the descendant of the leader of that branch of clan ancestors who first came and settled in the present *khap* area.

A clan is segmented into lineage of varying depth spans, namely, *thoks*, sub-*thoks* and *khandans*. Like the clan each lineage segment has a headman who is also called the Chaudhry. But unlike the clan his office is not always hereditary. However, once a lineage headman is elected or unanimously selected by the lineage Panchayat, he cannot be removed from his office during his lifetime.

The depth span of a *thok* or maximal lineage varies from ten to fifteen generations; of a sub-*thok* or major segment from six to ten generations; and of a *khandan* or minimal lineage

from three to five generations, from the living adults. These lineage segments are named after the founding ancestors. The line of descent from a founding ancestor is generally remembered or in case of doubt, which only happens in case of *thoks* having many generations, can be ascertained from the genealogical tables of the bard of the *khap*. The suffix of 'ke' meaning descendants of such and such person is attached to the name of the founding ancestor of a lineage group; and this gives a clear indication which segment is referred to, or whether a segment belongs to another maximal lineage or major segment. After the clan Chaudhry, the headman of *thoks* wield the greatest amount of prestige and political influence. These are wielded in diminishing order by the headmen of sub-*thoks* and *khandans*.

A *thok* is divided into sub-*thoks* or major segments, and a sub-*thok*, in turn, comprises various *khandans* or minimal lineages. A *khandan* comprises various nuclear or joint families.

Like the localized clan, each *thok* or maximal lineage has a compact geographical area of its own in a village, including both residential and agricultural lands. *Thoks* do not extend beyond a village.

The lineage segments are autonomous to a large extent, and freedom in internal matters is jealously guarded by each segment. However, *thoks* or sub-*thoks* can interfere in the internal matters of a member lineage if that lineage segment invites the elders of the higher segments to do so, or when the *thok* leaders feel that they should interfere in the affairs of a member lineage for the sake of preserving the solidarity of the whole maximal lineage.

Land Tenure and Inheritance

The spatial compactness of *thoks* or maximal lineage within a certain area of a village is maintained by two factors, namely, the *bhaichara* (brotherhood) system of land tenure, and the customary law of inheritance of property of the Jats. Under the *bhaichara* system, land is equally divided among *thoks* which consist of the descendants of the founding ancestors or original conquerors, so that all may share alike. In this system, possession determines the measure of each proprietor's right. Where a village is divided into *pattis* (divisions of a village for purposes of revenue collection), the land allotted to each may be held within it according to equally divided

shares among the descendant *thoks* of the original conquerors. This differs from the pure *pattidari* system of land tenure, in which the proprietors hold land severally and fractionally according to known ancestral shares (cf B H Baden-Powell, "Land System of British India", Clarendon Press, 1892; pp 131-132).

According to the customary law of inheritance of the Jats, land — whether ancestral or acquired — cannot be alienated outside the *thok* or maximal lineage; and the natural course of succession cannot be altered for the benefit of non-agnates (cf C A Roe and H A B Hattigan "Tribal Law in Punjab", 1895; p 41). The customary law of the Jats differs from the Mitakshara law of inheritance of the Hindus which is not applicable in the case of the Jats. Thus the spatial compactness of the *thoks* within a village is maintained, and the dismemberment of residential or agricultural lands belonging to a *thok* does not take place. Therefore, like the clan, the ties of kinship reinforce the ties of local contiguity at the *thok* level. The nexus between these two aspects enables the Panchayats of various lineage segments, and also the *khap* Panchayat, to exercise social control within their respective units to a greater degree than would have been possible without the help of the *bhaichara* system of land tenure and the customary law of inheritance of the Jats.

The chief function of the *bhaichara* land tenure is to maintain the egalitarian structure of the Jat society in the economic field. But this concept has also been extended by the Jats to other fields of kinship, social and political relations. For example, the principle of *khap bhaichara* or brotherhood implies that all the castes and communities living within a *khap* are like brothers, and this forms a basis of *khap* exogamy not only for the Jats but also in the case of other castes. Jats of other clans or with other *gotra* names living within a *khap* are also considered as brothers and may not marry within that *khap*. Any attempt to flout this rule quickly brings the *khap* Panchayat into action, and an infringement, which is very rare and of which I could find only one example, is seriously dealt with by the *khap*, Panchayat; and the whole family of the defaulter, or even his *thok* or his whole village, may be ostracised until he has made expiation and has satisfied the Panchayat by giving a fine, a community feast, and a firm

promise not to flout this rule in future. As against other *khaps*, the various castes and communities of a *khap* are regarded as "brothers" and are allowed to participate in the *khap* organization as equals. Thus, on the political level the concept of *bhaichara* provides a rationale for *khap* unity and solidarity.

Structure of the Khap

A *khap* is divided into a number of political units called *thamba* Panchayats. A *thamba* comprises a number of neighbouring villages varying, from *thamba* to *thamba*, from 3 to 20. For example, *khap* Baliyan has seven *thambas*. Each *thamba* has a headman whose office is hereditary, and who presides over the meetings of the *thamba* Panchayat. The headmanship of a *thamba* has no backing of a kinship unit like that of the lineages of varying depth spans, and that of the clan. This is the main weakness of the *thamba* as a political unit. When the *khap* Panchayat lost its legal charter given by Mughal emperors on the advent of British rule in India, the *thamba* Panchayats lost their political power and effectiveness as institutions of social control, and to some extent fell into disuse. This was due to the lack of specific support from any of the kinship units and the corporate group structure of the Jat society.

A *thamba* is again divided into a number of informal *ganwand* Panchayats. A group of 5 to 8 neighbouring villages is called *ganwand*. The same principles of local contiguity, kinship proximity, and ties of social and economic interaction, which are the basis of clan and lineage organization as political units, also support the *ganwand* and the *thamba* Panchayats. But unlike a *ganwand*, a *thamba* for the most part is too big to have close social and economic interaction between its villages in day to day affairs (except where a *thamba* comprises only a few villages, say four or five, and in such cases the *thamba* Panchayat still functions effectively and performs most of the functions of the *ganwand* Panchayat). Otherwise, the sentiment of kinship ties is more fluid at the *thamba* level as compared to a *ganwand*.

The *thoks* of a *ganwand* and a *thamba* are related to each other in the sense that some persons from a parent *thok* of a village may have migrated to a neighbouring village of the *khap* area and founded a new *thok* there. This kinship proximity forms

the basis of these two political units. But the *thoks* or maximal lineages of a big *thamba* do not have such close contact and economic and social interaction as is found between the *thoks* of a *ganwand*, which is generally a smaller unit than a *thamba*.

But the village remains the fulcrum of all the political units of the *khap* Panchayat. The village Panchayat traditionally comprises the heads of the *thoks* and the headmen and leaders of other castes and communities of a village. There was no office of hereditary village headman in the villages of the *khap* Baliyan. Political power lay with an assembly of *thok* and caste leaders. The president of a village Panchayat was chosen at each meeting. Even today the village Panchayats hold their meetings on the same pattern when they function within the traditional framework of the *khap* and the *sarv-khap* organizations.

A village is divided into a number of *thok* Panchayats of the Jats and caste Panchayats of other castes living within the village. The *thok* Panchayats are presided over by *thok* headmen, and the caste Panchayats of other castes by their respective headmen or leaders. Similarly, other kinship segments like sub-*thoks*, *khandans*, and joint families, have their own headmen who preside over their respective Panchayats. Thus there is an elaborate hierarchy of political units from the minimal lineage councils to the *khap* and the *sarv-khap* Panchayats.

These political units belong to two categories, namely, those which are based on the corporate group structure of the Jat society and are supported by the kinship charter; and those which are primarily based upon territorial grouping, and are supported by such principles as local contiguity, kinship proximity, concept of *bhai-chara*, and so forth. Various lineage councils and the clan council belong to the first category; and the *patti*, village, *ganwand*, *thamba*, *khap* (as a general political council of all the castes living within a *khap* area), and the *sarv-khap* Panchayats belong to the second category. On the whole, and particularly since the *khap* lost its legal charter and the change in economic and political conditions in the country, the kinship-based councils tend to be more effective and show more political solidarity than the territorially based Panchayats. But the suggestion is only tentative, for there are important exceptions and it

also depends upon the circumstances of a social situation. For example, the *sarv-khap* Panchayat, a Panchayat of neighbouring *khaps*, and also a *khap* Panchayat, may command more influence and political power than any kinship based councils whether of a clan, *thok*, sub-*thok*, or of a *khandan* or minimal lineage.

(To be Concluded)

Notes

- 1 The fieldwork was carried out from August 1958 to July 1959 and again in December 1962 in Muzaffarnagar district, in connection with a doctoral dissertation which was submitted in November 1961 to the University of London. I am indebted to the late Robert Redfield for a travel grant of the Ford Foundation given by him to cover my expenses from London to India and back. I am also indebted to the School of Oriental and African Studies, University of London, for giving me two educational grants during my course of study in London.
- 2 The collection and translation of the recorded historical materials on *khap* Baliyan and the *sarv-khap* Panchayat was mainly done in Shoron and Sisauli villages, where such material is kept by the Chaudhry and the Wazir of *khap* Baliyan. The translation of mandates of Mughal emperors from Persian to English, and of other historical material from Hindi to English, was done by me.
- 3 A formal meeting of the *sarv-khap* Panchayat is held every five years only, according to tradition. To

this meeting the heads and leaders of all the *khaps* and of other castes of Meerut Division must be invited. The meetings of this Panchayat are informal when it meets to decide cases or disputes among *khaps* or caste groups. A meeting of four or five *khaps* is also called *sarv-khap* Panchayat.

There is no separate local term for the major segment of a maximal-lineage. Sometimes it is referred to by the Jats as *thok* and sometimes as *bara-khandan*. To avoid confusion between the terms *thok* (maximal-lineage) and *khandan* (minimal-lineage), I have termed it as 'sub-*thok*'.

Satisfactory Progress by Hindustan Construction

A VERY satisfactory growth in turnover and earnings has been reported by Hindustan Construction in the year ended August last. The current year's prospects too appear equally pleasing; the company secured new contracts worth Rs 23.68 crores in the year 1964-65 and worth Rs 2.85 crores after the close of the year. It is intended to sell the company's holding in Vikhroli Metal Fabricators to Premier Construction at the break-up value.

The 1964-65 results show increase in work bills from Rs 19.31 crores to Rs 21.09 crores and in gross profit from Rs 3.43 crores to Rs 4.86 crores. Even though the necessary provisions have chopped off bigger slices, equity earnings of Rs 1.19 crores are nearly a half better than the preceding year's Rs 82.95 lakhs. The dividend, stepped up 10 points to 60 per cent, therefore, enjoys a thicker cover.

Pattern of Land Concentration

P S Sharma

In this article land concentration ratios have been worked out to measure the relative disparity in the distribution of cultivated area among cultivating households, using data collected by the 1961 Census.

A study of the distribution pattern of households and area over 11 size-classes of holdings reveals that about half of the total cultivated area is worked by about 12 per cent of cultivating households with holdings above 15 acres. At the other end 57 per cent of the households with holdings less than 5 acres cultivate 16 per cent of the total cultivated area.

In the second part of the article correlation co-efficients between productivity and land concentration ratios have been calculated for 20 crop regions, five State zones and for the country as a whole. Whatever significant associations are observed between per acre productivity and land concentration are all negative, thus confirming the findings of the Farm Management Studies that the bigger farms have relatively lower productivity.

ONE of the ways to study the pattern of concentration of land among cultivating households is to find out the relative distribution of cultivating households and cultivated area among the various size groups of holdings. This is statistically reflected by the levels of land concentration ratios. Concentration ratio is a statistical measure of the relative disparity in the distribution of two related characteristics. It is a statistical measure of the departure of the given distribution from the line of equality. The smaller the difference between the line of equal distribution and the given distribution of the related variables, the lesser will be the levels of concentration. In this paper land concentration ratios have been worked out to measure the relative disparity in the distribution of cultivating households and cultivated area. If the distribution of cultivating households and cultivated area over various size classes of holdings is exactly identical, the concentration ratio will be zero. If these two distributions are infinitely uneven, concentration will be unity.

In 1961 Census, each cultivating household is co-terminus with an individual holding. No joint operational holdings have been considered. In case of joint operational holdings, the share of the respective households has been taken as equivalent to the area of that holding. Under 1961 Census,

1 The cultivated area has been estimated on the basis of arithmetic/geometric mean fixed for each of the 9 size classes (except 50+) on the basis of actual area and households especially tabulated for about 150 tehsils, spread out in various regions of India. For size class 50+, the actual size for a tehsil was taken to indicate the level in a district. The cultivated area included net area sown plus current fallows.

the cultivating households and cultivated areas have been grouped under 11 size groups of holdings: less than 1, 1-2.4, 2.5-4.9, 5-7.4, 7.5-9.9, 10-12.4, 12.5-14.9, 15-29.9, 30-49.9, 50+ and unspecified. The total cultivating households at all-India level have been estimated to be 48.2 million accounting for 369 million acres of cultivated area¹ giving an average holding size of 7.7 acres.

The State-wise distribution of cultivating households and cultivated area is given in Table 1. This shows that Uttar Pradesh alone accounts for about one-fifth (9.5 million) of the total cultivating households, followed by Bihar with 5.8 million households accounting for another 12 per cent. Maharashtra with 3.7 million, Andhra Pradesh with 3.9 million and Madhya Pradesh with

4.3 million households, each separately accounts for about 7 to 9 per cent. States like J and K with 0.5 million and Kerala with 1.0 million each account for about 1 to 2 per cent only. As regards the distribution of cultivated area, it is found that as in the case of cultivating households, Uttar Pradesh also ranks high from the point of view of cultivated area. However, the relative proportion of area (13 per cent) is less than the proportion of households (20 per cent). As against this, Maharashtra and Madhya Pradesh with 8 to 9 per cent cultivating households account for 12 to 13 per cent of the area indicating that the average holding size is higher in these States. Also in Gujarat, Rajasthan and Punjab, relatively smaller proportion of households have a higher

Table 1: Distribution of Cultivating Households and Cultivated Area

State	Cultivating Households (lakhs)	Cultivated Area including Current fallows (lakh acres)	Households (Per Cent of Total)	Area (Per Cent of Total)
Jammu and Kashmir	4.9	18.7	1.0	0.5
Punjab	16.7	225.3	3.5	6.1
Rajasthan	26.2	411.1	5.4	11.1

Note: Estimates made after inflating the 20 per cent sample.

proportion of area. Reverse tendency has, however, been observed in Bihar and West Bengal. In the rest of the States, more or less equal proportions of households and area have been observed.

A study of the relative distribution pattern of households and area over 11 size classes at all-India and State levels reveals that in rural India about half (50.69) of the total cultivated area along with 12.44 per cent households are located under large sized holdings (15 acre +) and another one-third of area and households under medium sized holdings (5-15 acres). Only 16.18 per cent of the area along with 57.34 households are located under small sized holdings. The preponderance of cultivated area relative to households under large sized holdings is also observed in many of the States like Punjab (65 per cent), Rajasthan (74 per cent), Madhya Pradesh (56 per cent), Gujarat (67 per cent), Maharashtra (69 per cent), Andhra Pradesh (55 per cent) and Mysore (59 per cent). In the rest of the States, per cent area under large sized holdings varies between 16 and 33 barring Kerala (13 per cent) and J and K (10 per cent). As regards medium sized holdings, it is observed that in the States which are having relatively significant proportions of area under large sized holdings, the household proportions are in excess of area proportions. Reverse tendency, viz, area proportions exceeding household proportions, has been observed in the rest of the States located in Central (excepting Madhya Pradesh), Eastern and Southern India (excepting Mysore).

The disparity in the proportion of households and cultivated area over various size classes reflects the level of concentration ratio with respect to the distribution of area. In seeking an explanation for the particular level of concentration ratio, two aspects have to be borne in mind (a) the disparity in the relative distribution of households and area over various size classes; (b) the disparity in households and area proportions in that holding size where a significant proportion (50 per cent +) of the cultivated area is located. The overall concentration ratio for cultivated area could be explained with the help of these two indicators. If one is interested in knowing the relative levels of concentration of households as against area, then the (b) indicator mentioned above would be replaced by the disparity in area and households proportions in that holding size where a significant pro-

portion (50 per cent +) of households is located.

In this context if one glances through the levels of land concentration ratios as given in Table 2 for 15 States, it is observed that Andhra Pradesh shows the highest overall concentration ratio (.6076) and Assam, the lowest concentration ratio (.4326). The relatively lower level of concentration is observed in Assam because quite a significant proportion of cultivated area (47 per cent) is located under medium sized holdings, where the ratio of household-area proportion is 0.61:1. Another 36 per cent of area is located under small sized holdings where the ratio of household-area proportion works out to 1.911:1. Compared to the other States, the relative inequality levels in the distribution turns out to be of a lower order in Assam. In large sized holdings, the relative inequalities are higher compared to Andhra Pradesh in this sized class, yet since an insigni-

ficant proportion (17 per cent) of area is located under large sized holdings, this has not affected the over-all concentration ratio. In Andhra Pradesh, however, since a significant proportion of area (55 per cent) as against 14 per cent of households is located under large sized holdings and since in this size class, the relative levels of inequality are higher than the levels under medium sized holdings and small sized holdings, this has inflated the concentration ratio. Other concentration ratios can be followed with the help of this example.

II Productivity and Land Concentration

Theoretically, one would expect a positive relationship between the productivity level and land concentration. This is because higher the land concentration ratio, higher will be area proportion concentrated in relatively

Table 2: Land Concentration Ratios

States	Household-Area proportion			Land Concentration Ratio	Land Concentration Ratio Rank	Percent of Area under Significant Size Class

larger sized holdings and since the productivity levels should be higher in large-sized holdings due to economies of scale, higher material inputs and better management, the two are likely to move in the positive direction. Under Indian conditions, however, as the Studies on Farm Management and 1961 Census data have shown, the relatively bigger farms are associated with relatively lower productivity and as a result, the land concentration ratio and productivity levels have a negative relationship. This negative relationship exists because of the following factors:

- Higher land concentration ratios are associated with higher proportion of area under large sized holdings.
- The area under large sized holdings are relatively inferior in quality of land.
- The large sized holdings are constituted of many small parcels of lands which in turn are situated at distances from each other. In fact, each of these small plots are small sized holdings, and, therefore, from operational point of view, make large scale efficient cultivation difficult and perhaps un-economical too.
- Relatively higher pressure of workers in small sized holdings enable them to use their land and other associated resources more intensively and thus perhaps get higher per acre gross production. In the case of bigger farms relatively fewer hands are perhaps not able to utilise their resources properly due to difficulties of supervision, management and control. These difficulties are particularly felt in hilly and mountainous areas where distances between plots are difficult to traverse and, therefore, for operational convenience, the far flung plots are given on lease to tenants for cultivation. Also relatively higher proportion of hired workers among total workers in large sized holdings tends to deflate the productivity levels as the hired workers are supposed to work less quantitatively and qualitatively as compared to family workers.
- Recent surveys and studies have shown that relatively large farmers are of late assuming the role of traders and speculators and are in a position not only

to withhold their own marketable surplus but also are able to mop up the surplus in their adjacent areas in order to make profit during the slack season. The implications of this trend have to be carefully studied. But if this trend implies that the big farmers are not investing their agricultural surplus for capital intensification in agriculture, and are trying to shift gradually their occupational class among traders and speculators and thus are tending to drift gradually towards urban and semi-urban occupations leaving cultivation of land under the supervision of their tenants and hired farm hands, then the agricultural productivity is bound to suffer. This aspect requires closer study.

The above factors may differ from region to region in their intensity, content and form. But, broadly speaking, they are in operation in various types of holdings.

The correlation co-efficients between productivity and land concentration ratios have been worked out for 20 crop regions, 5 State zones and for all-India (Table 3). Among crop regions, rice (irrigation above 26 per cent), jowar-cotton and all-jowar bajra combinations are having significant positive 'r', being of the order of .57**, .46* and .38**, respectively. Crop regions like rice-wheat (irrigation upto 15 per cent) (-.77**) wheat-gram (-.46*) and all-wheat (-.35**) are having negative 'r'.

* Significant at 5 per cent level of probability.

** Significant at 1 per cent level of probability.

growing districts have significant negative 'r'.

The implications of positive and negative associations in various crop regions have to be understood. A positive association implies that higher concentration ratios and higher per acre productivity are going hand in hand and that, therefore, inequalities in the distribution of land as reflected by concentration ratios are to be welcomed. A study of the areas where these associations have been observed reveals that in the irrigated rice deltas it is the availability of regulated water supply that perhaps explains the positive association. Again the positive association in dry jowar-bajra areas is perhaps due to higher labour inputs which lead to intensive utilisation of land and associated resources.

The association between productivity and land concentration could perhaps be better understood with the help of multiple regression equations by including land concentration ratio as one of the independent factors. A study was carried out by taking per acre productivity (y) as the dependent variable and rainfall (X_1), irrigation (X_2), farm size (X_3), land concentration ratio (X_4), area under pure tenancy (X_5), agricultural workers per acre (X_6), area under small sized holdings (X_7), area under mixed tenancy (X_8), and hired workers as percentage of total agricultural workers (X_9), as the independent variables. Thus the function fitted was a simple linear function and may be written as:

$$Y = a + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + b_5X_5 + b_6X_6 + b_7X_7 + b_8X_8 + b_9X_9$$

On the basis of this function, the productivity coefficients with regard to land concentration ratios were worked out. These are given in Table 4.

This table shows that whatever significant associations have been observed between per acre productivity and land concentration ratio have all been negative. The negative partial regression co-efficient is observed in 112 districts having rice as the major crop. In these areas, a unit increase in land concentration ratio, other things remaining the same, will bring about a reduction of Rs 147.6 in per acre productivity. Similarly, in all wheat growing districts (62 in number), the association is again significantly negative at 5 per cent level and here one unit increase in land concentration ratio will bring about a reduction of Rs 340 in productivity. This negative pattern is also observed at the all-India level in 303 districts and is significant at 10 per cent level. Here 1 per cent increase in land concentration ratio will bring about a reduction of Rs 82, keeping other factors constant. Again, in the Eastern zone, this negative pattern has been observed and this is significant at 10 per cent level.

These conclusions, with all their limitations, point to the fact that further increase in the inequality of land distribution cannot be permitted. Also since existing inequality is exerting a dampening effect on per acre productivity, there is a case for reduction of inequality in the distribution of land. Looked at in this way, the various land ceilings provided for in different land reforms Acts are necessary and should be expeditiously implemented.

BUSINESS NOTES

Rayon Industry's Prospects

A SCHEME of export promotion and issue of import entitlement has been evolved by which the rayon industry would be able to import adequate supplies of raw materials out of its own foreign exchange earnings so that the present dependence on imports from the US under the AID programmes can be done away with. Under this scheme, the Association of Man-Made Fibre Industry has been given recognition on a par with STC and Rayex Private Ltd so that the Association will be able to import not only raw materials required by its members but also synthetic yarns. These yarns, being in great demand, can be sold to weavers at a reasonable profit to cover at least part of the loss incurred in the export of synthetic fabrics. All the same, imports of raw materials under this scheme will involve a certain increase in the cost of raw materials. Consequently, the industry will have to increase the prices of rayon and synthetic yarns made by members of the Association to cover these increased costs. The government has appreciated the justification for such an increase in the price of rayon yarns. Murarji J Vaidya, Chairman, Indian Rayon Corporation, believes that unless some other unexpected and unfavourable events occur, there is every prospect of the rayon industry being able to carry on its production programme.

In his Chairman's statement circulated to shareholders, Vaidya conveys some of the confidence that the industry has gained after impressing upon the government its role and usefulness as producer of an important raw material for the weaving sector. He has based his confidence on two factors: first, the reduction in the excise duty should improve profitability and, second, demand for rayon filament is keeping ahead of the expansion of the industry.

Presenting a picture of the world rayon situation, Vaidya says that total production of man-made fibres in the world in 1964 increased by 14 per cent to 11,309 million lbs as compared to 9,921 million lbs in 1963; total cellulosic (i.e., rayon and acetate) fibre and filament production rose by 7.8 per cent to 7,256 million lbs as compared to 6,278 million lbs; the share of all man-made fibres in world textile fibres production increased to 28

per cent as compared to 26 per cent. The share of rayons and acetates in world production of man-made fibres is even now 64 per cent in spite of the great increase in the production of other synthetic fibres.

Vaidya is convinced that rayon is not a neglected fibre nor is it in any way out of fashion. On the other hand, with the improvement in the standards of living of people all over the world, particularly in under-developed countries, rayon is enjoying higher demand, because it is the cheapest textile yarn available. Of course, other man-made fibres and yarns are also making good progress, but that is not in any way prejudicial to rayon.

This buoyant world situation is also reflected in increasing production of rayon yarn in India. The production of rayon filament yarn in 1964 was 35.29 million kg as compared to 32.25 million kg in 1963, showing a rise of approximately 21.5 per cent. It may, however, be noted that the target of 60 million kg of rayon production set for the Third Plan has still not been achieved.

Indian Rayon

The working of Indian Rayon in the year to June last shows that production progressively increased and reached the installed capacity of 5.2 tonnes of viscose rayon yarn per day in May 1965, as compared to an average production of about four tonnes per day in the preceding year. Total sales of yarn, waste, chemicals, etc., were more than trebled, from Rs 45.45 lakhs to Rs 1.53 crores, but the outcome was a loss of Rs 31.39 lakhs as against a profit of Rs 3.67 lakhs previously. As before, no provision has been made either for depreciation or for development rebate reserve.

This outcome is attributed to the company not being able to run the plant to full capacity during the major part of the year, the higher incidence of excise duty and higher interest charges.

Premier Automobiles

SATISFACTORY progress has been recorded by Premier Automobiles during the year to June last in the volume of production, the indigenous content of products and operational efficiency. The total num-

ber of cars and trucks manufactured reached the record level of 15,043 units. Fiat car production, in which foreign exchange shortage constitutes a serious handicap, increased from 325 to about 500 units a month after the stamping plant at Kalyan went into operation sometime in the middle of 1964-65, and can be increased to over 700 units a month subject, however, to the availability of foreign exchange for those components and raw materials which are not available in the country. With the utilisation of its next foreign exchange allotment, the company hopes to attain indigenous content of 94 per cent in the case of commercial vehicles and 81 per cent in the case of cars.

After utilising the three million dollar loan from AID, the company decided not to import additional dyes and jigs and other tooling required by Kalyan plant for manufacturing the remaining body panel component of the car for which licences had already been issued. Instead, the company decided to make them in its factory in order to save foreign exchange. The tooling for more than three-fourths of these body panel components of the car has now been completed and put to work; the tooling for the remaining components is expected to be ready within a short time.

To help the company tide over the foreign exchange difficulty in importing Fiat components, the Italian associates, Fiat S P A, has offered a loan of £200,000. Representations have been made for price adjustments to cover increases in costs, such as of bought-out components and of raw materials prices and wages, but the government has not yet acceded to the company's request.

The year's financial results show a marked improvement: sales have advanced 41 per cent to Rs 9.81 crores and gross earnings 52 per cent to Rs 2.38 crores. After providing a much higher depreciation (Rs 1.16 crores against Rs 0.77 lakhs) and development rebate Rs 60 lakhs (Rs 17 lakhs) and without providing for taxation, which required Rs 33.50 lakhs last year, there is a net profit of Rs 61.66 lakhs against Rs 29.07 lakhs. After making other provisions, the available surplus stands at Rs 45.61 lakhs, as against Rs 20.77 lakhs previously. The dividend raised by a point to five per cent demands Rs 37.42 lakhs, and is well covered.

ABRASIVES GIVE WINGS TO MODERN ENGINEERING

Consider a plane. Any part of it. Any component. Precision made to do a precision job. At various stages in its manufacture, abrasives gave it the right shape and finish.

Quality abrasives are vital tools of modern engineering... for precision cutting, grinding or finishing of metals, wood, plastic, leather, glass... And *impeccable* quality is what fastidious engineers find in Carborundum Universal bonded and coated abrasives.

No matter if it is a plane or a pin—Carborundum Universal abrasives help you make it better.

What's more: engineers welcome the special abrasive service Carborundum Universal offer. Expert advice on tools and techniques to solve any tricky grinding problem. Ask the man from Carborundum Universal—he is always ready and qualified to help.

BENSONS 3-CUL-12

AROUND BOMBAY MARKETS

Further Decline

Thursday, Morning

DALAL STREET last week was forced to beat a further retreat under persistent selling pressure both from bulls and bears. Much of the selling was in the nature of 'distress' selling by bulls who had been sitting tight for long in the hope that prices would some day stage a good technical rally if nothing else; these hopes have been completely belied. There was nothing particularly disturbing in the week's news to unsettle the market sentiment. The market could, in fact, have derived some comfort from the thought that some good might come out of the proposed Tashkent meeting between the Prime Minister Shastri and President Ayub.

Equities continue to drift lower and lower as investors' confidence is being further undermined by the steady deterioration in the economic situation and continued political uncertainties. Official utterances on the economic situation have created a psychology of crisis and added to the stock market's despondency. Of course, the crisis is not just psychological. Many industrial units are being forced to suspend or curtail their production due to scarcity of essential spares, components and raw materials, imported as well as indigenous. Under-utilisation of capacity is bound to push up industrial costs still higher which is sure to have its impact on profitability and possibly also on the dividend paying capacity of many units.

While industry's profit margin is being squeezed by mounting costs, rising cost of living is making it increasingly difficult for individuals to save for fresh investment. Economic distress is increasing fast and if allowed to grow unchecked for long it might easily disturb industrial peace. Neither the economic situation nor the political situation is conducive to the revival of investors' confidence. It is difficult to think of measures which could boost the morale of the capital market without restoring health and vitality to the economy. While New Delhi seems to be fully seized of the disturbing trends in the economy there is little evidence that adequate steps are being taken to bring about quick economic recovery. In the circumstances it is difficult to take an optimistic view of the outlook for equities. A technical

rally is perhaps about all that one can look forward to in the near future.

COTTON

The Big Gap

DESPITE reports of favourable weather conditions, in some of the cotton growing areas, especially in Surat, Broach and in the South, the 1965-66 cotton crop continues to be placed around 52 lakh bales against 57.5 lakh bales in 1964-65. With imports likely to be about 5 lakhs less due to the anticipated shortfall in P L 480 and global imports, the total reduction in the availability of cotton in the current season is expected to be of the order of 10 to 11 lakh bales compared to the previous season. Such a shortfall can be made good only partially by drawing on the previous season's carry-over of 23.72 lakh bales.

Therefore, in any case, there will remain a big gap between the total available supplies of raw cotton and the industry's normal requirements. It is quite obvious that cloth production will suffer substantially and very possibly the industry will have to pay higher prices for the raw material than in the previous season. How high, it is difficult to say because that will depend on the trend of cloth off-take and the general state of the textile industry.

Since the industry is at present faced with the problem of stock accumulation, reduced availability of cotton might not be regarded as a matter of any serious concern. In fact, there are quite a few observers who are inclined to regard the power cut and shortage of cotton as a sort of blessing in disguise. But the prospect of resolving the so-called crisis of stock accumulation, when cloth production is already running far behind the Plan schedule and cloth prices are ruling around their all-time high, through a reduction in cloth production is far from pleasing, to say the least. It is one thing to have to put up with shortage of even an essential item of daily life, but to regard a cut in production as a good solution to the problem of stock accumulation created largely by factors other than a decline in effective demand, is quite a different matter.

Conditions in cotton market did not show any noticeable change last week. The spot market continued to display a subdued tendency with extremely limited turnover and futures also drifted lower in sympathy with the continuing easiness in the spot material. The weakness has been more pronounced in Bengal Deshi because of the virtual absence of overseas demand. Export sales registered till the first week of December totalled only 59,627 bales as against 1.30 lakh bales in the same period last year. It bears repetition that despite the recent sizable decline, cotton prices are still well above the previous season's ceilings and that prices would not have registered even this much decline but for the peculiar difficulties of the cotton textile industry, financial stringency and political uncertainty.

There have been reports that New Delhi is considering the imposition of some more curbs on cotton such as restrictions on the movement of cotton from certain zones for limited periods, widening the scope of statutory survey and requisitioning on a selective basis. The new measures are intended to reinforce the present regulatory measures and to ensure a steady flow of cotton supplies to the textile mills at reasonable prices. The tight supply position does hold out the prospect of prices being pushed up appreciably in course of time. But the Government would do well to restrict its regulatory measures to the minimum when it does not have the ability to enforce them effectively.

OILSEEDS

Bulls Turn Cautions

PROSPECT of better rabi crops—mustard and rapeseed, linseed and castorseed—following recent beneficial rains in most of the oilseeds producing areas have affected the general trading sentiment in the oilseeds market. Bulls have ceased to be aggressive and at least for the time being they seem anxious to reduce their commitments at higher levels. The turnover in futures has shrunk considerably which is partly due to the imposition of heavy margins. After keeping steadier on short covering induced mainly by the strength in groundnut oil, oilseeds futures de-

veloped a sagging tendency near the week-end. Castorseed April and linseed April which had rallied to Rs 106.50 and Rs 123 earlier in the week eased to around Rs 102.75 and Rs 120.75 which were only slightly higher than the previous week's lowest levels. Linseed oil and castor oil also shed all their early gains. Groundnut oil which had recovered further from Rs 32.50 to Rs 35 (per 10 kilograms) receded to around Rs 33.60. In the preceding week, however, groundnut oil had been marked down to Rs 29.50 from its mid-November high level of Rs 37.50.

Only bulls who had been gambling on ideas of a failure of the rabi crop were uneasy over the recent rains which will prove very beneficial to the standing crops. But since rabi sowings have been rather poor because of inadequate rains at the sowing time, the total output of rabi oilseeds is unlikely to reach the previous season's level even if the weather continues to oblige until the harvest is ready. The overall supply position of vegetable oils will remain very tight in the current season because of the substantially smaller groundnut crop. Prospects of securing edible oils from the US under PL 480 seem quite dismal. In the circumstances, there is little chance of any significant fall in vegetable oil prices even though they are standing at very high levels. Little comfort can be had from the fact that prices have registered a moderate setback from the mid-November ridiculously high levels. The supply position of edible oils being what it is, the Government and the market authorities will need to be very vigilant in order to prevent prices from being pushed to new high levels in course of time. It is, however, quite possible that oilseeds prices may remain subdued for a while. Short-term fluctuations in prices are always difficult to predict. More so when the various States continue to impose all sorts of restrictions on the movement of goods outside their boundaries.

Export activity is confined to groundnut extractions and cottonseed cakes. Fairly large business is reported to have been put through in groundnut extractions recently with East European countries. Business with the UK has been relatively small. Recent restrictions in the movement of oilcakes outside certain States and even districts have caused considerable confusion and uncertainty in the minds of manufacturers and exporters.

YOUR SAVINGS IN UNION BANK

HELP GROWING INDUSTRIES GROW EVEN BIGGER

Union Bank helps industries. From Steel and Engineering to Textiles, Plantations and Public Utilities, Union Bank channels your savings into many useful industries. This stimulates production, encourages economic development and conserves vital foreign exchange, besides earning you interest on your savings.

SEVENTY-FIVE PAISE

E.I.D.-PARRY IN THE SHOP

From the very beginning Parry & Co. Ltd., later known as the E.I.D.-Parry Group, has been one of the major trading companies in India.

The E.I.D.-Parry Group distributes machines and spares manufactured by well-known Indian and foreign companies, drugs and chemicals made by leading pharmaceutical companies and household products such as milk-food, biscuits, squashes, flavours and essences, antiseptics, metal and boot polishes, crown corks, paper, starch products and a host of other items.

Trading, however, is only one of the Group's operations as it

leads in the manufacture and sale of sugar, confectionery, fertilisers, sanitaryware and a large number of other goods besides the formulation of plant protection products.

Today, the E.I.D.-Parry Group, fondly known as "Parrys" is one of the larger companies in India, consisting of 9 subsidiary and associated concerns, providing employment for more than 10,000 people.

Are Tax Credits Relevant?

THE gazette notification of December 12 merely elaborates on the tax credit scheme for investment in equities announced on December 24 last year and given effect to in the Finance Act, 1965. The salient features of the original scheme remain. There are some further attempts at closing a few possible loopholes, and a couple of concessions regarding purchases from underwriters or from another party. The details also specify the manner and processing of applications for tax credits.

The tax credit still applies to initial issues of equity capital by industries that fall under the first schedule of the Industries (Development and Regulation) Act, which amount to not less than Rs 20 lakhs and which have been made on or after December 24, 1964. The issue has to be declared eligible by the Controller of Capital Issues. The investor in such issues—who may be an individual or an Hindu undivided family—is entitled to a five per cent tax credit on the first Rs 15,000 invested, a three per cent tax credit on the next Rs 10,000 invested, and a two per cent tax credit on the next Rs 10,000 invested. On an aggregate investment of Rs 35,000 he would thus get an annual tax credit of Rs 1,250. Being entitled to this for the year of subscription and for the three following years, he would thus get a total rebate of Rs 5,000 on an investment of Rs 35,000. If the investor purchases the equities from an underwriter, he will get the credit for the period remaining out of the four years from the time of purchase by the underwriter. Also, if an investor purchases the equities from another investor, the credit will be apportioned between them according to their respective share of the four-year period.

The grant of tax credit on purchase from an underwriter (the earlier scheme had provided only for credit on inheritance of the eligible equities on the death of the original investor), or from another investor, are added incentives, welcome in themselves, provided of course that the transferability does not in the present state of the stock markets lead to frequent switches. For, the purpose of the incentive is to help the stock market hold, and easier transfers by definition go against this aim. The ceilings and sums involved in the tax credit indicate that it is aimed at encouraging the relatively small investor who would fall within the Rs 35,000 investment limit. A total tax rebate of Rs 5,000 on this is certainly more sizable than the gain from tax credit schemes formulated earlier for exports and later for production increases. But is it large enough? It is difficult to answer this merely by relating it to the yield pattern or the gestation period of the company. In any case, a system so related would be rather cumbersome to operate.

What does seem doubtful about the present tax rebate scheme is its adequacy as a measure in the face of the persistently falling equity values on the stock market. The small investor has suffered the most from this collapse. Would a 14 per cent gain over a four-year period compensate for the capital losses and the loss of confidence that he has suffered even on the "safer" shares by now? For the small investor such capital losses are especially weighted because investment in equities is his hedge against inflation. It is interesting too that since last December, when the outline of the scheme was first announced, the response to new issues has by no means improved and today it is still negligible. It is the loss of hope with the persistent fall in the share market since the end of 1962, except for very brief periods of improvement, not the size of the present gain, nor the apparently complicated procedure (which is not as complicated as some comments have made out), that may eventually decide the fate of the present scheme.

The sustained decline on the share market has often been attributed to the toughness of the fiscal and monetary measures. So simply put, the picture is misleading. For, it is likely that it is not so much the present toughness as the former leniency towards the stock exchange boom of the early 'sixties, alternated now by sudden and extreme stringency that account for today's unrelieved decline. Share values were rising steeply at that time, and measures such as a rise in Bank Rate, bigger margins on

Weekly Notes

the stock exchange, credit restriction and selective credit control for stock exchange purposes, were steps that did not come on time. Today they have come with full force with severe credit restrictions, the successive rises in Bank Rate, and the tax on bonus issues which hits at the investor's capital gains calculations. Sentiment is low, but the normal methods of introducing buoyancy in the market to counter that are still not available. These could be, it has been suggested for instance, larger advances against shares left as security with banks, or easing of the tax on bonus issues.

The question is, do the authorities want to inject such life into the stock market, though this evidently is the motivation behind the tax credit on new equities? The general burden of taxation cannot be blamed for the present state of affairs. Those resources are needed for planned development. And what is more significant, the profits and the dividends paid by companies have still been showing a rising trend. The occasional case of lower dividends is the exception rather than the rule, as for instance the fall in the payment by sugar companies following the land ceiling order by the Maharashtra Government.

Still, savings need to be siphoned into investment in the various concerns. When the Finance Minister hinted that he could do without the stock markets, he obviously had institutions such as the LIC, the Development Bank and the Unit Trust in mind. These certainly could provide sizable alternative sources of finance. Being able to set off insurance premia as expenditure for income tax purposes, the exemption of the Unit Trust from double taxation, unlike other investment trusts, and similar measures, would make investments through these institutions attractive. But the stock market does on the other hand provide a more direct method of choice for the investor, affords him greater manoeuvrability and promises, in optimistic conditions, comparatively better returns. The period of buoyancy of the early 'sixties, it must not be forgotten, was the period during which much fruitful new industrial investment took place.

Since the economy, despite being planned and controlled, leans heavily on modern private business for capital formation, there are two further points to reckon with. First, the relevance of controlling prices on the soaring commodity markets, since

higher commodity prices, by pressing on costs and profit margins of final manufactures whose market prices are often Government-controlled, depress the investment market and the invest-

Bokaro, How Much Longer?

THE danger of further delays in Bokaro is not entirely over. Acceptance of the Russian project report has to be communicated within two months but a number of decision bottlenecks appear obvious. The cost of the project is significantly higher than was anticipated earlier though it was known that the capital cost may be high till the final projected capacity is reached. Costs, unfortunately, do not stay constant with the passage of time; in any event, the Russians, no less than others, are susceptible to bargaining. The cost issue does tend to get clouded by the noisy fears of Andhra that Visakhapatnam might go by default as a result of over-spending on Bokaro. The talk in some quarters of inviting global tenders, however, is utterly irresponsible: the Russians do not participate on that basis and, placed as we are, time is infinitely more valuable than a few crores of rupees. What is required is more steel and more of particular varieties in the quickest possible time; the number of steel plants it should come from is an entirely subsidiary matter. Negotiations for Bokaro have to be based on the intrinsic merits of Russian designs and quotations; they cannot proceed on the hypothesis that resources have also to be kept aside for Visakhapatnam.

A greater cause of worry is that the Russian credit is for Rs 100 crores only while the foreign exchange component is significantly higher. Some of the balance might come from the additional credits and trade arrangements which Russia has promised to consider but full cover is not in sight. Free foreign exchange would be required for some imports specifically for the plant and for payment of royalty on the I.D. process, and indirectly for the fulfilment of targets of procurement from domestic sources which are expected to provide about 35 per cent of the total value of plant and machinery. This sorting out should be facilitated to some extent by the de-freezing of aid from Consortium sources.

The reported moves to introduce aluminising in place of galvanising and to provide for the use of acids other than sulphuric acid are in the right

ment motive. And secondly, the need perhaps, in the circumstances, not to rob private industry of a direct, potentially buoyant source of investment.

direction. Unless import substitution is built in wherever possible into the plant, there would be avoidable drain of foreign exchange in the course of operations. These changes, too, might tend to delay the execution of the project for no indication of them had been given earlier to the Russians.

With the project report and designs in hand, it should be possible now to proceed with the tapping of domestic sources of equipment. The exploration carried out so far has been perfunctory. Sending out questionnaires is no substitute for sustained location of capacity, indication of delivery schedules and mobilisation of technical assistance within the country to maximise import substitution. Instead, much time and energy are being spent on the issue of Dastur vs Others for the consultancy contract.

That a few more consultancy firms have come up since Dastur did the spade work on Bokaro is an entirely welcome development but their existence and competence are not strictly relevant. Moral commitments (which are being mentioned as if fulfilling them is an act of charity) apart, Dastur has been identified with Bokaro and is wholly Indian-owned and staffed. Inviting tenders for the award of consultancy would, for one thing, cause intolerable delay; for another, it does not eliminate the question of choice which in this matter is not a question of the fees alone. The Russians would be handling the consultancy for their part of the work and Bokaro Steel itself would be looking after some of the domestic portion. The residue is not so large as to justify the employment of more than one consulting agency. And this agency has to be a unitary organisation, not a consortium, if the intricate task of procuring equipment and parts from something like 500 different enterprises within the country has to be carried out expeditiously. A consortium of uneasy claimants, at least one of whom has been actively lobbying against Dastur at political levels, will not work; it could tarnish the reputation of Indian consultancy, apart from endangering the schedule of the project itself.

World Bank and Haldia

Our Shipping Correspondent writes :

THE World Bank seems to have once again irked the Government of India by its advice. The Minister for Transport, Raj Bahadur, informed newsmen on Tuesday that the Government took exception to certain suggestions made by the World Bank because they impinged on the Government's authority. Apparently the suggestions that have upset the Government so much are about the administration and accounting systems to be followed at Haldia. The World Bank wants the Haldia port to be separate from the Calcutta port. The Union Government does not know what it wants, but as the Calcutta Port Commission wants to have Haldia firmly under its thumb, the Government is unwilling to agree to the World Bank's suggestion for independence.

Without going into the merits of the problem the first point to consider is whether the Bank has exceeded the norms governing the relationship between it and its debtors. The administration of a port is of course the business of the Government but this does not mean that the Bank has no right to make suggestions. The Bank is a lender and any lender has the right to make suggestions to ensure that his funds are utilised in the best manner. The normal banker concerns himself primarily with the safety of his funds and therefore limits himself to making suggestions which will ensure this safety, but it is a well-known fact that American banks have always taken a far wider interest in their borrowers and have certainly felt themselves at liberty to advise on the management of a project to which they are substantial creditors even when they are fully satisfied with the security of their funds.

The World Bank may think its case for interference to be even stronger; the safety of its funds depends on good administration by the Government for it does not rely on ordinary securities; it relies much more on political considerations and on its assessment of a government's ability. In India's case the Bank has made substantial loans on scarcely evaluated projects and as not all the projects have been uniformly commended by their success, the Bank has increased its vigi-

lance, not always to the resentment of the Government which has in the past often been grateful for this free and competent watchdog. The trouble is that the Bank's relationship with the Government seems to fluctuate with the Finance Minister in saddle: the last one did not think himself much of an economist and was therefore glad to have the Bank's assistance; the present one does not think he needs any one to tell him how to run the economy. The rest of the Government takes its cue from the Finance Ministry and not many Indian Ministers have yet developed enough maturity to discern advice from a foreigner which will genuinely improve the working or implementation of a project from advice of the other type. The Bank however is unlikely to forgo its privilege of giving advice as a creditor. The sooner we learn the hard fact that if you don't want advice, don't borrow, the better.

Calcutta Not Given Fair Chance

AS for the project itself neither the Government nor the Bank has performed creditably. The Government has never quite known what it wants except that it wants something and the Bank has never known whether the Government should have it or not. In the teams of officials that have come from the Bank to evaluate and consider this project not one has been able to express clearly what the Bank's view is of the project. Every now and again some mighty man of that organisation comes here and assures everyone that the project is through, only to be followed by another team to evaluate the project. Not that a decision on the project is easy. The present writer has been a consistent opponent of it on the grounds that if the Indian Government wishes to spend Rs 30 crores on ports it could do it in many better ways. Indeed, it could spend it all on Calcutta to much greater advantage. The more general view, and incidentally that of the Port Commissioners of Calcutta, is that the Hooghly must have a port at the mouth of its estuary because Calcutta can never be turned into a proper deep draft port. This is perhaps the more reasonable view, but one can still argue that the need for a port on the mouth of the Hooghly can only be determined after enough money has

been spent to restore Calcutta to its former vigour. It is still the considered view of this writer that the protagonists of Haldia do a great disservice to Calcutta and this view is shared by many who have spent their lives serving that great Port.

The Port Commissioners' views are born of despair that nothing can be done for Calcutta. Therefore, like school girls wanting a new pen in order to write better, the Commissioners want a new port away from the historical problems of Calcutta. Yet if this is so, why all this objection to having a different administration? Surely the logic of a new port is that Calcutta cannot be improved; the despair can only stem from a lack of confidence in Calcutta's present set up. Would it not therefore be better to have a new administration? Although why the World Bank is insisting on this is another mystery. Surely, they know by now that however new the pen the school girl will be the same?

Small Drug Makers in a Quandary

THE revised import policy for drugs and pharmaceuticals has now been published. Established importers were till now allowed to import about 200 items of essential drugs and medicines falling in list III of Appendix 19 of the Red Book. This list has now been drastically cut and only 47 drugs will be allowed to be imported. Licences already issued to established importers against their consolidated quota for the year 1965-66 will also be valid only for import of these 47 drugs.

The impact of this restriction will mainly fall on the small manufacturers. The 125 or so big manufacturers have their actual users' quotas, but the 2,700 smaller ones depend mainly on established importers for their raw materials. They are bound to be hard hit under the new dispensation. In fact, the impact is already being felt. If manufacturers intend to continue their normal manufacturing programme, they will have to buy the raw materials at enormously high prices. The only materials available now are either those imported against export incentive licences which are sold at 300-350 per cent premium or those smuggled. Smuggling is very likely on the increase since the risk involved in smuggling costly drugs is perhaps less

than that in smuggling of gold and the margin of profit definitely higher.

The raw materials supply position in the pharmaceutical industry is deteriorating fast. Some of the essential vitamins and steroids and many other chemicals have completely disappeared from the market. The solution suggested by the Government has not enthused the industry much. The DGT D has prepared a substitution list of chemicals and raw materials and has circulated it among the big manufacturers asking them to produce these items indigenously as soon as possible. It is not difficult for the indigenous manufacturers to start producing these in our country with the available technical personnel and know-how. But the difficulty is that to prepare these intermediates and pharmaceutical chemicals, we need many basic chemicals and solvents which are not available. Moreover, there is the time factor: even if we start now it will take some time to come to the stage of actual industrial production, depending on indigenously available equipment and plant.

This is another glaring instance of short-sighted planning. The sudden restriction of imports completely upsets the development programmes as well as the normal production schedules of pharmaceutical units. Demand for essential drugs and pharmaceuticals, on the other hand, has been going up very rapidly in recent years. With such buoyant demand it would not be surprising if the important drugs soon went underground, to be sold in the black market.

Price of Scientists

A LARGE proportion of our scientists who go abroad for training stay there. A similar problem has long existed in East Germany. East German scientists are trained at home, except for a few who go and do research in the Soviet Union at a late stage in their training. There has nevertheless been an outflow of scientists, mainly to West Germany and the United States. The Berlin wall has probably had the least deterrent effect on the emigration of top scientists, for east-west meetings are unavoidable nowadays in many sciences.

The first reactions to the problem of loss of scientists came very early. Around 1955 scientists' salaries were raised to levels comparable to those of the top political functionaries. A young scientist could expect to earn at least 3,000 Marks a month right from the

beginning, and if he was very good he could get a salary up to 8,000 Marks. The top scientists — perhaps twenty of them — got 15,000 Marks.

The real value of these salaries is much greater than its rupee equivalent at the official exchange rate. Among other things, the income tax rates are much lower in East Germany — the highest rate is around 25 per cent. And the prices of consumer goods, especially luxuries, are lower. A three-room flat in Unter den Linden, the main street of East Berlin (which is perhaps better known by its temporary name, Stalin-Allee) costs 60 to 90 Marks a month; an equivalent flat in Bombay would cost Rs 800 at least. The prices of cars, refrigerators, radio sets, hotel rooms, restaurant meals, etc., are between a fifth and a half of those in Bombay.

At such low prices there is naturally a scarcity of many consumer goods, from cloth down to cars; and the most valuable of scientists' privileges are not so much financial ones as the rights to jump queues. They get houses and cars more quickly, they are among the few who go to the best holiday resorts, and provided their children have the minimum qualifications they have no difficulty in getting a place in universities. Their career is also not dependent on their membership of the communist party; many prize this privilege because it enables them to avoid time-wasting meetings, the need to be loudly conformist and to jump on to the right bandwagons in time.

With these privileges, the material sacrifice involved in leaving East Germany was greatly increased; this had a deterrent effect on the emigration of scientists in the middle levels. What emigration takes place now is from among the top scientists. Partly this is because they get more chances, but they take the chances mainly because of political interference in the running of scientific institutions. The cost of political interference is, however, the last thing politicians could do anything about.

Trumps Played Out

A Correspondent writes:

THE fact that India is a bigger country did affect the outcome of the twenty-two days' war; Pakistan's reserves were much more tightly stretched than India's and all she could do at the end was to fight from entrenched positions on static fronts. It was just her luck that India also chose to fight on those

fronts and that Pakistan's ammunition did not run out.

But India's bigger size seems to be playing an even more important role in recent days. For wherever the sympathies of the big powers lie, their interests would be more hurt by antagonising India than Pakistan. This is the only explanation of Pakistan's lack of diplomatic success. For all the oratorical and lobbying skills of her foreign minister, Pakistan failed to get a mention of self-determination or of earlier resolutions in the Security Council resolution of September 20. It failed to get multi-power mediation on Kashmir, and no major power has shown any warmth for its arbitration proposal.

With his visit to Washington, Ayub Khan seems to have played out his last trump. He could expect to have certain leverage with the United States owing to the central position of Pakistan and to the American air bases; but it apparently failed altogether to move Johnson. If Ayub Khan stayed put he might expect economic aid to flow again soon; and military aid might be resumed when aid to India was resumed. By putting pressure on bases he could have forfeited these promised benefits and gained nothing vis-a-vis Kashmir.

So he goes now to Tashkent, disarmed, empty-handed. He has even further muffed matters by giving the impression that he is being pushed reluctantly to Tashkent by Johnson. From his experience over Kutch and Kashmir, Shastri has little reason to trust Ayub Khan; perhaps the internal political situation leaves Ayub little reason to trust himself.

What will these people do in Tashkent? What can they do? Even though Shastri does not stick to his condition that the talks must not be over Kashmir, his best tactic would be to carry a great many little proposals of release of seized goods, resumption of traffic, a trade agreement, freer monetary transfers and movement of people, another meeting after a few months and so on. The more he proposes the better, for it will reduce the time devoted to Kashmir over which there is no room for give-and-take, and it will give more choice to Ayub Khan who must be very hard-pressed at home. There is much reason for us to begin a rapprochement by however tiny steps; the hostility of Pakistan neutralises much of our military and political power internationally.

FROM THE LONDON END

What Future for the Aircraft Industry?

A YEAR ago the Government appointed a Committee, under the Chairmanship of Lord Plowden, to consider what should be the future place and organisation of the British aircraft industry. The findings of this Committee are now being studied by the Government. The majority of the members of the Committee have recommended that the Government itself should take a majority financial interest in the two major U K airframe groups — the British Aircraft Corporation and the Hawker Siddeley Aviation. It also proposes that the two major aeroengine groups — Rolls Royce and Bristol Siddeley — should remain in the private sector and should be amalgamated. However, a minority of members are against the Government taking over the two major airframe groups and would favour instead a non-controlling shareholding, while one member (Aubrey Jones, now Chairman of the National Board for Prices and Incomes) is opposed to the Government acquiring any financial holding at all. The general view of the minority is that it would be a great mistake for the Government to acquire the declining assets of the British Aircraft Corporation. They also argue that companies owned by the Government would give shareholders no good reason to remain in these companies.

As is only to be expected, considerable controversy will be aroused by the majority recommendations of the Plowden Committee, which would, in effect, mean that the Government would be invited to take steps which would amount to nationalising another major industry — the first industry to be nationalised since the Labour Government under Attlee nationalised the steel industry. While most people believed that the Plowden Committee would suggest some element of public ownership of the British Aircraft Corporation, which is in financial difficulties, the fact that it has gone as far as to recommend a holding of more than 50 per cent as well as to suggest that the same treatment should be meted out to Hawker Siddeley, has been in the nature of a bombshell. It is perfectly true that the Labour Party in its election campaign suggested, apart from nationalisation, a much closer working between the private and public sectors. Among

the suggestions made were co-operation with private firms who needed support to develop new projects and action to help industries (which were not pulling their weight) to become more efficient.

Nothing to Do with Socialism

The arguments of the Plowden Committee, however, have nothing to do with socialism. The list of the members of the Committee, including such men as Barran, the Managing Director of Shell International Petroleum, and William Penny, makes it quite clear that none of them are doctrinaire socialists. Their main reason for suggesting a controlling Government interest is that they feel the two companies need help badly and cannot get it from private sources. The gist of the argument is that since the State pays the piper it should call the tune. Well over half the earnings of the two companies comes from Government aviation contracts. Since the Government is the industry's biggest customer, major projects cannot be financed without State backing, and in these circumstances, a majority financial holding seems only reasonable.

In their own defence, the two airframe companies concerned may well point out that it is because the British Government has in the past been a very capricious customer that their future has been jeopardized. B O A C, the Government-owned State airline, has always insisted upon aeroplanes designed to meet their own special needs but aeroplanes which no one else wanted and so could not be sold abroad, thus restricting the market to a very small and not profitable one. Apart from the Canberra and Viscount (which were produced for British European Airways), custom-built British planes have not commanded much favour abroad. They might also point out that the other airframe company in which the Government has already taken an interest, Short Brothers and Harland of Belfast, has not made very great progress.

The fact remains that the main difficulty with the British aircraft industry lies in the fact that the national market is too small for profitable operation. It is for this reason that the Plowden Committee comes out strongly in favour

of co-operation with Continental countries, particularly France, as the basis for all future major aircraft development. This sort of plan would result both in cost saving and a wider market. The fact remains that only on the basis of joint European co-operation could any country in Europe provide suitable competition to the US aircraft industry which at the moment has the field virtually to itself.

The case with regard to the aeroengine groups is much simpler. Both Rolls-Royce and Bristol Siddeley are doing well and require no special help. Bristol Siddeley engines have a good future. Rolls-Royce also has few problems, and since it has been decided that the Phantoms are to be fitted with new Rolls-Royce Spey engines, their order books will give rise to little concern.

The Plowden Committee is bound to face the Labour Government with an awkward decision to make at this particular time. With its parliamentary majority down to two it is unlikely to want to take a major decision on what the Opposition could easily construe as yet another attempt of the Government to appear as the Party for nationalisation. Of course, the Government could get out of this awkward predicament by using the same argument as was used about the steel nationalisation bill, namely, that the programme for the current parliamentary session is already heavily overloaded and that it will, therefore, not be possible to discuss such matters as the takeover of the two major airframe companies in Britain. It, therefore, appears unlikely that any major decision can be taken until after the General Election when, if the Labour Party is returned with a large majority, it can tackle this controversial subject.

In the meantime, the Government must hammer out some policy with regard to its co-operation with the private sector. When is it right for the Government to assist an industry which is in trouble, and will Government assistance really help to make the industry viable? The question has already arisen with regard to the shipbuilding industry, and the Government is now in the process of providing assistance to the Fairfield shipbuilding yard on the Clyde which is in difficulties. This could well be the beginning of public ownership

or joint enterprise on a selective basis. One of the reasons for the Government's interest in this Clydeside yard is that if the company has to close down more than 5,000 people will lose their jobs in Scotland, where even now the unemployment rate is exceptionally

high. The Geddes report which is to be published in the new year will provide some recommendations for the shipbuilding industry, and the Government has already announced plans to assist the computer industry. For those in Britain who believe that once the

dead hand of State ownership comes down on an industry no progress can be achieved it might be well to point out that the French aircraft industry, which is in the main nationalised, has been able to produce the record-breaking Caravelle.

**FRESH AND
GLOWING...**

Get that fresh and glowing complexion with daily Hamam care. Hamam's rich, fragrant and gentle lather actually refreshes your skin as it cleanses—gives you a radiant glow. Use longer-lasting Hamam—the toilet soap that keeps its shape, always. Hamam is a Tata Product.

CBTH-2A

The Great Escape

Concentration Good, Monopoly Justiciable

R K Hazari

The report of the Monopolies Commission cannot be treated with the indifference (or amusement) which was extended to the report of the Mahalanobis Committee. Too many undertakings have been given about implementing its recommendations and a draft bill is incorporated in the report.

However, the only charitable interpretation possible of the general approach and recommendations of the Monopolies Commission is that it proved unequal to the task of reconciling the opposing logic of capitalism and socialism.

Those who had felt that the Commission should never have been set up in the first place have been proved right.

THE report of the Monopolies Commission* has three merits. It has been completed on schedule and released quickly to the public without prolonging its existence or that of its establishment. The Commission has essayed, though with very limited success, the task of improving efficiency and business practices in a sheltered market through regulatory processes. And the principal deficiencies in its approach and recommendations have been made up in an able and comprehensive minute of dissent by, of all persons, a senior civil servant. It also marks a departure from the tradition of high power commissions: *obiter dicta* take the place of reasoned and documented analysis, the Commission's interpretation of recent history is unbalanced, the report is shoddy by any (leave aside Cambridge) standard, and there is no summary of conclusions and recommendations. Even those who expected little from this Commission have reason to be disappointed.

The Commission was supposed to bring its ripe wisdom to bear upon some of the basic problems of a semi-planned mixed economy. That it has failed to do. The Majority chose either to wallow in British precedents or to refrain from the effort to reconcile the justifiable areas of concentration and monopoly with the socio-economic objective of broad-based economic power. They became victims of the implicit compulsion to frame legislation which, if at all seriously intended, can deal with monopolistic practices only, and a prey to the common irrational feeling that the judiciary can deliver the goods for which politicians and bureaucrats have proved inadequate. This faith in the

judiciary, which some other countries repose in the army, is touching indeed; the Santhanam Committee whose recommendations seem to have coloured what little thinking the Commission did, shared this faith, which only proves that the age of faith is not over.

Terms of Reference

The main purpose behind the appointment of this Commission was never clear. By the time it took over the boiling pot from the Mahalanobis Committee on Distribution of Income and Wealth, public attention was already diverted to other more elemental issues. There was, perhaps, a serious intention to clear private traffic lanes but the implications of this process in the light of an increasingly sheltered market, a growing public sector and proliferating weeds of administrative regulation were not fully understood. Nobody, however, bargained for the substitution of judicial processes (ie, unforseeable delays) in place of administrative bungling and indiscretion which are by now foreseen and reasonably discountable factors.

The Commission appointed in May last year consisted of Justice K C Das Gupta of the Supreme Court (Chairman), G R Rajagopaul (Legal Draftsman), K R P Aiyangar (former Chairman of the Tariff Commission), R C Dutt (Chairman of Company Law Board), and I G Patel (Chief Economic Advisor). Its terms of reference were as follows:

(a) to inquire into the extent and effect of concentration of economic power in private hands and the prevalence of monopolistic and restrictive practices in important sectors of economic activity other than agriculture with special reference to

(i) the factors responsible for such concentration and monopolistic and restrictive practices;

(ii) their social and economic consequences, and the extent to which they might work to the common detriment; and

(b) to suggest such legislative and other measures that might be considered necessary in the light of such enquiry, including, in particular, any new legislation to protect essential public interests and the procedure and agency for the enforcement of such legislation.

It was further authorised to report on any other matter bearing on any aspect of the national economy or functioning of the private sector and financial institutions as well as to look into concentration in the ownership of newspapers.

The terms of reference, thus, clearly distinguished between concentration of economic power, on the one hand, and monopolistic and restrictive practices, on the other. The Majority confounded both these phenomena under 'concentration of economic power' and decided to handle only the latter on the ground that what it describes as country-wide concentration has proved beneficial* so far and would remain so in future.

"The concentration of economic power has helped the economic betterment of the country. Even today our industrial development is far behind that in the western world or in Japan. But what little development there is owes much to the adventure and skill of a few men who have in the process succeeded also in becoming 'big business', thus concentrating in their hands a great portion of the economic power controlling and directing the production and distribution of national wealth and income. It is fair also to state that after concentrating power in their hands these men have gone on often to push forward development of further industries, which has been"

* Report of the Monopolies Enquiry Commission 1965, vols I and II. Price Rs 6.50 or 15s 2d or \$2.34. The listed prices are consistent with the Commission's devotion to petty detail.

DUNLOP MANUFACTURE INDIA'S FIRST EXTRA LARGE OFF-THE-ROAD TYRES

In the race against time to complete various projects on schedule, giant earthmoving vehicles are being used in increasing numbers throughout the country. The extra large size tyres required for these vehicles were hitherto imported, costing the country valuable foreign currency.

Dunlop have now undertaken for the first time in India the manufacture of Extra Large Off-The-Road tyres in sizes 24.00-25 and 26.5-29 for these massive earthmoving vehicles. Weighing nearly half a ton each and standing over six feet high, these tyres are made to the highest international standards.

➤ **YET ANOTHER DUNLOP FIRST**

to the advantage of the country. It is also generally agreed that concentrated economic power has been responsible for the greater part of the not very high capital formation in the country. Huge profits were often earned so that even after the distribution of high rates of dividends good surpluses were left. These were utilised to add to the industrial capital, whether by way of issue of bonus shares or in the shape of reserves or by investment in fresh ventures.

"Although complaints were not infrequently heard that dynastic control of big business has sometimes kept professional managerial talent from coming into its own, it is fair to say that big business has generally been able to supply over the years considerable amount of managerial skill of high quality, so that production has been high, profits have been good and failures comparatively few in number.

"It is important to note that big business has been able to attract and obtain foreign collaboration and such collaboration has helped the starting of many industries specially by supplying the essential machinery and technical know-how. As we have already stated when discussing the factors responsible for concentration of economic power, foreign business concerns are not likely to extend similar collaboration to small units.

"From its past records in the development of industries and the special advantage it has in starting and keeping up capital intensive industries as also the bright chance of obtaining helpful foreign collaboration, it is reasonable to expect that concentrated economic power may be relied upon to make important contribution to industrial development in the crucial years to come."

This confidence in big business has greater empirical justification than the commonly held belief in the extra-territorial benefits of judicial processes. Beyond that one is constrained to remark that the Commission should have had the benefit of more tangible and analytical evidence before getting swept off its feet. This is all the more remarkable because it has not hesitated to outright condemn resale price maintenance (Report, pp 129, 162, 178-79, and section 28 of the draft bill, a condemnation which at least one of the signatories to the Majority does

not recollect), presumably because it has been so treated in U K recently after acute controversy. The Commission has produced no evidence, apart from its "anxious consideration of the problem", to establish that resale price maintenance is *per se* against the public interest. In a word, the Commission has chosen, for reasons nowhere documented or elaborated in its report, to give an unqualified good certificate to concentration and to create a semi-judicial agency in the name of policing private sector traffic, which would add a new dimension to over-extended administration of industrial planning, or what goes under that label.

Analysis of History

In the Commission's analysis, technological economies of scale lead to control of large amounts of capital and the limited supply of managerial skill has proved a fruitful source of concentration of economic power. From this it delves into history and comes up with a few gems. On the basis of a deductive interpretation of history, unalloyed by a check on facts, it comes to the conclusion that war-time expansion and transfers of companies from British to Indian control around 1947 'necessarily' caused an increase in concentration. Less exalted minds, bogged in detail, might find it difficult to understand how a less than 20 per cent expansion of industrial production between 1939 and 1945 during which period a number of new Indian groups came into prominence at the expense to some extent of British groups specialising in stagnant tea, coal and jute, and the subsequent transfer of several British companies to Indian control would 'necessarily' cause an increase in concentration. Judicially oriented high power commissions, one understands, do not look into such niceties. Nor, in spite of the economic expertise at their disposal, do they care to observe that the demands of planned development itself, not merely food scarcity and hoarding and machinery imports, necessitate substantial trimming of imports.

For many years, Government spokesmen vehemently denied that concentration had increased and was probably increasing. The Commission, one wonders how, takes growth of concentration as a proved fact, though its own catalogues of 'product-wise' and 'country-wise' concentration relate only to March 1964. I refuse to believe that my modest effort, completed in 1961,

in studying one aspect of these problems has borne this fruit. The Commission refrains from offering any proof of its hypothesis that concentration has increased over the period of planning. That need not restrain observers from asking how the Commission started with this hypothesis.

It gives five main reasons, nevertheless, for the increase in concentration:

- (1) Big business could raise capital easily and there was less risk of their industrial licences remaining unutilised. (Did the Commission look into the list of unutilised licenses between, say, 1955 and 1960, when Government began to revoke unutilised licenses, to evaluate this risk?).
- (2) Licensing authorities have been inclined to favour the larger groups on account of their proved competence and greater resources. The Commission found no evidence of prejudice against the larger groups, rather the country. "We are convinced that the system of controls in the shape of industrial licensing, however necessary from other points of view, has restricted the freedom of entry into industry and so helped to produce concentration". It is implied, as emphasised in Dut's note of dissent, that licensing alone prevented smaller men from taking up big projects and raising more money than they actually did.
- (3) Foreign collaborators have tended to favour the larger groups.
- (4) The advantage which big business has over smaller people in obtaining assistance from banks and other financial institutions is another factor.
- (5) Import restrictions and exchange have played their part.

Product-wise concentration is bound to arise and to continue for some time in every new line of production. In some cases, the supply of raw materials and/or the size of the market is limited. The law of patents has also played a role.

Product Catalogue

The Commission then proceeds to make a catalogue each of the two brands of concentration uncovered by it. The product-wise catalogue is based upon data provided by the Development Wing. The Commission itself makes no effort to define 'product' or to look into the possibilities of substitution. The emphasis is on ratios, high, medium,

low and nil; these can be handled with reasonable safety by supervisory and clerical staff. When the share of the three top producers is 75 per cent or more, the ratio is high, between 60 and 75 per cent it is medium, and between 50 and 60 per cent low. Where the share is less than 50 per cent, "the concentration may be considered to be nil". There is no reference to price leadership with a much smaller share of production or to local monopoly. Of the 100 products "specially selected in view of their importance to the ordinary consumer", two-thirds have high concentration, 10 medium, 8 low and 17 nil. These, incidentally, include infant milk food, corn and wheat flakes, biscuits, chocolate, refrigerators, tooth paste and talcum powder.

Group Catalogue

For country-wise concentration, the Commission defines a business group as comprising "all such concerns which are subject to the ultimate and decisive decision making power of the controlling interest in the group*—the group master." It has tried to ascertain the substance of control and has not gone merely by legal technicalities. The Commission does not follow the concept of "outer circle" which, it alleges, "has found favour with some authorities". The innocent reader is left to find out what this concept is, why it found favour with somebody whether authority or nonentity, and why the Commission could not countenance it. It could not avoid coming across companies under joint control, which it decided to exclude from the list of companies in various groups. Consequently, Associated Cement and its affiliates are treated as a separate group, without any mention of their joint control by Killick, Shapoorji, Tata and Khatau. Parenthetical references are made to the Tata interest in Macneill & Barry, the Bajoria interest in Soorajmall Nagarmull and British India Corporation, the links between Wallace and Vissanji and between Walchand and Kilachand. The Shapoorji interest in Nowrosjee Wadia is attributed to interlocking of directorates when it is known to exceed 40 per cent of share capital. There is no reference to the Indian holding in Jardine Henderson.

The Commission looked into financial journals, but it does not seem to have

* Any resemblance between this definition and what appeared in my article in *The Economic Weekly* of November 26, 1960 is a pure coincidence.

come across the fact that Binny and Macneill & Barry are both subsidiaries of the Inchcape group. There are interesting references to close associates of the Birla group.

The group catalogue includes 75 groups and gives the number of companies (excluding banks), their share capital, assets (balance sheet totals?), turnover, industrial classification and role in product concentration. As of end-March 1964, these 75 groups had 1,536 companies which accounted for 44 per cent and 47 per cent of the share capital and assets, respectively, of all non-government non-banking companies. The Commission has refrained from giving the ratios for the two top groups, Tata and Birla, but a little calculation of its own data give a ratio of about 12 per cent for them—which excludes the groups which are closely related with Birla, and the Tata interest in ACC, Macneill & Barry and several other companies. That even a Commission is not immune to the dangers of cataloguing is obvious from the fact that Thapar's Crompton Parkinson (Works) is described as Crompton Engineering Co (p 111).

Definitions

The Commission has found instances of monopolistic exploitation of consumers and restrictive practices. These two are distinguished on a rather tenuous basis. A *monopolistic practice* is "every practice whether it is by action or understanding or agreement, formal or informal, to which persons enjoying monopoly power resort in exercise of the same to reap the benefits of that power and every action, understanding or agreement tending to or calculated to preserve, increase or consolidate such power". *Restrictive practices* are defined to mean practices other than those pursued by monopolists which obstruct the free play of competitive forces or impede the free flow of capital or resources into the stream of production or of the finished goods into the stream of distribution at any point before they reach the hands of the ultimate consumers, e.g., horizontal fixation of prices, vertical fixation of price and resale price maintenance, allocation of markets, discrimination between purchasers, boycott, exclusive dealing contracts and tie-up arrangements. Within the limited time at its disposal, the Commission could secure only illustrative examples of these practices but it believes them to be widespread.

What are the consequences of concentration? The common man in India, according to the Commission, regards concentrated economic power as wholly evil, a belief which it does not share, but which it regards serious enough to disturb "the mutual goodwill that is the *sine qua non* of a happy community". Its recipe for harmony is a lengthy appreciation of the past, present and future role of concentration and big business (quoted above), tempered with a realisation of certain evil effects, the most serious of which is the emergence of monopoly, control of publicity media, and keeping out of small business. As regards misdirection of investment resulting from concentration, which the Commission should have investigated, it was unable to study the matter. Unlike other matters, which it did not study in any depth, it has not made any comments on this issue.

General Recommendations

General Recommendations

Having found nothing to justify dealing with country-wise concentration, the Majority's general recommendations are, briefly,

- (1) Self-discipline by political parties, i.e., rejection of assistance from business houses,
- (2) Removal of corruption from administration,
- (3) Liberalisation of licensing since it cannot be abolished and preference in favour of small business without sacrifice of efficiency,
- (4) Insistence on proper distribution of goods imported under licenses,
- (5) Higher imports to stimulate efficiency,
- (6) Countervailing action by public sector through public units to prevent monopoly, and,
- (7) Promotion of small industries and preferential Government purchases from small units, strong consumer cooperatives and organised consumer resistance.

It considers the regulation of inter-company investments and loans with a view to dealing with concentration as wholly outside the scheme and purpose of the relevant sections of the Companies Act. This is not accepted by the dissenting member. The proposition was rejected by Government many years back.

Since rapid industrialisation is bound to bring with it greater concentration of economic power which would give rise to monopolistic conditions and practices, the principles of legislative policy have to be:

- (1) We need not strike at concentration of economic power as such but should do so only when it becomes a menace to the best production (in quality and quantity) or to fair distribution;
- (2) To accomplish this a constant watch must be kept by a body independent of Government to see that big business does not misuse its power;
- (3) Monopolistic conditions in any industrial sphere are to be discouraged but without injury to the public interest;
- (4) Monopolistic and restrictive practices must be curbed except when they are conducive to the common good.

A permanent Commission should be established primarily to look into restrictive and monopolistic practices which are to the common detriment. The proviso is not all that qualified, at least so far as resale price maintenance is concerned because, as stated earlier, this practice has been condemned *per se*. The Chairman of the Commission is to be chosen from Supreme Court Judges or Chief Justices of High Courts. The minimum age for members should be 50.

Expansion and Mergers

All restrictive practices would have to be registered with a Registrar and the documents concerned would be open to public inspection. Trade practices would be deemed to be against the public interest if they unreasonably increase the cost or price of goods or unreasonably reduce or limit competition or limit or prevent the supply of goods to consumers. A judicial investigation by the Commission would follow on the reference of a *prima facie* case either from its Director of Investigations or direct from Government. If the Commission gives a verdict of no detriment, nothing further would be done. If the practice is found to be against the public interest, it can issue an order to discontinue the practice. This order would be mandatory (not a recommendation to Government, as Dutt suggests on the British pattern) but subject to *unqualified* Supreme Court review on appeal. Punishment would be only by fines; "in the circumstances of our country", imprisonment is not considered feasible. Special provisions have been recommended to deal with hoarding, cornering and profiteering; it is pro-

posed to empower the Commission to cancel the licenses of those who refuse "to sell at the usual rate".

As regards monopolistic practices, the permanent Commission would be empowered to give a verdict on reasonable prices, regulation of production or supplies and prohibition of agreements against the public interest. When the Commission enquires into the conduct of any undertaking in this connection, Government would be debarred from investigating its management under section 15 of the Industries Development and Regulation Act and *vice versa*. (This is, incidentally, the only provision which allows specific relaxation of other procedures of industrial policy.) It can examine the structure of an industry in order to combat inefficiency and obsolescence. Mergers and take-over bids involving undertakings with assets exceeding Rs 1 crore which lead to acquisition of one-half or more of the market for a product or service would need prior clearance by the Commission, which would appraise the proposal on grounds of higher productivity, lower costs and better quality. Similarly, any 'dominant undertaking' (assets exceeding Rs 1 crore and having one-third or more of the market) proposing to expand by 25 per cent or more would have to get the Commission's approval (Patel and Dutt have dissented from this recommendation). Interlocking directorates in competing businesses outside the same group are to be prohibited (relatives and other associates are not debarred). All dominant undertakings and all companies with assets exceeding Rs 5 crores would be required to file with the Commission annual returns of organisation, business, conduct, practices, management, costs of production and connections with other undertakings according to prescribed rules. The Commission would also look into the implementation of patent law.

Press and Managing Agency

This merciless delegation of powers is not softened by any recommendations to dilute controls elsewhere. The unstated hypothesis is that judicial processes would work where the executive arm has failed.

So far as country-wise concentration is concerned, this is all a case of diversification and both are necessary evils in the economic interests of the country. "We believe that by proper use of licensing and other powers vested

in Government under the existing laws, Government can effectively prevent the growth of country-wise concentration wherever it is to the common detriment. We do not consider it necessary to vest the Commission with any power in this behalf".

The press and managing agency system are dealt with summarily. The Commission finds that a large segment of the press is controlled by big business, and that newspapers are prejudiced in favour of business, especially big business (though some papers have exposed business malpractices). By its own twisted logic, however, it considers the "essence of the matter" to be that "any attempt to curtail big businessmen's control over newspapers which impedes the exercise of fundamental right (by big business) must be ruled out", but attempts should be made to encourage more independent journals.

The Commission has made no recommendations for abolition or control of the managing agency system because it is part of the blessings of concentration, its abolition would have no marked effect on concentration since its place would be taken by some other system of group management, and action in this field has to consider not just concentration of economic power but also the effect on industrial progress "which is hardly possible for this Commission to undertake". Other matters which the Commission handled somewhat less casually have, presumably, no effect on industrial progress. ...

Note of Dissent

It is hardly surprising that, in their evidence before the Commission, spokesmen of the Associated Chambers suggested this kind of approach and that since the publication of its report, the Federation of India Chambers of Commerce and Industry has expressed its dissatisfaction with the proposed adoption of one more set of controls. Members of the Associated Chambers are interested mainly in jute, coal, tea and cotton, none of which have high product-wise concentration or expect a high rate of growth. FICCI has reason to be disturbed because its members are relatively more monopoly and growth oriented, and administrative or judicial delays hurt them much more.

In a lengthy well-reasoned note, Dutt has dissented from the approach

and most of the recommendations of the Commission. He is more tolerant of monopoly than concentration. Dutt feels that the harmful effects of "real" concentration of economic power have been seriously under-estimated, that the causes of concentration are basically different from those enumerated by the Majority, that planning is neutral in the growth of concentration, and that it is possible in some ways to strike at further concentration without endangering growth.

Dutt regards the managing agency system as an instrument, not a cause, of concentration. The alleged shortage of managerial talent cannot be one of its main justifications for such shortage is to be expected; the system has made no attempt to meet the shortage. This instrument has to be dealt with to the extent concentration has to be discouraged. As regards the Majority's contention that licensing and controls have helped concentration and implicitly the assumption that the growth of concentration would have been curbed in their absence, "There is no assurance that...the larger established industrialists would have had to yield their places to new entrants". If this expectation did exist, there would be no justification for anti-trust and monopoly laws in other countries or for many of the Majority's recommendations. He feels that the Commission should have recommended the extent and manner of using planning and controls to curb concentration.

Control over Resources

Without denying the significance of financial links between political parties and industrialists, he asserts that the influence of big business over politicians and administrators arises from their control over resources, production, employment, investment, growth and the press. Together with their command over unaccounted money, this power inevitably leads to malpractices. As for the contribution of concentration to economic betterment, bigness of individual industrial units should be distinguished from over-all concentration "which involves inter-linking of companies for purposes of control and does not necessarily contribute to greater efficiency of any of the individual units so inter-linked, (and) has no effect on the quantum of surplus". It does not follow from the Majority's argument that the quantum of managerial skill available would have been less if there had been less of concentration; rather the contrary

is possible resulting from the denial of opportunities to persons unattached to privileged families.

Dutt feels that it would be undesirable to restrict the growth of individual units till they receive the full benefits of economies of scale. Dominance in any particular industry does not by itself give power to a firm to influence the national economy as a whole, which comes from country-wide concentration. To the extent that dominance in individual products and industries is inevitable and economies of scale are desirable, it is necessary to set up a machinery which can deal with the monopolistic and unfair trade practices which are likely to arise therefrom.

Demarcation of Areas

At the same time, proliferation of large groups into different industries should be permitted only on a balance of advantages. Since a certain level and some growth of concentration might be inevitable, certain steps are necessary to provide safeguards against their harmful effects. Dutt favours some kind of demarcation of areas of concentration:

"It is possible, for instance, to reserve new units in conventional industries where the rate of growth envisaged is not very high for the new entrant or the small man. For certain other industries, where the rate of planned development envisaged is higher, but which still (do) not enjoy a very high degree of priority, established entrepreneurs of moderate means can be encouraged. For still other industries, such as Fertiliser, Aluminium, etc, which enjoy high priorities and which are also highly capital intensive, reliance will have to be placed on the well established entrepreneurs, even though such reliance may add to the concentration of power."

He also suggests that the public institutions which hold large blocks of shares in companies should take a more active interest in the management of these companies to help diffuse economic power "at least to the extent of preventing a greater concentration of such power than their shareholding justifies in the hands of a comparatively few persons". (He does not, however, specify the nature and extent of this more active interest.) And the State must play an active part in countervailing the power of big business, particularly in basic industries.

This report cannot, unfortunately, be treated with the same indifference (or amusement) as was extended to the Mahalanobis Committee. Too many undertakings have been given about implementing its recommendations, and a draft bill is incorporated in the report. The issues and problems raised by it might be of somewhat marginal significance in the over all immediate context—a view which the Commission does not accept—but having been raised, they have to be taken into account. Personally, I did not see the need for setting up this Commission last year and feel there is little justification for setting up a permanent Commission in the near future. Insofar as the problems of concentration are amenable to regulation, they have to be dealt with through the general economic policy and administrative mechanism of Government. Political corruption cannot be eradicated by outlawing corporate donations; they are at least over the counter. No amount of exhortation from judicial authorities would improve the moral tone of the community so long as the political and financial stakes are high and there is money around to play on them. Public opinion against monopolistic and restrictive practices can be mobilised only when effective action is taken to improve production and to reduce the influence of big business on the implementation of development policies. Turning a blind eye to concentration and summoning petty industrialists and traders to the witness box for charging a few paise more than the "usual rate" is hardly the right way to mobilise public opinion. The only charitable interpretation that one can place on the approach and recommendations of the Monopolies Commission is that it proved unequal to the difficult task of reconciling the opposing logic of capitalism and socialism. That reconciliation is the obligation of intellectuals.

Patents Bill Retains Drug Patents National Interest Demands Their Abrogation

S S Sokhey

The registration of drug patents for process only and the endorsement of the patents with the words 'licences of right', which are among the major changes proposed in the Patents Bill introduced in Parliament in the last session, will in no way break the monopoly of the patentee and his licensee under present Indian conditions. They will continue to exploit the suffering of the Indian people to extract high profits.

Our national interest in this sphere demands nothing short of complete abrogation of patents. The fear that this will discourage research in the country is baseless; on the contrary, it will stimulate research by opening out a whole new field for Indian scientists in developing known processes into fully workable forms.

For fast development of the Indian drug industry to supply the population with the widest range of essential drugs and pharmaceuticals at low prices, along with the abrogation of patents it is necessary to go back to the original Soviet plan for the drug industry submitted in 1956.

WHILE introducing the new Patents Bill, T N Singh, Union Minister for Industries, rightly referred to the special provisions in regard to drugs and invalid foods. Truly, drugs are things apart, as they deal with the alleviation of human suffering and saving of lives and, therefore, they require a treatment different from other items. With the introduction of the life-saving drugs like sulphonamides, antibiotics and hormones and insecticides, like DDT, a new era in the history of medicine has begun. These life-saving drugs have become an essential tool in the practice of medicine. But the high prices at which they were and are sold, put them out of the reach of most of the Indian people and even public hospitals cannot afford to use them adequately.

Earlier Decision Reversed

This had caused the Government a great deal of concern. It conducted extensive investigations and consulted leading scientists and technologists of the country. In August 1963 the Cabinet had taken the decision to make inventions in drugs and foods non-patentable in the forthcoming Bill, both as regards process and product. This I was told by Jawaharlal Nehru. But early in 1964, it was represented to the Government that if we ceased to register patents for drugs, though it might not very much affect us in the manufacture of drugs because we did not need much aid, it would psychologically upset manufacturers in other fields, whose aid and know-how we badly needed.

This argument has no validity. All the important firms know that different countries make patent laws to suit their own needs and they are

accustomed to this practice. It was sheer pressure tactics. But our Government yielded and decided to retain the drug patents with minor modifications. The life of the patent was reduced from 16 years to 7 years, the royalty was fixed at 2 per cent and the patents were to be only for process. Now, when the Bill is actually presented to Parliament, the life of patents is extended to 10 years and the royalty raised to 4 per cent. The patents will still be for process only, and they would be endorsed with the words "licences of right". The Union Minister believes, as he said in his speech, that these new provisions will make medicines readily available to the public on reasonable competitive prices and domestic production and development in the field of drugs will not be hampered by monopolies, while a reasonable return would be ensured to the inventors and the cost of research would be met. It is obvious that vested interests have again exerted enough pressure to make the Union Minister entertain these false hopes, in spite of all evidence to the contrary. The only thing that his legislation will achieve will be to maintain the monopolies and enable them to make huge profits at the cost of the Indian people who will have to continue to pay high prices for their drugs.

Persistent Demand for Abrogation

Soon after our liberation, year after year, the Pharmaceutical and Drug Research Committee of the Council of Scientific and Industrial Research, Government of India, on which were represented the important agencies engaged in research on and the manufacture of drugs both in the public and private sectors, passed resolutions asking Government to abrogate drug patents. The

Committee in 1958. (when the representatives of foreign drug firms and their Indian collaborators had not yet captured PAMDAL, Pharmaceutical and Allied Manufacturers and Distributors Association Ltd, which has since conducted extensive misleading propaganda in their commercial interests) once again passed a resolution to stress their demand that the Government abrogate drug patents. They represented to the Government that "for the further progress of drug research and drug production and for the development of drug industry in all its aspects in India, the patent laws constitute a great hindrance in the exploitation of many processes". The committee, therefore, strongly recommended "that immediate steps should be taken to abrogate the patent laws as applied to drugs and pharmaceuticals". They sent the resolution through the Director-General, Council of Scientific and Industrial Research, to the Governing Body of the Council over which Jawaharlal Nehru presided.

A Hindrance to Research

The significance of the remark that the patent laws constitute a great hindrance to the exploitation of ordinary processes for production and research is realised if we recall that when during world War II the British Government itself had to take up manufacture in a large way, it appointed a Cabinet Committee to look into the patent system. This committee came to the conclusion that patents are now taken by big enterprises largely to pre-empt a field of research and thereby prevent others from doing research in it. Thus the patent system, they thought, stifled research. They recommended that, to meet this evil, patents should be abro-

gated or held only by Government. The British Medical Council insisted that this action must be taken at least in the case of patents for drugs.

The one-man Committee of Justice Rajagopala Ayyangar appointed in 1958 to conduct an enquiry to see if our Patents Act was conducive to national interests came to the conclusion that although the patents system in India had been in existence for 100 years it had failed to serve its objective which was to benefit the trade and industry of this country and the system had been generally detrimental to the national economy. Even this conclusion is very much of an understatement, when it is applied to drug patents. In spite of this, Justice Ayyangar recommended the continuation, in a modified form, of patents as, in his opinion, patents stimulated research.

Patents Do Not Encourage Inventions

Shortly after the report of Justice Ayyangar, the report of the American Senate Committee, presided over by the late Senator Kefauver, was published. This Committee had made an exhaustive investigation lasting for two years into the working and practices of the drug industry, the first investigation of its type ever carried out in modern times.

The Committee held numerous public hearings at which the leading drug manufacturers of the United States gave evidence and had their full say. The Committee's report throws a flood of light on the practices of the manufacturers and how they exploit drug patents to rigidly control the market to make excessive profit—at more than double the rate of those made by US manufacturing industries as a whole, including oil, steel, automobiles and chemicals. The report flatly controverted Justice Ayyangar's view. The Committee said "The conclusion would appear to be warranted that in this industry the mere existence of patent protection is not a guarantee of invention, nor its absence much of a barrier".

This is borne out by the fact that though the United States started giving full patent protection for drugs in 1790, that country made no outstanding discovery until the last 20 years. Since then inventions in drugs have been due to factors other than the patents. The great drug breakthroughs of modern times, such as insulin, vitamins, the first sulpha drug (Sulphanilamide), the first antibiotic (penicillin) and the first tissue culture live virus vaccine (polio

vaccine) were made in public laboratories by scientists who were not working for monetary gains and did not take out patents.

The existing laws and even the amendments proposed in the new bill, as I shall show below, confer monopoly rights on the drug patent holders in that only their products can be sold in the market and at prices fixed by them. Until recently they have used this monopoly to mercilessly exploit the protected market over half a century to extract enormous profits, but they had shown no desire whatsoever to put up any drug plants in the country. The Government's Pharmaceutical Enquiry Committee found as recently as in 1954 that no drugs were made in India and said that "the drug industry in India may be considered to be non-existent". The situation was no better in 1956. The Soviet Expert Committee invited by the Government of India surveyed the whole field and came to the same conclusion.

India: The Victim of Patents

A large proportion of our drugs came from the United States and even now those made in the country are produced in collaboration largely with American firms from penultimate compounds imported from USA and sold at about the same price as the imported drugs.

The Kefauver Committee cites India as an example of the disastrous effect of patents on the prices of drugs. It says: "India which does grant patents on drugs, provides an interesting case example. The prices in India for the broad-spectrum antibiotics, Aureomycin and Achromycin, are among the highest in the world. As a matter of fact, in drugs generally, India ranks among the highest priced nations of the world—a case of an inverse relationship between per capita income and the level of drug prices."

Thus not only large sums of money were drained out of India, but the high prices put life-saving drugs beyond the reach of most of our people.

This exceedingly unsatisfactory situation had to be met. In 1955 the Government of India's attention was drawn by me to a very effective, inexpensive and friendly way of solving the problem. The Soviet Union was approached and in 1956-57 offered India free technical assistance and know-how and a loan of 80 million roubles (old) on easy terms which made the loan almost a free gift, to put up four large plants to give India a fully integrated drug industry to make the country entirely

THE ECONOMIC WEEKLY

free of foreign imports of its requirements of intermediate chemicals, synthetic drugs, vitamins, antibiotics and hormones. These plants were intended to be completed and functioning by the end of 1960, to supply the country more than three times the amount of drugs we were then importing and with a capacity to treble their production. This would have saved the country over 60 crores of rupees in foreign exchange a year and made drugs available to the hospitals and public at very low prices.

But the vested interests, largely the members of PAMDAL and its foreign bosses holding patent rights which were making cent per cent profit on their imported drugs, used the good offices of the Development Council which lacked any adequate knowledge of the practices of the drug manufacturers to see that the agreement with Soviet Union was not signed or at least the signing was delayed. Consequently, the agreement was not signed till June 1962 and even then in a mutilated form. The basic plant which was to produce to begin with 94,600 tons of raw chemicals and 33,200 tons of intermediate chemicals with arrangements to increase its production several fold, from which drugs were to be made, was left out and handed over to a German firm which has now refused to build it. Then again, the plant which was to have made 2,400 tons of 65 synthetic drugs and vitamins with facilities to increase the capacity of its production several fold was cut down to 800 tons of 20 drugs and hormone plant was left out. Worse still the synthetic drug plant is being installed at Hyderabad where the plant will find great difficulties in getting rid of its chemical effluent; so even this small plant has no future.

Powerful Friends at Court

During the time the signing of agreement with the Soviet Union was delayed, the foreign patent holders, mainly American firms, saw that their lucrative market was in danger, they on the basis of their patents, hurriedly obtained licences from their friends in court to start a number of plants in collaboration with Indian parties or on their own and thus ruined the Soviet-integrated project.

They had truly powerful friends at Court. When Morarji Desai went to USA in 1958, the leading American technical journal *Chemical and Engineering News* (November 24, 1958 p73) printed a photograph of Morarji Desai with the caption: "Much negotiating took place between government and

THE ECONOMIC WEEKLY

company men before Merck's Indian venture got a green light". The article under it said, *inter alia*, "Merck's entry in Indian pharmaceutical makes friends, future profits and helps sideswipe Soviets ... Drug officials started ... looking at India about two years ago, just as the Russians began a big push to have India freed from the dependence on Western chemicals and pharmaceuticals. Soviet engineers, loans and all else needed would be provided if the Indians would take USSR help and build the state-owned industry ...

"Fortunately for the Free World, Merck and other US and Western drug and chemical firms have not been idle since ...

"Merck's efforts have helped in part to stall this Soviet offensive; however, Knoppers fully admits that eventually some products in this area will be produced using Russian knowledge and aid. But the original Soviet offer, which was all-embracing (and somewhat obsolete technologically, some say), is shelved, and the *Indian Pharmaceutical Industry will not be a government monopoly*" (italics mine).

The plants so started by the foreign patentees still make drugs largely from imported penultimates but not from raw materials, and sell them at almost the same price as the previously imported drugs, and make huge profits. According to the Reserve Bank of India *Bulletin* (November 1964) these foreign firms had since 1958 invested Rs 5 crores and had by 1964 already taken out of the country Rs 4.9 crores in foreign exchange in the form of royalties, charge of technical aid and profits. This drain will continue to increase over the years.

Drug Prices Exorbitant

The present drug prices are admittedly exorbitant and this was brought to light during World War II in the early 1940's when sulphathiazole came on the market. The drug was imported and sold in India at Rs 800 a pound from chemists' shops. It was a great new invention in medicine. But the high prices charged kept this wonderful drug out of the reach of the Indian people. The young brilliant chemists at the Haffkine Institute under my direction took up the matter to see whether the drug could be produced cheaper. They were successful in inventing a new process other than the process patented under which the drug was being sold and obtained a patent of their own. They were provided with the necessary pilot plant, the first of its kind in India, and they started producing it at

Rs 17 a pound in semi-commercial quantities and that too from imported intermediate chemicals. The Institute started supplying this drug at Rs 20 a pound to the hospitals in Bombay as no element of profit was involved. This was the first instance that brought to our knowledge that drugs were being sold at prices much higher than the cost of production.

Later the Kefauver Committee established that the drug companies sold their products roughly at about 17 to 20 times the cost of production. To give an example: tetracycline (sold under different brand names) cost the makers 47 cents for 16 capsules of 250 mg each. These 16 capsules of tetracycline as well as those of Chlorotetracycline and Chloramphenicol were sold to chemists in the United States at the uniform price of \$5.10 with a suggested price of \$8.50 to the consumer, while the same 16 capsules were sold at \$1.19 to chemists in Argentina which not only does not grant drug patents but also controls drug prices. The representatives of the American firm admitted before the Committee that they made a profit even at that sale price. The same 16 capsules which now perhaps cost the makers even less than Rs 2 are being sold in India at Rs 20.

Factors Underlying High Prices

Since the Kefauver Committee was an official committee it could and did obtain detailed statements of accounts of 22 leading drug firms of the United States for the year 1950. Their "output worth \$2.3 billion cost the 22 producers less than one third of this amount to manufacture; the industry's gross margin on drug operations alone came to no less than 67.9 per cent of sales. Fully three quarters of the margin (or more than half of the industry's receipts) was either used to promote the sales of its products or went into profits. Indeed, promotion and profits before taxes in the drug operations of the 22 firms exceeded the combined costs of production, research and administration and all other expenses." Be it noted that the whole amount invested on research was no more than 6.2 per cent and yet research is blatantly cited as the principal justification for high drug prices.

The entire American drug industry including these 22 firms spent in 1958 as much as \$750 million on advertising and sales promotion. They lavishly printed circulars and brochures, advertisements in medical journals and

employed about 20,000 super salesmen costing about \$15,000 each a year to visit physicians. This wasteful expenditure compares ludicrously with \$200 million which the USA spent in that year on all its medical schools.

The Union Minister of Industries, while introducing the bill, attached a great deal of importance to the proposal to grant in future drug patents only for the process and not for the product. It is believed that new processes could be developed to make the same drug and thereby prevent the patentee from establishing a monopoly. This provision is taken from the Patent Laws of developed countries with highly developed chemical industries where experience and facilities exist for developing new processes. But even there this is not usually done because commercial firms do not invade each other's territory; they resort to finding alternative molecular modifications.

Licences of Right

In our country the situation is very different. Since our chemical industry is still in its infancy, we have to build our drug industry on the basis of known processes. There is no alternative and this is the only right policy to adopt. In this regard we must keep in mind the very valuable advice which P M S Blackett, Nobel Laureate, gave us in a public lecture in Delhi in 1963. He stressed that we should not waste our talent and resources to find new technologies, we should build up our industries on processes known to the developed world till we catch up with them. The patent specifications for known process can be readily obtained for a very small charge from any country where the specifications have been filed. The patent specifications never reveal all the details of the process, yet there is enough information for Indian talent to work on and develop complete processes. This has several advantages; in the first place one does not have to pay royalty at all and secondly it gives a chance for Indian scientific and technical talent to develop. After all the most important asset of the country is highly developed talent. So we must make every effort to build our industry on the basis of known processes. If we use any foreign patents, we can always make *ex-gratia* payments to foreign patentees when necessary.

The endorsement of each drug patent with the words 'Licences of right' implies that any one interested in the exploitation of the patent shall be

DA 65/401

We shall purify your gold. We shall purify it by refining the gold to 23.88 carats. We shall purify your gold by devoting it for fifteen years to the service of this sacred land of ours. Your gold will then be returned to you, blessed, burnished and brighter, purified on the altar of service.

Serve your country — get Gold Bonds

Never before has our country needed gold so much. We are desperately short of foreign exchange. More gold with the Government means more foreign exchange. We need gold; your gold, for the defence of the country, to buy food from abroad, and to get machinery and raw materials to keep our industries going. Our land, our jobs, and even our lives will be safe only if more gold is made available to the Government NOW.

The Government appeals to you to lend your gold to the country in its hour of need. The Government is not asking you to sell your gold or give it away. Gold Bonds will be issued when you tender gold, gold sovereigns or gold ornaments. The Government will refine the gold to 23.88 carats (old ornaments have a purity of only 18 to 22 carats; sovereigns are made of 22 carat gold). The weight of the refined gold will be entered on the Gold Bond, and this purer gold will be returned to you after 15 years. If you have subscribed to Gold Bonds in the form of ornaments, gold returned to you after 15 years can be reconverted into ornaments of any purity.

If you tender gold ornaments, the Government will give you Rs. 3 per 10 grammes of refined gold as compensation for making charges, along with your Gold Bond. (One tola is equal to 11.66 grammes.) Every year you will earn Rs. 2 per 10 grammes of refined gold. (A sovereign weighs 8 grammes). This money is free of income-tax. A Gold Bond will not attract wealth tax. There are liberal exemptions from gift tax and estate duty also.

When you tender the gold, nobody will ask you how you acquired it. No action will be taken under the Income-tax Act, the Gold Control Order or Customs regulations.

You can borrow money from banks with Gold Bonds as security, just like gold.

Gold Bonds are issued at the offices of Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi and all branches of the State Bank of India and its subsidiaries.

Exchange your gold, gold sovereigns and gold ornaments for Gold Bonds. Put your gold to work in the service of the country.

Issued by the Ministry of Finance, Government of India

KEEP YOUR GOLD IN TRUST FOR THOSE YOU LOVE

entitled to get a licence for it from the patentee. This of course will make the obtaining of licences easy but the Indian firms will still have to go to the patentee to obtain the licence. Because the Indian firms often lack knowledge of chemical technology, they are bound to go to the patentees for their know-how, and thus become dependent on them. Indian firms find it cheap to carry out the processes under the patentees' instructions and do not employ any highly trained scientific staff and thus give no chance to Indian talent to develop. When foreign firms start their own plants or in collaboration with Indian firms, matters are even worse. The foreign patentees control every thing and the Indian collaborator merely carries out the process under the supervision and direction of the foreign patentees.

What is equally bad is the fact that since the Indian licensee depends on the foreign patentee for the know-how the latter uses all the pressure at his command to see that the licensee sells the drug at the same exorbitant price as the patentee himself. Indian firms are unfortunately not averse to making high profits. Furthermore, when one Indian firm has taken out a licence to manufacture a drug, another Indian firm is not likely to take another licence to make the same drug. This will cut out all competition. The 'Licences of right' like the process patent would not, therefore, cut out the patentee's monopoly to sell the drugs at exorbitant prices.

Misleading Propaganda

Pamdal has been carrying on misleading propaganda to establish that the high prices are due to high cost of production in spite of the clear findings of the Kefauver Committee to the contrary. They mention a few factors which increase the cost of production in India, such as the high price of indigenous intermediate chemicals and their low quality, loss of solvents due to high temperature, high cost of imported equipment and production of drugs in numerous plants in small quantities. Whatever importance one may be inclined to attach to these factors, they certainly do not raise the cost of production twenty-fold or even ten-fold. However the fact remains that it was Pamdal and its foreign bosses who prevented the Soviet-aided integrated project from going through under which intermediate chemicals would have been produced in very large quantities in one plant and, similarly, all the synthetic drugs would also have

been manufactured in one large plant. Therefore, it is Pamdal and its friends who are guilty of having created the present unsatisfactory situation. Obviously, it is absurd that in the 1960's chemical drugs should be made in hundreds of small plants.

Then again, Pamdal is talking a great deal about the research laboratories that foreign firms have started in India and the huge expense they incur on them. This, of course, is also a misleading statement. The amount of money being spent on drug research in India, as in the United States, is relatively small as compared with the expenses incurred on sales promotion and profits. Anyhow, the so called research laboratories have not invented any new drugs that one has ever heard of.

Then again, Pamdal asserts that the prices of drugs produced under patents are not higher than the prices of non-patented drugs. This is contrary to evidence. Not only are the prices of drugs produced under patents 17 to 20 times the cost of production, as indicated above, but what is worse still is that the sale prices of drugs produced under patents are kept undiminished for years. For instance, the prices of broad spectrum antibiotics, Aureomycin, Chloromycetin, Terramycin and Tetracyclin, which are produced under patents and which cost the makers only 47 cents for 16 capsules of 250 mg each, were kept unaltered from 1951 to 1960 at \$5.10 to the chemists and \$8.50 to the consumer in USA; only recently was a small reduction of 10 per cent effected. During the same period the bulk prices of unpatented antibiotics, penicillin and streptomycin, fell by about 90 per cent from 25 cents to 2.1 cents per mega unit and from 32 cents to 3.6 cents per gramme respectively. Similarly, numerous molecular modifications of sulphadiazine and sulphamerazine, of which patents have now expired, are selling at more than 10 times their prices.

Abrogation, Only Solution

From what I have said above, it is perfectly obvious that the registration of drug patents for process only and the endorsement of the patents with the words 'Licences of right' would in no way break the monopoly of the patentee and his licensee under the present Indian conditions. They will still continue to exploit the suffering of the Indian people to extract high profits.

The other point that the Minister

makes, the need to reward the inventor, arises from utter ignorance of the present position of the drug industry. Scientists are employed by private enterprises or public laboratories, and in order to get their jobs they are required to write off their right to any inventions they may make in favour of the employer. In the modern times because of the necessity of putting up big plants, no inventor has the means to start a plant of his own; such endeavours have become too expensive for individual research scientists. Therefore, the question of rewarding the inventor does not arise; the enterprises make all the money through their sales. Furthermore, as I have said above, research is a very insignificant part of the total cost of production.

The only possible solution of our problem is to abrogate drug patents altogether. I stress that it would in no way hinder research in the country; on the contrary, it will stimulate research by opening out a whole field for scientists to develop known processes into a fully workable form. The principle of non-registration of patents has already been established in the Bill by making inventions in the field of atomic energy non-patentable.

More Plants in Public Sector

The next step would be to go back to the original Soviet plan and put up with Soviet aid the large plant for intermediate chemicals which the Soviet experts had designed. The present organic chemicals plant being put up is inadequate to meet our requirements. The Antibiotics Plant put up at Rishikesh and the Surgical Instruments Plant in Madras will make us completely independent of the import of antibiotics and surgical instruments. But the synthetic drug plant being put up at Hyderabad is not even a ghost of the plant originally planned. And because of its location, it has no future. Therefore, a new drug plant, bigger even than the one planned in 1956 should be set up with Soviet aid in the public sector at some sea-coast town, to make all the needed essential drugs, vitamins and hormones. And until this plant is built up, if there are no patents, we will be free to import our requirements from the cheapest sources not only for Government use but also for sale to our people by chemists. If they are imported from the Soviet Union, Czechoslovakia or Hungary, not only is their quality fully guaranteed but, also, we pay for them in rupees. Anyhow under the Drug Act

the Controller of Drugs does ensure that the quality of drugs sold is good.

The State plants will not in any way interfere with the functioning of the existing private drug plants; the latter are small enough to become an-

cillary to the big synthetic drug plant. However, the State plants must be run under competent scientific management on sound business lines but on a non-profit making basis. Drugs are obviously the one commodity which should

not be exploited to make large profits, as is being done at present. That the drug industry makes profits at a much higher rate than any other industry was shown by the Kefauver Committee.

EACH IS VITAL TO THE OTHER

A farmer works hard on his land. Yet hard work alone will not coax the land to yield more. For that he requires fertilisers, chemicals and implements which are made by various industries. Indeed, today agriculture cannot remain divorced from industry, for the two are too closely inter-linked. If we are to increase our food production, both industry and agriculture will have to develop side by side. Agriculture going it alone is retarded. Indeed, today agriculture cannot remain divorced from industry, for the two are too closely inter-linked. If we are to increase our food production, both industry and agriculture will have to develop side by side. Agriculture going it alone is retarded.

The Jats of Northern India Their Traditional Political System—II

M C Pradhan

Social and political changes do not seem to have had much effect upon the traditional political system of the Jats of Northern India, based on the khap and sarv-khap Panchayat.

A person who comes to occupy a status position outside the traditional system strives to consolidate it by acquiring the status roles within the traditional system. To do this he has to live up to the social norms dictated by it. Thus he upholds adherence to the traditional system and reinforces its authority. The prestige and political ascendancy of such persons is used by the traditional Panchayats to command allegiance and exercise social control within the Jat community and, to some extent, in inter-caste relations.

[The first part of this article appeared last week.]

THE functions of various political units of *khap* and the *sarv-khap* Panchayat fall into three categories, namely, adjudicative, legislative, and executive. The *khap* council and its various political units now, for the most part, do not have legislative functions because they have no legal sanction or authority as they enjoyed earlier under their legal charter. Then the *khap* Panchayat could frame rules and regulations to be obeyed not only by the Jats but also other castes and communities of the *khap* area, and their infringement was punished by the *khap* Panchayat which was supreme in internal matters. Several instances from the historical records of the *khap* Panchayat of Baliyan and from the minutes of the Panchayat meetings can be cited where certain rules of conduct for inter-personal, inter-group, and inter-caste relations, rules guiding land revenue collection, and general policies of social welfare for the people, were framed and executed by the *khap* Panchayat. However, the *khap* Panchayat and its units now function only as adjudicative bodies, and executive bodies in so far as the implementation of their decisions is concerned, by virtue of what may be called the traditional charter. The *sarv-khap* Panchayat still functions as a legislative body when it meets for its formal session every five years since its revival in 1950. (See the resolutions of the *sarv-khap* Panchayats below). An informal meeting of the *sarv-khap* Panchayat of neighbouring *khaps* may also function as adjudicative and executive bodies when they judge cases of infringement of resolutions adopted in the formal meetings of the *sarv-khap* Panchayat or decide to implement these resolutions in the various *khaps* of the area or when they decide cases and disputes between persons, groups or castes, and implement their decision on the parties concerned. Executive power, particularly in implementing the sanctions passed by a Panchayat, is

generally used in extreme cases of default or flouting the social norms by a person or a group, and its success depends upon a strong public opinion behind the decisions of the Panchayat.

A council of higher political units may be summoned if a smaller unit is not successful in settling an issue. Among the territorially based councils, a *khap*, an inter-*khap*, or a *sarv-khap* Panchayat, is considered more effective than lineage, *patti*, village, *ganwand*, and *thamba* Panchayats. To make a council effective and successful important persons like the headmen of maximal lineages and the leaders of villages, *ganwands*, *thambas*, *khap* leaders, and sometimes also of the neighbouring *khaps*, are invited to attend the meeting and to act as judges or mediators. With their judgement and experience and also because of their prestige and political influence, they are considered in a better position to put forward such proposals as may lead to the settlement of a dispute or to implement the decisions of a Panchayat.

Primary Functions

The primary functions of the councils of various lineage segments are to maintain unity and solidarity within their respective groups, and to remove or at least to keep in check the forces of schism which are inevitable in the relations between their members. Thus the lineage Panchayats settle disputes between the members of various kinship groups and strive to keep peace and goodwill between them. Sometimes matters of common interest are also discussed in these council meetings and a common line of action adopted. The cases decided by a *khandan* or minimal lineage council generally deal with quarrels over the partition of joint family property, misuse of borrowed agricultural implements, the priority in use of irrigational resources and with cases of personal aggrandisement, in-

timidation by a member against another, breach of promise, theft, refusal to pay back a loan, and other kinds of misbehaviour. These disputes mostly arise between brothers, step-brothers, parallel cousins or members of joint families of a minimal lineage.

These conflicts may also be present at the sub-*thok* or major segment level, though with lesser frequency than at the minimal lineage level on account of the fact that the partition of property takes place mostly at the minimal lineage level thereby reducing the chances of jealousy or bad blood between the members of a sub-*thok*. A sub-*thok* Panchayat thus performs the same functions as the *khandan* Panchayat. But sometimes a sub-*thok* council may also take decisions on matters of common interest and adopt a particular line of action. One of the major segments of Shoron village, for example, decided to discontinue the service of the *khap* genealogist on the grounds that he gave false evidence against a member of that segment in a court case on account of which the member lost his claim to some property.

The *thok* or maximal lineage Panchayat is the most powerful and effective of all lineage councils. On account of kinship factors and local contiguity an individual is largely dependant upon his *thok* for economic, social, and political support. It is not easy for an individual to acquire prestige and political influence without the support of the members of his maximal lineage. The *thok* Panchayat functions to maintain unity and solidarity among its constituent segments and decides cases and disputes among them. It has power to use certain positive and negative sanctions (to be described later), which are not the prerogatives of other lineage councils. For example, in cases of ostracism or "dropping the *huqqah*" of an individual by a Panchayat, the assent of his

thok is essential before the decision can be carried out.

The secondary functions of the lineage councils are, for example, taking decisions whether to sell sugar-cane to factories or to crush it in the village itself; whether to sell the finished products of sugar-cane to a particular market; whether to offer voluntary labour for building a village road; whether to support a certain faction in a *ganwand* or the *khap* Panchayat; whether to support a candidate in the Gram and the Adalat Panchayats. There is a tendency for political unity among lineages against other segments. Personal and factional differences within a *thok* or a sub-*thok* are patched up for the time being and the members unite under an external threat to the prestige, solidarity or freedom of their segment.

The village Panchayat acts mainly as an adjudicative body to decide cases or disputes between maximal lineages or between the members of various castes. The primary function of a village Panchayat is to maintain unity and solidarity within the village (which is based, as far as the Jats are concerned, upon common ancestry and kinship proximity) by exercising social control over various kinship units of the Jats and over other castes so as to keep the forces of conflict and dissension in check and to promote peace and goodwill. Among the secondary functions of this political unit may be mentioned, for instance, raising a fund for the *khap* Chaudhry (working on the resolutions of the *khap* council) to improve his economic condition, making an application for converting the village into a township, commemorating the martyrs of the *khap* who laid down their lives in 1857, deciding to play host to a *khap* or a *sarv-khap* Panchayat meeting, discussing and deciding a matter of common interest and adopting a certain line of action.

The *ganwand* Panchayat functions only as an adjudicative body to decide cases or disputes between members or groups of the neighbouring villages. The primary function of this political unit, like that of others mentioned above, is to maintain the ties of goodwill and to check conflict, which are necessary for close co-operation in economic and other matters between the neighbouring villages. The feeling of kinship proximity between the parent *thoks* or maximal lineages and the subsequently founded *thoks* in the villages of a *ganwand*, together with sentiment of common descent, proximity

of the villages and the personal relationship among its members form the charter of the *ganwand* Panchayat. These factors are also at work (though to a lesser extent for reasons already discussed above) and form the charter of the *thamba* Panchayat. Though the *thambas* were originally carved out only for the administrative purposes of a *khap* Panchayat, when it came to have legal privileges and autonomy in internal matters during the medieval period, the basis for dividing a *khap* into a number of *thambas* was the same in that maximal lineages of a *thamba* are related to one another in the same manner as those of a *ganwand*.

Inter-Caste Disputes

A dispute between two *thoks* or villages may be decided in a *ganwand* Panchayat, but if a dispute or a case is of a serious nature or if it is felt by the people that more important persons should be present at the council meeting, a formal *thamba* Panchayat may be called by its headman. Sometimes a prolonged dispute within a *thok*, between *thoks* or between members of two different castes, may also become an object of concern to the lineages or the elders of the castes involved. In such cases, the *thok* headmen of the villages concerned and the leaders of other castes hold a Panchayat and strive to settle the dispute in the interests of goodwill and neighbourly relations among the maximal lineages or with the other castes of a *ganwand* or a *thamba*. Disputes regarding agricultural lands or the extension of boundaries into the fields of another person who may belong to another village, disputes over the use of agricultural facilities, harrowing of crops by cattle, cases of personal or group aggrandisement and cases of breach of social norms are decided by these political units. But the *ganwand* and the *thamba* councils also meet to decide matters of common interest like commemorating the anniversaries of *khap* heroes, raising funds to help the *khap* Chaudhry and preserving peace and goodwill among different religious communities during religious riots.

The primary functions of the *khap* Panchayat are to decide cases and disputes between maximal lineages, castes or villages under its jurisdiction, to punish cases of adultery, incest and breach of social norms, and to maintain unity and solidarity of the clan and also among other castes living in

a *khap* area. But the *khap* council also functions as a political unit of higher appeal from its constituent political units. Disputes which could not be settled by lineage, village, *ganwand*, or *thamba* councils are referred to this Panchayat. A dispute could also be taken to this council if an aggrieved party feels that it has not received justice at the hands of a previous council. In such cases the *khap* Panchayat can override the decision of any of its political units. Sometimes, in the interests of preserving peace and amity within a kinship or a territorial unit, the *khap* elders and leaders may decide to call a meeting and try to settle the dispute.

Intra-caste disputes are also taken to the *khap* Panchayat. Either of the disputing parties may approach the *khap* Wazir with a request to summon the Panchayat. But in these cases the *khap* council mostly comprises the leaders and influential persons of the caste concerned; though at the request and with the consent of both the parties, some influential Jat persons and sometimes leaders of other castes also may be invited to act as judges or mediators. Otherwise it remains an intra-caste affair. If it is an inter-caste dispute, the *khap* Panchayat may consist of members of the disputing parties and such persons as are invited by the parties to act as judges; and here even if the Jats are not involved, some influential Jats are always invited to the meeting to lend more prestige so as to make the decision effective. The *khap* council meetings are presided over either by the Wazir or the *khap* Chaudhry; and the decision of the Panchayat is recorded by the Wazir in the *khap* register of records together with the signatures of the council members who acted as judges and the signatures of the leading members of the disputing parties. Thus the *khap* Panchayat also functions as an institution of social control for castes other than the Jats, though most of them may have their own caste councils modelled after the *khap* council of the Jats.

The secondary functions of the *khap* Panchayat are: promoting social welfare schemes such as female education, opening schools and colleges within the *khap* area, and asking people to raise funds for these institutions, promoting religious harmony between communal groups—as during the days of communal unrest in northern India during 1947–8—, propagating against excessive expenditure on

marriages, in giving dowry, etc, and persuading the people to save the money and spend it on education of children, on improvement of agriculture, and on religious rites. Certain functions of the *khap* Panchayat which it had during the medieval period, eg collecting land revenue, keeping an army and police force for the purpose of defence and internal administration, etc, have now fallen into disuse. But it has at the same time taken on certain new functions as mentioned above.

A serious dispute within a *khap*, between *khaps* or their members, may be decided either by a council of neighbouring *khaps* or by the *sarv-khap* Panchayat. The procedure for calling such a meeting is the same as in the case of a *khap* council. The Wazir of a *khap* is approached and he, judging the seriousness of the dispute or the difficulties involved in its settlement, invites the respected and influential persons from the neighbouring *khaps* or from all the *khaps* of Meerut Division, intimating to them the date and the venue of the proposed meeting. The meeting is generally called at the house of the party which is at fault or has infringed a rule. Persons selected to act as judges or mediators at the council meeting are known for their honesty, neutrality, fair play, tact and sense of justice. The reputation of an individual for these qualities is built up gradually over a period of years, and by his behaviour in council meetings, by his opinions and by his ability to settle a dispute, he gets the opportunity for being invited from one important Panchayat to another of increasing significance.

Cases decided by a council of neighbouring *khaps*, or an informal *sarv-khap* Panchayat may fall into any of the following categories: Marriage disputes arising out of divorcing a girl or maltreatment of her by her husband or parent-in-law; cases of cheating in marriages, eg, showing one girl to the bridegroom's parents and then marrying another with a defect, asking a heavy dowry and demanding a continuous flow of presents from the girl's parents after marriage under the threat of maltreating her if such a flow stops; and cases of breach of other social norms. Now breach of the *sarv-khap* Panchayat resolutions adopted in 1950, 1956, and 1963, which will be discussed later, are also discussed at such meetings. Most of these cases may also be decided by a *khap* Pan-

chayat. Serious disputes between maximal lineages, clans or castes, villages of two different *khaps*, or between *khaps*, are also decided either by a council of neighbouring *khaps* or by an informal meeting of the *sarv-khap* Panchayat.

The Sarv-Khap Council

The *sarv-khap* council is a representative body of all the Jat clans and of the *khaps* of other castes of the Meerut Division. It does not have a hereditary headman or Wazir or secretary. The president of the council is elected at each meeting. The Wazir of *khaps* Baliyan acts as the secretary at the Panchayat meetings, and records its minutes and decisions. The membership of this council is now voluntary, but during the medieval period, it seems, all the *khaps* were under the jurisdiction of this council. Now only those *khaps* or castes which attend the meetings of the *sarv-khap* Panchayat and agree with the decisions and resolutions passed by it are bound by them. The *sarv-khap* council does not have any administrative power over the other *khaps*. Its executive powers are also limited in that they can only be exercised with the consent of those *khaps* which have agreed to implement its decisions within their clan areas. In its informal meetings, the *sarv-khap* Panchayat mostly functions as an adjudicative body, and the implementation of the decisions is either left to the *khaps* concerned or to a committee of influential persons constituted with the consent of the *khaps* to see to their implementation. The legislative functions of the *sarv-khap* Panchayat are mostly confined to its formal quinquennial meetings. But during the medieval period when faced with extraordinary circumstances like a foreign invasion or political or economic turmoil, a formal meeting of the *sarv-khap* Panchayat could also be called which could formulate certain rules or regulations for the people of the area. This is borne out by the minutes of the *sarv-khap* council meetings of that period. The authority under which the *sarv-khap* council has been functioning for centuries is mainly traditional and it has not had any legal charter such as was granted to various *khaps*. This traditional authority is based on its role in defence of the *sarv-khap* area in the past. Now it has become a moral force which is hard to flout even for a *khap*.

The primary functions of the *sarv-khap* council are the same as those of a council of neighbouring *khaps*. The

functions it came to acquire during the medieval period, eg, keeping an army for defence and maintaining internal autonomy of the area, demanding political recognition for the *khaps* from rulers at Delhi, etc, have now disappeared. But it has now taken on certain other functions such as working for schemes of social and economic welfare of the people. These new functions have strengthened the traditional belief of the people in the *khap* and the *sarv-khap* councils.

To convene a formal meeting of the *sarv-khap*, a council of five or six *khaps* is held to decide the date and the venue for the meeting. A *khap* may offer to play host. Then a working committee consisting of important leaders from various *khaps* is set up to raise subscriptions from the *sarv-khap* area and to send invitations to headmen and leaders of the *khaps* and also of various castes to participate in the meeting and, finally, to make necessary arrangements for food accommodation and other conveniences for the delegates and for holding the council meeting. A steering committee is also instituted to decide the agenda of the meeting and to finalise a list of topics which is put before the general meeting for discussion and passing of resolutions. But the delegates are also free to put forward any resolution they wish to before the council meeting. Speeches are delivered elucidating the aims and purposes of the resolutions and the desirability of adopting them. Then those who do not agree with this or that resolution deliver their speeches. Finally, the resolutions are put to vote one by one. Voting is by show of hands. If a resolution is passed by an overwhelming majority, it is considered as adopted, and the one which cannot muster enough support or which do not have an overwhelming majority, fall through. A resolution may not be binding upon those *khaps* or castes which were not in favour of it. After the resolutions have been adopted, the leaders of those *khaps* and castes who were in favour of them come to the dias one by one and take an oath to implement the resolutions in their respective *khaps* or castes.

A working committee is set up consisting of the leaders of various *khaps* and castes to canvas and enlist support for the resolutions by touring the villages of the *sarv-khap* area, and to persuade the people to accept and implement the resolutions. After the meeting of the *sarv-khaps* council is

over, the leaders of various *khaps* and castes may also hold meetings of their respective political units in which the *sarv-khap* council resolutions are again adopted with a view to emphasise their importance and to persuade the constituent political units such as *thoks*, *ganwands*, and *thambas*, etc, to accept and implement the resolutions.

If the resolutions have been accepted by a *khap* or a caste council it may punish any infringement of them in its Panchayat. In more serious cases of default, the matter may be referred to the *sarv-khap* secretary who then summons a Panchayat meeting of four or five *khaps*, and the defaulters are fined, warned or admonished for flouting the resolutions. Other sanctions may also be passed against the defaulting persons or groups, but the implementation of these sanctions is again left to the *khap* or the caste concerned, and only on its suggestion a committee of influential persons may be set up to see the sanctions implemented. The secretary of the *sarv-khap* Panchayat keeps himself in touch with the efforts of the committee and after it has successfully carried out its task the secretary makes a note of it in the *sarv-khap* Panchayat register of records. If the sanctions passed by a Panchayat is not successful because of the intransigence of the defaulter, a bigger Panchayat of more influential persons and leaders of a larger number of *khaps* is called at the doors of the culprit. They refuse to eat or drink (by the tradition it is the duty of the person at whose house the Panchayat is assembled to provide food and other hospitality) till he has accepted the decision of the council and has carried out the sanctions to the satisfaction of the council members. It becomes very difficult for a person or a group to ignore such an assembly of persons. Moreover, if the Panchayat goes away from the house of the defaulter without accepting food and water from his hands the prestige of such a person is mortally affected and other persons, groups and even his service castes may discontinue social and other relations with him till he complies to the sanctions passed by a Panchayat and expiates himself by giving a community feast in which the same council members must be invited. If, however, the Panchayat has failed to bring a person to book it may ostracise him, his whole *thok*, village, and even the whole *ganwand*, (if it is found that these units are siding him or are helping him in other ways) till such time as when the defaulter has

carried out the directions of the Panchayat and the leaders of other units have apologized and asked to be forgiven for their conduct. During ostracism, which is almost always temporary among the Jats, eating, smoking, marriage, and other kinds of interaction are prohibited with the person concerned and also with such units as may have helped him. Over a period of years these restrictions become unbearable and then the defaulter and those who have been helping him try to reach a settlement with the Panchayat. After they have either paid a fine or tendered an apology or given an undertaking (with a straw under the teeth signifying humility) not to go against the wishes of the Panchayat, they are pardoned and are allowed to enjoy the usual privileges of the caste. There are a few cases in which such extreme decisions were taken to ostracise a *ganwand*, and once the whole of the *khap*, in recent years. The normal relations of commensality and marriage were established after several years and then only when the defaulters in the *ganwand* case had apologized and paid the fine, and in the inter-*khap* dispute between Baliyan and Desh when a rapprochement had been reached between the two.

First Formal Meeting

The following case will make the procedure and the functions of the *sarv-khap* Panchayat explicit. It relates to the first formal meeting of the Panchayat held in 1950 after a period of one hundred years. It will also show the influence this council has had upon the Jats as well as other castes of Meerut Division since its revival:

The meeting of the *sarv-khap* Panchayat was held in Shoron village, *khap* Baliyan, and was attended by hereditary leaders of all the 18 *khaps* of Meerut Division and also by the leaders of other castes and communities. The headman of *khap* Kalaslain (of Gujar caste) was elected as president of the meeting, which lasted three days. Speeches were given by several leaders from various *khaps* eulogizing the past history of the *sarv-khap* Panchayat, the aims behind its revival, and its importance for the welfare of the people. Then followed discussions and speeches on the 14 resolutions put up before the general meeting. These resolutions had been framed earlier by the working committee of the Panchayat. They were:

(1) People should not incur heavy expenditure on daughters' mar-

riages, particularly on extending hospitality to the grooms' parties.

- (2) Display of ornaments by groom's father at the time of 'the ceremony of welcome' held at the bride's house should stop.
- (3) Not more than five persons should accompany a marriage party.
- (4) No relations should be invited by a bride's father at the time of her marriage, except her maternal uncle (mother's brother), for this custom entails heavy expenditure which the bride's father can ill-afford.
- (5) The feast of *mandha* (final feast before the departure of the marriage party) should be discontinued.
- (6) The engagement ceremony should be performed only with one rupee and the old custom of incurring heavy expenditure on this ceremony should be discontinued.
- (7) The groom's father should not present more than 3 *tolas* (weight measurement for precious metals) of gold and 50 *tolas* of silver ornaments to the bride. The bride's father should not give more than one *tola* of gold and 25 *tolas* of silver ornaments.
- (8) Only 5 items of clothes and 5 of kitchen ware should be given in dowry.
- (9) The boy and the girl should be fully satisfied with each other before the marriage takes place. After the marriage, the husband should not leave his wife.
- (10) The marriageable age for a boy should be 25 years, and for a girl 16 years. Child marriages should be stopped.
- (11) In the *bhat* ceremony (when presents are given by the bride's mother's brother to the parents of the bride) not more than 50 rupees should be given in cash and presents of cloth and kitchen utensils should be discontinued.
- (12) The custom of sending presents to daughter's husband's place on every festival after marriage should be discontinued.
- (13) In the ceremony of *gauna* (when the bride goes to her husband's place for the second time after marriage) only five items of cloth and one set of bedding should be given by the girl's father. All other presents in cash or kind should be discontinued.
- (14) Other malpractices now prevalent in marriage ceremonies

GROWING BIGGER EVERY DAY

That's us. Always trying to do a little better than yesterday. Always doing it. Textiles, jute, dyes and chemicals. These are the interests we have today. Tomorrow? The possibilities are endless. The future is wide open.

should also stop; and the money thus saved should be spent on education of boys and girls and for religious causes.

All these resolutions were passed by the general assembly and were adopted. Members of all the *khaps* came to the dais one by one and pledged their support for the resolutions and also promised to implement them in their respective *khap* areas. Leaders of several other castes also pledged their support and promised to implement the resolutions within their castes.

These resolutions have had a profound effect upon the people of Meerut Division. Some of the resolutions such as those about marriageable age of boys and girls, limit on the number of relatives to be invited in marriages by the bride's father, or the limit imposed on presents and expenditure incurred on the *bhat* ceremony are not strictly followed. But the other resolutions are being strictly followed by quite a number of *khaps* and the infringement of these resolutions brings swift punishment from the *khap* or inter-*khap* Panchayat. The defaulter is generally made to pay a fine and give a firm promise that he would not break the resolutions in future. The fine thus realized is donated by the Panchayat to the school in the locality to which the defaulter belongs or towards building such a school if the village has none. From the register of records of the *sarv-khap* Panchayat kept by the Wazir of *khap* Baliyan, it is evident that *khaps* and councils of neighbouring *khaps* have punished a number of persons who have infringed one or the other of these resolutions. During my fieldwork I came to know that these resolutions have been effectively implemented and are being strictly followed by the Jats as well as by certain other castes of such *khaps* as Baliyan, Salaklain or Desh, Chogama, Gathwala, Kalaslain (of Gujar caste), Badanu and so forth. Information about breaking a rule by a person may be given either to the *khap* leaders or the Wazir of the *sarv-khap* council who, after verifying the complaint from the respected persons of the village of *ganwand* to which the defaulter belongs, calls a Panchayat meeting either of the *khap* or council of neighbouring *khaps*, depending upon the seriousness of the breach or the status of the defaulter.

The 1950 meeting of the *sarv-khap* Panchayat was also attended by several Jat leaders from the Punjab. And it had such a profound effect upon them that after their return they can-

vassed for a meeting of the *khaps* of their state which ultimately led to a meeting of several *khaps* in the town of Beri, on January 31, 1951. The prominent leaders of the *sarv-khap* Panchayat of 1950 were also invited to this meeting. In this Panchayat the 1950 resolutions of the *sarv-khap* Panchayat were adopted.

Resolutions Taken Seriously

The second meeting of the *sarv-khap* council was held in 1956, again in Shoron village of the *khap* Baliyan. I attended the meeting. The same resolutions of 1950 were put up before the general meeting for discussion with a view to finding out their impact upon the people. It was established from the speeches of leaders from different *khaps* and castes that these resolutions had done quite a lot of good in removing malpractices of too high dowry, unnecessary expenditure in marriages, leaving the wife after marriage and extortion of money and presents from the wife's father or maltreatment of the wife. One Jat leader in his speech assessed the amount saved by the Jats and such other castes as Rajputs, Gujars, Ahirs, Tiyaagi Brahmins, Blacksmiths, Carpenters, Goldsmiths, Muslim Jats, and Weavers of the *sarv-khap* area at Rs 750,000,000 during the five years between 1950 and 1956 through economizing in marriage ceremonies and related expenses. And this, according to him, was due to the resolutions of the first formal *sarv-khap* Panchayat. This showed the effectiveness of the council as an institution of social control and its popularity with the masses. However, it was felt that in some areas of Meerut Division the resolutions were not being followed strictly. Therefore, it was decided that these resolutions should again be passed and adopted by the second Panchayat meeting, and fresh pledges for their implementation should be taken from the leaders of the *khaps* and castes. This was done and the 1950 resolutions were adopted again and fresh pledges taken. The second *sarv-khap* council also passed some other resolutions of minor importance, but its main task was to infuse of fresh sense of dedication to the resolutions of the first formal Panchayat and to propagate for their acceptance by certain *khaps* or castes which had not yet seriously taken up their implementation within the areas of their jurisdiction. In this the second *sarv-khap* Panchayat succeeded to a great extent.

The third quinquennial meeting of this body was held on March 2, 1963 in Baraut (a town in *khap* Salaklain of the Jats of Tomar clan, in Meerut district). The president in his speech before the general meeting eulogized the role of the *sarv-khap* council in maintaining and propagating the cultural tradition of the country and its devotion to the cause of social welfare of the masses and to defending the freedom of the country as was borne out by its past history. He said that in the difficult period of national emergency created by the Chinese attack on their country the eyes of the nation were fixed on the farmers who had to produce more food so that the country could be strong enough to defend itself; and in this task the *sarv-khap* council and its leaders could render valuable service by persuading the farmers to make the country self-sufficient in food. He also expressed the hope that in its present meeting the Panchayat would be able to put forward before the public a constructive programme of economic and social development and would be able to implement it with the dedication which had characterized its functioning from ancient times.

The resolutions put up for discussion and adoption before the general meeting are of topical interest because they indicate the present trends in the *sarv-khap* council, the thinking of its leaders, the effect of the Panchayat resolutions upon the masses and their relevance for the political processes of today within the various *khaps* and castes of Meerut Division. The resolutions finally adopted by the Panchayat are:

- (1) The Panchayat should contribute its mite towards the defence of the country in the wake of the Chinese aggression by persuading the people to donate to the national defence fund, helping the government in building a village volunteer force and in army recruitment and persuading the farmers to grow more food.
- (2) The Panchayat should continue to work towards the implementation of the resolutions of the two earlier Panchayats of 1950 and 1956. These resolutions have done quite a lot of good in removing malpractices in marriage ceremonies and customs prevalent among the castes and the communities of the *sarv-khap* area.
- (3) The Panchayat should strive to remove caste distinctions and barriers.

- (4) The Panchayat should promote better educational facilities and better management of educational institutions. It should also raise funds towards building a girls' college. But co-education in schools and colleges should not be encouraged.
- (5) Cows should be protected (from slaughter) and production of milk and *ghee* (clarified butter) should be increased in villages.
- (6) People should be made conversant with the history of the *sarv-khap* Panchayat so that they may know the importance and the role of this organization in the life of the people from old times to the present day and follow its resolutions.
- (7) Two military colleges should be opened, one in Baraut and the other in Bulandshahr district. The Panchayat should persuade the government to undertake this task and should also raise contributions from various *khaps* towards the financing of these colleges.
- (8) A working committee should be set up to implement these resolutions.

I have not been able to visit the field recently to assess the impact of these resolutions on the people of the various *khaps* of Meerut Division. Nor has it been possible to know how far the working committee has been able to implement the new resolutions adopted at this Panchayat meeting. But it was bigger and more important than the two earlier meetings of the *sarv-khap* council held in 1950 and 1956, both with regard to the number of delegates and the topics on the agenda of the meeting. The resolutions indicate that since its revival the Panchayat has taken upon itself the responsibility of tackling with social and economic problems facing the people of the *sarv-khap* area, and to some extent the nation as well and is thus trying to widen its influence among the masses. Moreover, the resolutions on national defence passed by the Panchayat indicate that its leaders still consider it as their duty to defend the country against foreign invasion which was one of the important functions of the *sarv-khap* Panchayat in mediaeval times. The Panchayat's contribution to defending the country could not, of course, take the same form as in earlier times, like raising an army from different *khaps* and fighting the invader directly.

By and large the leadership of the *sarv-khap* council still functions

within the traditional thought pattern as can be seen from the resolutions mentioned above. Rather than accepting a political ideology and programme of social and economic development from the 'rightist' or 'leftist' political parties functioning in the country, the Panchayat is grappling with these problems in the traditional manner with a 'peasant-outlook' as it were. This is born out by resolutions 2,4,5, and 6 mentioned above. On the one hand, the *sarv-khap* Panchayat stands for schemes of social welfare and change (resolutions 2,3,4, mentioned above); on the other, it also acts as a check on certain other social changes like co-education in schools and colleges and urbanization and westernization and the ideas that go with them.

Sanctions, Negative and Positive

This sophisticated and largely attended meeting of the *sarv-khap* Panchayat (its proceedings were broadcast by the All India Radio, and were also covered by the Nav Bharat Times of March 2nd and 5th, 1963, and by other newspapers), passing bold resolutions on problems having an all-India bearing, may seem a far cry from the informal lineage Panchayats in different *khaps* with parochial interests in the Jat villages: it may also seem at first that there is no connection between these two political institutions. But a closer look at these political processes will show that these two units form a chain in the political continuum. For the same structural and organizational principles, viz, kinship proximity and local contiguity at village and *khap* level, the concept of 'brotherhood' (*bhaichara*), and so forth, are at work at the *sarv-khap* level also. And the resolutions are primarily addressed to the people of the various *khaps* and the caste Panchayats of other castes. Here the *khap* leaders, at least in the case of the Jat clans, will only be able to implement these resolutions by the active support of the headmen and leaders of *thoks*, sub-*thoks*, and *khandans* of minimal lineages. It is these lineage councils, together with the *khap* Panchayats, which see to the implementation of the *sarv-khap* Panchayat resolutions.

The sanctions exercised by various units of the Jat political system, may be divided into positive and negative sanctions. Positive sanctions promise economic, social, or psychological rewards to an individual. Negative sanctions are those which may inflict punishment, penalty or ostracism for the breach of norms of the society.

They are negative in the sense that they can be applied only to penalize or punish but not to reward. (R T La Piere, "A Theory of Social Control", McGraw Hill, London, 1954).

Positive sanctions are used not by the Panchayats but by the society or social groups and their use is closely related to an individual's actions and behaviour in relation to the lineage groups to which he belongs and to those with whom he comes in contact in face-to-face relationships. But sanctions like total extermination of an individual, economic intimidation, wilful harm to a person's property or, conversely, economic reward are unknown among the Jats and are not used by the Panchayats. Formerly such physical sanctions as beating or whipping of a defaulter were common but now they are rarely used by the councils. Permanent expulsion or ostracism of an individual was rarely practised if at all, and is now totally absent. But temporary expulsion signified by 'dropping the *huqqah*' (withdrawing the right of a person to eat or smoke with other members of his caste) is common, though resorted to by the Panchayats only in extreme cases of default. And then, to be effective it must have the active support of the *thok* or maximal lineage of the offender. Thus the exercise of this sanction is the privilege only of the *thok* or the *khap* Panchayat. Fines and economic restitution of an aggrieved party are common and can be used by any unit of the Jat political system.

A curse is considered one of the most effective sanctions. The faith in a curse, particularly when uttered by Panchayat members, is very strong and a curse is considered infallible. Several cases could be cited where a curse uttered by a Panchayat against the persons who have flouted its decisions has come true. A typical case is that of a person in Shoron village in *khap* Baliyan who, on the advice of his elder brother, got married in *khap* Salaklain. But this was against the resolutions of his own *khap* which had banned marriages between Baliyan and Salaklain on account of some dispute between the two *khaps*. The *khap* council tried to persuade the two brothers not to break the ban, but it failed to persuade them in spite of two or three meetings of the *khap* Panchayat. The elder brother of the person concerned was the headman of a *thok* of Shoron village. On account of party politics within the *khap*, with the backing of his maximal lineage, the headman succeeded in marrying his brother against

the ban. After the marriage, a meeting of the *khap* Panchayat was held and a curse was uttered by the council members that there will be no male issue from this marriage to carry on the family name. This incident happened more than twenty years back but there has been no male child born till now. The person concerned is now about seventy years old (this was his second marriage); the only son from the first marriage had died at the age of eighteen before the second marriage took place. According to the villagers there is now not much hope of a son. The curse of the Panchayat had had effect.

A curse may be uttered by any political unit from a minimal lineage to a *sarv-khap* Panchayat when all other means of social control have failed. It is the last, but not the least, of the effective sanctions at the disposal of the Panchayats. The belief in the efficacy of the curse and the strong fear of it strengthens the moral element in social relationships and checks unethical or anti-social conduct. The process of education and urbanization, it seems, has not affected this belief and it is fairly common among educated and urbanized Jats serving in the Indian army, government or civil service and also among college students.

A Panchayat may also ask an individual to take an oath of good conduct in future. This practice is supported by the common belief that if an individual breaks his words of honour or a promise given before a Panchayat, he loses his respect in the eyes of others.

For certain religious and moral lapses an individual may be asked by a Panchayat to undergo expiatory religious rites such as going on a pilgrimage, taking a purificatory bath in the river Ganges or giving a communal feast. Others may be forbidden to eat or smoke with him until he has performed these rites. In some cases he may also be asked by a *khap* or *sarv-khap* Panchayat to tour the villages of his *khap* and ask to be forgiven by the leaders of those villages. In such cases the Panchayat appoints a committee of two or three respectable persons who are asked to accompany the defaulter on his tour to the villages and to see that he carries out the decision of the council. Generally, this sanction is accompanied by temporary expulsion of the person from the caste. The caste councils and the *khap* Panchayats of other castes also use these sanctions.

Impact of Economic and Political Changes

The Jat community as well as other

castes of Meerut Division have experienced certain economic changes brought about by the introduction of irrigation facilities and of sugar-cane as a cash crop, by the growth of the competitive market economy and the growth of industry and towns. These factors have produced economic inequality among the Jats. Those who have gained wealth now aspire for leadership or office within the traditional political system, as headmen of lineage groups and as judges or council members in Panchayat meetings and also for office in the new government instituted political set-up of Gram and Adalat Panchayats (village committee and justice committee respectively).

Traditional System Not Weakened

Those who are more well-to-do than others may even stand for the state legislature or the parliament. For such status roles as are outside the traditional ones, an individual need not follow the traditional values demanded by the society. Such persons, if they are unable to achieve a position of leadership or office within the traditional political system, may turn against it; and then it becomes difficult for a Panchayat to control their behaviour. Those who come to hold office as president of a Gram Panchayat, a judge on the Adalat Panchayat, a member of the Zila Parishad (district committee), or member of the state legislature by virtue of their economic or political influence, may also be elected as the heads of *thoks* and sub-*thoks* or to such other status roles within the traditional system as are not strictly hereditary. This is because the belief in the traditional authority and value system of the Jats, as moulded by their kinship and political structure, has not changed much in spite of education and urbanization. Education among the Jats is increasing fast on account of the keen interest the community is taking in education by raising funds for schools and colleges. But the traditional values, ideology, and thought patterns of the Jat society are not undermined by the dissemination of education, in spite of its broadening of outlook which is used to rationalise and to reinforce the traditional value system based upon the kinship and the political system of the society. This happens because the Jats are still tied to the land which cannot be alienated outside the *thok*, a factor which maintains the corporate group structure of the society. Moreover, because of the introduction of the cash crop of sugar-cane and the increase in

land prices on account of irrigation facilities resulting in substantial increase in agricultural output and its market value, an individual has high economic stakes in his ancestral property. And those Jats who are serving outside their villages in army, civil service and other jobs like to return to the villages after retirement to settle down there. I did not come across even one case where a Jat had sold his property in his native village and had settled down in a city. On the other hand, many cases could be cited of senior army officers, government servants, etc, who have come back to their villages after retirement and now lead wealthy agriculturists' lives. These values and interests uphold the kinship and the political system of the Jat society under the conditions of change.

A person who has come to occupy a status position outside the traditional system strives to consolidate it by trying to achieve the status roles within the old system. To do so he has to live up to certain social norms dictated by kinship and the political ideology of the certain social norms dictated by the community; and in doing so he upholds the belief in the traditional system and thus reinforces its authority. The prestige and political ascendancy of such persons is used by the traditional Panchayats to command allegiance and exercise social control within the community and, to some extent, in inter-caste relations as well.

Social and economic changes do not seem to have much effect upon the traditional political system; nor is the system showing any signs of disorganization. The Jats, as well as other castes, still believe that "five *panches* (council members) sitting in a Panchayat are like five gods". This epitomises the ethos of the Jat community. The council members entrusted with the task of settling a dispute or making a decision are considered sacred. This belief not only protects them against any harm from the litigants for the decisions they may give, decisions which are morally binding upon the parties concerned and could only be broken at the pain of incurring a curse by the Panchayat which is considered infallible, but also compels the *panches* to conduct the affairs of the Panchayat with justice, equity and good conscience.

Such structural and organizational principles as *khap bhaichara* (brotherhood), *khap* exogamy, kinship organization and sentiment, corporate group structure of the society and the settlement pattern of the lineages and the

clan remain very much the same. They still seem to uphold and reinforce the traditional authority and the political system in more ways than one.

The Gram and the Adalat Panchayats introduced by government function at village and inter-village level. The Gram Panchayat has certain economic and political advantage over the traditional village council by virtue of the legal authority invested in it by government statutes. It can act towards village-wide goals with more effectiveness than the traditional village Panchayat. But the success of the Gram Panchayat in any undertaking depends largely upon the co-operation of maximal lineages and major segments of the Jats without which it remains ineffective. Other castes like the Carpenters, Blacksmiths, Sweepers, Chamars, Water-carriers, etc, are still largely dependant upon the Jats by virtue of their having most of the agricultural resources. These castes also support the decisions of the leaders of maximal lineages. Thus the Gram Panchayat can hardly get the majority of its members for an undertaking if it is not supported by the Jat *thoks*. It is also largely controlled by inter-

thok politics and relations between various lineages of a village. The traditional village council still functions independently of the Gram Panchayat.

The Adalat Panchayat is an adjudicative body comprising four or five neighbouring villages and decides cases and disputes between the members of these villages. It has become a rival institution to the *ganwand* and *than.ba* Panchayats. But the villagers do not place much faith in the Adalat Panchayat, consider it a hot bed of politics and intrigue and do not take their disputes to it. They still prefer a *thok*, *patti*, village, *ganwand*, or *thamba* council for their disputes; for in these Panchayats they can have a say in the selection of the council members, which they cannot be sure of in an Adalat Panchayat. The new political set-up of Gram and Adalat Panchayats has not yet established itself in the thought patterns of the villagers. Finally, the new set-up has a restricted scope and frame of reference as compared to the traditional political system which has much wider functions in the social, political and cultural fields. The new political set-up has taken over some of the for-

mer's functions, like the administrative and adjudicative powers at village and inter-village level, but it leaves out other fields of activity in which the *khap* and its political units and the *sarv-khap* Panchayat remain as effective as possible under the changing conditions.

Above I have discussed briefly the relation between the Jat kinship structure, concept of *bhaichara* (brotherhood) system of land tenure and the customary law of inheritance on the one hand, and the traditional political system of the Jats on the other; the history and the functions of the political system from medieval times to the present day; and the impact of certain processes of change upon the political system. Other aspects like the techniques of propaganda, implementation of Panchayat decisions, the effectiveness of the *khap* and the *sarv-khap* councils in regulating conduct within the Jat community as well as other castes, the maintenance of political dominance of the Jats (within their clan areas) over other castes and the present trends of the political system could not be discussed here.

(Concluded)

FROM THE CHAIR

Delhi Cloth & General Mills Co Ltd

Speech of the Chairman, Dr Bharat Ram

THE following is the Speech of Dr Bharat Ram, Chairman, Board of Directors, Delhi Cloth & General Mills Company Ltd, delivered at the 77th Annual General Meeting of the Shareholders of the Company on December 14, 1965 at Bara Hindu Rao, Delhi-6:

Ladies & Gentlemen:

It is indeed a pleasure to welcome you all to this 77th Annual General Meeting of your Company. Since we last met, a number of events and developments have taken place in our country. Our food situation, which has a vital impact on the general economic situation, was extremely serious, on account of natural causes; and we had the unfortunate experience of an armed conflict with our neighbour, Pakistan. The combined effect of natural factors and the actions of our neighbour on the economic situation of our country has been extremely serious, and ominous clouds still hover around us. However, the situation has its brighter aspect also. The conflict with Pakistan has forged a sense of unity in our people which is matched only by the bravery and valour of our Jawans. The difficulties on the agricultural front have made us acutely aware of the necessity of developing internal resources and standing on our own legs. I am, therefore, optimistic that the difficulties with which we are faced will do us some good in the long run, for they will lead us to greater efforts in all spheres of activity. I have no doubt that there is plenty of talent in the country, and the present situation will bring to the fore the latent capacities of our people. If we can take lessons from our past mistakes, particularly in the field of economic policy, it would be all to the good of the country.

We are extremely fortunate in having, at this juncture, the leadership of Shri Lal Bahadur Shastri, who, by his calm and unperturbable demeanour, steered the nation to the defence of its integrity and honour, and I pray that God may spare him for a long time to guide the destinies of our country.

The major economic problems of the country have been with us for some time, and the present conflict has only accentuated them. Food is

certainly the most crucial problem facing us. Nature has not been kind to us this year, but I would not blame Nature alone. Even in the years of good rain-fall, in the recent past, we have hardly produced enough food for ourselves, and 6 to 8 per cent deficit has always been with us. Although there has been a great deal of talk about importance of agriculture, it has not received the same kind of concentrated attention and administrative talent, as has been attracted by schemes of more spectacular character. We have often talked of giving the highest priority to agriculture; but talk alone will not yield results. Immediate steps need to be taken to render help and assistance to those who are in a position to increase the production of fertilisers, pesticides, irrigation facilities etc. The best talent in administration, both at the Centre and in the States, has to be made responsible for achieving the required results. The fact that our yield per acre in most agricultural commodities is very low should, in one sense, give us the confidence that we would be able to produce more, not only to meet our own requirements but also to increase exports of some agricultural commodities.

The second problem which the country faces is the shortage of foreign exchange. Many industries are having to curtail production for want of raw materials and components. This again may be a blessing in disguise. One can already see a greater effort in import substitution. Yet a good deal more can be done if there was a well organised effort. I would only suggest that we give greater priority to the utilisation of existing capacity in preference to new and long range capital intensive schemes.

Apart from foreign exchange resources, there is the problem of internal rupee resources, the supply of which has been made so scarce that some concerns have had to close down on account of lack of working capital. Our policy makers should recognise that in a country such as ours, where a predominant sector of the economy remains outside the pale of monetary policy, monetary controls alone can have only peripheral effects on prices. This has been repeatedly demonstrated, and particularly by the recent

trends in production and prices.

In the sphere of agriculture particularly, our credit policies have little effect on prices. On the other hand, excessive stringency in the policy of finance for the legitimate requirements of industry and business can only inhibit operations. There is need for re-consideration of the present banking and credit policy of Government.

The increase in bank rate has had, and will continue to have, a depressing effect on the capital market. In sympathy with the bank rate, the deposit rates of companies have also risen, and dividends on equity have become less attractive for the investor. It is not surprising that in this situation, the state of the share markets is what it is today, and that fresh investment is not taking place. In the light of our need for industrial development, it is essential that an entirely new look be given to our taxation structure and financial policies. For the last 15 years, we have experimented with controls and regulations. These may have served some limited purposes; but the time has come when courage should be taken in both hands to allow freer play to economic forces. In order to persuade people to invest, two things are necessary: firstly, the expectation of reasonable capital appreciation, and secondly, the hope of a reasonable return on investment. New projects do not yield much return in the first few years, and the investor looks forward to capital appreciation for recompense. Taxes on capital gains, including the entire value of bonus shares, act as a great deterrent to investment in new projects. I have no doubt that if the rate of taxation on capital gains from equity shares is prescribed at a level lower than that for unearned income, it would be a great incentive for investment. Piecemeal and small concessions such as have been announced recently, are not likely to yield substantial results. A bold approach is required in respect of tax policies.

Apart from the high rate of taxation, there is the problem of lack of stability in tax policies. Of late our tax structure has been subjected to so many novel ideas and experiments that investors do not really know where they stand. The feeling

Peace of mind at home

LPE-Aiyars S 1812

of insecurity is enhanced when retrospective effect is given to new tax measures, not only in respect of rates but also in respect of the basis of taxation.

While on the subject of taxation, I would like to refer to the recent announcement of Government for attracting Foreign Exchange held by Indian nationals abroad, and also for subscriptions to Gold Bonds. Earlier, a scheme to facilitate voluntary disclosure of undisclosed incomes was also announced. There may be good reasons for these decisions; at the same time, I must say that when Government is prepared to allow concessions to those who have not disclosed taxable income earlier, it must also think in terms of reducing the burden on the honest tax payers. In the long run, if dishonest practices have to be stopped, there must be a premium on honesty, and not dishonesty.

I have briefly stated some of my views on the general economic situation, and some Government policies. I must here express the hope that we will learn from our past experience and take a more practical view of problems now.

Coming now to your Company's affairs, you will observe from the Balance Sheet in your hands, that while the gross profits have gone up from Rs 384 lakhs to Rs 434 lakhs, the net profits have declined. As I said last year, this phenomenon is a reflection of the Company's continued investment of large amounts of money in new industries, entailing a heavy initial depreciation and development rebate.

The textile industry, as a whole, is passing through difficult times. Some units have already closed down, and others have reduced production. It is fortunate that the textile units of your Company have maintained satisfactory performance in spite of increased costs of raw materials, stores, wages etc. The exports of the Company have also continued to be satisfactory.

The position in respect of your textile mill in Pakistan is however very uncertain. We have no contact with the factory presently, and I understand that control of the unit has been taken over by the Custodian of Enemy Property in Pakistan.

There has been a certain amount of loose talk about the Company donating a large amount of money to the Pakistan Defence Fund. Our position has been made clear

in the press, and also by the Finance Minister in the Lok Sabha. We have no knowledge of what is happening to the factory in Pakistan, nor how much money has been extracted from it for any purpose. We have filed a claim with the Custodian of Enemy Property in India in respect of this unit, and I hope that the Government will arrange for a suitable compensation to be given to the Company for this loss.

You will be glad to know that your Directors have recently re-named the two units in Kota as Shriram Vinyl & Chemical Industries and Shriram Rayons. These two units have had their share of operational problems during this last year. A 60 per cent power cut has been imposed in Rajasthan, seriously affecting the caustic soda and carbide plants. Steps have been taken to send stand-by turbines from Delhi and also to acquire diesel generating sets from abroad. Shri-

ram Rayons, which started production in 1965 is now facing the problem of supply of pulp, which is imported. The shortage of power and pulp are likely to affect the working at Kota this year also, and the management is taking all possible steps to meet the problems.

The sugar units of your Company have also suffered due to shortage of cane. However, it appears at present that the working of the sugar factories would be better this year as cane supplies are better than they were at this time last year. The Chemical and Vanaspati units of your Company have worked satisfactorily.

In the end, I would like to record our sincere appreciation of the wonderful work of all our workers and staff whose efforts have enabled us to achieve such good results during the year in spite of so many problems.

Note: This does not purport to be a record of the proceedings of the annual General Meeting.

The Scindia Steam Navigation Co Ltd

Statement of the Chairman Shri Dharamsey M Khatau

THE following is a summary of the speech of Shri Dharamsey M Khatau, Chairman, The Scindia Steam Navigation Co., Ltd., made at the 46th Annual General Meeting of the Shareholders on Wednesday, the 15th December 1965, at Patkar Hall, Bombay-1:

In his Statement made at the 46th Annual General Meeting of the Scindia Company, held on 15th December 1965, Shri Dharamsey M Khatau, Chairman, referred to the critical period of the country had recently passed through and observed that our achievement so far had clearly shown to Pakistan and the world outside that any further infiltration or encroachment of our territories would not be tolerated. It was of immense value, he said, that under the worthy leadership of our Prime Minister the people had 'discovered' their capacity to stand united against an external foe and that the present crisis had awakened us to the importance of standing on our own legs in regard to all our essential requirements. Paying his homage to the men in the Armed Forces and the civilians who gave up their lives or otherwise suffered in defence of the country, Shri Khatau said that, as in the past, Scindia's entire resources were at the country's service.

Economic Solution

Commenting on the state of the country's economy, Shri Khatau observed that due to the difficult foreign exchange, position, our imports had been severely restricted and our exports had also declined on account of the surcharge imposed by the U.K. — our biggest Market abroad — on their imports for reasons affecting their own economy. The trade between India and the U.S.A. had also become virtually stagnant. This situation, he said, was bound to worsen further in the event of any drastic curtailment in our existing foreign exchange facilities or delay in reaching firm decisions thereon. Regarding the planned development of Shipping, Shri Khatau observed that in spite of considerable expansion of our National tonnage since Independence, we were still not able to cater for a substantial share of our Overseas trades. He, therefore, pleaded that future expansion should be so planned that at least 50% of our bulk cargoes and an increasing share in the liner trades are carried in our ships. A ma-

jor difficulty in this respect was our growing shortage of foreign exchange. For their Coastal services, Shipowners had to purchase such second-hand ships as were offered. As they had no choice in the matter of age of such vessels, Shri Khatau pressed for restoration of full development rebate of 40% instead of the present rates of 30% for ships not more than 7 years old and 20% for older ships.

New Ships

During the year under review, Shri Khatau said, two new ships had been delivered: JALAKALA, built at Visakhapatnam and RUKMAVATI built in the U.K.; also two 12,000 d.w.t. 16 knots second-hand vessels had been purchased. Two fast Cargo ships were on order from the Hindustan Shipyard and three 15,000 d.w.t. fast Cargo ships were under construction in the U.K. He added that the Company's unremitting efforts to keep its fleet young and efficient had fairly succeeded.

At the very beginning of the present conflict, Shri Khatau continued, two Scindia ships (SARASVATI AND JAL RAJENDRA) together with cargoes on board had been impounded by Pakistan; Scindia's assets in Pakistan worth about Rs 25 lacs had also been taken over by the Custodian of Enemy Property in Pakistan. The impounding of these ships would adversely affect Scindia's Coastal and Overseas services. Arrangements had, however, been made in the U.K.-Continental trades to operate separate services to and from India to and from Pakistan and to enable Indian Lines to lift correspondingly additional cargoes between India and U.K.-Continent to compensate them for the loss of their share in the Pakistan trades.

Referring to the Company's Overseas services, Shri Khatau said that the cargo carried and freight earnings had shown improvement over the previous year as a result of additional services provided in certain trades, freight increases made last year, and rationalisation of berthings in the U.K. Continental trades; but the advantages accruing from these measures were considerably offset by rise in operational costs and serious berthing delays to ships in Indian ports; delays suffered by Scindia ships during the year came to 1485 days out of which 1006 days

were in Indian ports, which is nearly double the corresponding delays suffered in the preceding year. In the interest of maintaining the efficiency of Overseas services, Shri Khatau urged that the allocation of cargoes to Indian Lines by Government as the biggest importer should be on the basis of sailings provided by the Lines.

Referring to the U.S. Government's policy to reserve 50% of "Aid" cargo for their Shipping and the pressure brought on them by American Shipowners to reserve upto 100% of such cargoes for U.S. Flag vessels, Shri Khatau apprehended that if such a proposal were to be accepted, Indian ships would be wholly deprived of U.S. "Aid" cargoes. He hoped that our Government would take a firm stand and secure equal participation for Indian Shipping in the movement of "Aid" cargoes to India, as, in substance, such cargoes were no different from commercial cargoes both had to be paid for. Shri Khatau also urged very strongly that while negotiating bilateral trade agreements with different countries, utilisation of Indian shipping services on a 50:50 basis should be insisted upon.

Coastal Freights

The 10% increase in Coastal freights as from 1st August 1965, Shri Khatau said, fell far short of the shipowners' demand based on operating costs which had further gone up; about 50% of this increase was taken away by the increase in excise duty on fuel oil. He also referred to inadequacy of discharge facilities at several ports and Government's hesitant and vacillating policy in regard to quantum and types of Coastal cargoes. These and other questions had been examined by a Committee of the National Shipping Board and Shri Khatau pleaded for speed at every subsequent stage in considering the Board's recommendations. He also urged the setting up of a special machinery for examining continuously the variations in operating costs of Coastal shipping and recommending adjustments in freight rates as and when necessary.

Regarding the War Risks Insurance Scheme introduced by Government as from the 20th September 1965, Shri Khatau hoped that the Government would find it possible to provide necessary cover at reasonably low rates.

Subsidiary Companies

Regarding the working of Subsidiary Companies, Shri Khatau said that the Scindia Workshop Ltd., had shown a profit of Rs 13,714/- as against a loss of Rs 1,86,860/- in the preceding year, and that its activities would be diversified by taking up the manufacture of McGregor Hatch covers, Topping Winches, Fibre Glass Life Boats, Davits,

etc. Regarding the B.S.N. (1953) Ltd. he regretted that despite strenuous efforts no progress had been made in realising the amount due from the State Government for 1962-63 and onwards.

Concluding his Statement, Shri Khatau expressed his gratitude to the Government of India and in particular to the Transport Minister, Shri Raj Bahadur, Transport Secretary, Dr. Na-

gendra Singh and Chairman of the National Shipping Board, Shri Raghunath Singh for their encouragement and assistance to Indian Shipping. He also conveyed his sincere thanks to the Shippers and Consignees — here and abroad — for their continued support to the Company's services and appreciated the devotion to duty of the Management, Officers and Staff and Agents at various ports.

BUSINESS NOTES

Alkali and Chemical

FURTHER good progress has been recorded by Alkali and Chemical Corporation in the year ended September 30 last in its various manufacturing units. Both the polythene units were operated at full capacity throughout the year. All units producing rubber chemicals are now operating at full rate, and an application has been made to the government for permission to increase capacity. Production of caustic soda continued at the maximum. There was a substantial increase in technical BHC and liquid insecticides production as compared with the previous year.

A new unit for the production of hydrochloric acid was commissioned and production increased. A further unit is expected to come into operation in 1966. Alfloc formulation was, however, lower due to the restricted supplies of raw materials. Liquid chlorine sales were also lower due to the conversion of larger quantities of chlorine to hydrochloric acid to meet market demands. New resin and paints plants have been commissioned and capacity over an extended range of products has been increased. Production rose despite recurring raw material difficulties. The company has secured services of Imkemex (India) Ltd, a registered export house, and exports were raised to over Rs 50 lakhs in the year.

Improved raw material availability made possible full utilisation of plant capacity and, as a result, sales were pushed up sharply from Rs 8.66 crores to Rs 12.79 crores, and gross earnings from Rs 1.80 crores to Rs 3.42 crores. Of this, depreciation has claimed Rs 89.97 lakhs (Rs 68.20 lakhs) and development rebate reserve Rs 17 lakhs (Rs 38 lakhs), leaving a pretax profit of Rs 2.35 crores, over three times the preceding year's Rs 73.68 lakhs. The tax liability, including Surtax of Rs 14.51 lakhs, demands Rs 1.11 crores as against only Rs 11.67 lakhs. Besides, Rs 5.68 lakhs have been provided for taxation in respect of a previous year. For the second year in succession, total dividend is stepped up five points, this time to 25 per cent requiring Rs 77.50 lakhs compared to Rs 62 lakhs a year ago. The usual dividend on preference capital takes away, as before, Rs. 2.02 lakhs. Transfer to general reserve is lowered from Rs 10.37 lakhs to Rs 8.07 lakhs but that to dividend equalisation reserve is as much as Rs 31 lakhs (nil).

Looking back over a period of 10 years, one finds that the company has made impressive progress. In this

period, fixed assets have risen from Rs 2 crores to Rs 12.41 crores, sales from Rs 1.88 crores to Rs 12.79 crores and gross earnings from Rs 40 lakhs to Rs 3.42 crores. Income before taxation and transfer to development rebate reserve as a percentage of total net assets employed in business has increased from 10.7 to 17.8. After paying dividends at the rate of 80 P per share on an equity capital of Rs 62 lakhs in the first two years of the decade, these were gradually raised to Rs 2.50 a share payable on a capital of Rs 3.10 crores for all the subsequent eight years.

Ashok Leyland

SATISFACTORY progress is being made by Ashok Leyland in implementing its new programme of manufacturing heavy duty chassis. The construction of buildings for the machine shop is well advanced, and these should be soon available for occupation. Meanwhile, the assembly of the new range of vehicles has already begun and the order book is fully taken up. There is, however, a sting in the latest report from the company. It says that the year 1965-66 has begun with a serious powercut, the adverse effect of which is already reflected in the output of chassis from the works. The directors, however, hope that the set-back in production on account of the powercut and the uncertain conditions due

to the emergency will be of a temporary nature and that in the later part of the year conditions will considerably improve enabling achievement of the target of performance.

The financial results for the year to September last show sales turnover up from Rs 17.38 crores to Rs 20.24 crores and gross earnings from Rs 2.42 crores to Rs 2.59 crores. After making necessary provisions and writing back an excess provision of Rs 0.24 lakh, there is left a disposable surplus of Rs 1.06 crores to compare with the previous year's Rs 83.54 lakhs. The cover for the dividend raised by a point to 10 per cent has, thus, looked up from 1.68 times to 1.92 times. The balance sheet at the year-end shows capital almost unchanged at Rs 5.52 crores and reserves up from Rs 1.36 crores to Rs 1.45 crores. The net block stands at Rs 5.14 crores (Rs 5.17 crores).

It may be noted that these results reflect the unsettled conditions in the closing months of the year due to the outbreak of hostilities between India and Pakistan.

John Oakley and Mohan

APERCEPTIBLE improvement has been recorded by John Oakley and Mohan in the third year ended June last. Both the plants (waterproof and glue bond) worked satisfactorily, and a new range of products was introduced. These were well received by manufacturing units. More important, the quality of products is being further improved. The technical manager of the

P.V.C. RESINS & COMPOUNDS

Quality P.V.C. Resins and Compounds are now freely available from our factory at Kota for a wide range of applications such as:

- WIRES AND CABLES
- FLEXIBLE SHEETINGS
- RIGID SHEETINGS
- CORRUGATED SHEETS
- TUBES AND PIPES
- FOOTWEAR
- UPHOLSTERY
- TILES

- RAINWEAR
- BRIEFCASES
- TOYS
- HANDBAGS
- BOOK BINDING PAPER

RAJASTHAN VINYL & CHEMICAL INDUSTRIES, P.B. 671, NEW DELHI-1

company's collaborators, John Oakey and Sons Ltd, of the UK, stayed at the plant for three months for this purpose.

The financial results show sales up from Rs 16.33 lakhs to Rs 22.10 lakhs and gross profits from Rs 1.93 lakhs to Rs 2.98 lakhs. After making increased necessary provisions, however, the surplus is halved to Rs 0.48 lakh. This is transferred to general reserve.

West Coast Paper

THE pioneering effort of West Coast Paper in having undertaken plantation work needs to be applauded. The company had been doing extensive and intensive plantation of fast growing varieties of tropical woods like eucalyptus, hybrids, paper mulberry etc, in addition to the species of bamboo not usually grown in Dandeli forests near which the factory is located. The total land under plantation since the scheme was taken in hand is 36,584 acres—5,316 acres for woods and 31,248 acres for bamboo. Meanwhile, the Mysore government has sanctioned extraction of 60,000 tonnes of bamboo from the forest outside the

company's area at a royalty of Rs 7.50 per tonne.

The company acts as technical collaborator to Andhra Pradesh Paper Mills, and has also invested Rs 66 lakhs in its share capital. Another Rs 34 lakhs are being invested therein. The State Government has also agreed to invest a similar amount. A P Paper Mills has revised its plans to increase production right from the beginning to 100 tonnes a day, primarily to utilise the extra in-built capacity in certain sections of the mill. The extra in-built capacity with some balancing equipment will enable the mill to expand at a much cheaper cost at this stage and will also make the project more viable.

During the year ended June 30 last, West Coast again set a new record of production at 32,535 tonnes, an increase of 2,322 tonnes over the previous year. As a result of continuous improvement in the process, the cost of production was reduced despite further rise in prices of chemicals, packing materials, salaries and wages and transport and other services. Net sales increased from Rs 4.44 crores to Rs 4.58 crores and gross earnings from

Rs 1.49 crores to Rs 1.61 crores. Because of the increased tax liability, however, the improvement has been nearly erased, and equity earnings are only a shade better (Rs 41.18 lakhs against Rs 40.50 lakhs). The cover has slipped slightly from 2.08 times to just under twice, as the dividend is raised by a point to Rs 14 a share.

Looking back over the past five-year period, one finds that the company has shown creditable performance. In this period, production of paper has increased from 25,771 tonnes to 32,535 tonnes, net turnover from Rs 3.84 crores to Rs 4.58 crores and gross profits from Rs 1.06 crores to Rs 1.61 crores. At the same time, equity dividend distribution has risen from Rs 11.25 lakhs to Rs 21 lakhs, following increase in the rate from Rs 7.50 to Rs 14 a share. The company's financial position has been gaining strength year by year; gross block has risen from Rs 5.87 crores to Rs 6.63 crores and net block stands at Rs 4.06 crores. The paid-up share capital has remained unchanged at Rs 2.40 crores, but retained earnings have advanced from Rs 80.09 lakhs to Rs 179.75 lakhs and net worth from Rs 3.20 crores to Rs 4.20 crores.

Dalal Street at New Low

Thursday, Morning

THE stock market continues to present a picture of unrelieved gloom. In spite of the fact that equity prices have been declining since long and heavy bull liquidation over the past few weeks has considerably improved the technical position, the market has been finding it extremely difficult to stage a worthwhile rally. Dalal Street's performance last week was not much different from that in the preceding week. Short covering induced mainly by technical considerations did impart some steadiness but the rally was very feeble and near the week-end the market was again forced to seek a new low level with several shares in the forward as well as in the cash list striking new lows for many years. Among other things, trading sentiment near the week-end was unsettled by the Stock Exchange Board's directive requiring bears to lodge their shares with the clearing house or produce the banker's certificate in order to seek exemption from the margins at the turn of the settlement. The modification in the margin rule is likely to push up 'badla' rates which in turn will discourage bullish activity.

The US Administration's decision to supply immediately 1.5 million tonnes of wheat, release of \$50 million for purchasing fertilisers, modifications in the national defence remittance scheme enabling a much wider participation in it and better prospects for rabi crops because of the widespread winter rains—all these failed to produce any significant impact on market psychology. This was mainly because of the growing tension on the northern borders as a result of more frequent clashes with the Chinese troops. The stock market has not been much enthused over President Ayub's offer at the United Nations asking India to sign a no-war pledge with Pakistan. Few observers are inclined to be optimistic about the outcome of the forthcoming Tashkent meeting.

Though the decline in prices has pushed the average yield on equities to around 8.8 per cent, fresh investment support remains conspicuous by its absence because of the economic and political uncertainties. Prospects of a marked and sustained recovery in equity prices cannot be regarded as encouraging in face of the growing strains on the economy. The continuous decline in stock market activity has led to a sharp fall in the price of the mem-

bership card which is reported to have changed hands recently at Rs 15,000—the lowest for many years.

COTTON

Futures Rally

THE Vidarbha/MP Vinnar March contract which had been marked down to Rs 887.25 per 3 quintals on December 14 was up again at Rs 894.25 the next day thereby making good all the ground lost earlier in the week. Short covering and renewed bull support which produced the week-end rally were inspired mainly by the release of November figures of mills' production and stocks. Despite a rise in cloth output from 377 million yards in October to 407 million yards in November, stocks with mills have declined from 703.5 million yards to 670.5 million yards. Likewise, yarn output has risen from 154 million lbs to 165 million lbs, and stocks have come down from 71.2 million lbs. to 60.4 million lbs. Obviously there has been a considerable improvement in off-take and because of the seasonal factor this trend is likely to be maintained for some time.

If cloth off-take remains good and stocks with mills decline, the industry can certainly be expected to evince a keener interest in the purchase of raw cotton. This should check any further big fall in cotton prices, particularly when the supply position of cotton is known to be very tight. Conditions in the spot cotton market have continued to be rather subdued, reflecting essentially financial stringency and the mill industry's difficulties. Despite a substantially smaller crop, arrivals this season have been fairly good because of the general reluctance on the part of growers and merchants to accumulate stocks. The prevailing high prices of cotton—the decline over the past few weeks notwithstanding—the high cost of financing stocks and political uncertainty—all these factors have been discouraging piling up of stocks.

The US Administration's decision to supply immediately foodgrains and release \$50 million for purchase of fertilisers has raised hopes of cotton imports under PL 480. If India is able to secure a good quantity of cotton under PL 480, it would ease the supply position here and make it possible for the textile industry to secure its raw material requirement within the statutory ceilings without any official inter-

vention. The export performance continues to be disappointing because Japan, India's main customer of Bengal Deshi, is still unwilling to offer prices which would make business around the current levels possible. Sales registered up to December 10 total 62,497 bales.

OILSEEDS

Easier Tendency

THE oilseeds market last week displayed an easier tendency on ideas of improved outlook for the rabi crops because of the widespread rains in nearly all the important oilseeds producing areas. Sentiment was also aided by optimistic reckoning of prospects for securing substantial quantities of soyabean oil as well as mutton tallow from the US under PL 480. The recent US decision to supply 15 million tonnes of wheat to India on an emergency basis along with the release of 50 million dollars for purchase of fertilisers are regarded as indications of a positive change in the US attitude towards India's pressing needs. Informed sources are inclined to the view that since the US is having a record soyabean crop, it might not be difficult to secure about 1.5 lakh tonnes of soyabean oil and about 70,000 tonnes of mutton tallow. The outcome of the Union Food Minister's visit to the US will be awaited with keen interest. Needless to say that if the rabi crops turn out to be reasonably satisfactory — production in any case is not expected to exceed last season's output — and domestic supply is augmented through imports of soyabean oil and mutton tallow, the overall supply position of vegetable oil will improve and thereby prevent a big rise in prices from the current high levels. As against the current price of about Rs 3,300 per tonne of groundnut oil, the price of soyabean oil works out to around Rs 1,700 per tonne.

Prospects of improved supply led to considerable bull liquidation in castor and linseed futures during the week. Castor April eased from Rs 103.62 to Rs 99.75 — the lowest level for many weeks. Linseed April moved down from Rs 121.50 to Rs 118. Near the week-end, however, castor recovered to Rs 102.25 and linseed rallied to Rs 119.50. The recovery was caused mainly by short covering though modest bull support was also reported. Groundnut oil which had eased from Rs 33.50 to Rs.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

THE INDIAN OVERSEAS BANK LIMITED

you**

31.50. recovered to Rs 32.60 (per 10 kgs). Linseed oil eased from Rs 29 to Rs 27.75 and castor oil Commercial was down by about a rupee per 10 kilograms.

It was on November 16 that vanaspati manufacturers last announced an all-round big increase in the prices of their product. This was the second time that prices had been raised within a fortnight. The price of vanaspati had then been fixed on the basis of an average price of about Rs 3600 per tonne of groundnut oil. Since the middle of November groundnut oil has all the time been available at substantially below Rs 3,600 a tonne. And yet the vanaspati industry has not bothered to reduce its prices. Could it be that the vanaspati manufacturers have not purchased groundnut oil in quantity during the past four weeks. It is most unfortunate that poor consumers should never be able to benefit from the decline in prices.

Export houses reported fairly good business in groundnut extractions with the Communist countries mentioned as the chief buyers. The Gujarat Government's ban on the movement of all oilcakes not only to other States but also to foreign countries has caused considerable apprehensions in the minds of solvent extraction manufacturers in Saurashtra. The Karmahom Conference Lines have also been kept guessing whether or not their steamers should call at Saurashtra ports. Cottonseed cake continued to evoke fair inquiry from overseas buyers.

AEI

ASSOCIATED Electrical Industries (India) Private Ltd, the Indian subsidiary of AEI of the UK, has planned to step up production of its electrical pumping sets by 330 per cent and its electric motors by 50 per cent. The manufacturing time for power and distribution transformers is scheduled to be cut down by an average of four months. The company is assisting in increasing steel production capacity by indigenously manufacturing electric melting and heat furnaces for the private and public sectors. At present, 49 electric furnaces are under manufacture on orders from DGS and D.

At its factory in Calcutta, AEI (India) manufactures electric motors, transformers, switchgear and control-gear, pumps, electric melting and heat treatment furnaces, lighting fittings and ceiling fans. Its engineering and commercial departments offer design and

consultancy services, from planning and lighting schemes. The Calcutta factory draws upon the experience of and designs evolved by the AEI Group's 60 factories the world over.

INDIAN INSTITUTE OF MANAGEMENT CALCUTTA

has pleasure in announcing
a four week residential course
on

ECONOMIC ANALYSIS AND OPERATIONAL TECHNIQUES FOR INDUSTRIAL MANAGEMENT

in its series of Executive
Development Programmes under the
direction of the Institute's faculty

from March 25 to April 20, 1966

The course is intended for executives from industry/government and research workers/teachers in Universities and research institutions. All applicants must be sponsored by the management or the head of the department of their organizations.

The course would broadly cover aspects of the economics of the firm, project analysis and evaluation, analysis of financial sources and other relevant areas. The emphasis of the course is on application of the analytical techniques in economics as applicable to a company.

Those who are holding at least a Bachelor's Degree, with some knowledge of mathematics and having three or more years of research, teaching or executive experience and those between 24 and 40 years of age are preferred.

Last date of application is January 27, 1966

For detailed information please write to

SEVENTY-FIVE PAISE

NOT JUST A BODY ON FOUR WHEELS

The modern automobile is a complex and intricate piece of mechanical contrivance. The average motor car comprises 4000 to 5000 parts, a great many of which require high precision machinery and must be made to conform to exceedingly narrow limits of tolerances. It is not just a body on four wheels.

Hindustan Motors have been pioneers in the development of India's automobile industry. We are proud of the fact that we have marketed three models in the last decade alone—Landmaster, Hindustan Ambassador and Mark II—and developed two models of engines reputed for powerpacked performance with outstanding fuel economy. Last year we produced 16,000 cars out of the total production of 24,000 in the country. No mean achievement.

We are doing our best to put the country on the wheels. A gigantic task indeed. It calls for the development of highly skilled engineering techniques which we are doing our best to develop.

The 'American' Asian Bank

THE Manila meeting of Ministers early this month, like the Bangkok meeting of the Committee of Officials in September, took another step towards making America the manager of the so-called Asian Development Bank. Commentators writing in American newspapers can hardly conceal their happiness that the Asian Bank is being made secure for American control. The *New York Times* commented editorially on the eve of the Bangkok meeting of officials that the US might have to yield a few points if it was felt that the position of the Western countries in the proposed Bank's charter was too strong. A commentator in the *New York Herald Tribune* has noted with satisfaction that the Bank would be managed by the US. Some Asian countries, it was true, were asking for a greater share in management for Asians but their demand lacked "muscle", so that although called an Asian Bank, it would be really a smaller edition of the US-managed World Bank. The US Senate and Congress had been assured by the State Department that this had been made certain in the Bank's constitution itself—Japan, the only Asian power which had an equal share of equity with the US, could not present a problem since she was not liked by many Asian countries.

Nor is the *Herald Tribune* commentator's confidence misplaced. The charter of the Asian Bank gives the majority votes to the industrial countries led by the US and her associates in Asia like Australia and New Zealand. This charter is now ready for signature on the dotted line by the Ministers of Asian countries.

Why have the Asians done this to themselves? There are at least four clear reasons. First, many of the countries have no appreciation of what they are signing away. Some argue that unless management rights are given to the industrial countries, capital will not come. Simple civil servants from several small Asian countries, asked to draft the Bank charter without being bankers, do not realise how the power of management stands related to voting rights. Officials have been known to argue that since non-Asian countries will have only 40 per cent of the equity, Asians will have the majority vote! They fail to realise that Australia, whom they count as an Asian power, has a large share of the votes which will be used jointly with the US. And then there is Japan, another Asian nation technically, which will inevitably join hands with the US and the industrial countries—as she did so often at the UNCTAD meetings—and not with the Asian countries. Similarly, it is pointed out that the majority of directors and most of the chief functionaries of the Bank will be Asians. In the last analysis, however, what matters is who controls the majority of votes. The Americans understand this well and that is why there is such widespread satisfaction in the US that the Asian Bank has not gone the way of the African Bank, which is designed as a purely African-managed institution—very much to the frustration of the US.

Secondly, the Economic Commission for Asia, which played the important role in preparing the Bank's charter, is just now sadly deficient in technically effective leadership. It is staffed poorly by officials who have no practical experience or understanding of technical matters such as are involved in the establishment of an institution like the Asian Bank. Besides, as pointed out earlier in these columns (September 4, 1965, p 1363), the principal technical personnel involved in the preparation of the charter—the legal adviser, the banking expert, the chairman of the committee of officials which drafted the original charter and who later advised the committee of officials preparing the final draft—were all drawn from countries which could be depended upon to underwrite US interests and the US viewpoint: two of them from the Philippines and the other from Costa-Rica, from the staff of the Inter-American Development Bank. The ECAFE's own staff, weak and with little experience of this kind of work, provided mainly the secretarial services.

Thirdly, and most important, the US is now settling down to a secure position from which to manipulate Asian economic policies, thanks to the gradual emergence on the Pacific sea-board of what may be described as an American Asia. In Africa there is French Africa consisting of all the African countries which are still tied to France's apron-strings, economically and poli-

tically, and which allow themselves to be "used" by France in the UN, the African Economic Commission and elsewhere to subserve France's foreign policy interests and, when necessary, to subvert genuinely African interests. An American Asia in a similar sense is emerging gradually. Paralleling Sukarno's leftist axis of North Korea, Cambodia, North Vietnam and China, there is the growing right-wing axis of South Korea, Formosa, the Philippines, Thailand and South Viet Nam and, in many matters, Japan, and gradually Malaysia. The smaller of these countries need the crutch of US support to stand up and all of them are anxious not to take any collectively Asian line if that clashes with their short-term national interest. Moreover, with the British licking their own balance of payments wounds and de Gaulle trying to bully the US in Asia through political and other alliances with China rather than by supporting the smaller Asian countries with economic aid, the string of small countries on the Pacific sea-board is left with no choice but to be nose-led by the US.

Finally, the bigger Asian countries like India, Indonesia and Pakistan are preoccupied with internal problems and are unable to offer any leadership to Asia even in terms of ideas, let alone of money, leaving the smaller States to remain happy in a state of voluntary serfdom to the US. The real powers in Asia seem to have settled down into a wasteful negative 'equilibrium' in which the conflicts and suspicions among themselves hold them all down and the little powers are joining hands to make things safe for Western, particularly US, policy interests in Asia. To be sure, an American-managed Asian Bank will produce some useful results in terms of Asian economic growth, but these will be results conceived and supported in the interests of US foreign policy in Asia which will not be identical with the goals and objectives of an Asian long-term economic policy.

The notorious prophecy about Asians fighting Asians in a future war may not have been quite realised yet, but in the economic sphere at any rate the dream of Western policy-makers of creating enough divisions and diversions within Asia so that conflicts of national interests will create a negative balance, seems to be in the process of realisation as is reflected in the structure of the emerging Asian Bank. The western objective today is the same as that which led the British diligently and intelligently to work for the partition of India and to set up Malaysia as a

separate entity to frustrate the larger and the genuinely Asian Maphilindo idea. The break-up of the federation of Indo-China into separate small countries had never pained the Western powers, for these countries would be too small to be really independent and too insecure and suspicious of each other to ever offer a serious problem jointly. In the separateness and insecurity of small nation-States lies the opportunity for the furtherance of Western interests and the Asian Bank is just one more of the kind of projects that are bound to emerge from this hopeless situation which the West has successfully engineered in Asia and which the Asians unfortunately have helped and are still helping to create, being unable to appreciate the larger perspective of a collective Asian interest.

Years ago when the Colombo Plan was produced, British politicians started talking about *South* and *South-East* Asia as though these were two separate Asias. This dream of splitting the continent is gradually being translated into reality by the US. In South Asia Pakistan and India are cancelling each other out in a mutual conflict which it is ap-

parently in the Western interest to foment (and in which some of the Moslem countries of the Middle-East are getting involved as the authors of this divisive policy had hoped they would). In South-East Asia the small countries of the Pacific sea-board are rushing like chicken under America's wing for fear of China, all too ready to accept American economic and military aid projects conceived essentially in American foreign policy interests, but which are being publicised as Asian projects. It is not just an accident that the Economic Commission for Asia holds the majority of its seminars and meetings in Manila, Bangkok or Tokyo or that a nine-nation economic conference of South-East Asian countries, mostly of American Asia, is to be held shortly in Tokyo to weld together these countries' development policies under joint American and Japanese guidance, but with the title of an Asian development plan. Neo-colonialism is scoring many notable successes under the aegis of the UN Economic Commission for Asia and the Far East and the official delegations of the Government of India are, wittingly or unwittingly, lending a helping hand.

Fumbling with Decontrol

DECONTROL is in the air but a consistent and well-defined policy for this purpose has yet to emerge. Free market pricing and distribution have been promised to private fertiliser units licensed upto March 1967 for a period of seven years from the commencement of production. The safeguard here is that the public sector's share of production will be two-thirds till the end of the Fourth Plan and the Government has retained the option to acquire upto 30 per cent of each unit's output at a negotiated price.

In the case of cement, on the other hand, the price has been fixed by voluntary agreement at Rs 16 per tonne higher than the present level and it will remain uniform all over the country; the Government will acquire 50 per cent of the output at a discount of Rs 6 per tonne. The additional amount earned from the increase in price will be put aside in a separate account distinct from the development rebate reserve, which will be utilised exclusively for financing expansion. The distribution set-up will be entirely in the hands of a joint organisation of cement producers, who have agreed upon a code of conduct among themselves to give a fair deal to all the consumers. This experiment will be reviewed at the end of 1966.

In both cases, the policy revision is directed at providing greater incentives for investment. The pace in fertilisers has been forced as much by external pressures as by the urgent need for agricultural inputs. In cement, production at capacity level and the extreme shortage, estimated currently at 3 mn tonnes, caused by the inability of cement producers to find resources for expansion, have induced the government to put decontrol on trial but with a safeguard for compulsory deliveries to government. Rationing of private demand has been left to the market mechanism.

The new policy for fertilisers certainly marks a change from that pursued for the last few years, mainly in that free market pricing and distribution have been conceded. Letting private capital and management into this industry is not inconsistent with the Industrial Policy Statement of 1956, which placed fertilisers in Schedule B, i.e., industries in which the State would increasingly establish new undertakings but private enterprise would also have the opportunity to develop "either on its own or with state participation". The projected demand for fertilisers has now so far exceeded earlier estimates and marketing (as distinct from mere distribution) has assumed

such proportion that it is no longer possible or feasible to maintain the industry as a public monopoly either in production or distribution. Decontrol of steel and cement, which also are key, and generally scarce, development commodities, has in any event taken away what little force there was in the arguments for retaining the present system of controlled distribution of fertilisers.

The terms now being offered to prospective investors in fertilisers are, it should be emphasised, basically different from what Bechtel demanded. For one thing, Bechtel was not itself an investor but proposed to bring in oil companies as investors and these companies insisted on tying up the deal with supplies of crude and, if possible, setting up of refining capacity. For another, the Bechtel offer was a multi-plant package deal, involving a 50:50 share in capital and almost indefinite control over management and procurement of equipment under the new policy. Fertiliser projects would now be treated "on merits" at par with other high priority projects for licensing and

approval of collaborations. One hopes that the possibilities of domestic procurement of equipment and setting of Indian specifications for designs would be fully exploited in spite of opening the doors to foreign investors.

The position as regards cement is on a different footing. Its price was due for an upward revision on account of cost escalation but the opportunity has been taken to wipe the slate clear, for the time being, of inadequate formulas and cumbersome distribution controls. Returns in cement were almost consistently poor as compared with other industries till 1961-62, but since then they have practically equalled the average if not done slightly better. In relation to the general average, dividends have been lower but even then they have absorbed a much larger proportion of the profits after tax, leaving very little for retention. Consequently, it has been difficult for cement units to finance their expansion from internal resources or to raise external funds. A more remunerative price and voluntarily regulated distribution, together with the substantial

tax concessions given over the last two years, should enable the industry to expand rapidly, especially since the foreign exchange component for plant and machinery has been greatly reduced. Just now machinery suppliers are starved for orders.

The acceptance of a code of conduct by producers, is, however, no guarantee against anti-social behaviour which is, to a large extent, inevitable under scarcity conditions and a uniform regulated price. While the black market premium on cement has declined over the last few days, it is unlikely to disappear altogether till supply catches up with demand. Till then, if the market mechanism is to be given a serious trial, some premium would have to be tolerated to the extent of improvement in the distribution arrangements as compared with those presently enforced. The degree of freedom which is being permitted to cement producers is much less as compared with that allowed to steel and fertiliser producers. The risk of profiteering by sections of industry and trade is very real but it may be unavoidable.

Weekly Notes

Yes, There Is a Santa Claus!

WITHOUT the slightest official indication from the Indian Food Minister or from the US President or Secretary of Agriculture or even from an anonymous "official spokesman", Indian or American, the happy tidings have been triumphantly splashed in the Indian press that the United States has offered us 15 million tonnes of grain in 1966, or actually 5 million tonnes more than what we had asked for! This is not the doing of this or that Indian correspondent in Washington trying to get a lift out of the State Department. Such efforts are frequent enough, but this time practically all papers have carried identical reports and the impression is unavoidable that the common inspiration has come from the US Administration itself, albeit unofficially. Why this rush to impress the Indian public with US magnanimity when until now the Administration had given the appearance of following a firm policy of not loosening PL 480 purse-strings until it was satisfied with India's plans for agricultural development? The long-term agreement on PL 480, incidentally, is yet to come; according to reports it

will be signed when the Prime Minister goes to the US in February. But apparently the impression of American munificence had to be created immediately.

It may be that the agricultural development plan submitted by Subramaniam to the US Secretary of Agriculture a few weeks ago has impressed the Administration enough to remove its reservations about India's prospects of achieving self-sufficiency in food. What Subramaniam's plan contains has not been disclosed to the public in India; what has been is that there will be a sharp increase in the financial outlay on agriculture which, judging by past experience, is certainly no guarantee that output will go up correspondingly. That apart, it is not known in which respects precisely the Administration had found India's agricultural planning so far deficient and to what extent Subramaniam's plan has met these objections.

Some obsequies have been made. The most obvious is the new fertiliser policy announced last Friday under which all fertiliser units, including those to be licensed in future, will have full freedom of pricing, sale and distribution for seven years from the

start of commercial production. This is intended to make the field attractive to private investors, particularly foreign collaborators. As Asoka Mehta disclosed at the annual general meeting of the Fertiliser Association of India, these concessions are expected to result in a "substantial" increase in the share of the private sector in fertiliser production in the coming years. It is not known whether the Bechtel deal which was rejected six months ago because the Bechtel Corporation had insisted on majority participation and had wanted to be left free to price its output as it thought fit, will now be revived, but it is clear that the Government's views of what terms and conditions can be offered to foreign investors in fertilisers consistent with the national interest have undergone a sea change since the Bechtel offer was refused. The Food Minister himself is now approaching American fertiliser companies: according to reports, along with his talks with the Administration on food imports he is "scheduled to meet American business interests in the field of fertilisers".

However, a climb-down on fertiliser policy alone has not wrought the miracle of 15 million tonnes of PL 480.

grains. The Administration has other, and more important, reasons. There is the question of blocked US economic aid to India which will come up for discussion when Shastri meets Johnson in February. It has been quite clear that US ire over the Indo-Pak conflict is only one of the factors behind the suspension of aid — in fact it may be more an excuse than a cause. Johnson is using the aid weapon to force Pakistan to reverse her policies towards China. In India's case the same weapon is being used to effect a change of course in economic policies. The next few months will see a clear formulation of the essential prerequisites in terms of policy changes which alone, in the Administration's view, will render India deserving of US assistance. In a general way these demands will be pressed on Shastri in Washington. What better preparation for their eventual acceptance than to begin by softening the Government of India by baling it out of the food crisis and the Indian public by leaving it breathless with gratitude at American munificence which actually exceeds even our own requests.

Rhodesia: Oil Embargo, at Last

Our London Correspondent writes:

WILL Wilson's Rhodesian policy pay off? The Prime Minister's capacity for cliff-hanging survival has continued to amaze most political commentators. Even with his parliamentary majority reduced last week to only one in the parliamentary division on the Territorial Army and the many sins of omission and commission perpetrated by the Government, Wilson continues to ride high in the current opinion polls, and even the most optimistic Conservatives now have to admit that, if necessary, Wilson could remain in office till October of next year and still be re-elected with a majority.

However, with regard to the action he has taken in Rhodesia, it remains open to doubt whether the gamble will pay off. Wilson's Rhodesian policy can certainly give little cause for comfort to the newly independent African countries, and it is perhaps ironic that a Labour Prime Minister should see the day when there would be a walkout of African representatives at the United Nations when he got up to speak. The Africans cannot help feeling that while the British Government is prepared to take tough action in Aden, it is not prepared to use force against white settler rebels who are determined to keep the Africans from possession of their own land. With the unpopular

immigration control act passed by the Government which has given in to pressure from racist groups in the United Kingdom, Wilson's words of warning about the dangers of racial conflict sound a little hollow. Moreover, Wilson has made it perfectly clear that his solution to the Rhodesian problem would certainly not mean majority African rule. He has gone out of his way to explain that he does not believe that there is, in Rhodesia, "an African nationalist movement capable of the responsibility of self-Government".

Very briefly, Wilson's attitude to the Rhodesian crisis can be summarized as follows on the basis of the statement he made in Parliament last week. The use of force against Rhodesia is entirely ruled out. Sanctions must be given time to work, and they must be of such a nature that the Rhodesians will realise that the continuance of sanctions will be much more serious for them than the decision to reverse the Unilateral Declaration of Independence. He also made it clear that there is no intention of taking punitive action once UDI is ended and that the alternative to UDI is certainly not immediate African majority rule. The Rhodesians are free at any time to tell the Governor that they are prepared to hand control back to the constitutional authority, in this case the Governor. Once this is done, there must be some form of constitutional conference and new elections. The problem of restoring constitutional Government to Rhodesia is essentially one for Britain alone to tackle.

The announcement of the imposition of oil embargoes now means that the Rhodesian crisis has entered a new stage. This is the final step that Wilson can take, short of using force, to bring the rebel Smith Government to heel. Oil sanctions take force under two orders which (1) prohibit the import of oil and oil products into Rhodesia, which is regarded as a British territory for which the Parliament at Westminster is the sovereign legislature, and (2) prohibit British nationals from carrying or supplying oil and oil products for Rhodesian use. It is important to realise that the oil embargo is very different in quality from the earlier sanctions imposed by the British Government. The object of these was to try and make conditions progressively difficult in Rhodesia so that the more moderate elements in the country could assert themselves against the Smith regime. Certainly, the action taken so far has not had this effect, and, therefore, the tougher oil embargo has been imposed with the object of bringing the

THE ECONOMIC WEEKLY

Rhodesian economy to a standstill and thus forcing Smith to capitulate.

It is interesting to note that even quite recently Wilson had told the House of Commons that an oil embargo would not have his support unless it was effective and general. Wilson's recent visit to America and his discussions with President Johnson, and the latter's support of oil embargoes, has apparently given Wilson enough confidence to go ahead with this controversial measure. The agreement with America is part of the Wilson line of "inter-dependence" with the United States which, as a result of the recent discussions with the President, will embrace not only British support of the American line in Vietnam, but will involve a sharing of Britain's East of Suez commitments, not only with the Americans, but with Australia and New Zealand as well, and a closer integration with NATO.

The 'Ifs' and 'Buts'

OF course, the vital question is whether the oil embargoes will work or not. If they fail, there will be no alternative to force, and the matter might well be taken out of the hands of Britain.

Whether the oil embargo is really effective or not depends not so much on Britain, supported by the United States, but on the attitude of South Africa and Portugal. Since the pipeline from Beira to Umtali goes through Portuguese territory, unless the Portuguese Government co-operates, it will be difficult to ensure that supplies do not reach Rhodesia through this outlet, even though the pipeline itself is owned by the Lonhro Company which is part British owned. Again, South Africa is in a position to nullify the embargo if it chooses to supply the rebel Government with oil. So far there is no indication of the line which Verwoerd intends to take. On present showing, it looks as if the South African Government will stick to the line of legality it has adopted so far.

At the present moment, there is no talk at all of a naval blockade, which is the only sure way of making the sanctions effective. Immediate action has, however, been taken to stop the British tanker "Staberg", a Norwegian vessel on hire to Shell, which was on its way to Beira. This has now been diverted, but the tanker about which questions were asked in the House of Commons earlier, the "British Security", has already reached Beira for unloading. Rhodesia consumes some 280,000 tons of oil a year, and by diverting the

THE ECONOMIC WEEKLY

"Staberg", some 20,000 tons will now be denied to the Rhodesians. How active the American embargo will be remains to be seen. The American Government is only seeking the co-operation of American oil companies in enforcing the Rhodesian oil embargo.

On the home front, this new move in the Rhodesian crisis could be a heavy strain on the bipartisan policy which is at present being followed in the country with regard to Rhodesia. Not only will this bring sharp reactions from the "kith and kin" element among Conservative members of the House of Commons, but it will also impose severe strains on Heath as leader of the Opposition to keep his party together. It seems that after his discussions with the Nigerian Prime Minister, Alec Douglas-Home is convinced that the African Commonwealth will be seriously affected if Britain does not go ahead with these embargoes. There are certainly elements in the Conservative Party that would be unwilling to see the Commonwealth disintegrate because firm action was not taken against the rebel Government. The Liberals, who have for some time been urging the Government to take stronger action, may support the Government.

On the international front, of course, the main problem is that of Zambia, and the need to see that all possible assistance is given to this country so that it can stand up to the stern measures of retaliation which the Smith Government has already taken in the form of imposing punitive royalties on the export of coal to Zambia which will increase the pithead price by more than five times. Apart from Kariba power, Wankie coal is one of the few Rhodesian exports which Zambia cannot easily secure from other sources. While Britain has now organised an airlift to deliver oil to Zambia, the quantities that can be carried are not really sufficient on a long-term basis, but can at least keep the economy going for some time. However, it is quite out of the question to organise a large-scale airlift of coal. If, therefore, despite the oil sanctions Smith and his party remain in power, Zambia's dilemma will not be solved, and there will be no alternative to the use of force which, through having been postponed, may in the end turn out to be more long-drawn than might have been necessary.

Corporate Performance Improves

CORPORATE performance has improved for the second consecutive year. The Reserve Bank analysis

of finances of 1,333 public companies for 1963-64 and *The Economic Times* quick study of 51 industrial giants in 1964-65 clearly indicate that public companies have done appreciably better than before. In spite of foreign exchange difficulties and rising material and wage costs, utilisation of capacity has gone up and fixed assets and profitability have grown faster than in the first two years of the Third Plan. Tax liability has declined, partly, because of the higher depreciation permitted and, partly because of rebates for selected industries. A larger proportion of the disposable profits has been ploughed back; the decision appears voluntary because the higher appropriation is mainly carried to general, not development rebate, reserve.

In 1963-64, for example, the increase in depreciation provision was twice as large as in the previous year and more than two-thirds of the increase in net profits was retained in business. This trend appears to have been maintained in 1964-65 by the 51 giants at any rate: their pre-tax profits rose by 14 per cent and after tax profits by 21 per cent; 49 out of the 51 recorded an increase in profits after tax; the major part of the increase in profits was retained in business, since dividends increased by less than 4 per cent.

Interest continues to absorb an increasing proportion of gross profits (i.e., profits after depreciation but before interest, managing agents' remuneration and tax); it rose from about 14 per cent in 1960-61 to more than 16 per cent in 1963-64. As a proportion of average borrowings in the year, interest cost increased from 5.7 per cent in 1961-62 to 6.3 per cent in 1963-64, during which year there was a marked shift away from banks towards 'other mortgages' and 'others', i.e., sources other than banks and financial institutions. This trend of

Greetings

We wish all our Readers, Advertisers and Well Wishers a Merry Christmas and a Happy New Year and extend to them the Greetings of the Season.

As the offices of *The Economic Weekly* will be closed for the New Year there will be no issue on January 1, 1966.

BUSINESS MANAGER

higher interest costs and larger borrowings from 'other' sources must have been further reinforced in 1964-65. Capital locked up in inventories and receivables recorded a noticeable decline in 1963-64; simultaneously, there was a slight shrinkage in the importance of trade dues as a source of finance.

In brief, therefore, the last two years for which data are available have witnessed, apart from better sales and profitability, a considerable spurt in gross retention (both depreciation and undistributed profits), a marginal increase in distributed profits, more intensive tapping of sources of finance other than banks and financial institutions, and a significant reduction in inventories and receivables (in 1963-64 at any rate). These are welcome developments, for which fiscal and monetary policies can claim some credit.

If the statistical position is so impressive, why is the stock exchange community not impressed? Political and foreign exchange uncertainties, financial stringency and the steep rise in the structure of interest rates which requires a re-adjustment of equity values and which diverts investment from equities to various forms of deposits, are the main factors discouraging the investing fraternity. Raids by income-tax and other authorities have also caused wide-spread (but well deserved) nervousness. The practical absence of bonus issues and nominal increase in dividend appropriations are other discouraging factors. All these do tend to restrict growth of fresh investment at the same time as fiscal and monetary discipline improves the intrinsic financial position of the private sector. A fresh stimulus to new investment will depend on when the over-all position of physical and financial resources clears up. That in turn hinges upon expectations of achievement in self-reliance and the possibilities of external assistance in the Fourth Plan. In the meanwhile, one can derive some comfort from the pattern of corporate developments in 1963-64 and 1964-65.

If Pakistan, Why Not China?

WHAT did the Prime Minister say at his press conference in Rangoon? According to a report from Reuter published in the *Times of India* of December 23:

"The Indian Prime Minister, Mr Shastri, said here today that there was no third party involved in the

proposal for his meeting with the Chinese Premier, Mr Chou En-lai, for talks on the Sino-Indian conflict. The conference would be similar to his proposed Tashkent meeting with President Ayub Khan of Pakistan."

However, that is not what the Prime Minister said, apparently. A PTI report published in the next day's *Times* reads:

"A spokesman of the Prime Minister's secretariat said here today that a foreign news agency reporting Mr Lal Bahadur Shastri's press conference at Rangoon had attributed a statement to him about his meeting with Mr Chou En-lai which he never made. The spokesman said that a correspondent had asked Mr Shastri if there were any plans for a meeting between him and Mr Chou En-lai on the line of his meeting with President Ayub at Tashkent. The Prime Minister had replied that so far as the Tashkent meeting was concerned, the Soviet Prime Minister had taken the initiative. No proposal for a meeting between him and Mr Chou En-lai had been made. Of course, the Colombo proposals were there which India had accepted and China had declined. The position had not changed since then."

Did the Prime Minister mean that India sticks to her by now somewhat time-worn position that there can be no talks unless China accepts the Colombo proposals or that no proposal, like the Soviet Union's for the Tashkent talks, has been made for an India-China meeting? If Pakistan, why not China?

LETTER TO EDITOR

Air-India's Indian Summer

AIR-INDIA has prided itself as one of the few consistently profitable airlines of the world. For the last two years it has paid interest on the government's loan capital in spite of the moratorium granted up to October 1966. Doubts can, however, be entertained as to how long after 1966 it will be able to show comparable satisfactory results.

In a boom year like 1964 the Air-India has been losing its share of the international traffic. Against an increase in international traffic of 17 per cent in passenger kilometres, 20 per cent in freight tonne kilometres and 6 per cent in mail tonne kilometres, Air-India's traffic increased by 16, 17 and 4 per cent respectively. Its share has thus

slipped in all three fields. Its operating profit fell from Rs 384 lakh in 1963-64 to Rs 362 lakh in 1964-65. Staff salaries have recently been increased after much acrid wrangling; and the recent war with Pakistan must have drastically reduced load factors and increased distances. So a fall in profits is on the cards this year.

There have been two main factors behind Air-India's profits—its favourable position in the traffic around India, which owes much to the pool agreement with the BOAC and Qantas, and the cheapness of its staff. The pool agreement caused a once-fall increase in the profit level, but cannot raise profits progressively. The staff is cheap but it has also become discontented. The recent handling of wage disputes by Air-India has been very ham-handed. It has always given too little too late, and often allowed recourse to arbitration. This is not the best way of maintaining the morale of its staff.

The morale of pilots has also been adversely affected by over-work. Owing to the shortage of pilots there are delays in sanctioning the leave to which pilots are entitled. Air-India often complains about the lackadaisical and obstructive ways of pilots, but it has not shown much care for them. This is especially harmful since pilots are its most valuable asset. Services to London

and Tokyo were curtailed early this year for lack of pilots, which also rendered planes idle and slowed down the expansion of the fleet. Air-India's dependence on the IAF and the IAC for pilots is bad enough and will prove worse in the coming days of pilot scarcity; its neglect of pilots' morale might lame it.

The most serious portent is that Air-India is slipping back on the Atlantic run. This is the most competitive route in the world, the testing ground of airlines. The number of passengers on it increased 29 per cent in 1964-65. Air-India's load factor on this route is lower than that of other airlines. It manages all right in summer when the demand for flights is high, but it does very badly in the off-season when competition is the keenest. And this competition is not in fares; nor is it in advertising on which Air-India so prides itself. It is competition in service, and this is where Air-India is failing. It is not enough to oppose TWA's in-flight cinema in IATA; Air-India must think of an equally good gimmick. Air-India's most serious handicaps are lack of imagination and lack of skill at handling passengers and staff.

LETTER FROM AMERICA

Decline of the Labour Movement

THE American Federation of Labour-Congress of Industrial Organisations (AFL-CIO), America's labour union federation, has just celebrated its tenth anniversary as a united movement. The anniversary convention, which has received national attention, is indicative of the prospects and challenges which the 13,000,000-member federation faces in America's affluent society. It should be noted that the AFL-CIO has the allegiance of virtually all of America's organised workers (except those in unions expelled from the organisation for corruption, such as the powerful teamsters, or for communist influence, such as the Longshoremen's Union) and that unlike the Indian trade union movement, political factionalism has not been a major factor in America.

The anniversary convention attempted to deal with a number of serious problems which face the movement. Despite the fact that the AFL-CIO has huge strike funds and even investments in important sectors of the economy, the movement has all but stagnated in recent years. Its membership has remained static, while the labour force as a whole has increased. Thus, the proportion of unionised workers in the United States has actually decreased in recent years. The AFL-CIO increasingly represents the labour "aristocracy" — workers in skilled trades such as metal work, plumbing, building, etc., — who earn very high wages, sometimes as high as Rs 25 per hour. Poorly paid workers, particularly Negroes and Puerto Ricans, have been all but neglected by the union movement.

The AFL-CIO leadership has been a key element in the stagnation of the movement. The president of the federation, who was recently re-elected for another five-year term, George Meany, is a former plumber from one of the most conservative unions in the entire federation. He has succeeded in exercising a strong influence on the federation during his ten year reign, and has insured that conservative policies have been perpetuated. More progressive elements, under the leadership of the former CIO leader and president of the automobile workers union, Walter Reuther, have not been notably successful in pressing for reforms within the federation.

While the American labour force has undergone substantial changes in recent years, with the proportion of

industrial workers decreasing and the proportion of "white collar" and service workers increasing dramatically. Despite this shift, the union movement has made almost no effort to recruit members from these new areas. Furthermore, the American South has strongly resisted unionisation, being the most traditional and conservative section of the nation. As a result, workers in the South are much more poorly paid than in other parts of the country. The unions, with the notable exception of the teamsters, have not pressed organizational drives in the South, thereby abandoning an entire section of the nation in need of union activity.

One of the most important problems for the labour movement is its relationship to minority groups. While Negroes and other minority groups are now an important segment of the labour force, the unions have been slow to organise them. The more conservative unions, mostly the old "craft" unions (painters, bricklayers, carpenters, etc) actually discriminate against Negroes. Groups like CORE and the National Association for the Advancement of Coloured People (NAACP) have actually held demonstrations against these unions, bringing much embarrassment to the union movement as a whole. The more progressive "industrial" unions (automobile, textiles, steel, coal, etc) have strongly encouraged the civil rights movement and have encouraged Negro membership. The anniversary convention went on record in favour of civil rights and condemned discrimination in unions and in other aspects of American life, but it significantly did not do anything to implement this resolution. As one union leader stated, a resolution without enforcement is really no resolution at all.

American unions have been marked by pragmatism, and have not generally involved themselves much in politics. While the unions have consistently supported the liberal wing of the Democratic Party, and have often provided vital support for the Democrats, they have not played the radical role which unions have in some nations. The American labour movement has become an increasingly conservative force in American politics and both labour and management have consistently played down notions of "class struggle". The debate on foreign policy at the recent convention

is an indication of this fact. The AFL-CIO officially supported the Johnson Administration's Vietnam policies, and effectively cut off debate on the floor of the convention on this issue to avoid "embarrassing" President Johnson. The union movement has generally been extremely "anti-communist" to the point of paranoia, and has often played a reactionary role in the international labour movement.

A short historical note will help place these developments in perspective. The present AFL-CIO, as the name indicates, came from two separate union federations which formally united ten years ago. The AFL, the older of the two federations, consisted of the traditional "craft" unions, the labour aristocracy. The CIO, on the other hand, was formed during the Depression of the 1930s, and consisted of the militant industrial unions with mass memberships, such as the steel, automobile, textiles, and other unions. Many of these unions had fairly radical leaders. With amalgamation, the AFL managed to achieve dominance over the united federation, and its policies prevailed on the national level, while on the local level the CIO union continued to pursue more militant policies. The conservative influence of the AFL and the Meany leadership has, during the past decade, succeeded in influencing the entire movement.

Thus, while the AFL-CIO celebrates its tenth anniversary, the American trade union movement is faced with some of its most serious problems. Its national influence has declined although it is still a powerful force in American social and political life. It has failed, for the most part, to deal constructively with the quiet "revolution" in American technology and the shift in the labour force. It has, generally, not met the needs of Negro workers. Its foreign policy has become tied to that of the government despite much talk of "free" and "independent" trade union movements. The future prospects for the movement do not look particularly bright, particularly in the light of the fact that recent leadership changes have not substantially altered the complexion of the all important Executive Board. All is not lost, however, and there is some hope that the American trade union movement will again assume its role as a primary spokesman for progressive social policy in the United States.

Plan Collapse in Andhra

AT an all-India level and in aggregate terms Plan cuts and Plan pause appear somewhat meaningless, especially as it is all put out in aggregate financial terms. The actual disastrous consequences of it all become more apparent when the consequences are felt in the States. Andhra's Plan collapse is a good example.

The Chief Minister's statement on the subject reveals that the first tentative proposals for the outlay in 1966-67 would have been Rs 139 crores plus Rs 19 crores for Nagarjunasagar and Rs 7 crores for Srisailem or a total of Rs 165 crores. Alternately, on the assumption of a 15 per cent outlay for the first year of the Fourth Plan the absolute minimum which the State Government hoped to spend in 1966-67 was Rs 131 crores. After lengthy consultations and with due consideration for the "needs of the emergency" the outlay now accepted by the State Government and legislature is only Rs 79 crores. Even taking the lower figure for purposes of calculation, Andhra's Fourth Plan starts off with a straight 40 per cent cut. The higher figure would give us a 50 per cent slash. The official speech-makers of Brahmananda Reddy have tried their best to disguise this enormous diminution by comparing the 1966-67 outlay with that of the current year and making out that there has been "only" a 20 per cent cut—which is, of course, bad enough.

In preparing the Fourth Plan high hopes had been raised that, unlike the previous three Plans, this time there would be an orientation towards industry. It had been estimated that in the very first year itself something like Rs 16 crores would have been spent on industry and mining. This has been reduced to Rs 2.9 crores or a 78 per cent cut. What is even worse is that most of this is to go in one on another form of subsidy to the private sector, i.e., underwriting of issues, loans and development of Industrial Areas. It never seems to enter the heads of the Ministers or their bureaucratic advisers that the public sector is not meant for the Centre alone. The State Government could well afford to start some industrial enterprises on its own. But in Andhra the Government's penchant is all for denationalising on the one hand and pleading for Central public sector projects on the other.

A small but interesting fact is that

as long ago as December 1960 the Planning Commission had promised to allocate Rs 7.66 crores for Minor Irrigation and Soil Conservation Programmes, provided the State Government spend Rs 21 crores or thereabouts. The State Government did its duty but each time it asked for the Rs 7.66 crores the Planning Commission maintained an embarrassed silence. It appears that the Commission had been bold enough to make this promise without first asking the almighty Finance Ministry and so it is now being told by that redoubtable body to find that money itself! In the meantime the poor Andhra Government is in a fix as it knows that TTK does not take at all kindly to any of the Andhra bigwigs and is quite capable of seizing this opportunity to give vent to his splenetic prejudices. The Chief Minister can only, somewhat pathetically, state that "I hope the Government of India will honour a commitment that had been given nearly five years ago and on which we have already acted all these years."

There is, however, a great deal of misinformed criticism of Andhra's aspirations. Rather lofty expressions of disgust are voiced at the reported offer of the Chief Minister to increase considerably food production in the State provided the Centre takes the responsibility

for the completion of the Nagarjunasagar project and accepts the finding of the Anglo-US consortium about the location of the fifth steel plant at Vishakapatnam. This is termed blackmail. And, why not? Why should the leaders of Andhra ask their people to do their duty by India if the rest of India shows not the slightest sign of doing anything for Andhra? The real tragedy in India is that the Andhra politicians—and here the entire is State united—alone should have to plead for the rapid completion of Nagarjunasagar and the Vishakapatnam steel plant. The real parochialism and complete misreading of the composite nature of the Indian personality is demonstrated in this fact and not in Brahmananda Reddy's pressure. Are we to take it that correction of regional imbalance is now to be treated in the same cavalier fashion as the so-called "Socialism" of the Congress leaders? If this is so, then an explosive situation will be created for which the responsibility will have to be borne by the Central leadership. Andhra has to orientate towards industry and quickly too. This is quite impossible if Nagarjunasagar hangs like a millstone round the neck of the State and if its legitimate hopes about the Vishakapatnam steel plant are dashed. It is quite fantastic to argue that all steel plants have to be in the coal belt.

Andhra's Fourth Plan has got off to an incredibly unpromising start. One can only hope that the Centre will not unduly aggravate the situation.

BOOK REVIEW

The Newars of Nepal

N G Chapekar

The Newars by Gopal Singh Nepali;

United Asia Publications, Bombay, 1965; pp 476, Rs 30.

THE author of this book, Gopal Singh Nepali, belongs to Nepal, of whose population the Newars form an important section. The facts as stated by him concerning the Newars can be presumed to be unchallengeable. A foreigner is likely to slip into believing a bit of a composite fact as an independent fact. Having the advantage of intimate knowledge of the people, Nepali scrupulously collects facts, analyses them skilfully and interprets them intelligently. The impression one gains on reading this book is that the author has spared no pains in tapping all the available sources, including the results of personal investigation.

In assessing the value of such ethno-sociological studies it must be remembered that there is a mixture of blood as well as of culture in most of our communities. The aggressive nature of man has brought about, though unconsciously, the integration of the multiseptate people of India. The Nayars, a martial race of the extreme south-west, the Kerala of today, march conquering to Nepal, in the extreme north, and settle there. The local people, under subjugation, are tempted to imitate the conquerors by adopting their manners and customs, adding to or modifying their native ones. The conquerors are also anxious to mollify the anguish of those who are hurt by the loss of their status and privileges. Thus there is a two-way traffic in culture and in traditional thinking, both religious and secular. (The English rulers alone were an exception to this as they wanted to impress upon Indians their superiority of culture, religion and learning.)

Prevalence of Polyandry

Another important social effect of conquests from far off lands is that there is always a paucity of women. When people migrate to a distant place, they are mostly men. Polyandry in the mountain regions is, besides, a necessity. It is a check on proliferation. Population must not outgrow food production as the chances of its growth are nil. Gopal Singh Nepali has discovered traces of polyandry amongst the Newars. The wife calls her husband's home her *husbands'* home, suggesting prevalence of polyandry in the past. The former Teheri

state law allowed the wife of the younger brother to be wife of the elder brother as well.

It is a peculiar custom amongst the Newars that a girl is first married to the immortal God Narayana as her principal marriage. It is an ingenious idea the like of which will probably not be found anywhere else. The Newar woman in consequence never becomes a widow. Human wedding loses its sanctity, becoming an act of convenience. Divorce is easy and common. The woman has greater freedom. She is as free as she was before the introduction of the institution of marriage.

The Original Inhabitants?

Are Newars the original inhabitants of India, possibly unconnected with the Vedic Aryas? I am not sure if girls' marriage with the God Narayana has any reference to the Vedic story of a woman being married to several gods such as Savita, Agni, etc. Nor can I say whether the custom was derived from the Veda or whether the Veda echoes the prevailing custom.

The author has referred to Newar women changing their spouse from time to time. Instances of this practice are found amongst forest tribes such as Katkaris and Thakurs. In such situations it is not surprising if aberrant sexual unions go without punitive consequences. Against this somewhat licentious background, it is interesting to find the high reverence in which a girl before puberty is held. She is raised to the status of a Goddess. She is worshipped; even the king pays homage to her. In this context, the temple of Kanyakumari in the South is a further clue that the Newars came from the South. In my book "Himalayanta", I have hinted at the possibility of migration of the Newars from the South, judging by their calculation of time. Their month begins from the new moon day and ends on the last day of the dark fortnight. Quite the reverse is the practice in Upper India, where the month begins after the full moon. The use of betelnut in far off Nepal further supports this view.

Nepali has remarked that the religious beliefs and practices of the Newar are dominated by the desire for material gain, suggesting thereby that the Newars have not progressed beyond the primary stage of life. In early times when people knew only

their immediate environs and when natural resources were undeveloped, their pressing concern was the satisfaction of their basic needs. That was their goal. Religion came into being to help them to achieve that goal. Natural elements and imaginary deities whom they feared most were placated for favours. When man was no longer at the mercy of nature, his mind turned elsewhere and the other-world ideology began to dominate his thinking.

Customs are the store-house of history. Ample material can be culled from such customs as boys eloping with girls, occasional *pratiloma* matrimonial unions, the sale of girls and the sharing of the price by all the relatives of her parents, etc. Instances of such customs can be copiously cited from the "Mahabharata". In fact, the "Mahabharata" will be far better appreciated if read in the light of the picture of these mountain people as ably delineated by Nepali.

Language Ignored

In my opinion, a chapter on the language of the Newars should have found a place in this book. The language cannot be ignored in an ethno-sociological study of a community. From my scanty knowledge, I have the impression that the Newari language is distinct from Nepali. The latter is the off-spring of Sanskrit, though largely influenced by Gurkha, Hindi, Punjabi and Sindhi. The word *mama* (maternal uncle) is found in many Indian languages including the non-Sanskrit derived Kanarese. Nepali language has that word, but not the Newari. The Newars use the word *pazu* (spelt as *paju* in the glossary). For fire *aga* is the Nepali word whereas the Newars call it *mee*, if I am not wrong. I have noticed that the Katkaris, a forest tribe, use the word *indhana* (a genuine Vedic word) and, what is more striking, they have no other word for fire. The Newars understand by the word *sinha*, not a lion but a horse. When, however, they talk of the sky, they come nearer to Sanskrit. I am told that *akasa* is their word for sky. On the other hand, *surunga* stands for sky in the Nepali language. Maybe it is the corrupt form of *svarga*. Languages and dialects, it is obvious, offer a vast field for research.

Oskar Lange: The Complete Social Scientist

S Ganguli

Oskar Lange's position in the history of economic thought will remain a unique one.

This is not only because of the vast range of his contributions in economics and other allied subjects, but also because he was not merely an economist. Oskar Lange was a complete social scientist. Though his name is most often associated with a particular model of a socialist economy — competitive socialism where the market mechanism prevails, with a co-operative sector covering the petty commodity producers —, his contribution to the economics of socialism is much broader.

There is one guiding idea in all his writings. It is "the attempt to combine a precise scientific approach to economic study with the needs of social practice, and in particular with the working class movement and socialism" ("Papers in Economics and Socialism" Warsaw, 1962; in Polish).

[My thanks are due to N C Ray, my colleague, and to Prabhat Patnaik and Joseph Peris, our students at the St Stephen's College, Delhi, for helpful comments.]

THE characteristic of a true social scientist are (a) a social purpose (b) a scientific approach and (c) the commitment to put into practice the result of one's enquiry.

Economics is not a neutral science. The purpose of economic enquiry differs between economists. Broadly, the purpose may be either to reveal or to conceal objective reality. There are good grounds for some economists to help to conceal objective reality. History has ample evidence to offer that when the elements of objective economic reality turn out to be such that if revealed, they will be embarrassing to the Establishment, economists, particularly those who are beneficiaries of the system, find it necessary to conceal the reality. Such is the role of the apologists. Whereas the task of the true social scientist is the task of a revolutionary. His task is to indicate the necessity and direction of change for the better. For the purpose of economic enquiry is to contribute to "human happiness".

Approach to Reality

Every economist approaches reality on the basis of a certain set of initial premises which reflect his social attitude. This choice cannot be explained in a simple way. It is not an overstatement, however, to say that the nature of one's relationship with the Establishment has something to do with it. Compare the position of Lionel Robbins with that of Lange. Robbins' "facts of everyday experience" of Britain², which are the basis of his initial premises, are such that they exclude the fact of exploitation of the workers by the capitalists. On the other hand, Lange experienced this—he saw capitalists exploit workers, imperialists exploit colonies. Further, he saw that another man had realised this before him—Karl Marx.

Lange not only made the socialist

ideal the supreme value of his life, but was also an active participant in the movement for the establishment of a socialist society, in the process of its development in his own country and in the international socialist movement.

Lange's was a quest for the totality of economic science, i.e., political economy. As a revolutionary, he could not imagine social progress without a continuous perfection of scientific methods. His scientific attitude and dialectical method of enquiry called for first a study of objective reality as it is and secondly a process of enquiry consisting of further questions being put to the answers he obtained to his initial questions.

Analysis of Capitalism

His interest was first in the world economy as a whole which consists of two main systems, capitalism and socialism, secondly in the socialist system as such and thirdly in under-developed economies.

Lange approached the world economy from the point of view of the emergence of a world socialist system. In regard to capitalism the question was whether capitalism could survive. His enquiries dealt with the laws of motion of the capitalist society and its functions. One of his earliest studies was on "Business Cycles in Polish Economic Life in 1923-27" (in Polish) followed by a study of the role of the state in monopoly capitalism. The necessity of understanding the functioning of the capitalist economy led him to study the market mechanism and in this field he made lasting contributions.² Although it is recognised that his papers on "Say's Law" and "Price Flexibility and Full Employment" are permanent contributions to economics, the social question he was seeking to answer is not always appreciated.

Effectiveness of Price Flexibility

In his "Price Flexibility and Full Employment" the question he sought to answer was how far the trade unions, alleged to be monopolies, were responsible for unemployment in monopoly capitalism. Bourgeois economists alleged that the trade unions were obstacles to the "parametric adjustments". The mechanism of parametric adjustment is based on the concepts of "elasticities" and "flexibilities." Arising out of it, neo-classical economists held that flexibility of prices and wages is a basic condition for the maintenance of economic equilibrium. Hence rigid wages are the source of unemployment. Lange noted a very interesting inconsistency in the attitude of the neo-classical economists, not from the point of view of their social attitude but on theoretical grounds. "The people who insist upon the necessity of keeping money wages flexible, are the same ones who demand a ceiling on money wages to prevent an inflation"³. To examine this question of equilibrium theoretically, Lange used the tools of analysis of the neo-classical general equilibrium theory of Walras and introduced "money", as he had already done in his "Say's Law", into the theory of general equilibrium and showed that only under very special conditions is price flexibility effective. In the changed conditions of the world economy of today the special conditions are not to be found. Thus, Lange blew up, so to say, the neo-classical doctrine from inside by showing the dynamics of its own internal mechanism.

Two points arise out of Lange's demonstration. First, price flexibility did work as a stabiliser during a particular period of history, 1840 to 1914, and even then only for the long run equilibrium and not in the short run. Secondly, after this period the

changes in the capitalist economy "render price flexibility inapplicable under present conditions as a norm of either long run or short run economic policies".⁴ It is not surprising that Milton Friedman finds Lange's proposition that "price flexibility was successful as a long run stabiliser of the economy" damaging to Lange's basic answer to the question. But those who have no vested interest in the capitalist system may not find it difficult to comprehend that a Marxist has to examine two hypotheses. First, in capitalism there is a period of correspondence between forces of production and relations of production, the counterpart of which in the sphere of economic mechanism is the applicability of price flexibility during a particular period, though in a particular sphere, i.e., the long run. Secondly, this correspondence breeds lack of correspondence subsequently, i.e., in the phase of monopoly capitalism when price flexibility does not work. Thus the two main findings of Lange in regard to price flexibility fit perfectly with the requirements of his scientific enquiry.

Socialism and Objective Laws

Insofar as the purely analytical aspect is concerned, Lange's study of price flexibility, particularly his analysis of "stability conditions", will remain a permanent contribution to the study of the price mechanism. It will have its use in the study of the price mechanism even in a socialist economy when there is a market.

The scope of Lange's contributions in the field of socialist economics can be best comprehended if his studies are examined, first, in the context of the totality of the debate, both Soviet and Western, on the economics of socialism and, secondly, in the background of the process of development of socialist societies and generalisations from these experiences. The Bolsheviks as they had to build a socialist economy were directly faced with the question whether there can be an economic science of socialism. The answer given by some like Bucharin and before him by Rosa Luxemburg was that there cannot be any because the proletarian revolution was the last act of political economy. A subject of lively debate in the Soviet Union in the 20's, this was later revived after the Second World War, and was answered by Stalin in his famous booklet on the economic problem. The debate was

resumed in the peoples' democracies in the late 50's. Those who deny the possibility of a science of economics of socialism also consider its absence a necessity and a good thing—that is, a socialist economy is not subject to any objective laws, hence can be consciously guided at will.

Marginal Utility Concept

On the other hand, in the western world the denial of the possibility of an economics of socialism was considered to be a bad thing for the socialist economies. It was alleged by Mises during the 20s that socialist economies could not work as there could not be pricing and hence no rational economic calculation could be made.

It is at this point that Lange joined issue with Mises. Basing himself, as is well-known, on Walrasian apparatus, he demonstrated conclusively that rational pricing is possible in a socialist economy and further that it is possible even in a fully centralised economy. About the group of socialist economists who deny that a socialist economy is subject to objective laws, he stated that "those who do not recognise the necessity of an adequate price system in a socialist economy do not reach up to the great heritage of Marxian doctrine". Thus Lange was to challenge both the groups. In this standpoint one can find the key to Lange's socio-economic study, the types of questions he asked himself and the dialectical method of his pursuit of knowledge of the political economy of socialism.

At the very outset of his academic life Lange asked himself the question, what is the scope and method of economics⁵ — a question he enquired into again and again. In his first study in this direction he found that Marxian economics was unsatisfactory in solving the problem of optimum allocation of resources, although Marx and Engels recognised the existence of and the necessity of a solution to the problem.⁶ The Labour Theory of Value as such is insufficient to provide a normative principle for economic calculation in a socialist economy. This requires the use of Marginal Utility analysis. But insofar as the theory of economic equilibrium is merely a theory of allocation of scarce resources between different uses, it is not even a social science.⁷ In his *Review of Economic Studies* article in 1946⁸ he tried to answer the same question in a developed form. Here he

gave a more sophisticated formulation of the nature of economic rationality, though he was still working on the basis of the Marginal Utility theory with maximisation of utility as the objective function of the consumer. But he introduced the household as the maximising unit. In one of his very last works⁹ he found the most satisfactory answer to this question. He could at last get rid of Marginal Utility to find his maximising solution for the household. On the other hand, he could use the concept of the margin, without that of utility, as a tool of analysis wherever applicable.

Basic Unity in Evolution of Ideas

One can trace a basic unity in the evolution of Lange's ideas. He based his enquiry firmly on the experiences of the development of socialist society. Basing himself, as he did, on the tenets of scientific socialism and various branches of economics and other auxiliary subjects, developing his tools of analysis, and drawing from the study of others he attempted certain theoretical generalisations. This synthesis, the theoretical analysis of the principles of socialist economics, true to his method he offered as preliminary and tentative, to be developed and verified by continuous studies.¹⁰

Scientific socialism is a historical undertaking intended to control social development and to create conditions in which it would be possible to use economic laws in order to obtain intended effects. It is here that political economy acquires a new and creative role. It becomes a source of knowledge at the service of social practice. From being a passive observer of spontaneous economic process, it changes into a source of knowledge serving to direct that process. To fulfil this function, political economy must supply true knowledge i.e., knowledge which is an adequate reflection of social laws operating in the economic process.

"The basis of the scientific treatment of the political economy of socialism is the assumption that there exists in a socialist society objective economic laws".

"A true understanding of economic laws is thus a prerequisite for controlling them and hence the practical importance of Political Economy as a science".

In the socialist social formation, then, economic laws do not cease to operate. A socialist society is also subject to the general laws of social development, laws of historical materialism. Hence development of socialist society takes place through the operation of contradictions. Socialism is not the realisation of the religious ideal of the Kingdom of God, but a new stage in the development of human society which can and must be studied with the methods of Marxist analysis. It is to the credit of Mao Tse-tung that he has shown with emphasis the fact that a socialist society, too, develops through contradictions.¹¹

Lange then goes on to trace the basic contradictions in a socialist society on the basis of historical materialism. These are (a) the interaction between man and nature in the social process of labour, (b) the contradiction between the new forces of production and the old relations of production, and (c) the contradiction between the new relations of production, i.e., the new economic base, and the old superstructure. However these contradictions are non-antagonistic, though there can develop social conflicts. In society there are not only social classes but also social strata which have their economic bases (unlike the social classes which have their bases in the relations of production) in the superstructure of society. "Consequently the contradictions which may arise in the development of socialist society between the requirements of the economic basis and antiquated superstructures, such as methods of management of national economy, political superstructures and others, may also provoke the opposition of vested interests of certain strata, which make a change difficult. But these are not social classes—there are no class struggles".¹² This can be better understood in terms of Lange's analysis of the stages of development of socialist society.

Laws of Socialist Society

There are laws which operate in socialist society as well, as the experience of socialism has shown (they need not operate in an elemental way and can be made to operate in accordance with the human will). Lange distinguishes four types of laws in the socialist mode of production.

First, general economic laws which operate in any socio-economic system,

such as laws of production and reproduction, laws concerning the general features of the organisation of the labour process. These laws establish certain technical balances between material objects.

Secondly, laws specific to the socialist mode of production, determined by the social relations of production which determine the stimuli (or incentives) governing human economic activity. Out of the economic laws specific to a given formation it fashions a single law which determines the entire mode of functioning of that social formation. This is called the *basic economic law* of the social formation as introduced by Stalin¹³ (maximum satisfaction of social needs, unlike in capitalism where the stimulus is the maximisation of profits).

Thirdly, there are laws of an intermediate nature which are not general but specific to more than one mode of production. They operate in several modes of production and express certain common features of these modes, for example, the law of value which is the result of commodity production. In socialist society as commodity production takes place, owing to historical circumstances, the Law of Value continues to operate, though it is not specific to the socialist mode of production.

Fourthly, there is a type of economic laws which are not connected with the socialist mode of production but result from the particular types of superstructure of management of socialist economy and which, therefore, change when the organisational and managerial superstructure changes. "Different methods of managing socialist economy which change historically and also from country to country produce their own particular economic laws. They produce specific economic laws because they produce specific incentives and opportunities of action". To study these laws one has to consider two points, first the relative scope of administrative allocation of goods and of the Law of Value and their consequences, and secondly consequences of different types of remuneration of labour because these are related to the question of incentives in a socialist economy.

Thanks to the social ownership of the means of production there are new opportunities for economic development. This means that the rational use of the means of production in social interest is possible because social ownership of means of produc-

tion makes possible economic planning. Here Lange makes two fundamental contributions to the economics of socialism: first, his formulation of the principle of economic rationality and, second, the statement of the problems of its realisation through the process of construction of socialist society.

Lange answers the basic question—what is the principle of economic rationality, a question which he asked himself some thirty years ago. He found that Mises' assertion that human action is necessarily always rational and that economics is simply rational activity¹⁴ was too narrow and Mises' formulation of the nature and principle of rational activity unsatisfactory. For Mises is unhistorical and his equation of human action with rational action leaves no room for traditional behaviour. Marxist economists so far had a negative answer to this question—that the principle of economic rationality postulated by the neo-classical school as the foundation of political economy was wrong. Lange had to seek a positive answer because economic activity being a part of human activity has to be rational to be most fruitful.

Principle of Economic Rationality

Since human economic activity is conscious and purposive, the science of political economy, if it has to be an instrument of social practice, has to discover not only the economic laws of human behaviour, but also the best method of realisation of given ends¹⁵ by the use of certain means—this is the principle of economic rationality. First, Lange, as opposed to Mises, shows that there is a necessity for a science of rational activity in general because rationality of action is now a common feature of many fields of human action and this gives rise to the problem of discovering what is common to all fields of rational activity. This, however, is not economics as Mises asserts but praxiology, "logic of rational activity". Lange arrives at a new formulation of the principle of economic rationality purely from the formal point of view. The concept of optimum allocation of resources depends on the possibility of quantitative measurement of ends and means. Secondly, he shows that the principle of economic rationality is historically relative (based on historical conditions). He traces the transition of human action from tradition to rational activity based on reasoning, on comparison of means

with ends achieved, i.e., the capitalist society is only partial and confined only to private capitalist enterprise. Private rationality as manifested by the capitalists' profit maximisation motive stands in the way of the realisation of the maximum benefit for members of the community as a whole which is the criterion of social rationality. Rationality from the point of view of the whole economy is possible only in a socialist society because of the social ownership of means of production. Planning becomes the instrument of realisation of economic rationality for society as a whole. Thus the tables are completely turned: in capitalism rationality can only be partial; it is only in socialism that rationality can be realised fully.

Stages of Development

The proper study of Political Economy of Socialism then requires knowledge of objective laws and principles of economic rationality to administer the economy in the best possible way. For this one has to approach a socialist economy not as a static model but in terms of its stages of development which are historically conditioned. It is clear that there must be recognition of necessary stimuli for economic action and a system of appropriate incentives must exist in the organisation and methods of management of a socialist economy. Otherwise there may be two kinds of degeneration, (a) anarcho-syndicalist degeneration where the enterprise ceases to be socially owned, and (b) bureaucratic degeneration, the danger of a new kind of "alienation" of the producer from his product.

The question that needs to be considered is what is the connection between Lange's formulation about objective nature which is not elemental and economic laws and planning. "Planning is the means of subjecting the operation of economic laws and the economic development of society to the direction of human will". First, planning cannot deny the existence of economic laws but requires a knowledge of them to make use of them. Secondly, the extent of reliance on economic laws as opposed to administrative means for the functioning of the economy, i.e., direct intervention by the state apparatus, depends on the historical stage of development of a socialist economy. Basing himself on the experiences of the development of the socialist economies he makes the following

generalisations. The first stage he characterises as a war economy. It is the initial stage of socialist industrialisation which uses certain techniques of a war economy. The very process of transformation, and in addition, in under-developed countries, the need of rapid industrialisation, impose the necessity of high centralisation of planning and management. However, the dialectical character of the development of socialist society is such that the methods which are necessary, and useful in the period of social revolution and of intensive industrialisation become an obstacle to further economic progress when they are perpetuated beyond their historical justification. The greatest obstacle to further progress results from the lack of proper economic incentives in this bureaucratic centralised type of management. Thus in this stage the extra-economic force of the State which played a dominant role in the first stages of the emergence and development of the socialist society needs to be gradually replaced by the operation of economic laws, i.e., by the establishment of proper economic incentives which produce the results desired by the will of the organised society. Does this mean a revival of capitalism as some people misconceive? "By utilising economic means planning makes use of the automatic character of peoples' responses to given incentives". "In a socialist economy the automatic processes are part of the method of realisation of the plan, the conditions establishing incentives are set up by economic policy to produce desired results, whereas in capitalist society these conditions develop in an elemental way". But this development from the first to the last stage passes through a period of transition. He suggests that one important feature of the end of the period of transition and the beginning of the functioning of an established socialist society is the substitution of the methods of administrative and centralised management by development of new methods based on the utilisation of economic laws.

Separation of Management of Economy from Government

Lange's studies in the Political Economy of Socialism show that "he belongs almost entirely to the classical Marxist tradition". He fully vindicates the tenets of historical materialism which he made the *leit motif* of his academic work — a

basis for the acquisition of further knowledge. First the discovery of economic laws by science is necessary to control them and to use them in the interest of the community. Only in a socialist society does man become master not only of nature but also of social conditions. "It is only from this point that men with full consciousness will fashion their own history; it is only from this point that the social causes set in motion by men will have, predominantly and in constantly increasing measures, the effects willed by men. It is humanity's leap from the realm of necessity into the realm of freedom"¹⁵. Secondly, organisational expression of the replacement of extra-economic force by the utilisation of economic laws must be a gradual separation of the management of national economy from the extra-economic activities of the State, i.e., from the exercise of political power¹⁶. The long run perspective of communist society is a gradual replacement of "government of persons" by the "administration of things and direction of production processes" (Engels). This is the substance of the process of "withering away" of the State. For the realisation of this long run perspective it is necessary to prepare institutional conditions such as the process of gradual separation of economic management from political government.

The "Lange Mechanism"

In the light of the foregoing analysis, we can now better appreciate the role of the so-called Lange mechanism. It is clear that the role of the price mechanism is not a permanent feature of socialist economy; the same is true of co-operatives, however much some people now in India may like to regard these features as the hallmarks of the Lange model as an apology for rightwing social democracy. The market mechanism can be used fruitfully in a socialist economy so long as commodity production prevails, and then too for a limited purpose and in a limited sphere within the planned economy. The need for co-operatives arises from the necessity of the allies of the working class and from the lower level of development of the forces of production. With the development of the socialist mode of production all means of production will become social property.

Lange's recent views on the market mechanism in socialist society were very different from those in his 1936

article. This was due not only to his acquaintance with the experience of socialist economies but also due to his theoretical studies, especially in the new branches of knowledge such as cybernetics. Not very long ago in a lecture in London, Lange declared that if he were to write his essay today it would be called "The Computer and the Market, an Essay in Economic Cybernetics". For, it is an interesting point that the process of determining the accounting price (the so-called shadow price) with the help of an electronic computer is also achieved by a process of successive trial and error. Thus, both these mechanisms, the market and control accounting with electronic computers, may supplement each other, putting in a new light the mutual relationship between centralised and decentralised decision models.¹⁷

Insofar as the policy of transition is concerned, his basic position remains the same. This section of his 1936 booklet has not drawn the attention it deserves. "A Socialist Government really intent upon Socialism has to decide to carry out its socialisation programme at one stroke or to give it up altogether." Further, "the Socialist Government must start its policy of transition immediately with the socialisation of the industries and banks in question".¹⁸ In a recent work,¹⁹ Lange repeats this much more strongly. "A revolution which does not take this step is doomed to failure".

Lange and the Second Plan

Although Lange's studies on the problems of under-developed countries are of special interest to us, we can only note here two main points: (a) Lange's association with the formulation of India's Second Five-Year Plan and (b) his studies on the problem of under-developed economies as such.

To suggest that Lange took part in the formulation of the Second Plan will be, to say the least, an over-statement, if not an abuse. The papers that Lange wrote while he was in India are of two categories. One pertains to the general background such as the nature of the fundamental problems of under-developed countries, planning in socialist countries as a standard of reference, and a theoretical study of input-output analysis. The other is the memorandum on the Second Plan submitted to Nehru in April 1956.²⁰ In this paper while accepting the fact that the Indian Government is not a socialist government he clearly expressed his doubts about the possibility of the mobilisation of resources for the realisation of the Plan.

To solve this problem, he suggested certain clear-cut steps such as basic land reforms, allotment of a part of industrial and commercial profits for planned development, nationalisation of banks and at least part of foreign trade, special restrictions on foreign capital and dividends etc. The actual policies pursued by the Indian planners are sufficiently eloquent in their results to deserve discussion here. It seems the "best present from Poland" was accepted but not utilised. This, however, does not close the possibility of misuse of Lange's name.

Lange did find, however, some positive elements in the Indian plan, such as the role of public investment for economic development. This fits with his findings about the problems of under-developed economies.

The "National Revolutionary Pattern"

Lange offered a definition of an under-developed economy: "An under-developed economy is an economy in which the stock of capital goods available is not sufficient to employ the available labour force on the basis of modern techniques of production".²¹ In the present historical conditions, it is not possible for these economies to develop on the basis of the capitalist path. The lever of economic progress must be industrialisation by public investment, through the creation of a powerful public sector and the instrument is economic planning. He also made a characterisation of a new pattern of social development in contrast with both capitalism and socialism. He called this the "national revolutionary pattern" which is establishing itself in countries which emancipated themselves from colonial or semi-colonial dependence.²² In India he finds an example of this pattern.

The national revolutionary pattern, however, is a transitional pattern. "What is happening in India and similar countries is industrialisation by methods of State capitalism, which under certain circumstances can become the starting point of socialist development."²³ But this will not follow automatically. The further course of development will follow from the differentiation between the social classes within the societies. "There are, however, in history examples of countries achieving tremendous economic growth where public investment provided the initial impetus for growth, and which later followed the path of capitalist accumulation. The classical example is that of the economic development of Japan."²⁴

Oskar Lange is dead. Lange, the man, the teacher and the friend of his students and colleagues will be sadly missed by them. As I write these pages, I cannot help feeling that the reader I will miss most is the Professor himself. I visualise him telling me with a smiling face, "Oh, this is what you think of my work... all right. This reminds me of a story...". What the anecdote would have been we would not know, for our beloved teacher is no more.

Lange, the social scientist, however will live through his works ever more. Economics of today and tomorrow is mainly the Political Economy of Socialism. The socialist economists of today and generations to come will get guidance and inspiration from his works. Above all they will take note of his warning "Socialism is not an economic policy for the timid".²⁵ And he was not a timid man.

Notes on the Bergsman-Manne Model And the Uses of Planning Models

Louis Lefebvre

The process of planning does not consist of searching for some path which takes the structure of the economy as constant and which has no merit other than that, in terms of some historical criteria, it is consistent and feasible. Instead, planning consists of trying to ascertain the benefits and costs of adjusting the supply and demand relationships so as best to approximate the social objectives of development.

This is where the use of planning models is justified: they can be used to analyse the relationship between certain strategic elements of a plan and to study the consequences of changing the assumptions underlying these elements. But since the analysis can be undertaken only at the cost of abstracting from the majority of objectives and constraints, the results must be interpreted from the point of view of their qualitative rather than quantitative significance.

Further, economic plans represent the conciliation of a vast number of political as well as economic constraints with a multitude of frequently contradictory and non-quantifiable social objectives. In a world of imperfect knowledge and uncertainty, the use of planning models is necessarily confined to partial analysis. It would be foolhardy as well as illegitimate to use them for prejudging the strategy of economic development.

IN recent years, in developed and developing countries alike, there has been an increasing awareness of the need for improving the methods of economic planning. In particular, politicians and public administrators want to have detailed prescriptions for a consistent and feasible path toward socially desired goals. The evident public need, coupled with recent advances in growth theory and computational techniques, has motivated a number of economists to search for computable models of economic planning. The Bergsman-Manne paper represents the outcome of such an effort.*

The paper was written before the outbreak of India's most recent military engagement with Pakistan and before the information on the failure of this year's monsoon in India was available. Hence the computations and the authors' judgment as to feasibility are based on information and expectations which prevailed before these most recent emergencies. Clearly, then, it would be pointless to discuss the relevance of the actual numerical results, and I shall confine my comments primarily to the qualitative aspects of the Bergsman-Manne approach.

Economic plans are political documents and as such they are made up of three components: (a) the statement of the social goals; (b) the projection of those patterns of private and public activities which are required for approaching the social goals

and (c) a design of policies aimed at motivating the private and public decision makers (consumers, investors and producers) to act in a way consistent with the projected path. In this sense, the Bergsman-Manne model — as well as any other model I am acquainted with — is not a model of an economic plan, since it is not concerned with either the selection of the social goals or with the design of policies. It is designed to find or to describe a path which is consistent with a limited number of exogenously given social objectives. The latter are stated in the form of desired annual rates of growth for household and government consumption and exogenously specified capital formation.

Derivation of Trajectories

The computations are carried out in two distinct steps. First the sectoral targets (consistent output levels, endogenous investments and imports) are computed for the terminal years of the plans under investigation. Then the sectoral output levels in each of the intermediate years of the plans are determined on the basis of a log-linear interpolation between the terminal and initial plan years. The resulting sectoral time paths are mechanical extensions of the single period solutions for the target years. They are best described as trajectories which have neither a recursive structure nor a necessary internal consistency. Thus the authors do not work with a growth model which would ensure an optimal or even a consistent allocation of resources. Nonetheless — with some limitations which I shall discuss below — by literally bridging the resulting supply

and demand gaps with what they call "shock-absorbers" (unconstrained imports of producers' goods, consumption shortfalls and changes in domestic services) they can trace out a consistent and, on the trajectory itself, feasible time path for each of the sectoral outputs. This procedure does not ensure, however, economic feasibility at the beginning of the plan period. Here the assumption is that whatever the required sectoral rates of growth, the necessary initial productive capacities (capital and investment in progress) are available in each sector. In sectors where production lags and investment gestation periods are significant, this assumption may not be readily defensible.¹

After the derivation of a consistent set of trajectories, the authors (a) compare the computed outputs with the statistical estimates of outputs in the initial year of the period under investigation; (b) compare the domestic savings implications of the alternative computed growth paths with statistical estimates of the economy's current savings; and, (c) trace the behaviour of the "shock-absorbers" over time with particular reference to determining the foreign exchange requirements of the alternative paths. The information thus obtained can then be used to analyse the question of the feasibility of alternative development paths in terms of their particular savings, foreign exchange, and initial capital requirements.² It is in this sense that the authors regard their work as a model for "requirements analysis".

The model was specifically developed in order to analyse the foreign exchange requirements of India's Fourth

* J Bergsman and A Manne, "An Almost Consistent Intertemporal Model for India's Fourth and Fifth Plans", *The Economic Weekly*, Vol XVII, No 47, November 20, 1965.

One of the world's outstanding cigarettes

Wherever in the world cigarettes are smoked, the name Player's stands for quality — the outstanding quality that has made Player's Gold Leaf Filter Tipped one of the world's great cigarettes. Here's a filter cigarette rich in tobacco, rich in taste and with a reputation that matches its good looks. Try it — you'll agree that it is quite the most satisfying cigarette you have ever smoked.

Rs. 2.50 for 20 • Rs. 1.25 for 10

and Fifth Plans. For this purpose the authors investigate the implications of two alternative aggregate growth paths over the ten-year period beginning 1965-66. Each of the two alternatives is then considered in combination with three different import substitution policies. The results of the computations can be briefly summarised as follows: (a) with the exception of the initial induced construction requirements, the different growth paths are found to be feasible in terms of the estimated initial capacities, and (b) the foreign exchange costs (measured in terms of balance of trade deficits) of accelerated programmes of import substitution are not only recovered over the ten-year planning horizon but are smaller than those of less ambitious programmes of substitution.

The Results and Structure of Model

These are interesting and significant results. However, since there may be a temptation to look upon planning models as if they could serve primarily *predictive* rather than *normative* purposes, it may be useful to consider some of the qualitative aspects of the relationship between the computational results and the structure of the model. This is all the more important, since the computations were not performed in the context of a hypothetical economy but in the very real setting of the Fourth and Fifth Indian Five-Year Plans which are currently in preparation and under technical and political consideration.

In this connection, we must first remember that the Bergsman-Manne log-linear trajectories are arbitrarily determined and do not represent optimal paths with respect to any objective. The necessary implication is that the efficiency of the trajectories may be improved by injecting some optimising principle. Since in the model the rate of growth of private and public consumption is given — and the focus is on the foreign exchange requirements of alternative import substitution policies — the minimisation of foreign exchange costs of production and investment may provide such a principle. The point is not that optimising models are necessarily preferable; depending on their specification they may or may not be better approximations of the conditions prevailing in the economy than the Bergsman-Manne model.³ The point is that the structure of the model was chosen by the authors not because it provides a better description of the economy than some optimising models — as far as

I know, no tests were performed with alternative models — but because of its computational advantage, which is an arbitrary criterion when it comes to determining a model's relevance. Thus one must keep in mind that more efficient resource utilisation than that in the Bergsman-Manne trajectories could be indicated which then would make the attainment of the targets that much easier. The same comments are also relevant to the efficiency of foreign exchange use: the extreme rigidity of fixed import-output ratios does not permit allocation according to real cost advantage. If some endogenous choice were permitted in the framework of an optimising mechanism, decreases in the implied foreign exchange requirements might be experienced.

Second, the way the technical and demand coefficients are entered may be of importance. We know from the experience of advanced countries that in addition to investment, technological change has a fundamentally important role in bringing about (explaining) economic growth. There is reason to believe that the same must be true — possibly with even greater force — in the case of underdeveloped countries. We might expect this change to manifest itself both in the structure of the input-output tables and in the magnitudes of the capital-output ratios. The Bergsman-Manne computations are based on input-output tables which, save for a shift in the direction of greater reliance on chemical fertilisers in the agricultural sectors, show *no further change* during the period 1970-71 to 1975-76. In addition, the capital coefficients remain constant over the entire ten-year period. Now these may be correct assumptions, but if they happen not to be, then they will have strong implications for the computed savings and foreign exchange requirements. And though no one can accuse the authors — and particularly Professor Manne who has already done important work in India on the effects of technical change on the input-output structure — of ignoring technological change, it would be desirable if the paper itself were more explicit about the underlying assumptions and their implications for the computed results.

Similar observations could be made about the demands coefficients. Though in general the computations do not indicate a major consumption shortfall over the entire ten-year period, the paper is termed "an almost consistent" model because insufficient ca-

capacity in the construction sector could be a bottleneck in the initial years of the ten-year planning period.⁴ In evaluating the significance of this constraint, one has to keep in mind, however, that as much as half of the shortfall in the initial induced investment may correspond to residential house construction. On the one hand, the demand for housing in a country like India can be defined only in the most arbitrary terms, and on the other hand, the supply of housing is relatively easily restricted if that is considered desirable.⁵ Hence the initial bottleneck in construction may be less constraining than indicated by the unexplained findings.

Changing the Norms

When computations with the help of planning models are undertaken with the intention of using them as aids in actual policy decisions, the relevant coefficients must be subjected to scrutiny not only from the point of view of their historical plausibility but also with an eye toward the possibility of changing the norms. The purpose is not to cheat with statistics but to investigate the possibility and desirability of adjusting demand and supply by suitable policy measures.

Of course, every time the norms are adjusted or the constraints are shifted, the implied savings and foreign exchange requirements are correspondingly affected. It is unlikely that the general findings of the paper as to the time profiles of the balance of payments deficits would be very much altered by changes in the norms — though the size of the deficits might be significantly affected.⁶ As to savings, they would be very sensitive to technological change and also to demand restrictions. It would be important to undertake at least some sensitivity analysis to determine the savings implications of variations in the norms, particularly since the average savings requirements as computed by Bergsman and Manne seem to be excessive. Nonetheless, they may be attainable if the recent average savings trends continue over the coming plan periods. However, the road from 15 to 22 per cent is arduous. At the same time, as a matter of relief, the rather prohibitive percentages listed by them as "marginal ratios" cannot be considered to be marginal savings ratios in their generally understood sense. They are the slopes of straight lines which connect points on vertically shifting savings functions and not changes in planned savings (as function of in-

come) with respect to changes in income. The actual marginal rates cannot be determined from the model; a simple geometrical exercise, however, can convince us that if the average savings rates are increased in response to a shift in the savings function, the actual marginal rates must be below the rates computed by the authors.⁷

As mentioned above, the authors do not specify the policy measures needed to implement any one of the alternative programmes computed in their "requirements analysis". Nor do they take a position as to the feasibility or the desirability of any of the alternatives. They are correct in pointing out that the parameters and constraints they work with must not be considered as fixed forever. And, indeed, constraints are not immovable and norms can be changed. For instance, in a country like India, agricultural productivity could be increased if the government would intensify its farm programme. Then, on the basis of some assumptions about how agricultural productivity would be affected, we could estimate the corresponding changes in the norms used in the computations.

Choosing Growth Paths

Thus, resource or input requirements can be reduced not only by reducing targets but also — most importantly — by increasing efficiency or by adjusting the composition of demand. In fact, the process of planning does not consist of searching for some path which takes the structure of the economy as constant and which has no other merit than that in terms of some historical criteria it is consistent and feasible. Instead, planning consists of trying to ascertain the benefits and costs of adjusting the supply and demand relationships so as best to approximate the social objectives of development. And, indeed, this is where the use of planning models is justified: they can be employed to analyse the relationship between certain strategic elements of a plan and to study the consequences of changing the assumptions underlying these elements. But since the analysis can be undertaken only at the cost of abstracting from the majority of objectives and constraints, the results must be interpreted from the point of view of their qualitative rather than quantitative significance.

Before concluding my discussion, I would like to make one further comment about the uses of planning mo-

del for choosing growth paths and strategy. The Bergsman-Manne computations provide us with six alternatives to choose from. By subjecting the model structure and the norms to further changes, we could generate any number of other growth paths, many of which might be as plausible or as relevant as the Bergsman-Manne trajectories. Each path implies a different set of policies and the choice among the alternatives can be made only in terms of some political-economic judgment. Thus, I am in agreement with the authors when they consciously side-step the question of choice. Economic plans represent the reconciliation of a vast number of political as well as economic constraints with a multitude of frequently contradictory and non-quantifiable social objectives. In a world of imperfect knowledge and uncertainty, the use of planning models is necessarily confined to partial analysis. It would be foolhardy as well as illegitimate to use them for prejudging the strategy of economic development.

Notes

- ¹ To the extent that multiple shift operations can be introduced, the assumption may be less damaging.
- ² Non-feasibility in this context does not necessarily mean absolute impossibility in a technical sense; it may just mean social or political lack of desirability.
- ³ In a normative context, however, optimising models are inherently less arbitrary than non-optimising ones. But this in itself is insufficient to determine the relevance of any model to an actual economy.
- ⁴ Though this is semantics, the title of the Bergsman-Manne paper is somewhat misleading. The model itself is consistent. The question is whether the computed trajectories are feasible in terms of the estimat-

ed capacities expected to prevail in the initial year. Hence, if the authors are concerned about the non-feasibility of their trajectories because of the initial construction bottleneck, they would be more accurate if they used the term "almost feasible" rather than "almost consistent".

⁵ In fact, historical experience suggests that the supply of housing lags in the initial stages of both capitalistic and socialistic development. Consider the Manchester slums and the Soviet housing squeeze.

⁶ The profiles themselves would change, however, in response to introducing an optimising mechanism combined with some endogenous choice in the import substitution policies. This is borne out by the results of Chenery and MacEwan "Optimal Patterns of Growth and Aid Over Time", mimeographed paper presented at the Conference on the Theory and Design of Economic Development, Iowa State University, Ames, Iowa, November, 1965.

⁷ For the case of comparing observed savings S_0 and S_1 before and after a shift in the savings function (say in response to a change in tax policy) consider the following geometrical representation. The MPS are

the slopes of the functions shown in solid lines. The rates computed by the authors correspond to the slope of the straight line defined by the points (Y_0, S_0) and (Y_1, S_1) .

1966 is here! What it will bring for you, your family and your country, depends on you... on your resolution. You need your savings; the country needs your investment. And the best way to save and invest is in the Unit Trust of India. When you buy Units your capital helps many industries, including defence oriented ones.

- Units bring you attractive dividends (6.1% last year)
- Earnings up to Rs. 1,000 from the Trust are free of income-tax
- Units provide safety of capital through spread of investment in diverse securities
- Your money's not tied up—Units are easily encashable

Buy Units now. The face value of a Unit is Rs. 10; you buy them in blocks of 10. Get them from your Bank, or through 'approved' brokers of recognised Stock Exchanges. Sale and repurchase prices are announced daily by the Unit Trust.

Kashmir in the Wider Context

G M Rajpori

IT is not intended here to calculate the military gains that accrued to India in her conflict with Pakistan. That is not possible in the absence of adequate precise information. What will be attempted below is to assess the impact of the conflict on our national life with reference to the situation prevailing immediately prior to the conflict.

India, being a vast multi-lingual and multi-communal country, has the advantages and disadvantages of a diverse human society. In the recent conflict Indian society presented a co-ordinated response to Pakistan's aggression. This seems to indicate that a stage has been reached when the various communal forces in India have arrived at a point of synthetic assimilation and objective adjustment, providing a durable base for the future advance of Indian society as a powerful composite force. The picture of a solid national front spear-headed by various shades of patriotic opinion was projected. A theocratic state clashed with India on an issue supposed to affect a large minority here. Pakistan no doubt depended on the potentialities for discord within Indian society and expected a situation of chaos and communal strife. What happened, on the contrary, was that in India's defensive struggle various communities fought with exemplary heroism and dedication and a wave of complete national solidarity swept the country. This was perhaps the most important gain to India as a country inhabited by diverse communities. A side-effect was the submerging of linguistic controversies.

Pakistan's game can be defeated further if this united response to the aggressor is intelligently fostered and the Muslim community as a whole is encouraged to play a leading role in this. Pakistan's propaganda of a 'Jihad' goes to pieces when it is understood that what is happening is that a country inhabited by five crores of Muslims is being attacked by West Pakistan with a population of four crores. The sordid act of sending infiltrators to kill and create disorder into a State where the majority is Muslim must shock the Muslims in India. The way the infiltrators have been treated in Kashmir is a manifestation of the maturity of the Muslim community in India. The military regime in Pakistan has reasons to

write off the Muslims of India from its list of potential allies.

Another gain of tremendous importance is the straightening of India's diplomatic postures. For the first time India reacted with complete firmness to debunk the claims of Pakistan on Kashmir. It has been made unmistakably clear that Kashmir is an integral part of India. A further gain, following from this, is a clarification of the position of the various countries in regard to Pakistan's untenable claims to Kashmir. This gives us the opportunity to adjust our foreign relations on a more objective basis.

But this is not, of course, the end of the matter. How will the situation evolve round the so-called Kashmir issue? The question will have to be answered in the context of the attitudes and postures of various world forces vis-a-vis Pakistan and India. The USA and, to an extent, the UK, are smarting under Pakistan's adventurism and expending of anti-communist military resources against a non-communist power, and their flirtation with China which has completely upset the entire Anglo-US strategy of building up Pakistan as a militant bulwark against "communist expansionism" in Asia. Consequently, a phase of rethinking in the US and the UK is inevitable. Pakistan may yet persist in trying to be an ally of both the US and China, but the game is all but played out. Skillful diplomacy by India at this stage can no doubt contribute to queering the pitch for Pakistan's relations with both countries.

Pakistan's predicament at the moment is much grayer than what it appears to be to a casual observer. Beneath the surface there are powerful forces of unrest. The misadventure in Kashmir cannot but have political repercussions within the country. A further tightening of the already stringent restrictions on democratic freedom is likely. It is clear that President Ayub Khan is just now as much concerned with ensuring his personal survival as with forcing a solution of the so-called Kashmir problem in favour of Pakistan. The dictatorship in Pakistan has systematically crippled the initiative of its common people. The people's energy and enterprise have languished amidst the plethora of "do's" and "don't's". The failure of the regime's military adventure and the very considerable destruc-

tion caused by the war must give rise to a deep sense of frustration. In addition, account has to be taken of the Pakistani economy's inability to support from its own resources, as opposed to gratis aid from abroad, large-scale military preparations.

On the face of it, in China the rulers of Pakistan have a substantial ally against India. But on close scrutiny the possibility of China plunging into a major conflict without a reliable brief appears remote. China may not be averse to making use of Pakistan for limited tactical purposes, but she is not oblivious of the character of the Pakistani regime. The fairly narrow limits of Sino-Pakistani friendship may at the moment be concealed behind demonstrative troop mobilisation and diplomatic utterances. The revolutionary forces within Pakistan, which close contact with China is bound to foster and encourage, are anathema to the country's present leadership, including the top brass of the army. Considerations of self-preservation will, therefore, compel the leadership to maintain its basically pro-West attitudes with the flirtation with China only a temporary, tactical phase.

These theoretical formulations assume importance in the context of the Indo-Pak flare-up. Pakistan's frantic efforts to repair its loss of face through diplomatic manoeuvring are destined to fail. In India the mood of the people has hardened. This should discourage any outside power from attempting to pull Pakistan's chestnuts out of the fire. The situation in India just now is totally opposed to all suggestions of compromise and so the world powers can do little more than to console Pakistan with little diplomatic pats on the back. India is too important a country for anyone to antagonise to please Pakistan. Besides its democratic set up and plural social order must necessarily pull a large number of countries towards her vis-a-vis Pakistan and China. The sulky exasperation of Pakistan and her friends cannot stand in the way of India's natural rise as a formidable Asian power. If anything, Pakistan's belligerence will hasten the process through its impact on India's internal policies and on her national will. Pakistan's hostility is bound to awaken the prodigious forces of nationalism and social dynamism in India.

Impressive Recovery

Wednesday, Morning

DALAL STREET's trading pattern last week suggested that it had probably halted for an important technical correction which had been much overdue. The panicky sell-off on December 15 which had pushed the market to a new low for 1965 — the lowest for nearly three-and-a-half years — had rendered its technical position extremely vulnerable. The market needed some pretext for a rally and it therefore responded quickly to the announcement of US loan of \$35 million to the Industrial Development Bank and the ICICI and to the Johnson-Ayub communique stressing the need for a peaceful resolution of all outstanding differences between India and Pakistan.

The comparative lull on the borders, increasing indications of a welcome change in the US attitude towards India's pressing needs in respect of food as well as other economic assistance, improved rabi crop prospects, abolition of price and distribution control on fertilisers, increased off-take in the cotton piecegoods market, modifications in the rayon textiles export promotion scheme to facilitate the import of pulp and art silk yarn, curbs on short selling through modification of the margin rules by the stock exchange authorities — all these factors contributed to the improvement in market sentiment.

Equity prices have recorded a fairly impressive recovery from their previous week's lowest levels and in a matter of days some of the scrips have recouped most of the losses suffered over the past few weeks. The rally started with short covering but as sentiment improved with the recovery in prices bulls also appeared on the scene and lent selective support which accelerated the pace of recovery.

Long-term assessment of the outlook for equities has become difficult and hazardous because of the far too many uncertainties in the economic and political situation. Even the near-term outlook is difficult to assess. However, it seems very likely that the current recovery phase will continue for quite sometime, barring some unforeseen developments of course. The US decision to supply 15 million tons of foodgrains to India will not merely enable the country to overcome the anticipated food deficit in 1966 but also keep pri-

ces under control and induce a psychology of confidence. Washington's generosity in the matter of foodgrains supplies suggests a significant change in the US attitude towards India's economic difficulties and this has revived hopes of increased flow of aid. The favourable implications of over-abundant supply of foodgrains and large economic aid can scarcely be over-emphasised.

While it would be reasonable to expect that the recovery phase which is now underway will be continued for some time, optimism about the outlook for equities will need to be tempered with caution. A great deal would depend on the outcome of the forthcoming Tashkent meeting and the February Budget.

COTTON

Futures Harden Further

COTTON futures last week staged a further recovery with the March contract moving up from Rs 894.25 to Rs 902 (per 3 quintals). The buying in futures was inspired mainly by encouraging advices from the cotton piecegoods market. The turnover in futures, however, continues to be extremely poor and the whole week's business could be easily put through in a single session without causing the slightest excitement in the market. Despite increased production over the years, King Cotton has lost its old glamour for speculators.

The spot cotton market continued to present a dull appearance though the undertone was slightly steadier than in the preceding fortnight or so. Because of the quota system, mills' purchases have necessarily to be restricted. And added to this is the problem of acute financial stringency. Bengal Deshi prices which had been declining for the past one month or so have steadied up a little following the Textile Commissioner's decision to exempt Deshi cotton from the restrictions and limitations imposed about the middle of November (November 19 to be very precise) on the purchases, deliveries and stocks of Indian cotton that may be held by the mills.

The removal of restrictions on mill purchases of Bengal Deshi cotton seems to have been occasioned by the declining trend in its prices due mainly to

lack of overseas demand. Export sales up to December 17 total no more than 66,437 bales which is a very disappointing performance indeed. Since the Deshi crop this season is expected to be smaller than in the 1964-65 season, the authorities will need to take care that increased domestic consumption by mills does not reduce the exportable surplus and thereby adversely affect export performance. Bengal Deshi is a valuable foreign exchange earner. The Union Minister of Commerce is reported to have advised millowners to use more Bengal Deshi cotton for spinning lower count yarns and export that even at much reduced prices with a view to earning foreign exchange. The proposition does not appear very feasible. Bengal Deshi cotton is probably much easier to export than yarn, particularly inferior yarns.

OILSEEDS

Unexciting Affair

EXCEPT for some excitement in castor futures which displayed marked strength on bull manipulation, trading in oilseeds last week was quite a dull affair. Castor futures which had been marked down to Rs 99.75 in the preceding week moved up to Rs 104.75 by the week-end. Castor oil commercial improved from Rs 20.50 to Rs 21.50 per 10 kgs. The buying in castor futures was said to have been inspired partly by rumours about more liberal incentives for the export of castor oil and partly by fears of damage to the standing castorseed crop in case the cold spell continued for long. The marked strength in castor and castor oil did not, however, have any significant effect on other oilseeds. Linseed futures moved irregularly between Rs 121 and Rs 119.50, linseed oil between Rs 28.75 and Rs 29.25 and groundnut oil between Rs 32.50 and Rs 33.25.

No big fluctuations in oilseeds prices are expected in the immediate future. While the groundnut crop is expected to be 30 to 35 per cent smaller than in the previous season, the flow of arrivals has so far been quite satisfactory because of the general reluctance on the part of growers and merchants to accumulate stocks. Financial stringency, prevailing high prices and political uncertainty — all these factors have been discouraging piling up of

stocks. Since the shortfall in groundnut production cannot be made up through increased production of rabi oilseeds — despite recent beneficial rains the total supply of rabi oilseeds is not expected to exceed last season's out-put — and imports, the overall supply position of vegetable oils is likely to remain tight which will check any

significant fall in prices during the current season. The US generosity in regard to the supply of foodgrains has raised hopes of securing substantial quantities of soyabean oil and mutton tallow under PL 480 and if these hopes materialise, oilseeds prices might not record any steep rise from the current levels.

Export houses did not report any big business last week. Communist countries made some further purchase in groundnut extractions at around R 440 a tonne f.o.b. basis. Cottonseed cake did not evoke much interest and overseas prices were down by about 10 to 15 shilling per tonne over the week.

Necessary evil?

Yes—and understandably. An FAO Survey reports one-third of India's food crops go waste.

No one likes to queue up for anything. Least of all for food. And yet when food is not plentiful, restricted but equitable distribution is the only answer. Worthy of everybody's support.

Basically the problem is that the nation does not produce enough food. Worse still, as much as a third of what is produced rots away before it can be consumed.

The permanent solution is to grow more food. And growing more food has been given top priority in the Fourth Plan, by the end of which a 50% increase in food production is envisaged. But more food produced may mean more food wasted. Unless we lower the rate of spoilage.

One way to prevent spoilage is to process and preserve more food and more varieties of food. A recent report issued by the Food and Agriculture Organisation of the United Nations says, "Practically all the spoilage of food that

now occurs...could be eliminated by known methods of preservation."

That's why the consumer packaging industry must grow fast.

We at Metal Box believe that this growth must be made to happen. And to this end all our know-how in packaging, all our research and development facilities and our access to the mainstream of international packaging technology are at the service of the packers.

At Metal Box we can't grow more food. But we certainly can help save more of it. And that, you will agree, is almost as important.

CURRENT STATISTICS

Arid land

now bears fruit

For centuries this land lay arid. Lift irrigation has brought it to life and productivity.

LIC investments have helped many thousands of acres of land to bloom and grow more food.

The Life Insurance Corporation of India invests about Rs. 3 million a day in projects that are vital to the growth of India's economy.

Your welfare is our responsibility

Life Insurance Corporation of India

These were some of LIC investments as at March 1965:

Fertilisers,	
Chemicals, etc	Rs. 4,45,18,000
Plantations	Rs. 2,57,88,000
Central & State	
Govt Loans	Rs. 447,07,00,000
Central Co-op. Land	
Mortgage Bank Loans	Rs. 22,46,40,000
