with

# HINDALCO ALUMINIUM EXTRUSIONS

Lightness, corrosion resistance, good surface finish, along with strength and combination of properties—you can obtain all at low cost with HINDALCO Aluminium Extrusions. There are endless applications in every industry using fabricated metal shapes as components of assembly. A single aluminium extruded shape substituted for other metal can impart greater stiffness and strength with simpler assembly along with reduction in cost.

Extrusions can be custom-made in alloys which can give a combination of mechanical properties needed in a wide range of sections—rods, bars, angles, channels, tees, zeds, I-beams, H-sections, hollow shapes or semi-hollow shapes or special shapes.

Why not investigate the possibilities of Aluminium Extrusions application in your industry? It will pay you handsomely to do so! Please write to:

## THE GOOD OLD 'SEVENTY

THE YEAR, which we are now leaving behind us, is entitled to our gratitude, for it could have been worse. In these 12 months our country's developing democracy has been exposed to grave dangers, but it has survived them. Not all of these dangers have come from the acknowledged forces of subversion. Indeed, for the more serious of them, the blame lies with persons or institutions whom the country has a right to expect to remain faithful to the letter and spirit of our Constitution.

There had been during this year occasions when it almost seemed as if political opportunism of the grossest kind would triumph, destroying, in the process, the hopes of our people for a continuous strengthening of the democratic fabric of their community. Fortunately, these onslaughts and depredations on our democratic ideals and institutions have so far been frustrated by the instruments of our Constitution. The rule of law, as interpreted and enforced by a free and fearless judiciary, has succeeded in asserting itself. If eternal vigilance is the price of liberty, we may rejoice in the thought that our people are now well endowed in this respect. Every attempt that has been made to abridge the liberty of our people has only resulted in arousing their vigilance to enable it to entrench itself as a powerful factor in our public life.

Seen against this gain in our democratic values and the inner strength of our people to defend those values, the political terrorism now ravaging some parts of our country would appear to be a disturbing but not yet a disastrous trend. It is still within the power of any normally effective government at the centre to deal with the Naxalite violence in West Bengal or elsewhere. If effective measures are not now being taken to this end, it is only because the present government at the centre is both inappropriate and inadequate for the needs of our country. It is of course within the authority and capacity of the people to mend this situation and, luckily for them, they do not have to wait long for an opportunity to intervene. It is possible, of course, that the verdict of the general election that will be held within the next few months may usher in a period of coalition governments at the centre. It is probable, again, that these coalition governments may spell a phase of unstable or weak administrations. This prospect need not necessarily cause us despair. On the contrary, the nation may well benefit from a decline in dogmatism in government or the arrogance of power in politicians. Much of the harm done to this country in the past has been done by politicians over-sure of themselves. In the next phase of India's democracy it may well be to the country's advantage that its government should be able to function only by the sufferance of the people.

Quite possibly such a situation might facilitate our economic development rather than hamper it. It has been our experience of the last 20 years that governmental intervention in economic affairs has obstructed progress rather than promoted it. There is little evidence that the direction of the course of the national economy by the government has made any significant contribution towards releasing the energies of the people or increasing the material resources of the community. If, as a result of the political situation after the next general election, it so happens that the government's preoccupation with managing the economy is reduced, the consequence may well be that the arrested forces of economic dynamism may at last get a chance to go to work. We may well take leave of the receding year in this mood of hopefulness.

|                                                                                                                                                                                                                                  |    |

## The Explosive Unemployment Problem

FOR TOO long have we been hearing demands, such as inclusion of the right to work in the Fundamental Rights under our Constitution and effecting of radical changes in our economic system, as sovereign solutions to the growing unemployment problem in the country, but more employment opportunities simply don't flow out of such demands as pigeons emerge from a magician's hat. Nor do they follow in the wake of such cavalier suggestions as imposition of a ceiling on gold holdings or urban property, or taking over of plantations and industries without paying compensation. More pragmatic and practicable measures are needed to meet the grave situation and the few that could be regarded as such or nearing such put forward by some members included (i) acceleration of the pace of industrial expansion, (ii) intensive programme to improve communications, (iii) taking up of such projects as sinking of wells, construction of rural roads and housing, and (iv) starting of agro-industries and cottage and small-scale industries, all regarded as being capable of generating greater employment potential generally. In the light of this approach, the normal reaction of any one would be to ask whether there is as yet sufficient appreciation in the country of this "most explosive problem" and the need for a serious attempt to tackle it on a mass scale as urged by some members when the problem came up before the last Parliament.

But that is not the impression one got when one heard the studied speech on "creating the climate for employment opportunities" of Mr Naval H. Tata, President of the Employers' Federation of India, at the Golden Jubilee Conference of the Employers' Federation of South India, at Madras, the other day. The latter body thoughtfully chose to hold a seminar to consider the problem of unemployment and the need for creating an appropriate climate for greater job opportunities as part of these celebrations and to invite Mr Tata to give the keynote address. Mr Tata's was a business-like approach, as is only to be expected of a seasoned businessman like him. He first sized up the enormity of the problem and then indicated the right approach, while, at the same time, pointing to the mistakes in the present official policies. Of course, he also told his audience, consisting, in the main, of employers from different parts of the country, as to what they should do by way of their own contribution towards a solution of the acute problem.

This is how he sized up the problem. "The staggering fact of the Seventies in India", he said, "is that, due to the population explosion between 1955 and 1965, the 15-year olds will number 170 million of which 90 million will enter the labour force in this decade. The present labour force already numbers 210 million, 70 per cent of whom depend upon agriculture and of them 40 million are mere farm labourers". According to him, although the unemployment problem is world-wide, it appears to be in an aggravated form in our country, because "India has to sustain 14 per cent of the population with only 1.5 per cent of the world's income and 2.4 per cent of the world's land." The problem in India tends to get worsened as, to its already heavy population of over 550 million, we go on adding at an annual rate of growth of 2.5 per cent. No wonder, as he said, that "the number of unemployed has continuously risen from 3.3 million in 1951 to 5.3 million in 1956, 7.1 million in 1961, 9.6 million in 1966 and 12.6 million in 1969. A widely accepted estimate puts the present volume of unemployment as high as 20 million".

Explaining this phenomenon, Mr Tata listed four causes. First, he said "the rate of industrial expansion has not been fast enough to absorb all the additions to the labour force. Secondly, the capital-intensive technology of the basic industries, established in the last few years, does not create as much new employment as would have been possible under a different pattern of development. Thirdly, for every one job offered by industry, the rural sector throws up several aspirants from its limitless ranks of the under-employed. And, lastly, while there is a general surplus of manpower, many of the skills needed by modern industries are often in short supply, the availability of skilled jobs providing no relief to the unemployed."

Let us turn to the possible solutions offered by Mr Tata. The first point to be clarified in this connection is the relative availability of rural and urban employment opportunities. In a predominantly agricultural economy such as ours, a large numbers of the new entrants to the labour force must continue to find employment in agricultural and related occupations. Is this feasible? The fact is, to quote Mr Naval Tata, that, "out of the 42.5 million jobs created between 1950-51 and 1968-69, as many as 11 million were in the agricultural sector". And, further, as the National Labour Commission (NLC) has pointed out, "under-employment

in agriculture has diminished considerably since 1961, especially in areas where the farmers have taken advantage of new inputs and methods of cultivation. It has been estimated that each acre under high-yielding varieties of crops provides 30 man-days of additional work in a year and that an acre under intensive multi-crop farming gives 26 more man-days of work. Add to this the potentialities of rural labour camps and agro-industries for processing agricultural products, and you have an idea of the vast scope there is.

Industry is, and will always be, complementary to agriculture in providing job opportunities. "Without rapid industrial growth, it is difficult for any nation to solve the employment problem, despite efforts to offer more rural employment through agriculture", said Mr Tata rightly. In fact, as spare land becomes scarce, greater reliance has necessarily to be placed on industrial growth. A distinction has to be drawn here between traditional labour-intensive industries and modern capital intensive industries. Mr Tata felt a study to be necessary to find out how far the former have been utilised through intensive operation. Evidently he is of the view that there is some latent employment potential here, which explains his asking the government to examine the possibility of the cotton textile industry working three shifts round the clock, including Sundays. In this way, Mr Tata estimated, some 2½ lakh additional hands could be employed, but this presupposes, as he took care to add, increased supply of raw cotton. Similarly, according to him, fuller use of the unutilised capacity of several other labour-intensive industries could create substantial additional employment opportunities.

Mr Tata also dwelt on certain factors, including the emotional, if not unimaginative, trade union opposition to automation, that have been inhibiting the growth of our industries and thereby avoidably eroding fresh employment opportunities. For instance, he referred to the unsettled political climate which has had a pernicious effect on industrial relations and also alluded to the high levels of taxation imposed upon industry, indiscriminate wage in-

A HAPPY  
NEW YEAR**

creases extended to only one section of the working population (organised industrial labour), an aggressive phobia about concentration of economic power, an irrational fear of "bigness" in industry, opposition to automation and, more than everything, imposing of political solutions on wholly economic problems. Such policies, as he added, are a travesty of true socialism. "If, in the name of socialism", to quote him, "the highest priority is accorded only to fighting the imaginary fear of concentration of power, whilst the need for maximising production and fighting inflation is relegated to the background, then our socialistic-minded government is merely assuming the role of a play-back singer, to create an illusion of a voice which is not genuine and is merely intended to deceive the public. A suicidal ideology indeed!"

The EFI President also effectively countered the allegation that the so-called monopolists also are stifling the progress of the smaller entrepreneurs by citing what Telco, Voltas, Kirloskars and Nocil, among others, have been doing to help ancillaries. "A realistic and unbiased study of the inherent link between large and small-scale industries", he maintained, "would prove, be-

yond doubt, that far from stifling the growth of the smaller units, the larger units actually generate the smaller ones, and contribute mightily to their growth."

In regard to the role of employers in the matter of improving the climate for employment, Mr Tata referred to training of apprentices, providing reasonable job security for workers and expanding operations as best as possible under the prevailing conditions (which he had no hesitation in describing as tending to cause a severe setback to the development process). However, he added: "There is no instant remedy for these deficiencies in the economic and political fields, but one must hope that our leaders will show timely and sufficient wisdom to arrest and, in fact, reverse the present trends by adopting the correct policies that would permit more rapid industrial development and thus mass employment". "Timely and sufficient wisdom", indeed, is what the desperate situation in which the country finds itself today warrants. But it implies the shaking off of false dogmas or prejudices on the part of the powers-that-be. The sixty-dollar question is: will they, that too when the opposition challenge to them is mounting in the way it has been for some time now?

## Collaboration in Chemicals

THE JAPAN Chemical Goods Industrial Co-operation Mission during its three-week tour of our country in November this year seems to have discovered many fields suitable for collaboration with Indian entrepreneurs. Headed by Mr Y. Nakagawa, President of Toyo Plastic Co. Ltd, the seven-member mission was organised by the Osaka Chamber of Commerce & Industry and sponsored by the government of Japan. Its object was to meet leaders of industry and representatives of government in order to study the investment climate in India and explore the possibility of joint ventures and technical co-operation in chemical products. The mission's members represented plastic wall cabinets, birth control goods, water colours, plastic flexible hoses, and chemicals for rubber. The mission visited Delhi, Ahmedabad, Bombay, Bangalore, Cochin, Madras and Calcutta and held detailed discussions with the representatives of the chemical trade and industry.

To what extent the mission's visit will produce concrete results in the form of collaboration agreements will be known only after some time. Its members would like to discuss with their colleagues in Japan the implications of the schemes in which Indian businessmen have shown interest. Some of these schemes relate to synthetic fibres,

shell-fishing operations, plastic containers for transfusion of fluid, plastic pipes for irrigation, rubber chemicals, barium compounds and detergent soaps.

Collaboration with Japan will considerably accelerate the development of our chemical industry. Japan's chemical industry has progressed rapidly and vigorously especially in petrochemicals, dyestuffs, organic synthetic products, plastics, fertilisers, paint and pharmaceuticals. In 1969 Japan's export of chemical products was valued at about \$1,104,055 million — while her imports of these items amounted to \$836,492 million. Japan's development of the chemical industry has been facilitated by the import of technology from foreign countries and her own technical progress.

India's chemical industry has also made great progress under the three five-year Plans. The various sectors like fertilisers, synthetic fibres, synthetic resins, plastics, heavy chemicals — organic and inorganic — dyestuffs, drugs and pharmaceuticals and miscellaneous chemicals have been able to increase and diversify their production substantially in recent years. In 1968-69 we produced 1,038,000 tonnes of sulphuric acid, 304,000 tonnes of caustic soda, 405,000 tonnes of soda ash and

15.4 million tonnes of refinery products. In exports too our chemicals and allied items have made impressive progress.

However, there still remain many gaps in our chemical technology. In the list of items identified by the Government of India where foreign collaboration is to be encouraged, about 12 chemical industries have been mentioned, including fertilisers (other than super-phosphate), selected pesticides, selected petrochemicals, thermo-plastics, synthetic rubber, detergent alkylates, rubber chemicals, and so on.

The fourth five-year Plan has provided for a large expansion of the chemical industry especially in fertilisers and petrochemicals. Japan has vast experience in this field and will be in a position to collaborate with Indian parties in many projects. There is now a scheme to develop a petrochemical complex in Haldia. On completion this will give scope for setting up new industries with Japanese know-how.

But the prospects of foreign collaboration in chemicals cannot become bright unless the official machinery in New Delhi functions with speed. Although the Prime Minister and her colleagues repeatedly proclaim their intention to expedite the issue of industrial licences, entrepreneurs continue to complain of dilatory tactics by the government. In his speech at the annual meeting of Tata Chemicals held on November 17, 1970, Mr J.R.D. Tata regretted that hundreds of applications for licences, including two of their own projects, were bogged down in the Department of Company Affairs. In May 1969 Tata Chemicals had applied for the expansion of its capacity by 400 tonnes a day to 1000 tonnes a day but even after 18 months, the sanction had not come.

Meanwhile, the country was confronted with a severe shortage of soda ash necessitating imports. Mr Tata said, "Had the control machinery of government been a less cumbersome and quicker moving one, and we had been allowed promptly to respond to the country's needs, we would today be within a few months of being in a position to meet the increased demand. Instead, we find the same government that calls upon the industry for a crash programme of expansion of the country's soda ash producing capacity enforcing interminable delays on those most able and willing to respond to their will." Statements of this type coming from top industrialists are not likely to enthuse businessmen from Japan or from other countries. It may be recalled that a delegation sponsored by the Engineering Export-Promotion Council to Japan in February this year referred in its report to "harrowing experiences of frustra-

tion on the part of some Japanese businessmen to set up collaboration units in India while others criticised the Indian investment regulations, the taxation policy, and the limitations on the repatriation of profits.

It is gratifying however to find that Indian technology in chemicals has become so advanced as to be able to offer its know-how in foreign countries. The 200,000-tonne per year plant for the production of soda ash sponsored by Tata Chemicals in Argentina is perhaps the most ambitious and prestigious project ever undertaken by an Indian firm in a foreign country. This should be able to inspire confidence among the Japanese industrialists about the ability of their Indian counterparts to export their know-how and to set up joint ventures in various parts of the world.

Besides seeking collaboration, our chemical industry should also explore the prospects of direct exports of chemi-

cal and allied products to Japan. We should study Japan's import statistics and find out the type of chemicals they are importing from other countries. The delegation sponsored by the Engineering Export Promotion Council to Japan suggested that business worth Rs 50 lakhs could be secured during 1970-71 and worth five crore rupees by the end of the fourth five-year Plan. Many of these engineering goods require components made of chemicals, plastics and related products. This is so especially in the case of television, radio, tape recorder and so on. Japan has been described as the biggest consumer of electronic components in the world. Our chemical industry therefore should examine to what extent there is scope for fitting its products into the engineering goods exported to Japan. The visit of the Japanese mission has opened up interesting possibilities of co-operation and it is up to our government and businessmen to follow up the discussions and achieve substantial results.

## Self-Sufficiency in Cotton

WITH EVERYBODY shooting off his own cotton statistics — and each seems to have his special source — which conflicts with everyone else's, it has become well-nigh impossible to say where exactly the country stands in the matter of actual cotton supplies today.

In the circumstances, we ought to be thankful to Providence that there are no two opinions on the available supplies being far short of actual requirements and that the situation could be remedied only by additional imports, as Mr Madanmohan Ruia, President of the Cotton Buyers' Association, Bombay, stated at the last annual general meeting of the association held a few days ago.

Now that the Government of India has decided to import 13.15 lakh bales in all during the current cotton season, the total supplies that would be available during 1970-71 would be of the order of 86.21 lakh bales made up as follows:

|                                             | Indian          | Foreign |
|---------------------------------------------|-----------------|---------|
|                                             | (in lakh bales) |         |
| Carry-over from 1969-70 season              | 13.50           | 3.56    |
| Estimated production                        | 56.00           | ..      |
| Estimated imports                           | ..              | 13.15   |
| Total estimated supplies (86.21 lakh bales) | 69.50           | 16.71   |

If it is conceded that available supplies fall short of actual requirements,

it must be presumed, the statement applies to the situation prevailing today. At any given time, actual availability depends on arrivals from cotton-growing areas within the country, as well as from abroad. There are conflicting views about the rate of arrivals depending upon who makes the statement. But *vis-a-vis* the actual demand today (which is higher than last year), the rate of arrivals has been lagging behind, notwithstanding what the Minister of Co-operation, Maharashtra, contends. This is borne out by the stocks of *kapas* with co-operatives having reportedly risen phenomenally. With the unlimited credit facilities available to them and the active exhortation by co-operative officials to buy and stock cotton but wait till prices rise further to dispose it of, this is quite conceivable.

As regards foreign cotton, the authorities should not be content with mere pronouncements of import quotas but see that steps are taken for supplies of this cotton to reach the country as speedily as possible, as Mr Madanmohan Ruia appealed to the government.

Knowing the vagaries of weather, on the one hand, and the uncertainties of adequate availability of foreign exchange, on the other, Mr Ruia rightly reverted to his oft-repeated theme of self-sufficiency in cotton. "Despite our efforts to increase the domestic production", he said, "our Plan targets continue to remain mere illusions". He was frank enough to admit "the efforts made by the Indian Cotton De-

velopment Council in the sphere of improving the per-acre yield of cotton, as also in the evolution of better strains and the measures taken by the industry also in this behalf have only touched the fringe of the problem". So, he went on to ascertain why this has been so.

According to him, there are two reasons for this, namely (i) the funds allocated for the purpose are inadequate, and (ii) isolated efforts, however sincere, cannot go very far. "The funds allocated every year by the government are so inadequate", he said, "that the efforts made by these organisations could not make any headway from the experimental stages". Accordingly, he availed himself of the occasion to request the government to make adequate funds available for the important task of increasing the per-acre yield and thereby augment cotton production. We are at a loss to make out why, when the government is actually spending nearly around Rs 100 crores on imports of cotton and staple fibre a year, it is so parsimonious as not to earmark more than Rs 16 crores (including the extra of Rs 8.4 crores announced a few months ago) for cotton development in the whole of the fourth five-year Plan period. In this connection, the lead given by the Indian Cotton Mills' Federation, which has sanctioned Rs 25 lakhs and has offered to spend more, if need be, for cotton development needs to be emulated by the powers-that-be.

Secondly, in place of the isolated efforts by the Indian Cotton Development Council and the Indian Cotton Mills' Federation, Mr Ruia wanted the government to set up a corporation in which the government, the trade, the industry and the growers should be entrusted with the work of achieving self-sufficiency in cotton as speedily as possible, and he also added significantly that "all assistance needed for such work should be readily sanctioned". If this is done, he felt "it should not be difficult for the country to march ahead and attain its goal in achieving the cotton targets fixed by the government from year to year".

The nine-point programme recommended by the Cotton Textile Consultative Board recently and accepted by the authorities since may be all right to meet the present emergency. When it is over, as it bids fair to be thanks to the extremely co-operative attitude of the millowners and the tactful handling of the crisis by the Chief Minister of Maharashtra, the authorities should not relapse into their erstwhile apathy but apply their minds in right earnest to evolve a practicable policy aimed at achieving self-sufficiency in cotton as speedily as possible.

## Rule of Law in Industrial Relations

K. SANTHANAM

INDIAN ECONOMY is suffering from two major ills — the prevalence of the law of the jungle in the relations between the employer and the employed and the existence of a large number of unemployed youths and adults seeking employment, and unless satisfactory solutions can be found for both, Indian economy will continue to be in the doldrums. Of these two, the establishment of the rule of law in the relations between the employer and the employed in the factories and the offices deserve priority, for it is through the surpluses created by the efficient working of the employed labour and avoiding the losses incurred through strikes, go-slow methods, absenteeism and other labour troubles that the central and state governments can find the resources to tackle the unemployment problem in an adequate manner.

### Foundation of Democracy

It is admitted that the rule of law is the basis for any civilised society and that it is the indispensable foundation of a democracy. Unfortunately, a narrow interpretation of the rule of law has prevailed which has been applicable only to disputes between individuals and those arising from the laws of property and contract. In the beginning of the industrial revolution, it was thought that the law of contract would suffice for regulating relations between the employer and the employee but the immense power which modern science and inventions gave to the owners of industrial concerns using power machinery led to gross exploitation and oppression of labour. This gave rise to the trade union movement and parliaments elected by adult suffrage had to make laws providing for health, sanitation and safety of workers and for collective bargaining, conciliation and in some cases adjudication of labour disputes. In the case of government servants, it was considered sufficient to regulate the conditions of service by rules and effect changes through periodical enquiry commissions.

While these steps have mitigated the worst abuse, they have not altered the fact of the final settlement of disputes by strikes and lockouts. Though it is generally considered that government servants employed in adminis-

trative services have not the right to strike, such strikes have been restricted in this country and not ignored as in other countries. There is no doubt that these methods of settlement of the disputes between the employer and the employee are analogous to the duels by which personal insults were settled in the middle ages. Only the duels between the management and labour affect the normal life of the people even more than the participants themselves.

While the worker is certainly entitled to reasonable wages and fair conditions of work, the claim that he can withhold labour at will and stop production of goods and services which are essential to the community cannot be conceded by any civilised society. As in the case of aggrieved individuals, they should have the right to approach some impartial tribunal whose verdict should be binding in the same manner as that of a law court. Some attempt has been made in our labour laws to regulate strikes and lock-outs and prohibit them when disputes are referred to arbitration or adjudication particularly in the case of essential utility services but, unfortunately, these have not been effective as penalties are not automatic and it is not possible to inflict arbitrary punishment on a large number of workers who believe that it is their inherent right to enforce their demands through a strike.

### Bright Prospect

If the central and state governments in India can make up their minds to abolish the right to strike and substitute for it the right to approach a proper judicial tribunal in all cases where negotiations and conciliation proceedings have failed, the prospect of Indian economy can become very bright.

In this connection, the present government of the UK has set an example which deserves careful consideration. The Industrial Relations Bill which has been introduced in the British Parliament goes a long way to enforce the rule of law. It has not banned the right to strike and lock-out altogether but if the bill becomes law, they will be made so difficult as to become practically impossible. According to the Bill,

the Secretary of State for Employment is to publish a code of industrial relations within a year of passing of the Bill. A new system of industrial courts is to be established providing for suits by injured parties against employers, unions or individuals for adopting 'unfair industrial practice' which should include dismissal and retrenchment other than for prescribed reasons and the observance of proper procedures. Collective agreements are to be legally enforceable. Trade unions and employers' associations will have to accept the minimum standards in relations to their rights and the methods of enforcing them.

The most important point is that both employers and employees will be entitled to claim civil damages for the losses suffered by improper action. Also action can be brought against unions and strike leaders and not merely against the individual participating in a strike, or declaring a lock-out. The labour courts to be set up will be empowered to award compensation up to a maximum in the case of individuals or unions related to their capacity and also award costs. Preventive orders can also be issued by such courts against threatened strikes and lock-outs.

While the provisions of this bill are commendable, it is necessary to make a

## STANDARD and CHARTERED BANKING GROUP LIMITED

The Directors of Standard and Chartered Banking Group Limited have resolved to pay on the 22nd January, 1971 to shareholders registered on the 24th December, 1970, a second interim dividend of 4% less income tax for the 15 months ending 31st March, 1970. This is as forecast in the Scheme of Arrangement.

The Directors are pleased to report that the profits of the Group show a satisfactory upward trend, despite the limiting effect of credit restrictions in some areas and problems arising from the acquisition by certain Overseas Governments of interests in our local business.

simpler and more direct approach to the problem in the country. A complete prohibition of strikes, lock-outs and every other kind of direct action coupled with mandatory provisions for quick negotiations and adjudication, if necessary, should provide a climate of industrial peace which will give a sudden momentum to our economy.

It may be conceded that any such step will be stoutly resisted by the labour unions and even more fiercely by their leaders whose power and influence today is in their capacity to threaten strikes and dislocations. I shall not be surprised if many employers too dislike the idea of automatic and compulsory adjudication but, in this matter, it is not the likes and dislikes of employers or workers that should be de-

cisive. Modern industries and administrative services are essentially public utility activities in which the public interests should prevail. It is impossible to contemplate any strike or lock-out which does not in some way or other affect public interests adversely.

In this connection, it should also be remembered that strikes and lock-outs are practically banned in all the communist countries. I have no doubt that in those countries any body of workers who resort to strikes, and their leaders will be liquidated in one way or another. It is absurd to think that only dictatorship and totalitarianism can enforce the rule of law and orderly settlement of disputes in this field. Democracy should be able to do it in a more reasonable and humane manner.

## Indo-French Economic Co-operation

K. K. G. NAMBIAR

THE VISIT of the French economic mission to India led by Mr Stephane Thouvenot and the many-sided discussions it had with the Indian government and industrialists should lead to more purposeful, extensive and cordial economic and trade relations between India and France. Already, the "practical outlook" of the French mission has pleased everyone in India, leading to new hopes and optimism about strengthening the economic relations between the two countries.

In a way, the visit of the French delegation is the upshot of the meeting of the Indo-French Economic Commission held in Paris a few months ago at which several measures aimed at strengthening the Indo-French economic relations were discussed. It may be recalled that the 1959 trade agreement between the two countries expressed common desire to expand and diversify trade relations between the two countries. Since then, the volume of trade between the two countries have grown.

### Important Partner

France is an important trading partner of India in the European Economic Community and rank-wise tenth trading partner and absorbs 1.4 per cent of Indian exports. Imports into India from France account for 1.9 per cent of our total imports. A characteristic of the trade between the two countries has been that never has there been a trade balance in favour of India. For instance, India's imports from France during the period 1951-56 totalled Rs 13.4 crores (annual average) against her exports of Rs 6.9 crores. During 1956-61, the value of India's import

from France was Rs 21.4 crores, (annual average) which was Rs 13.2 crores more than her exports. Further, against India's exports of Rs 20.0 crores in 1968-69 to France, the value of imports from that country was Rs 36.4 crores. However, during the nine months of 1969 (April-December) the gap has been somewhat narrowed down, the import being Rs 18.2 crores against the export of Rs 16.4 crores.

### Principal Exports

Primary products like leather, precious and semi-precious stones, coir yarn, claws, cotton raw, gums, sandalwood oil, cashew kernels, jute and silk products are the principal exports from India. Heavy plant and machinery, fertiliser and various industrial raw materials, chemicals and pharmaceuticals are the major items in India's list of imports from France. Capital goods account for about 70 per cent of India's imports from France. The important issue concerning the Indo-French trade is how to increase India's exports of non-traditional goods to France. France

being an industrially developed nation and her market being both competitive and sophisticated, it will not be too easy for India to increase the export of her manufactured products.

Besides these, there are other significant handicaps. France being a member of the EEC, no duty is leviable on goods originating from the member-countries of the EEC. Since those countries are industrially far advanced, it is less easy for India to gain a good market for her non-traditional and manufactured goods. Even some of the traditional items being exported by India are faced with a threat and challenge since some of the EEC countries have set up units to produce jute goods, textiles, coir goods, etc. Further since the primary goods being imported into France from the African countries enjoy duty-free imports, our traditional exports are faced with additional threat. Also, many Indian goods such as jute cloth bag, woollen hosiery, shoes, synthetic fibres, articles made of coir fibres and onions are subject to quota restrictions. It is true that as a result of the efforts made by the Indo-French Economic Commission, some restrictions have been removed. However, many items continue to be subject to restrictions and import tariffs.

The French economic mission during its recent visit has, however, identified areas where close economic co-operation can be fostered between the two countries. It has suggested, among other things, Indo-French manufacturing firms utilising designs developed by the French technologists. Joint exports to third countries (mainly industrial machinery) in which labour intensive components could be produced in India to French design and sophisticated components in France and the assembly of the complete plant in the third countries and export of French know-how to India has also been suggested.

According to Mr R.P. Goenka, President of the Indian Chamber of Commerce, industrial machinery manu-

FINANCIAL & TECHNICAL COLLABORATION AVAILABLE FROM EUROPE FOR INTERESTING INDUSTRIAL PROJECTS REQUIRING UPTO DOLLARS 5 MILLION IN NON-RUPEE CURRENCIES. PREFERENCE GIVEN TO:

1. ALREADY APPROVED SCHEMES OR SUCH PROJECTS WHICH WILL ATTRACT QUICK GOVERNMENTAL APPROVALS;
2. PARTIES WHOSE FINANCIAL STANDING & RESOURCES MATCH THE CONTRIBUTION REQUIRED IN FOREIGN EXCHANGE.

# ITC/ILTD help the farmer

India Tobacco Company Limited and its sister organisation and tobacco supplier, Indian Leaf Tobacco Development Company Limited, pioneered the cultivation of Flue Cured Virginia tobacco in 1920 resulting in self-sufficiency in the basic raw material for cigarette manufacture—a permanent and perpetual contribution to the self-reliance of the country's economy. And, of course, FCV tobaccos are also a major export item.

Demonstrating the use of the latest cultural practices, developing pesticides, innovating new crop strains, providing pure seeds and tailor-made fertilisers on credit, granting interest-free cash loans—this is the kind of practical help that ILTD's research establishment, manned by highly qualified agronomists and scientists, extends to the tobacco farmer.

Beyond today, ILTD helps prepare for the future—by engaging in extension farming and imparting scientific skills in Flue Cured Virginia tobacco cultivation through their Training School at Hunsur (Mysore) to its own employees as well as to Government personnel.

These steps ultimately benefit the 240,000 village folk who live on tobacco farms and who are the constant and collective concern of ILTD and ITC.

**India Tobacco Company Ltd.**

facturers in India — especially those who produce sugar and cement plants — are asked to indicate to the French side the type of components that could be supplied to them so that when the French side quote for turn-key jobs in the third countries, they could keep the items that India can supply very much in mind.

All this certainly promises to give a boost to India's export of non-traditional goods. India should, therefore, strive hard to explore ways and means to realise these objectives by giving practical shape to the suggestions and discussions carried out during the French economic mission's visit. Here, it is necessary to remind both the Government of India and the industry about the complaints voiced by the French delegation that manufacturers in the EEC countries do not know what India could export by way of plant and machinery and processed products.

#### Important Point

According to the French mission, many in western Europe are ignorant about India's ability to export machinery and equipment. The leader of the French economic mission also referred to the existence of intermediaries who tended to inhibit wider trade contacts between India and France directly. This is an important point which should engage India's attention. While increase in the tempo of industrial activity in India would lead to higher imports from France, we should make a concerted effort to export several non-traditional goods to France. Such items as bicycles, automobile ancillaries, electrodes, dry batteries, forgings, castings, electric lamps etc. have a good market in France and we should tap it.

Since the French mission has referred to the ignorance in many parts of the western Europe about India's ability to supply machinery and equipment, efforts should be made to project India as an industrially advancing nation with ability to supply a variety of industrial goods and raw materials and in certain cases technical know-how also. In fact, projecting such an image should form part of India's overall export strategy and publicity.

The French team also complained about India's "stringent payment terms." France, for instance, buys technology from the USA and pays, in several cases, a royalty of even 10 per cent tax-free. But people in India do not want to pay more than five per cent and half of the payment goes in taxes. This is discouraging many French firms to sell know-how to India. It is necessary that as a part of vigorous efforts to

foster close and intensive economic relations with France, India displays a flexible attitude on these issues. The French mission has stated that a few link-ups between Indian and French industrialists would not suffice in the creation of enduring economic ties. The mission called for trade and industrial pacts with clauses protecting long-term interests of both countries.

On its part, France can relax restrictions on the import of Indian goods and also simplify French import licensing system which is said to be very cumbersome and complex. At a time when both the countries are sincerely and anxiously searching for new areas to intensify and diversify their trade and economic relations, a flexible and conciliatory attitude on both sides will help to realise the objectives better.

France's interest in India's economic transformation has been very generous. Between 1961 and 1969, aid by France which joined Aid India Consortium in March 1961 totalled Rs 131 crores of which Rs 73 crores has been utilised. Public sector projects which have installed machinery purchased out of the French credits include Khetri Copper Project in Rajasthan, the Sharvathi Hydro-Electric Project in Mysore, Parambikulam Aliyar Hydro-Electric Scheme in Tamil Nadu, Hindustan Ma-

chine Tools factories and Hindustan Zinc for the Zawar mines in Rajasthan. Thermal power in Nasik (Maharashtra), the Oil and Natural Gas Commission, Indian Railways and IAC also received French assistance. In India's private sector, between 1957 and 1969 as many as 138 joint ventures with entrepreneurs from France have been set up. Of these, 129 involved only technical collaboration and the remaining financial collaboration. These industrial enterprises produce a variety of items like machine tools, electrical equipments, transport equipments, chemicals, pharmaceuticals, metal and metal products, etc. The French are also helping India to put up a fast breeder reactor at Kalpakkam, and coking coal mines for the NCDC and TISCO. The French also has expressed their readiness to associate with India's small car project and plans have already been submitted.

Thus, in India's economic transformation, France has been playing a notable part which has helped this country to accelerate her programme for industrialisation in many directions. The visit of the economic mission and the fruitful discussions it has had with the Indian government and the industrialists should lead to purposeful economic and trade relations between the two countries.

## TIT: A Glorious Record

A CORRESPONDENT

THE SILVER Jubilee celebration recently of the Technological Institute of Textiles (TIT) at Bhivani highlighted the significant contribution made by this institution over the years. For instance, the institute has established a distinctive record of training versatile pupils who hold as many as 25 per cent of all the important positions in various institutions and technical bodies related to textile technology and trade. Besides being managers, consultants, superintendents, spinning masters, weaving masters, sales executives, purchasers in the textile mills, the graduates of this institution hold vital positions in research organisations such as ATIRA, BTRA, SITRA, SASMIRA and government offices such as the Textile Commissioner's Office, directorates of industries, controllers of export and import, finance corporations, small-scale industries institutes and corporations and export promotion councils. They have also occupied positions on various committees constituted to advise the government and the industry.

The institute was founded by Mr G.D.

Birla, who felt the need for personnel trained in textile technology to man the textile industry in this country. This institute was, consequently, established at Bhivani in 1943 under the auspices of Birla Education Trust. The founder of the institute also realised that even best theoretical training divorced from proper industrial atmosphere would be incomplete. A full-fledged textile mill was, therefore, attached to the institute where practical training was imparted along with the courses of study. In this manner the pupils got proper feel of the practical problems involved in the textile industry. In this context Mr M.D. Dlamia, Chairman, Managing Committee of the Institute, rightly stressed that students acquire confidence after having worked in a mill during their period of theoretical training.

Students from all the classes are attached to specific sections of the mill where they work during regular hours along with their professors. Thereby they acquire working knowledge of a fully competent spinning and weaving master. Starting from the job of an

Eiffel Tower, Paris.

## Speed away to the splendours of Europe on the wings of reliable KLM

The best of 50 years of experience is at your service when you fly KLM. The Super DC-8 jets operated by KLM from India are fitted with ultra-modern equipment and offer you the most relaxing way to travel. The service on board has still the same personalised touch which makes so many world travellers fly KLM again and again.

#### Direct flights from India

KLM offers direct flights to Europe from Calcutta and Delhi. And from Bombay too, in co-operation with its pool partners, Garuda Indonesian Airways.

#### Daily flights from Amsterdam

KLM and its pool partners run several flights daily from Amsterdam to a number of cities in Europe like Rome, to 15th March 1971. Some of the new attractive features added this year are: free full-day Grand Holland tour and a day to the UK! Remember, 50% discount on the third

KLM's network in Europe covers as many as 44 cities!

#### "Day-on-the-House" in Amsterdam

This year too, the Amsterdam Tourist Office offers inter-continental passengers using Amsterdam as first or final stop in Europe, the popular "Day-on-the-House" facility, valid from 15th October 1970 to 15th March 1971. Some of the new attractive features added this year are: free full-day Grand Holland tour and a day to the UK! Remember, 50% discount on the third

night's stay in a hotel. Ask your Travel Agent for details about 19 other free surprises.

#### Your Travel Agent — A Travel Expert

He will tell you all about KLM's multistopover plan and other KLM facilities. Get in touch with him or contact the nearest KLM office in Calcutta, Delhi, Bombay or Madras. Or any of KLM's General Sales Agents in Ahmedabad, Goa, Indore and Madras.

ROYAL DUTCH AIRLINES

# For some people there's no cotton shortage.

People who are conspicuous by what they are not wearing, may not be affected by the cotton shortage. That leaves only about 550 million who are affected!

Is the much-talked-about cotton shortage fact or fiction? Here's the naked truth:

India's cotton production has remained stagnant for the past 5 years, but not the population. This year's crop is expected to be only about 55-57 lakh bales. The requirement is 70 lakh bales (at a

per capita consumption among the lowest in the world). Shortage is now an indisputable fact that must inevitably create an impact on a basic necessity of life.

What is the choice? If the mills are to work full steam, the gap should be filled by a time-bound import programme. Otherwise the machines have to go idle, either by a planned cut in consumption or by sporadic and large-scale closure of some 50 to 100 mills—leading to unemployment and misery all round.

The Indian cotton mill industry is all for the cotton growers getting good returns on their outlay and labour. This is better achieved by more carts of cotton per hectare than by more price per cart. This will also help us maintain our impressive export performance, instead of virtually wiping out Rs.120 crores in foreign exchange earnings. Which must happen if prices spiral.

Unless we are willing to go back to nature, let's make short work of the cotton shortage now.

**INDIAN COTTON MILLS' FEDERATION**

P O Box No 1449, Bombay 1.

ordinary worker, they go through various stages of textile manufacture such as spinning, weaving, dyeing, bleaching, printing and finishing. While in the mill they develop faculties of controlling and maintaining proper working conditions with complete understanding of human psychology. They also acquire proper insight into the complicated processes of organisation, production planning, quality control, cost control, wage incentives and merit ratings.

The institute has continuously exhibited splendid dynamism and has expanded its areas of activity. Presently it is proposing to introduce post-graduate classes in Textile Technology, M.Sc (Textiles), which has already been approved by the Punjab University. The managing committee of the institute has also decided to introduce a specialised course in Textile Chemistry, because there is appreciable demand for such chemists in the industry. In order to keep the students informed of latest developments and research taking place in the field of textiles, the institute has also continued to help keep the laboratories and the mills up to date with the latest technology. The textile mill has 33,124 spindles and 644 looms and is equipped with metallic cards, high speed draw frames, simplex, combers, ring frames

with modern high-draft systems, Schloforst pirn winders, Barber-Colman spooler and warper, automatic looms, calenders, jiggers, cheese and beam dyeing plant, mercerization plant, singeing, raising and roller printing machines screen printing section and hot-air stenters with beat-setting arrangements.

The institute has also been furnished with a workshop of modern design built in 1962 to provide advanced specialised training for the students. Latest machinery for spinning, weaving, dyeing, bleaching and printing incorporating recent developments in machine design and automatic controls, have been installed there at a cost of over Rs 12 lakhs. Among other equipments, the workshop contains a complete Truetzschler blow room line with automatic doffing, combing plant, different drafting systems on ring frame, weaving preparatory machines and automatic looms. The workshop has been provided with two humidification units so as to maintain the desired atmospheric conditions for carrying out experiments in spinning, weaving and other departments.

The institute has also earned the gratitude of the textile industry by carrying out research on problems faced by the industry in this country. Broad subjects on which research has been con-

ducted at the institute include assessing the length of the fibre, its strength, weight per inch, trash contents, maturity count, ginning, neppiness, micrograms per inch, testing of laps for irregularity, determination of card or drawing hanks slivers, hand rovings, and counts of yarn and its strength, evenness and twist, determination of ballistic rupture and bursting strength and the strength of the cloth in warp and weft way, study of characteristics of different textile fabrics analysis of mixtures, qualitative and quantitative, examination of cloth threads per inch, causes of various defects in the manufacturing of fabrics, investigation of various problems arising out of working of the textile mills, time and motion study, testing the quality of different types of cotton in order to produce the most economical mixings, study of all problems — mechanical, chemical or otherwise — relating to machine and labour efficiency and material economy, different types of blends, different types of novelty yarn, different types of weaves and patterns, and different types of shades.

It is hoped that the institute with its glorious record of over a quarter of a century will pursue its path of progress and will soon become a model for many more similar institutions in other manufacturing trades.

## RECORDS AND STATISTICS

*A Quarterly Bulletin of "Eastern Economist", this publication surveys important developments in each quarter in the various fields of the national economy as well as in the world economy, organizes its material in a convenient form and illustrates it with diagrams, graphs and charts. Its features are a business roundup, an analysis of markets and an investment supplement.*

*The Bulletin averages 64 pages and is priced at Rs 4 per copy. The annual subscription is Rs 16.*

*Inquiries regarding subscription and advertisements may be addressed to:*

Post Box No. 34,  
New Delhi-1.

## WINDOW ON THE WORLD

## Alarm Over US Trade Bill

E. B. BROOK

VIENNA:

It is more probable that the international squabble over protectionist policies is causing less of a flurry in the United States, which has attracted to itself — not a little unjustifiably — the role of principal offender, than in Europe. Compared to the degrees of indirect but very effective protection introduced by the Common Market in its agricultural support policies and the exclusive tariff-free trading in the EFTA group, the US proposal to give the President power to restrict imports of textiles is relatively straightforward.

The position in the United States over the Trade Bill is quite clear. President Nixon sent a bill to Congress proposing that it empower him to impose import quotas on textiles. The busy industrial lobbies in Congress managed to persuade the House to add other items, including footwear, to provide potential relief against imports for other domestic industries and tax relief for US exporters which the Administration not only never contemplated but regards as unacceptable. The bill is now being prepared in amended form for the Senate but is unlikely to be ready for debate and speculation is increasing that there will not be enough time before the end of this congressional session to complete the legislation. The Trade Bill will not, however, be allowed to die but several months are likely to pass in Senate-House conferences before an agreed text can be voted on and sent for presidential signature.

## Unwise Legislation

This pause gives time for the crescendo of protest from Europe and Japan to mount and, in the United States, an important Republican-Democrat group of senators has stressed what they regard as the unwisdom of legislation in quotas and tariffs by Congress this year. They fear the reality of a world trade war arising from retaliation to the proposed American measures and have expressed their "sincere belief that a trade barrier bill would cause grave harm to the farmer, would jeopardize employment in many of our most important and significant industries, would impose higher prices on the American consumer and would do irreparable harm to US foreign policy and to the future of trade

negotiations with our major trading partners."

The Senate group is much more alarmed than is Mr David Kennedy, the US Treasury Secretary now visiting Europe, who told me recently that he had personally met no threats of retaliation in Europe though, of course, no one liked another's tariffs, and though all states, despite the Kennedy Round and GATT, were obliged permanently to maintain some measure of protection in one form or another. To a question whether any form of protection was not a violation of the GATT policy of favoured nation treatment, Mr Kennedy said he would not like to get involved in an argument on GATT policies which he regarded as open to many interpretations.

The deepest alarm and annoyance over the US Trade Bill as amended by Congress has been expressed in Europe. Industrialists from every west European

Mr. Josselyn Hennessy's second article on "Inflation: A World Scourge" will appear in the "Eastern Economist" issue dated January 8, 1971.

country have officially informed the United States that if access to the US market should be blocked for an increasingly wide range of European products, balance-of-payments considerations would, among others, eventually compel west Europe's governments to react to restrictive US policies. The industrialists recommended using established institutions for consultations and conciliation rather than unilateral action in curbing trade and appealed for a continuation of the 25 years' work of trade liberalization in which the USA and west Europe have taken an outstanding share. They pointed out that the west European market was worth over 10 billion dollars to the USA last year, that its dividends earned in investments there totalled 850 million dollars and that the USA had a favourable trade balance with the area of some 50 million dollars. The implication is that these earnings are worth protecting as well as US industries.

The Common Market has gone further in the matter by setting up a group

of senior officials from the agricultural, industrial, finance and economics departments of its Commission to consider how the Market should react to the protectionist trend of legislation in the USA. While this group will pay particular attention to textiles and footwear, all types of possible reaction, from conciliation to retaliation, are being explored. Retaliation could evidently occur in areas other than direct trading. But the Market, like the industrialists, is more concerned to utilize all means of conciliation rather than even make any threats. If, as seems possible, an agreement can be reached between Japan and the United States on limiting imports of Japanese textiles to the USA it should be possible to find means of avoiding direct or even indirect retaliatory measures in the area of US-European trade. The Common Market may help to ease the US-Japanese problem by absorbing some of the Japanese textiles unable to enter the United States; this prospect is already causing concern among textile manufacturers in western Europe.

## Ultimate Danger

The threat of trade conflict is not, however, confined to the prospects of differences over the US Trade Bill, which the new US Congress will be unwilling to leave in peace. If the Common Market is expanded in this decade to include Britain and other applicants it would be a much more powerful body to impose restraints on the USA than it is now and Britain might be in a minority in advocating more liberal trade policies. The ultimate danger is that an enlarged Common Market would be regarded not only by the socialist group of states in east Europe as an economically hostile body but that the United States, Canada, Japan and others might feel it necessary to form their own trading bloc or to impose tariffs and quantitative restrictions.

The present mood is uncomfortably to exchange accusations over protectionist tendencies threatening world trade, the more cautionary advice to use conciliation being an indication of nervousness over a possible trade war as much as a desire to be reasonable. As the later stages in implementing the Kennedy Round decisions are put into force by its signatories the trend is beginning to run strongly the other way and GATT regarded as a vague counsel of perfection. There is a real risk of economic regionalism increasing in Europe and elsewhere, a risk that would be best checked not by integration of groups, which could increase it, but by an increased concentration on global free trade that seems, at the moment, to be regrettably far from most government's thoughts.

## The moving finger writes

WRITING THESE lines on the penultimate day of the session of Parliament which ended last week, I was struck by two kinds of intense activity, one physical and the other verbal, among the Members of Parliament. The former consisted mainly of last-minute purchases of such bargains as the ghee and other dairy products retailed by the Delhi Milk Scheme in Parliament House for the convenience of our legislators and subsidised packets of superior qualities of tea also similarly made available for these privileged buyers. The second, or verbal kind of activity to which I have alluded was, of course, talking about a mid-term election. With this Lok Sabha having already existed for nearly four years, the phrase mid-term election is obviously becoming less and less appropriate as the days pass. But our legislators are not known for being particular about precision of language and it is therefore next to impossible to stop them from talking about a "mid-term" election.

It may be assumed perhaps that the Prime Minister has the prerogative of choosing the date for the dissolution of Parliament for an appeal to the electorate. Mrs Gandhi may be expected to fix a date which, in her view, would serve her and her party's interests best. Granted this, it seems to me that it is not going to help her very much if a general election is to be held sooner rather than later. The country is in a sorry mess. West Bengal is battling with Naxalite (or perhaps a larger political) terrorism. In Kerala, similar violence, although less continuous, is still terrifying enough when it erupts. Industrial peace is being regularly violated all over the country. Prices are rising without the justification even of intensified investment in development. Unemployment is becoming more and more acute.

In the normal course, all these circumstances and strains to which the public is being subjected must tend to work against the party in power. It would no doubt make a difference to this if the people have reason to believe that, given a clear mandate, this party would be able to do better. As it is, there is no ground for such hope. In spite of the untutored enthusiasm which large sections of the public did have for the nationalisation of banks, more and more men and women in our country are coming to feel that Mrs Gandhi's party has no realistic or effective programme

for restoring economic health to nation. Even greater scepticism is coming to be entertained about this party's ability to cope with the forces of political disorder and instability.

In the circumstances, the Prime Minister and her party may hardly benefit from courting a general election earlier than when it is normally due and cannot therefore be postponed further. That shrewd politician, Mr Jagjivan Ram, seems to appreciate all this only too well and his influence may be expected to be thrown in favour of the evil day of a general election being postponed for as long as possible. It must of course be clearly understood that I do not believe that Mrs Gandhi's party will be better placed to fight a general election for the Lok Sabha in February 1972 than in, say, March 1971. All that I am saying is that a date in March 1971 or in any other month between then and February 1972 is not going to be particularly useful to her, which suggests that without any disadvantage to herself and her party, the Prime Minister could well allow the present members of the Lok Sabha to enjoy their membership and its attendant benefits for the full term.

From the point of view of the Opposition parties, again, a general election for the Lok Sabha earlier than its due time may not have much positive advantage. The official Congress party, for instance, clearly needs time to get a grip on itself. To the extent that it has boldly decided to participate in the formation of a grand alliance of all democratic parties in the country against a possible coalition of the Prime Minister's party with some of the leftist forces, it has certainly taken a great step forward towards clarifying its thinking and consolidating its strategy. But, at the same time, and for this very reason it has had to face desertions from its ranks. As a result, there is some risk of its being considerably weakened in Gujarat, which is one of its major power bases. It seems to me that its leaders will need time to tide over this internal crisis and rally their ranks especially for fighting a general election of the Lok Sabha.

As for other Opposition parties, the SSP and the PSP are in a state of schizophrenia. It is doubtful that they will long continue as distinct political entities of significance. Perhaps the Jana Sangh and the Swatantra Party may

derive some marginal advantage from a general election coming sooner rather than later, this is because they stand to benefit most from the public's disillusionment with Mrs Gandhi's politics. As for the CPI, the balance of advantage may be substantially in its favour if an election is held sooner rather than later. This is on the assumption that it has a certain bargaining power where Mrs Gandhi's party is concerned. As for that other party on the left, viz., the CPM, it should make little difference when exactly the next general election is held. I expect its strength to undergo a very considerable diminution in a new Parliament in all circumstances.

Finally, there are the state level parties. The DMK has every reason not to want a general election for the Lok Sabha before its time. This is for the simple reason that while it cannot win more seats than it already has in the present Lok Sabha, it may well lose quite a few. As for the Bangla Congress, it, like other political parties in West Bengal, must realise that it will not be able to electioneer freely in the prevailing circumstances in the state. In Uttar Pradesh, the BKD may perhaps welcome an early opportunity of testing its strength in an election to Parliament as a reassurance to itself after its recent traumatic experiences.

From the point of view of the nation, a general election for the Lok Sabha is certainly not of the highest priority. There are other and more urgent tasks demanding attention. The restoration of law and order in West Bengal and discipline in industry in different parts of the country, and the formulation of measures for stimulating the economy through increased investment and production so that prices may be better regulated and employment opportunities increased are and must be matters of more immediate concern for the country and its government. It is idle to believe in the present political circumstances that a general election for the Lok Sabha will help to give the country a chance of being governed more purposefully than is the case at present. On the contrary, the chances are that the next general election may usher in a period of even greater disequilibrium at the centre. It follows that the country need not go out of its way to hold this election a day sooner than it has to be held.

V. B.

## Trade Winds

### **GUIDELINES FOR BANKS**

THE RESERVE Bank has formulated a set of guidelines for commercial banks for financing agricultural development. These have been prepared on the basis of a study of the methodology of operations, policy and procedure adopted by some of the nationalised and other commercial banks involved in agricultural financing made by the Reserve Bank's credit planning cell. Dr R.K. Hazari, Deputy Governor of the Reserve Bank, in a letter to the public sector banks forwarding the guidelines, has emphasised that while meeting the requirements, the efforts of the banks should always be (a) to improve the quality of loaning; (b) to move into the agriculturally less developed areas, moving away from security oriented lending to purposive, productive and incremental income-oriented lending and financing small and potentially viable farmers; (c) to help borrowers to move on to a higher technological plane, and (d) to funnel back into the banking system surpluses, accruing to the borrowers or from others residing in the area.

### **STEEL IMPORTS**

Arrangements are being made for bulk import of steel billets for supply to re-rollers in order to step up the production of bars and rods required mostly for house-building. These supplies will be in addition to bulk import of other categories of steel by Hindustan Steel Limited, already under way. This was stated by Mr B. R. Bhagat, Minister of Steel and Heavy Engineering, at the meeting of the Consultative Committee of Members of Parliament for the ministry, held recently. He said that the present steel supply situation was "tight" and the government proposed to meet it by pursuing a rational and equitable distribution system with emphasis on direct supply to the actual users.

Replying to points made by Mr Shiv Chandrika Prasad (Cong) and Mr K.P. Mallikarjunudu (Cong-O) who called for all-round improvement in the distribution machinery and quicker disposal of indents, Mr Bhagat said that government proposed to establish regional offices under the Controller of Iron and Steel to exercise effective check over the stock-yards as well as consumers in the various zones to put an end to unauthorised transactions. It was intended to have a system of comprehensive checks and deterrent action.

For speedier disposal of indents, the work at the Joint Plant Committee was being computerised.

About imports, Mr Bhagat and the Deputy Minister, Mr Mohd. Shafi Qureshi, assured the committee that large quantities of scarce items like plates, sheets and tin-plates were being imported through HSL for distribution to priority consumers, export-oriented industries and the small-scale sector. In addition, considerable quantities of sheets, plates, coils etc. were being imported against export of pig iron worth over Rs 5 crores to Japan.

### **I.D.A. LOAN**

The international Development Association (IDA) has announced a \$24.4 million loan to help farmers of Andhra Pradesh. The loan, part of the IDA's continuing programme to assist this country in expanding credit facilities to farmers, will provide for agriculture credit programme, minor irrigation and levelling and farm mechanisation efforts. The loan is for a period of 50 years including a ten-year grace period. It will be interest-free but will carry a service charge of 0.75 per cent.

### **EXPORT OF EXCAVATOR**

Tata Engineering and Locomotive Co. has shipped an excavator to West Germany, the first earth-moving machine from Telco's Jamshedpur works. This export order was secured against stiff international competition. The company has already exported goods worth one crore rupees to Ceylon, Yugoslavia, Rumania and Holland. It is trying to build up a market for Tata products in Asian, European and South American countries.

### **SUGAR EXPORTS**

This country is exporting about 329,000 tonnes of sugar in 1970 against 94,000 tonnes in 1969. Out of this, about 95,000 tonnes (representing the US and other quotas) are being exported to the preferential markets of the US and the UK respectively, under the provisions of the Sugar Export Promotion Act 1959 and the loss thereon will be met by the sugar industry. Another 50,000 tonnes are being exported to Canada by the State Trading Corporation, which will meet the loss by the import of certain scarce items. The balance quantity is being exported to Ceylon, Malaysia, Singapore, Saigon,

Indonesia and some Persian Gulf countries on government account and the loss thereon will be met from central revenues. The industry has, however, agreed to bear the handling expenses on this quantity. The shipment of over 280,000 tonnes has been completed and the balance is likely to be completed by the end of December 1970. This information was given by Mr A.P. Shinde, Minister of State for Food and Agriculture, recently.

### **HINDUSTAN STEEL**

During the year ended March 31, 1970 no contribution was made by the government towards the share capital of the Hindustan Steel Ltd which remained at Rs 557 crores. No loans were also advanced. On the other hand, the company started repayment of its long-term borrowings. An amount of Rs 32.35 crores was repaid to the government bringing down the loan amount from Rs 534.5 crores at the beginning of the year to Rs 502.2 crores as at the end of the year. No government funds were proposed to be released during the year 1970-71 and the entire capital expenditure during this year would be met by the company out of its internal resources. The company has further repaid an amount of Rs 25.5 crores during 1970-71 against its capital borrowings till November, 1970.

The gross surplus secured by the company after meeting all expenditure, but exclusive of the provision for depreciation and interest, amounted to Rs 82.8 crores as against Rs 47 crores in 1968-69. However, after making provision of Rs 29.5 crores for interest and Rs 64.7 crores for depreciation and taking into account adjustments for earlier periods, the company sustained a net loss of Rs 10.47 crores as against a loss of Rs 39.91 crores in the preceding year. The working results of the various units during 1968-69 and 1969-70 were as under:

|                            | (Rs lakhs) |         |
|----------------------------|------------|---------|
|                            | 1968-69    | 1969-70 |
| Rourkela Steel Plant       | (-)397     | (-)783  |
| Bhilai Steel Plant         | (-)1135    | (+)364  |
| Durgapur Steel Plant       | (-)1737    | (-)1550 |
| Fertilizer Plant, Rourkela | (-)111     | (-)168  |
| Alloy Steels Plant         | (-)682     | (-)577  |
| Coal Washeries             | (-)60      | (-)37   |
| Adjustments                | (-)11      | (+)63   |
| Total                      | (-)3391    | (-)1047 |

Cumulative loss of the company from its inception up to March 31, 1970, came to Rs 172.83 crores.

There was improvement in production

during the year under review. The output of hot metal was 4.493 million tonnes, of steel ingot 3.781 million tonnes, of saleable pig iron 1.138 million tonnes and of saleable steel 2.785 tonnes. Production at the Alloy Steels Plant was 65,600 tonnes in terms of ingot and 41,100 tonnes of forged and rolled saleable steel. The production of calcium ammonium nitrate (25%N) at Rourkela Fertilizer Plant, however, fell from 1,93,400 tonnes in 1968-69 to 1,19,800 tonnes during the year under review. This was mainly due to the explosion in the Naphtha Reforming Plant in May, 1969. Despatches from the three main plants during 1969-70 were also higher by 3.0 per cent in the case of saleable steel and by 0.8 per cent in the case of pig iron. Despatches of finished steel from Alloy Steels Plant rose to 35,700 tonnes during the year as compared to 16,400 tonnes in the previous year, representing an increase of 115 per cent.

### **INDIAN STANDARDS INSTITUTION**

A new division of the Indian Standards Institution dealing with the work of standardization in marine engineering, cargo movement and packaging, namely, 'Marine, Cargo Movement and Packaging Division' was inaugurated recently by Mr K. Raghu Ramaiah, union Minister for Parliamentary Affairs, Shipping & Transport. This is the ninth division which the Institution is forming based on the necessity of growing shipping and shipbuilding industry as well as to cater for the new transport technology.

### **CASHEW EXPORTS**

This country has earned over Rs 52 crores through the export of cashew kernels and cashew-nut shell liquid during January to November, 1970. Exports of cashew kernels during this period amounted to 50,210 tonnes valued at Rs 51.6 crores. The USA and the USSR who were the main buyers, together accounted for nearly 80 per cent of the total cashew exports. Exports during the same period of last year amounted to 58,920 tonnes valued at Rs 54.97 crores.

### **INDIAN AIRLINES**

Indian Airlines recorded a net profit of Rs 2.28 crores in 1969-70, according to the annual report. This has been achieved on account of improved load factors, which averaged 77 per cent in 1969-70, the highest achieved during the last decade as well as better and rational utilisation of all resources of the corporation. The increase in fares, which came into effect from November 1969 also contributed to this rise in revenue by one crore rupees. The report shows that the airline carried 2.25 million passengers in 1969-70 as against

1.96 million in 1968-69, an increase of 14.8 per cent. The foreign exchange earnings of the airlines during the year under review amounted to Rs 8.50 crores as against Rs 7.61 crores in 1968-69. The outgo of foreign exchange on revenue account was Rs 4.15 crores in 1969-70 as against Rs 3.99 crores in 1968-69, giving a net foreign exchange earning of Rs 4.35 crores in 1969-70 compared to Rs 3.62 crores in 1968-69. The revenue maintained a steady rising trend during the year 1969-70, the total revenue amounting to Rs 47.12 crores as against Rs 40.40 crores in 1968-69, while the expenditure for the year increased from Rs 38.74 crores in 1968-69 to Rs 44.84 crores in 1969-70, an increase of 16 per cent. This increase is due to rise in expenditure under "Pay and Allowances, Fuel & Oil and Depreciation."

The report states that the operating revenue per available tonne kilometre (ATKm) has shown an increase from Rs 1.93 in 1968-69 to Rs 2.06 per ATKm during 1969-70 and the operating expenses per ATKm also rose from Rs 1.76 per ATKm in 1968-69 to Rs 1.90 per ATKm in 1969-70. Indian Airlines had placed an order with HAL for 10 more HS-748 aircraft, five are expected to be delivered during 1971-72 and the rest in 1972-73. During the year 1969-70, the airlines faced two major strikes by the pilots and by the employees belonging to the Airlines Corporations Employees' Union (ACEU). The total number of man-days lost during the year due to work stoppage was 15,302 as against 52 during 1968-69.

### **PROFESSIONALS IN TOURISM**

The need for building a cadre of professionals in Tourism was stressed recently by Dr Karan Singh, Minister for Tourism and Civil Aviation. "Tourism was a highly sophisticated and complex consumer oriented industry requiring careful handling, he said.

The minister announced that a tourist training institute would set up soon by the Ministry of Tourism and Civil Aviation to train young people in the various aspects of tourist industry. Dr Karan Singh was inaugurating a two-day seminar on Tourism Management, ment, organised by the All India Management Association, for working out an integrated plan to manage tourism in the context of its new role in the country's economy. The growing affluence in various parts of the world and the revolution in aviation technology, Dr Karan Singh said, would bring about an unprecedented and massive growth of international tourism in the 70's. "We must see that the country

takes maximum advantage of this growth by attracting more tourists", he said.

Dr. Karan Singh also underlined the need for proper analysis of feedback from the industry's consumers, the tourist, about their reactions and preferences. This required an efficient statistics service. A beginning, he said, had already been made in the ministry by setting up a cell.

He also suggested that we should gain from the experience of other countries which had promoted tourism. However, we must keep in mind to give an Indian orientation in presenting tourist attractions.

The allocations for tourism during the fourth Plan of Rs 34 crores (Rs 25 crores for the central sector and Rs 9 crores for the states), he said was not sufficient considering the awareness that had been created in the country recently about the economic benefits of this new industry.

### **NAMES IN THE NEWS**

Mr R. O. Jackson, Chief Executive of Burmah-Shell Oil Storage & Distribution Co of India Ltd has been elected President of the Bombay Chamber of Commerce & Industry for the year 1971-72. He will take office after the Chamber's annual general meeting in February 1971.

## Company Affairs

### SCINDIA STEAM

MR KRISHNARAJ M.D. Thakersey, Chairman, the Scindia Steam Navigation Company Ltd, told the shareholders at the annual general meeting held recently that ship operating costs had registered continuous rise. He pointed out that two items, namely fuel and and port charges, had shown substantial increase. He added that the price of fuel oil had increased by as much as 54 per cent on Indian coast, nearly 100 per cent on the coast of west Africa and by nearly 80 per cent in other areas since the beginning of 1970. Talking about the port charges, he said, ports all over the world had been repeatedly facing increasing demands from water front labour, while the average productivity had been falling in some of the major ports. In this respect, strikes had paralysed various ports for a considerable period leading to changes in ship schedules.

Mr Thakersey pointed out that the company had been trying to maintain an efficient fleet and, therefore, had placed an order for eight fast cargo motor ships of 13,500 DWT each with GDR ship builders. Out of these, three ships had already been delivered and one ship was proposed to be delivered shortly. The deliveries of the remaining ships were scheduled to be completed by July 1972. He also hoped that two cargo motor vessels of 16,200 DWT from West Germany would also be delivered during 1972.

Mr Thakersey quoted instances where delayed response from the government caused considerable hardships to the company. It was on account of the delay in getting government's approval for financial arrangements that the company failed to clinch a deal for the purchase of a secondhand bulk carrier of 57,000 DWT negotiated for \$ 6.25 million sometime back. In the meantime, prices of ships had risen and the shipowner was not prepared to sell the ship even at a price of \$ 9 million. In another case, the company placed an order for a bulk carrier of 54,000 DWT with Rheinstahl shipyard but the government's approval was delayed. In the meantime, the yard withdrew the offer and was asking for a higher price and offering delivery about a year later. These instances reveal that the government should take up such proposals from shipping companies a little

more seriously and take decisions expeditiously.

### INCHEK TYRES

As a result of deteriorating law and order situation in West Bengal, Inchek Tyres Limited has suffered a fall in production during the year ended June 30, 1970. The company's sales have dropped from Rs 12.82 crores to Rs 9.97 crores. The accounts reveal a loss of Rs 38.06 lakhs as against a net profit of Rs 56.53 lakhs for the preceding year. The directors are, therefore, compelled to skip dividends, both on the equity and preference shares for the year. In 1968-69, a dividend of six per cent was paid on the equity shares. Taking into account the balance brought forward from the preceding year, there is a net deficit of Rs 37.18 lakhs, which is carried forward to the next year. In regard to the expansion programme, the directors have stated that import licences for capital goods have been received but the provision thereof relating to export obligations is awaiting the final settlement with the government. Financial arrangements by way of loans and deferred payment guarantees from financial institutions are progressing. It is also stated that the allotment of additional shares against the right issue of Rs 46.80 lakhs new equity shares has been made in consultation with the Calcutta Stock Exchange. Arrangements have also been made for the redemption of the first series of 30,000 (9 per cent) redeemable cumulative shares of Rs 100 each on the respective due dates.

### PREMIER AUTOMOBILES

Premier Automobiles Ltd has achieved a turnover of Rs 14.86 crores during the first five months of this year against Rs 12.08 crores in the corresponding period of last year. Its sales during the year ended June 30, 1970 amounted to Rs 32.27 crores against Rs 30.32 crores in the previous year. Sales of trucks in the first five months of the current year are higher at 2,012 against 1,292 vehicles in the corresponding period of last year. Sales of cars have also increased from 5,129 to 5,179 while production of trucks has gone up from 1,305 in the first five months of 1969-70 to 2,094 in the corresponding period this year, that of cars has gone down slightly from 5,171 to 5,143. The company has introduced a new model "PST-260-165" vehicle, regular

production of which began in March 1970. It has sold 506 units till October 1970. Increased production of this vehicle is limited by the inadequate availability of the P6-354 engines. The chairman hoped that the government will take a helpful and prompt decision on the recommendations of the commission on car prices which are expected to be announced by the end of this year. He has attributed the unsatisfactory working of the company for 1969-70 to the unremunerative selling prices of cars and difficulties in raising the production.

### ASHOK LEYLAND

Ashok Leyland Ltd, has reported a rise in sales from Rs 29.11 crores to Rs 33.38 crores. The gross profit has risen by Rs 22.43 lakhs to Rs 2.88 crores. The directors propose to increase the equity dividend from nine per cent to 9.5 per cent. The improvement in the working results is a sequel to a record production and sale of 5,103 Comet passenger and goods vehicles during the year. The provision for depreciation has been raised from Rs 63.48 lakhs to Rs 69.39 lakhs and that for taxation from Rs 88 lakhs to Rs 106 lakhs. The allocation to development rebate reserve is only Rs 3.36 lakhs against Rs 17.21 lakhs. The net profit has gone up from Rs 96.63 lakhs to Rs 1.09 crores. The directors have allocated Rs 17 lakhs to the debenture redemption reserve. After providing Rs 73.99 lakhs for the proposed dividend a sum of Rs 18.48 lakhs has been transferred to general reserve. The company has made full preparations for the expansion of Comet production to increase its sales to 7,000 vehicles per annum. It is looking forward to the government's early approval to its expansion licence application.

### PAPER PRODUCTS

Paper Products Ltd has decided to revive the proposal to issue bonus shares in the ratio of one for every five shares held. The company has made a higher gross profit of Rs 23.77 lakhs during the year ended July 31, 1970 against Rs 15.20 lakhs in the previous year. The directors have declared an ordinary dividend of 12 per cent. Allocations include: depreciation Rs 13.26 lakhs, taxation Rs 3.30 lakhs, development rebate Rs 89,505 and general reserve Rs 7.16 lakhs. Sales have increased from Rs 3.48 crores to Rs 4.37 crores. The flexible packaging division of the company has recorded increased sales at Rs 3.37 crores as against Rs 2.58 crores. The growth is being maintained in the current year also with sales increasing by 17 per cent to Rs one crore in the first four months. The company has acquired a conversion plant at Nagpur which is in operation

since October last. Sales of the paper unit as Roha have been higher at Rs one crore but its working has been affected in the current year due to a major breakdown of the paper machine. The directors hope that after the replacement of the damaged parts and modification of the machine, production will improve during the remaining part of the year. The company's subsidiary, Premier Paper Mills Ltd, has also recorded a net profit of Rs 5.43 lakhs. With the transfer of a new machine from the parent company, which has already gone into production, sales are likely to increase substantially. Printpak Machinery Ltd, another subsidiary, revealed a net profit of Rs 59,754 for the year. Sanction of the government to a technical collaboration agreement with a Japanese firm for the manufacture of packaging machines is awaited.

### UTTAR PRADESH HOTELS

Uttar Pradesh Hotels and Restaurants Ltd, which owns hotel Clarks Shiraz in Agra, entered the capital market on December 21, with a public issue of Rs 26.0 lakhs — Rs 16.0 lakhs in equity shares of Rs 10 each and Rs 10 lakhs in 9.5 per cent preference share of Rs 100 each at par. The proceeds of the public issue will be utilised to meet a part of the finance required for setting up two fully air-conditioned five star hotels — one each at Lucknow and Jaipur — at an estimated cost of Rs two crores. Both the new luxury hotels will have rooms and suites along with a large shopping arcade, restaurants and bars, swimming pool and auditorium. Hotel Clarks Avadh in Lucknow is expected to be ready by the end of 1971, while the Hotel Clarks Amer at Jaipur will be ready by early 1972. The company has an authorised capital of Rs 1.20 crores. It is making a capital issue of Rs 42.5 lakhs — Rs 32.5 lakhs in equity shares and Rs 10 lakhs in preference shares. Of this, equity shares for Rs 16.5 lakhs have been reserved for directors, existing shareholders, and employees of the company. The balance of the issue will be offered for the public subscription. The entire public issue has been underwritten. The project cost of Rs two crores will be met from the capital issue of Rs 42.5 lakhs, a loan of Rs 1.20 crores from Hotel Development Loan Board and Rs 37.5 lakhs from short-term borrowing and internal resources. After the two new hotels start functioning, the company's sales will increase considerably. It is estimated that its turnover will increase from Rs 41 lakhs in 1968-69 to Rs 1.45 crores in 1971-72. Its pre-tax profit for 1971-72 is estimated at Rs 26.4 lakhs against Rs 7.84 lakhs for 1968-69. The company's sales in the first 10 months of the current year have amounted to Rs

44.60 lakhs and pre-tax profit about Rs 11.70 lakhs.

### KCP

The directors of the KCP limited, Madras, have proposed to maintain the dividend at 10 per cent for the year ended June 30, 1970. The company has earned a gross profit of Rs 184.92 lakhs against Rs 178.96 lakhs in the previous year. After providing for depreciation and managing agents' remuneration, the net profit amounts to Rs 86.92 lakhs against Rs 93.46 lakhs in the previous year. Adding thereto a sum of Rs 4.74 lakhs being transferred from development rebate reserve and Rs 1.39 lakhs being income not related to the year, there is a distributable surplus of Rs 93.59 lakhs. From this a sum of Rs 1.31 lakhs is provided for expenses not relating to this year, Rs 10 lakhs for development rebate reserve, Rs 43 lakhs for taxation, Rs 15,000 for gratuity reserve and Rs 25.41 lakhs to dividend reserve. General reserve gets Rs 10 lakhs.

Sales of the company during the year were around Rs 14.63 crores as against Rs 13.66 crores during the previous year. The sugar factory crushed sugarcane for 153 days and produced 39,921 tonnes at a recovery of 9.15 per cent as against 46,578 tonnes at a recovery of 8.97 per cent in the previous year. The directors pointed out that expansion of the factory has been completed. To improve the quality of confectionery, the factory was air-conditioned and an increased turnover was expected. The production at the cement plant during the year was 191,000 tonnes as against 174,000 tonnes in the previous year. The central workshop at Tiruvottiyur received several orders. The contracts that were entered into earlier for sugar factories and cement factories were either completed or nearing completion. The expansion of the workshop had also been completed.

### GARWARE NYLONS

Garware Nylons Ltd proposes to enter the capital market with a public issue of Rs 1.06 crores in equity shares of Rs 10 each. The proceeds of the proposed issue will be utilised for financing partly the expansion programme of the company. The company has an authorised capital of Rs 3 crores comprising 2,700,000 equity shares of Rs 10 each and 30,000 (9.3 per cent) cumulative redeemable preference shares of Rs 100 each. The issued, subscribed and fully paid-up capital is Rs 1.10 crores in equity shares. Originally known as Plastics Packing Pvt. Ltd, the name was changed to Garware Synthetics Bristles Pvt. Ltd in September 1969 and to Garware Nylons Pvt. Ltd in November 1969. It was

converted into a public limited company in September 1970. A plant was set up in 1961 at Pimpri (Poona) for the manufacture of nylon filament of 500 kg per day. The plant went into production in the beginning of 1962. The company was initially manufacturing nylon filament yarn for technical deniers required for fishing nets, parachute cords and other industrial applications. The nylon yarn manufacturing capacity was increased to 756 tonnes per annum in 1968. The company has been recently granted permission to increase its capacity to 2,000 tonnes per annum. It has been permitted to manufacture nylon chips suitable for plastic industry with an annual capacity of about 350 tonnes. It has also plans to install certain equipment for the manufacture of textured yarn.

### TATA-MERLIN

Mr Mansour Rouhani, Minister for Water and Power, Imperial Government of Iran visited the Thana Works of Tata-Merlin and Gerin Limited recently. He was accompanied by Mr S.H. Madani and Mr K. Magbool, Managing Director and General Director, respectively, of SATKAB Co., Ministry of Water & Power, Imperial Government of Iran. Tata-Merlin and Gerin Limited manufactures a wide range of electrical switchgear comprising isolating switches, current and potential transformers, railway interruptors, airbreak circuit breakers, air blast circuit breakers, switchboards, control panels and their variations in the low to extra high tension range.

### RATHI ALLOYS

Rathi Alloys & Steel Ltd will enter the capital market shortly with a public issue of 132,300 equity shares of Rs 10 and 9,000 (9.5 per cent) redeemable cumulative preference shares of Rs 100 each. The company has an authorised capital of Rs one crore and issued capital of Rs 36 lakhs of which shares worth Rs 13.77 lakhs have already been subscribed by promoters and their friends. The entire issue is fully underwritten. The total outlay for the project is estimated at Rs 85.50 lakhs which will be met by fresh capital of Rs 22.23 lakhs, subscribed capital Rs 13.77 lakhs, loan from the Industrial Finance Corporation Rs 39.50 and short-term borrowing Rs 10 lakhs. The company plans to put up a 10-ton electric arc furnace and a steel rolling mill to manufacture mild steel/alloy, steel ingots/billets and re-rolled sections viz., torsteel, free cutting steel, spring steel and other sophisticated items. The construction work of the factory at Ghaziabad has already commenced.

- Notes :**
1. A writ petition has been filed in the High Court of Delhi by The Punjab National Bank Ltd. and its three shareholders in November, 1970, claiming payment of ad-interim dividend of Rs. 24 lacs sanctioned by their Board of Directors on 16-7-1969; the said claim has not been acknowledged as debt and has not been included in the amount of Contingent Liabilities.
  2. The affairs of Lahore and Karachi Branches of the Bank have been in charge of the Custodian, Enemy Property, Pakistan. No Returns having been received from these branches, it has not been possible to compute the Profit and Loss Account and the unaudited Balance Sheets as at 30-6-1965 have been incorporated in the preparation of the accounts as on 31st December, 1969.

Annexure to our report of date.

## AUDITORS' REPORT

### The President of India:

We have audited the foregoing Balance Sheet of Punjab National Bank as on 31st December, 1969 and also the foregoing Profit & Loss Account of the Bank for the period 19th July, 1969 to the 31st December, 1969, in which are incorporated the returns of 7 branches audited by us, 297 branches audited by other auditors, and the unaudited returns in respect of 327 branches not visited by us, for the exclusion of which branches from audit, concurrence of the Reserve Bank of India was obtained.

2. The Balance Sheet and Profit & Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that—

- (a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank :
- (i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1969;
- (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account;
- (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
- (c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;
- (d) The returns received from the offices and branches of the Bank have been found adequate for the purpose of our audit.

DECEMBER 26, 1970.  
New Delhi.

## Foreign Monopoly In

# An Expose

By Golden Tobacco Company Private Limited

Shri Pratap Narsee

Extracts from the Statement by Shri PRATAP NARSEE, Managing Director, Golden Tobacco Company Private Limited at a Press Conference in New Delhi on September 14, 1970.

### GENTLEMEN,

I extend to you all a hearty welcome on my own behalf and on behalf of Golden Tobacco Company Private Ltd.

As you might know, the purpose of this Press Conference is to call the attention of the public and the Government to certain aspects of the Indian Cigarette Industry involving vital National issues.

Our Prime Minister, Mrs. Indira Gandhi, said in Lusaka two days ago that colonialism is far from a dead issue. She called for a relentless fight against colonialism in all its aspects.

What I am trying to do amounts to what Prime Minister has called for. We are fighting against a relic of the colonial era, a relic that threatens to engulf us from all sides.

Twenty-three years after independence we find the Indian cigarette industry dominated overwhelmingly and totally by a foreign Monopoly which like Kali Nag of our mythology has many heads but one body.

All I am seeking to do is to present the facts — and all the facts — and leave the final judgment to the wisdom of the Press, the people and the Government.

### IMPLEMENT POLICIES

At a Press Conference held on last August 3rd, I had, as Chairman of the Indian Cigarette Manufacturers' Association, called attention to the plight of indigenous cigarette manufacturers and pleaded for implementation of declared Government policies listed below:

1. The expected increase in demand for cigarettes will be met by 100% Indian-owned companies. The Minister of Industrial Development, Internal Trade and Company Affairs — Shri Fakhruddin Ali Ahmed — stated in Lok Sabha on 13th May 1969, "Government's policy is to encourage the production of cigarettes by Indian-owned firms to take care of the increased demand. Government is also encouraging the establishment of companies which are 100% Indian-owned. One such company has been given a letter of intent for setting up a factory in Gujarat State."

2. Under the provisions of the Monopolies and Restrictive

Trade Practices Act no further expansion will be permitted to any one group which is already a dominant/monopolistic undertaking.

3. The relaxation which had been sanctioned for over-production/diversification to the extent of 25% of installed capacity has been withdrawn in the case of big houses/foreign-owned firms by a notification, published in the Gazette of India Extraordinary, Part II, Section 3, sub-section (ii), dated the 18th July, 1970.

4. The foreign-owned monopoly has been producing far in excess of their installed capacity. This is in direct contravention of the Industries Development & Regulation Act and works to the great detriment of the indigenous sector which has 70% idle capacity. (ANNEXURE I).

### PEG PRODUCTION—PLUG LOOPHOLES

As you know there are loopholes in every policy, in letter as well as in spirit. This is evidenced by the increasing production of the foreign monopoly beyond its licensed capacity. To close such loopholes, I had pleaded for the pegging of the production of the foreign monopoly in the cigarette industry as was successfully done by the Government in the case of Match and Soap industries which resulted in the reduction of foreign monopoly's share of the match and soap market from 100% to 48% and 90% to 40% respectively in 17 years.

A similar measure in the case of cigarette industry will reduce the control of the foreign sector from 80% to 25% in 20 years. Present annual consumption is 60,000 million cigarettes. Share of Indian sector is only 12,000 million. With 5/7% increase every year the total production in 1990 will reach the figure of 1,92,000 million cigarettes. If production of foreign monopoly is pegged, their share will be 25% and remaining 75% will go to the wholly Indian-owned companies.

I had also pointed out that such a peg on the production of the foreign monopoly will also result in checking the increasing drain of foreign exchange — which goes up by 300% in every 10 years — as detailed in the ANNEXURE II.

These are simple and clear-cut demands for the implemen-

## Cigarette Industry In India

tation of the avowed policies of the Government. But if the Government in its wisdom were to decide to change the policies so as to enable the foreign monopoly to continue its preponderance in the Indian market I would forthwith withdraw the demands and abide by the changed policy.

My temerity in making the demands, however, has brought on me the wrath of the Patriarch of the foreign monopoly. As you know my pleadings were all made on behalf of the indigenous cigarette manufacturers who are fighting with their back to the wall.

### MONOPOLIST'S CHANGE OF HEART?

Mr. A.N. Haksar's agitation as Chairman, India Tobacco Co. Ltd. (formerly Imperial Tobacco) is the result of a bolt from the blue, the formation of the ICMA. He is panicky that the natives are getting restless and his citadel in India is under attack. After 60 years of merciless exploitation the ITC is discovering in itself an overflowing solicitude for the small entrepreneur who is being offered all manner of assistance. I welcome this change. But I still insist on pegging of the monopolist's production to ensure that the change of heart does not change again.

Yet Mr. Haksar, Chairman of India Tobacco Co., has chosen to pour venom on Golden Tobacco. I am therefore constrained to answer on behalf of Golden Tobacco as its Managing Director. I would like to counter some of the major points made by Mr. Haksar in his attack on us. A rebuttal of his charges will be released to the Press shortly.

### ITC IS A MONOPOLY

The Monopolies and Restrictive Trade Practices Act defines the monopoly as an undertaking which alone or together with another undertaking controls not less than 50% of the market. As per the 1970 Balance Sheet ITC had a total sale of Rs. 145 crores, which is 60% of the All-India sales of Rs. 250 crores. Over and above this, there is the inter-connected Vazir Sultan Tobacco Co.

### VAZIR SULTAN IS INTER-CONNECTED WITH ITC

There is considerable evidence that ITC and Vazir Sultan are inter-connected companies. They have common links with the British-American Tobacco Co. Ltd. of London, apart from inter-changeable management, common sales and purchase arrangements and foreign shareholdings by sister companies as detailed herein.

The question of inter-connection cannot be settled by obtaining opinion of jurists, however eminent, who are provided with only a partial picture, as Mr. Haksar has attempted to do.

A large portion of cigarette industry is controlled by American Tobacco Company in U.S.A. and Imperial Tobacco Company in U.K. These two giants have formed yet another powerful combine British American Tobacco Co. Ltd. which controls cigarette industry through their 150 factories spread in 55 countries in the world, except where the industry is nationalised.

The foreign shareholding in ITC & VST and its composition was given by the Minister for Industrial Develop-

ment in Lok Sabha on 13th May 1969 as under:

|                                          | (Rs. in lakhs) |
|------------------------------------------|----------------|
| 1. Imperial Tobacco Co. of India Ltd.    |                |
| Amount of equity capital                 | 1,516.00       |
| Non-resident shareholding is:            |                |
| Tobacco Manufacturers (India) Ltd., U.K. | 1,032.19       |
| Tobacco Investments Ltd., U.K.           | 330.11         |
| Carreras Ltd., U.K.                      | 53.70          |
| other non-resident shareholders          | 1.75           |
|                                          | 1,417.75       |
| Percentage of foreign holding            | 94% (approx.)  |
| 2. Vazir Sultan Tobacco Co. Ltd.         |                |
| Amount of equity capital as at 30-9-1965 | 100.00         |
| Non-resident shareholding is:            |                |
| Raleigh Investment Co. Ltd., U.K.        | 44.19          |
| Tobacco Manufacturers (India) Ltd., U.K. | 15.61          |
| Tobacco Investments Ltd., U.K.           | 4.99           |
| Carreras Ltd., U.K.                      | 0.81           |
| Other non-resident shareholders          | 2.12           |
|                                          | 67.72          |
| Percentage of foreign holding            | 67.72%         |

The above two companies had common chairman directors at one time or other all these years which included Mr. V. S. Coilett, Mr. B.K. Nehru, Mr. C.A. Bose, Mr. A. N. Haksar and Mr. S.D. Gupta. The services of their executives have also been interchangeable between the two companies.

The charge of inter-connection is supported overwhelmingly by opinions of some of the world's leading authorities on tobacco, apart from opinions of other jurists. One such opinion expressed by World Tobacco (the international magazine for tobacco industry) London, is

"There certainly is a connection between Vazir Sultan and BAT as BAT's own latest Annual Report dated September 30, 1969, indicates. It is there shown that 47% of Vazir Sultan's shares are effectively owned by BAT. I say 'effectively' because the link is indirect that part of the Vazir Sultan shares owned outside India being held by one or more holding companies in which BAT has a financial interest, though BAT does not apparently control 100%."

Likewise — and also indirectly through a holding company or holding companies in which, I would assume, there are at this time no non-BAT shareholders — ITC is connected with BAT. But there is not, so far as we can trace, any shareholding of ITC in Vazir Sultan, or vice versa. So, although ITC and Vazir Sultan are, so to speak, cousins having Aunt with BAT

# Mammoth, Multiple Threats of

they do not seem to be financially inter-connected and I have never heard it suggested that they were. There has in the past been co-operation between the two companies in technical matters; I do not know whether this persists."

## DRAIN ON FOREIGN EXCHANGE

The much publicised nett earnings of foreign exchange is a myth. Of Rs. 10 crores it has claimed as its annual foreign exchange earning only Rs. 2 lakhs was earned against cigarette exports whereas Rs. 9.98 crores was brought in by export of leaf tobacco by Indian Leaf Tobacco Development Co. Ltd., a branch of a 100% Sterling Company not even registered in India. In the light of this fact, it can never be denied that the ITC causes a drain of foreign exchange and this drain is increasing year by year.

## ITC SELLS BRANDS CLAIMING FOREIGN OWNERSHIP

Several of the brands manufactured by ITC are international. They have won Gold Medals and can be exported, provided the parent companies in U.K. and U.S.A. are willing and co-operative. This will enable the company to earn Rs. 25/30 crores a year in foreign exchange by diverting excess production to export.

ITC sells brands claiming foreign ownership such as Capstan Navy Cut, Scissors, Wills 99, Wills Navy Cut, Wills Filter King, Wills Gold Flake, Embassy, Passing Show, Gold Leaf, Bristol, Three Castles, Berkeley, Bears' Special, Windsor, Lex, Woodbine, etc.

## INDIGENOUS FACTORIES WIPED OUT

The ITC, citing a myth of viability, has stated that the Indian market could not have accommodated more than ten or so manufacturing units, taking 50 million cigarettes a month as the smallest economic operation. This patently absurd thesis has been trotted out in support of ITC's stand that it is just not true that 200 factories have closed down. An extensive list of the factories that were forced to wind up is given in ANNEXURE III. A separate list is also given of the companies that have been merged, amalgamated or bought over by the foreign monopoly.

The two oldest cigarette companies in India, older than ITC itself—D. Macropolo started in 1863 and Crown Tobacco started in 1900—each produces 6 to 12 million cigarettes per month. They are not only surviving but one of them, according to Mr. Haksar himself, "is doing extremely well". Consistency as a virtue is apparently not listed in Mr. Haksar's book.

## IDLE CAPACITY OF INDIGENOUS UNITS

Mr. Haksar has given a company-wise analysis of 7 Indian companies. The sum total of their performance, as depicted by Mr. Haksar himself, confirms that there is idle capacity in the indigenous sector to the extent of 10,000 to 12,000 million cigarettes. This is in contrast with the excess production of 8000 million cigarettes by the foreign monopoly.

## FOREIGN CAPITAL CONTROLS 80% OF INDIAN CIGARETTE MARKET

Mr. Haksar resorts to a jugglery of figures to disprove the contention that 80% of the Indian cigarette market is con-

rolled by substantially foreign-owned/controlled companies. But this is borne out by the statement made in the Lok Sabha on 11th August 1970 as reproduced in ANNEXURE IV.

## FOREIGN MONOPOLY OBSTRUCTS GROWTH OF INDIAN COMPANIES

Mr. Haksar remains silent about the hundreds of companies that have been rubbed out of existence and refers to the one per cent that has survived. He has failed to mention that these companies have survived and prospered in spite of the foreign monopoly and not because of it.

My appeals to the Government to create a favourable climate for the growth of the indigenous industry were largely made with the limping indigenous units in mind and to attract new entrepreneurs. It certainly was not for the benefit of Golden Tobacco.

## ITC OPENS PANDORA'S BOX

Mr. Haksar has boasted of ITC's contribution to the development and industrialisation of the country. This is a claim which not only belittles the Government but is also tantamount to an admission of the stranglehold ITC has acquired on the industry by vertical monopoly. The inter-connected or associate companies of ITC are as follows:

1. Indian Leaf Tobacco Development Co. Ltd., — tobacco buying and selling.
2. Molins India Ltd. — cigarette machinery manufacture.
3. Tribeni Tissues Ltd. — cigarette paper manufacture.

All these companies enjoy monopolistic hold in their respective fields and on the cigarette industry. Many of the activities of ILTD are harmful to the economy of the country. A case in point is the complaint lodged by Suvarna Tobacco Co., Guntur, to the Indian Tobacco Association on the exploitation by foreign monopoly of buying and selling of tobacco, as a result of which 725 merchant firms out of a total of 800 have been forced to close down in the last six years.

## ROYALTIES CAMOUFLAGED

Mr. Haksar has claimed that his company pays no royalty on trade marks or brands, or know-how charges either in rupees or foreign exchange. This is manifestly a falsehood as revealed by the ITC balance sheet. An amount of Rs. 4,90,34,487 has been capitalised for goodwill and trade marks on which the present annual drain of foreign exchange by way of dividend is Rs. 65 lakhs at the rate of 13%. This is over and above an equal amount which remains in reserve, rightly claimable by the goodwill holders.

## SHAREHOLDING—ITC v/s GTC

Much has been made of the fact that GTC has only 14 shareholders for the capital of Rs. 2.80 crores — or Rs. 20 lakhs each. This is like the pot calling the kettle black. The ITC's Rs. 14.16 crores is held by 3 major foreign shareholders, the largest holding being Rs. 10.32 crores.

## PROFIT AND SOCIAL RESPONSIBILITIES

The GTC has shown for the last 10 years a profit of 9.5% on turnover as against ITC's 6.4%. This works out to 50%

# the Foreign Monopoly

more than ITC. Considering the monopolistic hold of the company this figure is unbelievable. GTC of course does not have the blessings of willing and co-operative foreign shareholders/associates/sister companies to help it reduce the burden of taxes on profits by techniques such as buying tobacco at competitive prices.

From the standpoint of giving value to consumer, it is a proven fact that the consumer gets 5% more value for his money in GTC's brand than in the brands of ITC. Moreover, ITC's production has increased in the last two years — 1967 to 1969 — by less than 7% whereas their profits have shot up by 70%. Some consumer service and some social responsibility!

Similarly, the production of VST — ITC's Interconnected concern — went down in 1969 whereas profits went up by 50% and yet Mr. Haksar talks about social responsibility! GTC is averse to blowing its own trumpet. But in the circumstances I am to reveal that Rs. 50 lakhs worth of shares are in possession of a public charitable trust named after the founder of the Company. This 17% share-holding in GTC given ex gratia to the public compares favourably with 25% of the shares in ITC given to the Indian public at a premium of 30% and that too without any representation on the Board.

## SUBTLE METHOD OF VILIFICATION

It is distressing to note Mr. Haksar hedging many of his comments on vital aspects of the Cigarette Industry with the proviso, "To the best of my knowledge." I do not know whether this a general confession of ignorance or a subtle method of vilification.

I have endeavoured to deal as briefly as possible with the major points on which Mr. Haksar based his onslaught against us. Further details and comparisons are presented in the annexure on capital, production, profits, tax, management (ANNEXURE V) and the comparative contributions of the two companies given IN NUT SHELL. These details and comparisons are on public records.

I hope I have conveyed a true idea of the mammoth, multiple threats forced by the foreign monopoly to the indigenous cigarette manufacturers, tobacco growers, the trade and the consumers.

I would request you to satisfy yourself further as to the validity of the charges by making personal enquiries with people directly and indirectly engaged in the cigarette business.

Mr. Haksar has also stated that GTC's contribution to the national economy is insignificant. I do not wish to enter into polemics with him on this point. But GTC has in the cards one achievement of which I am sure Mr. Haksar will sit up and take note. That will be when I succeed — and succeed, I will — in putting an end to the era of continuous and unrestricted exploitation of the Indian market by the foreign monopoly. With your co-operation I am certain that this achievement will not be long in coming.

In the concluding part of his statement Mr. Haksar has avowed his intention to discharge his social responsibilities with devotion and duty. This is a declaration that gives us heart. If he really means it he could do a great service to

the country by exporting the excess cigarette production of the ITC and bringing in foreign exchange to the country.

I would also urge him to stop denying interconnection between ITC and VST and bring the operations of both the companies within the spirit and letter of the Monopolies Act. Knowing Mr. Haksar as I do, I feel that if ITC is to adapt itself to changing conditions it will have to be done during his Chairmanship. I wish him well.

## HIGH LEVEL PROBE URGED

I close the statement with fervent and urgent plea to the Government. Indigenous cigarette units are unable to hold their own against the gigantic foreign monopoly whose tentacles reach all over the industry and its ancillaries. The methods and the manoeuvres of the monopoly are not always discernible. The Government should immediately institute a high level probe into the affairs of the cigarette industry, particularly the working of the foreign monopoly. Only then will it be able to initiate the corrective policies that are so desperately required.

## IN NUTSHELL

ITC has summarised contributions of ITC and GTC to the National economy under several heads of activities. I must, therefore, correct ITC on all these points and place before you my views about the facts as they are. In fact such a summary of contributions should have been prepared by an impartial authority. I hope now we will demand a detailed investigation by a body of jurists, the Monopolies Commission, so that the truth will be placed before the public and the Government can take action unhesitatingly to implement their policies

| Activities and Contributions                     | Golden Tobacco  | India Tobacco    |

| 1969 | Companies mentioned at S. Nos. 1-9 shown against the year 1960 and International Tobacco Co., Ghaziabad.                                                                                                                                                                                                                                                                                                    | 59,714                          | —do—                                                                                                            | 46,131 77%                                                                       |

ANNEXURE V  
THE FOREIGN MONOPOLY

## Its Performance in Brief

1. Total assets of ITC have gone up as under:

| (Rs. lakhs) | 1955 | 1960 | 1965 | 1970 |
|-------------|------|------|------|------|
|             | 2264 | 2466 | 2668 | 4463 |

It is noteworthy that though ITC has not applied for or obtained an Industrial Licence for expansion its total assets have steadily soared. Apparently it has been increasing its production without necessary sanctions. This is a violation of the Industries (Development & Regulation) Act.

ITC's registered installed capacity stands at 18,360 million cigarettes a year. Yet their actual production—which has now touched over 30,000 million cigarettes a year—is far in excess of their registered Capacity. The Government would be well advised to investigate the matter and to compel the monopoly to earmark the production in excess of the licensed 18,360 million capacity for exports.

I do not see why IDR Act should not be enforced to bring down the monopoly of ITC. Similar monopolies in other fields were successfully brought under control even before the Monopolies and Restrictive Trade Practices Act, which came into effect only recently. Metal Box, Hindustan Lever, Western India Match Company, Associated Cement Companies are cases in point. The hold of those one-time monopolies has been brought down from 90/100% to 20/80%.

## 2. AND NOW WE PRESENT THE TRUE FACTS:

| Equity Capital       | Rs. Crores | %    | No. of shareholders |
|----------------------|------------|------|---------------------|
| Foreign shareholders | 14.16      | 74.7 | 3                   |
| Indian shareholders  | 4.79       | 25.3 | 21430               |

Out of foreign shareholding of Rs. 14.16 crores, a single foreign shareholder holds shares worth Rs. 10.31 crores i.e. 70%.

Average amount of shareholding per shareholder works out as under:—

|                         |                           |             |
|-------------------------|---------------------------|-------------|
| Foreign shareholder—Rs. | 14,16,00,000 ÷ 3 = Rs.    | 4,72,00,000 |
| Indian shareholders—Rs. | 4,79,00,000 ÷ 21430 = Rs. | 2,235       |

This is the pattern of equity holding in the India Tobacco Company—a pattern which the company describes as "public participation"—and about which it puts its back.

The break-up of the British shareholding was given by the Minister for Industrial Development, Internal Trade and Company Law Affairs on 13th May, 1969, on the floor of the Lok Sabha as follows:

|                                          |                  |
|------------------------------------------|------------------|
| Tobacco Manufacturers (India) Ltd., U.K. | Rs. 10,32,19,000 |
| Tobacco Investments Ltd., U.K.           | 3,36,17,000      |
| Carreras Ltd., U.K.                      | 53,78,000        |

The 21430 Indian shareholders have no representation on the Board which is made up wholly of nominees of the Group—three British shareholders.

The Golden Tobacco is constrained to bring these facts to the attention of the public... for recently its status as a private limited company with only 14 shareholders was ridiculed by the India Tobacco Company... in the course of which it of course overlooked some salient facts.

Taxes paid by Golden Tobacco have been 80% higher than what was paid by India Tobacco, when computed as a percentage of turnover... 6.3% as against 3.5% to be precise... Also 17% of Golden Tobacco's shares are held by a public charitable trust created by shareholders in the name of the founder of the company.

#### PRODUCTION & PROFITS

| Years   | All India Production | Production of foreign sector (million pieces) | Percentage of foreign sector | ITC's profit (Rs. lakhs) |
|---------|----------------------|-----------------------------------------------|------------------------------|--------------------------|
| a. 1959 | 32166                | 24450                                         | 76%                          | 287                      |
| 1964    | 46196                | 23790                                         | 70%                          | 289                      |
| 1969    | 59710                | 46131                                         | 80%                          | 707                      |

#### India Tobacco Company

| Year    | Production (million pieces) | Profits (Rs. lakhs) |
|---------|-----------------------------|---------------------|
| b. 1964 | 23610                       | 287                 |
| 1969    | 29993                       | 707                 |

Production has increased by 28% whereas the profit shot up by 148%.

|         |       |     |
|---------|-------|-----|
| c. 1968 | 30384 | 593 |
| 1969    | 29993 | 707 |

The production went down but profits went up by Rs. 114 lakhs.

|         |       |     |
|---------|-------|-----|
| d. 1967 | 28106 | 409 |
| 1969    | 29993 | 707 |

The increase in production was 7% whereas the profits went up by 73%.

|         |       |     |
|---------|-------|-----|
| e. 1969 | 29993 | 707 |
| 1970    | 32184 | 783 |

Production rise was negligible but profits went up by Rs. 76 lakhs.

#### PRODUCTION (million pieces)

| Year | Foreign Sector | Indian Sector |
|------|----------------|---------------|
| 1965 | 37467          | 16666         |
| 1969 | 45801          | 13913         |

During the four years 1965 to 1969 alone, share of Indian Sector went down by 16% whereas that of Foreign Sector went up by 22%.

Note:—From the above it will be seen that when the share of foreign sector in the market went down during the years 1965 to 1969, the profit of the monopoly did not increase or go down comparatively but when foreign sector's share of the market went up in the years 1964 to 1969, the profit shot up by 144% (as against production increase of 28%) only. Even in the years 1967 to 1969 and 1969 to 1970, though the production was more or less the same, the profit went up. It clearly shows the advantage of checking the foreign monopoly and reducing their share of the market which will result in saving in drain on foreign exchange.

#### 3. COMPARATIVE PERFORMANCE FIGURES—

| 1960 to 1969 (10 years) | G.T.C. (Rs. lakhs) | I.T.C. (Rs. lakhs) |
|-------------------------|--------------------|--------------------|
| Sales                   | 17579              | 67388              |
| Excise Duty             | 9156               | 32950              |
| Nett Sales              | 8423               | 34438              |

|                                        | G.T.C. (Rs. lakhs) | I.T.C. (Rs. lakhs)              |
|----------------------------------------|--------------------|---------------------------------|
| Cost of Raw Materials                  | 5357               | 20736                           |
| Wages                                  | 362                | 5127                            |
| Profit before Tax                      | 1653               | 4343                            |
| Income Tax                             | 1103               | 2389                            |
| Profit after Tax                       | 550                | 1954                            |
| Dividends                              | 169                | 1415                            |
| Foreign Exchange payment for dividends | Nil.               | 1330 (94% foreign shareholding) |

#### NOTE:—

- The percentage of raw material value to the nett sale value of cigarettes is — GTC 64% and ITC 60%, which shows that the consumer of GTC brands gets 5% more value for the money.
- Percentage of profit to sales turnover is — GTC 9.5% and ITC 6.4%. It would be interesting to find out why this big monopoly has shown less profitability whereas GTC—a small company in spite of heavy odds and cut-throat competition from the monopoly—has fared 50% better in profitability.
- The percentage of income tax paid to the sales turnover is: GTC 6.3% and ITC 3.5%. If ITC was 100% Indian-owned company, it would have worked as efficiently as GTC and only in the last 10 years, the Government of India would have earned additional revenue of Rs. 1887 lakhs by way of Income Tax on ITC's turnover. On the other hand, supposing GTC had not survived the onslaught of the monopolistic competition, their turnover would have gone to ITC and the Government of India would have got Income Tax revenue less to the extent of Rs. 491 lakhs than what they have got from GTC in the last 10 years. It is enough to justify that foreign monopoly is harmful to the economy of the country.
- The percentage of dividends declared to the profit after tax is — GTC 30% and ITC 72%; thus GTC has not frittered away its resources for paying the shareholders like ITC but has ploughed back major portion of its earnings to develop business to fight and get share from the market which would otherwise have been in the foreign sector.
- Dividends remitted to foreign shareholders of ITC amount to Rs. 1330 lakhs as against nil in case of GTC. If ITC was 100% Indian-owned Company, this drain on foreign exchange would have been saved. On the other hand, if GTC had not existed, ITC would have been enjoying that share of business and would have remitted additional foreign exchange of Rs. 15 crores in 10 years.
- In 1970, GTC paid Rs. 83 lakhs as wages to 1350 workers which amount to Rs. 6150 per head per year. ITC paid Rs. 762 lakhs to 1200 workers which comes to Rs. 6350 per head per year. Compared with the size of operations, GTC pays far better than the competitor.

#### VAZIR SULTAN TOBACCO COMPANY

B.A.T. — London Invested less than Rs. 7 lakhs when it bought over VST and by capitalization of profits its equity today stands at Rs. 2 crores — over and above an almost equal amount in reserves and surpluses. Foreign shareholding in VST today is 67% and its assets are worth Rs. 6 crores!

Its profit before tax last year was Rs. 203 lakhs.

VST's registered capacity is 8800 million cigarettes a year, yet in violation of the Industries (Development & Regulation) Act, they have been producing far in excess of this capacity. On the top of all this, they now want further expansion of 250%!

Advertiser's announcement

#### COMPANY MEETING

## THE SCINDIA STEAM NAVIGATION COMPANY LTD

Summary of speech of Shri Krishnaraj M.D. Thackersey, Chairman, the Scindia Steam Navigation Company Limited, made at the 51st Annual General Meeting of the Shareholders on Wednesday, the 16th December, 1970 at Patkar Hall, Bombay-1.

Shri Krishnaraj M. D. Thackersey

I regret to inform you that the financial results of the Company have suffered a little setback. The net profits before taxation have gone down by Rs 40 lacs as compared to last year, although during the year the total earnings have gone up by Rs. 2.86 crores.

Ship operating costs are registering continuous rise. I shall name only two heads — fuel and port charges. (1) The price of fuel oil has gone up on the average as much as by about 54 per cent on Indian Coast and about 100 per cent on the Coast of West Africa and by 80 per cent in other areas since the beginning of 1970. (2) Port Charges, including cargo handling charges, at Indian and foreign ports have also registered a steep increase. As a matter of fact, ports all over the world have been repeatedly facing increasing demands from water-front labour, the burden of which port administrations invariably pass on to cargo owners and ship-owners. Moreover, the average productivity as reflected in the turn round of vessels has been falling in some of the major ports frequented by your Company's vessels. In this respect, the glaring instances are Calcutta and U.K. Ports. You are aware, how official and unofficial strike actions semi-paralysed Calcutta for a considerable period leading to last minute changes in ship schedules and piling up of unshipped cargoes in the port, resulting in uneconomic voyage of ships. In U.K., major ports like London, Liverpool and to some extent Avonmouth are experiencing acute labour shortage involving undue delay to our ships.

Maintenance of an efficient fleet with modern methods of cargo handling to serve various trades with greater productivity and output has always been the prime concern of your Company. Accordingly, and taking advantage of Rupee payment arrangements, the Company had placed an order for 8 fast cargo motor ships of 13,500 DWT each with Messrs. VEB Warnowwerft Warnemunde, G.D.R.. I would like to mention that out of these, 3 ships named 'Jalamani', 'Jalamayur' and 'Jalamatsya' have already been delivered and the 'Jalamangala' will be delivered to us next month. The deliveries of remaining ships are scheduled to be completed by July 1972. Two cargo motor vessels of 16,200 DWT each ordered from Messrs. Rheinstahl Nordseewerke, GmbH, Emden, West Germany will also be delivered during 1972. Whilst on the one hand new and fast units are being added

to the Company's fleet, on the other hand, some old and uneconomic units have been disposed of. This will achieve modernisation of the Company's fleet.

I had referred last year to a second-hand bulk carrier of 57,000 DWT negotiated by us for \$6.25 million but because of the delay in getting Government approval for our financial arrangements, this ship could not be purchased. In the meantime prices of ships have risen sharply and for your information I may say that when the same bulk carrier was again available in April this year, we had indicated a price of \$9 million, but the shipowner was not prepared to sell the ship at this price. In July we placed an order for a bulk carrier of 54,000 DWT with Rheinstahl Shipyard and we immediately applied to the Government for approval. Unfortunately the approval was only received recently. In the meantime, the Yard withdrew the agreed price and is now asking for a higher price and offering delivery about a year later, that is by January 1974 instead of January 1973. There is also a price escalation.

Efforts were also made by us for a credit from Japan, but as the Japanese Government agreed to give deferred payment arrangements for one ship only, the Government have decided to give that credit to the Shipping Corporation.

Moreover the shipyards and the Governments concerned are not interested to offer extended credits of eight years with 10% and 20% down payment. The shipowners of developed countries being in a position to purchase ships on cash basis steal a march on the developing countries in obtaining ships. Only recently our Government has agreed to release 20% down payment in foreign exchange and tax free interest rate of 7% on foreign loans.

The percentage of dividend exempt under Section 80K has been determined by the Income-tax Officer at 70.36%. The certificate issued by the Income-tax Officer is provisional as the final percentage can only be determined on the finalisation of the Company's income-tax assessment. The Company, however, estimates that the percentage of exempt dividend would be about 80%. The percentage as finally determined on the completion of the Company's assessment will be intimated to the shareholders. Under the circumstances, the shareholders are advised to claim the deduction at 80% of

the dividend in their Income-tax Return, and, if necessary, to keep their claim alive by preferring an appeal.

As I mentioned in my last report, your Company was listed as a large industrial undertaking by the Industrial Licensing Policy Inquiry Committee. As required by the Monopolies and Restrictive Trade Practices Act which came into force from 1st June 1970, your Company together with its subsidiaries have been registered under this Act. While the wordings of some of the provisions of this Act are not clear, the extent and scope of the Act's applicability are also not well defined. Regarding shipping companies, there are no guidelines to guide Government officials as to in what light they should regard acquisition of tonnage for replacement and expansion of liner and bulk trade services. This uncertainty adds to the factors which delay Governmental approval for acquiring tonnage. I, therefore, trust the Government frames without delay guidelines under the Act which should spell out whether a shipping company registered under the Act but engaged in providing vital transportation services in a trade which is international, must obtain prior clearance under the Act, to acquire tonnage for carrying out its day-to-day business. As Indian shipping carries only 18 per cent of India's foreign trade, acquiring tonnage by Indian shipping companies to maintain this percentage and to

increase it in the country's foreign trade should not need any clearance under the Act at all.

As Shareholders may be aware, shares belonging to Dr. Dharma Teja in the Jayanti Shipping Company are being auctioned by the Sheriff of Bombay and to that effect a notification has appeared in the papers. The shareholders are also aware that due to the restriction on the foreign exchange and the Government's policy, it is very difficult to obtain new ships, especially bulk carriers, from foreign markets. Hence, your Directors feel that if your Company is able to acquire the shares in the Jayanti Shipping Company, which has a fleet of 16 ships consisting of bulk carriers, tankers, ore-cum-oil carriers and cargo ships, your Company will ultimately benefit.

May I take this opportunity to thank the Minister for Shipping and Transport Shri Raghuramaiah and Deputy Minister Shri Iqbal Singh, the Secretary and Joint Secretary and other officials in the Ministries of Finance and Transport, the Director General of Shipping and his officials as well as the officials of Transchart who have offered their full co-operation to us. I also thank our patrons, shippers and other well-wishers of the Company. I thank the Management, Officers and staff both ashore and afloat and the agents at various ports for their devotion to duty.

## Why is **AMCO** *Power Plus* Battery always the First Choice of Vehicle Owners?

### Because it

- Ensures instant power to start the vehicle
- Guarantees trouble-free performance
- Provides maximum battery life — Unknown ever before
- Is backed by an excellent nation-wide net-work of after-sales-service

Insist on **AMCO** — the Power Plus Battery — that Stays Stronger Longer.

TRIED AND TRUSTED FOR NEARLY 40 YEARS

**AMCO BATTERIES LTD., BANGALORE-26**

Pioneers then — Leaders now

AM-MAC(8)-47

## RECORDS AND STATISTICS

### Newspapers in India

ACCORDING to the 14th annual report of the Registrar of Newspapers in this country, the number of newspapers at the end of 1969 was 10,281 as against 10,109 in 1968. While the increase in the number of newspapers in the year under report was a modest 2.6 per cent, the rise in the five-year period 1964-69 was as much as 26 per cent. The number of newspapers in 1964 was 8,161. If other publications such as market reports, racing guides, school magazines etc. are also taken into account, the total number of newspapers in 1969 was 12,826 as against 12,453 in 1968 and 10,256 in 1964.

The rate of numerical expansion in the case of dailies during the year was 25.3 per cent in relation to 1964, and 2.2 per cent over the figure for 1968. The weeklies increased by 28.6 per cent since 1964 and by 2.8 per cent over 1968.

Maharashtra with 1,596 newspapers leads the States, followed by Uttar Pradesh: 1,460; Delhi: 1,153 and West Bengal: 1,129.

#### Regional Pattern

Language-wise, the highest increase was recorded in the case of Hindi newspapers: 127, followed by those in Marathi: 50 and English: 49. Increases were recorded during the year under report in the States of Gujarat, Tamil Nadu, Punjab, West Bengal and the Union Territories of Delhi and Goa. Maharashtra recorded the highest increase 80 papers; 5.3 per cent; followed by Rajasthan 72 papers; 16 per cent; Madhya Pradesh 60; 17.5 per cent and Uttar Pradesh 27; 1.9 per cent.

The press in Hindi continued to be the largest having 2,508 publications, 24.4 per cent of the total number of newspapers in the country. Newspapers in English (2,123) were next with a share of 20.7 per cent. Whereas the Press in Hindi was evenly spread over the bigger and smaller cities and mofussil areas, the English Press was based largely in metropolitan towns. Newspapers in Malayam, however, were centred in smaller towns and only 66 out of 394 papers were published from Trivandrum, the capital of Kerala.

There were three additions to the number of languages in which newspapers in the country were so far brought out bringing the total number of languages to 52 in 1969 as against 49 in 1968. These languages are Chhatisgarhi, Nagpuria and

Guman. Out of 52 languages in which newspapers exist now, 41 were Indian (including 15 officially recognised languages) and 11 foreign. The remaining were all dialects.

According to the data available, more than two-thirds of the newspapers (67.8 per cent) were started during the post-independence period. The newspapers today include 14 centenarians. As many as 201 periodicals were in the age-group of 50 to 100 years.

With the total circulation of 269.64 lakh copies in 1969, the Indian newspapers gained an additional 1.6 per cent as compared to 1968, 11.4 per cent during the quinquennium 1964-69 and 60 per cent over the last decade.

Circulation of dailies was 78 lakhs copies during the year under report showing an improvement of nearly 3.8 lakh copies which was 5.1 per cent over the year 1968. Weeklies recorded a circulation of 77.33 lakh copies in 1969 indicating a gain of over 7.6 lakh copies or 10.9 per cent on that of last year.

Newspapers published in Hindi, English and Tamil languages counted for more than half (54.9 per cent) of the total circulation of the Indian newspapers. The English dailies gained 67 thousand in circulation during the year under report, English weeklies gained 1.95 lakh while journals of other periodicities lost in circulation to the extent of 4.77 lakh copies. Hindi and Tamil consolidated their circulation by increase of 2.12 lakh and 1.90 lakh respectively. The largest gain of 2.12 lakh (4.2 per cent) among the languages, during the year, was recorded by newspapers in Hindi.

State-wise, Kerala topped the country in circulation increase during 1969, gaining 2.10 lakh copies. Noticeable improvements were also recorded by the Press in Rajasthan (34.5 per cent) and Gujarat (5.7 per cent).

#### Common Ownership Units

The report which undertakes every year a study of chain newspapers and their ownership pattern stated that there were 65 common ownership units during 1969 owning 222 news-interest newspapers (including 170 dailies) as against 64 in 1968 owning 217 newspapers (including 165 dailies).

News-interest newspapers of common

ownership units commanded a circulation of 62.72 lakh copies in 1969 which was 23.3 per cent of the total circulation of the entire Press. This increase compared to 1964, was of 20.7 per cent and to 1968 of 7.6 per cent.

Dailies belonging to common ownership units claimed a circulation of 54.99 lakh copies during the year which was 10.2 per cent higher than the preceding year. At the same time, the circulation of news-interest weeklies belonging to such units was of the order of 7.73 lakhs registering a decrease of 8.2 per cent as compared to 1968. Besides, there were 53 non-news-interest papers which belonged to the common ownership units. The combined circulation of all newspapers owned by these units was 82.09 lakh, 30.4 per cent of the total circulation of the Indian Press.

According to the report, the largest number of newspapers 6,119 (59.5 per cent) was owned by individuals during the year under report as compared to 5,945 or 59.4 per cent during 1968. Societies and associations owned 19.5 per cent of the papers compared to 19.9 per cent in 1968. The percentage of proportion of newspapers belonging to the joint stock companies remained unchanged at 4.8 during both the years.

#### Newspapers and Political Parties

During the year under report, 19 political parties owned 84 newspapers including 10 dailies and 42 weeklies. Most of such papers were published in Hindi 18, English 12, Bengali 11 and Marathi 8. The total circulation of newspapers owned by political parties was 1.37 lakh, during the year of which papers owned by both communist parties had a circulation of 93,000 copies and those belonging to the Congress of 28,000 copies. The largest number of newspapers 28 was published by the communist parties, followed by Congress, both ruling and opposition 27, followed by the Praja Socialist Party 5 and others 24.

The report revealed that India was the second largest publisher of daily newspapers totalling to 650 during the year 1969. As compared to 1964, there was an increase of 136 dailies or 20.9 per cent. The gain made over the preceding year was of 14 dailies or 2.2 per cent.

The report further revealed that the number of Hindi dailies 186 was the largest, followed by Urdu 98 and English, which occupied the third position, had 69 dailies during the same year. However, so far as circulation was con-

Knowing how to do it is what we aim at—how to do it efficiently, economically with our own indigenously developed technology.

How to manufacture the full range of Catalysts, how to design a fertilizer plant, how to handle the complex technicalities—in short, how to plan a complete project from feasibility to fulfilment.

Today after two decades of research and development we Know-How to do it—the complete Know-How.

cerned. English dailies were on the top as in preceding years. The total gain in circulation made by the dailies during the year under report in comparison to 1968 amounted to 3.66 lakh copies or 5.0 per cent.

According to the report, the number of correspondents in service with daily newspapers was 3,153 in 180 dailies in 1969 as compared to 2,953 in 178 dailies in 1968. As many as 106 correspondents were stationed abroad. The number of editorial staff improved from 2,562 (including 16 women) in 278 papers in 1968 to 2,809 (including 29 women) in 294 papers in 1969.

The *Statesman* of Calcutta which had 1,308 such employees, was the largest employer for production of a single paper. The *Hindu* of Madras continued to employ the largest number of working journalists with 193 individuals functioning on reporting and editing sides.

#### Advertisement And Printing

It was revealed that out of 289 newspapers which furnished the relevant data, 130 earned 25 to 50 per cent of their total income through advertisements. None of the big dailies obtained more than 75 per cent or less than 25 per cent of revenue through advertisement. As regards 'medium' dailies, 49 reported 25 to 75 per cent income from advertisement, while 13, up to 25 per cent. 159 'small' dailies obtained 25 to 75 per cent income from advertisement, while 15 such dailies derived more than 75 per cent of their total revenue from advertisement.

The analysis of data intimated by 320 dailies showed that all 'big' dailies were

produced on rotary machines while 154 'small', 53 'medium' and 24 'big' dailies had printing presses of their own. However, a large number of dailies 164 (143 'small', 19 'medium' and 2 'big') out of 311 was composed manually, while 57 (15 'big', 22 'medium' and 20 'small') were composed on machine.

One important development during year under report, was that the *Hindu*, Madras introduced fascimile method of printing by which they started an edition from Coimbatore simultaneously with that of Madras.\* This is the first paper which has adopted such a sophisticated equipment in the country.

#### Periodical Press

The number as well as circulation of the periodical press in India steadily improved during the quinquennium ended 1969. The total number of periodicals reached 9,579, better by 1,978 (20.6 per cent) compared to 1964 and 247 (2.5 per cent) than 1968. The total circulation (available for 5,807 periodicals) were 191.74 lakh copies in 1969, an improvement of 11.31 lakhs (6.3 per cent) during the quinquennium and of 0.54 lakh copies (0.3 per cent) in relation to 1968.

The number of periodicals published by central and state governments improved from 390 in 1968 to 398 at the end of 1969. The central government published 224 periodicals (including 100 monthlies) while 174 publications, including 89 monthlies, belonged to state governments. More than half (140) of central government publica-

\*Another Similar edition has been started from Bangalore from this year (1970).

tions were published from Delhi, while among the states, the government of Uttar Pradesh brought out the largest number (24), followed by Maharashtra and West Bengal (13 each).

#### Foreign Mission Publications

The total number of publications brought out by foreign missions in India, according to the report, stood at 111 in 1969 as against 103 in 1968, recording an overall increase of 7.8 per cent over the corresponding number of 1968 and of 50.0 per cent compared to 1964. The total reported circulation was 14,18,730 copies in 1969, higher by 11.4 per cent than that during the preceding year and by 41.3 per cent compared to 1964. The USSR Embassy brought out 46 papers having a circulation of 6,56,047 copies (of 44 publications) and the US Embassy (17 papers,) 16 having a circulation of 6,32,393 copies. The next largest publisher among foreign missions was the German Democratic Republic Trade Mission whose 6 (out of total of 7) periodicals had a circulation of 38,660 copies.

The language in which most of the foreign mission journals (42) were published was English; the share of journals in English in the total circulation of foreign mission publications was 44.3 per cent in 1969. Hindi was the next most utilised medium with 12 papers and 14.7 per cent share in circulation.

The report stated that the policy for allocation of newsprint for 1969-70 announced on May 12, 1969, was based on the total anticipated availability of

about two lakhs metric tonnes of newsprint. The bulk of imports continued to be made during the year from rupee payment and free foreign exchange areas.

During the year, dailies were allocated 1,81,681.36 metric tonnes (7.3 per cent) while allocation to periodicals to-

talled to 26,464.38 metric tonnes (12.7 per cent).

#### Verification of Circulation Claims

Circulation claims of 645 newspapers were verified during the year under report as compared to 428 in 1968. The centres visited by the circulation teams

of the Registrar included places in Gujarat, Haryana, Jammu & Kashmir, Maharashtra, Mysore, Punjab, Uttar Pradesh, Delhi, Goa, Manipur and Tripura. Circulation checks resulted in the detection of exaggeration of 4,75,982 copies per publishing day affecting a national saving of Rs 15.10 lakh, in foreign exchange.

# EASTERN 2 ECONOMIST

RUPEES 1.50 JANUARY 8, 1971 VOL. 56

The Prime Minister denied that the economy was in poor  
shape and rejected the view that the quality of  
nationalised banks was going down.

# The forgotten cotton

Should we let half our cotton wealth lie underground?

The Indian farmer is playing a vital role in helping the country achieve self-sufficiency in food grains. But when it comes to cotton production, we are allowing pygmy crops to overpower our giant performance.

Four long years have gone by since the Third Plan period, and the Third Plan target of 70.65 lakh bales is still eluding us. India has the largest area under cotton cultivation in the world but the lowest yield per hectare.

The Cotton Development Project of the Indian Cotton Mills' Federation

has proved that cotton yield can be increased by as much as 50 to 100 per cent. These results have been achieved, year after year, not on a few farms but on more than a lakh of hectares, spread right across the country.

What India needs on a top priority basis today is a bold, vigorous programme by the Government to help every cotton farmer in the country discover the treasure lying buried under his feet! This calls for an outlay of about Rs.10 crores per year for say, five years.

- This will result in a saving of foreign exchange of over Rs 100 crores per year now spent on importing cotton.
- This will help the country to step up its textile exports from around Rs. 120 crores to Rs. 200 crores.
- This will increase the income of the farmer and yet make cloth cheaper for the public, and ensure gainful employment for many more workers.

Four million cotton cultivators could easily earn more—550 million people would be a lot happier!

## HER IDES OF MARCH

THERE WILL be general relief in the land that the Prime Minister has at last made up her mind and decided to seek a mandate from the people, early in the New Year, for her and her policies. In strict logic, she should have done this immediately after she had split the Congress organisation which had put her in the office she now holds. On balance, however, the country has gained rather than lost through the delay. For about a year and a half now the public has had ample opportunities of judging the worth of the substance as well as the style of her government. For the electorate, this record of Mrs Indira Gandhi as Prime Minister, since she struck out on her own, should be the most relevant single factor in deciding the direction of its voting. To put it bluntly, the people will not be voting in the dark and the responsibility for the verdict, whatever it is, will therefore be squarely on their shoulders. It would be particularly apt now to emphasise the point that a people get the rulers they deserve.

Despite the bravado of the Prime Minister's broadcast, it is quite evident, that in advising the President to dissolve the Lok Sabha and taking the country to the polls earlier than the due date, Mrs Gandhi has acted, or rather has been forced to act, from a position of very considerable weakness. Whether wittingly or unwittingly, she herself has confessed as much. In her own words, her government has been in power without being able to use that power. In other words, and in more straightforward language, Mrs Gandhi's administration has merely been in office during this period, while the routine administration of the country has been compelled to fend for itself as best as it could. The Prime Minister, of course, is too vain to own to this. Hence, she has resorted to the cheap and over-worked trick, of conjuring an apparition of vested interests which is alleged to be thwarting her intentions of social or economic reform. Since it is on record that her only difficulty so far has been the Constitution, as interpreted by the Supreme Court, her demagogic contention that she is holding a general election in order to give an opportunity to the popular will to assert itself and strengthen her in her alleged fight against reaction could only be treated with contempt.

Mrs Gandhi is clearly mistaken in her implied claim that, by virtue of being Prime Minister, she is entitled to coerce the constitutional processes for self-aggrandisement and so far as the Supreme Court is concerned, it has every right to drive home the fact over and over again that it is not expected to serve as a hand-maiden of adventurist politicians. Mrs Gandhi should be satisfied with having an obliging President of India who was only too willing to nationalise banks by an ordinance on the eve of a Lok Sabha session, or de-recognise the princes by Presidential order after a concerned bill had failed to pass muster in Parliament or dissolve the Lok Sabha when she found it no longer possible to carry government business effectively through that House.

Although the Prime Minister and her party have in fact been engaged in electioneering of a kind from August last year, the formal campaigning has now swung into full public cognisance. It may be expected that she and her cohort will squeeze the last ounce of advantage or utility from the fact of her administration continuing in power as a caretaker government. In elections, as in property suits, possession could be nine-tenths of the law. It was of course too much to expect of Mr V.V. Giri that he would have been a party to denying Mrs Gandhi this tremendous strategic advantage by suggesting that an independent and impartial administration should be installed at the centre on an *ad hoc* basis to advise the President on the administration of the country during the interregnum. Although normally the leader of the ruling party in the out-going legislature has a claim to functioning as the head of a caretaker government, in the circumstances in which Mrs Gandhi has continued to be Prime Minister after the split in the Congress organisation, it would have been a far healthier democratic practice had she voluntarily offered not to insist on the privilege of heading the caretaker government or had President Giri the moral firmness or the political courage to recommend to her this discipline.

It is a living fact of our current history that Mrs Gandhi and her party have shattered the political stability of our country, promoted the forces of factionalism and very nearly destroyed the cohesiveness of our federal polity by patronising and exploiting regionalism or even a narrower parochialism. It is also on record that, because of the unequivocal attitude of the Prime Minister and her advisers, political or bureaucratic, towards the forces of Left subversion, law and order, along with general administration, have broken

down in West Bengal, while a time-serving communist-led administration has been enabled to achieve respectability as a legally constituted government in Kerala. On the economic field, the process of development has been reversed and the country's rate of economic growth has been depressed to a point where the world's reaction to its efforts at fighting mass poverty is either one of scorn or of pity.

With such a record, Mrs Gandhi's administration can claim to no legitimate title to be the caretaker govern-

## Meeting Paper Shortage

AT A time when there is an acute shortage of paper and boards and the government has expressed an anxiety that a crash programme of expansion should be undertaken by the established units, recent developments concerning this industry in the southern region should be considered heartening. For quite a long time there were only two medium-sized units in Mysore and Kerala producing paper based on bamboo and coea reeds and the forest resources of Kerala and Mysore particularly were not exploited vigorously. Indeed, it is even now a matter for surprise why Kerala did not undertake the manufacture of either paper or rayon-grade pulp much earlier even though it has ample forest resources. There is, of course, a big-sized unit now in Kerala which is the single producer of rayon-grade pulp in the country based on bamboo and soft woods. With the successful functioning of this unit of Gwalior Rayon at Mavoor, the same company is engaged in the construction of another unit for turning out the same product in Mysore state. There is, of course, another plant in Kerala which is producing rayon-grade pulp. But the raw material used is different, being cotton linters. In Tamil Nadu, South India Viscose is a large producer of rayon-grade pulp by using the forest resources of Nilgiris.

The utilisation of bamboo and other raw materials for turning out rayon-grade pulp has necessarily minimised the scope for promoting paper mills. Even so, there are unexploited resources and with systematic replantation of cleared areas, a much higher level of output of paper and boards can be achieved in the coming years. It must be admitted, however, that commendable progress has been made in the post-Independence period with Andhra Pradesh having the proud claim of being the largest producer in the southern region. Apart from Sirpur Paper Mills in the Birla Group, Andhra Pradesh Mills in the Bangor Group has increased its stature considerably in recent years and with the completion of the expan-

ment. Whatever her speech-writers may have to say about the issues, the basic fact is that this election will be a simple quest for the people's verdict on the eligibility or capacity of Mrs Gandhi and her party to continue to govern the country. While it may be the right of free men to choose their rulers as they would — wisely or unwisely —, it is surely their responsibility to choose only wisely. Let us hope then that our democracy would have become adult as the people go to vote for the fifth time in a general election to the national legislature.

sion schemes, it is likely that the annual output of this unit will easily be 50,000 tonnes in the next one or two years. In Mysore, West Coast Paper Mill has been systematically raising its output by improving its operating efficiency. It is also engaged in the implementation of an expansion scheme besides installing balancing equipment. Mysore Paper has doubled its capacity in recent years and it is being examined how its output can be raised further. Strenuous efforts are being made to revive Mandya National Paper Mills and once the reconstruction programme has been put through and the change in management takes place, the capacity may be increased substantially. It will then be possible for Mysore to achieve an output of over 90,000 tonnes annually. In Kerala, there is only one medium-sized unit accounting for an yearly production of 10,000 tonnes. When the new schemes for producing newsprint materialise this region will be contributing substantially to the availability of printing paper and newsprint.

Until the sixties in Tamil Nadu there were no paper mills. But the two units, one large-sized and another small, have been making impressive progress and account for a capacity of well over 35,000 tonnes. Seshasayee Paper and Boards has implemented an expansion scheme for diversifying and raising its output by over 50 per cent. The four states thus account for an aggregate production of roughly 1.95 lakh tonnes which is about 27 per cent of all-India output. All the eight units are implementing or are having under consideration the execution of new projects under the crash programme suggested by the government with a view to overcoming the scarcity of paper that is expected to assume alarming proportions in the next two or three years. In spite of the anxiety expressed by the government to be helpful in implementing expansion schemes of the existing units, which will be less costly and can be completed in a short

period, the applications for creating additional capacity are not being quickly processed. Also, considerable delay is being experienced in securing licences for importing plant and machinery and some of the earlier schemes have been unnecessarily prolonged in execution due to the delays in obtaining deliveries of equipment from internal sources. The expansion scheme of a major unit in the southern region has been held up, though the required imported plant and machinery have been received, because of the inability of indigenous manufacturers to adhere to delivery schedules.

The emphasis on use of indigenous equipment is certainly to be welcomed as in the coming years there will have to be spectacular expansion of capacity of the industry. With increasing literacy and a low level of per capital consumption the capacity will probably have to be doubled or even trebled in the next decade which would mean that what has been achieved over a long period will have to be completed in a short period of 10 years.

When there is so much to be done, the indication by Mr S. Madhavan, Tamil Nadu Minister for Industries, that the state government is seriously thinking of establishing a large-sized paper mill in the joint sector with Canadian aid is a happy augury. Seshasayee Paper and Boards will be helping the government in the implementation of this project if it is eventually decided, with the concurrence of the Central Government, that the manufacture of cheaper printing paper for use in text books should be taken up by using mechanical pulp and chemical pulp in specified proportions.

It has been disclosed by the Managing Director of Seshasayee Paper, Mr S. Viswanathan, that the Canadian government will be agreeable to the use of the counterpart funds, arising out of imports of pulp under long-term credit, for developing a captive plantation. It is also stated that there will be no difficulty in securing foreign exchange for importing plant and machinery. As the required land is available in the Nilgiris and it can be planted with softwood trees, which will be ready for use after seven years, the project, if finalised without delay and implemented expeditiously, will go a long way in bridging the big gap between supply and demand that will arise in the next decade.

There has no doubt been a big increase in capacity since the beginning of the Plan era by five lakh tonnes. But the task of doubling this effort in half the period will call for Herculean effort and can be achieved only if there is proper organisation of the facilities for manufacturing equipment indigenously on the basis of an intelligens division of work. Considerable progres

has been already made in producing many items of machinery and there is greater confidence now that the indigenous content can be raised to a very high level in the next few years.

Whatever may be the success of the efforts in this regard, and there is no doubt that the same degree of development can be recorded as in the case of the cement, sugar and textile industries, the immediate objective should be to raise output at the rate of one lakh tonnes annually in the next four or five years. This can be done only if every major unit is encouraged to add to its capacity by 50 or 100 tonnes daily, where there is no problem in regard to the availability of raw material resources. The first phase of expansion contemplates an addition to capacity by about 1.5 lakh tonnes by the middle of 1972. There will probably have to be further expansion on similar lines in the second phase also as entirely new units cannot be brought into being within four or five years even assuming that considerable preliminary work had been completed in regard to the promotion of new units. Unfortunately, except for the proposal to erect a pulp plant in the public sector in Assam, there is no prospect of any other entirely new unit coming up in the near future. It is doubtful whether the Paper Corporation of India will be able to make significant progress in the current Plan period and it may not also be correct to rely on filling the gap only with the erection of units in the public sector.

It is, therefore, clear that the fourth Plan target of 1.1 million tonnes can be achieved only through the implementation of expansion schemes while for

## Expanding Trade with the USSR

THE INDO-SOVIET trade, which has already recorded a phenomenal increase during the past 17 years — from a bare Rs 1.3 crores, both ways, in 1953 to as much as Rs 372.34 crores in 1969 — is expected to get a sizable fillip from the new five-year agreement signed here on December 26, 1970. This pact envisages an increase of 15 per cent in our exports to the USSR in 1971 over the 1970 level which is reported to have reached Rs 190 crores. Although no firm commitments have been made for the subsequent four years — annual protocols will be negotiated for this purpose — similar sharp increases in our exports to that country are contemplated during these years too. By 1975, thus, our exports to the USSR may go up to nearly Rs 375 crores.

As our exports to the USSR have to be balanced against imports from that country over a reasonable period of time, the sharp increase to be effected in exports should suggest that imports

bringing about dispersed development and encouraging the promotion of entirely new units, fresh incentives will have to be provided. In spite of de-control of paper prices and the adjustments in selling prices in the past three years, no entrepreneur has come forward to establish new units. It is contended that the increase in selling prices for paper compared to other commodities, even with the recent adjustments, is inadequate and many units are even now finding it difficult to claim fully development rebate after absorbing depreciation charges allowed for income-tax purposes. As the capital cost of a new mill has risen to Rs 6,000 per tonne of annual capacity and a unit capable of producing 20,000 tonnes annually will now cost Rs 12 crores against Rs 6 crores in the early sixties, there is clearly need for devising new incentives which will make fresh investment in the paper industry attractive. There will also had to be a substantial concession in the form of a rebate in excise duty for using bagasse as basic raw material in the manufacture of pulp apart from the supply of cheaper furnace oil to the sugar mills which release bagasse to be converted into pulp. It will be wrong to expect that the gap in production caused by the inability of entrepreneurs to promote new units in the private sector can be filled by creating additional capacity in the public sector. There has to be new thinking as there will be an explosion in demand in the late seventies with a higher level of economic activity and growth in literacy. Even a doubling or trebling of the pitifully low level of per capita consumption of less than 1.25 kg can result in an unmanageable situation.

would also go up in the corresponding manner. But this is not to be the case during the next five years. Our imports from the USSR are expected to go up by 1975 by only 30 per cent or so from the 1970 level of about Rs 145 crores. This means that the balance of trade in our favour will increase from nearly Rs 55 crores in 1970 to approximately Rs 175 crores in 1975. The surpluses are proposed to be utilized for the liquidation of the debts which we have incurred under the economic assistance programmes. These debts currently aggregate to about Rs 395 crores.

The more significant aspects of the agreement, however, are: (i) the diversification it envisages in our trade with the USSR; and (ii) the co-operation it is expected to foster between the two countries in setting up joint projects in third countries. We will be exporting to the USSR under this agreement not only substantially increased quantities

of such traditional items of exports as cotton textiles, tobacco, tea, coir goods, handicrafts, etc., and of several items whose exports have been developed in the recent past — for instance, ready-made garments, woollen knitwear, cosmetics, automobile and other storage batteries, shoes, vacuum flasks, spectacle frames, enamel wares, etc. — but also many a new item. These include excavators and other industrial products from the Soviet-assisted projects such as electric motors, aluminium cables, garage equipment, wire ropes, spectacle lenses, machine-made carpets, paints and varnishes, dyestuffs, sports shoes and chappals and cigarettes.

In line with our changing import requirements, the Soviet Union will be appreciably diversifying its exports to us. As we do not now require most types of machinery we have been importing from that country hitherto, the accent in the next five years is to be on the USSR supplying us increased quantities of industrial raw materials and such other goods and machinery which we *directly* need. Our imports of non-ferrous metals such as zinc, nickel, platinum and palladium are proposed to be stepped up. For the first time, we will be importing copper from the USSR. Another new item which the USSR will supply us in future under the rupee payment arrangement is ships. Among the machinery items, the major ones listed for export from the USSR are equipments for textiles, printing and chemical industries, besides those needed for the Soviet-assisted projects. Our imports from the USSR of such items as tractors, agricultural machinery, kerosene, asbestos, industrial diamonds, sulphur, newsprint, fertilizers, rolled steel products and refractories are expected to increase substantially.

The proposed diversification in our trade with the USSR should enable us to utilize our installed industrial capacity to a somewhat greater extent than has been the case in the recent past. But since the cornerstone of the agreement is the stepping up of our exports to the USSR by as much as 15 per cent annually, its successful implementation will depend primarily on raising the tempo of our industrial activity not marginally but a great deal. Whether we will be able to do so or not, it is a moot point at present. The industrial growth in the recent past leaves much to be desired.

The understanding reached in regard to the USSR co-operating with us in joint ventures in third countries should help us in inculcating export markets especially in Africa, west Asia and east Asia. The effect of this co-operation on our exports of engineering goods can, indeed, be very lasting. Through this arrangement, we will be able to provide many more references than at present of our competency to undertake engineering jobs, which are so vital in

the field of engineering goods imports. It has to be conceded that we have been able to introduce several new items in the western markets after we could establish their acceptability in the USSR and other east European countries.

While the above features of the new trade agreement with the USSR make it a welcome pact, it is, indeed, disconcerting to note that no understanding has yet been reached with that country on inserting in our export contracts a gold-link clause as has been done in the case of Bulgaria, Czechoslovakia, Hungary, the German Democratic Republic, Rumania, and North Korea. While the USSR exporters insist on such a clause in the contracts of their supplies to us, the importers from that country have not yet agreed to the in-

section of this clause in our export contracts. This acted to our detriment when as a sequel to the devaluation of the rupee in June, 1966, we were obliged to pay 57.5 per cent more for the imports from the USSR. Our exporters, on the other hand, could get only 47.5 per cent more, and that too after protracted negotiations. The argument of the Soviet Union for not agreeing to link the prices of our exports to the gold content in the rupee is understood to be that it has no control over the exchange value of our currency and since the trade transactions between the two countries have to be in rupees, the losses arising out of any future devaluation of the rupee have to be borne by us. This stand of the Soviet Union does not accord with the principle of equal partnership in trade.

## Towards Mutual Co-operation

THE DECLARATION made at Kabul in the third week of December last, after the deliberations of the Council of Ministers for Asian Economic Co-operation, contained seeds for possible future growth of economic integration of Asian countries at the sub-regional level, but it would be sheer naivety to expect any miraculous results in the short period. It may be recalled that this was not the first attempt to evolve a "strategy for integrated regional co-operation". Three ministerial conferences on Asian economic co-operation had already been held — twice in Manila in 1963 and 1965 and once in Bangkok in 1968. The Kabul Asian Conference was the fourth in the series.

The subject of Asian economic cooperation has been discussed threadbare during the last two decades because it is believed, and rightly, that all countries of this region would stand to gain through trade expansion as well as economic integration. If the dream of accelerated co-operation between Asian countries has not come true all these years, it is because of many historical as well as institutional factors. Historically, the countries of this region have been dependent for a long time, both for their imports and exports, on the markets of the industrially advanced countries. As exporters of primary products, the Asian countries have been reluctant to disturb their long-established channels of trade (and payments) with the developed countries. Then there is the strong political element which has hitherto been a big stumbling block. For example, the political differences between India and Pakistan have shut off all economic co-operation between these two countries.

All these difficulties have been known to the secretariat of the Economic Commission for Asia and the Far East (ECAFE) which has, however, refused to be cowed down by them and has

continued its efforts to bring the Asian countries together so that they might help one another in the process of economic expansion. The ECAFE secretariat under whose auspices the ministers met at Kabul, had three broad objects in view, namely, expansion in regional trade, the establishment of an Asian Clearing Union and the setting up of an Asian Reserve Bank. A paper prepared by the secretariat indicated that trade among the developing countries of the region had declined from 15.6 per cent of the global trade in 1960 to only 6.4 per cent in 1968. The central problem, therefore, was to increase this intra-regional trade. The proposal for an Asian Clearing Union was designed to provide a clearing mechanism for the multilateral settlement of intra-regional payments which was expected to facilitate the expansion of intra-regional trade. The guidelines which were drawn up in November, 1970, in this regard envisaged the establishment of a common unit of account to be denominated as the "Asian Clearing Dollar". The Asian Reserve Bank was expected to provide the monetary authorities of the member countries with a new form of "international reserve asset".

As was expected, the discussions at Kabul started on a dismal note and the three proposals of the ECAFE secretariat looked like hard nuts on which no compromise could be had among the delegations of the participating countries. The wide divergence in the state of economic development of the different countries in this region was an additional factor which made the acceptance of any of the proposals very difficult by most of the participants in the deliberations. A majority of the countries which participated in these talks are committed to development plans and despite the optimistic view of the theoreticians that some harmonisation of these plans could be brought about

through trade agreements, no tangible results were visible.

Our country assisted by a few others including Afghanistan, dug in its toes in order to salvage the Kabul conference. What became very clear was that the prospects of economic co-operation were encouraging only at the sub-regional level. Already, steps have been taken in this region to bring about economic co-operation among neighbours (ASEAN and RCD) and some progress has been achieved. The ECAFE, however, is keen, and rightly, on promoting co-operation either on project or commodity basis. The establishment of the Asian Coconut Community, the agreement between India and Ceylon in regard to tea, the co-operation between India and Iran on increased trade in ammonia and oil exploration activities are some of the examples which do provide hope that slowly and steadily some limited economic integration at the sub-regional level can be brought about. The type of co-operation which has been seen in Europe through the formulation of the European Common Market or in Latin America through LAFTA might not be possible in this region for a long time, but it would be unwise not to continue with efforts to bring the Asian countries together even on a limited scale.

Regarding the Clearing Union, the Kabul declaration embodied the determination of some of the Asian countries to hasten its establishment. It does not follow that the Clearing Union would be established in the current year or even the next year. Certainly more ground work is necessary to give it a practical shape. What is worth admiring is that this useful institution is proposed to be set up at the earliest possible so that the intra-regional transactions might be handled without having to pay large fees to western countries for no other purpose but clerical handling of accounts.

The proposal regarding the establishment of the Asian Reserve Bank seems to have been shelved for the time being for many reasons, including the opposition from Japan and Australia. Perhaps both these industrially advanced countries in this region were reluctant to lock up their funds in the Asian Reserve Bank which they thought was exposed to a higher degree of risk than the internationally recognised finance institutions. The Kabul talks have made it clear that increased sub-regional trade would be followed by an arrangement for Clearing Union while the establishment of the Reserve Bank would follow, if at all, last of all.

It will be wrong to describe the Kabul deliberations as a failure. But it will also be wrong to read too much in them. Much more patient work at the committee level will be needed before the dream of increased Asian regional co-operation comes true.

## The Unfounded Charge

R.V. MURTHY

FAR TOO often, spokesmen of private enterprise do not, or are reluctant to, challenge even incorrect statements made by those in authority who seem to think it their privilege to react strongly even when there is really no reason to get provoked. The latest example of this was at the last annual general meeting of the Associated Chambers of Commerce. No impartial observer would say the speech of the Associated President, Mr Keshub Mahindra, was either harsh or discourteous. Yet, in the course of her reply, our Prime Minister chose to be caustic in her comments. Getting provoked even if it be without cause or being caustic is one thing, but to blame one without warrant is quite another. Such is serious enough to be taken note of and challenged, as, indeed, Mr J.R.D. Tata did well to, when he recently inaugurated the Fifteenth National Convention of the Indian Junior Chamber at Ahmedabad. Of course, Mr Tata could cite the unchallengeable experience of his own company to disprove the insinuations of the Prime Minister. Among others, she had accused private enterprise of being more private than enterprising, of being unwilling to take risks, of always seeking help from Government and its financial institutions and of asking for price increases for every little increase in costs.

### Unfair Criticism

Mr Tata first took exception to the allegation that the larger business houses have been unprepared to take risk and stated categorically that this charge was 'unfounded'. In this context, he cited Tata's offer of 1967 to put up a Rs 170-crore fertilizer project in Gujarat and the more recent offer by Telco to put forward a Rs 50-crore automobile manufacturing scheme. As pointed out by him, while even a much truncated version of the former is still awaiting approval, the later was not at all accepted.

To the unfair criticism that the private sector always seeks help from government financial institutions, his reply was: "Surely, government are aware that, in the last few years, they have created for themselves a virtual monopoly of the country's financial resources available for lending to the private sector. To whom then can the private sector turn for loan finance

except to government's financial institutions and nationalised banks?"

"Even more unfair" and also "unfounded" is the criticism that the private sector runs to government for price increases to compensate for "each small increase in cost", said Mr Tata. "Such requests", as he pointed out, "come only from industries, the prices of whose products are controlled by government and whose profits are, as a result, severely limited. Furthermore . . . they are only made in respect of major increases in costs, and limited, at that, to those beyond industry's control."

### Unreasonable Authorities

What is unreasonable is not the plea of industry for an increase in price, especially when almost 90 per cent of such increase is brought about by increases in non-negotiable costs, but the appeal of those in authority to industry (e.g. sugar) to slash prices even when they themselves are seized of all the relevant statistical situation which simply does not permit of any such slashing. Moreover, when confronted with an impossible position, it is not only the private sector but the public sector industry also which will be obliged to ask for a rise in prices, as, for example, in regard to steel. Mr Tata mentioned how the latest wage revisions in the steel industry would cost it an extra Rs 25 crores, or the equivalent of Rs 37 per tonne, as against a provision of just Rs. 9 per tonne in the latest steel prices revision by the government.

Perhaps the most unmerited remark of Mrs Gandhi was her suggestion that the private sector, and particularly the larger houses, are on an investment strike in order to embarrass government. Let figures, quoted by Mr Tata, speak for themselves. The number of licence applications in 1970 up to October alone, he said, was almost double of that in 1969 and three times that of 1968. According to a statement made by government itself in Parliament on November 23, against 444 licence applications from the larger houses this year, only three licences and three letters of intent had been issued, while 50 were rejected and the rest — 388 — were still under consideration. As Mr Tata aptly put it, "instead of the private sector being on strike, it is being struck against"! Much (not all, be it noted)

of the criticism levelled by government against private enterprise, he had no hesitation, therefore, in saying, was "based on incorrect or inadequate information."

It is, indeed, deplorable, as Mrs Gandhi observed, that government and the private sector should have to view common problems from opposite sides of the fence, but is the solution to this that both should be on the same side as she suggested? Is not the more proper course the removal of the fence itself? Anyway, the prevailing situation in the country does not permit of pondering over which is proper or which is not. What is needed today is, to quote Mr Tata that, "it behoves all of us, on whichever side of the fence we may be today, to do what we can to dismantle it and find common ground on which we can co-operate in attaining the common objectives."

Mr Tata dwelt at some length on the need to understand the causes of the deterioration of relations between government and the private sector in recent years. He put it in one sentence thus: "With the adoption, at first, of a mixed economy, then of a socialist pattern of society, and finally of full-blooded socialism as the desired form of economic organisation for our country, government's attitude towards private enterprise changed drastically and relations between the two became immensely more difficult and complicated." But the trouble (or is it mischief?) started when the leftist politicians began to regard private enterprise not as a valuable and beneficial element of society deserving of support and encouragement as it should have done but as a threat to the establishment of socialism.

### 19th Century Version

Unfortunately for socialism, socialism according to these, continued to be its 19th century version and not as it has changed since. Unaware of the tremendous changes which have taken place in socialistic thinking elsewhere, these Indian socialists, or so-called socialists, have failed to realise, according to Mr Tata that, far from being an enemy of socialism, private enterprise can be its partner and, indeed, its financier, in that it generates most of the resources required by a socialist state to pay for its schemes of welfare and social justice. "It is a startling but little known fact" he disclosed, "that, on the average, every rupee of profit earned by the private sector for its shareholders generates more than three rupees of taxes for government in one form or another."

¶ Mr Tata rightly attributed the havoc to the public image of the private sector

to the establishment of a permit and licence regime, a view which was first voiced and is being continually and consistently put forward by the country's elder statesman, Mr C. Rajagopalachari. "The fruits of corruption, tax evasion, black marketing, foreign exchange 'fiddles' and other fraudulent and unscrupulous devices" Mr Tata said, "were so great that many succumbed to temptation and in the process wrought havoc with the public image of the private sector." Between this poor public image of the private sector, on the one hand, and government's pathological dislike and fear of big business, on the other, as he went on to say, a situation has been created in which "the development of the private sector and its contribution to industrial growth has been only a fraction of its potential to the great detriment of the country as a whole."

But this unsatisfactory state of affairs cannot be allowed to continue. And, as Mr Tata remarked, "the private sector cannot make its full contribution to economic growth, unless its relationship with government drastically changes for the better." How, then, can this be brought about? Certainly not by the public sector blaming government, nor by government damning the private sector, as has been happening today. Nor is the fact that both are wrong or both are right much of a consolation. Nor even, for that matter, the recognition of a material contribution towards the desideratum. The time has come, in the words of Mr Tata, "for an honest and determined effort on the part of both sides to shed some of their pre-conceived notions and to seek an understanding based on a few simple criteria." While

he asked the private sector to restore its tarnished image by suitable action, he set down for government the following fair and significant criteria whilst dealing with a private sector firm or company:

- (i) Its record on the quality of its products and the prices charged by it;
- (ii) Its labour policies, relations with employees and wage and welfare standards;
- (iii) Its use of profits;
- (iv) Profession and competence of its management;
- (v) Its assistance to small-scale and ancillary industries;
- (vi) Its record of export performance and import substitution;
- (vii) Its freedom from political intrigue;
- (viii) How it has used its economic power? and
- (ix) Nature of its record and reputation.

These criteria also go to impose a heavy responsibility on the part of the private sector. Those units in the private sector which are able to satisfy these requirements, however, must be assured of a fair deal by government. It is only thus that a trustful relationship can be re-established between the private sector and government. And, when that happens, all efforts are bound to be concentrated on raising the standards of living of our people and not dissipated in fruitless controversy. "No cause is more deserving of our efforts and dedication" as Mr Tata concluded, "than the creation of a better life for the long-suffering people of India."

## Automation: No Escape From It

A. C. BANERJEE

AUTOMATION is a dreadful thing to many a people who fear that if introduced, it will render many an employee jobless. The panic has further been aggravated by some politicians who find in the introduction of automation a sinister motive of the capitalists to exploit the labour. The simple folk are led to believe that if 10 men can perform the job of 100 men with the help of a machine, obviously 90 men will be rendered surplus. This is simple arithmetic. And this simple arithmetic plays havoc in the minds of simple folk, particularly when they are afraid of not getting alternative jobs. It is, therefore, understandable that in the absence of job opportunities in our country automation shall be resisted more

vigorously here than in the west where the employment market is rosier.

Before we comment on the necessity of automation we must first of all know: What is automation? Automation is in fact a device for eliminating human energy. For any activity energy is required. A writer writing a book requires energy to move his pen so also the energy of a group of men is required to pull a heavy load. The human energy which is composed of manual labour has gradually been eliminated by the passage of time. Men in the early days used animals' energy to draw carts which was beyond the capacity of human labour. It was gradually replaced

by non-human energy. That was the first industrial revolution when steam engine, electric locomotive etc. were invented producing abundant energy to pull loads beyond the capacity of hundreds and thousands of human labour. Locomotive inter alia was in fact an automation in the first industrial revolution while in the threshold of the second industrial revolution we are having electronic computers and data processing machines which are eliminating not only physical but also mental labour.

### Unfounded Fear

As labour saving devices of the first industrial revolution have stayed so also the more sophisticated labour-saving devices of the present industrial revolution will stay. There is no escape from it. However, the fear of people about the redundancy of employees created by the automation has to be eliminated. If we look back to history we find that when locomotive was introduced in England the hackney-carriage owners, apprehending that the railways shall make them redundant, demonstrated before the British Parliament and smashed the first locomotive. Now, a century after, the British Railways directly employ people many times more than hackney-carriage owners. Furthermore, indirectly thousands of men are earning their bread by the grace of the British Railways. When the typewriter was introduced it was feared that the handwriting clerks shall lose their job but we now see that the number of the typists and people engaged in the typewriter trade and industry far outnumber the number of such clerks. Therefore, we see, how wrong it is to assume that the machines create unemployment.

If we peep through our window we find that there are 55,000 computers in the USA, 5,000 in West Germany, 4,000 in Japan, 3,200 in the UK and 2,800 in France, against only about 100 in India. The Bhabha Committee, appointed by the Government of India in the year 1965 opined that within the next 10 years India would use about 5,000 small and 500 medium-sized computers. Out of the present 100 computers used in India 30 are in research organisations, 70 are in the railways, the LIC and private organisations used mainly for data processing and routine accounting work. Therefore, the bogey of accelerated automation in our country like India is not valid. If the USA with 55,000 automation is not redundant with labour, why India with only 100 automation shall be worried about it? In fact, what we are having in India is only outdated automation which has long been scrapped in the USA. Be-

fore taxing our minds with the worries of automation in India we shall have to see what is its effect on the labour force in the USA where the largest number of such machines are in use.

No doubt in the initial stages of automation in the USA partial unemployment amongst certain categories of workers and in some areas have occurred. But these undesirable results have successfully been removed:—

(i) By the government's policy for regional development.

(ii) By training of the redundants in alternate jobs by the government, private companies and social organisations.

(iii) By the unions' attrition type clause.

"Attrition" means normal reduction of the working force due to retirement, death or quitting of jobs. When in a company workers are reduced due to attrition it appoints new workers to replenish the working force. The unions of the USA, particularly in the railways, newspaper and longshore industries, in their collective bargaining steps, under the "attrition-type" clauses prohibits firing of the workers due to installation of automation. The workers displaced by automation are kept in a "reserve force" and when vacancies arise through "attrition" the company instead of appointing new faces adopts workers from the "reserve force" and adopt them in the jobs after giving adequate training.

### Increased Productivity

In fact, automation in the USA has increased the productivity per man-hour so spectacularly that the rising prosperity has entailed abnormal demand of "services" industries such as educational institutions, medical services, roads and bridges, parks, swimming pools, recreational resorts etc. which cannot roll out of automated factories. The economy of the USA, during the past decade has expanded so rapidly that it has absorbed all the persons who were reduced by automation plus 25,000 additional people who came into the labour market every week; furthermore, it also absorbed a big chunk of the existing unemployed persons as the existing industries expanded their market rapidly thereby erecting more jobs. It is hoped that with more and more automation the workers shall gradually be shifted from factory to services industry. This change is now discernable in the pattern of the USA's labour force. In the USA 43 per cent works in factories and 50 per cent are engaged in

the services sector compared to 20 per cent and 10.5 per cent respectively of India. The technologists foresee that in the year 1980 the services sector shall engage 75 per cent workers and the factories 18 per cent. People in the USA are now enjoying more leisure due to automation; they retire early, enter late in job, have more holidays and less working hours.

When looms weave by themselves man's slavery shall end, so said a Greek philosopher. When looms have really started weaving by themselves we in India are having a wrong conception about its effect. The cry against automation is more political than economical and in India usually concentrates on two points:—

(i) It is a tool of the monopoly capitalists for exploitation.

(ii) In an underdeveloped country such as India if a few automated factories with few workers can overflow markets with goods the rest (majority) of people shall never get a job.

### Wrong Conception

Now, to say that automation is a tool of the monopoly capital is wrong when we find that government undertakings such as the LIC, Railways etc. are themselves installing automation; furthermore, when Bharat Electronics Ltd (a Government of India undertaking) has itself pioneered to manufacture automated machines then accusing the monopoly capitalists is politically motivated. Not to speak of our government but all the communist countries have adopted automation.

The communists who talk so loudly against automation, as Sir James Lindsay once quipped, will be the first to install automation in India. About the second objection that in an underdeveloped country such as India automation will not allow people to find job, it is not often understood that if with the existing input of men and materials products can be multiplied, the surplus production shall reduce cost and create more demand of the goods thereby increasing labour force. Suppose the Hindustan Steel Ltd with the existing labour force can, say, double its production by automated machines, in consonance with the productivity of the USA or Japanese steel-makers, who shall gain by it? Surely the country.

It is, therefore, prudent to invest a further capital of say Rs 40 crores to automate the Hindustan Steel Ltd than to lose Rs 40 crores yearly. Increased production by automation will surely raise peoples standard of living and in-

crease the demands of schools and colleges, parks and swimming pools, hospitals, hotels and sundry services industries creating enormous demand of labour in services sector. At present in India 20 per cent works in factory, 19.5 per cent works in agriculture and only 10.5 per cent in services sector. It is obvious that the anti-automation critics underestimate the job potential of the services sector and we can reasonably say that the services sector can absorb in India as much as 50 per cent of the labour force in the near future without disturbing the job potential due to automation.

The automation is synonymous with technological development. Whether in industry, agriculture or services sector contribution of the technologists are responsible for the present standard of living of the human being. The goods consumed and services enjoyed by us were beyond the dream of anyone a hundred years back. And with the development and application of further technology we do not know where human being shall stand a hundred year later. The most fantastic quality of automation is that, unlike the machines of the first industrial revolution which replaced only pure manual labour, it is also replacing mental labour. The calculator was the first effort to eliminate mental labour and now sophisticated electronic computers can perform the jobs of hundreds and thousands of brains in a trice. Automation is, therefore, used not only for producing goods but for research purposes, collecting information and decision-making etc. which helps the research fellows and management.

### Boon for Research

Because of the mass production of materials and use in data processing in sales, production, materials management and accounting jobs like payroll, wage bills etc. the application of automation in research and education is innumerable and in fact a necessity in this age of massive projects and plans. All the modern plans, projects, research etc. are carried on in a big scale and without automation it is impossible to collect thousands of data, analyse them and come to a conclusion quickly and correctly. In the field of education and research the computers are used for solving problems of logic and chemical equilibrium, quantitative concepts in social science and economics; in astronomy, nuclear physics, meteorology, space travel, crystallography etc. In research most of the time of a research worker is spent in collecting, sorting and probing large number of data in order to get an idea, the computer does all these jobs at a very fast

speed giving accurate results thereby saves his time for more creative thinking. The use of computers in research work cannot, therefore, be overlooked.

We find that automation does not create unemployment but only shifts employees from production to services sector. Automation is also essential for research and quicker services. Hence, further automation in India should be justified particularly in research and educational institutions. In production field, however, the automation should be installed in a phased manner where labour is plenty, without creating

much social upheaval. In export-oriented industries automation should be installed to compete in the international markets. When all the countries of the world are using automation we cannot lag behind, what we shall have to see is that it is suited to Indian environment for which phased programme of automation is suggested. The fight against the machines of the first industrial revolution failed so also the quixotic fight against the automation—the product of the second industrial revolution—shall also fail. And if we do not defeat the motivated anti-automation protagonist we shall be responsible to the posterity for the backward life they shall lead.

## Global Marketing a Challenging Task

D. S. ARORA

OVERSEAS SALES carried through careful product planning and development, dynamic policy, scientific packaging and efficient distribution, supported by continuous market research, generous sales promotion and advertising effort not only earn larger profits for a company but also contribute to its image abroad.

Global business is a fairly heterogeneous and specialised activity, for an export market is composed of a variety of people speaking different languages, following a great variety of customs, having widely diverse sets of wants and practising different trade policies, tariff regulations and monetary systems. Not only this, there are regional groupings, ideological and doctrinal divisions, varying technological advances, changing environments and population explosion, which make it more complex and a challenging task.

In this enlarged world consisting of completely distinct markets with varied cultural, social, geographical and political set up, it is a mere illusion to conceive that a product, which has sold successfully in the home market, would necessarily be accepted abroad. Consumer preferences for goods in world markets differ widely depending upon their social and cultural behaviours which are reflected in their choice for products based on colour, style, design, brands, precision, quality, etc. For instance, people in Italy are design conscious. Therefore, an exporter, who operates in this market, will not succeed unless his product is rich in design and style. Similarly, people in the USA prefer branded products, for they have little time for buying. The Belgians, on the other hand, are disloyal to brands;

they have enthusiasm for new products, and they also drop them quickly. The same is true with regard to colours in different overseas markets. In western Europe, people like soft shades; in African countries gaudy and bright colours are preferred. An exporter, while selling abroad, should therefore, closely look into the tastes of consumers constituting different markets and develop his products accordingly.

Knowledge of the customers in terms of their income, sex, age, family size, etc., is a very important factor, which an exporter cannot afford to neglect while extending his sales operations abroad. This information helps him in identifying different market segments and thus enables him to organise production to match the varying requirements of the people in an export market.

Channels of distribution also determine the success of a sales operation

abroad. They are like a pipeline running from the manufacturer to the consumer. And if it is not properly laid out, nothing would sell. In order to ensure a steady flow of goods and services in overseas markets, an exporter should be careful in his choice for distribution channels abroad. His decision in this context must take full note of the nature of products, market coverage, selling support, buying habits and alternate selling outlets available in foreign markets. Whether an exporter should sell directly or through wholesalers, agents, distributors, department stores, super-markets, etc., largely depends upon these factors. Sometimes, government regulations begin to operate in his choice of channel selection for distribution of goods abroad. For instance, in Saudi Arabia, it is only a Saudi who can transact business; on the other hand, in America any non-national can do it.

Another vital point, which needs particular attention of an exporter in global marketing is his competitor's activities abroad. For doing his business successfully in overseas markets, an exporter must know his competitors in terms of their products marketed or proposed to be introduced in the near future along with their prices, sizes, specifications, standards, packaging, as also the selling outlets, advertising media and sales promotion methods. Awareness of all these details would help the exporter in formulating vigilant export policies and enable him to compete efficiently abroad.

Pricing plays an important part in global marketing. In order to sell effectively in foreign markets, an exporter should have a dynamic price policy which should strictly follow his marketing objectives, consumers behaviour abroad in response to price variations as also the behaviour of the costs at different levels of output, and actual and potential threat of foreign

competitors. If an exporter with long-term objective in a foreign market is a new entrant in export trade and has yet to make his product acceptable to foreign buyers, he should be able to sell a little below his cost price. The export price should be calculated on the basis of variable costs, for in an export order, it is the relative profitability and not the overall profitability that matters. It should also be noted that in international marketing, it is not always the low price that decides a deal. On the other hand, it sometimes stands in the way of an export transaction. For instance, in most of the developed countries such as Switzerland and Italy a product with low price is taken as one of low quality and is thus rejected.

Packaging plays a significant role in global marketing. However, excellent a product may be, it would not stand any chance in a foreign market if it does not conform to international standards of packaging and presentation. While preparing a packaging plan for sale in an overseas market, an exporter must take into consideration, apart from marine perils and other hazards, the sophisticated marketing conditions abroad. He should avoid selecting colours for his package, which offend consumers' social and cultural feelings. For instance, a package with yellow colour will not sell in Venezuela for yellow is taboo in Latin America. Blue and white colours are a sign of mourning in south-east Asia and, therefore, any packaging having these colours will not sell with south-east Asians. Leaving aside the colours, approach of different groups of people demands different kinds of packaging. Buyers of shoes in the USA prefer folding type boxes whereas Britishers like card-board boxes. Further, in underdeveloped countries, one may like to packaging having domestic after-use but it is considered a nuisance in developed countries such as the USA.

### After-Sales Service

After-sales service is another factor, which provides a sound base for global sales. This is particularly essential in the case of engineering products. Therefore, an exporter of machinery and other capital goods, while selling in a foreign market, must ensure the availability of spare parts and service facilities in the local market so that if something goes wrong with the product it could be easily rectified without causing any delay or inconvenience to the customer abroad. In the absence of any after-sales service, an overseas operation would simply result in a business built on sand. It must be understood that when somebody purchases a machinery, he also

buys the services and parts which support the machine.

Communication of sales message to foreign customers is a very important factor which cannot be ignored in global marketing. Mere stocking of goods at different shops in overseas markets would not suffice, unless the consumers are made aware of the products and are stimulated to buy them. In order to promote sale of his goods in foreign markets, an exporter must, therefore, advertise his products through different advertising media locally available. In his selection of the various advertising media, he may, if necessary, consult some local advertising agency and ensure that his message reflects true understanding of the cultural background, preferences, choices and language of the country, where he is operating. It should also be ensured

that the sales message material conforms to legal requirements of the country, if any. For instance, in Germany, there are strict laws as to what can be said in an advertisement. In such cases, it would be desirable for an exporter to consult a local advocate before proceeding to advertise in the market.

Global marketing is thus a challenging task with multiple of market characteristics based on social, cultural, political and geographical diversities of the inhabitants all over the world. It provides fabulous marketing opportunities to a dynamic and enterprising exporter who can make his fortunes by greater concentration of planning and wider diversification of effort in terms of product planning and development, pricing, packaging, market research, sales promotion and advertising in each individual market abroad.

## Eastern Economist 25 Years Ago

JANUARY 11, 1946

Given the inflationary war finance and inadequate economic measures of the Government during the last five years, the black market inevitably became almost a parallel institution. The Government did nothing effective to check it; indeed, even on the currency plane, it continued to help it directly. Thus in Great Britain, in order to check black market, the issue of new high denomination notes was stopped in 1943; they were demonetized in May, 1945. The demonetization together with restrictions on cashing of uncrossed

cheques were calculated to check the operation of the black market. In India, on the other hand, the Government continued to issue high denomination notes on an ever-increasing scale to meet the demand for the black market operations. The proportion of Rs 100 and Rs 1,000 notes to the total notes issued rose from 32.1 per cent and 5.9 per cent respectively in 1939 to 38.0 per cent and 10.1 per cent at the end of 1944. At the end of 1944, Rs 100 notes in circulation amounted to Rs 382 crores and Rs. 1,000 notes to Rs 100 crores.

## WINDOW ON THE WORLD

## Inflation : A World Scourge

JOSSLEYN HENNESSY

LONDON:

THE OECD has just published a report, *The Present Problem of Inflation* (OECD, 2 rue Andre-Pascal, Paris 16) which, as I said here on December 11 is both magisterial and readably written, and which should be studied by every government ministry concerned with finance, planning, public spending and other economic activities and by every employer and trades unionist in all countries. On December 11, I summarised the OECD's diagnosis of the problem. This week I summarise the OECD's 22 recommendations for action, it being, of course, understood that the action appropriate will vary according to circumstances in different countries.

## I

## ACTION OVER 1½ YEAR

(1) All member countries should aim to restore at least the degree of price stability associated in the past with sustainable levels of employment and economic growth. To this end, cautious demand management policies are required. Excess demand should be eliminated and governments should be prepared, where necessary, to accept a temporary reduction in the rate of activity until there are signs that better price stability has been achieved.

(2) Where unemployment is rising towards unacceptable levels, attention should be directed to selective action in areas of high unemployment, rather than indiscriminate increases in public expenditure or general tax cuts. Within the framework of appropriate overall fiscal restraint, expenditure on government-sponsored manpower training and re-location programmes should be increased as much, and as quickly, as possible.

(3) Despite the difficulties, the search for effective price-incomes policies should not be abandoned; but this should be regarded as a long-haul operation unlikely to yield miracles. In the short run, temporary recourse to some form of price/wage control may be justified in the framework of an overall programme to deal with an acute inflationary crisis.

(4) Wages in the public sector should neither lead, nor unduly lag behind, wages for similar occupations in the

private sector. Prices in the public sector should be adjusted reasonably smoothly to rising costs — although there may be some scope for timing increases to fall at periods of below average demand pressures. Careful timing and the avoidance of abrupt price increases are also important when major changes are being made in e.g. systems of indirect taxation, agricultural support prices, etc.

(5) With prices rising at the present pace, there may be demands for some form of guarantee in real terms for incomes, social benefits, capital values etc. Where this is appropriate, rigid and quick-acting systems of price indexation should, however, be avoided, and preference given to more flexible arrangements, which allow account to be taken of the prevailing circumstances and the cause of the rise in prices.

(6) Recent moves to introduce new trade barriers should be resisted, and new action taken to reduce or remove remaining trade restrictions:—

(a) The remaining Kennedy Round tariff cuts should be brought forward to January 1, 1971 (or as soon as possible thereafter).

(b) Present efforts to reduce quantitative restrictions on Japanese exports in Europe, and on imports from all sources into Japan, should be stepped up.

(c) A start should be made on abolishing any government procurement procedures, which give open or hidden preference to domestic producers.

(d) Development aid should be untied as quickly as possible. The decision to give tariff preferences to the developing countries should be carried out.

The present world inflation provides a strong case for unilateral action and on tariffs, quotas, government procurement, untying aid, etc., taken conditionally, subject to the outcome of subsequent multilateral negotiations.

In putting together the elements of a policy package for immediate implementation, one should remember that the announcement of intentions to go ahead with measures even if they are only likely to bear fruit over the longer

run could, in itself, have a valuable psychological impact.

(7) The rise in food prices should be held by containing the rise of agricultural support prices and where possible reducing prices for products in surplus; greater resort to imports where these are cheaper than domestic products by adopting more flexible import tariffs; and the abolition of indexing by which farm prices are linked to other prices. Such steps should be backed up by action to ensure that price reductions are passed on to the consumer.

(8) The extent of existing government intervention in some important industrial sectors offers big opportunities for action. Direct financial aids, subsidised export credits, procurement regulations and technical standards are those fields for which government is directly responsible, and which therefore offer the best chances for short-run action, in some cases internationally.

(9) Governments should actively examine the implications of all their own activities on prices. Proposals for new legislation or administrative action should be accompanied by an assessment of whether they might affect prices and, if so, by an estimate both of their cost in terms of required tax revenue, and of their direct or indirect impact on the price level.

(10) All governments — and this means your government — should strengthen arrangements for watching prices at the international level. Those responsible for searching for means of enforcing legislation against restrictive business practices across national frontiers should be told to get on with the job on pain of losing their own jobs.

## II

## ACTION OVER LONGER TERM

(11) Governments should state their aims about prices clearly, and emphasize their intention to give priority to these aims in their economic policies. They should review the experience of the last few years in order to establish realistic medium-term targets for non-inflationary price behaviour.

(12) These targets should be based primarily on domestic considerations; the idea of just trying to do no worse than other countries is highly dangerous. Where appropriate targets for different countries, or groups of countries, prove to be incompatible with balance of payments equilibrium, governments should make timely adjustments in exchange rates.

(13) There is clearly scope for im-

provement in demand management policies. Here are some lessons from recent experience:

(a) Most generally — and perhaps most important — is the need for an evolution of political habits, which subject the implementation of demand management to short-term political lobbying and vote-catching.

(b) There has been an almost universal tendency to underestimate the buoyancy of private demand under full employment, and hence to over-estimate the speed and magnitude of the impact of restrictive fiscal and monetary action, and to overestimate the amount of expansionary action needed to prevent a slowdown developing into a recession. More even-keel policies with a generally greater restrictive emphasis are wanted.

(c) The need to give full weight to both fiscal and monetary policies so that they reinforce each other.

(d) The need for co-operation between central and local authorities in fiscal policy; and value (subject to the necessary safeguards) of incorporating a margin of planned flexibility in public expenditure programmes, which can be used selectively, and of having some discretionary powers to vary tax rates and social security contributions, according to conjunctural circumstances.

(e) The need to improve the techniques of monetary management, particularly those concerned with the increasing impact of international capital movements.

## Price-Incomes Policy

(14) Despite the difficulties, many feel that if the only alternatives are continuing inflation or an unacceptably high level of unemployment, then the search for some form of price-incomes policy cannot be abandoned. Experience shows, however, that a broader, longer-term and less immediately ambitious approach is necessary. Price-incomes policy should not be thought of as something that can be turned on and off according to the fluctuations in the balance of payments or the fortunes of the major political parties. Experience also shows that it is not possible to give any specific recipe for success. Further, the need for, and the nature of, such a policy varies greatly from country to country. But it nevertheless seems likely that an effective policy will require guidelines as to what increase in money incomes and price behaviour would, in the prevailing circumstances, be consistent with the collective interest. It would also seem necessary to:

(a) Rally widespread support in the

political parties, trade union and employers' organisations, based not on short-term balance of payments considerations, but on recognition of the need, on general economic, social and political grounds, to avoid high and accelerating rates of inflation. This requires closer co-operation between employers, trades unions and government.

(b) Encourage changes in institutions and attitudes, so that the guidelines can be brought to bear at the level at which price and income decisions are effectively taken. These changes apply as much to the employer's role in granting inflationary wage increases and passing on higher costs into prices, as they do to the need for moderation on the part of organised labour.

(c) Build up a rational framework for collective bargaining about, e.g., the definition of bargaining units, procedures for settling disputes, the legal status of collective agreements, the timing of negotiations, etc.

(d) Promote smoother and better balanced growth to prevent or mitigate the distortions in income structure inherent in inflation, which undermine efforts to build up incomes policies.

(e) Redouble efforts to stimulate competition and eliminate monopolies both of producers and workers.

## III

## GOVERNMENT ACTIVITIES

Governments have accepted a vast range of responsibilities, and their influence is felt throughout the economy. At the same time, the processes of inflation are deeply buried in innumerable individual decisions taken all the time in the public and private sectors. A new initiative is therefore needed in the fight against inflation: a wide-ranging review of the price-raising implications of government action (or lack of action) over the whole field of its activities.

(15) There is a need for more forward-looking trade policies.

(a) At the appropriate moment, steps should be taken to reduce or eliminate post Kennedy Round tariffs. There should be a vigorous attack on non-tariff distortions to trade: quotas, export subsidies and subsidised export credits, export restraint agreements and scores of technical and administrative practices.

(b) Advantage should be taken of the great potential supply possibilities in the developing countries, particularly for labour-intensive manufactured products. Preferential tariff treatment for them is only a first step;

beyond this, there is the need to remove non-tariff barriers, and the question of financing the necessary investments, adaptation of domestic industries, etc.

(16) Governments should encourage real competition of all goods and services, nationally and internationally. Legislation against restrictive business practices should be tightened up and enforced everywhere. More use could be made of less formal enquiries into costs, prices and productivity in industries and sectors where performance seems to lag. Consumers should be encouraged to be price conscious.

## Long-Run Objective

(17) On food and agriculture, short-run suggestions already made — notably concerning agricultural support prices and lower-levels of self-sufficiency will, to some extent, have to be regarded as longer-run objectives. In any case, agricultural policies should be modified to improve the structure of the industry and, where necessary, direct support should be given to farm incomes rather than subsidising prices. Such a change would use public money more constructively and should, over time, reduce the total costs (direct plus indirect) of agricultural policies.

(18) Similar consideration apply where exaggerated stress on national security or social problems has led to defensive and protectionist policies in other sectors e.g. textiles, shipbuilding and heavy engineering, coal mining, etc. Emphasis should be shifted to seek out and encourage industries best fitted to exploit changing international trends in supply and demand. Present government policies towards technologically advanced industries have not so far been very successful and reappraisal is necessary.

(19) In construction, the public sector should boost rationalisation, both in its role as a large-scale purchaser from the industry, and in framing building codes. In distribution and services, the small inefficient enterprises are kept alive in many countries. Where it still exists, resale price maintenance and refusal to supply larger more efficient enterprises should be abolished. Tax systems should be revised to remove biases and reduce tax evasion which tend to perpetuate inefficiency in these sectors, and legal provisions or administrative arrangements which effectively limit international competition should be eliminated.

(20) In all the above respects, more emphasis should be given to prompt and positive adaptation policies: manpower training and retraining programmes; aids to geographical mobility,

and comprehensive regional and industrial policies. In elaborating these policies it should be recognised that cyclical fluctuations are to some extent inevitable, and that appropriate counter-measures, which may need to be selective, should be planned in advance. In this way they can help governments to resist political pressure for too early relaxation of restrictive policies.

(21) More effective social policies complement structural adaptation and are needed to provide adequate protection to those most vulnerable to restrictive fiscal and monetary policies; and they may also be necessary to the evolution of effective incomes policies. At the same time, social expenditure on education, health and urban renewal are absorbing a rapidly rising share of national resources. However welcome on social grounds, efficient management and control of these expenditures is essential. Much more should be done to apply better techniques of cost bene-

fit/analysis to social expenditure, as is already done in several countries. Existing arrangements to redistribute income (and wealth) from the rich to the poor could, over time, be made more effective, and hence possibly less burdensome.

(22) Cost savings should be possible in other fields of public expenditure (e.g. defence, and above all prestige projects such as national air and shipping lines, etc.); more carefully selected charges to users of public services in education, health, roads, recreational and cultural facilities, etc., are needed in most countries.

**My apologies:** In order to avoid offending national susceptibilities the OECD's report is drafted in the most tortuously guarded language, which often calls for considerable reflection before one grasps what is meant. The OECD is not responsible for the crudity of my efforts to make tactlessly clear what they have left diplomatically obscure.

## Chill Wind Over the Common Market

E. B. BROOK

VIENNA:

AT THE end of last year the European Common Market was basking in the glow of universal praise for having just decided at The Hague meeting to admit the principle that its membership could be widened; at the end of this year it feels the chill wind of criticism from within Europe for just having failed to take three major decisions and from outside Europe for maintaining so narrowly and short-sighted protectionist policies and methods that it is leading the world back to tariff wars and endangering the international system of multilateral, reciprocal and non-discriminating trading relationships painstakingly built up over the past 30 years. Equally shattering for the Common Market's self-esteem is the strong doubt thrown on its "dynamic" advantages, it having been argued that members of the OECD group apart from the Market countries, Japan and the USA have developed more steadily and further in the last 12 years than has the Market itself.

With so heavily loaded a charge list against west Europe's most glittering post-war achievement it is necessary to be a little detailed in examination. All that last year's willingness to enlarge the Market has produced so far is a pilgrimage of applicants to Brussels from most of the members of the European Free Trade Association and the unattached countries. After nearly a year of discussions, in a few cases far

longer, not one of them has been admitted to the Market nor appears likely to gain either membership or association for some time to come. Willingness abounds; admittance remains remote. The prospect for the major applicant, Britain, a rejected suitor again seeking favour, is that if it succeeds at all it will be against stiff terms of entry the cost and worthwhileness of which is raising such debate in Britain that continental Europe begins to wonder once again if the UK really wants to come in after all.

As to the Market internally, it has signalled its cautious conservatism once again by being unable to accept the Werner plan for monetary reform and a Common Market currency; it has reached no decision about the time Britain should be allowed for paying its full share to the common budget and revision of the Market's common agricultural policy has again been deferred. The Market faced three decisions and failed to take any.

Internally, the Market is shying away from its two most painful decisions, whether to surrender the national right of veto within its Council of Ministers which enables the top structure to remain rigid, bureaucratic, resistant to change—in fact, thoroughly continental European—and whether to move to a directly elected European parliament that would remove the veto as a national safeguard and undermine national sovereignty. France

is fully opposed to both moves and it is not uncharitable to suspect that the principal reason why France is willing to consider British membership on stiff terms is that Britain also is jealous of its national sovereignty and would be at France's side in insisting on retaining the national veto in an enlarged Council of Ministers.

As it is, however, the Market staggers forward, checked by these national vetoes, rather than genuinely progressing. The stultification of its machinery has been shown by the strike this month of its administrative personnel, European civil servants who see salaries and conditions of work in their own national services steadily improving while those of the Common Market service is cramped into slow improvement by the combined niggardliness of its six members.

### Trenchant Criticism

Criticism of the Common Market from outside Europe is a good deal more trenchant. While President Pompidou has told the OECD in Paris that protectionism would not only lead to a generalized economic showdown at a time when the principal problem is to control inflation and reduce unemployment and criticized once again the US trade deficit while the dollar is maintained as an international reserve currency, the USA has, indirectly, had a good deal to say about Common Market protectionism, lead by France.

The effect, particularly, of the Common Market's agricultural policies is to keep lower-priced US farm products out of Europe while it disposes of "unsaleable surpluses" through massive subsidies.

Indirectly, also, the Common Market makes difficulties for US commerce by its restrictions on imports of Japanese manufactures, especially textiles, which results in their being channelled in bulk to the USA which has reacted with quota restrictions which are still the subject of negotiation between Washington and Tokyo.

The world has gone a long way backward since the initiative of the Kennedy Round; the efforts of GATT to persuade its members to begin reducing non-tariff barriers to trade have so far had little effect.

There is need for a new form of international negotiation over trade and for it to be started soon. The means for liberalizing the trade system appear to require a new code of international conduct, new indications for administrative practice and new principles against which to assess damage to trade interests of states.

# The moving finger writes

WALTER PATER found Mona Lisa's smile inscrutable. Very much more recently, and in a rather matter-of-fact age, the suggestion has been made that the look on the good lady's face really indicated a diseased liver. When Mrs Indira Gandhi smiles, there is even less room for speculation. Her smiles are mostly of two kinds. Occasionally, it is smile of a cat which has just swallowed cream. More frequently, however, it is the smile of a cat which wants others to think that it has just swallowed cream. At her press conference on December 29, her smile was generally of the latter quality.

Mrs Gandhi knows that she is appealing to the electorate from a position of weakness and not of strength. She knows too that others know this. But she would rather die than concede the fact. This explains her peevishness when a press correspondent asked whether her government could, in the present circumstances, be described as a care-taker government. Mrs Gandhi raised her voice and declared that hers was certainly no care-taker government, but a wholly regular one which could and would function with full authority and in a normal manner.

Her contention was that since her government had not been defeated in the out-going Parliament, its status after the dissolution of the Lok Sabha could not be described as that of a care-taker government. This of course is a very narrow technical argument. As she herself has conceded formally and publicly, her government had been finding it difficult to function effectively in or through Parliament and this, in fact, was one of the reasons given by her for dissolving the Lok Sabha and seeking a premature poll. This implies that at the time the Lok Sabha was dissolved, her administration was in office without quite being in power. Hence, its continuance pending a general election is clearly on sufferance. A less accommodating President of India could, in fact, have justifiably insisted on an all-party council of ministers advising him on the administration of the country during the *interregnum*.

While not quite declaring that her party would go it alone, Mrs Gandhi indicated that her thinking for the present was that she would seek no formal electoral alliance with other par-

ties at the national level. It is obvious that she has qualified her stand sufficiently to provide room for her party coming to all kinds of arrangements of convenience in the states.

Although the Prime Minister has decided to campaign under the twin flags of socialism and secularism, she showed an extraordinary unwillingness to commit herself to the position that her party would have no truck with communal organisations in fighting the election. On the contrary, she permitted herself the folly of rationalising the existence of Muslim political organisations by referring to what she described as legitimate Muslim grievances.

In the matter of 'like-minded parties', the Prime Minister was obviously anxious to avoid having to give a straight reply to my question whether the DMK's quixotic 'language' policy would be relevant to the determination of her party's attitude towards co-operating with or seeking the co-operation of the DMK in the election. Her pompous declaration that everybody knew what her views on the language issue were was certainly no answer.

I was unsuccessful, again, in provoking her to declare that she would commit her party to a clean election campaign—clean, i.e., in the sense that the party organisation or its candidates would observe the legal limit on election expenses. To another question from me whether her party expected the business community to extend to it large-scale financial assistance for the election, her reply merely was that so far no such assistance had been received.

The Prime Minister chose to treat as a joke my query whether her party would seek election loans from the nationalised banks. She quipped that she had not thought of it and was therefore thankful for the suggestion. I do not grudge Mrs Gandhi this easy indulgence in banter, but I do assert that there is a danger of nationalised bank credit being availed of by the party in power in connection with the forthcoming general election. The Reserve Bank should therefore issue a directive to the nationalised banks that, from now on, they should not provide credit facilities of any kind to political parties or make personal loans or advances to

prominent politicians in general, and in particular, to those standing as candidates for the election. The Reserve Bank has been issuing from time to time directives to banks regarding almost everything under the sun and here is one occasion where it can usefully exercise its authority to prevent possible political abuse of nationalised bank credit.

The Prime Minister was particularly uneasy when she was interrogated on the present state of the economy. She hurriedly, sought cover behind the green revolution and stepped out of it only to suggest rather diffidently that even the industrial sector had not been doing too badly. On rising prices she was discreetly silent. But about employment she was less tactful. Mrs Gandhi said that the level of employment had gone up by 2½ per cent during 1970 as compared with the previous year. This, she claimed, suggested that unemployment was declining. The Prime Minister should get her aggregates right. Even granting that the volume of employment has gone up by 2½ per cent, the volume of unemployment must still be rising since the population is also going up by 2½ per cent. Mrs Gandhi evidently is better at dealing with persons than with percentages, which is a good thing for politicians so long as they do not venture to discuss economic statistics with a knowing air.

On elections for state assemblies, the Prime Minister was needlessly cagey, especially about West Bengal. It was not apparent however that she herself was not very enthusiastic about such elections being held along with the poll for the Lok Sabha. To my rather loaded question whether the various governors were expected to go by the wishes of the respective chief ministers in this matter or whether the Attorney General might be appealed to, the Prime Minister was good enough to say that, although she was not quite sure of the legal position she thought that a chief minister's recommendation would be accepted. For once, Mrs Gandhi is thus agreeable to governors doing unto chief ministers as she would have the President do unto the Prime Minister.

V.B.

## Trade Winds

### EXCISE DUTY ON SUGAR, ETC.

**THE COMMITTEE** of Chief Ministers of the National Development Council, which met recently under the chairmanship of Prof. D. R. Gadgil, Deputy Chairman, Planning Commission, broadly agreed that the additional excise duty on sugar, tobacco and textiles levied in lieu of state sales tax should continue, subject to such adjustments as may improve the elasticity of the yields from additional excise duties. The union Ministry of Finance will work out the detailed proposals. Replacement of sales tax levied on sugar, tobacco and textiles first came into operation in 1957. The arrangement gave rise to issues on which there was some difference of opinion between the centre and some of the states. A Working Group was set up to consider all its relevant aspects and evolve an acceptable formula. The working group consisted of Economic Adviser, Planning Commission as its convener and finance secretaries of Andhra Pradesh, Assam, Gujarat, Haryana, Madhya Pradesh, Mysore, Tamil Nadu, Uttar Pradesh, and representatives of the Ministry of Finance as its members. The discussion at the meeting of the Committee centred round mainly on the recommendations made by the Working Group. The Working Group had recommended among other things that the overall incidence of additional excise duties should be increased to 10.8 per cent of the value of clearance and not be allowed to fall below this level in future. It had also recommended that the ratio of 2:1 should normally be maintained between the yields from basic and special excise duties on the one hand and additional excise duties on the other. The Committee broadly agreed to these recommendations. Many of the chief ministers also felt that this increase of the incidence to 10.8 per cent should be brought about as speedily as possible.

### INDO-IRAN CO-OPERATION

The joint Indo-Iranian Commission for Economic, Trade and Technical Co-operation has recommended, that the possibilities of increased interchange of expertise and components between industrial units in the two countries having common foreign collaboration arrangements should be investigated. A communique issued at the conclusion of the third meeting at Teheran

on December 30, of the Commission expressed overall satisfaction at the progress made since its last meeting held in February and directed that the sub-committees and co-ordination and implementation committees should continue to hold frequent meetings at all levels before the next meeting of the commission which would be held in October. It said that contract details were being finalised which would conclude very shortly. These contracts would make a significant contribution to the long-term economic collaboration between the two countries. The commission also examined the new proposals that had been submitted in the field of industry trade and commerce and technical co-operation between the two countries. The commission felt that more intensive collaboration in the field of small-scale industries would be of mutual benefit. To this end, this country offered a number of fellowships, information on financing and management, the carrying out of area surveys in Iran and the supply of technical data on identified projects.

### TRADE WITH NEPAL

Consequent on the expiry of the mutually agreed arrangements between this country and Nepal, the union government issued on December 31, 1970 a notification providing for continued trade between the two countries as with other friendly neighbours. In addition, in view of the traditional economic and social links between the two countries, the government has provided for special concessions which will ensure supplies to Nepal of essential articles, including some which this country imports on payment of foreign exchange. The notification also provides for the free entry into this country without customs duties or quantitative restrictions of a wide range of products from Nepal.

### INDUSTRIAL TEAM TO W. INDIES

A team of three experts from the Small Scale Industries Development Organisation under the Ministry of Industrial Development left for Trinidad and Tobago in the West Indies and Surinam in Latin America on December 26, at the invitation of the governments concerned. The team is being led by Mr M.K. Chitre, Director (Chemicals) and consists of Mr H.M. Som, expert in mechanical industries and Mr K.V. Bansal, Industrial Eco-

nomist. During its two months' stay in these countries, the team will assess the potentialities of industrial development with special emphasis on small-scale industries. The team will also explore possibilities of starting joint industrial ventures with Indian collaboration in these countries. The visit of the team of experts to the two countries forms part of the Indian Technical and Economic Co-operation Programme of the Ministry of External Affairs.

### SUGAR POLICY

The union government has decided to continue the present policy of partial decontrol of sugar. The ratio of levy sugar to free sale sugar will be 60:40, instead of 70:30.

### INDIA-UAR SHIPPING PROTOCOL

A protocol on operation of Indo-UAR shipping was signed in Cairo on December 25 by Mr M. Sobhi, Chairman of the United Arab Maritime Transport Company, and Mr R. Tirumalai, Joint Secretary in the Ministry of Shipping and Transport and leader of the visiting Indian shipping delegation which arrived in Cairo on December 19. During its stay in Cairo the delegation met the UAR Minister of Transport.

### QUOTA IN I.M.F.

This country's quota in the International Monetary Fund has increased from \$ 750 million (Rs 562.5 crores) to \$ 940 million (Rs 705.0 crores) with effect from December 24, 1970. The Government of India has completed the payment to IMF of the sum of \$190 million (Rs 142.5 crores), 25 per cent in Gold and 75 per cent in rupee securities, for which Parliament had voted funds. This country has been a founder member of IMF. Its quota was last revised from \$ 600 million to \$750 million in 1966. As a result of the Fifth Quinquennial Review of quotas of IMF members, this country became eligible for a 25 per cent increase in quota from \$ 750 million to \$940 million. According to the Articles of the IMF 25 per cent of the increased subscription amounting to \$ 47.5 million was payable in the form of gold and the balance of \$ 142.5 million in the form of non-interest-bearing non-negotiable rupee securities. These payments have been completed. Gold of the value of \$47.5 million (Rs 35.62 crores) has been transferred to the IMF account maintained by the Reserve Bank of India. The Reserve Bank has also issued rupee securities to the Fund on behalf of the Government of India. For the payment of the gold subscription, the Government of India purchased gold in the USA

to the extent of \$ 30 million and for the balance used newly-mined and confiscated gold available with government. The increased quota will be the basis for allocation of Special Drawing Rights on January 1, 1971.

### PUNJAB: ANNUAL PLAN 1971-72

An outlay of the order of Rs. 68 crores has been approved by the Planning Commission for the annual Plan, 1971-72 of Punjab at a meeting between the Punjab government and Planning Commission. The meeting was presided over by the Deputy Chairman, Prof. D. R. Gadgil, and attended by Mr Parkash Singh Badal, Chief Minister, Mr S.S. Bassi, Minister of Irrigation, Mr Balwant Singh, Minister of Finance, and Mr R. Venkataraman, Member, Planning Commission. Out of the total outlay, the amount of central assistance is Rs 20.20 crores. The outlays (in Rs. crores) approved for the major heads are: Agricultural Programmes 10.6; Cooperation & Community Development 3.7; Irrigation & Power 34.1; Industry & Mining 1.5; Transport & Communication 8.7; Social Services 9.2; and Miscellaneous 0.2.

### BAN ON COPPER WIRE

The union Ministry of Industrial Development and Internal Trade has issued an order prohibiting the use of copper in the manufacture of electrical cables and wires except with the prior permission of the government unless such cables and wires are for export and are covered by firm orders. Another order issued by the ministry empowered the government to control the sale price of electrical cables and wires manufactured in the country. It has been pointed out that every dealer will have to display the price list at the place of his business and he will be prohibited from withholding the sale of electrical cables and wires, which are ordinarily kept for sale by him.

### TAX ON CHARITABLE TRUSTS

The Central Board of Direct Taxes have clarified that where a charitable or religious trust transfers a capital asset forming part of the corpus of its property solely with a view to acquiring another capital asset for the use and benefit of the trust and utilises the capital gains arising from the transaction in acquiring a new capital asset, the trust will not forfeit exemption from income-tax on such capital gains. This is because, in such a case, the capital gains will be regarded as having been applied to charitable or religious purposes during the relevant accounting year itself or within three months immediately following. The Finance Act, 1970, had made several changes in the

scheme of tax exemption of charitable and religious trusts. Under one of these changes, a charitable or religious trust will forfeit exemption from income-tax, if the trust funds constituting its corpus or income are invested in any concern in which the author of the trust or any substantial contributor or any of their relatives have a substantial interest.

### NEW PROTEIN UNIT

Mr K.K. Shah, union Minister for Health and Family Planning, inaugurated the "new protein" unit of Unichem Laboratories at Ghaziabad recently. He stated that there about 100 million pre-school children of the age below six years and more than this number of school children who had to be supplied with nutritious foods. The minister added that malnutrition among growing children and expectant nursing mothers in the lower socio-economic groups had become a public problem of great magnitude and special attention should be paid not only to production of high protein foods but also distribution to the groups which needed them most.

### A.D.B. LOAN FOR NEPAL

The Asian Development Bank today approved loan financing equivalent to US \$4 million for a jute development project in Nepal. The Bank's financing consists of two loans of \$ 1 million each from Special Funds resources for concessional lending and from ordinary capital resources. The concessional loan will carry interest at three per cent per annum while the loan from the ordinary resources will carry interest at 7-1/2 per cent per annum. Both loans, to be made to the Kingdom of Nepal, will be repayable in 12 years including a three-year grace period. The jute development project is an integrated programme for improving the quality of both raw jute and manufactured jute products. The project calls for improved raw jute production, modernization of two jute mills and upgrading of marketing and trading facilities.

### ANCILLARIES INDUSTRIES

The Maharashtra Economic Development Council held a preparatory meeting of the representatives of various chambers of commerce, industries associations and prominent industrialists in Maharashtra recently for evolving a programme for the "Conference on Ancillary Industries in Maharashtra: Development Prospects and Problems," which the Council is holding in the beginning of 1971. Mr Pravinchandra V. Gandhi, Chairman of the Council presided in the absence of Mr V.G. Rajadhyaksha, President of the Council

who could not attend the meeting due to illness.

### I.F.C. LOANS

The Industrial Finance Corporation of India, has fixed the normal rate of interest charged by it on all its rupee loans at nine per cent per annum with effect from December 5, 1970. This will be subject to the usual rebate of interest at the rate of 1/2 per cent per annum for punctual payment of instalments of principal and interest on due dates. This will raise the effective rate of interest on IFC rupee loans from eight per cent to 8 1/2 per cent to meet its increased operational expenses. The revised rate of interest will be applicable to all rupee loans sanctioned on or after December 5, 1970, and also to all rupee loans sanctioned prior to the said date in respect of which loan agreements have not been executed to small and medium-sized projects in notified backward districts.

### PIPELINES INDUSTRY

The Pipelines Inquiry Commission, set up by the Ministry of Petroleum and Chemicals and Mines and Metals, to inquire into the allegations of irregularities in the construction of Gauhati-Siliguri and Haldia-Barauni-Kanpur oil pipelines, has now extended the date for receiving information by persons acquainted with the subject matter of inquiry to January 25, 1971. The information, according to the notification, should be sent in the form of statement of facts set out in separate paragraphs each relating to specific issue and should be accompanied by an affidavit.

### NAMES IN THE NEWS

The Engineering Export Promotion Council has elected unanimously Mr Raunaq Singh, Managing Director of Messrs Bharat Steel Tubes Limited as their Chairman for the year 1971. The council proposes to ensure Rs 250 crores worth of exports at the end of the fourth Plan — the target set for engineering items. The need for a man of Mr Raunaq Singh's drive therefore, was there. His close association with the industry spans three decades and his commitment, to exports is total and irrevocable. This is illustrated by the performance of Bharat Steel Tubes Limited whose exports last year aggregated to Rs. 3 crores or 40 per cent of the company's total production. He is the Chairman of the Haryana Chamber of Commerce, Executive Committee Member of Indo-American Chamber of Commerce; Punjab, Haryana and Delhi Chamber of Commerce, Indian Engineering Association, etc. He is also a member of the Central Advisory Council on Trade

## Company Affairs

### PUNJAB NATIONAL BANK

THE DEPOSITS of the Punjab National Bank on December 31, 1969, stood around Rs 391.09 crores including Rs 57.57 lakhs towards employees' security deposits held by the bank. Fixed deposits accounted for over Rs 171 crores, savings bank deposits Rs 138.13 crores and current accounts and contingency accounts around Rs 81.37 crores. Advances on that date stood around Rs 226.53 crores. Net profit of the Punjab National Bank Ltd., before nationalisation for the period of January 1, 1969 to July 18, 1969 was around Rs 72.93 lakhs out of which a sum of Rs 46 lakhs was provided towards the payment of bonus to staff and the balance of Rs 27.69 lakhs was transferred to reserve fund. Net profit for the period July 19, 1969 to December 31, 1969 was recorded at Rs 85.78 lakhs out of which Rs 38 lakhs was separated towards bonus to the staff. A sum of Rs 18 lakhs was transferred to reserve fund. The balance of Rs 29.78 lakhs has been transferred to the government in terms of Section 10 (7) of the Banking Companies (Acquisition & Transfer of Undertakings) Act, 1970.

### CENTRAL BANK OF INDIA

The working of Central Bank of India for the period July 19, 1969 to December 31, 1969 resulted in a net profit of Rs 47.41 lakhs. Net profit of the Central Bank of India Ltd for the period January 1, 1969 to July 18, 1969 was at Rs 61.66 lakhs. A sum of Rs 62.03 lakhs has been transferred to reserve fund in terms of Section 17 of the Banking Regulation Act 1949. Another amount of Rs 9.48 lakhs has been transferred to reserve fund in terms of Section 3 (6) of the Banking Companies (Acquisition and Transfer of Undertakings) Act 1970, out of the net profit for the period July 19, 1969 to December 31, 1969. The balance amount of Rs 37.93 lakhs has been transferred to the government in terms of Section 10 (7) of the Banking Companies (Acquisition and Transfer of Undertakings) Act, 1970. During the year 1969, increase in deposits was recorded from Rs 433.27 crores to Rs 500.75 crores. During that year advances increased from Rs 296.27 crores to Rs 357.74 crores. The number of branches of the bank increased from

504 to 673, showing a record number of increase during one year.

The bank had planned a multi-pronged drive to reach an overall target of Rs 500 crores of deposits which it was able to achieve. Rural offices of the bank extended their deposits campaign to small farmers and artisans. The bank amended and liberalised rules relating to opening of accounts in order to attract deposits from the common people who were traditionally accustomed to invest in gold ornaments or spend the surplus funds on marriages and festivals. There was also a marked improvement in the bank's efforts to extend credit to small scale industries, agricultural sector and exports sector. Advances to small scale industries increased from Rs 25.25 crores towards the end of July 1969 to Rs 30.97 crores towards the end of December 1969. Similarly during the period the agricultural credit increased from Rs 6.89 crores to Rs 22.44 crores. Advances to the export sector increased from Rs 10.16 crores at the end of July 1969 to Rs 18.41 crores towards the end of 1969.

### BANK OF BARODA

Bank of Baroda has reported, its working after nationalisation covering the period from July 19 to December 31, 1969. Its deposits have been reported at Rs 354.91 crores and its advances at Rs 233.81 crores. The number of branches has gone up by 100 to 433. The profit for the period has been recorded at Rs 34.32 lakhs. However, the profit for the year as a whole has added upto Rs 56.16 lakhs in 1969. Bonus to employees during the year amounted to Rs 63.81 lakhs. The overall growth rate of deposits has been 12.7 per cent. The share of current account deposits is 17.90 per cent, of fixed deposits 55.35 per cent and of savings 26.75 per cent. The share of urban branches has come to 82.26 per cent. Advances of the bank have increased by 19.4 per cent. A little over one-fourth of the bank's advances were given to agriculture, small-scale industries, exports and other neglected sectors. The share of agriculture in the total advances was 5.8 per cent with Rs. 12.38 crores outstanding against 19,834 accounts whose aggregate sanctioned limits amounted to Rs 22.71 crores.

The share of small industries was about Rs 7.7 crores.

### BALLARPUR PAPER

Mr L.M. Thapar, Chairman, Ballarpur Paper and Straw Board Mills Ltd told the shareholders at the annual general meeting held recently that production of paper during the year 1969-70 was around 92,000 tonnes, Ballarpur Division contributing more than 51,000 tonnes, an increase of 3,000 tonnes over the previous year. The company, he added, achieved this increased production through improved productivity and scientific management of men and machines. Mr Thapar pointed out that in view of the shortage of paper the company had embarked on a crash programme as an emergency measure to increase production by speeding up the existing machines. The crash programme he pointed out, is a stop gap measure and it will increase the existing paper production in the country marginally by about 130,000 tonnes for the industry. The real solution involved the creation of further capacity for paper production.

Mr Thapar, pointed out that the central and the state governments do not seem to realise the gravity of the situation. The industry, he added has been trying to impress upon the authorities to evolve an integrated paper policy, so that the industry may be able to play its assigned role in the national reconstruction. The Industrial Policy of the government with its prejudice against large industrial organisations has become a major impediment in the growth of this industry. Much of the progress in industry, he pointed out, would depend upon the initiative of the large units which account for nearly 80 per cent of the paper production in the country. These units alone have the resources, managerial skill and the know-how to produce paper on large-scale and at relatively less costs. To put restriction on development and diversification of these organisations would deprive the economy of the necessary dynamism and vitality which are badly required at present, he added. The paper industry requires nearly Rs 345 crores, to raise the installed capacity from existing level of 760,000 tonnes to 1,130,000 tonnes by 1973-74. He added that the financial institutions should be a little more accommodating.

Mr Thapar stated that increasing royalty rates on bamboo and the prices of other forest products have also become a serious problem for the industry. Similarly prices of other raw materials such as chemicals and

dyes have also been increasing. Electricity rates, transportation costs and wages have also resulted in an increase in the cost of production. To meet this situation the industry will have to adjust prices so that it is in a position to plough back its earnings and generate resources for any capital investment.

### SIEMENS INDIA

Siemens India Ltd proposes to issue for public subscription of Rs 60 lakhs in 600,000 equity shares of Rs 10 each at par and 20,000 (8 per cent) first mortgage redeemable debentures of Rs 1,000 each at par. The company has an authorised capital of Rs three crores in three million equity shares of Rs 10 each and an issued and paid-up capital of Rs 1.20 crores. The present issue is for Rs 1.20 crores, of which shares of Rs 60 lakhs will be allotted to Siemens Asia Investment AG, Zurich, Switzerland, and a sum of Rs 60 lakhs has been received by the company in advance for this allotment of shares. The company has set up a new factory at Kalwa, near Bombay and expanded and diversified production at its factories at Worli and Andheri (Bombay). The proceeds of the present issue of equity shares and debentures will be utilised to provide for working capital, finance for the expansion and diversification of production and to repay some of its short-term bank borrowings. The company has applied for an industrial licence for the manufacture of power line carrier equipment, railway signalling equipment and electronic equipment for power engineering purposes.

### DELHI CLOTH MILLS

The directors of the Delhi Cloth and General Mills Co Ltd have decided to issue bonus shares in the ratio of four equity shares for every five equity shares held. The company's paid-up capital is at present Rs 9.66 crores and bonus issue will help capitalise Rs 7.73 crores out of the general reserve, which stood at Rs 10.97 crores on June 30, 1970. The company also has plans to increase the capacity of the fertiliser unit at Kota. Already the expansion of the cotton textile units was in hand and another unit is to be set up at Basna on Ghaziabad-Hapur road in UP.

### RATHI ISPAT

Rathi Ispat Ltd entered the capital market on January 6, with an issue of Rs 22.23 lakhs made up of 132,300 equity shares of Rs 10 each and 9,000 (9.5 per cent) cumulative redeemable preference shares of Rs 100 each. The issue will close on January 15,

1971, or earlier at the discretion of the directors but not before January 8, 1971. The entire issue has been underwritten. The company has been formed to put up a 10-ton electric arc furnace to produce mild-alloy steel, ingots and billets as there is an acute shortage of these items in the country. The plant will be installed under the supervision and guidance of W.S. Atkins Pvt. Ltd. The plant will be located in Ghaziabad near Delhi. The company will commence production by June 1971.

### MYSORE CEMENTS

The Mysore Cements Ltd has announced a dividend of 9.5 per cent on redeemable preference shares and 12.5 per cent on equity shares. The gross profit has been placed at Rs 114.98 lakh of which Rs 47.16 lakhs has been provided for depreciation. The net profit has amounted to Rs 67.81 lakhs. Nearly Rs 34.8 lakh has been transferred to general reserve and Rs 10 lakhs to development reserve. Addressing the annual meeting of the shareholders at Bangalore recently, Mr D.P. Mandella, director, has stated that although the problems of the new plant have not been solved, production and sales have improved by 67 per cent and 77 per cent respectively over the previous year. While production cost has increased by Rs 10 per tonne, the price increase allowed has been only four rupees. The company has produced 3,70,000 tonnes of cement.

### HINDUSTAN LEVER

Hindustan Lever Ltd has executed an order from Russia for 800 tonnes of synthetic detergents in consumer packs. The FOB value of this order is around Rs 20.80 lakhs. This is the largest single order for synthetic detergents to be exported from India. Levers' Export House, Indexport Limited, negotiated this business through the State Trading Corporation of India with the buyers in Moscow.

### FOOD & INNS

Food and Inns Ltd is entering the capital market on January 13, with an equity issue of Rs 25 lakhs in 250,000 shares of Rs 10 each. The entire public issue has been underwritten. The proceeds of the issue will be utilised for financing the establishment of an egg powder plant at Chembur and for the purchase of egg producing poultry unit at Poona. The process and know-how have been developed by the Central Food Technological Research Institute, Mysore, and the plant and machinery is being fabricated by Larsen and Toubro Ltd in collaboration with Niro Atomizer of Denmark. The company's plant is expected to be commissioned

by the middle of next year. The project involves a total outlay of Rs 90 lakhs, including working capital of about Rs 10 lakhs. This egg powder plant is claimed to be the first of its kind in India. The production will be of the order of half a tonne of whole egg powder per shift per day. Most of the output is expected to be taken up by the defence services. The company has also acquired the sole selling rights of the popular "Madhu" brand of processed foods.

### NATIONAL-STANDARD DUNCAN

The working of National-Standard Duncan Ltd during the year ended June 30, 1970 has resulted in a gross profit of Rs 41.02 lakhs as against Rs 2.43 lakhs in the previous year. Sales have increased to Rs 1.71 crores from Rs 1.64 crores. Allocations include: depreciation Rs 8.24 lakhs, secretaries and treasurer's commission Rs 1.42 lakhs, development rebate reserve Rs 55,000 and taxation Rs 16.50 lakhs. The net profit works out at Rs 14.31 lakhs. The directors have transferred Rs five lakhs to machinery replacement reserve and Rs 9.50 lakhs to general reserve. They have proposed an equity dividend of 14 per cent which will be paid out of the general reserve and absorb Rs seven lakhs. The entire dividend will be tax free in the hands of shareholders. Production at 4,231 tonnes was higher than the last year's level of 4,030 tonnes. An additional capacity has been sanctioned by the government by issue of letter of intent and plans are in hand to implement this capacity in stages. Diversification of the product range is under consideration. A letter of intent has been received for the production of tyre moulds and plans are in hand to implement it.

### HINDUSTAN MOTORS

Hindustan Motors Limited has obtained the necessary sanction from the Controller of Capital Issues for the issue of 21,94,201 ordinary shares as bonus shares by capitalising a sum of Rs 1,55,300 from capital redemption reserve and Rs 2,17,86,710 from general reserve. The bonus shares will be allotted to those ordinary shareholders registered as on the end of February, 1971, in the ratio of one-for-five. Any distribution of shares or benefit of fractional entitlements to non-resident shareholders will be subject to the approval of the Reserve Bank. The bonus shares to be allotted, shall rank pari passu with the existing ordinary shares in all respects save and except that they shall not be entitled to participate in any dividend if declared for any financial year of the company prior to the financial year beginning April 1, 1970.

## REPORT OF THE AUDITORS

To

THE PRESIDENT OF INDIA :

1. We have audited the foregoing Balance Sheet of Bank of Baroda as of 31st December, 1969 and also the foregoing Profit & Loss Account of the Bank for the period 19th July, 1969 to the 31st December, 1969, in which are incorporated the returns of 81 Branches audited by us, 104 Branches audited by other auditors and the unaudited returns in respect of 244 Branches not visited by us, for the exclusion of which Branches from audit, concurrence of the Reserve Bank of India was obtained.

2. The Balance Sheet and Profit and Loss Account have been drawn up in forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that :—

- (a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank :—
- (i) The Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1969;
- (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account;
- (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
- (c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;
- (d) The returns received from the officers and branches of the Bank have been found adequate for the purposes of our audit.

| (2) As complete returns in respect of Pakistan Branches have not been received for periods beyond 30th June, 1965, unaudited returns as at that date only have been incorporated in the Bank's Balance Sheet as at 31st December, 1969. As no further information is available, the assets and liabilities in Pakistan have not been shown in the Balance Sheet under the individual heads but only the net book value thereof has been incorporated.                                                                               |                    |                   |    |
| (3) The figure of auditors' fees in the Profit and Loss Account for the period from 19th July, 1969 to 31st December, 1969 includes an amount of Rs. 3,54,900 being the audit fees for the additional audit of the account as at 18th July, 1969.                                                                                                                                                                                                                                                                                   |                    |                   |    |
| (4) These being the first statements of account of the Bank, the corresponding figures of the previous year are not given.                                                                                                                                                                                                                                                                                                                                                                                                          |                    |                   |    |
| (5) The Bank has been advised after the date of the Balance Sheet that Bills of Exchange amounting to DM. 10.5 million reported to have been discounted with some German/Swiss Banks are purported to have been endorsed/guaranteed by the Bank's London Branch and in respect of claims relating to some of these bills amounting to DM. 2.5 million, legal proceedings have been instituted against the Bank. The Bank has repudiated all alleged liabilities in respect of all such bills and claims/disputes arising therefrom. |                    |                   |    |
| TOTAL RUPEES ..                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                    | 6,15,50,70,094.46 |    |

## Auditor's Report to the President of India

1. We have audited the attached Balance Sheet of Central Bank of India as at 31st December, 1969 and also the Profit and Loss Account of the Bank for the period 19th July, 1969 to the 31st December, 1969 annexed thereto, in which are incorporated the returns of 255 Branches audited by us, 41 Branches audited by other auditors, 5 Branches in Pakistan for which unaudited returns as at 30th June, 1965 have been incorporated and the unaudited returns in respect of 377 Branches not visited by us, for the exclusion of which Branches from audit, concurrence of the Reserve Bank of India was obtained.

2. The Balance Sheet and the Profit and Loss Account have been drawn up in Forms 'A' and 'B' respectively of the Third Schedule to the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that :—

- (a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank :—
  - (i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1969, and
  - (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account;
- (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
- (c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;
- (d) The returns (except for Pakistan Branches—See Note (2) received from the Branches of the Bank have been found adequate for the purposes of our audit.

## COMPANY MEETING

# THE BALLARPUR PAPER & STRAW BOARD MILLS LTD.

## Speech of Mr. L. M. THAPAR, Chairman and Managing Director

The following is the Speech of Mr. L. M. Thapar, Chairman and Managing Director, read at the 25th Annual General Meeting of The Ballarpur Paper & Straw Board Mills Ltd., held on December 30, 1970.

Gentlemen,

To-day, for the first time, after my assuming the office of the Managing Director of your Company, I extend you a cordial welcome to the 25th Annual General Meeting.

1969-70 has been a significant year in the growth and development of your Company. As you will see from the Annual Report and Profit and Loss Account, already distributed amongst you, working results of the erstwhile "Shree Gopal Paper Mills Limited" have been fully incorporated therein, as Shree Gopal has completely merged into the Company with effect from July 1, 1969. Our family of shareholders to-day has grown in size and stature and I am sure, the future years would justify the trust and confidence that you have reposed in the Management in accomplishing their task.

Your Directors, after careful consideration, have recommended stepping up of the rate of dividend this year on Ordinary Shares to 15 per cent from 12½ per cent in the previous years. This is, as it should be, sharing the prosperity of the Company with hundreds and thousands of investors located throughout the length and breadth of the country. Generating 'surpluses' I have always considered as one of the most important objectives in corporate management, for this alone can result in a chain reaction of higher incomes, savings and investment and employment which is so essential for the social and economic upliftment of our community.

Our endeavour throughout the year has been to increase productivity and seek economies of scale through scientific management of men and machines. As a result, production of paper during the year increased to 92 thousand tonnes. Of this Ballarpur Division produced over 51 thousand tonnes against 48 thousand tonnes in the previous year,

representing an increase of 3 thousand tonnes. Shree Gopal Division accounted for the balance production figure of 41 thousand tonnes.

At the macro level of the industry as well, the production of paper has appreciably gone up to over 7 lakh tonnes. But this does not seem to cope with the existing demand for paper in the country. As it generally happens in a subsistence economy like ours, the supply gap appears to have been magnified beyond recognition, resulting in a general psychosis of shortages and higher prices and harassment for the paper consumers. It is undoubtedly an unfortunate situation, though not of the industry's making.

### Shortage of Paper

The shortage of paper to-day is not of a general nature. As the market reports would indicate, it is, more or less, confined to certain sections of paper alone, like writing and printing papers.

A number of factors have combined to bring about this situation in the country.

We no longer receive paper as gift from foreign countries. Our paper now sells abroad, in the East and West Asian Markets. And Government continues to buy over 20 per cent of the total paper production. Newsprint being in short supply, newspapers and periodicals now take away a fairly big slice of the white printing and writing paper. Lastly, whereas demand for paper has been increasing by about 10 per cent per annum, the rate of increase in output has been hardly 7 per cent.

Of these various contributory factors, I cannot think of even one which we can dispense with straightaway to relieve pressure on the existing supply

position. The only alternative, therefore, is to break the supply bottleneck by increasing production.

I may mention here, it is not as if we have been caught unawares by the existing gap in paper production. The industry did warn everybody about it well in time and, I am sure, had the Government been a little more sympathetic towards the working of the paper mills in mid-sixties, the country would not have been faced with the present predicament.

Be that as it may, your Company along with the other units in the paper industry have embarked on a "crash programme", as an emergency measure, to increase the paper output further by speeding up the existing machines. I am afraid, its impact may not be felt in the market before the end of the next year. There is always a time-lag between the procurement of machinery and equipment from local and foreign sources and the actual output. But what makes matters worse is that even at this time the industry is required to go through the same old procedure of publicising requirements of machinery and equipment locally and then after a lapse of over a month, make an application to the authorities concerned for importing it from abroad. It is a highly time-consuming process. And in the overseas markets also one cannot just buy things off the shelf. We have to wait and take our turn. The net result of all this is precious time wasted which neither the industry nor the country can afford to do, particularly under the present circumstances.

In any case, you would bear in mind, the "crash programme" is merely a stop-gap measure and it is expected to increase the existing paper production marginally by about 1.3 lakh tonnes. It may, at best, result in a delicate balance in supply and demand in 1972. The long term solution of the problem would be to push through all the preliminary

measures now for creation of further new capacity for paper production.

#### Industry's Problems

Regrettably, at a time when the crying need of the hour is production and more production, the Central and State Governments do not seem to have proper appreciation of the industry's problems and the formidable challenge confronting it. All these years we have been trying to impress upon the authorities concerned, to evolve an integrated paper policy so that the industry may be able to play its assigned role in the national reconstruction. The other day, I was reading through the editorial comment of a leading commercial weekly wherein it had been mentioned that "if the Government has bungled because of sterile doctrinaire considerations", the private sector should have risen to the occasion "to serve the community better at a time of scarcity of such a vital item of consumption as paper". Much as we would have liked to "rise to the occasion", the industry is unable to do so because of a number of limitations. Government having occupied almost all the commanding heights of the economy and with a plethora of outmoded controls, the industry cannot just go on its own to correct the imbalance in the demand and supply mechanism.

The industrial policy of the Government is one of the major factors impeding growth to-day. Its irrational prejudice against large industrial organisations — Our largest paper mill does not produce even half of the output of a paper unit in the West — has blocked new investment in the industry and kept the more experienced entrepreneurial class at bay. No note has been taken of the fact that if the large industrial houses had not acted with the dynamism and extraordinary sense of adventure, which they have undoubtedly shown despite the constraints of the licensing system, we might never have achieved the present stage in the industrial and economic growth of the country. Many of the enterprises they initiated during the last 20 years have become pride of the nation to-day. They have demonstrated a vigour and vitality worthy of any industry in the most developed countries.

In a developing country like ours, it is but natural that new industrial activity is pioneered by a small number of business organisations. These are the trail-blazers whose lead is followed subsequently by others in increasing numbers. In the early stage of development of any industry, therefore, there will be only few business units, but the position changes with the development of the demand for the product and subse-

quent entry of the new units into the same field of production. The much abused term "monopoly and concentration of economic power" therefore represents only a stage, an inescapable stage at that, in the early stages of industrial development of a country. This has been the experience of most of the advanced countries.

We must take note of the fact that to-day 80 per cent of the paper produced in the country is accounted for by the larger units. They alone have the resources, managerial skill and the know-how to produce paper on large scale and at relatively lesser costs to the economy.

To put restrictions on development and diversification of these organisations would tantamount to depriving the whole economy of the necessary thrust and vitality which it badly requires at present. It is only when we produce more, efficiently and economically, can the consumers hope to get a fair deal. In this context, therefore growth must have the overriding consideration with the Government. We, in the industry, would be only too glad to sit with the authorities to identify the constraints and devise effective mechanism to overcome them. I am confident the industry would not be found wanting.

#### Growth Potential

The paper industry in this country has a tremendous potential for development. A nation's prosperity to-day is judged by the standards it has achieved in consumption of paper and allied products. In India, the per capita consumption of paper is less than 2 kilogrammes per annum and it compares very unfavourably with the developed countries of the West like the United States where the consumption per head is approximately 200 kilogrammes. I believe we should be able to plan to catch up with the U.S. standards in the next 50 years and raise the country's paper production by at least 300 times to about 130 to 140 million tonnes from the existing figure of 0.7 million tonnes.

This may appear to be a utopia to come, but it is certainly a target which we can hope to achieve in the future years. Technology is changing fast and new high yield pulping techniques are being developed all over the world. In addition to bamboo, there are other unconventional raw materials like bagasse, hard woods, etc., which can be systematically utilised for paper making. Therefore, in the coming years there are distinct possibilities of our producing paper which will raise our country's consumption rate closer

to that obtaining in the developed countries. The industry needs support and understanding to meet this challenge of the coming decades.

Paper is a consumer industry, but what is very often overlooked is that the industry is also highly capital-intensive. It requires about Rs. 325 crores to raise the installed capacity from existing level of 7.6 lakh tonnes to 11.3 lakh tonnes by 1973-74, as has been envisaged by the Planning Commission. At the existing rates of interest the cost of raising this capital is very high and the industry can hardly bear it. The financial institutions would do well to be a little more accommodating in this regard, as also in the matter of debt equity ratio. They may also consider granting longer debt repayment periods to the industry.

The industry has also got to find resources from within for development. But its capacity to do so is very much restricted with mounting prices of almost all kinds of inputs. Ever increasing royalty rates on bamboo and the prices of other forest products have now become perennial problems of the industry. The prices of chemicals like chlorine, caustic soda, rosin and dyes have also been on the increase. Electricity rates, transportation costs and wages have gone up and this has inevitably resulted in an increase in the cost of production. To meet this situation, I consider that the industry will have to adjust sale prices, so that it is in a position to ploughback its earnings, generate resources for future expansions and attract new capital into the industry. I may mention here that although control on paper has been lifted, there is still an understanding with the Government by which prices cannot be raised except with the approval of the authorities.

#### Forest Policy

Closely linked with the cost of production is the forest policy pursued by the respective State Governments. I am not sure whether we can really call it a policy, for its only effect has been untold harassment of the industry, year after year, with all the attendant consequences. In the past, the practice was to lease out forests for periods extending from 15 to 20 years. But the present practice is to grant leases for very short periods only and every time the question of renewing of lease comes up the State Governments take full advantage of the situation and demand higher royalties. During the last few years, the royalties have thus increased considerably. Since raw material constitutes about 30 per cent of cost of production, increase in the

royalty rates directly results in cost-push inflationary pressures, which I am sure, Government would very much like to keep in check. Time and again, the Planning Commission and the Union Ministry of Industry have pointed out to the State Governments the need for adopting a uniform policy in respect of the fixation of royalties and the length of leases of forest areas to the industry. But nothing appears to have been done so far in this direction. For the industry, it is of utmost importance that the State Governments arrive at some kind of consensus so that the forest leases and royalty rates are linked up

with the prices of white printing paper and these do not exceed a specified percentage.

The paper industry is passing through an extremely critical stage in its growth. I am confident, given the necessary co-operation and good will from official and non-official sources, we should be able to steer our way clear of all the difficulties to usher in an era of affluence.

Before I conclude, I would like to convey my thanks to all workers, members of the staff and officers, both at the Mills and the Head Office for their

co-operation and devotion to work, and I hope they will show the same spirit of loyalty and hard work in the coming years. As you know, I have worked with them for the last sixteen years and I can assure you that the affairs of your Company are in excellent hands.

I thank you very much for coming to the meeting and listening to me so patiently.

# Foreign Monopoly Industry

Shri Pratap Narsee

Golden Tobacco's rebuttal of India Tobacco's

BY PRATAP NARSEE

Chairman, Indian Cigarette Manufacturers' Association

## Background of the controversy

At the Press Conference addressed by me on 3rd August, 1970, as the Chairman of Indian Cigarette Manufacturers' Association I confined my speech mainly to the present plight and future prospects of the Indian-owned cigarette manufacturing units, the implementation of the policy of the Government to encourage such units to meet the increasing demand for cigarettes and salvation of the industry as a whole from the clutches of the FOREIGN MONOPOLY.

Mr. A.N. Haksar, Chairman of India Tobacco Co. (Formerly Imperial Tobacco), however instead of dealing with my contentions has chosen to direct against Golden Tobacco a tirade which is remarkable for the low depth it touches and the sophistry it betrays. I would have dismissed his verbal adventure as one more publicity stunt of a foreign monopoly wearing the mask of injured innocence if it had not contained false and defamatory statement against Golden Tobacco which, I repeat, despite Mr. Haksar's protests, is India's Largest National Enterprise of Its Kind.

Therefore, I on behalf of Golden Tobacco, am constrained to rebut point by point the misleading and false statements made by ITC chairman at the Press Conference in New Delhi on 31st August, 1970 and leave it to you, the Press, the people and the Government to make your own judgement.

I had suggested that (a) the Government should implement the declared policy to allow expansion only to 100% Indian companies, (b) the monopoly will not be encouraged particularly the foreign monopoly in cigarette industry, (c) the excess production of monopoly to the extent of 25% allowed earlier stands withdrawn as per notification of 18th July and (d) the excess production of monopoly beyond the licensed capacity should be exported enabling the country to earn foreign exchange and the indigenous units to utilise their capacity which is idle to the extent of 70%, which means 10000/12000 million cigarettes a year.

I knew all this will not be appreciated by the foreign monopoly but I never expected them to stoop so low and to advance baseless arguments as revealed by Mr. Haksar's

statements which I consider a naked attempt by the foreign-controlled company to malign the 100% Indian Company in free India.

## Production peg—effective measure

We read daily in newspapers that the days when a foreign combine could get away with anything are going to end but it still happens that they do get things as they want in spite of Government's policies and laws dictating otherwise. To avoid such mishaps I advocate pegging of their production which will put a fullstop to their backdoor tactics aimed to undermine the laid down policies.

All this started from the day I came to know from a news item that Vazir Sultan had applied for expansion from 8880 million to 20620 million cigarettes. I came to Delhi several times and explained to all concerned the Government's policy to allow expansion only to wholly Indian units and that the case of Vazir Sultan, which is inter-connected with ITC controlling between them 70% of cigarette production in the country and constituting a monopoly, should be referred to the Monopolies Commission.

Once VST's expansion is sanctioned the indigenous sector will have to wait for 10-20 years for better days it looks forward to in view of Government's present policy to encourage it.

## A fit case for high level probe

The monopoly always got things done when they wanted and the way they wanted, so they were hurt and furious when VST's application was delayed in spite of VST/ITC's joint efforts spending time, money and energy to get it through and in which, unlike in the past, they were not successful. They have been putting forward all sorts of arguments to create misleading impressions but fortunately I had and still have many more convincing counter arguments based on facts and reality of the situation.

I have suggested reference to Monopolies Commission or thorough investigation by similar body giving us an opportunity for full hearing before Government decides the issue. ITC Chairman says that ITC/VST are not inter-connected. Then why are they using all the influence and pressure to see that such reference is not made? They have referred to opinion of leading jurists. I submit that it is

# in the Cigarette in India

baseless allegations & contentions

based on information as given to them; and therefore to get the correct opinion full facts from both the sides should be given to a body of jurists which I hope you will agree should be acceptable to all concerned. The Monopolies Commission has already come into being and it should be the right body to investigate.

I have made it clear that I am neither going to oblige the foreign monopoly by not submitting application myself for expansion against VST's application and I shall leave it to the Government to decide whom they prefer — 67% foreign-owned company or 100% wholly Indian-owned one. The fear by the foreign monopoly that Golden Tobacco will become a monopoly is amusing, to say the least. Those having monopoly of 70% of the market today are worried about a small Indian company having a share of 14% only becoming a monopoly tomorrow! This monopoly is so much used to enjoying 75% and above as their share of the market that not only is it not prepared to welcome others coming up and having a fair competition but it refuses even to think of it!

Therefore, I suggest that the better way is to peg production of the foreign monopoly and also other big Indian manufacturers who may exploit the situation as feared by the Government — though the fear is illogical and out of place—so that many new entrepreneurs in private as well as in state sector will enter this field without fear of failure.

## ITC argues against itself!

Mr. Haksar has used all methods and tools of arguments to emphasize that all that GTC has said is wrong but actually he has failed to prove what he tried to as will be evident from my detailed rebuttal herein. The sum total of piecemeal information given by him amounts to the same as I have been saying in support of my case for 100% Indian Cigarette industry, viz:

- (i) ITC is a monopoly as their sale of Rs. 145 crores as per their balance sheet is 60% of all-India figure of Rs. 250 crores. Tobacco — The International Weekly — published from USA states in its issue of 5th June, 1970 the following:

"INDIA—Cigarette exports declining greatly as production grows:

"The Indian cigarette market is dominated by one foreign-controlled company, Imperial Tobacco Co. Ltd. It commands nearly three-fifths of the total market."

- (ii) If ITC & VST are not inter-connected why do they hesitate about reference to Monopolies Commission? They should insist on it and get a clean certificate which will mean the end of one hurdle.

## Interconnected ITC & VST

Here let me bring it to your notice that ITC & VST are inter-connected beyond doubt because:

- (a) The Chairman, Directors and top management executives have been common and inter-changeable during their entire history which fact can be verified by anyone;
- (b) VST manufactures ITC's Will's brand and ITC makes VST's Charminar — true to ITC's slogan 'Made for Each Other'. They have been doing this for each other right from the stage of blending to the final stage of sending to the market and it must be noted that blending is a trade secret and cannot be given to any body else except to oneself. In other cases of similar job work a manufacturer gives to the other a blended ready-made cut tobacco only to make cigarettes and pack them in the other's factory so that blending is kept a secret.
- (c) ITC is the sole selling agent for VST's brands which are competing against their own brands in the same price range. Unless both are one can you think of any manufacturer promoting other's brand instead of his own?
- (d) ITC/VST have a common parent in British American Tobacco Co. Ltd., London, which commands a family of innumerable members, all related and inter-connected like a cobweb. To identify each with the other you have to go to the root and I would only cite two documents for your reference, viz. Report of U.K. Monopolies Commission published in 1961 and World Tobacco Directory.
- (iii) It is an indisputable fact in black and white that the monopoly has an excess production beyond au-

## We want more Indian Cigarette factories to come up & share market held by foreign companies

thorised installed capacity whereas a number of indigenous companies have idle capacity. This is a pure case of concentration of economic power to the detriment of others. Why then fumble with so many arguments and attribute unrelated reasoning to prove otherwise? You can verify the facts from the records of Directorate General of Technical Development.

(iv) ITC is a burden on the country causing drain on precious foreign exchange by way of dividends, import of tobacco and other materials, accumulating liability—for future repatriation, remittance by way of dividend on capitalised goodwill and trade marks etc. To camouflage this drain ITC publishes misleading advertisements showing itself as net earner of foreign exchange by clubbing Rs. 998 lakhs earned by Indian Leaf Tobacco Development Company, a branch of a 100% Sterling Company introduced as a sister concern, with its own meagre export of cigarettes worth Rs. 2 lakhs making a grand total of Rs. 10 crores. What a classic example of deception!

(v) VST is to my mind the aggrieved party; why is ITC getting so jittery about it? I wonder why VST is silent whereas ITC holds its brief and ITC Chairman becomes its spokesman. Is this not enough to prove INTER-CONNECTION?

### Tirade against Golden Tobacco

Now about ITC's tirade against GTC. Honestly I see no point in Mr. Haksar trying to compare the two except that he wants to harm us and tarnish our good image. I doubt if he has succeeded even in this, yet let me give my reflections and leave it to your good wisdom to decide who is who.

(i) GTC has made excellent progress—more than ITC. I never disputed that, yet for your knowledge percentage-wise ITC/VST have taken the cream of the expanding cigarette market. Since Independence 80% of the increased demand has gone to factories owned by this monopoly group.

If you have Rs. 10 as your capital and over a period if you earn Rs. 10 you have 100% increase but if you have Rs. 10 crores as capital and earn even Rs. 1 crore it is only 10% increase; can you not perceive the difference between the earnings of Rs. 10 and Rs. 1 crore in the same period? Would you — or for that matter any Indian — like the benefit of Indian market to go to the foreign investor in a consumer industry? Should it not be stopped forthwith?

(ii) I am surprised that foreign monopoly in spite of its monopoly position shows less profits than GTC which has to struggle against the monolithic competitor. GTC's profit is 9.5% against ITC's 6.4% i.e. percentage-wise 50% more. Is it a crime to show right profits? We do admit that we do not have willing and co-operative shareholders overseas who will oblige us in reducing the burden of our profits by buying tobacco at competitive price nor do we have to

maintain larger and heavily paid staff to continue monopolistic hold on all spheres of the industry. The entire issue if investigated will bring to light interesting information.

Indianisation conditional to getting substantial expansion will further strengthen the hold of the monopoly and increase drain of foreign exchange. If VST offers to reduce foreign shareholding, not by selling foreign shares to Indian public but by issuing additional equity, from 67% to 49% or even less i.e. 18% or so, to get expansion from 8880 million to 20620 million i.e. 250%, it is easy for anyone to understand its implication to the indigenous cigarette industry. The whole game is to effect a nominal increase in Indian shareholding in order to get a disproportionately larger share of the market. Now I shall explode with facts the myths created by ITC—item by item.

### Myths V/s facts

At his Press Conference on August 31, 1970, Mr. Haksar made a methodical attack on the Indian Cigarette Manufacturers' Association and Golden Tobacco. I give below the true facts pertaining to the issues raised by him in his campaign of denigration.

A1 ICMA—The Cigarette Manufacturers' Association has 10 members whereas the newly formed Indian Cigarette Manufacturers' Association has a membership of all the six wholly Indian enterprises. They are:

1. Crown Tobacco Co.
  2. Golden Tobacco Co. Private Ltd.
  3. The Hyderabad Deccan Cigarette Factory.
  4. Masters Tobacco Co. (India)
  5. S.G. Agrawal
  6. Universal Tobacco Co.
- Others may join later.

2. The necessity of forming ICMA arose because the voice of the small wholly Indian-owned sector representing 20% of the production was never heard. It has no say against the powerful foreign monopoly and its all-pervading influence in every sphere of the Industry including CMA where the voting rights are unequal.

The formation of ICMA has already yielded rich dividends to its members. At the CMA meeting last month, representatives of the foreign monopoly very politely asked, "Where have we failed and what should we do to encourage the Indian sector."

Tempting offers were made to help Indian cigarette manufacturers by supplying machinery, technical know-how, selling and marketing facilities, finance, etc. As Mr. Haksar stated in his speech, one of the companies which was limping has been given fantastic offer of assistance. As a result the company has severed its connections with those who were long helping it, to get maximum advantage under the circumstances. I hope other

## Foreign monopoly has wiped out 200 Indian companies

members of ICMA or CMA will also derive similar advantages in the near future from the foreign monopoly.

### B.I. ITC's tirade against GTC

What is termed as 'vilification campaign' by ITC is nothing but my placing before the people and the Government the full facts pertaining to the plight of indigenous cigarette industry. This naturally infuriates those to whom exploitation has become a way of life. I would like to state here that now as in the past I have placed before you and the public only facts and nothing but facts. I stand by them now and for ever.

2. It is a matter of complete surprise to us that the simple factual case we had made out on behalf of the indigenous cigarette manufacturers should have provoked ITC Chairman into making an intemperate attack on us. If what we have stated was vilification, we are unable to find a word to describe his reaction. For the damage he had done on many counts to Golden Tobacco and its public image he will be accountable.

### 3. Golden Tobacco Co.—Performance

We are however quite flattered by the facts and figures presented by him about our achievements in sales and production. It is very true that we started in a very humble way and so have many of the leading enterprises in business and industry the world over.

The progress made by Golden Tobacco is very impressive in absolute terms. However, in relative terms, even today Golden Tobacco has only 14% share of the ever expanding cigarette market. ITC's statistics showing that GTC's sales/profit has increased by 11500% in the period 1948-70 is like a grandfather complaining that his grandson has registered a 2000% increase in weight from 7 lbs. to 140 lbs. while he himself has suffered a loss in weight!

You are familiar with Panama advertising. It is now available everywhere in the country. It is the largest selling brand in its class. You can well imagine the time, money and the energy that had to be expended to reach this point. The unfair practices and the non-cooperative attitude adopted by the trade at the behest of the foreign monopoly is something unimaginable to those who have not actually passed through the ordeal. The cut-throat competition is equally heart breaking as evidenced by the series of brands that were introduced to snatch away the sales of Panama cigarettes—viz., AMERICAN CLUB, SIMLA with added filter attraction, PLAZA KINGS with extra length, LEX, WOODBINE, BERKELEY in 20's, CAPSTAN MAGNUM, WILL'S BRISTOL with filter, etc.

As to the impressive figures of issued capital, reserves and other figures from the balance sheet, I would only say that Golden Tobacco has not frittered away their profits by declaring high dividends. Dividends declared are less than 30% and 70% has been taken to reserves. In contrast, the foreign monopoly has frittered away 75% of the profit by declaring dividends, and 93% of the dividends till last year have left the country for good. Had they followed our practice by declaring smaller dividends, they could have achieved better performance and the drainage of foreign exchange would have been one-third of what it has been.

Similarly, I was surprised that the profitability of GTC in spite of its handicap in resources and in having to compete

with the foreign monopoly is higher than that of the ITC. I would leave it to you to go into details as to how this has happened. Is it due to higher overhead expenses or are there invisible avenues through which the money has disappeared? Is the money still in our country or has it left for good? It can never be that the foreign monopoly is satisfied with smaller margin or gives more value for the money to the consumer. It is the Indian company that is always at a disadvantage when confronted with the monopoly, partly because of the premium the latter can demand on its internationally known brands which are marketed directly in competition with the Indian cigarettes.

### 4. Golden Tobacco's prosperity

It is nice of ITC to have wished us well.

As to the capital of Rs. 5 lakhs in 1955-56 and subsequent increase, it is as mentioned earlier due to our retaining the profits and not frittering them away. Had Mr. Haksar taken into account the year in which Golden Tobacco was established as the base year, when its capital was minus

I shall leave it to the Government to decide whom they prefer—67% foreign-owned company or 100% wholly Indian-owned one. The fear by the foreign monopoly that Golden Tobacco will become a monopoly is amusing, to say the least. Those having monopoly of 70% of the market today are worried about a small Indian company having a share of 14% only becoming a monopoly tomorrow! This monopoly is so much used to enjoying 75% and above as their share of the market that not only is it not prepared to welcome others coming up and having a fair competition but it refuses even to think of it!

Rs 5,000—a borrowed capital—instead of the year 1955-56 I wonder how the percentage of achievement would have worked out—it would have touched infinity!

I would like to know how much capital in foreign exchange was originally brought in by ITC or their parent company B.A.T. when they first came to India, how many thousand times they have taken it back and how the picture looks statistically at present.

### 5. GTC prospers in spite of ITC

The conclusion drawn by ITC from the progress of Golden Tobacco is that indigenous manufacturers are in no way impeded or impaired in their progress by the foreign monopoly. I would like to state that GTC's progress was achieved in spite of the monopoly. A variety of factors came into play. Consumers began taking into account the quality and the price of the product offered and the trade started supporting GTC in retaliation against the monopoly's high handed ways and the meagre margins with which monopoly wanted them to be satisfied.

### 6. Golden Tobacco's role in the Cigarette Industry

Golden Tobacco has always championed the cause of

# Important question is the drainage of Foreign Exchange, NOT number of shareholders

the indigenous sector to the chagrin and the resentment of the foreign monopoly.

To give you an example—the first few pages of the diary published in 1960's by GTC dealt with the problems and prospects of indigenous cigarette industry, the closure of 200 factories etc. This was an eye-sore to ITC. The predecessors of Mr Haksar had on several occasions tried to persuade us to desist from this practice. He will find evidence of this in the records of his own organisation.

- (a) The mention of competition by Golden Tobacco with two small manufacturers making brown cigarettes i.e., YACHT CLUB & ROYAL YACHT, is a masterpiece in concoction. Mr Haksar does not seem to remember brands like NETA and VANRAJ introduced by ITC itself in brown paper and in the same price range to wipe out TAJ CHHAP of Golden Tobacco and YACHT CLUB and ROYAL YACHT of other small companies. It may be of interest that Taj Chhap was introduced in the year 1935 and it has never been seen in the light in which Mr. Haksar sees it now.

You will be interested to know that a few years ago we introduced Taj Chhap in white paper and since then our sale of brown Taj Chhap has substantially been reduced but the benefit thereof has gone to other white-paper brands and not to the two small manufacturers still selling brown-paper brands.

- (b) It is correct that Golden Tobacco is not a public limited company but to say that Golden Tobacco's prosperity is not shared by Indian public is far from truth. Golden Tobacco pays the highest rate of income tax as a closely held company. About 17% of our share capital is in the hands of a Public Charitable Trust for benefit of the public without its having invested any money as against the 30% premium paid by Indian shareholders over and above the face value for their shares in ITC. Even though Indians hold shares to the extent of 25% of total capital, they have no representation on the Board of Directors of ITC.

- (c) Golden Tobacco has played a very positive role in the development of tobacco which would be borne out by people in tobacco growing areas. They have benefited by our entering the field which was completely dominated by Indian Leaf Tobacco Development Co. associate of ITC with a common parentage in B.A.T.

Now therefore the farmers get better prices, better facilities and better treatment from the monopoly which was not the case before.

- (d) In development of exports of Indian cigarettes, Golden Tobacco can justly take pride in being the pioneers in introducing extensively their brands in several countries in the world like Russia, Czechoslovakia, Afghanistan, Gaza, Congo, Indo-China, Korea, USA etc.

We did good business for about three years with Czechoslovakia but when the foreign monopoly started a price

war to oust us we allowed the business to go out of our hands rather than lose precious foreign exchange of the country by decreasing our prices.

Even in the field of export of tobacco, Golden Tobacco can justifiably take credit for convincing the first two Chinese and Russian delegations that the Indian tobacco is good and could be used for making cigarettes in their countries. This did create a very favourable impression in these countries which had never before used Indian tobacco. We have been progressively increasing our exports of tobacco year after year to U.K., European countries and Japan in spite of severe competition from foreign monopoly and its international connections.

- (e) We have always believed that Government of India effectively initiated and enforced the policy of import substitution. This policy is still being pursued. But on going through Mr. Haksar's speech, it appears as if it is ITC which is really responsible for advance in the cigarette industry. As a matter of fact by giving guarantees, high prices and inviting their associates to develop import substitution ITC has only created for itself and its associates a strangle-hold of a vertical monopoly as well on the industry. This could be verified by a detailed investigation.

At times we used to blame the Government for imposing on us such import substitutions as a result of which we were forced to take machinery or material that were sub-standard in quality at very high prices.

- (f) The development of indigenous machinery for cigarette industry has been solely monopolised by the foreign monopoly and its interconnections and associates. Golden Tobacco is now blamed for not having played a part in this field. But is it Golden's fault or the fault of the monopoly in having invited their associates so as to increase their own hold on the cigarette industry? This vertical monopoly created by Imperial Tobacco needs investigation.

- (g) It seems Mr. Haksar's impression is that training and development of management and professional managers could only be done through training centres set up specially for the purpose. It is equally possible to develop managerial cadres by in-plant and on-the-job training. Small manufacturers cannot afford the luxury of formal training centres which are very costly. Only big companies can afford them.

However looking to the progress made by Golden Tobacco as cited by Mr. Haksar himself it stands to reason that the management of the company cannot be all that poor. Call them professional managers or just managers or call them by any other name—so long as they are devoted to their work and are able to function well it makes little or no difference.

- (h) Before we can say anything about research in the industry, we would like to know what research has

# Break the hold of monopolists . . .

been done by ITC in India. We are under the impression that the real research is being done in London and the laboratories they have here are just to check the raw material supply.

We had no benefit of foreign know-how. In fact it was totally denied to us and we had to work on our own ingenuity all throughout. But whatever research we have done is our own and our products are the best proof. It is for the people to judge whether we have lagged behind in this much talked-about field.

- (i) Golden Tobacco's part in assisting the tobacco farmers may not be known to ITC Chairman. This could be verified from the farmers themselves and I am sure they will always say that till Golden Tobacco came in a big way they were mercilessly exploited. Even today they are being exploited in spite of Golden Tobacco's increasing requirement and participation. Tobacco merchants and exporters are still being dominated and exploited by ILTD, the sister concern of ITC. As soon as more Indian cigarette manufacturers come up this problem will automatically be solved. The Indian farmers and the Tobacco merchants will have ample business possibilities when there are more and more interested buyers competing with one another.

- (k) It seems the absence of labour union in Golden Tobacco is a sore point for ITC. But this does not mean there is no collective bargaining in Golden Tobacco. You will be glad to know that the Works Committee of the GTC's workers meets very regularly at which issues are thrashed out in a spirit of collective bargaining.

Can any normal person think that an industrial worker anywhere today can be that dumb as Mr. Haksar suggests?

As already stated before what Golden Tobacco wants is more and more Indian cigarette factories to come up to see that 80% share of the market held by foreigners comes down slowly and gradually without harming the foreign monopoly. They should of course be penalised if they do or have done something against the laws of the land. But otherwise it is our hope and our wish that they should continue to enjoy the fruits of their long labour. Yet this does not mean that they should be allowed to grow in an unrestricted manner which will curb the growth of indigenous companies.

## 7. ITC already a Monopoly fears GTC's future growth

It would appear that the foreign monopoly is fearing that an Indian company with just 14% share of the market will become a monopoly. Naturally to ensure that they do not lose the monopoly they advance as many arguments as they could possibly dream of. The question of Golden Tobacco becoming a monopoly is subject to Monopolies Act and Government policies. Golden Tobacco's activities should certainly be restricted when it ever becomes a monopoly. But if such a day is to come it will be long after the present foreign monopoly is restricted.

## 8. ICMA's Suggested Remedies

- (a) Our argument that multiple shift operations must be stopped should be read in context of unauthorised excess

production by the monopoly group and it is for the Government to consider.

(b) The plea for pegging of the production of foreign-owned/controlled units has nothing to do with the registered capacity. Pegging should be done as was done in case of match industry, soap industry and oil industry at whatever level the Government may deem fit in the national interests.

(c) My suggestion that no further expansion be allowed to the foreign monopoly and inter-connected undertakings is in national interest. If expansion is given to foreign monopoly, it will in effect increase the monopolistic hold and lead to the drainage of foreign exchange due to increased profit. Monopolization cannot be masked by calling it a natural growth.

(d) The suggestion of reducing certain manufacturers' production is in fact asking them not to over produce beyond licensed capacity as they are doing it to the detriment of so many other manufacturers who are working at only 30% of their capacity, 70% lying idle.

Here I would give the glaring example of National Tobacco, Calcutta. Because of the labour trouble this company had lost business in 1967 and when they resumed after 4-1/2 months they found that the demand had been catered to by other companies and they were finding it difficult even

When the Government is so keen to Indianise foreign companies, ILTD which is having such a big business of supplying tobacco to foreign monopoly has somehow escaped the attention of the Ministries concerned. I hope this will be looked into so that the country will be benefited not only by way of income tax but also by higher foreign exchange earnings as the profit will be added to the cost and higher sales value will earn more foreign exchange.

to sell one-fourth of their previous production. Even today after 3/4 years of hard work they are still not able to get more than one-third of their former market with two-thirds capacity still lying idle. The labour, management and other overhead expenses could not be reduced and the company is in bad financial shape due to this calamity. Will it not be just and fair if this company gets back what they had lost because that belongs to them.

Not only that but Bengal which is facing increasing unrest will also be fairly benefited as production of cigarettes in Bengal has gone down by 50% due to National Tobacco being deprived of their original share of the market and this is the only big cigarette manufacturing company in Bengal. There are so many other manufacturers whose capacity is lying idle and they will also be benefited if the over-production of the foreign monopoly which is 8000/10000 million cigarettes is cut back. As the relaxation of over-production upto 25% by foreign/big firms has been withdrawn on 18th July, it is only natural that this decision should be implemented.

## 9. Results of these Remedies

- (i) Indianising the foreign companies while allowing their expansion will neither reduce the mono-

# ... Take steps in larger national interests

poly nor the drainage of foreign exchange. The best way to Indianise is to allow the increase in demand to go to wholly Indian manufacturers. If the expected annual 6% increase in demand goes to companies other than foreign monopoly the share of the indigenous sector will go up to 50% in 10 years and 75% in 20 years. Will this not be a better way of Indianising the cigarette industry as this will not only Indianise but bring in fair competition to the benefit of one and all?

- (ii) There is no question of loss of productivity. If anything, productivity instead of being confined to foreign monopoly will be spread to other factories where men, material and machinery are lying idle as stated above.
- (iii) The scare of scarce capital resources in the cigarette industry is of a very short term and of insignificant importance considering the capital investment of the monopoly and the resulting perpetual drainage of foreign exchange.
- (iv) Plant and machinery now manufactured by Molins India would be made available to Indian units at a competitive price. As to secondary machinery, we hope the foreign monopoly will use their influence to see that the same is not only made available but also at reasonable prices.
- (v) Curb on the foreign monopoly is in the public good because it will create greater competition to serve consumer interest.
- (vi) The question of retrenchment or lay off of labour does not arise under the present Labour Laws and if other factories come up naturally there will be employment of labour and management to run these factories. Till then the foreign monopoly can as well continue to employ them which at the most might reduce their profits and thereby save drainage of foreign exchange to that extent.
- (vii) There is no question of any effect on the development of leaf tobacco. Whether A makes the cigarettes or B or C, it is immaterial as long as the cigarettes are made in the country and tobacco is consumed.
- (viii) The fear of exports going down is very difficult for me to understand. There is no reason why the overseas buyers of tobacco should divert their attention to other countries. Tobacco is handled by a different company with its associates and its headquarters is in a foreign country.
- (ix) There cannot be any adverse effect on tobacco growing. In fact the farmers will be rescued from the clutches of monopoly and will reap benefits of free competition.
- (x) The question of development and research being impeded in cigarette and tobacco industry is irrelevant to the basic issue of curbing the foreign monopoly. Only the role of the monopoly is being regulated to enable others to come in the field.
- (xi) As to the ancillary industries, I think they will be better off, if monopoly's influence is reduced.
- (xii) The loss of revenue to the exchequer because of consumer's loyalty to their brands is something to be considered but keeping in view the experience of National Tobacco and diversion of the share of market, it seems most unlikely.
- (xiii) Restricting the growth will, no doubt, not be liked by those who are having a monopoly but unless this is done, the development of the indigenous

sector will not take place and it will stagnate at the level of 20% as has been the case for the last 22 years and the increased demand — at least 80% of it as at present — will continue to go to the foreign sector. Actually the share of foreign sector has gone up from 68% in 1965 to 80% in 1969 as per the statement given in the Parliament.

- (xiv) The Government, alive to the image of the country, is keeping a watch on the foreign investments and will allow them to expand only where development is otherwise not possible.
- (xv) As for the consumer being forced to buy what he does not want it is not correct. In many democratic countries where there are Government monopolies handling the cigarettes like Japan, Thailand, Nigeria, Ethiopia, Bulgaria, Italy, Czechoslovakia, France and many others, the consumer has a wide choice.

Even today the consumer in India wants something outside the range of brands that is available and hence the smuggled brands in the market.

#### C. Our reply to ITC's contentions

##### Item No. 1: ITC does drain Foreign Exchange

Because of overseas shareholders there is net drainage of foreign exchange. We, the Indian Cigarette Manufacturers, will never be tired of repeating it.

It will be interesting to note that average export of Rs. 10 crores in the last 3 years as advertised by ITC includes tobacco while cigarettes export in the last year was only Rs. 2 lakhs. This means Rs. 998 lakhs was tobacco. How can ITC as a cigarette manufacturer take credit for earning from export of tobacco and adjust these earnings against foreign exchange drain caused by payment of dividends to 76% foreign shareholding? This is like Hindustan Steel taking credit for exports of iron ore by STC or MMTC or a textile mill claiming credit for export of raw cotton worth crores of rupees!

As far as dividend remittances are concerned, they are bound to go up if ITC is allowed to grow unrestricted as has happened during last 11 years. From 1958 to 1969 ITC's turnover and profits have gone up by 300%. Today the foreign sector of the cigarette industry is remitting dividends worth Rs. 4 crores. If this is allowed to go unchecked the dividend drain in foreign exchange is bound to increase at the compound rate of 12/14%.

There is another interesting fact pertaining to ITC. ILTD a 100% Sterling company having branch in India, is termed as 'sister company' of ITC which is an Indian company with majority foreign shareholding. This is perhaps due to the fact that the professional managers of ITC, who are employees of a foreign combine in London, are also controlling ILTD. Some of these professional managers now promoted to the Board of Directors are also on the local Advisory Committee of ILTD. As against this, ITC denies interconnection with VST which in fact is ITC's sister concern by common parentage.

##### ILTD — a case for scrutiny

As far as the working of ILTD is concerned, I have not been able to understand it nor how this company is being taxed. Figures of sales which are much lower than what they should be — it may be because of the local supply they make to the foreign monopoly and also have a monopoly in export of tobacco business — do not tally with the figures as available in the office of the Registrar of Companies. It is not that I suspect any deliberate falsification. What I

mean is that the way it has been presented does not reflect the full activity of ILTD. This calls for more detailed investigation by the Government to understand ILTD's operations.

When the Government is so keen to Indianise foreign companies, ILTD which is having such a big business of supplying tobacco to foreign monopoly has somehow escaped the attention of the Ministries concerned. I hope this will be looked into so that the country will be benefited not only by way of income tax but also by higher foreign exchange earnings as the profit will be added to the cost and higher sales value will earn more foreign exchange.

#### Goodwill Trade Marks

I am glad to know that no royalty, know-how or collaboration fees of any kind are paid to anybody by ITC. Here again if you see the balance sheet of ITC you will find that a sum of Rs. 490 lakhs has been capitalised under "Goodwill Trade Marks". The dividend declared there on which has increased from 6 to 13 % in recent years had ranged from Rs. 30 lakhs to Rs. 65 lakhs a year. Is this not royalty remitted in the name of dividends?

##### Item No. 2: ITC is nothing but a Monopoly

A foreign monopoly exists in India in the cigarette industry.

Out of the total turnover of Rs. 250 crores of the cigarette industry, ITC are having sales of Rs. 145 crores as per their balance sheet. Is it not more than 50%? Has the definition of monopoly changed recently? If it has not, ITC is nothing but a pure and simple monopoly.

I would also quote from the weekly magazine "TO-BACCO" dated 5th June published in UK wherein under the heading 'INDIA' and sub-heading "Cigarette exports declining greatly as production grows", it has been mentioned apart from so many other interesting facts that "Indian cigarette market is dominated by one foreign controlled company, Imperial Tobacco Co. Ltd. It commands nearly three-fifths of the total market". It must be evident from this where the truth lies.

#### ITC & VST are inter-connected

The contention that none of the three companies having overseas shareholders have any shareholding in each other may be true. But it conveniently ignores common shareholders in three companies and many other associated companies. Also it does not take cognizance of their common link in the parent company — British American Tobacco Co. Ltd. — in London. India Tobacco Co. have no shareholding with Vazir Sultan nor Vazir Sultan with India Tobacco, yet the tie up through BAT is one of the many links — strongest perhaps — inter-connecting them.

I do not know whether it is ethical to give names of jurists in support of one's contention which is highly controversial and unconfirmed.

In view of the reliance placed on the opinion from eminent jurists, I do not know why ITC is using its influence to see that VST's application for expansion is not forwarded to Monopolies Commission. As far as the opinion of the jurists is concerned I have very high regard for all the eminent persons referred to by ITC but I doubt whether all the facts and relevant material were given to them to enable them to give the correct opinion. Taking what ITC says at its face value the best course would be to let the issue be decided by jurists in Monopolies Commission after full public hearing.

Here I would like to point out that the aggrieved party is VST. whose expansion application had been delayed by

more than 3 months in spite of the best efforts of VST and ITC. If VST Chairman had said what ITC Chairman has said, it would have been understandable. Is this not yet another proof of inter-connection?

##### Item No. 3: ITC does sell International Brands

ITC says that there are no international brands sold in the country except those which are smuggled in. I know that different people in cigarette industry in different countries have tried to define international brands and I need not enter into controversy. What I want to say is that the brands manufactured by ITC claiming foreign ownership such as WILL'S GOLD FLAKE, GOLD LEAF, EMBASSY, SCISSORS, BRISTOL, etc. are the brands which are imported in some countries from Imperial Tobacco, London or their associates in other countries. Even in India these brands are sold in packets bearing words like "The contents of this package are the goods of the successors to W.D. & H.O. Wills, Bristol & London." What does this indicate? Why should Imperial Tobacco, London or India Tobacco not try to export these cigarettes from India? Since the country is trying very hard to increase export of all items and earn foreign exchange, it might allow the foreign monopoly to continue their over-production if it is earmarked for export. As long as it restricts its production for the domestic market to its installed capacity and diverts the surplus production to export, nobody would object to it.

Since India is well situated in respect of raw materials, labour costs etc. and ITC has all the technical know-how,

If law of our country forbids the use of names of leaders, national monuments and emblems for commercial purposes, how can the name of the country itself be used for cigarettes?

it might be profitable for it in the long run to export cigarettes from India. Not only the country but also the foreign shareholders of the company will benefit by foreign exchange earnings. Also instead of importing tobacco, making cigarettes and then exporting them, I think BAT will be more benefited if India exports cigarettes made from her tobacco.

I am glad to know that India Tobacco has been the owner of all the Trade Marks used by it by law and usage. I am glad to know this because now there should not be any restrictions imposed on ITC in exporting these brands anywhere they like.

##### Item No. 4: 200 Indigenous Cigarette Companies have been wiped out.

In the last four decades 200 indigenous cigarette companies have been wiped out.

There are two cigarette manufacturing companies, viz. D. Macropolo and Crown Tobacco Co., who have been manufacturing cigarettes for more than 70/100 years. They are the pioneers who entered the field long before ITC made its appearance. D. Macropolo has produced in last 5 years 6 to 11 million cigarettes per year while Crown Tobacco's production has ranged from 7 to 11 million cigarettes per year. So Mr. Haksar's assumption that 600 million cigarettes per year (i.e. 50 million per month) is the smallest viable economic unit is not correct. If they are producing 7 million today, 70 years back they must have been producing at least a little less than 7 million. This is yet another myth of ITC.

He said that ITC have never merged or amalgamated or bought over a single indigenous undertaking in 60 years. It is a matter of common knowledge that Union Tobacco,

Calcutta and Hind Tobacco, Hyderabad were bought over by ITC as running concerns. I also understand that A.J. Green, an American Company in Bombay was purchased by ITC. ITC's present Bombay factory is now operating in the same place where A.J. Green used to be. This is of course, over and above the large number of companies that were wiped out and a still larger number of companies prevented from entering the monopolist's field.

ITC says that a few undertakings who tried to enter the industry were unsuccessful because of their insufficient input resources or management or inability to satisfy the consumer demand. It is difficult for Indian cigarette entrepreneur to match the input resources or management of foreign monopoly and this is the main cause inhibiting their development. This is why we maintain that unless the monopoly's production is pegged others cannot come up as they are no match for the foreign monopoly.

That seven indigenous companies are operating with reasons to be satisfied with their performance is news to me. As far as I know the biggest is National Tobacco, whose balance sheets show how poorly it is doing. As to the other companies though the balance sheets are not readily available it is a known fact they are not flourishing. The production of all these factories put together is not even 1% of the total.

The reference to a proprietary concern flourishing and the figures given of sales ranging from Rs. 54 lakhs to Rs. 90 lakhs can mislead only those not familiar with the industry. Due to merciless competition by the foreign monopoly, that company has been making and selling cigarettes at unremunerative prices.

Mr. Haksar's reference to a company with capital of Rs. 20 lakhs and turnover of Rs. 1.18 crores may be correct. But I am not aware of any new cigarette company having such a big turnover in its own brands. Maybe it manufactures brands for another company!

I am glad that he has referred to the largest cigarette factory in India and says they are not doing so well due to lockout of 3/4 months in 1967. It is right that the consumer does not wait for such a long time of 3/4 months and as a result this company has lost sales to other cigarette manufacturers. I will be very happy if my suggestion of restricting the over-production will enable the unfortunate company to get back what they have lost due to reasons beyond their control. It will be just and fair to give them back what was theirs.

It may suit ITC to say that the company whose main brand is YACHT CLUB has not been able to compete with Golden Tobacco's TAJ CHHAP. I am eagerly looking forward to the fulfilment of the offer recently made to the company by the representatives of foreign monopoly to give them machinery, material, selling and marketing facilities. I am sure this company will then be able to compete with Golden Tobacco. The recent change in the thinking of foreign monopoly in favour of helping the small manufacturers after 60 years of merciless and unfair competition which wiped out so many concerns is most welcome. If the foreign monopoly helps the company making YACHT CLUB and such other small companies, my problems are happily solved. But all the same, pegging is very necessary to see that the change of heart does not change again!

As to Mr. Haksar's statement that GTC is amassing gross profits, I do not know how to deal with the inability of his to read figures in the correct perspective. The word "amassed" is not correct because these profits are subject to high income tax which is a positive contribution to the national economy. And 90% of the taxed profits are again

ploughed back to ensure that the Indian cigarette industry is able to compete with the foreign monopoly.

#### Item No. 5: Idle Indigenous Capacity does exist.

There is a great deal of idle capacity in the wholly indigenous sector of the industry. This is not a secret. Apart from whatever has been said as per the statement given by the Minister of Industries in the House of Parliament, the six Indian cigarette factories have capacity of 16768 million cigarettes, and they are producing less than 5000 million cigarettes leaving 11000 and odd million cigarettes idle capacity as against the over-production by the foreign monopoly to the extent of 8000 to 10000 million cigarettes. Is it not desirable that the over-production of the foreign monopoly be checked so that six Indian companies will get enough work?

As per the policy statement of 18th July the relaxation of over-production by 25% has been withdrawn as far as the foreign big firms are concerned. The foreign monopoly in cigarette industry has to abide by this without grumbling or distorting the facts to suit its own ends.

#### Item No. 6: Foreign Monopoly does control cigarette Market.

Mr. Haksar denies that "foreign capital controls 80% of the cigarette market." Actually what I had said was that foreign-owned companies with major foreign shareholding are controlling 80% of the cigarette market. This is as per the statement of the Minister in the House of Parliament and I am sure he is right. The statement made by him to justify his stand is clumsy and the figures are distorted to suit his arguments.

Commitments made by the foreign monopoly to reduce the percentage of foreign shareholding with a view to getting permission to expand is not in national interest, as it will reduce neither the monopoly nor the drainage of foreign exchange. Here I would like to say that this foreign monopoly has expanded its activity 1000 times without Indianising and now it is for the Government to see that they Indianise without expanding or remain where they are and also see that their share of market gradually goes down, resulting in true Indianisation.

#### Item No. 7: Foreign Monopoly does affect Indigenous Sector.

That because of certain companies other companies cannot prosper has been proved in the classic case of the match, soap and oil industries. As soon as the activities of the foreign monopolies were curbed, indigenous units quickly came up in those industries.

#### Name — "INDIA"

I can very well understand that the Chairman of India Tobacco Co. is panicky because of the impending 25% reduction in their production which has exceeded the licensed capacity and consequences like surplus labour and management, loss of market, loss of profit, loss of prestige, etc. No doubt, I have taken shelter under the Government of India's laid down policies and can only take credit for having shown them what should not happen within the framework of these policies.

#### ITC sells International Brands

ITC Chairman has referred to creation of internationally famous India Kings cigarettes. If India Kings cigarette is internationally famous, I do not know why he says that international cigarettes are not made by ITC because I am sure the other brands which I have referred to such as GOLD LEAF, EMBASSY, SCISSORS, BRISTOL, etc. are selling

much more than the internationally famous India Kings cigarettes referred to by Mr. Haksar.

As for the use of name "India" for cigarettes, we are all entitled to our own opinion on the question of propriety. I know in the past the makers of cigarettes with name VIR CHAKRA were forced to withdraw it because it was not in line with the law of the land or sanctity of certain names. The same thing happened to SHIVAJI BIDI. If law of our country forbids the use of names of leaders, national monuments and emblems for commercial purposes, how can the name of the country itself be used?

#### D. COMPARISON OF CONTRIBUTIONS OF INDIA TOBACCO AND GOLDEN TOBACCO

I have still to look into the other two companies but I know ILTD is a 100% Sterling company while Delhi and Orient Tobacco Co. is a subsidiary of ITC. I doubt very much if all these creations have really contributed to the economy of the country as only one company would have done the same work instead of 5 companies having single integrated business under the same control and management.

#### 1. EXPORTS—IMPORTS—Foreign Exchange

I am glad to know that ITC is aware of the crucial foreign exchange position of the country. I have already explained how ITC is wrongly taking credit for export of tobacco. There is in fact a net drain on foreign exchange as far as ITC is concerned.

Actually between 1959 and 1970 India Tobacco Co. have remitted Rs. 15 crores i.e. 93% of the total dividends declared during these years.

It will be interesting to know that had Golden Tobacco not been there, its share of sales would also have gone to the foreign monopoly and profits thereon would have gone to foreign shareholders. Not only that but if there was so much less competition the profits of the foreign monopoly would have been many times more because it is only competition that keeps a check on exploitation.

Even tobacco exports by ITC/ILTD is declining every year in last 3 years. So also cigarette export which is now only 2 lakhs a year.

The exports achieved by India Tobacco Company have by its own admission the active support and assistance of its overseas shareholders. This proves that these shareholders are not mere shareholders but they are people in holders are not mere shareholders but they are people in the same line. These overseas associates have been willing and co-operative in helping the exports from India. They are doing some good to our country. I would like to know the names of these associates as this might make it clear as to who the associates are and how they are controlling not only ITC, ILTD but also other similar companies.

As to exports of Golden Tobacco, I have already stated that we have done much better in export of cigarettes in spite of not having any willing and cooperative foreign shareholders or world wide International brands or foreign associates all over the world. We are still doing whatever we can to the best of our ability.

#### 2. INDIAN CAPITAL—Indian equity shareholders

The propaganda value of having 21430 Indian shareholders of ITC is very impressive but the total percentage of shares they hold is less than 25%. It is not the number of shareholders but the amount of their holding that really matters where question of ownership is concerned. As far as Golden Tobacco is concerned, it was a proprietary

company and a one man show and is now a private company. Naturally the number of shareholders is very much limited but the big difference is that 100% shareholding is in the hands of Indians.

The important question is the drainage of foreign exchange and not the number of shareholders.

I cannot understand how the figure of Rs. 9.11 crores which includes premium charged to poor Indian shareholders and also the debentures which have no voting right is quoted as participation in share capital of the company. Debentures are nothing but loan secured to increase the business/increase the profits — and share premium is not equity too.

I would like to add that in spite of the investment by Indian public and financial institutions like LIC and Unit Trust, there is no representation of these investors on the Board. I do not know why this is not being done. Indian shareholders are happy to be investors and as long as they get their return on the investment they do not participate or ask for representation in the company management. It is high time that the outlook is changed and I am sure, very shortly these Indian investors — either individual or financial institutions — will get their rightful place on the Board of Directors.

#### 3. Management

As far as India Tobacco Co.'s Board of Directors is concerned, they are nothing but the professional managers employed and directed by the foreigners to look after their interests. To tell you very frankly it is not the Board of Directors but group of managers who are doing their best to safeguard foreign interests and show better results to their employers and are adopting all methods of management whether in the interest of the nation or otherwise to prove to their employers that they are more efficient or capable than their foreign predecessors. Actually the professional managers' right place is that of managers but the Board of Directors should be something above them to check them or to encourage them and to see that the Company does not do anything which is unfair or anti-national. Though the profit making motive and motivation and incentives should be there, some one who has a stake financially should be the overseer.

#### Golden Tobacco's Management

Most of the management are relatives of the owners according to Mr. Haksar. I do not expect him to have better knowledge than what he has as far as our company is concerned. For your information, apart from the board of directors, the managers and the top men of the company are as under:

|                         |                          |
|-------------------------|--------------------------|
| Shri S.K. Oza           | Secretary                |
| Shri S.R. Shringarpure  | Manager                  |
| Shri J.C. Shah          | Sales Manager            |
| Shri S.P. Shah          | Accountant               |
| Shri P.V. Nagda         | Business Manager         |
| Shri M.S. Ram           | Publicity Manager        |
| Shri R.L. Jaswal        | Manager                  |
| Shri A.D. Marphatia     | Manager                  |
| Shri B.H. Vahalia       | Factory Manager          |
| Shri P.S. Venkatachalam | Chief Engineer           |
| Shri G.B. Sawant        | Asst. Chief Engineer     |
| Shri G.R. Chablani      | Asst. Chief Engineer     |
| Dr. P.D. Kuttan         | Chief Chemist            |
| Shri S.A. Savant        | Personnel Officer        |
| Shri C.N. Mathuria      | Industrial Engineer      |
| Shri A.R. Kadakia       | Quality Control Engineer |

SL  
Xm2, N70  
N71.56

69339

|                          |                      |
|--------------------------|----------------------|
| Shri L.V. Dhutia         | Chief Engineer       |
| Shri D.N. Murty          | Tobacco Leaf Adviser |
| Shri R.V.S. Rao          | Tobacco Leaf Adviser |
| Shri T.S.N. Gandhi       |                      |
| Chowdary                 | Manager              |
| Shri M. Ramaswamy        | Manager              |
| Shri K.K. Ghelani        | Factory Manager      |
| Shri Ch. Narayana        | Manager              |
| Shri Ch. V.P. Gopala Rao | Manager              |

They are not relatives of the Directors of the Company. If he is referring to some specific branch of the Management, there can be reasons which he had not to go into as he might find himself more vulnerable. Hence it is not necessary to dwell any longer on it.

4. It is interesting to know that the profit of foreign monopoly is much lower than that of GTC. I cannot imagine how a company with such monopolistic hold can justify lower profits and I would be very much interested in knowing where the difference lies or where the money has gone. It will be ridiculous to say that a small Indian company can give less value for money and compete with the foreign monopoly. Actually GTC has always to give much better return for the price consumer pays in view of the number of odds such as the premium foreign monopoly can command on their brands which are internationally advertised or have been in market for three generations.

As to the differently priced categories of ITC and GTC, as you know, generally the most profitable lines are given preference by business houses. It will be interesting to know that ITC's production went up by less than 7% during 1967-69 while profits have gone up by more than 70%. That means the proportion of profit is 10 times more than the increase in production. Is it due to lower priced cigarettes or is it due to INDIA KINGS which tops the maximum price range in the Indian market?

Actually we were always under the impression that ITC has the sole monopoly in the higher grade cigarettes and that is why the profit margins given to the trade are not even one-third of that on the medium priced cigarettes. Unless there is competition, ITC has always dictated terms which are not fair apart from so many other high-handed methods and rude behaviour the trade has tolerated under foreign monopoly. The change, if any, is due to slightly more competition in recent years and the Monopoly Act which has the desired effect on the foreign monopoly's trade practices and treatment of the trade.

As to the cheaper brands which are being referred to by ITC, it should be noted that VST is making only cheaper cigarettes — to be more precise CHARMINAR cigarettes — and the profit of this company has gone up by 50% from 1968 to 1969, while actually the production has gone down. Does it not mean increase in price of cigarettes or decrease in quality; in short, exploitation of low income people who are not so well off?

#### 5. IMPORT SUBSTITUTION (Comparison between ITC and GTC)

Here again very conveniently ITC has excluded import of tobacco for the obvious reasons. It ranged from Rs. 20 lakhs to Rs. 120 lakhs a year as per our information. No doubt GTC being a wholly Indian company has to pay higher price or has to import such material which is costlier than the material which ITC imports through their associates — may be the same associates who are helping in the export of tobacco or the willing and co-operative partners/shareholders. But if the foreign exchange remittance is added to the foreign exchange liability including tobacco imports, the figures

calculated by ITC will be 30 times higher compared to what they have given.

#### Machinery

India Tobacco Co's contribution is much more because the machinery manufacturers, Molins of India, are interconnected to the parent company of ITC which is holding the shares of ITC through other holding companies of their own. This could very well be looked into and a reference to U.K. Monopoly Commission Report will give better idea of the operation of the British combine known as B.A.T. or Imperial Tobacco, London.

This combine is a monopoly in U.K. and has a substantial share of world market including U.K. and U.S.A. They have cigarette factories in 55 countries (we do not know if a few of them have been nationalised in recent years). This could also be verified from the list of B.A.T. and I.T.C., London associates as referred to in the World Tobacco Directory and we have to go a little deeper to the roots rather than look at the branches and try to find out whether they belong to the same tree. Unless we go into the horizontal

In spite of the investment by Indian public and financial institutions like LIC and Unit Trust, there is no representation of these investors on the Board of India Tobacco Company. I do not know why this is not being done. Indian shareholders are happy to be investors and as long as they get their return on the investment they do not participate or ask for representation in the company management. It is high time that the outlook is changed and I am sure, very shortly these Indian investors—either individual or financial institutions—will get their rightful place on the Board of Directors.

and vertical monopoly controls which this root is having by virtue of inter-connections, subsidiaries, investment companies, etc., it will be very difficult to find out the truth about the part they have played in controlling the machinery manufacturers, raw materials supplies etc. Whatever they have said about their contribution by way of expertise, technical know-how, drawings, blue prints etc. is subject to verification.

It is also interesting to know that India Tobacco has set up a machine construction unit in Bangalore and I only hope that they have taken the permission or at least informed the Government about their activity which has not been known to us as it has not been published in the list of Indigenous Machinery Manufacturers published by the DGTD.

In view of the multifarious activities like cigarette manufacturing, leaf handling, machinery manufacturing and raw materials manufacturing which they have described, you can very well imagine the hold the monopoly has and how easily it can further tighten it if not checked effectively.

It is surprising the ITC takes credit for self-reliance. It is the Government's economic policy. I would have given ITC credit if they had not brought in their associates and the interconnected companies and entrenched themselves in vertical monopoly as well. This is self-aggrandisement, plain and simple.

I have no idea of the total connections or controls the foreign monopoly or their parent company exercise on many industries in India and it should be looked into by the Government. The reduction in import by India Tobacco Company is praiseworthy unless they have had exclusive and hidden benefits of their inter-connection with suppliers whom they have obliged by finance, know-how, etc. These

are the details which I am not supposed to know but which the Government should look into and definitely see that the imports by the different companies are genuine. The reason for variations in import requirement of different manufacturers is generally verified by and known to DGTD and, therefore, ITC need not worry on this count.

What we object to is the exploitation by these companies which are under direct influence of the foreign monopoly by such methods as high prices, quantity discounts, reserving specific quality for ITC only, changing the manufacturing schedule to suit the requirement of foreign monopoly etc. These are against the indigenous sector's interests. It is heartening to know that a number of small scale industries have been helped by ITC. Before saying that Golden's contribution is nil, I hope ITC Chairman would have either verified or consulted GTC as I have been doing from time to time and asking for his confirmation which may or be not be given to me.

#### Research and development

Research and Development contribution cannot be measured by the number of people employed in a laboratory. Let us know precisely what new inventions have been made so that we may know whether this is a dead weight or something useful to the entire industry.

As far as our research and development is concerned, we would ask to be judged on the basis of the quality and price of the products we offer to the consumer. It is the results which should speak for themselves and one need not boast about it. Let others judge.

If monopolistic hold is reduced, research and development will fast develop in other companies also because they know they have a future before them. Research and development activity is expensive and has to be commensurate with production, resources and future growth.

#### Employment — employees

What has been most gratifying to us at GTC however is the unstinted loyalty and cooperation offered to us by our employees — a loyalty which has gone far beyond mere material consideration. Without this dedication GTC would not have been able to register the progress it has achieved, especially when pitted against a mammoth foreign monopoly right from its inception.

India Tobacco Co. is employing 12000 workers. They are offering very good terms of service. Good terms and conditions of service given to employees are too well known to be enumerated. The emoluments and environments of work at GTC are highly favourable and comparable with ITC. No doubt, what the so-called professional manager of ITC gets is extravagant, may be they have to look after the interest of the foreign monopoly.

It is interesting to know that number of workers employed by GTC is less per unit of production compared with ITC. What can be the reason? Does it mean that the foreign monopoly is employing many more people who are not directly connected with the production but are necessary to continue the monopolistic hold on various spheres of economic and bureaucratic activities? As to the wages paid, it would be interesting to know that a very low wage said to be paid by GTC is not at all correct. Average per capita amount is Rs. 6100 for GTC against Rs. 6350 of ITC. Is that low?

#### No Union — no sweated labour

It is the elected Works Committee which functions effectively for collective bargaining in GTC. The workers and management are united as a team of family members. It is enviable, we admit.

It is very interesting to know that it is understood by

ITC's Chairman that all labour is obtained from Cutch by the Sardars employed by GTC who are known as "Group Leaders". As far as the labour is concerned it is from the local area and most of them are other than from Cutch. They are Maharashtrians, Muslims, Christians, Parsees, Sikhs — all communities residing in Maharashtra.

#### 9. Foreign exchange — collaboration — Royalties

Goodwill-trade mark has been capitalised as shown in balance sheet of ITC and the payment of dividend thereon — Rs. 65 lakhs a year — is as good as paying royalty. It would be cheaper to pay a fixed royalty on production of brands with foreign ownership because gradually over a period production of such brands can be replaced by Indian brands and royalty incidence reduced instead of having permanent liability of capitalised goodwill. If this could be decapitalised in a manner which is more favourable to the country it should be done at once to save perpetual drain of foreign exchange.

#### 10. Agricultural economy

It seems Indians would not have had the pleasure of seeing tobacco, had the foreign monopoly decided not to come to exploit India. Whatever good may have been done is welcome but the foreign exchange drainage, the exploitation of growers, trade and consumers by the monopoly should be checked in larger interests of the country's economy.

Golden's contribution as buyer of tobacco is unique in the sense that it helped reduce the monopolistic hold and exploitation of tobacco growers and you should go to the tobacco growing area to understand this.

#### 11. Brands for exports markets

When ITC can make cigarettes which successfully compete in the world contests, I do not know what restricts them from exporting the cigarettes and earning foreign exchange. Exports of cigarettes will earn at least twice the amount of exchange earned on export of tobacco. Not only that but labour and ancillary industries will also get a boost. I am eagerly looking forward to the day when ITC will export cigarettes worth Rs 25 crores instead of making a wrong claim of export of tobacco worth Rs. 10 crores.

#### 12. Profit—social responsibilities

I have noted Mr. Haksar's exposition on Social Responsibility, but as I said earlier, ITC's profits have gone up by 70% against the increase of 7% in production. However, it seems the fear of reduction in profit further coupled with the fear of restriction on the production to the installed capacity might have prompted him to advance the theory of Social Responsibility and Profit Making.

Profits made by GTC are not as unsocial as he thinks. After paying the highest tax which is applicable to closely held companies, only 30% is declared as dividends while 70% is being used to expand our business which further helps reduce the foreign monopoly. In contrast, ITC have remitted abroad Rs. 15 crores by way of dividends in 10 years. Please be rest assured GTC has done nothing against the law of the land.

I have already dealt with the argument of import substitution. If the manufacture of cigarette machinery, cigarette paper etc. were not a part of the grand design of vertical monopoly of ITC, I would have appreciated it.

Having placed all facts before you, the Press, the people and the Government we leave it to you to judge how Indian sector of the industry is placed against foreign sector and what steps should be taken in larger national interests.

## Development and Rural Savings

**Rural Savings in India:** P.G.K. Panikar; Somaiya Publications Pvt. Ltd, Bombay; 1970; Pp. 179; Price Rs 18.

**Studies in Demography:** Compiled by Ashish Bose; P.B. Desai and S.P. Jain; George Allen and Unwin Ltd., London; 1970; Pp. 579; Price Rs 50.

**Studies in Green Revolution:** Edited by G.S. Pohekar; United Asia Publications, Bombay; 1970; Pp. 52; Price Rs 5.

**Industry and Trade In Some Developing Countries — A Comparative Study;** Ian Little, Tibor Scitovsky, Maurice Scott; Oxford University Press; 1970; Pp. 512; Price 40s.

**Freedom and Necessity—An Introduction to the Study of Society:** Joan Robinson; George Allen & Unwin; 1970; Pp. 128; Price 25s.

**The World's Money — How it Works:** William M. Clarke and George Pulay; George Allen & Unwin; 1970; Pp. 216; Price 45s.

Reviewed by ACADEMICUS

It is generally believed that one of the important constraints on India's planned developmental efforts is the low rate of domestic saving for investment purposes. The rural sector of the Indian economy which accounts for nearly half of the country's national income is naturally expected to contribute its appropriate share of saving for economic development. Not only should the rural sector provide resources for investment in its own sector, but it should also release resources for the non-agricultural sectors. It is however generally believed by most that the rural sector in India has not been contributing its due share as the rate of saving in the rural sector is very low. Dr P.G.K. Panikar has critically analysed the above hypothesis in his book *Rural Savings in India* which by sheer repetition has almost assumed the status of an axiomatic truth.

Having emphasised the role of saving in economic development, the author has given a critical analysis of the concept and measurement of saving. He has explained briefly but clearly the two well-known methods of measuring savings, namely 'the income account method' and 'the balance sheet method'. He has subjected to criticism the methods used by the National Sample Survey (NSS) and the All India Rural Credit Survey (RCS) to derive some estimates of savings in the rural sector of the economy.

The author has shed light on the difficulties experienced in estimating the incomes of the rural households due to the existence of non-monetised sector, in estimating consumption due to absence of accounts and in estimating depreciation without which net savings cannot be worked out. The

conceptual and methodological difficulties explained by the author show the gaps which persist in this field and which must be removed by research workers, if proper estimates of rural savings are to be made. The accurate assessment of the rural savings and investment pattern of rural households is absolutely necessary, if the governmental policy to mobilise savings is to succeed.

What have been the conclusions arrived at by the author by following a methodology which attempts to avoid the pitfalls and shortcomings of the methods adopted by the NSS and the RCS?

According to Dr Panikar the general belief that the rural sector in India does little saving is only an impression based on scanty empirical evidence. The NSS and the RCS which covered the entire country, indicate a gross saving-income ratio of more than 12 per cent, excluding direct investment (i.e. investment in kind). If the non-cash savings are also included, according to the above surveys, this percentage would rise to 20 per cent or so. With adjustment for repairs, maintenance and depreciation, according to the author, the net (cash) saving-income ratio would be at least eight per cent.

Further, the author finds that rural households have a higher propensity to save than their urban counterparts belonging to the same income group.

Another significant finding of this study is that the bulk of rural savings is invested by savers directly in their household enterprises. The prevailing pattern of values and institutions in rural areas do not promote the transfer of savings. In the absence of banking

institutions and other financial instruments, the rural households hold almost their entire savings in the form of physical assets such as land, buildings and jewellery. Only an insignificant proportion of savings of rural households is held in the form of financial assets. Thus for the year 1951-52 financial investments (i.e. purchase of shares of co-operative societies, deposits in co-operative banks, postal savings and other banks, purchase of National Savings Certificates, Treasury Bonds etc.) amounted to only Rs 3.5 per rural family.

### Significant Findings

These findings have great significance for the formulation of appropriate policies. Though the rural savings may not be substantial in absolute terms or compared to the magnitude of investments required, they still represent a significant proportion of the income of rural families. It needs to be noted that even poor families save so much. This means along with steps to increase this percentage of rural savings, immediate attention needs to be given to the types of investment. The existing pattern of investment in traditional forms of assets like building and jewellery keeps productivity at a low level leading to low saving and investment. This vicious circle must be broken by inducing rural households to invest greater percentage of their savings in productive assets incorporating modern technology and yielding greater returns. This also involves greater and more effective diffusion of modern and appropriate technology in rural areas of India.

Also, the fact that most rural households invest their savings directly prevents their effective mobilisation and use. The savings must be effectively mobilised and transferred into the hands of more enterprising farmers. This means that financial institutions such as commercial and co-operative banks must be established in larger number in rural areas, familiarising the rural masses with new forms of investment. This will tone up rural capital market and wean away investments in buildings, jewellery and such other unproductive real assets. A radical change in the pattern of investment seems to be the first necessity for breaking the vicious circle of poverty and accelerating the economic growth of the country. When this is achieved, according to the author, savings will cease to be a serious impediment to economic development.

We have come to accept so many hypotheses as axiomatic truths due to slogan-mongering in which we have been indulging even after independence

that it comes as a revelation that the generally accepted view regarding rural savings has absolutely no foundation. The thesis of the book, a doctoral dissertation submitted to Vanderbilt University, USA, will certainly make us more critical about many other assumptions which have become part and parcel of our current thinking. If this book proves anything, it is this that nothing should be accepted as valid unless proved so by empirical evidence. We are in great need of this critical faculty and Dr Panikar deserves our congratulations for bringing out this book throwing new light on a vital subject.

### PROBLEMS OF POPULATION

*Studies in Demography* presents a collection of essays presented to Prof. S. Chandrasekhar on the occasion of his fifty-first birthday in honour of his outstanding contribution to the cause of Indian and Asian demography. The essays in this book are written by distinguished scholars all over the world and cover different aspects of demography.

Part I consisting of only one essay by Ashish Bose gives an exhaustive survey of practically all the research work done in India in the field of demography from 1947 to 1969. This essay should serve as a good reference work on demography for research students in this field. The author has also drawn attention to some of the loopholes that continue to characterise research in Indian population problems. Thus we do not know with any degree of accuracy the number of unemployed and under-employed persons in India, and about the number of people practising family planning and the impact of family planning programme on fertility.

There are very few studies on the evaluation of data, on the methodology of data collection, on techniques of estimation on the basis of insufficient data, on the need to improvisation and innovation and on data collection in an underdeveloped country like India. What is more, very few attempts are made to utilise intensively the available data and often surveys are undertaken not because there is a problem to be investigated or a hypothesis to be tested but simply because financial grants are available. The author also points out that demographic surveys of small towns are rare and there are major gaps in respect of mortality and morbidity studies. He has pointed out that a lot more research has yet to be done for planning and policy-formulation. Let us hope the census of 1971 will further strengthen the foundations of demographic research in India! In one long essay of about 30 pages the author has given a clear perspective of the state

of demographic research in India to the present day.

Part II of the book containing three essays deals with the problems of population and economic growth. The theme of the song all through these essays by Joseph I. Spengler, R.K. Som and L.A. Knyazhinskaya is that the agronomists have given us a revolution in crop production and that revolution must be followed by a revolution in population control. If this is not done a dangerous 'Times of Troubles' would soon be at hand! The essay by Ranjan K. Som on population problem in African countries is very informative. With about one-fourth of the total land surface and about nine per cent of the total world population, Africa (excluding South Africa) accounts for only two per cent of the world output (which is less than the total output of Italy)! The author has emphasised that energetic steps will have to be taken to increase production and investment and to cut back unemployment and under-employment in the African countries, and at the same time make population trends the subject of deliberate and comprehensive policy in their planning for economic and social development and not merely an outside item to be taken into account only casually. This essay gives in a nutshell the economic and population trends in Africa about which Indian readers generally know so little.

### Accelerated Urbanisation

L.A. Knyazhinskaya writing on the growth of population density has emphasised that the problem of increasing population load on land in densely populated agrarian countries cannot be considered insoluble. The problem will have to be solved by accelerated urbanisation, reclamation of new land, reduction of birth rate by suitably transforming socio-economic background and scientifically grounded demographic policy which can promote a more desirable correlation between the population and the level of development of the productive forces in the country.

Part III of the book analyses the technical problems which are faced when taking the census of people living in about 567,000 villages of great ecological variation, and with 70 per cent of the population illiterate and speaking various languages and dialects. After reading this part one gathers at least some idea of the stupendous problems of organisation and administration in planning a census.

Part IV deals with 'Techniques of Analysis and Models'. It deals with some important technical problems such as the use of logistic curves, in-

ferring births from age distribution and estimating fertility and mortality all of which is so useful for demographers.

In Part V dealing with 'Family Planning and Population Policy', two essays attract our special attention. Writing on 'Population Policy', Kingsley Davis has warned that despite strong anxiety over runaway population growth the actual programmes purporting to control it are limited to family planning only and are therefore ineffective. He feels that, (i) the goal of zero or even slight population growth is one that nations and groups find it difficult to accept; and (ii) measures that would be required to implement such a goal generally tend to offend most people reared in existing societies. As a consequence the goal of so-called population control is vague; the method is only family planning.

### Familistic Method

According to Davis this method far from de-emphasising the family, is in fact familistic. "It goes along with most aspects of conventional morality, such as condemnation of abortion, disapproval of premarital intercourse, respect for religious teaching and cultural taboos and obeisance to medical and clerical authority..." The things that made family planning acceptable are the very things that make it ineffective for population control... The unthinking identification of family planning with population control is an ostrich-like approach in that it permits people to hide from themselves the enormity and unconventionality of the task." This is a subtle argument from the well-known authority on demography and must be taken into account when framing the population policy.

Of all the essays in this book that of Asok Mitra is easily the most thought-provoking. He has put the problem of expanding population into a proper perspective by pointing out that with stagnant and even diminishing population for many decades, India in 1921 was unspeakably poor compared to India of 1951 and of 1961 with vastly increasing population. In 1968 India with more than 550 million or so of her population is even richer than she was in 1961. This implies that 'A small population alone is no guarantee of prosperity'. He therefore rightly believes that wholly unnecessary and harmfully rigid postures have been taken. Champions of economic growth have ignored the harmful effects of runaway population growth, while champions of population control have generally underestimated the necessity of economic growth. Very few have stressed the fact that economic growth and population control are

the two sides of the same coin and that both are completely dependent on rapidly changing industrial, economic and cultural technology in the life of a nation.

It is only when industrial change on the one hand and socio-cultural changes on the other are enabled to catch each other by the forelock that economic change and population control will achieve simultaneously the best results. Overstatement in any direction can create undue optimism with its inevitable backlash of disappointment and despair and nothing is more disastrous for a country's progress than pessimism and loss of self-confidence. From the outrageously indecent manner in which the family planning propaganda is being carried on with a total blindness to its moral and cultural implications and economic effects on sparsely inhabited territories such as Assam, Rajasthan, Haryana and Dandakaranya, one is inclined to believe that population control and family planning has become a new obscurantism for which no small blame attaches to Prof. S. Chandrasekhar.

This commemorative volume, like most such books, is good in parts only. While there are some good essays in this book, there are others analytically inadequate in that the arguments therein are supported by extremely flimsy empirical data.

Demographers have almost identified the science of demography with family planning and birth control which fact explains why few are attracted to this subject and why demography does not command much respect among social sciences. Unless demographers have proper grounding in economics and other social sciences, they will be unable to make any worthwhile contribution to the country's progress. From reading this commemorative volume the reader hardly get the impression that most writers have shown this awareness.

### GREEN REVOLUTION

There is much talk — at any rate among the governmental circles — about the occurrence of 'Green Revolution' in India in recent years.

But is there really a 'Green Revolution' in the country? Where has it occurred? How green is it? And if there is a 'Green Revolution' why should prices of foodgrains move up giving rise to the general wage-price spiral? There are the questions that at once crowd the minds of the public which has become weary and sceptical of governmental pronouncements these days. Mr Pohekar in his

book *Studies in Green Revolution* purports to give objective answers to the above problems.

Of the six articles included in this small booklet, "How Green is the Green Revolution?" by G.A. Pai is easily the most comprehensive and analytical and therefore should have been the first in the book instead of the last.

### Restricted Sweep

In his essay G.A. Pai has complained that the revolution does not appear to be as green as it is made out to be by constant government propaganda. If there is any revolution it is confined to the 20 per cent irrigated areas and to the production of wheat and gram only. He maintains and rightly that the process of transformation in respect of other cereals and pulses, oilseeds, sugarcane, cotton and jute is long and arduous. If this revolution is to take place soon, government, farmers, industrialists producing various agricultural inputs such as agricultural machines and fertilisers and money lenders and the nationalised commercial banks will have all to play an integrated role in a properly worked out comprehensive scheme of agricultural transformation.

The author rightly insists that it is no use comparing the current year's production and productivity with that of the previous year which may be a drought year, nor with the production of 1950-51, this distant base having ceased to be of any practical significance. To be reasonable, the current year's production should be compared with that of the earlier peak year which happens to be 1964-65. Thus, in spite of the fact that during the four-year period between 1964-65 and 1968-69 population increased by about 10 per cent, production of rice increased by only one per cent, of jowar by 0.6 per cent, of wheat by 51.8 per cent; while production of groundnuts declined by 24 per cent, of cotton by 6.4 per cent, and of sugarcane by 28,000 tons. Since absolute increase in the production of certain agricultural products has come about as a result of absolute increase in area under that crop, it is not the absolute increase but the productivity per hectare which should be the real basis of measuring the extent of so-called agricultural revolution in the country.

Adopting therefore the criterion of productivity per hectare and comparing productivity in 1968-69 with that of the peak-year productivity of 1964-65, we get a very revealing picture. The productivity of wheat has gone up by 28 per cent, of gram by 12.9 per cent, of cotton by 12.2 per cent, of sugarcane by

3.8 per cent, of rice by 0.3 per cent, of jute by 0.2 per cent; while productivity has declined by 22.7 per cent in the case of groundnuts and by 3.7 per cent in the case of jowar. This also clearly means that per capita availability in respect of cereals, pulses, grams, edible oils, sugar, and cotton cloth have all gone down as compared with the previous peak figures. This then is the extent of the 'Green Revolution'. These figures culled from government sources clearly explain the current spurt in the prices of agricultural commodities and government's anxiety to enter into agreements with the USA for the import of foodgrains, not only for the current year but for the next year is an indirect admission of the propagandist nature of the 'Green Revolution'. G.A. Pai with the help of excellent tables has analysed the nature and extent of the 'Green Revolution' and has shown its extremely limited nature in a manner that is irrefutable. We may be on the way to such a revolution; but we must not profess to be already in it. Complacency can be as destructive of progress as lethargy.

V.S. Vyas has drawn attention to the fact that overall targets in agriculture are being fulfilled mainly because of extremely good results only in a few

states notably in Punjab, Haryana, Tamil Nadu and to a lesser extent in Maharashtra and Gujarat which have all contributed more than their proportionate share. Also, it is only in wheat and to some extent in inferior cereals such as bajra that remarkable success has been recorded. The most important cereal of the country namely rice has yet to show worthwhile progress. Similarly, none of the commercial crops has so far witnessed the breakthrough. This suggests that hybridisation has yet been highly localised and has not measured up to the promise.

The author has drawn three important lessons — attempts must be made to extend the use of hybrids to other areas and simultaneously full complement of other agricultural inputs to such areas; there should be constant research in both existing varieties as well as new crops not yet covered by the programme; and thirdly the 'spread effects' of this programme must be encouraged and concentration of its benefits in fewer hands must be avoided. This would imply additionally taxing the farmers so benefited and using the proceeds for building infrastructure in agriculturally backward regions which must also be brought into the orbit of growth.

T.P.S. Chawdhari has emphasised that the economic impulses generated lead into the sociological fields as well and with cultivation becoming more profitable, owners may find it to their advantage to resume land from benami tenants for 'personal cultivation' as has been happening in Maharashtra. The author has rightly warned that there are yet problems such as need to achieve greater stability in terms of crop output, financial stability, improvement in marketing arrangements and industrial uses of grains like maize and constant attention to research and coordination. As long as these major problems await solution, it would be too early to name the developments in the agricultural field by the term 'Green Revolution'.

### Green is Grey

Without detracting from the merits of the agricultural developments during the latter part of 1960s, the essays leave the impression that the green revolution is less green than the impression created by government propaganda. One is also disheartened that various allied problems such as those of storing, marketing, proper pricing and agro-industrial development have as yet been receiving inadequate attention and agricultural revolution has come to be identified with only hybridisation. Above all the rising prices of foodgrains and commercial crops indicate that this revolution is too evolutionary and that it will have to gather more speed if it

is to successfully overcome the obstacles of increasing population and increasing prices, the two barriers to our progress.

### A LUCID ANALYSIS

This excellent volume, *Industry and Trade in Developing Countries* contains an exceedingly lucid analysis of the results of studies conducted by experts under the direction of Ian Little, T. Scitovsky and Maurice Scott on the industrial development in seven countries, namely Argentina, Brazil, Mexico, India, Pakistan, Philippines and Taiwan which have all made substantial progress towards industrialisation.

The authors have arrived at some very instructive conclusions as a result of this comparative study.

It is observed that in all the countries reviewed, an important feature of industrialisation since the World War II has been the creation of and dependence on an internal market by adopting the policy of high protective customs duties and fixing import quotas. The nascent industries so developed with the aid of protection are producing substitutes for goods previously imported. Protective policy was intended to support initiative which otherwise would not be easily forthcoming and promote savings by favouring the creation of small firms which could survive only under the shelter of high tariffs.

Further, the studies of the seven countries indicate that these countries have now reached the stage where policies aimed at import-substitution are proving harmful for their economic development. Industrialisation behind high protective walls has led to the creation of high-cost industrial units which are producing highly priced goods used mostly by the rich and middle class. This implies that production of many commodities is rapidly coming up against the limits of domestic market.

High industrial prices due to protective tariff has meant that industrialisation has been carried on at the cost of agricultural development and rural population has been made to bear the burden of industrialisation. The result has been to encourage a drift from the countryside, accentuate inequalities in income distribution and create serious unemployment problems in towns and cities as countryfolk have been migrating faster than the new industries in towns can create jobs for them. The increase in costs and prices of industrial and agricultural goods produced in these countries has seriously discouraged exports from these countries, both of primary and industrial goods and has created balance of payments difficulties

and foreign exchange crises. The policy of substituting domestic goods for imports, while inevitable and legitimate at the outset in most developing countries, has after 15 or 20 years come to a dead end and is in fact causing increasing difficulties. This policy has now been acting as a barrier to economic growth.

What is the policy to be recommended? The developing countries are essentially agricultural countries. With the new techniques of production, an agricultural revolution can be achieved and an appreciable increase in the production of foodgrains can be fairly quickly ensured. But the producers must derive a direct profit from the result of their labours and must be freed from the domination of landowners and money lenders. But for this to happen structural changes such as co-operative credit and marketing will have to be effected. This would help reduce the costs of financing agricultural development.

The labour that is likely to be freed from land due to progress in agriculture will result in their exodus to towns. This labour can be absorbed by establishing light industries in small and medium-sized towns. The creation of these industrial complexes will generate demand for agricultural commodities which will further accelerate agricultural growth. It is therefore, necessary to encourage industry. But the authors recommend direct encouragement and not through high levels of indiscriminate customs protection. They recommend extension of a revenue tariff of about 10 per cent on all imports. In addition there should be consumption taxes levied on imported goods and domestic production alike, the part levied on domestic production being used to make grants to encourage industries in various ways, especially those that create employment.

### Promotion of Exports

The authors thus emphasise promotion of exports so as to earn foreign exchange required to pay for essential imports, whether of capital goods or raw materials which cannot be economically produced at once. They want the administrative controls to be replaced by a better use of price mechanism and replacement of high-cost internal production by a reorganised agriculture and industry capable of gradually becoming efficient and competing in world markets on competitive terms. There are difficulties in implementing the above policies especially arising out of instability of prices of primary products and existence of international combinations. But progress involves efforts and these

a B.E.I. product

THE ORIENTAL  
MERCANTILE CO., LTD.

Calcutta - Bombay

DM 17A

obstacles will have to be overcome with or without the cooperation of developed countries.

This is a fine comparative study, grand in design and excellent in execution. One may not always agree with the arguments in the book, but one will surely be struck by the abundance of information collected, the way all that is woven into a systematic pattern and the lucidity with which the complex problems are analysed and expressed. Like all great works of deep scholarship this book should be read and reread by students and policy-makers. The study will be more than rewarding.

#### AN ANGLE OF VISION

With a fascinating title *Freedom & Necessity*, the book gives a survey of the structures of the world's economies and of the ideas which underlie them—feudalism, central administration, imperialism, colonisation, the new mercantilism, Soviet industrialisation and the Chinese alternative path. It is an attempt to telescoping the entire course of economic history from the origins of social institutions in the dim past to the Chinese cultural revolution of the present decade. The authoress however has made it plain that the book is intended to offer 'an angle of vision' and thus provoke inquiry.

The first five chapters that deal with the evolution and development of human societies contain practically nothing that is new and much that is said of man's biological past is commonplace and hence often tiresome.

And thus we arrive after a quick journey from the neolithic age to the eighteenth century and modern age which according to the author has been characterised by the hypertrophy of the nation state, the application of science to production and the penetration of money values into every aspect of life. With a big sweep Robinson traces the evolution of socialism and arrives at Russian revolution. Of the serious drawbacks of the Russian revolution, the main is that the communist faith which made the revolution possible became hardened into a dogma. Marx-Leninism became an obscurantist, persecuting religion. 'Physics and engineering were too important to be smothered, but questions of biology, linguistics, psychology, aesthetics, and above all, economics, and social science were settled by decree.' The contradiction between the spread of education and suppression of a free intellectual life of enquiry and criticism has been producing a tension which has not yet been fully resolved in Russia.

There is quick journey through 'The New Mercantilism' (where the welfare

state has very much softened the hardness of raw capitalism and has played a large part in saving it till now from the doom Marx foresaw a hundred years ago) to the Cold War and 'Socialist Affluence' whose problems of decentralisation of power and winning loyalty of workers etc. and achievements especially in the field of public education have been detailed. We arrive at the final great scene of the Chinese revolution. She believes that Chinese socialism is 'something new in the world.' The Chinese have set themselves on the ambitious course of 'establishing economic development with a human sense of values.'

Another 20 years will show whether or not humanity is capable of carrying out such a programme. Meanwhile the Chinese experience, unlike the Russian, has shown to the developing countries the requirements of economic progress—to get the whole population engaged with goodwill in the economic effort and to organise employment so that all can contribute; to increase productivity in agriculture so that a surplus can be extracted without the need to use brutal methods; to check inequality so as not to waste resources on unnecessary consumption and undermine morale by generating envy; to raise the general level of health and to institute birth control; to build up the basis of heavy industry so as to be able to modernize production as fast as possible; and meanwhile to encourage handicrafts to mechanise themselves by means of 'intermediate techniques'; to spread education and develop self-reliance (at every level from the paddy fields to the atomic laboratory) in applying the scientific method of experiment in every activity. The authoress writes confidently that in the face of all these developments in Russia and especially China, the apologists of modern capitalism have lost their self-confidence and are on the defensive.

#### Ignorance : Basis of Wonder

From Cambridge in the UK Joan Robinson was once enchanted by what was happening in distant Russia. But with the lapse of time came the disenchantment. It is now the Chinese revolution that appears to fascinate her. Familiarity, they say, breeds contempt and very often ignorance is the basis of wonder and therefore of hope. How else can we explain Robinson's turning a blind eye to the dynamism of new capitalism in the USA. West Germany and Japan, the latter two hardly finding any reference in her book. While the top intellectuals from the west are viewing with hope what India has been doing within the democratic framework since 1951, the

authoress seems even to be unaware of this Indian drama whose objectives are exactly the same as the Chinese ideals which she mentions. While disenchantment has overcome the newly liberated countries of Africa and south-east Asia over Mao-tse Tung's thoughts during the later part of 1960s, they still seem to be the only basis of reforming the world for the authoress who therefore appears to have chosen his thought for the title page.

It is as the authoress herself admits a book written with 'an angle of vision'. The academicians are therefore, likely to find the treatment perfunctory and biased. One picks up the book with great hope and expectations but feels extremely disappointed as the book unlike her other books fails to measure up to the expectations.

#### MONETARY CRISES

Why have there been so many monetary crises in recent years? Why have they been caused? Why was there a run on gold in Washington? What exactly is the role of gold in international monetary affairs? How do foreign exchange rates get fixed? What are the objectives of the IMF and the World Bank and how do they function? What are currency blocks? What is the Euro-dollar market? What is the new world money? Why were so many currencies devalued since World War II? Will and can 1929 recur?

These are some of the questions which are often agitating the minds of the public that is daily reading about them in the newspapers. But strangely enough few among the readers can critically follow these developments which affect their daily lives. *The World's Money* is an extremely readable book written by two former city editors of *The Times* for the lay public who want to understand some aspect or the other of the world's financial affairs.

Starting with 'The Uses of World Money', the authors point out that the international payments can be made by a country in its own currency, if the creditor country is prepared to accept it. The chances are that this may be possible to a limited extent only and the creditor country may not want too much of that particular currency as it does not want to purchase the goods and services of the country paying it. Most countries therefore keep only small working balances of other countries' money. If they get too much of it, they convert it into gold, dollars or pounds. The latter two reserve currencies are in a special position and between them account for just under 30 per cent of the total of international money.

The authors then explain why and

how payments are made and how trading deficits and surpluses arise. Thus the United States until 1969 had a substantial trading surplus and a further surplus on invisible account. But these were more than wiped out by massive government expenditure and private investment abroad. Thus for the USA during 1950s and most of 1960s there was a visible trade surplus of about \$3,000 million a year and an annual surplus of \$1,500 million on invisible account, making a total surplus of about \$4,500 million available for investment and government expenditure abroad. But net investment overseas was amounting to between \$2,000 million to \$5,000 million, thus leaving a deficit of \$2,000 million to \$3,000 million a year.

#### Puzzling Question

One puzzling question for the public is—if both the USA and the UK have been running annual deficits since the World War II, how have they managed to pay for them? This has been done to some extent by using gold reserves with these two countries partly in other currencies earned by their exports, to some extent by borrowing from other nations and institutions, and partly by giving dollars and pounds to other countries, if they were willing to hold them as reserve currencies.

But then why is it that first pound and later dollar became acceptable to other countries as reserve currencies? Since pounds were readily acceptable in payment by most other countries which wanted to purchase British goods, or to ensure ship or finance trade through London and since above all they could be invested in London at a useful rate of interest, the habit grew, first of holding pounds and later dollars as 'reserve currencies' rather than cashing them immediately with the Bank of England or the Federal Reserve System. These two currencies have thus been playing two roles—as trading currencies and as reserve currencies.

But the trouble now is that, less successful Britain and the United States are in keeping their payments in balance, the more pounds and dollars become available through their deficits to lubricate world trade and as reserve currencies, while on the other hand the continuing deficits will themselves undermine confidence of other countries in these two currencies as reserves. But if the UK and the USA balance their payments, stronger their currencies will be and fewer pounds and dollars will be available for lubricating world trade and as currency reserves. And therefore many experts and people like General de Gaulle came to the conclusion that there must be a better

way to finance world trade than leaving the supply of world reserve and finance to the ups and downs in international payments of the UK and the USA.

The writers then explain the emergence of currency blocs—the Sterling Area, the Franc Area, the Dollar Area and the Comecon Bloc, each holding as reserve the currency of their leader country, because of their peculiar position in world trade and also due to past historical connections. But as already seen, the western countries are finding it inconvenient to hold pound and dollar or franc as reserve currencies and since the stock of gold is inadequate either for financing increasing world trade or for reserve purposes, the countries had to think of some device to make the increasing volume of international trade flow in smooth channels. This explains the birth of the Special Drawing Rights (SDRs). The first distribution of the SDRs agreed by the IMF in September 1969 amounted to a total of \$9,500 million. Of this \$3,500 million is being distributed in 1970 and the rest is to be distributed over 1971 and 1972.

All this and the other relative matters and institutions are treated with that lucidity and mastery which only mature journalists can command. The authors discuss recent events as illustrations to illuminate theory, history and future of money and monetary system so that the book has become at once topical and of lasting value. Though the authors claim that they assume that the readers of this book need know next to nothing about economics to follow this book, this claim appears a trifle exaggerated. But the students who have done their primary course in economics will find the book extremely instructive and at the same time entertaining, unlike most of the scholarly books on this subject which are generally characterised by heavy footnotes and unreadability.

## RECORDS AND STATISTICS

## Dissolution of the Lok Sabha

THE FOLLOWING is the text of the Prime Minister's broadcast from the Delhi station of All India Radio on the dissolution of the Lok Sabha on December 27, 1970:

There comes a time in the life of a nation when the government of the day has to take an unusual step to cut through difficulties in order to solve the pressing problems with which the country is beset. The present is such a time. Therefore, on the advice of the Council of Ministers, the President has dissolved the Lok Sabha before its full term. In a Parliamentary Democracy this is not unusual, but in India it has happened for the first time.

Why did we do this, when it is conceded on all sides that our government could have continued in power for another 14 months?

It is because we are concerned not merely with remaining in power, but with using that power to ensure better life to the vast majority of our people and to satisfy their aspirations for a just social order. In the present situation, we feel we cannot go ahead with our proclaimed programme and keep our pledges to our people.

In the years since Independence, the nation has many achievements to its credit — vast and complex industrial enterprises, agrarian reforms, including the abolition of the zamindari system, mass education including substantial expansion of university and technical education; major social reforms and advance in many other spheres; particularly in science and technology.

But despite this progress, many problems still await solution. Millions live in backwardness and poverty in towns and countryside. Justice — social, economic and political — which is the basis of our Constitution, is yet a goal to be fought for and attained. Our people are rightly impatient in their ardent desire for a speedier and more resolute advance towards this goal.

Our recent political initiatives reflect this urge. The decision to nationalise the banks, the setting up of the Monopolies Commission and the attempts to abolish Privy Purses were welcomed

by large masses of people throughout the country.

These attempts to accelerate the pace of social and economic reforms have naturally roused the opposition of vested interests. Reactionary forces have not hesitated to obstruct in every possible way the proper implementation of these urgent and vitally necessary measures.

The present political situation has set in motion a process of rethinking on major political issues within every political party.

With the division in the Congress, we lost our party majority although throughout we retained the confidence of Parliament. The amendments to the Constitution designed to pave the way to abolish Privy Purses and Princely privileges were lost by a fraction of a vote in the Rajya Sabha. The Presidential Order derecognising the Princes has been struck down by the Supreme Court as unconstitutional.

Economic difficulties and the growing

## Kabul Declaration on Asian Co-operation

THE COUNCIL of Ministers for Asian Economic Co-operation consisting of the representatives of the regional and associate member countries of the United Nations Economic Commission for Asia and the Far East (ECAFE) met in Kabul, Afghanistan, from December 16 to 19 in order to examine proposals for trade expansion, Asian clearing union and reserve bank. In the area of trade and monetary co-operation the ministers decided to establish a preparatory committee consisting of the representatives of member countries interested in the establishment of Asian clearing union to further examine the guidelines and to negotiate an agreement on terms and conditions acceptable to them for an early establishment of such a union. It also decided to establish an inter-governmental committee to conduct an examination of the principles involved so that a trade expansion programme could be launched as speedily as possible. It invited the member countries to depute representatives to the inter-governmental committee for further examining the guidelines for the establishment of Asian reserve bank. The declaration made by the Council of Ministers at the conclusion of the deliberations in Kabul is given below:

The Council of Ministers for Asian

impatience of the people are being exploited by political elements. Violent activities are being organised by extremists. Reactionary groups are arousing communal passions and trying to divide our people. This has often led to a break-down of law and order and the dislocation of normal life, causing suffering to our people. The challenges posed by the present critical situation can be met only by the proper and effective implementation of our secular socialist policies and programmes through democratic processes.

Time will not wait for us. The millions who demand food, shelter and jobs are pressing for action.

Power in a democracy resides with the people. That is why we have decided to go to our people and to seek a fresh mandate from them.

We hope that the elections will be completed in time for the new Lok Sabha to assemble in March 1971, well before the end of the current financial year.

The old year is ending. I wish you — each one of you — a happy New Year — a year of renewed hope and common endeavour to realise the great goals, which we have set for ourselves.

**Economic Co-operation:** Taking note of the General Assembly resolution on International Development Strategy for the second United Nations Development Decade, unanimously adopted at its twenty-fifth session which, *inter alia*, endorses the determination of developing and the developed countries to continue their efforts for instituting the schemes for trade expansion, economic, co-operation and regional integration among developing countries which foster the rationale and outward looking expansion of production and trade as a significant contribution towards the attainment of targets set for the second United Nations Development Decade.

**Re-affirming** the resolution on the Strategy for Integrated Regional Co-operation, adopted at the third Ministerial Conference on Asian Economic Co-operation which, *inter alia*, attached great importance to the proposals for intra-regional trade expansion and for the establishment of necessary payments arrangements to support the trade expansion efforts.

Noting with appreciation the progress made with implementing the recommendations and programmes

adopted by the third Ministerial Conference on Asian Economic Co-operation in regard to joint action in the field of primary products, co-operation in shipping and in the other areas of the Strategy for Integrated Regional Co-operation.

**Recognizing** the contribution made by the meeting of government and central bank officials on Regional Trade and Monetary Co-operation to regional co-operation in the trade and the monetary fields and also appreciating the technical groundwork prepared for that meeting by the ECAFE secretariat in co-operation with the staff of the International Monetary Fund, the secretariat of the United Nations Conference on Trade and Development, the United Nations Development Programme, the Commission of the European Communities as well as individual international experts.

**Considering** that the initiative taken and efforts made by the regional members of ECAFE in the promotion of trade and monetary co-operation in Asia and the Far East, are still far off from the objective of the integrated strategy for economic co-operation.

**Considering also** the initiatives taken and efforts made by the ECAFE developing countries in the promotion of trade and monetary co-operation in Asia and the Far East, towards the attainment of the targets for the second United Nations Development Decade.

**Considering further** that sub-regional arrangements for economic co-operation have already come into existence in Asia and the sub-regional arrangements within an overall regional frame to the extent possible constitute one of the most important and practicable instruments for realising the aims and objectives of development.

**Recognizing** the need for adequate transit facilities to the land-locked countries and the difficulties in promoting economic development of the least-developed countries in the region.

**Noting** the different views expressed on the draft statements of principles for trade expansion among the developing countries of the ECAFE region, and for sub-regional groupings, draft guidelines for the establishment of the Asian clearing union and draft guidelines for the establishment of the Asian reserve bank prepared at the meeting of government and central bank officials.

**Noting further** that some countries have indicated their interest in proceeding with further work in the field of

trade and monetary co-operation on the basis of the aforementioned principles and guidelines.

**Recognizing** the necessity of further work including such examination and modification of the aforementioned principles and guidelines as may be necessary to secure wider participation,

**I. In the area of trade and monetary co-operation:**

## DECIDES

**A. to establish** a preparatory committee comprising representatives of regional member and associate member countries of ECAFE, interested in the establishment of an Asian Clearing Union to further examine the aforementioned guidelines and to negotiate amongst themselves an agreement on terms and conditions acceptable to them for the early establishment of such a union;

**B. To establish** an intergovernmental committee comprising representatives of regional member and associate member countries of ECAFE interested in initiating a Trade Expansion Programme to conduct such examination of and make such modifications to the relevant principles and to deal with other necessary technical and operational matters so that a trade expansion programme can be launched as speedily as possible.

**INVITES** regional member and associate member countries of ECAFE interested in the establishment of an Asian reserve bank to depute representatives to an intergovernmental committee to further examine the guidelines for the establishment of such a bank, and if found feasible, to consider and recommend provisions for its establishment.

**Requests** the Executive Secretary of ECAFE:

**(i) to service and assist** the above-mentioned preparatory committee and intergovernmental committees, to call their meetings and organise negotiation as required, and to convene conferences of central banks or monetary authorities and of plenipotentiaries as appropriate; and

**(ii) to seek, as appropriate** to each programme, technical and financial assistance from UNDP, IMF, UNCTAD, the Asian Development Bank and other institutions, as well as from co-operating countries, in carrying out the above tasks;

**Expresses** the earnest hope that the developed countries will accord to all these efforts their wholehearted support.

**II. In regard to other programmes under the integrated strategy:**

**Urges** the member and associate member countries of the region, in co-operation with the ECAFE secretariat:

**(i) to evolve and implement** regional co-operation programmes relevant to the industrial components of the strategy in the light of the background information furnished to this meeting and in accordance with ECAFE resolution 94 (XXV) entitled the second Development Decade, ECAFE resolution 103 (XXVI) entitled United Nations Twenty-fifth Anniversary ECAFE Declaration and the resolution and declaration adopted at the second session of the Asian Conference on Industrialisation;

**(ii) to concert measures for stabilising commodity prices and for defending the interests of Asian products in relevant international forums;**

**(iii) to render every possible assistance to land-locked countries of the region to enjoy the right of free access to the sea and to provide port and transport facilities, minimum and simple customs formalities, reasonable transport charges and transit by air and overland routes;**

**(iv) to accord specially favourable treatment to the imports from the least developed among the developing countries in respect of tariff and non-tariff barriers;**

**(v) not to allow disputes between two countries of the region to affect adversely the interests of third countries;**

**(vi) to support the studies being undertaken by ECAFE with a view to identifying economic potentialities of international river basins as well as the current steps for evolving an integrated long term programme of development for the lower Mekong basin;**

**(vii) to accord priority to the formulation of an effective programme for the control of typhoon and cyclone damage;**

**(viii) to continue assistance to the development of infrastructural facilities needed for promoting intra-regional trade expansion such as those being undertaken under the Asian highway, railway and telecommunication network programmes and according high priority to achieving, during the next phase of the Integrated Strategy, significant progress in the (a) improvement of shipping facilities and development of ports, (b) adoption of measures to facilitate inter-national traffic, and (c) provision of efficient**

and economical telecommunication services ;

(ix) to strengthen and utilise for furthering this strategy the regional institutions in the fields of trade, industry, mineral resources development, science and technology, economic development, planning, and statistics,

and also to take steps to ensure the early establishment of the centre for development administration, including a decision on its location on the basis of the proposed criteria.

III. In regard to the foregoing programmes:  
Urges the Executive Secretary of

ECAFE to evolve on the basis of this declaration an integrated programme of action and to assist in including it in an accelerated and co-ordinated manner and to take such steps and make such arrangements as are deemed necessary for implementing the strategy.

### Company Notices

#### UPPER GANGES SUGAR MILLS LIMITED

Regd. Office : 14, Radha Bazar Lane, Calcutta-1.

##### NOTICE

NOTICE is hereby given that the Thirty-eighth Annual General Meeting of Upper Ganges Sugar Mills Ltd. will be held on Wednesday, the 20th January, 1971 at 2.45 P.M. at 1B, Old Post Office Street (4th Floor) Calcutta for the following purposes :-

1. To receive and consider the report of the Directors and to adopt the audited accounts of the company for the year ended 30th June, 1970.

2. To declare dividends.

3. To elect a Director in place of Shri B. T. Thakur who retires by rotation and being eligible offers himself for re-election.

4. To appoint Auditors and fix their remuneration.

##### AS SPECIAL BUSINESS :

5. To appoint a Director in place of Shri K.K. Birla who was appointed as an additional Director by the Board of Directors and whose term of office expires at this Annual General Meeting under Section 260 of the Companies Act, 1956 and in terms of Articles of Association of the Company and in respect of whom the Company has received a notice in writing from a Member proposing his candidature for the office of Director and signifying his intention to move the following resolution as an Ordinary Resolution :-

"Resolved that Shri K.K. Birla be and is hereby appointed a Director of the Company."

6. To appoint a Director in place of Shri C. P. Dalmia who was appointed as an additional Director by the Board of Directors and whose term of office expires at this Annual General Meeting under section 260 of the Companies Act, 1956 and in terms of Articles of Association of the Company and in respect of whom the Company has received a notice in writing from a Member proposing his candidature for the office of Director and signifying his intention to move the following resolution as an ordinary resolution:-

"Resolved that Shri C.P. Dalmia be and is hereby appointed a Director of the Company".

By Order of the Board  
S. N. GUPTA  
Secretary.

Dated the 22nd December, 1970.

##### NOTES :

1. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.

2. Shareholders are requested to notify any change of address, failing which the dividend warrants will be posted to their address as registered with this Company.

3. The Registers of Members of the Company will remain closed from the 14th January, 1971 to the 20th January, 1971 both days inclusive.

4. The dividends when declared will be payable to the registered shareholders as on the 20th January, 1971 or to their mandates on or after the 25th February, 1971.

Explanatory Statement has been sent to the Shareholders directly.

#### BHARAT SUGAR MILLS LIMITED

Regd. Office: 14, Radha Bazar Lane, Calcutta-1.

##### NOTICE

NOTICE is hereby given that the Thirty-ninth Annual General Meeting of Bharat Sugar Mills Ltd. will be held on Friday, the 29th January, 1971 at 3.15 P.M. at 1B, Old Post Office Street (4th Floor), Calcutta for the following purposes:-

1. To receive and consider the report of the Directors and to adopt the audited accounts of the company for the year ended 30th June, 1970.

2. To declare dividends.

3. To elect a Director in place of Shri R.K. Bhuwarka who retires by rotation and being eligible offers himself for re-election.

4. To appoint Auditors and fix their remuneration.

##### AS SPECIAL BUSINESS:

5. To appoint a Director in place of Shri K.K. Birla who was appointed

as an Additional Director by the Board of Directors and whose term of office expires at this Annual General Meeting under Section 260 of the Companies Act, 1956, and in terms of Articles of Association of the Company and in respect of whom the Company has received a notice in writing from a Member proposing his candidature for the office of Director and signifying his intention to move the following resolution as an Ordinary Resolution:-

3. The Registers of Members of the Company will remain closed from the 21st January, 1971 to the 29th January, 1971, both days inclusive.

4. The dividends when declared will be payable to the registered shareholders as on the 29th January, 1971 or to their mandates on or after the 1st March, 1971.

Explanatory Statement has been sent to the shareholders directly.

## ITC/ILTD earned an average of Rs.10 crores a year in foreign exchange in the last three years

India Tobacco Companies are the largest net earners of foreign exchange in the entire tobacco industry in the country — and this after meeting dividend commitments to overseas shareholders.

They started the export of unmanufactured tobaccos as far back as 1933. The fact that today leaf tobacco has become a traditional export item is due entirely to the pioneering efforts of India Tobacco Companies. Their exports have earned the country Rs. 66.14 crores net in foreign exchange for the years 1959 to March 31, 1970. The Government of India recognised their achievement by awarding them the Certificate of Merit for Outstanding Export Performance for the period 1966-1968.

India Tobacco Companies are determined to continue doing their very best in this vital national task of earning more foreign exchange, with the willing help and active co-operation of their overseas associates, despite increasing international competition.

## HINDALCO ALUMINIUM EXTRUSIONS

Lightness, corrosion resistance, good surface finish, along with strength and combination of properties—you can obtain all at low cost with HINDALCO Aluminium Extrusions. There are endless applications in every industry using fabricated metal shapes as components of assembly. A single aluminium extruded shape substituted for other metal can impart greater stiffness and strength with simpler assembly along with reduction in cost.

Extrusions can be custom-made in alloys which can give a combination of mechanical properties needed in a wide range of sections—rods, bars, angles, channels, tees, zeds, I-beams, H-sections, hollow shapes or semi-hollow shapes or special shapes.

Why not investigate the possibilities of Aluminium Extrusions application in your industry? It will pay you handsomely to do so! Please write to:

## TURN OF THE SCREW

WE ARE back to an era of dear money. On January 8, the Reserve Bank not only stepped up the bank rate from five to six per cent but also announced that the minimum net liquidity ratio for purposes of determining the penal rates of interest chargeable on excess borrowings of commercial banks from the central banking institution would be raised from 33 to 34 per cent with effect from January 15. The two measures, according to the RBI Governor, Mr S. Jagannathan, have been taken to contain the prices spiral and restrain the resort by commercial banks to refinance by the Reserve Bank.

With the index of wholesale prices registering a rise of nearly 7.4 per cent during 1970, the concern over the inflationary tendencies in the economy is wide-spread. This can also be expected to throw the fourth Plan out of gear as the planners have not anticipated any sharp rise in prices during the five years to 1973-74. But can the prices spiral be contained by the above two measures?

No doubt, the sharp increase in bank advances in the recent past—advances of commercial banks, instead of shrinking during the conventional slack season, registered an expansion of as much as Rs 192 crores and they rose further by Rs 184 crores during November and December, the first two months of the current busy season—has had its impact on the price level, the basic reasons for the high prices are: (i) shortages of goods; (ii) the increasing dependence of the government on deficit financing; and (iii) the cost-push inflation resulting from high taxes and successive wage hikes in utter disregard to increase in productivity. In the circumstances, the dear money policy, in so far as it raises cost of production, can be expected to accentuate the inflationary tendencies, instead of having a salutary effect on them.

It may be argued that tighter and costlier bank credit will curb speculative transactions. But the pertinent fact to be noted in this regard is that there are already severe restrictions on bank advances for such purposes. The objective of curbing speculative transactions, it can further be argued, could be better achieved through a selective approach rather than through raising the bank rate and consequently pushing up interest rates across the board.

The efficacy of the two measures to restrain resort by commercial banks to refinance by the Reserve Bank is similarly open to question. The main reason for the increased resort by commercial banks to refinance by the Reserve Bank in the recent past obviously has been extension of credit following the nationalisation of the 14 major banks in the country at a rate much faster than the growth in deposits. This is also the reason why there was no shrinkage of bank credit during the last slack season. The efforts of the nationalised banks to mobilise deposits, especially from the rural areas where undoubtedly surplus money is available, leave much to be desired. The stepping up of the return on deposits, following the increase in the bank rate, it is thought, will help mobilisation of deposits. But the enhancement of interest being just modest—not more than half a per cent—it is highly improbable that this will prove any big incentive for depositors. Some other measures to mobilise deposits will, therefore, have to be thought of.

The switch-over by the Reserve Bank to dear money policy in the midst of the current busy season can be questioned on another count too. All the factors which have prompted the Reserve Bank to go in for this policy now were operative in no less vigour at the start of the busy season. That the prices spiral was expanding fast was a well-known fact even in July last. It was equally clear several months ago that the growth rate of deposits in 1970 had tended to decelerate as compared to 1969. But the Reserve Bank preferred to wait! Is it that it could not at the start of the busy season prevail upon the Union Finance Ministry to clamp dear money policy on the country? The ills of our economy are far too deep-rooted to be cured by changes in the monetary policy alone. There is urgent need for a fresh look at the entire gamut of the economic policy of the government.

## Resurrection for a Mixed Economy?

At a press conference on December 29, the Prime Minister expressed her view of what the structure of our economy should be, in words which deserve to be widely publicised. The relevant extract from an official transcript of the proceedings of this press conference follows:

"Question: Don't you think that, as Prime Minister, you should welcome the private sector not coming in to invest because this will help expand the public sector?"

"Prime Minister: I am afraid you have got our policies wrong. I think perhaps we should have an education of the press class. The Government of India stands for a mixed economy. There are areas very clearly demarcated for what can come under private enterprise and what comes under public sector. But we do want private enterprise to be more widely spread. We do not want it to be confined to a few families. We want other people to take it up, the younger people or the older for that matter, so that the base is much wider."

The question was put in relation to the statement which the Prime Minister has been repeatedly making lately that the larger business houses have not shown sufficient interest in promoting industries in the core sector in spite of the fact that the government has liberalised its policies and procedures with a view to facilitating their participation in this essential area of industrial development. What the questioner had in mind was that a government and its leaders who have been publicly expressing a decided ideological preference for the growth of the public sector should be rather pleased if, in fact, the private sector is, as is being alleged, not being over-keen on entering or expanding its activities in the core or other essential industries.

The Prime Minister, as could be seen from her reply, was quick to avail herself of the opportunity provided by this question, to make clear her and her administration's view of the structure of industry as favoured by them. Mrs Indira Gandhi stated categorically that "the Government of India stands for a mixed economy". The significance of this statement is that many of us have been led to believe that the party ruling at the centre had abandoned its faith in a mixed economy as far back as in the middle fifties.

It will be recalled that it was only in the years of the first five-year Plan that

This article, which is by the Editor, is reproduced here by courtesy of "The Hindustan Times" in which it was published on January 4.

the ruling party used to speak in firm and clear accents of the concept of a mixed economy as a desirable guideline for the co-ordinated development of private enterprise and state undertakings. Subsequently, and over the years, the pendulum of the politico-economic doctrines of the ruling party started swinging more and more in the direction of a concept of the increasing domination of the public sector in industry and trade which would radically alter the composition of the mixture in a 'mixed economy'. The doctor's prescription, in other words, was no longer 'mixture' as usual. As a matter of fact, the idea of a mixed economy was becoming gradually discredited and the ruling party has had its platform shifted, first, to a socialistic pattern of society, then, to a socialist society, and lately, after the split in the Congress organisation, to radical socialism. As a part of the process, the concept of a mixed economy has been getting narrowed to an article of faith of only one major political party, namely, the Swatantra Party.

In these circumstances, it is indeed both intriguing and interesting to find the Prime Minister declaring so unequivocally that her administration "stands for a mixed economy". It now remains to be seen whether this forthright observation made by her will find its due place and emphasis in the formal manifesto of her party, and what is more important, be incorporated, in letter and spirit, in the policies and programmes which may be spelled out in that document.

This issue is not an academic one, especially to such of us as are inclined to believe that much of the lack of sufficient growth in our economy over the last 20 years or so has been due to a dogmatic propagation of the public sector by the government in violation of any reasonable or acceptable conception of a 'mixed economy'. This may be a matter about which views differ even as the political inclinations of the concerned people differ. But, on behalf of those who may be of the opinion that, over the past 15 years or so, the concept of a truly 'mixed economy' has not been promoted to evolve and seek to fulfil itself in a proper way, it may perhaps be pointed out that government action or activity has been more in the

direction of controlling the private sector rather than encouraging or enabling it to play its part fully in promoting economic growth.

For one thing, procedural complexities and administrative restrictions have been obstructing expansion in the private sector in many ways and one of the more obvious consequences of this has been the vicious circle of shortages and controls which has been in more or less perpetual motion. These administrative attitudes have followed from the ideological or political postures taken up by the ruling party, partly under the pressure of Leftist influences or forces, whether operating within its own ranks or from outside.

As a result, a kind of mystique has been sedulously sought to be fostered about the public sector. In the process, a belief has been preached that the public sector, in all circumstances, is a qualitatively superior instrument of economic or social development than private enterprise. As a corollary, an attempt has been made to condition the public mind to accept the view that normal considerations should not be applied in evaluating investment priorities or operational results, where the public sector is concerned. Although lip sympathy has been lavished by the protagonists of this doctrine on the need for improving performance in the public sector, the main thrust of their argument always has been that, although the working of enterprises in the public sector may have been generally unsatisfactory in terms of the profitable utilisation of resources, this is a price which the community can afford to pay and should not grudge paying for establishing a predominantly public sector economy in which private enterprise would be compelled to confine itself to an ideologically desirable or politically acceptable minor or, at any rate, subordinate place.

The Prime Minister's observations in the press, to which I have referred in the beginning, do not of course, amount to a clear repudiation of this thinking. But it is, nevertheless, of strategic significance at this point of the political season when the minds of certain types of politicians are only too apt to turn in the direction of radical socialist talk. However, as I had suggested earlier, what will matter is how far declarations in the election manifesto of the ruling party would live up to the Prime Minister's blunt statement at her press conference that "the Government of India stands for a mixed economy".

There was another similarly significant observation made by the Prime Minister at this conference with reference, again, to the implications of a mixed economy. This, too, deserves to

be widely noted. The relevant extract follows:

"Question: You said one of the main planks of your campaign would be against vested interests. Do you envisage further nationalisation as one of the methods to help the people. And if so, what are the kind of things you have in mind?"

"Prime Minister: No, we don't have any nationalisation plans and when we say that we are against vested interests, I want to make it clear that we do not believe, I mean that we are not against any one group or section of the people but when in a country like India, there is so much poverty and so much disparity and inequality, there can only be stability if there is an effort made to reduce this inequality and disparity..."

It should be possible for most of us to welcome the Prime Minister's declaration that her party does not "have any nationalisation plans". We may wait however for her party's election manifesto to endorse this position in an equally firm language. Meanwhile, some clarification seems called for. For instance, the 10-point programme to which her party, evidently, stands committed as of to-date, has stipulated the nationalisation of general insurance.

## Indo-Nepal Trade Talks

It is rather unfortunate that Nepal has thought of launching a diplomatic offensive against our country even though the efforts at resolving the outstanding issues concerning a new trade and transit agreement between the two countries are continuing. The Commerce Minister of Nepal, Mr N.R. Subede, is reported to have accused us of exerting undue pressure on his country with a view to altering its economic and trade policies. He is also reported to be trying to build up a case that under the pretext of controlling deflection of trade, we are trying to have a stranglehold on Nepal's economy. Nothing can be farther from facts than these uncharitable outbursts of the Nepalese Commerce Minister.

That we wish to carry forward the tradition of good neighbourly relations with Nepal should be evident from the fact that despite we ourselves being hard-pressed for resources — both financial and technical — we have, over the past several years, made available substantial assistance to that country, and that too without strings, for its economic development. The bona fides of our government in regard to assisting Nepal to the maximum should also be evident from the unilateral announcement made in New Delhi early this week for the maintenance of the supply of essential goods to Nepal as well as

Could the Prime Minister's present statement be taken to mean that this is a matter on which her party is now entertaining second thoughts? There is, again, the case of the sugar industry. At the Bombay session of her party held soon after the split, the nationalisation of the sugar industry was proposed and recommended as a party programme. Since then this particular matter has run a strange course, with politicians in Uttar Pradesh trying to embarrass politicians in the central government or vice versa. Can the Prime Minister's latest statement that her party has no nationalisation plans be taken to mean that it applies to its intention regarding the sugar industry?

These however are details, though important in themselves. What matters basically is the Prime Minister's two categorical declarations that her party does not have any nationalisation plans and that her administration stands for a mixed economy. They are integral to each other and read together — as indeed they must be — they constitute one of the most reassuring pronouncements ever made with the authority or on behalf of the ruling party of its basic attitude towards the future economic structure of our country.

the present arrangements for trade and transit. The following facilities are being provided by our government with effect from January 1 so as not to put Nepal to inconvenience in any way:

- (i) Exports to Nepal are permitted as hitherto and supplies of essential articles like milk, salt, sugar, cloth, kerosene and medicines are being maintained uninterrupted;
- (ii) Imports of primary products will continue to be allowed from Nepal free of basic customs duties and free of quantitative restrictions as hitherto; and
- (iii) Access to the sea will be provided for Nepalese trade with third countries and facilities will be given for this purpose, for transport between Calcutta and Nepal, through the approved route: of goods of Nepalese origin exported to third countries, and of goods imported from third countries for use in Nepal.

In the face of the above, it is indeed a matter of regret that Nepal should be charging us of trying to strangle its economy with a view to pressurising it in any way.

That the recent protracted parleys between our government and Nepal on

a new trade and transit treaty have not yielded satisfactory results is primarily due to high-pitched demands made by Nepal. These include: (i) Nepal should have trading facilities across Radhikapur to East Pakistan; (ii) it should be allowed to continue as it thinks fit the bonus voucher scheme under which it can import a large variety of goods from abroad; (iii) Nepal's exports to us should continue unhindered as hitherto; and (iv) Nepalese traders also should have the facility of using the road transport to Calcutta — the facility which has been hitherto available for the movement of imports for the royal family.

All the above four points of difference obviously are not such as cannot be resolved amicably. But their resolution demands a spirit of give and take, particularly on the part of Nepal. The insistence of Nepal to have access to East Pakistan through Radhikapur appears to have political overtones. Otherwise, the present pattern of its trade with East Pakistan hardly warrants an uncompromising posture. The Government of India allowed transit for Nepalese trade through Radhikapur in terms of a protocol signed in 1965. So far, only trial parcels are said to have moved to East Pakistan through Radhikapur. Besides, the woeful lack of facilities at this transit point does not hold promise for large-scale movement of goods.

As regards the continuance of Nepal's bonus voucher scheme, we apparently cannot have any objection to it provided the items imported are consumed within Nepal. But the case hitherto has been just the contrary. Fairly large-scale smuggling is going on in several of these goods across the Indo-Nepal border to our detriment. A developing country like ours can hardly afford this. Nepal's arguments for the continuation of this scheme would have carried conviction with the Government of India had concerted efforts been made by it to check this smuggling activity.

Nepal's demand for road transport facilities to Calcutta for the trade of private parties too has to be judged against this background. Hitherto, the private trade movement is allowed over our railway system. This ensures that there is not much leakage of goods en route. If road transport facility is allowed, the danger of smuggling getting accentuated would obviously go up.

The main objection of our government to allowing unhindered duty-free entry of Nepalese manufactured goods to our country pertains to those goods which have import content. The Government of India, of course, is willing to allow free access to the Indian market to goods "wholly" manufactured in Nepal. The genesis of this objection

can be found in the fact that although Nepal does not have any large manufacturing capacity, it has been exporting to us substantial quantities of such goods as stainless steel items and synthetic fibres. No doubt, we ourselves are using many an imported material for our industrial production. But, by and large, the import content in the goods exported by us is not overwhelming as is the case with Nepalese goods.

## The Jute Package

THE TRADE union leaders who sponsored the recent strike in the jute industry have claimed that the settlement reached in Delhi represents a significant victory not merely for its workers but for the labour movement in general. There was no doubt from the beginning that with the powerful support of the Government of India the jute workers were bound to win their case though as Mr Wahi, the Chairman of the Indian Jute Mills Association, described the action of the unions in shifting and inflating their demands from day to day at the negotiating table was "astounding". The workers feel gratified that the employers have been made to concede their demands; and the Government of India also seems happy over this agreement. But it is worth remembering that this was reached only after Mr Wahi's warning that prolongation of the strike would "sound the death-knell" of the jute goods trade which had been losing its export markets at an alarming rate.

It is relevant to recall that the jute industry lost Rs 8 crores — Rs 6 crores in foreign exchange — due to the strike in August 1969. Shipments valued at Rs 29 crores were held up in June and July 1970 by the 66-day bargemen's strike. In the subsequent months also many developments took place, which severely affected the jute industry's capacity to compete in foreign markets. It was in this background that the strike was organised in December, which caused a daily production loss of 3,500 tonnes valued at Rs 1 crore, 60 per cent in foreign change.

The settlement provides for a six per cent bonus for 1970 against the workers' demand for four per cent plus an ad hoc payment of Rs 50. For the subsequent two years the minimum bonus has been agreed at 6½ per cent and seven per cent of the basic pay respectively. A gratuity scheme is going to be evolved by the wage committee, appointed by the Government of West Bengal. Pending this, an ad hoc scheme will be introduced under which workers will get gratuity on the basis of 12 days' basic wages per year of completed service. The question of some allowance for the 60,000 odd badli workers has been referred to the wage committee which is to submit its recommendations

Perhaps some stipulation in regard to the import content in Nepalese manufactures exported to our country can help in resolving the differences over this issue.

The hurdles in the way of a new trade and transit treaty with Nepal, thus, are not insurmountable. They can be crossed in a spirit of goodwill. It is hoped the deadlocked negotiations will be resumed soon.

within six weeks.

It is not known whether the Government of India has assured the jute industry of any assistance like the abolition of the export duties or some sort of subsidy to offset the higher costs arising from the Delhi settlement. Unless the industry is actively encouraged by some positive measures more or less on the lines given to the jute mills in Pakistan, our products will find it increasingly difficult to meet the challenge in the foreign markets. The profitability of the jute mills has been eroded considerably in recent years. According to an analysis by the Reserve Bank of India, the profits after tax as percentage of net worth of 48 jute companies was 3.8 in 1965-66 but in 1966-67 it was minus 4.3 and in 1967-68 minus 10.0. As wages contribute substantially to the costs of production, urgent attention has to be given to measures to enable the jute industry to meet the higher burden. The total labour cost, direct and indirect, for each tonne of production has been estimated at Rs 413.72 for hessian, Rs 307.27 for sacking, and Rs 540.88 for carpet backing. According to the survey conducted by the Administrative Staff College of India on behalf of the US Agency for International Development, the following has been the trend in the value added per worker and his income.

### VALUE ADDED PER WORKER AND INCOME TRENDS

| Year | Average no. of workers | Average income per worker Rs | Value added per worker Rs |
|------|------------------------|------------------------------|---------------------------|
| 1961 | 210,967                | 1,078                        | 1,636                     |
| 1962 | 227,044                | 1,216                        | 2,564                     |
| 1963 | 239,795                | 1,296                        | 2,562                     |
| 1964 | 238,777                | 1,435                        | 2,382                     |
| 1965 | 251,299                | 1,551                        | 2,506                     |

Since this survey was undertaken, the workers' earnings were increased as a result of the settlement reached in August 1969 after an eight-day strike. But, regrettably, this has not been followed by an improvement in productivity or even in discipline. As the IJMA has said in its annual report for 1969 "indiscipline and disorderly behaviour amongst the workmen, and re-

fusal on their part to carry out the orders of the management, became increasingly widespread. Wild cat strikes, gheraos, and other forms of demonstration which were in some cases of a violent nature became a common feature in the jute mill areas". The report added that the growing inter-union rivalry aggravated the situation and that rival unions took up the demands for further increase in wage rates. In this context, attention may be invited to the comments made by the US Aid survey to the indifference on the part of the industry to extend the scheme of payment by results. It is hoped that the industry and the labour unions would co-operate to evolve a scheme to motivate the workers to put forth their best efforts and help to bring down the costs of production.

The workers should realise that their prosperity depends mainly on the extent to which the jute industry is able to sell its products abroad. Year after year the competition for our jute goods becomes more intense. Even in regard to carpet backing which is usually described as the saviour of the jute industry, the export prospects seem to have become rather bleak. This is evident from the fact that compared to a decline of 44 per cent in the US imports of Indian carpet backing from 139,387 tonnes in the first nine months of 1969 to 77,835 tonnes in the same period of 1970, imports from Pakistan jumped by 21 per cent to 22,005 tonnes. The USA's imports of hessian from Pakistan increased from 37,537 tonnes to 51,002 tonnes, a rise of 36 per cent, in the first nine months of 1970 compared to the same period of 1969.

Mr R.M. McCoy, President of the Jute Carpet Backing Council in the USA, has cabled Mrs. Gandhi, inviting her attention to the serious threat to India's jute exports to the USA. He has said that the jute strike, the second in 16 months, has badly shaken the confidence of the US tufted carpet industry and the importers in India's ability to maintain continuity in the supply of jute carpet backing. He has told the Prime Minister that strikes in various forms had resulted in 144 days of either delayed shipping or manufacturing time and has urged her to take strong measures to guarantee the uninterrupted flow of jute goods. But the Prime Minister, engrossed in the poll, is unlikely to take any initiative in this matter. She may have just passed on Mr McCoy's cable to Mr L.N. Mishra, the Foreign Trade Minister, who may have promptly sent it to Mr Mukherjee, the Jute Commissioner in Calcutta. The Jute Commissioner may acknowledge the cable and file it. But it is for the workers and the trade union leaders to realise the implications of Mr McCoy's warning and take the necessary steps to maximise production and productivity.

## Govt Servants' Right to Strike

A CORRESPONDENT

THE QUESTION whether government servants have a right to strike was highlighted recently in the debate in the Maharashtra legislature. Both the Houses of the Maharashtra legislature passed the Bill putting on the statute book the Essential Services Maintenance Ordinance. The opposition in both the Houses walked out after the Bill had passed the first reading. All readings of the Bill were passed by a comfortable majority in both the Houses.

Before the 12-day strike of Maharashtra Class III and IV government servants to enforce a demand for parity in emoluments with central government servants, the Maharashtra government servants had gone on a one-day mass "casual leave" and later again on three days' mass "casual leave." The government passed an ordinance banning strike in essential services to be notified by government. The Confederation of the Maharashtra State Government Employees announced that the strike would be extended also to state hospitals and milk centres. The government took prompt action by endeavouring to maintain essential services with the help of Home Guards and others. More than 400 Home Guards were utilised to operate vehicles for supply of essential services to the community.

Patients who could be safely discharged from hospitals were discharged. Patients in serious condition who could not be discharged were attended to with the aid of trainee nurses, undergraduate students and social workers. The leaders of the Confederation who had instigated the strike and a number of other strikers were arrested under the ordinance. Notices of discharge were issued to temporary government servants and some new hands were recruited.

### No Public Sympathy

The strike secured no sympathy from the public, but it was supported by leaders of leftist unions who formed a so-called "action committee" which proposed to lend further support to the strike by calling for a Maharashtra bandh. When it was realised that government would not give in and the strike was failing, it was called off.

In answer to the debates in which opposition members in the State Legislative Assembly and Legislative Council criticised the Bill, Mr S. K. Wankhede, the state Finance Minister, said that

while a strike by government servants was unfortunate, it was more so in Maharashtra because the state government had always the most sympathetic attitude towards its employees' demands. It had maintained a dialogue with its employees' organisation and, as a result of talks, the government had sanctioned Rs 2.5 crores more than the employees were to receive under the Badkas Commission recommendations. Since April 1966, the government had increased the dearness allowance on seven occasions. The emoluments paid to the Maharashtra government servants were better than those paid by other state governments. Further increases could not be given without curtailment of welfare services or slowing down of development. The government and especially the Chief Minister had discussions with leaders of the employees' confederation several times. He would have met them again but they chose to launch an uncalled for strike. In defending the Bill, Mr Wankhede said that it was an enabling measure, but he wished there would be no occasion to use it. The powers under the Bill were similar to those enjoyed by the union government under the Essential Services Maintenance Act.

### Misconceived Notion

The question of the right of government servants and employees in essential services to strike has involved many misconceptions. It is therefore of general importance to note some of the views expressed in the debate. It was stated that employees had the right to strike, that in US and the UK civil servants had the right to strike and that in any case the right to strike should not be denied as long as provision was not made for compulsory arbitration. Now it is not correct that in the US and the UK civil servants have the right to strike. In the US the Taft Hartley prohibits employees of the US government, including wholly government corporations from going on strike. If they do so they are liable to dismissal, and to ineligibility for re-employment under the federal government for three years. In the UK no law gives the right to strike. The Conspiracy and Protection Act prohibits any strike which endangers human life, or exposes valuable property to destruction or serious injury. Section 4 of the Act prohibits strikes in public utility services such as gas or water supply. There is no law in the UK which forbids civil servants to

strike, but it is an act for which disciplinary proceedings can be taken against them. Under the Whitley Council system in the UK there is a machinery for redressing grievances of government servants and disputes not resolved by negotiation are referred to the industrial court. But the machinery is meant for the redress of particular grievances. A demand for general increases in emoluments of government servants cannot be referred under the Whitley procedure to arbitration. In any case arbitration awards in the UK are not legally binding and the industrial court is expected to adhere to standards laid down from time to time by Royal Commissions on the Civil Services.

### Disrespect of Law

In a recently published book "Collective Bargaining in the Public Service" edited by Kruger, Marc Somershausen, a review of public employees' organisations in Europe, concludes that "in most countries the very notion of civil services implies the prohibition of any concerted stoppage of work". Another European writer has also written, "Strikes by public employees which are illegal in every government jurisdiction result in disrespect for the law."

Here it might be mentioned that there is a fundamental distinction between employment in industry and government service. In industries, the right to strike and its concomitant, lock-out, are recognised in certain circumstances. The right to strike does not and cannot exist without the reciprocal right to lock-out. They give meaning to collective bargaining. But a strike cannot be permitted where the employer cannot exercise the right to lock-out. Government service as also services essential to the life of the community, fall in a special category. The services in which these employees are engaged cannot be suspended without seriously endangering the normal life of the community. The state is therefore quite justified in not permitting in government service as also in services essential to the normal life of the community the right to go on strike.

As regards the point that the right to strike should not be denied to government servants so long as provision is not made for compulsory arbitration, this view is also misconceived. Here also there is a vital difference between government service and private enterprise. In private enterprise collective bargaining is limited by the realisation that if demands are passed by strike beyond the capacity of the industry it may close down. This limitation does not exist in government service. Further the moneys required for expenditure on salaries and other benefits to government servants have to be found by taxation. The legis-

lature has to maintain a balance between the rights of government servants to fair emoluments and the limits of taxation. The right to decide finally what general increases in salaries and benefits should be given to government servants cannot therefore be conceded to an arbitrator. The issue is not arbitrable. In this connection it may be mentioned that the central government some time back refused to refer to arbitration the demand of government servants for a need-based wage. The central government rightly regarded the issue as not

arbitrable under the joint consultative machinery for central government servants.

It might also be mentioned that the Central Government Servants' Rules lay down, inter alia, that "no Government servant shall resort to strike or in any way abet any strike in connection with any matter pertaining to his service or any other Government servant." The Supreme Court in one case observed, "In so far as the rule prohibits participation in a strike, it is valid because there is no fundamental right to strike."

## India's Trade with GDR

V. VITHAL BABU

TRADE BETWEEN India and the German Democratic Republic (GDR) has grown from a very modest level of just Rs 1.8 million in 1954 to Rs 43.38 crores in 1968. The 1970 shopping lists between the two countries provide for the exchange of goods to the extent of Rs 55 crores, both ways. In other words, the growth of Indo-GDR trade has been quite remarkable over the past 15 years. However, the volume of trade between the two countries reached a substantial size only during the 1960's and more particularly from 1965 onwards. In the early fifties India's trade with GDR, was only two per cent of her total trade with the east European countries. By 1968, this has gone up to eight per cent. At present, GDR is the fourth largest trading partner of India in the region of eastern Europe, next only to the USSR, Czechoslovakia and Poland. Considered from the side of GDR, India is her second largest trading partner amongst the developing countries.

The details of trade expansion between India and GDR are given below:

| INDO-G.D.R. TRADE<br>(Rs crores, post-devaluation) |                  |                |             |
|----------------------------------------------------|------------------|----------------|-------------|
| Year                                               | Imports from GDR | Exports to GDR | Total Trade |
| 1954                                               | 0.17             | 0.01           | 0.18        |
| 1960                                               | 4.14             | 6.25           | 10.39       |
| 1961                                               | 8.01             | 5.10           | 13.11       |
| 1962                                               | 11.40            | 13.07          | 24.47       |
| 1964                                               | 14.26            | 18.91          | 33.17       |
| 1965                                               | 17.91            | 22.59          | 40.50       |
| 1966                                               | 20.10            | 19.62          | 39.72       |
| 1967                                               | 21.95            | 19.81          | 41.76       |
| 1968                                               | 22.49            | 20.89          | 43.38       |

Source: Journal of Industry and Trade—Jan. 1970.

Indo-GDR trade is entirely governed by the bilateral trade agreements en-

tered into between the two governments. The first agreement between India and GDR was signed in 1954, providing for trade exchanges for a period of 10 years. A second trade agreement was, therefore, signed on September 12, 1964, with provisions for periodical extensions up to January 31, 1969. On January 23, 1969, a third agreement was signed, and this will remain in force up to the end of the year 1971, i.e. December 31, 1971. For the trade protocol for 1970, letters were exchanged between India and GDR on October 26, 1969, in Berlin.

Recently an office of India's Trade Representative in GDR has been established. GDR established its Trade Representative's office in India quite some time ago.

### Imports of Essentials

India's import from GDR consist mainly of fertilisers, potash, tractors and other agricultural machinery, rolled steel products, special steels, X-ray films and other photographic materials, laboratory and scientific instruments, chemicals, fishing trawlers, and recently, ships. Of these, fertilisers constitute the largest single item of import accounting for about 40.7 per cent. In terms of India's total imports of fertilisers from all sources, the supplies from GDR amount to about 35 per cent. Similarly, in India's imports of potash, the share of GDR comes to about 65 per cent. It is important to note that GDR is one of the world's largest producers and exporters of potash.

The items of India's imports from GDR are of a very high import-priority in our development plans. The green revolution and the efforts to increase productivity in our agriculture very much depend upon our imports of fertilisers and agricultural machinery, especially the tractors. As trade with GDR is entirely financed through non-

convertible rupee accounts, supplies of such high import-priority items to us by GDR have resulted in the savings of considerable amount of free foreign exchange. In addition to this, the bilateral nature of our trade with GDR provided a good market for our expanding exports.

More recently, GDR has also emerged as a supplier of ships and India has concluded contracts for the import of 14 ships from GDR, worth about Rs 50 crores for the Shipping Corporation of India. Payments for this are to be made over a period of 10 years and that too in non-convertible rupees. Therefore, besides effecting savings in foreign exchange, the added tonnage as a result of import of ships from GDR, will facilitate expansion of our freight earnings as well.

### Non-Traditionals Increase

India's exports to GDR consist of both primary products as well as manufactures. The primary products include items like deoiled cakes, jute manufactures, tanned hides and skins, cashew kernels, tea, coffee, coir yarn, tobacco, mica, black pepper and iron ore. Of these, deoiled cakes constitute the largest single item.

It is, however, gratifying to note that over the past couple of years the proportion of non-traditional items in our exports to GDR has increased from 21.9 per cent in 1966 to 35.5 per cent in 1968. The trends in the proportion of traditional and non-traditional items of India's exports to GDR are given below:

| Year | Percentage share in total exports to GDR |                    |
|------|------------------------------------------|--------------------|
|      | Primary products                         | Manufactured goods |
| 1966 | 78.1                                     | 21.9               |
| 1967 | 68.5                                     | 31.5               |
| 1968 | 64.5                                     | 35.5               |

GDR being a fast growing economy, undergoing increasing degree of sophistication, provides ample opportunities for exports of simple manufactures from India. The main items of manufactures, in India's list of exports to GDR have been, knitting machines, dry and storage batteries, flanges, wire ropes, radiators, aluminium ingots, printing machinery, textile machinery, linoleum and cotton textiles. Exports of engineering goods to GDR, have increased considerably over the past four to five years.

From a modest level of just Rs 0.38 crores in 1964, India's exports of engineering goods to GDR have increased to Rs 1.84 crores in 1968. The Leipzig Industrial Fair, regularly organised by the GDR in which India has been a regular and leading participant, has proved to be a very useful channel for introducing our engineering products in GDR markets.

Economic relations between India and GDR, have not been limited to mere trade exchanges between the two countries. GDR being well advanced in the field of industrial development, has extended technical collaboration in various industrial fields in India, and thereby helped the development of industries in this country. Some of the important fields of industrial-technical collaboration between GDR and India are listed below:

| Product                                             | Indian industrial concern receiving collaboration    |       |
|-----------------------------------------------------|------------------------------------------------------|-------|
| 1. Machine tools and printing machines              | Hindustan Machine Tools (HMT)                        |       |
| 2. Cables                                           | Premier Cables Ltd., Southern Cable Corporation      |       |
| 3. Electrical equipment                             | Electrical Constructions and Equipments Company Ltd. |       |
| 4. Welding electrodes                               | ARCElectrodes Ltd.                                   |       |
| 5. Office equipment                                 | Godrej Industries Ltd.                               |       |
| 6. Cold storage, refrigeration and air-conditioning | Blue Star Ltd.                                       |       |
| 7. Tractors                                         | Indian Agro Machines                                 |       |
| 8. Confectionery machinery                          | Ravalgaon Farm Ltd                                   | Sugar |
| 9. Precision measuring tools                        | Meters and Instruments Pvt. Ltd.                     |       |
| 10. Industrial rice mill machinery                  | De Smet (India) Pvt Ltd                              |       |
| 11. Inflatable life-rafts                           | Aero Marine Industries Pvt Ltd                       |       |
| 12. Flame/explosion proof motors                    | Rajendra Electric Motor Industries                   |       |
| 13. X-Ray contrast media                            | Jagson Pal & Co                                      |       |

The foreign trade policy of GDR has recently undergone some important changes, which are given below:

1. Foreign trade rights, until recently a monopoly of import and export agencies operating under the direct supervision of the Ministry of Foreign Trade, have now been granted to a large number of industrial firms. It is envisaged that about 50 per cent of GDR's foreign trade will come under this reform.
2. Like Hungary and Czechoslovakia, GDR has also abandoned the official rate of exchange for her currency. A wide range of 'currency multipliers' has been introduced to the official rate, more realistic and applicable to foreign deals.

To encourage exports to certain markets, the multiplier value is increased above one, thus allowing the exporter to earn more Ostmarks (GDR currency unit) per each dollar or pound earned, than would be possible at the official rate of exchange. Similarly, in order to restrict imports, the value of the multiplier is decreased.

This plurality of rates of exchange, apart from being an effective trade stimulus, makes it more difficult for Western countries to accuse GDR of dumping practices.

### Future of Indo-GDR Trade

**Simple manufactures:** As GDR economy is fast moving towards capital intensive and increasingly sophisticated methods of production, labour-intensive products of India are likely to be in growing demand in GDR markets. It is pertinent to note that the light industries and basic metals industries are growing in GDR at very slow rates of just 6.8 and 3.2 per cent respectively. Hence, exports of simple manufactures will have increasing scope for India in GDR markets.

**Electric goods:** The electro-technical and electronics is the fastest growing industry in GDR, with a growth rate of about 13.4 per cent. This provides excellent prospects for India's exports to GDR of switchgears, electric motors, light-fittings, dry and storage batteries, torches and other electrical goods, including transistor valves and TV tubes.

**Ores:** The bias in favour of heavy industries will necessitate GDR to import in large quantities items like structural and industrial ores such as manganese and iron ore. India should therefore, try for expanding exports of these items to GDR in the near future. The

growing consumption of iron ore in GDR, as a result of increasing industrial activity is bound to raise her demand for manganese ore also.

**Railway wagons and automobile ancillaries:** GDR has 16,108 kilometres of railway lines and its road mileage is 45,530 kms, as in 1969. Most of her trade is carried on by the rail and road transport. India, which is becoming a leading supplier of railway wagons and rolling stock, should explore GDR market for this purpose. Recently, GDR has evinced interest in buying wagons from India, especially since the conclusion of our contracts with Poland and Hungary for the supply of 500 and 1,000 wagons respectively.

### Auto Part Export

Besides railway wagons, Indian exporters have good scope for marketing automobile ancillaries into GDR market.

**Printing machinery and machine tools:** At the last Leipzig Fair contracts were signed for the export of printing machinery to GDR, by Indian-suppliers.

**Machine tools:** It is one of the major items in GDR imports. Indian machine-tools manufacturers should therefore explore the possibilities of exports to GDR markets.

**Fish and fish products:** GDR imports about 54,000 tonnes of fish every year. The consumption of fish in GDR is also showing rising trends. There are, therefore, good prospects for the export of Indian shrimps and lobsters to GDR markets.

**Clothing and footwear:** Other items having good prospects for exports from India to GDR are footwear, clothing and paper products. GDR regularly imports clothing and footwear to the tune of US \$130 million per year.

**Importance of Leipzig Fair:** The Leipzig Fair regularly organised by the Government of GDR plays a key role in the country's foreign trade. During the fair it has become rather customary to enter into contracts of purchase and sale of a wide variety of products between GDR and the participating countries. Almost the entire product profile of the GDR economy is exhibited at the fair, which has long attained the status of one of the most popular international industrial fairs in the world.

India has all along been a leading and regular participant in this fair. However, time has come for India to

plan its participation in this fair with a more deliberate effort to promote Indian exports to GDR, rather than aiming at general publicity and exhibition of Indian products. To achieve this, Indian participation should be more selective and be planned with more attention to the trade promotional aspect.

with an eye on GDR market in particular.

The products listed earlier, having potential for exports to GDR, should be specially exhibited at this fair, and during the fair efforts should be made to secure contracts from GDR buyers for their supplies.

## Farm Investments in Sri Ganganagar

K. K. S. CHAUHAN AND N.L. AGARWAL

THE PROSPERITY of people in India is closely linked with the progress in her agriculture because of the predominantly agricultural character of her economy. Modernisation of agriculture and its improvement with the help of technical advances necessitates a constant growth in capital investment per agricultural unit. There is a feeling that the recent breakthrough in Indian agriculture and the new economic environment have considerably affected the rate of capital formation and pattern of investment in agriculture.

The present study was undertaken with a view to examining the effects of this changed situation created by the new economic environment in villages—the high prices of agricultural commodities, shifting incomes and new agricultural technology in the economic activity of farmers. The main objective of this study was to see whether and in what ways this new environment has affected the amount and the pattern of capital formation in agriculture. The rate and pattern of capital investments and relationship with such factors as size of farms, rights in land, age of the head of the family and the size of the family were studied.

### Productive Capital

The Encyclopaedia of Social Sciences defines investment as the 'productive employment of capital'. In the economic sense, it involves the direction of savings or accumulated wealth into uses which fill an economic need and which are expected to produce a return. Investment may be of three kinds:

(i) **Gross investment:** The total amount of money spent on acquisition of capital goods is gross investment.

(ii) **Dis-investment:** It is just the reverse of investment. The amount received by sale of capital goods is dis-investment.

(iii) **Net investment:** The remainder, after subtracting the dis-investment from gross investment is known as net

investment. It indicates the actual amount of capital formation and is the best measure of capital formation.

Capital investment by agriculturists may be divided into two broad groups—(a) agricultural investments; (b) non-agricultural investments.

**Agricultural investments:** Investments made in the agricultural sector resulting in addition to agricultural assets are known as agricultural investments. The different terms included in this group are:

(i) Investment on land—it includes:

(a) Purchase of land; (b) land improvements like reclamation of land, bunding and other improvements; (c) laying of new orchards and plantation.

(ii) Purchase of livestock—draft animals and milch cattle.

(iii) Investment on irrigation—it includes: (a) digging and repair of wells;

<sup>1</sup>The purchase of land leads to an increase in the capital assets of an individual and from this point of view, it should be reckoned as an act of investment. From the society's point of view, however, this is simply a transfer of right and not a productive investment. As such it has not been considered as an investment in the present study.

(b) installation of tubewells; and (c) development of other irrigation resources.

(iv) Investment on implements, machinery and transport equipments.

(v) Construction of farm houses, cattle sheds etc.

### Methodology

The above study was conducted in Sri Ganganagar district of Rajasthan and covers a period of eight years from 1961-62 to 1968-69. Sri Ganganagar district is agriculturally the most advanced district in the state. A major portion of the district is irrigated by Gang Canal, Bhakra Canal, Rajasthan Canal and tube wells. As such Ganganagar is known as the 'Granary of Rajasthan'. Sri Ganganagar Panchayat Samiti was purposely selected from which three villages were chosen at random. Lists of farm holdings from khatedars (owners-cultivators) and non-khatedars (tenant-cultivators) were prepared separately and divided in three size groups i.e., below four hectares, four to eight hectares and above eight hectares.

Two khatedar and one non-khatedar farm families were selected at random from each size group from each village, thus taking six khatedar and three non-khatedar farmers from each village. In all 18 khatedar and nine non-khatedar farmers formed the sample of the study.

The 'expenditure of funds approach' was used to find out the amount of investment made by the selected farmers during different years from 1961-62 to 1968-69. Although most of the farmers do not keep proper records for capital investment yet expenditure on items which lead to acquisition of or

## Your cargo in our safe deposit vault!

Air transportation is not just for small goods. We're anxious to tell you that we carry heavy and bulky cargoes across oceans and continents with skill, care and speed.

On our palletised flights we carry seven thousand kilos on three pallets, all cabin loaded. In addition, we carry four thousand kilos in our holds.

We uplift heavy and massive items of machinery, ships' spares and generators, computers and other delicate equipment, requiring very special handling.

If you're fighting for time contact us. We'll fly your consignment on our palletised service swiftly, safely, efficiently.

Use Air-India and profit!

## THAT'S ENGLISH ELECTRIC PLAYING A LEAD ROLE IN INDIA'S POWER DEVELOPMENT

ENGLISH ELECTRIC have engineered and supplied Control and Protection equipment for power installations in all parts of India. From Kashmir to Kerala and Maharashtra to Meghalaya. What's more ENGLISH ELECTRIC equipment made in India is in service in Australia, Burma, Kuwait, Malawi, Nigeria, Thailand, Uganda, United Arab Republic and other export markets.

**PROUD CONTRIBUTION:**  
ENGLISH ELECTRIC are proud of their contribution to

the country's nation building efforts—whatever be the area—giant power generation and transmission complexes, distribution networks, Steel Plants, Railways, Posts and Telegraphs, Defence Services, Irrigation Projects and manufacturing Industries in the Public and Private Sector. Today ENGLISH ELECTRIC are fully geared to continue their efforts in the great task of building India's developing economy, both at home and in the export markets of the world.

**ENGLISH ELECTRIC'S BACK-BONE:** Forming the back-bone of the Company is an experienced team of internationally trained Indian Engineers whose services are always available for engineering, supply and commissioning of Control and Protection equipment.

ENGLISH ELECTRIC's reputation for quality and reliability is backed by unrivalled research facilities and experience gained under diverse operating conditions throughout the world.

The biggest Motor Control Centre built in India.  
ENGLISH ELECTRIC 34-panel 100-circuit Multi-Motor Control Centre supplied through Power Gas to The Indian Copper Corporation for Its Flash Smelter at Ghatsila, Bihar incorporating 'M-Pact' Air-Circuit Breakers with Protective and Auxiliary Relays, 'Frontier' Fuse-switches and Starter Compartments.

CONTROL AND PROTECTION  
IS OUR BUSINESS

addition to capital assets is generally incurred in lumpsums and thus remembered by farmers.

Net investment was calculated by deducting dis-investment from gross investment.

### Trends in Investment

**Total Net Investment:** Table I (p. 124) shows the amount of total net investment from 1961-62 to 1968-69 by the selected 18 khatedar and nine non-khatedar farm families. Total net investment by khatedars during this short period of eight years reflects roughly, three trends, a rising tendency in the beginning from 1961-62 to 1965-66, a declining tendency in 1966-67 and again a rising tendency reaching the highest point in 1968-69. The former rising tendency was due to accelerated economic activity with additional area being brought under canal irrigation and purchase of more machinery by farmers. There was a sharp fall in 1966-67 primarily due to low agricultural prices. In 1967-68, it was equally low mainly due to drought conditions throughout the state and the consequent decline in the investment capacity of farmers.

Net investment by non-khatedars, however, shows no definite trend. It was the highest in 1964-65 but declined considerably thereafter though it again increased in 1968-69.

**Net Investment per farm family:** Capital investment per farm family gives a more meaningful idea of capital accumulation in agriculture than total investment.

In case of khatedars the annual net investment per farm family varied from about Rs 418 in 1961-62 to Rs 2114 in 1968-69 with an average of Rs 978 (see

Table I). This again exhibits three tendencies as in case of total investment during the last eight years. However, one very important situation revealed by these figures is that this net investment (in view of the average gross annual income of khatedar farmers being about Rs 12,000) was between four and 16 per cent of the gross income during this period. On the whole, however, it varied between six and eight per cent. In view of the normal rate of 10 per cent of capital formation in our country a rate of investment of from six to eight per cent in the agricultural sector was not a very low figure. But it must be remembered that it is the result of the recently accelerated tendency because of extension of canal irrigation, encouragement of developmental activities under extension services, introduction of high yielding varieties and high agricultural prices. Capital investment at a still higher rate is essential to keep up the tempo of development in the agricultural sector.

Investment per farm family in case of non-khatedars was, however, less than one-sixth of the khatedars for the last eight years. The non-khatedars in this area were mostly share croppers getting one-sixth to one-fourth of the produce. They did not own the farm machine and equipment which was provided by the land owner.

### Net Investment

Net investment per hectare of cultivated land in the case of khatedars ranged from Rs 49.82 to Rs 251.52, being the highest in 1968-69 with an average of Rs 116.22 per hectare.

In the case of non-khatedars, however, net investment per hectare was very low in comparison to khatedars. Average net investment for this period was

only Rs 27.12 ranging from Rs 6.61 in 1962-63 to Rs 69.40 in 1964-65.

### Pattern of Investment

Table II shows the consolidated view of the pattern of investment by khatedars and non-khatedars from 1961-62 to 1968-69.

TABLE II

### PATTERN OF NET INVESTMENT BY KHATEDAR AND NON-KHATEDAR FARMERS (CONSOLIDATED VIEW FROM 1961-62 TO 1968-69)

| Items of investment    | Khatedar per cent net investment | Non-khatedar per cent net investment |
|------------------------|----------------------------------|--------------------------------------|
| Land improvement       | 9.76                             | 2.68                                 |
| Livestock              |                                  |                                      |
| (i) Milch              | 9.67                             | 48.89                                |
| (ii) Draft             | 11.02                            | 17.35                                |
| Irrigation             | 33.28                            |                                      |
| Machinery or equipment | 28.54                            | 8.68                                 |
| Farm buildings         | 7.73                             | 22.40                                |
| Total                  | 100.00                           | 100.00                               |

The khatedar farmers who have the most secured rights in land have invested largely in irrigation (33.28 per cent), improved farm machinery & equipment (28.54 per cent) and land improvement (9.76 per cent) which have really enhanced the productive capacity of land.

The non-khatedar farmers who cultivate land as share croppers and on lease, however, have invested mostly on milch cattle (48.89 per cent), farm build-

TABLE III  
NET INVESTMENT PER FARM FAMILY AND PER HECTARE FOR KHATEDAR AND NON-KHATEDAR FARMERS 1961-62 TO 1968-69

| Year    | Net Investment in Khatedar farmers |              |               |              |                 |              | Net Investment by Non-khatedar farmers |              |               |              |                   |              |

| 1968-69 | 191.66                             | 41.52        | 220.83        | 22.15        | 5931.66         | 407.90       | 161.66                                 | 59.95        | 143.33        | 28.14        | 95.00             | 11.06        |
| Average | 392.87                             | 101.93       | 551.31        | 80.26        | 1989.56         | 136.81       | 156.66                                 | 58.09        | 125.41        | 24.62        | 162.29            | 50.39        |

ings (22.40 per cent), mostly cattle sheds and draft animals (17.35 per cent). As much as 88 per cent of the total investment was on these items. None invested on irrigation and only about nine per cent was invested in purchase of machinery and equipment which included mostly traditional tillage implements, chaff cutters and bullock carts.

This leads us to the conclusion that in the case of farmers who have no secured rights in land there has been little agricultural investment so as to enhance the productive capacity. It is, therefore, imperative that if capital formation is to be encouraged the rights in land should be made secure.

It was further revealed in the course of our study that since 1965-66, the investment on the installation of tubewells and the purchase of improved machinery was steadily increasing, whereas investment on farm buildings and livestock was decreasing. In 1968-69 as much as 91.33 per cent of the total investment by the sampled farmers was made for irrigation and farm machinery.

#### Size of Operational Farms

The size of operational holding is said to have a marked effect on the amount and pattern of investment. To examine this relationship the total number of farm families were divided into three groups according to operational holding.

Group I covered families which had below four hectares, Group II had four to eight hectares and Group III had more than eight hectares. The division although arbitrary was indicative of small, medium and large sized farms in this region.

It is evident from Table III (p. 127) that as the size of the cultivated holding increases, the amount of total net investment and net investment per farm family increases. But this impression gets slightly changed if instead of the total absolute figures per farm family, we reduce the data per hectare of the net cultivated areas, which alters the picture.

In the case of khatedars the average net investment per hectare for the last eight years has been the highest for the large-sized farm (Rs 136.81) followed by small-sized farm (Rs 101.93) and the medium-sized farms (Rs 80.26).

An enquiry into the reasons for it showed that the large-sized farms owned by khatedar farmers made increased investment on tubewells and improved machinery during 1968-69. Another reason was big dis-investment by small-

sized farmers through the sale of livestock in the drought year of 1967-68.

In the case of non-khatedar farmers, on the other hand, the net investment per hectare was the highest in small-sized farm (Rs 58.00), followed by large-size group (Rs 50.39). It was the lowest in the medium-sized farm (Rs 24.62).

It was observed in the course of our enquiry that farmers in large-sized and medium-sized groups belonged to higher social categories. A large portion of their income is spent on acquisition of durable consumer goods such as, transistors, radios and guns, and also articles of luxury, ornaments, jewellery and social ceremonies. The expenditure on these items was proportionately much higher in the case of medium-sized farm families, leaving small savings for investment in agriculture. This brings about a very important conclusion that our agriculture is still influenced highly by social status of the farm community. Capital formation in particular and the agricultural development in general are closely related to and limited by the improvement in social status.

Table IV shows the consolidated position of the pattern of investment during the eight years under consideration (1961-62 to 1968-69).

The figures reveal that for khatedar farmers, livestock was the most important item of investment (36 per cent in small-size group followed by irrigation (26.79 per cent), machinery and equipment, farm buildings and land improvement. In the case of middle-sized khatedar farmers also, livestock

formed the most important item of investment amounting to more than 45 per cent of total net investment, followed by land improvement, machinery and equipment and farm buildings in that order. The large-sized khatedar farm families invested as much as 43.77 per cent in irrigation and 33.78 per cent in machinery and equipment, mainly in the form of tractors, seed drills, threshers and chaff cutters. Investment in livestock, land improvement and farm buildings was only 10.84 per cent, 7.53 per cent and 4.08 per cent respectively.

#### Accent on Cattle

In the case of non-khatedars livestock was the most important item of investment in all the three groups forming 64 per cent, 54 per cent and 82 per cent in small, medium and large-sized farms respectively. No investment was made by non-khatedars on irrigation mainly due to insecure rights in land. Farm buildings, generally in the form of cattle sheds constituted the next important item for small and medium-sized farmers amounting to about 28 per cent in both the groups. Investment on farm machinery and equipment increased as the size increased. The items included are generally the bullock carts, chaff cutters, seed drills and traditional tillage tools.

Another important aspect of the investment pattern in large-sized farms in both khatedar and non-khatedar families was that as the size increased the percentage investment on draught animals also increased. In the case of small and middle-sized farmers, on the other hand, the investment on milch cattle

TABLE IV

#### PATTERN OF NET INVESTMENT BY DIFFERENT SIZE GROUPS (CONSOLIDATED VIEW 1961-62 TO 1968-69)

| Items                      | Khatedars  |            |                 | No-Khatedars |            |                 |
|----------------------------|------------|------------|-----------------|--------------|------------|-----------------|
|                            | 0-4 hect.  | 4-8 hect.  | 8 & above hect. | 0-4 hect.    | 4-8 hect.  | 8 & above hect. |
|                            | % to total | % to total | % to total      | % to total   | % to total | % to total      |
| (i) Land improvement       | 5.95       | 20.54      | 7.53            | ..           | 8.12       | ..              |
| (ii) Livestock             |            |            |                 |              |            |                 |
| (a) Milch                  | 19.03      | 24.56      | 3.72            | 55.47        | 51.47      | 37.73           |
| (b) Draft                  | 17.15      | 20.78      | 7.12            | 8.80         | 2.85       | 44.03           |
| (iii) Irrigation           | 26.79      | ..         | 43.77           | ..           | ..         | ..              |
| (iv) Machinery & equipment | 16.60      | 18.06      | 33.78           | 6.62         | 9.37       | 10.47           |
| (v) Farm building          | 14.48      | 16.06      | 4.08            | 29.11        | 28.09      | 7.77            |
| Total                      | 100.00     | 100.00     | 100.00          | 100.00       | 100.00     | 100.00          |

was much more in comparison to draught animals. It appears that farmers having small and medium-sized farm invest relatively more on the purchase of milch cattle in order to substantiate their economies and while those with large-sized farms keep a large number of draught animals for agricultural operations.

The pattern of investment reveals that as the size of the farm increases, the net investment on the purchase of farm machinery and on the construction of irrigation works and land improvement increases while it decreases for livestock and farm buildings. It leads us to the conclusion that a major portion of the investment by small-sized farmers is on items which have not increased the productive power in agriculture correspondingly. It follows that reorganisation of the size of the operational unit in agriculture has to be brought about so as to make the average unit viable; otherwise the investment is bound to remain wasteful or on items which do not lead to proportionate increased output from land.

An attempt was made to make a statistical analysis to work out the relationship of net investment per farm family with some factors such as the age of the head of the family, size of the family and size of the operational holding. Regression analysis technique was tried. The following model for regression analysis was used for 1967-68 for khatedar families only.

$$Y = b_0 + b_1X_1 + b_2X_2 + b_3X_3$$

where Y = Net investment per farm

$X_1$  = Age of the head of the family

$X_2$  = Number of members in the farm family

$X_3$  = Operational holding in hectare

We are aware of the fact that many other factors such as risk and uncertainty, fluctuations in prices, availability of credit etc. affect capital investments in agriculture. However, due to non-availability of sufficient and reliable data these factors were not considered for this analysis and were assumed to be constant for all farmers under study.

The regression equation for capital investment was found to be:

$$Y = -2672.63 + 49.05X_1 + 152.27X_2 + 165.27X_3$$

(23.55)\*  
(115.29)\*(45.14)\*

Coefficient of determination ( $R^2$ ) was calculated to be 0.62.

\*Standard errors of the respective coefficients.

The 't' values of the above regression coefficients were.

| Regression coefficients | 't' value                 |
|-------------------------|---------------------------|
| $b_1$ 2.08*             | (Significant at 5% level) |
| $b_2$ 75.84*            | (Significant at 1% level) |
| $b_3$ 0.28              | (Not significant)         |

The regression analysis explains the

## The Hunger For Funds\*

A CORRESPONDENT

INTERESTING, INDEED exciting, developments are taking place in the money market which appear to have far-reaching significance for the banking system. In spite of a sizable growth in deposits during the twelve-month period ended December 25, 1970, there is an unsatisfied demand for funds and even in the early stages of the 1970-71 busy season the scheduled commercial banks have been obliged to borrow more than Rs 177 crores from the central banking institution additionally in a fortnight when pressure was felt acutely in connection with tax payments and seasonal expansion of credit. Actually the increase in deposits in absolute terms has very nearly doubled in the past three years, the addition during the period under reference being Rs 799 crores against Rs 656 crores in the corresponding period in 1969 and Rs 458 crores in 1968. In spite of this impressive growth in deposits of member banks in 1970, it was not possible to meet fully the needs of all constituents. Even so, advances rose in a 12-month period by as much as Rs 812 crores.

The jump in advances in 1970 in excess of fresh additions to deposits has taken place for the first time in the recent history of the banking system. In spite of the liberal grant of loans it is being complained that the nationalised banks have not been acquitting themselves creditably and the needs of small borrowers in the agricultural sector and in small industries are not being fully met. It has not been examined, however, so far how the new situation can be tackled and in what manner co-operative credit societies and commercial banks can take over the responsibilities discharged upto now by the indigenous money lenders. Recently there was a meeting of bank executives and representatives of the Reserve Bank for discussing how the mobilisation of deposits can be hastened and the newly opened branches can be made to function on a profitable basis within a short period. New incentives are proposed to be provided for bank employees for mobilising deposits and some institutions have even thought of giving small presents to new depositors in order to bring about a faster growth of the banking habit. In view of the fact that there has been an increase in the purchasing power of the agricultural income groups and a record number of branches have been opened in 1970, it is quite likely that fresh additions to deposits in 1971 will exceed even the Rs 1000-crore mark and there will be a significant increase in the proportion of bank deposits to notes in circulation or the national income. However, it is likely that there will also be a big rise in advances and the position might get adjusted only over a period of three or four years. What is happening immediately is increasing monetisation of the economy and an impressive growth in the stature of the banking system.

In this context the monetary authorities should ensure that available resources are being productively employed and the legitimate needs of industry and trade are not denied. It should also find out how additional pressure has been created by intensive procurement operations and the raising of the statutory liquidity ratio. It is understandable that the government is anxious to secure for itself a good portion of the new additions to deposits in the form of liberal support for open market loans. But there is no reason why the operations of the Food Corporation of India cannot be confined only to purchases for creating buffer stocks and in pursuance of support schemes whenever the need arose. With the relaxation of restrictions on the movement of foodgrains, particularly rice, within zones, and the lifting of statutory rationing in important metropolitan centres, the inflationary effects of the pumping of credit that is now taking place through procurement operations can be minimised. The farmers also will not be adversely affected because quicker movement of foodgrains from the surplus areas to the deficit regions will prevent any undue decline in prices. If the strain on the banking system on account of procurement finance for about Rs 100 crores can be eliminated and if suitable measures are devised to encourage the consumption of sugar and reduce accumulated stocks, the abnormality now noticeable in the shape of fresh advances

\* This article was written before the Reserve Bank of India raised the bank rate from five to six per cent and also the net liquidity ratio for excess borrowings of commercial banks from the RBI from 33 to 34 per cent.

being in excess of fresh deposits will not be in evidence.

As these steps may not be taken by the government immediately and it may take some time for sugar stocks to be reduced to normal levels, the Reserve Bank should not hesitate to provide the required refinance facilities and encourage productive activity. What it does in the coming months will determine the course of developments in the next two or three years. With rising prices and increasing turnover, the industrial sector is in an over-extended position and it has so happened that in the four weeks ended December 25, 1970, there was an alarming rise in borrowings of member banks, which at

one stage, as indicated above, touched the all-time peak of Rs 326.18 crores. This happened during the week ended December 18, 1970. On December 4, 1970, borrowings of member banks stood at only Rs 149.93 crores. As at the end of 1969 borrowings stood at about Rs 92 crores and a peak level of Rs 297 crores was touched on June 19, 1970, it is clearly indicated that borrowings will cross the Rs 500-crore mark by the end of June this year and may be even higher if procurement operations are to be carried out on a larger scale in May-June this year than in the corresponding period in 1970. The Reserve Bank is worried about this prospect. But it will be difficult to

avoid a big expansion of credit unless dramatic decisions are taken by the chief ministers relating to the relaxation of restrictions on the movement of foodgrains. It is, however, unlikely that major decisions in this regard will be taken by the central government or the chief ministers until the elections for parliamentary seats are over. Whatever may be the new developments, it has been clearly indicated by the happenings in the money market in recent months that banking system has assumed new responsibilities which can be successfully discharged only if there is sympathetic understanding of the new problems by the monetary authorities and credit creation is on desirable lines.

## UNITED COMMERCIAL BANK

### Report of the Auditors

#### THE PRESIDENT OF INDIA

We have audited the attached Balance Sheet of United Commercial Bank as of 31st December, 1969 and the Profit & Loss Account of the Bank for the period 19th July, 1969 to the 31st December, 1969, in which are incorporated the returns of 117 Branches audited by us, 214 Branches audited by other auditors, and the unaudited returns in respect of 41 Branches not visited by us, for the exclusion of which Branches from audit, concurrence of the Reserve Bank of India was obtained.

The Balance Sheet and Profit and Loss Account have been drawn up in forms 'A' and 'B' respectively of the Third Schedule of the Banking Regulation Act, 1949. Accordingly, they disclose such matters as were required to be disclosed in the case of banking companies prior to nationalisation by virtue of the provisions of the said Act as read with the related provisions of the Companies Act, 1956. Subject to the limitations of such disclosure and on the basis of the audit indicated in the first paragraph, we report that :—

- (a) In our opinion and to the best of our information and the explanations given to us and as shown by the books of the Bank :—
  - (i) the Balance Sheet read with the notes thereon is a full and fair Balance Sheet containing the necessary particulars and it is properly drawn up so as to exhibit a true and fair view of the affairs of the Bank as at 31st December, 1969;
  - (ii) the Profit and Loss Account read with the notes thereon shows a true balance of profit for the period covered by the Account.
- (b) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;
- (c) The transactions of the Bank which have come to our notice have been within the powers of the Bank;
- (d) The returns received from the offices and branches of the Bank have been found adequate for the purposes of our audit.

| (4) The Income-tax assessments in India for the years 1949 to 1958 which had been reopened, as the Income-tax Officer differed with the method adopted in the past by the Department for allowing Double Income-tax Relief, have been completed and the tax liability for these years and for the years 1959 to 1964 have been calculated by him according to the new method. As the Bank has disputed the action of the Income-tax Officer, no provision has been made for the additional liability arising from such assessments and provision for taxes for the years 1965 to 1969 has been made on the basis adopted all along in the past. The appeal relating to the year 1959, on the basis of which assessments for the past years were reopened and subsequent assessments were completed, has been disposed of by the Appellate Assistant Commissioner of Income-tax and the Bank's contention in regard to Double Income-tax Relief has been substantially upheld. |  |                |    |
| (5) The Assets and Liabilities of the Karachi Branch of The United Commercial Bank Ltd. stand entrusted to the Custodian of the Bank. Such assets and liabilities continue to vest in the Custodian of Enemy Property, Pakistan, and since no further information was available about the assets and liabilities in Pakistan after 27th August 1965, they have been incorporated in the Balance Sheet at their net book value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |                |    |

## WINDOW ON THE WORLD

## Europe and Japan: Rivals? Partners?

JOSSLEYN HENNESSY

LONDON:

I

## CRUCIAL TRADE NEGOTIATIONS

THE TRADE negotiations which opened on September 22 between the European Community and Japan have so far escaped notice, overshadowed by the more obviously important negotiations for the entry of the UK, the Irish Republic, Denmark and Norway into the Community. But the approach to Japan is nevertheless of world importance.

The process of European enlargement may itself become easier if there is a wider realisation of the enormous advantages that a bigger Community could achieve and that no one European state can hope to win on its own. Not the least could be much improved commercial and economic relations with Japan.

In contrast with, say, trade relations with the USSR and other East European countries, the USA, and to some extent even with the "third world" of developing countries, the possibilities of a new approach to Europe's trade relations with Japan are relatively unexplored. That is one reason why these possibilities are so interesting.

## Japan's Economic Power

The first point on which to be clear is the enormous and rising power of the Japanese economy. The facts are well known but since the moral has not been drawn, a quick look at them may be helpful.

Virtually all the conventional economic indicators show the Japanese economy to be, for its size, the most successful in the world. Japan's GNP is growing at the staggering rate of 10 to 12 per cent a year, and in 1968, at \$142,000 million, was five times what it had been in 1958. Already Japan is the third richest country in the world after the USA and the USSR. To reach this position Japan's growth rate has in the past ten years been twice that of the European Community.

Japan is now the world's third producer of steel and by 1975 plans to be able to supply nearly half the world's

need for steel — a target that would seem incredible if the Japanese had not achieved so many others that seemed equally unattainable, and if they had not already expanded their steel production by 370 per cent during the 1960s. The USSR, with an increase of 70 per cent in the same period, was a poor runner-up.

In 1969, 48 per cent of the world's new shipbuilding was in Japanese yards. The success of Japan's motor industry is well known — in particular, Japan is the world's largest producer of commercial vehicles. Nor is this super-power performance confined to conventional industrial products. Japan is highly computer-minded, and on the basis of its thriving electronics industry it is planning, with the aid of protection, to build up its own computer industry to the point of being independent of the USA by 1980, an aim which seems far beyond present European aspirations and capacities.

II

## THE "MAGIC SQUARE"

All this has been achieved to the accompaniment of an embarrassing balance-of-payments surplus. More than any other developed country, Japan has based its economy on the "magic square" — growth, price stability, full employment, and a healthy balance of payments. In addition,

Japan has invested and saved massively. If the average standard of living (about equal with Italy) is still not up to the level of Japan's other indicators, her workers are at least on their way to becoming little capitalists in their own right. Wage rates have recently been rising at the rate of 15 per cent a year without causing European-style inflation, at least not in relation to the vital and large capital-intensive export industries.

In 1969, bonuses averaged £96 per worker, of which no less than 62 per cent was put straight into savings. Strikes are almost unknown. The larger Japanese industrial concerns are run on neo-feudal lines and most employees stay in one job all their lives. To European trade unions this may seem frightening, but the Japanese flourish on it. Such is the background against which the American Herman Kahn predicts that Japan will by the year 2,000 A.D. overtake the USA to become the world's strongest economic power.

## Absurdly Small Trade

It is now 25 years since the old militaristic Japan surrendered to General MacArthur, and (like West Germany) was born again as a new economic power. It is also 15 years since Japan joined GATT and six since it joined OECD. Yet Europe's trade with Japan remains absurdly small (Table III p.144). In 1968, Japan's imports from EEC were \$7,369 million, or 5.6 per cent of total imports. Exports to EEC were \$6,857 million or 5.7 per cent of total exports. From the viewpoint of the Community, exports to Japan in 1968 represented a mere 1.8 per cent of the total. At the same time it is worth noting that this trade is at least increasing. In 1958, EEC exports

TABLE I

EEC, JAPAN AND THE U.S. — SOME BASIC COMPARISONS (1968)

# To manage people, first reach them —

# FAST.

## PHILIPS Industrial Communication Systems show you how:

Ever wondered how much time you lose in sending a message all the way to the other end of your factory? Specially if it has to reach there by the slow surface route?

You can save time and labour if you can reach anyone anywhere in your works (however big it is) — at a moment's notice. At the flick of a switch.

You need one of the Philips Industrial Communication and Paging/Announcement Systems to keep your

factory running smoothly, efficiently, effortlessly — harmoniously.

## Why Philips

● The Philips Industrial Communication Systems are

- simple and quick in use
- adaptable and multi-purpose
- robustly built for rough use

● We have both the expertise and the experience to custom-build just the right system for your special needs — at a reasonable cost.

● Our Industrial Communication Systems

are right this moment doing a great job in some of India's most modern plants like TELCO, TISCO, Chittaranjan Locomotive, Hindustan Steel, Indian Iron & Steel, as also several fertilizer projects.

Do write to us for your requirements. Our Engineers will be glad to help you with the right scheme. Get in touch with Electro Acoustics Dept., Philips India Limited, Shivsagar Estate, Block A, Worli, Bombay 18.

| Cars ('000 units)     | 78     | 2,057  |

Source: EEC

The reasons for these disappointingly low figures are complex. In the early postwar years, Japan was occupied by, and entirely dependent on, the USA, while Europe itself was not much better-off. Later, it was at first rational for both Europe and Japan to seek to redevelop the markets traditional to them. The distance has been as much psychological as physical. Japan is still in many ways strongly nationalistic (although not militaristic) and even, despite its export successes, somewhat inward-looking. For its part, Europe — especially the European Community — has been preoccupied with the development of an integrated money market.

### III

#### WHAT EUROPE CAN OFFER JAPAN

Europe's preoccupation with its own economic integration is likely to continue, especially as the negotiations for enlargement come to a head. But Europe's internal problems and its external opportunities are inextricably related. It was Europe's moves towards integration, with the formation in the 1950s of the European Communities and EFTA, that prompted Japan's first real interest in Europe.

It is important for Europeans, the British not least, to realise how interested the Japanese are in European unification. A recent business mission to Japan from Antwerp was surprised to find the Japanese thinking of trade with Europe in a broader geographical framework than is often conceived by Europeans themselves. It was interesting to note, the members of the Antwerp mis-

sion said the importance that the Japanese attached to Brussels as the capital of the Common Market. They thought of the city as the logical starting-point for the European ventures that are interesting them more and more.

#### 1. Freedom from over-dependence on USA

It was natural for the beginnings of Japanese economic recovery to be sponsored by the USA, just as Europe's was. But a reaction is now inevitably setting in. In 1968, more than 30 per cent of Japanese exports were going to the USA and the latest trend towards protectionism in Washington has reinforced Japanese awareness of the vulnerability of its present pattern of trade. Politically, too (although not militarily), the Japanese have been reasserting themselves more and more. The USA has been persuaded to hand back Okinawa, and the defence pact with the USA, although renewed, is now on a year-to-year basis.

Japan wants increasingly to be able to pursue its own policies without feeling that its every move is being jealously watched by the Americans. An integrated Europe would be strong enough, and could be independent enough, to provide a new partnership on which Japan could rely in its efforts to bring a better balance to its commercial relations with the USA.

#### 2. New outlet for Japanese exports

The beginnings of this new balance can be seen already. Japan's exports to Europe are rising. With all its difficulties, Europe is the only developed market at all comparable with the USA, which is at present accessible to the Japanese on the scale that they believe is required. China is still effectively closed and only a slow improvement can be expected. Russia is not much more hopeful, although like the Europeans

the Japanese are expanding their trade with the USSR and want to go on doing so. In south-east Asia, a major Japanese market, there are special difficulties. Bitter memories of the war, coupled with fears of Japanese economic domination, are obstacles that cannot easily be overcome.

#### 3. Collaboration in developing countries

The developing countries present another question of key importance to both Europe and Japan. Whatever political interests the USA and the USSR may have in the "third world", neither of the two super-powers has the same economic need to promote its development. For the USA and the USSR, rich in raw materials and land, commerce with the developing world is a luxury. For Japan, as for Europe, short both of space and of raw materials, commerce with the developing countries is a necessity. This necessity could give Europe and Japan an advantage in the competition to bring to the "third world" the powerful new industrial development and the sharp increase in living standards so desperately needed.

Irrespective of politics and ideology, the fact remains that the development of the "third world" depends on the possibility of making adequate profits, and of this the Japanese, probably more than the Europeans, are very much aware. The world lead that the Japanese have established in commercial vehicles, for instance, was based on their shrewd appreciation of the great need of such vehicles in the developing markets of south-east Asia — a need that they have worked hard, successfully, and profitably to supply.

Note that out of its large balance of payments surplus, Japan lent in 1970 no less than \$200 million to the World Bank, out of a total lent by all countries of \$735 million. The only way that the Japanese can get their money back

TABLE III  
PERCENTAGE SHARE OF JAPANESE TRADE

| Australia and Oceania | —       | 3.7   | —       | 8.0   |

Sources: EEC and OECD

is by rapid development of the countries that it is the aim of the World Bank to help. Like everyone else, the Japanese regard financial aid not only as a form of good works but also, at least in part, as an investment. But Japan's relations with much of the developing world could be smoothed by co-operation with Europe. France could help in Africa, the Dutch in parts of south-east Asia, the UK in both. Through its preferential agreements with Mediterranean countries, the EEC could help Japan to access in that area as well. In the delicate field of relations with Latin America, Japanese-European co-operation could perhaps also achieve results that an approach by either singly could not.

#### 4. Technological co-operation

Not the least, the Japanese are interested in the opportunities that scientific and technical collaboration with Europe would bring. Recently, e.g., the Japanese electronics firm, Matsushita Electric Industrial Company of Osaka, and Philips, the Dutch electronics giant, announced that they would set up a new joint venture in the Netherlands to exploit a new technique to produce dry batteries. The two firms had previously founded the Nippon Phonogram Company in Tokyo to market records in Japan (the world's second largest market for records). Such technical collaboration could go much further. Japan's home market is too small to support the range and scale of many of the technological projects which the Japanese have.

Europe, provided that it continues to unite, can provide the extended market that the Japanese need, while for its part Europe can find in Japan the powerful partner that it needs to catch the Americans up in advanced technology, including the development of space.

#### Europe Needs Japan

For Europe also needs Japan, and not only in advanced technology. Most of the advantages to Japan outlined above would be gained by Europe as well from a satisfactory agreement. It could even be said that Europe needs Japan more than Japan needs Europe. Given Japan's amazing postwar performance, Japan has at least a chance to catch up the USA by itself. Europe's hope of catching up is based on unification, a dream which appears slowly to be coming true, but which, as yet, is still a dream. A Europe that failed to integrate would cease to be of major interest to Japan and would have to reconcile itself to dependence on the USA.

The foregoing summarises, by special arrangement, an exclusive report in *European Trends*, published quarterly to subscribers only by the Economist Intelligence Unit (27 St. James's Place, London SW1) but the EIU is responsible neither for my summary nor for my comments, based on a variety of sources.

## Israel : Silent Revolution in Trade

K.S.V. MENON

ISRAEL, with a population of a little over three million, is one of those countries which have registered a comparatively high rate of economic growth, estimated at 10 to 11 per cent per annum. Both agriculture and industry have made impressive progress, under the impact of continuous immigration of Jews and the Arab economic boycott which necessitated a concerted action to accelerate the process of industrialisation. Equally noteworthy is growing volume and diversified nature of Israel's foreign trade. Israel has constantly tried and successfully built up economic relations not only with the advanced countries, particularly, the European Economic Community, but also with developing countries of Asia and Africa.

The major agricultural products of Israel are citrus fruit, a wide range of vegetables, wheat, barley, bananas, olives and grapes. Poultry and egg production too have gone up in recent years. Consistent efforts, with considerable success, are made to raise the output of

groundnuts, flax, sorghum, sugar-beet and high quality cotton. Mineral products, such as potash, bromine and other salts, phosphate, copper and oil are available indigenously. The exploration of natural gas has been successful. A wide range of produce is manufactured, processed or finished in the country, including, *inter alia*, chemicals, metal products, textiles, tyres, diamonds, paper, plastics, leather goods, glass and ceramics, building materials, precision instruments, tobacco, foodstuffs, refined oil and electrical goods.

Both exports from and imports to Israel have shown perceptible increase in recent years. The total exports from Israel amounted to \$372.4 million in 1964, while imports accounted for \$826.2 million. During the first half of 1970, net exports amounted to \$380 million, as compared to \$365 million during the corresponding period last year. Net imports in the first half of 1970 came to \$717 million as compared to \$624 million in the previous half year.

Thus, during the course of the last five years or so, the volume of foreign trade of Israel has more than doubled, which, incidentally, brings into sharp focus the expanding market available in Israel.

Major imports are rough diamonds, machinery, transport equipment, and cereals. Exports include polished diamonds, chemicals and oranges. The USA, the UK and West Germany are Israel's major trading partners. More than 40 per cent of the imports is from the USA and the UK. Incidentally, it may be mentioned that consumer goods too have a potential market in Israel. Goods defined as "luxuries" accounted for \$85 million of the total volume of consumer goods imported in 1969; the total purchase of which reached \$140 million. These items include motor cars, television sets, gramophones, etc. Besides, imports of spares for the manufacture of motor cars increased from about \$41.7 million in 1968 to \$50 million in 1969, while parts for the local manufacture of television sets were imported to the tune of \$4.5 million a year ago.

Israel's imports from the European Economic Community are growing as shown in Table I. In the case of West Germany, major items of import are iron and steel, machinery and machine parts, electrical equipment, and vehicles. Belgium and Holland supply diamonds, while Italy's shipments include machinery and electrical equipment. France exports a considerable quantity of iron and steel products including machinery items.

TABLE I  
IMPORTS INTO ISRAEL FROM E.C.M. COUNTRIES (\$'000)

| Country | 1968     | 1969     |
|---------|----------|----------|
| Germany | 1,15,094 | 1,55,360 |
| Holland | 52,752   | 71,710   |
| Italy   | 55,027   | 70,203   |
| France  | 53,660   | 51,845   |
| Belgium | 39,995   | 47,337   |
| Total   | 316,285  | 396,455  |

The preferential trade agreement signed in Luxembourg recently marks yet another important event in the history of trade relations between Israel and the ECM. In 1964, a non-preferential trade agreement with ECM was signed which proved to be of little material advantage. The new agreement is the first real step along the road for the establishment of full customs union with the ECM. The five-year pact goes into effect on October 1, 1970, with a 30 per cent cut in tariffs on Israel's industrial exports, going up to

35 per cent in January 1971. Then it will increase by five per cent till it reaches 50 per cent on January 1, 1974. With the operation of this pact, and, the cuts effected and expected under the Kennedy Round, the average rate of customs duty on Israeli goods entering the Market in 1974 will be only 7.5 per cent.

#### Diversification

Attempts are now being made by Israel to improve trade relations with developing countries. Exports to some 60 developing countries exceeded \$100 million in 1969, while imports from the latter came to \$60 million. The recent Tel Aviv Trade Fair put special emphasis on trade with the developing countries. It is proposed to increase the participation of Israel in the forthcoming trade fairs and exhibitions in different parts of the world.

Trade with Japan has assumed a new dimension with exports reaching \$30 million. Imports amounted to \$18 million in 1969 as compared to \$12 million in 1968. The steep increase is due mainly to larger imports of steel. Other important commodities include cameras, transistors, rubber goods, synthetic materials and toys. In 1969, Israel's exports to Singapore came to \$3.4 million. Machinery accounted for \$2.2 million; other imports exceeded \$2 million, of which plastic goods accounted for \$1.5 million.

Iran is another important trade partner of Israel. The exports of the former to the latter came to \$20 million. These items include agricultural products, processed foodstuffs, textiles, rubber and plastic goods, chemicals, etc. Imports from Iran last year amounted to \$1.5 million (excluding petroleum) and comprised mainly plants and plant products. The trade with other Asian countries like Thailand, Philippines, etc. is also growing.

It is also significant to note that Israel has made its impact felt on the expanding east African market as can be seen from Table II. Imports from African countries have depicted a downward trend, although the total volume of trade has been going up. It is expected that in the years to come the upward trend will continue.

Kenya supplied to Israel dried fruits and vegetables, coconuts, coffee, oilseeds, chemicals and cotton. Exports of Uganda consist mainly of cotton and coffee. The purchases from Tanzania include coffee, oilseeds, cotton and fibres. Zambian sales, among other things, consist of timber and boats. Meat accounts for a substantial share of imports from Ethiopia.

Extensive plans are reported to be under way to promote trade and economic relations between Israel and east

TABLE II  
TRADE WITH EAST AFRICA

(in \$'000)

| Country  | Israel's Exports |        | Israel's Imports |       |
|----------|------------------|--------|------------------|-------|
|          | 1968             | 1969   | 1968             | 1969  |
| Ethiopia | 4,118            | 4,286  | 2,870            | 1,705 |
| Kenya    | 2,604            | 2,948  | 1,293            | 755   |
| Uganda   | 3,580            | 3,303  | 2,749            | 1,833 |
| Tanzania | 1,156            | 1,446  | 405              | 192   |
| Zambia   | 1,791            | 2,947  | 278              | 358   |
| Total    | 13,745           | 16,181 | 5,629            | 4,847 |

African countries. Possibilities of launching joint ventures in various fields, such as chemicals, packaging, electrical goods, are now being explored. A contract was recently signed between an Israeli firm and the Government of Ethiopia for putting up a chemical factory. Negotiations have also reached an advanced stage with another east African country for a joint venture for the manufacture of furniture. Two joint ventures have already been set up in Uganda and Kenya for door-frames. In Ethiopia, a pharmaceutical company has entered into partnership with an Israeli counterpart for the manufacture of pharmaceuticals in Addis Ababa.

According to Israel's current trade policy, all imports must be authorised by the country's Ministry of Commerce and Industry. Licences are not required for goods on the liberalised list, but importers must hold an approved certificate; for all other imports, a licence, which must be endorsed by the Controller of Foreign Exchange, is required. The customs tariff is based on Brussels nomenclature system of classification. There are no preferential rates of duty. Customs duties are predominantly *ad valorem* for all rates vary from 30 to 100 per cent. Purchase taxes are comparatively high. No surtaxes are levied.

The basic objective underlying the

government's economic policy is to improve the balance of payment position by promoting exports and restricting imports. The five-year plan now under execution seeks to increase industrial output by 60 per cent and more than double the exports of industrial products. The per capita output is expected to increase by four per cent per annum and the export target for 1971 is \$845 million. It is estimated that investment in industry would go up to \$1100 million by 1971. The exports of agricultural products are also projected to depict an upward trend.

Although the country's dependence on imports is decreasing, Israel will certainly need to continue to import much of the raw materials required for its expanding industries and large quantities of capital goods, particularly industrial and communication equipment. It seems to suggest that Israel has sought to project its image and capability in entering into joint ventures in developing countries and in the years to come more and more such projects are likely to be successfully set up in Africa and elsewhere. Indian entrepreneurs in particular and the Ministry of Foreign Trade in general will do well to have an objective appraisal of these developments.

*Eastern Economist 25 Years Ago*

JANUARY 18, 1946

DURING the war years there has taken place an enormous accumulation of liquid funds in the economy mainly due to deficit financing by Government in the wide sense of the term. In India the aggregate addition of liquid funds consists of (1) currency which rose from Rs. 182 crores in August 1939 to Rs. 1,200 crores in December 1945; (2) time deposits of scheduled banks which increased from Rs. 102 crores to Rs. 277 crores; and (3) demand

deposits which increased from Rs. 134 crores to Rs. 679 crores in the same period. These three together amount to Rs. 1,738 crores. If to this sum are added (1) the increase in the volume of Government debt, at least that part of it which is in the form of immediately saleable securities and (2) the amount of gold which has been sold in the last three years, the war time addition to liquid funds would easily be above the Rs. 2,500 crore mark.

## Trade Winds

### BANK RATE RAISED

THE RESERVE Bank of India raised the bank rate from 5 per cent to 6 per cent with effect from the close of business on January 8. Simultaneously, it has decided to increase the minimum net liquidity ratio for purposes of determining the penal rate of interest chargeable on the excess borrowings of a bank from the RBI by one per cent from the present 33 per cent to 34 per cent, with effect from January 29. The liquidity ratio for the purpose of Sec. 24 of the Banking Regulation Act will remain unchanged at 31 per cent.

Banks have been advised that, while adjusting the rates of interest on their advances, consequent upon these changes, they would ensure that on an average the increase in the rate charged by them on advances is only about one per cent. The RBI would continue to provide refinance in respect of credit to priority sectors on the existing basis, that is: (1) At 4.5 per cent, irrespective of the net liquidity ratio, against the increase in credit over the specified base period to exporters and in lending to primary co-operative credit societies, in terms of the scheme instituted for this purpose. (2) At bank rate irrespective of the liquidity ratio in regard to the increase in short-term lending to small-scale industries and agriculturists, over the specified base period and rediscounting of bills under the new bill market scheme. (3) At bank rate in respect of bank advances for food procurement operations up to 50 per cent of the increase over the outstanding level of such advances on October 30, 1970. In exceptional cases, discretionary accommodation at the bank rate will be made available to individual banks — based on the merits of the situation to help them finance high priority demands for credit.

In order to encourage savings and further assist deposit mobilisation the ceiling rates on various categories of deposits have been increased. The rates on savings accounts has been increased from 3.5 to four per cent. The rate on deposits for 15 days to 45 days has been stepped up from 1.25 per cent to two per cent and that on 46 days to 90 days from 2.50 per cent to three per cent. There is an increase of one-quarter of one per cent in the various other maturity categories of deposits up to one year and an increase of one half of one per cent in the maturity categories of deposits of one year and over up to five years. The maximum rate payable would be 7.25 per

cent in respect of deposits for period above five years. Smaller banks will be allowed, as before, to quote rates slightly higher than those offered by larger banks.

### BANKING COMMISSION

The tenure of the Banking Commission has been extended by six months. It was appointed in February 1969 and was to submit its report by the end of last year. The extension of time up to June 30 has been given as the replies to the Commission's questionnaire have not kept pace with the time schedule. The questionnaires had been issued in November 1969 to 91 commercial banks, 220 co-operative banks, state governments and nearly 7,500 borrowers from industry and trade. Headed by Mr R.G. Saraiya, the Commission has been asked to enquire into the banking structure and suggest improvements in the functioning of banks. Its other members are: Mr N. Ramanand Rao, Mr Bhabatosh Datta and Mr V.G. Pendharkar (member-secretary). The Commission has set up two study groups, one on banking cost and another on legislation affecting banking. It has also been engaged in collecting material from the banks and their customers and in ascertaining the views of persons connected with banking.

### COMMITTEE ON CAPITAL ISSUES

The Advisory Committee on Control of Capital Issues has been re-constituted. Mr R.S. Bhatt, Chairman of UTI is the Chairman of the re-constituted Advisory Committee. The other members are, Mr N.M. Wagle, Mr C.P. Mukherjee, Mr Tulsidas Dasappa and Dr L.C. Gupta. Mr P.D. Kasbekar, Controller of Capital Issues, and Dr Raj K. Nigam, Joint Controller of Capital Issues, attend meetings of the Advisory Committee. The first meeting of the re-constituted Advisory Committee was held on January 5. The next meeting is scheduled to be held in March.

### EXPORTS IN NOVEMBER

With exports in November 1970 totalling Rs 124 crores, the declining trend in India's exports has been reversed. The total exports for April-November 1970 add up to Rs 931.8 crores, over Rs 8 crores more than the exports for the same period in the preceding year (1969). This works out to an increase of about one per cent in exports during April-

Nov. 1970, as compared with the same period in 1969.

Exports in November 1970 at Rs 124.01 crores are higher by Rs 19 crores, as compared with the exports in November 1969.

The figures are:

| Exports (including re-exports) | (Rs crores) |
|--------------------------------|-------------|
| November 1970                  | 124.01      |
| November 1969                  | 105.30      |
| April-Nov. 1970                | 931.79      |
| April-Nov. 1969                | 923.64      |

The import figures for November 1970 are yet to be received.

### COINS FOR THAILAND

The State Trading Corporation has received orders for the export of Rs 1.55 crores worth of coins, prepared in this country. The first order from Thailand worth Rs 1.22 crores has been nearly completed. The coins, against the second order are expected to be supplied by the end of February. The STC has found that the technical know-how and mint facilities available in this country can provide a new line of ex-

a B.E.I. product

DB/E/202

port. Several countries — particularly, developing countries — get their coins minted in other countries. In the case of the Greek order worth Rs 30 lakhs the STC vied with a number of developed countries. The STC made the bid for the Greek tender in consultation with the union Finance Ministry. The Greek coins were to be minted from copper-nickel alloy (copper 75 per cent and nickel 25 per cent). Now that this country has switched over to aluminium bronze alloy coins, the government wants to dispose of the 500 tonnes of cupro-nickel alloy stocks. A little more than half of the stock would be consumed by the two orders received by the STC. The STC is on the lookout for countries that might want to get cupro-nickel coins minted. This country has an edge over the European mints because the labour costs here are comparatively low and technical skills are quite competitive.

#### TRADE FAIR IN SWEDEN

The union government has decided to organise India's participation in the 54th Swedish International Trade Fair to be held from May 7 to 16, 1971, at Gothenburg (Sweden). The exporters and manufacturers, who intend to participate in the Fair, have been required to send their list of exhibits to the Director of Exhibitions in the Ministry of Foreign Trade direct or through export promotion councils and commodity boards by January 15, 1971. Detailed particulars regarding the Fair can also be had from the Director of Exhibitions.

#### STATEHOOD FOR HIMACHAL

Himachal Pradesh will become a state on January 25, 1971, according to a notification issued by the Ministry of Home Affairs on January 6, under clause (b) of section 2 of the State of Himachal Pradesh Act, 1970.

#### GOA'S ANNUAL PLAN : 1971-72

The outlay for the Annual Plan 1971-72 of Goa, Daman and Diu will be of the order of Rs 7.8 crores. This was agreed to at a meeting between Prof. D.R. Gadgil, Deputy Chairman, Planning Commission and Mr D.B. Bhandarkar, Chief Minister of Goa, held recently. Goa's fourth Plan outlay is of the order of Rs 39.5 crores. Expenditure during 1969-70 was Rs 5.82 crores, while the anticipated expenditure during 1970-71 is Rs 7.84 crores. The distribution of the outlay (in Rs lakhs) in the Annual Plan for 1971-72 under major heads of development is: Agricultural programmes 179.27; Co-operation and Community Development 35.49; Irrigation & Power 108.30;

Industry and Mining 13.74; Transport and Communications 127.00; Social Services 305.26; and Miscellaneous 10.94.

#### ESTIMATE FOR GROUNDNUT

The all-India first estimate of groundnut has put the current year's area under the groundnut crop at 5,734,900 hectares. According to the Directorate of Economics and Statistics, union Ministry of Food, Agriculture, Community Development & Co-operation, this year's estimate shows an increase of 137,600 hectares or 2.5 per cent as compared with the corresponding adjusted estimate of 5,597,300 hectares for the year 1969-70. The increase in area under groundnut during the current year has been mainly in Maharashtra, Andhra Pradesh, Tamil Nadu, Rajasthan and Uttar Pradesh and is attributed to favourable weather conditions at the sowing time. This increase in area has, however, been offset to a great extent by a decline reported from Madhya Pradesh, Gujarat and Punjab. The present estimate does not cover the entire area sown under groundnut crop during 1970-71. Past experience has shown that the area at the first estimate stage forms roughly 75 per cent of the area under the crop finally reported.

#### DRUG PRICES

The government has assumed powers, through drastic changes in the Drug (Prices Control) Order, to unilaterally revise the retail price of any drug considered essential to the life of the community. The new order issued by the Ministry of Petroleum and Chemicals, under the Essential Commodities Act of 1955 to amend the earlier order comes on a day when the revised prices of drug formulations are being enforced. An official release says "a price fixed under the new order will remain in force until altered or cancelled by the government." In a major departure from the original order, it has also been stipulated that no manufacturer shall increase drug prices, once fixed, without the prior approval of the government. The earlier order permitted the manufacturer to introduce revised prices on their own. This was subject to the condition that the revised prices were later to be approved by the government. For the convenience of the industry, the government has spelt out the criteria for fixation and revision of the prices. The criteria will be the cost of raw materials, promotional expenses, volume of sales, product-mix nature of specialised formulations, export performance, expenditure on research, profitability and prices approved for similar and other comparable formulations of other manufacturers.

#### NAMES IN THE NEWS

Mr Harshavadan J. Shah, Managing Director of Shah Construction Company Ltd, has been elected Chairman of Steel Wire Manufacturers' Association of India, Calcutta, for 1970-71. Mr Shah is the president of the International Federation of Asian and Western Pacific Contractors Association, Manila.

Mr Shriram C. Chokhani of Sudarshan Chokhani Co. and Mr H.N. Khira of Khira Steel Works Pr. Ltd have been elected Chairman and Vice-Chairman respectively of the Engineering Association of India, western region for the year 1970-71. The other members elected to the Managing Committee are as under: Mr N.D. Sahukar, Godrej Boyce Mfg. Co. Pr. Ltd, Mr Vinod Shah, Mukand Iron & Steel Works Ltd, Mr A.T. Kajiji, Garlick & Co. Pr. Ltd, Mr Homi J.H. Taleyarkhan, Kamani Engg. Corp. Ltd, Mr M.S. Shastri, Automobile Products of India Ltd, Dr. Pranlal Patel, Malleable Iron & Steel Castings Co. Pr. Ltd, Mr F.S. Baldiwalla, Tayabi Bucket Factory, Mr B.R. Adagra, Walchandnagar Inds. Ltd, and Mr D.T. Amin, Hindustan tractors Ltd.

D.P.M. KANGA

Managing Director

VICTORIA HOUSE

Calcutta, the 6th January, 1971.

## Company Affairs

#### SHRIRAM REFRIGERATION

SHRIRAM REFRIGERATION Industries Ltd, one of the units in the Shriram Group of Industries, was established in 1961 for manufacturing hermetically sealed compressors, in technical collaboration with M/s Westinghouse Electric International Inc., New York, USA, in Balanagar in Hyderabad. Shriram compressors are being manufactured in the range of 1/8 HP to 1-1/2 Ton and are being supplied to all the leading original equipment manufacturers of airconditioning and refrigeration appliances in India. The company is also exporting compressors in large quantities to various countries. The company has extended its manufacturing activities and is now manufacturing in addition water coolers, diesel engines, and electric motors. Water coolers are being marked 'USHA' and are being manufactured in the range of 10 litres/hour cooling capacity to 160 litres/hour capacity in both instantaneous and storage types. Usha water coolers are also on DGS&D rate contract. The company is at present manufacturing Usha diesel engines in three sizes of 6 HP, 6.5 HP and 7.5 HP. These are being sold and serviced by M/s Usha Sales Pvt. Ltd and are being well received by the market. M/s Usha Sales are our selling agents and have branches all over India.

#### COROMANDEL FERTILISERS

Coromandel Fertilisers Ltd has recorded sales in 1970 at around 210,000 tonnes of fertilisers valued at Rs 23 crores as against 200,000 tonnes valued at Rs 21 crores in the previous year (of 15 months). The company has applied to the government for a licence to almost double the existing capacity. Under the two-phased expansion programme, the production of complex fertiliser will be first taken up from 260,000 metric tonnes to 287,000 metric tonnes and then to 420,000 metric tonnes. The production of nitrogen will go up from 80,000 to 100,400 tonnes by the end of phase one and to 234,700 tonnes by the end of phase two. Rallis India Ltd have been appointed sales agents with effect from January 1, 1971. The agreement with Rallis is complementary to that which the company has with EID-Parry Ltd and which will continue. The new selling agency is necessitated by the proposed expansion of the

company. The total assets employed by Coromandel which are Rs 66.1 crores now are expected to increase to Rs 72.6 crores by 1973 when phase one is expected to be completed and to Rs 129.6 crores by 1974 when phase two is expected to be completed.

#### EAST INDIA HOTELS

THE EAST India Hotels Ltd will enter the capital market on January 18 with a public issue of 5,47,333 equity shares of Rs 10 each and 20,154 (9.5 per cent) cumulative non-redeemable preference shares of Rs 100 each. The issue has been fully underwritten. The company owns and operates Oberoi Hotels, a large chain of luxury hotels. The company enters Bombay with its big venture, the Hotel Oberoi-Sheraton presently under construction and scheduled to open in 1972. The United States Agency for International Development (USAID) has extended a loan of Rs 4.35 crores to help finance this hotel. This is the first time that a hotel project has been extended such a facility by the USAID. The cost of the project in Bombay is estimated at Rs 6.52 crores. Sheraton International Inc., American collaborator, has agreed to take equity shares of Rs 52.50 lakhs and preference shares of Rs 6.75 lakhs.

#### SHALIMAR ROPE WORKS

The working of the Shalimar Rope Works Ltd during the year ended June 30, 1970, has resulted in a net profit of Rs 2.14 lakhs compared to Rs 18.862 in the previous year, after providing Rs 6.27 lakhs for depreciation, Rs 2.53 lakhs for development rebate reserve and Rs 95,000 for taxation. Sales have risen to Rs 1.58 crores from Rs 1.38 crores. General reserves gets Rs 2.16 lakhs. The directors have proposed an equity dividend of 75 paise per share of Rs 10 each which will be paid from the general reserve. The directors have stated that the company could achieve better results due to modernisation, diversification and increased turnover. The demand for the company's products continued to go upward.

#### PREMIER BREWERIES

Premier Breweries will enter the capital market on January 18, with an issue of 49.09 lakhs. The issue will close on January 23, 1971, or earlier at the dis-

cretion of the directors but not before January 20, 1970. Out of the present issue shares worth Rs 26 lakhs have been offered for public subscription in the form of 20,500 equity shares of Rs 100 each and 5,500 (9.5 per cent) cumulative redeemable preference shares of Rs 100. The company has an authorised capital of Rs 50 lakhs. The company proposes to manufacture beer, aerated and mineral water and other soft drinks. The foreign exchange commitment in respect of import of machinery will be about Rs seven lakhs only, besides a small quantity of essential stores. The company has been promised technical assistance by Messrs Henninger International of West Germany. The Kerala government has given it permission for the installation of a brewery.

#### TUNGABHADRA INDUSTRIES

Tungabhadra Industries expects to enter the capital market with a public issue of Rs 25 lakhs — Rs 15 lakhs in equity shares of Rs 10 each at par and Rs 10 lakhs in 9.3 per cent preference shares of Rs 100 each at par. The proceeds of the public issue will be utilised to meet a part of the finance required for expansion of its vanaspati plant and solvent plant capacity. The company's present paid-up capital is Rs 32.18 lakhs in equity shares of Rs 10 each. It owns two factories one each in Secunderabad and Kurnool. Its vanaspati plant is a large composite plant in south India. It manufactures hydrogenated oils, refined oils, laundry soaps, deoiled cakes, etc. The company's performance during the year ended September 30, 1970, revealed sales amounting to Rs 12.97 crores against Rs 10.76 crores. Its gross profit has increased to Rs 32.76 lakhs from Rs 24.68 lakhs. The directors have proposed to pay an equity dividend of 10 per cent, the same as that paid for the preceding three years. The company has secured an order of 4,800 tonnes of vanaspati from the Government of India for supplies in the current year. It has also received an export order for 3,450 tonnes of deoiled cakes.

#### SHAMA ENGINE VALVES

Shama Engine Valves Ltd is implementing its expansion programme aimed at raising its production capacity from 600,000 valves to 1.4 million valves per year. The government has accepted in principle its claim for the import of capital goods worth Rs. 15 lakhs from the USA and Rs 13.40 lakhs from West Germany and no difficulty is expected in the receipt of import licences. The construction of the factory building is scheduled to

be completed in the next six months. Provisional orders for the foreign machinery have already been placed, and it is expected to complete a part of the expansion work in the current financial year and the balance by middle of 1972, according to the company's report for the year ended September 30, 1970. The company's product has been well received in the market. Over the last few years, the number of vehicles and diesel engines which use valves has increased. The company has already on hand orders worth Rs 50.25 lakhs from original equipment manufacturers. Its production in 1969-70 showed a decline compared to the previous year on account of shortage of raw materials but the problem will ease in future as the company is helping to develop sources of indigenous supply. Despite the fall in production, the company's performance for the year was better with a higher gross profit of Rs 5.42 lakhs against Rs 4.53 lakhs for the previous year.

#### MANDYA NATIONAL

Mandya National Paper Mills Ltd has reduced its loss at Rs 21.82 lakhs for the year ended June 30, 1970 compared to a loss of Rs 40.62 lakhs for the previous year. This follows an increase in sales from Rs 87.91 lakhs to Rs 1.94 crores and that in production from 4,319 tonnes to 8,032 tonnes. The loss which has been arrived at before providing for depreciation amounting to Rs 20.96 lakhs raises the company's total deficit to Rs 2.41 crores which is carried forward. The report states that the company is taking steps to implement its expansion programme aimed at raising its production capacity from 35 tonnes to 60 tonnes per day. It is felt that the completion of the expansion programme will enable the company to wipe off the accumulated losses within a short time and earn a reasonable profit. Steps are also being taken to implement the proposal for a reconstruction of its capital structure.

#### DENA BANK

Dena Bank Ltd has declared a final dividend of Rs 1.50 per share (three per cent) for the half-year ended December 31, 1970. This is in addition to the ad-interim dividend of Rs 3 per share (six per cent) declared earlier in the year, thus making in all Rs 4.50 per share (nine per cent) for the year 1970.

#### CAPITAL & BONUS ISSUES

Consent has been accorded to 13 companies to raise capital of over Rs 7.08 crores. Eight of them are to

issue bonus shares totalling over Rs 1.08 crores and the amount of bonus shares ranges between Rs 20,000 and Rs 40 lakhs. The consents are valid for twelve months.

The following are the details:

**Messrs Sri Gopalkrishna Mills Private Ltd** has been accorded consent to capitalise Rs 5,00,000 out of its general reserve and to issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of one bonus share for every one equity share held.

**Phillips Carbon Black Ltd, Calcutta**, has been accorded consent to capitalise Rs 18.75 lakhs out of its general reserve and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of one for every 10 equity shares held.

**New Gujarat Cotton Mills Ltd, Calcutta**, has been accorded consent to capitalise Rs 15 lakhs out of its general reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of two bonus shares for every three equity shares held.

**Western India Vegetable Products Ltd** has been accorded consent to capitalise Rs 5,66,700 out of its general reserves and issue fully paid equity shares of Rs 100 each as bonus shares in the ratio of one bonus share for every three equity shares held.

**East India Pharmaceutical Works Ltd, Calcutta**, has been accorded consent to capitalise Rs 22 lakhs out of its general reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of one bonus share for every equity share held.

**United Motors (India) Ltd, Bombay**, has been accorded consent to capitalise Rs 2,04,240 out of its general reserves and issue fully paid equity shares of Rs 20 each as bonus shares in the ratio of one bonus share for every six equity shares held.

**Garware Nylons Ltd, Bombay**, has been permitted to issue further capital of Rs 146 lakhs, Rs 40 lakhs as bonus shares to the existing shareholders in the ratio of four bonus shares for every seven equity shares held and 106 lakhs in equity shares, for cash at par to the general public by issue of a prospectus. The proceeds of the cash will be utilised for financing the company's expansion scheme for the manufacture of nylon yarn.

**F.D. Stewart Private Ltd, Madras**, has been accorded consent to capitalise

Rs 20,000 out of its free reserves and issue fully paid equity shares of Rs 10 each as bonus shares in the ratio of four for 25 equity shares held.

**Hyderabad Vanaspati Ltd, Hyderabad**, has communicated to government of its proposals to issue capital of Rs 35 lakhs under clause 5 of the Capital Issues (Exemption) Order, 1969, divided into equity shares of Rs 30 lakhs and 9.5 per cent redeemable cumulative preference shares of Rs 5 lakh for cash at par out of which equity share of Rs 15 lakhs have already been subscribed. The proceeds are to be utilised for modernising the existing plant.

**East-India Hotels Ltd, Calcutta**, has communicated to government of its proposal to issue capital of Rs 1,34,13,730 under Clause 5 of the Capital Issues (Exemption) Order, 1969, divided into 10,72,333 equity shares of Rs 10 each and 26,904, 9.5 per cent cumulative preference shares of Rs 100 each at par, out of which equity shares of Rs 52.5 lakhs and preference shares of Rs 6.75 lakhs for technical know-how to Messrs Sheraton International Inc. of USA. The proceeds are to be utilised as part of the finance for construction of a hotel in Bombay.

**Gujarat Industrial Investment Corporation Ltd, Ahmedabad**, has been accorded consent to issue bonds of the value of Rs 175 lakhs for cash at an issue price of Rs 99.75 per cent, carrying interest at six per cent per annum and redeemable after twelve years.

**Indian Detonators Ltd, Hyderabad**, has communicated to government of its proposal to issue capital of Rs 100 lakhs under clause 5 of the Capital Issues (Exemption) Order, 1969, in the shape of mortgage debentures for cash at par. The proceeds are to be utilised for the company's rationalisation plans to make more modern types of detonators and explosives.

**New Gujarat Cotton Mills Ltd, Calcutta**, has communicated to government of their proposal to issue capital of Rs 50 lakhs under Clause 5 of the Capital Issues (Exemption) Order, 1969, divided into 5000 debentures of Rs 1000 each carrying interest at the rate not exceeding eight per cent per annum for cash at par. The debentures shall be payable to registered holders only. The proceeds are to be utilised for financing the modernisation cum expansion scheme, repayment of loan to National Industrial Development Corporation Ltd and for augmenting working capital of the company.

#### COMPANY MEETING

## ASHOK LEYLAND LIMITED

### Sir A. Ramaswami Mudaliar's Review

Speech delivered by Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L., (Oxon.) Chairman, Ashok Leyland Limited to the Shareholders at the Twentysecond Annual General Meeting of the Company held on 9th January 1971 at Ennore, Madras-57.

Gentlemen,

It gives me very great pleasure to welcome you to the 22nd Annual General Meeting of your Company.

The Directors' Report, Audited Balance Sheet and the Profit & Loss Account for the year ended 30th September 1970 have been circulated to you and with your permission I shall take them as read.

You must have noted from the Profit and Loss Account that the sales for the year 1969/70 were to the extent of Rs. 33 Crores, which is about 11.4% more than the corresponding figure for 1968/69, when the sales were to be the value of Rs. 29.22 Crores.

As will be seen from the Accounts, a sum of Rs. 17 lakhs has been provided for the Debenture Redemption Account in terms of the Prospectus governing the Debenture issue and the Debenture Trust Deed. Besides this, we have been able to transfer to General Reserve a sum of Rs. 18.48 Lakhs.

#### SALES AND PRODUCTION:

The sale of 5103 Comet vehicles in the past year is the highest yet in the history of the Company and we are hopeful of increasing our production in the new financial Year. Also, there has been a steady progress in the indigenous manufacture of components of our heavy duty chassis, namely, Beaver, Hippo models and Titan double-decker bus chassis. The development and production of the highly successful Hippo Dumper with power steering has been yet another landmark in the activities of the Company.

The industrial version of the engines manufactured by the Company has continued to enjoy popularity in varied operations as main motive power for

Compressors, Generators, Diesel Rail-cars, Ballast Tamperers, Excavators, Aircraft servicing units and crane handling equipment etc. The marine version of the '370' and '680' diesel engines are increasing in popularity as power units by the fishing industry, high power launch applications and other crafts.

Last year, I referred to the acute shortage of production materials in the country especially steel. It is pleasing to report some improvement in supplies primarily as a result of Government's liberalisation of imported steel sections. Upward spiralling of prices of materials, however, is causing us concern. It is to be hoped supplies from Indian Steel manufacturers will soon improve so that we are not faced with high cost of imported material.

#### EXPORTS:

Your Company has been steadily increasing its export business. During 1969/70, export sales reached a figure of Rs. 1.67 Crores as against the figure of Rs. 57.33 Lakhs in the previous year. Apart from the present market in Ceylon and Singapore, an intensive export drive is being made in East Europe, Middle East, Africa and Far East. British Leyland International continue to give us assistance to widen our export fields.

I would like to refer to the Engineering and Research and Development Department in your Company, which has been carrying out continuous development and testing work to bring about improvement in the design and quality performance of our vehicles. This, as you all know, is most essential in an Engineering Industry of this kind, where we have not only to maintain our standards of quality but also constantly evolve modifications to the parti-

cular requirements of users of our vehicles operating in Indian conditions.

#### LAEOUR:

The Company have again entered into a four-year settlement with the Ashok Leyland Employees' Union and you will be gratified to know that under this settlement payment of emoluments are linked up with increasing productivity year by year.

Our Personnel and Welfare Departments require special mention as owing to their efforts and training programmes, there has been considerable reduction in the accident frequency rate in the Factory winning them well earned awards from the State Government.

#### ENNORE FOUNDRIES:

As stated in the Directors' Report, Ennore Foundries have continued to make good progress and your Company will be receiving a dividend of 9% subject to deduction of tax on its investment in this Company and as Chairman of Ennore Foundries, I am pleased to inform you that plans have been submitted to Government for expanding the production of cast Iron Castings.

#### FUTURE PROSPECTS:

As you all know, the Fourth Plan has estimated the doubling of goods traffic by road and 40% increase in passenger traffic in the next five years. This will undoubtedly create a higher demand for passenger and goods vehicles and we are confident that the offtake of our vehicles will steadily increase. In my report to you last year I indicated our intention to expand our capacity of Comet vehicles to the rate of 7,000 per annum by the end of the Fourth Five-Year Plan and our plans and proposals for expansion now rest with Government for their approval. It is a matter of

considerable concern to us that so much time is being lost awaiting Government's sanction which is likely to affect our ability, to meet the increasing demand for our vehicles. You are aware that most automobile manufacturers purchase components and in some cases units from the ancillary industries, who in turn must expand their production to meet the increasing demand of vehicle manufacturers. Unfortunately, in many cases expansion proposals of many of these industries are awaiting Government's approval. I appeal to Government for more speedy approval of the expansion programmes in the industry in general so enabling the industry as a whole to prepare themselves to meet the increasing need for vehicles.

#### ACKNOWLEDGEMENTS:

Mr. J.C. Watson, the Managing Director has during his 8 years of service played a most notable part in the remarkable development of this industry. He has identified himself closely not merely with the progress of the Company but with the welfare of the staff and workers. This enlightened policy he has created in the staff and workers has resulted in greater and better performance and in achieving the targets that have been set to them and in some cases, exceeding such targets. The progress of the industry and the place that Ashok Leyland has attained is due as much to his technical knowledge as to his personal qualities in the management of the affairs of the Company and its expansion. My colleagues in the Board and I would like to convey our keen appreciation and sincere thanks to Mr. J.C. Watson for the signal contribution he has made to the progress of the Company.

It is my pleasant duty to express our appreciation to the staff and workers for their co-operation and devotion to duty which has enabled the Company to achieve satisfactory results.

Our thanks are due to our British Collaborators for their continued guidance and assistance in the activities of the Company.

I take this opportunity to convey our thanks to the Central and State Governments for their support and encouragement.

Finally, on behalf of the Board of Directors and myself, I would like to convey to you our thanks for the support and the confidence you have reposed in us in the development of the Company.

**NOTE:** This does not purport to be a record of the proceedings of the Annual General Meeting.

# PACKED!

## in ORIENT boards

Orient's Simplex and Duplex boards are ideal for both utility and elegant packaging. They are equally good for tough packaging that can take rough handling.

Orient boards are economical too. They are crack resistant, sensitive to sharp colour reproduction and colour absorbance. No wonder Orient boards are used to pack so many products— from soap to cigarettes, cosmetics to confectionery, food products to medicines and so much more. Orient are the largest paper manufacturers in India. Their skilled personnel, modern machinery and rigid quality control guarantee the best paper and paper boards available anywhere in the country.

#### RECORDS AND STATISTICS

## Towards Dear Money

ON JANUARY 8, the Reserve Bank of India raised the bank rate by one per cent to six per cent and increased the net liquidity ratio of commercial banks from 33 to 34 per cent, effective from January 29. While the priority sectors will continue to enjoy the concessional rate of credit at 4.5 per cent, banks have been asked not to raise their overall interest rates on lendings by more than one per cent. Simultaneously, the RBI has also announced a revised rate of interest structure on bank deposits.

The following is the text of the letter of the Reserve Bank Governor to the scheduled banks enumerating the monetary changes:

"In November last, I had the opportunity of assessing the outlook for the year 1970-71 busy season at a meeting of the chief executives of major banks. At the meeting, concern was expressed with the price situa-

tion and there was a general appreciation of the need for credit restraint and for minimising the resort to re-finance from the Reserve Bank.

"The price situation still continues to cause concern. The index number of wholesale prices on December 19, 1970 was 7.4 per cent higher than a year ago and during the financial year 1970-71 so far, the increase in price has been of the order of a little over five per cent. The money supply with the public has risen at about 12 per cent in the calendar year 1970.

"This increase has been the result to a significant extent of a large credit expansion by the commercial banking system. Thus during the calendar year 1970 commercial bank credit showed a continuous expansion. Even during the conventional slack season there was an ex-

pansion of as much as Rs 192 crores. This was followed by an expansion of Rs 182 crores during November and December, the first two months of the busy season. While a part of this large expansion in bank credit can be attributed to the requirements of food procurement and other priority sectors, the rate at which bank credit is expanding currently is a matter for concern.

"During the calendar year 1970 bank credit has outpaced the growth in aggregate bank deposits. This has resulted in the banks making a very substantial use of Reserve Bank's resources to support their credit operations. The banks, it will be recalled, commenced the busy season with a level of borrowing from the Reserve Bank of Rs 150 crores. By now it has shot up to Rs 351 crores. As the busy season progresses the banking system will come under even greater strain.

"In the context of the present price situation it is necessary for the banking system to exercise caution in credit operations and take suitable measures to contain credit expansion. At the same time it is very necessary to

#### NEW RATES OF INTEREST ON DEPOSITS

provide incentives to stimulate savings and mobilise deposits to the maximum extent.

"After a careful review of the position, the Reserve Bank has decided to take the following steps:

- (i) With effect from the close of business today, the bank rate would be raised to six per cent per annum.
- (ii) The minimum net liquidity ratio for purpose of determining the penal rate of interest chargeable on the excess borrowings of a bank will be increased by one per cent from the present 33 per cent to 34 per cent, with effect from Friday, the 29th January 1971.
- "The liquidity ratio under Section 24 of the Banking Regulation Act together with the cash reserve requirements under Section 42 of the Reserve Bank of India Act will, however, remain unchanged at 31 per cent.
- (iii) It is expected that while adjusting the rates of interest on their advances, consequent upon the change in the bank rate and the net liquidity ratio, the banks will ensure that on an average the increase in the rate charged by them on advances is only about one per cent.

"The Reserve Bank of India would

continue to provide refinance in respect of credit to priority sectors on the existing basis (as indicated in the memorandum annexed to our letter DBOD. No. Sch. 1758/C. 96-70 dated November 17, 1970) as below:

- (a) At 4-1/2 per cent irrespective of n.l.r.
  - (i) against credit to exporters at pre-shipment or post-shipment stages i.e. in respect of packing credit advances and against post-shipment usance export bills; and
  - (ii) short-term lending to primary co-operative credit societies in selected districts in the states of Andhra Pradesh, Haryana, Madhya Pradesh, Mysore and Uttar Pradesh in terms of the scheme instituted for the purpose.
- (b) At Bank Rate irrespective of n.l.r.
  - (i) short-term lending to small-scale industries covered by the guarantee of the Credit Guarantee Organisation; and
  - (ii) short-term direct lending to agriculturists.

"In respect of bank advances for food procurement, the Reserve Bank will continue to provide refinance at bank rate up to 50 per cent of the

increase in the level outstanding as on October 30, 1970. Similarly the rediscounting of bills under the new bill market scheme will be at the bank rate irrespective of the net liquidity ratio. The Reserve Bank will consider on merits the provision of discretionary accommodation in exceptional cases at the bank rate to ease liquidity pressure on individual banks arising out of sudden or specially heavy, but genuine, demands for credit for high priority purposes.

"In order to encourage savings and further assist deposit mobilization, the rates of various categories of deposits will be increased, as per the directive issued separately. I, hope that banks would take advantage of this measure and will step up their efforts at deposit mobilisation.

"The success of these measures would depend a great deal on the co-operation and understanding of the banking system and a proper implementation of these policies in letter and in spirit. They should pay still greater attention to proper credit planning and exercise appropriate restraint in their lending operations.

"I intend to have a mid-seasonal review of the credit situation at another meeting with bankers, which I propose to convene in the first half of February 1971."

# High cotton prices are beating India right out of the export market

Foreign exchange may soon become foreign to one of India's biggest exchange earners!

India's cotton textiles bring in foreign exchange to the tune of Rs 120 crores a year. Now all this stands to be wiped out with one fell blow—the blow dealt by the acute cotton shortage and the resulting increase in cotton prices.

In the last three months cotton prices have gone up by 35%; and since January 1967 by about 85%, thereby raising the cost of production of cloth by nearly 40% and that of

yarn by nearly 55%. As anyone knows this must inevitably create an impact not only on exports but also on domestic consumers.

On the international front disaster looms large. We are pricing ourselves right out of the export markets we've nurtured with so much care. No new export bookings are being made. And many mills who have entered into longterm export commitments are faced with heavy losses.

The critical cotton situation is cutting both ways. Because of the

shortage the country is importing cotton—and paying dearly for it. An estimated Rs 100 crores in 1969-70, very much more in 1970-71. Instead of paying out our precious foreign exchange to farmers abroad, why don't we let the Indian farmer benefit? A concerted programme to increase the yield per hectare will benefit everyone concerned.

The fight for export markets is worse than a free-style wrestling match. Does it make sense for India to enter this arena without strengthening her sinews?

# MRL— a record-cracking refinery

Ninth in India, Madras Refineries Ltd. at Manali near Madras is the first all hydrogen and lube integrated refinery.

# 30

Built in just 30 months, with maximum indigenous engineering and materials. And with a foreign exchange cost of only 36% of the total investment.

With a petro-chemical complex and other industrial units coming up around it, MRL heralds prosperity for Tamilnadu and India.

# 2.5

Designed for a throughput capacity of 2.5 million tonnes a year, MRL has 13 major processing units controlled centrally.

# 13

# Rs

MRL has saved more than Rs. 2 crores in foreign exchange. And earned over 1 million dollars by export of Naphtha and Furnace Oil

# \$

On stream by June 1969, MRL today produces Lube base stock (in eleven grades) and elemental Sulphur for the first time in India.

Other products are:

LPG  
(Domestic Gas)

Naphtha

Petrol

Kerosene

High speed and light Diesel Oils

Aviation fuels  
(Turbine & Jet)

Furnace Oil

Asphalt

# If everybody designed switchboards like these maintenance engineers would have a break

But everybody doesn't. So maintenance engineers sometimes touch breaking point. How about you? You have the option to install an L&T switchboard and make downtime disasters a thing of the past. How can you be sure an L&T switchboard won't strike work? It can't. It's completely compartmentalised. You can inspect any section without switching off the entire switchboard. That means easy accessibility. Easy maintenance.

What's more, an L&T switchboard feels at home almost anywhere—in dusty, moist and corrosive conditions. Thanks to effective gasketing and special surface treatment like degreasing, phosphatising, spray painting. And of

course you have other things thrown in when you take an L&T switchboard—things like interchangeability, flexibility, safety, easy extension at site, superb surface finish. But before you write to us, you ought to know one fact about us. We don't expect your requirements to suit our switchboards. We expect switchboards to suit you. That's why we have such a range of standard designs. And that goes for motor control centres as well. But whatever we say, only installing is believing. Once you install an L&T switchboard you'll find it looks after itself so well, you'll think there's a built-in maintenance engineer behind its elegant sheet steel enclosure.

## WHITHER INDIA ?

# TIGER IN A CAGE

V. BALASUBRAMANIAN

THE GROSS National Product has suddenly become a symbol of sin, even like the Golden Calf. Yehudi Menuhin, living in a world of his own where great music is perhaps the only sound he hears, has spoken more in sorrow than in anger of the human race destroying itself by a mindless and soulless pursuit of self-frustrating technological triumphs that destroy morality and beauty as well. John Galbraith, of the earth earthy, has sneered at the enslavement of the twentieth century man by a gospel of consumption which distorts human needs while degrading human effort. Thus the creative artist and the polemical economist have come together to question, in their individual but still strikingly similar idioms, whether the multiplication of human wants and their ever-incomplete satisfaction could be the goal of all organised human activity.

Menuhin's speech was made on the occasion of his being presented the Jawaharlal Nehru Award for International Understanding in New Delhi on November 4. The great violinist was obviously too full of memories of his friendship with Nehru. Naturally, he was sentimental about that man and that friendship. But he was sentimental too about India or rather what he thought was India. He spoke of the Indian peasant as one who might yet redeem a world maddened by the materialism of the West. His dream went like this : "Like Mahatmaji, the rural Indian, having washed his white dhoti drying on the stones by a stream, understands full well that the measure of a man's worth is not the power he wields, but is rather a worth which survives and increases with his nakedness." Perhaps these words or their meaning could be set to music and sound meaningful on Menuhin's violin. But, did this Indian peasant of his imagination ever exist? More relevant still, does he now exist?

"Unlike a large proportion of our Western population", says Menuhin, "the Indian peasant cannot afford suddenly to want what he has never known, he simply must put up with what he has. For never will the billion people of India and China own two cars per family or all die in a hospital."

This sounds reasonable. Or, does it? For every Indian peasant who could die in a hospital, should some thousand Indians be content to die unattended or uncared for in their final illnesses in their hovels or on the streets? Would it be an impertinence on the part of the Indian peasant to ask that medical facilities in this country should improve and that they should not remain what they were in the past when, at least, there were far fewer Indians (because the population was much smaller) needing them?

As for two-car families, there is certainly no danger that the Indian peasant will start thinking in those terms in the near future. As it is, it is only the government in New Delhi which has been clamouring for a people's car. But, then, can the Indian peasant afford not to

want to escape from the drudgery of a bullock-cart economy? Would he be asking for too much if he desired that his goods should move to markets quicker or more economically than on the back of a camel or a mule? Would it be vaulting ambition in his case if he were to hope for buses to take his children to school in nearby towns? In other words, should the Indian peasant live in the twentieth century only in name, a stranger to its opportunities and possibilities? Is it a good enough argument that, because the resources of civilisation have been abused sometimes in some lands, the Indian peasant should deny himself what good this civilisation may do for him?

#### Satisfaction of Appetites

Menuhin mentions "the childish trust in the inevitable rise of living standards for all through industrialisation" and declares that this naive faith "must be exploded for the half-truth that it is." For him the assumption that industrialisation would necessarily improve the living conditions of all "is in large part a myth to perpetuate a still crude technology, which can only make an increasing part of the world impoverished and tributary, compelling it to depend on the satisfaction of appetites which can never be assuaged."

If the Indian peasant is not to put faith in industrialisation and the improvement in farming techniques which it engineers as well as demands, on what else is he to rely for feeding the increasing number of human beings in his family, as well as other families around him? Would India's good earth yield enough for its exploding population if the Indian farmer would merely scratch his land a little more with his feeble plough pulled by famished beasts? Menuhin speaks of "appetites which can never be assuaged." Is it so

difficult as all that to fill empty stomachs when the farmer of today could learn to grow not two blades of grass but twenty where only one grew before? Should men, women and children go half-naked in this century and this decade as though their race had stood still because its Biblical forefathers were admonished to consider the lilies of the field, for "they toil not, neither do they spin"?

"I for one," declaims Menuhin, "will not accept, as the final God-redeemer of India, the noisy, smelly, uncompanionable tractor, which cannot even copulate and reproduce—no Indian temple would have been elevated to this monster."

Alas, this is the trouble with India. The tractors, unfortunately, cannot copulate and reproduce. Scarce resources of capital, organisation and technical manpower have to be invested in their manufacture. But the burdensome cattle of India can certainly copulate, and they do, most obviously, reproduce. So do the men and women of India. They are reproducing and reproducing until they are driving themselves crazy.

#### Next Technological Round

Menuhin advises the Indian people to hold their soul in patience till the next round of technological application arrives, when "the most discreet and elegant solutions will be wedded to age-old practices and forms of life, as already it is happening in Switzerland, where many small villages have a compact unirritating industry a few yards from where a farmer may be restoring his land with the precious wastes, liquid and solid, of his barnyard, as in fact in a little village my wife and I visited near Jaipur, which manufactures a fine quality paper for official requirements."

It is not quite clear whether

Galbraith too shares this vision of a Golden Age written on hand-made paper and wrapped up in unbleached khadi. In fact, it has been seldom easy to discover what Galbraith is for, although there is usually much less difficulty in identifying what he is against. One of the things he is presently against seems to be the Gross National Product. However, although he could always put things in a new way, it is seldom that he has anything new to say. For instance, when in the course of a recent interview he suggested that "the editors of the *Economist* and *The Wall Street Journal*, the archbishops of our economic faith, still hold that St. Peter asks applicants only what they've done to increase the Gross National Product", he was only paraphrasing what was said much more seriously ages ago about the camel and the needle's eye.

#### Not by Bread Alone

That man does not live by bread alone or that cake is not even healthy may be true enough, but it does not exactly amount to a new philosophy or even a new religion. To the extent that Galbraith is only concerned with questioning current patterns of economic and social priorities in the affluent societies of our times, he may be usefully doing for these communities the job of a needed mentor. But there is always a danger that iconoclasts do not destroy only those idols which they set out to destroy. Although Galbraith is far too sophisticated to believe in the idyllic Indian peasant of Menuhin's fancies, he has not been known to be particularly careful about avoiding saying things, or saying things in a manner which might tempt superficial minds to strain their meaning or application. When Galbraith jousts against the GNP, he does not always make it clear that this GNP is western, particularly American. Even assum-

ing that for the United States or West Germany (or Japan which, in Galbraithian terms, is of the western world) it has become more important to know how to spend its GNP better than to increase it still further, for peoples in many other lands, including ours, it is still very much a matter of the poor, rather than the GNP being always with us.

For, let us make no mistake about it. Some of the poorest people that history has ever known now live in our country. The utter destitution of those who dwell in the slums of Calcutta or sleep on the pavements of that city has been advertised all over the world. Such, or at least similar poverty is by no means unknown in other parts of the country. The tribal folk in Orissa or Andhra or the more backward

among the Harijans in many parts of our country have to live with hunger. At least one man or woman in every ten Indians fails to find work for more than 150 days in the year. Even such casual employment as they are able to obtain brings them wages at less than subsistence rates.

#### Basic Necessities Lacking

In two if not three out of four families in our country, parents are unable to provide milk for their children when they are infants a full meal when they are growing up a minimum of clothing when they go to school or sufficient education or training in technical skills before they are sent out into the world to earn their livelihood. For an even higher percentage of Indian families

there never is any hope of being able to provide for the rainy day, whether it be against such contingencies as loss of employment, major illnesses or disablement due to disease or other causes or against normal old age. It is worth noting that the Indian peasant whom Menuhin has idealised for his philosophy of life is no less vulnerable to these built-in hazards of existence in this country than any other section of its population.

Poverty, such as this not only destroys a people physically in due course, but also impoverishes them mentally, emotionally and spiritually here and now. There is perhaps more parental cruelty to children or man's cruelty to animals in this country than in most others. It is doubtful again, that there is as much joy

## Tourism is everybody's business

Tourism is the biggest business in the world today - and the fastest growing. It's already twice the size of the oil industry. It is a business from which everybody profits. From the airline companies and travel agents to the craftsmen in villages scattered all over India. From big hotels and shopping centres to the small traders, taxi drivers, waiters, and so many hundreds more. Italy alone earned \$4,000 crores in foreign exchange from tourists last year. And Spain could easily top that place. She lured more than four million tourists each year!

What about India? It is true that the number of tourists visiting India has greatly increased. From 1,50,000 in 1964 to almost 2,25,000 in 1968. And our earnings from tourism have gone up to Re. 33 crores in foreign exchange. But in terms of world tourism, only one out of every thousand world travellers visited India last year. Yet we have just about everything in this country to make it the world's most attractive tourist destination. We are privileged we have India.

What's missing here? We lack nothing but broad-based public participation and enough of what is known as the "infrastructure" - local accommodation, transport facilities and tourist amenities. For instance, the city of Bangkok alone has more hotel beds available for tourists than we have in India.

And when the jumbo jets... Jumbo jets will soon bring past India more tourists than people than have ever come this way. They will need clean, comfortable accommodation, at least 25,000 more hotel beds are required by 1974. Wholesome, hygienically prepared food, more shops, restaurants, increased facilities... all these are necessary now. Above all, a friendly welcome must await our visitors to make their visit a happy one.

What are we doing about it? The Government is taking an increasingly active part to help build more hotels, improve air and transport services, provide new and better tourist facilities.

But Government effort alone is not enough. Tourism is everybody's business. Because people benefit wherever the tourist travels. Wealth flows from affluent countries to the less affluent, and within the country, from the developed areas to the less developed and from the richer strata of society to the less rich. Everyone benefits from tourism.

So, join us in our efforts. Let us give the tourist the amenities he needs and see that he goes home happy. Each happy tourist means so many more will come next year. Shouldn't it be difficult for us, isn't ours one of the world's oldest traditions of hospitality?

Welcome a visitor and back a friend.

Department of Tourism  
Government of India

difference to or neglect of environmental hygiene or public sanitation among comparable numbers of people anywhere in the world as there is to be found in this country. This particular instance of apathy is only one of the grosser manifestations of our pervasive lack of public spiritedness, the consequences of which are clear in the conduct, for instance, of politicians or the functioning of administration in the India of today.

#### Harsh Fact

It follows that the harsh fact of Indian poverty cannot be refuted by any philosophy, however rarefied. For those who would lead India to a better future there can be no mission more immediate or more noble than that of taking the Indian people out of the morass of this poverty. Prof Blackett, who delivered the first Nehru Memorial Lecture, evidently knew India better than Menuhin. Said Prof. Blackett:

"In rich countries there may be legitimate doubts whether a lower economic growth rate might not be more conducive to human welfare; but I am sure this is not the case in India. The present poverty is so great and the task of dealing with the rapidly rising population is so formidable that in my view almost everything must be sacrificed to economic growth. Economic growth is not everything; but in India today it is almost everything."

These are words which government and industry in this country will do well to inscribe on their respective banners. I am therefore glad indeed that Mr Keshub Mahindra, delivering the presidential address at the annual general meeting of the Associated Chambers of Commerce and Industry, held in New Delhi on December 5, thought of quoting this particular passage from

Prof Blackett within the hearing of Mrs Indira Gandhi, the Prime Minister of India, who inaugurated that meeting.

There can be little doubt that the Indian peasant himself will find more meaning in Prof. Blackett's evaluation of the Indian situation than in Menuhin's idealisation of it. On the cover of this issue is pictured a white tiger from the Delhi Zoo as it was exhibited in the Indian Pavilion

at Expo '70 in Osaka. The Indian economy today is a captive beast, unable to fend for itself through no fault of its own, imprisoned in a cage of obscurantist beliefs and attitudes, sheer political opportunism and simple misdirection of the resources and energies of government. Not inappropriately was the India of today exposed to the world at Osaka through the exhibition of a tiger behind the bars.

## India at the Cross-roads

V. BALASUBRAMANIAN

WHITHER INDIA? This question has been asked so many times that it has become a cliché. Nevertheless, in the particular situation now prevailing in the country, it is legitimate to raise this question again. A country in its course, naturally comes across many cross-roads. This has happened to India often enough in its long and chequered history. Some of these moments, however, have been more important than the others and I personally believe that the cross-roads at which India stands today will have an extraordinary and truly tremendous significance in determining its future.

#### Sense of Direction

Around the middle years of this century, India, newly become independent, began groping towards political stability and economic progress within the framework of a democratic order. It will soon be entering, along with the rest of the world, the third quarter of the present century. Over these 25 years, has India succeeded in achieving a sense of direction in terms of these twin goals?

At some earlier stages of this period, it was perhaps possible to believe that the country was moving more in the right direction than in

the wrong. Around 1960, for instance, a certain degree of optimism could well have been justified. In the area of industrial development, for example, there was definitely a very considerable activation of ideas, aspirations and resources. Although there were undoubtedly a great many lapses in performances for all to see, it was still a fact that India was becoming conscious of opportunities for industrial development and the consequential economic and social wellbeing which the triumphs of science and technology, a new knowledge of corporate management and modern concepts of international co-operation were presenting to peoples of the various countries as the later half of the present century was unfolding itself.

#### Urge for Fuller Life

Thanks, partly, to the personal involvement of Jawaharlal Nehru in the tasks of economic planning and development, the active and very ambitious enterprise of the larger business houses and their leaders, the participation of friendly foreign governments, the initiatives on the part of foreign private capital and enterprise to explore the vast potentialities of the Indian market and a general awakening among the people

# Goods tied up on long journeys cost you money

## Profit from Air Cargo

If you don't use Air Cargo because you think its expensive, you could be cheating yourself. Some of your profits could be lost on unnecessary inventory, warehousing, packaging, labour and insurance.

Air cargo is not as costly as it first seems, because transport costs are not really a true indication of these total distribution costs. Also, because air cargo gives you faster delivery, you get a faster sale and a faster return on your investment.

Customers are impressed, further orders are encouraged. Suddenly new markets are opened to you.

Now, if your particular product or market won't allow a complete switch to air exporting, you still needn't risk losing orders through late deliveries.

You can take advantage of air cargo's speed with BOAC's Air/Sea Mix Plan. You send the bulk by sea, but build an allowance into your costing system to use air in emergencies. The extra cost is offset by spreading it over every unit you export.

Discuss the potential of air cargo exporting with your local BOAC Cargo Office. You owe it to your profits.

**BOAC**  
**CARGO**

## ONWARD MARCH OF DELHI ADMINISTRATION SERVICE TO THE WEAKER SECTIONS OF SOCIETY (Achievements of Last 3½ Years)

- \*\* Nine-fold increase in expenditure on uplift of Harijans.....
- \*\* Doubling of Expenditure on Rural Planning.....
- \*\* Programme of distributing 90,000 bighas of land to 15,000 landless peasants.....
- \*\* Distribution of 20 lakhs of rupees to Harijans for housing....
- \*\* 3,800 plots of land leased to Harijans....
- \*\* A Plan of Medical Care through 112 dispensaries for the benefit of the under-privileged sections of society at a cost of Rs. 10 crores....
- \*\* An expenditure of about a crore of rupees for the improvement of Harijan colonies and khatras....
- \*\* Construction of 6,000 single unit houses for scavengers, labourers and other workers in lower income groups..
- \*\* Provision of book banks, study centres and evening schools for poor students.

*Lend your hand of cooperation to increase the prestige of Delhi City.*

*Issued by:*

**Public Relations Directorate, Delhi Administration**

### Need a helping hand ?

Come to THE VYSYA BANK. We're big enough to offer timely assistance, yet not too big to take a personal interest in your dreams and aspirations. If you require financial assistance to start a new enterprise or to expand an existing one, to modernise your farm, we have several schemes to suit your needs.

The status of your account—big or small—is immaterial to us. You can always be sure that we extend our helping hand. We pay high rates of interest on deposits, too.

to the need for material progress as a condition of a fuller life, this country did seem to have committed itself in the late fifties and the early sixties to an expansion of its economy as a primary national objective. Looking back, this all too brief a period of a few years strikes me as a precious and promising moment in the history of India since 1947, which had great potentialities for the progress of our country.

### A Passing Phase

Unfortunately, this turned out to be a passing phase and since the middle sixties, at any rate, this country has been drifting both in political and economic terms as a ship without rudder or compass. The only area where any forward movement has taken place in this generally depressing period is agriculture which is, clearly, a very considerable part of our economy. It must be conceded of course that the government's new agricultural strategy was an effective contributor to this advance on the farm front. India's farm technology took a giant leap forward, particularly in the area of wheat cultivation and especially in the region of Punjab, Haryana and parts of Uttar Pradesh. The programme for the breeding, multiplication and propagation of improved strains of wheat scored remarkable progress in northern India, while here as well as in other parts of the country, notably Gujarat, Maharashtra, Andhra Pradesh and Tamil Nadu, the intensive application of chemical fertilizers, accompanied by the adoption of modern cultural practices, has had an extensive impact on crop yields.

It is well to remember, however, that the success of the new agricultural strategy was due to a large extent to the favourable economic environment in which it could go to work. It is not as generally recog-

nised that a good part of the stagnation in agriculture, which this country had witnessed since the middle fifties and until the breakthrough in the later sixties, was due to the fact that the prices of foodgrains particularly were being kept low in absolute terms as well as in relation to other prices. With population advancing more rapidly than the output of foodgrains, the country had to face recurrent shortages of food which were aggravated by periodical failures of crops due to lack of rainfall in some years or in some parts of the country or floods in other years or in other parts of the country. This situation was further complicated by inefficient controls and governmental restrictions on the marketing and consumption of foodgrains.

### Unannounced Change

Fortunately, from the middle sixties, there was a gradual and largely unannounced change in this adverse economic environment. The government's price support programmes for foodgrains became more and more realistic and the country slowly got accustomed to the idea that foodgrain prices had to be allowed to rise to levels which would be more in conformity with other categories of prices in the economy. It is not too much to say that it is this agricultural expansion which has kept the economy going in the later sixties when there was an otherwise general depression in economic activity, particularly in the industrial sector.

As the nation is moving into the seventies, it is becoming increasingly clear that good as this performance in the agricultural sector has been, it has its limitations, some of which are serious. Broadly speaking, the country is now in a position to feed itself in years of more or less favourable monsoons without undue dependence on imports of foodgrains.

At the same time, the output of rice which is the larger food crop in the country is yet to reach a comfortable balance with the requirements of those sections of the population whose consumption of cereals is mostly in the form of rice. As has been mentioned earlier, the breeding and propagation of improved strains, which has been the driving force behind the green revolution in the country, has been remarkable mainly in the case of wheat, so much so this green revolution is being defined as a wheat revolution. Although research has made some advance in the evolution of improved strains of rice, there is still much to be done, both in the way of refining these strains to suit local cultural conditions and in the direction of popularising superior rice strains among the farming communities. As a matter of fact, the extension of the green revolution from wheat to rice is now accepted as one of the priority purposes of agricultural planning in the immediate future.

### Important Gaps

There are several other important gaps in the agricultural sector which need to be urgently filled up. It has been noticed, for instance, that the output of pulses, which are an essential ingredient in the diet of a people whose intake of protein needs to be greatly improved, has been lagging behind the minimum requirements of an increasing population. The green revolution has hardly touched these crops. Of even far greater prominence have been the deficiencies in raw cotton and edible oilseeds. One of the country's major industries, viz., the textile industry, is now facing a critical shortage of raw cotton. It has been claimed that enough research has already been done to enable the farmer to double the yield of the cotton crop and that the bottleneck now is the absence of funds and organisation for extend-

**VICTOR CABLES ARE**

PHONES : 561284 - 562612 CABLE : "VICTORCABLE"

PAM/VC/48

December 25, 1970

ing the benefits of this research to the actual operations of growing cotton in the fields. The case of edible oilseeds is somewhat different. Here there is a basic deficiency in research and indeed very little attention has been given to the evolution of high-yielding strains of groundnut or other oilseeds. So far as the foreseeable future is concerned, reliance has to be placed on better cultural practices, particularly the application of irrigation, for increasing the production of edible oilseeds. As it is, the shortage and consequential high prices of oilseeds are among the more serious pressures acting on the general price level and the cost of living in the country.

#### Competitive Position Undermined

Jute, again, is another agricultural raw material, like raw cotton, which is in short supply. Although in a particularly good year this country may grow enough of this fibre for the requirements of its jute industry, in at least three out of five years there tends to be a shortfall of the crop. The fluctuations in the availability of raw jute leading to fluctuations in its prices have greatly undermined the competitive position of India's jute industry in world markets. It follows that, even in the case of agriculture, where the late sixties have seen considerable progress, the advance has been limited, in the main, to wheat. Much leeway thus remains to be made up in respect of other foodgrains as well as the agricultural raw materials needed for two of the nation's major industries.

When such is the case even with agriculture, which has been our only growth sector in recent years, there is really not much to be said about growth in the rest of the economy. In fact, ever since the devaluation of the rupee in 1966, the process of industrial development in the coun-

ANNUAL NUMBER 1971

1965

try has become listless. It is possible to argue that devaluation had at least brought some short-term gains to some of our export trades. But it has been quite clear that, so far as the industrial economy as a whole is concerned, devaluation has only added to its long-term problems by encouraging a cost-push inflation within the country. In combination with the protected market created by a continuous shortfall in the production of consumer or other goods, the after-effects of devaluation on the cost of domestic manufactures as well as imports have aggravated the wastages and inefficiencies in the functioning of our sheltered industrial economy. This unhealthy situation is deteriorating further as a result of a widespread surge of agitation, often politically motivated, among organised labour. Although the rising cost of living has provided some legitimate justification for demands for higher wages and even strikes to back up those demands, it has been clear enough that the main motivation for the industrial unrest has been from outside the area of normal trade union activity.

#### Basic Weaknesses

It is true, of course, that, superficially the country's industrial structure has expanded and diversified. But those observers of the Indian economic scene who may be inclined to deduce from this that there has been a qualitative as well as a quantitative advance of significance in our industrial economy do not seem to realise that there are still far too many basic weaknesses in our infrastructure. I have already indicated the grave lacunae in the country's growth performance, the green revolution notwithstanding. Elsewhere in this issue are discussed the deficiencies in the development of the important sectors of power and transport, both in terms of what has been done

in these fields and in the light of what the Planning Commission or the central government is planning to achieve in the coming years. If, for the time being, there appears to be an equilibrium between demand and supply in the areas of transport or power, this is largely because of the stagnation in industrial or general economic activity during the later sixties.

#### Local Bottlenecks

Moreover, although the national balance-sheets for transport and power may present an appearance which is currently not uncomfortable, there is the much less reassuring reality of local bottlenecks or regional shortages of power or transport facilities. With the government having been forced to slow down the pace of further investment in rail or road transport, whether due to lack of resources or because of the prevailing inflationary conditions, it is very much on the cards that, in the event of there being even a marginal upturn in economic activity, shortages will promptly emerge in the field of transport facilities. As for power, there is little doubt that, due to a series of acts of commission or omission, amounting to criminal negligence on the part of those authorities in the government who plan or manage our oil policy, the country is heading straight towards a famine in petroleum products in the foreseeable future.

Right now, however, what is causing grave anxiety is not these prospects of a developing transport and power shortage but the actual and present fact of a shortfall in the supply of steel. Our steel development programme has been so inadequate and inefficient that the entire steel industry in this country is at present unable to provide an additional quantity of even one million tonnes which may serve to meet some of the

urgent but unsatisfied needs of export industries or essential domestic consumers. This critical steel shortage utterly discredits the entire concept of the apparatus of steel planning over the last 25 years. It is worth noting that to the meagre starting capacity of about 1.5 million tonnes of finished steel, the country had been able to make a firm addition of only another three million tonnes or so over a period of three five-year Plans. Here is a shocking revelation of how grievously the so-called planned economic development of our country has been falling behind any acceptable norm of growth for a people whose number has increased

from about 315 million to 550 million in a period of two decades.

I had sketched earlier the grim dimensions and depth of Indian poverty. What is most frightening about this poverty is not even its absolute massiveness, but its inexorable intensification in the context of, first, the passage of time, secondly, the growth of population, thirdly, the advance of science and technology in the wide world which has helped so many countries to improve their material conditions and, finally, the meagre development effort of our five-year Plans. Whither India? What is to be the answer? Down the Gadarene slope?

## Will We Survive In Strength?

V. BALASUBRAMANIAN

IN THE present circumstances of our country it is surely permissible to be pessimistic about its future. The population should approach the billion mark in another 20 years. The nation and the government are no doubt committed to policies and programmes of family planning and population control. It would be easy to belittle what has been done in these areas of effort, but it would be irresponsible to do so. There has undoubtedly been an awakening among the people of the importance to the individual household as well as the nation of families being limited by the practice of contraception. The ideal of a small family has not only been accepted but is being acted upon by middle class families, particularly in the urban areas. All the same, it is becoming increasingly clear that the practice of limiting families by contraception will take time to make a real impact on the size of the rural population. As it is, the birth rate is not falling fast enough in comparison with the fall in the mortality rate. As a result,

the rate of growth of population is being slowed down only negligibly. In practical terms, the problem of steadily increasing numbers will be with us for the next 20 years at any rate.

This would mean that at least 10 million new jobs will have to be found every year for absorbing the increases in the working population. As against this, the total of employment outside the agricultural or craft sector is probably not more than 20 million jobs at the present time. Would it be unreasonable to suggest that India, with its meagre infrastructure and an even leaner base of capital goods as symbolised by production of about five million tonnes of finished steel, will not be able to meet this challenge of employment unless a revolution takes place in its concept or practices of industrial growthmanship?

The tragedy of this country is that there are at present very few among its political leaders who are even remotely conscious of the need for such a revolution. No political

party, including the party now in power at the centre, has even attempted to grasp the dimensions of this problem of industrial growth which confronts our people. Indeed, there is reason to believe that the Planning Commission, which has been half-heartedly toying with notions of perspective planning, has for all practical purposes given up evaluating the growth needs of the country because this exercise has been found to have forbidding implications.

For instance a country with a population expected to be about a billion in another 20 years would need to produce at least a hundred million tonnes of steel by that time if it were to provide gainful employment to this increased population at a level of wages which would ensure a standard of living not far lower than what many countries, not particularly affluent, are enjoying even today. But can India which could manage to increase its production of steel from 1.5 million tonnes some 25 years ago to only about three times that small amount now, dare to think in terms of such awesome possibilities as a hundred-million-tonne steel industry in another 20 years?

### Tactics of Evasion

Quite evidently, the politicians and the planners find it not merely convenient but necessary to discourage such trains of thought in themselves or others. But, then, can India survive through such tactics of evasion? Whether we like it or not, we have got to face the fact that this country, which has most of its 550 million people living in abject poverty, can avert the disaster of Malthusian proportions which threatens to be its lot in another 20 years, when its population would be double what it is now, only if, in the meanwhile, there has been a tremen-

dous acceleration in the pace of industrialisation.

Even the politicians, obsessed as they are with the next general election, cannot indefinitely shirk this issue. Unfortunately, before they have been actually brought to face this reality they could do immense harm to the country. As I had suggested earlier, none of the political parties has either the urgent awareness or the great daring and imagination needed to grasp the nature and size either of the economic crisis or the economic challenge. Right now they are engaged in exploiting petty issues for sectional ends. The ruling party at the centre has been the greatest sinner in this respect, particularly after the split in the Congress organisation. Looking back over the last 20 months or so, it could be said that the present central government has done nothing that is positive or constructive in terms of preparing the country for the immense task of industrialisation which it must attempt if it is to survive. The nationalisation of banks has not only wantonly dislocated the functioning of an important institution in the economy but has precipitated a flood of irresponsible impulses in the nation, encouraging the ill-informed or the uninstructed to believe that income or wealth could be obtained without disciplined effort or hard work.

#### Perverved Attitudes

As a result, the people's attitudes to work and discipline have been perverted and the mood has been created among the workers that to labour at one's job is to permit oneself to be cheated for the benefit of a few. The country, in other words, has become a victim of demagogy of a kind which is dangerous and could be destructive in its present circumstances. A

specific technical effect of this development is the revival and upsurge of inflationary forces. A more basic consequence is the further and very serious deterioration in the fundamental ability

of the country to gear itself to the large effort needed for it to achieve even the minimum rate of economic growth which is essential for its survival in strength and with honour.

## For the Sake of Its Future

V. BALASUBRAMANIAN

THERE is little doubt that this country will have a future worth the name, only if its political parties turn over a new leaf. I am referring here only to those political parties and politicians who are faithfully wedded to the democratic system of government. As for the rest, which are truly outside the pale, there is clearly no legitimate role for them to play in the politics or public life of our country.

#### Divisive Forces

One of the first tasks of those political parties which would want to serve this country and its people loyally would in fact be to identify those political forces and influences in the country which are antagonistic, openly or otherwise, to its democratic order, isolate them and push them out of the mainstream of national life. The divisions and subdivisions in the communist movement in our country have served to confuse the public about the true and precise frontiers of the anti-democratic spread in our national politics. One rather odd result is that the Communist Party of India has been almost successful in presenting itself as a legitimate political force eligible for functioning within the four corners of a democratic constitution. To such an extent has this process of falsification succeeded, that people do not hesitate to believe that the Prime Minister's party may make common cause with the CPI when contesting the next general election.

I am firmly convinced that this

country cannot hope to be able to pursue programmes for sufficiently rapid economic development unless it breaks off definitely and completely with the communist movement in its entirety. While such sections of the communist movement as may be preaching or practising violence as a means of overthrowing the Constitution should naturally be dealt with as an issue of law and order or a threat to national security, other sections of it, which may be playing the Constitutional game only for the purpose of subverting the Constitution from within should be relentlessly pinned down and exposed as alien political forces with which no genuinely democratic political party can have any dealings. One of the virtues of the next general election could well be that it may help our people to recognise which among the various political parties professing to be democratic are really democratic in terms of their reactions or responses to overtures from any section of the communist movement.

#### Discouraging Communalism

Second only to the importance of isolating and excluding all sections of the communist movement from our political life is the need for all democratic political parties coming together to discourage communal influences in politics. From this point of view, the willingness of the official Congress party and the Swatantra party to associate themselves with the Jana Sangh against an alliance with the Prime Minister's

### PER CAPITA AVAILABILITY OF SELECTED ARTICLES OF CONSUMPTION: 1950-51 TO 1968-69

\*Relates to calendar year

Note: For foodgrains the figures relate to per capita availability per day.

December 25, 1970

party or the communist movement is a welcome development. Historically, the Jana Sangh has been born as a political party out of a certain communal ideology. Over the years, however, it has been forced to develop a broader outlook and emphasize increasingly certain socio-economic beliefs which are essentially of a non-communal kind. By inducting the Jana Sangh into a larger political fold, the official Congress and Swatantra may help to complete this very desirable transformation in the character of that party.

#### Muslim Communalism

As against this gain, we have to reckon with the fact that an attempt is being made in some quarters to promote artificially the politics of Muslim communalism by deliberately encouraging certain existing Muslim political organisations to develop militant communal or even separatist attitudes. The Prime Minister's party, for instance, has been suspected—not without reason—of having been active in this extremely regrettable manner. Any tendency for Muslim communalism to revive or assert itself is bound to lead to a situation where Hindu communal tendencies may be tempted to over-react. Such developments are bound to detract from the national development effort in the same manner as violence precipitated by communist subversive activities. It follows that besides isolating and throwing out of our political life the forces of the communist movement, the political parties which are genuinely democratic should also come together to discourage sternly any attempt at reviving communalism as a political force or factor.

The weeding out of communism and communalism is an essential but, still, a negative aspect of any operation to save India for the future. The more positive aspects

ANNUAL NUMBER 1971

1071

of this task would be represented by efforts to bring into the mainstream of a national constructional effort such sections of the community as have become estranged or even alienated largely as a result of the politics of adventurism and opportunism in which various parties have been indulging for some time now. High on the list of priorities in this context would be an attempt on the part of political and government leaders to rebuild their shattered bridges of credibility and confidence with the business community.

In my view, one of the basic weaknesses of our economy at present is that, thanks to the pressure tactics of self-aggrandising political leaders, the business community has been made to feel that it is unwanted and regarded as expendable. The demagogues in our midst seem to have been acting in the belief that the weaknesses of a democratic system could best be exploited for their own benefit by stirring up sectional suspicions, jealousies and rivalries. Nowhere have they been employing these tactics of 'divide and rule' more relentlessly and ruthlessly than in the economic field.

#### Stirred up Passions

While the passions and prejudices of the people in a very poor country have been stirred up against the business community as such and the view has been propagated that industrialists and merchants are essentially exploiters of the weaker sections of the public, attempts have also been made to spread the poison of mutual suspicion and jealousy within the business community itself. Thus, conflicts of interest have been created and promoted between the small-scale sector and the large-scale sector, the decentralised sector and the organised industry, the small or middle entrepreneur and the big entrepreneur and among the big

entrepreneurs themselves, between the large business houses and those which are larger. This insidious importation of politics into business has destroyed the homogeneity of the business community, robbed it of a common philosophy or purpose, converted it into a demoralised suppliant before the seat of authority and thereby greatly weakened its orientation or capacity for playing a dynamic role in the economic development of our country.

#### Sterile Controversies

As a result, instead of there being a relationship of consultation and co-operation between government and business, there has merely been an unending series of sterile controversies, thwarting positive activity. Mouthing cheap socialist slogans about the concentration of economic power or wealth, the unscrupulous practitioners of the politics of opportunism have effectively prevented the rich and varied human resources of initiative and enterprise which must inhere in the vast and experienced business community of our country from participating freely and vigorously in our industrial expansion. Efficient and successful industrialists, business houses or corporations, who or which have struggled against odds to expand and diversify our industries and thereby successfully established their entrepreneurial worth, are now being sought to be "Cabin'd, cribb'd, confin'd" merely for the reason that they have grown with the growing economy of the country.

A natural extension of this political animus against domestic capital and enterprise has been the antagonism to foreign private capital and enterprise. In an age of global advance in technology and business management, our adventurist politicians, in their criminal selfishness and shortsightedness, have denied

to our country legitimate access to international availabilities of capital, technical know-how or business expertise. Although it must be obvious to anyone, with the least awareness of the gap between the country's current capacity to save and its need of capital or of the colossal call which a struggle against a poverty of Indian dimensions must make on business or technological leadership, that our country can attempt development seriously only by enlisting external resources on a grand scale, government policy has been to treat foreign capital and enterprise as, at best, a marginal element of doubtful value.

#### Strict Limits Imposed

As a result, the nation has been avoidably condemned to labour its economic growth within the very strict limits imposed on it by its basic poverty and therefore its low capacity to save and invest. This unwholesome and ugly situation in which the business community, which should normally be among the natural leaders of any forward movement of economic growth, is being treated by the politicians either as a prisoner or as an outlaw should be changed without further delay if the nation's rapid course towards an accentuation of its poverty is to be arrested or reversed.

The first step in this direction would be for the government of the day to abandon forthwith its policy of putting a check on further activity by the large or larger business houses. Mr J. R. D. Tata has rightly pointed out that to deny a business house or a company the right to expand merely because it is alleged to have become big is to import a gross political prejudice into the management of our economy by the government. The proper criteria to apply to an enterprise in evaluating its claim to grow could only be,

as Mr Tata explained, a company's past record of achievement, its pricing and labour policies, the level of its professional and managerial competence, its promotion of small-scale and ancillary industries, its export performance, its research programmes, its freedom from political intrigues and its contribution to the common good. The objection, in other words, is not to the government seeking to evaluate the worth of individual industrialists, business houses or company managements, but to its attempting to do it on irrelevant and often grossly malicious grounds. The community or, as one of its representative institutions, the government of the day, is entitled to judge the business community, even as any other section of the people, on its performance in terms of contribution to the nation's economic development on proper lines, but not in the light of arbitrary concepts or considerations of a partisan political nature.

#### Foreign Private Capital

In the same manner, the legitimacy of foreign private capital and enterprise playing its part in promoting our national economic growth should be assessed in the context of the contribution it may be able to make towards relieving poverty and increasing employment as fast as is necessary for this country to survive. Business leaders, such as Mr B. M. Birla, who certainly cannot be ac-

cused of any lack of confidence in the capacity of the Indian business community to work vigorously for the industrialisation of the country, have plainly and frankly conceded the need for the massive association with our own domestic effort of the resources of foreign capital, enterprise, technology and business management.

#### Spelling Out Mandate

Some days ago, Dr Seymour Wolfbein of Philadelphia, an educationist and specialist in manpower problems, said in Madras that only "a deliberate policy of stimulating economic growth" could help this country and its government in dealing with the problem of growing unemployment. The idea that the Indian economy should be forced to grow if its people are to have any future at all is inexorably gaining ground among thinking people at home and abroad and the tribe of mere politicians may ignore this truth only at its peril. At the time of writing, ministers, members of Parliament or state legislatures and the like seem to have time or thought only for the next general election. Even so, it is doubtful that they realise well-enough that elections are fast ceasing to be party games. Let us hope that when the people go to the polls, they will spell out their mandate in a language which the politicians will understand and must obey.

## RECORDS AND STATISTICS

*A Quarterly Bulletin of "Eastern Economist", this publication surveys important developments in each quarter in the various fields of the national economy as well as in the world economy, organizes its material in a convenient form and illustrates it with diagrams, graphs and charts. Its features are a business roundup, an analysis of markets and an investment supplement.*

*The Bulletin averages 64 pages and is priced at Rs 4 per copy. The annual subscription is Rs 16.*

*Inquiries regarding subscription and advertisements may be addressed to:*

## TWO CASE STUDIES

# Energy : The Developing Crisis

R. C. UMMAT

## I

THE ECONOMIC development of our country has not only progressively raised the requirements of energy but also brought about three other significant changes in our energy pattern. As against a total of about 184.5 million tonnes coal equivalent energy consumed in 1953-54, the country used up nearly 241.9 million tonnes coal equivalent energy in 1960-61. Currently, our consumption of energy is around 360 million tonnes coal equivalent.

In 1953-54, non-commercial fuels—dung, firewood, and vegetable waste — accounted for approximately 68.2 per cent of our total energy consumption. The rest of the requirements — nearly 31.8 per cent — were met by commercial fuels — coal, oil and hydro-power. The share of non-commercial fuels declined to about 60.4 per cent by 1960-61. Currently, they account for just about half of the aggregate consumption of energy. This means that commercial fuels, apart from meeting the energy requirements of agriculture, industry, transport, etc., are increasingly being used to provide domestic energy which till the early 1950s was being primarily supplied by non-commercial fuels.

The second major change in our energy pattern has been that, among commercial fuels, the relative importance of the various sources of energy has undergone appreciable change. The contributions of coal, oil and hydro-power — which in the early 1950s were the three main commercial sources of energy — were 18.5, 11.9 and 1.4 per cent, respectively, of the total energy consumption in 1953-54. By 1960-61, the contribution of coal went up to 20.8 per cent and that of hydro-power to 2.8 per cent. The contribution of oil by that year went up to as much as 16.2 per cent. Currently, nearly 19.4 per cent of our total energy requirements are being met by coal. The contributions of oil and hydro-power, on the other hand, however, have increased further to 23.4 per cent and slightly over four per cent, respectively. Three other fuels have also been introduced in the 1960s as sources of commercial energy. These are lignite, natural gas and nuclear power. Their contribution, however, is still modest. Lignite accounts for nearly 2.5 million tonnes coal equivalent energy. The only source of nuclear power on a commercial scale at present is the Tarapore power station having a capacity to produce 380,000 Kws electricity. Natural gas is being utilised for producing electricity to a modest extent at Dhuvaran in Gujarat and Nahorkatayia and Uttran in Upper Assam.

The third important change that is taking place on the energy scene is the growing importance of secondary energy in the form of electricity and manufactured gas. The use of electricity went up from about four per cent of the total energy consumption in 1953-54 to as much as 7.7 per cent in 1960-61. Today, electricity accounts for nearly 15 per cent of the total energy consumed in the country. Manufactured gas, which accounted for approximately 0.7 per cent of the total energy consumption in 1953-54, currently accounts for nearly three per cent. In 1960-61 its contribution to the total energy consumption was about 1.7 per cent.

## II

The comparatively easy situation on the energy front in most parts of the country currently may suggest that the growth of energy has kept pace with economic development.

But this has hardly been the case. The acute scarcity of coal around the turn of the sixties is too fresh to be forgotten. Subsequently, various parts of the country have been experiencing shortages of energy quite often. Even today several areas, especially in north and west India, are experiencing fairly acute shortage of power, which has not only necessitated cuts in supplies to industrial units but has also delayed energising of irrigation pumpsets in the agricultural sector.

Another important fact that ought to be taken note of while assessing whether the pace of growth in energy supply has been commensurate with the needs or not in that the rate of growth of the economy went down a great deal after 1965-66. Though it has somewhat picked up during the last two years, it still remains, particularly in the industrial sector, much below not only the planned targets but also much lower than the rate witnessed in the nearly 1960s. The major factor for the comparatively comfortable energy situation at present in most of the states, thus, is the slow growth of the economy and not that the augmentation to energy supplies has been satisfactory.

#### Lagging Targets

Right till the mid-1960s, the growth in commercial energy supply left much to be desired; the accomplishment in this field lagged considerably behind targets. For instance, during the first two Plan periods, the total installed capacity for generating electricity increased to only 5.70 million Kws, as against the 1960-61 target of 6.94 million Kws. The shortfall from targets was not only in the case of hydro but also thermal power. Of the 5.70 million Kws installed power capacity in 1960-61, hydro-power accounted for 1.93 million Kws and thermal power for 3.77 million Kws. The respective targets for the two sources of electricity generation for that year were 3.06 million Kws and 3.88 million Kws, respectively. During the third Plan period, the installed capacity for the generation of electricity, which was to be in commercial operation in 1965-66, was to be of the order of 12.69 million Kws. The hydro-electricity generation capacity was to be raised to 5.10 million Kws. The capacity for producing electricity from coal was to be raised 7.08 million Kws. A small quantity of power was proposed to be generated from oil and gas — to the extent of 0.36 million Kws. Beginning had also to be made for producing nuclear energy to the extent of 0.15 million Kws. Actually, however, the installed capacity in 1965-66 did not exceed to 10.17 million Kws. In this year also the shortfall was not only in the case of hydro-electricity and thermal power, but also the nuclear power station at Tarapore, in Maharashtra, which was to be set up during the Plan period, could not be completed according to schedule.

As regards coal, production lagged behind targets all through the first three Plan periods by a wide margin. The second Plan aimed at raising production to 60 million tonnes by 1960-61. The actual production in that year, however, was 54.62 million tonnes. When the third Plan was drawn up, it was estimated that the requirements of coal would go up by 1965-66 to as much as 97 million tonnes. Subsequently, this target was first reduced to 87 million tonnes and later on to 78 million tonnes. The actual production of coal in 1965-66, however, did not amount to more than 65 million tonnes.

In the case of petroleum, though a good beginning has been made in the first Plan period with the setting up of three

Subsequently, this target was first reduced to 87 million tonnes and later on to 78 million tonnes. The actual production of coal in 1965-66, however, did not amount to more than 65 million tonnes.

In the case of petroleum, though a good beginning has been made in the first Plan period with the setting up of three

## WHAT, WHEN, WHY AND HOW?

As far as fertilizers are concerned, we answer all these questions, so that the farmer gets the best out of the vital inputs.

The Fertilizer Corporation of India Ltd., has a massive agricultural research and fertilizer promotional set up for rendering door-step services to the farmers. Through its extensive field network guided by an expert group of scientists located in the P & D Division, Sindri, the farmer is educated in the correct choice and application of proper quantities of fertilizers. The F.C.I. organises over 15,000 fertilizer demonstrations per year in the farmers' fields to educate them in maximising crop yields and farm income by the correct use of fertilizers. The programme is supplemented through organisation of fertilizer festivals, field days, farmers group discussions and display of posters and charts.

For recommending correct dosages of fertilizers based on soil test recommendations over 4 lakhs soil

samples are tested annually in the Corporation's laboratories spread out at Namrup, Durgapur, Gorakhpur, Trombay, Kolhapur and Sindri, free of cost, tailored with six mobile soil testing vans to penetrate to the remote villages.

The nucleus of agricultural scientists at Sindri are provided with complete backing facilities for handling any research problem related to soil fertility through the use of sophisticated facilities, like radio isotopes laboratory, atomic absorption spectrophotometry, temperature controlled glass houses and extensive experimental farms.

**FCI**

**OF INDIA LTD., NEW DELHI.**

new private sector refineries—two at Trombay and the third at Vishakhapatnam—based on imported crude, which augmented the refining capacity in the country from just about 0.4 million tonnes at Digboi (Upper Assam)—that was based on indigenous resources of oil—to nearly 3.62 million tonnes and oil had been struck in fairly substantial quantities at Nahorkatiya, the progress in the subsequent two Plans failed to correspond to the targets laid down in these Plans. As against the target of raising the refining capacity to 4.31 million tonnes by 1960-61 and 10.77 million tonnes in 1965-66, the actual capacities in 1960-61 and 1965-66 were of the order of 3.62 million tonnes and 8.05 million tonnes, respectively. The production of crude oil, similarly, lagged much behind expectations. The result was that we had to depend right up to the mid-1960s to an overwhelming extent on imports of crude oil and to a substantial extent on imports of refined petroleum products.

The reasons for the above lags in the growth of energy supply are not far to seek. So far as electricity is concerned, the shortfall in the attainment of targets during the 1960s was due to the foreign exchange difficulties that arose in the mid-1950s and inordinate delays in the execution of some of the major hydro-electric projects. As regards coal, there were difficulties of having adequate additional machinery for installation, again thanks to tight foreign exchange situation—at that time, we did not have any significant capacity to manufacture coal mining machinery. Another factor which hindered the growth of coal industry, especially during the second and the third Plan periods, of course, was the slackness in demand, specially because of the delays in fully commissioning the three public sector steel plants which had been established in the mid-1950s.

In so far as petroleum is concerned, the dogmatic approach of the government, has been primarily responsible for its

slower-than-warranted growth. Even though the Industrial Policy Resolution of 1956 was flexible enough to allow the private sector a useful role in the development of the oil industry, Mr Malaviya's dogmatic approach not only delayed the exploitation of the Nahorkatiya (and later on of Moran) oilfields but also gave a setback to oil exploration in general at least to some extent, notwithstanding the smile of dame fortune on the Oil and Natural Gas Commission in the initial years of operation of this public sector undertaking when it struck oil in Gujarat area. The expansion of the refining capacity during the second and the third Plan periods also got stultified due to the anxiety of the government to build up public sector in this line of activity to commanding heights at the earliest. The government successfully stalled any large-scale expansion of the private oil refineries, but the public sector refineries at Noonmati, Barauni and Koyali, too did not come up according to their original schedules. The Noonmati and Barauni refineries also experienced prolonged teething troubles.

### Eased Situation

The present easing of the situation on the energy front started towards the close of the third Plan period, when due to withholding of economic assistance by Aid-India Consortium following the Indo-Pakistan hostilities in September, 1965, and the two successive severe droughts in 1966-67 and 1967-68 gave a big blow to industrial activity. The growth in demand for energy during these years slackened considerably and even modest efforts at augmenting services of energy, which continued after the third Plan through annual Plans for three years, helped in energy supply catching up with demand.

With the revival of economic activity towards the end of 1968, the demand for energy, however, again started growing at a rapid pace, but shortages did not develop except temporarily in most parts of the country. The slow industrial

**Indian  
farmers'  
FIRST  
choice**

Massey-Ferguson 1035 tractor is the Indian farmers' first choice. There are more firm orders for Massey-Ferguson 1035 than any other tractor produced in India. It is because Massey-Ferguson 1035 tractors have proved over the years most suitable for Indian conditions and are backed by country-wide dealer organisation with the most comprehensive after-sales service.

Indian farmers are fully convinced that Massey-Ferguson 1035 tractors are the best value for their money.

**STAFE**

Madras

growth during the current year, the reasons for which are too well known to be repeated here, has also been a contributory factor to the easy availability of energy at present except in certain areas of north and west India.

### III

It would, however, be erroneous to assume that the energy supply position will continue to be easy during the current Plan period and thereafter. Once economic activity picks up to the extent warranted in terms of the fourth Plan targets, it can well be expected that fairly acute shortages of energy will develop. This is because the progress on the energy front during the first two years of the current Plan has not been any spectacular. Moreover, a number of problems are cropping up which may hinder the growth of energy supply even to the extent envisaged in the fourth Plan document.

Take first coal. Although the target for raising the production of this energy source by 1973-74 (Table I) has been reduced in the fourth Plan document to 93.5 million tonnes from a little over 100 million tonnes level which was worked

out by the 1968 Planning Group on Coal, on considerations that the growth of consuming industries in 1968 and 1969 had been slower than what had been envisaged by the Planning Group, the last year's output was 74.5 million tonnes. This year we may be producing just about 70 million tonnes of coal; an indication to this effect was given by the Minister for Petroleum, Chemicals, Mines and Metals, Dr Triguna Sen, at the recent meeting of the Coal Advisory Committee.

The tardy progress of industrial activity during the current calendar year may prompt some to argue — in fact, it has already set the union Department of Mines athinking — that the 93.5 million tonnes production target for coal under the fourth Plan is too ambitious and therefore it ought to be somewhat lowered. But if note is taken of the fact that the current slackness in the consumption of coal is due, besides the faltering growth in industrial activity, particularly in the steel sector, to transport bottlenecks over the last few months on the central, eastern and south-eastern railways, any large reduction in the target can be ruled out. A new factor in the situation that, however, may compensate to some extent the

All over the world he is the same. A hard nut to crack. Knows just what he wants...Exacting quality...Absolute precision. With NGEF, the tougher he comes, the happier he goes.

NGEF electrical equipment are sturdy. Reliable. Guaranteed to give smooth performance in all climates...From torrid Middle-East to snow-capped Europe.

In collaboration with AEG Telefunken, NGEF undertake turn-key electrification for Paper Mills...Fertilizer Plants...Refineries...In fact any industrial project.

NGEF's range includes: Distribution transformers upto 1600 kVA, 33 kV. Power transformers upto 40 MVA, 132 kV.

■ Furnace transformers ■ Rectifier transformers ■ H. T. & L. T. Circuit breakers ■ H. T. & L. T. Switch-boards ■ Fuses and Fuse Units ■ L. T. Motors from 0.25 to 760 H.P. ■ 3.3 kV motors from 150 to 1700 H.P. ■ 6.6 kV motors from 170 to 1360 H.P.

# The tough customer

AT/ABS-NGEF-70

fall in demand for coal due to slow industrial activity is the government's anxiety to step up the housing construction programme through the institution of a revolving fund. This programme should apparently push up demand for coal from brick kilns. This means that coal output by 1973-74 may have to be raised to at least 90 million tonnes. This appears to be an uphill task if the problems of the industry are correctly appreciated.

The main difficulty that the coal industry faces today, apart from depressed demand, as stated above, is the lack of finance. Till about three years ago, this industry was subject to rigorous controls, which impoverished its financial viability a great deal. This is evident from Table II.

This table indeed makes a very interesting reading. It reveals that although the average gross profits in the industrial sector taken as a whole as percentage of total sales remained around 10 per cent between 1960-61 and 1966-67 — mostly above the 10 per cent level — this percentage in the case of the coal mining industry went down from over nine per cent in 1960-61, 1961-62, 1962-63 and 1963-64 to just 6.3 per cent in 1964-65 and 1965-66 and further down to 5.5 per cent in 1966-67. The gross profits of the coal mining units as percentage of the total capital employed too showed a sharp decline during this period. Compared with 1962-63, this percentage in 1966-67 was just about half the 1962-63 level. For the industrial sector as a whole, the gross profits as percentage of total capital employed declined only by one point during the seven years to 1966-67, having reached the peak in 1963-64.

The more significant pointer to the sharp deterioration in the profitability of the coal mining industry between 1960-61 and 1966-67 however, is available from the profits after tax

as percentage to net worth. Whereas this percentage for the industrial sector as a whole went down from 11 in 1960-61 to 8.9 in 1966-67, it fell in the case of the coal mining industry from 7.8 to as low as 3.4.

The deterioration in the profitability of the industrial sector as a whole and in the coal mining industry in particular naturally led to deterioration in the percentages of dividends in relation to net worth, the ordinary paid-up capital and the total paid-up capital. Significantly enough, the deterioration in these percentages was much more marked in the coal mining industry than in the industrial sector as a whole. Dividends as percentage of net worth declined in the coal mining industry from 5.4 per cent in 1960-61 to just about 3.1 per cent in 1966-67. The ordinary dividends as percentage of ordinary paid-up capital went down from 10.2 per cent in 1960-61 to 5.9 per cent in 1966-67. The percentage of total dividends in relation to the total paid-up capital in this industry showed a decline from 9.5 to 5.9.

#### Some Improvement

In 1967-68, however, there was some improvement in the coal mining industry with four of the above-mentioned six percentages going up. The gross profits in relation to sales went up from 5.5 to 6.5 per cent and in relation to the total capital employed from 4.9 to six per cent. The percentage of profits after tax to net worth improved from 3.4 to 5.1. Similarly, the percentage of dividends to net worth went up from 3.1 to 3.2. The ordinary dividends in relation to ordinary paid-up capital and the total dividends in relation to the total paid up capital, however, remained stationary in percentage terms, implying that the industry was able to plough back larger profits in 1967-68 as compared to the previous year. The percentage of profits retained by the industry in relation

## MYSORE STATE ROAD TRANSPORT CORPORATION

- (1) M.S.R.T.C. with a capital of 28 Crores is one of the largest State undertakings of Mysore State.
- (2) M.S.R.T.C. is operating a fleet of nearly 3,200 vehicles and is the third largest State Transport Undertaking in India.
- (3) M.S.R.T.C. gives conveyance to over 10 lakhs of people every day.
- (4) The average daily service kilometers operated by the Corporation is 4.71 lakhs.
- (5) M.S.R.T.C. operates 71 Interstate services, 172 express services, 10 Luxury services and 6 night services.
- (6) The average daily earning per bus on road is Rs. 270/- and the total traffic revenue realised exceeds Rs. 21 crores per annum.
- (7) M.S.R.T.C. has its own efficient and well run Printing Press.
- (8) In 10 out of 19 Districts of the State, nationalisation of passenger transport has been practically completed. In the remaining districts nationalisation is partial.
- (9) In terms of area covered M.S.R.T.C. extends its services to 68% of the State.

## ELMOT WARD LEONARD VARIABLE SPEED DRIVES PROVE IDEAL IMPORT SUBSTITUTES

ELMOT Ward Leonard Variable Speed Drives have won the confidence of users in extensive field tests conducted under the most rigorous working conditions. ELMOT Drives help reduce dependence on imports in key industries like steel, textiles, jute, cement, paper mills, wire drawing, cables, rubber and plastics. Another step towards self-reliance by ELMOT.

to the profits after tax improved from 8.9 in 1966-67 to 35.8 in 1967-68. Incidentally, this percentage was the highest in seven years to 1967-68, except for the two years of 1962-63 and 1963-64.

The strained financial position of the coal industry has had its adverse impact on capital formation. This is evident from Table III. Although, as this table reveals, the various indicators of capital formation in the industrial sector as a whole have generally shown a downward trend between 1960-61 and 1967-68, the deterioration in these indicators regarding the coal-mining industry has been very sharp. The net fixed assets formation in this industry went down from 6.1 per cent in 1961-62 to just 0.2 per cent in 1967-68.

If note is taken of the fact that the bulk consumers of coal, such as the railways and the public sector steel plants, have been allowed only niggardly increases in the prices of coal supplied to them, as against the substantial increases asked for by the producers on account of mounting costs, particularly following the implementation of the Coal Industry Wage Board's award, the increased prices which the industry has been able to obtain from the other consumers cannot be expected to have restored it to robust financial health. In the circumstances, any rapid expansion of the coal industry without substantial assistance from the government obviously cannot be expected. This should lead to the conclusion that the slower growth of the economy than what the fourth Plan envisages may not result in as pronounced shortages of coal as occurred around the turn of the 1960s, but if economic activity picks up materially, some shortages of coal can well be anticipated. In fact, BP hard coke has already gone in short supply. This has necessitated stoppage of further releases for export.

The second cause of anxiety on the coal front relates to coking coal—not, of course, in the short term of the fourth Plan, but from the long-term view of the succeeding Plans. At present, due to the steel plants not working to full capacity, there is accumulation of stocks at the pitheads, to service which credit facilities are being liberalised. But from the

long-term point of view, our reserves of coking coal are not abundant. According to a seam by seam analysis of the Jharia coal belt, which has almost the entire reserves of this type of coal in the country at present, our total reserves of coking coal are estimated to be of the following order: (Table IV).

TABLE IV  
RESERVES OF COKING COAL  
(million tonnes)

| Seam IX/X to XVIII                    | Proved | Indica-<br>ted | Inferred | Total |
|---------------------------------------|--------|----------------|----------|-------|
| Down to 61 metres<br>(200 feet)       | 2,510  | 2,504          | 786      | 5,800 |
| 61 metres to 122<br>metres (400 feet) | 11     | 406            | 1,820    | 2,237 |
| Total                                 | 2,521  | 2,910          | 2,606    | 8,037 |

It is feared that these reserves may not be sufficient to feed the growth of the steel industry till the end of the current century unless very judicious use is made of them. In view of the fact that the steel-making capacity in the country is to be augmented by two million tonnes every alternate year during the 1970s, the problem of raising coking coal judiciously is indeed sizable.

Currently, the exploitation of our coking coal resources is very unscientific as only about 40 per cent coal is recovered from a mine. The rest is left in the form of pillars. With proper stowing, the rate of recovery, it is believed, can be raised to as much as 75 per cent. Even though some technological changes in the coming decades can be expected, which should facilitate the use of non-coking coals in the steel industry, the present wasteful mining of coking coal apparently has to be obviated. With a view to modernising the mining of coking coal, the government has been thinking in terms of amalgamating the small mines which are being recklessly exploited by a large number of owners. It has been experi-

TABLE III

menting with voluntary amalgamation, but without much success. Should it be hoped that the proposed scheme of compulsory amalgamation, which the government has been considering for quite some time, will be enforced soon?

The recent finalising of a scheme of financial assistance for the development of coking coal production and conservation of coking coal resources, of course, is a step in the right direction. In view of the growing shortage of river sand in the Jharia area, the French method of controlled caving under artificial roof or some other such method also needs to be given a proper and fair trial at an early day so that modernisation of our coal industry can be undertaken in right earnest.

If the production of coal has to be raised adequately in the near future, two other problems of the industry will have to be effectively dealt with. The first is the problem of procuring mining machinery and spare parts. The scarcity of spare parts and steel items (rails and sheets, in particular) is being increasingly felt by the coal industry. The Mining and Allied Machinery Corporation, Durgapur, though it is geared to producing the entire requirements of coal mining industry, is in a bad shape at present. The pattern of indigenous production of coal-mining equipment too is said to have undergone some changes. In the circumstances, the ban on the import of certain spares and components, e.g., cutting machines, needs to be removed till the indigenous production of the desired quality actually becomes available.

The second difficulty is in regard to the supply of permitted explosives. Many collieries, particularly in the Ranee-gunj and Jharia fields are said to be experiencing difficulty in

carrying out their normal mining operations owing to the inadequate availability of permitted explosives. Further, how the entire dependence on a single unit manufacturing permitted explosives in the country — the Gomia factory of Indian Explosives Ltd — with no alternative source of supply, can nearly paralyse the mining industry and can create an explosive unemployment situation was evident from the wild-cat strike of the workers of Gomia factory in August last. Immediate arrangements, therefore, need to be made for having a second unit to manufacture permitted explosives. The creation of a buffer stock of permitted explosives will also have to be considered.

#### Opening Virgin Areas

Still another problem of the coal industry which has to be attended to expeditiously is the allowing of some of the existing collieries to open up virgin areas as their existing mines are fast depleting. The Industrial Policy Resolution of 1956 placed coal and lignite in the first list of industries (Schedule 'A') the future development of which is to be the exclusive responsibility of the state. All new units in these industries, save where their establishment in the private sector has already been approved, have to be set up only by the state. It, however, has been categorically stated in the resolution that this does not preclude the expansion of the existing privately-owned units, or the possibility of the state securing the co-operation of private enterprise in the establishment of new units when the national interests so require.

When the Coal Bearing Areas (Acquisition and Development) Act, 1957, was introduced, it was clearly stated in the objects and reasons of the bill that the intention was to take over, if necessary, unworked coal bearing areas covered by private leases or prospecting licences, which are found surplus to the legitimate requirements of the private sector. But the restrictions imposed by the government on opening of new mines in the private sector collieries have placed them in an extremely difficult position. The collieries in the private sector are finding it very difficult to keep their economy balanced even in modernised and progressive units. While it is not the intention of the private sector units to urge that they should be permitted to retain any unworked areas in their existing leaseholds disproportionate to their legitimate needs during a reasonable period of time, it has, at the same time to be appreciated that having regard to the fact that private sector coal-mines are by and large confined to vertical expansion, it is necessary to keep some areas in reserve for their future expansion.

It is also pertinent to point out that coal mining involves the working of a wasting asset, where reserves are progressively depleted. In accordance with the universally recognised standards in mining, all prudent mine operators retain areas in reserve for future working as and when the existing reserves get exhausted. Conforming to this practice, it is not unreasonable that the private sector should also keep some areas and/or seams in their existing working lease-holds for the future. In order that these collieries may remain viable, it is necessary that permission for opening up new mines in their virgin holdings should be granted so that they can make up the losses incurred in operating difficult and expensive units. This will also enable these collieries to replace their existing units. In addition to providing additional employment, this will contribute to the advancement of the mining techniques.

It is, therefore, necessary that there is a more pragmatic application of the Industrial Policy Resolution. Unfortunately at present the resolution is unduly restrictive to the private sector in its application. There are many collieries whose reserves are depleting rapidly and whose production is likely to decline in the not-too-distant future. It is, there-

## SERVICE...

from project planning  
to commissioning

FEDO is equipped to render a complete and comprehensive service—from planning to finished plant. The organisation gained its expertise the hard way. For about 25 years, FACT has been growing... expanding... diversifying... adding new processes... accumulating a fund of experience. And so when FEDO came to be formed (1963), the organisation had with it some of the finest engineering talent in the country.

With about 200 graduate engineers and over 120 other technical staff, FEDO is well equipped for its task.

You will also find in FEDO a team of people, familiar with most process problems. Their background makes them react quickly to your own problems. Makes them grasp what you want to do.

We know how to do it.

fore, imperative to grant leases for new coal areas to such coal producers so that they could maintain their output, and unless this is done, many coal producers will be faced with the prospect of declining output, rising costs and retrenchment of labour.

There are particular areas in which the private sector has not been permitted to work because, even though the areas had not been notified under the Coal Bearing Areas (Acquisition and Development) Act, 1957, the public sector is said to be "interested" in them. Such areas sometimes comprise small properties between faults and/or small properties contiguous to the existing private sector working collieries. The only criterion for deciding whether the public or private sector should work a particular area should be which sector can work it more easily and economically.

There is also need for discovering and developing coal reserves in areas far away from the main coal belt in east India, if the strain on railways has to be contained in the future years. The shortage of power in the coal-mining areas which are dependent on the Damodar Valley Corporation (DVC) as well needs to be looked into. The crisis in the power supply there is said to have arisen because of (i) operational and maintenance problems, (ii) resort to lightening strikes by staff, and (iii) highly abrasive nature of washery middlings/rejects coupled with over-loading of boilers.

With the growth of mechanisation in coal-mining in course of time, the slack coal problem can be expected to assume wide dimensions. In order to avoid a likely glut of slack coal and middlings towards the end of the fourth Plan period, scientific utilisation of slack coal has to be rationally planned ahead. Some giant electricity generation units near the collieries will have to be planned.

## IV

Whereas, as stated in Section III, shortages of coal cannot be ruled out in the next few years if concerted action is not taken to resolve the industry's problems, pronounced difficulties on the power front are expected even otherwise. This is because contrary to the practice in the advanced countries, we have all along been planning during the last 20 years for marginal shortages of power instead of marginal surplus. Apart from the practice in the advanced countries, the need for us to plan for marginal surpluses of power arises from another factor. This is the inherent hazard of our hydro-electric projects. Depend as they do on benign nature, their capacity to produce power dwindles considerably if rains fail or the snow in mountains does not melt adequately in the summer months. The shortage of power in Punjab and Haryana today has got accentuated because of the inadequate water supply in the Bhakra reservoir.

Although the financial allocation for the development of power during the current Plan has been recently revised from Rs 2,135 crores — Rs 2,085 crores in the public sector and Rs 50 crores in the private sector — to Rs 2,520 crores — Rs 2,450 crores in the public sector and Rs 70 crores in the private sector — the generation capacity expected to be installed by 1973-74, if, of course, all goes well according to schedule, will be 23.1 million Kws. The original allocation would have raised the capacity to only about 22 million Kws. That this will not be sufficient to meet the requirements in that year is evident from Table V.

Presently, as Table VI reveals, the installed capacity for power generation is insufficient in the northern and western regions. The northern region comprises the states of Punjab, Haryana, Rajasthan, Uttar Pradesh, Jammu and Kashmir and Himachal Pradesh and the union territories of Chandi-

Please Bank with State Bank of Patiala your regional Bank, Strengthen us with deposits so that we can strengthen you.

K. SUBRAMANIAN  
General Manager.

Head Office,  
The Mall, Patiala.

## ACCENT ON QUALITY

Fabrication of Equipment for the process Industry-Fertilizer, Petroleum, Petro-chemical etc. calls for special and rigid inspection—we may say RUTHLESS-INSPECTION at all stages of manufacture, to ensure that equipment gives satisfactory service under severe conditions of operations.

We have the necessary equipment, the qualified staff and near FANATICISM when it comes to maintaining QUALITY.

With inspection by our own trained staff, the experts from our collaborators and-in addition-inspection by M/s. Lloyd's Industrial Services, we can claim that our customers are assured of QUALITY in our products which include light, medium and heavy Columns, Pressure Vessels, Heat Exchangers, Storage Vessels, Piping, Furnaces and any other fabricated equipment.

SYMBOL OF GUARANTEED QUALITY.

**BHARAT HEAVY PLATE & VESSELS LTD.**

Post Box No. 100,  
VISAKHAPATNAM

garh and Delhi. The western region consists of the states of Gujarat, Maharashtra and Madhya Pradesh and the union territory of Goa, Daman and Diu.

In the other three regions—(i) the southern region, comprising the states of Andhra Pradesh, Tamil Nadu, Kerala and Mysore and the union territory of Pondicherry; (ii) the eastern region, consisting of Bihar, West Bengal, Orissa and the areas served by the Damodar Valley Corporation; and (iii) the north-eastern region, composed of Assam, Manipur, Tripura, Nagaland and the NEFA area — there is some overall shortage of power, but individual states do experience difficulties. Shortages of power are also being experienced in some parts of the country because of the lack of full utilisation of the installed capacity and several other reasons. For instance, the Raneejung coal belt is experiencing power difficulties due to labour trouble and lightning strikes in the DVC complex. By 1973-74, on government's own admission, there will be overall power shortage in quite an acute form in

the southern region also. Only two regions — eastern and north-eastern — will have some overall surplus. State-wise, power shortage will be there in most of the states — Punjab, Haryana, Uttar Pradesh, Gujarat, Maharashtra, Madhya Pradesh, Andhra Pradesh, Tamil Nadu, Mysore, Bihar and West Bengal. To some extent power shortages in these states may be mitigated by the transfer of electricity through the regional grids from the adjoining states, but even then acute shortages are expected to be experienced in Punjab, Uttar Pradesh, Maharashtra, Gujarat, Madhya Pradesh, Andhra Pradesh, Tamil Nadu and West Bengal.

If the past experience is any guide, the shortage of power in 1973-74 may be much more acute than is suggested by Table V. The current Plan does not take into account any substantial rise in the general price level. But the wholesale prices index today is over seven per cent higher as compared to the index at this time last year. This implies that even the revised allocation in the fourth Plan, although it amounts to nearly 70 per cent of the total investment in the power sector during the last 70 years, may not be sufficient to raise the power generation installed capacity to 23.1 million Kw, as envisaged. Further, the demand for energy may be much larger than is envisaged in Table V. Even the sixth Annual Power Survey of India, whose recent demand forecasts are included in this table, hints that the requirements of power may be between 18 and 20 million Kws, depending on the extent of the implementation of the Plan. The 18 million Kws re-

## 7 YEARS OF UNDAUNTED COUNTRYWIDE SERVICE TO THE FARMERS

### NSC HAS HELPED IN :

- Production, stocking and supply of foundation seed of improved varieties and hybrids of All India importance.
- Arranging production and distribution of high quality seeds of hybrids of maize, sorghum (Jowar) and pearl millet (Bajra), outstanding varieties of Wheat, Paddy and selected varieties of vegetables, flowers, fodder and fibre crops.
- Pre-release multiplication of seeds of outstanding varieties evolved by research, but not officially released, in order to meet the largest possible demands of the cultivators immediately after these varieties are released and in helping boost up agricultural production programme.
- Introduction of seed certification on large scale in hybrids, vegetables and other crops for the first time in India.
- Development of quality seed production indigenously of improved varieties of Snowball Cauliflower and Perfection New Line Peas.
- Establishment of large number of seed processing plants in the private and public sectors.
- Indigenous manufacture of seed sowing and seed processing equipment to replace imports.

- Organisation of training programme for seed producers, State Government personnel and others for certified seed production.
- Development of quality seed business in seeds.

**NATIONAL SEEDS CORPORATION LTD.**  
(A Govt. of India Undertaking)  
P.O. Box 100, South Extension,  
Part I, New Delhi-110048

quirements assume the present restrictions on consumption to continue.

Even if the requirements of power increase to 18 million Kws, the requisite installed capacity will have to be around 26 million Kws. The target set for raising the installed capacity to 23.1 million Kws, thus, is quite inadequate. By 1980-81, we may need — on the basis of a five per cent growth in agriculture and nine per cent growth in industry annually — electric power generation capacity between 55 to 60 million Kws. We obviously will not be able to create an additional capacity of 32 to 37 million Kws in the seven years succeeding the fourth Plan if the outlay in the fourth Plan is not raised further in the interest of having at least three to four million Kws additional capacity over and above what is now envisaged in this Plan. The implementation and gestation periods of power projects is at least five years in our country.

The task of raising power generation capacity to 55 to 60 million Kws by 1980-81, of course, is by no means beyond our technical competence. So far as the manufacture of equipment is concerned, the Bharat Heavy Electricals and the Bhopal Heavy Electricals, along with the private sector concerns already in the field, will be able to cater for about all the equipment requirements of hydro and thermal stations. Of course, orders on these manufacturers will have to be placed judiciously in a phased manner. To a substantial extent, nuclear power equipment can also be supplied by indigenous sources. The primary commercial fuels and the resources for the generation of hydro and nuclear power are also in abundance in the country. They can be easily exploited. There are no difficulties of manpower also, although some training programmes may have to be strengthened.

The main bottleneck in the way of the expansion of electricity generation installed capacity to the levels required in 1973-74 initially and 1980-81 in the longer run is finance. It is indeed surprising that instead of catering for the needs of this vital field of activity, the public sector resources are sought to be diverted to such low priority projects as the manufacture of small cars. In the field of electricity generation, the private sector can also play a more useful role than what is envisaged in the fourth Plan. But the main difficulty is that the rate of return on investment under the present governmental policies is unattractive.

#### Battle for Funds

The battle for funds for electricity has to be fought on two fronts. Not only additional resources have to be raised but also all wastages in construction have to be avoided. A major source of wastage is the undue prolongation of the implementation period of a project. Sometimes this is due to shortage of construction materials. At other times the allocation of funds is so inadequate that it is exhausted half-way through the implementation of a project. There is also often a failure to set up the distribution system to synchronise with the completion of a generation project. It is, therefore, necessary that these mistakes of the past are not allowed to be repeated.

With a view to utilising electricity surpluses in some areas for the benefit of the deficit areas, the setting up of the all-India grid has to be expedited. Power grids in some areas, of course, have been inter-connected in the past few years. But the progress has left much to be desired. The leeway has to be made up expeditiously.

It is encouraging to note that two innovations are being made on the electricity front during the current Plan period. The first is the construction of 400 Kv lines for the first time in the country. These will be set up in the northern region between Odra and Sultanpur, Dehar and Panipat and in the

Punjab-Haryana belt. In the western region these lines will be set up in the Nagpur and Bombay areas. The second innovation is the adoption of load despatching techniques on regional basis. While the latter innovation will enable integrated operation of power systems in the various regions, the former will strengthen the transmission arrangements so as to avoid frequent breakdowns in electricity supply which are causing a good deal of headache to consumers.

The direct involvement of the central government in the execution during the current Plan of a few large power projects intended for regional operation is also a happy augury for the future. The large power projects to be set up by the centre during the current Plan period are: (i) 300,000 Kws thermal station at Badarpur (Delhi), (ii) 200,000 Kws hydro project at Baira-Siul in Himachal Pradesh, (iii) 270,000 Kws hydro project at Salal in Jammu and Kashmir, and (iv) 70,000 Kws hydro project at Loktak in Manipur. The benefits from the Salal project will accrue during the fifth Plan period.

#### V

The present somewhat easy supply of petroleum products, like that of electricity, too, cannot be expected to last long. The main problem here will be how to find adequate foreign exchange to finance the growing requirements.

The demand for petroleum products is anticipated in the fourth Plan document to grow to around 26 million tonnes by 1973-74 from nearly 16.1 million tonnes in 1968-69. If, by and large, the 1973-74 requirements are to be met by the indigenous refineries — some marginal shortages in certain products being met by imports and the slight surplus of some other products being exported — the refining capacity in the country will have to be raised by that year to at least 28 million tonnes. Currently, we have 19.5 million tonnes refining capacity. Another 2.5 million tonnes capacity is being set up at Haldia. An additional one million tonnes capacity has been sanctioned for Assam.

The rest of the required capacity, according to the fourth Plan document, is expected to be realised through the expansion of some of the existing refineries. The Cochin refinery is proposed to be expanded by one million tonnes. Koyali's capacity is envisaged to be raised to 4.5 million tonnes and that of Barauni to three million tonnes. The expansions of the Koyali and Barauni refineries will yield about 2.5 million tonnes additional capacity. If the Madras refinery is also expanded by one million tonnes, the total installed capacity in 1973-74 will be of the order of nearly 27 million tonnes. The remaining one million tonnes throughput can well be expected from the Burmah-Shell and Esso refineries at Trombay which have nearly 1.5 million tonnes excess capacity at present. If all the above expansion programmes materialise according to their schedules, there may not be any petroleum refining difficulty in 1973-74. Of course, in the interest of catering for the growth in demand for petroleum products during the first half of the fifth Plan, further expansion of refining capacity will have to be sanctioned in the near future as it takes anything upto five years for installing additional capacity after the decision to do so is taken. By the end of 1974, the requirements of petroleum products are expected to grow to 27.2 million tonnes.

The problem will be in respect of crude oil supplies. The indigenous production of crude oil in 1968-69 aggregated to 6.08 million tonnes, against the refinery throughput of 16.10 million tonnes. Nearly 10 million tonnes of crude oil were, thus, imported in that year. By 1973-74, according to the requirements of petroleum products envisaged in the fourth Plan, our demand for crude oil would have grown to nearly 30 million tonnes. The slower-than-expected

### ANTICIPATED SURPLUS (OR DEFICIT) IN POWER CAPACITY : 1973-74

growth of the economy since the launching of the fourth Plan may somewhat bring down the demand for petroleum products, and consequently of crude oil—some lags in the expansion of the refining capacity incidentally may be absorbed by this reduction in demand. But the requirements of crude oil cannot be expected to fall to below 28 million tonnes.

By 1973-74, according to the expectations entertained till recently, the indigenous supplies including the share of the public sector explorer—the Oil and Natural Gas Commission (ONGC)—in the offshore concessions in Iran would have grown to about 10 million tonnes. But these expectations may not be realised now. Apart from the fact that we have not been able to utilise in the existing refineries, and may not be able to do so without modifications involving substantial investment, the ONGC's share of crude oil from the Iranian concessions, the domestic production during the last two years has been lagging behind the targets. In 1969-70, for instance, as against the anticipation of raising the output of crude oil within the country to 7.3 million tonnes, the revised estimate for the year puts the production at 6.7 million tonnes. During the current financial year, the production of crude oil, according to this year's Plan, is not likely to exceed 7.1 million tonnes. Actually, however, it may be around the last year's level as the ONGC's production till about a couple of months ago was at a rate of 3.65 million tonnes per annum and the other oil exploration agency in the country—Oil-India—will be producing around three million tonnes. The ONGC is working to raise its output to 5.5 million tonnes a year by the end of the fourth Plan. On the basis of the trends in production in 1969-70, and 1970-71, as stated above, it is doubtful whether it will be able to achieve in 1973-74 the target set by it for itself.

#### Rising Cost of Imports

Even if the above misgivings about the domestic production of crude oil prove misplaced, we will have to import 19 to 20 million tonnes of crude oil in 1973-74. In 1969-70, when we imported nearly 12 million tonnes of crude oil, the foreign exchange outgo on this account was approximately Rs 96 crores. The cut in the prices of imported crude effected early this year may prove a very short-lived phenomenon, as according to the indications available presently, crude oil prices are expected to go up in the near future. Whether or not they will be raised by 30 cents a barrel—from \$1.28 a barrel currently—as reported to have been talked about at a recent meeting of the 10 major oil producers of the world, a fairly substantial rise in prices perhaps cannot be ruled out. Even at current prices, the crude oil import bill can be expected to go up by 1973-74 to nearly Rs 145 crores. If a price-hike is there, this bill will exceed Rs 150 crores. This means that we will be required to spend nearly Rs 60 crores more on imports of crude oil in 1973-74. Will we be able to afford this much foreign exchange for importing crude oil alone?

It will be presumptuous to assume that we will be able to make any big dent on this import bill by the end of the fourth Plan even if we step up oil exploration and development activity immediately. This ought to have been done several years ago. What can be done now to contain the crude oil import bill is to suppress consumption of refined products. This will entail raising their prices. But the adverse effects such a step will have on the cost of production in agriculture and industry will have to be very carefully analysed before any move is made in this direction. Till now there is no evidence to suggest that such an analysis has been undertaken even though the prices of petroleum products have been successively raised, through imposition of heavy excise duties, over the last 15 years.

From the long-term point of view, the tempo of oil exploration, however, will have to be stepped up a great deal right from now onwards. By 1980-81, our requirements of crude oil are anticipated to grow to as much as 45 million

tonnes. Taking into account the present oil exploration and development programmes, it is feared that the import bill for crude oil and deficit petroleum products will be in the region of Rs 250 crores in 1980-81. But there does not appear to be any anxiety in the governmental circles to step up oil exploration to the requisite extent. Despite the fact that the lack of pragmatism in the policy of the government is primarily responsible for the slow growth in the indigenous production of crude oil, there is no indication of effecting any relaxation in it. On the contrary, the policy seems to be being made more and more inflexible.

The pre-independence belief that our country was deficient in oil resources has proved to be misplaced. Many promising hydro-carbon bearing structures have been found both on land and in the continental shelf of the country as a result of the seismic and geophysical survey conducted during the past one decade. Oil or gas has, in fact, been struck at a number of places in Gujarat and Assam. Indications of the presence of hydro-carbons are also available in the Marathwada area of Rajasthan and in Tripura, although the exploratory work in Punjab and the Indo-Gangetic and Cauvery basins has not yielded any fruitful results. The most promising area identified for oil exploration offshore till now has been what is known as the Bombay High. But the exploration of this area has been held up on account of ideological reasons for over four years now. This area was discovered in 1964.

*"Heavy pressure of work sometimes gives me an intense headache."*

says Vipin Jain,  
a Bombay executive.

## Headache? Take Anacin for fast relief

**strong enough for adults—  
safe enough for children**

Anacin is strong—it contains more of the pain-reliever doctors most recommend all over the world. Anacin is safe—it is a combination of medicines like a doctor's prescription. Take Anacin for headache, colds and flu, backache, toothache and muscular pain.

**strong and safe**  
**ANACIN**  
India's most popular  
pain-reliever  
acts 4 ways

A-41

Regd. User of TM: Geoffrey Mennors & Co., Ltd.

Negotiations for exploring it were started soon thereafter. Talks with a US party — Tennico — in fact were carried on to an advanced stage early in 1967 and it was expected that exploration work would be taken up before or soon after the 1967 monsoons. Even though, in line with the government policy, this American firm was not only prepared to join hands with the ONGC on a minority basis but was also agreeable to shoulder the initial foreign exchange expenditure on exploration on its own, besides helping in training Indians in the job, the collaboration offer was not grasped.

Now, following the advice of a British consultancy firm, exploration in the Bombay High area is proposed to be undertaken by the ONGC on "assisted owner operation" basis. A suitable mobile platform is being ordered from Mitsubishi's Hiroshima shipyard; an agreement to this effect is expected to be signed in the middle of next month. But the actual drilling operations will start only in about two years. Thus, the work on a job which could have been started in the middle of 1967 has been delayed by nearly 5½ years.

#### Inept Operations

That the operations of the ONGC, which has been assigned the task of all future oil exploration, both on land and in the off-shore areas, leave much to be desired is evident from the inept way this organisation started its operations in the shallow waters of Aliabet in the Cambay area. Started in March this year, these operations have been held up for several months now due to the fact that the supply line to the operations got disrupted by the loss during the violent monsoon season in the area of the only tug the ONGC had. After a frantic search, a new boat has now been secured from the Minerals and Metals Trading Corporation to restore the supply line to the operational fixed platform at Aliabet. The drilling work, thus, may be resumed in the near future. But is it judicious to rush into a job without adequate preparations?

The task of oil exploration in the country is so huge that the ONGC alone will not be able to complete it as expeditiously as the requirements of the economy demand. The operations of this public sector undertaking have to be supplemented by making experienced oil explorers from abroad interested in the exploration work in the country. The oil participation policy has to be made flexible to allow foreign participation on a sizable scale. Otherwise, the heavy crude oil import bill will continue to act as a drag on the growth of the economy.

The crude oil reserves that have been established within the country till now are no more than 165 million tonnes. Crude oil to the extent of about 30 million tonnes has already been taken out of these reserves, leaving nearly 135 million tonnes to be exploited over the future years. A very disconcerting fact is that, during the past three or four years, fresh discovery of reserves has not matched the exploitation of the already established reserves. The result has been that the known reserves, instead of going up, have started going down. This fact alone should prompt us to accelerate our oil exploration programme.

#### VI

Our accomplishments in the field of nuclear power generation on commercial scale too have been lagging much behind the planned growth. As stated earlier in Section II, the Tarapore nuclear power station, which was to be completed during the third Plan period to yield in 1965-66 a modest quantity of 150,000 Kws electricity, could not be completed according to schedule. It was commissioned only last year.

An indication of how the programme for producing nuclear energy for commercial use has been revised downwards

is available from Table VII.

TABLE VII  
INSTALLED NUCLEAR POWER CAPACITY IN  
MEGAWATTS ELECTRICAL (MWe)

| Year    | As suggested by Atomic Energy Commission in 1954 | As forecast by Energy Survey Committee in 1965 | As proposed by Atomic Energy Commission in 1968 |
|---------|--------------------------------------------------|------------------------------------------------|-------------------------------------------------|
| 1970-71 | 600                                              | 600                                            | 400                                             |
| 1975-76 | 3,000                                            | 2,000                                          | 1,000                                           |
| 1980-81 | 8,000                                            | 5,000                                          | 2,700                                           |
|         |                                                  | (by 1978-79)                                   |                                                 |

The Tarapore station has an installed capacity to produce 380,000 Kws electricity. Although another 600,000 Kws capacity is being put up — 400,000 kws at Ranapratap Sagar in Rajasthan, and 200,000 Kws at Kalpakkam in Madras — this will materialise partly in 1972-73 and partly in 1973-74. The Kalpakkam station will also be expanded to 400,000 Kws ultimately. So, by 1975-76, we shall be having nuclear power generation capacity to the extent of one million Kws, as against three million Kws in terms of the 1954 proposal of the Atomic Energy Commission and two million Kws in terms of the Energy Survey Committee's 1965 forecast.

Many factors are said to have contributed to the slip up on the nuclear power front. These include: (i) lack of adequate national commitment to a long-range programme; (ii) difficulties in achieving effective co-ordination of training and personnel needs; (iii) inadequacy of research and development facilities; and (iv) the absence of the complex industrial infrastructure to back up the programme. The Tarapore and Ranapratap Sagar projects have been undertaken with foreign collaboration. The inherent need for external financing and agreement on international safeguards have involved protracted negotiations, leading to major time delays.

#### Dependence on Nuclear Power

Apart from the necessity of keeping ourselves abreast of the global trends, we have in the future to go ahead with nuclear power generation on a sizable scale if the shortages of power are to be obviated in the eighties. As argued in Section V, the huge dependence on crude oil imports rules out uninhibited recourse to petroleum as source of energy. The dependence on electricity, therefore, is bound to grow.

While in areas close to coal mines, the generation of energy can and should for the time being be based on coal, large regions of the country are removed from the deposits of coal by more than 800 kms. These regions constitute 35 per cent of the country by area and 30 per cent by population. With the exception of the eastern region, they include the principal communities engaged in activities needing energy in the rapidly increasing quantities for industry as well as agriculture. The transport of coal to these areas involves major investments on the transport system, for which the requirements of capital are large and the recurring economic penalty is substantial. "Atomic power", according to Dr Vikram A. Sarabhai, "clearly provides the most advantageous solution even with single units of 230 MWe, a size small compared with atomic power producing countries."

There are several advantages in going in for nuclear power reactors to optimise a grid with hydro and thermal generating units. They arise from the special characteristics of hydel power which is best for peak loads and nuclear power which

## ANDHRA PRADESH MARCHES AHEAD

Alphabetically first among the States of India, Andhra Pradesh has many "Firsts" to its credit.

It was the first State to be formed on a linguistic basis and the first to usher in Panchayati Raj.

Fifth largest State in India and fourth in population, having the mighty Godavari and Krishna rivers and rich mineral wealth, Andhra Pradesh is now 14 years old, confident of a bright future, stepping out from a predominantly agricultural State into industrial field, the industrial base in Hyderabad and its neighbourhood, in Visakhapatnam, Ramagundam and Kothagudem, attracting new industries to the State.

Even the worst critic cannot deny that Telangana with Hyderabad, as the Capital of the State, has progressed considerably in every field, as an integral part of Andhra Pradesh.

Common language, common aspirations and common destiny beckon to the 4 crores of Telugu-speaking people, whose unity was disrupted under foreign rule, to remain united in an integrated Andhra Pradesh, essential for the maximum utilisation of its resources, skilfully distributed over the State's different regions, with a rare balance and complementarity.

| Number of Industrial Projects financed ..          | 505             |

### FORMS OF ASSISTANCE AVAILABLE

Only public limited companies and registered co-operative societies may apply. Public Sector Projects, organised as public limited companies, can also avail of assistance within the framework of Government policies. Loans on concessional terms are granted to small and medium sized industrial concerns located in notified districts in under-developed states/areas. The Corporation's assistance—medium and long-term credits—could be in one or more of the following forms :

- \*Grant of loans in rupee and foreign currencies.
- \*Underwriting of equity, preference, or debenture issues.
- \*Direct subscription to equity, preference shares and debentures.
- \*Guaranteeing deferred payments for plant & machinery imported or purchased within the country.
- \*Guaranteeing foreign currency loans raised from foreign banks or financial institutions.

The Corporation welcomes enquiries from eligible applicants for financial assistance for setting up of new industrial projects or for expansion, diversification or modernization of existing projects. They may contact the Head Office or any of the Branches of the Corporation.

OFFICES ALL OVER INDIA

is best for base loads. Nuclear energy is practically independent of geographical factors, the only requirement being that there should be a reasonably good water supply. No combustion problems are created by nuclear plants and consequently they are a clean source of power. They, thus, do not contribute to air pollution. Fuel transportation networks and large storage facilities are also not needed for a nuclear project. And, finally, if low cost power units are imaginatively planned, a power consuming complex built round them could provide much needed inputs to the country.

One of the major factors inhibiting recourse to nuclear energy in our country hitherto has been the high cost of production. But with production costs going up in the case of the alternative sources of energy also, the difference between these costs and the cost of producing nuclear energy is being bridged rapidly as the scale of nuclear energy production is increasing. Nuclear energy plants of 400,000 to 500,000 Kws capacity can easily be competitive with the alternative sources of energy in the areas far away from the main coal belt. Further, with the development of fast breeders using plutonium instead of natural uranium, the cost of producing nuclear energy, according to experts, can be brought down. The programme proposed by Dr Sarabhai early this year for developing production of nuclear power to 2.7 million Kws by 1978-79 appears to be the minimum required for avoiding acute shortages of energy from 1975 onwards. It is indeed encouraging that the government has decided in principle to set up a new nuclear power station in the near future to cater for the requirements of the northern electricity region.

With the setting up of the Kalpakkam power station, which is being established without any foreign help, our technical competence for developing nuclear energy would be fully proved. This augurs well for the future development of nuclear energy in the country.

### VII

To sum up, it can well be visualised that the relatively easy energy supply position now existing will not continue for long.

In the very near future, as the tempo of economic activity picks up, shortages of energy, particularly of electricity, will start developing in a fairly acute form.

From the long-term point of view, the production of nuclear energy will have to be developed at a rapid pace, especially in areas situated away from the main coal belt in the country. The competing sources of commercial energy in these areas are oil and hydro-power. The fast growing imports of crude oil rule out uninhibited recourse to this source. Hydro-power, on the other hand, is best suited for peak loads. For providing base loads in these areas, therefore, the development of nuclear energy is essential.

In areas where coal is in abundance, the primary dependence for energy obviously has to be on this source. In view of the growing problem of slack coal as a result of mechanisation of mining operation, some giant thermal power stations near the coal mines have to be planned.

The setting up of the all-India electricity grid ought to be expedited. Planning for power on regional basis, of course, is a step in the right direction.

We will also in future have to plan for marginal surpluses of energy than for marginal shortages as has been the case hitherto. It is hoped that the Fuel Policy Committee, set up recently under the chairmanship of Mr R. Venketaraman, Member, Planning Commission, will complete its deliberations expeditiously so that arrangements for the development of the various sources of energy to meet the future requirements can be made in a rational manner and well in time. The economic penalty of energy shortages is much more severe than the penalty of surpluses, as has been strikingly brought out by the current energy situation in Punjab, where a rate of growth in agriculture or small-scale industry, somewhat ahead of the related national averages, has placed a heavy strain on current availabilities of power.

## The Wobbling Wheels

S. P. CHOPRA

THE TRANSPORT system in our country covering railways, roads, shipping and aviation has a sad story to tell. The railways have continued to incur losses for the last five years and the current year's deficit threatens to assume alarming proportions. The railways have now been pleading for a reduction in the rate of dividend to be paid to the central exchequer. Also the outlay earmarked for the railways for the fourth Plan period is likely to be slashed. Road building activity continues to be sluggish and the outlays earmarked for this purpose in the Plans have hitherto remained no more than paper exercises. What is distressing is that a significant part of the funds allocated for this purpose is used in repairing unmetalled roads which, because of poor construction, are always in bad shape. In the case of shipping, despite our desire to acquire new ships and carry more and more of goods in our own ships, the boom in the international shipping industry is a serious limiting factor. The order books of the ship manufacturers are full and we do not hope to add many new ships during the current Plan period. This country is still not ready to cope with the increased traffic consequent upon the acquisition of jumbo jets in 1971. The parking bays, terminal building facilities and amenities for passengers and servicing facilities to aircraft are highly deficient.

### The Red Signal

In sharp contrast to the steadily rising surpluses in the first 15 years of planning ending in 1965-66, the railways

have registered deficits in each of the last five years. Even though the budget for the current year had indicated a marginal surplus, it turned into a deficit of the order of Rs 16.61 crores consequent upon the concessions allowed by the Railway Minister, Mr Gulzari Lal Nanda. The statistics relating to the operation of the railways for the current year indicate that the loss is expected to be much larger than in any of the preceding four years. It will be no surprise if it exceeds Rs 70 crores.

The deteriorating financial performance of the railways has been the result of more factors than one, the foremost being the shortfall in freight earnings. It may be recalled that the original estimate of freight traffic for 1970-71 was put at 217.10 million tonnes representing an increase of 8.3 million tonnes over 1969-70. It now turns out that it would be impossible to hit this target during the current year. The figures for the seven-month period ending in October 1970 showed that the total freight traffic at 93.69 million tonnes was lower by 5.60 million tonnes than the traffic carried in the corresponding period last year (see Table I). As against the estimated target for the same period, the shortfall was of the order of 9.49 million tonnes. It follows that the overall rail freight traffic during the current year might not exceed 206 million tonnes which would be lower than the last year's freight traffic at 208.80 million tonnes. (see Table II).

The slackness in the economy has no doubt reduced the freight traffic offerings. The shortfall in freight offerings was due to a decline in the despatches of coal for washeries

and for other public users. The same story was repeated in the case of raw materials for steel plants, pig iron and finished steel from steel plants, iron ore for export, cement and other goods. A natural outcome of this discouraging performance of the railways has been to throw its finances out of gear. Whereas during the past four years, the railways used up all the reserves and borrowed from the central exchequer a sum of Rs 56 crores in order to meet the dividend liability to the central revenues, the demand on the central exchequer would be much larger during the current year than in any one of the preceding four years.

If earnings from freight have been far below expectations, the burden of increasing costs has also been causing great hardship to the railways. The interim relief to employees is expected to impose an additional burden of nearly Rs 37 crores in the current year. At the same time, the rain gods have been angry with the railways in the sense that floods in various parts of the country washed away railway track in vast areas necessitating large-scale repair work. The increasing cost of fuel is another factor which has raised its expenditure, thus increasing the gap between receipts and expenditure.

What is imperative is that the railways must make all possible efforts to regain financial solvency. An attempt should also be made at the earliest possible to earn a reasonable return on capital. Until a few years ago, the railways were considered a first class commercial undertaking which was able to earn an adequate return on capital employed despite the fact that it provided a number of concessions to low-rated traffic such as coal, fruits and vegetables.

Because of the financial straits in which the railways find themselves today, it is now argued that a clear decision should be taken whether the railways represent a commercial undertaking or a social undertaking. The railways were not allowed to raise passenger fares during the current year's budget because of popular opposition and also the railways were not permitted to raise freight rates on low-rated freight traffic with the result that the losses continued to grow. The railways have pleaded that they should be allowed to

reduce the dividend payable to the central exchequer for capital employed from six per cent to four per cent. It is estimated that this would give to the railways a relief of Rs 60 crores a year. This is however a matter which should be gone into by the Railway Convention Committee. The rate of dividend paid by the railways to the central exchequer is reviewed from time to time by the Railway Convention Committee which consists of members of Parliament. The rate of dividend was increased in 1966 from 4.5 per cent to 5.5 per cent on capital invested up to the end of March 1964. For all investments made thereafter, the rate was enhanced from 5.75 per cent to six per cent. Mr Nanda has now asked for a review in these rates and has asked for reduction by at least two per cent from the present level of six per cent. The argument is that the railways can certainly earn adequate return on capital employed provided they are allowed to function as a commercial undertaking, which implies that the increase in freight and fare rates should be allowed in keeping with the increasing costs of the railways and also of the general trend in prices of goods and services in the country.

#### Possibilities of Savings

The railways cannot be allowed to continue to hike up the passenger and freight rates because there are possibilities of more efficient management and elimination of wastage which would lead to considerable savings. Mr Nanda has admitted that concentrated attention in certain sections has resulted in sizable savings, especially in the consumption of coal. It is necessary that the Railway Minister should devote more of his time and energy in eliminating waste wherever it exists. Also it is believed that the use of capacity available with the railways could be enhanced. Leaving alone the particular sections where there has been reduced economic activity in recent months, it is possible to increase the average wagon turn-round, thus getting more work out of available capacity.

The economies of scale which result in a commercial undertaking with the increase in operations are conspicuous by their absence in the case of the railways. There is need

MARTIN BURN

for more prudent management and the introduction of healthy innovations in order to make the running of the railways more economical. Perhaps a greater degree of decentralisation in decision taking could be of help. The railways thus must try unorthodox ways for improving their working results.

What is patent is that the current plan of the railways will have to be pruned keeping in view the reduced traffic offerings likely to accrue in the next two years. The fourth five-year Plan had indicated that the development programmes of the railways would cost Rs 1,525 crores. According to current estimates, the cut in the railway Plan is likely to be as much as Rs 250 crores. According to newspaper reports, the Railway Board is proposing a phasing out of the fourth Plan projects to seven years. Whether the current Plan is cut or is allowed to be phased out into seven years, the result is the same in that the anticipated investment would not take place during the current Plan period. The process of phasing out of the Plan to seven years will, however, provide satisfaction to the Railway Board that some of the projects which have been started will not be stopped half-way and their continuance would be ensured.

If the finances of the railways are to be put on a sound footing, it is necessary to evaluate the burden caused by its public service obligations. If it is decided that these obligations of the railways have a high priority, the losses incurred by it on such services should be financed from some other fund. In regard to new railway lines also, the railways will have to adopt a realistic approach. The construc-

tion of only those railway lines should be taken up which are expected to yield, over a period of time, reasonable return on the investment made. All efforts should be made to avoid the construction of railway lines which are likely to remain unremunerative even after a number of years of their working.

In a planning exercise where a number of units are involved the failure in one sector is bound to have serious effect on the other. For example, the Diesel Locomotive Works in Varanasi has been steadily increasing the output of locomotives and according to present estimates, the total acquisition of locomotives in the first three years in the current Plan period would be equivalent to 433 locomotives. If in the remaining two years of the Plan period, the rate of production and acquisition of diesel locomotives is kept at the 1971-72 level i.e. 181 locomotives a year, the total acquisition in the five-year period of the fourth Plan would be 795 locomotives exceeding the plan target of 758 locomotives. However as the freight traffic for the current year and the next two years is expected to be lower than what was anticipated earlier, the requirements of diesel locomotives for the Plan period would be less than the target of 758 indicated in the Plan. The railways and the Diesel Locomotive Works have two options open to them. Either the rate of production and acquisition of diesel locomotives in the next two years should be slowed down or the fourth Plan requirements of steam and electric locomotives should be revised downward thus increasing the requirement of diesel locomotives, beyond the target of 758 locomotives in the Plan period. The railways will have to think out which

of these alternatives is acceptable to it keeping in view the working of various lines and also the incidence of cost. A similar reappraisal in the case of wagons and coaches will be needed.

In short, the unfavourable performance of the railways during the current year requires that all its estimates for the Plan period should be reviewed once again. It is not enough that the estimates in regard to freight traffic should be revised. Similar efforts need to be made in regard to passenger traffic as well. There have been constant complaints of overcrowding on long distance routes. The railways have to take sooner or later measures in order to reduce congestion, specially on these routes. While the burden of increasing costs will have to be borne and the under-utilisation of capacity in some sectors will have to be tolerated for some more time, it is necessary that attention should be diverted to elimination of waste wherever it exists. It is only through a process of constant reappraisal of their operation that the railways can hope to emerge out of their present plight.

#### Rubbles on the Roads

Road construction is an important part of the building of infrastructure in our country but performance in this sector according to a recent survey by the Reserve Bank of India, has been "woefully inadequate". The same viewpoint was put forward by the World Bank Team of the Transport Survey of the Eastern Regions which in 1967 said that "the major lag in Indian transport development is on roads." The report also added that modern motor transport across the world had made a major contribution to gross national product but both road building and motor transport in this country have lagged far behind in this regard.

The inadequacy of the length of roads, both metalled and non-metalled in our country has been brought out clearly in Tables III and IV. The road length in 1968-69 was not more than 963,907 kms out of which the surfaced road length was less than one-third at 285,453 kms. For every 100 sq. kms. of area, the road length worked out to no more than 29.8 kms. Also, for every 100 sq. kms. of area in our country, the surfaced roads were not more than 10 kms. in length. The inadequacy of these figures is brought out

clearly when we compare them with those of other countries such as the USA, where for every 100 sq. kms. of area, the length of the surfaced roads is more than 48 kms. despite the fact that the total area of the USA is more than double of our country's area. Even in the Philippines and Ceylon, the length of surface roads for every unit of 100 sq. kms. is sizably larger than in our country.

The absence of a modern road system in the country has also penalised our economy. The Keskar Committee has estimated that the annual operating cost of our road transport would be lower by as much as Rs 160 crores if we had developed a modern road system. Despite these disadvantages, our attitude to road building has remained callous. That is why we continue to allocate meagre outlays on this activity and more often than not, they are not fully spent. The share of national income earmarked for the construction of roads is less than one per cent while even in such developing countries as Turkey and Iraq, it is significantly higher.

The volume of increase in road traffic in the seventies is likely to be staggering and we are not at all prepared to meet the challenge. In 1951, the total traffic on our roads was 5,500 million tonne kms. By 1974 it is likely to rise to 84,000 million tonne kms. i.e. a 15-fold increase. The yield of revenue from road transport has been increasing but we have continued to neglect expansion of road building activity with the result that on our national highways two-thirds of the length is very narrow while no less than 3,000 small bridges and 17 major ones still require to be built. The unmetalled roads are in bad shape and every year their maintenance causes a heavy strain on funds earmarked for this purpose.

In so far as paper exercises in regard to road building are concerned, we have spared no effort. The chief engineers in 1958, for example, formulated a 20-year road programme for the period 1961 to 1981 which followed broadly the pattern set out in the Nagpur Road Plan of 1943. The goals of this programme were laid on the basis of the immediate needs of the country to meet the increasing traffic on the roads. The other factors which were taken into account while formulating the objectives were the cost of construction at that time and estimates regarding the availability of

TABLE III

LENGTH OF ROADS IN INDIA : 1947-48—1968-69

### SPEED-UP YOUR COMMUNICATIONS FASTER THAN EVER BEFORE

Concepts of time and distance in business management are constantly changing specially when top level decision making has to be more scientific and faultless. Let the teleprinter be the link between your research, sales, works and administrative operations, no matter how many miles apart they are situated. The telex is one such service which can bring your branch offices anywhere in India or abroad at your finger tips.

Hindustan Teleprinters, in collaboration with Ing. C. Olivetti and Company of Italy, manufacture various types of teleprinter machines and ancillary equipment which are used by commercial organizations, Public Telegraph networks (P & T), News Agencies, Railways, Defence Services and Civil Aviation etc.

Specialized consultation given on individual requirements. Prompt service facilities provided through our regional service organizations at Bombay, Calcutta, Delhi and Madras.

**The Seed Corn:** There is one quick way of bringing a farm to an end, and that is to rob the farmer of his seed corn. Out of each harvest, a farmer must put by a percentage of his corn to plant again in the next season. And if he has to expand and to plant new fields, then he must retain more and more of his crop to have more and more seed corn.

Profit is the seed corn of industry. As the corn grows and the seed increases, so profits flow out of industry. They are not a weed, to be scythed by the scythe of taxation or to be eradicated by the hoe of nationalization. They are the measure of an industry's efficiency. They are the new power generated by that industry for the creation of further industries.

revenue. Now it turns out that the cost estimates of the Chief Engineers' Plan were on the lower side and therefore the provisions made by them are likely to prove deficient. The outlay indicated for this purpose will have to be raised by 30 per cent in money terms in order to cover a part of the rise in costs. What is annoying is that in each of the five-year Plans, the outlays suggested by the chief engineers have been cut making the situation still worse. Already the traffic on our roads has exceeded beyond all expectations and we have failed to provide funds even according to the norms set by the engineers' plan. In these circumstances, the conclusion is irresistible that we cannot but meet disaster on the roads in the coming years.

It is necessary to quote some figures to show the continued neglect in road building. At the end of the third Plan period, the backlog of Plan outlay was Rs 150 crores. The annual plans for three years ending in 1968-69 raised it to Rs 478 crores. The proposal of the chief engineers for an outlay of Rs 1350 crores plus the backlog of Rs 478 crores implies that we should spend at least Rs 1,832 crores on our roads even if the increase in prices since 1958 is ignored. The fourth Plan has, however, provided a sum of Rs 876 crores which is less than half of what is needed.

In the scheme of priorities laid down by the planners,

TABLE IV  
ROAD LENGTHS IN DIFFERENT COUNTRIES IN  
RELATION TO AREA AND POPULATION IN 1964  
(Road length in kilometers)

| Country         | Road length in kilometres per 100,000 of population |           | Per 100 sq. kilometres of area |           |
|-----------------|-----------------------------------------------------|-----------|--------------------------------|-----------|

| India (1968-69) | 57.6                                                | 181       | 10.0                           | 29.8      |

1. USA had a total mileage of roads in 1967 as:

|                  |                        |
|------------------|------------------------|
| (a) non-surfaced | 877,611 miles          |
| (b) surfaced     | 2,827,303 miles        |
| <b>Total:</b>    | <b>3,704,914 miles</b> |

2. USA is twice as large in area as India — and for every 100 sq. kms. area had 48.5 kms. of surfaced roads in 1968.

3. Total road mileage in Great Britain in 1967 was 202,674.

4. Length of fourlane Autobahns in Germany in 1969 4500 kms.

5. Canada in 1966 had 440,385 miles of roads and 44,390 miles of street roads — out of which surfaced roads and streets were 316,469 and 34,272 respectively.

the road building programme comes somewhere near the bottom. It is this pathetic neglect which is making the position steadily more precarious. It is the plea of the Indian Roads and Transport Development Association that "there should be some proper relationship between the funds to be allotted for road development and the revenue accruing from road transport." While the exchequer is continuing to receive increasing volumes of funds from road transport through additional imposts, there is no corresponding increase in the funds earmarked for road construction as well as road maintenance. Because the yield from tax revenue on road transport has been always much higher than anticipated, it is necessary to keep roads in good shape if for no other reason but for considerations of revenue. Also, if the roads are motorable, the traffic on them would increase and would generate more employment. Instead of creating additional jobs through the building of *kucha* roads, more attention should be given to surfaced roads which would increase the number of vehicles plying on the roads. It has been estimated that each motorable vehicle creates more than 12 jobs. Thus the increase in the number of vehicles can be a powerful instrument for generating new jobs, though the government through its policy of heavy taxation has retarded its growth. This was also the verdict of the Keskar Committee Report.

The fact which needs to be highlighted is that the entire industrial activity and agricultural efficiency of the country is dependent upon an efficient road transport system. It is only through good roads that access can be had to the markets, both rural and urban. The transport bottlenecks in the coming years might cause disruption in the movement of essential goods which in turn would recoil both on agricul-

# We keep pace

At Madura Mills we keep up with developments in textile technology. Our equipment and techniques are the most up-to-date. Our laboratories correlate machines and procedures with international testing houses. A special pilot plant devotes time to research and development of new products. Manufacturers in 26 countries prefer Madura Mills' yarns and fabrics which are on a par with the world's best. In the financial year

1969-70 Madura Mills' exports earned for the country Rs. 7.6 crores in foreign exchange.

**MADURA MILLS' RANGE:** Cotton and synthetic yarns from counts 2s-120s; Industrial fabrics (Tyres and Warp Sheets, Transmission and Conveyor Belt Fabrics, Industrial Leno and Canvas); Twin Tush cotton fabrics; Saraband and Saraband 'Terene' blended suiting and shirting.

**Madura Mills Co. Ltd.**

ture and industry. At a recent meeting of the Indian Roads Congress held in Madras, it was suggested that a crash programme for building village roads should be evolved. It is true that we need roads for linking towns with villages, but we must learn a lesson from our past experiences. The building of the unmetalled roads under the community development programmes has been a wasteful effort in that valuable resources are spent on the construction of roads which cannot bear the impact of two monsoon seasons. That is why all money spent on them has gone waste and the villagers have still to use the bullock cart for carrying their produce to the market. It is time that we reconsider our policy in this regard and build only such roads as would be available for a number of years for use and would not be washed away by the first shower of rains. The *kucha* road is a great burden in the sense that its cost of maintenance is high.

#### Contributors of Growth

In the United States of America the automobile industry as well as the road transport industry have been great contributors to economic growth. Out of every seven workers in that country one has connection with the automobile or the road transport industry in one way or the other. The USA also has the most advanced system of mobility on the roads. On per head basis mobility is equivalent to 5,000 passenger miles and 7,000 tonne miles annually. In order to reach this level of mobility we will have to multiply our passenger transport by 24 and freight transport by 44.

According to an estimate made by the Planning Commission, a crore of rupees invested in roads generates 13,000 jobs in roads and road transport while the corresponding figures for agriculture and housing, forestry, irrigation and other sectors including small industries, railways and large industries are 5,000, 8,000, 7,000 and 2,000 jobs respectively. Because current estimates show that the number of the unemployed in our country ranges between 20 and 25 millions

—5 times the level in 1950—it has been suggested that the road building activity should be given more attention if for no other reason but for creating increasing employment. The President of India, Mr V.V. Giri, in his book entitled *Jobs for Our Millions* has said: "Apart from the direct employment potential of a vast road building programme, the rural areas, if opened up will undergo a transformation in their economy. The cost of such a programme is worth meeting even by deficit financing of half to one per cent of the national income." While we do subscribe to the view that road building as well as the road transport industry should be given more attention than it has been possible for this country to do so far, we do not agree with Mr V.V. Giri that we should resort to deficit financing for this purpose. There are many other sectors of the economy which have not been able to progress at the rate at which they were expected to do because of the paucity of funds. If Mr Giri's thesis of deficit financing is accepted in the case of road building and road transport, it will be logically applicable to other priority sectors as well with the result that we will resort to increasing deficit financing which in the end would be detrimental to our economy due to the inflationary pressures that it would generate.

As stated earlier, pity of all pities is that in each of the five-year Plans, the funds allocated for road building have not been spent fully. This has also been one of the root causes of under-development in this field. In the current Plan period also, our country is expected to spend about Rs 55 crores a year on national highways not including the lateral and other programmes but the estimated expenditure in 1969-70 and 1970-71 was less than half of the allocated funds. It is this non-implementation of the road plans which has been the basic cause of our failure in this vital sector.

The figures regarding road lengths for the whole country do not reveal the alarming situation which prevails in some of the states. Table V sets out the state-wise length of roads

TABLE V

## STATE-WISE LENGTH OF ROADS : 1955-56—1968-69

(Kilometres)

Source : Government of India, Ministry of Shipping and Transport—Basic Road Statistics of India and Road Facts, India.

and shows that the states of Assam, Bihar, Jammu & Kashmir, Orissa, Punjab, Haryana and Uttar Pradesh are extremely backward. In each of these states, the percentage of surfaced roads is less than one-third of the total which is the all-India average. Relatively fast rates of growth in the construction of surfaced roads have been witnessed between 1955-58 and 1968-69 in Assam, Kerala, Jammu & Kashmir, Orissa and Rajasthan. Such states as Uttar Pradesh and Bihar continue to ignore this activity as their pace of advancement has been lower than other states.

#### Taxation on Road Transport

The Government of India appointed eleven committees during the last 20 years to enquire into the problems of the road transport industry and almost each one of them recommended a reduction in taxation and simplification of the procedures. Ignoring the advice of these committees, the governments both at the centre and in the states have been imposing fresh taxes from year to year on the road transport industry. Consequently, the incidence of these taxes on every vehicle plying on our country's roads has been increasing year after year, and according to an unofficial estimate is the highest in the world today.

The Indian Roads and Transport Development Association has estimated that the annual burden of taxes on commercial vehicles varies from state to state, ranging between Rs 10,500 and Rs 15,000 on each commercial vehicle and from Rs 11,000 to Rs 26,000 on each passenger bus. In addition to these varying taxes in each different state there is the multiple tax system in our country. The state governments permit single point taxes only in the case of motor vehicles on regular permits on inter-state routes, which are issued on a very small scale. A majority of motor vehicles engaged in inter-state traffic have to obtain temporary permits which implies that the vehicles have to pay taxes once in the original state and then in the states which lie on the inter-state routes. The burden of taxes thus increases when the vehicle passes through four or five states.

Heavy tax burden, increasing cost of automobiles and inadequacy of our roads are three of the major factors which have curbed the progress of the road transport industry in our country. The suggestion of the Keskar Committee and the Study Group on Motor Vehicle Taxation (1963-65), that a standard inter-state tax should be imposed, has not been accepted by the state governments and there has been no change in the taxation policies of both the centre and the states. In 1950-51 taxes on motor vehicles were 6.15 per cent of the total tax revenue of the country. By 1959-60 this percentage rose to 8.55, and to 13.33 in 1965-66. At present, the tax burden is estimated to be around 16 per cent of the total tax revenue of the country. It is thus clear that the government has seized every opportunity of increasing the burden of taxes on this industry but has been reticent in providing facilities in road construction which should be commensurate with the burdens borne by this industry.

#### Strengthening the Sails

Even though the shipping strength of our country has increased from 200,000 tonnes in 1948 to more than two million tonnes today, yet we are not able to carry even one-fifth of our overseas trade in our own ships. In the case of liner trade the share of our shipping industry ranges from 40 to 45 per cent but our share in bulk cargo trade is less than 10 per cent. It is because of this deficient situation that the fourth five-year Plan has set a target of attaining four million tonnes capacity by 1973-74. It implies that by the end of the current Plan period, 3.1 million tonnes will be engaged in overseas trade, 0.4 million tonnes in coastal shipping while about half a million tonnes would be on order.

The main acquisition will be in respect of bulk carriers or tankers. If the target set by the Planning Commission is achieved, this country would be able to cater for about 40 per cent of its overseas trade.

The provision made for this purpose in the fourth Plan is Rs 140 crores. In 1969-70, a sum of Rs 26.28 crores was spent while in 1970-71 as against an outlay of Rs 23.62 crores, a sum of Rs 49.10 crores is expected to be spent. The proposed outlay for 1971-72 is put at Rs 58.15 crores. In other words, in the first three years of this Plan period, a sum of Rs 133.53 crores is likely to be spent on the acquisition of ships. It, no doubt, looks encouraging in the sense that as against road transport where the allocated funds are never fully deployed, in the case of shipping an earnest effort is being made to use all the funds allocated for this purpose. The problem, however, is accentuated by the paucity of foreign exchange which is scarce and sometimes this country finds it difficult to provide even a down payment of 20 per cent of the cost of the ship. The closure of the Suez Canal and the boom in the shipping industry have brought about revolutionary changes in world shipping in the sense that more and more countries are going in for larger ships. The order books of the ship builders, both in Japan and European countries, are already full. According to latest indications it appears that our orders for ships would not be executed by the ship-builders before the end of the fourth Plan period.

The delay in the acquisition of ships will not only cause increasing hardship to us but will also put us at a disadvantage because, year after year, the prices of ships are continuing to increase. Wages all over the world are going up; similar is the case with raw materials, particularly steel. That is why the ship-builders are now insisting upon incorporating in their agreements a clause for price escalation. Because of the boom in the ship-building industry, ship-build-

'Zari' work is the livelihood of hundreds of homes in Surat.

**Union Bank**  
gives loans that help  
this traditional  
craft to prosper.

India is one of the original homes of 'zari' embroidery. This traditional craft is kept alive by the womenfolk in Surat. The Union Bank advances 'zari' workers loans at a preferential rate of interest. The Union Bank also plays a vital role in developing the national economy. Grants loans to farmers and small-scale industrialists. Encourages them to buy modern equipment to increase production. The Union Bank is not just a city bank. It has branches all over India. Many are spread over the rural and semi-rural areas. Out in the country with the people, the Union Bank helps them better their living.

ders are no longer willing to extend deferred payment terms to buyers.

These problems which the shipping industry faces were brought to the fore at a recent seminar on "Problems and Prospects of Indian shipping in 1970s", which was organised by the All India Ship Manufacturers Organisation in Bombay. This seminar was inaugurated by the union Minister for Shipping and Transport Mr K. Raghuramiah, who in his inaugural address stated that the government had accorded the highest priority to the development of shipping. It was for this purpose that the government had approved the establishment of a second shipyard at Cochin which would be able to build ship at first of 66,000 DWT and ultimately of 85,000 DWT. In order to give a practical shape quickly to the setting up of the shipyard at Cochin, the government had now entered into an agreement with a Japanese firm so as to commission the yard within five years. It is, however, patent that the Cochin shipyard would not start working till after the end of the fourth Plan period. For augmenting our capacity during the current Plan period we have no option but to take measures for increasing the capacity of Hindustan Shipyard at Visakhapatnam. At present the Visakhapatnam shipyard is in a position to build four to five ships a year but its capacity can be increased to build at least six ships every year. The public sector shipyards which have so far been catering for defence needs should also be harnessed for the construction of merchant ships.

As stated earlier, the paucity of foreign exchange has been one of the main reasons for our failure to increase our shipping capacity at a much faster rate. The government, however, has assured the shipping interests that it would exert its utmost to obtain credits from foreign countries for purchase of ships. The government has also promised the release of free foreign exchange for down payment for the ships purchased on deferred payment terms. Let us hope that these assurances would be honoured both in letter and spirit.

#### Revolving Fund

The shipping interests in this country have many times made a request to the government to set up a revolving foreign exchange fund by pooling net foreign exchange earned by our ships. This, it is stated, will go a long way in the acquisition of additional shipping capacity. Some time back the government of the USSR made an offer to our government to construct 10 to 12 vessels so as to meet our needs for tankers and bulk carriers. As the Japanese and other European suppliers of ships have taken rigid postures due to the boom in the shipping industry, it will be in our interest to accept the Soviet offer. An added advantage of the Soviet offer is that the shipping companies in this country would be able to acquire bulk carriers at international prices on rupee payment basis.

We can continue to ignore the ship-building industry at our own peril. Already, all over the world the trend is towards giant tankers of 100,000 to 300,000 GRT for the expressed purpose of achieving economies of scale. In our plans for expanding the ship-building industry and the docks we must take into account these trends and should start planning the construction of large-sized tankers as well as bulk carriers.

According to the present plans of the Shipping Ministry orders for the acquisition of 525,000 GRT will be placed before March 31, 1971. For the last two years of the Plan period orders for the acquisition of 422,000 GRT and 305,000 GRT are expected to be placed with the suppliers.

While our country has rightly shown its anxiety to acquire new ships it should not at the same time neglect another

important activity, namely, repair and servicing of ships which cannot only save us considerable foreign exchange but can also be instrumental in earning sizable amount of hard currencies through the offering of these services to ships of foreign countries. It is worth mentioning here that the United Kingdom is able to earn as much as £ 50 to 60 million every year through repair services provided by it to ships of other countries. It is necessary that we should devote more attention to this aspect. Idle ships lying in docks for want of repairs can be the cause of considerable loss every year. We have repairing and servicing facilities in the docks of Bombay and Calcutta only. It is necessary that we should diversify these activities so that the ships of foreign countries may get these services easily in one of our major ports while they are passing through the Indian Ocean. Moreover, the servicing facilities and the techniques being currently used in both these docks are obsolete. We must make additional investments to bring them up to the present-day international standards.

Again the National Shipping Board has appointed a committee which is currently studying the question of opening new routes where potential markets exist for goods of our country. The opening of new routes will not only help us in increasing our trade but will also be a useful way of establishing friendly ties with different regions of the world. Direct connections through our ships to some of the ports in west Africa, south-east Asia and Latin America will provide an outlet to our goods and for the purpose of export promotion alone, if not for any other reason, the opening of new routes is essential.

#### The Crowded Ports

In recent years, the steady increase in the volume of our foreign trade has brought about congestion in our ports. Berth occupancy is reported to be as high as 95 to 97 per cent. Consequently, many a ship is forced to wait outside the port which causes a number of problems. In view of the fact that the standing charges for a vessel range from Rs 10,000 to Rs 18,000 a day, the high cost of keeping ships waiting outside the port can well be imagined. Inordinate detention of ships cannot but add to the freight costs of our foreign traders.

As stated elsewhere, the trend in the world is towards large-sized ships. Our limited quay space is likely to come under great pressure if we do not devote enough attention to increasing cargo handling capacity of our ports. According to the Planning Commission, the volume of cargo to be handled in our ports is expected to increase four-fold (see Tables VI and VIII) between 1968-69 and 1985-86. Action on two fronts is needed. The capacity of our berths needs to be expanded and at the same time we must start making use of specialised bulk cargo handling facilities which are increasingly being utilised in some of the advanced countries. The speed of loading and unloading of cargo can certainly be increased if we go in for modern equipment. It has been observed that the clearance of cargo at our ports is hampered by procedural delays due to rigid customs and import control formalities. It is essential, in the interest of smooth and efficient working in the ports, that all such hurdles should be removed and the recommendations made by the Study Team on the Customs Department (April 1967) should be accepted and effectively pursued.

For rational cargo handling, containerisation is being increasingly practised all over the world. It not only reduces damage to the cargo but also brings down the cost of transportation. It is therefore essential that our ports should acquire facilities relating to container operations so as to be "in consonance with the world trend." The Commission on Major Ports rightly suggested in June 1970 that Haldia on the east coast and Bombay on the west coast

## SCINDIA

### GIRDLES THE GLOBE IN THE SERVICE OF THE NATION

Scindia's ships work ceaselessly round the clock, round the year, round the world, carrying India's exports and imports, thus helping the wheels of our industries to move, our development projects to forge ahead, our soil in producing more, in keeping up the flow of our exports to earn vital foreign exchange and to strengthen the infrastructure of our developing economy. Scindia's ships also, by their services, save and earn precious foreign exchange for our country. In the service of India's commerce, Scindia is foremost.

## INDIAN SEAFOODS find a place at tables the world over

Indian seafoods have gained wide acceptance in highly sophisticated markets in the U.S.A., the U.K., Japan, Australia and the Continental countries.

In 1969, 330 million rupees worth of Indian seafoods were exported. The Fourth Plan aims to step up foreign exchange earnings to over Rs. 600 million through the export of marine products.

India has a long coastline, and her seas are rich. If you are interested in cashing in on this tremendous potential, ... if you need help, advice or information on any aspect of the Indian seafood industry, please contact,

The most important conclusion arrived at by the Commission was that without large-scale mechanisation of our ports, the congestion would be impossible to remove. The slow pace in this regard has been due to the unhelpful attitude of labour which has always opposed large-scale mechanisation. It is necessary that the government, the shippers and the shipowners should take labour unions into confidence and without hurting the interests of the latter, a policy should be devised whereby the ports are made capable of handling the challenging tasks which we will be called upon to face in the seventies.

### Airlines: Room for Improvement?

The sharp increase in air traffic during the past few years has exerted increasing pressures on Air-India and Indian Airlines — both public sector undertakings — which have been trying to put up a good show but with varying success. Their working operations leave much to be desired, though taking the long-term view Air-India has definitely done better than Indian Airlines. One lesson which the operation of these two corporations during the last 17 years — both came under state control in 1953 — has driven home is that nationalisation of an industry does not "generate a new spirit of enterprise and co-operation" which the protagonists of statism proclaim from house-tops. From the very beginning, both these undertakings have been victims of ugly employer-employee relations and the managements have had to face strikes, go-slow and work-to-rule tactics of workers. Even the highest paid employees, i.e. the pilots, have created considerable trouble for them. For instance, the pampered pilots of Indian Airlines went on strike in the first week of December 1970, thus holding the public to ransom and also causing considerable harm to the working of the undertaking. This is not the first time that Indian Airlines has been made to suffer because of the difficult attitude of its employees. In fact, the workers have been resorting to these tactics off and on. Air-India has been no exception in this regard. The 21-day strike by the Flight Navigators' Guild in protest against the award of the National Industrial Tribunal in 1965 is still fresh in our memory. In 1966-67, all Air-India aircraft had to be grounded in the first week owing to a strike. Again in 1967-68, there were a number of strikes by flight and ground personnel.

While the impact of the stoppage of work in December 1970 by the pilots of Indian Airlines will be reflected in the profit and loss account of the corporation for 1970-71, it is worth recording that during the past 10 years Indian Airlines has not been able to earn an adequate return on capital employed. In Table IX working results of Air-India and Indian Airlines have been compared. It is shown that the average annual capital employed in the case of Indian Airlines between 1960-61 and 1969-70 was Rs 29.67 crores. The net profit after meeting all liabilities including taxes was on the average Rs 0.27 crore a year. It follows that during the past decade, Indian Airlines obtained a return of less than one per cent on total capital employed. The picture is however encouraging in the case of Air-India. The average capital employed in the case of Air-India worked out to be Rs 17.23 crores a year while the net profit per annum was Rs 1.70 crores a year indicating a rate of return of about 10 per cent.

If a monopoly such as Indian Airlines which only recently raised its fares has failed to put up a good performance, it is because of its incapacity to manage its affairs with an iron hand. Nationalisation of the nine private airlines in 1953 was expected to enthuse the workers to put in much harder work and give increased co-operation to the corporation but according to Mr Shankar Prasad (a former chairman of Indian Airlines) "the workers saw in it as elsewhere an opportunity for doing less work for more pay." This is clearly reflected in the inordinate increase in the overtime bill of Indian Air-

lines during the last six years. In 1964-65, the overtime and holiday bill of the corporation was Rs 79.81 lakhs. By 1969-70, it had multiplied almost three times to Rs 238.94 lakhs. No operational indicator of the corporation has increased at this fast pace.

It is argued by Indian Airlines that its financial operations cannot improve unless it is provided relief in the cost of fuel (kerosene) which is the highest in the world. Indian Airlines is currently paying more than five paise per seat kilometre whereas no other airline is called upon to pay more than two paise per seat kilometre. Some of the airlines in other countries are provided with still cheaper fuel. During the current year, the cost of aviation fuel and oil is likely to be 28 per cent of the operating expenses in the case of this corporation. In the case of other airlines, the percentage of fuel and oil cost to operating expenses varies from 7 to 15. The incidence of high excise duty on kerosene accounted for nearly one-third of the total cost of fuel. If the percentage of fuel and oil cost to operating expenses were reduced to 20 through concessional excise duty on kerosene, the annual profits of Indian Airlines would increase by four crore rupees according to the General Manager, Mr K.T. Satarawala.

But the moot question is: why should Indian Airlines be given this relief? Once this facility is conceded to Indian Airlines, many other undertakings in this country would come forward asking for similar concession. This is hardly a practical proposition. Indian Airlines had better streamline its activities and cut out all unnecessary expenditure wherever it exists. If even after that, it is unable to earn a reasonable return on capital employed, it had better raise the fare rates. After all, nearly 90 per cent of its passenger traffic is on government or company account. It must, however, see to it that the increase in fares is not once again consumed by wasteful expenditures. There is a feeling in the country that the managements of all public sector undertakings have been lax in relation to the use of funds at their disposal. Mr Shankar Prasad, a former chairman of Indian Airlines, has opined that: "Time was when a civil servant spent public money as if it was his own. But this concept has been thrown overboard".

It is encouraging to note that this undertaking has started making increasing use of electronic data processing machines in order to tone up its working. According to the report of the board of directors for 1969-70, the utilisation of the

computer increased to 207 hours in March 1970 as against 139 hours in the corresponding month in 1969. The major works undertaken by the Computer Division were inventory control plans for advance passenger reservation and work in connection with the Boeing project. Improved data processing coupled with improved communication facilities is likely to cut down its costs, thus leading to increased surpluses.

Air-India, like its sister concern Indian Airlines, has also suffered many a time due to strikes and go-slow tactics of its workers but over the long period its working results have been better than that of Indian Airlines. It is true that Air-India has one advantage, namely, it is not called upon to pay any excise duty on kerosene consumed by it but, by and large, it is a better managed undertaking. Despite keen competition with some of the foremost airlines of the world, Air-India has been able to give a good account of its working. In line with international standards, its fleet consists of only Boeings as it stopped using Dakota freighters in 1961 and super constellations in 1962. It has a good image among the leading airlines of the world.

#### A Good Record

Back in 1963-64, Air-India took the decision to pay interest on the loan capital received from the government despite the fact that the latter had granted the undertaking a moratorium in this regard. Interest charges were paid regularly every year thereafter as the corporation continued to show good working results. In regard to punctuality of take-offs, Air-India has a good record. The punctuality factor has ranged between 97 and 99 per cent during the past decade.

Now that Air-India is expected to receive its first jumbo (Boeing 747) in May 1971, it is legitimate to ask if this country has taken necessary steps for their smooth ushering. It seems that parking bays, terminal building facilities and amenities to passengers, and servicing facilities to aircraft are still deficient. There is urgent need to improve these conveniences at the four international airports at Bombay, Calcutta, Madras and Delhi. The airports in particular need to be redesigned so as to accommodate the increased activities of not only the jumbo jets of Air-India but also of other airlines.

In regard to runways, Boeing 747 is not likely to cause much trouble as it can operate from the same runway from

## What makes an AMCO Battery stand out from the rest?

**BUILT-IN QUALITY WITH SILVER COBALT**

Every Amco Battery Positive Plate is protected by a hard, super-tough coat of double-action Silver Cobalt. Silver Cobalt protects your Amco Battery three times longer against over-charge failures compared to any other battery.

Silver Cobalt also 'locks-in' that trouble maker—Antimony (which is needed to harden the lead)—on the Positive Plates to give extra long life to the Negatives.

It's no wonder that the AMCO POWER PLUS BATTERY STAYS STRONGER LONGER

BATTERY PERFORMANCE & OPERATING COSTS

• SILVER COBALT PROVIDES MAXIMUM BATTERY LIFE—UNKNOWN EVER BEFORE

• GIVES YOU THE BEST VALUE FOR YOUR MONEY

INFERIOR BRANDS MAY BE CHEAPER BUT CAN ONLY CAUSE YOU ENDLESS TROUBLE WITH FREQUENT BATTERY FAILURES.

IT DOES NOT PAY TO BE PAISA WISE & RUPEE FOOLISH

\*Includes likely payment of wages equivalent to Rs 1.66 crores.

plane manufactured commercially. Air-India has placed an order for four of these jumbo jets. The purchase of these jumbo jets will be partially financed by loans extended by the Export-Import Bank of the United States. The value of the loans is Rs 41.6 crores.

Though Air-India and Indian Airlines are both public sector undertakings, there is lack of co-operation between the two. Indian Airlines is responsible for looking after the domestic services where the load factor is extremely high while in the case of Air-India, it is relatively low. While flying over our own country, the low load factor of Air-India can be profitably used for accommodating passengers on the crowded routes such as the golden triangle. It is, therefore, necessary for Air-India to start negotiating with Indian Airlines to secure more traffic for itself. In the recent crisis created by the strike of the pilots, Air-India had come to the help of Indian Airlines. But this arrangement needs to be placed on some sort of a permanent footing.

TABLE X

## Some Thoughts on Mature Socialism

JAN TINBERGEN

It is a great honour for me to have been invited to give this year's Nehru Memorial Lecture; for me, it is also a great occasion. India is by far the largest country of the non-committed world and many of my friends like myself are aware of how much depends on where India goes. Jawaharlal Nehru decisively influenced India's future path. Under his guidance India was the first of the non-committed countries to embark upon a planned development. In the second five-year Plan this country chose in favour of a "socialistic pattern of society". Having been, since my student days, a member of the Democratic Socialist Party of my own country, I took a keen interest in the road chosen by this great country. For today's occasion I could not think of a better subject than the one announced, that is, Some Thoughts on Mature Socialism.

It is a good habit to start an address with a definition of the subject and a layout of the address. In my case this seems to be the more necessary since the word socialism in our days covers a variety of versions and also as I have added an unusual adjective. Although I propose to elaborate somewhat on the origin and the history of socialism a bit later, I see some convenience in formulating my own definition of socialism now. I see it as the institutionalisation of solidarity among human beings and as the recognition that in last resort the community is responsible for the welfare of its members. Its opposite is individualism in the sense of each individual being responsible for his or her own welfare. The word socialism, having been derived from the same root as the word society, in my opinion stands for this task of society to maximise the welfare of its members.

The word mature, in my mind, stands for using as much human experience as possible in order to avoid inconsistencies in behaviour; especially to avoid doing things which one later deplors.

The subjects I propose to take up in an attempt to elaborate on my theme are (1) some lessons from socio-economic history; (2) some features of the history of socialism; (3) scientific socialism as I see it now; (4) actual and possible contributions of socialist ideas to Indian development and, finally; (5) actual and possible contributions of socialist ideas and of India to world development. I apologise for the ambitious suggestions implied. I will take up these subjects one by one.

### Socio-Economic History

Socialism was launched, as a set of ideas, about a century and a half ago. Some of the facts used as a basis for Marxian scientific socialism were registered about a century ago. Since then society has further developed, with development of science and technology, as one of the driving forces. Technological development has indeed been unprecedented and today's production methods are infinitely more complicated than those of a century ago; also the size of productive units has grown enormously. Very impressive contributions have been made to the well-being of the population of the developed countries and some modest contributions to the well-being of the poorer sections of the world. Increasingly also negative effects have emerged, especially the change in technology of armament. Other dangers are the deterioration of human environment, the dangers of drugs and the problems created by the population explosion.

The last century has also added to our social experience. New social structures have come into existence, under the

Text of the Jawaharlal Nehru Memorial Lecture delivered in New Delhi on November 13, 1970.

impact of two main forces and a number of the secondary ones. The two main forces are the labour movement and the movement for national self-determination. The new structures appear in different forms. In the highly developed countries stepwise social reforms have prevailed; in the less developed part of Europe sudden changes have occurred of which the creation of the Soviet Union was the most important. All over the world—with few exceptions—nations have liberated themselves from foreign domination and empires have been dissolved as in the case of the Austrian-Hungarian empire after World War I or been transformed as in the case of the British and French empires after World War II.

The new structures were inspired by theories and hence constituted experiments from which we have been able to learn. The lessons we learned have often been starting points for other changes, forward or backward, depending on the nature of the experiences.

### Relevant Experiences

It is of particular interest to list experiences relevant to socialist ideals. In the early phase of the socialist movement the social structure aimed at was fundamentally different from the free enterprise free-market system more or less prevailing around 1850 in the then most developed countries. According to these theories private ownership of the means of production should be changed into community ownership; free competition into central planning. Incomes should be distributed much more equally and as a consequence all citizens would have access to the boons of culture. In the new classless society the forces making for war would have disappeared. This picture I will indicate as "primitive" socialism, as distinct from mature. As announced, we will discuss later in some more detail the history of socialist ideas. For a better understanding of that history and of what I mean by maturity we will discuss first some of the experiences gained from the changes introduced.

A positive experience western Europe has made is the possibility of stepwise change, implying that each step is a partial change and not necessarily a fundamental one. The introduction of social legislation, progressive tax systems, a long series of new public tasks and, in particular, anti-cyclical policies are examples of successful partial changes contributing to the welfare of the socially weak groups.

An experience of a mixed character is the one with changes in ownership. State-owned enterprises and co-operative enterprises have not been universally successful. No doubt Soviet experience has shown that production is possible without private ownership of the means of production. Whether that production is more efficient than private production cannot be derived from the Soviet experiment, however, since fair competition between the two types had not been arranged. Even in western countries comparisons in efficiency between privately and publicly owned enterprises have rarely been made, since as a rule an industry is either completely private or completely public. The few cases I know of where public and private units existed side by side in

bring to explosion antiquated social structures, that is, structures preventing new technologies from being applied.

The word socialism has had a tremendous appeal to western workers and later, more generally, to the oppressed elsewhere. This appeal has also been abused by such groups as the "national-socialists" — a *contradictio in terminis* — and some French politicians. Unfortunately the accusation of abuse has also been used against people of a truly socialist conviction. This is a consequence of the dynamics of thought and society. Around 1900 one form of revisionism was started by the German socialist Bernstein<sup>2</sup> and then a long series of revisionists have followed; I only mention Tito and Khrushchev.

While dramatic discussions already took place before World War I, a decisive split between the revolutionary and the reformist wings occurred as a consequence of the events in 1917 in Russia. In the so-called October Revolution (November, according to our calendar) power was taken over by the Bolsheviks or, as we now say, communists, followed by a series of internal power struggles within the communist ranks. It was a matter of considerable controversy whether this development — I mean Russia emerging as the first socialist country — was in line with Marxist thought, where socialism was assumed to be the fruit of a highly developed capitalism. There was doubt even whether Marxist theories were at all fitting a predominantly agricultural society as Russia was in 1917. No doubt the greatest difficulties of the Soviet regime have been in the field of agriculture, a matter of importance to India. As an alternative, Maoist thought starts from the village as the *avant-garde* in the socialist struggle.

In the meantime the Soviet Union has become a major industrial power, though at the cost of immense sacrifices in consumption, especially during the thirties, and notwithstanding the murderous war imposed on them by the German "national socialists". In the fifties Soviet development has been quite remarkable, although still surpassed by recent Japanese development, but in the sixties the need for some decentralisation of decision-making became clear.

### Yugoslav Experience

Decentralisation of a more pronounced character had already been introduced in Yugoslavia, where not only the market, but also labour management has been introduced, implying forms of industrial democracy not existing in either western or eastern Europe.

Within the eastern European bloc some of the decentralisation reforms accepted by the Soviet Union spread, and in some respects tried to go further. The Czech version was blocked by military intervention, whereas the Hungarian and Rumanian versions did not cause difficulties. In Hungary probably the most sophisticated new internal decentralisation was tried out, whereas the Rumanian case is one of more national independence from the bloc.

Thus, the river of socialist ideas has split into a large number of branches. The Social-Democrats adhere to parliamentary democracy and to stepwise transformation of society. The communists of all brands stick to the idea of the monopoly of one party. The Chinese look at the peasants as the innovators; the European communists at the industrial workers. The official east European bloc sticks to state-owned production units, but is shifting decision power from the state to these units.

The discussions between the representatives of these branches have been troubled by emotional outbursts. As you

know, emotions restrict our capability to think objectively, that is scientifically. The names given to each other reflect the emotions of the discussers. One of the names called is "bourgeois", evidently a bad word. Another is "revisionist". You are no doubt aware that many socialists consider the word revisionism also a bad word and few revisionists announce themselves as such; usually they are called that by others. To me it seems that no scientist should ever reject revision of any theory if observation shows that the theory does not fit the facts. It is the essence of science that it consists of a series of revisions. In the history of socialism we observe, however, a succession of splits between revisionists and orthodox, with a danger for the orthodox to degenerate into doctrinairism and a danger for revisionists to become opportunists. A scientific approach implies, though, the possibility of a free discussion and of fair experiments. I am not sure, to say the least, that experiments with public enterprises in western countries and with private enterprises in eastern European countries have always been fair. My own conclusion from the history of socialism is that in order to remain scientific socialists we must accept revisions, in the light of experience, of the means to attain the goal. The goal remains the same, however, and its core is solidarity among human beings to be reflected in our social structures.

### Scientific Socialism Today

Let me now try to give my own interpretation of socialism in today's world. I apologise for the technicalities involved and will soon return to plain language. You will not be amazed that as an economist I take as my starting point the theory of welfare economics. This chapter of economic science attempts to formulate the conditions that have to be fulfilled in order to maximise social welfare, under the restrictions given by nature and technology (or the "productive forces"). Of course, the outcome depends on how we define social welfare. In this definition some of our humanitarian values must be expressed. I believe that large sections of a modern community are accepting these values, which I will sketch out later.

Let me add first that the real problem of welfare economics is not only to state the conditions to be fulfilled by the maximum, but to interpret these conditions in terms of the institutions which together will let these conditions materialise. This group of institutions may also be called the optimum social order or regime and this I take to be identical to the mature socialist order. Indeed it is derived from our value system while using all scientific information available.

Our value system finds its expression in the social welfare function. I submit we have to think of it as the sum total of all individual welfare or utility functions. I use the word utility as the broadest concept of human satisfaction and hence use the expression welfare as synonymous with it. Both must take into account what psychology and sociology have taught us and not stick to material well being only. In what I said the sum total of all individual welfare reflects the element of solidarity: everybody's welfare is counting. The shape I give to individual welfare functions reflects my view on that old concept of the fundamental equality of all human beings. Each individual welfare or utility function contains variables and coefficients. Variables may be the individual's consumption, an index (or several indices) representing his job, and one or more indices representing his abilities and his needs. Among the latter are the size of his family or his professional needs. The coefficients indicate the intensity of the influence of the variables on his satisfaction or welfare. I interpret the fundamental equality of human beings as the equality of these coefficients for all individuals. This is an assumption, a working hypothesis.

Since the variables may differ from person to person, all observable differences among human beings which science

has shown us are accounted for. So in a way my approach to the subject of equality is that I assume equality unless observation shows inequality for instance in abilities and needs. Among the variables some of these abilities and needs may be given; the problem of the best social order is to choose the job and the consumption of each individual as to maximise total social welfare. Of course the brevity of the formulation leaves unanswered a number of questions, but I hope it has the advantage of emphasising the essence. I should add that, on the one hand, there are a number of lacunae in our knowledge which have to be filled by further research, but that, on the other hand, some conclusions about the optimum order can be drawn without some of my assumptions or our knowledge.

The advantage of using welfare economics as a starting point to define a mature socialist order consists of using the same method as the one applied by the most sophisticated defence of liberalism offered in the past. In this way the definition of socialism can be seen as a critique of liberalism based on criticising the assumptions made for its justification. In fact it is mostly because of antiquated assumptions regarding the production process that the liberalist view must be rejected.

In our critique a distinction must be made between what I shall call ultraliberalist practice and the liberalist theory as defended by V. Pareto and his followers. Ultraliberalist practice not only defended free enterprise and free markets,

but even the principle of "each for each", which is the rejection of income redistribution. This cannot be justified, however, by welfare economics, and even a man like Milton Friedman recognizes this. Income redistribution is necessary any way and is already implicit in Pareto's optimum situations. But with today's production processes the general decentralisation in decision-making typical for free enterprise and free markets is no longer optimal. This is due to the increased indivisibility of capital goods and to external effects. Both require decision-making on higher levels for the activities showing these features.

#### Consequence of Indivisibilities

Often external effects can also be seen as a consequence of indivisibilities. So the pollution of air and water, often described as an external effect of motor traffic and chemical production, can be seen as a consequence of the indivisibility of the earth's atmosphere and the earth's rivers and seas system. What has emerged from new technologies as well as from a better understanding of the operation of economies is a long list of activities which are government tasks and cannot be left to private decisions. Private armies and police, or competing issuing banks once existed, but we have understood early that they are not the best way of taking care of external and internal security or of our need of a sound monetary system. Today we recognise that large parts of transportation, energy and water production and education cannot be left to private decision-making; that the government has to regulate unstable markets, the total volume of demand, the rate of investment, and to provide macro-planning and a good deal of information and communication. Thus we arrive, on the basis of the new productive forces, at the conclusion that a mixed economy is better than the extreme of decentralisation. In the light of experiences I discussed before, complete centralisation is an inferior method too. Both state ownership and central micro-planning have their drawbacks. The remaining problems of an optimum order are problems of degree, rather than problems of principle. Here we find quite a few unsolved problems, for instance, those of the right system and level of taxes, depending on the outcome of further research. The problem is related to the problem of the optimal job and income distribution. Elsewhere<sup>16</sup> I have tried to show that this optimal distribution can be said to imply the well-known slogan: "from everybody according to his capabilities, to everybody according to his needs", but that this requires a tax system which we are not yet able to administer. In the meantime we have to use "second best" tax systems. May I add that in my opinion the concept of an optimum income distribution will have to replace the concept of the elimination of exploitation. One dramatization of these unsolved problems is the question whether we can avoid mass misery during take-off. So far the masses suffered in each type of take-off we know: the British around 1800, the Russians around 1930 and the Indians right now. I am coming back to this vital issue later.

From my view on the optimal or mature socialist order I derive two conclusions which I want to emphasise. The first conclusion is that we should not stick to doctrinaire views based on antiquated theories, sometimes on scientific views of a hundred years ago. It is essential to science and hence to scientific socialism that our minds are open instead of closed and that we are tolerant instead of narrowminded. There is a message involved for socialist political parties. Intolerance and the tendency to form small sectarian parties is not in conformity with solidarity, apart from being against the spirit of science. One condition has to be fulfilled in order to re-unite socialist parties; the condition that a clear and vigorous policy be followed. I hope to specify the contents of such a policy later.

The second conclusion refers to the developments to be expected in both western and eastern societies. If we accept

the broad Marxian view that the economic forces determine to a large extent the super-structure of a social and political nature, we must expect that all societies have a built-in tendency to move towards the optimum. Since the optimum is somewhere between the completely decentralised and the completely centralised structure, we must expect a movement which will reduce the differences between the originally liberalist and the primitive socialist structures. This is what we actually observe in Europe. Already we have started a dialogue between economists of eastern and western Europe about a number of common problems, such as which decisions to centralise and which not. If this is the picture in Europe isn't it tragic then that in Asia the tendency prevails to fight a struggle of life and death? Persuasion, not violence should be the way to decide upon social structure.

As a last remark on my view of scientific socialism as of 1970, let me add that it also has an important international aspect, to be discussed later.

## Actual and Possible Contributions

I may now try to sketch out what actual and potential contributions socialist ideas are making or may make to the development of India. As your President Mr Giri said on July 6, "we are pledged to establish a socialistic pattern of society by democratic means" and he warned that "our people must realise that it is hard work alone which can bring about equality through increasing prosperity". To avoid any misunderstanding let me start the subject by saying that not only socialist ideas but also non-political ideas of technicians, employers and educators will have to play their part, a very important part even.

Socialist ideas, however, have to contribute an important part in shaping the general structure of society in developing countries and hence also in India. Thus, it is a simple truth that tax evasion is contrary to solidarity and hence rejectable. It is a truth officially recognised in this country that the caste system is also rejectable, for the same reason. Among the most important aspects of a society's general structure is inequality among individuals with regard to their starting point in life. "Equal chances" is a slogan already accepted by liberalism, but not materialised during the rule of this political principle; socialists should try to dig more deeply here. Partly they have done so in their pleas against inherited property or against property of capital goods generally. As I tried to make clear, the western alternative to complete nationalisation as advocated by eastern European programmes is gradual socialisation of property rights. In a way this western viewpoint is reflected in Myrdal's<sup>10</sup> recommendations with regard to land property. He is in favour of tax measures and a minimum property rather than either nationalization or a ceiling. A quantitative assessment of the possibilities here, and the influence of a steeply progressive land tax on tax revenue as well as productivity in agriculture, seems to be useful. In addition a study of which other types of property can be tackled the same way should be considered.

Another way of reducing the inequality of chances has been long recognised to be education. Here all countries, rich and poor, are facing the same problem. For developing countries the problem is even more important than for developed countries. As we know by now, the trouble for the least educated groups of population is that education starts long before schooling. Just as is the matter with nutrition the harm to underprivileged children is already done at very young ages and the organisational problem is how to reach these young children by schemes of improvement. Quite apart from this difficulty there is the urgent need for more effective methods of education than the traditional ones: less learning by heart and more teaching to understand, less passive listening and more active participation.

A third way of attaining equality in opportunities is to create more employment. I am coming back to this later, in

the framework of some suggestions on development policies as I see them. These I am now going to make.

Foremost in our minds agriculture has still to be, not only because such a large portion of Indian population is rural, but also because, as Minister Jagjivan Ram told the second World Food Congress in my home town<sup>11</sup>, "agriculture is becoming as much a source of capital and investment as industry". In this context Mr Ram of course also mentioned the green revolution, which has given rise to new hopes, but also to new problems. The small farmer needs special attention, partly by appropriate credit facilities. Together with other inhabitants of rural areas he may profit from a number of so-called intermediate technologies and from further research around the use of sunlight and wind. Such research has obtained higher priority now that the dangers of ecological disequilibria are spreading and some allegedly modern techniques may have to be restricted in order to save human environment.

While it remains true that development requires industrialisation, the first source of industrialisation in many developing countries is better use of existing capacity. This in turn requires expansion of demand and here trade policies of the developed countries are the bottleneck. The choice of new industries should be more employment-oriented and hence labour-intensive industries; again the bottleneck of trade policies has to be eliminated. The plea I just made in favour of labour-intensive industries has been criticised by many colleagues of mine. I am glad to find the President of India, in his statement of June 10, before ILO, is on my side<sup>12</sup>. I also think my collaborator B. Herman has collected new evidence showing that from one million rupees both more income and more employment can be obtained if invested in labour-intensive or intermediate than if invested in capital-intensive activities<sup>13</sup>.

In the field of industrialisation the multinational firm and the joint venture remain important. Since this also is an old subject of discussion let me only say this: just as much as the possibility of trade to mutual advantage exists, as our Soviet friends put it, investment to the advantage of both parties is possible.

## Contribution to Employment

But the contribution to employment to be expected from industry is not large in the near future. A much larger contribution could be obtained from an expansion of building. From a humanitarian point of view an enormous volume of building is desirable. In the restricted economic sense it is not too attractive a proposition, although opinions are somewhat changing, now that some of the indirect (external) effects of better housing have been estimated. Again international co-operation will be a way out, especially, for instance, if the execution of the Basic Development Plan of the Calcutta Metropolitan District is to be assured. Among international housing experts there is a beginning of support for such a special project.

A last word about Indian development. Western socialists openly and eastern Europe implicitly, by their own behaviour, thoroughly sympathise with the efforts made by the Government of India to stimulate family planning. It is part of doing away with superstitions.

I quoted Marx about antiquated social structures which stand in the way of modern productive forces and hence have to disappear. None of our social structures is more antiquated than the international structure, which is almost the jungle. It is heartening to quote Mr. Apa B. Pant, India's High Commissioner in Britain, speaking in his personal

capacity: "Basically, India thinks of only 'one world'".<sup>11</sup> May I add another quotation, from Mahatma Gandhi who said: "The conception of my patriotism is nothing if it is not always...consistent with the broadest good of humanity at large".<sup>12</sup>

In my own way I would say the same things by elaborating on what I announced as the international component of mature socialism. The proposition that in the optimal social order some decisions have to be taken on higher levels than the enterprise or the individual level can be further specified. The level should be high enough so as not to leave sizable external effects. For some types of decision the level of a city may suffice—think of traffic regulations—; for others the level of the nation is required—think of education. Finally there are decisions which can only be properly made at supra-national levels, some at world level only.

This is true for commodity agreements for world-market products; it is also true for other trade decisions and for decisions on financial flows between developed and developing nations. The urgent need for such collective decisions exists, first of all, in the field of development policies. Minister Swaran Singh was quite right when in this summer's ECOSOC session he said: "...I sincerely hope that our partners from developed countries would not hesitate to exercise the necessary political will and assume additional responsibilities which alone will make it worthwhile for the developing countries to plan their future course of development within the framework of a global strategy".<sup>13</sup> When discussing Indian development I already indicated several subjects where India can go ahead only if the developed countries play their part.

Recently more socio-economic subjects have come up

where some international authority will be needed. The multinational enterprises will have to be under some public control and supervision will be needed of air or water polluting activities and other activities threatening our future environment. These are questions of importance to all of us, whether from developed or from developing countries.

#### Matters of Peace and War

Of course the oldest and most urgent need for collective decisions is in matters of peace or war. I already mentioned our disastrous experiences with nationalist attitudes. Here socialist attitude all over the world is still pitifully immature, not to speak of other political parties. Perhaps business is ahead of politicians. Why do we have multinational firms but hardly any multinational authorities where they are needed?

Another way of presenting this fundamental problem is to state that a tremendous discrepancy has developed between man's intellectual capabilities and his moral capabilities. Politically we have not been able so far to unite, whereas the world we have created with our brains requires that unity for our survival. It requires statesmen (or women, of course) of the greatest stature to take the first steps here. I think of steps as they have been taken in my continent by Jean Monnet. Also here stepwise changes seem to be the most promising, but the dilemma is that we do not have much time. Would U Thant or Professor von Weizsacker be right who give us only ten years<sup>15,17</sup>?

I am now coming to my last subject: the role India can play in world development. Here also the first steps may be the application of international solidarity with regard to neighbours. It may encourage the world enormously if co-operation with Pakistan could be extended. I am thinking of further co-operation in the basins of the Indus and the Brahmaputra rivers. Economic co-operation often is a good start for wider co-operation. This was also Jean Monnet's thesis. I take some encouragement from our experiences at home, although I apologise for the comparison: in my part of the world, countries are so small as to be comparable to the states of this great country, sometimes to parts of states. The experience at home is that immediately after World War I the relationship between Belgium, our neighbour, and the Netherlands was one of great distrust. I remember that in 1920 our newspapers interpreted the construction of a four-track rail-road near Antwerp as the intention of Belgium to invade Holland. This distrust did not have any basis, as appeared later on. During World War II we concluded the Benelux Union between Belgium, Luxembourg and the Netherlands and this was one of the starting points of the European Economic Community. Often the problems between neighbours are the most difficult problems: a common frontier by definition constitutes a source of friction.

India's influence extends much further, because of its cultural contribution and the size of its population. As the leading country among the developing countries of the non-communist world India has been, and I am sure will be, instrumental in pushing other nations. The Prime Minister Mrs. Indira Gandhi<sup>18</sup> admirably put one of the issues at stake when in the second World Trade Conference in New Delhi she said: "The question before the advanced nations is not whether they can afford to the developing nations, but whether they can afford *not* to do so." By so speaking she showed that she sees the world situation better than most westerners. Even though it is correct to state, as the Pearson Report<sup>12</sup> does, that

# A wealth of chemicals to make your products more CAPtivating

The satisfaction your consumers get out of your product depends on what you put into it. There's a CAP chemical to make your product softer—or stronger—or glossier—or more

supple—more fragrant. CAP can provide you with a wide range of chemicals scientifically processed from Indian Turpentine... and do so consistently, economically.

by far the largest effort needed for world development has come and still has to come from the developing countries, the bottlenecks at the moment are to be found in the luke-warm attitudes of the developed countries in matters of trade and of financial transfers. When speaking about what India should do for her own development I pointed out already that the fuller use of her industrial capacity, the extension of labour-intensive industries and the execution of the Calcutta Plan are all blocked by these bottlenecks.

Numerous are the contributions made by Indian scientists and Indian industrialists to international development. It would be impossible for me to give an elaborated account of these performances. At most it could be the list of the representatives of these two areas of activity I had the good luck to meet, a small sample taken from the fields in which I have been active myself. Even this, time would not permit. But speaking of samples, I cannot help mentioning Professor P.C. Mahalanobis, the father of the famous sample surveys and of planning models<sup>9</sup> thanks to whom I was once received by Prime Minister Nehru. Then, speaking of Indian contributions to world development, I want to remind you of all Dr P.S. Lokanathan did. Neither could I forget mentioning Mr Tarlok Singh without whom Indian planning cannot be conceived of. I am sure the younger colleagues in my sample will forgive me that I do not mention them individually. Many of them made and are making substantial contributions to our understanding of development and planning. And it is my loss, of course, that as a rule a sample does not include all members of the population from which it is drawn.

Even though, as the Polish joke goes, production is only the brief interval between the construction of a plan

and the evaluation of its execution, planners have become aware that the execution of a plan is of some importance and that managers are quite useful people, especially if they are able to export, although not only in that capacity. In a developing country one of the most precious capabilities a manager may have — or else may have to acquire — is to employ people, which gradually has become more difficult than to use machines.

Jawaharlal Nehru was the architect of India's foreign policy, the policy of non-alignment. In a world threatened with polarisation because of the east-west conflict this was a wise policy because it was an attempt to create a more stable pattern of thinking. This was understood in the west much later only. For its influence to grow this policy needs an economically strong non-committed world and this is one more reason in favour of a through policy of development for the second Development Decade.

India can enhance her position as a mediator between extremists of east and west also by elaborating her brand of socialism, using to the full all that modern science has to teach us about the optimal social order and applying that knowledge with the courage characteristic of great men such as Gandhi and Nehru. As Myrdal's research has shown, the gap between principles and practice is bound to be strong in a developing country and this is one of the challenges: to bring practice closer to the principles.

It is my opinion that the various social systems of the world move in convergent directions. But if this is not the view of others, may I finish by commenting on a famous poem by Rudyard Kipling<sup>7</sup>. In his time we spoke of east and west in a different sense. Today we call south what he meant by east. Today east stands for the communist

## TODAY IT'S GIANT TANKERS... tomorrow who knows?

... whatever be the latest development in world shipping, we'll be keeping pace. From a mere 1.73 lakhs DWT in 1961 SCI has today over 12 lakhs DWT crossing the waterways of the world. We ply all important routes on the seven seas with cargo liners, super and giant tankers and bulk carriers, ore-oil-grain carriers, colliers, timber carriers & passenger-cum-cargo vessels carrying an ever increasing volume of India's international trade.

We are the 'invisible' foreign exchange earners!

With the changing pattern of international trade, we are adding more and more giant bulk carriers. Soon with the delivery of pending orders SCI will be having the largest Indian bulk carrier fleet.

Today, tomorrow and the day after, SCI will be there to keep India's maritime flag flying proudly over the world's oceans.

world; and even that world now seems to have an east and a west. Instead of thinking of two cultures we may have to think of three or even four. The line of Kipling's poem always quoted is not too encouraging: "Oh, East is East, and West is West, and never the twain shall meet". My wife who knows literature better than I, reminded me of the complete text, not so generally known:

"Oh, East is East, and West is West, and never the twain shall meet.

Till Earth and Sky stand presently at God's great Judgment Seat;

But there is neither East nor West, Border, nor Breed, nor Birth

When two strongmen stand face to face, tho' they come from the ends of the earth!"

In my own words: if, in mutual respect, east, south and west understand they are all responsible for the world's survival, they must forget borders, birth and..... creed! Or, rather, they must be aware of one common creed: that, we have a common interest in survival, still to be organised.

## Planning in Agricultural Backwardness

G.P. MISHRA

ECONOMIC HISTORIANS generally concur that there are no cases of successful development of a major country in which a rise in agricultural productivity did not precede or accompany industrial development.<sup>1</sup> The Rostow stages-theory of growth<sup>2</sup> has historically observed that agriculture plays a distinct but multiple and converging role in the transitional process of 'the take-off into self-sustained growth'. The operation of planned development in India over one and a half decades or so bears witness to this fact. The performance of the last three five-year Plans has clearly shown that the stimulation of a high but sustained rate of increase in per capita output in India is difficult to have without a strong development base in her agriculture.

Agriculture occupies a major place in the dualistic set-up of the Indian economy. Its development operation has snow-ball effects over the whole of the economy. It constitutes the most important constraint on the process of growth because it conditions and determines the over-all rate of growth of the economy by supplying food for meeting the requirements of the population, by supplying some basic raw materials for the expansion of certain important consumer goods industries such as cotton textiles and jute, by enlarging the demand for industrial output through an increase in agricultural incomes and through extending the capacity to absorb the monetary flow of industrial investments<sup>3</sup>, by employing a large pool of labour force, and by raising foreign exchange earnings through export. It is unfortunate therefore that Indian agriculture continues to be backward having multi-dimensional facets.

The malady of multi-dimensional agricultural backwardness can economically be diagnosed as the deficiency of agricultural

cultural production in meeting the domestic requirements of food, and its incapacity in making agricultural incomes adequate for absorbing industrial output and monetary flow of industrial investments, tapping foreign exchange by sufficient export and providing work for the engagement of surplus labour input. We have observed the coexistence of inflation in the presence of a low rate of increase in agricultural productivity with industrial recession due to lack of demand for industrial output. This has given rise to inter-sectional imbalances which have been a stumbling block to the process of growth in India.<sup>4</sup>

#### Some Facets

The economic backwardness of Indian agriculture has two main facets: (a) the existence of low agricultural yields per hectare (as well as per head), and (b) of surplus agricultural labour.

Table I shows that the average yields of such major crops as rice (paddy), wheat, cotton (lint), and groundnut (in shell) per hectare are lowest in India.

The level of yields of these crops per hectare is even lower than that in Pakistan. The reasons for the existence of such differences in the average yields of these crops between India and the other countries of the world (mentioned in Table I) are the disparity in the percentages of irrigational facilities, use of fertilizers, and the application of the scientific methods of farming and cultivation. Table II indicates that the per capita availability of arable land remains to be the same (more or less) in most of the countries of the world except Australia, USA, USSR, and Canada, where it is more

than one hectare (America has 0.94 hectare per head). The per capita availability of arable land being less than 0.94 hectare in the rest of the countries, the level of yields per hectare is much higher than what we find in India. It is, of course, on account of great use of fertilisers and better irrigational facilities, as shown in Table II.

Table II indicates that Japan and UAR having 0.06 and 0.09 hectare of land available per capita respectively, record a very high level of yield per hectare because of higher irrigated area-arable land ratio and greater consumption of fertilisers per hectare. But India having 0.33 hectare per capita records relatively low yield per hectare in comparison to Japan and UAR. This level of average yield is essentially on account of poor irrigational facilities and insignificant consumption of fertilisers per hectare. The Hayami estimate<sup>5</sup> of the productivity gap between India, Japan and the USA has found out that 'differences in the inputs of modern manmade' and 'education and research' are crucial in determining their productivity gap. Thus the existence of a very low land-population ratio is not a significant cause for the prevalence of low yields per hectare in India. The low level of yields per hectare in the country is due to the very small use of agricultural inputs such as irrigation, fertilisers, and other methods of farming.

#### Malthusian Rule

Hence in spite of higher population-land ratio in Indian agriculture, the process of its production operates in line with the Malthusian rule. The fourth Plan points out that the all-India compound rates of growth in total agricultural production and foodgrains during 1949-50 to 1968-69 were 2.79 per cent and 2.92 per cent per annum respectively. These rates of growth in agricultural and food production are little more than the rate of growth of population per annum, as the census of 1951-61 shows. The all-India compound rates of growth in the productivity of all crops and foodgrains during this period were recorded at 1.53 per cent and 1.65 per cent per annum, respectively. These rates of yield improvement in total agricultural and food production are actually a result of the contribution of area growth which is estimated at 1.17 per cent and 1.37 per cent respectively.

This implies that the rate of growth in agricultural productivity per annum in 1968-69 over 1949-50 is an outcome of the extensive type of growth in Indian agriculture. If

the gross area sown is plotted on a horizontal axis in a graph year-wise from 1950-51 to 1967-68 and yields per hectare on

the vertical axis of that graph year-wise corresponding to this period, the diagram will show a fluctuating agricultural production function curve. The over all picture of the diagram will not exhibit a significant increasing trend in agricultural productivity but, on the contrary, a Malthusian trend if population growth rate is indicated corresponding to the period taken into consideration. Of total arable land, only 20 per cent is irrigated and the rest still depends upon the monsoon.

## SOME UNITED NATIONS PUBLICATIONS STATISTICALLY SPEAKING ARE ESSENTIAL

### Statistical Yearbook 1969

Just published, comprehensive collection of international statistics Paper \$13.50 Cloth \$19.00

### Demographic Yearbook

International demographic survey of statistics for over 250 countries and territories on population trends, marriages, divorces, births, deaths and expectation of life. Published since 1949. Bilingual (English/French) New edition in preparation.

Paper \$13.50 Cloth \$19.00

### Monthly Bulletin of Statistics

The foremost source of current, official statistics on world economic and social conditions covering 170 countries and territories. Data given on more than 60 subjects in the following fields: population, manpower, rubber production, industrial production, mining, metals, building materials, transport, textiles, public utilities, construction, internal and external trade, wages and prices, national income, finance. Annual figures from 1956 and monthly figures for the most recent eighteen-month period. A Supplement (in English, French or Spanish) giving definitions and explanatory notes is supplied to subscribers at intervals. Bilingual (English/French).

Annual Subscription: \$25.00 Single copy \$3.00

### Yearbook of International Trade Statistics

A compilation of national tables showing annual figures for several years for over 132 countries, and summaries of trade by large commodity classes and by principal regions and countries. Published since 1951

\$12.50

### Population and Vital Statistics Report

This quarterly presents, for each country and territory of the world, the results of the latest nation-wide census or sample survey of population, the latest official estimate of population, and nationally representative statistics of live births, deaths and infant deaths for the most recent year available. It also provides estimates of population for the world and major divisions as well as corresponding data for each of the 236 geographic areas of the world. English.

Annual Subscription: \$4.00 Single copy \$1.25

### Commodity Trade Statistics

Issued in fascicles of about 200 pages as quarterly data become available, the publication contains international commodity tables according to the Standard International Trade Classification, Revised (SITC, Rev.) showing the imports and exports of countries reporting according to that classification (taken together, without duplication, the imports and exports of these countries cover about 90 per cent of world trade). Within commodity headings trade is analysed by countries and regions of provenance and destination. Figures are in U.S. dollars and metric units of quantity. English.

\$30.00 yearly \$2.00 each

### Statistical Yearbook for Asia and the Far East

First issue of this title. Statistics cover population, manpower, national accounts, agriculture, forestry and fishing, industry, transport and communications, external trade, wages, prices and household expenditures, finance and social statistics

Paper \$4.50

### World Energy Supplies, 1964-1967

Eleventh issue of quantitative annual data on production, imports, exports and gross consumption of solid fuels, petroleum and its products, gas and electricity (thermal, hydro, geothermal and nuclear) for approximately 175 countries with regional and global totals.

\$2.00

### Foreign Trade Statistics of Africa

#### Series A: Direction of Trade.

Trade by country data in thousand U.S. dollars for African countries. Data analysis are based on special trade system, general trade system, and general imports and national exports. Published since 1966. Bilingual (English/French).

\$2.00

#### Series B: Trade by Commodity.

Cumulative half yearly data on African commodity trade according to the Standard International Trade Classification (SITC), revised, by regions and countries of provenance and destination in thousand U.S. dollars. Published since 1966.

Bilingual (English/French).

\$3.50

# INDIAN TUBE'S 10 MILLION DOLLAR STORY

**An all-time export record  
to beat all past records  
of all Indian steel tube makers**

The percentage distribution of irrigation source-wise indicates that about 10 per cent of the total irrigated area gets water from canals and the rest from other sources of irrigation such as wells, tanks, tubes, etc. It means that the major source of getting water for the irrigation of land is still the rainfall. The proverb, 'Indian agriculture is a gamble in the monsoon' still remains. Thus the agricultural production function in India is highly responsive to the uncertainty of the rainfall.<sup>6</sup>

## Surplus Agricultural Labour

The fertility of the soil in India being low due to the absence of adequate water supply and use of fertilisers, the existence of surplus farm labour indicates a very low agricultural output per head. A pool of labour force employed in farming does not add to agricultural production because it fails to transform a given amount of labour-time available at the disposal of the surplus labour force in a given technological set-up into the actual operation of agricultural production.<sup>7</sup> The actual participation of labour force in terms of putting in a given number of working hours (i.e. labour time) in the process of agricultural production depends on the supply of water, fertilizer use, plant protection methods, high varieties of seed use, and other complementary agricultural inputs which make the labour force busy in sowing, plantation, harvesting, and other auxiliary and complementary activities of farming by raising the intensity of cultivation and cropping. But the amount of capital (in terms of these inputs) per unit of labour force is less than minimum. As a result, a pool of labour force working in agriculture fails to transform its available labour time in a given technological set-up into the operation of farming business which constitutes a case of surplus labour situation leading to disguised unemployment. Table III shows the extent of agricultural labour unemployment in India.

The table gives the different man-days unemployed per agricultural labourer and unemployed per thousand of

TABLE III

male labour force in the rural areas of the different states of India. The all-India figures of these two aspects of unemployment of agricultural labour, 90 and 4.78 per cent respectively, are very significant. Mitra's estimation<sup>8</sup> of surplus labour in Punjab shows that "37.50 per cent of the total labour (in terms of days) employed per acre in crop production is surplus". The extent of man-days employed per agricultural labourer implies that a given number of labour force working on agriculture does not actually put in a given number of working hours in the process of cultivation and farming and so nothing is added by that labour force to the total agricultural production of the country. Hence the level of agricultural output per worker is considerably low. The Hayami calculation<sup>9</sup> on the productivity gap among India, Japan, and the USA shows that farm output per worker in terms of wheat units is 2.22 in India, while in Japan and USA it is 10.7 and 96.2 respectively. Thus the conclusion is that the existence of surplus agricultural labour results in a low level of agricultural output per worker in India.

From the above empirical analysis the following facts come to light:

(1) The level of agricultural yields per hectare is low because the proportion of water supplied for irrigation to total arable land, the consumption of fertilizers and the application of other complementary inputs per hectare are small.

(2) The level of agricultural productivity per worker is low because the ratio of fertiliser and machinery use to labour force working in agriculture is very low.

## New Investment Policy

Thus, such an investment policy should be formulated which could invest capital in increasing the proportion of water supply for irrigation to total arable land, the consumption of fertilisers, the technical facilities for better farming, the amount of capital equipments per worker, and other complementary agricultural inputs. If this is done, the fertility of the soil of arable land per hectare will increase. The fertility of the soil will increase because a higher application of water, fertilisers, and other methods of cultivation will firstly prevent the fertility of the soil from depletion and, secondly, will raise the plant growing power of the soil by raising its biological capacity to germinate and grow healthy plants of different crops. It is very essential because the rate of soil exhaustion increases in the absence of water and fertilisers of adequate quantum. Chauhan<sup>10</sup> has empirically but scientifically observed a general declining tendency in the agricultural productivity of land per hectare because of a high rate of soil exhaustion in the absence of replenishing it by the use of water and fertilisers. The rate of soil exhaustion of agricultural land that has shown an increasing tendency, is still not fully checked as the availability of irrigational facilities and the consumption of fertilisers per hectare indicate. Thus the soil-fertility of arable land must be sharpened by using these agricultural inputs on land in sufficient quantity.

The efforts to increase the percentage of irrigation to total arable land, the consumption of fertilisers per hectare, and the application of other complementary agricultural capital equipment per worker will raise the productivity of agricultural land per worker leading to effective engagement of the surplus farm labour in the process of agricultural production because the intensity of cultivation and cropping, apart from the growth of other subsidiary complementary farming activities, will lead to greater use of labour input in agriculture and farming.

Thus the conclusion is that the capital of some minimum quantum<sup>11</sup> should be invested in agriculture in order to increase the use of water, fertilisers, and other complementary inputs per hectare and per worker. As a result, the level of agricultural yields per hectare as well as per worker will rise

leading to the attainment of 'minimum critical effort per capita real income' as has been visualised by Leibenstein.

#### Development Efforts in Five-Year Plans

Why the level of agricultural yields per hectare and per worker still remains low even after the formulation and execution of the last three five-year Plans is obvious to us. Faulty agricultural planning is the reason for this phenomenon. How agricultural planning has been faulty, can be shown and measured in terms of what efforts of development for agriculture have been made during the last

three Plans. These development efforts can be shown in terms of the percentage distribution of the outlay and investment made in agriculture in order to achieve planned objective-targets and success achieved in their attainment during the Plan periods. On the basis of the inquiry made into efforts of planning for agricultural development, the approach of the fourth Plan to achieve 4.5 per cent rate of growth in agricultural production per annum is also examined and assessed.

Tables IV & V present a comparative picture of the public and private outlay and investment among different heads of

development in order to show the position of agricultural development in the strategy of the different Plans and progress made in agriculture during the Plan periods.

Table IV indicates that the the first Plan, basically being agricultural in strategy, had an excess of about 10 per cent outlay over what the second and third Plans had. This shows a considerable degree of difference between the agricultural development efforts of the first Plan and the other two Plans. Thus the success attained in the field of agricultural development during the first Plan was more than expected. The unexpected success of economic development in agriculture during the Plan was, however, much more responsive to the favourable monsoons and to the existence of excess capacity than to the development efforts of the Plan. The proportion of the outlay and investment allocation for the extension of irrigational facilities was 8 per cent and 6.3 per cent respectively in the third Plan. The proportion was also very small during the second Plan. Table IV shows that the percentage increase in the irrigated area to the total arable area, more or less, remained the same during the second and third Plans. The proportion of irrigated area to the total arable area rose by 8.3 per cent between 1950-51 and 1965-66.

The impact of the monsoons on the production of agriculture is still predominant and the uncertainty of the rainfall still shed its spell over Indian agriculture in the absence of sufficient irrigational facilities. Table IV indicates that effort for the extension of sufficient irrigational facilities has not been encouraging. The percentage increase in the consumption of nitrogenous fertilizers though insufficient had been rather encouraging.

On the whole, we observe approximately a constant degree of emphasis on the development of agriculture if the proportions of the outlay and investment allocated for agriculture, irrigation, and community development during the three five-year Plans are compared. Irrigation, being most crucial for increasing agricultural production, has received poor attention during the Plan periods. As a result, agriculture is still 'a gamble in monsoon' and it will continue to be so, unless the proportion of irrigated area to the arable area is raised to sufficiently higher levels than what it is today.

#### Approach of the Fourth Plan

Agriculture has received a special place in the formulation of the fourth Plan and is clearly shown as the most significant key to self-sustained growth of the economy. The fourth Plan aims at increasing the level of agricultural production at the rate of 4.5 per cent per annum during its operation. This rate of growth in agricultural production is required for the achievement of the goal—'growth with stability'. The achievement of desired rate of growth in agricultural production depends on the development efforts of the Plan made in regard to the allocation of its total outlay and investment envisaged for agriculture.

The fourth Plan envisages expenditure of Rs 3815 crores for agriculture and allied sectors and irrigation and flood control. This amount constitutes 23.9 per cent of the total outlay. Similarly, the investment pattern of the fourth Plan indicates that an amount of Rs 3718 crores (including public and private sectors) should be spent on these development heads of agriculture during the Plan. This amount is 21.1 per cent of the total Plan investment. In relative terms, these percentages of the outlay and investment allocation for agricultural development are, more or less, equal to what they are in regard to the second and third Plans. Thus the relative degree of development emphasis on agriculture continues to be same in the fourth Plan. In regard to the percentage distribution of the outlay and investment for irrigation purposes

during the fourth Plan, the degree of emphasis also remains the same. For instance, the fourth Plan proposes to spend 6.3 per cent of the total outlay and 4.3 per cent of the total investment on irrigation and flood control. With these percentages of outlay and investment allocation for these heads of agricultural development, the aim of the Plan is to

increase agricultural production by more than 25 per cent during the Plan period, as presented in Table VI.

It is a true that the envisaged outlay or total investment for agriculture in the fourth Plan is nearly double the outlay or investment spent for the purpose of agricultural development during the second and third Plans. Thus the fourth Plan outlay or investment for agriculture and its other heads of development appears to be sufficient in view of the estimates made thereof, as shown in Table VI. But a comparison between what was invested in view of the estimates made and what was achieved in view of the investment and the estimates made during the second and third Plans, the anticipated success during the fourth Plan becomes doubtful. This becomes obvious when the agro-industry projection<sup>12</sup> made by the Advisory Committee of President Johnson is compared with the agricultural development projection of the fourth Plan. The committee has projected that 105 million tons per year gain in food production, a virtual self-sufficiency, could be made over a period of 1964-86. The capital cost that this would incur is \$30.3 billion. The investment of \$30.3 billion during the period of 1964-86 will raise food production by 105 million tons per annum by making 26 per cent to 34.5 per cent of the cultivable land irrigated, by raising horse-power per hectare from 0.19 in 1964 to 0.23 in 1976 and to 0.27 in 1986, by increasing truck transportation per 1000 people from 250,000 in 1964 to 1700,000 in 1986, by raising all-India fertiliser application from 3.8 kgs per hectare to 45 kgs. per hectare in 1986, and by raising pesticides application from 149 grams per hectare in 1964 to 900 grams per hectare in 1986.

How can the fourth Plan raise agricultural production to 129 million tonnes in 1973-74 by investing an amount of Rs 3718 crores with a view to raising irrigated area by more than 34 per cent, improving high yielding varieties in terms of area covered by 200 per cent and increasing the consumption of fertilizers of all types combined by more than 800 per cent over a period of five years? This is a

puzzling question and it reflects a genuine doubt over the approach of the fourth Plan in regard to agricultural development in India.

Hence the conclusion is that planning is not going to provide a sufficient quantum of water supply and fertilizer use per hectare and per worker in agriculture by the end of the fourth Plan. Unless water input, fertilizer and other inputs per hectare and per worker are sufficiently raised, the level of yields per hectare as well as worker will remain low.

## Progress of Industrialisation: 1947-1966

K. SITARAMASWAMI

DURING CERTAIN stages of industrialisation, the consumer goods industries tend to lose their predominance when the production of capital goods expands. During these phases of industrialisation, there will be a tendency for the textile, food and beverage industries to lose their dominant positions in favour of the engineering, metals and chemical industries. Generally the expansion of modern industrial economy is characterised by a continued increase in the output of manufactured goods which is closely associated with a steady expansion in the quantity and value of capital goods available in the economy. In India during 1947, textile industries absorbed as much as 63.8 per cent of the total number of persons employed and contributed some 59 per cent of the total value added by manufacturing industries as was revealed by the 29 industries covered in the Second Census of Manufactures, India. But these high percentages are considerably reduced in 1965 to a miserable low figure of 32 per cent in the employment field and still much lower at 22.9 per cent in the value added by manufacture. On the other hand, engineering industries have shown a sharp increase from a pitiable low figure of 8.1 per cent in total employment to 26.5 per cent, from a level of 6.9 per cent in the value added by manufacture to a respectable high level of 29.3 per cent during the same period (1947-1965). This brings out the

fact that the process of Indian industrialisation is shaping the development of capital goods industries.

The general pattern of industrialisation is marked by three stages. Stage one exhibits the domination of consumer goods industries and the typical ratio between consumer goods industries and capital goods industries in this stage of industrialisation is  $5 \pm 1.5$ . Stage two presents the picture of increasing importance of capital goods industries and its typical ratio is  $2.5 \pm 1$ . Stage three represents an advanced stage of industrialisation, when a balance of consumer goods industries and capital goods industries is attained with a growing tendency on the part of capital goods industries to expand more rapidly. Here the net output ratio is  $1 \pm 1/2$ . India had entered the first stage of industrialisation as early as 1925 as observed by Prof. W.G. Hoffmann. Unfortunately the same pattern was continued up to 1947. There was a striking domination of consumer goods industries in India's industrial economy during 1925-1946. In the year that of the capital goods industries was 4.1 times more than this was as high as 5.1 times. The net output ratio between consumer goods industries and capital goods industries was 4.2 in 1925 and 4.1 in 1947. At this point we might en-

## or Bumper Crops

# SHRIRAM UREA

Shriram Urea is a low-cost, highly concentrated, versatile nitrogenous fertiliser. It is guaranteed to contain not less than 46% nitrogen.

What does it mean to the user?

- \* It supplies nitrogen at the lowest cost.
- \* It can be used in all crops and all soils under all weather conditions.
- \* It can be used as a foliar spray.

Shriram Urea provides your crops the nitrogen they need in less time, with lesser efforts, at lowest cost. Your investment in nitrogen is safe with Shriram Urea.

**PROMISE OF PLENTY WITH SHRIRAM FERTILISERS**

## That's Versatility!

Take a 'Jeep' Universal of your choice. 'Jeep' Tower Ladder. 'Jeep' Soft Top. 'Jeep' Fire Engine. 'Jeep' Ambulance. 'Jeep' Wagonette. Or the original, dashing, 'Jeep' Open. In four or two wheel drive. Plus the power of the famous Hurricane engine, great economy, and its priceless manoeuvrability on the road, features that leave similar vehicles trailing.

CALCUTTA • DELHI • MADRAS

phasise the difference between the development of the two subsectors of manufacturing industries. Basic metal industries, metal products, chemical and chemical products were approximately of equal importance in the first stage of industrialisation of 1947. But the overwhelming predominance of the consumer goods industries was clearly seen from the dominant position of textiles and consumer good manufacturing industries in India during the same period.

The first stage of industrialisation in India carried with it the seeds of change and in due course a new industrial structure has evolved. The transition from the first stage of industrialisation, when consumer goods industries were dominant, to the other stages, where capital goods industries expanded relatively more rapidly than the consumer goods industries, occurred more rapidly in India because of the huge investment in the capital goods industries and the deliberate industrial planning, particularly during the second and third five-year Plan periods. Out of Rs 4,646 crores of total industrial investment during the first three Plans, Rs 3,002 crores were invested in metallurgical, engineering and chemical industries. Nearly a balance between the consumer goods and the capital goods industries was reached in the year 1965. The industrial employment in the two sectors was almost equal. Prof. Hoffmann put the limits of the net output ratio between these two sectors in stage three in between 1.5 and 0.6, after considering the patterns of industrialisation in a number of developed countries during 1921-51. The net output ratio between consumer goods industries and capital goods industries in 1965 for India was 1.2, which was already attained by USA in 1900 and Italy in 1938. The principal capital goods industries which contributed to this change were engineering, chemicals and steel. The total output of machine tools had gone up

by 80 times in value, chemical fertilisers had registered 25 times rise in physical output and finished steel had increased by four times in physical output during 1950-51 to 1965-66. The pattern of industrialisation in India is thus characterised on the one hand by important engineering, chemical and steel industries and on the other by the textile, food and beverage industries. The expansion or decline of these two distinctive groups of industries changes the entire industrial pattern in India. The net output ratio of 1.2 between the consumer goods industries and the capital goods industries during 1965 showed a great change in the pattern of industrialisation in India (Table I).

Industrialisation involves a number of changes in the economic structure and the most important among them are

(1) a rise in the relative importance of manufacturing; and (2) a change in the composition of industrial output. Prof. Hollis B. Chenery has interpreted the first change as the pattern accompanying a rise in the share of industrial output from 17 per cent at an income level of \$ 100 to a share of 38 per cent at an income level \$1000. The pattern is necessary for a change in the structure of the economy. The principal feature of the pattern of Indian industrialisation is the rise in the share of industrial output from 17 per cent at a low income level of Rs 250 (half as that of \$100 at pre-devaluation level) to 20 per cent even at Rs 427 income level. These two rates of income level refer respectively to the per capita net output in 1948-49 and per capita net national product in 1964-65 at current prices in India.

The change in the composition of industrial output is marked as the change in the pattern of output as a whole. The difference in growth elasticities between the investment goods and consumer goods is almost as great as the difference between agriculture and industry. Prof. Chenery observed that at an income level of \$100, 68 per cent of manufacturing consists of consumer goods and 12 per cent of investment goods and at an income level of \$600 the share of investment goods industries increases to 35 per cent of all manufacturing, while the share of consumer goods falls by 43 per cent. The per capita income in India during 1950-51 was Rs 266 (at 1960-61 prices) and at this income level consumer goods industries constituted as much as 68 per cent in the total value added by manufacturing and the share of investment goods industries was only 8 per cent. Even without raising income levels to six times as in the analysis of Chenery, at a considerable income level of Rs 339 (per capita income in 1964-65 at 1960-61 prices) investment goods have increased to 22 per cent and consumer goods have fallen to 34 per cent in the total value added by manufacturing. The 50 per cent fall of consumer goods during 1950-51 to 1965-66 is quite remarkable and it shows that the development of investment goods is rapid and advanced (Table II). This change in the composition of industrial output is just enough to strengthen the argument that there is a change in the pattern of industrialisation moving more towards the development of investment goods industries in India.

TABLE II  
VALUE ADDED IN MANUFACTURING INDUSTRIES  
IN INDIA: 1950-51 and 1965-66  
(in crores at 1960-61 prices)

| Sector                        | 1950-51         | 1965-66          |
|-------------------------------|-----------------|------------------|
| Consumer goods industries     | 260.7<br>(68%)  | 487.6<br>(34%)   |

| Investment goods industries   | 30.9<br>(8%)    | 315.9<br>(22%)   |
| Others                        | 3.1             | 10.3             |
| Total                         | 384.2<br>(100%) | 1434.0<br>(100%) |

Indices of industrial production measure average percentage changes over time in physical volume of industrial output. Indices of industrial production adjusted for changes in weight reflect the changing pattern of industrialisation. The interim index of industrial production with the base year 1946 was the first official index number of industrial production in India. This index, based on production statistics of 35 items was first published in July 1950. This series was discontinued from April 1956 and a revised index with the base year 1951 covering 88 items was introduced in October 1955. The 35 items of interim index accounted for about 75 per cent

of the value added by 88 items of manufacturing industries in the revised index of 1951. The index with 1951 as base was replaced in July 1962 by another series with the base year 1956 covering 201 items of industrial production. The 88 items covered by the index with 1951 as the base year accounted for about 78 per cent of the total value added by manufactures in 1956 by the 201 items included in the index with 1956 as base. In order to make the index numbers of industrial production reflect adequately the pattern of industrialisation in India, the series with 1956 as base is now replaced by a revised series with a more recent base period and greater coverage in items of production constructed in accordance with the recommendations of an ad hoc working group set up by the Central Statistical Organisation. The calendar year of 1960 has been taken as a base for comparison for the revised series. The revised index is based on regular monthly series of 324 items of production as compared to 201 items in the old series. Out of the 201 items included in the old series, only 191 items of production can be identified in the revised series and these account for about 85 per cent of the total value added by manufactures in the year 1960 of all 449 items included in the revised annual series.

Weights have been allotted on the basis of value added by manufactures according to the Annual Survey of Industries.

TABLE III  
WEIGHTS ALLOTTED IN INDEX NUMBERS OF  
INDUSTRIAL PRODUCTION IN INDIA  
(1951 and 1960 as base periods)

| Industry Group                                                        | Old revised index weights | New revised index weights |
|-----------------------------------------------------------------------|---------------------------|---------------------------|
| Division :                                                            |                           |                           |
| 1. Mining and quarrying                                               | 7.16                      | 9.72                      |
| 2.3 Manufacturing                                                     | 90.68                     | 84.91                     |
| 20.21 Food manufacturing industries                                   | 11.85                     | 12.09                     |
| 22 Beverages & tobacco                                                | 1.59                      | 2.22                      |
| 23 Manufacturing textiles                                             | 48.01                     | 27.06                     |

# How could India Pistons have sold A MILLION piston castings to a single customer in the United Kingdom

unless the quality  
of our products  
is consistently good?

In the field of exports, repeat orders are worth their weight in gold, endorsing the ability of a manufacturer to maintain quality standards and delivery schedules.

India Pistons have received such recognition from all parts of the World. Take the United Kingdom, for example. A single customer there has trusted us with repeat orders valued totally around £400,000. In addition to this, we supply Original Equipment and Replacement pistons to a host of manufacturers in the U.A.R. and Yugoslavia.

besides our regular exports to Asian, African and European markets.

At home, we meet the OE requirements of almost all automotive and industrial engine manufacturers and 60% of the total replacement needs.

How do we manage both?

One of the reasons is we have the largest and the most modern piston assembly-making unit in South East Asia. Another is we give precisely what our customer specifies.

INDIA PISTONS LIMITED

Sembiam, Madras-11

Manufacturers of: *Power Pak* Pistons, Piston Rings, Cylinder Liners, Gudgeon Pins and Circlips

A unit company of the Amalgamations Group

1960, covering both the census and sample sectors. The value added by manufactures is identical to the manufacturing sector's contribution to the net national product. The weighing of the older revised index was also based on the value added by manufactures in 1951, based on the data supplied by the sixth Census of Manufactures, India, 1951. The total value added by these 85 items of manufacturing sectors in the old revised series of 1951 was Rs 384.2 crores and of that of all the items included in the recent revised index of 1960 was Rs 928 crores. The weight of the textiles industry, though the highest still, has substantially declined from 48.01 to 27.06 as revealed by the comparison of the revised index with 1951 as base with that of the new revised index of 1960. The food industries group still retains the second place. Chemical and chemical products, transport equipment and machinery including electrical have gained appreciable importance in the revised index of 1960. Chemicals in the basic industries group and mechanical engineering in capital goods industries group have improved from 4.16 and 4.99 in 1951 base period to 7.26 and 14.20 in 1960 base year respectively. (Table III p. 1140). These remarkable shifts reflect the changes in the pattern of Indian industrialisation. The pattern is thus fastly moving towards the development of basic and capital goods industries. These industries have already reached

as appreciable level of importance by contributing about one-third of the total value added in the manufacturing sector in India.

## Price Movements and the Plans

CHAKRADHAR SINHA

THERE HAS been a persistent rise in prices during the last 15 years except for a brief halt in 1968. An attempt has been made here to analyse briefly the price trends in the period from 1951-52 to 1967-68 and assess the impact of price movements on the growth process of the country. This will help us to enlighten the paths to be followed in the fourth five-year Plan.

Prices during the Plan period display the following broad trends.

1. The phase of declining prices: This phase comprising the period of the first five-year Plan (1951-52 to 1955-56) witnessed a decline of 17.3 per cent in the index of wholesale prices. All commodity groups, except fuel, power, light and lubricants, contributed to this decline.
2. The phase of increasing prices: This is covered by the second five-year Plan period (1956-57 to 1960-61), and this phase recorded a rise of 35 per cent in prices. All commodity groups contributed to the rise in prices during this phase. However, food articles and industrial raw materials experienced the most marked rise.
3. The phase of relative price stability: This is the period of the first two years of the third Plan. During these two years, the annual average rise was 2.4 per cent and the compound annual increase 1.2 per cent only. Industrial raw materials contributed most to this rather relative stability in prices.
4. The 'resumed-rise' phase: This period comprising the last three years of the third Plan (1963-64 to 1965-66), registered a rise of 29 per cent in prices. Food prices rose faster than the overall increase in prices.
5. The phase of strong inflation: This covers the period of three years of 'Plan holiday' and the first year of the fourth five-year Plan.

The wholesale price index number, which stood at 165.1 at the end of 1965-66, further increased to 191.3 in 1966-67 and to 212.4 in 1967-68. There was thus a rise of 28.6 per

cent over the two-year period or an annual average rate of 14.3 per cent. In 1968, however, the continuously rising trend in prices was halted and even reversed for the first time in the 13-year period when the wholesale price index showed a fall of one per cent over the earlier year. It may be mentioned in this connection that the general price level in 1968 was more than double the level in 1955. Available statistics indicate that there was an increase of 129 per cent in the general price level during the period 1955-68. In 1969-70, prices continued to rise at a rapid rate. Table I sums up the price variations during each of the three Plan periods.

TABLE I  
VARIATIONS IN PRICES

(Percentage change in the index)

It appears from the above table that there was a large rise in prices during the 10 years covered by the second and third Plans. The all-commodities index which declined during the first Plan period by 17.3 per cent, registered a sharp rise of 35 per cent during the second Plan period, and maintained, on the top of the second Plan increase a rise of 32.2 per cent during the third Plan period. It may be mentioned that the rate of price increase was accelerated during

the third Plan. During the last three years of the third Plan, for example, the annual rate of rise in prices at 8.9 per cent was much higher than the rate of 5.9 per cent during the 10-year period 1956-57 to 1965-66. The sectoral prices also reveal an uptrend during the period.

Food articles and industrial raw materials have largely contributed to the rise in prices. The weight of food articles and industrial raw materials together comes to 66 per cent of the total weight of the general index. This shows that the variation in the general index of wholesale prices is largely influenced by changes in the price indices of these two commodity groups. As these are agricultural based commodities, it is obvious that agricultural prices exercise a decisive influence on the course of prices in general. Another important feature of price movements during the Plan period is the stickiness of prices. Due to governmental regulation, improved storage and marketing facilities, the post-harvest price decline has tended to be much smaller than the rise in the preceding lean season. The result is that there has been a cumulative rise in the price level over the second Plan and the third Plan periods. There has also been the paradox of inflationary recession.

### Some Explanations

A number of attempts have been made to explain inflationary price rise in India. Some have considered movements in money supply to explain prices.<sup>1</sup> Some others have advocated the 'wage-income theory' of prices.<sup>2</sup> Professor Weintraub has stressed that the phenomenon of a larger rise in wages far in excess of the increase in the average level of labour productivity is almost exclusively responsible for the persistent rise in prices in India. In this article, we attempt to explain price movements in our country in terms of the Keynesian 'inflationary gap' approach which attributes price changes to a divergence between aggregate demand and aggregate supply. The rapid rise in prices in this country during the last 15 years is a reflection of the persistent gap between aggregate demand and aggregate supply. Table II indicates the broad trends in demand and supply. It presents figures of variations in net national expenditure (at market prices) to represent spending and net national output (at constant prices) to represent real output.

TABLE II  
INFLATIONARY GAP IN INDIA

|                                                     | (in per cent) |             |            |
|-----------------------------------------------------|---------------|-------------|------------|
|                                                     | First Plan    | Second Plan | Third Plan |
| Growth in net national expenditure at market prices | +6            | +44         | +50        |
| Growth in net national output                       | +18           | +22         | +14        |
| Change in wholesale prices (1952-53=100)            | -17           | +35         | +32        |

Source: Calculated from RBI Bulletin, various issues.

It appears from the foregoing data that during the second and the third Plans, the growth in net national expenditure considerably outpaced the growth in net national real output. This led to rise in prices by 35 per cent and 32 per cent respectively. The gap between spending and real output which was considerably widened during the period, may be called the inflationary spending gap. During the first Plan, however, the growth in net national expenditure was much smaller than in real output, and naturally wholesale prices declined by 17.3 per cent. In recent years, demand has expanded rapidly due to the growth of population, increase

in per capita income, increasing pace of urbanisation and many other factors. There has been enormous increase in public expenditure, both development and non-development, financed largely through Reserve Bank credit. On the supply side, domestic production and imports effect prices profoundly. Domestic production comprises agricultural and industrial output. There exists sectoral bottleneck, i.e. imbalance between agriculture and industry. Inadequate supplies of foodgrains and raw materials tended to accentuate the price rise during the second and the third Plans. Over the Plan periods, demand for foodgrains increased at a much faster rate than the increase in output.

The general psychology of scarcity gave rise to speculative tendencies such as, withholding of stocks from the market. There was a steady decline in market arrivals of principal commodities. For example, the proportion of market arrivals of rice to the estimated marketable surplus which averaged 12 per cent per year in the first two years of the third Plan, declined to about seven per cent in the last two years. The corresponding proportions for wheat were 11 per cent and five per cent, and for jawar five per cent and four per cent.<sup>3</sup> It is therefore, correct to say that it is the variability in marketed surplus even more than the variation in production which is more important from the point of view of prices.<sup>4</sup> The 'green revolution' in the farm sector during the last two years has not led to any appreciable increase in market arrivals of foodgrains. This has created pressure on food prices. Increase in food prices in turn affected cost of living and hence it led to rise in money wages. The industrial and other sectors experienced wage-price spiral. Thus the economy remains vulnerable to inflationary impact and the process becomes self-reinforcing. In brief, the basic explanation of the present inflationary price rise in India lies in the fact that 'the money income multiplier (the demand generating effect of investment) works

*With the compliments*

fully, the real income multiplier (the output generating effect) works haltingly and in a limited fashion."<sup>5</sup>

The vital question is whether inflation is conducive to economic growth. Two schools of thought — the 'structural school' and the 'stability school' have emerged on the subject. The structural school regards inflation as a necessary concomitant of economic growth. According to this viewpoint, the choice lies between two alternatives—creeping inflation and economic growth or price stability and unemployment. E. J. Hamilton has maintained that inflation has been a powerful stimulant of growth in a number of historical instances. His study reveals that during the sixteenth and the seventeenth centuries, prices rose with the influx of gold into Europe. Prices increased but wages lagged behind. Thus there was profit inflation to the benefit of saving, investment and growth.<sup>6</sup> Keynes gave his theoretical support to this interpretation of history. He recommended profit inflation as a factor stimulating growth.<sup>7</sup> Rostow has maintained that several take-off processes were assisted by inflation. He observes, "In Britain of the late 1790's the United States of the 1850's and Japan of the 1870's, capital formation was assisted by price inflation which shifted resources from consumption to profits."<sup>8</sup> The rate of growth of the Soviet Union during the 1930's has also been cited as an instance of growth being successfully promoted by inflation.<sup>9</sup> On the other hand, the stability school maintains that price stability is a necessary prerequisite for self-sustained economic growth.<sup>10</sup> The monetarists believe that rapid inflationary pressures diminish the volume of resources available for investment. There is diversion of resources to uses which are not of the highest social priority i.e., inventory accumulation, luxury housing, etc. Empirical studies made by Bernstein and Patel,<sup>11</sup> Dorrance and Shaalan,<sup>12</sup> support this viewpoint. Shaalan has shown that in an inflationary environment, factor and product prices are affected in a manner leading to relatively less productive allocation of resources which may be reflected in a low capital-output ratio.

#### No Consistent Correlation

Statistical inductive studies which have been made with regard to the relationship between inflation and economic growth in a large number of countries, have not been able to establish any consistent correlation between the two. It has been shown, however, that inflation of the moderate type has some favourable impact on the growth process. This is well illustrated by the IMF Report submitted to the Government of India in 1953. In fact, a distinction has to be made between a 'functional' price rise and an inflationary price rise. A functional price rise is rather small, just enough to direct movement of resources and utilisation of surplus manpower. This would also be necessary for making increased supplies of food and raw materials available to the industrial sector. A mild dose of inflation would create an optimistic atmosphere conducive to growth in investment and output. Monetary theorists like Keynes, Robertson and Kaldor, have shown in their studies of economic growth in relation to inflation that while a mild dose of inflation promotes growth, pronounced price increases distort the pattern of investment and give a wrong direction to development. The post-war experience of the Latin American countries shows that in an environment of inflationary price rise, economic growth suffers. This suggests that while a 'functional' price rise is permissible, a cumulative rise in the price level is to be avoided for social and economic reasons.

In India, in the face of inelastic supplies of resources and continuously rising monetary demand, the inflationary process, instead of being self-destructive, has become self-cumulative. Surely, this is not a 'functional' price rise which is conducive to growth and development. The inflationary price rise experienced during the last 15 years has adversely

affected resource allocation, financial and material balance, saving, investment, consumption, and distribution of wealth and income. Rising domestic prices have aggravated the balance of payments difficulties as well. This is evident from available statistics relating to the Indian economy.

**Inflation and Domestic Saving:** Inflationary prices have adversely affected the volume of savings in the economy. The proportion of aggregate saving to national income at constant prices averaged 6.5 per cent per year during the first Plan and 8.4 per cent per year during the second Plan. During the third Plan period, aggregate savings declined considerably. The decline has been more marked during the last two years of the third Plan when prices rose at an annual rate of 10.5 per cent. Real savings of the household sector also declined during the last two years of the third Plan. In the corporate sector, the proportion of internal resources to the total sources of funds of public limited companies declined from 91.4 per cent in 1952-53 to 51.4 per cent in 1963-64.<sup>13</sup> The estimates of savings by the CSO for the three years 1966-67, 1967-68 and 1968-69, show that the net savings of the private corporate sector dwindled from Rs 139 crores in 1966-67 to Rs 105 crores in 1967-68, and further to a meagre sum of Rs 98 crores in 1968-69. Inflation has eroded the real value of money savings. The gap between required investment and available savings has led to creation of additional resources in the form of deficit financing which, in turn, has further aggravated the inflationary situation. Inflationary prices have tended to become regressive in their impact on savings. Inflation has proved to be a wasteful form of forced saving because there has been a shift in income from the poor to the rich. Prof. Nurkse has rightly observed, "Better tax the poor and invest the proceeds without the intermediary of the rich."<sup>14</sup> It appears, therefore, that inflation has adverse effects on the habits of voluntary saving while its ability to force saving is limited. In the face of the inflationary pressures in the economy, it is doubtful whether the fourth Plan target of raising savings from the present level of 8.8 per cent to 13.2 per cent would be reached at all.

**Inflation and Investment:** The real content of investment has been reduced because of price inflation. Available statistics show that the average annual increase in real investment (at 1948-49 prices) was 24.5 per cent during the first Plan. It came down to 10.7 per cent during the second Plan and further to 4.2 per cent during the third Plan. This is evident from the Table III.

The figures presented in Table III indicate that the price rise has been regressive in its impact on investment especially during the third Plan. Under the circumstances, the fourth

Plan target of increasing the volume of investment from 11.3 per cent in 1968-69 to 14.5 per cent in 1973-74, would have no real meaning unless sincere efforts are made to hold the price line. The Indian experience reveals two things: first, inflation reduces the availability of physical resources for investment and thus it creates a vicious spiral of reduced supplies and rising prices, and second, it encourages diversion of resources from productive to speculative purposes, such as gold, real estate, etc.

*Inter-Sectoral Terms of Trade:* The inflationary rise of prices in India since 1963-64 has been accompanied by a decisive shift in the inter-sectoral terms of trade in favour of the agricultural sector. Table IV shows this trend.

The shift in the terms of trade in favour of the agricultural sector has led to a redistribution of income in favour of the bigger farmers with large marketable surpluses. Such an increase in agricultural income leads to an increase in consumption of luxury articles or investment in real estate. This has resulted in aggravating the inflationary pressures in the economy. Secondly, as prices of food and raw materials increase faster than other prices, the non-agricultural sector has to spend more on these items, and this reduces the margin for saving by the non-agricultural sector<sup>15</sup>. This has adversely affected the growth rate in the economy.

*Consequences for External Payments:* The impact of price rise on the country's external payments position has been adverse. By raising costs in the domestic economy it has made it more and more difficult for Indian exports to compete in international markets. Prices of Indian products have been out of alignment with international prices. It has been shown that over the 15-year period since 1950, while our export price index recorded a rise of 14.3 per cent

the corresponding indices for Pakistan, Ceylon and Japan, showed declines of 13.3 per cent, 8.7 per cent and 2.0 per cent respectively. It is undoubtedly one of the main reasons why India has failed to benefit by world export boom. During the two decades from 1950, India's share in world exports successively declined from two per cent in 1950 to 1.2 per cent in 1960, one per cent in 1965 and further down to 0.8 per cent in 1969. This is amply demonstrated by Table V.

TABLE V  
GROWTH OF EXPORTS: WORLD AND INDIA  
(Million US dollars)

| Year | World<br>exports | Indian<br>exports | Indian<br>exports<br>as<br>percentage<br>of<br>world<br>exports |
|------|------------------|-------------------|-----------------------------------------------------------------|
| 1950 | 56,100           | 1,146             | 2.0                                                             |
| 1960 | 113,200          | 1,331             | 1.2                                                             |
| 1965 | 165,400          | 1,687             | 1.0                                                             |

The poor performance of our exports aggravated the balance of payments difficulties. It is the inflation at home which led to the devaluation of the Indian rupee in June, 1966. The effects of high domestic prices have been equally harmful in respect of our imports. The relative cheapness of imports increased the demand for imported goods. This

led to severe import restrictions which adversely affected the growth of industrial production. It also gave rise to malpractices such as foreign exchange leakage and smuggling. Surely, inflation has adversely affected our balance of payments.

Finally, inflationary prices have led to hardship and misery for the majority of the people. As changes in price structure do not bring about corresponding changes in income structure, the real incomes of fixed and low income groups get terribly reduced. They are deprived of the benefits of planning and development. On the other hand, windfall profits accrue to those advantageously situated. There is conspicuous rise in income, wealth and consumption of the minority of the privileged classes. The Indian experience bears ample testimony to this inequity of inflationary development. This must undermine the tempo of development.

It is thus evident that in the ultimate analysis, inflationary prices have done positive harm to the Indian economy. It is in view of these harmful effects of inflation that corrective action is called for to promote growth with stability and social justice, in the fourth five-year Plan.

## Non-Farm Employment in the Traditional Sector

B. L. AGARWAL & J. S. NAIN

MANPOWER PLANNING as an integral part of economic and social growth cannot be overemphasised. Broadly speaking, manpower planning includes the harnessing of human resources, developing their present and potential capabilities and utilising them for the maximum benefit of the economy and to the maximum satisfaction of the people. The first step to any such attempt is the knowledge — both quantitative and qualitative — about the present stock of human resources.

Whereas facts are available about the manpower engaged in organised industries and services in India, very little is known about the large section of population working on their own or in household industries and small establishments. This may be called the 'traditional sector' of Indian economy in which people are either self-employed or are working with the help of family members with little or no outside hiring, or are engaged in private establishments employing less than 25 persons.

In the traditional sector economic organisation is characterised by family or household enterprise and life in all its aspects is usually centred on the family. Work is shared among the members of the household as part of their way of life. Subsistence handicrafts and a variety of unorganised services make up a major segment of the traditional sector. It "comprises mainly peasant agriculture, handicrafts and small-scale industry, and the financial, transport, distribution and other services associated with the rural village economy, although traditional handicrafts may appear in cities as well. It is characterised by high ratios of labour to capital and often also to land, by relatively slow technological progress; by little or no capital accumulation, and by low productivity per man-year. The modern sector, on the other hand, is composed of plantation or other large-scale commercial, agriculture, mining, petroleum production and refining, large-scale manufacturing, and the financial, transport, distribution,

personal and other services associated with these activities. As a contrast to the traditional sector, the modern sector is characterised by high capital-labour ratio; by capital accumulation, by technological progress, by relative high productivity per man-hour and by provision of wage earning employment".

In the process of economic development, the traditional sector plays a very significant role. On the one hand, the traditional industries in general and family firms in particular exert a supporting influence on industrial growth. On the other hand, depending upon the availability of capital and skill, the traditional sector has to be transformed from less productive to more productive and from less integral to more integral one in such a manner that the relationship between traditional sector and industrial growth may lead to mutually reinforcing tendencies. The traditional sector has also to be made more amenable to financial and fiscal policies, in order that its wheels may move towards the desired path at the desired pace.

In terms of manpower, this sector (including agriculture) commands 94 per cent and (excluding agriculture from it) 24 per cent of the total work force according to 1961 census, as can be seen from the following chart:

## THE MANUFACTURER OF LARGE POWER PLANT

### THERMAL POWER PLANT

We are fully equipped to engineer a complete Thermal Power Station and manufacture Turbine, Generator, Condenser and Feed Heating Plant and associated auxiliaries.

A 30 MW set has been commissioned at Basin Bridge; another delivered to Parli as also a 120 MW set to Santaldih.

Under manufacture are two 30 MW sets for Parli and Namrup and seven 120 MW sets for Chandrapura, Santaldih and Ukai.

In addition, work is on hand on a 233 MW Nuclear Turbine for Madras Atomic Power Project at Kalpakkam.

15 MW Vertical Generator for Basi Hydro Power Stations (Himachal Pradesh) in Test Pit.

Spiral Casing having 7.92 metre inlet diameter for 45,700 m HP Turbine at Obra Hydro Power Station in Uttar Pradesh under erection.

### HYDRO POWER PLANT

With our equipment already delivered, Erection work is in progress at:

Basi (3x15 MW) Obra (3x33 MW) UBDC (3x15 MW) and Chibro (4x60 MW). Further 28 sets for Koyna (4x80 MW) Gumti (2x5 MW) Sumbal (2x11.3 MW) Ukai (4x75 MW) Sharavati (2x89 MW) Khodri (4x30 MW) Dehar (4x165 MW) and Pong (3x60 MW) are under various stages of design and manufacture.

Yes, 41 Power Plants for 13 Hydro Projects in 9 states in all!

## Our ace service engineer

Buying a machine tool is only half the investment. The other half is to keep it working efficiently for years to come.

Based on past service experience and current data, our computer works out the type and quantity of spares the HMT machines in use will need periodically. We stock them at important centres, so that you'll get them when you need them.

Again, we have found that a safe two years' supply of spares is about 5% of a machine's cost, but a priceless insurance against expensive downtime and the rising cost of spares! So, play safe and order a stock of spares when you buy a machine tool.

Now, match this with the training on the machine we can organise for your operators at the HMT factory, if required.

You could be 90% self-reliant. As for the other crucial 10% of maintenance services, get our men with restless feet — our service engineers.

HMT is far deeply involved and

more actively responsive to your technical needs than you would have ever imagined.

This is HMT today.

### The HMT range

**TURNING:** High speed precision lathes H22/26; General purpose centre lathes LB17/20/25; Centre lathe LT20; Heavy duty centre lathe L45; Production lathes L22PP and L22UP; Hexagonal turret lathes L22TP; Drum turret lathes RTV; Automatic copying lathes PILOTE; Multi-tool automatic lathes HMT-FAY; Single spindle bar and chucking automatics TR and PF; Multi-spindle bar and chucking automatics AS and ASH; Semi-automatic short piece turning machines mini-chucker. **MILLING:** Knee type mechanically controlled milling machines M2, M2P and M2EP; Knee type electrically controlled milling machines E2 and EM3; Turret ram type milling machines M1TR; Bed type duplex and simplex milling machines.

**DRILLING:** Radial drills RM; Column drill; Multi-spindle drilling machines. **GRINDING:** Hydraulic cylindrical and universal grinders G131/17/22; Hydraulic surface grinders SFW; Mechanical cylindrical grinder G9; Internal grinder G91. **GEARING:** Gear shaping machine 2A; Gear hobbing machines L. **BORING:** Horizontal boring machines FA5, AF7 and AZ9; Fine boring machines FB. **BROACHING:** Horizontal broaching machines RW; Vertical broaching machines RISZ. **METAL-FORMING:** Presses and press brakes. **MULTI-OPERATION:** Special purpose machines; Rotary and linear transferlines; Facing and centering machines;

**hmt** — Responsive To Your Changing Production Needs

The collection of statistics relating to the traditional sector, on a regular basis, is rendered difficult partly by the numbers involved and partly by the spatial scatteredness of its activities. Indirect estimates of employment can be derived but the procedure thereof would be quite different from that usually applied for the organised sector. Unlike the latter, it is difficult to fix any norm on the basis of investment or production for estimating employment in the traditional sector.

The industrial distribution of 45.4 million workers in the traditional sector is given in Table I. It has been derived from the data revealed by the 1961 census in respect of persons at work other than cultivation, and by the Directorate General of Employment and Training (DGE & T) in respect of the so-called "organised sector". It will be seen from the table that in all the industry divisions except in Transport, Storage and Communication and in Mining and Quarrying, a major share of the activities is carried on in the traditional sector. Even in Transport, Storage and Communication and Mining and Quarrying the employment in this sector is 40 and 24 per cent, respectively, of the total employment in these industry divisions. Trade and Commerce is almost entirely (97 per cent) carried on small scale. In manufacturing also the traditional sector commands 82 per cent of employment in this division on account of the preponderance of cottage and household industries in India. Most of the services, except the administrative, educational, scientific, health and medical and community services, are also carried on small scale. Construction and electricity, gas, water and sanitary services are almost equally divided between organised and traditional sector, although here also the latter holds a major share.

Of the total workers, manufacturing and services together employed about 60 per cent both in organised and traditional sectors, but their relative positions are different. In traditional sector manufacturing industries employed 32.1 per cent and services 27.6 per cent, while in organised sector the corresponding employment is 27.4 per cent and 33.9 per

cent. This is due to the fact that a large number of persons employed in public services, educational and scientific services are covered by the organised sector. In manufacturing household industry being the biggest employer, a greater percentage of employment is found in the traditional sector. The third place in the traditional sector is occupied by trade and commerce (16.3 per cent) while it occupies the lowest place in the organised sector. Transport, storage and communication which employs 15.0 per cent workers and occupies third place in organised sector has a very low position (2.7 per cent) in traditional sector. This is so because in India, trade and commerce are mostly carried on by owner proprietors with the help of family members or by partnership firms with a little outside hiring, while transport, storage and communication activities are mostly carried on large scale.

### Industrial Pattern of Workers

In order to comprehend the structure of employment in the traditional sector, it is necessary to know the distribution of workers in each major and minor industry group. This can be obtained as the difference between the total employment given by the census and employment in organised sector in each major and minor group given by the DGE & T. But the reported DGE & T figures for the private sector pertain only to responding establishments which are 82.3 per cent of the total establishment and cover 81.5 per cent of employment. We have, therefore, inflated their figures for non-responding establishments by using the following formulae:

(a) *Employment in industrial minor groups (3rd digit)*

$$E_{ijm} = \frac{\sum_{j=1}^n e_{ijms}}{\sum_{j=1}^n n_{ijms}} \times N_{ijms}$$

Where  $E_{ijm}$  = Estimated employment in  $m$ th minor group of  $j$ th major group of  $i$ th industry division;

$e_{ijms}$  = Employment in reported establishments of

TABLE I

Figures in brackets represent percentages.

\*SIC—Standard Industrial Classification issued by DGE & T.

$m$ th minor group of  $j$ th major group of  $i$ th division in  $s$ th state;

$n_{ijms}$  = Number of reported establishments of  $m$ th minor group of  $j$ th major group of  $i$ th division in  $s$ th state;

$N_{ijms}$  = Total number of establishments of  $m$ th minor group of  $j$ th major group of  $i$ th division in  $s$ th state;

and  $\sum_s$  stands over all states.

(b) *Employment in industrial major groups (2nd digit)*

Employment for an industrial major group has been worked out by adding the above estimates of each industrial minor group comprising the major group in question. Thus, if  $E_{ij}$  is estimated employment in  $j$ th major group of  $i$ th division,

$$E_{ij} = \sum_m E_{ijm}$$

Where,  $E_{ijm}$  is estimated employment in  $m$ th minor group of  $j$ th major group in  $i$ th division and  $\sum_m$  stands over all minor groups.

(c) *Employment in industrial division (one digit)*

Employment for an industrial division has been worked out by adding the estimates of each industrial major group comprising the industry division in question. Thus, the employment ( $E_i$ ) in the  $i$ th industry division has been worked out as

$$E_i = \sum_j E_{ij}$$

Where,  $E_{ij}$  has the same meaning as in (b) above, and  $\sum_j$  stands over all major groups.

To the figures thus obtained for employment in private sector, employment in public sector has been added to obtain total employment in organised sector. The employment in traditional sector is a residual obtained by deducting employment in organised sector from the total employment given by the census for each major and minor industry group.

The employment in the organised and traditional (including household industry) sectors at 3 digit (minor group) level of Standard Industrial Classification has thus been obtained. In analysing the data here, we shall be concerned more with major industry groups although a reference to minor groups wherever called for may be made.

0. *Plantations, Livestock, Forestry, Fishing and Hunting*: Table II shows the industrial distribution of persons working in plantations, livestock, forestry, fishing and hunting. Out of 6.4 million workers in this group, 5.6 million (87.5 per cent) work in traditional sector. Fishing, livestock and hunting is almost entirely traditional and so is forestry and logging except planting, replanting and conservation of forests, an activity which is looked after by the public sector. Among plantations, about three-fourths of tea plantations are in the organised sector, but other plantations, e.g. coffee, rubber, tobacco, etc. are almost entirely in the traditional sector.

1. *Mining and Quarrying*: About 24 per cent of the total employment in this division is in traditional sector (see Table I). This is mostly in quarrying of stone (including slate), clay, sand, gravel and limestone. Mining of coal, iron ores, gold and silver, manganese, mica, petroleum and natural gas etc. is concentrated in organised sector, although about 40,000 persons are engaged in traditional sector also in these activities.

2 & 3. *Manufacturing Industries*: As shown in Table III, out of 17.9 million workers in manufacturing industries, 14.6 million are in the traditional sector.<sup>3</sup> Wood and wooden products and leather and leather products are almost entirely manufactured in traditional sector. In textiles (except jute and silk), foodstuffs, beverages, tobacco products and non-metallic mineral products (other than petroleum and coal) also, the employment in traditional sector is more than 80 per cent. It is in paper and paper products, rubber, petroleum and coal products, machinery and electric equipment and chemical and chemical products, that the employment in organised sector is more than that in traditional sector.

In the traditional sector of manufacturing, cotton textile, wood and wooden products and foodstuffs provide

TABLE II

EMPLOYMENT IN ORGANISED AND TRADITIONAL SECTORS IN PLANTATIONS, LIVESTOCK, FORESTRY, FISHING AND HUNTING: 1961.

# NOTHING TO CHOOSE BETWEEN THEM

The VBE, VN and VK Bonds have created a revolution in the grinding wheel industry. They have created a new record in consistency. Making for 'perfect duplication'—for wheels that are identical within each batch and from batch to batch. Establishing a major advance in sophisticated abrasive technology. The VBE, VN and VK Bonds give grinding an edge in every type of grinding operation. Intensive quality testing has proved the new bonds to more than meet Norton's international rigid standards of acceptability. They mark a triumph in high quality, high economy, high precision grinding.

# 1899 - NOW

On 17th April 1899...the day we were born, we lit our Alladin's lamp and changed the life of Calcutta... Gone were the old days of oil lamps and punkhawallas... In came power and energy from India's first steam station... our own Power Station at Emambag Lane... then from Cossipore Generating Station in 1912, Southern Generating Station in 1926, Mulajore Generating Station in 1939 and New Cossipore Generating Station in 1949... Every pulse beat of Calcutta is recorded at Victoria House... In 1899 we sold 2 million units... this year

2600 million units thro' 740,000 meters... We read a meter every second of the working day and we send out a bill every 1.6 seconds of the working day... We shall be here through the Seventies to supply as much power as Calcuttans want in their homes... in their factories... at their offices... We are proud of our past contribution to the development of Calcutta's domestic and industrial complex... We are confident of meeting the challenge of the Seventies... Greater Calcutta is assured of a "lighter" and brighter future.

**THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED**

Victoria House, Calcutta-1.

employment to 7.0 million persons which constitute about 50 per cent of the employment in this sector. In cotton textiles alone 3.3 million persons are working in traditional sector out of which 2.12 million persons are engaged in cotton weaving in handlooms and more than half a million in cotton spinning (other than in mills). Miscellaneous textiles also employ about 1.6 million (10.7 per cent) persons. Next in order of importance are non-metallic mineral products, tobacco products, basic metals and leather and leather products, which together employ 3.7 million (25.4 per cent) persons in the traditional sector. In the organised sector, cotton textiles, foodstuffs and basic metals are the

largest employers employing 1.7 million persons (a little more than 50 per cent) out of the total 3.31 million workers employed in the organised sector of manufacturing.

It may be mentioned that in the traditional sector of manufacturing, the household industries<sup>4</sup> preponderate. As shown in Table, IV, they employ 9.9 million workers out of 14.6 million in the traditional sector, i.e. more than two-thirds. In case of textiles of all types, wood and wooden products and leather and leather products, the household industries command more than three-fourths of the employment in the traditional sector in these industries.

| 39.          | Miscellaneous Manufacturing Industries                        | 0.95<br>(5.30)                            | 0.03<br>(0.91)                 | 0.92<br>(6.31)                   | 96.84                                         |
|              | Total                                                         | 17.91<br>(100.00)                         | 3.31<br>(100.00)               | 14.60<br>(100.00)                | 81.52                                         |

Figures in brackets represent percentages.

The household industries having more than 90 per cent employment in traditional sector are:

- 206: Production of butter, ghee, cheese and other dairy products;
- 210: Production of distilled spirits, wines, liquor from alcoholic malt, fruits and malts in distillery and brewery;
- 231: Cotton spinning (other than in mills);
- 235: Cotton weaving in handlooms;
- 236: Manufacturing of Khadi textile in handlooms;
- 253: Wool spinning other than in mills;
- 255: Wool weaving in handlooms;
- 264: Weaving of silk textile by handloom;
- 288: Manufacturing of materials from cork, bamboo, cane, leaves and other allied products;
- 350: Manufacture of earthenware and earthen pottery.

On the other hand, in case of printing and publishing; rubber, petroleum and coal products; machinery (other than transport) and electric equipment, the place of household industry is very marginal—none of these household industries have more than 11 per cent of the employment in the traditional sector. No household industry probably exists in the following areas of manufacturing:

- 201: Production of sugar and syrup from sugarcane in mills;
- 208: Production of hydrogenated oils (vanaspati);
- 217: Processing of tea in factories;
- 232: Cotton spinning and weaving in mills;

- 252: Wool spinning and weaving in mills;
- 260: Spinning and weaving of silk textile in mills;
- 290: Manufacture of pulp from wood, rags, wastepaper and other fibres and the conversion of such pulp into any kind of paper and paper board in mill;
- 324: Production of petroleum, kerosene and other petroleum products in petroleum refineries;
- 374: Manufacture of heavy electrical machinery & equipment such as motors, generators, transformers;
- 380: Manufacture, assembly and repairing of locomotives;
- 381: Manufacture of wagons, coaches, tramways and other rail road equipment;
- 387: Manufacture and repair of air transport equipment including aeroplanes, aeroengines.

It is interesting to note that cotton textile and foodstuffs industries are equally important both in organised and traditional sectors and also in household industry sector. These two industries together employ more than 33 per cent of workers in each sector.

4. *Construction*: In construction activities, about 59 per cent of the total employment has been estimated to be in the traditional sector (see Table I). Of the total employment of 1.21 million persons in this sector, 0.82 million persons are working in construction and maintenance of buildings, 0.28 million in construction and maintenance of roads, railways, bridges and tunnels and 0.11 million in construction and maintenance of waterways and water reservoirs. The

TABLE IV  
DISTRIBUTION OF EMPLOYMENT IN TRADITIONAL SECTOR AND HOUSEHOLD INDUSTRIES OF MANUFACTURING INDUSTRIES: 1961.

| SIC Code No. | Industry Groups                                               | (Employment in millions)         |                                    |                                                        |

construction and maintenance of telegraph and telephone lines is entirely in the organised sector.

5. *Electricity, Gas, Water and Sanitary Services*: Out of the total employment of 0.63 million in this division, 0.37 million persons (57.1 per cent) are in the traditional sector (Table I) and that too mostly in water supply and sanitary services. Generation and transmission of electric energy, distribution of electric energy and manufacture and distribution of gas are entirely carried out in organised sector employing together 0.22 million persons.

6. *Trade and Commerce*: Traditional sector plays an important role in trade and commerce. As shown in Table V, nearly 97 per cent (7.4 million)<sup>5</sup> of the employment in this

division is in this sector, out of which 6.7 million are engaged in retail trading, 0.45 million in wholesale trading and 0.24 million in miscellaneous trade and commerce.

The important wholesale trades in the traditional sector are cereals and pulses, vegetables, fruits, sugar, spices, oils, dairy products, eggs, poultry and other foodstuffs and all kinds of fabrics and textiles. Almost all retail trading (99.5 cent) in terms of employment is done in traditional sector. In organised sector, provident fund, insurance, banking and similar types of financial operations are important. These activities together employ only 0.16 million persons.

7. *Transport, Storage and Communication*: Transport, storage and communication services seem to be better orga-

Figures in brackets represent percentages.

nised, as only 40 per cent of their employment is in traditional sector (Table I). Out of the total employment of 1.21 million in traditional sector, as many as 0.92 million persons are engaged in non-mechanised transport such as transporting by animals and animal drawn vehicles, man and man drawn vehicles and boat and other water-borne means by river and canals. Transporting by railways and by air, storage, warehousing and communication are entirely in the organised sector.

8. **Services:** In traditional sector, 12.56 million persons are engaged in services which is 75 per cent of the total employment in this division. Table VI depicts the proportion of employment in different services in organised and traditional sectors.

It will be seen from the table that religious and welfare services, legal services, business services, recreation services and personal services are carried almost entirely on a small scale (mostly done by individuals and families and are, therefore, in the traditional sector.

Educational and scientific services and medical and health services are both in organised and traditional sectors, although in terms of employment, greater portion of them is in organised sector. Public services obviously should be and are in public sector (organised sector).

#### Occupational Pattern of Workers

The occupational distribution of workers in the traditional sector is obtained as the difference between the workers given by the census and workers in organised sector given by the DGE & T. The directorate has, under its Employment Market Information Programme, been collecting information regarding occupational pattern of employees in the public

and private sectors at biennial intervals. The reported data for public and private sectors relate to September 30, 1960, and September 30, 1961 respectively. In the absence of any knowledge of the extent of non-response in each occupational division or major group the reported employment in each occupational division group has been blown up by taking a constant multiplier as under:

$$\text{Estimated employment} = \text{Reported employment} \times \frac{100}{\text{overall coverage}}$$

where over-all coverage has been calculated by taking the reported employment as percentage of estimated total employment given by the DGE & T (7.05 million in public sector and 5.04 million in private sector).

Table VII (p. 1163) shows the occupational distribution of workers in organised and traditional sectors. Sales workers are almost entirely in traditional sector (99.4 per cent). Out of 6.84 million sales workers in traditional sector, 6.56 million are working as proprietors (wholesale and retail trade) and salesmen, shop assistants and related workers. Planters, fishermen, hunters and loggers are also mostly in traditional sector. Other occupations employing more than 80 per cent of their workers in traditional sector are service, sport and recreation and craftsmen, production process workers and labourers. The most important occupations in organised sector are professional, technical and related workers and clerical and related workers where less than 50 per cent workers are in the traditional sector.

Table VIII (p. 1163) shows the occupations in which employment in traditional sector is 50 to 75 per cent. It is interesting to note that 63.2 per cent of physical scientists are working in traditional sector. Nurses and other

(Over to p. 1167)

In our little way...

## we help India fight its war on all fronts

As India moves towards its goal of all-round development, we make our contribution. On the food front Union Carbide provides pesticides and polyethylene film which help the farmer reap a bigger, better harvest. On the home front we bring to you a variety of household articles ranging from batteries and flashlights to colourful containers made from our polyethylene. We supply raw materials and chemicals essential for the pharmaceuticals, paints,

textiles, iron and steel and rubber industries. On the export front Union Carbide combs the five continents for new markets and its products reach more than 50 countries including the U.S.A. These are but some of the seeds that Union Carbide India Limited has sown to raise the standards of living of the people of India. Yes, in our little way we help India fight its war on all fronts!

UNION  
CARBIDE

## sowing the seeds of progress

## Assured Protection WITH...

## Lightning Arresters

W. S. Lightning Arresters guard your valuable Power Equipment around the clock. A full range from 400 Volts to 2,20,000 Volts is manufactured with exclusive features like Mobilare gaps, Air Transfer Devices, Solder Sealed Bushings, folded pole construction, etc.

W. S. also manufacture Bushings for Power and Distribution Transformers, oil and air blast Circuit Breakers up to 220 KV. Special solder sealed Bushings for hermetic applications can be furnished to your designs. Other products are a full line of Transmission and

Substation Insulators up to 2,20,000 volts including High Creep puncture proof Post Insulators. Technical collaboration with M. S. WESTINGHOUSE U.S.A.

W. S. INSULATORS OF INDIA LIMITED,  
Dhun Building,  
175-1, Mount Road, Madras-2

# "Having a profitable time in Maharashtra. Wish you were here",

say industrialists who have come from all over India and who list profits and prosperity high among Maharashtra's charms.

## Talking of profits.

These happy industrialists point to Maharashtra's high productivity: Cordial labour/management relations. Steadily growing infrastructure. Extensive transport/communication network. Unlimited power. Ample water. Untapped mineral/natural resources. And, the fact that it offers one of the largest, fastest-growing markets in the country for most products. (Pop: over 4,95,00,000.) Aside from formidable export opportunities offered by the Gateway to India.

## Talking of prosperity.

These industrialists' thoughts naturally turn to Maharashtra's per-capita income, among the highest in India. To its plentiful social amenities. To its cosmopolitan way of life. To its excellent climate which vies only with its healthy and stable industrial and political environment.

## What else has Maharashtra to offer?

Many profit-boosting incentives. And, SICOM. With its team of young, aggressive, practical-minded, hardworking and friendly people. Financial experts who help to raise capital fast. Plant location experts who pinpoint the most profitable sites. Industrial service experts who know industrial needs and meet them. SICOM people who work for you. Like you.

**SICOM**—the moving force for developing industries

## ECONOMIC MULTIPLIER

**Highlights of Hindustan Steel's role as a multiplier of economic activity in the development of India.**

**INDUSTRIES**  
Hindustan Steel has so far supplied over 20 million tonnes of steel and 7.7 million tonnes of pig iron to Indian industry. This has initiated the growth of several engineering and other industries which use iron and steel. The equipment and machinery produced by these engineering industries have made the growth of various other industries possible. With this rapid industrial development, a steady and increased supply of raw materials also became essential. To meet this demand, still other industries sprang up—industries engaged in mining, transportation, production of industrial raw materials, etc. Together, these have added to the nation's wealth and contributed several million rupees to the exchequer in the form of taxes and duties.

**AGRICULTURE**  
Hindustan Steel not only provides the steel for building dams, power houses, tube wells, silos and farm equipment, but has also supplied so far 1.5 million tonnes of nitrogenous fertilizers to help improve agricultural yields. Many of Hindustan Steel's chemical by-products are also important ingredients in the manufacture of pesticides and insecticides commonly used for crop protection.

**THE EXCHEQUER**  
Hindustan Steel's cumulative contribution till

March, 1970 to Central and State revenues exceeds Rs. 762.5 crores—over Rs. 250 crores as excise duty, over Rs. 75 crores as customs duty, over Rs. 30 crores as sales tax, over Rs. 185 crores as outward railway freight, over Rs. 190 crores as interest on loan capital and Rs. 32.5 crores as return of loan capital.

**SAVING AND EARNING FOREIGN EXCHANGE**  
To date Hindustan Steel has sold Rs. 1600 crores worth of iron and steel and chemical by-products, all of which the nation would have otherwise had to import by spending foreign exchange. Such massive savings apart, Hindustan Steel has over the years earned over Rs. 140 crores in foreign exchange from its exports of iron and steel and by-products.

**EMPLOYMENT**  
Hindustan Steel employs over 120,000 people. For every man employed by Hindustan Steel several times as many find employment in the industries which serve steel-making or use steel. The increase in steel production has led to the expansion of the nation's employment potential.

**NEW SKILLS AND PROCESSES**  
Hindustan Steel has introduced many new steel

products and steel-making processes. With the establishment and expansion of Hindustan Steel the nation has gained new experience, developed new skills and competent consultancy services. A cadre of over 4,000 engineers and technicians essential for the future growth of the steel industry in India has been trained and developed by Hindustan Steel.

Steel, we thus see, is crucial to economic development. It was this appreciation of steel's role as the mother industry that prompted our planners to lay deep emphasis on expanding India's steel-making capabilities. Starting with three new million-tonne steel plants at Rourkela, Bhilai and Durgapur, Hindustan Steel's present annual production rate is 4.25 million tonnes, constituting over 60% of India's total annual steel-making potential. Further expansion is already under way. The bulk of the country's requirements of highly specialized alloy and tool steels too are being met by Hindustan Steel's Alloy Steels Plant at Durgapur.

paramedical personnel are equally divided: a little more than 50 per cent in traditional sector.

Table IX (p. 1163) shows the occupations wherein 75-90 per cent workers are in traditional sector. About 85 per cent of physicians, surgeons and dentists are in traditional sector.

It is to be noted that there are a number of occupations which can be carried out with little investment. Table X (p. 1164) gives the names of such occupations in which 90 per cent or more workers are in traditional sector.

In the traditional sector, household industry plays an important role. It will be seen that out of 45.4 million workers in traditional sector, 12.0 million are engaged in household industry of which 9.9 million are craftsmen, production process workers and labourers and 2.1 million are planters, fishermen, hunters and loggers. These two occupations are very important in household industry which employs about 43 per cent of the workers in the traditional sector in these occupations. The occupations which are largely being carried out on household basis with little investment are shown in Table XI (p. 1164).

#### References :

1. ILO, *Employment Objectives in Economic Development*, Report of a

*Meeting of Experts, Studies and Reports*, New Series, No. 62 (Geneva, 1961), para 105, p. 27.

2. Industrial and occupational data given in respect of traditional sector hereafter exclude cultivators and agricultural labourers.

3. According to National Sample Survey, the employment in small scale manufacturing in 1958-59 was 16.85 million, which comprised industries employing less than 10 persons if using power and less than 20 persons, if not using power. The NSS estimate thus seems to be higher than our estimate of employment in traditional sector of manufacturing industries which, for the purpose of this article, is defined as comprising industries employing less than 25 workers. This is partly due to difference in concepts and partly due to inclusion of subsidiary and part-time workers in NSS.

4. The term 'household industry' introduced for the first time in the 1961 census was defined as "an industry conducted by the head of the household himself and/or mainly members of the household at home or within the village in rural areas and at home in urban areas." Being a processing industry, household industry is found only in 0, 1 and 2 & 3 industry divisions of SIC and employs 2.1 million persons in agriculture etc., about 3,000 persons in mining and quarrying and 9.9 million persons in manufacturing industries.

5. The National Sample Survey has estimated an employment of 4.97 million in 1959-60 in household trading which means only trading carried out entirely by the households or in co-operation with other households as joint enterprise. The NSS estimate excludes non-household trading establishments, households engaged in trade registered under Sales Tax Act and trading of self-manufactured goods.

## Economics of Electricity in Urban India

I. R. KHURANA

ELECTRICITY HAS revolutionised the entire world. Electricity is, today, the most versatile form of energy at the service of mankind. It can be effectively used at any hour to produce heat, light and refrigeration or be called upon to supply motive power for almost any purpose irrespective of whether it is required for working a small electric shaving razor or to run a giant motor employed in a steel rolling mill. The greatest advantage of electrical energy is its flexibility, adaptability and the ease with which it can be handled and controlled. The possibility of its transmission at high voltage over long distances and distribution to a variety of consumers is an advantage not possessed by any other form of energy at present.

Electricity has become so indispensable to civilisation that it is no longer considered a luxury but an essential requisite of modern living. Unfortunately in India this fac-

ility is not provided to all human settlements. Even in cities and towns only 2387 urban areas constituting about 88 per cent of the total were electrified in 1967. All the cities and towns with a population of over 50,000 were electrified while 86 to 88 per cent of smaller towns were provided with this facility. The number of electrified cities and towns may be seen from Table I.

The provision of electricity in urban areas of different sizes is made according to the norms drawn up by the Central Water and Power Commission. The average connected load per consumer has been taken to be as follows:

| Population       | Connected load per consumer |
|------------------|-----------------------------|
| 50,000 to 1 lakh | 500 watts                   |
| 20,000 to 50,000 | 400 "                       |
| 10,000 to 20,000 | 350 "                       |
| 5,000 to 10,000  | 300 "                       |
| 2,000 to 5,000   | 200 "                       |
| Below 2,000      | 100 "                       |

TABLE I  
NUMBER OF ELECTRIFIED CITIES AND TOWNS OF INDIA: 1967

| Population range   | Total number of cities/towns | Number of electrified cities/towns | Percentage of electrified cities/towns to total |
|--------------------|------------------------------|------------------------------------|-------------------------------------------------|
| 5 lakhs and above  | 12                           | 12                                 | 100.00                                          |
| 100,000 to 5 lakhs | 95                           | 95                                 | 100.00                                          |
| 50,000 to 100,000  | 139                          | 139                                | 100.00                                          |
| 20,000 to 50,000   | 518                          | 455                                | 87.83                                           |
| 10,000 to 20,000   | 820                          | 717                                | 87.43                                           |
| 5,000 to 10,000    | 848                          | 733                                | 86.43                                           |
| Less than 5,000    | 268                          | 286                                | 88.05                                           |
| Total              | 2,700                        | 2,887                              | 88.48                                           |

Source: Central Water and Power Commission.

The above connected load per consumer is a general category of load and does not include requirements for heating and small motors. For this purpose the provision is made only in towns situated in hilly areas. In respect of urban areas located in the plains a separate provision is made in each city; there is no norm for this. The connected load as well as maximum demand for rural areas in hills is 1 kW while in respect of rural areas electricity is provided according to the needs. Normally, kutcha houses and temporary buildings such as sheds are ignored in working out connected load. The demand factor for general load may vary from one-third to one-fourth depending on the size and prosperity of the location. The day demand is taken as one-fifth of the total estimated demand for night.

In working out the demand for street lighting, length of streets and shopping centres as well as financial resources

of local bodies to pay for this amenity are taken into consideration. For small towns 40 watts lamp are assumed whereas for bigger towns 60 to 100 watts lamp may be included. In working out the industrial load, factories have been classified into five categories viz., cottage, small-scale, medium, large and heavy industries. Connected load varies with the BHP while the demand factor varies for different types of industries and may even be more than 80 per cent. Requirements of power for water supply, drainage, irrigation, dewatering and bulk supply to other distributing agencies are assessed on the basis of requirements of the plants and demand.

It is thus evident that the Central Water and Power Commission is guided solely by the size of the urban area in the provision of connected load and the cost of operation is not taken into consideration.

It is a well-known fact that the cost of electricity supply is affected significantly by the physical conditions such as the built-up pattern, area covered, number of structures and consumers, source and level of supply, type of consumers, systems of transmission, capital structure etc. Unfortunately data pertaining to these variants are not readily available for all the urban areas to analyse their impact on cost structure. However, from the data available for nearly one thousand urban areas an attempt has been made to peep into the cost structure and derive useful ratios which reflect the economics of this utility.

#### Number of Agencies

The distribution of electricity is looked after by a number of agencies namely the state electricity boards, state governments, local bodies and a number of private agencies. In 87 per cent of cities and towns, state governments and state electricity boards were distributing power directly to ultimate consumers, in four per cent cities and towns private agencies continued to maintain their supply while only in six per cent cities and towns urban local bodies were looking after its distribution. So far as the source of power is concerned cities and towns are reported to be getting power directly from grids or buying from other sources or generating themselves by thermal or diesel stations. 60 per cent of cities and towns were getting power from the grid, 13 per cent were generating power themselves by thermal stations, four per cent were generating power by diesel stations, 10 per cent of the cities and towns were partly generating power themselves and partly getting from the grid while the rest of them were partly generating power by diesel stations and partly getting from the grids.

The per capita consumption of electricity has also been found to vary directly with the size of the urban area as seen from Table II. Cities with over five lakh persons topped

TABLE II  
PER CAPITA CONSUMPTION OF ELECTRICITY IN  
URBAN AREAS BY POPULATION RANGE: 1966

| Population range   | Per capita consumption of electricity (kWh) |
|--------------------|---------------------------------------------|
| 5 lakhs and above  | 209                                         |
| 2 lakhs to 5 lakhs | 113                                         |
| 1 lakh to 2 lakhs  | 74                                          |
| 50,000 to 1 lakh   | 54                                          |
| 20,000 to 50,000   | 43                                          |
| 10,000 to 20,000   | 24                                          |
| 5,000 to 10,000    | 19                                          |
| Less than 5,000    | 16                                          |

with 209 kWh in 1966 which is almost twice and three times the per capita consumption of cities of population range of two to five lakhs and one to two lakhs, respectively. In towns of the population range of 20,000 to one lakh, per capita consumption worked out to about 50 kWh while the consumption in small towns with the exception of hill stations it was significantly less, being not more than 20 kWh.

Regarding the pattern of power consumption in cities with a population of one lakh in 1966, about one-half is consumed by the industrial sector while in towns of population range of 20,000 to one lakh industrial sector accounts for two-fifths of total consumption. In towns of population range of 5,000 to 20,000 it was nearly one-third while in towns of less than 5,000 persons it was only 16 per cent. Lower consumption of power by industrial sector in smaller towns evidently reveals their poor economic base. The distribution of electricity by class of consumers is given in Table III.

TABLE III  
PERCENTAGE DISTRIBUTION OF ELECTRICITY BY  
CLASS OF CONSUMERS: 1966

| Population Range   | Percentage distribution of electricity by class of consumers |            |            |                 |        |
|--------------------|--------------------------------------------------------------|------------|------------|-----------------|--------|
|                    | Domestic                                                     | Commercial | Industrial | Street lighting | Others |
| 5 lakhs and above  | 23.6                                                         | 11.2       | 56.2       | 2.9             | 6.1    |
| 2 lakhs to 5 lakhs | 28.2                                                         | 12.7       | 51.4       | 3.3             | 4.4    |
| 100,000 to 2 lakhs | 29.2                                                         | 16.0       | 46.0       | 3.7             | 5.1    |
| 50,000 to 100,000  | 39.4                                                         | 12.6       | 38.9       | 3.9             | 5.2    |
| 20,000 to 50,000   | 42.1                                                         | 9.5        | 39.2       | 4.6             | 4.6    |
| 10,000 to 20,000   | 57.4                                                         | 5.3        | 29.7       | 7.6             | ..     |
| 5,000 to 10,000    | 59.5                                                         | 4.6        | 26.6       | 9.3             | ..     |
| Less than 5,000    | 67.9                                                         | 3.6        | 16.4       | 12.1            | ..     |

Just the reverse is the case with power consumed by the domestic sector. In towns of less than 10,000 persons consumption of power by domestic sector predominates. About 60 per cent of the total power consumption is by the domestic sector in small towns of less than 20,000 persons while it is about 40 per cent in towns of population range of 20,000 to one lakh. In cities of one to five lakhs it is about 30 per cent and it is about 24 per cent in cities with over five lakh inhabitants.

Consumption of electricity by commercial sector fluctuates in relatively narrow limits, namely 3.6 to 16 per cent. Surprisingly, in cities of population range of one to two lakhs the highest percentage accounted for by commercial sector. Street lighting generally accounts for not more than five per cent although the higher percentage in some of the towns may be either due to defective reporting or relatively larger utilisation of electricity for this purpose.

Another significant point borne out by the analysis is that there has been a persistent upward trend in the consumption of electricity for all cities and towns for which data could be gathered. This increase has been the highest in the towns of less than 5,000 followed by towns of population range of 10,000 to 20,000 over a period of four years. Only

## High Pressure Boilers and Boiler House auxiliaries

**- wholly Indian-built  
equipment to  
international standards  
for high efficiency,  
economy and reliability**

The manufacture of boilers and valves involving high pressures and temperature ratings calls for a high standard of quality control from the stage the materials enter the factory upto the time the equipment are despatched.

At its Boiler Plant and at its other sister units at Hyderabad and Hardwar, the most advanced manufacturing techniques build

uncompromising quality into all the products at all stages.

# They saved the ancient banyan tree and now their daring knows no bounds

'Let it stand,' someone said of the banyan tree as the site was being cleared for the Hindustan Lever Research Centre, at Andheri.

So the tree still stands—and it stands for quite a lot. For one thing, the tree signifies that we can't easily get away from what is home-grown. Appropriately, therefore, the Centre will tackle problems rooted in India—the kind that can only be solved here:

Can we discover and exploit hitherto unused local sources of oil, thus cutting imports and saving foreign exchange? Can we develop milk foods that are ideally suited to Indian needs? How can we improve the nutritive value of protein-poor foods? Can we develop processes for the preservation of Indian type food dishes?

Research on all this can only begin at home. It has, at the Hindustan Lever Research Centre in Andheri. The sweep and thrust of the studies are daring. The scientists are producing new devices for old, making traditional things happen in new ways.

They have, of course, left the banyan tree alone to grow by itself.

in towns of 5,000 to 10,000 there was a fall in the consumption of electricity and that too only in 1966-67. Otherwise in all the towns and cities there has been an upward trend. The trend of consumption of electricity for the years 1964-65 to 1967-68 is given in Table IV.

TABLE IV  
TRENDS IN CONSUMPTION OF ELECTRICITY FOR  
THE YEARS 1964-65 to 1967-68

| Population range   | Increase in consumption                     |                                             |                                             |                                                |
|--------------------|---------------------------------------------|---------------------------------------------|---------------------------------------------|------------------------------------------------|
|                    | Percentage increase in 1965-66 over 1964-65 | Percentage increase in 1966-67 over 1965-66 | Percentage increase in 1967-68 over 1966-67 | Percentage cumulative increase over the period |
| 5 lakhs and above  | 7.1                                         | 10.2                                        | 6.7                                         | 25.9                                           |

As regards the economics of electricity, it is sought to be studied by analysing certain financial aspects which vitally affect generation and transmission of electricity supply. Important among these are cost of operation,\* revenue, operational ratio\*\* and capital turnover ratio†.

Cost of operation of electricity is affected by the type of generation, system of distribution and administrative setup. As the cost of generation varies significantly depending on the source, it has been thought better that only the distribution costs are taken as the criterion for working out the operating expenditure per unit of electricity. The cost of, distribution per unit for cities with population of more than five lakhs is generally low, being 1.8 paise per unit, although three of the cities covered by the study have underground transmission lines and their operation and maintenance costs are rather high. The distribution cost per unit increases inversely with the size of the urban area and in the case of towns of population range of 20,000 to one lakh it is more than two paise per unit. One of the reasons for larger distribution cost may be that in smaller towns distribution networks are spread over larger area per connection and some power is also lost due to its transmission on lower voltage. Another factor which may be responsible for higher distribu-

\*Cost of operation = gross operational expenditure

gross units of electricity sold

(Gross operational expenses = maintenance and operation expenses + cost of establishment + debt charges + depreciation cost.)

\*\*Operational ratio = gross expenditure/gross revenue.

†Capital turnover ratio = gross revenue/capital investment.

tion costs is that these towns have to pay for the overhead charges, depreciation, interest etc., on account of capital cost of the distributional network.

It will be seen from Table V that the cost of operation (distribution cost and cost of bulk purchase or generation) is the lowest in cities with over five lakh population and the cost goes on increasing as the size of the urban areas decreases. There is a sharp increase in the cost of operation in the towns of a population range of 10,000 to 20,000 as in this class of towns a large number of diesel stations were covered by the study while in towns of population of 5,000 to 10,000 only one diesel generating station was in operation. Similar is the case with revenue per unit as higher tariff rate is charged for electricity generated from diesel stations.

Efforts were also made to work out if possible separately the cost of operation and revenue per unit for urban areas of different sizes according to the source of power. But due to limitations of the data it was not possible to do so according to the size. However, it was found that the cost of operation and revenue per unit was the lowest, that is five paise and seven paise respectively, for power acquired from grid. In the case of power generated from thermal stations the cost of operation and revenue per unit were seven and eight paise while they were as high as 22 and 29 paise for electricity generated by diesel stations.

### Capital and Operating Expenditure

An analysis of the capital and operating expenditure per unit of output for cities and towns for which data are available shows that the book value of capital assets per unit of output is the highest in towns of population range of 10,000 to 20,000 being Rs 1.86. Correspondingly the capital expenditure in these towns is also very high being nearly 36 paise per unit.

Operating ratio, that measures the efficiency of a public utility enterprise, has been defined as the ratio of operating expenses, including depreciation to gross revenue. If the operating ratio is favourable i.e. it is less than unity, the utility enterprise is taken as a profitable one. Expressed as a percentage, the operating ratio shows the proportion of gross revenue which is required to cover the cost of operating expenditure before any return can be earmarked for the capital. The complement of operating ratio (difference between total expenses and gross revenues) is termed the return margin. If operating ratio is say 80 per cent, the return margin is 20 per cent and the lower the operating ratio the higher the return margin. Corresponding operation ratio and return margin

TABLE V  
COST OF OPERATION AND REVENUE PER UNIT BY  
SIZE OF URBAN AREA: 1966

| Population range   | Cost of operation per unit (paise) | Revenue per unit (paise) |
|--------------------|------------------------------------|--------------------------|
| 5 lakhs and over   | 5.8                                | 6.9                      |
| 2 lakhs to 5 lakhs | 7.2                                | 12.1                     |
| 100,000 to 2 lakhs | 7.9                                | 12.2                     |
| 50,000 to 100,000  | 8.1                                | 12.4                     |
| 20,000 to 50,000   | 10.7                               | 15.3                     |
| 10,000 to 20,000   | 21.4                               | 29.6                     |
| 5,000 to 10,000    | 18.0                               | 26.1                     |
| Less than 5,000    | 16.2                               | 19.6                     |

for cities and towns whose cost of operation and revenues have been analysed earlier is given in the Table VI.

TABLE VI

# OPERATING RATIO AND RETURN MARGIN OF ELECTRIC SUPPLY UNDERTAKINGS : 1966

| Population range   | Operating ratio expressed as percentage | Returns margin percentage |
|--------------------|-----------------------------------------|---------------------------|
| 5 lakhs and over   | 77                                      | 23                        |
| 2 lakhs to 5 lakhs | 81                                      | 19                        |
| 100,000 to 2 lakhs | 82                                      | 18                        |
| 50,000 to 100,000  | 83                                      | 17                        |
| 20,000 to 50,000   | 87                                      | 13                        |
| 10,000 to 20,000   | 91                                      | 9                         |
| 5,000 to 10,000    | 93                                      | 7                         |
| Less than 5,000    | 94                                      | 6                         |

Operating ratio according to P.J. Garfield and W.F. Lovejoy in *Public Utility Economics* is related to capital turnover ratio because there is a strong tendency for the former to be relatively lower as the amount of capital required increases. This is particularly true of public utilities. The large capital requirement of public utilities makes essential an operating ratio that is low enough to result in a return margin sufficient to provide a reasonable return to the investors. Thus, industries such as public utilities whose capital turnover ratios are relatively low (or whose capital requirements are relatively large) are apt to have relatively

low operating ratios. Conversely industries with relatively high capital turnover ratio, generally have low operating ratios. This is illustrated by the following representative operating ratios for selected industries.

|                       | Per cent |
|-----------------------|----------|
| Electric utilities    | 80       |
| Natural gas           | 88       |
| Natural gas pipelines | 82       |
| Bell Telephone system | 86       |
| Water utilities       | 75       |
| Total manufacturing   | 94       |

The contrast between the utility and manufacturing industry operating ratios provides one measure of the investment risks in the respective enterprises. The high operating ratios and narrow return margin of the manufacturing indicates that their return margins are vulnerable in the face of either declining revenues or increasing costs, other things being equal. Public utilities have low capital turnover ratios relative to practically all other industries. This is suggested by the following capital turnover ratios for selected industries.

|                       | Capital turnover ratio |
|-----------------------|------------------------|
| Electric utilities    | 0.30                   |
| Natural gas           | 0.60                   |
| Bell Telephone system | 0.40                   |
| Water utilities       | 0.20                   |
| Total manufacturing   | 2.00                   |

It is seen from Table VI that the operating ratio varies from 77 to 94 while the return margin from six to 23. The return margin is the most favourable in the case of cities with population over five lakhs where it is 23 per cent. The return margin has generally been found to vary directly with the size of the urban area and it is less for the hill towns with less than 5,000 population. It may be added that the operating ratio for some of the individual cities and towns might be unfavourable but the average has invariably been found to be favourable.

Capital turnover ratio shows the gross revenues earned per rupee of the book value of capital assets or, in other words, the efficiency of capital investment. Efforts were also directed to analyse the book value of capital assets to find out these ratios. Many of the cities and towns have not reported the data pertaining to book value. The foregoing results are arrived at supplementary sources and from information that could be gathered and analysed. The foregoing results are arrived at in Table VII.

The capital turnover ratio varies from 0.34 to 0.45 and is nowhere less than 0.30. It is most favourable in the case of cities with over five lakhs population. This ratio is also

TABLE VII  
CAPITAL TURNOVER RATIO OF ELECTRIC SUPPLY UNDERTAKINGS : 1966

| Population Range   | Capital turnover ratio |
|--------------------|------------------------|
| 5 lakhs and over   | 0.45                   |
| 2 lakhs to 5 lakhs | 0.43                   |
| 100,000 to 2 lakhs | 0.43                   |
| 50,000 to 100,000  | 0.40                   |
| 20,000 to 50,000   | 0.41                   |
| 10,000 to 20,000   | 0.39                   |
| 5,000 to 10,000    | 0.36                   |
| Less than 5,000    | 0.34                   |
|                    | NA                     |

## Not For Her...The Order Of The Bath!

Elizabeth I (1533-1603) an able sovereign and an estimable woman in many respects, had but one failing — she wouldn't take a bath, if she could help it. And being queen, she could often help it. Neither would she shower — excepting perhaps largesse on the multitude. Small blame attaches to her, though. For one thing, the first British patent on soap was issued circa 1770, some sixty-seven years after the good lady had decided to call it a day. Not that soap, or what passed for it, was not known in ancient times. At least, the elder Pliny has recorded that the Germans used a mixture of wood ash (caustic) and tallow, or what our long-haired chemist friends would call fatty glycerides, to wash their bodies with. And those bodies, as you know, should have needed some washing!

Be that as it may, our thesis is that Queen Elizabeth would not have developed her cold feet at the sight of a bath tub, if they could only have had (a) some kind of perfumed tablet or soap substitute to go round in those days; and (b) radio commercials to sing the praises of some saponaceous product.

To those honeyed words, few could turn a deaf ear.

In the soap business, advertising is an important ingredient. Another essential is caustic soda — of which we make the rayon-grade as well as commercial. In solid, flakes and lye.

Here's the full range of the chemicals we produce:

**INORGANIC CHEMICALS:** Caustic soda • Stable bleaching powder • Hydrochloric acid • Liquid chlorine • Calcium chloride • Aluminium sulphate • Potassium chlorate.

**ORGANIC CHEMICALS:** Methyl Chloride • Methylene chloride • Chloroform • Carbon tetrachloride.

**THE METTUR CHEMICAL & INDUSTRIAL CORPORATION LIMITED**

more than 0.40 in all the cities and towns with population of over 50,000. It varies between 0.34 and 0.39 for towns of less than 50,000 persons with the exception of towns with less than 5,000 persons. A study of capital turnover ratio of certain selected electricity supply undertakings conducted in the USA also reveals that this ratio is 0.30 and the ratios for Indian cities and towns are only slightly higher.

To conclude, in electricity, unlike other public utilities,

diseconomies of scale have not been observed at any stage and it is very difficult to identify the size of urban area where the operation of electricity judged by certain financial criteria is most economical. Cost of operation, operational ratios and capital turnover ratios have been found to be more favourable for larger cities than for smaller ones. But it is certainly highlighted by the analysis that the cost of operation per kWh is on the high side and there is need to scale it down even if the entire structure has to be reorganised.

## Material Capital Formation In A P Agriculture

V.B.R.S. SOMASEKHARA RAO

IN THIS article an attempt is made to study the accumulation of material capital formation in agriculture in Andhra Pradesh. The study mostly refers to the years from 1956-57 to 1966-67.

The state of Andhra Pradesh was formed on November, 1, 1956 by the integration of the Telangana region of the erstwhile Hyderabad state with the former Andhra state. The state extends over 1,06,052 square miles and has a population of 35.98 millions or 8.2 per cent of the estimated population of the Indian union. It is the fifth largest and the fourth most populous state in the country. Rural population constitutes 82.56 per cent of the total, living in 28,997 villages. The state is divided into 20 districts, 189 taluks, 321 panchayat samithis and 15,285 gram panchayats. The state comprises three distinct regions, viz., the coastal area consisting of seven districts, the Rayalaseema of four districts and the Telangana region of nine districts.

Out of the total geographical area of 67.8 million acres, 28.029 million acres, constituting 41.8 per cent, are under cultivation. The cultivated area with irrigation facilities is 7.585 million acres, constituting 27.7 per cent of the total area under cultivation.

Distribution of the irrigated area, sourcewise is given in Table I.

TABLE I  
IRRIGATED AREA

| Source of irrigation | Area in (lakh hectares) | % to total area under irrigation |
|----------------------|-------------------------|----------------------------------|
| Canals               | 12.5                    | 40.7                             |
| Tanks                | 13.6                    | 44.3                             |
| Wells                | 4.6                     | 15.0                             |
| Total                | 30.7                    | 100.0                            |

Before estimating the increase in the rate of material capital formation, it would be desirable, first, to discuss capital formation conceptually. "The meaning of capital formation is that society does not apply the whole of its current productive activity to the needs and desires of immediate consumption, but directs a part of it to the making of capital goods; tools and instruments, machines and transport facilities, plant and equipment—all the various forms of real capital that can so greatly increase the efficiency of productive effort". "Thus capital is accumulated output". "Capital formation is, of course, not an automatic process but a

response to investment of money, effort and time in new resources of facilities of production."

Today, we are witnessing a remarkable technological change in its agricultural sector. The Indian farmer, who has a surplus to sell and who can now do so with the terms of trade somewhat improved in his favour, has begun to realise that agriculture could be a business rather than a way of life. With technological improvements, his average cost of production tends to get reduced, thereby making it possible for him to earn more profits which thus pave the way for more savings and investment. Increased farm products are thus a response to the increased investment. It is this increased investment on various items, such as, machinery, irrigation, power, etc., which we call material capital in agriculture. The growth which is taking place in material capital in Andhra Pradesh's agriculture seems to be highly impressive.

### Changes in our Decade

Table II shows the changes in the material capital of Andhra Pradesh's agriculture from 1956 to 1966. The percentage increase in wooden ploughs in 1961 over 1956 was 4.09 whereas for 1966 over 1961 it was 3.78. Iron ploughs increased by 111.4 per cent between 1956 and 1961, the corresponding increase between 1961 and 1966 being only 6.69 per cent. Water pumps for irrigational purposes went on increasing at an astronomical rate throughout this period. The percentage increase in privately-owned tractors in 1961 over 1956 was 27.29; it was 88.40 in 1966 over 1961. However, in respect of government owned tractors only decreases were recorded of the order of 28.78 per cent in 1961 over 1956 and of 15.85 per cent in 1966 over 1961. The overall percentage increase in tractors in 1961 over 1956 was 8.36 and as high as 65.26 in 1966 over 1961. Such a big jump was rendered possible through the remarkable contribution of the private sector.

The percentage increase of draft cattle in 1961 over 1956 was 12.50, being only 2.69 in 1966 over 1961. This gradual diminishing rate of increase in draft cattle as well as traditional implements has been due to the increased use of tractors. In regard to cane crushers, while there was no real change in the number of bullock-driven crushers, increasing expenses of maintaining bullocks apparently led to a shift toward more mechanical power crushers whose number increased by 270 per cent over the 10-year period. It is a common observation in Andhra Pradesh that several farmers now use either hired bullocks or hired tractors for tilling operations as this method is more economical than the annual expenses of Rs 1,000 to Rs 2,000 on maintenance of an average pair of owned bullocks per year.

"In Andhra Pradesh, mechanical devices are coming in to increasing use for supplementing bullock power."

The Plan outlay in Andhra Pradesh during the entire first Plan period was Rs 64.52 crores. Irrigation and power received the highest precedence, claiming about Rs 39.78 crores or nearly 62 per cent of the total outlay. The total

The author is grateful to Dr T.P.S. Chawdhari, Director (Economics) of the National Institute of Community Development, for his valuable suggestions. He also offers his thanks to Mr J.N. Sharma, Research Officer, NICD for his help.

There are occasions  
when you realise that  
**PERKINS 6.354 V**  
is more than an engine; it  
is an essential power

Transport operators all over the country acknowledge the reliability of Perkins 6.354 V in power performance. Either they have proved it or bear testimony in the sharp contrast between frustration and satisfaction. With present day needs to provide a reliable road transport system to keep things moving... all the time. Perkins 6.354 V are being more and more sought after for their power reliability and easier, economical maintenance.

area under crops had risen from 17.3 million acres to 18.4 million acres and the total production of foodgrains increased from 3.0 million tons to 3.9 million tons during the period. Estimates of capital outlay on agriculture during the first Plan period are not available because Andhra state was constituted in 1953 when the first five-year Plan was half-way through. The investment on material capital formation in agriculturing during the second and third Plan periods is shown in Table III.

It will be seen from Table III that in the public sector alone the percentage contribution towards capital formation through power and irrigation (both major and minor) has been very large throughout the second and third Plan periods. Even for the first Plan, the assumption may well be justified that the maximum capital formation might have come about through irrigation and power since these items received the highest precedence even during the first Plan. The average annual capital formation works out at Rs 2131.11 lakhs for the second Plan and Rs 4354.97 lakhs for the third Plan period. These figures reveal that for the second and third Plan periods respectively average material capital formation in agriculture in Andhra Pradesh constituted 2.73 per cent of the average gross national product generated taking all sectors together and 4.59 per cent of the average national income generated in agriculture.

Authentic estimates are not available as to the capital formation in agriculture through the private sector. The private agricultural sector is highly disorganised consisting as it does of regions of small and scattered farms. It is thus very difficult to make estimates about the individual contribution towards capital formation in this sector. It might not be out of place to assume, however, that such contribution will not be appreciable, because in Andhra Pradesh, holders of less than five acres constitute 62.5 per cent of total hold-

ings. Such small holders generally are not in a position to contribute much to capital formation.<sup>5</sup>

# IT ALL BEGAN IN THE FIELD OF STEEL...

Indo - German collaboration goes back to the time when the big steel works Rourkela and Bhadravati were set up. They are still considered the most modern steel plants in India. The Flat and Alloy steel they produce had once to be imported. Both plants were set up with equipment that came from some of W. Germany's most well known industrial concerns, Demag, GHH, Fried. Krupp, Mannesmann and Siemens to name a few.

## Over 400 ventures — from electronics to heavy machinery

There are now over 400 joint Indo-German ventures in operation. They range from electrical goods, electronics and chemicals to machinery and heavy equipment. And all these enterprises receive the most modern know-how from their German partners. Besides, total private investment by the Germans in India amounts to well over Rs. 600 million.

## Earning foreign exchange through exports and import substitution

Indo-German companies like BASF and Siemens India have begun exporting equipment, spare parts and chemicals to Western Europe. Among the products exported are electric motors, cables, switchgear, tanning agents, etc. Even spare parts for the Rourkela plant are being indigenously made by Utmal at Kansbahal. Thus saving foreign exchange besides earning it.

## Over 4,500 Indians trained abroad

Ever since 1948 over 4,500 Indians have studied in German colleges of Technology and thousands have been trained in German industrial enterprises. Indian engineers, trained in Germany, are in charge of the planning, construction and supervision of various Indo-German projects in India. And every year more and more technicians and sales executives are being trained there. The aim is to provide them with more modern know-how. Increase the export of Indian goods to Western markets. And assure continued progress of the industrialisation of the country.

## A bright future for Indo-German collaboration

India and Germany have many years of fruitful collaboration ahead of them. And in those years much can be accomplished. In the near future there is the completion of an aromatics project, which is under way in Baroda, Gujarat. It will produce a wide range of intermediate products for the manufacture of basic chemicals, pesticides and fibres. And so it will go on. More and more Indians will utilise German technical knowledge for India. More exports of various products will be made. And the country will become more and more self sufficient...

Aromatics complex by Fried. Krupp under construction at Koyali near Baroda

## Indian and German Industries: Partners in Progress

# EXPORT ORIENTED

M. M. T. C. exported 11.75 million tonnes of iron and Manganese Ore in 1969-70. The superiority of Indian ores is now established in foreign markets. With mechanization in ore handling and transport, the M. M. T. C. expects a 37% step-up in exports in 1970-71.

**THE MINERALS & METALS TRADING CORPORATION OF INDIA LTD.**  
EXPRESS BUILDING, BAHADUR SHAH ZAFAR MARG, NEW DELHI (INDIA)

state is very low and below the all-India average. According to these estimates, the per capita income in Andhra Pradesh was Rs 232 in 1956 and Rs 261 in 1961 (at 1956 prices). It is expected to rise to Rs 379 by 1971 assuming that Andhra Pradesh will double its national product from Rs 768 crores in 1956 to Rs 1,526 crores in 1971 'at 1956 prices'.<sup>6</sup> So far as national aggregates are concerned, by 1971 India plans to double its annual national income — Rs 10,800 crores in 1956 to Rs 25,000 crores — and to raise national average per capita income from Rs 261 to Rs 450. We thus see that the per capita income in Andhra Pradesh is much lower than the all-India estimate. Such being the case, savings are bound to be low and capital formation in agriculture meagre.

In the context of capital formation, credit has a vital role to play. Only the Andhra Pradesh Co-operative Central Land Mortgage Bank Ltd has so far seriously engaged itself in providing long-term credit to agriculture. The purpose-wise classification of the loans issued by this bank is shown in Table IV (p. 1178). The bank issued loans for the contribution of material capital in agriculture up to Rs 66.61 crores during the period 1960-61 to 1968-69, with an average annual disbursement of Rs 7.40 crores. As the figures show, the bank has made a remarkable contribution towards capital formation through its credit policies. Yet, this organisation is not in a position to help the low-income group since its rules of operation call for mortgage of land before the loans can be made.

## Steady Improvement

Table V (p. 1178) shows the area and outturn of principal crops from 1956-57 to 1966-67. Although area and outturn in the case of all cereals taken together and rice in particular have registered steady improvement over the 10-year period, the same does not hold good for pulses where these figures have remained, more or less, constant. In the case of sugarcane, there has been a very modest increase in acreage whereas the corresponding improvement in outturn has been somewhat below par. In respect of tobacco, the improvement on both counts seems to have been nominal. Chillies and sesamum do not seem to have registered any clear trend. In the case of groundnut, both average and outturn have registered declines. Considering the enormous amount of public outlay on agriculture, the achievements do not appear to be commensurate with the expenditure incurred or the investment made in capital formation. In fact, the working expenses and investment outlays could only have had their impact if cash crops had shown corresponding improvements which has not been the case.

During, the last decade or so, important technological changes have been taking place in Indian agriculture. The Andhra farmers are not lagging in reaping the benefits of this change. There is sufficient proof of gradually rising investment in material capital formation in agriculture both in public and private sectors. However, so far, the increase in output of food crops in general and non-food crops in particular does not seem to be commensurate with the investment made in material capital. As the bulk of farmers possess tiny holdings (those with less than five acres constitute more than 60 per cent of the total farmers in Andhra Pradesh), they are unable to contribute adequately to capital formation, and as such are unable to compete with well-to-do farmers who command improved labour and material resources. Unless the problems of these farmers are properly looked into, their contribution to agricultural production will continue to be negligible. The following measures are recommended with a view to providing protection to such small farmers.

Firstly, the state has to strengthen itself by getting more income from the agricultural sector in order to provide adequate finances to the lower income group of cultivators to

bring them out of the vicious circle of poverty. The cropping pattern in Andhra Pradesh is mostly paddy oriented. This should be changed and cultivation of pulses, oilseeds and cash crops such as sugarcane, tobacco, etc. should be encouraged. It is for the Department of Agriculture and its research and extension wings to immediately look into this question. For a clear enunciation of public policy, low-income farmers have to be precisely and objectively defined. For farmers falling above this level an agricultural income-tax or a progressive land tax based on land revenue should be imposed.<sup>7</sup>

There is also enough evidence available to the effect that little is being done to better the lot of poor, small farmers even in the package districts. There is great need for a special and independent agency to finance the lower-income group of farmers on the basis of cheap and reasonable credit. Rules regarding mortgage of land and securing credit through land mortgage banks should be liberalised and credit should be provided on easy instalments.

## A WELCOME BREAK

Well-matched teams — a keen contest. Spirits are high, energy low. Now the whistle and it's time for coffee.

So refreshing. So satisfying... then back on the field with renewed energy. For coffee refreshes body and mind. Those who know, know that, whatever the game, you play better after coffee.

Coffee has so much to give... anywhere... anytime

COFFEE BOARD • BANGALORE

Mr. M. S. Oberoi, M.P., Chairman, East India Hotels (centre) and Mr. L. Paul Oechsl, Deputy Director, United States Agency for International Development Mission in India (right), signing the loan agreement, in New Delhi. The loan runs into 4.4 Crores.

## Rs. 4.4 Crore U.S. loan to OBEROI-SHERATON, Bombay

The United States Government extended a loan of 4.4 Crores rupees to help finance the 32-storey Oberoi-Sheraton in Bombay.

A loan agreement to this effect was signed in New Delhi, on November 3, 1970, by Mr. M. S. Oberoi, M.P., Chairman of East India Hotels Ltd., and Mr. L. Paul Oechsl, Deputy Director, United States Agency for International Development Mission in India.

The East India Hotels Limited is constructing the 400-room Oberoi-Sheraton at Nariman

Point on Bombay's Marine Drive in collaboration with the Sheratons — one of the world's largest — and most prestigious — hotel chains.

Bombay is deficient in luxury hotel accommodation. Requests for hotel rooms from hundreds of foreign tourists are turned down daily. Foreign tourists either tend to skip Bombay or cut short their stay in India. The result is loss of valuable foreign exchange to the country. The Oberoi-Sheraton, which is slated to be completed early in 1972, will go a long way toward remedying

this situation and attracting more tourists to Bombay.

The Oberoi's American collaborator in the enterprise is providing assistance in planning, constructing and equipping the hotel and training Indian personnel. It will also help in advertising and sales promotion and in booking-reservations. Sheraton's worldwide facilities are expected to help the Bombay hotel's profitable operation and its maintenance of international standards.

# Export Policy Resolution and After

K.B. LALL

Secretary, Ministry of Defence (till recently Secretary, Ministry of Foreign Trade)

THE EXPERIENCE of nearly 20 years of planning has brought into sharp focus the basic anatomy of the process of planned development. It consists of two parts: first, the formulation of its objectives and, second, determination of a plan of action to achieve them. The former is described, in the planning jargon, as a target and the latter as the strategy.

The emphasis in the first two five-year Plans was on production and import substitution. While the second Plan was under way, the constraint of external finance threatened to thwart its fulfilment. To overcome this constraint, we sought to obtain development finance from abroad and simultaneously took the first steps to stimulate our export earnings.

By the time the third five-year Plan was launched, some progress had been made in widening the industrial base, as also in increasing agricultural and mineral output. The export programme of the third Plan was consequently directed towards utilisation of increases in output for expanding our exports. The effort encountered a number of difficulties, ranging from inadequacy of production to its high cost.

It is in the fourth Plan that the vital inter-dependence between exports and growth has been explicitly recognised. The objective of self-reliant growth is firmly enshrined in it. The expansion in exports is accepted as the chief, if not the sole, instrument of such growth. To this end, the target of a seven per cent growth in exports earnings — 1½ per cent in excess of the growth postulated for the economy — per year has been provided. The purpose of the Export Policy Resolution presented to Parliament towards the end of July 1970 was to enunciate and elaborate the strategy for achieving this target.

The resolution did not provoke much controversy. There has of course been some criticism but one is struck by its mildness. The main thrust of criticism is against what is missing from it rather than against what is contained in it.

### Unassailable Arithmetic

The arithmetic of the export target is unassailable. Unless around Rs 8,300 crores of foreign exchange are earned through exports, it would be difficult to provide the external finance needed for the economy's growth. Rs 8,300 crores can be earned from exports over the five years only if the level of exports is raised from Rs 1,358 crores in 1968-69, the last pre-Plan year, to about Rs 1,900 crores in the terminal year of the fourth Plan or, at an average compound rate of seven per cent per year.

In 1968-69, our exports went up dramatically by 13.3 per cent. In 1969-70, the first year of the fourth Plan, they fell short of the seven per cent target by three per cent. Why? The obvious answer is that the repertoire of policy instruments with which the target has to be realised could not be brought into full play in that year. If 1968-69 proved that we can do it, 1969-70 proved that it cannot be done

without the necessary effort. Hence, the Export Policy Resolution.

The resolution endeavours to focus attention on production, its quality, pattern and volume. The initial impact of economic progress is of course to stimulate domestic demand and consumption. If economic development is financed partially, by deficit financing, there is an inevitable upward thrust in domestic costs and prices. This thrust must be contained if the export effort is to succeed. The secret of containing it lies in increasing production but not consumption, or better still in increasing production faster than consumption.

Mere increase in production will not bring about increases in exports. It is also necessary to orientate the production pattern to the requirements of external markets. Production, in other words, should be export demand oriented in addition to being home demand oriented. And exports should be demand oriented rather than supply oriented.

It is not easy for entrepreneurs and investors to bring about the needed orientation of the production structure on their own. While their effort is in its infancy, it has to be nursed to adulthood before it is exposed to the full fury of international competition. The concerned ministries and other relevant authorities are expected to provide to this end, during the transitional period, the support and the inducements needed to spark and sustain these efforts.

### No Pious Platitudes

One of the criticisms levelled against the resolution is that it is a pious set of platitudes. A close look, a deeper reading, should dispel this impression. It is astonishing how a thought or a concept loses its impact when clothed in the prosaic terms appropriate to an official resolution. The significant departure from traditional thinking implicit in the change from supply orientation of production to its demand orientation does not seem to have attracted adequate attention.

In some quarters the resolution has been criticised for permitting large business houses and overseas investors to expand their production facilities. In other quarters, it has been viewed as giving a *carte blanche* to the expansion of the public sector. The balance in its approach to efficient production appears however to have been missed. Size or efficiency is not objectionable *per se*. The real objection is to concentration of economic power. The resolution seeks to meet it by imposing export obligations on further expansion. Economic power is sought to be counter-balanced by economic duty to the community. Where this duty is inadequately discharged by the private sector, it is obviously the function of the public sector to step in to organise production on an efficient basis.

The criticism against alleged inroads of the public sector into established trade channels is misconceived. The role of the public sector in the country's foreign trade has yet to be fully appreciated. The partnership and the spirit of co-operation expected to bind the two sectors together in the

## CONVEY WITH PIPES

Convey vital products to aid the growing industry of India.  
Convey petrol. Convey oil. Convey chemicals. Convey gas.

**BST FOR THE BEST IN TUBES**

mcm/bst/115

realm of foreign trade would only reflect the structure of our mixed economy in which the two sectors are expected to grow side by side and in mutual inter-dependence. In foreign trade, as in the field of industry, it is vitally necessary for the public sector to increase the scale and widen the range of operations. A large public sector organisation, by its very nature, is better able to develop a commercial relationship of mutual confidence, respect, and benefit with foreign state trading organisations or giant international firms. It may be expected to prefer national gain to private benefit and to plough its resources into the service of the community. It may persuade itself to engage in trading operations which need a long initial period of market development during which the returns may not be very attractive.

Public sector trading organisations are also better equipped to establish direct connections with public procurement authorities and purchase departments of foreign governments. They would venture into virgin territories where their compeers in the private sector may be reluctant to enter. They would develop new products and test them in different markets. They could provide package services to co-ordinate the activities of diverse organisations and thus participate in the development of the infrastructure of developing countries or in the diversification of their economies. It needs to be appreciated that when we are planning to increase our exports at the rate of seven per cent per year, the scope is so vast that there is room, and need, for both the private and

the public sectors to participate in the noble task of building up our self-reliance brick by brick.

A feature of the resolution which has attracted somewhat greater attention is the philosophy of temporary restraints on home consumption. Some critics have argued that the resolution is not strong enough on this point. Others have felt that it perhaps goes too far. The truth probably lies somewhere in-between. The resolution seeks to steer a middle course and adopt a balanced approach. There are items of essential mass consumption where it would be unrealistic to talk of restraining home consumption, especially when the ultimate aim of all planning is to raise the level of consumption in our poor country. At the same time, not all commodities produced in the country enjoy the same priority in the matter of domestic consumption.

To illustrate this point with a concrete example, if there is a general shortage of rice in the country, it would be impracticable to think of exporting *basmati* rice without ensuring that essential domestic consumption is maintained at least at the current level. On the other hand, if there are not enough television or radio sets to meet domestic needs, it would obviously be justifiable to restrain domestic demands of such goods in the interest of generating larger exportable surpluses. The basic point is that it makes no sense to talk of consumption restraints without reference to a given product. Consequently, the resolution provides that 'the question of restraint will be decided.....

To develop to his full stature.  
Earn a livelihood. To support his  
family and contribute to the  
increasing productivity of the nation.

## A MAN HAS THE RIGHT TO WORK...

LIC helps to provide and create jobs by supporting industry and agro-industry. Total investments rose to Rs. 1,528.66 crores by March 1970, making LIC the single biggest investor in India. Of this Rs. 218 crores have been invested in a wide range of industries in the public and private sectors. Every growing industry needs other industry to feed it. Thus an intermeshed job structure evolves and grows, creating more jobs for people all over India.

**LIFE INSURANCE WORKS  
TOWARDS BETTER  
LIVING FOR YOU**

ASP/LIC/PR-1

keeping in view the degree of essentiality of the product in question for industrial use or consumption at home." Restraint on domestic consumption in the interest of building up export markets is advocated only as a temporary measure. The longer term solution lies in increasing production adequate to meet both home and overseas demand at a rising level. Disincentives for consumption of non-essential products over the longer term could be justified only in the pursuit of the country's socio-economic objectives.

#### Effective Implementation

The need for effective implementation of policies set out in the resolution has been emphasised by many commentators. They would not be wrong in describing it as a pious platitudinous declaration if it was not fully put into practice. It would however hardly be fair to expect action to coincide with it. If action had already been taken, there would be no need for the resolution. It would of course be fair to expect follow-up action to be taken by the government, and by all concerned, and to press for speed and efficiency where these are found to be wanting.

It has been argued that the resolution cannot be divorced from policies in other related sectors of the economy. For instance, it has been suggested that an inflationary environment is not congenial to the growth of exports. At the same time, it has also been urged that an expansionary trend in the economy as a whole, and in the industrial sector in particular, is indispensable to the achievement of the export target. The resolution assumes that it is possible to achieve

expansion without inflation, if production is demand oriented and cost conscious.

The resolution is not the product of the thinking of the Ministry of Foreign Trade alone. It is a joint effort of all the concerned ministries and has been the result of deep consideration at the highest level. It has received the weighty support of Parliament. It is to be hoped that all the relevant authorities of the central government, at policy making and at operational levels, will join their forces to implement effectively all the elements of action included in this resolution.

The state governments and other local and public bodies are no less enthusiastic about speedily achieving economic self-reliance for the country: if they are convinced that the resolution paves the path to it, they will do their bit to help the community to tread it. Each section of the community normally takes an atomistic view of its interests and consequently sometimes comes into conflict with other sectors. All the sections, however, whether industrial workers or owners of capital or managers of enterprises or farmers or railwaymen and dock workers, are expected to rise above their parochial interests and to look upon the promotion of exports as one of the highest forms of patriotic activity and join with one another in protecting the integrity of the nation and advancing its prosperity.

The Export Policy Resolution offers to all of us an opportunity for joining our respective forces in a national endeavour to make it possible for India to hold its head high and to live and grow in all its diversity, and with dignity to occupy its rightful place in the comity of nations.

## USAID Support for Export Development

F.H. THOMAS & G. BREY

USAID Export Promotion Division, New Delhi

**PUNDITS SAY** there is nothing quite like an idea whose time has come.

Developments of the past year or so in India suggest that now is an auspicious time to undertake a concerted national effort to raise substantially the level of export earnings. The government has clearly supported such a concept. A recent cabinet resolution on the subject has cited the need to support an export drive as being "second only to defence."

Policy planners are aware that the nation's economic development is intimately tied with its performance in international trade. Export earnings are essential to any economy to finance critical imports needed to support overall development.

In 1967, USAID agreed to assist the Government of India in its efforts to build the nation's export capacity. For the past three years AID has sponsored a modest-size programme of technical assistance to the Ministry of Foreign Trade and other ministries in their efforts to analyse the problems which seem to impede the growth of export earnings.

The task of promoting export is, of course, complex and there are several ways of approaching the problem. Since the inception of the export programme in India, however, it has been thought that the principal lacuna that USAID could fill on behalf of the government was the information gap on

foreign trade. A programme was initiated to improve the flow of information to both traders and government officials so that they might formulate trade policies under conditions having a closer approximation to Adam Smith's ideal of a rational economic man having a perfect knowledge of the market conditions.

To provide information on modern export trends, AID embarked on a series of research programmes designed to survey India's export sector and identify bottlenecks, indicate markets, and devise solutions to specific trade problems. These research programmes have been carried out for the past three years principally by Indian research teams supported by one or more foreign technicians.

The main effort has centred on reviews of export commodities. Approximately 20 surveys have been initiated. These include such products as jute goods, spices, oilcakes, tobacco, shellac, machine tools, fruits and vegetables, wood products, marine products and textile and readymade garments.

The second broad area of the research effort has been to review "functional" subjects related to the export trade. Examples of this work include (1) an analysis of India's trade within the Indian Ocean Basin, conducted by the National Council of Applied Economic Research, and (2) an intensive study of the nation's transport system for export products

# A Survey of Friendship

**India and Germany – Partners in Progress**

# Industrial production gains momentum... and Dunlop keeps the wheels turning

A measure of a country's development is its rate of industrial growth. The rise in industrial production during 1968 reflects the upward trend in India's economy. Industrial growth has not only reduced dependence on imports but also helped increase national income. That's not all: industrial growth has

also generated demand for a wide range of products—from giant earth-mover tyres to tubes of adhesives. And helping to keep the wheels of industry turning is Dunlop India. Dunlop products are at work in factories, farms, mines and at major national projects; in Defence Services, in the railways and at ports.

These Dunlop products include rubber and PVC fire-resistant conveyor belting, Vee belts and transmission belting; over a dozen varieties of braided hose, industrial adhesives and of course, a range of tyres. As industrial production gains further momentum—Dunlop India is equipped to keep the wheels turning.

**DUNLOP INDIA**—keeping pace with India's industry

undertaken by the Operations Research Organization, Baroda. The transport study has been designed to demonstrate, for example, what the requirements are for development of "containerisation" needed to achieve effective methods of cargo handling in India in the 1970's.

Another functional survey, carried out by the Indian Institute of Foreign Trade, is an analysis of the nation's export procedures and documentation requirements. The thrust of this work has been to determine how essential trade documents can be presented with less effort and fewer administrative complications. The study team has also recommended major reviews of export procedures whereby the basic control of foreign trade activities can be more effectively exercised with less inconvenience to businessmen.

Many of the recommendations of this study have been already implemented by the government.

Follow-up programmes are also carried out regularly on each survey project. Usually this follow-up work is divided into three phases: (1) transmit the relevant information to export officials; (2) encourage government and private trade agencies to give fair consideration of the strategy and recommendations made by the survey team; and (3) arrange to have the research groups regularly review and update the material presented to trade officials.

As of October 1970, outlines of strategies for development of most of India's 20 leading export commodities have been completed or are in the advanced stage of preparation. These surveys have generally examined traditional export items and outlined long-term strategies to improve sales and earnings of these commodities within the limits of existing industrial policy constraints.

## Expanding Facilities for Export

Recently, however, the focus of the nation's export effort has changed. More attention is being given to improving the performance of non-traditional commodities that have recently made their appearance in India's export list and to expand production of commodities that can be profitably marketed abroad.

One industry which is likely to be an important item in India's export list is plastics manufactures. Presently, export earnings are low (about Rs 3.8 crores in 1969-70) but the industry has considerable potential, particularly since under India's fourth five-year Plan, the capacity of the nation's petrochemical industry is to be increased many fold.

The question arises as to how best to utilise the additional petrochemical raw materials which will be available by 1975-76. To help answer this and other related questions, AID has sponsored a study of the export potential of the plastics industry which is designed to show conclusively: (1) what will be the increased supply of raw material for the plastics industry in India by 1975-76; and (2) whether existing and proposed plastics fabrication facilities have the capacity to fully utilise this supply of raw materials by that time.

If there is a predicted shortage of fabrication facilities, the study will cite how and in what fields an expansion of plastics processing facilities should be encouraged, both to satisfy basic local demand, and also to generate maximum earnings of foreign exchange from this product. The study will further show, for example, what particular types of goods India can best sell abroad. Efforts can then be directed to-

wards the production for export of goods such as plastic coverings for electrical products, or PVC drainage pipes, or floor covering, or moulded bath tubs, or ordinary buckets, or any combination of a wide range of plastics products. Naturally, the required investment in production facilities for the selected commodities will not be mutually exclusive, but given a limited amount of investment funds available, some crucial choices have to be made.

The study of the export strategy for the plastics industry will, like others, review in detail most aspects of the industry, from the supply of raw materials and machinery requirements, to the exact techniques required to market the goods abroad. Members of the research team are required to travel abroad to examine foreign market structure and potentialities for products which either are made or should be made in India for export. The result of this research will be a comprehensive report describing what Indian production plans for plastics goods should be, as seen against the backdrop of world demand estimates and the availability of raw materials expected to be produced by 1975-76 in local petrochemical complexes.

The survey is, of course, fully supported by the plastics industry and the Plastics and Linoleum Export Promotion Council. Representatives of the industry are taking an active part in the conduct of the research, and some specialists will accompany the study team abroad.

Other export promotion activities are also being undertaken in anticipation of future development in world trade policies. Recently for example, a functional study of the impact on Indian goods of proposed tariff preferences has been initiated. The rationale for this effort stems from the

fact that for the past two years or so, the USA has been leading negotiations in an attempt to arrange special tariff preferences for the products of LDC's, including India, in the markets in the USA, Europe, Japan and other industrial nations.

One cannot be sure, of course, how or when these special preferences will be initiated, but now is the time to plan India's response to such a programme when it is sanctioned. With this in mind the Indian Institute of Foreign Trade has undertaken a comprehensive survey, sponsored by AID, to estimate which Indian products are likely to be more readily sold in which foreign markets, as and when the scheme of generalised tariff preference is enacted.

#### LP Model for Investment Decisions

Another programme that is being carried out by AID is an examination of how to determine India's investment priorities in the export sector. This study, now in its initial stages, is an attempt to demonstrate where new investments can be most efficiently allocated to produce a given quantum of export earnings.

The methodology used is complex. It involves, for example, the collection of data on Indian production costs, foreign demand elasticities and the import contents of export products. It also requires the survey team to compute the "shadow" (i.e. real cost) rate of exchange for a vast array of products to be exported.

The effort required to amass this information is considerable, but when gathered, the data can then be run through a computerised linear programming model to show the minimum resource cost of a full "menu" of products needed to obtain a given objective. That objective can be stated a number of ways, e.g., to examine net foreign exchange earnings or to minimise the domestic resources cost of earning an annual increment of foreign exchange of say, seven per cent per annum. The model chosen is expected to outline an optional plan of investment within the export sector on the basis of the given total investment expected to be available during the fourth five-year Plan period. The finished programme will also demonstrate the benefits of a given import-export policy or, conversely, illustrate the extra resource costs of policies which deviate from the optional solution.

A long-range programme that USAID has helped arrange is that of market orientation tours abroad for executives of middle size Indian industries. While in a sense these market tours constitute a new programme they also constitute a part of the general follow-up effort of the overall export promotion programme. The first groups to go abroad under this programme are members of medium size firms producing (1) machine tools, (2) hand tools, and (3) industrial castings. These executives represent industries which have been identified by various surveys as having a high export potential in selected foreign markets.

The tours are sponsored and administered under a multi-lateral programme including the Government of India (through the Indian Institute of Foreign Trade), the United Nations Development Programme, the International Trade Centre, Geneva, and the US Agency for International Development Mission to India. Valuable assistance to the programme has also been given by a foreign consultancy group, Planungsgruppe Ritter, which is working in India in conjunction with the German Vollrath Plan of technical assistance to India.

Participants in these tours are sent abroad to visit both established markets and potential ones. The participants

spend most of their time in pre-arranged meetings with buyers, attending briefings and orientation sessions, visiting trade fairs, appointing agents, investigating new products and seeking specialised know-how. When a team returns to India, the sponsors evaluate the results of the trip and undertake a thorough follow-up programme designed to secure firm export orders for the participants.

#### Investigation of New Products

Another new programme that has been included in overall USAID export promotion activities is the investigation of new products which India should produce but does not now produce for export markets. The first requirement for this project is, of course, to identify the goods which are likely, *a priori*, to have good sales potential.

At the present time, for example, a study is underway to examine the export potential of western style sporting goods from India. The Indian sporting goods industry now produces in cottage industries a limited range of the fine quality items such as tennis rackets, footballs, hockey sticks and cricket bats. The demand for these products is good in Commonwealth countries, but only a limited number of these items can be sold in the booming US and continental European markets where for instance hockey and cricket are seldom played.

In an attempt to expand sales of a wider range of sporting goods to new markets, a survey has been initiated to examine the demand for various types of western style sports equipment such as baseball gloves, ski poles, golf bags, camping equipment, sporting shoes and other leisure time clothing and accessories. The study group is determining what raw materials are needed to produce these goods in India, the

labour and management skills required, and what kind of plant facilities are necessary. When completed, the study is expected to outline a strategy to produce in India new types of sporting equipment which can be sold primarily in foreign markets at competitive prices.

Other commodities which are being considered for this type of investigation are electronic components, modern style toys and Christmas decorations.

It is generally known, for example, that some manufacturers of electronic components in developed countries are trying to reduce costs by setting up fabrication centres in other countries where labour costs are low. Some US firms have set up new production facilities for export in a number of countries of the world. A few German manufacturers, for example, are moving assembly plants into Portugal and Italy, while Japanese firms are setting up subcontract production facilities in Taiwan, Korea, Singapore and Hong Kong. It is important that India also determine precisely what is needed to attract these kinds of export-oriented industries.

#### Export Processing Zones

If the nation expects to successfully establish new style industries to produce goods exclusively for export, it is important to realise that these firms will be facing formidable competition from foreign-based industries which are invariably given full authority to import anything required in their production process — as long as the finished commodity is exported in a form which has suitable value added.

The principal rationale for the special support given to export oriented industries in any country is that these firms are

able to earn foreign exchange in a manner which cannot be matched by industries which are oriented to supply the domestic market.

An industry which is willing to produce goods expressly for export is eagerly sought by most nations. Such industries are not normally given the privilege of marketing their goods in the host country's own market. Predictably then, these industries must be given tangible inducements to set up facilities in a particular country. Inducements offered usually include: (1) attractive tax concessions; (2) freedom to import machinery, materials, and capital from the cheapest source; (3) efficient labour; (4) convenient international communication and transport, especially air cargo facilities; and (5) active support of the local authorities.

#### Special Territorial Areas

Other countries have generally found that the special incentives which are required to support export industries can best be arranged by housing them in special territorial areas such as the Kandla Free Trade Zone in Gujarat.

The concept of producing goods exclusively for export is well advanced in several countries, particularly Taiwan and Singapore. A study of this question is now being made by the Indian government to determine how the nation may emulate the experience of others and set up carefully planned processing zones in key centres of the nation.

Overall, the export drive in India is gaining momentum in various quarters. Several well established organisations have been involved in this effort and a new one, the Trade

Development Authority (TDA), has been set up to service the needs of small and medium scale firms which should be induced to market their products abroad. To begin, the TDA is assuming responsibility for only a few basic functions of export development, notably product identification and market development.

The AID organization is providing the services of a few trade specialists and consultants to assist in the implementation of the various trade development schemes of the TDA. One specialist, from the Harvard International Marketing Institute in Cambridge, Massachusetts, arrived recently in India to help set up a foreign trade information centre within TDA. Another consultant is outlining a new strategy of publicity designed to improve the marketability of selected commodities in the 1970's.

Other AID sponsored programmes include proposals to improve the compilation of India's trade data, training tours abroad for port, railway and other government personnel, and programmes to bring to India selected foreign buyers to review the present array of Indian products and to suggest ways of adapting local products to meet foreign requirements.

Looking to the future AID participation in India's export drive, we note that President Nixon in a recent message regarding US foreign aid recommended that the US should channel an increasing share of its development assistance through multilateral institutions. This recommendation is expected to hold true for future AID support of Indian export programmes. Already a few programmes have been anxious to extend and broaden this co-operation for mutual benefit.

## Role of Packaging in Export Promotion

H. D. SHOURIE

Director General, Indian Institute of Foreign Trade, and  
Chairman, Indian Institute of Packaging

AMIDST THE progress of industrialisation in the country, and particularly in the context of the need for stepping up exports, packaging has begun to assume great importance. It is not enough that our goods, be they food, pharmaceuticals, leather products, textiles, consumer products or handicrafts, should be of the right quality to meet the international requirements, but it is equally important that they should be appropriately packaged so that they can compete with goods in the sophisticated, discriminating and competitive markets abroad. Packaging, thus, plays a very important role in the development of exports.

In this context the packaging materials and the techniques adopted call for over-all improvement. It is not uncommon that some of our products reach the destination in an indifferent condition. This results in rejections or under-valuation affecting the export earnings. It is absolutely necessary that the packaging materials used for the purpose should be adequate and functional. For meeting competition in the export markets, it is essential that the consumer packages should be of high quality and should have a distinctive feature of their own. Manufacturers of packaging materials need to devote greater attention to keeping abreast with the latest developments in new packaging materials. Packaging technology needs to be continuously studied with a view to incorporating the latest techniques adopted by the sophisticated industries.

While various types of packaging materials possessing adequate barrier and strength characteristics are available in India, there are still a large number of areas which have yet to be developed. Mention may be made of the light weight thermal shock resistant glass, which is commonly used abroad, 2CR plates in place of conventional tin plates, newer plastics like polyvinylidene chloride film, polyesters oriented polypropylene etc. Similarly, a number of paper based materials of requisite quality, such as coated papers, pulp boards, high strength kraft paper, duplex boards, which are so important in export packaging, need to be developed. Attention also has to be devoted to the production of ancillary packaging materials like wax blends, steam resisting inks, suitable types of lacquers, lining compounds etc.

For achieving higher packaging standards for international requirements, it is necessary to simultaneously improve the domestic standards. It is not practicable to have two standards, one for the internal trade and the other for export. This is particularly so in the case of mechanised and mass production. Every sphere of packaging industry in India has to strive to raise the standards to international levels at the earliest.

In the matter of bulk packages for transportation, Indian enterprises have so far depended mainly on wood. The

**"What?  
Exports worth  
Rs 70 lakhs are not  
worth talking about?"**

"Well, consider India's total foreign exchange earning of more than Rs 1410 crores—and our Rs 70 lakhs do seem rather insignificant."

"Granted. But how do Metal Box exports compare with total packaging industry exports?"

"Ah! That's different. 66% of India's crown corks exports, 62% of tinplate container exports, 80% of roll seal closures and 76% of collapsible tubes exported are made by Metal Box. And what is more, our growing exports of can-making and closing machinery have added a new dimension to the industry's achievements."

"There you are. And what has been the trend of your exports—say over the last ten years?"

"On the whole steady, with some ups and downs—largely due to raw materials shortages."

"What about your indirect exports? I mean the value of Indian products exported in Metal Box packages?"

"In 1969-70, over Rs 18 crores worth of goods—all the way from foods to toiletries and oils—were shipped out in Metal Box containers. And the value of Metal Box packages exported this way was around Rs 1.7 crores."

"Not bad! But I guess you'd like to do better. And you should. With supplies of raw materials, such as tinplate, assured."

"Oh you need much more than raw materials to compete effectively in foreign markets. You need international standard products. To make which you need international standard know-how. At Metal Box we have been lucky so far. We've had ready access to the research and development work done by our UK and US associates. For example, with assistance from our associates, we developed lacquer for the prawn can, paving the way for canned prawn exports, which today fetch Rs 2.25 crores! And that's just the beginning. Given this inflow of technical information and assistance, we shall do our mite to boost exports—directly and indirectly."

world over, paper-based materials, viz. corrugated/solid fibre-board, have replaced wood. This change-over has been due to depletion of forest resources and economies offered by the alternate packaging materials. Some countries do not permit the use of wood for outer containers on account of the infestation they carry. Similarly, dry grass used for cushioning is not accepted by many countries.

Realising the need, some industries in India have already commenced the use of corrugated/solid fibre-board containers for export. But the problem faced by exporters is that the currently produced corrugated board does not have the necessary strength properties. The reason attributed by the board manufacturers is the non-availability of suitable liners and fluting media. The development of suitable liner depends upon the availability of right type of pulp, especially of the nature of coniferous pulp. In India, the manufacturers of liners are compelled to use the short fibre pulp which alone is available here. There is, therefore, need to make available the coniferous pulp, if necessary through import. Similarly, for the production of fluting media semi-chemical pulp is required by the producers of board. Solid fibre-board is currently being produced in the country and is a good substitute for wood, particularly for the packaging of consumer goods. Although it has good strength properties similar to those of corrugated board, it lacks in cushioning characteristics. By suitable combination of corrugated board for inner fittings, solid fibre-board cases can be advantageously used on account of the economies offered by the solid board over its wooden counterparts in export packaging. In view of the advantages that corrugated/solid fibre-boards offer, there is urgent need to study the areas of their usage and standardise their applications.

It is important that our exporters adopt scientific

packaging methods suited to countries to which the goods are exported. The Indian Institute of Packaging is currently engaged in this aspect of the problem. Adequate facilities do not at present exist in various parts of the country to determine the transport-worthiness of the export packages. It is possible that some packages may be either over-packed resulting in increased cost or under-packed resulting in loss due to damages. There is, therefore, need to establish testing centres at important ports, to test, evaluate, certify and advise exporters on the transport-worthiness of export packages. This activity will be complementary to the work of the Export Inspection Council, which is concerned with the quality of the product packed. With the establishment of these centres it will become easier for the industries to effect improvements in the standards of their packaging. In due course, codes of packaging practices for exports will gradually be evolved, enabling the exporters to adopt right packaging techniques.

#### Transit Hazards

Owing to the inadequacy of warehousing facilities and also due to improper handling methods, our goods are subjected to very severe transit hazards even before they are shipped. It is essential that at the transshipment points of the railways, as well as at the ports, requisite storage space and mechanical handling methods such as pallets and fork lifts are provided. Introduction of containerised transport of goods, both by rail and sea, which is gaining great prominence in all parts of the world, will necessarily have to come about.

The materials manufacturers, producers, designers, shippers and the packaging technologists have to devote

greater attention to various facets of packaging research and technology. The packaging industry has gathered considerable momentum in the country during the past few years, and every sector of the industry is increasingly becoming package conscious. One can envisage that in the coming years there will be distinct improvement in the supply

position of various packaging materials and, correspondingly, there will be greater realisation of the importance of adequate and functional packaging. It is obvious that side by side with these improvements there should also be further expansion and improvement in the manufacture of packaging machinery suited to Indian conditions.

## Export Pricing

K. G. VAIDYA

Director, Economic Research, Ministry of Foreign Trade

BETWEEN 1963 and 1968, while the consumer price level in India rose by 49 per cent, the corresponding rise was of the order of 15 per cent in the USA, 23 per cent in the United Kingdom, 13 per cent in West Germany and 29 per cent in Japan (Table I). If one takes developing countries in a stage of economic development comparable to India, the picture is somewhat mixed: in two Latin American countries, namely, Brazil and Argentina, the consumer price level had risen by 502 per cent and 196 per cent respectively during the same period, while it had risen by about 18 per cent in Mexico, 30 per cent in Pakistan, 41 per cent in Turkey and only 13 per cent in Greece. In almost all countries, there is a divergence between the trends in the domestic consumer price level and the export price level, partly, because the package of goods which is exported often differs from that which is consumed at home. It is also due to the fact that when the share of a country in total world exports of a given product is small, the export price is set for it internally and the country must sell at that price if it wishes to sell at all. Therefore, even for the same countries the change in the export price level differs from that in the consumer price level.

It is interesting to note that although it is commonly assumed that inflation is the worst enemy of exports, the two have not always moved in opposite directions. This is brought out in Table II, in which percentage changes

in consumer price levels and in the values of exports (expressed in US dollars) between 1963 and 1968 are given. It is remarkable, for example, that while Japan could bring about a 237 per cent increase in her exports between 1963 and 1968, despite a rise in the domestic consumer price level of 29 per cent, American exports increased during the same period by only 46 per cent despite the fact that domestically there was only a modest increase of 15 per cent. Similarly, while British exports increased by 26 per cent with a rise in the domestic consumer price of only 23 per cent, Brazilian exports also increased by 26 per cent in the same period in the face of a staggering rise of 502 per cent in the domestic price level.

It would, therefore, appear that there is no strong positive correlation between changes in the domestic price level and in the value of exports. To some extent this is one of the curious results which follow from the aggregation of a multitude of divergent variables. It is also due, partly to differences in the product composition of exports and their destination pattern. It is scarcely necessary to emphasise that for any country the key to the growth of exports lies in competitiveness. Empirical studies have proved this point time and again. It has been estimated<sup>1</sup>, for example, that 43 per cent of the variations in the shares of different countries in total world exports of particular products can be attributed to changes in relative prices and that one

TABLE I

PERCENTAGE CHANGES IN PRICE INDICES : (1963=100) FOR SELECTED COUNTRIES IN 1968.

per cent increase in the relative price competitiveness would tend to reduce the value of exports by almost three per cent. Competitive pricing of exports is not merely a function of the productive and marketing efficiency of the producer, but also of the fiscal and budgetary policies of the country. Indeed, sometimes a country's competitive position in the market is adversely affected even because of a fall in the price level in some other market which itself could be due to a fall in the level of economic activity in that country. Competitive efficiency is also affected by other factors such as discriminatory tariffs employed by the importing countries; cost and other incidental charges, such as, those for forwarding, clearing, bank commission, insurance, etc.

As was observed in the *Economic Survey of Asia and the Far East*, 1967, Part One:

"Conceptually, a country's relative export performance can be broken down into two components, one which may be labelled the demand effect (or structural effect) and the other the competitive effect. A country's export performance over time is partly influenced by the trend in world demand for the products which the country starts with. The fact that a certain product is already being exported reflects the availability of the requisite knowledge and skills, and the existence of a productive basis. The demand effect thus explains that part of a country's export performance that can be attributed to changes in the international demand for its established (i.e. initial) exports. Numerous other factors have to explain the rest, which is called the competitive effect for short. A country may not be able to take advantage of a rising trend of demand for its established exports

because it is running out of the required resources, or because its competitors are given preferential access to certain markets, or because its competitors have become relatively more productive. The competitive effect thus embraces a variety of causes not all of which are under the control of the particular country."

According to the analysis given in the *Economic Survey of Asia and the Far East* referred to above, over the period 1955-65 the developing ECAFE countries as a whole lost ground in competitive position to other countries of the world. The value of the losses sustained on this score during the 10-year period was about \$ 2,000 million taking all exports together. This was estimated to consist of \$ 300 million on exports of food, beverages and tobacco, \$ 1,600 million on exports of crude materials (excluding fuel) and oils and fats, \$ 400 million on exports of mineral fuels and products and \$ 40 million on exports of chemicals. On the other hand, they gained ground in competitive efficiency in the exports of machinery, transport equipment and other manufactures and the gains were estimated to have amounted to \$ 60 million on exports of machinery and transport equipment and \$ 200 million on exports of other manufactures.

This method of estimating the competitive gains or losses in world exports is, however, not entirely unexceptionable. For, some decline in the share of each country in world exports is almost inevitable on account of the fact that with the development of other economies, each country's weight in world trade tends to go down.\* Subject to this qualification as well as others mentioned later in this article, (such as, product and destination patterns of exports, for example) the changes in India's competitive

# BLOWING OUR OWN TRUMPET

The Council forms an important link between local suppliers and overseas buyers, directing its efforts to generate favourable atmosphere abroad and assist home traders to cash in on it.

The Council collects data on overseas markets from various publications, through specialist agencies and personal visits of its delegations. This data is made available to local trade.

Apart from playing a conciliatory role, the Council has formulated standard procedures, pre-shipment inspection, etc. to avoid commercial disputes.

To obtain selectivity in trade channels, avoid inter-se competition and ensure quality and prompt deliveries, the Council has set up Exporters' panels for different territories. This has secured better prices and appreciation overseas.

In Table III, a crude coefficient of India's competitive efficiency has been calculated, on much the same basis as was adopted in judging changes in the competitive position of ECAFE developing countries in world exports in the *Economic Survey of Asia and the Far East 1967*. From this it will be seen that although India's co-efficient of competitive efficiency (CCE) for total exports went down to 0.8 between 1964/1964-65 and 1968/1968-69, significantly that for primary products also declined to 0.8 while the co-efficient for exports of total manufactures rose to as much as 8.1 in the same period. The highest increase was to 11.5 recorded in the exports of iron and steel followed by a CCE of 6.1 for non-ferrous metals and of 2.0 for exports of engineering goods.

#### Increased Domestic Absorption

The conclusions arising from this exercise must, however, not be taken at face value. For, the fall in the CCE of the exports of primary products to 0.8 also signifies increased domestic absorption of primary products for industrial production, resulting sometimes even in a deliberate restriction of their exports (e.g. raw hides and skins), which was more than offset by increased exports of manufactured products. The phenomenal increase in the CCE for non-ferrous metal exports, again, is more a result of the very small export base from which we started, rather than of a very large increase. The role played by international developments, such as, preferential tariff treatment in the main consuming markets of certain products of some other countries, as in the case of the Associated Overseas Territories of the European Communities, is also important in this. Broadly, however, Table III shows a distinct improvement in India's international competitive position in the exports of semi-manufactures and manufactures.

It is well-known that developing countries often find it difficult to compete in international markets. To a significant extent, the competitive handicap of developing countries, as a whole, owes itself to the fact that their characteristic export products are discriminated against by the commercial policies of the advanced countries. Here, again, the discrimination is not so much countrywise as productwise. And this has been due to the fact that during the past score of years the code of conduct in international commerce was generally governed by the General Agreement on Tariffs and Trade (GATT) with two cardinal principles: (1) the principle of reciprocity and (2) the principle of extending most favoured nation treatment to all other members of GATT. The first acted to the disadvantage of developing countries because under the rule of reciprocity, however defined, only he can get a concession who can give one and then, again, only to the extent that he gives it. Since developing countries are, *ex hypothesi*, in a weak economic position and a weaker balance of payments position especially when they take to development and begin to run deficits in their balance of payments, they are manifestly unable to extend concessions. The result is that they do not get any.

This effect is, to some extent, softened and, to some extent, heightened by the operation of the MFN clause. It is softened in so far as concessions exchanged between developed countries are also automatically extended to the developing members of GATT. However, this is of little avail to most developing countries as they generally are not in a position to export the type of products on which concessions are exchanged between developed countries. It is heightened to the extent that if a developing country agrees bilaterally to extend a concession on the import of a certain

product from any other GATT member, it is compelled to extend the same concession to all other members also.

It is true that Chapter IV which was added to GATT a few years ago has tried to make amends for the injustice implicit in the earlier rule of treating unequals as equals. Under the new Chapter IV, developing countries are not expected to reciprocate the concessions which they receive from developed countries in trade or tariff terms.

Thus, as a result of this trade regime the competitive position of developing countries in international trade has been considerably hampered. Another cause of the slow growth of exports from developing countries has been their excessive dependence on the exports of primary products (usually, only a few) for which world demand is growing at a far slower pace than world supply, for which the price elasticity of foreign demand is rather on the low side and the income elasticity of demand is not only low but sometimes negative. It is also true that supply elasticities in developing countries are generally not only low but sometimes contribute significantly to a deterioration of the situation because of a lagged and uncoordinated response to a demand stimulus. This happens particularly in the case of agricultural products where production stimulated by high prices at a given point of time comes to the market, perhaps, a year later when the demand may have disappeared or excessive supplies may have come to the market. Finally, in recent years, since developing countries' demand for imports for development has outstripped their ability to pay for in foreign exchange, credit has rapidly become an integral element of competitiveness, and *ipso facto*, the ability of de-

veloped countries and the inability of developing countries to extend export credits has significantly influenced the relative rates of growth of their respective exports.

The question of competitiveness in exports is thus a fairly complex one and competitive pricing of export goods, by itself, is not always calculated to increase aggregate foreign exchange earnings.

Nor does the decision on the pricing of exports always rest with the producer/exporter. As has been stated earlier, where an exporter commands a very small fraction of the total supplies to a given market, the market price is given to him and he is unable to influence it either one way or the other because of the small scale of his operations. It is normally assumed that a producer/exporter who is in a monopolistic or quasi-monopolistic position can either determine the volume or the price of his product, though not both. This is not entirely true either. Even a monopolistic (or quasi-monopolistic) exporter cannot dictate terms to the rest of the world for all time to come. If he prices his products too highly, a frantic quest for synthetic substitutes is started and the substitution elasticity of demand for the product in such cases becomes very high. The situation has become highly volatile with the rapid strides of technology in recent years. The clearest examples of this which have hurt India's exports in recent years are those of the synthetic substitutes for jute goods, such as, polypropylene, new plastic insulating agents which have been developed as substitutes for mica and so on.

What, then, is the meaning of the competitive pricing of exports? Strictly, it would mean pricing of exports so as

to maximise the country's share in the total world exports of the product concerned. In a broader sense, however, this should mean the pricing of export products in such a way as to maximise foreign exchange earnings from the exports of a given product both in the short and in the long run. Where the elasticity of foreign demand is low or the elasticity of home supply is low, there is little to be gained by reducing the price since it is not possible to increase turnover so as to more than offset the fall in unit values and increase total foreign exchange earnings. This was the rationale of the imposition of export duties on several primary exports from India at the time of the devaluation of the rupee in 1966. Similarly, when the share of an exporter in the total international market is very small, he can dispose of his entire output at the existing international price and there is nothing to be gained by reducing or raising the price.

At the other extreme are price-sensitive products where a small reduction in price leads to a very considerable increase in demand. In such cases there is a strong case for competitive pricing of exports. Most of the non-traditional items which we have begun to export in recent years, fall into this category.

The real problem in the case of competitive pricing of exports in a country such as India arises from the fact that in a developing economy, costs and prices are always tending to move up. This is not only due to the deficit financing of development, but is also occasioned by the fact (a) that the supply response comes after a certain time lag after the creation of money demand; and (b) the standards of consumption are so low that the first impact of a rise in money incomes is not to save but to spend. Therefore, the pull of the home

market is always very strong in such economies especially in a country like India where the per capita income is pitifully low. On the other hand, production in developed countries is rising so fast that the general price level in the export markets tends to remain steady, if not decline. This perpetual struggle between rising domestic costs in developing countries and prices and falling external prices is aggravated by the restrictive commercial policies of other countries.

"National and international measures, in exporting or importing countries, may be required to assist the processing industries in the developing countries to overcome such initial difficulties. In exporting countries, possible solutions include tax reliefs, duty refunds on imported inputs, multiple exchange rates to favour the exported products, and outright export subsidies. Importing countries can assist the developing countries to overcome such obstacles principally by granting preferential tariff treatment, unilaterally or in agreement with other importing countries, and by technical and financial assistance to ensure the production of goods of desired quality and type, including joint industrial enterprises."<sup>3</sup>

#### Several Aspects

The solution to the problem of competitive pricing of exports from a country like India has, therefore, several aspects. To start with, external commercial conditions as they exist at present can do with some improvement. A significant step has no doubt been taken in the recent agreement reached at Geneva on the establishment of a General Scheme of Preferences (GSP) to be extended by developed countries unilaterally to imports of semi-manufactured and manufactured products from developing countries. This will certainly go a long way towards removing tariff discrimination against our exports which renders them more uncompetitive than they would otherwise be. The invisible discrimination of quantitative restrictions would, however, have to be removed by taking further action. Secondly, to the extent that the uncompetitiveness of the private producer/exporter owes itself to governmental action, such as, excise duties, import duties, etc., steps are taken by most countries to refund or rebate the incidence of such taxes, levies, imposts, etc., at the export stage<sup>4</sup>.

In India, the scheme of drawback (or rebate in import) of central excise duties is addressed to this purpose. There are other factors underlying uncompetitive prices of exports such as less than optimum scales of production, infancy of an industry, infant marketing, infancy of an economy (which reflects itself in the inadequacy of infrastructure and the high cost of services, such as, water, electricity, transport, etc., and so on) which also need to be and are, in fact, compensated in most countries in one way or the other.

Finally, export uncompetitiveness may also be due to high production costs, backward technology, etc., of the producer himself. Apart from striving to increase productivity and reducing costs, which is the only ultimate solution of the problem of the uncompetitiveness of exports, various techniques of pricing exports competitively even in the short run have been tried out<sup>5</sup> from time to time. These include differential pricing, marginal cost pricing, etc. Differential pricing in different markets is an accepted commercial practice intra-nationally. However, the existing international code of commercial conduct frowns upon this practice, somewhat irrationally. Within a country a commercial firm seldom tries to maximise profits on every single transaction. This is particularly so in the case of multi-product firms. There is no good reason why the practice cannot be extended with sound commercial justification to differential pricing in

different markets so that, on an average, the opportunity cost rate of profit is earned.

Marginal cost pricing involves charging a price which covers only variable costs, on the assumption that the overhead costs will be covered separately. This technique is particularly suitable when the exportable surplus is a temporary or an occasional one and is not expected to continue. Secondly, it is also possible in a partial market so that sales to other markets are at a price which would cover the overheads fully. Thirdly, it is possible when a firm is operating under conditions of increasing returns to scale. Finally, it can be employed as a means of introductory pricing so as to develop a market for a product after which the price can be raised to cover the overheads.

## Export Promotion Through Quality Control

C. N. MODAWAL

Director, Inspection and Quality Control, Ministry of Foreign Trade

EXPORTS PLAY a positive, contributory role in the accelerated economic development of a country through the earning of foreign exchange needed vitally for development plans. A country, be it developed, under-developed, or be it still in a developing stage, has little choice in the matter of dispensing with the import of commodities required for its industrial advancement. Modern India forging ahead towards a self-reliant economy is fully seized of the crucial importance of this factor of growth. In fact, the fourth five-year Plan envisages an export target of Rs 19,000 million by the end of the Plan period aiming at an annual growth rate of seven per cent.

India has enjoyed from ancient times a high reputation as a traditional exporter of goods of superb craftsmanship and excellence. As a result of sustained efforts in the recent past, India today is rated as the tenth largest country in the world according to GNP, ranking ninth in industrial production and eleventh among the major steel producers of the world. Export expansion as an integral part of India's development plans has taken into consideration the need to broaden the export structure both as regards commodities and destinations. In her multi-pronged drive for accelerating exports, it became therefore imperative for India to exercise control over her exportable products, so that the exported goods, which make or mar the image of a country according as they are of good or bad quality, are of competitive quality in the international markets.

For the sound development of export trade of India, the Government of India enacted the Export (Quality Control and Inspection) Act, 1963, with the specific object of introducing quality control and preshipment inspection in the export sector and for providing a co-ordinated approach to this subject. By virtue of this Act, the government is empowered to notify specified commodities which would be subject to quality control and inspection or both prior to export; specify the type of quality control and inspection applicable to each commodity; establish or adopt or recognise one or more standard specifications of commodities; and to prohibit export of commodities unless they satisfy the conditions relating to quality control or inspection.

Though largely voluntary, control or assessment of quality for export was in practice even before the enactment of Ex-

port (Quality Control & Inspection) Act, 1963. For instance, the AGMARK grading of agricultural produce under the Agricultural Produce (Grading and Marking) Act, 1937 was extended for compulsory grading relating to export of a number of such products. Similarly, the ISI Certification Mark, authorised by the ISI (Certification Mark) Act, 1952, which may be applied to any goods conforming to Indian Standards, was obligatory for two export items, namely, aluminium utensils and tea-chest plywood panels used for packing tea. Another important preshipment inspection facility was provided by the ITEX scheme operated by the Cotton Textiles Fund Committee, as a voluntary service, to such Indian exporters or importers abroad who may desire to have their consignments inspected for quality. There were also private agencies who undertook to issue certificates after conducting surveys, inspection and testing of goods before export. Some export promotion councils also undertook quality control measures for certain export products under their purview.

#### Urgently Needed Rules

All these schemes, rules, regulations and legislations carrying out compulsory and voluntary quality control and preshipment inspection of export commodities were urgently needed to be co-ordinated on the basis of a comprehensive national policy for export promotion. The Export (Quality Control and Inspection) Act, 1963, provided that pivot for co-ordination and ushered in the era of silent but dynamic revolution in Indian export trade.

The Export Inspection Council came into being on January 1, 1964, under the provisions of this Act to advise the government in regard to the measures to be taken for quality control and preshipment inspection of exportable commodities. The Council has its secretariat in Calcutta, and regional offices in Bombay and Delhi. The setting up of two more regional offices — one in Madras and the other in Cochin—is in the offing. Specialised knowledge, experience and administrative and technical know-how of the various organisations of the country in the field of grading, standardisation and inspection have been pooled together under the overall co-ordinating role of the Export Inspection Council;

this has paved the way step by step for planning, programming and enforcing, quality control and preshipment inspection measures in the most efficient and scientific manner.

The massive implementation of the programme launched by the Government of India, has not only resulted in almost all the major export items being brought under the canopy of compulsory quality control and preshipment inspection but has in the process generated a new wave of enthusiasm for voluntary effort for quality improvement. Some of the products so far covered under compulsory quality control and preshipment inspection include light engineering goods, steel and steel products, cables and conductors, organic and inorganic chemical, mica, minerals and ores, coir and coir products, jute manufactures, spices, cashew kernels and fish and fishery products.

In determining the basis of inspection, the approach is pragmatic and not doctrinaire. The procedural details of the preshipment inspection schemes are worked out in close collaboration and consultation with the representatives of industry and trade. While preparing the detailed procedure besides taking into consideration the existing trade practices, the government departments concerned including the customs authorities, are invariably consulted. The general procedures for inspection are, therefore, notified in the form of draft inspection rules under the Export (Quality Control and Inspection) Act, to elicit comments from the public. Draft notifications are also circulated among important foreign buyers through Government of India trade missions abroad and the comments and suggestions received thereon, are taken note of.

The schemes finalised in the light of these comments and notified for enforcement therefore enjoy a very large measure of buyer acceptability. In the course of formulation of specifications for export, the health and

safety hazards, if any, involved are also kept in view and suitable minimum specifications are drawn up below which exports are not permitted. Wherever it is found necessary, the schemes are, in the first instance, introduced on a voluntary basis for some period and made compulsory only thereafter. This helps the industry and the export trade to get used to the procedures for preshipment inspection and make appropriate adjustments and improvements in their production system to maximise the quantity fit for export.

Inspection of consignments of finished products cannot by itself maximise quality output of an industrial product. In-process quality control in the manufacturing units for this purpose has also been enforced in respect of a number of chemical and engineering products. This, in other words, brings into play in-plant controls at the stages of selection and purchase of raw materials, processing, production and packaging. Products from units not enforcing the in-process quality control as prescribed are not allowed to be exported.

#### Preshipment Inspection

Besides the various aspects of compulsory preshipment inspection for notified commodities, mentioned above, the Export Inspection Council also undertakes preshipment inspection of other commodities not notified, if so desired by the exporter or the importer. An exporter, when tendering for bulk contract, on his own or against global tenders may like to mention as an additional inducing factor that he will get his goods inspected for quality prior to shipment by the Export Inspection Council and send its certificates along with each consignment. Such quality assurance against international competition places the Indian exporter in a far better position to win over such contracts. The increase in the demand for such voluntary inspections, is a welcome augury and it brings out the fact that the exporters realise the importance of quality assurance by third party preshipment inspection, as a dependable export promotion measure.

To plan, organise and supervise the maintenance and operation of these elaborate and comprehensive measures is a challenging task. The inspection system consists of a large network of inspection organisations, governmental as well as private, recognised by the Government of India after thoroughly ascertaining that they possess the necessary technical knowledge, sophisticated equipment, competence and integrity. Apart from these, five export inspection agencies have been established at Bombay, Calcutta, Cochin, Delhi and Madras under the direct administrative and technical control of the Export Inspection Council. These export inspection agencies are well-equipped with necessary up-to-date laboratory and testing facilities and competent technical staff for carrying out the day-to-day preshipment inspection work. Inspectorate units and sub-offices set up throughout the country under the agencies render prompt and dedicated service to exporters.

The statutory quality control and preshipment inspection measures introduced by the Government of India facilitated various non-traditional products to make successful debut in the international market. Every exported article activated with quality built into it, paved the way as a forerunner for export of other goods from India. The technological expertise and the industrial joint collaboration ventures carried out by Indian entrepreneurs in the developing countries reflect India's reach in scientific and technological advancement and bias towards meticulous adherence to procedures, methods of testing and inspection to make the end-product answer the buyer's requirement. Steps taken to make the Indian exportable product conform to the import regulations bearing on quarantine or quality directly or indirectly facilitated the exports to such destinations. The rejection of sub-standard goods on the basis of inspection and testing carried out spurred the Indian business management to exercise quality

control checks more thoroughly and carry out such other improvements in men, machinery and processing as would build quality into the product. In regard to the traditional goods where India has a well-established reputation for its products the third party assurance of the export-worthy certificate has given a plus stature to the products covered under it.

Though it was only a little over five years ago when the statutory quality control and preshipment inspection were introduced in India, the rise in the unit price of the export

commodities, decline in the number of complaints on quality from abroad and the growing insistence of the foreign buyers in their import deals for production of export-worthy certificate, is a significant index of the progress of the operation of quality control and preshipment inspection on the right lines and in the right direction. Nevertheless all our endeavours would be directed to maximising quality output of exportable commodities so as to enhance the export image of this country and make it known as a producer and supplier of quality goods.

## Coir Products : Search for Sophistication

R. RABINDRANATH MENON

Chairman, Coir Board

THOUGH HISTORY tells us of times in the distant past when Indian trade had crossed the seas, we owe it to the quickened pace of the modern age and international interdependence for making export expansion an inevitable facet of our national existence. Science and technology have progressed better elsewhere and we are growing too with quite some leeway to make up. The coir industry, in its traditional form, has been with us for about a century but the developments and innovations in the past two decades have come so fast that even India, the hoary home of coir, has to catch up with many of its ultra-modern improvements.

Coir has won belated recognition in international forums as one of the hard fibres useful to man. A United Nations' committee has decided to initiate research on it. The result may open many closed doors or bring to full view interiors where the doors are only half ajar. Coir is one of the traditional items that took shape and struck roots as an export-oriented industry. It has brought us returns in foreign exchange of not less than Rs 13 crores a year for the past few years. Though we feel that we have lived with it for long, the industry is hardly a century old.

#### Traditional Expertise

Due to certain natural advantages such as the abundance of coconut trees, a string of lakes and canals on the coastal belt providing retting fields, and availability of traditional expertise, Kerala came to occupy a premier position in the production and export of coir. Other states are picking up and Mysore has made a notable advent into the mechanised sector. It is estimated that we are still using only less than half of our coconut husk, the basic raw material, and this is one item where there need never be a conflict between internal consumption and export requirements. On the other hand the basic strategy for the development of the coir trade should be the building of a stable matrix of consumption within the country, which can absorb the tremors and pressures of foreign market fluctuations.

Despite the competition which coir has to face from other natural fibres such as sisal on one side and a host of synthetics on the other, it continues to serve the world demand, and will, I hope, survive with a reasonable status if only we back it up with adequate promotional measures and trade incentives. This is possible because of the inherent qualities of coir, its toughness and strength, its resistance to dampness and rot, its durability and a natural resilience. India has a virtual monopoly of spun yarn, and the traditional coir products, mainly mats and mattings, have been supplied to the world markets by this country. But in a world where tastes are getting more sophisticated, and techniques improve to feed them, we have to devise ways and means of bettering

and diversifying our products to meet the new challenges, or else we may be left behind.

The established uses of coir are too well known to be recounted here. I shall briefly refer to them with a view to highlighting the new patterns of utility. Though coir fibre is the basic material from which to spin yarn, it has long been in use as a stuffing substance, cheap, durable and resilient. Brushes too are made from it. Manufacture of oil filter is a new line and Italy has been a pioneer in this field. Coming to coir yarn, we find a good deal of it taken up in the manufacture of end-products like mats and mattings, rugs and carpets, ropes and tea-leaf bags. Its applicability in hop cultivation is a comparatively new development. Coir yarn has had to face some competition from synthetics in this respect but the superiority and special characteristics of the natural fibre have been borne out by the experience of agriculturists in the USA.

#### Need for Mechanisation

In the continent too, coir yarn has been used in hop cultivation and we are trying to persuade the USSR to undertake large scale experiments with a view to proving its worth in this sphere. Mats have been our prize item for export among coir products. Roughly 30 per cent of our exports comprise mats, and next to coir yarn which takes the major share of our exports (about 68 per cent), they constitute the largest foreign exchange-earner. Coir yarn itself is in a way a processed raw material which feeds manufacture abroad, but we need not feel hesitant in sparing this commodity since nature has endowed us with it in abundance. We have evolved beautiful designs and our craftsmanship is improving daily to compete in foreign markets. However, in certain sectors, it is necessary to introduce mechanisation in a selective manner so that the requirements of a sophisticated market abroad can be effectively met.

A possible development is the evolution of a wall carpet with attractive designs which can serve not only as a piece of decoration but also as a source of thermal insulation. Coir matting has begun to find its use as a roof covering with the reinforcement of light wooden rafters or aluminium rails. In proper proportions with other fibres such as sisal, table mats too can be made of coir. In a world that may perhaps grow weary of artificial concoctions, it is quite conceivable that the coming decades will disclose a latent hunger for natural fibres.

Coir matting is long known as a floor covering. It beautifies our floors, it adorns the stairs and it adds lustre to our houses and offices. Even in India, there are a good many floors yet to be covered, and as our economy improves our

More and more branches are being opened.

internal consumption can also be expected to rise. In cold climates, coir helps to retain warmth. Its resistance to moisture makes it highly acceptable in the humid climate of the coastal belts. The improved pile carpet is a new entrant and has attracted the attention of the discriminating upper class buyer. The prospects for use of coir matting in sand stowing operations for coal mines have improved considerably with the completion of a successful series of experiments by the Central Mining Research Station, Dhanbad. The overall saving in cost is said to be of the order of 64 per cent on the basis of the experiments conducted so far. More work is on.

#### Latest Innovations

Rubberised coir is one of the latest non-traditional innovations in coir. It seeks to confine within its fold the advantages of rubber as well as coir. A wide range of products has emerged in the shape of cushions and headrests, beds and pillows. Every car owner knows how durable and convenient the coir car mat is, and improved designs are being introduced to cater for diverse needs. This is a field that can be imaginatively expanded to suit the foreign markets. The use of rubberised coir carpet underlays is becoming more and more popular and coir mats with the backing of rubberised coir have come into vogue. They make the mats skid-proof.

The course of action to be pursued to safeguard the interests of the Indian coir industry, covers various fields — propaganda and publicity on a vast scale emphasising the quality and use of coir, improvement of marketing facilities abroad through suitable trade channels and subsidised warehousing, quality improvement with product betterment and diversification, revision of tariffs and extension of export

incentives to compensate the rising cost factors and assure adequate return on investment. Analysing the trend for the last five years we find that the quantum of exports has shown a steady decline. The following table gives the statistical picture:

#### EXPORTS OF COIR PRODUCTS : 1965-66-1970-71

| Year                   | Coir yarn (tonnes) | Coir products including yarn (tonnes) |
|------------------------|--------------------|---------------------------------------|
| 1965-66                | 53,377             | 74,234                                |
| 1966-67                | 45,096             | 64,899                                |
| 1967-68                | 39,276             | 58,165                                |
| 1968-69                | 42,528             | 61,725                                |
| 1969-70                | 37,726             | 55,481                                |
| 1970-71 (April-August) | 10,098             | 18,675                                |

Coir yarn which accounts for about 68 per cent of our exports of coir products, is given separately to show that the main component also follows the totality trend, and that the decline in yarn exports is not due to any increase in our yarn utilisation and export products.

Except for the brief upward spurt in 1968-69, the last quinquennium indicates a downward trend. It is too soon to form a view as regards the current year's figures but the distinct fact, even if fostered mainly by certain *ad hoc* favourable factors, is that our exports of coir products have risen by 18 per cent in quantity and 43 per cent in value compared to the corresponding period of the previous year. Another fact is that invariably yarn exports have risen or fallen with the total coir exports. Coir yarn is the basic stuff from which most of the diverse coir products are manufactured and one should think that the exports of our yarn and products are inversely proportional. But this is not the case. This is because of the plenitude of the raw material which can be suitably pressed into manufacture according to the requirements of the trade.

#### Resuscitation Needed

From the technological angle, the coir industry needs resuscitation in certain fields. Improvement of methods of fibre extraction, bleaching, dyeing and manufacturing techniques is urgently needed. The suitability of dyes for application in coir has been examined to some extent in the Central Coir Research Institute at Kalavoor near Alleppey and the dyes which could yield faster shades on coir have been identified. The processors of coir on the continent, however, give some special pre-treatments for the material and apply better dyes from mechanical systems to produce dyeings of lasting and more attractive quality. The availability of dyes at international prices and the improvement of dyeing techniques are fields where the industry undoubtedly needs assistance and guidance. This is perhaps the most fruitful area for research and if possible for a collaboration venture. Production of tufted carpets on plastic base, provision of non-skid backing surface to mats and matting etc. are techniques yet to be developed in our country.

Whenever we think of introducing mechanisation, we have to bear in mind the salient feature of coir production as it has developed in Kerala belt virtually as a cottage industry providing means of livelihood to half a million people. If mechanisation is essential for product betterment or diversification, it has got to be done because in the fierce competition of foreign markets, our products have ultimately to

stand by dint of their quality, usefulness and attractiveness. Cost is another important factor. It is not always that we find a reduction in cost by resorting to mechanisation, and even when the differences are marginal human factor cannot

be lost sight of. With thoughtful and timely help, the coir industry can develop on its own as a reliable earner of foreign exchange and a giver of bread to a substantial section of the people in these hard days when unemployment is increasing.

## Export Credit Insurance in India

P. B. SATAGOPAN

Secretary, Export Credit and Guarantee Corporation

A CONTINUOUS expansion in export trade is vital for building up a strong and healthy economy. Sound planning, appropriate policy measures and concerted effort to realise the planned targets are necessary for this purpose. Every country which has been able to show a measure of success in export promotion is known to have introduced facilities intended to aid and encourage exporters. These facilities, and the institutions set up to administer them, vary from country to country, depending upon the nature and composition of its foreign trade and the particular circumstances of each country.

One of the measures adopted by virtually all major exporting countries of the world with advantage is the scheme of export credit insurance. It has played a significant role in the post-war growth of international trade and has gained universal acceptance as a vital measure of export promotion. Convinced that credit insurance can make a useful contribution to the development of our export trade, the Government of India set up the Export Risks Insurance Corporation (ERIC) in 1957 to offer export credit insurance facilities to Indian exporters. The ERIC was transformed into the Export Credit & Guarantee Corporation (ECGC) in January, 1964, with added responsibilities. Today, the ECGC offers a wide range of export credit insurance and guarantee facilities and occupies a place of importance among the institutions which serve the needs of exporters.

#### Broad Categories

The services offered by the ECGC fall under two broad categories; export credit insurance, which comprises policies issued to Indian exporters to protect them from possible losses that may arise from their granting credit terms to foreign buyers; and direct guarantees to banks which give protection in respect of exports.

Through its scheme of export credit insurance, the ECGC offers cover to Indian exporters not only against commercial risks such as the insolvency of the exporter or his protracted default to pay but also against risks arising from political and economic contingencies which sometimes affect an entire market, or from acts of government or similar developments which are usually unpredictable and entirely beyond the control of the seller or the buyer. In underwriting these risks, the ECGC follows certain basic principles adopted by credit insurers the world over.

One such principle is that of co-insurance, under which the exporter is required to retain, for his own account and risks, a small percentage of the total credit. This is meant to serve as a safeguard against overtrading and to provide the motive force for the exporter to make a careful selection of his buyers and to follow collection of overdue accounts with vigour. For credit insurance is not a substitute for the prudence and care that the exporter is expected to exercise in conducting his business; on the contrary, it seeks to protect the exporter against such risks which cannot be foreseen or controlled by him. Accordingly, policies issued by the ECGC offer to make good 90 per cent of the loss suffered by the exporter, the remaining 10 per cent being borne by the exporter himself.

In the case of very large export orders, however, a higher cover of 95 per cent is offered against losses arising from economic and political risks as, in such cases, a smaller stake is considered sufficient to retain the exporter's interest in the transaction.

To provide comprehensive coverage of the insured's receivables at as low a cost as possible, the insurer normally requires the exporter to offer for insurance his "whole turnover" of export business, that is all his shipments over a minimum period of 12 months, except those made on a secured basis or made to associates. The ECGC, therefore, insists on the whole-turnover policies. Where, however, an exporter wants to exclude his business with certain markets, or in certain items, for sound reasons, the ECGC agrees to exclude it from its cover provided what is offered for insurance represents a satisfactory percentage of his total exports. Besides, large-value contracts of a non-repetitive nature can be insured under a specific policy.

#### Valuable Service Rendered

Where business is covered under the "whole turnover" policies, the ECGC, like all credit insurers, seeks to control the extension of credit to the different customers of the exporter. This is done by a system of approving credit limits on each foreign buyer, the limit in each case reflecting the credit status of the buyer concerned. This is a valuable service rendered by the ECGC to its policyholders because, in its effort to approve the highest limit consistent with sound trading practices, the ECGC obtains reports on the probity and resources of the buyers through reliable sources and periodically reviews such records.

Over the years, the ECGC has devised a variety of policies to suit the requirements of exporters. A policy can be obtained either to cover the comprehensive risks or, where the transactions do not involve commercial risks, only the political risks. Again, cover can be obtained either from the date of shipment or from the date of contract. Recently, the ECGC has introduced a "services policy" to cover invisible exports in the form of technical or professional services, copyright fees, royalties and hiring and leasing; and a policy to cover payments for construction works done in foreign countries is on the anvil. Thus, the ECGC is able to offer a suitable cover for almost every type of export transaction.

Where an exporter increases his exports, especially by giving liberal credit terms to his customers, it ties up a significant part of his working capital. This is a restraint on the expansion of his business, apart from being a clear disincentive to export. Exporters seek to overcome this difficulty by obtaining financial accommodation from bankers. A problem will, however, arise in cases where an exporter is unable to get the needed facilities from his bankers. To meet such a situation and to enable the banks to extend to the exporter facilities on a scale higher than what it would have granted on its own, the ECGC issues direct guarantees to banks. The guarantees protect the banks against a major portion of

#### THE EXPORT CREDIT & GUARANTEE CORPORATION LTD.

(A Government of India Concern)

Head Office : 4, Rampart Row, Bombay-1.

Branches : 123, Mount Road, Madras-6.  
15, Chittaranjan Avenue, Calcutta-13.  
Saraswati Bhavan, E-Block,  
Connaught Place, New Delhi-1.

any loss that they may suffer in extending credit for the purpose of facilitating export transactions.

The ECGC has evolved a number of guarantees to take care of the difficulties that the exporter might face at different stages of the export transaction. Its Packing Credit Guarantee enables the exporter to secure a line of credit from banks for the purpose of buying, manufacturing, processing and shipping the goods against firm export orders or letters of credit. The percentage of loss covered by the ECGC under this guarantee is 66 per cent. But where a bank agrees to cover all its pre-shipment credit accounts, the ECGC offers to make good 75 per cent of the loss in view of the improved spread of risks it gets under this type of cover. For the same reason, the premium rate is also lowered to 0.6 per cent of the amounts advanced as against the normal rate of 0.9 per cent per annum.

The financing of an export transaction at the post-shipment stage does not pose so much of a difficulty as it takes the form of purchase or discounting of bona fide commercial bills of exchange. Instances do, however, arise where, for various reasons, banks decline to extend discounting facilities to the extent required. The ECGC issues a Post-Shipment Export Credit Guarantee to meet such situations and enables the bank to offer discounting facilities for bills which they would have normally accepted only for collection.

The exporters' funds get blocked up for some time in the form of cash assistance and draw-back of duty receivable on

goods exported. In order to enable banks to make advances immediately on shipment against such receivables, the ECGC issues Export Finance Guarantee. If, however, the exporter needs such advances at the pre-shipment stage itself along with the packing credit, they can be covered under the Export Production Finance Guarantee.

Quite often, exporters are required to furnish bank guarantees to the foreign buyers as well as to various government departments and other agencies in India. Banks would issue such guarantees only up to a stipulated limit fixed in the case of each exporter on the basis of its assessment of his ability and resources. In order to eliminate occasions in which the bank's inability to issue a guarantee on behalf of an exporter may lead to the non-fulfilment of an export order, the ECGC issues a counter-guarantee to the bank.

The ECGC works on a commercial basis but its intention is not to make profit. It fixes its premium rates at such a level as will earn for it just enough income to meet its operating expenses and claims over a period of years. Its services can be offered at a progressively lower cost in step with increase in the volume of its business and the quality of risks covered by it. In fact, the ECGC has lowered its premium rates whenever it has found it possible to do so. In any event, the cost of ECGC insurance, which stands a favourable comparison with that of its counterparts abroad, is certainly low; and the benefit of this insurance can be really great to an exporter intent on diversifying and enlarging his exports.

## Fish Production: Bright Future Ahead

R. RABINDRANATH MENON

Chairman, Marine Products Export Promotion Council

WITH A coastline 5,100 kms long and a strategic location with operational advantages over wide sectors in the Indian Ocean that extends over 75 million square kilometres, India should have a pre-eminent position as a producer and processor of marine foods. That she is only seventh tells a story of untapped resources. It is not dearth of natural wealth that has held us in leash, but undeveloped means of exploitation and infrastructure necessities. We are closing in to fill the gap.

There is a relation between the total amount of organic material produced in the sea and the quantum of fish available. Estimation of potential production is made by inoculation of radio-active carbon in samples of sea-water and by assessment of radio-active organic residue in it. By using this method in different times and climes and over various oceanic areas, the organic productivity, a sure indicator of marine resources potential, can be calculated. From experience and observation, it is known that only 0.4 per cent of the organic carbon comes to man in the form of edible marine products even in intensely exploited coastal waters.

As we go deeper and deeper into the sea the proportion of production tends to become less, and the overall percentage of the entire oceanic area for the world is reckoned at 0.03 per cent. Taking only the Indian Ocean, this ratio is found to plummet down to the level of 0.005 per cent. Not that the organic matter in the Indian Ocean is less, but the processes of fishing have to catch up. In fact, the organic matter, and the consequent fish potential, is higher in certain regions of the Indian Ocean such as the south-west and the south-east coasts of India. Even to come to the level of exploitation in the Atlantic and Pacific areas, we have to raise the yield from Indian Ocean six-fold, i.e. from its present level of 2.2 million

tonnes to 13 million tonnes. The important and indisputable point is that as far as natural marine resources go, they admit of a six-fold increase in marine fish production from the Indian Ocean.

India accounts at present for about 40 per cent of the total production from the Indian Ocean. Even though this percentage itself could increase, it is a question of comparative effort. Even at the present level of 40 per cent, India's share in the total annual potential of 13 million tonnes works out to no less than six million tonnes. Reckoning the continental shelf area alone i.e. up to the depth of 100 fathoms along the east and west coasts, it should be possible to net in at least 50 per cent of this estimated six million. Our present production stands at less than a million tonnes per year and a three-fold increase is possible with a little more planned and co-ordinated effort.

Marine life, grouped under the name of Crustaceans, which has prawn or shrimp at the head of the list, forms about 13 per cent of the total yield in the Indian Ocean. Annual landings in India come to about 34 per cent of the Indian Ocean yield, i.e. at about 91,000 tonnes, consisting mostly of shrimps. The phenomenal growth in shrimp exports in the past two decades is the story of successful Indian entrepreneurship. If, prior to 1950, someone had predicted that shrimp will occupy the premier position in India's exports in a decade or two, he would hardly have been believed.

Prawn even according to the zoologists is not a fish and the regular fish-eaters seldom used to consider it as a choice food item which it has become today both in India and abroad. There is much to be done for improving the catches and for energising and bettering our market operations. But there is an established demand for Indian prawn abroad.

and we're not even an airline!

Don't mistake us. We make quality abrasives. And our products travel to 15 countries around the world: TANZANIA, KENYA, UGANDA, U.A.R., IRAN, IRAQ, RUMANIA, CZECHOSLOVAKIA, ITALY, U.K., U.S.A., MALAYSIA, THAILAND, JAPAN and CEYLON. In a 3 year period from 1967-69, exports of Carborundum Universal coated and bonded abrasives and calcined bauxite have increased nine times!

though this position has been attained with what was virtually the spontaneous growth of two decades. Realisation of its importance has come in recent years, and growth, when it comes in this age of science and technology, is often spectacular and compensatory. There is no doubt that the export of prawn will continue to rise in the years to come.

Fish for the seventies is, however, the Indian sardine. Pelagic fishes, among which sardine is the most prominent, contribute 28 per cent of the total catch in the Indian Ocean, and India accounts for 60 per cent of it. The peculiar thing about the sardine is its unpredictability as a resource. Landings vary from one per cent to 33 per cent over a number of years. In 1956, we got a meagre 7,412 tonnes, but an all-time record was attained with 3,01,446 tonnes netted in 1968. Yet we have come a long way from the sparse production of the fifties with an annual average of a little over 50,000 tonnes to the present stage of about 200,000 tonnes, the annual average of the past decade. This is likely to grow in the seventies.

The Central Marine Fisheries Research Institute is gearing up its studies to detect factors which bring about fluctuations so as to eventually forecast the presence of the fishery fields and their possible yields. Scouting may be necessary to find out rich shoals. Instead of the sardine coming to us, we should be able to go out into the sea where they are, and meet them at least half-way, so to say. Researches underway would soon discover the method to track them out. This is the problem of catch. These are clear indications to show that we are exploiting only a fraction of the stock and our present catch, even in our best statistical year such as 1968, is much below the potential yield. From productivity studies it has been assessed that the po-

tential yield of pelagic fisheries in the west coast alone will be over a million tonnes in a year.

Sardine presents quite a few problems, some easy to solve, others more difficult to overcome. We have already dwelt on its unpredictability as a resource, but this defect may soon disappear. The next problem is that it is easily perishable. It does not lend itself to be packed in the frozen condition. Though freezing processes have been developed, deterioration sets in after a period of three months or so and this will be a dampener as far as export is concerned. The best way to pack sardine lies in canning, and here the problem is one of cost regarding cans and packing medium. Oil is still the popular medium and olive oil is the most popular in foreign countries. Ring-pull-tab cans have been developed abroad and if they are allowed to be imported, the canning industry for sardines can develop immediately.

A promising field of oceanic fisheries of India, which is hardly developed at present, is that of the tuna group. This forms about a tenth of the total yield from the Indian Ocean and 60 per cent of the catch is made from the high seas by countries outside the Indian Ocean region. India's share in the catch is dismally low, some 3,800 tonnes in a pool of 150,000 tonnes. Based on the assumption that Indian Ocean can at least be exploited to the same intensity as the Pacific, its potential yield is 450,000 tonnes, almost three times the present level.

Starting from the beautiful prawn which is an artist's dream come true, tethering the difficult and delicate sardine with a dullness we must yet acquire, and ending up on the dancing tuna which hides herself in distant seas, the Indian fish is going to gain many faces — rich, resplendent and rewarding. That is the phase of the future.

## Role of Publicity in Export Promotion

NIRMAL J. SINGH

Director, Commercial Publicity, Ministry of Foreign Trade

It was long time ago that I had read the account of a lonely Indian traveller who had gone to a small-town eating place somewhere in the United States. The owner of the place, on knowing the nationality of the visitor, had stated apologetically that he had till then heard or known about one Indian only, Gandhi. The traveller had to tell him that surely he had known about another Indian pointing at the small stone figure of Buddha on his mantelpiece. The owner had laughed heartily at this and asked the Indian not to pull his leg for, after all, he had read a little bit of history. Of course Buddha was a Chinese, who did not know that!

I have mentioned this story only to make the point that publicity is needed to inform others about something which ought to be well-known, to establish an image which is not already there, to persuade people to accept a view without appearing to be persuasive.

It is not the Buddha alone whose origin gets lost due to lack of organised spreading of information. This, of course, is different from propaganda. By consistently spreading certain principles, even wrong principles, one may be able to gain support; that is propaganda. Publicity is the art of opening to the knowledge of all the actual state of things, the news of happenings or developments and the redeeming features or distinguishing characteristics of an object, person or place, which if not told by somebody through effective means, would remain beyond the ken of those who require them. I have seen common teas of other countries being packed and sold in the UK as "pure Darjeeling tea". Now this is possible because of the lack of knowledge of the geo-

graphical location of Darjeeling among the purchasers. Publicity to educate the masses about the cultivation of tea and to propagate the merits of Darjeeling tea may result only in boosting the export of common teas from other countries. The message needed here is that of the effectiveness of quality teas in revitalising a tired or a worried person and in that context the charm of the lingering aroma of tea leaves grown only in one part of the world — north-eastern India.

Publicity is no more than making known and creating public knowledge. Such publicity is informative, making no attempt to induce action. This is publicising which is not synonymous with advertising.

In the past the colonised countries had been suppliers of raw materials and semi-processed products needed to meet the requirements of the industrialised countries. Their products always found ready markets, and the need for conscious publicity for export trade promotion did not make itself felt at that time. Today, many of these countries have reached the "take-off" stage of industrialisation. Promotional measures, chiefly publicity, are now necessary to introduce the products of the developing industries of the emerging countries on to the world markets. Moreover, keen competition in the form of synthetics necessitates more effective and intensive publicity efforts in order to maintain the present markets and create new ones.

The rapidly changing demand patterns and the increasingly competitive conditions in export markets have given con-

siderable importance to publicity in export promotion and led to significant changes in export publicity technique. Commercial publicity today is a specialised activity and constitutes a big promotional force in any selling effort. It is an extensive operation which seeks to marshal every possible aid for successful marketing. These publicity/public relation services have to be carefully planned and an integrated programme of work has to be chalked out.

Since the primary aim of export promotion is to develop the export markets, export publicity, which includes dissemination of commercial intelligence and commoditywise and areawise market research, is considered as the most effective tool of export promotion. In those countries where the organisational structure of the governmental machinery as well as of trade and industrial bodies connected with export promotion efforts, is well developed, export publicity is handled in a fruitful manner. The liaison between the government commercial representatives on the one hand the Ministry of Foreign Trade and institutions working for export promotion at home on the other hand is close and effective, particularly in the matter of dissemination of export information within the country.

In the conditions prevailing in developing countries such as India, government has to take on its shoulders the major portion of work relating to export publicity. In the field of internal publicity, the twin objectives of creating an export consciousness and conveying the news of export opportunities to the businessmen are sought to be achieved mainly through the printed word, and also through radio broadcasts and documentary films. It is not difficult to assess the impact of the existing services and enlarge or reorient them in a suitable manner.

#### Specialised Endeavour

Overseas publicity is a more specialised and complex sphere of endeavour where any form of amateurism is destined to produce negative results. It is a question of different approaches to different countries with their own levels of development and living. The documentation needed for this purpose is so extensive and complex that only the public authorities are in a position to provide it. In some advanced countries, however, these responsibilities are delegated to private professional undertakings which operate with technical and financial aid from the state. In India the major work for overseas publicity is undertaken by governmental agencies and bodies like export promotion councils and commodity boards.

But the mechanics of market assessment apart, effectiveness of overseas publicity lies in the selection and use of media. So far in our country the stress has been on the printed word. The Directorate of Commercial Publicity issues illustrated monthly and quarterly journals for wide publicity abroad and regularly feeds the Indian missions abroad with material for publicising at their end. Some of the councils and boards also bring out similar journals for foreign consumption. On specific occasions special supplements on India are sponsored in the popular newspapers in selected countries. Besides, special broadcasts are beamed to different regions by the All India Radio as a measure of export publicity. The material for these broadcasts, which are invariably in the language of the region, is supplied by the Directorate of Commercial Publicity. A few documentary films are also produced for screening abroad. The cumulative effect of all these has no doubt helped to push up the sales of Indian products in international markets but we are still behind in modern publicity because the concept of publicity in this age of mass media has undergone a revolutionary change. Electronic devices are now used for mass communication and electricity moves

at the speed of 186,000 miles per second. Publicity in the present world has to move with that speed and has to be planned so as to reach millions of people.

India has not in her publicity campaign abroad made use of the TV which is the most suitable medium for establishing an indelible image. Making of an image is nothing but creation of a clear impression of a product or a service—a distinctive impression which identifies the product or service as being the cheapest or the most exclusive, or the most reliable. These and similar export promotion characteristics are to be brought out in the medium used. Once again this is not to be confused with advertising. The most advantageous sales promotion asset is the intrinsic quality of the product itself. It is a truism that a customer seldom buys a bad product twice. Export publicity aims at making known to the potential customer the essential good quality of a product so that he may not miss it on account of ignorance.

#### Hearing Is Easier

Reading is tiresome particularly in a foreign language. Besides those who are averse to reading there are many who are unable to read. A readership survey of popular newspaper will indicate a large proportion of regular readers not noticing any advertisement and even the news appearing on particular pages. Hearing is easier but it fails to register unless the spoken word holds the interest to the end. Seeing is believing whether in picture postcard, posters, animated figures, displays in exhibitions and showrooms, small TV screens or large 70 mm film screens.

The last two media of communication are now the most powerful tools of export promotion. TV has extensive outlines. The cost is prohibitive but in the arithmetic count of the number of persons reached simultaneously, TV easily scores. Films are almost equally effective and less costly but it is difficult to get a documentary accepted for commercial showing in cinemas unless it is of very general interest. There is of course a scope for advertising shorts, a type of semi-documentary intended for brand or product publicity, which a trading body or consortium can sponsor and get released against payment.

Export publicity cannot be a half-hearted attempt particularly in advanced countries and unless one looks ahead and plans in a big way, he will not succeed in persuading people to believe what was distasteful to them or buy what they did not want to buy. The use of the mass communication media will be expensive but will in the long run be far more effective and also economical if the same result is to be achieved through the printed word.

In printed word also one has to think of utilising the Indian correspondents of leading foreign newspapers and magazines where thousand dollar despatches can be published in mass circulation papers abroad. Sponsored supplements are being brought out now but half-a-dozen supplements a year ought to be multiplied substantially, in frequency and area coverage. It may be mentioned that a mass circulation paper in an advanced country would need advertisement support to the extent of about Rs Two lakhs for each supplement and Indian firms have to have a sufficiently large overseas advertisement budget. A contribution of five per cent or so of the consignment value of all exports should be made by firms voluntarily for promotion and publicity.

Our participation in overseas fairs has been worthwhile as the recent success in Expo '70 and similar exhibitions indicates. If the foreign exchange position permitted we could have participated in many more international exhibitions with encouraging results.

USE

S.E.V

**'CAREPAC'**  
FOR CONTINUED TOP PERFORMANCE

Regular check-up of the fuel pump in any vehicle ensures trouble-free performance. Worn-out parts in the Fuel Pump result in poor performance. To increase efficiency replace worn-out parts with genuine S.E.V. spares available in 'CAREPAC'

S.E.V. 'CAREPAC' contains genuine S.E.V. parts precision-engineered under strict quality control.

S.E.V. Fuel Pumps are already fitted as original equipment on Standard Herald, Fiat, Ambassador Cars, Standard Twenty trucks and Jeeps.

## You can spell progress in three letters—ACC

More than 50 years ago, ACC pioneered the manufacture of cement in India. Today, they are leaders in the manufacture and research of cement, cementitious materials and industrial machinery. Achieving a breakthrough in the export market for cement-making machinery, ACC won a Rs. 2 crore contract for a project in Kuwait, earning international recognition of Indian technology. And just recently ACC has been awarded another contract (4.909 million dollars) for erecting a cement plant in Iraq. Over the years, far-sighted management decisions have built the ACC organisation into a dependable and progressive force in the country's economic development.

### A STATISTICAL SURVEY

## Economic Trends

IN THE following pages statistical tables have been presented which review the growth of the economy since 1950-51. Starting with the growth in population and national income, the tables give a bird's eye view of the progress in agriculture, industry, foreign trade, prices and employment. At the end, the standard of living in our country is compared with selected foreign countries.

### DEMOGRAPHIC DATA

#### GROWTH OF POPULATION

| Year   | Population<br>(in millions) | Growth over previous period |                   |
|--------|-----------------------------|-----------------------------|-------------------|
|        |                             | In millions                 | Percentage change |
| 1901   | 236.3*                      |                             |                   |

# JUST 3 MINUTES PLEASE!

—it won't take you longer to read this bit of information about the German Democratic Republic

Ours is a small country. According to territory we rank 92nd in the world and would cover, for instance, only one third of Rajasthan state. Our population as well cannot be compared to India's. Here we rank 31st in the world, having about the same number of inhabitants as Kerala.

It's different, however, with the industrial output of the German Democratic Republic and her 1 crore and 70 lakhs of people. Our country is among the 10 leading industrial countries of the world. Let's prove this by facts and figures:

How much is being produced in the German Democratic Republic today, now, during these very 3 minutes? First of all: the current output of 2 months and 21 days is equal to that of the whole year of 1950! But let's stick to our 3 minutes. Goods worth 27 lakh rupees are being produced in the German Democratic Republic in 3 minutes, goods such as 42 tons of cement, 15000 litres of diesel oil—100 square metres of photographic and cine film—300 kg synthetic fibres, which would be sufficient to make 2,100 shirts—all in 3 minutes!

How else is this twentieth part of an hour utilized, what else is being produced? Just a few more items: 3 sets of bedroom furniture—4 sewing machines—9 bicycles—10 cameras—15 motors—18 radio sets—87 clocks and watches—3,480 pairs of stockings and socks—13,632 square metres of textiles, which would be sufficient to make 4,545 suits and dresses—all in 3 minutes!

So, about 3 hours would be enough to provide, for instance, the entire population of Bhopal with new clothes. And the output of textiles in the G.D.R. in 2 days would do to dress, for instance, all the people of Delhi and Bangalore. This could be continued, of course. But, as we said before, let's stick to our 3 minutes. They are almost over now, and you didn't spend them in vain since you got to know what the GERMAN DEMOCRATIC REPUBLIC is able to make out of and in just 3 minutes!

## GERMAN DEMOCRATIC REPUBLIC

The nation's defence is a serious matter. It calls for sturdy, reliable equipment that will perform well under the most adverse conditions. BEL equipment meets these requirements, which is why, in the field, the armed forces depend upon sophisticated radars and wireless communication equipment made by BEL.

EVERY DAY IN MANY WAYS  
BEL SERVES YOU BETTER AND BETTER

**BEL** **BNARAT ELECTRONICS LTD.**  
Regd. Office: JALANALLU-BANGALORE-13

In real battle, however,  
BEL is  
very much on the scene...

For BEL equipment is the 'eyes and ears' of the Defence forces.

From experience comes faith...

Watch a young boy comparing and selecting book after book.

They look much alike to him now. When he is older, through experience, he will have judgment. He will know books he can live by. The rest can gather dust on the shelf.

Life is like that. Out of each new experience, a man gathers wisdom. He learns to hold fast to things of proven worth.

By comparison, man also learns the value of things unseen, things in which he finally puts his faith.

The priceless ingredient of every product is the honor and integrity of its maker

**Into the future with confidence...**  
**INDIANOIL is helping to change**  
**the economic face of India**

The heart of India beats in her villages. More than 80% of her population lives in villages scattered all over the country.

Today, village life is changing. Development projects are bringing progress to village people. And INDIANOIL is helping to take them closer to modern life by contributing to the growth of agriculture, transport and industry.

INDIANOIL is helping to change the life of the common man. He can look into the future with new hope and confidence.

\*Provisional.

Notes : 1. Population figures relate to mid-year revised estimates.

2. Production figures relate to agricultural year July-June; 1951 figures correspond to the production of 1950-51, and so on for subsequent years.

3. Net production has been taken as 87.5 per cent of the gross production, 12.5 per cent being provided for feed, seed requirements and wastage.

4. Figures in respect of change in stocks with traders and producers over a year are not known. The estimates of net availability given above should not therefore be taken to be strictly equivalent to consumption.

5. Net availability = net production + net imports + change in government stocks.

Chari

There's a  
fragrant body  
in this  
Poysha can

Poysha cans bring  
you talcs for  
day-long fragrance,  
day-long freshness

Every day, everywhere, Poysha containers go to thousands of homes, carrying hundreds of products—all with their original quality intact. Besides, Poysha helps you by helping manufacturers. With four of the most modern container-making factories in various parts of India... cutting down warehousing costs, speeding up deliveries... all adding up to lower packaging costs.

**POYSHA**

INDUSTRIAL CO. LTD.

Bombay • New Delhi • Cochin  
Subsidiaries:  
Kaira Can Co. Ltd., Anand  
Colrige Ltd., Bombay.

POYSHA India's fastest growing container-maker

# india exports food

THE PROCESSED FOODS EXPORT PROMOTION COUNCIL 119, Jorbagh, New Delhi-3

Surprising ! Is that ?

But we mean no dramatics while making this pleasant surprise known to you. We mean business. India has the vast resources and high potential to catch the foreign markets through processed foods.

The mere mentioning of foods 'Indian' spells sumptuous delight, 'romantic' taste and hot, delectable cuisines abroad. They are highly popular overseas. In U.K., Sweden, Denmark, France, West Germany, Netherlands, Switzerland, Bahrain, Kuwait, Iraq, Hong Kong and Singapore, for instance. Already numerous exciting Indian delicacies are delighting many.

The list includes canned fruits and vegetables, pickles and chutneys, biscuits and confectionery, spicy papads, instant tea, instant coffee and a host of other items. During the current year, envisaged exports would be of the order of Rs. 13.5 crores.

Incidentally, are you manufacturing any variety of processed foods ? We are at your service. We'll provide all the information regarding exports and render overall help through planning and publicity abroad.

## 'HELP US TO SERVE YOU BETTER'

"Cleanliness is next to Godliness" according to an old adage. Clean surroundings radiate joy. More than that they help in controlling diseases. On Railway Platforms, in Waiting Rooms and in Carriages, etc., where people gather, it is of paramount importance to maintain proper hygienic conditions, to preserve the health of the passengers. You can help the Railways in this fight against disease by :

EXTENDING YOUR CO-OPERATION FOR KEEPING THE SURROUNDINGS CLEAN AND BY AVAILING OF THE SERVICES OF SANITARY STAFF PROVIDED AT STATIONS WHENEVER REQUIRED.

## The challenge of Telecommunications

Building an efficient and modern telecommunications network in a vast country like India is a major challenge. ITI has been successfully meeting this challenge—multiplying telephone lines, modernizing telephone exchanges, speeding up trunk calls, extending Subscriber Trunk Dialling and telex services, nation-wide installing microwave systems, adopting electronic techniques in telecommunications.

ITI manufacture a wide range of telecommunications equipment...to serve the nation's diverse needs.

ITI supply to the P & T, automatic exchange equipment—both Strowger and Cross-bar—and teleprinter exchanges. Long distance multi-channel transmission equipment, multiplexing equipment and microwave equipment for increased channel capacity. And electronic measuring instruments.

ITI also make specialised communication and control equipment for the Railways and Defence Services.

Results ? ITI's annual turnover exceeds Rs. 215 million. Exports hit a record—Rs. 9 million in 1969-70. And Rs. 31 million saved in foreign exchange in the last five years through multi-point import substitution.

## **TARGET: Progress**

## **or, how to work wonders with oil through research**

Today's demand for 14 million tonnes of petroleum products in India will jump to 30 million tonnes by 1975. Bridging this gap is a colossal task, involving major challenges—one of which is research.

Esso "Research" has worked wonders with oil... halting the desert's advance... helping water conservation... improving steel-making... producing synthetic rubber... diversifying into fertilisers, insecticides and chemicals. More important, Esso Research means continuously improving designs and

methods—all aimed at increasing production, reducing costs and substituting imports. These, and many more, are the fruits of Esso Research. Esso worldwide spends Rs. 75 crores a year on research—benefits of which are available to the country through Esso India.

Esso shares the nation's determination to face the challenges of growth and is ready to share the burden of the task that lies ahead.

## INDIAN COPPER CORPORATION LIMITED

GHATSILA P.O., S.E. RLY., BIHAR.

### COPPER AND BRASS

INDIA'S ONLY MINERS AND SMELTERS OF COPPER.  
PRODUCERS OF ELECTROLYTIC V.C. COPPER WIRE BARS.  
MANUFACTURERS OF ROLLED COPPER AND BRASS SHEETS & STRIPS

### KYANITE

INDIA'S LARGEST EXPORTERS OF KYANITE. Our hard and lumpy LAPSO  
BURU KYANITE from our own quarries is used by Refractory Makers throughout  
the World.

KYANITE QUARRIES AT LAPSO  
SINGHBHUM DIST.

### MANAGING AGENTS :

**GILLANDERS ARBUTHNOT & CO., LTD.**

P. O. Box 174,  
NETAJI SUBHAS ROAD, CALCUTTA-1.

### BRANCHES :

BOMBAY, MADRAS & DELHI

# planning

## PLANNING FORWARD, TESTING BACK— THAT'S NRC

From its conception all the way to its finished form, an NRC product is the object of systematic, scrupulous scrutiny. Be it NRC's Rayon Yam. Or Rayon Tyre Cord. Or one of numerous process chemicals. Always preceded by meticulous planning and followed by unsparing quality control, NRC knows no other way.

**THE NATIONAL RAYON CORPORATION LTD.**  
Ewart House, Bruce Street, Fort, Bombay-1 BH.

**Gedore exports are on the up and up!**

With a 30% increase in exports over one year—and now to over 30 markets abroad!

- Made to international specifications
- Precision engineered from high grade steels

- Rigidly checked for quality
- Made by India's largest manufacturers and exporters of handtools

**GEDORE Handtools**  
Unmatched in Quality  
Unmatched in Range

GEDORE TOOLS (INDIA) PRIVATE LTD.  
151 Golf Links, New Delhi-2

Selling Agents for Northern & Eastern India:  
**JHALANI BROTHERS**  
P.O. Box 540, New Delhi  
Also at Calcutta, Kanpur & Jullundur City

## WELDING IS A THREE-LETTER WORD

*That needs some explanation.*

The three letters are obviously IOL. Obviously because IOL (Indian Oxygen Limited) has always pioneered advances in welding technology, and introduced the latest welding techniques to this country. Simultaneously, IOL has developed indigenously a wide range of welding equipment and consumables and trained up a cadre of welding technologists, equal to the best anywhere.

IOL functions today through a network of over sixty plants, offices, depots and compressing stations located in every major industrial area of the country. It maintains an extensive distribution system. IOL's technical experts and service-engineers are available throughout India to tackle any conceivable problem related to welding.

**Leaders in the field of welding :**

**India's Future and the Computer**

**If you are one of IBM's 387 vendors**

**You'd know how IBM is helping you to make the computer-age components.**

Many people pool their efforts to make IBM computers in India. As many as 387 big and small manufacturers, spread all over India, make many components needed for computers and Data Processing machines being manufactured at IBM plant in Bombay. To enable them to make components which will measure up to international standards, IBM makes its world-wide fund of technological know-how and expertise available to them. Right at their doors. And, that is not all. Where certain computer components involve extreme precision work, IBM also trains vendor personnel at its own plant to an international level of competence.

These vendors, in turn, are employing many personnel to turn out the computer-age components—opening new avenues of employment and opportunities. And, IBM is always looking for more vendors. For as the need for computers grows in India, with it will grow the need for an increasing number of vendors to help IBM build the machines—vital for the nation's progress.

Some airlines fly across continents. Some across countries. Some even aspire to fly faster than sound. We don't. We fly across centuries. From present day Delhi to the 16th century Taj at Agra. The 10th century temples of Khajuraho. The timelessness of the holy river Ganges at Banaras. And back to the present in industrial Calcutta. And we return the same way, the same day, across the centuries.

THERE'S A  
**DODGE**  
AND  
**FARGO**  
CHASSIS FOR  
EVERY NEED—

Dodge and Fargo offer you a wide range of chassis to suit your individual requirements. These chassis are ideally suited to do almost every job on wheels, and lend themselves admirably to a variety of body designs—whether luxury transport, school bus, ambulance, fire brigade or a load carrier. Dodge and Fargo chassis are built sturdy, rugged and safe—to carry loads on any road, with perfect ease. You have a choice of 4 engines, too, P-6 Diesel Engine, Meadows Diesel Engine, Premier Petrol Engine and P-6-354 Diesel Engine.

## HAVE YOU LOOKED BEHIND THE "SANFORIZED" LABEL?

If you look behind the "SANFORIZED" label you will see a lot of people making tests, taking measures, comparing sizes, checking charts, making notes and reports. They are the "SANFORIZED" technical representatives making sure that shrinkage control conforms to the rigid specifications set by the owners of this trademark.

If you look at the label again, you will see that it's telling you that a garment carrying this label will

not shrink out of fit, no matter how often it's washed.

Yes, there are a lot of things that you can see and read in the "SANFORIZED" label. It is your assurance that you're getting your money's worth, that the clothes you buy will retain their original fit.

Next time you buy cottons or cotton blends, make sure you look for the "SANFORIZED" label. It's a trademark you can trust.

**SANFORIZED**

REGD TD MK

owned by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietor of the registered trademark "SANFORIZED." The proprietor uses this trademark or permits its use by registered users, only for tested fabric which meets its strict residual shrinkage requirements.

## Behind every good product is a long line of people

A product isn't just the sum of its ingredients. It has to be packaged—attractively and efficiently. It has to be transported across many miles and brought to your dealer's shelf in the best condition. And all along, checked to give you the quality you expect...and deserve.

A product passes through the hands of a small battalion of people before you buy it.

People make our products what they are: trusted, and therefore special.

**WARNER-HINDUSTAN LIMITED**  
makers of pharmaceuticals,  
chemicals and consumer products

# THIS IS REGAL INDIA

This is regal India.  
Serene, unruffled, calm. All cool white marble and royal red sandstone. Where turbaned 'darbans' greet you with a courtly 'namaste' and usher you into a palace of oriental magnificence.

This is gracious India.  
Warm, friendly, smiling. Where service is a time-honoured tradition and hospitality a way of life.

This is historic India.  
In the heart of the capital. Towering above the floating domes and turrets of the seven cities of Delhi.

This is the India of today.  
Modern, vital, efficient. Where international standards of comfort and service are maintained. Central airconditioning with room temperature control. Private baths and balconies. And all the extras of 5-star luxury!

This is the India of your dreams.  
Arcades of shops that spill over with silks, antiques, jewels and handicrafts. A paisley pool warmed by the proud Indian sun. Gourmet restaurants that serve exotic and traditional fare. And the sheer luxury of space. All 25 acres of it.

**ASHOKA HOTEL**  
NEW DELHI

## REGION-WISE AND COUNTRY-WISE VALUE OF IMPORTS, EXPORTS AND BALANCE OF TRADE 1967-68 to 1969-70

(Rs lakhs)

# Beyond a Bata window

A Bata shopwindow naturally arrests attention. And when you gravitate to it, you're at once transported to an entirely new world. You picture everybody—men and women, boys and girls, old and young, all seem to step out of the Bata shopwindow—beautifully shod.

But what lies beyond that window? Let us give you a panoramic view of the Bata enterprise.

What a vista!

An entire army of 22,000 highly skilled personnel, and factories equipped with the most modern machines, for the production of 200,000 pairs of footwear a day. Despite that output, intricate shoe engineering blends skillfully with the craftsman's individual artistry.

Moreover, there are devoted hands fitting shoes to eager feet in over 1100 Retail Stores and Agencies, 430 Wholesale Depots, Dealers and Distributors.

There are whole townships exclusively for Bata employees, who make shoes not only for you, but also 10,000,000 pairs for people all over the world—including those in the most sophisticated countries.

This is only a fleeting glance.

Come again with us into this domain of footwear and take a relaxed look at each facet of the impressive Bata mosaic.

Go West  
young man

once in a while  
15 times a week  
go West young man and  
meet your angel  
or take her with you  
shake the three-year dust  
from off your tired feet  
then wander further West  
to lands of music, fun and laughter  
go like a maharajah — recognised  
with that extra something  
Air-India alone can give.

15 flights to London  
7 flights to New York  
every week

**AIR-INDIA**

### V/O TSVETMETPROMEXPORT

attends to a wide range of matters.

One of our jobs is to give our customers technical co-operation in the construction of coal mines, coal and oil shale concentrating mills.

Under contract stipulations and at the request of the interested parties we undertake to blueprint and design these facilities ;

export sets of fully-interested equipment ;

supervise its assembling, erection, adjustment and start-up ;

direct the construction or

supervise assembling work ;

take a hand in commissioning said facilities ; train local personnel

to run them, either in the customer country or in the USSR.

All jobs are done by experts of specialised and research institutions as well as industrial personnel.

Our Address :

## TSVETMETPROMEXPORT

†Compilation of the 1949 based All India Index was discontinued with effect from the index for August 1968 as from this month the New Series of All India Average Consumer Price Index Numbers for Industrial Workers on Base: 1960=100 was started. As such average for the financial year 1968-69 is based on 4 months' figures in the old series on Base: 1949-100 and 8 months' figures as estimated from the 1960 series. †Average figures for the subsequent period have also been obtained from the converted figures on Base: 1949-100. †Average of 8 months from August 1969 to March 1969.

\*Indices for the period January 1961 to September 1965, in respect of Bombay, Nagpur and Sholapur have been obtained respectively from figures on Base: July 1933-June 1934=100; August 1939=100 and February 1927-January 1928-100 by arithmetic conversion. The figures from October 1965 onwards are from the new series of index numbers on base 1960=100

\*\*Figures for the period upto January 1970 have been estimated from the old Consumer Price Index Series for Madras city on Base: July 1935-June 1936=100. From February 1970 and onwards, figures are from the Labour Bureau's New Series on Base: 1960=100.

\*The bulk of the increase is due to the reclassification of certain categories from 'Services' division to this head.

\*\*Provisional.

## BETTER WITH BORON

### A little boron can make a very big difference to crop yield and quality.

For healthy growth plants require not only the major soil nutrients such as nitrogen, phosphates and potash, which are supplied in commercial fertilizers, but small quantities of other elements as well. Boron is one of the more important of these essential trace elements.

Boron deficiency in the field was clearly recognised over thirty years ago (heart-rot in sugar-beet and man-golds). Since then many reports have appeared describing the characteristic symptoms of boron deficiency in a wide variety of crops. These include apples, bananas, grapes, citrus, coconut palm, coffee, cotton, groundnut, maize, sugar-beet, tea, tobacco etc.

Many crops have particularly high boron requirement and remove appreciable quantities of boron from the soil, but some crops have a relatively low requirement for boron and do not tolerate heavy applications.

Boron deficiency causes serious loss of crops as a result of low yield and poor quality, but can be cured very cheaply by supplying boron to the crop. Borax (disodium tetraborate decahydrate) manufactured by Borax Morarji Limited, Ambarnath is a boron nutrient which can be used to prevent and correct boron deficiency in crops. It is available in special packing for agricultural use.

Illustrated descriptions of boron deficiency symptoms, details of dosages of Borax to be applied to particular crops for correction of this deficiency and methods of application to the crop can be obtained from:

**BORAX MORARJI LIMITED**, Mahatma Gandhi Road, Ambarnath P.O., District Thana, Maharashtra

## wheresoever you may be CENTURY RAYON is with thee

Century Rayon is with you in the suits, shirts, ties, underwear, sarees and dresses which you wear; in your bedsheets, pillow-covers, blankets and carpets, as well as in the curtain and furnishing fabrics around you at home, or in the transport you use.

When you ride a car, scooter or bicycle, you are, in fact, riding on Century Rayon's continuous filament high-tenacity viscose rayon yarn from which the tyres used in these vehicles are made. The tractor which tills the earth, the truck that transports food, clothing and other materials for you as well as for the nation, and the vehicles that safely transport over rough terrain the

jawans and their supplies, also use this miraculous yarn in their tyres. The tarpaulins, tents, drive belts, hoses, ropes and cords used in farming, defence and industries, also use Century Rayon yarn.

Your sewing and embroidery threads, your ribbons and laces, the zari borders for your sarees, the elastic tape used in your dresses, gas mantles for petromax lanterns, even the humble lace of your shoes and the straps of your fancy chappals very likely contain Century Rayon's versatile yarn.

This is how Century Rayon always serves you, no matter where you are and what you are doing.

**CENTURY RAYON**

## HINDALCO ALUMINIUM EXTRUSIONS

Lightness, corrosion resistance, good surface finish, along with strength and combination of properties—you can obtain all at low cost with HINDALCO Aluminium Extrusions. There are endless applications in every industry using fabricated metal shapes as components of assembly. A single aluminium extruded shape substituted for other metal can impart greater stiffness and strength with simpler assembly along with reduction in cost.

Extrusions can be custom-made in alloys which can give a combination of mechanical properties needed in a wide range of sections—rods, bars, angles, channels, tees, zeds, I-beams, H-sections, hollow shapes or semi-hollow shapes or special shapes.

Why not investigate the possibilities of Aluminium Extrusions application in your industry? It will pay you handsomely to do so! Please write to:

\* Employment less than 50.

Note : 1. Coverage of coffee plantations is inadequate.  
2. Largely on account of exclusion of smaller plantations, these are underestimates.  
3. Coverage in the private sector, particularly is known to be inadequate.  
4. The figures need not necessarily add up to the total on account of rounding off.

CEMENT PRODUCTS LTD.**

SANATNAGAR, HYDERABAD-18.

Factories at: SANATNAGAR, HYDERABAD,  
BALLABGARH, HARYANA.

# CLEVITE

RESEARCH HAS PROVED  
**COPPER-LEAD**  
TO BE THE RIGHT  
COMBINATION  
MATERIAL FOR

In 50 years working with all materials, CLEVITE research has proved copper-lead to be the right combination material in the world for heavy duty applications.

Where in all cases, the test is in performance spread over many years, CLEVITE copper-lead have proved to be the best heavy duty engine bearings.

**HEAVY DUTY APPLICATIONS**

## BIMETAL BEARINGS LIMITED

In technical collaboration with Clevite Corporation, Cleveland, Ohio, U.S.A.  
Sembiam Madras-11

## EXCLUSIVELY FROM *Godrej* FORK-LIFT TRUCKS

with **\*HYDRATORK\* TRANSMISSION**  
and **\*CARBON PILE CONTROL**

Manufactured in technical collaboration with CLARK EQUIPMENT A. G., U. S. A. - a world leader in Materials Handling Equipment.

**ELECTRIC FORK-LIFT TRUCK** (with cushion tyres)  
Model—EC-40

- **\*INSTANT, POSITIVE CARBON-PILE CONTROL**
- **FUME-FREE OPERATION**
- **LESS-OPERATOR FATIGUE**
- **BETTER SUITED FOR HAZARDOUS AREAS**
- **IDEAL FOR IN-PLANT MATERIALS HANDLING**

**DIESEL FORK-LIFT TRUCK** (with pneumatic/solid tyres)  
Model—DCY-46 (capacity 2000 Kg.) and  
Model—DCY-58 (capacity 2500 Kg.)

- **POWER STEERING FOR FATIGUE-FREE OPERATION**
- **\*HYDRATORK\* TRANSMISSION WITH TORQUE CONVERTER**
- **UNEQUALLED FOR HANDLING HEAVY LOADS ON UNPAVED SURFACES**

For fuller particulars, write to

*Godrej*

& Boyce Mfg. Co. P. Ltd., Lalbaug, Parel, Bombay 12.

Branches: Calcutta · New Delhi · Madras · Hyderabad · Kanpur

N.B. Capacity ratings reckoned at 500 mm load centre.  
Enquiries entertained for intermediate capacities and variations in uprights.

RUPEES 1.50 JANUARY 22, 1971 VOL. 56

While for the condemned man nothing concentrates the mind so wonderfully as the imminence of his date with the hangman, a general election around the corner seems to be able to do the job equally effectively for the politicians. Mrs Gandhi, for instance, started thinking furiously about the state of the nation's economy immediately after she had opted for a poll for the Lok Sabha. Brave, new plans are being unfolded day by day by the various ministries of the central government for stabilising prices or promoting employment. Those among us who are sufficiently cynical may prefer to look at this situation with an unkindly eye. They may suggest that there is nothing like a general election to put the fear of God into the most brazen 'he' or 'she' in politics.

From "She Stoops All Right . . ."

## Planting prosperity through power... Badarpur

## To quench his thirst for more power, at Badarpur BHEL helps to produce it

Twenty kilometres from Delhi, another source of power is being created.

The Badarpur Thermal Power Station.

The first of such projects undertaken by the Government of India in its scheme for a nationwide power network, it will be linked with the Northern grid.

Badarpur will produce power to help meet the increasing demand in the North by the growing number of small entrepreneurs and large industries... for lift irrigation of lands revived by vast canal schemes... to realise the potential of mineral wealth in the region.

BHEL High Pressure Boiler Plant is supplying three 100 MW boilers to this project, all designed and built at Tiruchi.

BHEL-Tiruchi, in association with the other sister units at Hyderabad and Hardwar, is helping to create new and more power to sustain our country's progress.

An investment that pays  
Other thermal power stations that will equip

with BHEL high pressure boilers amounting to a value of over Rs. 1000 million: Ennore - Delhi - Harduaganj - Kothagudem - Obra - Bhatinda - Ukai - Pathratu - Namrup - Panki - Faridabad.

When they progressively go on steam by 1971-1972, and later, BHEL-Tiruchi will have more than repaid the investment. More, it will add enormously to the national exchequer and earn foreign exchange in the world markets.
