Preoccupation with Form

WHEN the rate of contributions to the Employees' Provident Fund was raised in the early sixties from 6¼ per cent to 8 per cent for undertakings employing 50 or more workers, the Government had thought it necessary to follow an elaborate procedure involving discussion in the tripartite, appointment of an Expert Committee and careful consideration of its recommendation before effecting the actual increase in the rate. The enactment of the statute on Bonus prescribing, *inter alia*, a minimum bonus of 4 per cent was similarly preceded by an even more elaborate procedure. On both occasions employers in the country had strongly resisted the proposals. In the context of this past history, the proposal to raise the P F contributions rate from 6¼ to 8 and from 8 to 10 per cent as the case may be, as also the proposal to double the quantum of minimum bonus from 4 per cent, which are reported to have been unanimously approved by the Conference of Labour Ministers in New Delhi last week, appear to have got through with astonishing casualness. Is it the radical posture of the Congress or the proximity of the elections in most states that has influenced the attitude of the Government both at the Centre and in the states towards these measures which will obviously be of far-reaching impact?

So far as the proposal for raising the P F rate is concerned, the benefits to the Government are more real than those to workers. This source has long provided the Government with very large loan funds at cheap rates. The total amount already runs to some Rs 1,200 crores and a rise in the rates will bring in even larger funds for whatever use the Government might want to put them to. This is, perhaps, the most acceptable form of compulsory long-term savings which industrial workers will submit themselves to and the interest that the Government has to pay on these savings is much lower than on almost any other savings borrowed by it. For the workers themselves, the benefit of the enhanced rates will be much smaller than might appear, for, apart from the low interest earned, in an inflationary situation, the real value of the P F contributions will continue to be eroded seriously.

The proposal to prescribe prison sentences for those employers who default in paying contributions to the P F according to the law would also be welcome, but for the insistence of the state governments on retaining the powers to authorise prosecution. The state governments have shown no inclination at all to make use of these powers, though P F defaults by employers have already reached grave proportions. The reluctance to hand over these powers to the P F organisation itself is really difficult to understand.

The value of the proposal to prescribe a minimum 60-day advance notice for closure of undertakings is likely to be only formal. There are numerous cases of closures taking place without the managements following even the present requirements of notice and payment of retrenchment compensation. The Government has been found to be virtually powerless to enforce these requirements of law against an employer who does not want to run his establishment anyhow. Prolonged and frustrating litigation in various Courts by the workers or their trade unions sometimes succeeds in recovering a part of the workers' dues from the employer but never in protecting their jobs. The Government, however, is rarely of any help in this. How a 60-day notice provision can be enforced against an employer who actually closes down without any notice at all and has no intention of running his establishment or of paying anything to the workers, is not at all clear.

The preoccupation of the Government with form rather than content is also evident from the jurisdictional disputes, which seem to have figured so prominently in the Labour Ministers' Conference, among the Centre and the states about the handling of industrial relations problems in different sectors. The more important question of how these problems should be handled seems to have received little attention. The jealous safeguarding of authority which earlier led to the Centre and the state governments rejecting the National Labour Commission's unanimous recommendation for the setting up of autonomous Industrial Relations Commissions for dealing with problems in this area, now leads to a dispute over authority between the Centre and the states. In the meanwhile, there has been no progress towards devising more satisfactory ways of handling these problems than those that exist now.

It may possibly be that the Labour Ministers did not want to take any rigid positions as the whole subject of industrial relations and all the controversial questions therein is at present the subject of discussion among the three central trade union federations which expect, hopefully, to put forward agreed proposals from the side of labour. But there are undoubtedly other kinds of

problems to which the Labour Ministers might have given urgent thought without prejudging the outcome of the trade union discussions. It is well known, for instance, that violation of the welfare and safety provisions of labour laws by employers and managements is rampant. Even in a centre like Bombay, cases of workers being made to work for 12 hours a day and seven days a week without any overtime payment, non-payment of wages according to awards or on the legally prescribed pay-day, workers thrown out of employment without any notice or compensation, refusal to grant paid leave prescribed under the Factories Act, workers kept as casuals for years on end, safety provisions of laws flagrantly flouted and numerous such violations of the law are all too common. Surely, there is no Centre-State jurisdictional disputes or any controversy over policy in such cases. The basic problem here is that while the Government has progressively taken upon itself increasing responsibilities and powers through new enactments, the discharge of these responsibilities and the enactment of these powers has become progressively less effective. The Labour Ministers assembled at Delhi do not seem to have shown even an awareness of this situation.

PM's Trip to the West

Search for Complete Security

WITH the Indo-Soviet Treaty we formalised our relationship with the Soviet Union and put it on a firm, legal basis. It became necessary, in view of our declaration that we still intend to be non-aligned, that the Western states should understand the nature and scope of our new alignment. Indira Gandhi's proposed trip to the West would in effect do just this. An alignment with the Soviet Union is not an alignment against the West. Earlier, we managed with considerable success to impress upon the West that there is no real contradiction between non-alignment and bi-alignment. The West not only understood this principle but also welcomed it. It followed that we must now explain that our Treaty with the Soviet Union does not, and is not intended to, alter our equation with the West. There is no contradiction between non-alignment, alignment and bi-alignment. It is all a question of interpretation. Peaceful bi-alignment is our policy and the document we signed on the ninth of August only reinforces that policy. Presumably the Prime Minister would explain our position during her trip to Western capitals.

This explanation becomes necessary because of two factors. For one thing, there are some political groups within our own country who imagine that socialist transition is best achieved through treaties and pacts. It was time the West was told that the Treaty is not meant to bring about a transformation within our socio-economic structure. On the contrary, it is meant for its very consolidation. No matter what the detractors of bi-alignment might say here in this country, the Americans and the British should understand that our intentions are quite clear and honourable. We might need a few roubles for defence hardware but we still continue to love the dollar however shaky it might be.

Secondly, Pakistan is trying to make it look as though the Treaty neatly divides the subcontinent into the American and the Russian spheres, mostly exclusive. Of course, we do not like the continued arms supply to Pakistan by the US. However, this does not mean that we treat the US as a power hostile or inimical to India in any fundamental sense. If our defence requirements make our dependence on the Soviet Union almost complete (for which again the US alone shares the blame), we need the US for our Green Revolution. In other words, we keep our minds and door absolutely open on the subject. The West need not look upon India as an exclusive dependency of the Soviet Union.

These are the messages which the Prime Minister presumably wants to carry to the Western capitals. This again is not strictly new. We have been pursuing these policies for last few years. The Indo-Soviet Treaty does not mark a break with that tradition. It is a part of our continuing search for security—security of the system that is. A section of our people thought that an alignment with the Soviet Union meant, in effect, putting all our eggs in one basket. As that basket looked to many rather frighteningly red, it was essential to remove the optical illusion. We could not have done that by saying that the Soviet basket is really not all that red. The only way in which we could achieve the desired result was by emphasising that our trust in other baskets is not any the less genuine. It is all very well to say that these policies are necessary to ensure our security. What it means in terms of freedom we have steadfastly refused to look into. In a recent interview with the *Times Literary Supplement*, V S Naipaul gave a very apt definition of a colonial. A colonial is one, he said, who has a complete sense of security. May be it is time we paused and gave some thought to where our bi-alignment is inexorably leading us to.

Incomes Policy

Chasing Wrong Hares

A Correspondent writes:

APPARENTLY taking a leaf out of Nixon's book, the Planning Commission has convened a meeting next week to consider an incomes policy. When Prime Minister Harold Wilson imposed a wage-price freeze in the UK in 1965-66, the advisers in our Finance Ministry had persuaded T T Krishnamachari, then Finance Minister, that an incomes policy was no less needed here. An obvious advantage of the proposal, from the bureaucrats' point of view, is that a prices and incomes board would have to be set up, thereby furthering the cause of bureaucratic employment and empire-building. The idea, however, died a quiet death with TTK's exit from the Government.

Now the proposal appears to have been revived. What is being attempted in the UK and the USA is not an incomes and prices policy as such, but only a wage-price freeze (as in the USA and, that too, for 90 days initially) or a regulated system of wage bargaining (as in the UK). An incomes policy would seek to regulate, in a long-term perspective, the growth of wages so as to de-fuse a wage-price-wage inflation and, as a *quid pro quo*, guarantee real wages by keeping down price increases to acceptable levels.

This might have relevance in advanced economies where the potential for organised bargaining as well as for government regulation is large. In economies where the normal balance of countervailing forces is disturbed by extraneous factors (such as inflation), the State can use its power to restore the balance or to become a long-term arbiter.

A large part of incomes in advanced countries arise in the organised sector. Also, a large proportion of goods, including food articles, undergo 'processing' and are sold in packaged form. Unprocessed goods (like fresh vegetables) account for a very small part of total consumer expenditure. Consequently, in such economies incomes and price control are amenable to effective policing. Even in these countries, however, a temporary measure such as a wage-price freeze is difficult to administer in an equitable way. In the UK, for instance, it was found that where commodities were sold loose there was a tendency to raise prices by giving less for the same money-worth of purchase. In the USA, sales of vegetables, fish and similar raw articles have been exempted from the price-freeze.

In an economy like India's, it is precisely these kinds of situations which predominate. Organised factory employment forms 0.8 per cent of total population and most incomes arise in the unorganised sector. Let alone safeguarding wage levels in the unorganised sector (e g, hotels and restaurants, laundries, domestic service), the Government is not able even to protect employment in these sectors.

Similarly, we have had price control on individual commodities for the last 30 years. But this has only led to evasion, corruption and administrative favours for a few people. Rent control, for instance, has led to a parallel price system. In other commodities, price control has resulted in black markets and unjustified — and economically indefensible — transfers of incomes to middlemen.

Finally, retail sales in India mostly take place in loose form. When tea or spices are bought in 5 or 10 paise worth quantities, who is to check whether the grocer's thimble-full is smaller than it used to be before the planners imposed their incomes policy? Even as regards packed goods, some cement producers, for instance, systematically fill ½ to 1 kilo short-weight in their 50-kilo bags and attribute the shortage to transit losses.

An incomes policy also assumes a vigilant, capable and reasonably honest administration. In the US, Ford was denied a price-rise on its new models; in India in a similar situation we would have perhaps had some civil servant writing out a learned note stressing real and imaginary changes in the new model to justify a price rise. In the US, top executives of electric equipment companies were put in jail for breach of anti-monopoly legislation; in India, when a top industrialist was put in prison for misappropriation, we had an attorney general shedding tears, in official opinions, about the suffering the industrialist had to undergo.

There are enough real problems in India in the field of planning without the Planning Commission having to run after artificial ones. In the field of employment and wage levels, we have to recognise the fact that money wage levels in India in the organised industrial sector are the same as in other underdeveloped countries with per capita income levels two to three times India's. Is this not protection of organised labour at the cost of those who are kept out of the wage employment market? In other words, it is necessary to ask the question: what shall we maximise — employment or wages?

So also it is necessary to recognise the impact of prices on wages which are price-index-linked, as happens through the system of dearness allowance. While industry, whose profits benefit through price rises, can afford to meet such claims, the Government can meet wage increases only through taxation. There are also other issues to consider. If the economy has got bogged down in secular stagnation, the fault has not been that of the Government's social welfare policies, but of its investment and development policies. What the Planning Commission ought to be doing is to make a quick review of the economy and suggest areas of investment to raise the level of economic activity.

Cossipore-Baranagar Murders

The Judge Is Ill

A Correspondent writes:

SO the retired Chief Justice of the Allahabad High Court, B B Malik, who was to conduct the inquiry into the Cossipore-Baranagar mass murders last month has declined to undertake the responsibility. Disclosing this, the Union Minister for West Bengal Affairs, Siddhartha Shankar Ray, is reported to have said on Wednesday that "Malik had agreed to conduct the inquiry but later expressed his inability to do so owing to ill-health". How convenient, indeed!

This is not the first time that a potentially embarrassing inquiry has been scotched in this manner. In the case of the Barasat murders, widely suspected to have been the work of the police, the commissioner for the inquiry withdrew after an attempted assault on him. Naturally, it did not occur to the government to appoint another commissioner. And now the Cossipore-Baranagar inquiry ... What a coincidence!

The disclosure of the retired Chief Justice's ill-health came just as the Prime Minister began yet another of her visits to West Bengal. During the visit she will, one may be sure, speak in high dudgeon about the "politics of murder". Accusing fingers will be pointed by her, and by those in her entourage, at the Naxalites and the CP(M). And yet who were the assassins of Cossipore-Baranagar? Not the Naxalites; they were the victims. This is admitted on all sides.

The victims, some 100 of them, were not even all Naxalites. Many were suspected (by whom?) Naxalites. Many others who were butchered or had their hands and legs chopped off were only relations of Naxalites—elderly parents, sisters ... But now the "ill-health" of a superannuated judge threatens to ensure that a cloak will be drawn over the identity, personal and political, of the assassins, over the connivance of the police and the administration and over the larger political motives of the murderers and their patrons. It is evidently expected of us that we accept without question Siddhartha Shankar Ray's verdict that the mass murder (of little girls and elderly people) "was an expression of mass anger which had accumulated over a long period".

Is this, may one ask the Prime Minister, how she proposes to fight "the politics of murder"?

Berlin

Soviet Gains

THE four-power agreement on Berlin which was initialled on August 23, has run into minor trouble with the postponement of its signing last Thursday. This is not surprising as it is an extremely involved and complex agreement which has required the co-operation not only of the four powers (United States, Soviet Union, France and Britain), but also of the two Germanies. Behind the minutae of the agreement which deals with easing transit transport into West Berlin from West Germany, allowing West Berliners to visit East Berlin once again, and redefining the political status of West Berlin, there are major international trends at work.

The chief initiators of a warmer climate in Central Europe have been the Soviet Union and Willy Brandt's West German Government. Ever since the departure of Khrushchev in 1964, the Russians have been keen to

smoothen relations with West Europe and particularly, West Germany. While the Christian Democrats were part of the ruling coalition in Bonn, there was little response to Soviet overtures. But once the Social Democrats became the major partners in the Bonn Government and Willy Brandt the Chancellor, West German suspicion and distrust were reduced, and past rigidities began to dissolve.

The main goals of Soviet policy in Europe are first, the maintenance of ultimate Soviet control of the East European satellite states and second, accommodation with as many West European countries as are willing. And since the Americans, for economic reasons, are as keen to lessen defence commitments in Europe as the Russians are, accommodation with the West is not a difficult task. What is more taxing for the Russians is that the improvement in Soviet-West European relations might also lead to independent initiatives by the East European states towards closer economic as well as political and ideological ties with the West. Rumania is already a case in point. The Berlin agreement is, however, ideal from the Russian viewpoint. It improves relations with the West, makes it more convenient for the Russians to begin their own *ostpolitik* on their Asian boundaries, and at the same time reinforces the Russian hold over the East Germans and indirectly over other East Europeans, as the major Western powers have now openly acknowledged that the Soviet Union remains the only voice that counts in East Europe.

BUSINESS

Ergo, Subsidy for LIC?

INDIANS are supposed to be notoriously security-minded as reflected in the preference most of us have — or had till recently — for jobs in the government rather than in the private sector. Whether this concern for security has encouraged purchase of life insurance cover is, however, a moot question. It is no secret that most buyers of life insurance seek not only cover against death, that is, buy security, but shrewdly mix such cover with investment. This mix is clear from the overwhelming majority of policyholders buying 'with-profit policies'. Whatever else this pattern of preference might mean, it is certain that life insurance is being taken up by the well-to-do (including, in the Indian context, those in the lowest income-tax bracket) who want to maximise the return on the savings in the form of life insurance and earn a tax rebate in the bargain. Consider, for example, the fact that the average size of policy sold more than doubled during a decade to over Rs 8,000 in 1970-71. Surely, even after allowing for inflation, this would suggest that insurance is not for the poor man.

What then is the point of saying, as LIC chairman T A Pai does in his annual statement for the year ended March 31, 1971, released this week, that the Corporation did away with penal premium rates for garbage cleaners, menials in TB and leprosy hospitals, cycle rickshaw drivers, etc? Does he really expect these low paid staff to buy insurance on their present low wages? Surely, such a presumption would be unwarranted in a situation when the all-round pressure of inflation is deepening the indebtedness of the poor. At any rate, Pai cannot be unaware of the fact that just as every occupied agricultural family has its quota of the disguised unemployed, so too has the worker in the organised sector unemployed dependents. Where then is the scope for saving for those at the lower income levels either in the urban or the rural sector?

The question is relevant in the context of LIC's efforts to give life insurance the image of a product needed by the poor. Which poor — the unemployed, the casual employed, the seasonally employed or those employed who borrow to maintain current levels of subsistence? If these are excluded, the categories of relatively poor would really be the wealthy in the Indian situation. Should insurance be made attractive for them by a subsidy, as asked for by Pai? Pai has asked the Government to forgo its profit from LIC on the understanding that LIC would use the funds for a development fund. He has justified the need for such a development fund on the ground that expansion of life insurance means not only the appointment of more insurance agents but the establishment of offices for servicing policies all over the country.

Of course, insurance needs to be spread not only among the poor (whom the gods love) but also, as Pai says, among "the prosperous and affluent farmers in the villages" who provide "a potential market" for life insurance. Somewhere along the line, the prosperous farmer has got mixed up with the entire rural sector. The mix-up is even more curious since Pai himself says that urbanisation — and presumably with it the large rural conglomerations, *a la* Bernard Cohn — is proceeding apace, blurring the dividing line between the urban and the rural sectors. In sum, what Pai really means by covering the entire rural population is that the rural, i e semi-urban, market for life insurance needs to be market for life insurance needs to be tapped. For this, LIC cannot rely on its existing network of 664 offices in the country. But why should the Government subsidise this effort? Pai's argument is that LIC has to maintain the "bonus" payable to "with-profit policyholders" lest incremental business declines. And the payment of such bonus from out of its profits leaves it without the funds for the scale of development expenditure it has in mind to cover the rural sector with "with profit" policies. The argument is supported by drawing attention to the statutory limit placed on LIC's expenses as a ratio of its income. *Ergo*, the Government should forgo its share of the profit which is well above Rs 5 crores a year.

The first question that arises in discussing the claim is whether rural earners who are exempt from tax should be subsidised additionally by cheap life insurance? The second question is whether all the expenses LIC incurs are justified. This is the nub of the problem, since expenses limit the size of profits and the residual, after bonus and return to Government, available for development. True enough, LIC does not confine its business to the most profitable sectors but goes beyond this to cover factory workers through group insurance schemes and so forth. Acturially speaking, this is not really social service, considering the improvement in the average life expectancy and the health-consciousness (*via* the Employees' State Insurance Scheme) of the section of the people of interest to Pai. But Pai uses the social service argument to justify LIC's overall expense ratio which remains over 27 per cent (27.19 per cent in 1970-71 against 27.69 per cent in the previous year).

It should be conceded, however, that even after considering Pai's arguments for a subsidy for what they are worth, the case for a subsidy would still not be totally weak. As an instrument for tapping savings — not from the Harijans, menials and destitutes, but from the relatively wealthy — life insurance could be used more extensively. This would give more savings for organised investment in the bonds of land development banks, state electricity boards, or other development agencies. But what form should the subsidy take? Should not the subsidy be realised in the shape of higher yields from investments that is, through alert shuffling of investments — in a different context, Pai has bemoaned the underutilisation of capacity in a number of industrial units including those in which LIC has taken up equity — and higher premiums for, policies of, say, over Rs 25,000? Why should not premium rates rise sharply for heavy insurance policies that go to protect the very wealthy and fatten the inheritance of their progeny? Had life insurance been in the private sector, the issue of concealed subsidy to the wealthy policyholders would have been questioned. So too would have been high expense ratios.

At any rate, the issue of a subsidy fund for LIC is not as simple as it appears at first sight. It could as easily be asked why not a subsidy for banks? Just as bank deposits are influenced critically by the level of deficit spending, so too are sales of life insurance. To quote T A Pai: "The average sum assured, per policy, for the business done in India went up from Rs 7,394 in 1969-70 to Rs 8,066 in 1970-71 showing an increase of Rs 672, i e, *approximately 9 per cent.* This can be attributed to inflation". Expecting a subsidy in addition to this fiscal "growth" factor is asking for too much.

Foreign Exchange

Plugging Leaks

A Correspondent writes :

THE country loses an estimated Rs 240 crores of foreign exchange every year, according to the findings of a study team of Central Financing Ministry. The break-up of the unauthorised uses of foreign exchange is roughly: Rs 160-170 *crores smuggling*, Rs 35-40 crores travel and Rs 25-30 crores under-invoicing of imports. However, unofficial estimates made from time to time about smuggling and under/over-invoicing of foreign trade have put the foreign exchange loss much higher. Gold smuggling alone is believed to account for about Rs 350-400 crores every year. As gold smuggled is generally valued at prices prevailing in India, the foreign exchange leakage on this account would be around Rs 200-250 crores at the official rate of exchange. Exchange loss on account of smuggling of numerous other goods like watches, radios, cosmetics, etc, would be in the range of Rs 30-40 crores. As regards under-invoicing of imports, total imports on private account were Rs 646 crores in 1968-69 as against Rs 785 crores in 1967-68. A number of unofficial estimates indicate that under-invoicing of private imports are unlikely to be, on an average, less than 10-15 per cent Foreign tourists in India also get without much difficulty rupees at a rate much cheaper than the official rate. If foreign exchange loss on account of all these leakages are added they would amount to Rs 350-425 crores every year. Obviously, when an official study team attempts estimates about such an embarrassing subject as the foreign exchange leakage, its figures are bound to be underestimates.

The study team has suggested various measures to plug loop-holes through which leakages of foreign exchange take place. Some of the suggestions are such that even if they are implemented in earnest, their impact is unlikely to be felt at least in the immediate future. Take for instance, the recommendation that a central enforcement machinery should be set up to check the capacity of industrial units and the utilisation of the goods imported by them. The task facing such a committee would be so enormous and technically complicated that it would be futile to expect any tangible results to emerge. The so-called 'essentiality certificates' are not difficult to obtain and it would be not an easy job in each case to verify the genuineness of the 'essentiality'. As regards under-invoicing of imports and over-invoicing of exports, the malpractices cannot be easily curbed without delaying unduly all export/import clearances at the customs. Many thousands of commodities, the prices of which fluctuate during the year, are exported and imported throughout the year. A meticulous check of all foreign trade transactions to verify the accuracy of their stated values in the foreign trade documents would involve a tremendous effort. On the other hand, smuggling out of silver and smuggling in of gold take place through established routes. It would be perhaps a much easier task to keep greater vigil on the coastlines than check each and every foreign trade transaction. Government owes an explanation as to how such a bulky commodity as silver is so easily smuggled out of the country in large bars of 10-20 kgs and how the country is kept regularly supplied with such large quantities of gold. Much more could be achieved by strengthening the enforcement branch of the Customs Department than by resort to such devices as meticulous checking of foreign trade transactions or of capacity of industrial units and utilisation of the goods imported.

It need not be altogether denied that greater scrutiny of capacity of import-consuming units and export-import transactions and also greater effort to bring to task people who indulge in malpractices would certainly yield some of the desired results. But these measures have their limitations. The ingenuity of people indulging in smuggling and foreign exchange malpractices is such that even the Nazi regime in Germany could not put down their activities. The level of foreign exchange leakage could be safely linked to the degree of governmental control on foreign exchange transactions. With the black market rate of the rupee being slightly above one-half its official parity, smugglers and their 'fellow-travellers' can easily offer high temptations to the very people who are expected to put down their activity — whether they belong to the Customs department or to any of the other inspecting departments of the Government.

Fertiliser Corporation

In the Same Boat

FORMED a decade ago (January 1, 1961) by bringing together all the fertiliser units in the public sector to coordinate policy better and make possible unified control, Fertiliser Corporation has had a chequered career. It was thought in the mid-sixties that is could not cope with the necessary expansion of fertiliser capacity and output; so the industry's doors were thrown wide open to the private sector. Today, the Fertiliser Corporation can claim that it deserved better. First, the private sector units have neither 'arrived' fast enough nor without support of collaborations—while the Fertiliser Corporation has built up a capable Planning and Development Wing that it can bank upon for new expan-

sion, from the stage of adaptation of technology, design, and engineering, to procurement and execution. In fact, it has last year taken on consultancy work for a private firm. Secondly, the Fertiliser Corporation is one of the few public sector undertakings that is not in the red. In 1970-71, it made a net profit of Rs 1.7 crores after providing for depreciation. The Nangal, Gorakhpur and Trombay units were mostly responsible for keeping the Corporation out of the red. Their joint 'profit' (as chairman Sethna calls it), of Rs 4.69 crores, was diminished by the Rs 3.02-crore loss made by Sindri and Namrup. This despite the fact that because of the severe power cut by the Bhakra authorities, Nangal produced 32 per cent less than in 1969-70 when it had crossed its rated capacity. Gorakhpur's operations too were handicapped by irregular power supply and higher cost of raw materials. Significantly, Trombay seems to have surmounted its technical difficulties and Sethna expresses hope of even better performance by it in future. Namrup's difficulties are claimed to be those of uneconomic size and wrong location, though it did produce marginally more in 1970-71. Sindri is 'ageing' being very much the oldest plant, dating back to 1951, though 'corrective' action is under way.

The Corporation, in fact, has a sizeable expansion programme in hand worth Rs 450-500 crores (its internal resources are Rs 108 crores). This includes the Durgapur and Barauni projects, the Trombay expansion programme, and the Ramagundam and Talcher coal-based fertiliser plants where a pioneering attempt is being made in this technology. Like his private sector counterparts, Fertiliser Corporation's chairman complains of delay in the supply of indigenous equipment by fabricators, shortage of structurals and other steel items.

Like the private sector units, too, Fertiliser Corporation is feeling the change in the fertiliser supply and demand situation over the past three years. Consumption has failed to rise at the expected pace, while expansion programmes have gone ahead. With several public sector units due to be commissioned this year and next the pressure will mount. Like the other fertiliser companies, the Fertiliser Corporation has been building up a marketing and sales network. The chairman has described this at length including the mode of marketing and sales meetings regularly held to review problems of sales, supplies, distribution, credits, etc. The new pressures are also having their impact, making this public sector Corporation very management-conscious. During 1970-71, an elaborate system of Management Reviews—of Production, Materials Management, Marketing and Management Reporting—was set up.

Despite all this management-consciousness (or as part of it?), Fertiliser Corporation, like most of private industry, complains that costs are rising while prices are being depressed with Government taking off the cream of what the market will yield *via* the 10 per cent excise duty. So it seems poised to ask for a higher price on two of its products that are still controlled.

Chemicals

Not Competitive

A Correspondent writes:

AT Rs 26.5 crores in 1968-69 India's chemical exports represented an increase of 21 per cent over the previous year. In 1969-70, they increased to Rs 39 crores. This performance fostered the hope that chemical exports were poised for a strong, sustained growth and that by 1973-74 they could reach Rs 75 crores.

What has been overlooked in the enthusiasm is that the increase in chemicals exports over the last three years is not underpinned by a growing competitiveness of Indian chemical products in international markets. It was the closure of the Suez Canal that opened to India the markets of several Arab and African countries which had earlier bought chemicals mostly from Western countries. A second factor that helped chemicals exports was the large offtake by Ceylon and Indonesia financed by special credits extended to them by India. These twin factors, however, cannot be banked on for ensuring the long-term growth of India's chemicals exports.

A sustained increase in chemicals exports can be based only on the country's ability to offer a wide range of products of an acceptable quality and at a competitive price. This is no easy task given the state of the Indian chemicals industry. The weaknesses of the industry stem mainly from the exorbitant costs of almost all indigenous raw materials and their recurring shortages, the outdated technology of the major undertakings, and the uneconomic scale of operations which hikes up the unit cost of production.

There is, for instance, countrywide shortage of such vital organic raw materials as ethylene, propylene, benzene, xylene, ethylene alcohol and methanol. So also, inorganic chemicals, like soda ash which is another basic chemical, have frequently been in short supply. Projects like Hindustan Organic Chemicals, IDPL and the Durgapur complex, which produce certain basic chemicals, have failed to deliver the goods. This fact, together with inadequate imports, have been mainly responsible for the raw material shortage in the chemicals industry. The shortages inevitably led to a sharp rise in prices of raw materials. Chlorine which was about Rs 175 per tonne two years ago is now over Rs 500 per tonne. The price of naked benzene rose from Rs 800/960 to Rs 960/1,350 a tonne. Prices of naphthalene have also risen sharply—Hindustan Steel, which manufactures this item, raised the price quite substantially from Rs 600 per tonne to Rs 1,800 per tonne which is very much higher than the international price. Prices of other basic raw materials like Bix-N ammonia, nitric acid, urea and methanol, manufactured in the public sector, are also very high.

One way open to improve the availability of raw materials would be to utilise existing capacity fully. Similarly, the chemical industry will have to endeavour to produce a more complementary range of items; though the industry now produces about 160 items, it is yet to grow into economic complementarity. Technological changes in the chemical industry have been quite rapid. While it may not be possible—nor necessary—for the chemicals industry in India to adopt all these technological changes, it is important for it to undertake intensive R and D programmes both in private industry and in Government-financed laboratories with a view to adapting advanced technological processes which are more pertinent to our conditions, to suit our endowments and our markets. However, the present policy of encouraging the small-scale sector in this industry may militate against producing cheaply for export markets.

If the consortium of the manufacturers of chemicals, drugs and dyes, formed recently in a bid to capture a greater share of the highly competitive foreign markets, is to be successful in the long run, it will have to be clear that it can hope to promote and sustain export only by becoming more competitive.

Despite Government Takeover . . .

Hansavivek

INDIA UNITED MILLS, which has been under government management for about 6 years, has gone deeper into the red. With a fresh loss of Rs 2.75 crores in 1970, against Rs 2.07 crores in the preceding year, the accumulated deficit has mounted up to Rs 12.04 crores. The company's share capital is only Rs 2.50 crores. The company has not paid (a) to the provident fund authorities Rs 1.09 crores collected from workers and Rs 1.58 crores as its own contribution, (b) to the Employees' State Insurance authorities its own contribution aggregating Rs 49 lakhs, and (c) dividend for 1964 though it was demanded by the shareholders. Also no provision has been made in the accounts for bonus to employees. In accordance with the decision of the Bombay High Court, the company was exempted from the provision of the Payment of Bonus Act since it was taken over by Government. But the High Court has granted certificate to the applicant workmen to go in appeal to the Supreme Court, and the applicants have filed a petition. The decision of the Supreme Court is awaited. Moreover, among the contingent liabilities not provided for is the workmen's gratuity estimated at about Rs 58 lakhs.

During 1970, the company received further loans of Rs 80 lakhs from Maharashtra Government which has also extended the period of repayment of a temporary loan of Rs 65 lakhs by a year to March 1, 1972. Further loans amounting to Rs 1.39 crores have been received from the State Government during the current year, which, too, are repayable on March 1 next. Besides, the State Government has extended the dates for payment of all the previous loans granted to the company till November 28, 1971, and renewed the moratorium on payment of interest on the loans of Rs 213.50 lakhs for a year till the end of November next. The company has requested the State Government to grant a moratorium on payment of interest on the remaining loan of Rs 2.84 crores for a "further suitable period". The company has received a loan of Rs 1.15 crores from National Textile Corporation, New Delhi. It has not received any fresh loan, however, from the Union Government during 1970. Since 1969, the company has not paid interest on the Union Government loans amounting to over Rs 5 lakhs for 1969 and Rs 17 lakhs for 1970. The Union Government had granted a moratorium for payment of interest till the end of last March. Here again, the company has requested extension of moratorium for a further suitable period.

The Authorised Controller's report ascribes the disappointing results in the latest completed year to all-round increase in costs, particularly in prices of cotton and cost of dearness allowance. The rise in DA from Rs 187 to Rs 195.78 over the year left a strong impact on the profitability of the company employing more than 16,700 persons. The report states that prices of cotton registered "unprecedented levels" in the early months of the current year and that DA reached a new peak of Rs 201.13 for the period January to June 1971. During 1970, the company exported cloth valued at Rs 177 lakhs. The UK Government's decision to impose, from January 1972, import duty on cotton textiles imported from India and to scrap the quota system will hit the company's exports. At present the main markets for the company's exports are the US, Sudan, and Russia. It is feared that the continuous rise in cotton prices will adversely affect Indu Mills' exports.

ZENITH STEEL PIPES' three directors, S G Nevatia, I K Kejriwal, and S M Mohta, have recently resigned from their board, D M Dahanukar and M S Davar have been taken on the board to fill the casual vacancies caused by the resignations of Kejriwal and Mohta. The vacancy caused by Nevatia's resignation has not yet been filled. Nevatia was associated with the company from its very inception. Also B K Birla resigned as chairman though he continues to be on the board. No reason has been given for these important changes in the board. The report, however, says that an application has been made recently to the Company Law Board for excluding the company from the list of large industrial houses referred to in the Dutt Licensing Enquiry Committee report, and that CLB's reaction is awaited. The company complains that its application for manufacture of pipes of larger diameters, for export, has been rejected by Government on the plea of shortage of indigenous steel while applications of some other parties have been sanctioned even though these have been based on the home market. The company is seeking Government's approval for setting up a pipe manufacturing plant in Indonesia; it has already received approval of the Indonesian Government. The electric resistance welding process has been replaced by the high frequency welding unit, and the new equipment is now operating satisfactorily after initial troubles. The change has reduced production costs and improved the quality of tubes. The tools manufacturing division of the company has recently obtained an industrial licence for manufacture of 300 tonnes of industrial knives per annum. During the year ended April last, Zenith's production suffered on account of shortage of steel and irregular supplies of zinc. The increase in import duty on zinc, by about Rs 1,100 per tonne listed in the last budget, will "substantially" increase the company's cost of production.

SWADESHI COTTON complains that last year its Naini unit had to work intermittently and partially because of irregular and inadequate supplies of viscose staple fibre by the only supplier, Gwalior Rayon, even though the Central Government has directed that company to supply 4 lakh kg per month to the unit. The supplier also raised prices. The working of the company's Kanpur unit has not been satisfactory owing to "abnormal rise" in the cost of production. The Udaipur unit showed satisfactory results, but the Pondicherry mills' working was affected by frequent low voltage in power supply and workers' strike for a few days. The new mills at Maunath Bhanjan went into full production in the later part of the year and suffered from lower productivity as the labour has not attained the required degree of skill. Swadeshi incurred losses on Government orders worth Rs 1.69 crores because orders were booked at fixed prices and by the time they were executed, cotton prices had increased. Despite increase in sales, gross profit declined. The company spent Rs 1.15 crores on modernisation, renovation, and expansion. It has got an industrial licence to set up another textile mill at Rae Bareli. Production at the Kanpur mills has been partly switched over to fine and superfine varieties in the later part of last year following installation of high production combers. The company's working in the current year has been affected owing to further rise in cost of

cotton and a power-cut imposed by the UP Government from January, which affected the Kanpur, Naini and Maunath Bhanjan units. Diesel generating sets were installed at these last two units The power-cut has been withdrawn from June 26. The Government scheme of a cash subsidy at 50 paise per square metre of controlled cloth packed during June-August 1971, if continued, is expected to bring some relief to the mills.

UNIVERSAL CABLES complains that the problem of idle capacity in PILC cable plant will be aggravated when the change-over is made, from PILC to XLP cables upto 11 kV, as required by Government. The industry, it says, installed mostly imported plants at heavy cost to create PILC cable manufacturing capacity only a few years ago, and these plants would be rendered redundant. The company suggests that the position could be retrieved if the industry is allowed to manufacture telephone cables which are at present heavily imported. The company has applied for the import of plant and machinery for manufacture of cross-linked polythene cables. The technical collaborator, British Insulated Callender's Cables, has agreed to extend the technical know-how agreement to cover the manufacture of XLP cables. During the year to March 1971, the company experienced brisk offtake of cables on account of intensification in rural and railway electrification programmes. Demand for cables for engineering and industrial applications, however, remained depressed. The company has obtained a 'carrying-on-business' licence for manufacture of 1,500 tonnes of AAC/ACSR conductors. Owing to shortage of E C grade aluminium, especially in the earlier part of the year, the company could not fully utilise the capacity of its properzi plant for manufacture of redraw rods. With the subsequent expansion of the primary aluminium output in the country and with substantial imports of E C grade aluminium, the metal supply position has eased and the mill is now working at full capacity. "Unhealthy agitiation by unscrupulous union leaders" provoked a strike at the company's works, resulting in stoppage of production and assaults on some of "our devoted officers and staff". Since such labour trouble had become a recurring feature at the works, the management declared a lockout on March 17. Work was resumed from March 29 and the plant is working to full capacity.

INDIA TOBACCO's chairman, A N Haksar, says his company was among the first in the organised sector of industry to recognise trade unions and to enter into a series of long-term agreements with them covering terms and conditions of service of employees. Recognition, once conferred on a union, must be sacrosanct. Multiplicity of trade unions, according to him, is perhaps the one factor that has been most responsible for unhealthy industrial relations in the recent past. He urges Government to discourage not only the formation and growth of multiple trade unions, but any attempt by an employer to negotiate with more than one recognised union. Haksar says that long-term agreements have been concluded in 19 out of 20 branches of his company, and the last agreement is due to be finalised shortly. In this round of agreements, the basic wage has been further enhanced and the variable dearness allowance constitutes an even smaller component of the total pay packet. All earnings, besides the basic wage and dearness allowance, are for each member of the workforce linked to productivity — in the case of the annual productivity bonus it is linked to the productivity of the company as a whole, and in the case of monthly productivity payment at the factories it is linked to the productivity of each factory.

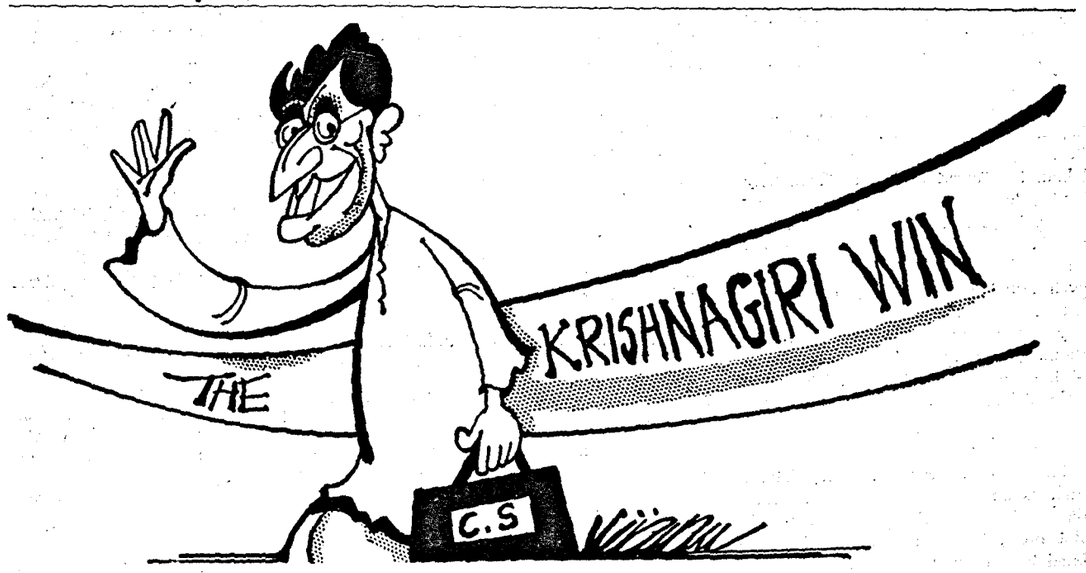
The Touring Season

Romesh Thapar



EVEN though an economic crisis of considerable gravity is beginning to mature, and the crises around Bangla Desh take on a sharper focus, life in the Capital goes on very much as before. Yes, Indira Gandhi is finding it more and more difficult to sample the opinions of all and sundry as time has become valuable, but her ministerial colleagues are not nearly so obsessed with work. Indeed, all manner of tours, internal and external, are under way.

The PM had only to suggest that she would be visiting countries in the West and the USA — possibly to offset the widespread impression that India is now aligned to the Soviet Union — when a host of ministers began to lobby for their own tours. Some had ailments of a kind treated only in their favourite holiday spots. Others were anxious to study "in depth" certain new developments in areas which provided a good holiday atmosphere. A few still expanded on the need to explain "our position" on Bangla Desh, forgetful of the changes that have taken place. And, of course, there were those who, like the ministers of Madhya Pradesh, could not organise hospitality abroad and were content to order a mass exodus of bureaucrats and their appendages to the vale of Kashmir for conferences and discussions.

Delhi is extremely cynical about all this intense tourism by ministers and their props—also of the PM's connivance at a huge wastage of foreign exchange — but what really got the locals aflutter was the global tour announced by none other than the Minister for Planning, C Subramaniam. The announcement, as it appeared in the Times of India, needs to be reproduced:

> "New Delhi: August 27: The Planning Minister, Mr C Subramaniam, will leave on a global tour on Wednesday visiting nearly half a dozen countries in about three weeks.
>
> While the purpose of the tour is to attend the board meetings of the International Rice Research Institute in Manila in the first week of September and of the International Wheat and Maize Improvement Centre in Mexico a fortnight later, Mr Subramaniam is taking advantage of the opportunity to meet political leaders in the West to apprise them of the Bangla Desh problem..
>
> A meeting with the US President, Mr Richard Nixon, is very much on the cards and the Indian Embassy in Washington is making the necessary arrangements. Mr Subramaniam will also call on Senator Edward Kennedy.
>
> The discussions with the US authorities will cover not only Bangla Desh but also Indo-US relations, especially those having a bearing on economic co-operation. When the Planning Minister reaches Washington, the Finance Minister, Mr Y B Chavan, will also be there to attend the Fund-Bank meetings. They may together have talks with some US leaders.
>
> After the Manila meeting, the Planning Minister proposes to go to Singapore to visit the Government housing colony there and see how it has been planned. He will return to Delhi on September 7 before restarting for Mexico on September 16. En route, he will visit Tokyo and have discussions with the Japanese Government and industry in regard to the Indo-Japanese committee meeting in Delhi in December.
>
> From Mexico, Mr Subramaniam will go to Washington and then to London before returning home towards the end of September".

I only hope "the system" will be able to make effective arrangements for our ministerial meanderings. Only the other day we learned that when our Foreign Minister passed through Singapore and requested a meeting with the Prime Minister of this city state, he was offered "fifteen minutes". In our relaxed condition, we tend to forget that in other lands people work very hard and to tight time-tables. When they go on

"It's as exciting to win with somebody else's votes as to plan with somebody else's resources!"

a holiday, they actually say so . . .

Of some significance in all this touring is the strange decision suddenly to invite the executioner of the Sudanese Communists, President Nimeiry, for a State visit to this country. The theories are many, but the most popular is that the PM is making clear that she is no one's stooge—*and certainly not* of the CPI which has been gloating rather openly about the alleged "coup" that it has staged in this country.

If all the *tours of our ministers* take *off, and they are mostly in the direction of various* well known and exciting destination points, we should be fairly busy this winter entertaining an odd variety of emissaries, and persuading them that nothing has changed in India. Nothing has, in fact, except that we seem to be roller-skating without any sense of direction.

So, why not go a-touring . . .

August 30

FROM OUR CORRESPONDENTS

NEW DELHI

Talking about Labour

INDUSTRIAL relations have been deadlocked for a long time now. And the new Union Labour Minister, R K Khadilkar, seems well aware of this. He has, of course, been very anxious and earnest about breaking the deadlock and establishing a more workable policy framework. But initiatives in this direction seem to have petered out. In place of the significant reorientation and reformulation of labour policy which is badly needed, we now hear high-sounding verbiage and expressions of lofty sentiments without much substance. This was all too evident at the two-day conference of state Labour Ministers held under the chairmanship of the Union Labour Minister in the last week of August.

Khadilkar opened the conference with impressive talk of a "*qualitative* change in the situation", of it being time for labour to "assert itself", as "monopoly capital had influenced very deeply our economic planning during all these years". The proceedings of the conference and its outcome, however, did not even remotely suggest any relationship with such talk. There was no hint of any escape from the *status quo*, notwithstanding the professed need for reform of the law and machinery relating to industrial relations.

No Breakthrough

Proposals for social welfare legislation, such as on the provident fund, were discussed and decisions were reached. But these, by themselves, signify no breakthrough in industrial relations. It was decided that PF rates should be raised *and that PF* scheme should cover a larger segment of business and industry including units employing only 10 persons. There was a consensus in favour of all-India legislation on gratuity for industrial employees; there were voices in favour of plugging the loopholes in the Bonus Act which employers use to deny fair bonus to workers. It was also proposed that the move to impose some restrictions on closure of industrial establishments in West Bengal be extended to the rest of the country since closures are often resorted to not so much for serious business reasons as to blackmail workers during industrial disputes. According to the proposed restrictions, employers would be required to give notice — of say, 60 days' — of their intention to close down an establishment during which time Government could investigate and possibly prevent the intended closure. There is no reason why such notice should not be required of employers when workers have to fulfil the same condition before going on strike.

While all these measures may be welcome to the trade unions, they are of marginal significance even within the established framework. When it came to tackling the problem of industrial relations, the conference failed to make any move forward. In fact, the entire outlook and approach of the Union Labour Ministry as well as of the state governments remained traditional and fixed. It was clear that the proposals made by the Union Labour Minister in this field were designed mainly to secure a greater say for the Central Government in handling labour relations and a greater leverage with respect to state governments.

It was suggested, for instance, that there should be greater uniformity in labour laws and that the Centre should exercise greater initiative. This was the general proposition presented to advance the more specific idea that labour relations in Central Government undertakings — particularly the larger ones which have several units located in different parts of the country — should be the business of the Centre instead of being, as at present, under the respective state governments. The Centre has been asking for this change for several years and this time it was most forceful about its proposal. The states predictably remained adamant and refused to surrender any part of their powers. They were unwilling, too, to relinquish control over the operation of the provident fund scheme — even resisting the suggestion that the Fund Commissioner should have authority to launch prosecutions in the event of defaults by employers under the PF Act, of which there are many. The state governments insisted that they retain this prerogative on the grounds that they were better informed about the conditions of individual units and the causes of defaults. But, they were very willing to let the Centre make the penalties under the Act as stringent as it might wish.

Public Sector

It is, of course, true that industrial relations in the public sector enterprises are in a very bad state. But they cannot be eased by the simple expedient of transferring the administration of the relevant labour laws from the states to the Centre. Uniformity in administrative practices and approach would, no doubt, be helpful where national level agreements are operative, but such centralisation could also lead to disregard of local circumstances and bureaucratisation of the administration of the agreements. Also, if state governments are considered competent enough to handle industrial relations of private sector units spread among different states but having common ownership, they could also deal as effectively in the case of public sector units. Finally, is there not a case for the disbanding of the present half dozen, multi-unit public sector giants for the sake of efficient management of the productive units under them?

While these jurisdictional matters were debated at length and with much passion at the conference, neither the Union Ministry nor the state governments displayed much thought or initiative on the major issues of labour policy and industrial relations which have been

hanging fire for a long time. Khadilkar spoke of the possibility of new legislation on industrial relations in the light of the recommendations of the National Commission of Labour. The Commission submitted its report nearly two years ago and it has remained on the shelves since then. In respect of industrial relations, the Commission had also taken a very hesitant and conformist view within the confines of the established framework of tripartite consultation, regulation and adjudication of industrial disputes. Its only new recommendation was that the machinery for adjudication should be made more independent of executive authority and be placed under judicial direction and control. The Central as well as state governments did not favour such a prospect at all and it has, therefore, been all but scuttled. This proposed move did not find support with labour either, with the exception of the Indian National Trade Union Congress whose entire philosophy banks on arbitration and adjudication. The militant sections of the organised trade union movement have been trying to remould industrial relations on a completely new basis which would break with the set patterns of the last two decades. Instead of constant third party intervention by the Government, a real advance towards healthy industrial relations can only be made on the basis of bilateral relations and collective bargaining between labour and employer with intervention by Government machinery and adjudicators reduced to a minimum.

Backsliding

The crucial element in any system of industrial relations is, of course, the question of union recognition by the employer. A measure of advance in solving this issue appeared to have been made when a consensus in favour of secret ballot to determine the degree of representativeness of rival trade unions began to emerge. It now appears that the Union Labour Minister has begun to backslide and the discussion on this issue at the conference remained totally vague and pointless.

Meanwhile, it will be worth noting that the present Labour Ministers' conference itself was held, unlike in the past, without convening either of the tripartite bodies—the Standing Labour Committee and the plenary Indian Labour Conference. The tripartite bodies in fact ceased functioning some time ago and it would probably be pointless to activise them on the old basis. If the new Labour Minister finds it inconvenient to hold a formal session of the tripartite bodies, this is only indicative of the inability even to approach the problems of evolvng a new labour policy framework.

The labour situation meanwhile is becoming difficult and strained. The rising price line, coupled with the attempted freeze on wages, even if it is not formally enforced, is likely to cause much labour resentment in coming months. Labour leaders appear to be preparing for this. While the CPI(M)-led CITU will attempt to act as the main organiser of labour demands, AITUC and the HMS are trying to come together to hold their own in this situation. Whatever their sympathies for the Central Government they will not be able to keep aloof. A preview of this could be seen in the recent West Bengal Bandh, when the uncompromising stand of CITU led all the trade unions, except INTUC, to reject the appeal of the Union Labour Minister to desist from adhering to the Bandh, even though some of them very much wanted to respond to his appeal.

The constraints under which Khadilkar has to function are underlined by the latest move to further restrict the participation of some segments of the labour movement in the tripartite bodies by stiffening the criteria for participation. This is in sharp contrast to his first attempt to enlarge the represeutation on the consultative bodies of the Labour Ministry. He had then called together, at a special conference, even those central trade union bodies, such as CITU, which are not represented in the Indian Labour Conference. There has now been an about face on this matter also.

GOA

Political Playmates

THE key to the understanding of Goa politics today is one word — fear. The pervading fear haunting each political party in the union territory is that another party will steal a march over it. There is also the fear of the future. (What is in store after the Assembly elections?) More generally there is the fear of political instability. It is the sum-total of these fears, that probably explains the continued existence of the Bandodkar Ministry despite the defection of seven legislators from his Maharashtrawadi Gomantak Party (MGP) in June 1970. The conflict between the Chief Minister, Dayanand Bandodkar, and the President of the Goa Congress(R) and MP, Purushottam Kakodkar, stems basically from the latter's fears of the Chief Minister's recent consolidation of his party and government. The compelling reason for the current fight in the open between the two — both are engaged in hurling serious allegations against each other — is the threat to Kakodkar's very political existence arising from the political advantage Bandodkar is likely to gain as soon as he manages to win back the seven Assemblymen who had defected from his party. And it looks like he will manage that quite soon.

The crux of the Goa Congress(R) leader's worries is the imminent break in the understanding reached at the time of the last Lok Sabha poll between his party and United Goans Party (UGP) led by Jack Sequeira. The UGP has now decided to fight 15 seats in the coming Assembly elections. This will give short shrift to Kakodkar's ambition to form an alliance with the UGP and thus defeat the MGP at the elections. Also, Kakodkar's attempt to prevent entry of Bandodkar and his followers into the Congress(R) has been frustrated by the UGP's refusal to merge with the Congress(R). The leadership of the UGP is actually conscious that its standing among the Christian population in the union territory is based on its anti-merger platform and on its opposition to Bandodkar. A majority section in the UGP is opposed to a merger with the Congress(R) as it feels that any departure from its present postures will cost it the support of the Christians who constitute the majority of UGP followers. Many Christians feel that they will lose their power of political leverage and their separate identity if the UGP merges with another party.

Kakodkar's main concern is the persistent reports of the MGP's imminent merger with Congress(R). Kakodkar knows for certain that these reports have substance, coming as they do from quarters close to the Congress(R) High Command and particularly to Indira Gandhi. Kakodkar and his followers fear that if Bandodkar joins the Congress(R), he will carry his large following with him as well as cause the anti-Kakodkar faction of the undivided Congress which became the Congress(O) after the split — as Kakodkar joined Indira Gandhi's camp — to join the Congress(R). This would reduce the Kakodkar group to a hopelessly minor entity.

While these moves continue to harass Kakodkar, he has not been able to patch up his differences with his colleagues in the party and build it on a sound footing. In order to divert public attention from the infighting in the Congress(R), Kakodkar recently resorted to making serious allegations of misuse of power by the Chief Minister. But these tactics have not helped as Bandodkar has launched legal proceedings against him.

Bandodkar is undoubtedly pleased about the possible break-up of the Congress(R)-UGP understanding, but his troubles with the Centre are still bothering him. What has indeed exasperated him is the annoying silence of the Centre — notwithstanding Indira Gandhi's support and sympathy for him — over his demand for filing the vacant posts in his Cabinet, desite several representations. Two of his Cabinet colleagues having resigned to join the Congress(R) in June 1970, the Chief Minister now heads the one-man Cabinet consisting of himself. He has one colleague who is merely a minister of state. The shrill quarrels between the Chief Minister and the Lt-Governor, Nakul Sen, have not helped to further the interests of Goa. Bandodkar has revived his demand for the recall of the Lt-Governor. Apart from the personal clash between the two, there is an all-round feeling that Nakul Sen interferes unnecessarily in the day-to-day administration of Goa. This has led Bandodkar to demand 'working statehood' for the union territory. The demand has received widespread support as the achievement of this status will bury once and for all the idea of merging Goa with Maharashtra.

Another important development, which has generally gone unnoticed, is the steady rise of the Jan Sangh. It is now concentrating on winning over Bandodkar by harping on the strong anti-Bandodkar feeling among the Christians. And Bandodkar has partly responded to the Jan Sangh's sympathy for him. The Jan Sangh has a shrewd idea that Bandodkar is quite capable of bringing his entire following into the Sangh. This is considered ominous by the Congress Party's Central leadership, particularly by Indira Gandhi. The leadership's fear is that if Bandodkar is not soon allowed to join the Congress, he will, out of sheer exasperation, join the Jan Sangh. As soon as the Chief Minister manages to get his defectors back into the MGP fold, the Central leadership is likely to invite him and his party to join the Congress(R) and overlook any embarrassment that might be caused to Kakodkar. With the elections fast approaching, this merger is going to take place quite soon.

Meanwhile, Goa is preparing to celebrate the tenth anniversary of its liberation from Portuguese rule on December 10, 1961. But among the people there is a general indifference to politics as many of them feel that democratic processes have not brought economic prosperity to their region.

Lamp Caps and Filaments

LAMP CAPS AND FILAMENTS is setting up a plant at Nasik with an installed capacity of 150 million metres of tungsten filament wires per annum. At present, there is only one organisation in India to manufacture these wires. Total cost of the project is estimated at Rs 75 lakhs, of which is 40 lakhs will be raised as share capital and the balance by loans. Of the share capital, equity shares of the value of Rs 10 lakhs have been subscribed by directors and their associates and equity shares of Rs 5 lakhs have been reserved for the collaborator, Oy Airam AB of Finland, and equity shares of Rs 15 lakhs and preference shares of Rs 10 lakhs carrying right to fixed dividend at 9.5 per cent per annum will be offered to the investing public through prospectus. The subscription list will open on September 10 and close on September 21, or earlier, but not before September 13. The entire public issue is underwritten. V K B Pillai, is the chairman and S A Trasy the managing director.

SOUTH

Telengana within Andhra

Mohit Sen

THE search for a solution of the Telengana problem persists. But the accent is now on giving Telengana a special position within Andhra. And it is the Chief Minister who now emerges as one of the main obstacles to the finalisation of the terms of the solution. So much so that some Telengana Praja Samiti leaders now quip that the biggest separatist is now Brahmananda Reddi himself. And here is a great deal of truth in that quip.

It has not gone unnoticed that just when the negotiations between the Prime Minister and Chenna Reddy, the leader of the TPS, were at a delicate stage and when the latter was being persuaded to postpone the demand for separation till 1977, the Chief Minister tried to cause embarrassment to the TPS leadership by publicly congratulating them for having given up the slogan of a separate Telengana. He knows very well that the price of postponement would have to be paid for by his quitting his post. Indeed, it was not so much to plead against separate Telengana as to plead for the retention of the present Chief Minister in his post that a large delegation of Congressmen from the state were despatched post haste to Delhi. And it is no secret that Brahmananda Reddi has told his closest colleagues that it would be better to separate than to give Telengana a special status within Andhra.

Of course, what he is really bothered about is the possibility of the coming into being of a separate Telengana Congress organisation or, at the least, of a distinct Telengana regional Congress committee within the APCC with the right to distribute tickets in the coming elections. This would mean that his power over Telengana would be substantially curtailed and this is the prospect he is not prepared to face.

No Mass Activity

These Chief Ministerial sorrows apart, what is the mood in Telengana? It is difficult to gauge but there is little reason to suggest that there has been any shift from after the mid-term poll. There is no mass activity around the issue, either for or against. And the response to the negotiations between the Prime Minister and the TPS has been one of hope, indeed, of expectation that some kind of compromise would be reached that would be an effective safeguard against the injustice and the domination of the delta that had been such a marked feature of the past 15 years. The realisation had grown that a separate state would now be difficult to achieve against the background of the massive voice of the Congress as well as the change in the national mood which has begun to concentrate simultaneously more on all-India problems and on social issues.

Thus, while it may outwardly seem as if Bangla Desh is rather far away and a concern of Delhi and West Bengal, there is in Andhra a great deal of feeling around the issue as well as a sensing of the fact that India is in danger of being attacked by Pakistan. True, the feeling is by no means as intense as in the north or the east but the feeling is there. An indication of this was provided by the successful march organised by the TPS in Hyderabad recently and the response by a usually politically apathetic mass to the series of meetings in support of the recent Indo-Soviet Treaty. There is a feeling that India as a whole is very much on the eve of significant developments and that to participate in these would be worthwhile. This is the mood of the youth, especially of the students and it is they, above all, who had taken up the banner of separate Telengana. Political commentators, to say nothing of political activists, would be led seriously astray if they missed this mood. And the mood is of Andhra, not of Telengana alone.

Added to this feeling for the nation there is the hunger for growth and the quickened aspiration for equality. For a time it looked as if the drought would create such a serious situation that all else would be well-nigh submerged in it. But the recent onset of the rains gives reason to hope that the monsoons would maintain their normal pace. And, contrary to some inexperienced opinion, it is not only between hunger and anger that the edge is thin, it is also between expectation and reality.

This explains the failure of any opposition to cohere against the move for radical land reform legislation proposed in the Andhra Assembly by the CPI. Partly, of course, the failure of the opposition to cohere is due to its cynicism. They feel that whatever the law not much would change at the village level. And this cynicism is justified so long as there is no mass movement of the toiling peasantry and the agricultural labourers at the grassroots level. But given such a movement progressive legislation has very considerable potential. And the movement is certainly helped forward by such legislation. If a progressive government is in charge of the administration as in Kerala, then, the mass movement, the law and large sections of the administration move together to accomplish significant social change, e g, the virtual abolition of landlordism. Even where the administration is not under the control of a progressive government radical legislation can secure a certain neutralisation of the state power—and this is a state power which habitually is on the side of the landlords—and give an added leverage to the mass movement. This is not to be taken to mean that a prospect of smooth gradualism now opens out. On the contrary, the prospect is of clash and of crisis and equally one of operating on the ground of reality, of utilising all the contradictions in the system.

CP(M) Splinters

It is the failure to even have an inkling of this particular ground of reality that has led to the virtual disappearance of the Naxalite movement in the state. Srikakulam is over and the Nagi Reddy and other trials drag on in the midst of public indifference even though there is the feeling, which is pretty widespread, that drastic sentences are no way of dealing with the problem or these particular detenus. There is the widespread feeling that some kind of Presidential amnesty would be the best way out. But this is sympathy and not support for the Naxalite cause.

Failure to come to clear terms with this ground of reality and wobbling around the issue has led to further splintering of the CP(M). Practically all its members and cadres from Khammam District led by Rajab Ali, MLA, have withdrawn from the party. This has reduced the party's representation in the Assembly from nine to five and seriously reduced its effectiveness as a mass force in the Telengana districts.

Finally, it is the failure to appreciate the complexity of this ground of reality that has led to the breakdown of Brah-

mananda Reddi's opportunist manoeuvre to try to set up an Andhra Congress more or less along the lines of Biju Patnaik's venture in Orissa. This abortive move never got off the ground though it shows the extent to which the Chief Minister is prepared to go in his game of blackmail and blandishment.

ASSAM

Election Prescience

WITH Assembly elections fast approaching, the parties in the state are gradually stirring. The most agitated and divided party is Congress(R), whose performance in the mid-term Lok Sabha poll had raised legitimate hopes in the minds of its leaders. The infighting between the Chaudhury and Bhagavati factions is not only still going on in the organisational wing of the Congress, but is being extended to the governmental wing. A 20-page press note issued by the Government of Assam last July, brought the bitterness and virulence of the continuing civil war to the surface. A tape-recorded speech made by Moinul Huq Chaudhury, the Minister for Industrial Development in the Central Cabinet, in his home district, Cachar, infuriated the entire Assam Cabinet and led to instant retaliation. In his speech, Chaudhury had accused the State Government of deliberately neglecting Cachar's industrial development and scuttling a paper mill project.

The long press note is a refutation of Chaudhury's charges of conscious neglect and it is now his turn to deny that the Central Government was in some way responsible for short-circuiting Cachar's development. The press note hinted that the implementation of paper, pulp and Barak Dam projects was being delayed not so much due to neglect by the State Government, but due to reasons beyond its control, including the Central Government's processing delays.

Whatever may be the merits of the press note or the heroics of Chaudhury, the plain truth is that the controversy has brought to the surface the inner struggle for power within the Assam Congress at a time when elections are around the corner. Chaudhury's strenuous efforts to consolidate his position continue. But he still does not have much influence in the State Congress. The President and the Secretary of the Pradesh Congress, Bijoy Chandra Bhagavati and Sarat Chandra Sinha, seem to be now in control of the State Congress organisation and both are working at present as a team to usher in a change of Assam's representatives in the Central Government. The controversy over Cachar's development therefore is an indication of the intensity of infighting over mobilisation of organisational and popular support for the two factions.

Chaudhury's idea of leadership is that of an energetic field officer ready to grasp any opportunity. He does not believe in discreet generalship from the rear like Chaliha did. The strategy of the Bhagavati group is subtle manipulation of top level and grassroots workers. Senior ministers of the Assam Cabinet rushed to New Delhi to meet Indira Gandhi while the controversy over Cachar was still hot. They feted her at Assam House (evidently the first Assam House dinner ever attended by the Prime Minister) and presented her with a memorandum filled with old demands like increasing Assam's quota of oil royalties and of central taxes, lowering the rate of Central excise duty on tea, building an infrastructure and quickening the pace of industrialisation. All these demands seem to be attempts to get reassurance of continued Central support for the State Government in the face of a Central Minister's (Chaudhury's) open denunciation of the Assam Government.

Indira Gandhi's actions in West Bengal and the Home Ministry's move to foist a supra-government in the shape of the North-Eastern Council, with the Governor of Assam as its head, on the states of the region, are sufficient indications of a major impending administrative change. Indira Gandhi's desire to change the complexion of the party and its leadership in Assam has never been explicitly stated, but Chaudhury's open denunciation of the Assam Government can be rightly interpreted as a step in that direction. These open controversies may or may not be a healthy sign of parliamentary democracy, but the lack of inner organisational and personal rapport is certainly an index of weakness of the Congress party as a political instrument.

Indira Gandhi's followers in Assam apparently indulge in faction fighting in the name of socialism. For the Congress party's coteries, aspiring for power, socialism has become a code word whose meaning is clear only to Congressmen. The weakness of Congress' socialism is the main plank on which the two Communist Parties and the newly formed United Socialist Party are functioning in Assam, although the last mid-term poll clearly revealed their limitations as socialist alternatives to the Congress. None of them improved their strength and the minorities and the middle classes seemed to have swung towards Congress. In some constituencies, the Bengali voters, apparently tired of the violent politics of West Bengal, expressed a clear choice in favour of a party which would maintain a *status quo* and stability. For instance, Phani Bora, the Secretary of the CPI, lost his previously sizeable support in his constituency (Nowgong), while Hem Barua of the PSP failed to mobilise the support of the Muslims. The result was clear defeats. If the tendency to support a *status quo* party persists among Muslims and some of the labouring classes, then Congress is likely to sweep the Assembly polls again.

The prospect of another defeat has caused a change of strategy on the part of the Leftists in the state. Both the CPI and the CPM are now united in a front and they are inviting the Socialists to join it. The Socialists are in the process of merger and their election strategy will not be known till the end of August. The Leftists in Assam have no choice but to join together in a front to fight the Congress. If the front is able to forge itself into a cohesive force, then at least 14 seats out of 126 may be won over by it. In the 1967 elections, both Socialists and Communists together got 14 seats, but at that time, the Muslims overwhelmingly favoured them. This time the Muslims may not vote for them, because both the acknowledged leaders of the Muslims are Congressmen — Fakhruddin Ali Ahmed and Moinul Huq Chaudhury. An overwhelming number of Muslims in Assam are, however, dissatisfied with the Congress stand on the Bangla Desh issue, but this is no reason for switching to the Leftists, whose policies are pronouncedly more radical on Bangla Desh. Popular dissatisfaction over the budget is growing, but as experience shows, votes alienated on this count can be easily manipulated by the party in power by stirring up feelings over stock emotional issues like communalism and foreign aggression.

Maharashtra's Somnambulant Universities

(From a Special Correspondent)

STUDENT trouble is non-news in most parts of the country, particularly in the north and north-east. Strikes by students and/or by staff, closure of a university, boycott of examinations, gheraos of officials, do not rate substantial newspaper space unless there are casualties in the process or unless the agitation is for a non-academic issue such as Telengana.

The situation was different in Maharashtra till recently. Whatever the reasons, educational institutions in the state led a fairly peaceful, if not somnambulant, life and local academics felt justified in indulging in occasional smirks of self-congratulation. Even at the height of the agitation for Samyukta Maharashtra, educational institutions were free from major trouble. However, in the past year or two, there have been several indications that things are not as quiet as they seem on the campuses.

Perhaps appropriately, the first rumblings have come from the agricultural universities in the state. Our genius for creating a caste system in any sphere of human endeavour has worked well in the educational sphere also. With the students of the medical colleges and the IITs forming the 'chosen' communities, agricultural students come way down the ladder. As such, it should surprise no one that they have also been the first to rise against the authorities.

Vidarbha's Agricultural University

This first happened about two years back when students in the Vidarbha region launched an agitation for the location of the agricultural university there. Although the Government did not yield immediately (which government does?), the demand was generally approved of, even in other regions of the state, especially because the chosen location in Ahmednagar district was so indefensible. Finally, the Government saved face and also yielded to the agitation by starting another agricultural university in Vidarbha. However, it is significant that despite their efforts, the local politicians did not succeed in converting the agitation into a movement for a separate Vidarbha. Evidently, Vidarbha is no Telengana.

Now it is the turn of the agricultural students from the western region. After a strike at the Agricultural University at Rahuri lasting over three weeks, the students are back in their classrooms after having forced the vice-chancellor to resign and after having most of their other demands accepted. The immediate reason for the eruption of student resentment was the blatant nepotism shown in admission to post-graduate courses. The son of the vice-chancellor himself and that of a Central minister were admitted out of turn. Other grievances of the students were also genuine enough. In fact, if we did not already know about the workings of our colleges and universities, it would be hard to believe that students have to agitate for such things as books in the library, equipment in the laboratory, lightbulbs in the hostel, bathrooms in working condition and so on.

Short Truce

The resignation of the vice-chancellor and the acceptance of most of the other demands of the students has brought peace to the agricultural university. However, this is likely to be of short duration if the educational authorities in the state fail to stir themselves in good time. Already, there are rumblings at other universities in Maharashtra. The grievances are distressingly familiar — nepotism in admission to prestigious courses, poor library and laboratory facilities, insufficient and poorly qualified staff, substandard living conditions in the hostels, irrelevancy of classroom instruction to the job situation later, etc. In addition, in many colleges, the teaching community itself feels aggrieved due to the behaviour of college and university managements.

The Government of Maharashtra proposes to start two new universities in the near future. However, for over a year now, it has not been able to select a vice-chancellor for one of the existing universities — Marathwada University at Aurangabad. Judging from this, even after making the highly unlikely assumption that the Government will find the resources to sustain the new universities properly, the problem of finding the requisite personnel will still remain. The resignation of one vice-chancellor should be enough of a warning about the dangers of choosing administrative personnel of poor quality, even though attracting high quality academic personnel is difficult.

Meanwhile, recent findings of employment agencies point out that despite widespread unemployment, there is a shortage of Devnagari typists, operators of punchcard machines, statistical assistants, persons with some knowledge of agricultural engineering for soil conservation and bunding operations, etc. Evidently, neither the universities nor the Government feel that teaching students a few marketable skills is part of their job. The basic tragedy of the situation is that what passes for education now does not prepare students in skills that are in demand even today, let alone those skills which would be needed say five or ten years hence.

Bangla Desh and India

A Special Correspondent writes:

IN the past month, a number of articles have appeared in the Indian Press, bewailing the 'inaction' and 'spinelessness' of the Indian Government in regard to the Bangla Desh crisis. Although the Indian Government does not obviously emerge from this crisis covered with wreaths of diplomatic or other glory, the lamentations of our bourgeois journalists cannot be taken too seriously by anyone who recalls their own performance in the earlier phases of the conflict in East Bengal. Mukti Fauj victories by the score, hundreds of villages and towns liberated, Dacca and Chittagong radio stations 'captured' on at least five different days! Our pressmen have only themselves to blame if their wishful thinking and cooked up stories have not come true. The poor freedom fighters of East Bengal who on more than one occasion told friendly Indian journalists about their future battle plans and had the mortification of watching them transmitted to the Pakistan Army *via* Indian newspapers which announced them as "great victories" in advance, must have ruefully wondered: "With friends like these who needs enemies?". Thus our national Press, now busy berating the Government, should look back carefully to the not very far off days when it treated every piece of bazar gossip as proven fact and no rumour was too fanciful for it to be held up as the truth.

Whose 'National Interest'?

Leaving the breast-beatings of our popular dailies aside, articles in a similar vein calling for 'positive action' on the part of the Indian Government have begun to appear in more serious magazines. In a recent issue of this journal,

J Bhattacharjee has presented a cogent and well-argued case for Indian military intervention in East Bengal to drive the Pakistan army out.[1] Because it is cogent and lucidly put forward, in contrast to the usual journalese, it deserves serious analysis. At the outset, it is necessary to state that the arguments for Indian army action appear, at first sight, so forceful and overwhelming that one begins to wonder why the Indian Government has not acted so far. It is childish to assume that these arguments have not occurred to policy-makers in New Delhi. Indeed, one is forced to look further and probe more deeply into the Government's policy of 'inaction'. In doing so, one discovers interestingly enough, also the limits of bourgeois analysis (like, e g, that of Bhattacharjee's) which, while considering conflicts between nation-states, takes as its sole standpoint the question of 'national interest' alone.[2] In such a viewpoint, the set of men constituting the governmental regime are presumed to act in favour of a certain well-defined national interest and if they fail to do so, they are guilty of irrationality, misconduct or spinelessness. This viewpoint, however, neglects to take account of the fact that, in bourgeois States, classes exist and the Government of such States represents the overall interests of the upper, ruling classes. In Marx's famous characterisation "the Government is the executive committee for managing the affairs of the bourgeoisie". The interests of the ruling classes do not, in general, coincide with those of the lower classes to which they are, on the contrary, directly opposed. In exceptional circumstances, however, such a coincidence of interests can occur as, for example, in a national independence struggle from foreign rule. Only in such cases is one justified in speaking about a 'national interest' existing. Otherwise, the phrase only serves to mask and obfuscate the underlying reality of the class struggle. It projects the bourgeois government as standing *au-dessus-de la melee*, as representing the interests of all classes in a single 'national interest', which is precisely the notion that bourgeois social democracy has tried so hard to put forward.

What are the 'national interests' of India, for example? Will Indian military intervention in East Bengal serve the interest of, say, a landless peasant of Midnapore district or a jute magnate of Calcutta? In arguing his "case for Indian military intervention" Bhattacharjee appears, though perhaps unconsciously, to identify our 'national interests' with those of the Indian ruling class. Among the reasons in favour of military intervention he mentions that "A friendly Bangla Desh will provide a natural market for Indian goods... and give a substantial filling to the sagging economy of West Bengal...". In other words, a "friendly" Bangla Desh will provide a happy hunting ground for Indian capitalists. Later on in the article, talking about the dangers of a protracted war, Bhattacharjee says that the "... leadership of the guerilla forces would *necessarily* pass into anti-Indian hands". Anti-Indian here clearly means anti-Indian ruling class. There is absolutely no reason why the broad masses of Indian peasants and workers should be apprehensive about the emergence of a genuinely leftist, guerilla movement in East Bengal.

We can now turn to a concrete examination of the Indian Government's policy *vis-a-vis* Bangla Desh in the light of the arguments of the proponents of military intervention. The Government is surely aware of these. Why, then, does it not act? Is it merely spinelessness — a propensity to moderation or non-violence? Certainly it has not shown lack of spine or violence in swiftly combating its antagonists within its own borders, whether in Srikakulam or in West Bengal. So why does it hesitate to act outside its borders? Especially, when, as we have shown, the arguments in favour of military action are pro-ruling class arguments. The reasons are twofold. One of them is related to the position of the Indian ruling class within the orbit of international capitalism, which robs it of the capacity for independent action. The other reason is related more specifically to the genesis of the conflict within Bangla Desh itself and the relative strengths of the various factions within it which are opposing the Pakistan Army. We shall take the latter reason first.

Awami League Defunct

After its overwhelming victory in the December elections, the Awami League emerged as a mass party enjoying widespread support in favour of its six-point programme of autonomy.[3] As the leading spokesman for Bengali nationalism opposed to the West Pakistan military junta, the Awami League occupied a position in Pakistan politics, and had a leadership and class composition similar to that of the pre-Independence Congress Party in India. As Mohammed Ayoob points out: "From this character of the party flowed certain weaknesses which became very clear during the closing days of the Yahya-Mujib parleys of March 1971. An open, amorphous organisation with a middle-class, city-based leadership, while eminently suited for fighting and winning elections and even leading a civil disobedience movement, was not the sort of organisation that could either prepare contingency plans for armed resistance or hope to lead a resistance which was bound to turn into a guerilla war."[4] Thus, once the situation in East Bengal had passed beyond the stage of bourgeois politics (electioneering, bargaining over power in the Assembly, etc) to armed confrontation, the Awami League became, in a sense, historically defunct. This is illustrated by the disintegration of their organisation soon after the massive Pakistan Army assault and the flight of many of their leaders to safety in India. The incapacity of the Awami League to successfully lead the armed resistance is also reflected in their inability to properly direct and command the military forces at their disposal, particularly in the early stages of the conflict.

The main interest of the Indian Government lies not only in getting the Pakistan Army out of East Bengal but also in getting the Awami League installed in power. (Given the present situation in West Bengal, no other active political group in Bangla Desh, who are all well to the left of the League would be acceptable to our Government.) At the present time, even if the Indian military actively intervened, it is difficult to see how this could happen since the resistance forces actively combating the Pakistan Army are not likely to agree to simply hand over power to whoever our Government would like. Another difficulty for Indian military action at present would be the relatively large-scale nature of the intervention required. The Indian Government, consequently, finds itself in a dilemma which proponents of armed intervention, like Bhattacharjee, should appreciate before rushing to castigate it. The longer the struggle continues the less likely it is that forces acceptable to the Indian ruling class could come to power in Bangla Desh. But the time when Indian military action could have put the Awami League in power is well past. Actually, the optimum time for the Indian Army action (from the viewpoint of our Government) was in the first two or three weeks after March 25 when a relatively small-scale operation of putting a few airfields out of commission and blockading Chittagong port would have sufficed to nullify the activities of the Pakistan Air Force as well as prevented reinforcements from reaching the Pak Army units. If one recalls that the Awami League was in effective control of most of the district administration at the time (ever since Sheikh Mujib's order of March 1) it becomes clear that such an operation would have effectively accomplished the policy aims of the Indian Government.

Why did India not act then? One can, of course, ask what the reaction of X, Y or Z power would have been in the event of such an action. But such a question only begs another. Why should the Indian Government be so inhibited in taking actions which are in its own interests? Although a number of different points may be raised in this connection, the main reason, we believe, lies in the extreme dependence of the Indian bourgeoisie on foreign capital for economic growth and the consequent social and political consolidation of its rule over the country. This dependence substantially circumscribes the freedom of action of the Indian ruling class particularly in international conflicts where its creditors may also be interested. Recent events bear ample witness to this fact. Which independent and self-confident bourgeois power would have sent emissaries scurrying all over the globe offering pitiful 'explanations' and 'clarifications' as a substitute for an independent self-assertive policy? Bhattacharjee is quite correct in deriding this non-policy which masquerades under such vain-glorious euphemisms like 'real-politik', but he fails to perceive that the logic of the Indian bourgeoisie's international position does not leave it with much choice.

Notes

1 "Bangla Desh: Case for Indian Military Intervention", *Economic and Political Weekly*, July 3, 1971.
2 The following arguments also apply to the views expressed by Ashok Sanjay Guha in his article "Bangla Desh and Indian Self-Interest", *Economic and Political Weekly* May 15, 1971.
3 See Mohammed Ayoob's essay 'From Martial Law to Bangla Desh' in "The Challenge of Bangla Desh" (Popular Prakashan, Bombay, 1971) for a very readable account of the developments leading to the Pakistani military offensive.

Chile's Land Reforms

Mohan Ram

IN the Latin American context, even limited 'bourgeois-democratic' land reforms of the kind contemplated in India, can go a long way to polarise property relations. But Chile, under a communist-socialist Popular Unity coalition is attempting something new—a radical agrarian reform programme to be pushed through in not more than two or three years. As its Minister for Agriculture, Jacques Chonchol, said recently, "agrarian reforms are like surgical operations. You can't do them little by little for fear that the patient will die during the operation." President Allende has described agrarian reform in his country as "Chile's second independence."

Because of its geography, Chile has always had a physical imbalance between cultivable land and total area. Of more than 75 million hectares constituting national territory, apart from the Antarctic regions, only 12 million hectares could be used for agriculture and cattle farming. Of this, only 5.5 million hectares are, in fact, used for agriculture.

Chile has four agricultural sectors, ownership-wise: the small farmers and *minifundists* who own upto five hectares each accounting for 190,000 farms and 9.6 per cent of the land; two thousand peasant settlements which include one thousand farms that the government will expropriate this year, accounting for 22.6 per cent of the land; the medium size farmers, who own from five to eighty hectares with irrigation facilities accounting for 38,500 farms and 35.3 per cent of the land; and finally 2,800 *latifundia* accounting for 32.5 per cent of the land.

One of the aims of the agrarian reform programme is to correct the imbalance in tenurial relations and to make the land produce its full potential. Much of the land is not being fully exploited due to low technological levels. So far the growth of agriculture has been lower than the population growth. Now with a higher purchasing power among the people and inflation curbed by the Popular Unity government, the demand for food products is certain to go up. In the 1934-39 five-year period, Chile exported agricultural products valued at 30 million dollars and imported food products valued at 15 million dollars. In recent years, Chile exported the same value but imported annually 200 million dollars worth of agricultural products. In short, Chile has an extensive type of agriculture, with small capital investments and low productivity. The big fortunes in the past few years were made, not in agriculture but in trade and industry. Chile's problem therefore is one of pumping in more capital into agriculture along with instituting agrarian reform.

As for this year's programme, Chile will expropriate one thousand farms. Until now, over 520 farms with an area of 1.5 million hectares have been expropriated. This is six times higher than the Christian Democratic Government expropriated in all its six years. Chile will also set up this year a state farm of 500,000 hectares expropriated from the Livestock Association of Tierra del Fuego, another state farm with 260,000 hectares from the Forest Complex of Panguipulli, and two or three others with stockbreeding cattle.

Of course, the agrarian reform carried out by the Popular Unity Government is within the framework of the law passed by the earlier Christian Democratic Government in 1967. It has serious limitations. The law in its present form provides for compensation to private owners of natural forests. The new Government does not see any sense in this because it thinks forests were created by nature and their only true owner is the nation, the people. The new Government also wants to shorten the time-lag between the decision to expropriate a farm and its implementation, which under the present law is as much as two months and more.

A unique feature of Chile's agrarian reform programme is the role of peasant organisations in drawing up policy. The peasant councils participate in a dialogue with the Government on issues of agrarian policy. As Jaques Chonchol said "We don't want only the technicians and bureaucrats to draw it up, but everybody."

The implementation of Chile's agrarian reform programme has resulted in tensions and conflicts in the countryside. The *latifundists* are leaving farms unplanted but the Government is determined to intervene in such cases. Secondly, the right-wing opposition is leading a campaign to denounce the seizure of land by Mapuche Indian communities in the southern parts of the country, in spite of the law in favour of the Mapuches. The Mapuche land has been usurped by others for a long time and the aim of the law is to restore the land to Mapuches. In the wake of this law, the Mapuches have been occupying land that justly belongs to them because they had been illegally evicted at the end of the last century and early this century. The Government now proposes to modify the law to accelerate the restoration of land to the Mapuches. Small groups of *latifundists* who want to defend their anarchist privileges are using armed violence against agrarian reform officials and the Mapuches.

A Matter of Supplements

Nireekshak

FOR a number of years now, newspapers have managed to get by without expressing any special Independence Day thoughts of their own on August 15. The accent rather has been on the thoughts of others in the form of specially written articles in I-Day supplements, and, more specifically, on advertisements which only a once-a-year supplement can attract. Something seems, however, to have happened this year to slightly upset the established practice. To begin with, not many supplements were issued on the occasion and, probably because it was a Sunday, even such supplements as were issued were almost indistinguishable from the usual Sunday supplements — especially in the bigger metropolitan dailies some of which, like *Times of India* and *Statesman* may be criticised for ignoring the day altogether. *Amrita Bazar Patrika* and *Hindustan Standard*, however, are notable exceptions to the general rule.

It is a matter of speculation whether the neglect is the result of any resistance on the part of advertisers or the nonavailability of newsprint, or both, but there seems to have been a lack of any special effort to produce I-Day supplements. There is no evidence that the newsprint position is more difficult this year than in previous years; it is, if anything, better. If advertisers have begun to regard the usefulness of these annual supplements with more than usual scepticism, it is an interesting development. The reader, however, has little cause for regret.

Another feature of I-Day 1971 is that the lofty sermons of yesteryears have returned to the editorial columns, but interestingly enough, again, only in the smaller metropolitan and provincial newspapers. The theme of the sermons varied, but they were influenced by recent developments — domestic as well as international — affecting the security and wellbeing of India. It was also probably not fortuitous that two of Calcutta's dailies, *Amrita Bazar Patrika* and *Hindustan Standard*, concentrated attention on the special problems facing the border states as a consequence of the upheaval in Bangla Desh.

As *Standard* put it, "war clouds that have gathered on the horizon of east Asia may at any moment pour death and destruction however much India may abhor an armed conflict". Eternal vigilance was, therefore, the watchword, and "no efforts should be spared to make our defence arrangements foolproof and knave-proof." *Patrika* while emphasising that 24 years of "political separation cannot cut off the multicoloured links which make the people of Bangla Desh our kith and kin", called the country to its "noble tasks", *viz*, "defending" it against aggression, "reconstructing" its economy, "revitalising" the system of its education and "enriching" the "precious legacy" of its culture. *Tribune* seemed to agree that, "with war drums sounding across our frontiers", I-Day this year was "indeed a sombre one". But it directed attention to the country's socio-economic problems more than to the problems of security. The country was still "far from achieving the basic purpose of political independence which Mahatma Gandhi (had) described as 'wiping out the tear from every eye'," it wrote, adding that the leaders might yet discover that "hastening slowly, with a profound sense of the practical, is a wiser course despite the lack of drama, than rousing high expectations through formulas far beyond the nation's resources." *Mail* took a somewhat similar though more negative view, saying: "With resolute leadership, a nation of 500 millions, united and hard-working, could have consolidated its independence in 24 years and bid defiance to any aggressor. India has not done so, and both leaders and masses must take the blame." The hard work theme was uppermost in the thoughts of *Hitavada* also. "By coinciding with a Sunday," it said, "Independence Day has curtailed a holiday and thereby has brought a message that more work is necessary to make our Independence everlasting"!

While the "biggest democracy" in the world was observing a sombre anniversary of its Independence Day, the "mightiest democracy" was facing trouble with the almighty dollar. And the echo of that trouble was loud and clear in the Indian Press. "Though the beleagured dollar has at last fallen", sagely observed *Times of India*, "it is still far from certain precisely how or when it will hit the floor. ... The package of drastic measures announced by President Nixon can at best keep it for a while in mid-air". Most of these measures, the paper added, "are clearly meant to give a much-needed shot in the arm to American industry and to stimulate employment". However, the "suspension of the reserve currency role of the US dollar is bound to give a sharp jolt to the international monetary order. ...." *Indian Express* was more forthright in its comments. In an editorial titled 'The God that Failed', it saw Nixon's measures as a "desperate bid to avert the demise of the dollar". The fact, however, was that "the dollar stands humbled". For, by "inviting the world's most powerful economies to revalue their currencies *vis-a-vis* the dollar, the United States has in effect devalued the almighty dollar, albeit through the back-door". And, "even if the crisis blows over shortly, there can be no escape from the fact that the world has to evolve sooner rather than later a more reasonable and workable solution to the problem ... of the basic disequilibrium in the international monetary system".

Only *Statesman*, it seemed, had any sympathy left for Nixon and the dollar. "Displaying once more the flexibility for which he is rapidly acquiring a reputation", the paper remarked, "Mr Nixon has announced a package of measures that will go a long way in reducing the pressure on the dollar ... The suspension of dollar convertibility opens up the prospect of a realignment of currency parities." Japan, it noted further, may have to revalue its currency while the Europeans will resist revaluation of theirs. "A compromise move (in the circumstances) could well include a small devaluation of the dollar and upward adjustments in the strong currencies." However, the "acid test of Mr Nixon's policy package will be whether it succeeds in improving the USA's international competitive position." And here, according to the paper, "the President is treading a tortuous path ... trying simultaneously to improve the balance of payments, increase employment, and reduce inflation .... These goals may prove mutually contradictory." In point of fact, *National Herald* seemed to add, "Nixon's package of sweeping measures to save the dollar amounts to a frank admission that the United States economy faces a crisis .... The present crisis is a sharp reminder that America has not yet seen the end of its economic problems. It remains a country in which incomes rise, prices rise higher, expectations higher still, and discontent soars skyward ...."

Sampling Theory Condensed

"SAMPLING Theory of Surveys with Applications", by P V Sukhatme and B V Sukhatme, is a revised edition of a book written by P V Sukhatme some 16 years ago. During the intervening period, several developments have taken place in the theory and applications of large-scale sample surveys. In India, the National Sample Surveys were organised and continued contributions were made, mainly by the Indian Statistical Institute and the Statistical Wing of the Indian Council of Agricultural Research. A revised edition of an earlier book on sampling theory and applications is, therefore, a welcome development. The Sukhatme brothers have special expertise and practical experience in this field, and these are amply reflected in the lucid exposition of the theory, the illustrations, and the compilations of exercises at the end of each chapter.

As the authors have pointed out, the revised edition retains essentially the same character as the first, "except that algebra has been somewhat condensed and exercises have been added at the end of each chapter". Chapter 1 in this revised edition is essentially Chapter 1 and Part A of Chapter 2 of the first edition. The partitional notation discussed in the latter does not appear in the revised edition, whereas two interesting sections — on (i) how to work out the variance of a function of two random variables and (ii) negative binomial or inverse sampling — have been added.

Chapter 2, dealing with sampling with varying probabilities, corresponds to Part B of Chapter 2 of the first edition. This subject is almost entirely rewritten and several new results which have appeared since the writing of the first edition have been incorporated. Although reference to Horvitz-Thompson's estimates and to Yates and Grundy's estimates is made in the first edition also, the limitation that, in both types of estimates, estimate of the variance may give negative values for some samples has been now indicated. Although the temptation to use proportional probability to size (PPS) is great, as the authors rightly stress, sampling with PPS and without replacement involves heavy and complicated computations, especially when the size of the sample is large. In this connection, it needs to be noted that Hansen and Hurwitz's article in the *Annals of Mathematical Statistics* (1948), Volume 14, describes formation of Primary Sampling Units (PSUs) in human population surveys as heterogeneous within and as homogeneous as possible among themselves so that only one PSU can be selected with PPS. While this reduces some of the difficulties in the estimation of the total or mean values and their variances, considerable pre-planning, grouping of properly mapped areas, and other preparations would be necessary before such a PPS design can be used. In its reference list in Chapter 8, the book under review refers to this fundamental article.

Additional matter in Chapter 3 on stratified sampling relates to formation of strata. An interesting aspect of the new material presented is regarding deep stratification. It is shown that for the proposed procedure of allocation over a two-day stratification, a given sample size n which is not large enough to provide an allocation to each such stratum can ensure a more efficient design than in the case of one-way stratification. Yet another interesting topic is the allocation of sample to different strata when several characteristics are being estimated. This problem is a constant headache to statisticians, since one is usually confronted with difficult choices of allocation procedures—particularly when the characteristics are not positively correlated. No final solution could be expected from this book, but suggestions regarding different types of allocation which could be considered and how a likely choice could be worked out will be interesting to readers. Interesting too are the sections on the method of collapsed strata and controlled selection. In the first section, the 'collapsed strata' topic is discussed in Chapter 8 on sub-sampling.

Chapter 4 on the ratio method of estimation introduces 'unbiased ratio-type estimate' and examines its efficiency *vis-a-vis* the usual ratio estimate. It brings out the conditions that, the former is more efficient than the latter if and only if the regression co-efficient β is nearer to $\frac{1}{N}\sum_{i=1}^{N} Y_i / x_i$ than to $R_N = \bar{y}_N / \bar{x}_N$. If $\bar{r}_N = R_N$, then the variances of the two estimates are equal. This result is due to Goodman and Hartly (1958). Since these conditions are restrictive, Quenoville's weighted estimate of ratios derived on the equally split samples (i e, two samples, each of size n, from a total sample of size 2n, the two samples being evolved by random allocation), as also the ratio based on the total sample, is of considerable interest. The weights are derived to yield an unbiased ratio-type estimate, the efficiencies of which are examined. The case of ratio-estimate when two auxiliary estimates are to be used to increase precision has been discussed. Another new section is on double sampling when the population mean of the auxiliary variable is not known. The conditions under which gains in efficiency due to double sampling may be expected are given.

Chapter 5 on the regression method of estimation covers more or less the same ground as in the first edition.

In Chapter 6, dealing with cluster sampling, the new result appears to be the one in the section on clusters of unequal size. Here, a third estimate defined as

$$\bar{y}_n = y_n + \frac{N-1}{N\bar{M}} \cdot S\bar{M}_y$$

has been formed on the lines of unbiased ratio-type estimate of Chapter 4 and is shown to be unbiased also. Its variance to the first order of approximation and the estimate of this variance have been worked out.

Chapters 7 and 8 relate to different sampling systems, and to two and three stage sampling. Some of the results obtained after the first edition appeared are given as exercises. The most important portion of these chapters is on the more complicated designs, because two or three stage sampling with varying probabilities at primary and/or secondary to ultimate level in a stratified sample are a common feature in practical applications. From this point also, the additional material on self-weighting designs should be of interest to the applied statistician.

In Chapter 9 on systematic sampling, two new items appear. One is on systematic sampling in two dimensions and another is on auto-correlated population which introduces the correlogram.

The last chapter on non-sampling errors is a considerably re-written Chapter 10 of the first edition. The discussion on the type of errors is considerably expanded and illustrated with more examples of various types of errors. The later portion of the Chapter

also discusses in greater detail the methods used to estimate the effects of *non-response in surveys*. Part D on the "recent experiences in sample censuses of agriculture" is a wholly new addition *in this book*.

In this last Chapter, there is sufficient warning for applied statisticians not to gloss over or minimise the importance of the practical side of the organisation of surveys. Introduction of unknown biases in measurements and observations made by the enumerators, and the additions to variability on this account (even when in the extreme case the biases cancel out), are indeed some of the most important aspects to which the survey organisation should give due attention. Carefully organised, and equally carefully imparted, training appears to be one of the most essential features of any large-scale survey. The theoretical model developed in the book, to measure the contribution of enumerators' biases to the variance of the characteristics, is itself based on the assumption that the enumerators are a random sample out of a large population of enumerators and allotted randomly to the selected sample units. This condition is hardly ever met in large-scale sample surveys. Moreover, even when there is knowledge of existing biases among enumerators, it is almost impossible to adjust the estimates. When one is concerned with a large number of enumerators, the only hope is effective and more effective training of the enumerators, and adequate supervision over them.

This brings us to the topic of interpenetrating sub-samples. One can sense in the writing of Chapter 10 that the authors do not think much of this technique. Sections 10.10 on the limitations of the method of replicated samples in surveys is a critique on the perhaps over-used technique of interpenetrating samples in the large-scale surveys designed by the ISI, Calcutta. This section describes in considerable detail the virtues of better supervisory agencies rather than application of interpenetrating samples in a routine way as a method of control. "Replicated samples are no alternative to supervisory check, though the latter can be" say the authors (p 416).

The authors do not explicitly state anything about another claim which is that the division of an overall sample into interpenetrating samples facilitates computation of an unbiased estimator of the variance of the estimated mean of the characteristics. Mean square between sample means, which can be easily calculated, then provides an unbiased estimator of the variance of the overall mean. However, it appears that if the contribution of 'biases' to the variability is to be measured separately, more detailed calculations, however time-consuming and expensive they may be, may be necessary.

On crop-cutting surveys the book observes: "When a crop is unevenly sown as in India, sample-harvesting it by *small plots* [italics added], such as those marked with a portable frame, may result in overestimation of yield." This is presumably an oblique reference to the circular cuts of small sizes propagated by the ISI, Calcutta, as against the fairly large-sized cuts of rectangular or square shape propagated by the ICAR, where P V Sukhatme developed the crop-cutting techniques.

Both these topics, the one on the subject of interpenetrating samples and the other on crop-cutting plot sizes were once subjects of raging controversies between the two schools, *viz*, the ICAR and the ISI. On a comparison of this book with the other one by M N Murthy of the ISI, Calcutta, one sees that these differences continue.

It may be that the book under review does not deliberately omit some major developments in India in regard to large-scale sample surveys. But some omissions need to be indicated. Non-use of the term 'interpenetrating sub-samples' which is quite fashionable with the ISI has already been mentioned. Murthy's book on the other hand mentions this term in about a dozen places as can be surmised from the index at the end of his book. Similarly, the other omission is about 'fractile graphical analysis' which finds detailed account in Murthy's book. Furthermore, the NSS surveys are conspicuous by their almost total absence of any detailed descriptions in the book. Murthy's book is replete with descriptions thereof. To cite another 'bias' of the book, Lahiri's (also of ISI, Calcutta,) method of selecting units with probability proportional to size is mentioned but the proof of how it ensures PPS is to be found in Murthy's book.

In a way, it is necessary for one to study both these books to get a more comprehensive picture of applications of sampling theory to surveys conducted in India and of the special problems which have held the attention of both these schools in designing the surveys.

If any criticism is to be made, it is only from the point of view of applications which relate mainly if not solely to agriculture. This is no doubt due to the special expertise of the authors in this field wherein they have made very outstanding contributions. However, for a text-book and reference type of book, more varied applications would have been welcome. In this regard, perhaps the book by Hansen, Hurwitz and Madow (1953) entitled "Sample Survey Methods and Theory, Volumes I and II" is really outstanding. One finds therein applications of the theory of sample surveys from finite populations from several fields like agriculture, human populations, industry, etc.

There is no doubt, however, that the book will be very widely read with interest by students, research workers, government statisticians and all those who are generally connected with the conduct of large-scale sample surveys. The references at the end of each Chapter make for a useful bibliography, although perhaps a single list of references at the end would have avoided duplications of references and would have been more satisfying to the readers.

The book is priced at Rs 32. A student of modest means may have to depend on a library even if he wanted to possess the book for ready reference. It may be worth considering publication of this and similar books as paperback editions — specially on the lines of "low-priced Indian editions of American Text-books."

Rural Unemployment: Measurement for What?

N A Mujumdar

To the dismay of the purists, it has been difficult to provide a precise assessment of the dimensions of rural unemployment in India. But is precise measurement the sine qua non of formulating policy measures designed to begin solving the problem?

A pragmatic approach to the estimation of the broad orders of magnitude of rural unemployment, on the basis of available data, is necessary for immediate policy formulation.

A more sophisticated estimate of rural unemployment is no doubt welcome for the purposes of long-term planning. Even here, it is not sufficient if the approach is merely disaggregative; it has also to be dynamic. At present the total rural labour force is artificially inflated by the participation of what can be called the "distress labour force".

For any secular planning for full employment in the rural sector, this point has to be taken into account.

[The views expressed in this note represent the personal views of the author and not those of the institutions with which he is associated.]

TO the dismay of the purists, it has been difficult to provide a precise assessment of the dimensions of rural unemployment in India. But is precise measurement the sine qua non of formulating policy measures designed to begin solving the problem? Are there no available data, on the basis of which a rough-and-ready estimate could be obtained for the more immediate purpose of formulating policy measures? These are some of the basic questions which arose, after reading a recent article[1] in this journal, reviewing the Report of the Committee of Experts on Unemployment Estimates. Rejecting the unidimensional measure of unemployment at present adopted by the planners, the Committee has suggested that a fresh estimate be carried out, presumably through an intensive Survey,[2] on the basis of more appropriate concepts and definitions. One is therefore likely to be left with the impression that unless such a detailed field investigation yields its results, nothing much can be done by way of formulating programmes to relieve unemployment or (confining the discussion to the subject of this note) rural unemployment at any rate. The purpose of this note is to put forward the view that the formulation of a meaningful programme designed to tackle the problem of rural unemployment need not await the results of a neatly-designed All-India Survey of Rural Unemployment, howsoever welcome such a Survey might be.

It is well known that rural unemployment, as distinguished from urban unemployment, presents certain inherent difficulties for measurement. Hence attempts to measure rural unemployment with the help of concepts or tools designed to measure urban or industrial unemployment are hardly likely to yield meaningful results. All this is by now well known and hence, while criticising the current procedures of estimating the extent of rural unemployment, the Committee appears to be treading on familiar ground. In fact M L Dantwala himself had raised some of these conceptual issues as early as in 1953.[3] Similarly, the "Manual on Statistics of Labour Force, Employment and Unemployment", issued by the Central Statistical Organisation, has also been subjected to critical examination, quite some years ago, at any rate with reference to certain underlying concepts.[4] Admittedly, several developments have since taken place and therefore the experts are entitled to sharpen their tools but is not the rural unemployed entitled to ask: While expertise accumulates what happens to him?

The provocative undertone is deliberate. In the light of the country's commitment to the abolition of poverty, the task of tackling rural unemployment should assume a sense of urgency. Viewed from this perspective the question that naturally arises is: For the purpose of immediately formulating some programmes to relieve rural unemployment is it not possible to estimate the broad orders of magnitudes of rural unemployment, on the basis of available data? The author, for one, would submit that this is possible.

Let there be no misunderstanding. To argue on these lines does not certainly amount to denying the need for a more scientific estimate of rural unemployment, based on more meaningful concepts, as proposed by the Committee. Such a detailed Survey should not only prove useful for long-term planning but also could provide, if carried out periodically, a quantitative indicator of the impact that each Five-Year Plan makes on the extent of rural unemployment. All that is sought to be driven home is that the planning, conducting and processing of data, etc, of such an intensive Survey will take some years; and in the meanwhile for more immediate planning a pragmatic approach to the whole question of estimating the broad orders of the present level of rural unemployment, on the basis of available data, however imprecise they might be, seems warranted.[5] Admittedly, such an approach will necessarily mean that some degree of precision has to be sacrificed. But after all, the end-use of such rough-and-ready estimates justifies the means. The almost obsessive pre-occupation with precision has therefore to be tempered by the test of "immediacy". Thus the pragmatic approach has no real quarrel with what might be called the purist approach. In this context pragmatists could as well be defined as theorists in a hurry and purists as theorists without the mandate of more immediate policy formulation.

How does one go about obtaining rough estimates of the present level of rural unemployment? Before sketching the broad outlines of the approach, it is necessary to indicate what might be called a "policy given". Ensuring full employment in the rural sector in the short run, say, during the next three or four years has perhaps to be ruled out

as a realistic policy objective. Employment cannot obviously become the sole objective of planning, notwithstanding the recent emphasis on the "dethronement of the GNP" as a development criterion in favour of the more pressing need of employment. How impracticable such a programme of full employment would be was demonstrated, some years ago, by V M Dandekar with reference to agricultural labour. On the basis of the data from the Agricultural Labour Enquiry (1950-57), he estimated that a total outlay of Rs 500 crores was needed annually, even if incurred on the most labour intensive schemes, if every earner in the agricultural labour family were to be provided with employment for 350 or 300 days in a year.[6] Thus the investment required was slightly larger than the *entire* annual outlay of the First Plan. The point in referring to this study is to stress that the short-run objective of policy will have to be necessarily one of tackling rural unemployment on a rather selective basis that is, areas and/or sections of population where the incidence of unemployment is greater will have to be accorded priority.

Viewed from this perspective, the problem boils down to one of identifying areas and/or sections of population where the incidence of rural unemployment is significant. In this limited context one could reasonably argue that it is possible to utilise the available data for arriving at rough-and-ready estimates.

The Committee's point that the aggregate figures of unemployment mentioned in the Plan, what the Committee seems to be apparently referring to as "unidimensional measure", are of little assistance in the formulation of policy is conceded.[7] A disaggregating dynamic approach is therefore needed in which the estimates of unemployment could be made with reference to age, sex, region, etc. Once again, it should be pointed out that such disaggregative estimates are *not* altogether absent. Of course, if one is looking for an omnibus survey yielding the data for all such components of unemployment, one is in for disappointment. The point is that several independent investigations have thrown up data on different aspects of rural unemployment; what is therefore required is a meaningful collation of the relevant data from these different investigations.

As illustrative of this approach, the case of agricultural labourers may be considered. In fact it would not be far wrong to say that the problem of rural unemployment is primarily the problem of unemployment among agricultural labourers — landless or with some land. Unemployment among non-agricultural workers there surely exists but in terms of dimensions, unemployment among agricultural labourers is of overwhelming importance. What are the basic data required to formulate programmes like, say, the Rural Works Programme, to tackle unemployment among agricultural labourers? Initially four items could be specified: regional distribution of agricultural labourers, average number of days of wage-paid employment in a year in respect of male and female workers, proportion of labourers totally unemployed and wage rates. The two Agricultural Labour Enquiries did provide these basic data. Such data were provided not only with reference to the country as a whole but also with reference to different zones, States and smaller regions within a State—and with reference to male and female labourers. In this sense therefore disaggregative data on unemployment are available, in respect of agricultural labourers. Of course, these data are out of date by now; but it should not be difficult to bring them up-to-date with the help of data from other inquiries. For instance, even the data from the 1971 Census might be useful in providing the present picture of the regional distribution of labour. Again, the various studies conducted by the Agro-Economic Research Centres might provide, with reference to some areas, data about changes in employment-pattern and the identification of the "off-season". Admittedly the concepts and definitions adopted by the different investigations differ and hence might raise problems of comparability. Some data thrown up may not be directly usable but may have to be re-worked to meet the requirements of this approach. With all these conditioning factors, it does seem that a working basis for the formulation of such programmes could be evolved from out of these data.

Although the immediate provocation for writing this note stemmed from the Report of the Committee of Experts on Unemployment Estimates, the main purpose here has not been to comment upon their recommendations as such. Rather, the purpose has been to emphasise that a pragmatic approach to the estimation of the broad orders of magnitude of rural unemployment, on the basis of available data, seems necessary for immediate policy formulation. A meaningful collation of data thrown up by various inquiries might provide a working basis for such policy formulation. In this context, it was pointed out that disaggregative data seem to be available, at any rate with reference to agricultural labourers.

A more sophisticated estimate of rural unemployment is no doubt welcome for the purposes of long-term planning. Even here, it is not sufficient if the approach is merely disaggregative; it has also to be dynamic. At present the total rural labour force is artificially inflated by the participation of what can be called as the "distress labour force". In some cases, women and children take to gainful work or "are available for gainful work", simply because they have to. Employment of these persons is an expression not so much of their ability and willingness to work as the necessity and compulsion to work. The reason for their employment is the extreme poverty of their families.[8] As the general level of farm incomes rises, therefore, probably this distress labour force might tend to disappear. For any secular planning for full employment in the rural sector, this point has to be taken into account.

Notes

1 "Measuring Rural Unemployment to Provide Guidelines to Policy-Makers", S V Sethuraman, *Economic and Political Weekly*, June 12, 1971.

2 I must confess, at the outset, that I have not had the benefit of reading the text of the Committee's Report and hence I have based my comments on the summary provided by Sethuraman's article referred to earlier.

3 "Notes on Some Aspects of Rural Unemployment", *Indian Journal of Agricultural Economics*, March 1953; see also the Chapter entitled 'Problems in Measurement' in the author's book "Some Problems of Underemployment", Bombay, 1961.

4 For instance, see the *Indian Journal of Agricultural Economics*, October-December 1956 and January-March 1957.

5 It is not suggested that the Committee should have explored the possibilities of undertaking such an exercise. Presumably, its terms of reference prevented the Committee from going into estimates provided by other inquiries.

6 "Use of Food Surpluses for Economic Development", V M Dandekar, Poona, 1956.

7 Such aggregates are perhaps useful only if they are the end-results of the aggregation of various components of unemployment estimated independently.

8 For a detailed discussion of this point see the author's note "Economic Backwardness and Labour Force", *Indian Journal of Agricultural Economics*, July-September 1957.

General Elections of 1967 in a Rural Constituency

Imtiaz Ahmad

This study reveals that the loyalties of religion, caste, kinship and factional grouping serve as a basis for the organisation of political support in rural areas. All these loyalties work simultaneously but they are situationally determined and operate at different levels. For instance, communal loyalty becomes operative whenever the main conflict is between Hindus and Muslims. In a situation where the conflict is between the members of the same religious community, internal cleavages come to the fore and crystallisation of political loyalties follows the line of sectarian or caste distinctions.

Political ideology plays relatively little part in determining voting behaviour in the rural areas. It is however, difficult to say whether the value or importance of caste, religious and kinship ties is merely sentimental or emotional. Perhaps, a more detailed and empirical study will reveal that there are often very practical reasons behind a particular religious community, caste or kin group becoming active politically.

[This paper is part of a project on the general elections of 1967 undertaken by the Department of Sociology, University of Delhi, with the help of a grant from the University Grants Commission. The project was directed by M N Srinivas and A M Shah who, with E A Ramaswamy, also did the initial editing of the paper.]

EVERY political party in the country issues a manifesto before the general elections outlining its political ideology and approach to major national problems. It is expected that voters will make their electoral choices according to the policies proposed by the different political parties. Several politicians in Uttar Pradesh to whom I talked before the 1967 elections felt that the electorate in India had not attained the level of political maturity where electoral choices are made entirely on the basis of ideological considerations, and that political ideology rarely played a crucial role in determining the voting behaviour of the Indian voter. More generally, they said, a candidate's chances of success in the election are determined by his general appeal as a representative, his personal background, his social links in the constituency, and his ability to manipulate the traditional social loyalties in his favour. The general election which followed a few weeks later clearly showed that policies and programmes were not the issues at the election (da Costa, 1967). The system of political spoils, which earned Congress rule in the State the name of 'quota-permit Government' and in which opposition members shared, corruption in all spheres of administration, and the political protection which corruption received, of course, figured as issues. Nevertheless, the real issues were, by all accounts, religion, caste, kinship and factional ties of the candidates (*Statesman*, March 14, 1967). In this paper[1] I shall present an account of the manner in which candidates manipulated traditional social relationships towards attaining political ends, and the crucial role which particularistic group loyalties such as religious community, caste and kinship played in determining voting behaviour in the election.

The analysis presented here is based on a study of the 1967 election in the Rudauli Assemby constituency in Uttar Pradesh. This constituency has been traditionally a stronghold of the Jan Sangh. In both the 1957 and 1962 general elections a Jan Sangh candidate was elected from here, defeating locally influential candidates contesting the election either as independents or on the Congress and other party tickets. Although the Jan Sangh more than doubled its strength in the UP Legislative Assembly in 1967, the sitting Jan Sangh MLA from Rudauli was defeated by a relatively young and politically inexperienced independent candidate by a margin of more than 2,000 votes.[2] The defeat of the Jan Sangh candidate[3] was considered a blow to the position of the party in the district. A meeting of the party workers held a few days later came to the conclusion that the defeat was mainly caused by the alignment of political forces somewhat differently from that in the earlier elections. In the discussion which follows, I shall show what this alignment of political forces was and how it came about.

Constituency

I shall begin with a brief description of the constituency and the pattern of political alignment which obtained in it in the previous general elections. The Rudauli Assembly constituency is situated in the Barabanki district in eastern Uttar Pradesh, the economically backward part of the State. Geographically, it is divided into two parts: the level upland plain sloping gently from the north-west to south-west and the submontane tract called tarai. It is predominantly rural in character, and the whole area of the constituency, except the low-lying areas along the river beds which are liable to flooding, presents a broad sheet of level land dotted with hamlets and villages. The principal town in the area is Rudauli, the headquarters of the pargana and the constituency. It was a large town of over 13,000 inhabitants in 1961. Rudauli was the scene of a great fight in 1442 between the Muslims of Rudauli and Muhammad Saleh, ancestor of the ex-talukdars of a neighbouring village. The tombs of those who fell in battle still exist in the town. It also has a fine imambara, a mosque, and the shrines of Ahmad Shah and Zohra Bibi, famous Muslim saints. Annual fairs are held in their memory and attract Muslims from different parts of the district. Rudauli is, however, mainly rural in character and lacks most of the features of an urbanised town. Lucknow, the capital of the state, is only forty-nine miles away and its urban influence radiates over the entire region. The constituency is well-developed in communication and transport facilities. Only the villages situated along the river Gharga are relatively cut off and remain inaccessible during

the monsoon season.

The population of the constituency is predominantly Hindu, although Muslims constitute a large minority with over 20 per cent of the total population. Scheduled Castes constitute over 31 per cent of the Hindu population according to the 1961 census. Both Hindus and Muslims are divided into castes. Of the Hindu castes most numerous are the Ahirs, Pasis, and Kurmis. Others largely represented are Chamars, Lodhas, Brahmins, and Thakurs. The Muslims include Sheikhs, Julahas, Behnas, Pathans, and Saiyads. A large number of villages in the constituency are dominated by Muslim high castes such as the Saiyads, Sheikhs and Pathans.

Before Independence, the Rudauli Assembly constituency was a talukdari and zamindari area. The principal talukdars and zamindars were Saiyad and Sheikh Muslims, Thakurs, and Brahmins. Around 1935, Barabanki district witnessed the emergence of an incipient kisan movement against a rise in the already high agricultural rents. The kisan movement was led by pro-Congress Sunni Muslims living in Rudauli town, but they had great difficulty in mobilising the kisans of the area. The Hindu cultivators lacked the economic standing and educational position to rise against the talukdars and zamindars. The Muslim kisans living in talukdari and zamindari villages were strongly in favour of the Muslim League, which enjoyed the support of Muslim talukdars and zamindars, and refused to respond to the kisan movement. The abolition of talukdari and zamindari tenures since Independence has produced some significant economic and social changes. On the one hand, some of the old talukdar and zamindar families have lost land to the Kurmi and Ahir cultivators, although the precise extent of land transfers is difficult to estimate from existing records. On the other hand, there has been a definite loss of status, position, and economic standing for the talukdars and zamindars. For instance, the Saiyad and Sheikh Muslims, who had been granted land as rewards for services to the ruling Muslim dynasties in Delhi or Oudh, were mainly non-cultivating landowners. Since the abolition of the zamindari system they too have taken to cultivation, although the rich Muslim families among them still show some aversion to manual labour. This change has been accompanied by a growing self-consciousness among the traditionally backward castes, such as the Kurmis, Ahirs, and Muslims Julahas.

The Rudauli Assembly constituency and certain parts of the adjoining Gonda district together form the Ramasanehighat Lok Sabha constituency. In 1967 the Ramasanehighat Lok Sabha seat was reserved for a member of the Scheduled Castes and there were three candidates belonging to the Congress, Jan Sangh and the SSP contesting for it. Because all the candidates belonged to the Scheduled Castes, the Lok Sabha contest did not arouse much interest and enthusiasm among the public. Nor did the candidates attempt to carry out an effective election campaign. It was generally believed that as opposition to the Congress was weak throughout the Lok Sabha constituency and the influence and popularity of the Jan Sangh was confined only to Rudauli, the Congress candidate would win the seat by a comfortable majority. Since the main interest at the time of the election in the Rudauli constituency centred on the contest for the Assembly seat and there was no significant inter-relationship between the Lok Sabha and Assembly contests, I shall confine myself to the Assembly contest.

At the time of the first general election, there was little opposition to the Congress in Barabanki district. There were five Assembly constituencies in the district from which seven members were to be elected, two constituencies being double-member constituencies. The Rudauli constituency was part of a double-member constituency. For elections to the Lok Sabha, Barabanki district formed part of the double-member constituency known as Lucknow-Barabanki constituency. The Congress captured all the Assembly seats, except one which went to an SSP candidate, and Congress candidates were elected to both the Lok Sabha seats. The total votes polled by the Congress for the Assembly seats numbered 131,903 out of a total of 263,656 valid votes polled, i e, about fifty per cent of the total popular vote. In general, the Congress Party enjoyed almost absolute dominance in the politics of the district and there was no political party to threaten this dominance.

By 1957, opposition to the Congress in Barabanki district was still deeply fragmented by personalities, factions and parties. Yet the performance of the opposition candidates in the election turned out to be quite impressive and they succeeded in reducing the hold which the Congress had over the Assembly seats in the district by carefully planning their electoral strategies and campaigns. As a result, independents captured four seats, the Congress three, and the Jan Sangh one, of the seven Assembly seats from the district. But the Congress continued to retain its hold over the two Lok Sabha seats.

The lone seat secured by the Jan Sangh in Barabanki district in 1957 was the Rudauli Assembly seat. At that election there were three contestants: Congress, Jan Sangh, and independent.[4] The Congress candidate was a locally successful kisan leader and social worker who had been an active member of the Congress party since the early thirties, and had participated in the freedom movement. A Sunni Muslim by religion, he enjoyed considerable popularity and support in the constituency. He was favoured for nomination by the UP Congress Parliamentary Board probably because as a prominent nad influential Muslim he was in a position to secure all the Muslim votes for the party besides retaining the support of the Scheduled Castes who were strongly pro-Congress on account of the benefits they had received from the party's welfare activities. The Jan Sangh candidate was a Bania by caste and belonged to one of the prosperous trading families in Rudauli town. Educated in Lucknow, where he had come in contact with the Jan Sangh leader, Atal Behari Vajpayee, he had been an active member of the Jan Sangh since Independence, and generally linked with the forces of traditionalism and Hindu orthodoxy in the district. The independent was a Shia Muslim belonging to Rudauli town. He had at one time been a staunch Muslim Leaguer and had been calling himself a PSP-type socialist since Independence. However, he did not enjoy any political standing in district politics. It was alleged that he had been sponsored and financed by the Jan Sangh candidate in a bid to avoid a direct contest with the Congress candidate and to prevent all the Muslim votes from being polled in favour of the Congress. In any case, his candidature was not taken seriously by anyone and the real contest was between the Congress and the Jan Sangh. Both the parties tried hard to win over the so-called fluctuating votes which were going to tip the balance, but in the end the Jan Sangh candidate came out successful, defeating his Congress rival by a margin of only 1,001 votes. The Jan Sangh strategy of splitting Muslim votes succeeded in so far as the Shia Muslim independent candidate polled 4,015 votes which might otherwise have gone to the Congress.

In 1962, the electoral contest in the Rudauli constituency was more intense and complicated than in 1957. There were seven candidates for the Assembly seat. First, there was the Jan Sangh incumbent who had carried this constituency in 1957. Next was a new Congress choice who, although not a notable figure in the politics of the area, enjoyed considerable popularity and influence. He came from one of the richest talukdar families in the district and his family was famous for the construction of the imambara, the mosque, and many other religious monuments in Rudauli town. He belonged to the Shia sect among the Muslims. In general the relationship between the Shias and Sunnis is characterised by a certain amount of hostility, the members of the two sects occasionally coming to blows. In the context of the election, however, it was likely that sectarian conflict would be subordinated to supra-communal loyalty. There was a Swatantra candidate who filed his nomination at the last moment when the effort of the Jan Sangh to arrive at an electoral alliance with the Swatantra party failed. He was a Thakur belonging to an ex-zamindar family. The political left was represented by the PSP and the SSP. Both the PSP and the SSP candidates were Sunni Muslims. The PSP candidate reportedly had personal differences with the Shia Congress candidate, and it was said that he was running in the election as an act of personal vendetta. In addition to the candidates contesting the election on party tickets, there were two independents in the field. One of them was the Bania who had withdrawn his candidature in 1957. He tried to get the SSP ticket with the help of Ram Sevak Yadav, a prominent Socialist leader of the district, but the SSP national and state leaders gave the ticket to a Sunni Muslim. The other independent candidate was a member of the Scheduled Castes, a Chamar, belonging to the area. It was said that the Jan Sangh candidate had bribed the independent Chamar to enter the contest in a bid to split the Scheduled Caste votes and the Congress had matched his strategy by encouraging the Bania candidate to run as an Independent. This time again the main contest was between the Jan Sangh and the Congress, the other candidates being relatively unimportant. The Jan Sangh candidate won the election over his Congress rival by a narrow margin of 492 votes.

In 1957 and 1962 the Congress candidates in Rudauli suffered a defeat not because the party had become unpopular with the electorate, nor because the Jan Sangh had established itself as a very strong political force. It was the electoral strategy of the Jan Sangh which had enabled it to capture the Rudauli seat on each occasion. Both in 1957 and 1962 the Jan Sangh made cow slaughter a major issue in its electoral campaign, and the elections were fought on a purely communal basis. It was alleged that before the elections Jan Sangh workers had gone round the villages in the constituency carrying a calf on a jeep and made all the influential Hindus swear that they would vote for Jan Sangh to ensure the protection of 'mother cow'. It was also said that Jan Sangh workers gathered sizeable audiences through reading from the Gita, and then called for all present to swear on the Gita to vote Jan Sangh.[5] There is no way of verifying these allegations. The Jan Sangh workers vehemently denied having done any such thing, although there were several informants who repeated the allegation. However, there is considerable evidence to show that the Jan Sangh appealed to Hindu voters and planned its election strategy and campaign in such a manner that the election centred on purely communal issues. In the first place, it confined the campaign to the predominantly Hindu villages. During their round of the villages in the constituency, the Jan Sangh workers generally bypassed Muslim villages and did not try to appeal to Muslim voters for their support. A supporter of the Jan Sangh candidate, whom I interviewed in 1962, said "We would like Muslims to vote for our party but we know very well that they have no sympathy with our cause and that they will not vote for us. What is the point in wasting our energies on them when we know that they will all vote for Congress?"

A factor which favoured the Jan Sangh propaganda was the association of the Congress with the Muslims. Before Independence the Shia and Sunni Muslims were divided on the basis of support to the Congress. The Shias usually supported the Muslim League under the leadership of the Rajah of Mahmudabad; the Sunnis largely supported the Congress. After Independence the Shia supporters of the Muslim League, who stayed on in large numbers as the area was not directly affected by communal violence, joined the Congress. It thus came to be increasingly dominated by Muslims. The Jan Sangh workers propagated that a vote to the Congress would be a vote to Muslims who would again bring about the partition of India. Given the political background of the 1962 Congress candidate, such a charge seemed credible to voters.

The propaganda carried out by the Jan Sangh had considerable influence on the campaign of the Congress candidate both in 1957 and in 1962. In 1962 I had the opportunity of witnessing the election. Congress party workers were then initially concentrating on economic issues in their campaign and trying to appeal to the voters by pointing out the progress brought about by the Congress during the period since Independence. However, when the Jan Sangh campaign became exclusively centred on the communal issue the Congress workers were placed on the defensive. They tried to refute the allegation that cow slaughter would increase if a Muslim was elected from the constituency on the Congress ticket and pointed out that UP was one of the first states to have passed the Anti-Cow Slaughter Act.

It is possible that the Jan Sangh propaganda about cow slaughter might have been less effective if the Congress nominee was a non-Muslim. Since he was a Muslim the propaganda proved effective among the villagers. Moreover, the communal solidarity prevailing among the Muslims also helped the Jan Sangh candidate. The Muslims were over-whelmingly in favour of the Congress and mass Muslim support for him had the effect of generating an opposing solidarity among the Hindu voters. It is difficult to say that the Muslims were supporting the Congress candidate primarily or simply because he was a Muslim himself. In the first general election when the Congress candidate from this constituency was a Hindu, Muslims had voted for him *en bloc*. One of my Muslim informants, the Pradhan of the Gram Panchayat in the village where I did my field work, said that he would have voted Congress even if the Congress nominee was a Hindu, because no other party would care as much for the Muslims as the Congress and the security of the Muslims lay in the continuation of Congress rule. In any case, block Muslim support for the Congress candidates both in 1957 and 1962 coupled with the Jan Sangh propaganda about cow slaughter had the effect of bringing about a more or less direct identification between the Congress and the Muslims on the one hand, and between caste Hindus and the Jan Sangh on the other. When it came to voting, inter-caste cleavages obtaining among the Hindus almost disappeared, and caste Hindus all voted for the Jan Sangh. On the other hand, Muslims generally voted Congress, although Muslim votes were

split by Muslim independents on both the occasions. Scheduled Caste votes by and large went to the Congress, the party which had promoted Harijan uplift, although in those villages where the influence of the dominant caste was pronounced, patron-client relationships were strong, and the patrons were pro-Jan Sangh, the Jan Sangh candidate was able to secure some support among the Scheduled Caste voters.

New Political Situation

The political situation in Rudauli constituency at the time of the fourth general election was significantly different from that in the earlier elections. For one thing, the Jan Sangh MLA had gradually lost popularity and several party workers and sympathisers who had worked for him in the earlier elections were now antagonistic to him due to what they described as changes in his behaviour and temperament. Some of them complained that his success in two consecutive elections had bred in him a sense of invincibility and absolute power, complacency, intolerance, arrogance, and unresponsiveness to the wishes of his partymen, supporters and the public. By the life he led, the way he acted in political matters, and the associations he kept, he had moved away both from his supporters and the electorate. There were some who also suggested that he had become a corrupt politician since his second election as MLA, and instead of sharing the advantages of his position with the party workers he had used his influence only for securing quota-permits for his family and kinsmen and a few chosen favourites. In other words, his unpopularity was growing and a strong opposition was building up against him. Nevertheless, the Assembly ticket was once again allotted to him. It was alleged in close party circles that he had succeeded in getting the ticket through the influence of one of his kinsmen who was a member of the UP Jan Sangh Parliamentary Board. In any case, the announcement of his candidature was looked upon as an imposition of an unpopular candidate on the constituency and it resulted in many peripheral workers and supporters of the party becoming alienated and deciding to work against him.

Another significant factor which played a crucial part in altering the pattern of political alliances was the absence of an influential Muslim candidate in the electoral arena. We have seen that in the two preceding elections the Congress nominees from this constituency had been influential Muslims and their presense in the field had created a sharp cleavage along the lines of communal affiliation. Political solidarity is a highly situational kind of solidarity, and Hindus and Muslims tend to interact as single political entities only in those situations where the main conflict is along the lines of religion. On the other hand, in situations where the conflict is confined to members of the same community, the cleavages prevailing within the community tend to become sharp and the crystallisation of political cleavages follows the lines of caste, kinship, etc. As there was no Muslim candidate in the field this time political solidarity did not follow communal lines. The internal relationships and cleavages within the communities became the basis of political alignments and the high caste Hindus who had cast their votes earlier in favour of the Jan Sangh candidate were now divided castewise, this division itself resulting in a much more complex voting pattern.

Finally, the political situation in the Rudauli constituency in 1967 was altered by the emergence of the Muslim Majlis-e-Mushawarat. I have elsewhere discussed the role of this organisation in some detail, but a few general remarks will be useful in understanding the electoral process in this constituency. The Majlis-e-Mushawarat was started by some Muslim leaders in 1960 following the communal riots in north and central India. Initially, the aim of the organisation was to create a consciousness of the problems facing the Indian Muslim community among the national political leaders and to call for the creation of adequate safeguards to protect the community from repeated outbursts of communal frenzy. Although the character of the organisation had been communal from the beginning, it had abjured political objectives and had decided to work only for the welfare of the Muslim community. In the course of time, however, the leaders of the Majlis were unable to keep the forces set in motion by them entirely under their control and the distinction between politics and general welfare activity could not be maintained effectively. The Majlis which had originally started as a non-political organisation soon found a pathway into politics by participation in the general election.

As a prelude to its entry into the electoral arena, the Majlis-e-Mushawarat formulated a nine-point charter at a meeting held in New Delhi early in 1967. It is unnecessary to enter into any detailed discussion of the various demands embodied in the charter or even to evaluate its underlying motivations. Suffice it to say that the charter contained a programme seeking special concessions, including acceptance of separate electorates through proportional representation for Muslims. There was some difference of opinion among the leaders of the organisation regarding the objectives to be achieved by the charter and the role which the Majlis should play in the forthcoming elections. Syed Mahmud, the President of the All-India Majlis-e-Mushawarat, maintained that the Majlis, being a non-political organisation, should keep out of the elections and allow Muslims to exercise their franchise as individual citizens. The controversy between the two leaders went on for some time until it was set at rest by Faridi unilaterally deciding to organise the Majlis on a provincial level with a view to wards political consolidation and electoral participation.

The political tactics of the Majlis-e-Mushawarat in Uttar Pradesh were based on the principle of bargaining. Before the elections the leaders of the Majlis presented a nine-point charter to national political leaders including those of the Congress for acceptance and approval. It was argued that in the earlier general elections the Muslims had stood solidly behind the Congress and that such unconditional support would not be forthcoming any longer. Prior acceptance of the charter was to serve as a basis for the continuation of Muslim support for the Congress in the 1967 elections. Having failed to receive the approval of the Congress, the Majlis entered into political alliances with individual candidates and supported them against the Congress candidates. In the state as a whole it supported a number of independents, several Socialists and Communist and a few Republican nominees. In Rudauli, it supported an independent candidate who was finally elected. The leaders of the Majlis-e-Mushawarat toured the constituency advising Muslims to vote in his favour. It is difficult to say that all the Muslims in the area voted for the Majlis-supported candidate, because Muslims did vote for the Congress and the SSP. Nevertheless, the Majlis-e-Mushawarat was quite successful in alienating a large number of Muslim votes from the Congress, opening up the possibility of a realignment of political support.[5]

The three factors which I outlined above were responsible for introducing significant changes in the electoral situation in the Rudauli constituency. For instance,

TABLE 1: CASTE AND OCCUPATION OF THE CANDIDATES IN RUDAULI ASSEMBLY CONSTITUENCY IN 1967

Candidate	Caste	Occupation	Per Cent of vote
IND 1	Brahmin	Agriculture	25.23
Jan Sangh	Bania	Trade	20.73
Congress	Thakur	Landowner	20.68
SSP	Kurmi	Lawyer	13.28
IND 2	Lodha	Agriculture	13.20
Swatantra	Bania	Lawyer	5.04
IND 3	Kayastha	Agriculture	1.82

they created a socio-political situation in which it became necessary for caste loyalty to play a far more important role in the election than it had done earlier. It would therefore be interesting to study the manner in which the traditional loyalties of caste and kinship were exploited by the candidates, the appeal they had for the electorate and the interaction between representative political institutions and traditional social groups. In the remaining part of this paper I shall discuss the career and background of the candidates, the organisation of their election campaigns, and the dynamics of the election generally.

New Electoral Strategy

Because of the dominant position enjoyed by the Congress in the politics of the country, it is usual for the opposition parties to announce the names of their candidates only after the Congress has announced its list. The election strategy of the opposition parties is mainly directed against the Congress candidates and an opposition party in any particular area is often required to change its candidate at the last moment so as to be able to offer a keener contest to the dominant party. In the Rudauli constituency, however, it was the Jan Sangh candidate who constituted the stable factor in the political arena, and consequently the election tactics of all the parties or candidates likely to enter the contest were directed against him. We have seen that in the past the Jan Sangh candidate was successful owing to the combination of two distinct factors. First, the main contest on both the occasions was between the Jan Sangh and the Congress. Second, the crystallisation of political forces had followed the lines of communal affiliation, resulting in a more or less clear-cut identification between the caste Hindus and the Jan Sangh on the one hand, and between the Congress and the Muslims and Scheduled Castes on the other. In the 1967 election the strategy of all the candidates likely to enter the contest for the Rudauli seat was directed towards avoiding a direct contest and preventing the election from becoming a purely communal contest.

In 1967 there were seven candidates in the Rudauli constituency. The Jan Sangh candidate who had won the election from this constituency in 1957 and 1962 was attempting to repeat his victory. During the previous decade he had used his position as an MLA to strengthen his influence in the constituency and he was considered a serious candidate by all standards. One of the important advantages enjoyed by him lay in the organisation of his party in the constituency. It had a network of branches covering the area, and party workers had tried to popularise its political ideology in practically all the Hindu-dominated villages during the past decade. It was expected that, apart from the caste Hindus whose support the party enjoyed traditionally, the members of the Scheduled Caste would also vote for the Jan Sangh as its political activity had lately been directed towards the latter. Prior to the election, the Jan Sangh leaders expressed the view that while the contest was going to be keen, their party candidate was going to emerge victorious by a margin of over 3000 votes.

The Congress choice for Rudauli was a big landowner belonging to the Thakur caste. He was recognised as a man of influence in the politics of the district. At the time of his nomination he was a member of the Educational Development Committee of the Barabanki District Board, and Pramukh (Chairman) of the Rudauli Community Development Block. In the UP Congress he identified himself as a member of the Tripathi faction, and had been allotted the Congress ticket in preference to another applicant belonging to the Gupta faction. He had close kinship ties with the Thakurs who enjoy a position of dominance in the villages in the central part of the constituency, and he expected his major support to come from his kinsmen and the Scheduled Castes and Muslims. Congress party workers thought that he would win the election by a comfortable majority.

Apart from the Congress and the Jan Sangh, the SSP was the only other party which had some organisational base and political backing in Rudauli. The following of the SSP was mainly concentrated among the Kurmis and Ahirs because Ram Sevak Yadav, a prominent SSP leader of the state, was an Ahir by caste and belonged to the district. The SSP candidate from the Rudauli constituency was a member of the Kurmi caste and he counted on the support of his castemen and of the Ahirs, a caste allied to the Kurmis. He was a lawyer practising in the District Court and had been a member of the SSP since its inception. It was believed that all of the six to seven thousand Kurmi and Ahir votes in the constituency would be cast in his favour and if he succeeded in securing some of the Muslim and Scheduled Caste votes he even had a chance of winning the election. As his running mate for the reserved (Scheduled Caste) Lok Sabha constituency was a member of the Chamar caste, it was expected that the latter would reinforce his compaign publicity.

The official candidate of the Swatantra party was a member of the Bania caste, the caste to which the Jan Sangh candidate also belonged, and he lived in Rudauli. He had at one time been an active member of the Jan Sangh and had also served as the Secretary of its district executive committee. He had also, at one time, been an associate of the Jan Sangh candidate but had broken off his association with the party, it is believed, due to some disagreement with the former and was now standing in opposition to him. The Bania community in Rudauli town was strongly pro-Jan Sangh and it was extremely unlikely that the Swatantra candidate would be able to split the Bania votes of the Jan Sangh. Otherwise also the Swatantra party had no following in the area. As a result, he was not likely to win the election, although he surely could be instrumental in splitting some of the other Jan Sangh votes in the neighbouring villages where he had kinship links and Jan Sangh influence was weak. Apparently, this was his major aim in contesting the election, for he had not forgotten his quarrel with the Jan Sangh candidate and wanted to see him defeated.

In addition to the official candidates of the different political parties, there were three independents who were also contesting the Assembly seat. One of them, to be called IND 1, was the son of a dissident Congressman belonging to the Gupta faction in the UP Congress. His father had intended to contest the election and had applied for the Congress ticket from this constituency. However, his application was rejected in favour of a member of the Tripathi faction and so he had decided to put up his son as an independent. IND 1 was a relatively young and inexperienced politician and had no personal following. However, he was recognised throughout the constituency as a man markedly secular in outlook with an obliging temperament, and people respected him a great deal. He was considered a good friend by the Muslims in particular and he enjoyed considerable support among them. It was alleged that he had saved several Muslim families in Rudauli from getting into trouble. Once, for example, when a cow was lying slaughtered in the house of a Muslim butcher and a police party was going to raid his house at the instance of some Jan Sangh leader, he had gone ahead of the police party to warn the butcher family of the impending danger. He was a Brahmin by caste and enjoyed the support of his castemen also. In this part of the country the Brahmins are rich landowners but, as they are forbidden by religious taboos to engage in cultivation, they cultivate their land through farm servants. It was expected that his castemen would use their influence and position as patrons and secure the votes of other castes too in his favour. It was estimated that he would command between seven to eight thousand votes belonging to his own castemen, his Muslim personal friends and supporters, and the clients employed by his castemen in the villages.

The second independent candidate (IND 2) was a member of the Lodha caste. The Lodhas are a caste of cultivators and farm labourers in the area, and constitute an estimated five to six thousand voters in the constituency. The appeal of IND 2 was largely confined to the members of his caste and, by all accounts, it was expected that he would not poll more than three to four thousand votes. However, the Lodhas have a strong caste panchayat and it had commanded all the Lodhas to vote for the candidate of their caste. Any Lodha who did not vote for his casteman was threatened with being made outcastes. It should be noted that from the point of view of the election his candidature was significant only insofar as it served to neutralise the Lodha votes.

The third independent candidate, IND 3, was a Kayastha, against whom there were several allegations. The Jan Sangh workers alleged that he had been bribed by the Congress candidate to contest the election to split Jan Sangh votes. On the other hand, the Congress workers alleged that he enjoyed the Jan Sangh's financial support as one of that party's tactics to split Congress votes. It was difficult to ascertain who his actual sponsors were but it was sufficiently clear that he was a dummy candidate. Although he filed his nomination, he did not carry out any campaign publicity, and he clearly did not want to waste whatever money he had received from his sponsors in organising an elaborate election campaign. Seen in the perspective of the total electoral picture and the final outcome of the contest, his candidature was insignificant.

By the time the names of all the candidates likely to enter the contest for the Assembly seat from Rudauli became known there was a more or less clear-cut identification between each candidate and the communal or caste group to which he belonged and from which he expected to derive his major support. The SSP candidate, for instance, belonged to the Kurmi caste and he was primarily banking upon the support of his own castemen. Similarly, IND 2 believed that his main support would come from the Lodhas, and the identity between him and the Lodha caste was so clear-cut that even others thought that he would only get the votes of his caste and none else. Moreover, each candidate had an approximate idea of the number of votes he commanded in the constituency.

In a system where many candidates stand and each candidate has the support of a block of voters, quite small groups can become important through the electoral system and victory can be obtained on a minority vote. This is particularly likely when the support of the different parties or candidates is more or less evenly balanced. In Rudauli the electoral campaigns and publicity of the various candidates were naturally directly towards two objectives: first, to strengthen and mobilise the allegiance of the group from which the candidate hoped to derive his major support, and second, to win over the uncommitted voters to his side.

For purposes of our analysis it is necessary to classify election campaigns into two kinds. First, there is what might be called the formal campaigning on the part of the candidates. It consists of the publication of leaflets, publicity through public meetings held throughout the constituency in the weekly markets and important villages, parades, entertainment programmes, and street-corner rallies. In some cases national party notables are invited to visit the constituency and speak at public meetings. The formal type of canvassing and campaigning begins quite early in the election, generally soon after the candidates have announced their candidature. Party workers and supporters start moving through the villages distributing pamphlets, posters and handbills, making announcements about their candidates and their party ideologies, making contacts with the influential leaders in each village and requesting them to support their candidates. Sometimes, these supporters also go from door to door and try to contact the heads of households in the villages. In the rural areas the weekly markets serve as a useful place for canvassing and these are often chosen by the supporters for organising election meetings. Sometimes the candidate himself comes and addresses the audience, but more generally it is the supporters who address the villagers and try to convey the candidate's policies to them. The market place is considered a suitable venue for campaign publicity by the candidates because people from different villages congregate there enabling news to travel far and wide.

Unlike in the past, the formal campaigns of all the candidates were almost entirely focused on economic issues. The Congress candidate tried to project the image that his was the only political party with the political experience and influence to rule such a vast country as India. He emphasised the role of his party in the national movement and the reconstruction of the country since Independence. He stressed the contribution made by his party in raising the living standards of the people through community development, agricultural and irrigational work and social welfare activity despite the many difficulties through which the country was passing. In particular, he referred to the introduction of democratic institutions at the village level, abolition of begari and exploitation of the cultivator by the non-cultivating landowner, and protection against alienation of landholdings.

On the contrary, the opposition candidates condemned Congress rule and highlighted the economic depression of the country. In order to make their campaign more effective and meaningful to the electorate, they tried to translate the national problems into issues which directly impinged upon the common man. Thus, they emphasised continuously rising prices, food shortages and drought in the areas adjoining the constituency, rampant corruption in government offices and law courts, and gangsterism which enjoyed political protection and produced increasing insecurity in the countryside. All the opposition candidates promised that they would try to work for the economic betterment of the people, reduction in the rate of land taxation and land revenue, and construction of public amenities such as schools, hospitals, roads, etc.

The extent of formal campaigning tended to vary according to the support and financial resources of the different candidates. Political parties such as the Jan Sangh and the Congress, which have an elaborate political organisation, large financial resources and a large number of party workers, were able to conduct a far more intensive and elaborate campaign than their independent counterparts. Nevertheless, compared to other candidates, IND 1 carried out an extremely intensive campaign although his financial resources were almost entirely personal and his supporters were mainly his friends.

In a mature democracy a candidate uses the formal campaign as a means of establishing mass contact with the electorate. In the rural areas of Uttar Pradesh the channels of communication are poorly developed and no candidate can expect to reach and establish contact with every voter even through a highly systematic organisation of village-rounds by his supporters. Moreover, the social situation is such that the individual voter is simultaneously subject to competing social loyalties, and he is often influenced by social considerations rather than a rational analysis of political programmes in choosing his candidate. In that situation, a candidate is required to find means of appealing to the traditional loyalties of his voters. Broadly speaking, the major social institutions that a candidate tries to exploit for this purpose are the religious community, caste and kinship.

The appeal to the traditional loyalties of the voters is generally made in the informal election campaign. It consists of making personal or direct contacts in the villages with the village leaders and their supporters. In recent years, a number of scholars have referred to the existence of vote-banks and pointed out that throughout the countryside there exist influential persons who enjoy the support of groups of people and can get them to vote in favour of a particular candidate. Informal electioneering is generally directed towards securing the support of the heads of these vote-banks in favour of a candidate and the politicians try to make their contact through these leaders. Candidates and their backers consider informal electioneering carried out through the party organisation or helpful individuals to be crucial to the final outcome of the election.

The most important aspect of informal electioneering consists in appealing to the voter through particularistic and traditional loyalties like those of caste, religious community or kinship. Where cleavages of various kinds operate simultaneously the candidate finds it difficult to compose a message which would seem constructive, much less, pleasing, to everyone. Any overt effort on the part of a candidate to ask people to vote on the basis of caste or religion amounts to a 'malpractice' which disqualifies a candidate. Yet, religious community, caste or kinship are crucial factors in the electoral process, and a candidate often has to make an appeal to all these competing loyalties in any electoral contest while he pays respect to the letter of the law. This type of appeal is made in informal campaigning. Informal campaigning is also used for purchasing votes, passing on bribes, pressurising the voters, etc. It is interesting that much of the expenditure incurred in the informal campaign is not included in the statement of election expenses which every candidate is required to submit to the Election Commission both because it would swell the expenditure far beyond the limit set by the law, and even more importantly, the items on which it is spent are not permitted under the law.

In the 1967 election all the candidates in Rudauli constituency tried to make an appeal to the voters on the basis of traditional loyalties although the specific technique varied from candidate to candidate. The main strategy of the Congress candidate was to approach the locally influential leaders such as Pradhans, Sarpanchs and landlords in the villages, and use their authority and power to influence voters belonging to the intermediate and lower castes.

In the past, approaching the electorate through the dominant castes worked well because their hold on the lower castes whom they employed as artisans, agricultural labourers and farm servants was quite firm, and a candidate who succeeded in securing the support of the dominant caste patrons automatically secured the support of the intermediate and lower castes. But in this election the dominant caste approach did not always work effectively. During the last decade, due partly to the periodic elections themselves, the intermediate castes had undergone a high degree of politicisation and they were no longer prepared to follow the dictates of the dominant castes. Whenever a candidate or his supporters approached the voter through the dominant caste patrons he enthusiastically agreed to abide by the wishes of his patrons, but when it came to voting he overlooked the command of the patron and voted for the candidate of his own choice, his choice of course having been determined by his allegiance based on his caste or kinship affiliation.

Some candidates sought to make a more direct use of caste in their electoral campaigns and even utilised traditional caste allegiance and channels of communication for enlisting the support of a whole caste group. The SSP candidate and IND 2 are cases in point. Both of them belonged to caste groups which have strong caste organisations, and they tried to approach their voters through their respective caste organisations. The SSP candidate approached the leaders of the Yaduvanshi Kshatriya Mahasabha and got them to issue an appeal in his favour. This appeal was widely publicised among the members of his caste and all the Kurmis and Ahirs worked for him. Similarly, IND 2 approached his voters through the caste panchayat. The Lodhas in this area have a strong caste panchayat and at one of its meetings before the election the panchayat decided that in the forthcoming elections all the Lodhas should vote for IND 2 who was a member of that caste. The political decisions of the panchayat spread quickly in this area and within a few days the entire Lodha caste was wholly behind IND 2. It should be noted here, however, that a candidate tried to make a direct appeal only to the members of the caste to which he belonged because he enjoyed a direct identity with them. For approaching the members of another caste the technique adopted was almost always indirect, although it happened in most cases that a whole caste group was behind a candidate even when he did not belong to the caste.

In addition to caste links the candidates also tried to explore and exploit kinship relationships for mobilising political support. Party workers and supporters of the various candidates went

TABLE 2: CASTE OF THE VOTERS AT MAKHDUMPUR POLLING STATION

to the villages where they had kinship ties and made an effort to secure votes for their candidate by invoking these ties. Whenever a candidate was faced with a situation where a leader of a caste or political faction openly declared himself in his favour but secretly worked for another political party or candidate, the problem was solved by finding an influential kinsman and making him counteract the machinations of the leader. It is significant that kinship loyalties often overrode loyalty to political faction and party. The Congress candidate from the neighbouring constituency in this election was a Brahmin and was related to IND 1. Although as a Congressman he should have canvassed for the Congress candidate from Rudauli, he used his contacts in the constituency to canvass support for IND 1.

It has been mentioned that the Muslims constitute a sizeable proportion of the population in Rudauli. In the earlier elections they voted for the Congress *en bloc*. It is quite likely that this time again they would have voted Congress but for the emergence of the Majlis-e-Mushawarat. The stand of the Majlis was that the Congress should be defeated, and all the leaders of the organisation tried to prevent Muslim votes from going to Congress candidates. They argued that, though the Muslims had solidly stood behind the Congress in previous general elections, their problems had failed to attract the attention of the Government. The Muslims were being increasingly isolated economically. They did not enjoy any significant place in the economic structure of the country, and their economic position was deteriorating rapidly. Moreover, there were also threats to the distinct social and cultural identity of the community. For example, the leaders pointed out, Urdu was fast dying out, and the Government had not taken steps to provide facilities for the study of Urdu. The Muslims should support candidates who agreed to work for their interest. As a result of this change in Muslim political orientation, other candidates who were not entirely regarded as representative of the communal Hindu organisations, such as the Jan Sangh, stood a fair chance of securing the support of the Muslim voters and winning the election. All the candidates in the constituency with the exception of those from the Congress and the Jan Sangh therefore tried to win over the support of the Majlis-e-Mushawarat.

The Majlis had devised a particular procedure through which its support could be secured by a candidate. At the beginning of his electoral campaign the candidate soliciting the Majlis' support was required to make out an application expressing his acceptance of the Charter of Demands formulated by it, pledging that in the event of his election he would work for the acceptance of those demands. A committee of the Majlis constituted for the purpose of deciding whom the Muslims in a particular constituency should support then considered the application and decided whether or not to support the candidate. Whenever there was only one application for the Majlis's support, it was readily given to the sole applicant. But when there were several candidates seeking support, the matter was discussed and one of the applicants selected. The Majlis generally selected those candidates for support who were even otherwise likely to win. In the Rudauli constituency four of the seven candidates sought the support of the Majlis and it was finally promised to IND 1.

How effective was the influence of the Majlis-e-Mushawarat among the Muslims in the Rudauli constituency? The Majlis was founded as a pressure group only a few months before the general election and its political influence hardly had time to penetrate into the rural areas. The Urdu newspaper founded by the Majlis to popularise its political ideology had an extremely limited circulation in Barabanki district and its readership was largely confined to the major towns. But the Majlis enjoyed a strong hold over the Muslim voters in the Rudauli constituency for a very special reason. Most of the leading Muslims in the constituency were strongly in favour of the Majlis and they were willing to deliver the Muslim votes controlled by them to the Majlis-supported candidate. Once the Majlis announced its decision to support IND 1, the leading Muslims carried out an effective campaign for him and tried to convince the Muslim populace of the desirability of voting for him. Moreover, statements signed by the leaders of the Majlis and pamphlets appealing to Muslims to support and work for IND 1 were distributed in the villages.

If IND 1 stood to gain by the Muslim votes, it was to the advantage of the other candidates that those votes should be split up. They tried, therefore, to make certain tactical moves to woo the Muslim votes. Many of the candidates tried to influence Muslim voters by bringing some pressure upon the leading individuals who were supporting the Majlis. The attempts made by the SSP candidate to win over the Muslim votes in one particular village provided a good example of how votes were sought. In this village the Muslims constituted more than fifty per cent of the voters and they were all likely to vote for the Majlis-supported candidate. The campaign for him was vigorously carried out by two leading Muslims who were influential among the villagers. One of them, a medical practitioner living near the railway station about two miles from the village, was widely respected by the villagers. The other was a landlord of a neighbouring village which is grouped with this village and the two together form the 'revenue village'. In the past he held considerable land in this village and several villagers were bound to him by ties of clientship. Lately, he did not enjoy any economic power over the villagers but they were bound to him in ritual relationships. He was a Saiyad *pir* and many of the villagers were his *murids*, devotees who had pledged their loyalty to the *pir*. The relationship between the *pir* and his *murids* is usually a very strong one and it was natural that the villagers should have been influenced by it.

TABLE 3: CASTE BASIS OF ELECTORAL SUPPORT

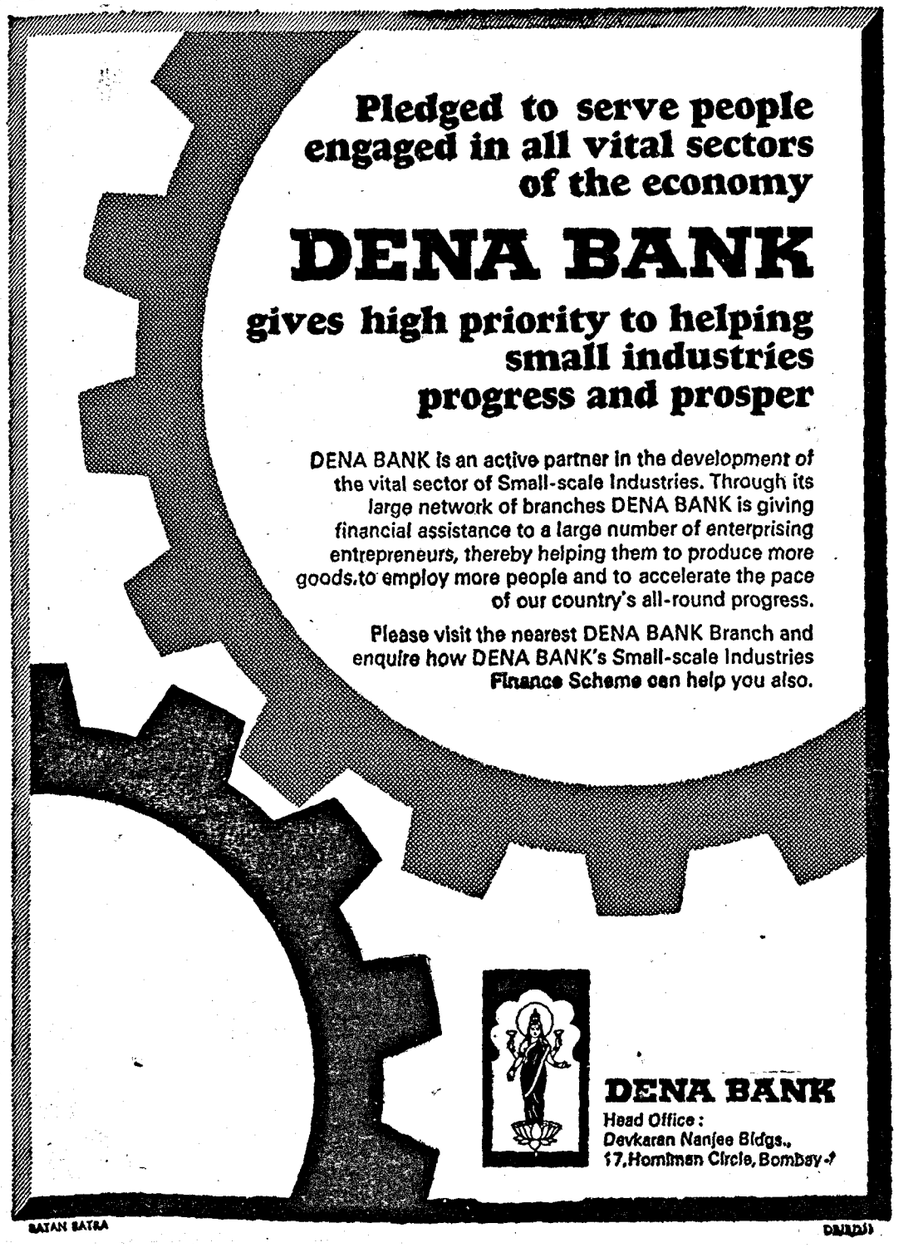
Candidate	IND 1	Jan Sangh	Congress	SSP	IND 2	Swatantra	IND 3	Invalid Votes
(a) Votes Polled	147	84	184	268	37	20	12	30
(b) Attributed Caste Base	Brahmin 6		Scheduled Castes	Ahir 140	Lodha 40			
	Muslim 169	Bania 63	151	Kurmi 59		—	—	—
	Murao 10		Thakur 28					
(c) Discrepancy	38	21	5	69	3	—	—	—

At the beginning both the medical practitioner and the Saiyad *pir*-cum-landlord were canvassing in the village for the Majlis-supported candidate. The SSP candidate who had a large following in a neighbouring Kurmi-dominated village attempted to split the Muslim votes in this village by securing the backing of one of the influential men working for IND 1. It is alleged that he negotiated with the Saiyad landlord to secure his support and even passed on some money to him. While it was difficult to ascertain whether he was actually bribed, it was striking that the landlord who was till then supporting the Majlis' candidate suddenly changed his mind and went about urging Muslim voters to support the SSP candidate. It may be mentioned that the change in the position of the Saiyad landlord posed a conflict of loyalties among the Muslim voters in the village and many of them resolved it by abstaining from voting. As one informant said, "If I went to vote, the medical practitioner as well as the Saiyad landlord would have tried to pull me to their camp and this would have embarrassed me. I did not go to vote so that I would not be embarrassed." Polling was very poor in the village as a result, only 310 out of 991 voters actually exercised their franchise.

On the eve of the election there was a more or less clear-cut identification between the different candidates and the different main social groups with the exception of the Jan Sangh candidate who was expecting diversified support. The Congress candidate believed that, apart from the Thakur caste to which he belonged, his main support would come from the Scheduled Castes. Although the Majlis-e-Mushawarat had been successful in consolidating the Muslims in favour of IND 1, the Congress candidate still expected that some Muslim votes would be cast in his favour. The SSP candidate and his supporters believed that their main support would be from the Ahir and Kurmi voters. The hopes of IND 1 centred around the Muslims and the Brahmins. He believed that if he succeeded in securing the votes of some of the Kahar and Murao voters whose support he had tried to enlist through their caste organisation, he would win the election. IND 2 enjoyed the backing of his caste panchayat and it was certain that his support would be confined to his caste-fellows only. It was clear that polling was going to follow the line of caste and religious affiliation and the candidate who succeeded in bringing most of his supporters to the polling booth would win the election.

It was widely believed that the main contest was going to be between the Jan Sangh, Congress and IND 1, although the SSP candidate was considered to be a close contestant. Both the Jan Sangh and Congress candidates had an edge over IND 1 insofar as both belonged to fairly established political parties and had been able to use the resources of their party organisations for election purposes. They had no paucity of workers and their campaign publicity had been carried out even in the most remote villages of the constituency. IND 1 did not have the resources of an established political party and he was also short of workers. Although he tried to make up for this shortage by the intensity of his campaigning, it was said that his entire campaign was going to fall apart on the polling day when he would not find sufficient workers to put up tents opposite every polling station to fill out the voter's registration cards and give the crucial, final push to the voter to vote for him. It seemed, on the whole, that the chances of IND 1 depended very much on his ability to bring his voters to the polling booth because the Jan Sangh and Congress candidates were certainly likely to have an edge over him in this matter.

Results



IND 1 won the election by a margin of 2,150 votes over his nearest rival. He secured 25.23 per cent of the total valid votes polled as against 20.73 per cent and 20.68 per cent by the Jan Sangh and Congress candidates respectively. The SSP candidate polled 13.28 per cent of the total votes, but he and the remaining three candidates lost their deposits. The contest was an extremely close one and the victor won by a margin of only 4.6 per cent of the total votes. The earlier speculation that IND 1's campaign would fall apart on the polling day on account of his inability to put up tents near every polling station was proved wrong. In fact, the rural voter proved more intelligent and subtle than was usually imagined. On the polling day the Congress and Jan Sangh tents in several places were busiest; but IND 1 led at all these places. It seems that a very large number of voters accepted the help of the Jan Sangh and the Congress workers but voted for IND 1.

What were the factors responsible for the success of IND 1 in the election? It will be recalled that in the earlier elections the Muslims and Scheduled Castes had supported the Congress, and the caste Hindu voters favoured the Jan Sangh candidate. At this election the Scheduled Castes again supported the Congress candidate but the votes of the caste Hindus were split three ways. The SSP candidate successfully attracted the Kurmi and Ahir votes, and IND 2 deprived the Jan Sangh of Lodha support. The caste Hindu votes secured by the Jan Sangh candidate were neutralised by the Scheduled Caste votes of the Congress candidate, and consequently both the candidates lost the election although both succeeded in getting almost an equal number of votes. Because the support of all the candidates was evenly balanced, the Muslim votes played a crucial role. Although some Muslim votes were polled by the Congress and SSP candidates, they largely went to IND 1. If there had been no Kurmi and Lodha candidates in the field, it is most likely that these votes would have gone to the Jan Sangh, enabling its candidate to win the election again. The defection of the Kurmi, Ahir and Lodha votes from the Jan Sangh, and the *en bloc* Muslim support for IND 1 paved the way for the defeat of the Jan Sangh candidate and the election of IND 1.

Although many of the candidates for the Assembly seat from Rudauli belonged to all-India political parties, the political ideology or programmes of these parties did not play a very significant part in the election. On the contrary, religious community and caste were the most influential determinants of voting behaviour. This is brought out most vividly by a casual glance at the number of votes polled by the various candidates at the various booths. By and large, the Congress and Jan Sangh candidates did uniformly well at all the polling stations, except that the votes polled by the Jan Sangh candidate were reduced in those areas where Muslims were preponderant. The SSP candidate led in those villages where the Kurmis and Ahirs were found in large numbers. In those areas where the population of Ahirs and Kurmis was particularly thin,

the SSP candidate polled very few votes. Booth-wise figures of votes polled by IND 1 reveal that he led from all the polling stations having a large Muslim population. In other areas he polled some votes and obviously these were those of the other groups who supported him.

Unfortunately, data on the caste or religion of voters for each polling station in a constituency is not available. However, an analysis of the caste of the voters can be attempted on a more limited scale. In Table 2 I have presented the caste of 756 out of a total of 782 voters who exercised their franchise at one of the polling stations, and I shall try to discern the relationship between caste and voting pattern on the basis of this voting. It may be mentioned that these data were obtained from the political parties who had set up their tents near the polling station. Before going into the booth the voters take their registration cards from these tents and the names of the voters are marked by the workers in their copy of

the election rolls. I obtained the names of all the voters who had exercised their franchise from these election rolls and then found out the caste or religious affiliation of each voter from the village to which he belonged. I had the data on the castes of the voters from two of the three villages which were included at this polling station, and I subsequently collected the information for the third village from the Pradhan of that village

If the total number of votes polled by each candidate at this polling station is seen in relation to the castes of the voters, it is found that there was a remarkably close relationship between the castes of the voters and the candidate whom they voted. I have presented this relationship in a tabular form in Table 3.

Table 3 gives the total number of votes polled by each candidate and the number of votes cast by each of the main caste or communal groups from whom he was expected to receive his major support. It is seen that IND 1 secured only 147 of the 185 votes belonging to the groups which were expected to support him, 53 votes being polled by other candidates. In this area, I have already mentioned, the SSP candidate had tried to split some Muslim votes and these 53 votes may be those of Muslims which were cast in favour of the SSP candidate. It seems more likely to have been the case when it is seen that the SSP candidate gained 69 votes more than the total votes of the Ahirs and Kurmis whose support he was promised. In the case of all other candidates, caste groups seem to have voted *en bloc* and the link between the candidate and the caste groups which voted for him was clear. If the Jan Sangh candidate, for instance, secured more votes than there were Bania voters, he definitely would have secured these extra votes from among the groups whom we have included under the category 'others'.

The part played by caste was both direct and indirect, although the increasing politicisation of the rural voter led to a more direct relationship between caste and electoral politics. The direct role of caste in the election was dramatically brought out by an incident which occurred at one of the polling stations in the constituency. A Lodha voter cast his vote for the Assembly seat for IND 2 whose election symbol was a lion. When he failed to find the lion on the ballot-paper for the Lok Sabha seat he returned to the polling officer and asked him why the symbol of his candidate was not there. The polling officer tried to explain to him that the candidate with the lion as his symbol was not contesting for the Lok Sabha seat and asked him to make a choice from among the candidates listed on the ballot paper. The voter looked puzzled and said, "If the symbol of my candidate does not appear here, I shall not cast my vote. I do not want to be excommunicated from my caste at this old age." And he walked away without even bothering to put his ballot paper into the ballot box.

It will be observed that the rate of polling in the constituency was extremely low. Only 52,156 out of the total electorate of 106,099, that is to say only 49.2 per cent, voted in the election. What were the reasons for the low polling? I am not in a position to offer any general explanation which may be applicable to the whole constituency, although some understanding of the reasons may be obtained from the situation in the village where I did my field work. In the first place, the rate of polling in the village was low on account of the failure of the candidates to bring the voters to the polling station. In the rural areas a voter does not generally come to the polling station on his own but it is rather the responsibility of the candidates to bring him in to cast his vote. This is particularly true in case of women voters who are unwilling to walk up to the polling booth and require some kind of conveyance. In this election there was considerable confusion regarding the candidate whom the villagers were likely to support. Originally, IND 1 was expecting the support of the villagers but after the SSP candidate's efforts to split his votes he thought that he was not likely to get much support, and so did not send bullock carts to fetch the voters from the village. On the other hand, the SSP candidate was not altogether sure of his backing and did not seem particularly keen to waste his resources on fetching the villagers. In fact, he thought that so long as the villagers were not going in his favour it was to his advantage that they should also not cast their votes.

Abstention from exercising his franchise is seen by the rural voter as a way out of a situation where his political loyalties are in conflict. We have seen that the support of the medical practitioner and the Saiyad landlord for IND 1 and the SSP candidate, respectively, posed a conflict among the Muslim voters in the village. They resolved the dilemma by abstaining from voting.

Conclusion

There are two main conclusions which emerge from the foregoing analysis. In the first place, it is seen that there are a number of loyalties which serve as a basis for the organisation of political support in the rural areas. These loyalties are those of religion, caste, kinship, and factional grouping. All these loyalties are operative simultaneously but they are situationally determined and operate at different levels. For instance, communal loyalty becomes operative whenever the main conflict is between two religious groups, i e, the conflict between Hindus and Muslims. In a situation where the conflict is between the members of the same religious community, internal cleavages come to the fore and crystallisation of political loyalties follows the line of sectarian or caste distinctions within the religious community.

Our analysis also shows that there is a tendency among the Muslims to turn away from the Congress, the party they have supported since Independence, under the influence of the Majlis-e-Mushawarat. While Muslims in the past stood behind the Congress and Muslim support constituted an important element of the Congress vote, they are now becoming politically organised as a separate group. It is difficult to say that all the Muslims in this constituency voted against the Congress at the 1967 election; in the northern part of the constituency the Congress certainly succeeded in securing some of the Muslim votes. Nevertheless, the role of the Majlis-e-Mushawarat has not been altogether ineffective; it has continued its activities in the region even after the election and it is quite likely that in course of time the influence of the Majlis may result in greater consolidation of the Muslim voters.

One last point. Our analysis shows that political ideology plays relatively little part in determining voting behaviour in the rural areas. On the contrary, caste, religious and kinship ties determine the way in which individuals vote. It is, however, difficult to say whether the value or importance of such ties is merely sentimental or emotional. Perhaps, a more detailed empirical study will reveal that there are often very practical reasons behind a particular religious community, caste or kin group becoming active politically. Apparently, politicisation of traditionalistic social groups is a corollary to the introduction of representative political institutions in a society where distinc-

tion between 'social' and 'political' is still inadequately developed.

Notes

1 This paper was first written in 1967. It is published here in its original form. I wish to thank the Principal, Delhi College, University of Delhi, for academic leave to conduct field work on which this paper is based. I am also thankful to Lloyd I Rudolph, Mckim Marriott, and Nur Yalman for helpful suggestions on an earlier draft of this paper. I am, however, alone responsible for the many deficiencies in it.

2 It seems that sitting MLAs usually lost the election in UP. Of the 24 Jan Sangh members of the Assembly who were re-nominated, 17 were defeated.

3 I have used party labels throughout this paper and not proper names in order to disguise the identity of the candidates.

4 A fourth candidate had filed his nomination as an independent, but he withdrew his candidature at the eleventh hour. A Bania lawyer from Rudauli town, he was alleged at the time to have been sponsored by the Congress candidate as part of a strategy to split Hindu votes. According to several Congress workers, he was persuaded by the Jan Sangh candidate to withdraw his nomination on the understanding that the former would support him in the next election.

5 Angela S Burger reports, "Village respondents of the two parties reported that a Jan Sangh activist came to the villages and, gesturing with his sacred thread, said, 'you are Hindu; I am Hindu. Therefore you should vote Jan Sangh'" (Burger, 1969, p 147).

6 The support of the Majlis-e-Mushawarat was certainly not always a blessing. In many instances block Muslim support produced a Hindu reaction from which the Jan Sangh benefited the most. In Bahraich district the Jan Sangh made a clean sweep of the nine Assembly seats where it previously had none, and the Swatantra party and the Congress had five and four respectively. In Basti, the Swatantra party lost one of the three seats it had held and the Congress three of its nine. In the Rudauli Assembly constituency, however, there was no strong reaction to the Majlis's activities.

Prospects for Indian Political Science Research in the Seventies

Work of the ISSRC

R Srinivasan

A FUTURE historian of the social sciences in India will certainly date the establishment of the Indian Social Science Research Council as the beginning of a new era in social science scholarship, when a new sense of direction was massively introduced in Indian social sciences. Several proposals for research are invited, scrutinised, and supported financially. A systematic centralised collection is being made to house all scholarly materials in the social sciences, like Ph D theses, etc. More important, research is being systematically mapped out, bibliographies of research done commissioned, scholarly items which are languishing in distant corners of the country are being tracked and made available to the world of learning. A number of papers are being written on particular areas in the different branches of social sciences, and regular seminars held to help the scholarly world to make itself more rigorous in its work and research perspectives.

Top level committees in the different fields of social studies were originally commissioned by the Council to indicate important research areas. In the different fields such as sociology, economics, law and political science papers have been written or are being written to survey the research work that has been done, the direction in which research is moving ahead, and neglected areas where no research is done at all. On the basis of these papers seminars in the different fields are being periodically held.

ISSRC and Indian Political Science

In the field of political science, three seminars have been proposed of which two already are over (in Public Administration and Political Science) and a third on International Politics and Area Studies is under preparation. A comprehensive bibliography of nearly 15,000 scholarly items not easily tracked down is being compiled. The papers that have been commissioned in the three branches of political studies, many of which are at present being revised, will be published in five volumes, each of 500 pages. (For the social sciences as a whole there would be sixteen such volumes.) The papers are not to be regarded as bibliographies and should not be expected to be exhaustive. They are to indicate the work done in the different areas, evaluate their quality and finally focus upon researchable items. The presumption appears to be that those who will engage in research in political science in the future will tackle those problems that have not been looked into in the past and that political studies will be comprehensive in their coverage and will gain in intensity in research. Since Indian social scientists, particularly political scientists, are not trained in rigorous scientific methods, a whole paper will look into the problem of methodology.

Readers of *Economic and Political Weekly* will be familiar with the proceedings of the seminar held on Public Administration, (*vide*, "What Ails Public Administration?" June 10, 1971). More recently, a large political science Seminar, large even by Indian standards, was held in Delhi between August 11 and 14, 1971. This was attended by nearly 80 social scientists. The Seminar programme and the timetable were directed by Rajni Kothari of the Centre for Study of Developing Societies, Delhi. An executive committee of the ISSRC had commissioned the papers and got them written. A unique feature of the Seminar was that it had a very wide range of participants from other disciplines—sociology, area studies, public administration, community development, political philosophy, all were represented by specialists. However there appeared to be few historians present—and this appears to reflect the general neglect of historical studies by social scientists in our country. Another distinct feature of the Seminar was that it was dominated by people in their thirties and forties. There was a great deal of critical debate and none was spared. Rajni Kothari, the moving spirit behind the seminar, had to face scholarly salvoes when he presented his papers. But by and large, it was good humoured. Another good thing about the Seminar was that ceremonials were totally absent. The three-day session was exhausting and one felt that had it been extended by at least two days there would have been a more relaxed atmosphere and more of frutiful exchanges between participants outside the seminar halls. There was little time to have leisurely cups of tea with one's colleagues across the subcontinent. Exhaustion was seen on the penultimate afternoon when the participation in the Seminar was almost non-existent, in contrast to the lively discussions on the first two days.

It would have been good if at the beginning of the Seminar some details had been presented about the findings in the earlier public administration seminar. (There appears also to be some reluctance on the part of the political scientists to regard public administration as an important part of political science.) It is quite likely that identical problems were raised in the Seminar on political science and in the earlier seminar, just because of lack of knowledge. It is to be hoped that in the later seminar to be held on International Politics, a brief resume would be made on aspects that might interest the participants, but which have been covered already.

Political Science Survey

The Seminar was called Political Science Survey and its total range was very comprehensive. In the appendix to this report is reproduced the titles of the papers presented in the seminar. This must be regarded as the most comprehensive of evaluations made in India of the state of political science. Many thought that it was indeed a memorable moment, even as perhaps Diderot felt on his completion of his Encyclopaedia. Though it was essentially an exercise in inventory making, it was at the same time something more than a mere inventory. Such attempts, in the past, had never been satisfactory. It was argued that henceforth political science in India will move forward with a sense of confidence that it lacked till recently. A participant remarked: "The level of performance of the papers is striking and they will stand well in comparison with any international group of papers. As a political scientist, I am proud to be here. It is a moving experience. The time is now to move forward."

Like adolescents who feel that they have become adults, there was a pathological concern about equality of status with Western political scientists. This was expressed time and again by many participants and valuable time was spent on trivial issues like whether a separate paper should be written on the contribution by Western scholars on India. That *ferenghi* and *desi* political scientists belong to a larger species of scholarship with identical standards of academic performances and failings was not stressed by even a single participant. Another amusing thing that was noticed was that almost all the participants agreed in general that political science in India had come of age, but when engaged in analying the work done in any particular area complained that there was very little of indigenous scholarship in the field analysed.

Themes and Panels

Since there were twenty papers, it was inevitable that they had to be grouped. Two panels were devised and participants attended such sessions as interested them. In the first panel were papers that are traditionally associated with political science—the Constitution, Parliament, Nationalist Movement, Party System and Elections, State Politics, Local Government, Indian Political Thought, etc. The second panel was concerned with the dynamics and processes of politics. A large number of sociologists were in the second panel. The subjects of these panels were Scheduled Tribes, Caste and Politics, Students, Political Culture, Violence, Religion and Politics, Leadership, Contributions to Political Theory, Performance of the Political System, etc. It was felt by several participants that the contribution of the papers as well as the discussions in the second panel were consistently of a higher order than in the first panel.

A surprisingly large number of papers in the first panel were disappointing, compared to those in the second. It was an extremely refreshing thing that the panel asked one of the paper writers to either rewrite his paper completely anew or hand over the job to someone else. Generally such exacting demands are seldom made in seminars. Two papers on the Indian National Movement and Political Thought of Modern India were again criticised and will have to be written again. It must be accepted that these were done rather indifferently. The paper on Federal Politics in India came too late to be circulated but it was summarised at short notice by a senior academic and it too was rejected as not at all being upto the standards of the panel. Papers in Local Politics and State Politics were surveys indicating the work done.

Annotated Bibliography

The paper on Institutions of Parliamentary Democracy in India while indicating exhaustively the work done in the field, suffered from having to cover a very vast canvas. It was inevitable that in the later parts of the paper it should read like an annotated bibliography. One of the authors of the paper maintained that he had adhered to the terms of reference that were given him for writing the paper. The exact terms of reference given to the participants were not available to the participants. This made the task of evaluating the papers difficult. For instance, while the paper on Leadership was criticised, it was defended on the ground that the writers had kept themselves within the ambit indicated by the terms.

Animated discussions took place on three papers in the first panel—on Comparative Politics, Party System and Elections and on Institutions of Parliamentary Democracy. Lack of empathy in understanding other political cultures and institutions, the need for comparative studies over time and space and above all the dangers of a parochial study of politics were stressed. It was urged that the study of castes and regions *qua* castes or regions should be given up and a wider framework adopted. The study of comparative politics has been generally restricted to studying Anglo-Saxon institutions and the need for exploring non-English speaking areas, particularly Latin America, was emphasised. The fact that election studies are mere *post facto* exercises and do not test hyoptheses, the dangers in the sampling procedures adopted, the neglect of party-building activities, the richness of the data collected and the poverty of the analysis were deplored.

The Second panel of the political sociologists started with an extremely well-written paper on Caste and Politics. It surveyed the research work stressing the continuity of the traditional social structure, the rich analyses of the differentiation that have come about in the social structures, thanks to the stimulation that has come from the outside. Lastly it looked into the politicisation of castes. The extremely wide connotation given to the concept of caste and the need for using the concept as a heuristic device were stressed.

Three papers on violence and politics, the political culture on India and students and politics indicated rich areas of research. The discussion on the political culture of India got bogged down mainly because of a long discussion on what political culture is. The writer of the paper, a psychologist, offering a narrower frame of reference than what is generally adopted was not acceptable to the sociologists who tended to view political culture from a larger prespective. Students and politics was a theme on which, it was discovered, a great deal was being written and analysed mainly by psychologists. It was said that there were nearly 1,500 papers on students but they cumulated into almost nothing of any great significance. It came as a revelation that bodies concerned with education, such as the University Grants Commission, did have a great deal of material that was highly useful but not generally used by the scholars.

Violence and politics was a theme on which the paper began with a consideration of the theory of Kornhauser on Mass Society. It pointed out that reporting on violence was mainly the work of newspaper correspondents. To at least more than one reader it gave the impression that a claim was made that social scientists are better qualified than journalists to look into these problems—a point which needed more defence than was put into the paper. The paper did not look into the psychological dimensions of individuals prone to violence and this is an area that is widely neglected.

Indian political theory is generally regarded to be highly underdeveloped, and the paper of Kothari provoked many to challenge his premises. Some feared that he has become an apostate to behaviouralism. It was suggested that philosophy may degenerate into ideology. It was again criticised that the shift from behaviouralism to normative political theory was not easy. The discussion between the relations between ends and means, a perennial theme, again came up.

Kothari's paper on the performance of the system and political development again raised controversies. Concerned with the political dimensions of the performance of the economy, it was inevitable that the paper should raise differences and controversies. A number of participants alleged that the author tended wholly to ignore critics of the planning processes and that he was highly selective in the evidence that he presented.

The executive committee of the Council was faced with the problem of six themes which remained uncovered by the papers. These were political socialisation, political participation, political recruitment, communication, coalition-making and decision-making. Satish Arora was asked to write on them and he wove them into a paper entitled the processes of politics, perhaps the longest paper presented in the seminar. It covered great ground and in a masterly manner and indicated research areas and priorities.

Religion and politics was a paper on which a great deal of acrimonious debate appeared to have taken place, though the paper itself was unexceptionable. The author argued that power was a central issue that motivated the religious elite to enter into politics. The Hunter thesis that Muslims did not take advantage of educational opportunities in British India, a theme often worked to great detail, was finally laid to rest by the paper-writer by citing their educational and service openings in UP.

Participants and Programme

Certain general observations need to be made on the seminar. In the first place it was essentially one that was dominated by the not-so-young Turks. There was a generation gap and the political scientists in their sixties with one or two exceptions were notably missing. The oldest member present regrettably cut a sorry figure when he did intervene. Unfortunately, the older members who had witnessed in their own professional life a shift from one type of political theorising to another just failed to correct the excesses of the behaviouralists.

The general temper of the Seminar appeared to be that political science in India began in 1960; here was an opportunity for the older members to correct the highly limited approach of the epigoni who sat in judgment of their professional elders with a totally inadequate study of their writings. But the elders failed in this. It was left to the younger generation to protest and to press for a survey of the work done by an earlier generation of political scientists. Occasionally, when an elder political scientist intervened to make a point it was most timely. For instance, K V Rao had to point out that several allegations have been made by political parties aout the working of the Election Commission and this needs to be looked into. Again a senior political scientist with long years of experience in educational administration did intervene and to good effect.

Another impression that one got from the proceedings was that too many papers were presented in too short a period. The programme was very much crowded and the discussions did flag towards the end. It is to be hoped that in the next seminar to be held on international politics, there would be some leisure offered to the participants. The important thing about these seminars is that the participants meet outside the proceedings, exchange notes on work done and of current developments; even gossip can be valuable. None of the participants had the time to meet in a relaxed atmosphere over a cup of tea. More, there was little time available to the participants to read those papers that were delivered late and to ponder over them. Again, the area covered was too large and more than three seminars could have been held on the themes discussed.

Some Persistent Themes

In all the papers some themes tended to repeat themselves over and over again, and it may be worthwhile recapitulating them. Almost everyone felt that the need of the hour was to develop an interdisciplinary approach to research. A participant called this a non-disciplinary approach. (It was again amusing to see political scientists of some sophistication stressing the need for an interdisciplinary approach. The best writing on political science always has been interdisciplinary and elementary acquaintance with the classics would reveal this.) Here the performance of the sociologists was particularly striking. Their interventions were always timely and insightful. One sociologist reminded the participants that political science research seems to lag behind sociological research by a decade. He gave the instance of how while political scientists in the fifties were engaged in institutonal studies, sociologists were studying the dimensions of caste. While the sixties saw them abandoning caste and moving to other fields, the political scientists have taken to caste with great seriousness. He argued that while the sociologists tended to be tentative in their conclusions, the sense of certainty with which political scientists, put forward their views certainly would not be conducive for the development of research in political science.

Yet while there was a general agreement on the need for an interdisciplinary approach, a few purist political scientists feared the sociologists interloping into their terrain and they regarded them as poachers. But such fears, fortunately, were not shared by the group as a whole.

Like King Charles's head the problem of using data cropped up again and again. The available data are not being used fully. What is more lamentable is that the data once used are allowed to gather dust and are not squeezed out to yield more. The need for using the cumulative data available in government reports, etc, was touched upon. Again, the function of the proposed data bank was explained. The pressing need is for scholars from centres to re-use the data gathered by different academic bodies and Rajni Kothari welcomed anyone who would be prepared to use the enormous data that his Centre had collected over the years.

Some Insightful Studies

The need for studying political phenomena in a comparative framework, both space- and time-wise, was stressed in more than one session. Here, the difficulties of having comparative data of similar dimensions were indicated and it was reminded that such a comparision has not been done extensively even in the West. Time-wise, the anthropologists have done some insightful studies and it was suggested that the political scientists do likewise.

It was feared that there is a likelihood of political scientists concerend with the political system as a whole overlooking sensitive areas, radical proposals, and generally impatient gestures on the ground that these would disrupt the system. A young radical political scientist from Delhi time and again offered the timely reminder that behavioural studies might descend to being apologia for the *status quo*. This again brought into focus the question of ends and means which engaged the attention of the participants in more than one session.

There were a few muted complaints which occasionally burst out into the open. It was feared that Delhi was over-represented and the papers were written exclusively by those in Delhi. It must be accepted that Delhi and Rajasthan did get the lion's share of paper writing; but then it was not clear whether in scholarly efforts there should be regional representation. However, generally the papers from Delhi were of a standard that was more than commendable—the same could not be said of all the papers that came from the other centres.

Again, it was felt that a threefold level in the world of scholarship in political science was developing and it was questioned whether this would do good to the discipline as a whole. While advanced research is done in a few whole-time research institutions, some very competent work in the universities, the colleges were not doing much by way of research. Between these Centres and the University departments there are continuous scholarly exchanges of research findings, but these just do not percolate to the colleges. They were being removed from the main lines of contemporary research.

It was also alleged that the Council itself was becoming elitist.

Theoretical Framework

The papers presented in the seminar could be broadly divided into two groups. Those, that started with a theoretical framework and starting from this perspective engaged in the task of inquiring into the work done in the area. Others, started with description of work done and indicated the gaps. Competent papers as well as indifferent ones were written from both perspectives. The latter approach could descend to being a barely organised annotated bibliography. There appeared to be nothing distinctively superior about either method. The need for a theoretical framework in the writing of papers can be overdone. It should be stressed that a theoretical framework is no end in itself. Some subjects may lend themselves better to this approach and others may not. A warning was never more necessary than now when the need for a theoretical framework tends to be regarded as a golden calf. It was good that the writers were given the freedom to freely adopt whichever method they wanted. Both could be used with advantage to indicate gaps and researchable areas.

However, a number of writers when criticised for their performance for not writing their papers within a framework complained that they kept within the terms that were given to them. Obviously, the Executive Committee failed somewhere to indicate exactly what was wanted; it is also likely that there was a misunderstanding of what was expected of them. This was evident most readily in a paper that was presented in the seminar.

While inaugurating the seminar, J P Naik said that this was essentially an exercise in stocktaking, in indicating neglected areas of research and an attempt in prognosis. He also said that periodically such recapitulations would be necessary if the social sciences are not to get stuck in a rut. Considered from these points, the seminar has made an excellent beginning and the prospects for political science research in India are indeed very bright. All agreed that political science in India had come of age, in that the practioners have a sense of confidence that they can contribute significantly to the understanding of Indian politics.

Appendix: List of Papers Presented

Panel I

(1) Institutions of Parliamentary Democracy in India
(2) Party System and Elections in India
(3) Constitutional Development in India
(4) Indian National Movement
(5) Political Thought in Modern India
(6) State Politics in India
(7) Local Politics in India
(8) Urban Politics in India
(9) Federal Politics in India
(10) Comparative Politics

Panel II

(1) Caste and Politics
(2) Politics of Scheduled Castes and Scheduled Tribes
(3) Student and Politics in India
(4) Political Culture in India
(5) Violence and Politics in India
(6) Studies of Leadership
(7) Performance of the System and Political Development
(8) Contributions to Political Theory
(9) Process of Politics
(10) Religion and Politics

Differential Interest Rates—I

Bimal Jalan

CONCEPTUALLY, one can think of four circumstances in which there is an economic case for subsidising interest rates to certain borrowers. First, such a case exists when the commercial rate of return in any "socially" desirable activity is lower than the prevailing rate of interest. For example, if it can be shown that (a) small-scale farming or small industry is socially desirable, and (b) that commercial returns in this activity are lower than the ruling interest rate, then there is a clear case for interest subsidy. This is the principal economic rationale for low interest loans for urban development or road building in both developed and developing countries.

Secondly, there may be a good case for interest subsidy when commercial return in any preferred activity is higher than the ruling rate of interest, but there are other less desirable activities where the returns are even higher. This may arise because market prices do not reflect social preferences and costs, and in such cases, the interest rate mechanism may be used to change the direction of private investment among sectors or among regions. This may be the rationale behind lower rates of interest for longer-term investment (as against trading) and exports (as against stocks), or for investment in backward areas.

Thirdly, there may be a case for subsidy on considerations of "creditworthiness" of the borrower regardless of the economic returns to the activity being financed. This consideration may work in opposite directions: from a commercial point of view, those who are financially strong would be charged a lower interest rate; from a social or economic point of view, however, those who actually *lack* creditworthiness may be given an interest subsidy. The first variant is a common feature of commercial banking throughout the world, the latter has now become an accepted principle in international lending. Thus "lack of creditworthiness" is one of the explicit conditions of eligibility for interest-free loans from the International Development Association, of which India has been a major beneficiary.

Finally, the case for interest subsidy occurs when particular borrowers are poor or disadvantaged, and it is an object of social policy to raise their standard of living *beyond* the level that would normally result from the act of borrowing and investing on market terms. An interest subsidy in this case is a way of subsidising the consumption of the borrower or enabling him to borrow less in future by increasing profits at the expense of interest in the value-added. This is the rationale for low-interest loans for housing in poor areas, and also for low-interest international loans to the poorer among the developing countries.

In this note, I propose to examine the report of the Committee on Differential Interest Rates with reference to this general framework.

II

Although the economic rationale for interest subsidy has not been formulated precisely either in the majority report or the note of dissent, from frequent references to social justice, the poor, the rich, and "correcting the historical perversity", one can deduce that the Committee's rationale for lower rates of interest is based on considerations of equity rather than the nature of the project or the borrower's inability to pay or the desire to influence the direction of investment. At one point, the note of dissent does refer to the project considerations and the rate of return: "a struggling engineer or artisan who wants to prove himself ... may find it difficult to attain straightaway a rate of return necessary to cover the high interest on loans contracted" (para 13). However, the basis of subsidised interest still remains the person and his initial means rather than the project being financed.

This means that a subsidised interest rate is strictly a subsidy and a transfer payment to a certain class of borrowers rather than an incentive to invest or a device to equalise the social and private rates of return. There is nothing wrong in principle with subsidising the poor or giving them dole; however, in the present Indian context it does raise an important issue of social policy. This is whether the poor who borrow (the struggling engineer or the small landholder) should be subsidised at the expense of the poor who do not participate in the economic life of the country — and, therefore, do not borrow and invest (the landless labourer or the struggling illiterate).

This is an important point and should perhaps be elaborated. It is a mistaken nation that a subsidy or a transfer payment to the poor engineer is at the expense of the rich who pay high interest, for the rich could have been charged a higher interest rate anyway. If the minute of dissent is right in claiming that the rich enjoy a large unearned rent because of high profitability in certain sectors, then the correct thing is to charge a high enough rate of interest or use fiscal policy to tap the unearned surplus. However, from this it does not follow that the additional resources raised in this manner have to be used to subsidise only the consumption of those who happen to be in need of a loan. This is a separate decision and must be considered in relation to other alternative ways of using the additional resources, including the subsidisation of consumption of the poor who do not borrow.

One can readily agree that all instruments of policy — monetary as well as fiscal — should be used to promote social objectives. However, these objectives are not always well-served by thinking of issues piecemeal or in terms of equalising incomes or consumption of people engaged in simliar pursuits (e g, big industry *vs* small industry or palaces *vs* bungalows). The vast majority of the Indian poor have neither a palace nor a bungalow, nor are they engineers or doctors or small-scale industrialists. Similarly, while the point regarding correcting the "historical perversity" whereby the banking system discriminated against the poor borrowers is unexceptionable, it does not follow that the present generation of small borrowers must reap the benefits of social subsidisation *vis-a-vis* those who are perhaps more needy and more poor, but do not borrow.

The point is simply that those who have should be made to pay for social and economic development of the country, and all instruments of policy have to be used to that end. However, use of resources thus raised is a separate matter, and must conform to our notions of equity in the society as a whole rather than equity *within* different sectors or districts. Divorced of its project rationale, an interest subsidy is an unrequited social transfer whose distribution among potential beneficiaries should be a matter of deliberate social policy, rather than be incidental to the allocation of credit.

In my view, both the majority report and the note of dissent propose the wrong thing for the wrong reason. I would, therefore, prefer "a fiddle here and a scratch there" to the far more interesting and quantitatively significant — but alas! equally partial — proposals of the minute of dissent.

Differential Interest Rates—II

Boswel

THERE is obviously much point in Ashok Mitra's criticism that the majority Report of the Committee on Differential Interest Rates in fact is for the *status quo*. What it has suggested is really nothing very different from what exists already though the majority Members are not quite prepared to say so frankly. On the other hand, it also appears that Mitra's scheme, while elegant as a model, has erred by overstating the case. It is, of course, always difficult to judge whether such overstatement is tactically useful or otherwise.

Both the majority and the minority agree on the basic point that the average lending rate of banks must cover the costs of operations. The majority wants to take the average cost of banking operations as the minimum lending rate and to have the differential range from about 8½ per cent to 12-13 per cent. Mitra wants that the rate should vary from 1 per cent (in the case of agriculture, ½ per cent) to 20 per cent. Both sides agree that softer terms for loans are at least as meaningful as cheap credit, if not more. The majority therefore suggests the sanctioning of unsecured loans and acceptance of certain unconventional items as security. Mitra, "purely for the sake of symmetry", suggests that the traditional policies of the banks of providing soft terms to affluent borrowers need a review. Mitra's objective is to use the lending policy of banks as an instrument of redressing 'at least partly' the wrong rendered through the decades.

Higher Deposit Rates

One of the points that is ignored by both sides is whether the average lending rate itself is an appropriate one, specially when one takes note of the scarcity of capital in the country and the need both to induce more savings and to channelise them to the organised banks and similar institutions. Is a rate of interest of 3½ per cent to 4 per cent offered by banks on savings accounts, and of 5 to 6 per cent on term deposits the best method of attracting more savings so as to increase the availability of funds to the banks? While one can easily concede Mitra's point that the returns on capital in many areas of economic activity are very high, why does he not then think of a structure of interest rates where the average rate itself is very much higher? Even if one leaves aside the fear of continued inflation on the present scale, can one say that our interest rates structure at present is such as to induce increases in savings as against consumption, specially on the part of a large number of persons such as certain categories of farmers, skilled industrial workers and government employees, whose family incomes have been increasing?

It would thus be useful to think of a structural change in the interest rates by way of general increase in their levels by a large margin. Would not, for example, an increase in the rate of interest offered by banks by 100 per cent, combined with inducements of the type already provided under the Income Tax Act (exemption of Rs 3,000 of interest income from income taxation) lead to a much greater flow of funds to the banking system and make the whole attempt of providing more credit to new productive sections very much easier and economical? It is true that this was not a question directly put in the terms of reference of the Committee; but surely it is a very important and relevant question.

Such an increase in the interest rates would probably make the expansion of bank branches an economically worthwhile and not merely a socially useful proposition. It will also cut down to some extent the large element of rent at present enjoyed by the fortunate few who are in a position to obtain bank credit for uses which give them returns varying from 25 per cent to 100 per cent. Finally, such a step would also help create a climate where the real scarcity of capital in the Indian economy would be actually felt by those who take decisions about using it and this may induce some effort at economising its use. All talk of intermediate technology to use more labour and less capital in keeping with the relative factor availability in an economy like ours becomes so much empty phrase-mongering in a situation where the price of labour is raised through various measures of State intervention, while the price of capital is kept low — at least for the lucky ones who can obtain it from institutional sources.

The main justification provided by Mitra in favour of very low interest rates for certain sections is that where the rate of interest appears to be forbiddingly high, prospective creditors in the lowest income groups tend to opt out. The barrier in his view is more than just a psychological one. A struggling engineer or an artisan who wants to prove himself in a small enterprise "may find it difficult to attain straightaway a rate of return necessary to cover the high interest on loans contracted" It is therefore that he suggests very low rates for certain types of borrowers. For similar reasons, he suggests a rate of even ½ per cent as the lowest lending rate in the agricultural sector.

Mitra has not made it clear whether in effect his proposal is to maintain this rate at this level for certain types of borrowers all the time, or whether his view is that this would be a kind of temporary promotional rate in the case of any individual borrower so that he should be enabled to set himself up in the production process with the use of required credit, and in the course of a few years lift himself by his bootstraps, so to say, so as to be able to pay a more reasonable rate.

Mobility Among Rates

Reading between the lines, one may assume that in the case of an artisan or an engineer, the idea would be that he should move from the category where a very low rate of interest is charged to a higher interest category within a few years. But what about a small farmer or tenant? The objective situation as judged by, say, the acreage under his control or the terms of his tenancy might remain the same. Would the approach be that this is a permanent arrangement? Or is it expected that as a result of adequate credit at low interest, it would be possible for even such a marginal farmer to bring about some improvement in his position and that therefore he should also gradually move from the lowest interest category to higher interest categories? The answer to this question is important because it would determine whether the very low interest rates are to be treated as a kind of permanent subsidy to certain sections of the population, or as a promotional activity by which, as a result of temporary subsidy, certain handicapped sections are enabled to come to the proper level of economic activity and standard of life.

If the latter approach is what underlies Mitra's suggestions, this would really be quite an appropriate activity for banks to undertake. By doing this, the banks would not be giving up their basically commercial position as purveyors of credit; they would only be looking for customers from among sections which they ignored before. The low interest rates would be charged on the

assumption that, as a result, a potentially good customer is induced to obtain credit and use it to build up his business properly. After an appropriate period of time, he would be expected to become an unsubsidised customer. One could even think of interest rates in such cases not being low as such. The banks would provide a facility for deferred payment of interest after a gap of a reasonable period of time. The person may be ultimately expected to pay a rate which would cover the average cost of bank operations; but for the initial period he may pay only a low rate, one quarter or 1/5th of the normal rate, making up the deferred payment through subsequent instalments. Would this not be far better than a permanent subsidy?

If Mitra's scheme is in reality only meant to use the banking system as an instrument of providing an indirect subsidy to the poorer and handicapped sections of the population, it appears to be a misuse of the institution of banking. No one can deny that there are very large numbers of the poor and the needy with us and, as he points out, they may continue to be with us for some more time 'despite national goals and objectives'. They certainly need to be assisted by the less needy and less poor, not to speak of the rich and the affluent. The question is — why use the banking institutions for this welfare task of subsidisation? Why not organise subsidies more directly through other programmes specifically arranged for that purpose? Mitra's concept of a permament class of low interest groups seems to be a kind of modern version of famine relief—do not give a dole but make people do some work and pay them a subsistence wage. It is not at all clear that the banks are the best institution for organising such relief to distressed sections.

While agreeing with Mitra about the necessity to charge much higher rates of interest to industry and trade — what the traffic can bear — and thus supporting the idea of a considerable jacking up of the interest rates, one cannot go so far as to accept his basic approach of using the banking institutions mainly as an instrument for correcting the historical perversity in respect of availability of credit. Nationalisation of banks has certainly got to be used to prevent the diversion of loanable funds which hitherto favoured certain groups. It must also be used in an enterprising manner to ensure that the sections of the population which are potentially capable of making a worthwhile economic contribution but could not do so because of lack of credit facilities are now enabled to do so as a result of the new direction of credit policies. But to try to use the banking system to provide a kind of poetic justice across the generations — to use them mainly to subsidise the poor at the cost of the rich—is to my mind a perverse approach. This is not the function of the banks. In any case, historical wrongs cannot be righted in this way.

While one can therefore support much of the criticism that Mitra levels at the *status quo* approach of the majority of the Committee, and one can even go a certain way along with him regarding 'what is feasible being practicable', one cannot but observe that he is trying to stretch the use of the nationalised banks to an area which is outside the banks' purview. Providing credit to everyone who is, *albeit* over a period of time, potentially capable of economically and profitably using that credit is certainly the function of banks. Indian banks have miserably failed in the past to carry out that function in the case of major sections of the Indian community. That is why they had to be nationalised. But it is certainly not the function even of nationalised banks to act as instruments for permanently subsidising certain sections of the population — however deserving they may be — at the cost of others, however undeserving.

FROM THE CHAIR

The South Madras Electric Supply Corporation Limited

Registered Office : Power House, Tennur, Tiruchirapalli—17

Speech of the Chairman, Thiru K A P Visvanatham

FOLLOWING are excerpts from the Speech delivered by Thiru K A P Visvanatham, Chairman, The South Madras Electric Supply Corporation Limited, at the 31st Annual General Meeting held on August 28, 1971:

LADIES AND GENTLEMEN:

It is my privilege once again to extend to you a warm welcome to this 31st General Meeting of he Company and to report to you that the affairs of the Company have been satisfactory.

The Company's licence, known as the Trichinopoly-Srirangam Electric Licence 1925, stands extended up to 12th January, 1982, as the Electricity Board has not exercised its option to take over the Company on 12-1-1972.

In the year under review, investment on capital works was lower at Rs 25.62 lakhs as compared to an investment of Rs 33.80 lakhs in the previous year. The fall in the pace of progress in this behalf during the year under review may be attributed to the uncertainty as to whether our licence was intended to be terminated on the expiry of the licence in January 1972. The growth rate of sale of energy, however, compared favourably with the previous year. being 7.12 per cent and the 4.802 numbers of service connected up were almost the same as in the last year.

With the introduction of a large number of capacitors in the system, the power factor of supply as well as tail-end voltages were substantially improved, resulting in reduction of line losses. The effective working of the Cyclic System of billing increased the efficiency in consumer bills service as well as collections. The effect of these improvements as well as the operational economies exercised enabled the Company to give rebates to consumers on their January, February and March bills to the extent of Rs 4.5 lakhs. In the current year the Company has proposed substantial system and administrative improvements.

The extension in the period of the tenure of the Company has cast added responsibilities on the Company with respect to satisfying the demands for power in the area of supply. There are yet 16 villages in our area to be electrified and it is hoped to electrify these during this year. Special attention is being paid to street light extensions and as also to supply to Harijan Colonies.

To meet the additional capital requirements of all these increased activities, the Company proposed to utilise the balance of Rs 9 lakhs, in Fixed Deposits in the Banks out of the Mayavaram-Mannargudi-Tiruvarur Electrical Undertaking compensation amount, this year and, for further capital requirements in the future years, we shall seek recourse to borrowing from Government or the Financing Institutions or seek your permission to utilise further compensation monies as may be received, in a manner that may be most advantageous to your interests.

I would only like to emphasise that so long as the tenure of our licence continues to remain with us, it behoves on us to fulfil our obligations as licensee.

The Arbitrator appointed by the Government to hear the disputes between ourselves and the Government on the quantum of compensation as well as the deductions made therefrom has taken charge of his office. The Company's statement of case would be filed on 1st September, 1971, before the Arbitrator.

Our Counsel has filed the required petition and affidavit before the High Court for the reduction of capital of the Company by the repayment of First Preference shares.

There has been unstinted co-operation from the Management, all the Officers, staff and workers and I would like to express here my thanks and appreciation to all of them.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

The Jay Engineering Works Limited

Statement of the Chairman, Lala Charat Ram

THE following is the statement of Lala Charat Ram, Chairman of the Jay Engineering Works Ltd, delivered at the thirty-fourth Annual General Meeting as also to supply to Harijan Colonies.

FRIENDS,

I am happy to welcome you to the 34th annual general meeting of the company.

OPERATIONS

The directors' report for the year along with the annual accounts has been with you for some time, and you will have noted that we ended the year considerably better than we had thought possible in the wake of the long production stoppage at Calcutta factories. This is mainly due to two factors. For the first, I should straightaway express my appreciation of the officers and workers of our two factories in Calcutta, who helped in quick normalisation on resumption of work, and indeed set up new production records in the fan factory. The second factor which helped us was the rapid progress made at the company's Hyderabad and Agra units in stepping up production. This was the proverbial silver lining in the gloomy situation created by the work stoppage at Calcutta. It is gratifying that the company's policy of geographical diversification has been vindicated so early.

DIVIDEND

On account of improved results, the directors have recommended an increased equity dividend from 8 per cent last year to 10 per cent. We are aware that this is still considerably lower than what an investor could earn by judicious deposit planning. I hope that we will be able to so manage our corporate affairs that the dividends will at least match deposit interest rates.

CALCUTTA UNITS

While we have been able to cut to some extent the losses of the long work stoppage, we have no reason to look back with equanimity over what had happened in the Calcutta factories. I had dealt with the position at our last annual general meeting, and would only like to add that it will still be quite some time before we can completely repair the damage. The most serious loss has been to the company's marketing position in India as well as in foreign countries; and literally a gigantic effort is being called for to re-establish the position. I am stating this so that no one may form the wrong impression that the work stoppage passed off without leaving a scar. The workers were equally sufferers in this misadventure. For the sake of the company as well as its employees, the thousands of small-scale industries and traders, associated with our work, I hope that the futility of anti-production activity would in future be kept in view by those whom the unsuspecting workers entrust with decision-making in their behalf.

The situation in Calcutta continues to be less than encouraging. Apart from the alarming prospects to one's life and limb, the warfare between the militant groups of trade unions has caused frequent strikes on one pretext or the other. There is an unending stream of interruptions to normal factory activity, and not a day passes when one or the other part of Calcutta city is not held to ransom with the result that production activity is at a constant discount. Clearly strikes and bandhs are no longer instruments of protest but constitute a part of a design so that these are also now resorted to in the name of causes on which all Indians think alike and there can be no mutual grouse or cause for protest. I am not a politician, but it seems somewhat plain to me that counter-productive activity can never serve our country and our people, and inter-party competition in such activity can only lead to unmitigated disaster.

OTHER UNITS

In contrast to the situation at Calcutta, the company's factories at Hyderabad and Agra have been making good progress. Local situation is conducive to growth, and relations with the workers are healthy in a normal sense. There is a great deal of dynamism in these units which makes it possible, to take progressive action for production increase, introduction of new models, improvement in manufacturing methods, and cost reduction measures. In the days ahead, these units are bound to become increasingly significant in the company's operations.

OPERATING SITUATION

The return to power of New Congress with a decisive majority is a good omen for our country because it could be a move in the direction of political stability. That is the first requirement after so many years of instability and lack of a sense of direction. Whatever our poli-

tical persuasions may be, we can only welcome a situation in which the party in power is in a position to act purposefully without having to enter into tactical compromises. A reflection of the change in the situation at the Centre is discernible in Bengal also, at least in structural terms, and I hope that this will lead to decisive action for restoring the state on a sound political and economic footing.

Working Capital

Of the problems at present facing the industry and your company, as a consequence of governmental policy, the problem of working capital is the most important. There is an undeclared embargo on increase in cash credits and bank advances. Consequently the supply of funds available to us for financing increased inventories is lagging behind the growth of business. Even temporary increases to meet seasonal requirements which were available so far are now being denied. This is having the result of diversion of surplus funds from asset building purposes to working capital requirements, and this is bound not only to retard the rate of investment in plant and equipment, but will endanger the current level of operations in real terms, because the requirement of funds is rising with rising prices even at constant physical levels of production.

Costs, Prices and Prospects

Costs of production are increasing constantly. This is the result of spiralling governmental levies, increase in freight rates and other secondary factors over which we have literally no control. For your company alone, this year's budgetary levies are likely to increase costs by over Rs 40 lakhs per year. It is not possible to recover all such cost increases by increasing prices. Already consumer resistance is a formidable factor in the way of expansion of business. In my opinion, there is now a need for the formation of 'consumer associations', for resisting increases in taxes by the government, and irrational price increases by manufacturers; this is imperative if the consumer is to at all survive as a consumer, and more importantly, if the government's policy of increasing employment and holding the price line are to have any meaning.

Shortages of all types of materials are increasing in their dimensions, quantitatively and qualitatively. Steel, special steels, ball bearings, copper, aluminium and most other materials are in short supply, or their prices have sky-rocketed, and in many cases industrial operations are being conducted on a hand-to-mouth basis with no long-term planning being possible. Our operations are also affected by this situation.

In spite of the difficulties which I have enumerated, I am glad to say that as a consequence of improved organisation and management techniques, we are maintaining a progressive trend, and I am optimistic about the prospects for the company in the short run as well as the long run.

Industrial Relations

In the highly uncertain and volatile situation prevailing particularly in the Calcutta region in the matter of industrial relations, I feel that I should attempt to explain somewhat the understanding of your company in this matter.

Industrial relations problems will plague any country until the leaders of labour and management understand and respect the survival needs of each other. Management has deep convictions about the principles of sound management. Labour leaders have equally deep convictions about the principles of effective unionism. Each is convinced that if he compromises his principles, he encourages a threat to his own survival. The labour leaders believe that if unions become the kind which management labels 'sound', they will cease to be real unions. Employers believe that if management yields to unions pressure, it will cease to be real management. These beliefs keep both in a fighting mood basically. Each group sees in the attitudes, actions and policy of the other a threat to its own survival. When the survival structure is threatened, the parties do not want peace until the threat is removed. This is in my view the basic problem. Men will not co-operate with those whose actions they believe threaten their survival. They may have the skills and brains to co-operate but they will not use them for that purpose. The basic issue in labour-management relations at the moment, then arises from the fact that each party is concerned primarily with its individual survival. All attention is focused on the means to that end. The leaders of each group are trying in every industrial negotiation and every political manoeuvre not merely to solve a specific problem; they are trying to solve it in a way that preserves their own structure of living intact. They are expecting peace on terms consistent with the maintenance of their own sovereignty. Preoccupied with that expectation and the effort to implement it, they have forgotten a very fundamental truth that "sovereignty in a democracy must be shared, not exclusively possessed by a particular group". Many have neglected the fact that partnership is essential to a democratic relationship in industrial as in political and family life; and that if one would be a partner, the other partner's interest must become one's own, at least to that degree which permits co-operative effort towards a common goal. Peace in industrial relations must mean co-operation.

Understanding the behaviour of the other party does not imply the necessity for approval. But to know why the other behaves as he does is to be armed with useful knowledge upon which intelligent action can be based. In the day-to-day development of workable relations between management and labour, it is more important for each to know why the other behaves as he does than to have convictions about how he ought to behave. Knowing such facts as they are, not as one would like them to be, is the first step towards achieving industrial peace. It is only the first step; but until it is taken, the nature and direction of further progress can not be determined intelligently. It will test the realism of knowledge each party has of the facts which determines the actions of the other. It will demonstrate whether both really want peace consistent with those facts. It will challenge the best skills and wisdom that practical men have. It will prove whether civilised men in labour and management can supplant the techniques required for self survival through domination with the skills and wisdom required for mutual survival through co-operation.

The task is hard, but not impossible. The chances for success are reflected in the satisfactory relations of scores of managements and unions all over the country. Whether or not they develop the will to succeed in the Calcutta situation is not a matter of choice for union leaders who desire the survival of free unions and for management leaders who desire the survival of free management. For the result of failure to work out the means of mutual survival will not be the elimination of one by the other, but the elimination of both as free institutions by public regimentation.

Personnel

Before I close, may I say that our greater asset is our pool of technological and managerial resources and dynamic operating personnel at all levels. This is our assurance against transitory malefic influences and of a steady upward trend transcending over the obstacles placed from time to time by clever people who now constitute the new priesthood of politicalised unionism. We continue to give concentrated attention to the augmentation of this pool.

Our officers and supervisors and other personnel have been doing an excellent job in the face of great difficulties and pressures and I have no doubt that you would want me to express our appreciation of their work.

Note: The above statement is not a document purporting to be a report of the proceedings of the Annual General Meeting.

The Fertilizer Corporation of India Limited

Speech of the Chairman, Mr H N Sethna

THE following is the speech of Mr H N Sethna, Chairman, The Fertilizer Corporation of India Limited, on the Report and Accounts for 1970-71, delivered at the Annual General Meeting held on August 31, 1971 at New Delhi.

Gentlemen,

I have great pleasure in welcoming you to this, the 15th Annual General Meeting of the Corporation. The Directors' report and audited Statement of Accounts of the Corporation for the year ended March 31, 1971, have been circulated to you and, with your permission, I shall take them as read.

I am glad to inform you that during the year 1970-71 your Corporation made a gross profit of Rs 17.07 crores which, after providing for depreciation (Rs 11.82 crores) and interest (Rs 3.58 crores), resulted in a net profit of Rs 1.67 crores. The turnover of the Corporation has increased to about Rs 78 crores as against Rs 66 crores during the previous year. Against an Authorised Capital of Rs 200 crores, the Corporation's paid up capital stood at Rs 115.55 crores.

Profits at Nangal and Gorakhpur declined mainly due to drastic power cut in the former and power interruptions and increased costs of raw materials and utilities in the latter. Trombay made a recovery this year showing some profit. These three Units together with the P&D Division made a profit of Rs 4.69 crores. However, Sindri and Namrup Units have together made a loss of Rs 3.02 crores.

Drastic Power Cut

The production at Nangal during the year was 53,926 tonnes of Nitrogen as against 79,765 tonnes during the previous year. The production loss at Nangal was entirely due to the drastic power cut imposed by the Bhakra Management Board and this Unit which exceeded the rated capacity last year, was thus forced to sustain a heavy loss of profit to the extent of about Rs 2 crores.

The production at Gorakhpur during the year was 67,752 tonnes of Nitrogen as against the previous year's 72,710 tonnes. In the case of Gorakhpur also there were serious power interruptions which adversely affected its performance. Your Directors are deeply concerned over the non-availability of the required quantum of power, especially at Nangal, and have approached the Government for their intervention.

Trombay's production during the year was 57,646 tonnes of Nitrogen and 24,145 tonnes of P_2O_5 as against the previous year's production of 48,012 tonnes of Nitrogen and 16,988 tonnes of P_2O_5. Trombay has significantly improved its performance during the year and it is anticipated that it will improve further.

In the case of Sindri, which is an old plant, problems peculiar to ageing still continue. The production during the year was 84,474 tonnes of Nitrogen as against 87,306 tonnes of the previous year. Your Directors have taken various corrective steps to remedy the problems and these are in various stages of implementation.

Namrup Unit's performance with a production of 27,659 tonnes of Nitrogen has improved marginally over that of last year's production of 25,821 tonnes. The initial teething troubles at Namrup are being got over; but this plant, because of its low capacity and locational disadvantage, may not significantly improve in profitability till the proposed expansion has been completed.

Cost Increase of Inputs

Your Directors are deeply concerned over the all-round increase in the cost of various inputs, *viz*, increase in the electricity rate, increase in naphtha prices, increases in freight, labour cost, etc, without a corresponding increase in the sale price of fertilizers, which, in some cases, as you are aware, is controlled under the Fertilizer Control Order.

To make matters worse, recently there has been decrease in the price of Urea by Rs 20 per tonne which will significantly reduce the profits of the Corporation in future as Urea-based plants with substantial capacity are being built up. It is significant to note in this connection that although the Government is rightly anxious to reduce the price of agricultural inputs, like fertilizers, in the overall interest of development of agricultural production in the country, there has been continuance of the 10 per cent excise duty on fertilizers which has been passed on to the consumers.

In other words, your Corporation is adversely hit on both fronts that is, continued increase in the input cost and a reduction in the price of products, while the Government retains the benefits of what the market can bear through the imposition of Excise Duty. It is significant to point out in this connection that your Corporation had paid an amount of Rs 5 crores as Excise Duty on finished products during the year.

Your Corporation's internal resources generated since the commissioning of the Corporation's oldest Unit at Sindri amount to Rs 107.92 crores, including Rs 91.27 crores as depreciation and Rs 15 crores as Development Rebate Reserve. The Internal Resources generated in 1970-71 was Rs 12.28 crores.

Your Corporation has been awarded an amount of Rs 100.52 lacs by the Court of Arbitration, The International Chamber of Commerce, Paris, in a dispute with Messrs St Gobain. The Corporation is deeply indebted to the dedicated band of its employees who were responsible for this effort.

Seven Projects Being Built

During the year, your Corporation had seven major projects under construction. These are Durgapur, Barauni, Rationalisation Project at Sindri, Namrup Expansion, Ramagundam, Tal-

cher and Trombay Expansion. This task, which is expected to cost approximately Rs 450-500 crores over a period of approximately 4/5 years, is being carried out entirely by our Planning and Development Division, an achievement unique in this country.

Of these, Durgapur is expected to go on stream in the end of 1971, initial trial runs having been already started. The projects at Barauni and Namrup are expected to be commissioned by the end of 1972. Delay in the supply of indigenous equipment by the fabricators, shortage of structural and other steel items and problems of contractors' labour at site have severely affected the completion of the project on schedule.

Though some of these problems are not uncommon in the initial stage of a developing nation, yet such difficulties in regard to inadequate capacity for indigenous fabrication, non-availability of structural steel, etc, will pose problems for timely execution of the projects.

Why Coal-based Plants?

A mention may be made in this connection about the two new coal-based plants at Talcher and Ramagundam. These two large fertilizer plants based on coal are being put up for the first time in the country, and this has considerable importance from the socio-economic point of view. Since the projects are based on coal, which is abundantly available in the country, there is no recurring foreign exchange involved in the use of raw materials.

Apart from this, the development of coal mines catering to these projects will generate additional employment potential in the coal mining industry to the extent of about 3000 persons in each area. These two projects together with the coal mining industry would contribute to the development of all infra-structure industries and trade from which the industry will derive substantial benefits.

Our Planning and Development Division at Sindri continues to play its important role in research and development, planning, designing and engineering, procurement of plants for all the major projects in hand, as well as some of the minor projects forming part of the diversification schemes of the Units. Planning of new projects at Haldia, Nangal Expansion, Capacity Stabilisation Schemes for Gorakhpur and Trombay, Sindri Modernisation and Paradip has also been undertaken. This year the Division has accepted a consultancy assignment from a private sector company for the design of a plant to manufacture Sodium Nitrite and Sodium Nitrate based on our know-how. We probably the only organisation in India which is capable of catering to its own demand for complete design and engineering services including indigenous process know-how and also making it available to other organisations.

Marketing Expanded

The Marketing Divison of your Corporation is on the threshold of large scale expansion to take care of he marketing needs that will come up in the next few years. The Eastern Marketing Zone catering to the Units in the eastern sector has at present about 1,000 dealers and 5,000 retailers. Regional offices have been established at Durgapur, Gauhati, Bhubaneswar, Patna and Raipur. This Zone is being geared to meet the seeding programme for Durgapur, Barauni and Talcher projects. Similarly, the Trombay Marketing Zone is being further developed to meet the market development and promotional activities relating to Trombay Expansion and Ramagundam projects. Nangal and Gorakhpur factories are marketing their production.

During the year, the Unions at Namrup, Durgapur and Barauni have signed agreements with the Management binding for a period of five years for continuing Government of India scales of pay and dearness allowance with a minimum wage of Rs 170 per month as in the case of other Units which entered into similar agreements last year. An agreement was also signed with the Trombay Union in the matter of linking the dearness allowance with the Bombay consumer price index. During the year, generally speaking, the industrial relations have been somewhat satisfactory.

New problems which have cropped up during the year are local situations leading to tensions, especially in the eastern sector, on the question of employment. While your Corporation continues to bestow adequate attention and are evolving a liberal policy to meet genuine local aspirations to the extent possible, it must be pointed out that such tensions will retard the progress of projects and also affect production which will cause overall economic problems.

Fresh Management Approach

I would like to bring to your notice that during the year there has been a new approach to Management outlook for conducting your Corporation's business in all areas of activity. In regard to the problems of production, maintenance, materials planning, inventory control, sales etc. Quarterly Production Review Meetings are regularly held where problems are reviewed and discussed by the Directors with all those concerned and corrective action taken. Similarly, quarterly meetings of Material Managers are also conducted to review and control inventories in all aspects.

In regard to marketing, meetings are held quarterly with the Zonal and Regional Marketing Managers to review problems relating to sales, supplies, distribution, credits, etc. On the promotion and extension side, quarterly meetings of a panel of agronomists and scientists of the Corporation with the Directors of Agriculture of the concerned States and also with the agriculture scientists of the Universities are held to review and plan for demonstrations, trials, publicity and other promotional measures for the two cropping seasons.

The management Reporting cell established in the Central Office has evolved a rationalised system of reporting to top Management. Your Corporation has increased its reliance on computers for data processing, engineering applications, project scheduling and other commercial applications. An Executive Committee of Functional Directors comprising the Managing Director, Director (Finance), Director (Projects) and Director (Production) has been set up during the year for conducting your Corporation's business in regard to important day-to-day problems and policies. This Committee meets frequently and discusses problems in all their aspects and takes decisions in accordance with the powers delegated by the Managing Director. Your Corporation has also constituted four standing sub-Committees, viz, Operations Committee, Projects Committee, Personnel Committee and Finance Committee to scrutinize and review the specific problems and policies that come within the respective area of responsibility.

In conclusion, I am happy to put on record my gratitude to you, the shareholders, for the confidence, trust and understanding extended to your Directors and to me. I also express my gratitude for the co-operation and assistance I have received from my colleagues on the Board, the officers and employees of the Corporation in the matter of formulation and implementation of your Corporation's policies and programmes. I have no doubt that with this co-operation, assistance and understanding, the challenging problems posed by the growing activities of an expanding organisation like yours, in the years to come, can be faced boldly and with good results.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

Only Partly about Parities

IN the three weeks since the shock treatment administered by President Nixon's economic measures of August 15, the international monetary system has remained transfixed by pulls in two directions. On the one hand, the erstwhile fixed exchange rates became untenable and the major European governments had to let their currencies float. Japan too, after numerous declarations to the contrary, climbed off the fixed exchange rate system on August 27. On the other hand, having let their currencies float, most governments have been straining to keep the effects of the decision as limited as possible. Japan, for instance, has succeeded, through central bank intervention and tightened restrictions on foreign exchange dealings, in preventing the yen from appreciating by more than 6 per cent so that it is still nowhere near its real market rate. The carefully managed floating of currencies had had other curious consequences such as the pound sterling appreciating in relation to the D-Mark and other European currencies.

Immediately after the Nixon measures threw the international monetary system into turmoil, there were those who thought that the way out of the situation lay in one of two directions: a prolonged period of floating currencies which would disclose the 'correct' exchange rates for the world's leading currencies and thus make possible eventual return to a rational structure of fixed rates; or, alternatively, a complete departure from the time-hallowed system of fixed exchange rates to one of permanently floating rates. Those who held this view argued that nothing would be achieved by discussions among governments aimed at deciding on new currency parities. However, apart from whether or not freely floating exchange rates will have provided the answers to the issues raised by President Nixon's measures, by now it has been established that none of the leading industrial countries — and certainly not Japan — is willing to give the prescription a trial by letting its currency float freely. This realisation has inevitably turned attention once again towards the prospects of a solution emerging out of negotiations and bargaining among governments.

Not that the portents here are any brighter. There has been already a flurry of bilateral talks among the countries of the European Common Market and Britain. The deputy ministers of the Group of Ten met in Paris earlier this month and the Group's Finance Ministers are to meet in London next week. A US-Japan inter-ministerial meeting began this Thursday in Washington. Finally, there is, of course, the annual meeting of the International Monetary Fund later this month which will provide enough opportunities for backstage bargaining. So far, at any rate, the discussions have borne no fruit. The European countries may be unanimous in their acceptance of the need for some rise in the price of gold (which the United States stoutly opposes) and for a revaluation of the yen, but among themselves there are sharp disagreements. France, for instance, refuses to revalue the franc, sticking instead to its two-tier exchange system (a fixed rate for commercial transactions and a floating one for financial transactions). Even among the rest, if there are to be parity changes (as there inevitably have to be), there is little agreement on the extent of change for particular currencies. The United States, for its part, would throw the entire burden of adjustment on parity changes by other currencies. And Japan, while it has accepted the inevitability of revaluation of the yen, is certainly not thinking in terms of an upvaluation of more than 8 to 10 per cent which is unlikely to make a major dent on the trade imbalance with the US.

That the currency tangle should prove so intractable is not surprising if it is seen that what seem to be arguments about currencies are in fact arguments about much wider issues. The debate is not about fixed versus floating exchange rates, or about a particular dollar price of gold rather than another, or about the dollar as the international reserve currency versus a new means of international reserve creation. What is really at stake is the preservation of the relative economic and political advantages of particular countries or groups of countries in the developed capitalist world. This is clearly brought out by the positions of the United States and Japan, the leading protagonists in the present situation.

Through its ridiculously undervalued currency — whose exchange value has remained unchanged even as Japan has transformed itself from a war ruined country into the world's third largest exporter — further buttressed by import restrictions, export incentives and foreign exchange control Japan has enjoyed an enormous economic advantage and achieved fantastic rates of export-led growth. Clearly, any lasting solution of the present crisis must involve

surrender on Japan's part of a considerable part of this advantage in the form of not only revaluation of the yen but also dilution of import restrictions and export incentives and dismantling of exchange controls. The United States, on the other hand, has enjoyed enormous political and economic benefits because the dollar's status as the world's reserve currency has enabled it to run persistent large balance of payments deficits to sustain its worldwide economic, political and military network.

It is interesting how, in the course of bargaining, both Japan and the United States hold out threats which, if carried out, would really defeat their own larger national purposes. Thus on the opening day of the US-Japan inter-ministerial conference in Washington the Japanese foreign minister was hinting to his American counterpart that, if the US import surtax was retained, Japan and other US trade partners would retaliate, leading to the collapse of free trade. Now, collapse of free trade is the last thing that Japan can wish for in its own interest, for no other country is as dependent on foreign trade to sustain its economic growth. Similarly, successive US governments have been fond of warning the rest of the world that if it did not play fair, the US would withdraw into its shell. Yet so much of the effort of each US administration is directed at sustaining and strengthening America's global role.

Just as Japan would like to come out of the currency crisis with its capability for export-led economic growth as little impaired as possible, the United States (though it may accept the inevitability of forced disengagement in Vietnam) wants its worldwide economic-political-military network to be retained as intact as possible. This is the type of conflict which lies at the root of the so-called currency crisis. Obviously, it is not a kind of problem as can be easily resolved by the Finance Ministers of the Group of Ten, or, for that matter, of all the member-countries of the IMF.

Kerala

Too Clever by Half?

THE Congress party in Kerala, which had thought itself to be in a commanding position with the state government totally dependent on its support for survival, has hardly come out with flying colours from the recent negotiations over its entry into the government. The outcome has been particularly embarrassing for the faction in the party which has been supporting the party's participation in the government. Not only has this objective been defeated, for the time being at least, but the impression has gained ground that the Congress has allowed itself to be outmanoeuvred by the other parties.

The Congress in Kerala is, as is well known, divided on the issue of joining the government. One group, dominated by the younger elements, wants the party to keep out of the coalition, expand its popular base and, at the opportune time, force an election which would in effect be a straight confrontation between it and the CP(M). The other group was able to eventually persuade the state party as well as the Central leadership to agree to participation in the government on the strength of the assurance that in the reconstituted government the Congress would be dominant. Though the Chief Ministership would be left with the CPI, the Congress would have a Deputy Chief Minister as well as four other Ministers in the Cabinet of 13, with some of the important portfolios like Home, Revenue and Industry. These terms were evidently advanced in the confident expectation that the ruling coalition, which has all along been pleading with the Congress to join the government, would agree to them.

Things turned out differently, however. The Congress terms would have required the CPI to reduce its representation in the Cabinet from four to three and also to give up the Industries portfolio held by it. This it was unprepared to do. Nor was it ready to accept a Congress Deputy Chief Minister. Similarly, the RSP was unprepared to part with the Revenue portfolio. So was the Muslim League initially reluctant to give up Home, though towards the end it seems to have relented. The coalition parties' counter-proposal was to offer the Congress six Ministerships, but in a Cabinet expanded from 13 to 15. It would get only one of the three coveted portfolios, Home, and there would be no Deputy Chief Minister. Of course, it must have been obvious to the coalition parties that the protagonists of participation in the government in the Congress would find it difficult, if not impossible, to persuade their party to agree to these terms. But this is where the Congress was outmanoeuvred. Instead of disclosing the coalition parties' counter-proposals, Chief Minister Achuta Menon allowed the negotiations to drag on till, one, the Assembly session was over and, two, the three PSP MLAs had decided to ignore the directive from the party's central leadership to withdraw their support to the state government. The PSP MLA's decision ensured that the government retained its majority in the Assembly, of course with Congress support. Now to reduce the coalition to a minority it will require a positive act of withdrawal of support by the Congress, whereas had the PSP MLAs decided otherwise the coalition would have lost its majority right away—a situation which might have been exploited by a Congress party irritated at the rejection of its demands by the coalition parties. In cleverly avoiding this contingency Achuta Menon may pride himself on a tactical victory.

However, the basic fact of the political situation in Kerala—that the political support that the coalition parties actually enjoy, individually and collectively, does not entitle them to rule the state—remains unchanged. The government will continue in power till the Congress decides that it can take on the CP(M) in a more or less straight electoral fight in which some of the present ruling parties (like the CPI) will be cut down to size and others (like the RSP and the PSP) will be altogether obliterated. For fact, the rebuff just handed out to the Congress by the coalition parties may very likely hasten the fall of their government. That the failure of the move to get into the government has strengthened the group in the Congress which had been all along opposed to the move is already evident. The joint meeting of the executives of the organisational and legislative wings of the party at Cochin on Monday demanded the summoning of the Assembly to pass the District Administration Bill. The meeting also decided to confront the government with a 'time-bound' programme for implementation.

Employment

A Problem of Strategy

EMPLOYMENT in factories increased from 2.9 million in 1951 to 4.7 million in 1968, according to a study published in the July issue of the Reserve Bank *Bulletin*. The study analyses, on the basis of published data, in depth the growth in factory employment generated during the period 1951-68. Given the considerable industrial dislocation caused in 1968 by the depression (and by labour disputes, particularly in West Bengal) it can be argued that employment potential in the factory sector at the end of the period of the study was much larger than the actual figure of employment.

Factories are defined under the Factories Act as manufacturing establishments employing 10 or more persons and using power or those employing 20 or more persons not using power. The five states having the largest proportion of factory employment in 1968 were Maharashtra (19.8 per cent of total factory employment), West Bengal (17.9 per cent), Tamil Nadu (8.7 per cent), Gujarat (8.6 per cent) and Uttar Pradesh (8.1 per cent). These five states accounted for more than three-fifths of total factory employment. Given the varying populations of states, this is no index of their respective levels of industrialisation. Per 100,000 population, only the following had more than 1,000 (that is, 1 per cent) employed in factories: West Bengal 2,014, Maharashtra 1,983, Gujarat 1,620, Tamil Nadu 1,084, Kerala 1,015 and Union Territories 1,000. The all-India rate was 912. Uttar Pradesh with 445 factory employed per 100,000 of population stood fourth from last in the list. The uneven factory employment level in the states is also evident from the growth rates of employment. While factory employment increased at 2.78 per cent per year on an all-India basis, it rose at 10.41 per cent in Mysore and 10.16 per cent in Orissa. This is evidently because of the low base of factory employment in these states in the initial year (1956).

The study raises a large number of issues relevant to planning policy. First, the rate of growth of factory employment (about 3 per cent per year) was not much faster than the rate of growth of population (2 to 2.5 per cent) during the period. As a proportion of the total labour force, factory employment increased from 2 per cent in 1951 to 2.4 per cent in 1968. As a proportion of employment in the organised sector, it declined from 31.4 per cent in 1960 to 28.3 per cent in 1968. Second, the investment cost of creating employment in the factory sector has been rising. Investment in organised industry increased from Rs 547 crores in the First Plan (upto 1955) to Rs 2,030 crores in the Second and Rs 3,632 crores in the Third, making for a total investment of Rs 6,209 crores (at current prices) in the three Plans — or almost one-third of the total Plan outlays. The investment required per additional job rose from Rs 22,792 in the First Plan to Rs 26,710 in the Second and, more sharply, to Rs 38,638 in the Third.

In a sense the country's planning effort has been geared to creating additional jobs, the strategy being not only to absorb the additions to the work-force in industry but also to divert the pressure of population in the agricultural sector. That this objective has not been fulfilled is clear from the trend of factory employment in the first 18 years of planning. The proportion of factory labour to the total work force has increased only marginally and the large increase (almost doubling in proportions) in income from organised manufacturing proves that the rise in value added in that sector has been far larger than that in employment. Even if indirect employment (in trading, tertiary services, administration, etc) is taken into account, the picture would not be much different.

There is another problem which has hardly been touched — namely, that of the growing economic disparities among the states. It is not necessary that each state must have the same degree of industrialisation, but each state faces the same problems of low agricultural productivity and the need to increase non-agricultural productivity and create non-agricultural job opportunities. Even the euphoria caused by the agricultural revolution in Punjab is likely to prove short-lived, as productivity gains taper off and labour gets substituted by machines.

The five-year Plans have never spelled out the regional or state development programmes. Given limited resources and the undefined location of industrial projects, there has been a scramble among the states for public sector as also for private sector projects. States have been bidding against each other for these projects, expecting to increase their share out of the general pool (which they are doing little to enlarge by their own efforts to mobilise resources). While tax revenues are shared and access to loans is determined on some criteria, these also lead to a fair amount of horse-trading (as, for example, happened this year in respect of state loans). Then there are the unprincipled overdrafts from the Reserve Bank which benefit the more unscrupulous among the states. Given the level of deficit financing and of foreign aid, it is necessary that well defined criteria for their sharing and for location of industrial investment are worked out — unless the tug-of-war for resources is to be allowed to accentuate fissiparous tendencies.

Yet the larger question of employment remains. Factory-industry is capital-intensive (as shown by the figures for the Third Plan in which large investment in chemical industry was planned) and the volume of investment has not risen adequately. Fifteen years after planning, the level of investment still runs at 11-12 per cent of national income with a quarter of the investment being financed by foreign aid. It is necessary both to raise the level of investment and to alter the pattern of investment in favour of low-capital-intensive programmes. On the present plan, this would involve an increase of 25 to 30 per cent in the rate of investment, and allocating this whole increase to public works programmes. The pace of progress in factory employment shows that such a programme may have to be continued for 25-30 years before factory employment (and family planning) makes a dent on the employment problem. This is not, *pace* economists, primarily a problem of resource, but one of planning strategy.

Industry

Weak Propulsion

A Correspondent writes:

EVEN as the country seems to have got a better control of its agricultural problem, the industrial situation has worsened. When, in the wake of two bad harvests and the devaluation, the industrial recession first set in, it was argued that it was transient and that with good harvests industry would resume its growth.

Since then, India has had four good harvests, but the rate of growth of industrial production has remained low. After a minor spurt in 1969, industrial production in 1970 rose at a lower rate of less than 5 per cent. This, it was argued, happened because the production index did not reflect the current industrial structure—yet was this not the case in 1969 also?—and that actually the small industry sector which is not covered by the production index had grown at the much higher rate of 11 per cent—although available evidence pointed to no sudden change in the performance of small industry.

Apart from the disappointing rate of increase in industrial production, organised industry's poor performance is also evident in the large unutilised capacity in many industries. Steel shortage has been blamed for this, though in fact there is little evidence to show that this has curbed output on a general basis. Thus, while steel-pipe output has suffered for lack of skelp, the low output of machine-tools or railway wagons is hardly the result of steel shortage. If steel were responsible for the industrial stagnation, steel imports would not be increased by only Rs 10 crores (or 5 per cent) in 1971-72 to meet the gap in supply.

Moreover, data compiled by the Ministry of Industrial Development in its annual report for 1970-71 showed not only excess capacity in many industries but also a decline in the output of some industries in that year. With mismanagement at the electricity boards,

orders for electrical goods (meters, transformers) have begun to decline. And the oil engine industry, overexpanded by the zealous supply of credit from banks and state governments, has had a recession for a year. In the first six months to June 1971, too, the rise in the industrial production index has slowed down to 1.5 to 2 per cent over the previous year.

All this has happened despite the fact that the secular increases in population and income should have helped generate demand and so work off excess capacity. Clearly some gap in the existing system is responsible for the recession being so persistent.

For the first problem of existing excess capacity, pump-priming can provide the answer. Given the sectors in which excess capacity exists — heavy engineering, machine-tools, structurals, castings, wagons—government can generate demand by lengthening its own order lists. An increase of Rs 500 crores in demand should take care of the major pockets of excess capacity in industry. But this is only one part of the problem of industry. New industrial capacity also has to be built up rapidly. If the rate of investment in industry is raised by Rs 1,000 crores, industry could start to play its leading role.

While these are the options the economy has, the risks of stagnation are far more serious than those of growth. Resource raising is a matter of economic policy and containing inflationary pressures a matter of economc management—fields in which government has failed to make much headway.

BUSINESS

With Some Concessions

TRADE relations between India and the UAR are in a state of suspended animation. The last agreement between the two countries expired at the end of last June and it is difficult to understand why negotiations for a fresh trade agreement have been delayed so long. The Government does not seem to have given as much attention to Indo-UAR trade relations as it did to the Indo-Nepal treaty. Not only was a new treaty not signed, but little effort appears to have been made to continue trade on the lines of the old treaty as was done in the case of trade with Nepal. In economic terms, trade with the UAR is much more valuable to India both for its size and its commodity-composition than that with Nepal. Part of the explanation for the slow progress of negotiations may lie in the changes in the political climate in the UAR, especially after the death of Nasser, leading to less close politico-economic ties between the two countries.

According to the official version of things, there was no breakdown in the trade talks with the UAR: they were only temporarily suspended and are to be resumed shortly. It is reported that Foreign Trade Minister L N Mishra would be going to Cairo in the second week of October. When the trade talks are resumed, a serious attempt will have to be made by both sides to remove a number of irritants that have developed over time. Total trade between the two countries is running at about Rs 85-90 crores annually; clearly, neither India nor the UAR can afford to do anything that would put this order of trade in jeopardy.

At the last round of talks, the UAR is reported to have told the Indian delegation that it was not interested in lifting engineering goods worth Rs 10 crores manufactured for export to the UAR. According to the Indian side, these goods were manufactured to the specifications of UAR importers against letters of credit opened by them quite some time ago. Another demand made by the UAR was that India should pay for the cotton and crude oil in free foreign exchange. The Indian position is that all trade between the two countries should be on rupee-payment basis. It is unlikely that the UAR would insist on this condition if the Indian side makes some concessions on other points. The UAR is reported to be interested in purchasing from India goods underground cables, rayon pulp and stainless steel items. But the Indian reaction has been that, since these commodities have a high import content, it would not be interested in selling them to the UAR. Another problem has been that the UAR has been continuously exceeding the limit of Rs 6 crores granted by India as technical credit. At one stage India had to grant a credit of as much as Rs 23 crores to enable the UAR to purchase Indian goods. During 1969-70 Indian trade surplus with the UAR was Rs 11 crores; for the period April 1970 to February 1971, the figure rose to Rs 17 crores. Unless the trade gap is narrowed considerably, it would be difficult to put Indo-UAR trade on a sound footing.

At present India imports mainly cotton and rice from the UAR. During the 11 months of 1970-71, imports of cotton were at about Rs 26 crores out of total Indian imports of Rs 39 crores. India has recently said that its imports of rice from the UAR would soon stop as a rice surplus was emerging in the country. It is not clear if this assessment of the rice supply position was made after taking into account the effect of the drought in Andhra Pradesh and the requirements of rice for feeding the refugees from East Bengal. Even when India has developed a comfortable position in rice, it may not be advisable to stop all rice imports from the UAR. Particularly, if the UAR agrees to supply crude oil, these concessions could be given without much hesitation. As it is, many of our engineering exports to the UAR do have an appreciable foreign exchange content. The UAR's requests for export of particular commodities need to be considered carefully and not turned down summarily on the ground of high import content.

Railways

Missing Management

OVER the last four years, revenues of the railways have not increased at the pace envisaged, while the growth in expenses has been uncontrolled. As a result, railways have failed to earn the 5.5 per cent on capital-at-charge which is the minimum dividend expected of them.

The railways' explanation and remedy for this situation has been surprisingly trivial. The Railway Board has often implied that the 'amenities' given to passengers—such as water, fans in compartments, etc—and not the railways' own incompetence have been responsible for the poor performance.

Also, recent moves by the railways' management suggest that—from the Railway Board down—the existing management has little clue to the kinds of solutions called for. Under the present Railways' Minister, Hanumanthaiya the first move of the Railway Board chairman was to make sudden and wholesale transfers of senior officials, with disastrous consequences on matters such as the negotiations with the Russian team that had come to discuss a tube railway for Calcutta. Now the proposal is to speed up trains, with references to 'bullet trains' such as in Japan, the UK, and the US!

But will this reduce the overcrowding in trains, make third-class tickets more easily available, reduce the railways' losses, increase wagon availability to customers, or improve the railways' relations with wagon-suppliers? It is their total obliviousness of these questions that casts doubt on the competence of railway management.

For instance, the railways, which had placed orders for 25,000 wagons in 1964-65, now plan to order only 3,875 wagons in 1971-72 — even though the annual wagon-building capacity of 30,000 wagons was established on the basis of their own calculations. The reason given for this low order-level is the slowdown in growth of railway traffic. If this is so, why has there not been greater flexibility in railway movements or improved availability of wagons to railway-users? Irrespective of the demand for railway services, the availability and efficiency of these services—such as the priority supply of wagons—remain the same.

Railways' investment decisions depict the same lack of perspective. There has been investment in dieselisation and electrification, without any impact on the railways' performance.

Unfortunately, overall pressure on the railways to improve does not exist. Nothing short of complete overhaul of the top management will yield results. Every service—goods and passenger trains, railway stations—has to be costed and factors making for bureaucratic and technical inefficiency removed. This requires a questioning attitude among top management. Two steps in this direction would be: employment of outside consultants to look into the railways' organisation-and-methods, and induction of new and younger persons into the Railway Board. Can the Railway Minister be banked on to take these steps?

Power

Making the Most of the Possible

IN its latest assessment of power availability, the Ministry of Power and Irrigation has reckoned that there will be a shortfall in generation capacity of 4.8 million kilowatts by the end of the Fourth Plan — a substantial upward revision of its earlier estimate of a 3 million kilowatt deficit.

Power shortage of this magnitude could well cripple the growth of the economy. When a 10 per cent annual growth rate for power generation was targeted under the Fourth Plan, the Ministry of Power and Irrigation had warned that, to ensure the growth rate of 5.5 per cent per annum expected of the economy, a 15 per cent growth rate of power would have to be aimed at.

Now already, the states in the northern region, viz, Punjab, Haryana, Uttar Pradesh and Bihar, face power deficits ranging from 100 mw to 300 mw. Even after inter-state transfers of power, the region's overall shortage is expected to be around 440 mw. In Punjab, power consumption for industrial purposes as a percentage of total electric power consumed in the state declined from 47.56 in 1968-69 to 39.86 in 1969-70. The consumption of commercial establishments, public lighting, and bulk supply, also came down from 20.25 per cent to 16.60 per cent during the same period.

Similarly, states in the western region will face deficits of 600 mw, which is also the extent of power shortage anticipated in the southern region although a part of the shortage in Mysore and Tamil Nadu could be met by the surplus of over 200 mw in Kerala. In Andhra Pradesh itself the shortage is likely to be about 0.5 million kilowatts.

In the eastern region, however, though Bihar and Bengal will experience power shortage, the region as a whole is expected to have a surplus of about 150 mw as a result of the utilisation of the surplus power from Orissa and the DVC power system. Elsewhere, in Rajasthan, Himachal Pradesh and Delhi, there will be a surplus of power.

The Union Ministry for Irrigation and Power has evidently yet to come to a firm conclusion on how it will go about overcoming the power shortage. What has stood in the way, partly, is the view that basically power development is a responsibility of the states and that each state government must, therefore, strive to meet its power requirements. However, with power technology undergoing significant changes, the need for central co-ordination in power development planning is becoming apparent. K L Rao, Minister for Irrigation and Power, has thus emphasised the need for a central agency to look after the generation of power and has disfavoured smaller power stations on the ground that they are not economical. The power stations to be built now are not to be of less than 200 mw capacity. At the same time, hydel schemes which generate power at cheaper rates will be given preference in the 1970s.

The need for a central agency is clear. Power development has to be planned on a regional basis rather than with the state as the unit in mind. In many states, available conventional resources have, in fact, been almost fully harnessed and it will be necessary for meeting future demand either to resort to costlier generation schemes within the states or to utilise power from economic schemes based on resources available in the region as a whole. Since the latter is more economic, the obvious choice must be regional power planning, and for this, a central power agency can co-ordinate very effectively. Further and partly as a corollary, where in the past the size of power plants was small and, therefore, uneconomical, future power projects are to be large in size.

But there have been various management factors, not strictly of a plan nature, in the shortfall in power targets. Inordinate delays in the commissioning of projects due to lags in civil works and recurring delays in supply of important equipment and machinery from both indigenous and foreign sources are two factors that are most in view. Unless there is an improvement here — and that is not easy considering the severe steel shortage — the power shortage will persist. In certain states, power shortage arose because transmission lines from the neighbouring surplus states were not installed as a result of the inadequate investment in the fields of transmission and distribution. In its report, submitted to the Central Ministry of Power and Irrigation earlier this year, the Power Economy Committee had warned that in the absence of interconnections, the unsatisfactory supply in the various power systems would continue. The Committee, therefore, recommended centralised generation as it thought the state to be too small a unit for satisfactory planning and operation in electricity. Government is yet to accept the proposal, and no early decision may be hoped for since it has decided meanwhile to appoint a new Panel to examine whether such an agency is at all called for.

The Power Economy Committee felt that one major factor retarding the growth and efficient working of the power supply industry is the gross inadequacy of research and development. While India has gone ahead in research facilities for nuclear power engineering conventional power engineering has been neglected. The Central Water and Power Commission, which is the highest technical body in irrigation and power engineering in the country, may have to apply itself to this task — especially as it is becoming increasingly clear that management of nuclear power engineering does not in fact match the promised targets of efficiency.

'Simple Question of Recognition'

KARUNAKARAN's '"Simple" Question of Recognition' (July 3, p 1320) is an unhappy example of good reasoning used to poor purpose. It is difficult to see whether he seeks to rationalise the inaction of the Government or call for a social revolution before we support the Bangla Desh struggle. Much of the sane reasoning he is offering is for the benefit of the Cabinet and their supporters. We, outside the Government, must only demand that effective support is given to freedom fighters, something which today is being done with reservations.

Perhaps the guerillas can fight better during the monsoons. Perhaps the Islamabad junta should be exhausted and bled white before we really get involved. Perhaps the junta's oppression of the West Pakistanis themselves may soon lead to a weakening in the Western wing. All this is possible. But effective assistance to fighters and to the building up of a broad democratic national front is what democratic Indians must do and what they must demand of their Government. And this must be as quick and decisive as possible; for, governments and peoples elsewhere will be inclined to recognise *faits accomplis*. The sort of arguments — either for recognition, which many others give, or implicitly against it, which Karunakaran offers — are neither here nor there and merely serve to divert attention from the major task of such political mobilisation in the country as will force Indira Gandhi to offer effective support to the fighting and the emergence of people's government in Bangla Desh, if, as one is encouraged to suspect, she is not doing.

There is a very remote possibility now that a victorious democratic movement of Bangla Desh may want to reunite with West Pakistan. We can have nothing against that. It is primarily an affair of the Bangla people. But, for the moment, the task is to help them fight. Karunakaran and all of us others must now try to see to it that the Indian Government does that. The question of recognition — now or in September — of Nazrul or Nazrul-Bhashani, matters less. I also feel Karunakaran has much exaggerated the international complications of support to the Bangla Desh struggle. The international community can as much swallow that as it has the current effort of the West Pakistani junta to clamp down an "Islami" dictatorship based on the possible support of some local Muslim groups, Biharis — and guns.

S SHUKLA

India and Ceylon: Generation Gap?

IN 'India and Ceylon: Generation Gap?' (May 22, 1971, p 1014) your correspondent accuses the CPI(M) of maintaining a "soulless silence" on the recent events in Ceylon. I must point out that this is a falsehood.

Your correspondent has either ignorantly, or deliberately, tried to distort the CPI(M)'s stand on Ceylon. If your correspondent looks up the May 9 issue of *People's Democracy*, the official CPI(M) paper, he will find a statement on events in Ceylon. This contains a detailed analysis of the matter and it categorically condemns the Bandaranaike Government. The statement has characterised the Sirimavo-led coalition as a reactionary, bourgeois-landlord regime. It is even more outspoken on the role of the Indian Government in rushing troops and arms to Ceylon. While not agreeing with the JVP's tactics, the CPI(M) makes it clear that only a working class-led revolution will succeed in Ceylon. The failure of the JVP insurrection lies in the fact that it failed to organise the working class and poor peasantry. I hope this will clarify the wrong impression created by your correspondent.

Further, I would only like to comment that for Marxists, society is not divided into young men and old men as your correspondent seems to emphasise. It is only for bourgeois commentators that a 'generation gap' exists. For Marxist-Leninists, it is the class of a person that matters, whether he is young or old.

P DEVARAM

New Delhi

Our Correspondent writes:

And what does *People's Democracy* of May 30 say on Ceylon? Apart from the usual mouthings about "parliamentary cretinism of the traditional Left Parties" and "Left adventurism", it grudgingly admits that "the misguided movement spread to wide sections of society, particularly the peasantry". However misguided the JVP insurrection, it came close to overthrowing the exploitative order of things in Ceylon. Much closer than the "parliamentary cretinism" of the CPI(M) has managed in this country. The Indian Left by not reacting sharply enough to the Government's armed help to Sirimavo, abetted the suppression of a movement which may not have been truly socialist, but all will admit, had much greater socialist *potential* than the United Front Government of Ceylon.

As for the generation gap, Marxist-Leninists, etc, are so tied up by dogmatic adherence to Marx's 'holy commandments' that they lose sight of the fact that if Marxism-Leninism is to lead to the good society, new factors like changes in population structure must be taken into account whether they fit into the catechism or not. Nor does the failure of a movement by itself mean that it was unMarxist.

If all this is bourgeois, so be it.

Neocolonialism and Publishing in India

MOHAN Primlani (August 28, p 1846) states that the text-books published under the Indian-American Text-Book Programme have helped to fill in gaps in the range of books published in India. I have no quarrel with this statement on a general basis, but would point out that there are some books reprinted in India which are out of date elsewhere; the quality of some books is also dubious. I am referring particularly to the field of economics.

Primlani's statement that the ELBS books contribute nothing to our publishing scene may be correct. However, some of the titles like Reddaway's 'Development of the Indian Economy' and Stonier and Hague's text-book of Economic Theory are very positive contributions as far as students of economics are concerned. Domestic authorship has not yet matched these texts in respect of quality and to view the matter entirely from the publishers' standpoint neglects the overall educational gains.

I am, however, in general agreement with Primlani's view that low-priced foreign text-books do serve a positive educational purpose.

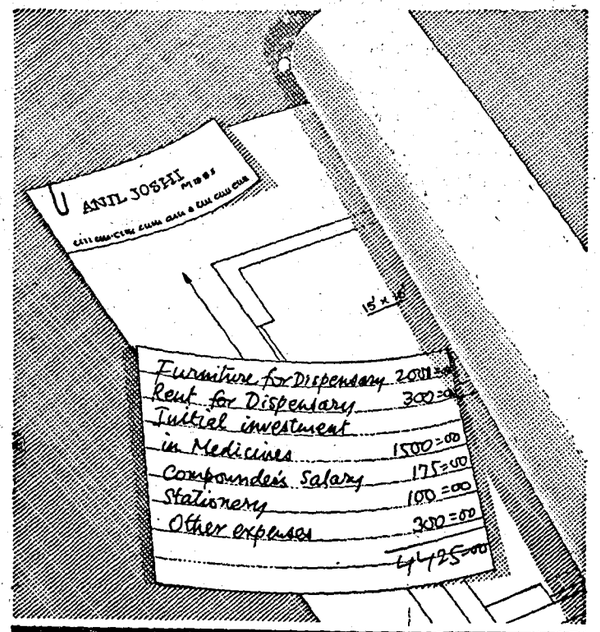
Downstream Problems

Hansavivek

POLYCHEM is still awaiting Government's decision on its application for an industrial licence to set up a merchant styrene plant and other plants for styrene based polymers at Koyali. Being one of the downstream units in the Koyali petrochemicals complex, the project is tied up with several of the other projects including the naphtha cracker. The 'letter of intent' received by the company for establishing ABS resins plant in Bombay has been cancelled by Government 3 years after submission of the company's proposals. Polychem, however, has made a fresh application for inclusion of this plant in its Koyali project. The potable liquor plant is expected to be commissioned early next year and the divinylbenzene monomer plant is to commence trial operations shortly. The company has made good progress in its research and development efforts. It has built a continuous vacuum forming machine, which is fully automatic and whose performance can compare with an imported one. Disposable articles in polystyrene, such as ice-cream cups, coffee cups, trays, etc, can be made in this machine. The company has also implemented another research project in which the Defence Department is keenly interested. Ramdas Kilachand, chairman, suggests that sponsors should be allowed to utilise fruits of their efforts to provide them with an incentive to continue and diversify research and development activity. Moreover, a small amount of foreign exchange for importing speciality instrument and chemicals should be allowed freely for purposes of research.



BAJAJ AUTO's application for expansion of manufacturing capacity to 1,00,000 vehicles per annum is still pending with Government. The company understands that Government has approved increase in licensed capacity from 24,000 to 48,000 scooters and three-wheelers per annum. The expansion application, however, is still pending with the Ministry of Company Affairs for clearance under the MRTP Act. The company's application for registering its project for manufacture of 24,000 numbers per annum of 50 cc Moped has not yet been approved. In response to the Government notification of last February, the company has made an application for increase in the manufacturing capacity of three-wheelers to 15,000 per annum. In spite of increase in cost of production, the company produced good results for the year to March last, with impressive advances in sales and earnings. The recommended dividend is payable on the capital as enlarged by a one-for-two bonus share allotted towards the end of the year. With the expiry of the company's collaboration agreement with Piaggio on March 31 last, the name of the two and three-wheelers has been changed from 'Vespa' to 'Bajaj'. Three directors, Shriyans Prasad Jain, Ramnath Podar, and Tanubhai D Desai, resigned. Manmohan Lal Gauba, D S Mulla, and Rishabhdas Ranka, have been appointed as directors in those vacancies.

COLOUR-CHEM lifted its output and sales to new peaks and also showed a fair improvement in earnings during the 14th year ended March 1971. These good results arose from the improved availability of indigenous raw materials which reduced dependence on import entitlement licences from the open market. Expansion and diversification programmes also made good progress, and production costs were kept under effective control. Exports, at around Rs 36 lakhs, were lower than last year's — owing largely to prolonged uncertainties concerning rates of incentives and replenishment licences for organic pigments an dto virtual stoppage of exports to Egypt during the second half of the year. Production has been firmly established at the intermediates project. The directors point out that, while output has been fairly steady in the current year, value of sales has declined by about 10 per cent compared to the same period of the previous year.

IN the development of banking in India, two banks — Syndicate and Canara — stand out for not having followed the conventional British pattern. Both banks were firmly rooted in their environment and had the originality to adapt their roles to the situation they faced. Syndicate, for example, adopted the lead bank role in the South Kanara District in Mysore much before the concept of lead banks was born. Syndicate specialised not only in financing agriculture but in giving technical assistance to farmers. It set up a demonstration farm in Manipal, carried out soil tests for farmers and advised them on crop patterns and fertiliser use. It also induced potential small entrepreneurs to enter the area of agro-industries. Many fishery projects in South Kanara have come up because of its guidance and encouragement. The Surgical Instruments Workshop at Manipal owes its existence partly to the bank; it was a brilliant idea to recruit goldsmiths and use their traditional skills in a project requiring fine workmanship. Syndicate has also pioneered new types of deposits like the Pigmy which was both a novel and a successful experiment. Recently, it has evolved new deposits schemes which are likely to set a pattern for other banks. The bank has launched a cumulative-cum-housing deposit scheme to attract the savings of salary earners or professionals who might like to save for purposes of building or purchasing a house in the course of 5 to 10 years. Another scheme which has been recently introduced is the farmers' protection deposit. Under this scheme, a farmer or a fisherman can keep his savings with the bank with interest at standard rates and is eligible to get a loan equal to double the amount kept by him in his account over the previous six months in case of unexpected losses. Syndicate's working results in 1970 have been in keeping with its past performance. Deposits rose by 16 per cent and deposit accounts by 27 per cent. Syndicate's advances to the priority sectors stood at 47 per cent of its total advances — a record for any bank. Of the increase in advances during 1970, 65 per cent went to the priority sectors. It opened 106 new branches in 1970, mostly in rural and unbanked areas. It has carried out detailed surveys in eight of the 16 lead districts assigned to it and proposes to take up three districts for intensive development work.

You are a graduate. You have a business proposition. But what is the use? Where is the money? Bank of Maharashtra will help you implement your schemes.

A President Prime Minister?

Romesh Thapar

POLITICAL circles are more than ordinarily agitated by the reports now current about the factional in-fights and out-fights which are under way. If these reports are to be believed, we would come to the conclusion that the world of the jungle has more discipline and decorum. What is, in fact, happening is a reflection of Indira Gandhi's battle to establish her rulership as supreme at the centre and in the states. The battle is forced upon her as she moves to consolidate her hold on the complex mechanics of the State assembly elections due early next year.

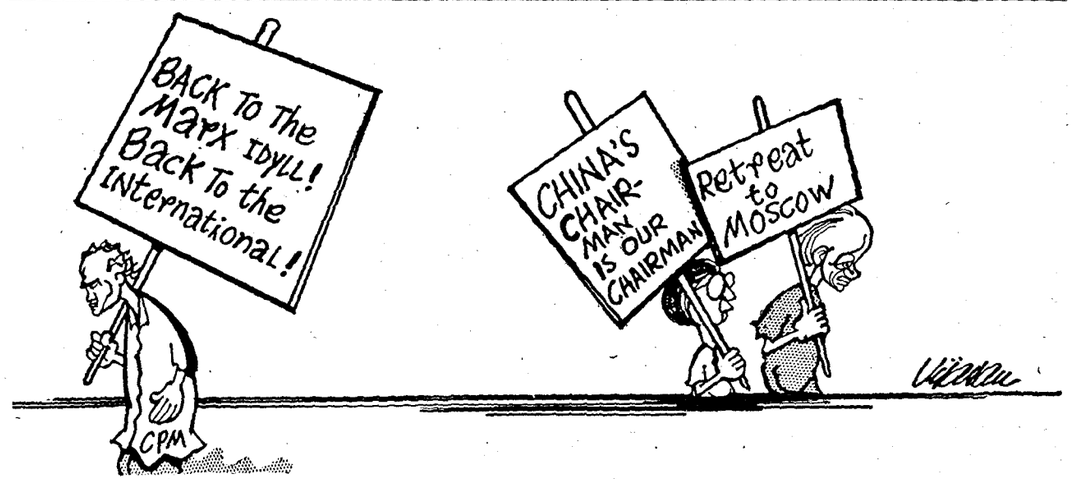
Another facet of the evolving situation which is becoming more clearly sketched as a result of these developments is the transition that the present political system is making in the direction of a presidential form. I say "form" because it is the Prime Minister who is increasingly playing the role of an all-pervasive President.

Indeed, the PM's Secretariat, as a result of the transition, has become a kind of cabinet within a cabinet. All decisions are taken at this point, and, if they are not, there is always danger that they will be repudiated. Witness the fate of the intrigue over the bill to diffuse press ownership.

In the situation that confronts India, and particularly with the breakdown of a monolithic political hold over the centre and the states (even though this may be hidden temporarily by the massive mandate at the last election), Indira Gandhi is perhaps not all that wrong in seeking *de facto* presidential-type powers. There is, in fact, no other way to cut through the obstacles to effective decision-making and movement forward.

The possibility — not to be discounted — of a major reverse in the forthcoming state elections has heightened the politicking. Indira Gandhi has chosen this moment to clean up or "surround" the factions opposed to her because the opposition parties are still recovering from their debacle in the parliamentary contests and have not realised the possibilities inherent in the state elections.

Yet to Realise



From the discussions which take place in the Capital, the politician has yet to realise that the victory of the ruling Congress party in the parliamentary elections was a dramatic vindication of Indira Gandhi's faith in the possibility of delinking national issues from parochial ones. By the same logic, regional issues, even parochial ones, are going to dominate the hustings early next year. Maybe, Indian democracy would be enriched in this way, and the federal principle reinforced, by such a diffusion of political expression. But political thinking at the moment is not nearly so convinced.

Indira Gandhi's fairly apparent bid to give the ruling Congress party an unencumbered leadership, a leadership which is above the paralytic struggle of the *dadas*, a leadership which can both talk and act, which is not helpless, constitutes a major bid to pitch the contest for the state assemblies at a level where the electorate is again made to think of the totality of politics rather than a mere facet. The task is more difficult than the earlier business of delinking the parliamentary elections from regional pulls.

We should not underestimate the passion that is being brought to bear on the build up of a President Prime Minister image. The Sukhadias, the Brahmananda Reddis, the Shuklas and the Naiks will all feel the new currents released against their all-powerful positions. The pressures will keep building until such time as the power equation which is sought to be established is accepted.

Of course, while we watch this play we wonder whether Indira Gandhi will develop the systems needed to make this kind of presidential-cum-prime ministerial set-up effective. In other words, confidence in the concentration of power is lacking. It is too often misused, even on peripheral matters. The building of this confidence is the sole responsibility of the PM herself. And it must be institutionalised.

The choice: between Primitive Communism and Slavery.

FROM OUR CORRESPONDENTS

Cavalier Approach to Fuel Policy

R S Ganapathy

THE Fuel Policy Committee was set up by a Government order in October 1970 with the following terms of reference:

(1) to undertake a survey of fuel resources and the regional pattern of their distribution;
(2) study the current trends in exploitation of fuels;
(3) estimate the perspective demand for fuels by sectors (in particular for transport, power, and domestic fuel) and regions;
(4) study the efficiency of fuels; and
(5) to recommend
  (a) the outline of a national fuel policy for the next 15 years,
  (b) a pattern of consumption and measures, fiscal and other, which would help the best use of national fuel resources, and
  (c) the measures and agencies to promote the optimum use of a fuel.

No Chairman for Months

Subsequent to the Energy Survey Committee Report (1965) it had become evident from the energy consumption pattern that there was a growing dependence on liquid fuel although indigenous coal resources were available in abundance. This had resulted in a huge drain of foreign exchange (the oil import bill rose from Rs 51.8 crores in 1950 to Rs 132.2 crores in 1969), even though indigenous production of crude oil had increased from 0.26 million tonnes in 1950 to 6.72 million tonnes in 1969. Alarmed by this tendency, which assumed crisis proportions in 1969-70, the Government somewhat belatedly set up the Fuel Policy Committee. R Venkataraman, then a member of the Planning Commission, was appointed chairman of the Committee and there were 10 members drawn from various Government agencies like Railways, ONGC, CWPC and the Department of Atomic Energy as well as from other bodies like the universities. The administrative secretariat for the Committee was set up in the Union Ministry of Mines and Metals. The Committee was supposed to submit its report within one year. The Committee set up four working groups to study various issues covered by its terms of reference.

Venkataraman resigned as member of the Planning Commission and also as chairman of the Committee on March 28, 1971. For nearly four months the Government did not appoint another chairman for the Committee and, except for some paper-work, the Committee's activities came to a standstill. Towards the end of July 1971, S Chakravarty, one of the new members of the Planning Commission, was appointed chairman. Since all the members of the Committee are part-time, it has not been possible for them to pay serious attention to the very complex problem of formulating a national fuel policy. The Committee, one understands, is nowhere near finalising its report and would probably take much longer than the one year time-limit initially set by the Government.

It is tragic that such an important area of policy planning is being handled in such a cavalier fashion. Growth in the consumption of energy is synonymous with the growth of GNP and improvement in standards of living. Hence the importance of planning for optimal use of fuel resources cannot be overemphasised. The terms of reference of the Committee are fairly comprehensive, but one does not know what the working groups or the main Committee itself have accomplished so far.

The formulation of a national fuel policy has complex dimensions and it is hoped that the Committee will consider the following issues:

(1) In the Fourth Plan, Indian energy economy takes a turn towards oil as a primary source of commercial energy and the commercial energy group as a whole gains marginally over the non-commercial group. In view of the uneven fuel resource position in terms of quality, quantity and spatial distribution, the present fuel consumption trend, if allowed to continue, will lead us in the direction of being a high energy cost economy calling for avoidable investment and expenditure of foreign exchange. A high priority in technological choice is, therefore, the development of substitute fuels to reduce imports and promote self-reliance in this strategic area. Any change in fuel will directly determine the technology of a particular industry. For example, if electricity is the only form of energy available then the production technology of fertilisers will be based on electrolysis rather than naphtha feedstock. The nature of interdependence among energy source, technology and economics of production is not at present clearly understood. More studies in this area would be necessary. However, the substitution of oil by other fuels is of paramount importance. The promising areas of work to reduce the dependence on foreign oil supplies are:

  (a) Liquefaction of coal to increase the supply of indigenous petroleum crude as natural reserves of crude are limited.
  (b) Electric traction of railways instead of the current trend towards diesel traction.
  (c) Extensive rural electrification to promote the use of electricity in lift irrigation instead of diesel engines and in domestic consumption to reduce the use of kerosene.
  (d) Production of fertilisers based on coal instead of fuel oil or naphtha.

Regional Imbalances

(2) The regional distribution of fuels in India is very uneven. Coal is mainly concentrated in eastern India and oil in north-eastern and western India. To achieve uniform development throughout the country, it is important that the price of energy at any location from any fuel source should be the same. If this were the basis, disputes like the one about the price/royalty of Koyali gas could not have arisen. Ideally, the price of energy in any part of India from whatever fuel source should be the same. This will ensure uniform development and offset locational advantages. The main obstacle to achieving this objective is, however, the legal and institutional framework in which the fuel economy operates. If all energy sources were owned by union government this would probably be very easy; but they are in fact owned by private investors, state governments and the union government. It might be necessary to introduce a complex system of subsidies and fiscal and other measures to remove the disadvantage of regions located far away from fuel sources and, at the same time, to ensure that fuel costs reflect the scarcity value of each type of fuel so as to curb foreign exchange outflows. Such a policy would promote the use of low-grade coal (which India has in abundance) in southern and western India where the use of fuel oil is going up (resulting in foreign exchange outflows) because of the shortage of coking/superior grade coal in the country.

(3) For resource conservation and adoption of more efficient methods of fuel utilisation specific R and D measures need to be taken. In the case of fuel technology there is no central R and D policy. Various agencies of Government are pursuing their own interests with no co-ordination. Since this is a vital area, this anarchy in R and D policy must end immediately.

(4) Substituting the form of energy results in changes in tradition, culture and patterns of living. For example, if one wants to prevent the use of firewood as a fuel in rural areas as it results in soil erosion and denudation or the use of cow dung since its alternative use as a fertiliser is more important or the use of kerosene which needs to be imported, the promotion of soft coke or electricity as an alternative fuel could mean adoption of practices in cooking which are radically different from the present ones. Such major social changes in the rural areas can be brought about only by extensive education and publicity. In economic model-building, expectation of use of substitute fuels without reference to the social change that will need to occur would be unrealistic.

Central Electricity Authority

(5) There are other kinds of institutional obstacles which prevent the optimum utilisation of fuel. It has been proven by the experience of developed countries that large power stations produce cheaper electricity. In India, the state electricity grids are comparatively small so that a single power station of 500 MW or above cannot be established by any one state. The pattern of consumption in particular regions can, however, support such large stations. The only way to ensure large-scale production of power and efficient utilisation of the installed capacity is to have regional grids operated centrally. Since the State Electricity Boards are evaluated on their own investment and accountable to state legislatures for their profitability and since there is much interstate rivalry, unified operation of regional grids is very difficult. The northern regional grid has been somewhat successful due to the co-operation of the State Electricity Boards.

To eliminate inter-state rivalries it may be necessary to entrust all electricity generation to a Central Electricity Authority (CEA). The CEA could operate large regional power stations and distribute bulk power to the State Electricity Boards. Such power stations along with adequate load despatch centres should form the nucleus of regional electricity grids. Eventually these regional grids can form part of the national grid. The CEA should also take over the operation of the nuclear power stations which are at present being operated by the Department of Atomic Energy — an arrangement which is highly irrational because the Department of Atomic Energy is not in the business of electricity generation and distribution; it is concerned only with the development of nuclear technology for the production of cheap power.

Similarly, the institutional structure of production and distribution of coal and oil is of diverse types, e g, in private sector and public sector with different priorities and objectives. A rationalisation and reorganisation of agencies in charge of production, distribution and regulation of fuel producing and consuming industries is called for. Unfortunately, this institutional reform does not find a place in the terms of reference of the Fuel Policy Committee except in an indirect manner.

(6) The problem of conserving the environmental quality does not find any mention in the terms of reference of the Committee. The choice of alternative forms of fuel will to a large extent determine the amount of pollution of air, land and water. Nuclear power is supposed to be the "cleanest" of all kinds of power though it creates some kind of thermal and radioactive pollution. In the Indian context pollution may not be the burning problem; but in the long range planning of fuel policy, the effects on environmental quality have to be considered.

(7) A comprehensive analysis of capital, foreign exchange and technical manpower requirements to ensure the desired pattern of development of fuels is necessary so that these are available at the right time in the right measure.

When these various issues are considered it becomes very clear that the organisation for the formulation of a national fuel policy has to have adequate resources, a competent and well-staffed secretariat, a majority of full-time members and a fairly long (say five-year) tenure. None of these conditions are fulfilled by the present Fuel Policy Committee. Fuel policy is not an *ad hoc* problem like the arbitration of a river waters dispute or an inquiry into the causes of a riot. A Committee consisting of only part-time members with a one-year tenure and an ill-staffed secretariat can hardly achieve anything substantial. Massive data collection and analysis about fuel consumption, energy technology, the institutional framework and other matters is necessary for policy formulation. Strangely enough, the Fuel Policy Committee is located administratively in the Department of Mines and Metals instead of the Planning Commission which has much better resources for collection and analysis of data.

If the Government is serious about evolving and implementing rational fuel policies, a permanent Commission with at least two-thirds of the members being full-time and with adequate resources should be constituted. This Commission should be an autonomous, statutory body outside the Government executive, reporting to Parliament through the Minister. It could be called the National Commission on Fuels and Energy. It will be the regulatory, long-range planning, development and funding authority for the fuel and energy industry. Such a Commission could formulate the national policy on fuels with alternative strategies the nation could adopt. It should get the Parliament's approval for a particular strategy so that measures for its implementation can be taken. A similar body is being set up in the United States as a result of Congressional efforts. The importance of the problem warrants an organisational structure which will have adequate authority and competence for the task.

Can one hope for a "white paper" on fuel policy from the Prime Minister proposing adequate measures in this regard?

South Madras Electric

SOUTH Madras Electric's Trichinopoly-Srirangam Electric licence stands extended up to January 12, 1982, as the Electricity Board has not exercised its option to take over the company on January 12 next. The company intends to electrify the remaining 16 villages in its area this year. To meet the additional capital requirements of the increased activities, it is proposed to utilise the balance of Rs 9 lakhs out of the Mayavaram-Mannargudi-Turuvarur electrical undertaking compensation. For further capital requirements in future years, the company will borrow from Government or financial institutions or utilise such compensation amount as may be further received.

Planning Commission and the States

(From a Special Correspondent)

ACCORDING to a Press report, an appraisal by the Planning Commission is said to have brought out the fact that the Fourth Plan's intersectoral balances have been upset "because of the repeated revisions in the estimates of multi-purpose projects". From this, the conclusion is drawn that apparently the existing arrangements for project evaluation "are not quite adequate in many States".

Obvious Gap

There is an obvious gap between the conclusion and the original premise, which is not uncommon in the Planning Commission's thinking, and obviously the reconstituted Planning Commission is also continuing this tradition. The revisions in the estimates of the multi-purpose projects have occurred for many reasons, the most important of which is the State Governments' anxiety to get both the Planning Commission and the Government of India committed to a particular project. All multi-purpose projects costing above Rs 5 crores are sent to the CWPC and the Planning Commission for approval. If the project evaluation arrangements are inadequate at the State level, what was being done at the CWPC and the Planning Commission when the schemes were approved by them? Obviously, their inadequacy could not be any less than that of the States.

The fact is that unless the anxiety to get projects committed is not removed by more rational procedures for allocation of resources between the Centre and the States, this charade will continue, no matter how expert the project evaluation organisation is made. Further, those who know the project evaluation techniques and the assumptions that are made in them would also be aware that it would be quite easy to juggle the evaluation itself so long as the basic urge to do so remains.

In the same newspaper report it is also said that in a number of cases inadequate allocations have been made for programmes falling under roads, soil conservation, housing, etc. The reasons for the States doing so are not given. The observation, however, is in keeping with another favourite suspicion of the Planning Commission, namely, that the State Governments have a tendency to starve these sectors, as well as the social services sector, in order to provide more for irrigation and power, the unstated implication being that there is some unworthy political motive behind this tendency of the State Governments. A little thought would however show that the State Governments are normally under political and local pressures for making allocations precisely for these sectors and if, in fact, they are starving these sectors and making allocations for irrigation and power, they are showing a degree of economic foresight and political courage which the Planning Commission itself seems to lack.

Not Enough Projects?

It is also mentioned that Central programmes for removal of disparities between different regions and different communities have not had an adequate impact "mainly because the local administration as well as the different credit and promotional institutions have not been geared to the task of identifying problems, formulating viable projects and programmes and implementing them vigorously". At the same time, it is stated that even though institutional finance, such as the liberal grant of loans by the public sector banks, is available some of the States have not been able to take advantage of these resources for want of properly formulated and economically viable projects, thereby putting the blame on the States instead of the financing institutions. This obviously contradicts the earlier statement that the financing institutions have not themselves been geared up. The experience so far shows that it is not the want of viable projects as much as the rigidity with which the concepts of viability are applied by the financing institutions that has stood in the way of their resources being utilised on a larger scale.

So far as Central programmes are concerned, the reason why these have not had an adequate impact is that, on the one hand, they are formulated at Delhi with an insufficient acquaintance with field conditions and, on the other, the degree of control that the Centre exercises not only delays the implementation, but completely kills the initiative of the local officials as well as of the State Government itself. There are instances like the Rural Works Programme in which schemes costing a few thousands of rupees, which in the normal course are sanctioned by the Superintending Engineer and not even by the Chief Engineer or the State Government, have now to be submitted to the Central Ministry at Delhi for clearance. Obviously, if procedures of this sort are adopted, Central schemes are bound not to have any impact on anybody except the Ministry itself, which keeps on expanding as a result of these schemes.

Successive Planning Commissions have been wise and modest enough not to search for a panacea for all the evils of our planning. However, they have not been equally wise in avoiding the temptation of trying to find at least a unique diagnosis of these ills, the diagnosis depending upon the individual predilections and the highly selective nature of the previous experience of the Planning Commission Members concerned. The assumption always has been that all was well with the plan itself, that when things went awry with our previous Plans the error had not arisen in the Yojana Bhavan but in the implementation by the State Governments. The latest diagnosis seems, from this report, to be the lack of adequate appraisal of projects. District planning and project appraisal are evidently going to be the twin engines that would hereafter push our plans forward.

From One Ivory Tower to Another?

In considering the problems of plan implementation in this limited content, the Planning Commission, deliberately or otherwise, is shutting its eyes to the basic reason for planning at the State level being weak so far, *viz*, the limitation of resources and the inadequacy of the control they exercise over the little resources that they have. The problems of planning cannot be properly analysed while ignoring the problems arising out of Centre-State financial relations. Any amount of pontification by the Planning Commission and any number of gimmicks suggested by them will not remove the basic defects in planning at the State level unless and until the problem of financial resources available to the States for developmental purposes is solved. To the extent the Planning Commission ignores this aspect it would only be living in an ivory tower and in that case its distinguished members need not have changed from their previous ivory towers.

COLOMBO

Economics of Survival

A Special Correspondent, recently in Ceylon, writes:

THE events of April 5 and 6 and the aftermath of political detention, emergency power and attempted "rehabilitation" of the disaffected merely highlight the acutely difficult situation facing Ceylon's coalition government and by Sirimavo Bandaranaike (see "Emerald Island Turned Bloody Red", Special Number, July 1971).

The underlying economic problems are not of this or the last government's creation, but are a part of the continuing drift since Independence. Ceylon's economic dilemmas are many: stagnant export earnings based on three plantation crops — tea, rubber and coconut —, rapidly rising population following directly from the post-War malaria eradication campaign, the total absence of serious attempts to introduce a birth control programme and steeply rising unemployment partly as a consequence of unlimited free access to university and secondary education.

Three Problems

These three major problems would have led to a rapidly deteriorating economic situation in themselves, but they have been aggravated by the dissipation of the foreign exchange reserves built up during the Korean war boom (reserves in 1955 of more than $ 400 million are now less than $ 100 million) on continuing high levels of consumption imports (rice, onions, chillies, canned products and synthetic textiles) and a disastrous import substitution policy which actively encouraged the establishment of sub-optimal units. There appears to be no economic planning rationale for some of the industries established. (There are seven chocolate products factories for a population of 12 million!) The results are seen not only in dissipated reserves, but in the form of crippling foreign debts, which currently absorb more than 40 per cent of the country's export earnings. The unemployment situation was considerably worsened by an insistence on the establishment of a large number of capital-intensive units, which have been operated at substantial deficits in the public sector.

Present government policies involve a cutback in consumption imports, attempts to diversify the plantation sector and to expand industrial and non-traditional exports through the foreign exchange entitlement scheme introduced in May 1968, which effectively devalues the Ceylon rupee (current parity Rs 5.95=US $ 1) by 55 per cent to Rs 9.00. However, this set of policies is doomed unless the more basic weaknesses are remedied.

The three evils are well known: population growth, widespread urban and rural unemployment and, finally, serious educated unemployment. The last led to the events of April 5 and 6 and will be repeated until remedies are found. First, the present government needs to launch as its immediate priority a birth control programme for the rural areas. Although Ceylon is losing doctors at a rapid rate it is still well-served in comparison to India, particularly in the rural areas. It is true that any campaign will not be fully operative before 1975 and so the employment aspects of "prevented births" will only be felt in 1990, but a radical cut in the birth rate from 35/38 per 1000 to 17/20 per 1000 would free fiscal resources for job creation rather than being absorbed, as at present, in educational and social welfare expenditures. Second, the provision of free education, health services and a subsidised rice ration will necessarily have to be replaced by a series of means tests, which would deprive of benefits those with family incomes in excess of Rs 800 and begin to reduce benefits on incomes as low as Rs 500 per month. Again the rationale is the provision of resources for job creation. These measures might well be considered politically more palatable if the tax rates on urban property were doubled and heavy taxes levied on all undeveloped land.

The resources raised should be channelled into diversification: in the small holder sector to tobacco, cashews, cocoa, fruit and vegetables, coffee, oil palms, sunflower and kenaf as well as minor spices. The government should finance the training and employment of the unemployed to produce these internationally tradeable crops. A major fisheries programme should be launched based not only on inshore expansion, but the purchase of trawlers and boats and the development of an integrated freezing plant to exploit the crab, lobster, prawn and tuna in Ceylon waters along the east coast of India and in the Bay of Bengal. The government should establish an Export Processing Zone to develop Ceylon's low wage potential in garment manufacture, electronics assembly, plastics, electrical products, wood products and light engineering. In the case of the export processing zone, Ceylonese resources would have to be associated with foreign capital and management knowhow and profit remittances should be allowed as freely as materials and machinery could be imported. Of course, an unpleasant political dilemma will arise: "socialism or unemployment?". Finally, the entire structure of higher and secondary education will have to be reorganised to train agriculturists and machinists rather than Pali and Sanskrit scholars and Buddhist philosophers.

These policies will not solve the desperate problem of Ceylon's political and economic structure. The level of unemployment at 650,000-700,000 out of a potential work-force of 4.2 million is far too high for easy economic answers. There is substantial overemployment in the organised sector at present and any government will be under pressure to continue inefficient manning practices and even to expand the bureaucracy by taking over parts of the private sector. Ultimately, any State whether socialist or capitalist must face the test of "economic efficiency." The state corporations and the bureaucracy in Ceylon may aspire with certain Ministerial members of the present coalition government to take over the economy along Burmese lines, but their present performance does not suggest that such measures would be in the public interest.

Persuade the People

Before introducing such a series of measures the government will have to persuade the Ceylonese that a critical situation really exists. Initially, they should announce that they have been forced to ban the bulk of food and consumer goods imports and follow this measure by declaring unilaterally a five-year moratorium on all international debt repayments. The foreign resources freed should be diverted quickly into birth control programmes, diversification and building of new plantation crops, fisheries and industrial exports from the processing zone, and restructuring of secondary and higher education. All these policies will be expensive and all will be unpopular. The absence of certain foods and consumer goods will hit everyone, not only the upper classes and the unilateral five-year moratorium will not be greet-

ed with delight by the IBRD and the Ceylon Consultative Group. There will be serious opposition to increased domestic taxation, educational reforms and birth control measures. However, some such set of measures based on the urgent necessity of job creation and economic restructuring will be required during the present phase of Ceylon's history. The politicians are unlikely to think, after the events of April 5 and 6, that masterly inactivity is the sovereign remedy for Ceylon's problem. It is possible they will abandon the limited ideas of their planners and economists and decide that the political economy of survival demands more radical measures.

V/O "TYAZHPROMEXPORT"

renders technical assistance to foreign firms and organisations in the construction of complete enterprises for *mining industry:*

Enriching concerns
Ferrous ore mines
Open-cut quarries
Enriching factories
Sintering factories
Suspended cable-ways

The work on projecting and construction of mining enterprises is carried out on the basis of the up-to-date achievements in the field of the Soviet and foreign science and engineering. The up-to-date equipment supplied by **V/O "TYAZHPROMEXPORT"** to mines including hoisting-and-transport facilities and power plants is designed with due consideration of modern requirements to safety engineering and guarantees full mechanisation of all production processes, high efficiency and economy apart from reliability in operation under various climatic conditions.

For detailed information regarding the construction of mines write to:

DAR-ES-SALAAM

Ideological Growth of TANU

A K Essack

IT is said that where there is no vision, a people perish. And whose task is it to provide this vision but the most conscious of its people grouped together in vanguard parties. The people of Tanganyika needed such a party and the Tanganyika African National Union (TANU) arose to fulfil just this historical role when it was formed in 1954 with Julius Nyerere as its President.

In many cases, it is more than a decade since many national movements in Africa were given the insignia of independence and became the governments of their territories. Today many of these parties have wilted and have become shadows of their proud and eventful past. Their role has degenerated into that of mere voting machines and they are given artificial injections once in four or five years so that they can play their electoral role by harking back to their past. If TANU, after 17 years of existence is still looking fresh and vigorous, if those lofty ideals which characterised its birth—as well as that of other national movements—still burn bright, radiating light beyond their own national boundaries, it is only because TANU has continued to adapt itself to changing objective conditions in order to pursue even more forcibly its declared goals. The late sixties ushered in a new phase where the battle for economic independence and the removal of all vestiges of colonialism from Tanganyika's institutions were, together with the battle to master and increase production, given top priority. This is the only way to pull the people out of the quagmire of poverty, illiteracy and backwardness and strike out towards modernisation. The best of the country's working youth have responded to TANU's call to meet these challenges. It is their entry into TANU, through its youth wing, that continues to give TANU its vitality, firmness and vision. The young have given faith to the faltering, sustained those whose political stamina was giving way, and have taken the place of those who have fallen by the wayside.

Prior to independence, Tanganyika was not legally a colony, as it was under the United Nations and Britain was only a Trustee. But Britain treated Tanganyika as it did its other colonies and hatched plans for the intensification of exploitation in this country as well. The principal targets here were the peasants, particularly those holding land or stock. The attack came on them either in the form of open and brutal expropriation of their land or by bogus schemes, cunningly designed to seem for their benefit but in reality aimed at rendering them landless and stockless.

The government acting on the Wilson Report decided on the "redistribution of the land along the Kilimanjaro-Meru area."[1] What this meant was that 3,000 Wameru were evicted forcibly and their land given to the Europeans. The Wameru put up a magnificent resistance through their Meru Citizens Union of Free Men, but lost their land. They, however, as well as the rest of Tanganyika, gained in that their resistance led to the increase of political consciousness and awareness. Not only the Wameru became politically conscious, but also the Chagga, for instance, for they knew that they would be next.

The Wameru lost in spite of their complete unity. This brought home the fact that what Tanganyika needed was not a local or tribal association but a national party of the people whose principal object would be to fight for their political rights. The need for such a party had already been seen, as early as 1945, by people like Ali Ponda, who said that Tanganyika needed an organisation whose principal task would be to mobilise the masses for direct political action.

TANU was formed in 1954 to meet this need. It was qualitatively different from the existing organisations in that its vision embraced the whole territory and all the people and its orientation was openly political. Proceeding from the analysis that the ills that beset the people were due to the denial of political rights, TANU concentrated on gaining political power by getting rid of the British. Past experience, e g, the Meru Land Case, demonstrated that it would be futile to fight this or that piece of legislation. Even if they were successful, it would not basically alter the oppressive system of colonialism with its exploitative character. The main strategy for TANU then was to capture political power. The slogan 'Uhuru' crystallised this idea.

Nyerere said of TANU's birth: "TANU is in one sense a new organisation, but in another it is an old organisation. It has taken over from what was formally called the Tanganyika African Association, TANU . . . is a new organisation in the sense that it is a political organisation whereas the former were semi-social and semi-political."[2] The politics of TANU was to work for independence and towards this end it sought to mobilise the masses. It is its political programme that changed TANU from a mere association to a national movement.

There is little doubt that 'Uhuru' caught the imagination of the people, precisely because it expressed their aspirations. There were many bodies in Tanganyika to which people owed allegiance. But if they looked to TANU, it was because the party became identified with Uhuru. It also became an organisation of the masses because it linked itself with the aspirations of the peasantry. A United Nations team commenting on this in its report of 1954 said "Land and its use and tenure, comprise in the African mind the outstanding political and economic issue of the day."[3] The attack on the people's land came through various bogus schemes like the Mbulu Development Scheme, the Usukuma Development Scheme, the Mlalo Rehabilitation Scheme, the Uluguru Land Usage Scheme, the Iringa Dipping Scheme. Despite high sounding names and outwardly lofty intentions like soil conservation and utilisation of scientific methods of farming, the aims of these were to deprive the people of their land and cattle. And that is how the people saw it. And they resisted. For instance, it is reported, "In Sukumaland where the administration used compulsory legislation through Usukuma Federal Council . . . opposition and hostility against the rules and against the chiefs was intense . . . in Usambara mountains where the Shambas resisted compulsory ridging and terracing, hostility and unrest broke out in 1957."[4]

Opposition also arose in Uluguru, Irangi, and Iringa. As in Sukumaland, TANU championed the rights of the peasants and highlighted their grievances. In 1954 TANU was banned in Sukumaland and Lake Province, Morogoro in 1955, Irangi in 1956, Usambara in 1957, and Iringa in 1958. In fact within four years of its existence TANU earned the wrath of the authorities and was banned in eleven districts.

It is this type of activity, with its leaders being one with the people, that transformed TANU into a mass organisation. Its membership grow at a phenomenal rate and by 1958 stood at 200,000. TANU within a short period had transformed itself into a national movement with a peasant base. TANU differed from other national movements in that the masses were directly represented at the very top in the central committee. It was not a party consisting of a small educated group which had appointed themselves trustees of the people. The people, the peasants and workers had their own spokesmen in TANU. It is this that made some of the educated elite refer to TANU as an organisation of 'illiterates'.

With growing mass support behind TANU, the crucial question was how to achieve Uhuru. Two roads were open: the constitutional one or that of armed struggle. There were many people who, remembering the Maji-Maji and Hey rebellions, doubted whether freedom could be won without the gun. In 1958 TANU met, assessed the situation, and evolved its strategy, which included the possibility of winning independence through constitutional means. At Tabora it was decided to contest the 1958-59 elections. The African National Congress and the United Tanganyika Party created by the British administration were severely trounced. TANU won all seats except two. The 1960 elections were a repetition of the previous one and Britain had no alternative but to grant complete independence on December 7, 1961. TANU had within a short space of time been able to achieve Uhuru. Independence meant that TANU was in a better position to try and mould 120 tribes and varied religious, social, and racial groups into a single nation.

Most African nationalist movements which were fighting for independence had a low ideological content. The lack of clarity was not so much on the immediate tasks or what methods to adopt to achieve them, but rather on what type of society was to emerge after independence. Would it be different from what they were going to inherit from the colonialists? Would it be a continuation of the same system of exploitation with its oppression and tyranny or would it be a system free from exploitation?

Nyerere, at his inauguration as President in December 1962, realised the difficulties he was facing. He said, "Long before independence, signs of trouble began to appear. First, some people began to mutter that TANU was a party of illiterates; that there were not many well educated people on its executive committees, and that a large number of the highest positions in the party were held by members who had hardly any education at all. This was in fact perfectly true, but it was by no means a bad thing... the leadership should be representative of the country as a whole".[5]

After analysing the situation, TANU opted for socialism. The "TANU Creed" stated, "it is the responsibility of the State to intervene actively in the economic life of the nation so as to ensure the well-being of its citizens and so as to prevent the exploitation of one person by another, or one group by another and so as to prevent the accumulation of wealth to an extent which is inconsistent with the existence of a classless society... and therefore ensure that this country shall be governed by democratic socialist government of its people".[6]

TANU adopted the tenets laid down in a pamphlet, *Ujamaa* written by Nyerere, on the basis of socialism. In it, the author described in broad terms the society he would like to see emerge in Tanganyika. He wrote, "We must not allow the growth of parasites in Tanganyika... TANU government must go back to the system of landholding. That is to say that a member of society will be entitled to a piece of land on condition that he uses it... True socialism is an attitude of mind. It is, therefore, upto the people of Tanganyika—the peasants, workers, students and the leaders and all of us—that this socialist attitude of mind is not lost through the temptation of personal gain"... a true socialist may not exploit his fellow".[7]

The significance of the pamphlet as well as the acceptance of socialism as a goal should not be overrated. The President himself, six years later, said of his pamphlet, *Ujamaa*, "it described the basic attitudes of socialism but it was published in English and was never easily available to the people of Tanzania. Many active party workers as well as many of our teachers and civil servants therefore remained unclear even about the most important principles of the socialism they were responsible for promoting and serving".[8]

The period from independence to the eve of the Arusha Declaration was characterised by contradictory policies. Tanzania took certain measures consistent with its commitment to socialism, including the conversion of all freehold land to leasehold, government purchase of private electricity companies and the encouragement of marketing co-operatives. The first Five Year Plan, launched in 1964, evaded the crucial question whether economic development was to be in the socialist direction or whether Tanzania would remain a neo-colonialist state with capitalism as the dominant mode of production.

On the question of race, TANU opened its doors to all Tanzanians irrespective of race or colour. Upto 1962, non-Africans were barred from membership. This was an anomaly inconsistent with socialism and was, therefore, removed. On this point Nyerere was forthright: "In a Tanganyika still clinging to the habits of colonialism, there might be racial discrimination. But it would be a shameful disgrace to the Republic of Tanzania or the Tanganyika of *Ujamaa* for us to refuse any of its citizens the right to be members of TANU because of their colour."[9] This flowed from the belief that while fascism and racialism may go together, socialism and racialism are incompatible.

At the end of 1966, the economic reality in mainland Tanzania was that banks, insurance, food processing industries, wholesale trade of imports and exports, were all still in the hands of foreigners. These were raking away the surplus generated by the toil and sweat of the peasants and workers. True the party had turned freehold into leasehold, but that was more to forestall the development of rural capitalism than to alter radically the pattern of agricultural property relations. These were small changes, as important sectors of the economy still remained in neo-colonialist hands. TANU, however, had to tread warily, for to touch these foreign institutions was to touch the 'nerve centres' of international finance capital.

Trouble was brewing and the murmurs came this time from the mass of the people. They were getting restless for they wanted to know why TANU did not implement its "Creed" and take over the commanding sectors of the economy. TANU was trying to use capitalism and socialism at the same time. "Prior to the proclamation of the Arusha Declaration all that existed in abundance was an economic base inherited from the colonialists; all that existed was a superstructure inherited from the colonisers. The peasants and workers had either to continue existing as slaves of a neo-colonial economic structure or part with it once and for

all. The people had either to control their own destiny or have it controlled by others".[10]

But on February 5, 1967, Tanzania took a bold and decisive step with its Arusha Declaration. The philosophy of socialism was clearly spelt out. Tanzania was committed to socialism from which there would be no retreat. Within a few years after the Declaration, the government nationalised: all banks (except the co-operative bank), certain firms engaged in processing food, insurance companies, and key firms engaged in wholesale and external trade. In some other firms, government acquired a majority of the shares.

Another significant feature of the Declaration was its focus on TANU leadership. Aware that some of the TANU leaders were taking to capitalist practices which would sooner or later link them with their imperialist masters, the Declaration said, "Socialism is a way of life... a socialist society can only be built by those who believe in it... A genuine TANU leader will not live off the sweat of another man nor commit any feudalist or capitalist practices". And to nip in the bud the accumulation of capital by TANU leaders, they were forbidden from holding directorships in private enterprise or receiving salaries from more than one source. Further, it was decreed that "No TANU or government leader should own houses which he rents to others".[12]

The Arusha Declaration with its nationalisation measures did not transform Tanzania into a socialist society, but it did indicate clearly and unequivocally the direction that Tanzania had chosen.

Another question that arose was about the relationship between the party and the government. There would have been no problem if the party had been the creator of the State machinery. But that was not so. The party was the creation of the people, the State machinery of the colonialists. The functions of the two were antagonistic. The State machinery was the superstructure of the capitalist system. Thus, the entire civil service, army, police, judiciary, schools, parliament were designed to facilitate the operation of this system for the benefit of the colonialists in London. This machinery to facilitate the extraction of profits was taken over lock, stock and barrel by the new rulers without critical examination.

The State machinery represented power. Through it one could yet a good job, a good house, a big car, and a number of other benefits. Party membership had begun to be regarded as a means to a good government job and other facilities. Government departments had begun to behave as little kingdoms independent of the party. Some leaders used the party machinery, also, for their own selfish ends. The "TANU Guidelines" of 1971 were formulated, among other reasons, to deal with this problem. They stated, "The responsibility of a socialist party is to lead the people in all their activities. The government, national institutions, mass organisations are all instruments for implementing party policies... In truth we have not only inherited a colonial structure of government, but have also regarded it as our own... To lead, the party must decide on the structure of the Government".[13] Henceforth one of the primary tasks of the party would be to dismantle the State machinery which the colonialists had left behind.

The "TANU Guidelines" reiterate the supremacy of the people in all branches of life: "The party's role is not to urge the people to implement what is decided on by leaders and a few experts. On the contrary, the role of the leaders is to see that the leaders and experts implement policies agreed on by the people themselves.[14]

SINGAPORE

'Backstage' Meeting

Harish Chandola

THE Foreign Minister, Swaran Singh, visited Indonesia and Singapore during his Southeast Asian tour from August 12 to 15. In Indonesia he led the Indian team which held bilateral talks with the Government there and in Singapore he called on the Prime Minister, Lee Kuan Yew. One would like to write about his meeting with the Singapore Prime Minister first, because the manner in which it was arranged was really unfair to both the Prime Minister and the Indian Foreign Minister.

On August 12, Swaran Singh had passed through Singapore on his way to Jakarta and during his halt at the airport had told reporters that the Indian High Commission here had already made a request to the Singapore Government for a meeting between him and Lee Kuan Yew. On August 15, the High Commission telephoned a few reporters to tell them that Swaran Singh was meeting Lee Kuan Yew the same day. It was a Sunday and the Prime Minister was specially busy that day because he was addressing the annual mass rally of his party and later attending a party dinner. This rally is of utmost importance to Singapore because at it the Prime Minister outlines the ruling party's policy for the coming years. Lee therefore had no time to see any visitor on Sunday and his office had informed the High Commission that the Prime Minister had asked Swaran Singh to be his guest in Singapore and meet him on Monday.

But the High Commission informed his office that the Foreign Minister wanted to leave Singapore the same night, to be in Delhi on Monday to see off Senator Edward Kennedy who was leaving India after his tour. And the High Commission persisted in seeking time from the Prime Minister on Sunday itself. The Prime Minister's office then allocated 15 minutes to Swaran Singh and informed the High Commission that Lee Kuan Yew would meet him at a theatre at 8.45 pm, between his rally speech and party dinner.

Swaran Singh had cancelled a lunch with the Indian community in Jakarta, which was celebrating the Independence Day, and some other engagements in order to arrive early in Singapore. He was here shortly after 12 noon and had then to while away the day witnessing a hockey match, etc. He arrived at the theatre in time for his 8.45 pm meeting, but the Prime Minister had not concluded his address at the rally. The address ended at 9.10 pm and he then met Swaran Singh at 9.15. The meeting, as indicated earlier by the Prime Minister's office, was a brief one, because 4,000 party members were waiting for Lee Kuan Yew at the dinner.

Were there really matters of utmost urgency which Swaran Singh wanted to discuss with the Singapore Prime Minister on the latter's most busy day? Were these matters of such urgency that he had to go to a backstage room of a theatre and wait there, instead of meeting the Prime Minister in his office on Monday? This behaviour lacked dignity. One never hears of a Foreign Minister going to a backstage room for an official meeting with a Prime Minister. In doing so we certainly have made diplomatic history!

Lee Kuan Yew is certainly not responsible for what happened. He had the grace to invite the Foreign Minister to be his guest and call on him at his office on Monday. But then the High Commission had indirectly conveyed that Swaran Singh had a more important task in Delhi on Monday, which was to see off Senator Kennedy. The only time that Lee Kuan Yew had was between his speech and his dinner. It was unfair of the High Commission to bother the Prime Minister on his busiest day and then to lead their Foreign Minister to a backstage room for an official meeting. There were no outstanding problems between India and Singapore. The two countries have been very good friends and would certainly have remained so even without the clumsily arranged meeting between Swaran Singh and Lee Kuan Yew.

Indonesia Trade and Aid

After writing all this, it is really difficult to talk about the normal, annual bilateral talks between India and Indonesia. These talks consist of exchange of views on current international and regional problems and efforts to find ground for more bilateral co-operation in various fields. They are not aimed at superimposing the thinking of one country on the other.

The most beneficial result of these talks for India was the assurance that an Indonesian Minister, possibly the Minister of Trade, would visit Delhi shortly to have a look at the industrial goods available in India which might meet the requirements of Indonesia and also to examine the credit-terms the Indian suppliers were prepared to offer to Indonesian importers.

The Indonesian officials who have visited India so far for the purpose of increasing trade between the two countries have been interested only in the credit-terms India was prepared to offer and had shown no interest in having a look at the goods. After ascertaining Indian terms, these officials examined terms offered by other countries and then accepted those that appeared to be most favourable. By doing so, Indonesia obtained equipment which was perhaps not best suited to its requirements and conditions in the country. Because of apparently easy credit terms from a country, Indonesia, for example, obtained from it railway rolling stock suitable for very high speeds. But the Indonesian trains do not move at 200 km per hour and so the optimum use of that equipment could not be made.

Similarly, another country offering long-term credit was prepared to sell to Indonesia highly automated and labour-saving textile-mill machinery. But the problem for Indonesia at the moment was to provide jobs to as many as possible, and by buying the most advanced textile-mill machinery not only was it going to spend more but was also not going to improve the lot of its unemployed.

It was in this context that the Indian equipment was relevant. It was not the most sophisticated and automated. But it cost less and provided jobs to more. The Indian rolling stock too was less expensive, though perhaps not capable of bewilderingly fast movement. It moved at speeds which suited Indonesian railways.

But India was itself a developing country and was unable to provide the easy credits. In spite of that, buying from it was not going to impose such heavy burdens on Indonesia as the seemingly easy credits from more advanced countries. The Indonesian Government was now prepared to examine this aspect of trade and was willing to send a Minister to India to have a look at the goods and see if they met the Indonesian requirements.

On the political side, the talks resulted in better understanding over problems of instability that the situation in East Pakistan was creating for the whole region. They also enabled Indonesia to understand the reasons for India signing a Treaty of Peace, Friendship and Co-operation with the Soviet Union. The joint communique issued at the end of the talks did not mention that Indonesia supported this particular move of India to maintain peace in the region, but it did say that the Treaty was among the subjects discussed by the teams of the two countries.

Not without Outrage

Farrukh Dhondy

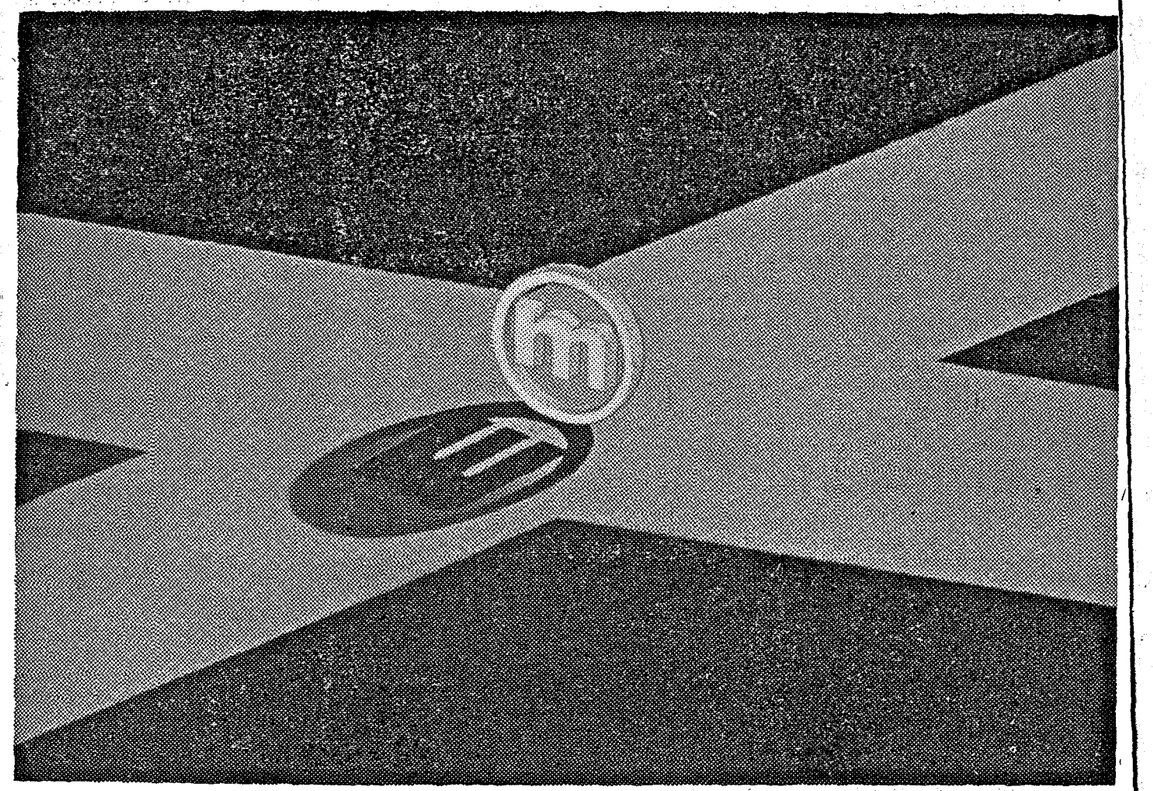
AMERICAN justice provides answers when American law has none. When it becomes impossible to stand a man up in court and frame him for murder, when it becomes impossible to release that man because of his courage and his singlemindedness in making no compromise with oppression, it becomes necessary to eliminate him. George Jackson was shot in prison last week. With the other Soledad brothers, Fleeta Drumgo and John Clutchette, he was on trial for his life and the trial was in process. The official reports of his murder say that he was killed while attempting to escape, shot in the prison yard by a guard from the watchtower after a shootout in which three prison guards and two white convicts, 'trusties' of the prison, died. Perhaps one day we shall know what actually took place in that prison. Today I can only say that I do not believe that George Jackson was a desperate man who gave his life in a last act of desperation.

Jackson knew, and often said, that he wouldn't get out of Soledad prison alive. For 10 years he had lived in the knowledge that the preservation of his right to live had passed from his own hands. He was originally imprisoned for assisting in the theft of $ 70 from a petrol station, and given a sentence of "from one year to life". His imprisonment revealed to him the political nature of his captivity, the rationale behind the meaningless arbitrary sentence he'd received.

In jail, he taught himself Chinese and Swahili, read anthropology, history politics, mathematics, and electronics, and began to understand and question the nation that was born in blood and built on slavery, the nation that resorts to both to sustain its imperial role. He wrote to his brother Jonathan inducing him to commitment, so as to live through him the life he would have himself led outside prison.

Early in 1970, two black prisoners were shot dead and a third wounded in the yard of Soledad prison by a guard on the watchtower. The wounded man who was still alive was dragged to the warden's office, instead of to the hospital, where he bled to death helplessly. Following the incident, and a subsequent statement by the prison authorities that the killings were justifiable homicide, a white guard was found strangled in the prison and George Jackson, Fleeta Drumgo, and John Clutchette were accused of his murder.

On August 7, 1970 Jonathan Jackson was killed while attempting to free a black prisoner and hold the judge hostage in Marin County courthouse. As he left the courtroom, his last words were: "All right, gentlemen, I'm taking over now. Free the Soledad Brothers by noon". Angela Davis, whom George called "my tender experience" was later accused of aiding Jonathan in the attempt.



The period of George's imprisonment coincided with that of the transformation of the black struggle in America. It was while he was inside and observing, that Malcolm X broke from the narrow nationalism of Elijah Muhammed, that Malcolm himself was murdered, that black people turned from civil rights to self defence, that the Black Panther Party was born and experienced America's violence in its turn. Watching the will of the oppressed being mobilised, must have given George some hope. The guardianship of his life had been passed on to the will and consciousness of the black people. When he died, this will and consciousness failed him in an important sense; his death showed that black America is prepared for martyrdom but not ready to demand that its sons come home. Finally, America bargained him away because it knew that his death was less dangerous than his life.

It was during his imprisonment, too, that black America found its new voices — men like Le Roi Jones, Eldridge Cleaver, and Bobby Seale, who brought to the surface the message that had been agonisingly implicit in the work of Richard Wright and James Baldwin. Their work, taken together (as it must be), is the autobiography of the revolutionary consciousness of America, the parallel growth of pain and awareness and determination. It is right that, in this evolution, Eldridge Cleaver's "Soul on Ice" and George Jackson's "Soledad Brother" are unwilled books, collections of letters to parents, brothers, and lawyers, written from an imprisonment which Jackson calls the closest thing to death that one can know in this life. They are 'art' in the only sense that is real for an oppressed people — the offspring of the marriage of predicament and consciousness. Being in jail, these men were denied the possibilities of action, and they contributed to the movement of their people these notes towards the redefinition of the culture of captivity. The man behind bars symbolised the limited possibilities of life that an Afro-American is born with. The man in chains metamorphosed the slavery of his people. The books actually stimulated movements all over America. They nurture the generation now growing — men and women for whom the words 'human situation' will inevitably mean degradation, limited opportunity, imprisonment, liquidation, and, most of all, resistance to the system that inflicts these.

In a revolutionary's obituary it is customary to say that his example lives, that the light he shed will always shine. If a revolutionary is one who is willing to take life and give life in the interests of social change, Jackson was a revolutionary, one who with the wholehearted conviction of experience and conscience knew that he had no option but to preserve his dignity and that of his race in a fight for survival. Through his letters, we see how Jackson saw himself: an individual whose survival was a mere function of the survival of the society which bred him. He knew that, for him to live meaningfully, America needed a revolution.

George Jackson would have understood why his obituary must also be on the death of all the others who die in the same cause. In India, where revolutionaries don't write books, where the tradition of outrage and retaliation for the death of a single man has not been established, the only purpose in writing about him, is to restore in some small way to those nameless youths who die for their convictions, their name and title.

we are at the crossroads- to bigger things and newer markets.

Mysore Sales International Limited, a young and dynamic organisation, has successfully made its presence felt in the diverse and difficult task of marketing.

Our organisation is equipped to face any challenge in the field of marketing, any product, consumer or industrial, any entrepreneur, in the public or private sector.

We have the resources and the manpower to make a dynamic success of your selling enterprise.

We can help you explore new marketing vistas for your product in any part of India and even develop overseas markets, giving that added dimension to your turnover which only exports could bring.

pediments to labour research and what could be done to remove these impediments. Here Adams has some very interesting suggestions: expanding the Ministry of Labour library; preparing comprehensive bibliographies; collecting information on current projects; setting up a central documentation centre; and greater emphasis on improving methodology. It is to be hoped that someone, such as the Indian Council of Social Science Research, is willing and able to implement some of these suggestions.

In the appendix, "Industrial Relations as a Social System", Suresh Srivastava and Theodore M Alfred provide a brief summary of Dunlop's framework [3] and try to extend it further by attempting to introduce into it the Parson-Smelser analysis [4]. Inasmuch as the Dunlop framework was partly based on the original Parsonian formulation, this extension is only a logical sequence. Consequently, the note, as it stands, is subject to the oft-repeated criticism of the Dunlop methodology. The analysis of industrial relations provided by Dunlop is primarily static in character. Unless it is possible to introduce the dynamics of inter-group and intra-group behaviour based on some such concept as that of 'exchange' developed by Homans [5], one cannot begin to comprehend the working of the ongoing processes of industrial relations.

The volume under review is sponsored by the Indian Society of Labour Economics and its publication is supported by the Indian Council of Social Science Research. It thus assumes an important place in the literature on labour problems. But, in the opinion of this reviewer, the volume has failed to live up to the standard of publication one expects from the leading professional group in the area. Except for one paper (by T S Papola), this volume is completely outdated. One cannot help feeling that the contributors were preoccupied with highlighting their own researches conducted several years ago. This attitude does not in any way help to further the cause of quality research. Another weakness of the volume relates to the fact that no attempt was made to review the methodologies adopted by researchers. The basic question in any scientific inquiry must surely be to develop and/or to modify a methodology with a view to make it more appropriate for the purpose of testing a hypothesis [6]. Perhaps the hypotheses in respect of the Indian labour situation would be different from those in respect of the labour situation in other countries. In view of this, can we just "replicate" foreign studies? Every researcher will have his own answer to this question, depending upon the appropriateness of the methodology of a given "foreign" study. Nevertheless, such a question must be posed in any critical review of research undertaken, especially in a developing economy. Finally, the editor rightly points out that labour problems can only be treated in a multi-disciplinary framework. One significant omission in the volume under review is the absence of sociological researches in the field of labour and industry.

Despite its many weaknesses, the volume as a whole directs our attention to some of the researchable topics in the field of labour. For example, one interesting subject mentioned is: "How real wages are shaped by the particular composition of the land-structure in village societies, and how this affects the trend of wages of factory labour who may or may not maintain links with the country-side" (p 30). Another useful line of inquiry indicated is: "Small-sized unions predominate. Why? What can be the optimum size of a union? Is there any relationship between size and industrial relations therein?" (p 71). Examples such as the ones quoted here can be multiplied. However, it can be reasonably argued that a mere listing of researchable topics does not by itself constitute a significant addition to the literature. Nevertheless, such a compilation of possible areas of investigation should prove useful to researchers. It is to be hoped that the next appraisal undertaken by the Indian Society of Labour Economics will contribute substantially more to the subject.

Oil Consumption Pattern

D C Kale

Consumption Pattern of Selected Petroleum Products, National Council of Applied Economic Research, 1971; pp xiv + 152; Rs 20.

IN the supercharged atmosphere surrounding oil companies today, practical considerations run a poor second to arguments about price-rigging, overseas remittances and so on. It is good to be reminded that the primary purpose of all refining is to provide consumable products of very great strategic and practical value. In turn, unless one knows which products are going to be required, it is not possible to produce them at the right time. This study prepared by NCAER for the Ministry of Petroleum and Chemicals is therefore welcome to those who prefer cold facts to hot arguments. The field survey was conducted in the middle of 1968, and it took an unconscionably long time — over two years — for NCAER to digest the data and prepare the conclusions.

The book is full of tables, which take about 90 pages compared to the text of about 57 pages. A good description of the field study and useful Appendices are well worth keeping permanently as useful references for similar studies later. NCAER was asked to estimate the consumption of certain products sector-wise as well as by end-use. Norms were to be established for each, and checked for a base-year. The products considered are motor-spirit, HSD, LSD (as used in oil engines, not for psychedelic trips!), furnace oil, lubricants, bitumen and wax. The sectors covered are road transport, railways, shipping, agriculture, power and industry.

Part of the study received a good deal of publicity as soon as its findings were announced: it showed up the extent of crooked dealings going on in the sale of HSD, where the primary sales are 2.8 mn tonnes, as against a consumption figure of 4.0 mn tonnes. While the consumers knew all along that they were getting or using adulterated HSD, nobody expected that additives would be over 40 per cent of the original product. The survey tries to connect the ratio of dilution with the relative price levels of kerosene and HSD, and is reasonably successful. Kerosene itself is in short supply or is imported, and hence it seems legitimate to ask Indian technologists to look into two possibilities. First, can HSD be made or sold a lot cheaper than at present? Second, is it not possible to design engines which run well on kerosene? The survey has not, apparently, looked into HSD substitution in the agricultural sector. This sector, incidentally, may not show as much enthusiasm about diesel pumpsets in future years, thus upsetting NCAER's predictions.

Many persons will find an unexpected bonus in this survey, in the estimates of scrap-rates of transport vehicles and motor-cars. This rate affects not only vehicle manufacturers, but also spare-parts, tyre and service industries. In the case of cars, there is almost 'nil' mortality for the first *eleven* years, after which it is reported to be 10 per cent for the 12th year and 4 per cent per year thereafter. Mortality rates are estimated also for motorcycles and scooters, and for commercial vehicles. (American car manufacturers, if faced with similar figures, will probably get heart attacks and give up their jobs.) The proportion of diesel vehicles is shown to be rising steadily, from 17 per cent in 1960 to 34 per cent in 1968. This trend is worth watching. The population estimates made by the survey are likely to prove wrong, through no fault of the survey itself, because of low production in years following 1968 and because of the proposed new units for scooters, cars and trucks.

Coming back to consumption of petroleum products, estimates of railway and shipping consumption are also likely to go wrong. The railways' own estimates of freight are turning out to be unrealistically high year after year, and the number of diesel locos in operation is also unpredictable. The survey has given only the most cursory attention to shipping and to proposed GRT additions during the next few years. There is no mention at all of consumption by airlines, which is a fast-growing sector.

The section on lubricants has an extraordinary amount of useful data, sector-wise and by type of lubricant used. The proportion of oil and grease used is studied well. With all this, it seems a pity that no attempt seems to have been made to explain the large difference between estimated consumption (301,000 tonnes) and actual sales (463,000 tonnes).

The survey has some inexplicable gaps, considering that it was meant to act as the basis of future production and import policies. There is no mention of defence requirements or consumption, although it is known that the same sources supply civilian and defence consumers. Airlines have been ignored completely. So also, in the products, no mention is made of kerosene, gas, or LPG which are all, according to the reviewer, petroleum products. Bitumen and wax have received the most cursory treatment. Lastly, the report assumes static technology upto 1978 in the fields of transport and power stations. With all this, there is no denying that this study deserved to be made, and is well made within the limits presumably imposed on it. The total demand for petroleum products, excluding naphtha, is expected to grow by 9.3 per cent upto 1973-74, and the total demand in that year is expected to be 27.7 mn tonnes. There is clearly no time to be lost in establishing new capacity and in utilising all the capacity that there is.

Tax Incidence on Agricultural Sector in Uttar Pradesh

Hemlata Rao

This paper examines the scope for additional taxation in the agricultural sector in UP. It poses the question: Does the agricultural sector have the capacity to bear additional taxation? An attempt is made to determine the intersectoral tax burden in the state. This is followed by a brief study of the contribution of agriculture to the marginal tax effort.

The analysis shows that tax effort in UP has so far been concentrated in the non-agricultural sector. The relative contribution of agriculture to resource mobilisation has been insignificant. The scope for taxation of agriculture is, it emerges from the study, considerable.

[The author is indebted to M J K Thavaraj and T Mathew for their critical comments and to her colleagues M M Jain and A Hameed for their suggestions. However, the author alone is responsible for the conclusions of the study.]

UTTAR Pradesh has now launched a vigorous and bold Fourth Five-Year Plan. The Plan envisages an outlay of Rs 951 crores, of which Rs 425 crores is to be financed through the state's internal resources. On present indications, current resources of the state available for financing the Plan would be about Rs 250 crores.[1] This leaves a gap of Rs 175 crores, to be financed from additional taxation and surpluses of public sector enterprises. As the latter is not so directly under the control of the Government, the state has to depend more on the former. In the circumstances, a study of the scope for additional taxation in the state becomes important.

The purpose of the present paper is to examine the scope for additional taxation in the agricultural sector of Uttar Pradesh. The study works out a case for additional agricultural taxation in the state. It poses the question: 'Does the agricultural sector have the capacity to bear additional taxation?'. To start with, an attempt is made to determine the intersectoral tax burden in the state. Then follows a brief study of the contribution of the agricultural sector to the Marginal Tax Effort of the state.

Tax Burden in Agricultural and Non-Agricultural Sectors

We are allocating total direct and indirect taxes, which constitute central and state taxes, between the agricultural sector (henceforth called 'A') and the non-agricultural sector (N) in the following manner:

Central Direct Taxes:— These include: (i) personal income tax; (ii) corporation income tax; (iii) wealth tax; (iv) gift tax, and (v) estate duty. Most of these taxes, except the estate duty fall entirely on the 'N' sector. However, the incidence of estate duty on 'A' sector is so small that it does not affect our analysis significantly if we group it along with other direct taxes and allocate their incidence entirely to the 'N' sector. Therefore, 100 per cent of the yield from the Central direct taxes is allocated to the 'N' sector.

State Direct Taxes:— The important state direct taxes are (i) land revenue and (ii) stamps and registration duties. The other direct taxes are (iii) urban property tax and (iv) profession tax, and these fall entirely on the 'N' sector. We allocate the incidence of state direct taxes as between the 'A' and the 'N' sectors in the following manner:[2] Land Revenue is allocated entirely to the 'A' sector. Of the yield from stamps and registration duties 20 per cent is on the 'A' sector and 80 per cent on the 'N' sector.

However, in our analysis, it is the incidence of all the direct taxes on the 'A' and 'N' sectors that is taken into account. Thus the total direct tax on the 'A' sector is the sum of land revenue and 20 per cent of the duty on stamps and registration; the total direct tax on the 'N' sector is the sum of 80 per cent of the stamps and registration duty and the other direct taxes which however are very insignificant.

Central Indirect Taxes:[3] The only central indirect tax collected in UP is the union excise duty. The collection from other indirect taxes, like customs, is nil. Of the total central indirect tax, which in this case is the union excise duty, 62.7 per cent is on the 'A' sector. The rationale of this distribution is contained in the methodology adopted for the purpose.

State Indirect Taxes:— Of the state indirect tax 57 per cent is on the 'A' sector and 43 per cent on the 'N' sector. The rationale of this distribution is contained in the methodology adopted for the purpose.

The main assumptions of our study are as follows: Although the classification 'agricultural' and 'non-agricultural' is used, data pertaining to 'rural' and 'urban' classification are used wherever data on the 'A' and 'N' classification are not available. Secondly, we are examining only the tax burden, not the fiscal burden. Thirdly, other variables, such as the distribution of wealth and income etc, are not taken into account. Fourthly, it is assumed that the capacity of any sector to pay tax can be measured by the income of that sector; we do not deduct the subsistence requirement from income primarily owing to lack of adequate data. Fifthly, only an intersectoral study is made here, not an interclass study.

Tax Burden on the 'A' and 'N' Sectors

An attempt is made to find out the relative tax burden on the 'A' and 'N' sectors, through various measures. We investigate below the direct tax burden according to these measures.

In UP, the only direct tax borne by the 'A' sector is the state direct tax, while the 'N' sector bears both the central and the state direct taxes. Among

the state direct taxes on agriculture, land revenue is the most important. In 1968-69 land revenue formed 18.8 per cent of the total tax revenue of the state. A study of the trends in land revenue, during 1952-53 to 1968-69, reveals that the fiscal importance of this tax has declined considerably; in 1952-53 it formed 40.8 per cent of the total state tax revenue, but its share declined to 18.8 per cent in 1968-69.[4] Besides the decline in its fiscal importance, it has also lost its importance as the largest source of revenue during 1952-53 to 1968-69. Before 1962-63, it was the largest source of state tax revenue, but after 1962-63 it became the second largest source of revenue in the state, with the sales tax occupying first place. Table 1 gives the figures for direct, indirect, and total, tax incidence on the 'A' and 'N' sectors.

The Table shows that the total direct tax incidence is more on the 'A' sector than on the 'N' sector. The absolute amount of direct tax is more from the 'A' sector; for instance, in 1965-66 the total direct tax collected from the 'A' sector was Rs 25.70 crores, while it was only Rs 23.36 crores from the 'N' sector. Thus, in 1965-66, the share of the 'A' sector in the total direct taxes was 51 per cent and that of the 'N' sector was 49 per cent. However, this does not give the complete picture of the situation. A comparative study reveals that, while 85 per cent of the population is bearing 51 per cent of the total direct tax, 15 per cent of the population is bearing 47 per cent of it. The relative burden is evidently more on the 'N' sector.

Per-capita direct tax in the 'A' sector was only Rs 3.6 in 1965-66, while in the 'N' sector it was Rs 19. Thus the 'N' sector was bearing six times more per-capita direct tax than was the 'A' sector (Table 2).

An analysis of Tables 1 and 2 reveals that between 1960 and 1966 the disparity in the tax collections from these two sectors has been considerably narrowed down. In 1960-61 the total direct tax on 'A' was Rs 23.18 crores, while on 'N' sector it was Rs 12.27 crores, i e, the 'A' sector was bearing nearly 90 per cent more direct tax than was the 'N' sector; but in 1965-66, the total direct tax on 'A' was Rs 25.70 crores and on the 'N' sector it was Rs 23.36 crores. It is thus seen that sector 'A' was bearing only 10 per cent more than the 'N' sector. Table 2 further reveals that the per-capita direct tax in the 'A' sector remained more or less constant at Rs 3.6, while in the 'N' sector it increased from Rs 11.5 in 1960-61 to Rs 19.0 in 1965-66.

TAX-INCOME RATIO

The direct tax on the agricultural sector formed approximately 2 per cent of agricultural income in 1960-61, but this declined to 1.4 per cent in 1965-66. In the same period, collection of direct taxes increased by 10.8 per cent while agricultural income increased by 73 per cent. On the other hand, direct taxes on the 'N' sector formed 4 per cent of non-agricultural income in 1960-61, and this increased to 4.6 per cent in 1965-66. In the same period the collection of direct taxes from the non-agricultural sector rose by 90 per cent while its income increased only by 51 per cent (see Tables 1 and 3).

Thus a higher percentage of the income in the 'N' sector is taken away by direct tax than in the 'A' sector. The analysis shows that the contribution of the 'N' sector towards tax revenue is more than that of the 'A' sector. It also shows that direct agricultural taxes in UP have remained largely income inelastic while taxes on the 'N' sector reflect income elasticity. The fiscal significance of direct taxes on the agricultural sector has declined significantly. In 1960-61, the share of total direct tax revenue from the 'A' sector was 69 per cent* of the total tax revenue collected in the state and for the 'N' sector it was 31 per cent. In 1965-66, this share of the 'A' sector declined to 51 per cent while that of the 'N' sector increased to 49 per cent.

DIRECT TAX AS PERCENTAGE OF INCOME

For a meaningful comparison of tax burden, it has to be studied with reference to the per-capita tax and per-capita income.

Table 2 provides the comparison data. It shows that the 'A' sector is paying about 1.5 to 2 per cent of its income (per-capita) and that the 'N' sector is also paying about 2 per cent. But if we take into account the disparity in the level of per-capita income we notice a significant disparity in the burden of taxation between the two sectors. There has been a 50 per cent increase in per-capita income in the 'A' sector, while the per-capita tax increased by 40 per cent. Against this, the tax per-capita in the 'N' sector increased by 70 per cent while the income per-capita in the 'N' sector increased by 44 per cent.

In 1965-66, the per-capita income in the 'N' sector was 3.4 times more than in the 'A' sector, whereas the per-capita tax in the 'N' sector was about 5.4 times more than that in the 'A' sector. Thus the difference in per-capita direct tax is more than the difference in the per-capita income.

Thus a cursory study of Table 1 reveals that the direct tax incidence is more on the 'A' sector, but a careful study reveals that relative direct tax burden is more on the 'N' sector. It is also seen that this burden is continuously increasing on the 'N' sector, while it has been declining on the 'A' sector. The per-capita taxes are higher in the 'N' sector than in the 'A' sector. Also, the disparity of tax collection in the 'A' and 'N' sectors has been narrowed down. The collection remained nearly constant in the 'A' sector, while it increased significantly in the 'N' sector. The disparity in the tax burden has widened during the period. The per-capita tax (direct) on the 'N' sector was four times that on the 'A' sector in 1960-61, but, in 1965-66, the 'N' sector was bearing six times more per-capita tax than was the 'A' sector. In spite of the fact that the increase in the 'A' income was more than in the 'N' income, the increase in taxes in 'A' is less than in the 'N' sector. It shows that the increased income in the 'A' sector was was not mobilised sufficiently. Direct tax in the 'A' sector is inelastic, while in the 'N' sector it is more income elastic. The per-capita tax, as a percentage of per-capita income, also indicates that the direct tax incidence on the 'A' sector is less than on the 'N' sector.

* Total direct tax comprises state + central direct taxes

1965-66	260	13.25	5	886	56.00	7.0

INDIRECT TAX BURDEN ON 'A' AND 'N' SECTORS

Total indirect taxes also seem to be more on the 'A' sector as it bore about 60 per cent of the total indirect tax in 1960-61. In the 'A' sector total indirect tax was Rs 45.81 crores, while in the 'N' sector it was Rs 28.34 crores. However, this does not permit us to say that the burden of indirect tax is more on the 'A' sector than on the other. However, the tax burden is comparatiyely more on the 'N' sector. In 1965-66, the per-capita indirect tax in the 'A' sector was Rs 9.4, whereas it was Rs 29.00 in the 'N' sector — i e, the 'N' sector bore almost 3 times more indirect taxes, than the 'A' sector. During 1960-61 to 1965-66, the total indirect taxes increased by only 49 per cent in the 'A' sector, while income increased by 73 per cent; on the other hand, total indirect tax on 'N' sector increased by 60 per cent, while the income increased by 51 per cent. Thus, here again, we see that whereas the 'N' sector is contributing more and more with the increase in income, the agricultural sector's contribution through indirect taxes is not keeping pace with the increase in its income. The per-capita indirect tax, as a percentage of per-capita income, is more or less the same in both sectors. (It is so because we have taken the constant ratio for all years. For a more exact analysis we should introduce some progression in the expenditure pattern as the data are not available, we are unable to do so.)

Thus we see that the indirect tax burden is also comparatively increasing in the 'N' sector.

TOTAL TAX ON 'A' AND 'N' SECTORS

So far, we examined direct and indirect tax burden on the 'A' and 'N' sectors. It will be more meaningful to examine the total tax burden on the 'A' and 'N' sectors, so as to find out whether the 'A' sector has scope for bearing additional taxation.

Table 1 shows that the total tax burden in both sectors, shows progressivity. The total tax in the 'A' sector increased from Rs 68.99 crores to Rs 93.63 crores in 1965-66, i e, by 35 per cent; similarly, the total incidence on the 'N' sector increased from Rs 40.61 crores to Rs 69.50 crores, i e, by 70 per cent.

This means that the increase in the incidence on the 'N' sector is much higher than on the 'A' sector during the six years. The Table shows that the proportion of total agricultural tax to the total tax declined from 68 per cent in 60-61 to 58 per cent in 1965-66, whereas during the same period the non-agricultural taxes as a percentage of total tax increased from 32 per cent to 42 per cent. Thus the contribution of the agricultural sector to total taxes has been continuously declining. This is mainly because the direct agricultural tax is income inelastic. The indirect taxes do not fall sufficiently on the agricultural sector as most of the commodities which are taxed by the central government or by the state government are not consumed in large quantities by the rural population — or, in other words, that most of the items which are consumed in the rural sector are not taxed and the indirect taxes on the agricultural sector are limited to a few commodities which too are consumed there in small quantities. Another factor which might be responsible for the lower contribution of this sector is that nearly 50 per cent[5] of the rural sector is non-monetised and so be-

yond the reach of indirect taxes.

In UP not only are agricultural taxes declining as a porportion of total tax, but the sector is bearing a lower tax burden. Though absolute figures indicate that more taxes are collected in the 'A' sector than in the 'N' sector, in making a comparative study we find that the reverse is true. In the 'A' sector, the total taxes increased by 35 per cent while the income increased by 73 per cent. Only 50 per cent of the increase in income is mobilised through taxation in this sector. On the other hand, the total incidence on the 'N' sector increased by 70 per cent while the increase in income was only 51 per cent — i e, the increase in taxes was nearly 30 per cent more than the increase in income, or that the taxes increased by 1.2 times of the increase in income during these years. The disparity of tax collection has also been narrowed down. In 1960-61 'A' sector was bearing about 69 per cent more taxes than was the 'N' sector, taking the absolute amount, and in 1965-66 the 'A' sector collected only 35 per cent more than the 'N' sector.

On the other hand, the disparity between the two sectors on the per-capita tax incidence has increased considerably. Table 4 shows that, in 1960-61, the per-capita tax on the 'A' sector was Rs 10.94, while on the 'N' sector it was Rs 36, i e, the latter had 230 per cent more per-capita tax or about 3.2 times more than the 'A' sector. In 1965-66, this disparity increased considerably — whereas the 'A' sector had per-capita total tax of about Rs 13.25, the 'N' sector had Rs 56.00, i e, the latter was bearing 4.2 times more taxes. Per-capita income in the 'A' sector shows an increase of 30 per cent while in the 'N' sector per-capita income increased by 60 per cent — thus the disparity of tax incidence was increasing in this period (Table 5). Between 1960-61 to 1965-66 the 'A' sector contributed about 5.6 per cent of its income, while the 'N' sector contributed about 6.1 per cent of its income. In the same period, per-capita income of the 'A' sector increased by 50 per cent while the taxes per-capita increased by 30 per cent; on the other hand, income per-capita in the 'N' sector increased by 27 per cent while the tax per-capita by 60 per cent.

The above analysis leads to the conclusion that the incidence of total tax on the 'N' sector is more than on the 'A' sector. Intersectoral equity demands that the 'A' sector should also contribute to the tax collection, if not more, at least as much as the 'N' sector in relative terms. Agriculture has scope for additional taxation in UP. Relative incidence on the 'A' sector is much less than in the 'N' sector. Besides, disparity in tax collection has narrowed down, while the disparity in tax incidence has widened gradually as between the two sectors. Thus the incidence on the 'A' sector is declining. Since the incidence on the 'A' sector is less than that on the 'N' sector, and since it is declining, intersectoral equity demands more incidence on the 'A' sector. All this shows that the 'A' sector has scope for bearing additional taxation.

AGRICULTURAL INCOME AND MARGINAL TAX EFFORTS

The view that the agricultural sector has scope for additional incidence is further confirmed by a study of the marginal tax efforts of the state and the contribution of agricultural income to it.

A study of marginal tax efforts (MTE) reveals that the contribution of the agricultural income to the additional taxation in the state is insignificant. Table 6 reflects that the MTE is very low in the state and is subject to wide variations. In 1961-62, MTE was only 1.4 per cent while in 1965-66 it was 126 per cent. Such variations are mainly due to a change in the ratio of change in the agricultural income to non-agricultural income.

In 1961-62 MTE was only 1.4 per cent in spite of an increase in the state income by Rs 114.4 crores. This year, agricultural income increased by Rs 49.36 crores, non-agricultural income was only slightly higher than agricultural income, and the MTE was 1.4 per cent.

In the next year, MTE increased to 16.2 per cent because now the increase in non-agricultural income is insignificantly higher than the increase in non-agricultural income. △ YN (change in non-agricultural income) was Rs 66.93 crores while △ YA (change in the agricultural income) was only Rs 8.31 crores.

In 1963-64, MTE declined to 2.8 per cent, in spite of a significant increase in △YA, i e, by Rs 162.8 crores, while the △YN was only Rs 76.20 crores. MTE declined. This shows that the increased agricultural income is not mobilised through taxation. This is further confirmed — when the rate of MTE increased to 127 per cent in 1965-66.

TABLE X: PER-CAPITA EXPENDITURE FOR 30 DAYS IN UP, 1957-58 $\left(\frac{\text{in Rs}}{\text{Total Household}}\right)$

Commodity	Rural Area	Urban Area
Cotton cloth	2.38	1.38
Coffee	—	0.01
Tea	0.03	0.12
Tobacco	0.32	0.40
Matches	0.03	0.06
Sugar	0.15	0.44
Footwear	0.10	0.20
Vanaspati	0.04	0.18
Kerosene	0.13	0.18

Source : The National Sample Survey Thirteenth Round: September 1957, May 1958, No 71. Consumer Expenditure by Levels of Household Expenditure.

TABLE Y: RATIO 'A': 'N' POPULATION IN UP, 1957, 85:15.

(in crores)

Year	Agricultural	Non-Agricultural	Total
1957	5.95	1.05	7.0

TABLE Z : PERCENTAGE OF UNION EXCISE DUTY BORNE BY 'A' AND 'N' SECTORS (Rs in crores)

Items (Shared)	Agricultural Sector		Non-Agricultural		Total	
	Percentage	Amount	Percentage	Amount	Percentage	Amount
Cotton	85	3.30	15	0.58	100	3.89
Tea	59	0.05	41	0.03	100	0 08
Tobacco	82	2.40	18	0 52	100	2.92
Matches	74	1.41	26	0.50	100	1.91
Sugar	66	14.71	34	7.30	100	21 47
Footwear	74	0 04	26	0.02	100	0.06
Vanaspati	56	0 61	44	0.48	100	1 09
Kerosene*						
Coffee*	—	—	—	—	—	—
Total	—	21.99	—	9 43	—	31.42
Non-shared excise	—	—	100	3.63	100	3 63
Total non-shared	—	—	—	3 63	—	3 63
Grand total	62.7	21.99	37.3	13.06	—	35.05

* Figures not available.

Note : As the non-shared excises are 10 per cent of the total excises in 1957-58, we have allocated 10 per cent of the total excises to the 'N' sector in all the other years.

This year △ YA was Rs 76.55 crores, while △ YN was Rs 88.05 crores. Thus, in spite of a significant fall in agricultural income, MTE increased appreciably.

The above analysis shows that tax efforts are mainly concentrated in the non-agricultural sector. Whatever additional resources are mobilised are from the non-agricultural sector. The relative contribution of the 'A' sector to resource mobilisation in the state is very insignificant. The analysis also leads us to the common belief that the agricultural sector is less taxed than the non-agricultural sector.

Appendix

Methodology for allocating incidence of union excise duty on 'A' and 'N' sectors :

The commodities on which the union excise duty is levied and which are consumed by the 'A' sector are: kerosene, sugar, matches, tobacco, coffee, tea, cotton cloth, footwear, soap and woollen fabrics. As the duty on these goods falls directly on consumers, the burden is shared by the 'A' and 'N' sectors according to their respective expenditures on the commodities concerned. We assume that other commodities like glass, steel, etc, are not consumed by the 'A' sector and that the duty on these commodities therefore can be allocated entirely to the 'N' sector.

Data of per capita expenditure on the commodities listed above, for the rural and urban sectors of UP, are from the National Sample Survey collected in various rounds. Table X gives such data for 1957-58. Multiplying the figures in the Table by the population of each sector, we get the total expenditure figures on individual items in both the sectors.

The population figures for 1957-58 are not available but from 1960 onwards (mid-term estimates) are available. Therefore, projecting it backwards, we get the figures in Table Y. Using the data given in Tables X and Y we get the ratios in which the excise duty on the above mentioned commodities are borne by the two sectors there are given in the Table Z.

Taking the total percentage of union excise duty borne by the 'A' and 'N' sectors, i e, 62.7 per cent and 37.3 per cent, respectively, we have allocated the union excise's incidence on the two sectors for the period 1960-61 to 65-66. In doing so our assumption is that the consumption pattern in the two sectors has remained relatively unchanged. Thus the total central indirect taxes, allocated on the above basis are given in the Table Z.

Y = Percentage of indirect tax in En.

Now =

$\bar{Ea} = \bar{Ea} \times Pa$

$\bar{En} = \bar{En} \times Pa$ i e,

$\bar{Ea}$ = per capita expenditure in A sector

$\bar{En}$ = Per capita expenditure in N sector

Pa = Population of A

Pn = Population of N

The figures relating to X and Y and $\bar{Ea}$ and $\bar{En}$ are given in UP Taxation Enquiry Committee Report 1968-69 (p 11) for 1965. Pa and Pn are estimated taking the 1961 population ratio in UP (85:15 A:N)—Thus we obtain:

$\bar{En}$ = 308—4 (Rs) $\bar{En}$ = 372.8 (Rs)*

X = 1.68%, Y = 6.13%*

Pa = 7.06 crores Pn = 1.24 crores

$\bar{Ea} = \bar{Ea} \times Pa$

= 308.4 x 7.06

= 2177.30 crores

$\bar{En} = \bar{En} \times Pa$

= 372.8 x 1.28

= 469.71 crores.

$Ta = \frac{2177.30 \times 1.68}{100} = 36.5$

$Tn = \frac{469.71 \times 6.13}{100} = 26.7$ crores.

Total state indirect tax estimated is

37.0 + 26.0 = 63.2

Actual state indirect tax

= 63.2 (1965-66)

We can take this ratio

$\frac{Ta}{Tn} = \frac{37.0}{26.0}$

or we can take the easi way

Methodology for the allocation state taxes between 'A' and 'N' sectors in UP :

As it is common we have allocated the direct state tax burden between 'A' and 'N' sectors in this manner:

1 Land Revenue: as it is a tax on agricultural land 100 per cent is allocated to agricultural sector.

2 Property Tax: 100 per cent to 'N' sectors = t is and the other taxes are quite insignificant therefore we have included them under the head other taxes.

3 Stamps and Registration: It is allocated in the ratio of 20:80 between 'A' and 'N' sectors respectively.

Indirect taxes : Main indirect taxes in the state are: sales tax, state excises, motor vehicle tax and so on.

The usual methodology is to take the all-India per-capita tax figures for these two sectors which are given in the TEC Report of 1953, and to multiply them with the population of 'A' and 'N' sector of a state. Such methodology is adopted by Ved P Gandhi, Kerala Taxation Enquiry Committee, and by A C Angrish in his article (*Economic and Political Weekly*, January 10, 1970).

But that methodology does not give the recent picture, especially when we are applying it to a particular state. Moreover, as the per-capita tax figures are all India figures, we are adopting a different methodology. The method applied in the allocation of indirect taxes of the state is:

$\frac{Ta}{Tn} = \frac{Ea\,(x)/100}{En\,(x)/100}$

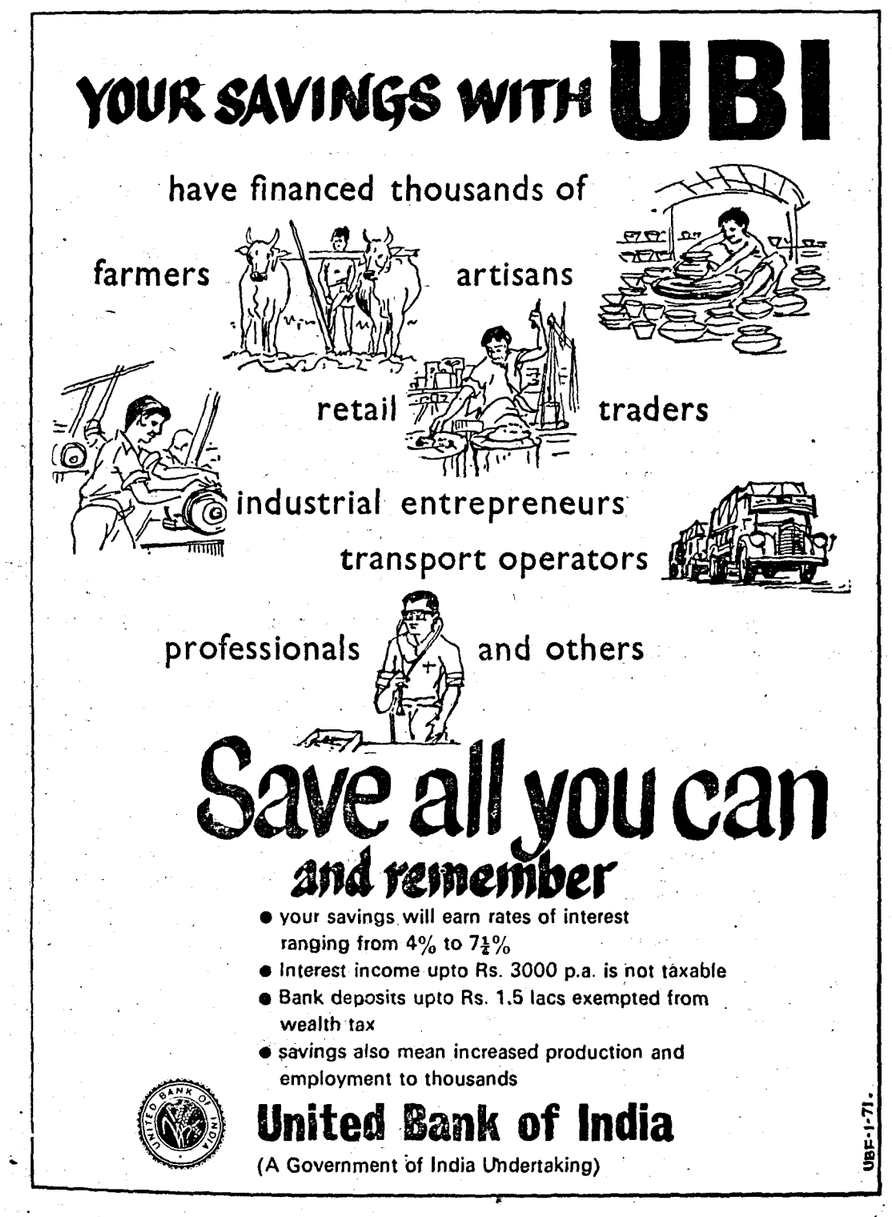
Ta = Total indirect tax collected from A sector.

Tn = Total indirect tax collected from N sector.

Ea = Total expenditure in A sector
En = Total expenditure in N sector
X = Percentage of total indirect tax in Ea

i e, $\frac{Ta}{Ti} \times 100$ ar.d

$\frac{Tn}{Ti} \times 100$



Ti = Total indirect tax of the state

Thus we find that in 1965—
Ta was 57 per cent of the Ti and Tn was 43 per cent of the total state indirect tax.

Jotirao Phule and the Ideology of Social Revolution in India

Gail Omvedt

It is one of the tragic dilemmas of the colonial situation that the national revolution and the social revolution in a colonial society tend to develop apart from one another. Jyotirao Phule represented a very different set of interests and a very different outlook on India from all the upper caste elite thinkers of the so-called Indian Renaissance who have dominated the awareness of both Indian and foreign intellectuals. The elite expressed an ideology of what may be described as the "national revolution"; it was the nationalism of a class combining bourgeois and high caste traditions. Phule represented the ideology of the social revolution in its earliest form, with a peasant and anti-caste outlook.

Phule's thought represented the fulfilment of the renaissance desire for social transformation along revolutionary lines. He, and not the later elite thinkers, from Ranade through Tilak, should be seen as the primary renaissance figure.

Any culture rests upon a class society and the dominance of a particular class. In India, Hindu culture and the caste system rested upon Brahmanism; hence Phule linked his thought with a movement of opposition to the Brahman elite. "Non-Brahmanism", therefore, represented not simply communalism or a result of British divide-and-rule policies; it represented the first expression of social revolution.

Phule, it is true, failed to provide economic analysis or political organisation appropriate for this struggle. But he had a clear vision of the need for and the basis of a liberation movement.

I

Introduction: The Indian Renaissance

"THE Indian Renaissance", as it is called, represents the efforts of the first generation of Indian thinkers under colonialism to come to grips with the challenge represented by the West and the seeming backwardness of their own society and culture. With ruthless self-criticism, they sought to lay the ground for a total social transformation, to weld science and rationality to Indian culture, to recreate India. Of this generation was Jotirao Phule, and his thought stands forth first as an expression of first generation renaissance thinking.

However, this generation was succeeded by one more concerned with the alien source of new ideas than with the errors of the old society. Perhaps this represented the solidifying of British colonial rule after the middle of the nineteenth century, which ensured the development of a narrowly based elite drawn from the upper (in Maharashtra primarily Brahman) castes, feeding in through the educational system to the British bureaucracy. This was a situation which ensured the status and power of the elite — making them concerned about threats from below to this status — at the same time as it made them restively aware that they were after all serving an alien bureaucracy but as subordinates not rulers within it. Henceforward, however much they spoke of the "Hindu tradition" or the "Indian nation", their thoughts and actions expressed the interests of a class and not a whole people: Hence they opted, as elites do, not for a revolutionary social transformation, but for a "modernisation", in other words a revitalisation, of the old society.

Their identification was as an elite of education and knowledge, as upper castes within the Hindu cultural system, and as modern intellectuals concerned about the scientific and industrial progress of India. Hence they developed an ideology which sought to use a revitalised Hindu tradition as the spiritual and moral centre around which the liberal modernism of the West could be grafted — "Eastern morals and Western science". They accepted the "Aryan theory of race" which had the implications of identifying them ethnically with their British conquerors rather than the majority of their fellow countrymen, which traced civilisation in India from the Aryan conquest, and which gave a new pseudo-scientific justification for the caste hierarchy by linking varna to race. And they developed an economic theory which looked to the capitalist development of India freed from the destructive bonds of British imperialism and therefore opposed foreign exploitation without considering the exploitation of workers by native capitalists or peasants by landlords and the lower bureaucracy.

But the majority of Indians were dark-skinned non-Aryans. The majority of Indians, in traditional varna terms, were Shudras at best. The majority of Indians were peasants and had no hope either in the near or distant future of becoming members of the bureaucratic elite or capitalists, large or small. The liberal modernisation of Hindu culture and the capitalist development of India did not speak to their interests. Peasants, tribals, workers, low-castes, untouchables were all affected (usually adversely) by the new colonial regime and responded, like the elite, with both renaissance and rebellions. But lacking access to education, lacking control over media of communication, their renaissance and their rebellion, their ideology and organisation, remained in a more incipient, crude, localised, and incomplete form. Nevertheless it may be fairly said that with Jotirao Phule the low-caste, non-Aryan, peasant masses of India came to consciousness.

Primary Renaissance Figure

To say that Phule's thought represents an "ideology" is to use the word in a sociological and not a pejorative sense. It is to say that he does not stand alone as an individualistic oddity, that he is not to be studied as an adjunct to all the other social reformers of the nineteenth century; but that he represented a very different set of interests and a very different outlook on India from all the upper caste elite thinkers who have dominated the awareness of both Indian and foreign intellectuals. The elite expressed an ideology of what may be described as the "national revolution", if we define nationalism as opposition to Western colonial rule and remember that it was a nationalism of a class combining bourgeois

and high-caste traditions. Phule represented the ideology of the social revolution in its earliest form, with a peasant and anti-caste outlook which saw its primary enemy as that very elite — and it is, in a sense, one of the tragic dilemmas of the colonial situation that the national revolution and the social revolution in a colonised society tend to develop apart from one another.

Phule's thought represented the fulfilment of the renaissance desire for social transformation along revolutionary lines. In sociological terms it makes good sense that he — and not the later elite thinkers, from Ranade through Tilak — should be seen as the primary renaissance figure. Any culture, after all, rests upon a class society and the dominance of a particular class. Hence the total transformation of culture requires the destruction of this dominance. In terms of India, Hindu culture and the caste system rested upon Brahmanism; hence Phule, who aimed for the complete destruction of caste, superstition and inequality within Indian tradition, linked his thought with a movement of opposition to the Brahman elite. "Non-Brahmanism" in India, therefore, represents not simply communalism or a result of British divide-and-rule policies; it traces its origins to the Indian renaissance and represents the first expression of social revolution in India.

II

The Moral Basis of Society: Revolutionary Values

To comprehend the extent to which Phule's thinking was revolutionary from a cultural point of view, we can note one simple fact: in almost all of his writings, he never uses the term "Hindu". Contrary to practically every other Indian of his day and the vast majority of his followers, he does not take his standpoint from within a valued tradition and seek to locate the essence of it from which other aspects can be criticised. Rather, he takes a stand from without and judges the whole culture in terms of two ruthlessly applied values, rationality and equality. This is not to say that he was speaking as an alien to Indian society; his actions, language and writings show a clear placement among and identification with the masses and their traditions. He does not take a stance outside the *society* but rather one outside the *cultural system* which had for so long dominated that society.

From the point of view of equality, the entire caste system and the authoritarian family structure was to be condemned. From the point of view of rationality, the whole system of superstition and religious traditionalism was to be overthrown, the whole corpus of religious writings stripped of authority. With this as his beginning point, Phule is saved from a good deal of unnecessary arguments, qualifications, compromises and logical inconsistencies. He does not, for instance, waste much breath arguing over the relative merits of different parts of the Hindu sacred scriptures. He simply treats them as legends which may offer *some* insights into past Indian history and as products of a group (Brahmans, Aryans) seeking to establish control over the minds of the people.

Use of Religion

In dismissing totally the dominant religious tradition of India, Phule accepted the assumption that something had to be put in its place: even a revolutionary culture required a moral-religious centre. He does not reject the idea of *dharma* but rather attempts to establish a universalistic one. *"Sarvajanik Satya Dharma"* expresses this concept completely (and the introduction to this book suggests that the appropriate translation might be "True Religion of the Community"): the moral basis of society had to be centred on truth, or rationality, and it had to be one that unified all men and women as equals rather than fragmenting and dividing them into separate social groups with separate responsibilities and rights (as the traditional idea of *dharma* did in separating the castes). The world is seen as good and holy, in contradiction to the Vedantic idea of it as an illusion, because it is God's creation; and God is seen in simple terms as the loving father (or, in the Indian expression which transcends the more patriarchal Semitic concept, as *ma-bap*) of all men who are thus equally valued as his children. This basic concept is used in all Satyashodhak teachings to justify the idea of equality and the assertion that no "middleman" or priest is necessary between man and God.

Because of his missionary education and the Christian influence on his thinking, Phule was accused by his orthodox opponents (until the time when it became politically suicidal for them to do so) of having become Christian. In a metaphorical sense there was some truth to this in that his stance was quite clearly from outside the Hindu tradition. In any other sense it is clearly nonsense. Phule never became a Christian in any institutional form, nor did he show the same concern for the person of Christ that many other Indian social-religious reformers (e g, Keshab Chandra Sen) did. Given the conditions of the time in which Indian Christianity was a colonial dependency, to have converted would have been to give up the game entirely; an Indian Christian became part of another social system and gave up any hope of transforming or redefining *Indian* culture. And this was Phule's overriding concern.

Due to his missionary education, then, and due to sharing the sense which most Indians possessed in that period of cultural and mental turmoil of needing a firm, moral-religious basis for a new society, Phule based his thinking on a concept of God and God's relation to the world which he considered necessary to anchor his passion for rationalism and equality. With that, he left the matter. One may say that he used religion to climb to a point from which a secular, equalitarian society could be built; beyond that his concerns were not religious in any traditional sense of the term.

Passionate Equalitarianism

One aspect of his rationalism can be seen in the Satyashodhak Samaj with its primary emphasis on "truth-seeking". It is most significant here that the truth seeking was seen as a quest guided by the individual's own reason, and not by the dictates of any religious guru or authoritative text. This was important for the development of the Satyashodhak Samaj in that it left it, in a sense, without any centralised organisational form. This was both its strength and its weakness. The movement spread by individual propagandising efforts; it was taken up in spontaneous ways and attained a real village basis in almost all sections of Maharashtra, but it never had an overall controlling body and members complained often of "chaos" within the organisation. Yet even while complaining of the anarchism created by individualism and spontaneity, they recognised that in a sense this organisation was different. Thus, for example, in the first "revived" conference in Poona in 1911, one of the speakers discussing this problem pointed out that while "monarchy" may have worked politically in ancient India, it was a failure in religious organisations and posts such as *guru, acharya, mahant* had been found useless. He therefore urged a steering committee for the Satyashodhak Samaj — and then concluded that the basic unifying factor could only be in terms

of accepting the fundamental *principles* of the organisation.[1] Similarly, the orthodox often charged that the Samaj could not properly be called a religious one since it had no authoritative text, no *dharmagranth* — to which Mukundrao Patil, one of the important later leaders, replied:

> We do not want to have a religious book but to satisfy the intellectual curiosity of the people. Minds should be open to new knowledge. Therefore, we do not recommend any religious book.[2]

In regard to the principle of rationality, the later Satyashodhak organisers remained on the whole true to the conceptions of Phule.

Phule's passionate equalitarianism was an even more crucial issue, one that can be seen at all levels of his thought and actions. It is expressed, for example, in his very language, the terminology of his writings. It is significant that this language shows a *positive* identification with some of the social categories considered "low" in the traditional culture. This may be called a kind of equalitarian reversal equivalent to the "black is beautiful" movement among black Americans. Specifically, in referring to the masses of Maharashtra or India, he constantly uses the words "shudra and atishudra". Shudra, of course, is the term by which the dominant brahmanical culture classified those who worked with their hands (including peasants) as part of the lowest order of society. Phule is well aware of the insulting connotation of the term (he states that it is derived from "ksudra" meaning trifling or mean)[3] but he ignores this and continues to insist with a matter-of-fact pride on the use of the term; these, he is saying in effect, *are* the people, the centre of society. He does not show the least desire to "sanskritise" in the way that almost all educated caste leaders did by claiming a kshatriya or other high-varna origin for his or any other caste. He does, it is true, identify "ksatriyas" as the original warriors of India and uses the word frequently, but never as an alternative to "shudra" but rather as inclusive of all original Indians from Kunbi-Marathas through Mahars.

Hostility to 'Maratha' Tradition

Another aspect of his identification with the masses is to note his ambivalence if not downright hostility to what has been called the "Regional Great Tradition" of Maharashtra, that is, the "Maratha" tradition.[4] To give a background, it must be emphasised that although in much of present-day Maharashtra the Kunbi-Maratha distinction has been practically abolished, this was not so in the nineteenth century. "Kunbi" at that time generally referred to the peasant population, "Maratha" to the aristocrats, the *shahanavkuli*, the sardars and their like who still remained a somewhat decadent rentier class. Phule shows no inclination to identify with this Maratha tradition in opposition to the Brahman tradition; he almost never uses the term "Maratha" and when he does so, it is slightingly. The clearest example of this is a conversation he relates with "a so-called pure Maratha":

> Having finshed the second part of *Asud* . . . a gentleman wearing a round Brahman turban came and sat in front of me and began to gaze around the room. Becoming aware of this gentleman, I at first thought he might be a Marwari, but he didn't have the three pigtails hanging down from his turban. I thought he might be a tailor, but there were no needles sticking out of his turban. He might be a goldsmith, but there was no stole over his shoulder. And he might be a Brahman, but I hadn't heard him speak a word. I could not identify his caste from this, so while I was thinking he looked at me and himself asked, "Haven't you recognised me?" I said, "No, sir, I have not, please excuse me." The gentleman said, "I am a Marathi of a Marathi lineage." I — "You may be Marathi but what is your caste?" "My caste is Marathe." I — "In Maharashtra, from Mahars to Brahmans, everyone calls himself a Maratha. So then, it is not clear to me what particular caste you are in." He — "Then you can understand that I am a Kunbi." I — "All right, then, What is your profession?" "Before Appasaheb Maharaj of Satara became infatuated with Bhagubai Tarkshin of Nimbajaval our family easily took one to two lakhs of rupees from him, and we are even today sitting pretty on that."[5]

This conversation shows a subtle taunt regarding the decadence of the aristocrats of the day and their dress; more than that it illustrates Phule's refusal to recognise the legitimacy of "Maratha" as a caste-category and his pressurising the man to admit his *peasant* connections. Phule's attitude toward the Maratha tradition may be summarised by saying that whereas in the Twentieth Century Kunbis had been absorbed into Marathas, he would have preferred to absorb Marathas into Kunbis, the archetypal peasant jati.

Phule's orientation is indeed toward the peasant and his problems. This is graphically shown in his biting and concrete, almost photographic, description of the peasant amidst his poverty, with his meagre food and clothing, harassed by officials and moneylenders. This is heightened by his identification of the peasant as *Baliraja* the traditional Marathi way of expressing the peasant as "lord of the land". Again it must be emphasised that Phule does not see the village leaders only as Baliraja; his orientation is towards the village but a village modernised in terms of equality: the revolution in personal relationships remains central. Unlike many of his colleagues or followers, he almost never refers to the "Patil" or identifies with the interests of the village headman as a foundation of the traditional village community. "Baliraja" in his usage is the peasant, the common man. This is clear in "Gulamgiri" where he describes the Brahmanic tradition as anti-equalitarian (anti-Bali), and traces the growth of nationalism in the West: the English, he writes, learned patriotism from the Greeks but only later learned the importance of the peasant (Bali) and thereby developed a *democratic* nationalism while the American revolution made the common man (Bali) the centre of their society.[6]

Women's Liberation

It is significant that Phule's first practical social reform efforts were involved in aiding the two social groups considered lowest in traditional Brahmanic culture — women and untouchables. He did not do so as a liberal paternalistically concerned for the "uplift" of some lower order of being, but as a radical well aware that a revolution in social relationships had to be founded on community with those most oppressed by the traditional social hierarchy. Untouchables, for example, were seen not as a group unique within India but as the most oppressed section of the masses, part of the original community of the peasants. This is related to Phule's "non-Aryan theory" discussed below; it may be noted here that while later non-Brahmans compared untouchability with Negro slavery, Phule in the book "Gulamgiri" considered peasants and untouchables together as a community of the oppressed, suffering under Brahman slavery. Indeed, it may be said to represent a failure of the Satyashodhak movement when later non-Brahmans identified as caste Hindus separate from untouchables, and untouchables under Ambedkar took their separate path to social liberation.[7]

In regard to the issue of women's liberation, Phule is one of the very few male social reformers in history who deserve a woman's respect. His depth of feeling on the matter was great enough that he was ready to attack one

of his co-workers, Krishnarao Bhalekar. Bhalekar, it seems, had written a severe criticism of a book published by one Tarabai Shinde comparing men and women. Phule replied in 1885 with an attack that was as ferocious and in some ways more bitter than his attack on Brahmans.[9] (It is one indication of the vitality of the Satyashodhak Samaj and the fact that it was not simply a one-man movement but an expression of the needs of an entire group within Indian society, that this rather bitter personal feud of the leaders did not split the movement; Bhalekar remained a leading organiser of the Satyashodhak Samaj until his death in 1910.) Bhalekar was attacked as a representative of the old Indian family system which allowed a free and decadent life to the man while the woman was helplessly bound to the home: the issue was the formation of a new and equalitarian husband-wife relationship; the goal was the breaking down of the old authority structure within the family. Phule seems to have sensed accurately that as long as there was inequality in the family, there could be no true equality in the society. Suppression of women, in traditional Hindu culture, went hand in hand with suppression of low castes and untouchables.

III

Aryans and Non-Aryans: The Problem of Indian National Culture

Phule's ideology, then, was based upon an identification with the peasant masses and an attachment to revolutionary values of equality and rationality. But a complete ideology[9] must contain not only basic values, but also an explanation of the present state or condition of society and a guide to action for change. As a mass ideology, then, Phule's thought expressed not only a drive for abolition of the caste system, but an explanation of how it arose and a theory of exploitation through which all of Indian culture and history were to be understood. Central to this is his "non-Aryan theory", and to pay homage to Phule as a "mahatma" and a "man of the people" without dealing with this theory of exploitation is to refuse to take him seriously.

Two points must be noted here. First, in any society, upper-class ideologies are distinguished from mass ideologies by the fact that they nearly always hold an organic and functionalist view of society, emphasising the reconciliation of opposing interests in the common welfare and the harmonious interaction of the separate parts of society. In contrast, mass ideologies take a polarising view. They focus on exploitation and the irreconcilable conflict of interests between different sections of society; in other words, they contain some doctrine of class conflict.[10]

From this viewpoint, the famous "Indian tendency to the reconciliation of opposites" is not at all a characteristic of the "Hindu mind" but of an elite ideology which sought in varying ways to combine eastern and western traditions and to combine symbols popular with the masses with symbols representative of elite power, regardless of possible contradictions. Phule's thinking does not show any such harmonising tendencies but was based upon the principle that an irreconcilable conflict of interests existed between the Brahman elite and the non-Brahman masses. Because of this, any effort to achieve equality necessitated an attack on the privileges and position of the elite. It makes no more sense to accuse Phule of "hatred of Brahmans" on the grounds of this attack than it does to blame a Marxist for hatred of capitalists.

Focus on Cultural Factors

Second, Phule's theory of exploitation focused on cultural and ethnic factors rather than economic or political ones. It is true that he was highly concerned with the economic and political aspects of exploitation, but (as will be analysed in the following section) the objective conditions of nineteenth century colonialism made it almost impossible to come to an adequate understanding of economic matters or to visualise political solutions. Therefore the cultural and ethnic aspects of mass-elite relationships were emphasised: the elite was seen primarily as Brahmans whose dominant position in the caste system and religiously justified monopoly of knowledge underlay their power; they were seen as aliens, descendants of Aryan invaders who had enslaved and divided the indigenous population by means of the caste system. This approach reflected a good deal of Indian reality, yet it was dangerously susceptible to the position that the acquisition of knowledge and education by the masses (a "revolution in consciousness") and the replacement of a Brahman elite by an elite developed from the non-Brahman masses would be sufficient to achieve an equalitarian society. Therefore, non-Brahman ideology developed after Phule mainly as a "cultural revolutionary" ideology which was never satisfactorily integrated with either the ideology of the national revolution or the ideology of class revolution promoted later by socialists and communists.

Nevertheless, the question of culture was a crucial one, particularly as it related to the problem of nationality, and particularly within the colonial context.

The driving power behind modern imperial expansion has been the development of capitalism, yet colonialism has involved not simply economic exploitation, but also cultural exploitation. It represents not only class domination but (almost by definition) the dominance of whole cultural groups or nationalities—specifically the domination of Asian and African peoples by white European nations. Even the working classes of the dominant nations are in some senses part of a colonial elite; even the bourgeoisie and upper classes of the colonised cultural group are in some senses oppressed. The entire culture of the colonised people (their customs, literature, languages, religions) is downgraded by the colonial rulers and sought to be replaced by Western languages and culture. Therefore an anti-colonial revolution is a national revolution, and involves a reaffirmation and revitalisation of the culture of the dominated nationalities.[10]

But the problem is more complicated than this. In the West the primary political organisation of the last few centuries has been the creation of the nation-state, the establishment of one sovereign, bureaucratic state based upon a "nationality" or a people unified by culture, language, ethnic identity. In the non-Western world, however, colonialism both held out the nation-state as an ideal and, at the same time, made it practically impossible to achieve. This was because the processes of colonialism have intensified the differences between groups (such as Hindus and Muslims) within a single geographical territory and intensified the worldwide movement of cultural-ethnic groups (Indians to Africa and the West Indies; Africans to the Americas; Chinese throughout South-East Asia) to the point where the resulting "plural society" has made the focus of a state upon a single nationality an impossibility. Colonialism has set up political divisions in many cases without much regard for existing ethnic divisions, and it has intensified the differences between elites and masses (and therefore between elite culture and mass culture) within a single ethnic group.

Therefore, if the nation-state is to be the goal of an anti-colonial revolution, the burning question then becomes: what is the nationality, and which is the national culture, that is to be the basis of the new state?

National Culture

When the Indian upper-caste and bourgeois elite dealt with this question, their answer was rather simple. They first accepted the political framework of the British Raj—all of India—as the basis for the state. They then identified the "nation" and the "national culture" as basically Hindu, as deriving from Vedic times, and as fundamentally a creation of the Aryan people. And with this they tended to accept as an inherent part of this culture some form of *varnashramadharma* and to relegate other Indian cultural traditions —non-Aryan, Muslim, tribal, lowcaste, peasant traditions—to a secondary and inferior position.

(This is not to say that there were not genuine secularists among the elite who opposed the injustices of the caste system and Hindu communalism. There were. But they failed to develop their position as a theory of specifically *Indian* culture. The idea of India as a meeting place where different cultures and groups merged did not really come to terms with this issue. Similarly it is interesting to note that the later representatives of the social revolution, that is the Communists, tended to accept the idea that the different linguistic groups within India in fact represented different nationalities, though they quite logically left open the question as to whether this necessitated an autonomous state.)

The elite was helped in their interpretation by the "Aryan theory of race" which was developed in the 1840s and 1850s by German comparative philologists and popularised by Max Muller to emphasise the blood ties between British and Hindus.[11] The Indian elite took up the theory, stressing the ancient superiority of their race and culture and adding that Western Indo-Europeans had lost this in forsaking "Aryan spirituality". Indian civilisation was seen as primarily derivative from Aryan civilisation, and the caste system was lauded as a means by which people of diverse racial and cultural backgrounds were brought together in one society and subjected to the civilising influence of the Aryans. It is somewhat interesting that while Western rationality tended to undercut the old mythological explanations of caste, Western racism at the same time reinforced the system. For the varna divisions were almost automatically reinterpreted in racial terms: the "twice-born" Hindus, Brahmans, kshatriyas and vaishyas, were seen as descendants of Aryan conquerors, while shudras, untouchables and tribals were viewed as basically descendants of the non-Aryan conquered peoples. Even those members of the elite (such as Aurobindo and Swami Dayanand) who rejected the racial aspect of the theory still treated "non-Aryans" — Dravidians, shudras, tribals, Muslims — as inferior in cultural, moral and intellectual terms.[12] And among those who accepted the Aryan theory in its full racial form were the two opposing Maharashtrian Brahman leaders, Tilak and Ranade. Tilak lauded

> the vitality and superiority of the Aryan races, as disclosed by their conquest, by extermination or assimilation, of the non-Aryan races with whom they came in contact in their migrations in search of new lands from the North Pole to the Equator.[13]

And Ranade

> hinted that in India the Aryans were the chosen race and lamented that their chivalrous civilisation had been submerged in the South by "lower" Dravidians and hill tribes and in the North by invading Huns, Jats, and Muslims.[14]

High Caste Symbols

In taking Aryan and Sanskritic culture as the basis of "Indian nationality", the elite was in fact taking a part — the culture of the upper castes and roughly more north Indian groups — for the whole. Indeed, whenever the national elite tried to use Hindu cultural symbols to rally support for militant nationalism, they invariably chose symbols that represented high caste culture and interests. The bhadralok of Bengal, for example, took the mother goddess Kali as their central symbol, and argued that the vaishnavism of the masses had weakened the resistance to foreign rule:

> In a society where the masses of the people were Muslims and Vaishnava Hindus . . . this was an exclusive myth which reduced popular Hindu beliefs to the level of degraded survivals of mediaeval cults and which gave an obvious sanction for continued high-caste Hindu dominance.[15]

In Maharashtra, Tilak and his followers chose first to organise Hindu nationalism around Ganpati, a pre-eminently Brahman deity.[16] Tilak's other choice, Shivaji, was a more universally accepted hero, but here as well a Brahmanical twist was given that provoked many non-Brahmans to anger. In developing the myth of Shivaji as protector of orthodox Hinduism, go-brahman pratipalak, the Brahman leaders gave it not only an anti-Muslim bias, but also a pro-Brahman one, and in emphasising the role of Ramdas as guru of Shivaji, they implied that any Maratha king needed Brahman advice to succeed. It was not surprising then, that both the Ganpati festival and the memorialising of Shivaji became centres of Brahman-non-Brahman conflict more than of unified Maharashtrian efforts.[17]

The same limitations held even for Gandhi's great symbol of Hindu nationalism, "Ram-Rajya". Ram is a more widespread figure than either Ganpati or Kali and certainly has a mass basis in the UP-Hindi heartland. Nevertheless for the Tamils he has become a symbol of north Indian conquest, and for many Maharashtrians he represents a ruler whose support of the orthodox caste system involved the killing of a Shudra boy, Shambuka, for the sin of trying to follow a Brahman path to self-improvement.

Phule's Answer

It is in this context of the question of Indian national culture that Phule's writing must be understood.

The predominantly Aryan theory was, first of all, a double-edged sword, and Phule took it up with vigour.[18] So the elite traced their culture, including *varnashramadharma*, from Aryan conquerors — then they were the descendants of foreigners, and their caste system and religion were inventions devised by foreign conquerors to enslave the natives of India. India, and especially Maharashtra, had been ruled by aliens not simply for the centuries of British and Muslim rule, but for thousands of years before that! The masses, from peasants through untouchables and tribals, were the original inhabitants of India, "sons of the soil"; the elites and particularly the Brahmans, the *irani-arya-bhats*, were seen as aliens; the choice between British and Congress elite rule was seen as the choice between an enlightened and a traditional set of foreigners. Upper caste, orthodox religion and the whole culture of the sacred books, from the Vedas through the Puranas, was seen by Phule not simply as superstition, but also as alien and a weapon of rule.

The sacred religious literature was reinterpreted to show how the invading Aryans had conquered the indigenous people through force, treachery and use of religious propaganda. The nine avatars of Vishnu were seen as different stages of the Aryan conquest. Matsya (the fish) and Kaccha (the tortoise) re-

presented invasion by sea; Varah (the boar) was so-called because the original Aryans were seen as barbarians by the more civilised native kshatriyas. The story of Narsinh (the man-lion) and Prahlad represented conquest by treachery and propaganda, where the mind of a local prince was corrupted to the point where he was willing to kill his own father. Finally Waman (the brahman boy) represented a kind of culmination of the Aryan conquest of Maharashtra by cheating the great Bali out of his kingdom. Not so much attention was given to the later avatars, Parashuram, Krishna, or Rama,[18] but the approach was clear. The "dasyus" or non-Aryans and the demons of the Vedas and Puranas represented the indigenous population and were depicted as enlightened kings and warriors, the Aryans and their gods as treacherous invaders.

The culmination of interpretation was Phule's emphasis on Bali-Raja, king Bali. This symbol was in a sense his reply to the elite's use of Ram, Ganpati or Kali; it was a symbol that united the Maharashtrian peasant masses with the tales of Aryan invasions. Bali, as has been noted, is an ancient and valued symbol for the peasant and at the same time represents a sort of golden age, expressed in the Marathi saying, "let sorrow and unhappiness go, let the kingdom of Bali come!" Bali's kingdom in addition serves for Phule as a focus around which positive interpretations of other peasant deities of Maharashtra are elaborated. That is, while Phule remained a rationalist and did not attempt to foster religious revivalism, at the same time he has a favourable approach to such peasant and low-caste deities as Khandoba, Jotiba, Martand, Kalbhairi, that contrasts with his hostility to Sanskritic deities. Khandoba, for instance, is derived from the title of the official in charge of each of the nine "khands", or parts of Bali's kingdom; Mhasoba from "mahasubha" or great province, and so on.

Mass Nationalist Ideology

The purpose of this interpretation was not so much to provide a full history of India as to give a viewpoint from which such a history could be understood, to develop a nationalist ideology from a mass point of view. The purpose of the "non-Aryan" theory is to establish a cultural and racial basis for the unity of the Maharashtrian masses. This was a unity that more or less excluded Brahmans but did positively identify the peasant majority (that is, the middle level castes of Kunbis, Malis, Dhangars, etc) with untouchables and tribals as one community, native inhabitants of Maharashtra. While Phule did not write in terms of "Dravidians" or try to theoretically establish a Maratha regional nationalism, his approach nevertheless pointed in the same direction as the theories developed later in the context of the non-Brahman movement of Madras.

The non-Aryan theory, however, has proved somewhat of an embarrassment to many of Phule's later Maharashtrian followers, for two reasons. First, the whole idea of ethnic conflict between Aryans and non-Aryans has been de-emphasised, not only because the question of actual racial mixing was recognised as a complex one, but also because of a need to assert a Hindu national unity. Second, the middle castes of Maharashtra, in the caste conferences of the twentieth century and under the impetus of their educated and rich leaders, chose instead to identify themselves as kshatriyas, and with this as basically of Aryan or northern descent. Phule's approach, therefore, came to be ignored and dismissed with the statement that he was not, after all, a historian; the concepts of "slavery", "shudra", "non-Aryan" came to be applied primarily to untouchables and tribals; and many modern Maharashtrian non-Brahmans have accepted the general north Indian identification of DMK ideology as "racist".

However, the issue was not basically a racial one, but a cultural one, a matter of group identity. As has been noted, even the nineteenth century national leaders who argued that "Aryan and non-Aryan" did not represent a racial division still accepted the inferiority of non-Aryans. Similarly, the Twentieth Century representatives of "Hindu nationalism" argue for the racial unity of all Hindus but at the same time assert that the centre of this "Hindu culture" is Vedic, i.e, Aryan, upper caste.[20] Under the assertion of unity the problems of divisions and hierarchy continue to be fostered.

In fact, there are varying cultural traditions in India as well as complicated racial intermixtures. The question of what is to be seen as the centre of the "national culture" — or of the culture of any Indian state — remains crucial. If the emphasis is towards Sanskritic Hinduism, Vedic culture, vedanta philosophy, Mahabharata and Ramayana stories, this implies a bias that is *socially* in favour of the upper castes and towards indirect support of the caste system, and *geographically* in favour of north India. If the emphasis is towards non-Vedic culture, towards peasant traditions and tribal traditions, towards traditions of religious revolt running through Buddhism and the bhakti cults, then the bias is socially in favour of the "masses" and geographically in favour of the outlying linguistic regions of India. In scholarship and nationalist thinking, the bias up to now has been towards a Sanskritic, and therefore elite, basis to Indian culture, but in fact non-Sanskritic traditions have as much claim to an all-India spread.

(Scholars, it may be noted, have reflected this bias when they identified the Indian "Great Tradition" with Sanskritic elements and characterised opposing elements as part of a localised "Little Tradition". In some senses however the non-Aryan traditions could be called more of a "great tradition". For example, a recent study of the spread of Ramayana stories throughout South-East Asia notes that non-Brahman, non-Aryan versions which characterise Ravana in heroic terms — essentially akin to DMK versions — which have had a basis in south India as well as Bengal and Kashmir, are in fact more widely favoured in South-East Asia than versions favouring Rama.[21])

Non-Aryan Version

In fact, the whole question of Indian cultural identity may be said to be still an open one, in the process of formation in the context of social struggles. Phule's "non-Aryan" version of Maharashtrian identity, then, remains still extremely relevant.

Tamil Nadu represents of course one section of India where the issue has been decided in favour of a non-Aryan national culture as a result of a non-Brahman movement much akin to the movement in Maharashtra. Maharashtra has developed no such nationalism, yet in some ways it remains a more crucial and open case. While in Madras Tamil language and literature as well as its extreme southern location provided an unambiguous foundation for a non-Aryan identification, in Maharashtra the choice between "non-Aryan" and "Aryan" has been, to a much greater degree, a choice between elite and mass cultural traditions. Thus Brahmans, especially Chitpavans, could be unambiguously characterised as non-natives; and untouchables and tribals as non-Aryan natives. But there is a wide range of middle castes whose position is more ambiguous. (This ambiguity can be traced in later non-Brahman thinking; for instance in "*Marathe ani Tyanci Bhasha*", Bhaskarrao Jadhav shows on the one hand the prevalence of Dravidian customs and racial intermixture among Marathas, and on the other asserts, without any qualification, the Marathas are definitely "Aryan Kshatriyas").[22] For such castes to emphasise an Aryan and kshatriya identity is to express a high status and a belongingness to northern and Vedic traditions that separates them from the low castes and untouchables of Maharashtra. It is no accident that this type of ideologising became dominant at the time when the non-Brahman movement was splitting into the untouchable upsurge led by Ambedkar and a drive of caste Hindus (primarily Marathas) for political power. On the other hand, when Phule chose to emphasise the "non-Aryan" identity of the majority peasant castes of Maharashtra, he was rejecting elite and aristocratic traditions and asserting their unity with low castes, untouchables, and tribals. (He was also, it may be noted, asserting a unity with other oppressed peoples throughout the world; it is no accident that in dedicating *Gulamgiri* to the abolition of slavery in the United States he was one of the few men of his time to identify with black Americans.)

It is no wonder, then, that Phule's interpretations of the Aryan-non-Aryan conflict recur in practically all of his writings. This theory was central to his concept of the exploitation of the masses, it provided a concrete basis upon which the caste system could be attacked as non-Indian, and it provided the foundations upon which a theory of Maharashtrian "democratic national culture" could be built. Even if his later followers did not choose to erect the building, the foundation remains; the question of identity and culture remains unresolved.

IV

Economic and Political Dilemmas

Because thought reflects social reality, not only do the elements of a particular ideology reflect the interests of a particular class or group within society, but the degree of sophistication, the development of theory also reflects the organisational and institutional development of these classes. In analysing Phule's economic and political views, it is necessary not only to consider the conflicts of interests between the largely Brahman, bureaucratic elite, but also the specific problems of mass organisational development in a colonial situation.

By the last half of the nineteenth century the Indian elite had reached a position where they could meet their Western rulers on something near equal terms in developing social theory and a "political economy" from an Indian point of view.[23] Western education, the formation of new associations, newspapers and journals, the beginnings of political organisations, all provided a basis of social institutions around which thinking could be developed, theories tested and exchanged. This was hardly possible for the colonial masses, whose organisational and ideological weakness relative to their own elite was much more marked than in Western industrial nations. Even workers could hardly form their own organisations or deal with their employers and the government without the mediation of literate and English-knowing outsiders; for the peasants, who formed the vast majority, autonomous organisation was impossible. They were in the position of being affected by the vagaries of a world-wide capitalist system while possessing only traditional institutions with which to cope with it. Thus peasant rebellions might occur, but organisational forms could not be maintained.

The same was true in the field of ideology. Here it was necessary not only to be literate, but to be literate in a foreign language in order to utilise the most advanced thinking for the understanding of the causes and remedies of the poverty of the Indian masses. (And this was necessary because in fact colonialism established an organic connection between the "backwardness" of non-Western peasants and the "development" of the West.) But few people of "mass" origin got any form of education; the tendency was for even these to be co-opted by the Brahmanised elite and to yield to the class status their education made possible; non-Brahman organisational and institutional development was slow — two or three newspapers by the end of the century could provide only a small basis for exchange and development of ideas. Thus, however much a "peasant" or "mass" viewpoint might exist, however strong the contacts of non-Brahman leaders were with the masses, the social institutional basis for developing this into a sophisticated theoretical analysis did not exist.

Designed to Shock

The work of Jotirao Phule and his colleagues has to be understood in this context. Phule's own writings reflect the sporadic nature of non-Brahman organisational development: they are unsystematic, sporadic, pictorial rather than discursive, hard-hitting but designed more to shock people into an awareness of the situation than to provide an extensive analysis. As he notes in the introduction to "*Sarvajanik Satya Dharma*", he had wanted to write a more thorough book but felt it was more important for the book to be useful to the daily life of the people. Non-Brahman leaders in general thought it was more important to speak to the masses than to engage in finely spun analysis. Thus Phule is not so much involved with providing economic and political theory or writing Indian history as with giving a viewpoint, a beginning, a foundation. He therefore has to be understood as a forerunner.

Yet his writings include not only heart-rending descriptions of peasant poverty, not only poetry and propaganda aimed at mass organising, but also discussions of the causes and remedies of such poverty. These are not systematic, but they contain a certain basic logic, and they reflect the dilemmas of the Indian masses of the time. Further, since both the weaknesses as well as the strengths of Phule's outlook became part of the general heritage of the non-Brahman movement, it is important to understand his position.

Phule's economic outlook might be summarised by saying that while the Indian nationalist elite developed a theory of Indian backwardness as a result of colonial exploitation, Phule and his colleagues saw the peasant masses as toiling under a double exploitation — that of the Brahman elite as well as that of the colonial rulers. And while the elite viewed industrialisation as the primary solution to Indian problems and took their stand with the emerging capitalist class, Phule focused on the problems of agriculture and spoke from the viewpoint of the peasant.[24]

It is interesting to note that Phule repeated much of the nationalists' economic critique of British rule. Unlike some of the later non-Brahman leaders who maintained an unqualified loyalty to the Raj, he seems to have seen it as largely destructive in economic terms; it was only on cultural and social grounds that he viewed it as providing a foundation for the liberation of the masses. Thus he linked peasant poverty to the ruin of Indian crafts and artisans by unfair competition with British goods, to the disastrous growth of population, to home charges and the expense of foreign campaigns, to excessive spending on fat salaries for bureaucrats. He described with scorn the decadent life-style of British officials and

their neglect of the peasants, and noted that even the common British soldier lived like an aristocrat at the expense of the masses. Like the nationalists, he viewed the "bureaucracy" as the primary enemy of the peasants — but where he differed from the nationalists was in seeing the bureaucracy as a whole, led at the top by the British but dominated at all other levels by the native Brahman elite. In fact, one of his major criticisms of the British was that in leading their pleasure-seeking life they acquiesced in Brahman dominance of the masses. In every department, education, irrigation, the judiciary, etc, the Brahmans were seen as monopolising the benefits of rule. In particular, the exploitation of the peasants by the incompetent, corrupt, wilfully alienated judiciary was heavily attacked. While the nationalists criticised the "drain" of income from India to England, Phule and his colleagues directed their attention to the "drain" from the peasantry to the urban-based bureaucratic elite, and criticised heavily such taxes as the octroi, which provided a major amount of municipality income, and the local fund, by means of which largely upper-caste students were educated at the expense of the peasantry.

Primary Conflict

The primary economic conflict within India was thus described as a conflict between the peasantry and the elite-dominated bureaucracy. Zamindars or inamdars in this area of ryotwari settlement were more or less viewed as irrelevant. Shetjis and bhatjis were coupled, later, as enemies of the peasants, but antagonism was always greater against bhatjis. Shetjis or moneylenders oppressed the peasant through indebtedness but it was felt they could only gain power as a result of the support they got from the Brahman-dominated bureaucracies. Brahmans or bhatjis were often landlords and moneylenders themselves; through religious domination they kept the peasant ignorant and subjugated; and finally they had social and family ties all up and down the bureaucratic hierarchy. It was this bureaucracy that was the source of power, and at its bottom, linking it with the village, was the Brahman kulkarni, whose power over the ignorant peasantry provided the linchpin of exploitation.

Phule did not give any consideration to the issue of economic differentiation *within* the peasantry, to class differences of rich and poor peasants, small landholders and agricultural labour; the whole problem of property and the organisation of the relations of production was absent from his thought. In one sense he cannot be faulted for this, since it was not until the Twentieth Century and particularly till the time of Mao that Marxists themselves elaborated a theory of class differentiation among the peasantry relevant to revolutionary development in rural areas. However, it can be noted that Phule's thought was in some ways pre-industrial. For example, although his own colleague Narayanrao Lokhande was one of the very first Indian spokesmen for labour, still the problems of industry and the working class did not enter into Phule's thinking in a theoretical form. This absence was symptomatic of the general failure to link the "cultural revolutionary" tradition of the Satyashodhak Samaj and the non-Brahman movement to the "economic revolutionary" outlook of Marxism—Phule himself was definitely revolutionary in seeing an irreconcilable conflict of interests between the masses and the elite and feeling that a complete change of the social system and the overthrow of a dominating class would be necessary for mass progress; yet this was not linked to a direct class conflict — of which the class conflict of factory labour and their employers provided the clearest paradigm — but more to issues of the caste society.

Industrialisation was not seen by Phule as a solution to Indian backwardness. In a primarily agricultural country, he felt, the remedy for mass poverty lay in a direct solution of the agrarian problem. Thus he urged extensive action by the government for the improvement of agriculture, including soil conservation schemes; the construction of tanks, bunds and dams; scientific programmes of animal breeding; the specific education of peasants to create a class of instructors to teach modern techniques of agriculture within each village, and so forth. This was consistent with his general opposition to "trickle-down" theories of progress—that is, he did not feel that economic or educational benefits to a small section would eventually result in overall social progress (hence his insistence on *mass* education). This general outlook has been justified in that industrial development in many capitalist underdeveloped countries has only increased contradictions between rich and poor sections. However, perhaps because of his lack of concern for economic differentiation among the peasantry, he did not foresee that even the benefits of agricultural development might not easily flow from a rural elite to the rural masses.[25]

These limitations of Phule's thinking are of course related to nineteenth century conditions: industrialisation had scarcely begun, the working class was as yet insignificant, agricultural development had not provided a solid basis for a rich peasant class to emerge. All of these were in a real way problems for his followers, for later non-Brahman leaders to cope with; and to cope with them they would have had to take Phule's basic viewpoint—a lively awareness of exploitation and a concern for equality and direct mass development—as a foundation for a full analysis that would transcend Phule's own. But this was, on the whole, not done.

Insoluble Problem

Politically, Phule's view of the double exploitation of the peasantry left him with an almost insoluble problem. How could an unorganised, illiterate and still mentally-enslaved peasantry fight two enemies at once? It was not simply that the Sarvajanik Sabha and the National Congress of Phule's time were overwhelmingly dominated by the Brahman elite; it was also that he could not visualise the possibility of *any* freedom movement, in his time or the future, that would not come under elite organisational control. And to a large degree this was a realistic assessment. Even in the Twentieth Century periods of mass mobilisation (such as the 1939 Civil Disobedience Campaign and the 1942 Quit India Movement) that drew in extensive mass participation and peasant leadership were followed by periods of organisation consolidation that saw the re-establishment of upper class control. Non-Brahman entry into the Congress coincided with the disappearance of the Satyashodhak Samaj, yet non-Brahman leaders did not gain control of the Congress organisation until Independence. By this time the fervour of social reform and cultural revolution had been lost.

Therefore, in the choice between British rule and Brahman organisational dominance, Phule opted for British rule as the best guarantee of the conditions under which the masses could progress. In one sense he had no other choice (and he was after all no simple supporter of the British; for instance, in 1880 he was the only member of the Poona Municipality to oppose the spending of Rs 1,000 for the

Viceroy's visit[26]). In another sense this reflected a failure in his analysis, a yielding to the illusion of beneficence which the British put forth. He was perfectly aware of the continuance of Brahman power under British rule —this was his major complaint—yet he never linked this to an analysis of colonialism as a system that depended on such intermediary elites to maintain itself. Therefore he was caught in the position of asking the British to institute changes which, as a colonial government, they had neither the will nor the power to carry out.

Consider for a moment the demands he was making. He wanted mass education rather than elite "trickle down" education. But the British did not have the financial resources nor the desire to carry this out; no colonial power did, and the very purpose of colonial education was to train the intermediary elite of bureaucrats whom Phule opposed. He wanted British civil servants and investigatory commissions to heed the testimony of mass representatives rather than the elite; but he was more aware than any nationalist leader that however much the British pretended to be protectors of the peasants, however much they distrusted the educated elite, in fact they were far removed from any sharing of interests or life with the masses. He was asking an impossibility.

Petitioning the British

Phule wanted sweeping social changes within village society itself. His primary goal was not simply to replace a Brahman-dominated bureaucracy with a non-Brahman bureaucracy over the villages and it was not simply to transfer power to the villages. Rather he wanted to revolutionise village society itself. Not only should the position of kulkarni be abolished; but also the patil's and other watan posts should be opened up to all on the basis of merit through special training schools.[27] Thus the entire watan system with its relationship to traditional caste privileges and functions was to be destroyed along with the hereditary linking of caste and occupation. Similarly, the traditional moral and social life of the masses had to be drastically reformed. Phule urged a strong legislation of morality that would prohibit bigamy and child marriage and concealed prostitution in the form of kolhatins and tamashas. The equality of women, as well as the equality of untouchables, demanded sweeping changes at the basis of society.

But what type of government would carry through such sweeping changes? Such a programme, even though it did not directly refer to economic inequalities within the village, nevertheless involved a revolutionary attack on traditional social arrangements. Therefore it projected a revolutionary state. It required a type of political organisation that was as far removed from the capitalist or colonial *laissez-faire* state as it was from traditional government by caste and social custom.

The British were after all by policy reluctant to attack the traditional customs of Indian society. They were, further, unwilling to attack seriously the privileges of the elite because they depended on this elite for maintenance of the Raj; in a colonial situation the relation of Western rulers with the native elite is an ambiguous one that involves not only a conflict of interests but also compromise, a sharing of power.[28] The problem was not simply that Phule was petitioning the government for reforms — the style of the Brahman nationalist elite in this period was also one of petitioning, of compromise and negotiation. The Congress was by no means a revolutionary body. But there was an important difference between petitioning for elite reforms and mass demands. Elite reforms could be conceded by the British after a process of agitation and compromise (and even in the nineteenth century there were British statesmen such as Macaulay who approved the idea of the end of direct colonial rule on the grounds that a "neo-colonial" regime in which Indians had political self-rule but continued to be economically linked to the West as consumers of English goods would accord more with British interests). But the mass demands for sweeping social revolution, heavy expenditure on educational and agricultural development, could not be conceded. Phule's petitioning was therefore contradictory in a way that elite petitioning was not.

The basic goal was revolutionary changes at the base of society. If the British could not carry them out, who would? Phule's other attempt to provide a solution was to look to the development of a non-Brahman elite who would implement such changes. Brahman positions, he argued, should be limited to their percentage of the population and non-Brahmans should be associated with the government at all levels. This was not seen as an end, but as a means. It was based on the belief that a non-Brahman educated elite would continue to have family and cultural ties with the masses that would limit their ability and willingness to exploit them as the Brahmans did.[28A] Yet Phule was aware that educated non-Brahmans of his day also tended to be co-opted into acceptance of the caste hierarchy and "Brahmanic" values and that they were susceptible to nationalistic appeals for unity with the elite rather than with the peasant masses against the elite. What would insure that this would not happen on a larger scale? This question was never satisfactorily answered.

Cultural Revolutionary Stance

The contradictions in the economic and political programme of Phule and his colleagues were in fact inherent in the condition of a peasantry under colonial rule. But they were transmitted as part of a heritage of a developing "non-Brahman movement" that did represent the social revolutionary drive of the Maharashtrian masses. Phule's greatest contribution was in his rigourous cultural revolutionary stance, his drive for equality and rationality, and in the creation of an organisation, the Satyashodhak Samaj, which would carry on agitation for social and religious reform at a mass level. However, his followers remained unable to coordinate this cultural revolution with a consistent economic and political revolutionary programme. Faced by a situation where the colonial government could not and would not carry out a programme of social revolution and where an elite-dominated national movement wanted to arouse mass participation without letting it get out of control (no-tax agitations, for instance, were invariably halted when they threatened to turn into no-rent agitations), leaders of the non-Brahman movement never managed to create an organisation to oppose both independence of both government and elite. In such a situation they yielded to the temptation to focus on the means (the creation of a non-Brahman elite drawn from village society) to the exclusion of the end (the transformation of village society itself).

Thus in the legislative councils non-Brahman leaders sought to achieve the opening up of bureaucratic positions to non-Brahmans, to hasten the process of transforming the watandar kulkarni into a talathi, and to destroy the hereditary rights of the village priest or joshi. At the same time they sponsored patil conferences and resisted the attempts of Ambedkar to abolish the

mahar watan. Phule's concern for a revolution of equality in personal relationships — between men and women, among the different castes, within village and family itself — tended to be neglected. The result was that the shift of power toward rural society meant a shift to an unrevolutionised village dominated by a rural elite. Thus the educational institutions founded by non-Brahman leaders and the agricultural co-operatives which had their beginnings in this period began to provide an institutional basis for the consolidation of the power of this elite.[29]

In this situation, the non-Brahman movement was merged with the national movement, but the former Satyashodhak leaders never succeeded in transforming the national revolution to a social revolution. The militant younger non-Brahmans, turning to nationalism, accused the loyalist non-Brahman leadership of giving up social revolutionary goals in exchange for elite positions under the British; but they themselves neglected these goals in the process of mass mobilisation and acquisition of power within the Congress organisation. Phule's overriding concern for social revolution and the awareness of the inherent conflict between the exploited masses and the educated and wealthy elite was compromised as non-Brahmans began to form a significant part of that elite.

V

Conclusions

Can it be said, then, that the ideology of the Satyashodhak Samaj was simply an ideology of a "rich peasant" class, of a section of the masses in their drive for participation in power? The answer is no — basically because important parts of Phule's thinking disappeared precisely as the rural elite came to power. Thus the emphasis on a "non-Aryan" cultural and ethnic unity of all the masses from Kunbi-Maratha peasants to untouchables was given up, and the Satyashodhak Samaj vanished as a vital force in village society after 1930. Phule's influence and the work of Satyashodhakas played a crucial role in giving birth to the most vital movement of untouchables in all of India — but this movement, while retaining the urge to overthrow Brahmanism and casteism, became separated from that of caste Hindu non-Brahmans. After the disappearance of the Satyashodhak Samaj, there remained no rural organisation that succeeded in uniting men and women from all non-Brahman castes in a drive for social reform. The thought of Phule remains a part of the Maharashtrian tradition, but its cultural revolutionary drive has been dispersed and fragmented, still unrealised — reflecting perhaps the still fragmented and unorganised poverty of the rural masses.

The thought of Jotirao Phule was revolutionary; it gave a clearer goal for individual freedom and self-fulfilment, complete inequality and social unity than any other "reformist" thinking of the time; it called for a revolutionary, ruthless attack on the injustice of the old society. It was no accident that this drive for liberation was linked with a "non-Aryan" theory that sought to give a cultural and ethnic foundation for the unity of the masses. The Aryan theory of the elite identified them, in a significant way, with the white races of the world; while Phule was the first Indian to identify with the oppression of American Red Indians and American Blacks. In this era of world history, which is still the era of industrial capitalism and its associate imperialism, the road to equality and freedom on a world-wide scale appears to lie *via* the liberation struggles of non-white peoples, whether this be in America, the archetypal Western nation, or in India, the archetypal non-Western nation. Phule failed to provide economic analysis or political organisation appropriate for this struggle, but he had a clear vision of the need for and the basis of a liberation movement. It remains to his modern followers to take up the challenge.

[This paper is, in a sense, a prelude to my doctoral dissertation for the PhD in Sociology, "Cultural Revolution in Maharashtra: the non-Brahman Movement and Satyashodhak Samaj, 1910-1930". It is based almost completely upon Phule's own writings and on my general sociological knowledge. I regret that due to my inadequate knowledge of Marathi I was not able to use much of the secondary literature on Phule and his works. Dhananjay Keer's English biography has thus provided me with most of the background on the life of Phule. For help in translation and interpretation of Phule's writings and for many stimulating discussions of these I owe thanks to R M Bapat of Poona University.

However, for help in my general dissertation work, for providing valuable information and discussion of the non-Brahman movement, and for help in understanding Phule's cultural revolutionary viewpoint, I owe thanks to all the Satyashodhak workers and non-Brahman leaders who have so generously given me their time. Their names are too numerous to mention here. Special thanks, however must be given to those who have preserved by their own efforts the literature of the movement. I am grateful to Madhavrao Mukundrao Patil and R M Patil for the maintenance of *Din Mitra*, to Madhavrao Shripatro Shinde for *Vijayi Maratha*; to Shamrao Desai for *Rashtravir*; to Ganpatrao Jadhav for *Kaivari*; to D S Zhodge, K K Savant, Appasaheb Jadhav, Prataprao V Shinde and many others for allowing me use of a wide variety of pamphlets, books and literature. Finally, special mention must by made of Gopinatrao Eknath Palkar for the preservation of much valuable material, including *Din Bandhu*, the *Deccan Rayat*, and the Satyashodhak Samaj conference reports. Without such material and help provided, social history cannot be written. If in the past biases have entered into the writing of Maharashtrian social history, it is partly due to the insufficient use of such material. It is to be hoped that with the new interest developing in the history of the *bahujan samaj* that can be seen with the establishment of such institutions as Shahu Institute of Shivaji University, these valuable newspapers and booklets can be preserved in permanent form for future students.]

29 "*Shetkaryaca Asud*", pp 237-8.
30 See Ian Catanach, "Rural Credit in Western India", for a discussion of the laying of the foundations of co-operatives in this period. Satyashodhak and non-Brahman attention was focused on these from the beginning.

Competitiveness of Indian Steel Exports

A Comment

S A Dave

S K Subramanian

IN a very interesting article ("Competitiveness of Indian Steel Exports" May 29, 1971) Samuel Paul has suggested criteria to judge the export competitiveness of products both in the short run and in the long run. The export competiveness of a product, according to Samuel Paul, should be determined by the domestic cost involved per unit of foreign exchange earned. All products can be ranked according to the value of this ratio and the product with the highest ratio, from the exporting country's point of view, would be regarded as the most competitive exportable product.

We agree with Paul that the basic rational of these criteria has to be in terms of the domestic cost incurred per unit of foreign exchange earned. But we feel that Paul has failed to take into account some important factors. As a consequence, Paul's criteria seem to us somewhat oversimplified. We will illustrate our arguments with reference, first, to the long term criterion and then to the short term criterion of Paul.

For a product "i", Paul has defined the criterion of domestic resource cost per unit of foreign exchange earned (D_i) as:

$$D_i = \frac{\sum_j X_{ji} + d_i + w_i + r_i}{F_i - (m'_i + m''_i)} \quad \ldots (1)$$

Where X_{ji} = value of indigenous, non-exportable inputs supplied from the jth industry (net of indirect taxes) for the manufacture of one unit of the ith item less the value of imported inputs required by X_{ji}
d_i = depreciation charges per unit of product i
w_i = wages per unit of i
r_i = return on investment per unit of i
F_i = FOB foreign exchange receipt per unit of i
m'_i = CIF value of imported inputs (direct and indirect) per unit of i
m''_i = FOB value of exportable inputs per unit of i

The numerator in the above ratio is the sum of the value added by manufacture and the cost of non-exportable (non-traded) inputs. Wages and the return on investment are to be valued at social cost. Paul is quite aware of the difficulties involved in assessing these two factors at social cost, but he would prefer to evaluate them at their social cost. We have some reservations regarding the use of shadow prices, particularly of labour, but we need not dwell on that point here.

Liberal Criterion

The denominator, as defined by Paul, is not sufficiently comprehensive of all foreign exchange costs. As in the case of the numerator, there should be charge on foreign capital as well as depreciation on foreign capital. At the time of import of this capital, the country had an option of import or investment in securities of foreign governments or in any high-yielding projects abroad. These investments would have yielded some returns in foreign exchange. By choosing the alternative of importing capital goods, the country is deprived of the foreign exchange that could have been available over time because of investment abroad. The charge on capital, therefore, should be considered the true foreign exchange cost to the economy.

Depreciation on foreign capital, as in case of any capital, should be part of the cost. Whether it should be treated as domestic cost or foreign exchange cost would depend on the source of procurement at the time of replacement. It should be treated as foreign exchange cost if it is known that the machinery will have to be imported for its replacement. With the

progress of industrialisation, one can assume, a major portion of the equipment, when due for replacement, would be available indigenously. But at the same time, due to obsolescence factors and rapid advance in technology abroad, imports may still be warranted. Hence, it would be prudent to provide for depreciation on imported machinery in the foreign exchange cost. Exclusion of charge on capital and depreciation leads to underestimation of foreign exchange costs and makes Paul's criterion rather a liberal criterion.

Paul has only suggested how to rank exportable products, but it certainly would not be profitable to export all products with a positive ratio. Paul has not discussed the maximum value of Di beyond which exports are no longer profitable. This would be given by the social cost of foreign exchange, or in other words, shadow exchange rate (SER). Only those products for which Di is less than the SER, are exportable and these products could be ranked by their Di values.

Whether we treat charge on foreign capital and depreciation on foreign capital as domestic cost or foreign exchange cost may not matter much for the *computation* of (D) ratio. The arithmetic part of computation *may not* be very sensitive to whether we put these values in the numerator or denominator particularly when these amounts are small. But it is of vital importance when it comes to demand for foreign exchange and the determination of the shadow exchange rate. Also, for conceptual clarity they should be in their right places in any theoretical formulations.

We suggest, therefore, the proper criterion should be :

$$D_i = \frac{\sum_j X_{ji} + d_i + w_i + r_i}{F_i - (d'_i + r'_i + m'_i + m''_i)} \quad (2)$$

Where

D_i, X_{ji}, d_i, w_i, r_i, F_i, m'_i and m''_i

would be as defined by Paul.

d'_i = depreciation on imported machinery per unit of i

r'_i = charge on imported capital per unit of i

The criterion for export promotion in the short run would not be basically different from that for the long run, except that some of the factors in the formula would assume a zero or lower value. Paul has assumed the existence of idle plant capacity and that the real cost for producing the additional output is only the imported variable inputs. The underutilisation of the installed capacity may not be due to the absence of adequate domestic market, but could be caused by difficulties in procurement of raw materials, spares and labour problems. The short-run criterion as suggested by Paul is to rank exportable products simply by FOB export value per unit output less the cost of all direct imported inputs per unit output. Higher this value, higher the export competitiveness of the product,

i e, $(F_i - m'_i)$.

This is a very simple criterion; in fact it is too simple and perhaps misleading. It does not adequately reflect the opportunity cost of all factors involved in production.

Current Input Costs

Paul's criterion would be appropriate only if all fixed capital and all variable inputs (except direct imported inputs) are specific to the concerned industry and would have remained idle in the absence of the production in this industry. In a general recessionary situation this may be true of all current inputs, and to regard their opportunity costs to be zero may not be very inappropriate. But if conditions are not of this type, current input costs should be regarded as cost for a given industry. By excluding wage costs, Paul has implicitly assumed all wages as fixed costs with zero opportunity costs. In other words, he has assumed the level of employment to be invariant with the level of production. It may be difficult for a firm to lay off workers when production declines. But to rule out the possibility of decline in the wage bill is to err in the other direction. Wage costs should be divided into fixed wage costs and current wage costs and only the opportunity cost of the former can be regarded as zero. The social cost of displaced labour cannot be regarded as zero as long as there is reduction in consumption of a labourer and his family when he becomes unemployed.

It would also be incorrect to regard the opportunity cost of other inputs to be zero, even in the short run. All exportable inputs can be exported at some price and whatever foreign exchange they can earn is their true opportunity costs.

Life of capital may be longer than the short-run period of two years under Paul's criterion. If the productive life of capital were to extend beyond this period and capital would have to be replaced, sufficient funds should be kept aside for depreciation. If capital is specific, its opportunity cost would be zero in the short-run period. But capital ought to be kept intact for its productivity in the long run. Depreciation, therefore, should be part of the cost. The annual charge on capital, however, need not be included as cost in the short run.

In his criterion for the short run, Paul has not taken into consideration any domestic cost. This would not make any significant variation when allied products are compared, as in the example of Paul dealing with products based on steel. However, if two products, say, one based on aluminium and the other on fertiliser are to be compared for export competitiveness in the short run, the value of the domestic cost has to figure in deciding the export criteria and the two products cannot be compared only on the basis of $(F_i - m'_i)$ values.

The criterion for the short-run (D_i) could then be defined as follows :

$$D'_i = \frac{\sum_j X_{ji} + w'_i + d_i}{F_i - (d'_i + m'_i + m''_i)}$$

Where $X_{ji}, F_i, d_i, d'_i, m'_i, m''_i$ are as defined in equation (2) above.

W'_i = current wage costs.

The inclusion of X_{ji} as domestic cost in the short run, perhaps, is somewhat questionable. X_{ji} would be largely utilities such as water, electricity and gas but there can be some inputs for a specific final product which may be non-exportable and yet they should be preferably considered domestic cost in the short run. For example, electricity in the aluminium or caustic chlorine industry would be an important element of cost and cannot be ignored. Similarly in the case of petrochemicals, natural gas will be part of the domestic cost, since it cannot be easily liquefied and exported.

The short range export criterion would be a useful tool for decisions relating to the utilisation of existing idle capacity. It could also be used in assessing new projects which envisage the recovery of the foreign exchange expenditure by exports over a short period or for new schemes, wherein the economics of scale warrant a large-sized plant and the gap between production and the growing domestic market is expected to be bridged by exports in the short run.

Life Insurance Corporation of India

Statement by the Chairman, Shri T A Pai

THE following are the extracts from the Statement by Shri T A Pai, Chairman, at the One Hundred and Eighty-Second Meeting of the Members of the Life Insurance Corporation of India for the period April 1, 1970 to March 31, 1971:

I have great pleasure to place before you the Statement of Accounts and the Annual Report of the Life Insurance Corporation of India for the period April 1, 1970 to March 31, 1971.

The country had an encouraging period, both in the realm of Industrial growth as well as in agricultural output, self-sufficiency in food being well in sight. There have been healthier trends in the national economy which are reflected in the national as well as per capita income. While the results of the mid-term poll of Parliament in March 1971 have laid the foundations of healthier democratic traditions in our political life, the buoyant economic conditions have led to a spirit of new awakening and greater expectations to improve the lot of the common man. However, the unfortunate events in Bangla Desh leading to influx of refugees in a gigantic proportion and a mass movement of people into our country on a scale unknown in history have thrown an unexpected burden on the country calling for considerable and unstinted sacrifice on the part of the people even at the expense of desirable and expected economic growth.

New Business

In 1970-71 the LIC has set up a new record completing a new business of Rs 1303.08 crores under 16.16 lac policies against Rs 1036.08 crores under 14.01 lac policies in 1969-70. The sum assured increased by 25.8 per cent compared to the previous year. This is the highest percentage increase that the Corporation achieved since inception. The number of policies issued each year had been stagnating around 14 lacs between the years 1964-65 and 1969-70. In 1970-71 the Corporation has achieved a major breakthrough in this respect also.

Out of the new business, nearly 66 per cent of the total number of policies issue in India, viz, 1062 lac policies assuring Rs 725.95 crores out of Rs 1303.08 crores were sold to persons insuring for the first time.

Size of Policy

The average sum assured per policy increased to Rs 8,066 in 1970-71 as against Rs 7,394 in 1969-70. While 11.11 lakh new policies issued in the year were for sums assured between Rs 1,000 and Rs 5,000, the corresponding figure for 1969-70 was 9.81 lac policies.

Rural Business

During the year, as many as 5.07 lac policies for sum assured Rs 296.37 crores were issued in the rural areas as against the corresponding figures for the previous year of 4.62 lakh policies assuring a sum of Rs 251.76 crores. In view of the vast potential that is still untapped in the rural areas, it is evident that vigorous attempts still need to be made to bring more and more people under insurance cover. In this context it has to be remembered that the LIC serves the country through 664 offices procuring new business as a Branch, Sub Office or Development Centre. Almost all of these offices, barring a relatively few which concentrate their activities exclusively in the urban centres, serve the urban as well as the rural areas of our vast country. If the entire rural population in this country has to be covered by the LIC, the presumption that this can be done only by appointing agents in the rural areas is not correct. With the selling of the policy, servicing also becomes an important aspect of the business and the location of a Branch of the LIC becomes important from this point of view. But, today, unfortunately, LIC's activities in undertaking developmental responsibilities of this type are restricted because the resources available for this purpose are only the premiums of the policyholders and there is a ceiling up to which this premium income can be utilised for the purpose. If the LIC has to spread the message of insurance covering the entire rural population and mobilise the savings from the rural areas, the State will have to take it as a major instrument for this purpose and help its developmental activities by providing adequate assistance. Obviously, a time has come when the LIC, in order to spread its activities far and wide in the country, to mobilise the people's savings and also to cover the lives which are not ordinarily covered, will have to create a Development Fund out of the share of the Valuation surplus that goes to the Government.

Non-Medical Business

During the year, 8.25 lakh policies, being 51.2 per cent of the total number of policies issued in India, were issued under the Non-Medical Schemes. In value, they amount to Rs 324.03 crores, which is 25.0 per cent of the total sum assured in India. The amount of Non-Medical business in 1969-70 was Rs 223.65 crores — 21.8 per cent of the total sum assured in India.

Group Insurance Schemes

During the year 1970-71, 54,938 lives were covered under Group Insurance Schemes for a total sum assured of Rs 79.55 crores and 273 lives were covered under Superannuation Schemes for pension benefits.

Salary Savings Schemes

As against 3.76 lakh policies assuring Rs 177.33 crores issued in 1969-70, 4.86 lakh policies amounting to Rs 252.06 crores were issued under the Salary Savings Scheme in 1970-71. This Scheme helps people, particularly in the salaried middle income groups, in making the payment on insurance as the first charge on their income.

Business in Force

The total ordinary life assurance

business in force as on March 31, 1971 was Rs 7,067 crores under 147.85 lakh policies as against Rs 6,348 crores under 140.41 lakh policies on March 31, 1970.

Lapse Ratio

Efforts made by the Corporation to conserve business are reflected in the progressive improvement recorded in the lapse ratio in the last three years. The ratio of lapses to mean life insurance business in force decreased from 5.9 per cent in 1969-70 to 5.2 per cent during the year under review. In 1968-69 the lapse percentage was 6.3 while in 1966-67 it was 7.4.

Life Fund

While the Life Fund as at March 31, 1969 was Rs 1434 crores, in March 1970 it rose to Rs 1611 crores (plus 177 crores) i e 12.31 per cent and in March 1971 to Rs 1825 crores (plus 214 crores) i e 13.04 per cent.

Total Assets

The total assets of the Corporation as on March 31, 1971 amounted to Rs 1989 crores as against Rs 1772 crores as on March 31, 1970.

Settlement of Claims

Death and Maturity Claims amounting to Rs 19.09 crores and Rs 68.01 crores respectively were intimated to the Corporation during 1970-71. Out of these claims and those outstanding at the end of the previous year, death and maturity claims for Rs 21.94 crores and Rs 68.92 crores respectively were settled by the Corporation during the year as against death and maturity claims for Rs 18.77 crores and Rs 62.59 crores respectively for the preceding year. An analysis of the settlement of claim operations in the year 1970-71 indicates that the number of outstanding claims as at March 31, 1971 was about 80 per cent of the outstanding claims as at March 31, 1970. This improvement has been possible with the special efforts made during the year to settle the claims expeditiously. The ratio of outstanding claims to claims intimated during the year also dropped from 79.8 per cent in 1969-70 to 63.5 per cent in 1970-71 in respect of death claims and from 14.9 per cent in 1969-70 to 12.4 per cent in 1970-71 in respect of maturity claims. On the whole, the drop in the ratio of outstanding claims as at March 31, 1971 was 23.6 per cent of the intimated claims as against 29.8 per cent as at March 31, 1970.

The number of claims that the LIC settled during 1970-71 came to 3.55 lakhs as against 2.67 lakhs in 1966-67 which shows that while in 1966-67 the Corporation had settled 921 claims per day based on about 290 working days in a year, in 1970-71 it was paying out 1224 claims per day.

Income and Expenses

The total income of the Corporation during the year 1970-71 amounted to Rs 304.01 crores made up of Rs 292.15 crores of premium, Rs 104.41 crores of Interest, Dividends and Rents and Rs 9.99 crores of miscellaneous income. As against this, the amount of total benefits paid to policyholders was Rs 99.37 crores, Expenses of Management Rs 79.43 crores and Miscellaneous Outgo Rs 1.20 crores. The gross and net rates of interest realised on the mean Life Insurance Fund were 6.25 per cent and 5.73 per cent respectively as against 6.06 per cent and 5.57 per cent respectively in the preceding year. Even this slight improvement of the yield from 5.57 per cent to 5.73 per cent has brought in an additional return of Rs 4 crores in the year.

Efforts were being made continuously to improve the yield on the Life Fund. While considerable emphasis has always been laid on the working expenses of the LIC, in the days of rising costs in every sphere of its activities, it must be emphasised that the working expenses of the LIC are not comparable to insurers in the world in the private sector. The private insurers have a right to confine their activities to a particular class of business which is less expensive or to particular areas at reduced cost. The obligation placed on an institution like the LIC to spread its activities far and wide in backward areas and even covering smaller policies, obviously cannot be judged by the same standard. It would be worthwhile evaluating its performance in this direction rather than only in terms of expense ratio. As a matter of fact, when even this expense ratio has come down, it indicates that the expense ratio could be high if the business is stagnant and could be brought down by continuous expansion of business. However, this does not mean that the LIC has no obligation to avoid any extravagant expenditure which does not fulfil its objectives.

Investments

The resources of the Corporation have become an important part of the national effort in mobilising the savings of the people, and the Government would have to ensure a fair return on these funds to make insurance attractive. Then again, there is no comparison between the insurers in the rest of the world in the private sector and the LIC. Insurers elsewhere may have vast opportunities to go in for high yielding investments. But the investments of the LIC will have to conform to the national needs. As a result of the LIC being in the Public Sector, enormous amount of money viz, Rs 1989 crores which constituted the total assets of the LIC today, are insulated from any political pressurisation for personal ends and the citizens have been reaping the maximum benefit of this accumulation.

It is inconceivable that, if LIC was not in the Public Sector, an amount of nearly Rs 309 crores (inclusive of current year's investment) would have gone for rural electrification throughout the country, an amount of Rs 279 crores (inclusive of current year's allocation) would have been utilised for housing development in the country, an amount of nearly Rs 50 crores could have gone for Water Supply and Drainage Schemes for our towns and villages, Rs 92 crores for agricultural development through Land Mortgage Banks and proposed allocation of Rs 5 crores for building up storages for the Food Corporation of India, and nearly Rs 28 crores for small scale industries through industrial estates and assistance to the State Financial Corporation. This infrastructure so necessary for the development of the country would never have been thought of. Besides, it has a huge investment of Rs 707.21 crores by way of subscription to the Government loans in order to support the planned development of the country.

The total book value of the investments of the Corporation as at March 31, 1971 was Rs 1717.59 crores, thereby recording an improvement of Rs 138.98 crores over the figures of 1969-70. Of this, the total book value of the investments pertaining to Life and General business was Rs 1700.30 crores and Rs 17.29 crores respectively. Of the total investments of Life Department, 74.8 per cent was in the Public Sector, 9.9 per cent in the Co-operative Sector, 0.3 per cent in the Joint Sector and 15.00 per cent in the Private Sector. The investment reserve account amounted to Rs 31.23 crores. The Corporation agreed, during the year, to underwrite 92 new issues to the extent of an aggregate amount of 51.08 crores.

LIC and Private Sector

The LIC has also assisted the private corporate sector and in terms of total resources with the current year's allocation, its direct assistance and market purchases together would come to Rs 251.50 crores. Besides, but for the huge investment in infrastructure, the growth of the Private Sector itself would have been inhibited in this country. There have been criticisms that the LIC has not assisted the private sector sufficiently. There have been criticisms also that the LIC has been responsible for building up monopolies. As at March 31, 1969, out of 6109 Public Limited Companies in the country, only about 1529 had their shares and debentures quoted on the 8 recognised Stock Exchanges in India. We had shares in 853 companies out of them. Out of the paid-up capital of these companies of about Rs 700 crores, we held about 13 per cent of the Equity Capital. In 275 companies, LIC holds with its investment of Rs 73,12,67,960 between 10 per cent and over 30 per cent of the paid-up capital in equities and in 578 companies, its holdings are less than 10 per cent of the equity capital amounting to Rs 25 crores. In 530 companies, we had an investment of Rs 35.20 crores in Preference Capital and in 121 companies, Rs 48.09 crores in Debentures. Consideration for this investment was naturally the yield and growth of these investments, and it is not that private sector always fulfilled these expectations. On the other hand, as the result of this investment, LIC became substantial owners of capital and acquired a stake in many of the Monopolies which, in effect, has come to mean substantial ownership of the private corporate sector by the public sector.

Housing and Housing Loans

Out of the total investments of the Corporation, Rs 300.97 crores is for housing purposes to meet the acute shortage of housing in the country. LIC is trying to build townships in several places including Bombay, Hyderabad, Bangalore, Lucknow and Calcutta with the active help of the State Governments. For middle class housing, unless the State is prepared to subsidise land prices, the problem itself will be difficult to solve. The idea of group insurance cover in case of housing loans is to provide a facility for the balance of the loan being paid off instead of its being a burden on the family involving into litigation after the death of the borrower. My grateful thanks are due to the Government of Maharashtra for expediting the Apartment Act. I have now to request the Government of Maharashtra for its enforcement as considerable demand is there for flats in Bombay and other cities. The maximum loan against a flat has been restricted to Rs One lakh.

The Corporation advanced during 1970-71 a sum of Rs 17 crores to State Governments for financing various housing and land acquisition schemes. It also advanced amounts totalling to Rs 16.57 crores to Co-operative Housing Finance Societies and other authorities for financing housing Co-operatives in various States. The advances during 1969-70 under these heads were Rs 14.80 crores and Rs 15.70 crores. It will be of interest to mention that the Corporation's total contribution to housing development alone, in India, by way of loans to State Governments and Co-operative Finance Societies and loans under other Schemes amounted to over Rs 287 crores as on March 31, 1971. The Corporation's "Own Your Home" Scheme, which was earlier operative in 159 centres in the country, was extended to all places where the Corporation has either a Branch or a Sub-Office with effect from February 2, 1971. It is in operation now in 424 centres inclusive of a few centres where the Corporation does not have any office. During the year, 1202 loans amounting to Rs 371.62 lakhs were sanctioned to policy-holders for construction or purchase of houses. So far, 7233 loans amounting to Rs 2086.41 lakhs have been sanctioned by the Corporation under this scheme. Likewise, the Corporation's Mortgage Scheme for construction of houses operative in only 57 centres was extended to all the 424 centres where the "Own Your Home" Scheme is in force. During the year, 349 loans amounting to Rs 136.82 lakhs were sanctioned. So far, in all, 3394 loans amounting to Rs 2288.35 lakhs have been sanctioned under this scheme.

Loans for Water Supply and Drainage Schemes

So far 434 Municipalities all over the country received a loan assistance of Rs 36.92 crores. In 1970-71 itself 205 municipalities were advanced Rs 10.76 crores besides 4 Zilla Parishads got an assistance of Rs 44.37 lakhs for rural water supply. It is openly acknowledged that the people living in these places would not have enjoyed the benefits of these amenities left to the State Resources for the next one or more decades.

Expense Ratio

The overall expense ratio for the year for Life business was 27.19 per cent as against 27.69 per cent in the previous year, while the renewal expense ratio comes to 14.65 as against 16.15 per cent in the previous year.

Corporation's Business Abroad

The main object of the Corporation in running the offices overseas is not only to write business but to build goodwill for the country. In foreign territories, in addition to writing new business and covering more and more lives, the Corporation is providing technical know-how to a large number of insurers. The Corporation continued to transact new business in Fiji, Kenya, Malaysia, Mauritius, Nepal, Singapore and the United Kingdom. The Corporation has ceased to write new business in Hong Kong and Uganda. During the year, the Corporation issued 3945 policies assuring Rs 8.50 crores in the countries abroad, the corresponding number being 4661 policies for Rs 10.28 crores in 1969-70.

General Insurance

During the year, the Corporation secured a gross direct premium of Rs 23.09 crores as against Rs 18.04 crores in the previous year. Of this, Rs 5.69 crores was secured under Fire Insurance, Rs 9.49 crores under Marine and Rs 7.91 crores under Miscellaneous insurance. The total net premium collection during the year amounted to Rs 8.36 crores as against Rs 6.01 crores in 1969-70. The net claims during the year amounted to Rs 100.11 lakhs under Fire, Rs 119.91 lakhs under Marine and Rs 98.28 lakhs under Miscellaneous insurance. The total net claims amounted to Rs 318.30 lakhs in 1970-71 as against Rs 242.82 lakhs in 1969-70. A sum of Rs 94.26 lakhs has been added to the reserve. The profits transferred to the Profit and Loss Account were Rs 2.38 crores from Fire 1.02 crores from Marine and Rs 0.75 crores from Miscellaneous insurance, making a total of Rs 14.15 crores. After making adequate provisions for Reserve and Taxation, a balance of Rs 49.85 lakhs is payable to the Central Government. The Corporation gave up the Open Market Business during the year and transferred it to its subsidiary, the Oriental Fire and General Insurance Company. With the nationalisation of General insurance, it is felt that there would be a great spurt in the insurance industry. Fields uncovered as yet like health and other social insurance,

Cattle and Crop Insurance, I trust, would be some of the main goals of the nationalised General insurance.

From Classes to Masses

Unprecedented steps were introduced by the Corporation in the current year to popularise the message of insurance on an accelerated pace. The Centenary Policy, for instance, was finalised during the year and introduced with effect from May 1, 1971 for meeting the needs of the people whose income fluctuates. The main feature of this policy is that, if a default occurs in the payment of premium not more than once in any block of three years subsequent to the first two years, the policy should not lapse. This should take care of the needs of our rural population as that of agriculturists faced with the uncertain ties of our agriculture and also the different sections of the country even in the urban areas. In accordance with our promise to see that in our endeavour to reach the masses we would resort to the use of our national languages, we have made a start with the Centenary Policy. The Corporation also decided to liberalise the profit-sharing scheme under One Year Renewable Group Term Assurance Plan and, under the revised scheme, the group policyholders having a membership of at least 200 will be entitled to share in the profits to the extent of 60 per cent to 80 per cent of the total profits in respect of the Scheme. The concept of Deposit-linked Life Insurance is proposed to be extended on a mass scale. This is a new experiment made for the first time in the World. I am happy that more and more banks are agreeing to introduce this measure and I look forward to their continued support not only for insurance but real mobilisation of savings.

The number of Savings Bank Accounts in the banks now come to about 1.5 crores. 25 per cent of them should at least satisfy the condition of the minimum balance of Rs 500/-. If insurance is automatically extended to all such accounts satisfying this condition, insurance cover to 30 lacs of lives would be possible. For this additional benefit, not only these persons would be keeping their balances in the bank rather than with themselves, it would be an inducement for another 20 lacs of people to improve their balances.

Premium rates in respect of (i) Mortgage Redemption, (ii) Temporary Assurance, (iii) Two Year Temporary Assurance and (iv) Convertible Term Assurance Plans were substantially reduced with effect from March 1, 1971. These rates were reduced also for (i) One Year Renewable Group Term Assurance Plan and (ii) Level Group Term Assurance Plan with effect from June 1, 1971. Another major decision taken was that of doing away with the occupational extra premium for a number of occupations where the extra premium chargeable is Rs 4/- per thousand sum assured per annum or less and such extras have been removed as From December 1, 1970 in the case of Whole Life Limited Payment and Endowment Assurance Policies.

In the past it had been the practice of erstwhile insurance companies and also of the Corporation to charge extra premiums to the weaker sections of our society like those who are engaged in the conservancy work. Similarly, the humblest of the self-employed Rickshawallas were refused insurance under our rules. This unjust state of affairs of penalising workers performing essential services for the community could not be continued any longer. I am glad that, with effect from the beginning of the year, LIC has removed all occupational extras to the socially weaker sections of the community.

This covered 40 occupations such as Orderlies, other menial staff and Nurses in T B Mental and Leprosy Asylums, Scavengers, underground employees in Mica, Coal, Gold and Bead mines, compositors in the printing industry, all types of workers in the Railways from Brakesmen to Travelling Ticket Examiners, Cycle Rickshaw Drivers, Hospital and Municipal Sweepers, Bidi Kamgars, workers in silk and textile industry, Linesmen in Telephones and Telegraphs, Naval Divers and Divers in Marine Industry, Guards and Foresters in the Forest Industry, Fire fighters in Fire Brigades, Coastal and Deep Sea Fishermen, Bargemen in Marine, Workmen and Heavy Vehicle drivers in the Automobile industry, Employees in X-ray Radium Department and Assistants working with X-ray Specialists, to give a few examples.

Re-organisation of Corporation's Offices

The Administrative Reforms Commission appointed by the Government of India had recommended that the Zonal Offices should be abolished and the Divisional Offices should function virtually as Head Offices of the erstwhile insurers, barring policy making, investments and such other functions. The object is to make the Divisions all important and responsible for development and servicing of business in terms of (A) Business Cost, (B) Underwriting and (C) Lapses. The process of decentralisation would be further extended to Branches which, at the grassroot level, would undertake policyholders' servicing also. In taking up this, the needs of the community would be borne in mind more than its own. Organised as it is, the implementation of this policy would take some time and expertise would have to built up to undertake the responsibility envisaged. This is being done expeditiously.

Staff

Continuous efforts to identify the employees with the Corporation and to build a philosophy of management where both the employer and employees meet periodically and continuously was evolved to sort out the problems. The exercise is to transform the working philosophy into one based on Industrial Relations rather than on Industrial Disputes. I look forward to the employees playing a responsible part as Members of the Board and of the proposed Divisional Advisory Councils. We believe that the constructive relationship now established between the employer and the employees would help to further the cause of the Corporation. The active co-operation of both should help to serve the community much better as both the management and the employees have a higher obligation to the community at large — an obligation transcending to themselves. Behind the published Balance sheet of any institution showing assets and liabilities, everyone working for the institution could either be an asset or liability. It would be a worth-while exercise to convert every liability into an asset. With this end in view, it is obligatory on the Corporation also to afford opportunities to the employees to develop themselves for the growth of their capacities by providing them with facilities for training and development. Corporation accepts this responsibility.

Forging Ahead

Even though the achievements of the Corporation during the year have been quite remarkable, we are conscious of the vast scope, both for expansion and improvement, that lies ahead of us. With a widening area of activity becoming accessible for our message and service and with the help of a live-wire network of more than 730 offices of the Corporation located throughout the length and breadth of the country, manned with an agency organisation spread over even to the smallest township, the LIC has to now establish itself as a very competent marketing organisation for all parts of the country. The prosperous and affluent farmers in the villages now provide a potential market for our message. New branches of the nationalised banks emerging in all parts of the country are gradually inculcating the savings habit among the people. These savings habits will indirectly provide a fertile ground for us also to sell life insurance. The Branches of the Banks will, moreover, be a facility for the rural policy-holders for remitting their premia to us. These welcome developments in the country will enable us not only to write more business but also to cover a large number of people.

Conclusion

Before I conclude, I would like to record my appreciation and thanks for the co-operation and advice I have received from the Members of the Corporation and my colleagues on the various Committees. I am also indebted to the Experts who have unstintedly given their time and energies in associating themselves with the Committees and for giving valuable guidance. For the excellent results recorded by the Corporation in the year 1970-71, my thanks are due to every member of the staff of the Corporation at the Administrative level and our Development Officers and Agents of the Corporation without whose enthusiasm, hard work and whole-hearted co-operation these encouraging results would not have been achieved. The year's results have proved what is possible and thrown open vast vistas for greater growth and greater progress. I look forward to their unstinted support for the noble objectives we have before us of spreading the message of insurance to all sections of people, particularly the weaker sections of the community, who need this protection most.

The motto of the LIC is "Yogakshemam Vahamyaham" i e "Your Welfare is My Responsibility". The welfare of the nation should be the obligation of the Life Insurance Corporation through millions of people assuring with it. The Trusteeship concept should be extended not only to cover the safety of the funds but the confidence that it should create of being the trustee for all widows and orphans; the strength and size of the LIC should be used in extending friendly assistance to everybody associated with it. Its symbol of two hands covering a burning lamp representing security, both our Development and Administrative wings will have to take care of, and it shall be our joint endeavour to see that this lamp of security burns in every home. As long as there are homes without this lamp of security, it should be a sad reminder to us of the existence of poverty which, with all our combined efforts, we have to fight.

We in the LIC re-dedicate ourselves to these tasks.

Polychem Limited

Statement by the Chairman, Shri Ramdas Kilachand

THE following is the Statement of Shri Ramdas Kilachand, Chairman, Polychem Limited, for the Fifteenth Annual General Meeting held in Bombay on Wednesday, September 1, 1971:

To the Members,

The Directors' Report and the Statements of Accounts for the year ended 31st March, 1971 is sent herewith.

Production and Sales

Progressive increase in the production and sales of the Company was maintained for the third year in succession, the percentage growth over the last year being of the order of 20 per cent. This growth rate has enabled the Company to operate its plants at about 80 per cent of their capacities. However, certain problems continue to exist, chief amongst which are:

(a) Indequate and erratic supplies of two major raw materials, petrochemical ethylene and benzene;
(b) Late receipt of licences required for procuring imported chemicals and spares; and
(c) Frequent power failures and inadequate water supply.

Even though we have made all arrangements to receive and unload ethylene and benzene expeditiously, no significant improvement has been achieved in the supply of these raw materials. The supplies could have been better if usual norms of customer obligations and interests were kept in view despite problems, if any, at the suppliers' end.

Increase in sales of Polystyrene was followed by increased sales of alcohol, ethylbenzene and styrene. It was indeed unfortunate that though best terms as regards both price and credit were offered, one of the largest consumers of styrene failed to lift the offered quantities of styrene for reasons of their own.

Production costs during the current year show an upward trend owing to rising costs on various items of expenditure such as raw materials, salaries and wages, utilities, transport, etc. The sales turnover, however, during the first quarter April-June 1971 is about 15 per cent higher over the corresponding period last year and if the same trend continues, the overall working results during the current year are expected to be satisfactory.

Export

It is gratifying to report that our products have been very well received in the foreign markets and increasing inquiries are being received not only from the previously established markets but also the new ones. While the export business was picking up momentum, it is unfortunate that the duty drawback on Polystyrene allowed earlier has been withdrawn from February 1971. Based on duty drawback in force, efforts were made to increase our export business and contracts to that effect made. The sudden withdrawal of the above referred to incentive removed the vital basis on which such commitments were made and which had to be honoured to maintain the good image of our Company as well as the country. Representations have been made to the concerned authorities to make available the benefit of duty drawback on these transactions.

It has also been stressed that unless adequate incentives are given it will be difficult to maintain the export business which has been built up at great effort and cost.

One of the most vital factors which help and expand the exports is a sta-

ble export policy. Frequent and sudden changes in export policies act therefore as a great retarding factor. *Export policies should be designed to continue unchanged for at least five years and sufficient advance notice of intended changes is most essential giving enough time to exporters to do the spade work to maintain continuity of exports.*

Besides offering adequate cash subsidy there is another way of promoting exports of Polystyrene or other products for which benzene is the basic raw material. Under present conditions, the indigenous demand of benzene is much lower than the production capacity established in the country. As a result, efforts are being made to export benzene at prices far below those charged to the indigenous consumers. If such benzene instead of being exported is made available to the indigenous producers of polystyrene and other products at international price, there is considerable scope in increasing the exports of benzene-based products and earning foreign exchange several times that possible to earn by exporting benzene. In case of exports of polystyrene, the foreign exchange earned will be four times. Despite this and the fact that the Ministry of Foreign Trade and Export Promotion Council have approved and recommended this approach, it is unfortunate that producers of benzene in the public sector have not implemented this recommendation. It is strongly urged that steps are soon taken to do the needful in this behalf.

It is indeed a pity that such a situation exists when it is the pronounced policy of the Government to increase exports of non-traditional commodities to earn more foreign exchange so badly needed for our increased development efforts.

Priority Industries

You are aware that the last Finance Act omitted the Petrochemical Industry from the list of priority industries. 8 per cent rebate allowed on taxable profits of the Styrene Industry, being one of them, will cease with effect from the current financial year. Also the development rebate presently allowed is sought to be withdrawn for all plants built after May 1974. The development of Petrochemical Industry which is highly capital intensive is in the initial stage in our country and both these fiscal incentives need to be continued for at least sometime to come for the rapid establishment as envisaged and planned.

While on one hand, the Government proclaims that the tempo of industrial development should be speeded up not only for achieving greater growth rate but also for making up the shortfalls which occurred during the initial years of the Fourth Plan, the fiscal policies on the other hand are so changed that I am afraid it may considerably slow down the pace of industrial investment and development.

The vital and imperative need presently is to achieve increased production in almost all fields and sectors of industry as quickly and as efficiently as possible. For this to happen, all unnecessary procedural and other bottlenecks need to be removed in respect of granting industrial licences, approving import requirements and several other approvals required to be taken at both central and state government levels. There is so much to be done on all fronts that whoever is able to contribute his mite, irrespective of a large or a larger house, dominant firm or otherwise should be freely allowed to do so. This is the only way the entrepreneurship base can be broadened which indeed is a very laudable objective. It is incomprehensible that with the extensive powers that Government already possess in its legislative armour, what was the need of passing new acts such as The Monopolies and Restrictive Trade Practices Act, 1969 which by experience has been found to slow down further the entire administrative machinery responsible for giving the numerous approvals? It is time that this is reviewed in the larger interest of development of industries.

Research and Development

I am happy to report that the construction of the Pilot Plant for the production of Divinylbenzene and Potable Liquor Manufactory for which the entire process and engineering knowhow were developed by the Staff of the Company is nearing completion. Both the Plants are expected to be commissioned during the current year.

R & D efforts in other fields are also in progress, including those involving fabricating sophisticated processing machineries. One such example is the building of a continuous vacuum forming machine. Though it is fully automatic and is comparable in its performance to a similar imported machine, it has been built based on the designs developed by our staff and requiring no imported components. Disposable articles in Polystyrene such as ice-cream cups, coffee cups, trays, tote box inserts, etc, which can be made on this machine have a big potential in the country.

The Company has also successfully implemented another research project in which Defence Department is keenly interested and is happy about our contribution.

R & D activity is an expensive one and there will be incentive to continue and diversify it only if the fruits of such efforts are permitted to be utilised by its sponsors without any inhibition ideological or otherwise. Also it is important that small amount of foreign exchange that is needed for importing speciality instrument and chemicals is freely made available. If the necessary changes in present policies are made to take care of the above two points, it will go a long way to put to use the excellent talent which is available in the country to develop the indigenous technology, at a rapid pace.

New Projects

I regret to report that there is very little progress on our Industrial Licence application which sought to establish a large merchant Styrene Plant and other plants for Styrene-based polymers at Koyali. Our project is one of the downstream units in the Koyali petrochemical complex and its progress is tied up with several of the other projects including the Naphtha Cracker. We are well geared to go full steam to establish this project and bring it on commission in record time and concurrent with the start-up of the Naphtha Cracker if an expeditious clearance is given to our Scheme.

The Letter of Intent which was granted for the establishment of ABS Resins Plant in Bombay has been cancelled by the central government after a delay of about three years since the proposals were submitted. The Company, however, has made a fresh application for inclusion of the ABS Resins Plant in our Koyali Project as it integrates ideally with the latter. The Government has viewed this proposed integration as technically sound and it is hoped that the whole scheme including ABS Resins Plant will be aproved soon.

Diversification and Scale Economics are the important factors to impart vitality to the industries established which in turn will not only help reduce costs, encourage self-sustaining growth and improve export capabilities but also spur the establishment and expansion of ancillary industries in the Small-Scale Sector which cater to the needs of the large industries. The objective of rapid industrial growth in the Small-Scale Sector and broadening the base of entrepreneurship, can thus be achieved not by denying but by encouraging the expansion and diversification of the companies which can do so by using their resources and expertise. Future of our industry as well as many other industries is therefore largely dependent upon to what extent we are allowed to play our role and whether to the best of our capabilities.

Finally, I would like to conclude this Statement by expressing our thanks to the staff members of both the Company as well as the Selling Agents who have worked sincerely and efficiently leading to the betterment of the Company. Thanks are also due to our esteemed customers for their increased interest in our products.

Note: This does not purport to be the proceedings of the Annual General Meeting.

Premier Tyres Limited

Speech of the Chairman, Mr Chandrakant S Desai

THE following is the Speech of the Chairman, Mr Chandrakant S Desai, at the Eleventh Annual General Meeting of Premier Tyres Limited, held in Bombay on Tuesday, August 31, 1971:

Gentlemen:

I have great pleasure in welcoming you all to the Eleventh Annual General Meeting of the Company.

Our Statement of Accounts for the year ended 31st March, 1971, and the Directors' Report thereon as also the Notice of this Meeting have been in your hands some time now and with your permission, I take them as read.

Before I proceed to review the Company's operations, I wish to take the opportunity of expressing on behalf of the Company, its Shareholders and myself, our hearty congratulations to the Prime Minister, Smt Indira Gandhi, on the victory in the recent General Election to the Lok Sabha. We wish her and her colleagues in the Government success in meeting the challenge of the times and in achieving the much desired economic progress of the Nation.

Economic Survey

It is not in the sphere of our political life, only that the past year has been extraordinarily eventful. The Fourth Five-Year Plan has been launched after a number of careful revisions and the Planning Commission itself has been reorganised. The Revised Industrial Licensing Policy, announced earlier last year, has now been formulated and its working has shown that it can be made elastic as well as more expeditious in its operation. Indeed the Government is still at pains to make it more effective by taking steps to avoid procedural delays.

Picture of our economy as a whole has been undergoing a significant change. The national income totalled Rs 17,995 crores and the per capita income Rs 339.4 in 1970 as compared with Rs 17,057 crores and Rs 329.9 in the previous year. What is of significance in these figures is that the structure of the net domestic product has been changing during recent years. The relative contributions of the Secondary and Tertiary Sectors have been increasing while that of the primary sector has been going down. In terms of figures, this transformation means that whereas in 1961-62 the primary sector (comprising agriculture, forestry, fishing and mining) accounted for 52 per cent of our net domestic product, in 1969-70 it contributed 45 per cent. As against this fall, the share of the other two sectors—manufacturing, construction, etc, rose from 19 per cent to 22 per cent and that of trade, commerce and services rose from 29 per cent to 33 per cent. My object in dwelling on this aspect of our progress is to emphasise that the share of industrial output in our National product has during the past ten years undergone a very sizeable as well as a significant increase. I can stress the importance of this increase in yet another way by referring to the marked increase of 8.3 per cent on our exports in 1970-71 as compared with the previous year. It will be conceded that the Fourth Plan target of 7 per cent annual increase in our exports has thus been notably exceeded. In fact encouraged by this excellent performance on the export front, our Ministry of Foreign Trade has now put up its target for the current year to 10 per cent. I need hardly add that this good performance on our export front changed the mood in the country from one of despair to that of confidence. It was on such a mood that our Budget this year in last May had the distinction of being the biggest ever. It envisages a massive tax effort of Rs 220 crores in the remaining part of this year and Rs 294 crores in a full year, while laying emphasis also on savings, both in the individual and corporate sectors. I believe the withdrawal of Development Rebate for new enterprises and expansions of existing units in Capital Equipment installed and operative after end May 1974, will hardly go to achieve this object. On the one hand, as I have shown, there has been a healthier outlook of our economy, a steadier performance of our industrial sector, on the other hand a sudden withdrawal of a proved incentive that I have mentioned above is hardly calculated to add to the favourable climate for new enterprises.

But scarcely had the Budget debate come to an end when we came to face a stupendous problem whose magnitude is growing almost daily and whose complexities spread for beyond the precincts of our subcontinent. I know we are all seized of this problem—I mean the problem of Bangla Desh and of the Refugees. While we are all getting increasingly conscious of its almost incalculably great impact on our economy, I wish to seize this opportunity to make an appeal to my countrymen that we get back to the mood of 1962 and 1965 when this country rose as one man to accelerate its industrial output. Let us remember that we can sink our differences in times of crises and show both to our denigrators and to the world that when we will, we can tap our latent energies and raise our production potential.

I would in particular appeal to our friends in the labour sector in this regard by referring to one more aspect of our problem. With a total of 7 million workers in our large-scale industries we lose nearly 19 million man-days annually—while a much smaller country, West Germany, with a labour force of 11 million loses only a quarter of a million man-days through stoppages of work. All that I would say is that under the conditions I have described above, no country can afford to have such frequent stoppages of

work and we can ill-afford under-utilization of our production capacities.

ACCOUNTS

The year under review has brought about best results so far in terms of Production, Sales and consumer-preference. As compared with the sales of Rs 7,23,31,551 in 1969-70, our sales for the year under review amounted to Rs 15,41,52,087 showing a rise of over 100 per cent. Profit, after providing for depreciation, amounted to Rs 1,08,38,723 as against Rs 17,12,754 in the preceding year. After adding thereto the excess provision of development rebate of Rs 19,83,124 there is a balance of Rs 1,28,21,847. Deducting therefrom the amount transferred to Development Rebate Reserve Rs 7,54,111 Provision for taxation Rs 63,80,000 and writing off the miscellaneous expenses Rs 5,52,928 the resultant profits amount to Rs 51,34,808 which has been transferred to the General Reserve.

LABOUR

We are happy to note that labour-management relations during the year and so far have continued to be cordial. For the first time in our history during 1970-71 there was one majority Union and many of the problems which were created by inter-union rivalries did not exist. As such the understanding and harmonious relationship established between the two has resulted in substantial increase in production and sales and take-home wages and we fervently hope in the interest of all concerned that this happy relationship shall continue uninterrupted as it would lead us to the path of greater progress and prosperity for all.

FINANCE AND DEVELOPMENT

During the year under review the Company repaid loans aggregating to Rs 10,75,223 according to the Schedules of maturity.

We have obtained a second sub-loan of Rs 17,95,238 out of (AID) Loan from the Industrial Finance Corporation of India to meet the cost of imported equipment for the implementation of our Licence for 60,000 Automobile tyres and tubes each per year. There has been a further addition of Rs 55,31,965 in respect of our capital expenditure. In my last year's speech, I had referred to the Letter of Intent which we had obtained from the Government of India to expand the capacity of our Automobile tyres and tubes to 6 lacs tyres and tubes each per year. Necessary steps have been taken to put through this proposed expansion. The Industrial Licence issued to us for manufacture of 2 million bicycle tyres and tubes each per year for which the Industrial Credit and Investment Corpn of India Ltd have sanctioned to the Company a loan of Rs 49 lacs, is also being implemented. Our application for the import of machinery for bicycle tyres and tubes is pending for clearance from the Chief Controller of Imports and Exports in New Delhi. Our production of Scooter tyres and tubes is proceeding very satisfactorily. Our tyres have continued to enjoy a high consumer-preference particularly the 'Lugmaster' Nylon and 'Super Mileage' Rayon Tyres which we have introduced lately. Our Scooter tyres as well as ADV tyres have been very satisfactorily received in the market.

EXPORTS

During the year under review we have achieved a much better performance in our exports as compared to the preceding year. Our products have been exported to Syria, Kuwait, Cyprus, Mauritius, UAR, Iraq, Jordan, Poland and East Germany. The total FOB value of our exports was approximately Rs 20 lacs, which in terms of internal price works out to about Rs 46 lacs without excise duty. Our efforts are continuing to explore avenues for export of our products to various countries abroad.

GENERAL

In January 1971, the Automobile Tyre Industry voluntarily reduced the price by Rs 7 on larger sizes tyres for supplies to replacement market. The automobile tyre market in general has continued to be quite satisfactory. The demand for all our products was highly encouraging. Due to strike in one of the Units and restrictive production on account of power cuts and labour trouble elsewhere there has been a marginal shortage of automobile tyres in the country.

ACKNOWLEDGEMENT

Before I conclude, I feel much grieved to report the sad passing away of Mr A L Freedlander, Founder, Dayco Corporation, our erstwhile Technical Collaborators. This sad event was followed by the demise of Mr R B Jacob, Chairman, Dayco Corporation, two days after passing away of Mr A L Freedlander. We extend our heartfelt condolences to Dayco Corporation for the very grievous loss suffered by them.

I extend my sincere thanks to all my patrons, dealers and customers, to the Financial Institutions and our Bankers with whose co-operation and encouragement we have been able to achieve our target and maintain the march of progress.

Our thanks are also due to the Government of India and particularly to the state government of Kerala for all the assistance and encouragement accorded to us from time to time. I should also thank all my colleagues on the Board and our Technical Collaborators, UNIROYAL, for the continuous co-operation and guidance extended to us.

On behalf of my colleagues on the Board and myself, I take pleasure in offering our thanks to our Officers, both technical and administrative, our workers at the Factory and the members of the Establishment and Sales Staff all over the country. Before I resume my seat I take it my duty to thank all our Shareholders whose confidence and goodwill we have continued to enjoy and specially those of you who have taken the trouble to attend this Meeting.

JAI HIND

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Jay Engineering

JAY Engineering's better results for the year to March last, in spite of a long production stoppage at Calcutta factories, goes to vindicate the company's policy of geographical diversification. The rapid increase in production at the Hyderabad and Agra units was possible because of the good relations with workers there. The Chairman, Charat Ram, feels that these units are bound to become increasingly significant in the company's future operations. He points out that the company, along with the industry as a whole, faces the problem of finding adequate working capital as a consequence of government policy. Moreover, he points out that costs of production are increasing constantly because of spiralling governmental levies, increase in freight rates, and other secondary factors. By the chairman's estimate, this year's budgetary levies are likely to increase the company's costs by over Rs 40 lakhs a year. He suggests formation of 'consumer associations' for resisting increases in taxes by Government and irrational price increases by manufacturers.

The Choice

IT is indeed curious, to say the least, that at last Thursday's meeting of the Political Affairs Committee of the Cabinet, called to discuss the precarious economic situation brought about by the steadily worsening stagnation of industrial production, one of the major proposals reportedly advanced by the Finance Minister was that public sector Plan outlay be cut by 5 per cent. The exact size of the cut is immaterial; what is significant is that an influential section of opinion in the Government should be thinking of curing the recession in industry by cutting back public investment—and that after a succession of years when public investment has unfailingly lagged behind Plan targets.

Naturally, the issue is not posed so simply or directly. The Finance Minister and others in the Government who take this position do so ostensibly on the basis of a two-part assessment of the current economic situation. First, it is suggested that the private sector, especially the larger entrepreneurs, have simply lost interest in industrial investment. At the meeting of the Congress Working Committee on September 9, the Finance Minister was reported as having said that "lack of initiative and co-operation" on the part of industrialists was responsible for the stagnation in industry. Following from this, it is suggested that a variety of policy concessions are needed to revive the initiative and win the co-operation of industrialists, including relaxation of industrial licensing restrictions, soft-pedalling of the Monopolies and Restrictive Trade Practices Act and holding in abeyance of the newly-issued directives about conversion of loans into equity, apart from the more perennial lollipops like liberal bank credit and generous imports. The other relevant aspect of the official assessment of the economic situation is that because of the expenditure on the refugees from Bangla Desh, the Government would not have the resources to carry through the public sector investment programme envisaged in the 1971-72 Plan. The Finance Minister has repeatedly asserted that there is no scope at all for additional taxation. Hence, the cut in the public sector Plan.

To take the first of the two points, what is striking is how different the Government's current assessment of the outlook for private sector investment is from what it was just a few months ago. The Economic Survey for 1970-71, released towards the end of May, had found definite evidence of "an upward trend in activity" in the small-scale sector and also a "number of pointers" indicating that "in the large-scale sector too entrepreneurial interest has been steadily on the increase". In support, the Survey had referred to the uptrend in capital issues, in the lending activities of the term-financing institutions, in the number of applications for industrial licenses and of licenses and letters of intent issued, in the value of approvals by the Capital Goods Committee and in imports of raw materials and components. The evidence was indeed overwhelming and the Economic Survey's verdict in the matter deserves to be quoted: "While developments in the private sector must be considered to have been on the whole encouraging, the fact remains that ... much greater support is required from public sector investment ...". The Survey, therefore, asked for "an improvement in the magnitude of public investment" to "provide an impulse and quicken the pace of activity" in industry. And yet we now have the Finance Minister making a case for a cut in public investment.

The argument about lack of resources compelling a cut in public sector investment similarly deserves closer scrutiny. True, the Government's resource position is difficult. As the note on credit policy that follows points out, net bank credit to Government is currently around Rs 580 crores against only Rs 80 crores last year. At the meeting of the Political Affairs Committee of the Cabinet, the Finance Minister reportedly warned that the Budgetary deficit in the current year would be Rs 600 crores against the Rs 220 crores provided for in his Budget. It is also a fact that prices have been rising. But none of this constitutes a case for shifting the burden of investment from the public to the private sector. One need not labour the argument that additional investment, whether in the one sector or the other, would draw upon the same supply of real resources. Even in financial terms, there are no substantial sources available to private industrialists but inaccessible to the public sector. The bulk of the finance for private investment in industry comes out of the term-financing institutions and the banks. The argument that even as stringency of resources forces a cut in public investment, private investment needs to be spurred by incentives and policy relaxations thus fails to convince.

However, the official views expressed at the meeting of the Political Affairs Committee of the Cabinet may have an explanation altogether different from the one actually advanced. There has been, in fact, no startling change for the worse in the outlook for private investment since the Economic Survey's optimistic assessment. On the other hand, it is, to use the Finance Minister's phrase,

"lack of initiative" on the part of the public sector which has brought the economy to the present sorry pass. The poor performance of the majority of the public sector industrial units and the deficiencies in their organisation and management are well known. But the failure in regard to the public sector goes beyond that. For the last several years, including after the launching of the Fourth Plan, there has been little of systematic mapping out of areas of industry for public sector investment and even less of detailed preparation of projects to be taken up in the public sector. The results have been evident in the regular shortfall in public sector investment year after year. This year, too, the stringency of resources on account of the Bangla Desh refugees provides only an excuse for an inevitable shortfall in public sector investment which would have been, as in past years, the result of this basic planning failure. In other words, after twenty years of planning and trying to push the public sector on to the "commanding heights" of the economy, is the stark choice the country faces one between accepting a near-zero rate of industrial growth and making special efforts to induce the private sector, especially the such-maligned large houses, to invest and produce more?

Credit Policy

Chavan's Shadow

Ottuketkal writes:

MINT ROAD has capitulated to the suasions of Finance Minister Chavan who evidently believes that credit policy should be liberalised to boost production and contain inflation. This is clear from two circulars issued by the Reserve Bank to commercial banks this week. Both circulars have one thing in common: they say one thing and mean another.

The first circular, relating to credit policy for the immediate future, apparently reflects the Reserve Bank's concern over excess liquidity with the banks in a situation in which the general price level has been boosted by net bank credit to Government (deficit financing) of the order of Rs 580 crores so far this year against Rs 80 crores in the corresponding period a year ago. The facts are: between the end of April and September 3 this year, bank deposits increased by Rs 469 crores against Rs 307 crores in the corresponding period a year ago, bank credit rose by Rs 100 crores against Rs 146 crores and banks' investments in government and approved securities went up by Rs 154 crores against Rs 153 crores. Despite additional deposits, investments have not expanded and the banking system remains a debtor to the Reserve Bank to the extent of Rs 80 crores against Rs 195 crores.

The Reserve Bank has called upon banks to repay their borrowing from it and expand investment in government securities. In asking for the first, the Reserve Bank has told the banks that advances to export, small industry and agriculture should not be adversely affected — that is, the very advances against which banks are entitled to preferential refinance from the Reserve Bank. In addition, they have been told to take care of "urgent" working capital needs of industry (undefined) and liberalise advances to the tea and jute industries. In other words, banks are not expected to take the notice to repay their borrowing from the Reserve Bank seriously.

However, banks are expected to pay attention to the Reserve Bank's circular relating to the need for larger investments on the ground that banks must "conserve resources" for the coming busy season, commencing October. How much should they conserve in order to lend how much in the busy season are questions that have been left unanswered in the Press Note on the Reserve Bank circular. After all, central banking is a delicate operation which cannot be conducted in public or even according to a prescribed manual!

The plain fact is that the second tranche of the Centre's market borrowing programme for the current year is now due. The Budget estimated a gross borrowing of Rs 500 crores. Of this, Rs 400 crores have been already tapped with heavy Reserve Bank subscription. The second tranche, judging from Chavan's plea about the limits to the use of taxes to raise resources, might be larger than the residual amount of Rs 100 crores. Whatever the size of the next floatation, banks are expected to invest more.

On the face of it, there is nothing wrong with the Reserve Bank asking the banking system to invest more in government securities. In fact, the Reserve Bank had decided to raise the liquidity ratio, including its sizeable investment component, during the Fourth Plan period, but this is to be done in gradual stages lest it strain the bank credit. If the Bank is now asking banks to put in more of its funds in dated securities, the reason for it is that they have not kept (the State Bank excepted) a sizeable cushion above the statutory minimum.

However, as already noted, a part of the additional deposits now sought to be conserved through investments has resulted from heavy deficit financing. Further, against the investments the banks make, they are eligible to borrow from the Reserve Bank. In other words, the Reserve Bank is seeking to ensure central bank credit to the Government via the 'investment' account of the commercial banks. It may be argued that the excess liquidity of the commercial banking system is being passed on to the Government. The rub lies in the fact that the Government is immersed in liquidity.

The second circular relates to the liberalisation of credit to the jute mill industry. Credit has been liberalised for two reasons. First, there has been a bumper jute crop and the farmers' realisation is likely to drop if prices decline sharply. Second, following the disruption of exports from East Bengal, the jute mill industry is in a position to take advantage of unsatisfied international demand. Farm price support is a good enough reason for liberalising credit to jute mills. Accordingly, the Reserve Bank has told the banks to advance funds to mills to enable them to stock raw jute for four months instead of three months as hitherto.

With credit liberalisation, the Reserve Bank has also suspended for the current jute year its prior authorisation scheme. This has been done to ensure the quick flow of advances to mills. Banks are required to report sanctions of new limits to the Reserve Bank and take "necessary" (but undefined) precautions. The Reserve Bank also "expects" the mills (not the banks) to finance raw jute purchases by "adopting the system of usance bills on the letter of credit basis".

Apparently, the jute farmer faces a crisis and credit needs to be rushed to the mills. Against this background, it is hardly relevant that jute mill owners have a reputation for diverting working capital tapped from banks for acquisition of fixed assets. (This is done by pledging raw jute obtained by them on credit with the banks.) Now the mills are expected to desist from this practice of double financing — the mills and trading companies supplying raw jute are generally under common ownership — by resorting to bill finance! This despite the fact that the State Bank's offer to convert the diverted portion of working capital into term loans has not been found acceptable to the jute industry. Questions such as why the Reserve Bank did not tie up fresh limits to its bill market scheme, since it has decided to suspend for almost a year the credit authorisation scheme could be raised only if it were assumed that the Reserve Bank can stand up to political pressures. How realistic is such an assumption today?

Khrushchev

Sauce and Sausage

"IF lack of intelligence is shown on the part of leaders of such states as the USA and the Soviet Union, then it would not only be a calamity for the people of our countries, but for the people of the whole world. A great deal depends on the mutual understanding betwten our two states." We have seen so much of the Soviet-American *detente* that the quotation would appear to be really from a bygone age. Yet it is well to remember that it was barely a decade ago that Khrushchev said this to visiting American journalists. Khrushchev's major contribution was the Soviet-American *detente* and it is a measure of his achievement that it still is the mainstay of the international system.

In spite of the rather modest funeral that the ebullient Russian has been given, his successors cannot deny that they have benefited from the new trend that Khrushchev introduced in Soviet foreign policy. What was this new trend? Its standard description is the policy of peaceful co-existence. However, this may not be an accurate description, as Stalin himself had introduced the element of peaceful co-existence in Soviet foreign policy. In his last work, "The Economic Problems of Socialism in the USSR", Stalin conceived of contradictions and conflicts within the capitalist bloc which would lead to the worldwide triumph of communism. It followed that co-existence with the capitalist states would not be a hindrance but might in fact accelerate the process. In other words, Stalin himself was preparing for the change in tactics.

How then does Khrushchev's concept differ from Stalin's? Peaceful co-existence meant something different for the West from what it meant to Stalin. Khrushchev was aware of this difference. After meeting President Kennedy in Vienna in 1961 he described the Western idea of peaceful co-existence thus: "This would mean that if a people in some country wished to alter the socio-political system, this should not be allowed to happen". It is his relative tolerance of this Western interpretation of and attitude towards peaceful co-existence that distinguished Khrushchev's approach from Stalin's on the one hand and from that of the Chinese on the other. It was to meet this new situation in international affairs that in domestic affairs Khrushchev talked of "the state of the whole people" where class-contradictions had disappeared. This contribution to the Soviet lexicon was meant to rationalise the *status quo* orientation of peaceful co-existence. One has only to look at these two concepts together to understand what far-reaching changes Khrushchev succeeded in bringing about within the Soviet Union.

Now the man is dead. The ideologue of the post-Stalin Soviet Union is dead. His impact on the Soviet Union and the world at large has been stupendous. However, he will also be remembered for his ebullient sense of humour which has been missing in Soviet leaders after him. Who will forget his famous quip "What sort of communist society is it that has no sausage?". When Harriman remarked that he thought Khrushchev's word was law in the Soviet Union, Khrushchev come out with a terse reply: "It is, but there is always a way of getting round the law". There can be endless debates on Khrushchev's role and contribution, but almost everybody had missed this dynamic, impatient and ready-witted statesman since his fall in 1964. The spirit was missing for over eight years. Now even the man is no more.

World Bank

Areas of Non-Action

THE World Bank's latest Annual Report is an impressive document. At a time when international aid has been losing momentum everywhere, the Bank Group has not only maintained but has actually more than doubled the volume of its lending — from an annual level of around $1 billion four years ago to the present level of over $2.5 billion. Equally significant, the report reveals the 'managerial dynamism' — the increased capability of the Bank to take on new challenges and to enter fields once considered the preserve of over-zealous, and often under-developed, economists and sociologists, e g, education planning, population control and research.

The Bank has also shown ability to learn from experience and to change its policies to match the acquired learning. In the field of education, for example, the Bank, contrary to its past policies, did not hesitate to accept the suggestion of the Pearson Commission to make funds available for research and experimentation "with new techniques, including television and programmed learning". For all this, a great deal of the credit goes to the Bank's President, Robert S McNamara.

Unfortunately, the Report also contains instances of non-action or retrograde action on certain matters of intetest to developing countries, for which one must feel more than a little sorry. Take, for example, the question of non-project (or 'programme') lending. A number of developing countries have been pressing, with hardly any success, for a relaxation of the Bank's 'projects only' rule. Last year, in response to the Pearson Commission's favourable recommendation on the subject, the Bank undertook a review of the question only to arrive at the conclusion that "the Bank and IDA had a well-established role and were particularly well qualified for financing projects . . ." (p 29). This conclusion, one suspects, showed more deference to the preferences of the powerful industrialised countries than to development economics.

Measures to stabilise the prices of primary commodities have been intensively discussed over the last 20 years — with little result. Three years ago, the Board of Governors of the Bank finally recognised it as the important problem that it was, and requested the Bank to work out schemes for stabilising commodity prices, including buffer stock financing. The proposals for action that have emerged from years of study and deliberation are, however, unlikely to set the Potomac on fire. The Bank would support agricultural research, intensify its work in market analysis and price forecasting, intensify co-operation with the Coffee Diversification Fund, and pay increased attention to problems of diversification in its economic reports. As for financing, "no immediate need was found for buffer stock financing beyond that available through the International Monetary Fund" (p 34).

Another idea that has been given a quiet and elegant burial is that of making available supplementary fin-

ance to less developed countries experiencing unexpected export shortfalls. The UNCTAD has been pressing for some such arrangement and by a unanimous resolution had (in 1964) requested the Bank to take some action in the matter. Many of the industrialised countries do not much favour the idea (although they voted for the UNCTAD resolution) and, after much discussion and repeated requests from the UNCTAD, the Bank has finally agreed that "the problem would be kept under review"!

The World Bank's Annual Report also contains a summary of a major study on debt. Concerned about the mounting debt burden of the developing countries, McNamara had last year committed the Bank's staff to a "thorough study of all aspects of the growing indebtedness of developing countries". The study, if it can be judged on the basis of the brief summary contained in the Bank's Annual Report, provides a wealth of information on debt outstanding, debt service payments, grant elements, etc, and is, therefore to be heartily welcomed. However, those who are looking for fresh insights into the problem must feel sorely disappointed.

It is obvious that the debt service obligation of a country is determined by the amount of debt outstanding and the terms of borrowing. The ability to service debt, on the other hand, depends on the capacity of the economy to generate export surpluses above import requirements. The capacity to generate export surpluses in turn is dependent on (a) the rate of growth of exports and (b) the rate of investment. Growth of exports depends on demand as well as supply factors. Rate of investment depends on the rate of saving and how ambitious a country is in its development effort.

It follows that a country, which is doing everything right, can still have a debt problem if (a) it attempts to grow at a faster rate than its debt servicing capacity (at any given set of terms) would permit, or (b) if it is unable to correctly forecast its future borrowing requirements and the period over which it needs to borrow turns out to be longer than anticipated, and because they have tried to borrow and invest more than they should have done purely on the strength of their debt-servicing capacity. Debt problems have little to do with 'inward' and 'outward-looking' policies; any country can avoid a debt problem if it borrows only what it is able to service and faces the consequences of this decision in terms of the pace and direction of development.

Not so for the World Bank. "To a major extent, the origins of debt servicing difficulties should be sought in the borrowing country's management of its economy as a whole" (p 54). As illustrative of good management, the report cites the case of Colombia which, in recent years, "has allowed its exchange rate to depreciate in line with increases in domestic prices, has provided generous export incentives, has pursued an active policy of increasing tax revenues and directing public sector expenditures toward productive purposes and has pursued an effective monetary policy" (p 55).

In a sense the Bank is right. Whatever its policies, a country has no business letting itself into a debt crisis. If it does, *ex hypothesi* it must be regarded as a case of bad management. But does it necessarily follow that a continuously depreciating exchange rate, along Colombian lines, is the only answer to the debt problem? Would it not have been more appropriate and honest to suggest that a country should follow the implications of its chosen development strategy and objectives and borrow only what it can service in line with those objectives?

Cricket

Craze for Crassness?

A Correspondent writes:

BOMBAY has accorded a "heroes'" welcome to India's cricketers on their homecoming from the triumphant tour abroad. Quite in the fitness of things. Concern for cricket comes naturally to Bombay. After all, isn't Bombay the cradle of Indian cricket? And haven't the boys conquered the West Indies for India and, now, England? Besides, not since the visit of the Pope (and before that the Queen) has Bombay had occasion to pour itself out. India, therefore, can safely leave the task of honouring its heroes to this city.

Of course, it is not Bombay alone that goes crazy over cricket in this country. However far removed they may be from one another in miles, mood or manners, the major cities in India all have at least one virtue in common—an ardent admiration for cricket. Come winter, and every home worth its hearth throughout the land will hum with cricket noise. Here, nothing electrifies and engages the elite more than the 'latest' cricket score. Indians' love for cricket cuts across 'provincial' as well as 'party' lines. Was it not a left-dominated United Front government that, alone among the States of the Indian Union, ordered a (half) holiday in West Bengal to celebrate a 'Test' victory? Managements fond of propagating the cause of productivity do not fail to take full five days off to have their eyeful of cuts and drives at the 'Tests' and of course, the fashion parades that go with them. (Does anyone, by the way, keep an account of the man-days we lose in seeing and hearing cricket in a year?).

Squeamishness over "people's" fondness for an innocent fare such as that the glorious game of cricket provides is, surely, out of place, if not suspect. But there lies the rub. Who are the 'people' who can get initiated into the intricacies of 'deeps' and 'fines'? That apart, suspicions about the maturity of a nation does arise if its entire press goes hysterical when the country's team — be it cricket or football — scores a win abroad and hails it as almost the most momentous event of the century. One of the leading dailies even went so far as to remind its readers that England had won the battle of Waterloo on the playgrounds of Eton and Harrow! Tears of joy over the victory of Mohun Bagan over a team manned by nationals of the ruling country were understandable for a subjugated country that India then was. Turning a sports event into an occasion for vulgarly puffing national pride betrays a deep-seated inferiority complex which can earn only ridicule abroad.

What causes pain, though not surprise, is not the national foible — every nation has and is entitled to its own — but the contrast in the quality of the response of the people, and the press in particular, to events. How much more avidly did the 'people' desire to have a ball-by-ball account of the historic match than about how many infants are squeaking in the rain in their mother's lap in the country's eastern borders? How much better informed are our lads — those who 'play cricket', that is — about the statistics of bowling and batting than about how many have died and are dying of cold and hunger on both sides of Bangla Desh or, for that matter, in their own towns? Games surely must have a place — a valued place — in man's life. But it should be a matter for some concern when the fondness for a game degenerates into a fad and blunts the sensibilities that it is supposed to sharpen. If only we, the educated Indians, reacted half as earnestly to the suffering of the homeless as we did to the cause of cricket!

Of course, Bangla Desh is fast becoming a bore. A sleek pictorial weekly of all-India popularity displayed the other day in one of its pages a blood-splattered bed where two young boys were shot in their sleep by Yahya's soldiers. The diametrically opposite corner of the same page showed two girls in a 'see-through dress' selling programmes for a 'sexational' entertainment in London. Even for a remarkably split personality such a quick switch of themes must be a difficult feat, unless of course, sights of blood and death leave one totally unmoved. Perhaps, our crassness towards human suffering and craze for cricket are all of a piece.

BUSINESS

Social Factors in Location Policy

AT a time when every state is competing to attract industry, it is unusual for a local development authority to raise objection to the proposed location of a huge industrial project and suggest that it be located elsewhere. This is exactly what is happening to Dharamsi Morarji's proposal to set up a large complex fertiliser project. The first choice of location for the project is Nhava Sheva across the Bombay harbour, but the City and Industrial Development Corporation (CIDCO), the authority responsible for developing a twin city in the same area, is trying to persuade the sponsors of the project to reconsider the matter.

The project itself has an unusual background. Conceived almost three years back, it has made slow progress, even by our standards. It is entirely based on imports — of rock phosphate, sulphur and even ammonia (whose import is otherwise a preserve of the public sector fertiliser projects). It is the issue of import of ammonia which had held up the project for quite some time. With this hurdle crossed, Dharamsi Morarji is now pressing ahead to finalise the financial arrangements.

In the meanwhile, CIDCO had come into being, with the mandate to set up a major urban complex in an area across the Bombay harbour which covers the proposed location of the Dharamsi Morarji fertiliser project at Nhava Sheva. CIDCO has taken its responsibilities for urban planning seriously. Even before the Dharamsi Morarji proposal came to it, it had commenced taking pollution measurements and had, on that basis, decided to shift the centre of its population base from its original location. Moreover, recognising the concentration of industry in greater Bombay and the need for industrial decentralisation, it has already commissioned a major study on location of industry in Maharashtra as a whole.

The chemical industry is a major source of pollution, and there is no reason why a fertiliser project — with only the port as a major factor in location (given the fact of imports of all raw materials required by the Dharamsi Morarji project) — should be placed in the midst of a major urban concentration. CIDCO is thus cold to the project on urban planning grounds.

But is this all that needs be said about the location issue? Other factors are perhaps of even greater significance. Bombay has already one major fertiliser project at Trombay. Consequently, the major market for the Dharamsi Morarji fertiliser project is likely to be in the southern region of the state.

Maharashtra has been long clamouring for a Konkan railway to develop its hinterland. A project like the Dharamsi Morarji fertiliser project (tentatively, but appropriately named Konkan Fertilisers!) throws up considerable traffic. Dharamsi's initial capacity is 250,000 tonnes of fertilisers, to be doubled to 500,000 tonnes. This involves movement of 1,500 tonnes of fertilisers per day — sufficient to justify a rail link on its own.

Maharashtra also has a port at Dabhol which can be developed to accommodate the Dharamsi Morarji fertiliser project. It is possible, using Dabhol as base, to build up the required port and transport facilities to make the project viable at this location. Some tentative estimates reportedly suggest that, purely from an economic point of view, the location at Dabhol is not commercially disadvantageous to the project.

Immediately, the issue is whether the public authorities are able to guarantee the required infrastructure in time to enable consideration of a shift in the location of the project. Perhaps, with its traditional interest in infrastructure development and its new-found concern for working anti-pollution measures into its project financing, the World Bank could be got interested in financing such a development, thereby overcoming some local bottlenecks.

Of long-term significance is the Maharashtra Government's concern, often vocally expressed, for balanced regional development. The Dharamsi Morarji project — capital-intensive and heavily import-based — with its large demand for infrastructure facilities can be the basis for opening up a region. This would be the main economic justification for such a project. For the first time, the question of location of a project is being considered on broader social grounds — as an issue in anti-pollution policy and as a means for regional development. It is necessary to work out a clear cost-benefit analysis of alternative locations for the project and to take a decision taken accordingly. Clearly, the decision on this project will be an important landmark in the evolution of the approach to regional planning.

Coal

Waiting for Nationalisation

Magnus writes:

THE coalfields are afire — if that is the correct expression — with speculation about the possible nationalisation of some collieries. It has long been known and accepted that we cannot afford to fritter away, or permanently lose, good quality coking coal. About a year ago the Government had announced that it will force small collieries to amalgamate and since then, various ideas and suggestions have been put forward. The current belief seems to be that all collieries which produce coking coal would be nationalised, ex-

cept for captive collieries of the steel companies. The move will affect such leading companies as Bengal Coal and East India. Naturally, the circumstances which led the coal industry to this pass are being critically examined in the coalfields, to see where the trouble started.

Basically, there is no escaping the fact that the coal industry has not made any large-scale investment during the past 15 years. Whether small or large, the private collieries have spent just enough to ensure survival. A leading exception is Indian Iron, which has reputedly invested as much in its Collieries Expansion project as the rest of Jharia put together. The National Coal Development Corporation, despite its other defects, is the only body to have taken bold decisions to tackle deep and difficult coal-seams in a big way. But for this public-sector body even these developments would not have taken place. If NCDC could only work more efficiently, it can force several small collieries out of business through pure competition. The latter could then be amalgamated, merged or acquired by neighbouring collieries, according to circumstances. The NCDC and private colliery companies have done a better job outside the coalfields of Raniganj and Jharia. More coal than ever is being produced from the once-neglected areas of Madhya Pradesh, Maharashtra and Andhra. If Bengal and Bihar had attracted investment in a similar spirit, the story might have been different today.

The last statement immediately brings forth cries of 'instability', 'labour trouble' and so on. These are given as the reasons for non-mechanisation, and to a large extent this is true. The collieries which, just after the War, bought coal-cutting and loading machines from the Western countries find that the machines are maligned by workers. Good maintenance is hard to achieve and spare parts are hard to get. The Mining and Allied Machinery Corporation was set up to supply these very machines but could not do so before the rot set in. Now MAMC itself does not get the orders for spares and replacements which good initial sales would have generated, and is generally in trouble. There is a school which believes that MAMC should have produced (or could even now produce) a good but small line of coal mining machines and sold it at low, or even subsidised, prices in order to get the coal industry really moving. Such enlightened self-interest is rare, but not unknown. If a realistic fuel policy places a sufficiently high coal target, such a scheme has every chance of being successful.

To get back to nationalisation, it is believed that minister Kumaramangalam and his senior adviser are pressing hard, but exactly which combination they select remains to be seen. On the industry's side, it appears that some of the companies would actually welcome nationalisation, as it will put an end to their misery. In the meanwhile some owners have started delaying payments to suppliers in the belief that nationalisation is imminent, and this has further vitiated the already murky business atmosphere in the coalfields. Senior persons from the industry have reportedly started visiting Delhi more often to canvass support for nationalisation. It is presumed that they also push their candidature as head of the forthcoming Collieries Development Corporation, or whatever it will be named. There is general consensus that NCDC will not be given the task of merging and consolidating small areas.

In the wider context of efficiency, it may be possible to ask the larger and more efficient companies to take over smaller contiguous areas. This procedure will reduce the amount of compensation to be paid; it will reduce litigation, and it will reduce government investment. It could also produce genuine competition among roughly equal rivals and thus, presumably, could make available more coal at cheaper prices without spoiling the limited reserves. Whether this logic can be translated into practice is not certain, even if it fits the new socialism.

Cotton Textiles

In Low Gear

THE cotton season which ended on August 31 saw the lowest production of cotton textiles by the mill industry in the last two decades. The lowest output since 1952 was 4,097 mn sq metres in 1967. In the first eleven months of this season, from September 1970 to July 1971, production was only 3,645 mn sq metres. If production in August is taken to have been the same as in July, 346 mn sq metres, the total for the season would come to 3,991 mn sq metres.

A notable feature of the organised cotton textile industry in the last two decades has been that while there has been a progressive decline in the production of cloth, there has been a steady rise in that of yarn. As a result, more and more yarn has been made available to the growing handloom and power-loom industries. Whereas the number of spindles has risen from 110 lakhs in 1951 to 179 lakhs in 1971, the number of looms has remained practically stationary. This year, however, there has been a marked fall in the production of yarn as well. Yarn output touched 965 mn kgs in 1969-70, a figure equalled only in 1965 and never so far exceeded. This year yarn production is likely to reach hardly 900 mn kgs or a decline of 7.3 per cent over the previous year. Production of yarn in the first 11 months of the season was 826 mn kgs and taking production in August to have been the same as in July, 77 mn kgs, the total production in the full season would be only 903 mn kgs.

Given this shortfall in the production of yarn, there has been a corresponding decline in the consumption of cotton by the textile industry. Last year, with a production of 965 mn kgs of yarn and 4,157 mn sq metres of cloth, the industry consumed 63.71 lakh bales of cotton. This year consumption of cotton by the mills in the first ten months of the season upto June was only 49.31 lakh bales and allowing for consumption at the average rate in the last two months, the total consumption in the season would come to about 59.25 lakh bales. This is nearly four and a half lakh of bales less than in 1969-70.

Various reasons have been advanced for the poor performance of the textile industry. One of the factors held responsible is the rise in the prices of cotton of all varieties which allegedly compelled many mills to cut production. This is reflected in the reduction in the number of spindles and looms working. However, the shutting down of spindles and looms may not have been due to high cotton prices alone. During the season just ended, particularly in the latter part of it, the number of mills closed down rose sharply. The number of closed mills which was 68 at the end of last year has now gone up to 83. Another reason for the sharp decline in the production of yarn could be the steep fall in exports of yarn during the first seven months of the current year. Exports of yarn reached 305 lakh kgs in 1970, or an average of 25 lakh kgs a month. But in 1971 there has been a steep fall, exports running at an average of barely nine lakh kgs a month. During the first seven months of 1971, only 63 lakh kgs of yarn were exported as against 218 lakh kgs in the corresponding period of the previous year.

For the 'Common Man'

Hansavivek

POYSHA INDUSTRIAL has been allowed to establish two more units — one in Madras and one in West Bengal. It has also taken, on lease, additional land adjacent to the existing factory, at Ghaziabad, which has already been enlarged to accommodate another printing line and other equipment. At Cochin, the main factory buildings are complete. The factory should be ready for commissioning soon after the monsoon. Printing lines are also being set up at the factory of the subsidiary, Kaira Can, which should make it self-sufficient in printed tinplate sheets. Poysha has concluded long-drawn-out negotiations for collaboration with American Can, whereby many new items will be taken up for manufacture — including beer cans (both conventional and specialised), aerosols and cans with easy opening ends of both aluminium and tinplate. The company has negotiated a further foreign currency loan of US $ 26,500 from ICICI for importing measuring and testing equipment and has secured a licence for importing two coater lines for installation at the Thana and Ghaziabad factories. Negotiations are under way for raising term loans of about Rs 70 lakhs from financial institutions to meet the cost of imported machinery.

The chairman, M R Ruia, complains that supply of tinplate continues to be unsatisfactory. Hindustan Steel and Tinplate Company of India are expected to meet the full demand of the industry for general line containers, but "the same irregularities and a continuously increasing backlog persist, in spite of promises to increase production and improve supplies". The company, he adds, has still to import large quantities of suitable plate from abroad because OTS tinplate is still under experimentation at HSL. Commenting on the increase in duty on imported tinplate from 27.5 per cent to 40 per cent in the last budget, Ruia says: "It would almost appear as if a dead set is being made against tin containers, on the misconceived ideological ground that preserved foods are mere luxuries beyond the reach of the common man". Tinplate prices have gone up by 50 per cent during the last 5 years. Can prices for preserved foods are perhaps the highest in India and account for as much as 30 per cent of the total cost of the end product, points out Ruia.

INDIAN TOOL MANUFACTURERS (IT) has stopped manufacture of electronic items and is disposing of the assets of that undertaking, as Government has not given it 'carrying on of business' licence to continue production commenced last year as a measure of diversification. The Colombian company, Herramientas Daga de Colombia S A, in which the company has an interest, might be closed down and taken into liquidation. When it was started, it was envisaged that the Colombian Government would permit export of drills manufactured by the Colombian company and would put a restriction on the import of drills from outside. The local collaborators, Corporacion Financiera de Calda, tried to persuade their Government to do so, but the latter took no measures. It was, therefore, considered advisable by the shareholders of that company to discontinue its activities. It is also being considered by the general body of shareholders whether or not to take their company into liquidation. IT supplied to the Colombian company capital equipment worth Rs 2,20,369, against share participation. Though provisional share certificate was issued to cover the value of machinery worth Rs 64,872—being the nominal value of 14,416 fully paid-up shares of 10 Pesos each of Herramientas Daga de Colombia S A—, it is now reported by the auditors of that company that final approval of the Colombian Government had not been granted for the issue of shares to IT. In view of this, it has been decided that Rs 64,872, standing to the debit of investment account for the last 2 years, be transferred to sundry debtors and that the total amount of Rs 220,369, standing to the debit of the Colombian company as on March 31 last, be treated as 'doubtful'.

IT has been granted permission for shifting its carbide tips and tipped-tool manufacturing plant to Nasik, for which the building is under construction and the plant is expected to be re-commissioned at Nasik shortly. The company was granted an industrial licence for expansion of capacity for cutters, reamers, and taps. Trial production has commenced at the unit which was established at Nasik with financial assistance from SICOM. The company has also been granted a 'letter of intent' for the manufacture of gear-cutting tools. IT produced good results for 1970-71, with notable widening of margins. Export sales increased by more than 25 per cent over the previous year, even though the company maintained the higher price realisation. Exports during the current year are expected to further improve.

METTUR CHEMICAL is installing equipment for increasing production of rayon caustic soda by 20 tonnes per day, and it expects the expanded capacity to go on stream before the end of March next. Concurrently with this expansion, the company has taken steps to replace in a phased manner some of the obsolete and worn-out equipment at plant number one. The phases are planned to ensure that production is sustained at full level at the old plant too. Erection work of the new semi-commercial plant for bromine at Vedaranyam is going on, and this plant is expected to be in operation soon. During its 34th year ended March 1971, the company's production of caustic soda was marginally lower at 38,426 tonnes because of inadequate supply of graphite anodes. Production of chlorine, hydrochloric acid, and other miscellaneous chemicals, was maintained at a satisfactory level. Output of stable bleaching powder declined by 10 per cent owing to competition and difficulties in getting good quality limestone. Production of chlorinated paraffin wax in the pilot plant has been stabilised, and the product is being supplied to the PVC industry. In chloromethanes, production rose by 15 per cent to 3,294 tonnes. Output of vanaspati and vegetable oil products was lower at 2,756 tonnes (2,933 tonnes) because of fluctuations in groundnut oil price, difficult raw material position, decline in consumer demand, and lack of parity between oil prices and vanaspati prices fixed by Government. Owing to extraordinary weather conditions and unseasonal rains, production of salt at the Vedaranyam and Adirampatnam factories suffered badly. Operations at the former factory have been intensified and an additional area of about 800 acres has been brought under intensive salt cultivation. Export sales of methyl chloride were made systematically during the year, and repeated orders were received.

CALICO MILLS (Ahmedabad Manufacturing and Calico Printing) has received industrial and capital goods licences for the polyester fibre plant, with a capacity of 6,100 tonnes per annum. Government has allocated foreign exchange under the UK credit, and orders have been placed with foreign suppliers. Civil construction work has commenced on site in the Gujarat Petrochemicals complex near Baroda. The new plant for production of 50 tonnes per day of caustic soda went into production at the end of March last. Work on the new PVC polymerisation and PVC processing plants is in progress. During 1970-71, the company and its subsidiaries increased exports by 40 per cent to Rs 375 lakhs. Although total sales were up, gross profit was a little lower owing to reduction in margins on account of increasing costs of production. Research and development activity in the field of chemicals and plastics is being substantially expanded. Additions to capital assets of the company amounted to Rs 424 lakhs. The scheme of amalgamation of Bank of India Ltd with Calico was approved by shareholders of both companies. In view of the guidelines issued by Government regarding bonus shares, the resolution passed at the annual meeting in connection with the issue of bonus shares in the proportion of one share for every two shares held could not be implemented.

J K SATOH AGRICULTURAL MACHINES, a new company, is setting up a project near Kanpur for manufacture of 6,000 power tillers per annum in technical and financial collaboration with two Japanese firms. The factory should go into production by the middle of next year. Of the total estimated project cost of Rs 1.70 crores, Rs 90 lakhs are to come from share capital and the balance by way of a loan from IFCI. The company's paid-up capital is Rs 41.80 lakhs in equity shares, of which Rs 16.80 lakhs is held by the collaborators and the rest by J K Synthetics and Indian directors. The public is being offered for subscription, through prospectus, equity capital of Rs 28.20 lakhs in shares of Rs 10 each and preference capital of Rs 20 lakhs in 9.5 per cent redeemable cumulative preference shares of Rs 100 each. The subscription list will open on September 14 and close on September 24 or earlier, but not before September 17.

AMERICAN EXPRESS and subsidiaries' earnings during the first six months of 1971 ran well ahead of records set during the comparable period last year. Consolidated net income rose 22.3 per cent to $ 42.9 million, or $ 1.80 per share, compared with $ 35 million or $ 1.47 per share for the same period last year. Of the total, consolidated income from operations increased 25.5 per cent to $ 38.3 million. Earnings of travel and financial service activities (other than insurance), continued their growth, with net income of $ 20.7 million — a 13.8 per cent increase over the first half of 1970. Important activities, such as the American Express Card and Travellers Cheques, showed continued improvement, but operating losses of American Express Reservations, Inc, have not yet been reduced, despite continued growth in volume. The Fireman's Fund American insurance subsidiaries showed good improvement in net earnings and underwriting results, with net income rising 31.4 per cent over the first half of 1970 to $ 22.2 million.

Not a Dull Moment

Romesh Thapar

SO ... Khrushchev is dead. With him passes a major catalytic figure of our troubled times. The Soviet press — and the Chinese! — can ignore the fact of his death, but all over the world grateful people recall his contribution to peace and sanity. Thinking Indians always held him in special regard. If diplomatic and political practice silenced the leaders of many lands from paying their tribute, it was good to know that Indira Gandhi could not be muffled. Her message to Nina Khrushchev spoke for millions all over the world.

There's not a dull moment these days. When the PM is not twisting the ears of an erring minister or preventing a senior colleague from disappearing on a 'global tour', she is visiting border outposts within a few yards of the cease-fire line, the scattered camps of refugees from Sonar Bangla, and the flooded, teeming valleys of the Ganga and its tributaries. In between these visits to reassure the people that their problems have not been forgotten, the attention of the ruling party big-wigs is turned on the traumas of a moribund Congress and its unthinking State-level leadership. In the Capital, we continue to be astonished at the Centre's capacity to deal with the Sukhadias and Brahmananda Reddis even as numerous crises mount.

Several developments give cause for satisfaction, including our incredible capacity to house and sustain so many millions of refugees; but the grim fact of our industrial failure continues to haunt the policy-makers. The growth rate is way below two per cent, and is likely to fall below one per cent this year. These statistics point to grave consequences. An industrial failure at a time when we are printing notes to cope with the expenditure on the refugees could shatter the price structure.

There is little point in putting the blame on certain political parties and their union tactics. The ruling Congress party has not been unaware of the general drift towards industrial failure. Warning after warning has been sounded, but no one has paid heed. Unfortunately, economics is not our Union Cabinet's idea of an absorbing subject. It never has been. But there can be no understanding of the crisis creeping up upon us unless we take a solid look at the mess in which India's industry wallows.

Whether it is the public sector or private sector, the effort of 25 years is in danger of being wasted. This is particularly so in the public sector where a host of managers seem to imagine that the purpose of this sector is to provide them with jobs and perks — an attitude of mind which is now firmly entrenched in the working force. To shake Government and industry out of their stupor will require the bulk of the GOI's time in the coming months. Economics will have to take pride of place in a varied programme.

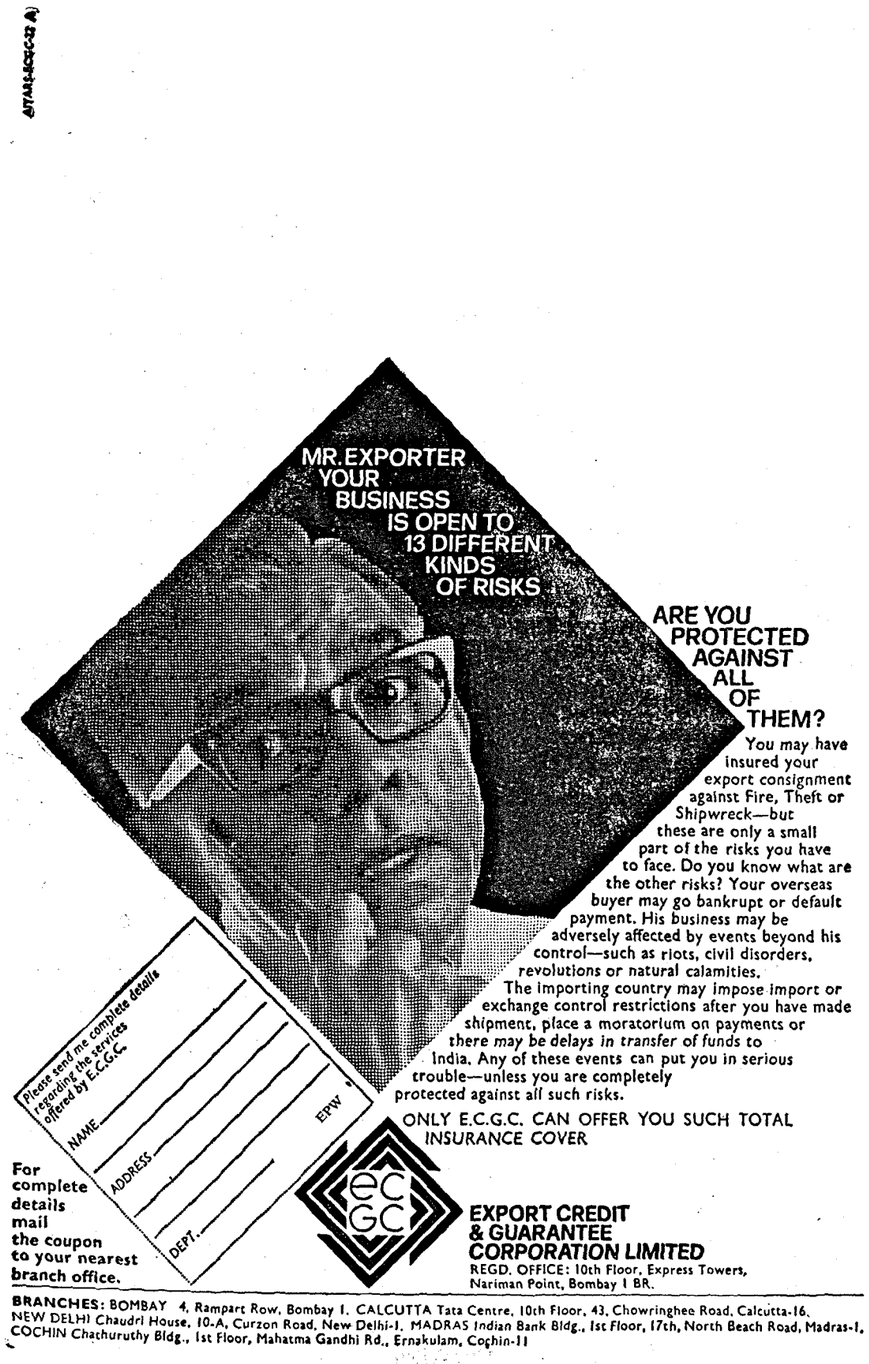
The theory is being advanced by the organs of the Left that the economy demands radical measures or else it will tend to shut down. The trouble is that Indian radicalism stops at 'take-overs'. How to make the take-overs *work* is conveniently shelved. Steel production is mortgaged to inter-union rivalry. Banks perform at their lowest possible efficiency. The call for 'bundhs' is given even though the impact on the local economy is disastrous. Maybe, our ministers should find out from the Soviet leaders what they do about such failures! But, seriously, we cannot play with productivity any more. We are sitting on a precipice.

The consequences of poor performance are now available to the politicians in Delhi. The students have taken to hi-jacking buses in protest against poor services. They are convinced that nothing will be done until they paralyse the inefficient, incompetent Delhi Transport Undertaking. So ... The GOI had better stop the slogan-mongering and perform—or better still, shout slogans, practise them, and perform. Then we would have relevant radicalism.

September 13

FROM OUR CORRESPONDENTS

Structural Syndrome in Science Policy



R S Ganapathy

SCIENCE policy is once again in the news. The Sarkar Committee has submitted the final part of its report on CSIR reorganisation. The Union Cabinet has taken a decision to constitute a new National Commission on Science and Technology in the place of the now-moribund COST. Directors of various national laboratories have come together demanding more autonomy, closer interaction between Research and Industry, better pay scales for scientists and association of the national laboratories in the planning for industries. New organisational forms, better administrative procedures and more importance to scientists in policy planning have been suggested. Judging from the proliferation of schemes and suggestions, one could conclude that something is really cooking in the management of science and technology.

Let us look at the relevance of some of these recommendations. That there is a desire to bring about quick change in the goals, policies and management practices of the scientific estate is obvious. But how is the organisational change to be brought about? The recommendations have some common elements. Nearly all of them are structural, universal, procedural or administrative without any reference to the individuals who constitute the scientific system. In other words, the solutions are mechanistic-prescriptive and not organic. It is this characteristic that makes them ineffective for bringing about real change. Let us look at the historical development of scientific organisations in this country before analysing the implications of the recommendations.

Different Histories

There are five major scientific research organisations in the country: The Council of Scientific and Industrial Research; Department of Atomic Energy; Defence Research and Development Organisation; Indian Council of Medical Research and the Indian Council for Agricultural Research. All these five organisations have had different histories of growth. The CSIR

is an independent registered society whose Director-General is a Secretary to the Government directly responsible to the Minister. The Department of Atomic Energy is a full-fledged department of the Government under the Prime Minister, the Secretary of which is also the Chairman of the Atomic Energy Commission — the policy-making body. The Defence R and D organisation is a part of the Defence Ministry and its Director-General is a Secretary to the Government. The Indian Council of Medical Research and the Indian Council of Agricultural Research are independent grant-in-aid bodies under the respective ministries; but the Directors-General do not hold any Government position.

Of these different organisations the Department of Atomic Energy has grown rapidly and is considered to be the most effective. Even though it is a Government department, it has a considerable degree of autonomy and has close linkage with the highest decision-making authority in the Government: the Prime Minister. The CSIR, even though technically independent of Government, is very bureaucratic and is considered ineffective. We can learn from this fact alone that the structure of an organisation is not the sole determinant of its effectiveness. Yet we find our leaders and committees recommending new structures to replace old ones, ignoring the other determinants of organisational effectiveness!

Faith in Judges

The Sarkar Committee has recommended that the top policy-making body on science and technology (to be called National Commission of Science and Technology or NCST) should be a high powered, compact committee, preferably with full-time members and adequately staffed secretariat. It should be charged with the responsibility of preparing a national plan for science and technology to be dovetailed with the socio-economic plan. The Sarkar Committee was set up only to examine the working of CSIR. Without studying in depth the other scientific organisations in the country, the Committee has proceeded to recommend the structure for a national policy-making body!

The Committee's earlier report examines various appointments, corruption charges and misdemeanours against various CSIR personnel over the past few years and particularly during the tenure of its earlier Director-General. The second report recommends measures to change CSIR organisation. These measures include the abolition of executive councils of laboratories, the regrouping of laboratories under four heads (Chemistry, Physical and Earth Sciences, Engineering and Commodities), the constitution of internal executive committees for laboratories to be assisted by a number of advisory committees on patents, royalties, finance, etc. It also has recommended the conversion of the Central Glass and Ceramic Research Institute, Central Food Technological Research Institute and the Central Leather Research Institute into co-operative research institutes with the participation of industry.

The Committee was headed by a retired Supreme Court judge. In our country, most Government committees on a variety of subjects get chaired by Supreme Court/High Court judges. It is difficult to understand this faith in the omniscience of judges. One can understand committees appointed for conducting a judicial probe or resolving a quasi-legal dispute being headed by judges; but what is the special competence of a judge to evaluate a scientific organisation? Is it that the Government does not trust people from other professions to have the same sense of impartiality, objectivity and fairness as those from the judiciary?

Priority for a Social Plan

The recommendations about the national policy-making body on science and technology made by the COST Conference and the Sarkar Committee have found an ardent supporter in C Subramaniam, Minister for Planning, Science and Technology. It is proposed now to set up (1) a National Commission on Science and Technology and (2) a Board for Natural Resources. The functions of these two bodies are not yet known, but they are to collaborate with the Planning Commission in linking science and technology with economic and social planning. Unfortunately, in our country, there has been no integrated social planning whatsoever. The plan targets are either in monetary or physical terms, but never in social terms. Our planners, for example do not tell us what are the alternative social systems which we could achieve in say 10 years' or 20 years' time. They completely ignore the social institutions, mores and practices which we would have in the future. We seem to be planning only for economic change and not for social change. In this situation no top policy-making body in science can plan for a national R and D effort which would eventually improve the quality of life in this country. The priority should really be to prepare a social plan and then one can search for alternatives in science and technology to bring about the desired social changes.

An organisational model that seems to be particularly popular with many of the scientists is that of the Atomic Energy Commission. This structure is the result of several factors: history, the captive market within the same organisational umbrella for the products of Atomic Energy research, and the special relationship which the late Homi Bhabha had with the then Prime Minister. It is advocated in several quarters that the same pattern of a Government department with a top policy-making commission be adopted for other scientific organisations as well. A new Electronics Commission has been created virtually with the same structure as the atomic energy organisation. Here one observes the tendency in Government to create new organisations without reference to the technology of the tasks to be accomplished, the demands of the environment with which the organisation has to interact and the needs of the individuals and groups who would constitute the organisation. One can clearly see that electronics and atomic energy are completely different technologies, have different environments and different working groups and personalities. Hence an organisation which was suitable for atomic energy at an early point of time could not be suitable for electronics at a different point of time. But this is not so obvious to the top brass in Government who found an easy way out by creating an organisation for electronics which is the duplicate of the Atomic Energy Commission. Such is the force of precedents!

Outdated Model

This tendency to treat casually the creation of new organisations is evident by the fact that the Electronics Commission has been placed under the Cabinet Secretariat like the Department of Science and Technology under which the CSIR functions. There is no logic for this arrangement as the Cabinet Secretariat's main functions are to co-ordinate inter-ministerial activities and cabinet matters. Now the entire character of the cabinet secretariat is being changed, making it into

a super-ministry by placing the department of personnel, department of statistics, department of electronics and the department of science and technology under it.

The preoccupation with organisational structures will result in ineffective scientific organisation, which will in turn give rise to further demands for structural changes. A great deal of research has been done about organisations and organisational change and all the research findings indicate that structure is only one of the factors in determining organisational effectiveness. The decision-making authorities in Government seems to extend the model of the civil services organisation to scientific organisations. In the civil services, closely following the principles advocated by Max Weber, systematic delineation of tasks and authority in an impersonal manner is supposed to create a self-perpetuating organisation. In the atomic energy programme, Homi Bhabha built up an organisation completely opposed to this principle. He believed that the new technology of atomic energy in India could be developed only by the philosophy of 'growing science'. He identified competent individuals in different areas of science and technology related to atomic energy, gave them freedom to organise and build up groups of scientific personnel around them. The highly personalised organisation that has grown as a result of this philosophy is sought to be duplicated for other scientific organisations. This model is no more valid as the science and technology scene is radically different now from what it was in 1948 when the AEC was created.

Culture and Norms

Let us look at the culture and norms of scientists as factors determining organisational effectiveness. Scientext, long years of isolation in the aca- of inquiry unfettered by bureaucratic controls. They also value peer-recognition considerably. In the Indian context, long years of isolation in the academic institutions have created among scientists an 'ivory tower' attitude and they look down upon practical/applied work or consultancy. This attitude-norm is the cause of poor liaison between industry and research. A constant interaction between teaching, research and consultancy is essential for the mutual growth of all the three activities. In the national laboratories and institutes we have neglected the combination of all three activities in one place.

Another characteristic of the Indian scientist is his basically authoritarian nature. There are very few scientists in India today who let the younger people working under them to grow both in the professional and personal senses in an atmosphere of autonomy and flexibility. There are innumerable cases of suppression of meritorious work by the superiors and the organisational culture is similar to that of a rigid hierarchy. A participative or a democratic organisation for many of the scientific institutions is practically unknown. There is also a tendency among scientists to covet administrative posts for career advancement. They do not think that advancement in research is sufficient inducement. Administration instead of being seen as a service function is perceived as a source of power and influence. Achieving any high research position is thus ranked below administrative positions. This is evident from the fact that in many laboratories the concerns of many senior scientists are about retirement, extension of service, perquisites, status, grades of pay, etc. This norm needs to be changed if science is to grow in this country.

In many of the laboratories, interpersonal problems and politicking has assumed rampant proportions affecting productivity, growth and morale. Openness in the expression of feelings, dissent from the superiors' opinions or policies and decision-making at levels which are close to the sources of information are practically unknown. These norms and characteristics of scientists need to be changed if organisational effectiveness has to be improved. Merely changing the structure or procedures without changing the behaviour of the persons involved will not result in any improvement.

From developmental history we know that social and organisational innovation always precede technical innovation. In science policy we are trying to achieve the reverse. The social implications of our scientific research effort are practically unknown. There is no interaction between the social scientists and the natural scientists. Many scientists think that science is a neutral activity independent of political, economic and social pressures. Unfortunately, the prospects of science remain uneasily suspended between admiration and fear in the public mind. Reaction to its challenges tends to be emotional because there is so little of public discussion by laymen, albeit laymen who have tried to understand a little of what is going on. There is a great need to generate more informed public discussion about the consequences of scientific research on society and economy. This would help society in more effective preparation for living with these consequences and it can decide through the feedback on its decisions about what research to support.

Symptoms Mistaken for Disease

The Government of India moves from one crisis to another in a time-span of twentyfour hours or so. The momentous choices faced in science and technology have been neglected just because they do not have to be resolved today; but there is no time to wait for the next generation to save us from our responsibility. The choices are before us and the course of development in the next generation will depend on the choices we make now. We need new machinery and leadership if we are to use science and technology more wisely than we have done up till now. The argument of this note should not be interpreted to mean that structural or procedural changes are uncalled for. Considerable improvements can be made in devising mechanisms for selecting and evaluating research projects, linking Research with Industry through consultancy, technical services or mobility of personnel and providing risk capital for inducing entrepreneurs to adopt knowhow generated in the laboratories. But improvement in these areas without better skills and change in the values, feelings and attitudes of the scientists would not be very effective.

The actual form which the top administrative body would take is relatively unimportant. We could have achieved much more with the COST structure. The reasons which prevented COST from being effective are inter-agency rivalry, ill-staffed secretariat, absence of a shared perspective of national science policy among top scientists who are members of COST and inter-personal conflict among the members of the COST. One can only hope that in the new NCST these problems will be solved or contained.

The structural syndrome in which the scientists and theoreticians of science policy seem to be involved is not helpful for the correct diagnosis of the malady and the development of a remedial strategy. The symptoms are perceived as the real problems. When will we learn the lessons of this clinical failure, resulting in the advancement of structural remedies rather than behavioural remedies?

SOUTH

Kerala Coalition

Mohit Sen

THE protracted negotiations to bring the Congress into the Ministry in Kerala are indicative of the unsettled balance of forces within that party and a certain lack of clarity on the perspective of the changes that have taken place within it. It is to be noted that the Congress is arguing with the United Front on the number of Ministers and on the distribution of portfolios. There is no argument on the problems of programme nor on whether there has been any lag in the implementation of what was commonly agreed to between the Congress and the United Front.

No Dispute

And it is precisely in this position that all the contradictions of the present position of the Congress are focused. The absence of any controversy with regard to the programme as well as the record of the Ministry is not because these are of no significance to the Congress. On the contrary, it is because there is really no dispute between the Congress and the United Front on these issues. The radicalisation of the petty bourgeoisie in Kerala and the strength of the Communist movement has been reflected in the great change that has taken place in the Congress. The land reforms that have already led to the abolition of landlordism and which were promulgated at a time when the CPI(M) was the dominant party in the ruling United Front, were not only not opposed by the Congress but welcomed by it. The youth wing of the Congress in Kerala was prepared for direct action in the form of seizure and tilling of the land of the recalicitrant landlords of Kuttanand when the latter threatened not to raise any crops in protest against the demands of the agricultural labourers. This is a new kind of Congress and the newness is the product of important objective processes which have had an impact on the mind of the intermediate strata as well as of the subjective factor of the Communist Party which has adopted realistic United Front tactics.

But while the newness is pronounced, it does not mean that the old has entirely departed from the arena. And this old consciousness and the persistence of the influence of the vested interests in the Congress is reflected in two main ways. One is the pursuit of office by a section of the older generation which believes that remaining in the coalition but not entering the governmet is a senseless sacrifice. They tend to discount the future and believe that a bird in hand is worth much more than two in the bush. The leaders of the Youth Congress who oppose this opportunism do so from positions of another kind of opportunism. They believe that this scramble into the Ministry would only discredit the Congress and reduce the chances of its coming back as a single-party majority in the next elections. They hold on to the view that programmatic differences with the United Front being absent, the latter cannot gain any kudos from radical policies and laws. At the same time delays in implementation, bureaucratic bungling and sabotage, lack of experience and the like would create a certain amount of discontent which would, however, not make the Congress its target so long as it remained outside the Ministry. The Youth Congress's aim, therefore, is the winning, in the near future, of a purely Congress Ministry. Thus its opposition to the Ministerialists is based on another variant of Ministerialism! The Youth Congress leaders too, are not concerned about what would be the best way in which the healthy, radical forces of Kerala can be united and that this State cannot only go forward most rapidly but act as a pace-setter for the rest of India. Their Leftism is, thus, not free from the corrosive approach of so-called dynamic Centrism.

Fatal Flaw

Because of this fatal flaw, it is precisely the radical image and trends of the Congress that are seriously affected. After all, the CPI and many of the other parties of the United Front have made the offer to the Congress that it can take over the Ministry on the basis of the support of the United Front. And to accommodate the Congress the Muslim League has expressed its readiness to part with the Home portfolio and the CPI has agreed not to press for the expansion of the Ministry which means that it is also ready to sacrifice one or another of the important portfolios that it now handles.

And what can the argument of the Congress be except that of "pure" power or exclusive power? And how can the Left in the Congress in this state not plead guilty to the charge that it prefers unity with the vested interests in its party to working jointly with the Left forces outside it? And it is because of this that there is a measure of instability abroad again in Kerala which is so detrimental to its progress.

From two different angles this uncertainty is sought to be utilised for purely factional gains by the Kerala Congress and the CPI (M). The former has come out with a declaration that it would unconditionally support an exclusively Congress government provided it did without the support of the CPI. The CPI (M) has decided to try to again build an anti-Congress Left front.

CPI(M) Approach

Some persons ask as to what is wrong about the approach of the CPI (M) and wonder whether this is not the really militant approach. Of course, this depends on one's definition of militancy. If by militancy one understands the movement of as large a section of the masses as possible to radical consciousness and action, then, obviously the CPI (M) approach is incorrect. And this is because it completely overlooks a very large section of the radicalised mass that supports the Congress and whose representatives are active within it. This mass and its representation can be, and are, a powerful support for action against the enemies of the Indian revolution. To ignore them, isolate them and advance slogans counter to their loyalty to their organisation is to weaken the tempo of the movement and retard the process of radicalisation.

Incidentally, it is this fact that is also missed by the Kerala Congress which imagines that its manoeuvre to isolate the CPI would enable the vested interests to once again come into their own in this State. But whatever the configurations and confusions of the coalition, Kerala's thrust to radicalism can no longer be blunted.

KUALA LUMPUR

Peking Picks a Friend

Harish Chandola

IF Peking decided to choose a country in southeast Asia to establish relations with, which one would it be? The obvious choice would be Malaysia. And that is what Peking has just confirmed. It has established the first contact by sending a 13-man trade delegation to Kuala Lumpur, which held talks there from August 22 to 28.

Why has China chosen Malaysia? It is because it recognises the reality that the Government of Prime Minister Tun Razak, though not socialist, enjoys popular support. It is going to keep that support for quite some time. The Malayan Communist Party is a minor force at the moment, hidden in the northern corner of Malaysia. It has not yet been able to mobilise political support all over the country and is likely to take a fairly long time to emerge as a major force to challenge the present Government.

Tun Razak has opened a new chapter in the foreign relations of his country. He has put forward the proposal for the neutralisation of southeast Asia, which means keeping the region free from the direct influence and consequent rivalries of the Big Powers. Under his leadership the country is getting out of the sphere of influence of the former colonial power, Britain. While doing so, it is not trying to get itself tied up with either the US or the Soviet Union. Many ties still bind him to Big Powers of the West. But there is no doubt that Tun Razak is leading his country on the path of true non-alignment.

In southeast Asia, Indonesia still spurns China. The ruling regime in the Philippines has come out with the canard of a large-scale armed communist uprising there in order to maintain its shaky power. The military rulers of Thailand are still securely tied to the apron-strings of mother America. In this region therefore it is only Malaysia which has extended the hand of friendship to China. And China has accepted it.

Direct trade between the two countries has been accepted as the first step in the attempt to befriend each other. Establishment of diplomatic relations will take time because many hurdles have still to be crossed. Malaysia has stated that it recognises only one China, which is the People's Republic of China. It has decided to be friends with it, though under the previous Prime Minister Malaysia had followed a policy of unremitting hostility to China.

Malaysia however does not want to rush into developing numerous ties with China, because by doing so it would be upsetting the southeast Asia region, where regimes are still basically anti-China. Suppose Malaysia announced tomorrow that it was going to open an embassy in Peking. At once there would be panic in this region and all neighbours of Malaysia, friendly towards it now, would become highly suspicious of it. Therefore Malaysia has to proceed in its policy of friendship towards China with caution, without disturbing everybody around and creating hostility for itself in the region.

China, it appears, understands this.

Trade Relations

That is the political part of the story of the new direct trade relations between Malaysia and China. The other part is about what was discussed by the Chinese and Malaysian trade delegations in Kuala Lumpur during almost a whole week.

Malaysian exports consist of primary products. Natural rubber accounts for nearly 40 per cent of its export earnings. The prices of natural rubber this year have been very depressed, adversely affecting the Malaysian economy. There appears to be no likelihood of the prices picking up again because the US has decided to unload a few thousand tons from its natural rubber stockpile every month. The US and the Soviet Union, both big buyers of rubber, have built large stockpiles. Though they still continue to buy, the demand from them is not keen. The result is that rubber prices continue to decline.

During the trade talks, the Chinese delegation placed an immediate order for 40,000 tons of rubber with Malaysia. It is most likely that China will buy more before the year ends. It used to buy about two million tons of Malaysian rubber every year until about three years ago, but of late it has been buying nothing.

What is more encouraging than this order is that China is not buying at speculative and declining prices. It is buying directly from the producer country, not in the international market, and is working out a price formula which will help Malaysia stabilise rubber prices. The formula, not made public yet, is that China will not buy on the basis of daily quotations but take into account the prices during the previous month, draw an average and then buy at that average price. Malaysia is greatly interested in keeping rubber prices steady and this formula will help it do so.

Another helpful gesture China has made is to buy Malaysian palm oil. China is surplus in edible oils like groundnut and coconut oils. In fact it uses these rather expensive oils for industrial purposes, like soap-making. Palm oil is cheap oil meant for industrial purposes. But if China used Malaysia's cheap palm oil, what would it do with its own production of groundnut and coconut oils. It would have to use them for some other purposes or sell them elsewhere. But in Kuala Lumpur its delegation decided to buy immediately 5,000 tons of palm oil.

The Chinese delegation also placed orders for 50,000 cubic metres of logs from timber-rich East Malaysia. It also agreed to buy Malaysian gutta-percha and pepper, for which it would place orders later.

China-Malaysia trade, so far carried on indirectly through individual traders in Hong Kong and Singapore, has been heavily in favour of China. Chinese goods, mainly clothing and foodstuffs, worth about two million Malaysian dollars were sold in Malaysia, while Malaysia's exports to China had practically dwindled to nothing. The delegations therefore agreed to balance this trade with increased Chinese purchases of Malaysian materials.

Malaysia's Shopping List

The trade balance would however continue to remain in favour of China for quite some time, in spite of the direct trade initiated last month. Malaysia will now not only be importing traditional items like made-up garments and foodstuffs, but will in fact be buying more of them, because it wants these cheap goods to reach the poor rural areas of the east coast also.

It is also buying new items, which attracted the attention of its trade delegation at the Canton trade fair in May this year. The new items Malaysia has decided to buy are agricultural implements like ploughs, weeders and a new simple man-drawn machine which while being pulled plants the delicate rice-seedlings in rows of five. With it a man can plant an acre a day. Malaysia will greatly need all these because its second development Plan (1971 to 1975) envisages bringing 750,000 additional acres under cultivation.

Malaysia is also considering buying from China cotton for its textile mills and a chemical compound for the manufacture of plastic for its rapidly-expanding plastic-goods industry.

China has not yet quoted the prices of the items Malaysia wants to buy. But it is understood that it will sell them to Malaysia at cheaper prices than it sells them to others, because both countries have decided to give each other the most-favoured nation treatment in trade.

In order not to let international shipping companies profit from this trade, and, as happens often, to negate the gains of the trading partners by increasing the freight-rates, it was decided that only Malaysian ships or those chartered by it would carry its produce to China and that only ships from China or those chartered by it would bring its goods to Malaysia. The Malaysian International Shipping Corporation, which has only four ships at the moment, is chartering 12 ships to increase its capacity and be able to carry this trade.

It was also decided that China will open an account with a Malaysian bank (most likely Bank Bhumiputra) and Malaysia will open an account with the Bank of China in Peking for the purposes of this direct trade. China will also appoint one of the travel agents in Malaysia as its agent to arrange and facilitate the visit of Malaysian traders to China.

The China trade will be handled by a Malaysian Government agency, Perbadanan Nasional Berhad (National Corporation), or Pernas for short. Individual traders from Malaysia, who are almost entirely of Chinese stock, will not be allowed to import goods directly from China. This has been done at the instance of China, which wanted to avoid giving the impression that it was enriching the overseas Chinese by using them for its trade. Also China wanted sincerely to cultivate good relations with the people of the Malay race and it could do so only by trading with the Malaysian Government-appointed agency.

Pernas is setting up a chain of stores in rural and coastal Malaysia, through which it will be able to make available the cheap and durable Chinese consumer goods to poor peasants and fishermen, whose average income, in spite of the tremendous riches of the country, is still about 50 Malaysian dollars (Rs 122.50) a month.

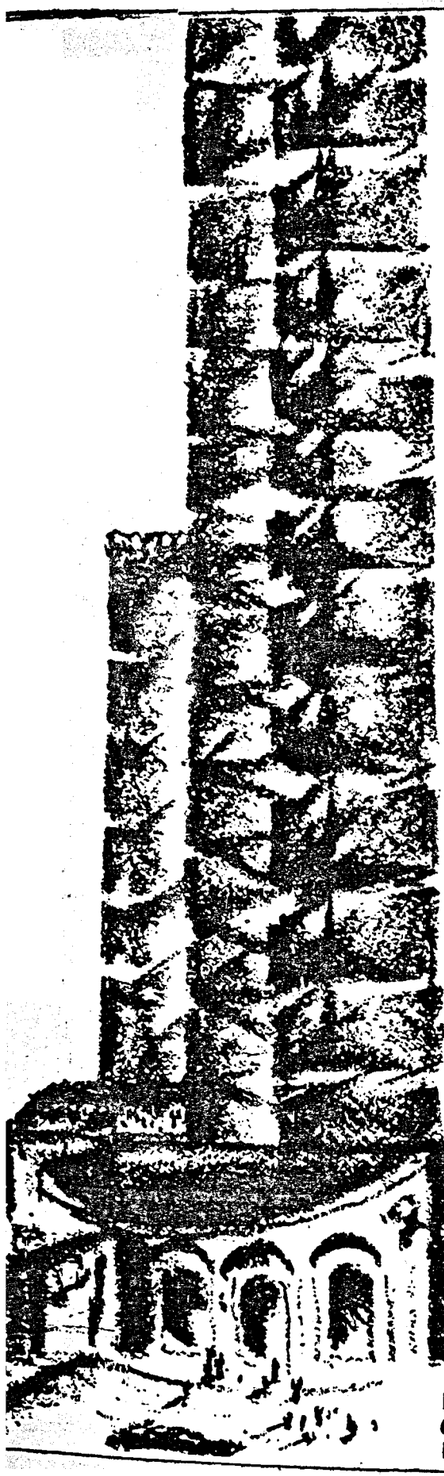
WEST GERMANY



The New *Weltpolitik*

Aswini K Ray

IT has been an exciting time for West German politicians and newsmen. So many things have been happening all around, at home and abroad, and in such quick succession that everyone here seems to have been disturbed in his seasonal search for surf and sunshine. The historic (or, was it histrionic?) stomach upset of Henry Kissinger which set the whole world purging; Nixon's announcement of, what the Kremlinologists may call, the American version of the NEP to save, if not the dollar, the presidency for the GOP; the much-publicised 'non-aligned' pact of Indo-Soviet Friendship; the new federation in the Arab world; finally, the four-power agreement on Berlin; all made big news at this end. In between there were 'minor' local irritants: a series of train and plane mishaps and a spate of daring, daylight bank holdups that could no longer be explained away as the misdeeds of the mop-haired, militant 'red' rebels.

But unlike elsewhere, neither Nixon's new diplomacy nor his new economic policy—which in their cumulative impact reverted America to protectionism without yet leading to its political counterpart of isolationism—came as much of a surprise to the West Germans. Certainly there was no panic. In any case, the West German economy is not so heavily dependent upon exports to the US as are Japan, UK or France. For example, according to representatives of the West German automobile industry, Volkswagen, which exports about ten per cent of its products to the US and is among the country's top exporters to that country, would be able to cover any gap caused by a possible fall of demand in the US by the expected rise in internal demand and through new markets opening up in Eastern Europe. The same is true of the chemical and electronics industries, the other big exporters to the US, according to the spokesmen of those industries.

So, apart from causing some oscillations in the stock market—nowhere near as violent as in Tokyo, London, or Paris—Nixon's new economic policies did not cause any panic in Frankfurt. Nor was there any emergency cabinet meeting like in some other capitals. Only seven half-tanned cabinet members—one short of the quorum—managed to attend the routine cabinet session to discuss the issue; Chancellor Brandt was shown on TV the same day, holidaying in his swim-suit on the island of Sylt. Schiller, the Economics Minister, an-

FEEL THE PULSE OF PROGRESS

All the time we are planning more and more years ahead. Planning, striving, attaining, both the possible and the impossible. Setting our sights to new horizons everyday. For all the time we are catching up sooner than we planned, on tiers built of achievements.

10,000 industrial units to date is not a mere term in Urban Dynamics. The sky scraper is only a visual symbol of how we are catching up, higher and higher, what we are planning year after year, farther into the future. Pulsating with dynamism — an outcome of successful industrial endeavours.

The basic essentials for progress are here.
An abundance of natural resources.
Developed land.
Surplus power.
Communication & transportation network.
Trained manpower.
All coupled with the state's encouragement and incentive schemes bring maximisation of opportunities within the reach of every enterprising individual or group of entrepreneurs.

You are invited to share this opportunity and the prosperity.

MSIIDC helps decision makers to invest in an industrial future.

Mysore State Industrial Investment & Development Corporation Ltd., 'Hari Nivas', 36, Cunningham Road, Bangalore-1B.

msiidc/1

nounced the government decision not to meet the US measures by a matching series of protectionist measures but by making West German products more competitive and by presenting a united European front against the dollar.

In fact the dollar crisis—euphemistically described as a world currency crisis—disturbs the West Germans more than Nixon's economic policy. Already French obstinacy has led to a setback for the proposed European currency, and there are at least three different fronts against the dollar, put up by West Germany, France and the Benelux countries, respectively. The immediate objectives for the Deutschmark have been achieved *de facto* by floating it, and it remains a matter for bargaining whether the D-mark is revalued by 10 per cent, as the Americans insist, or by 4.8 per cent as Schiller would permit. But Schiller's present mission in the different West European capitals is to thrash out a united front against the dollar before the 'Club of Ten' meets.

Nixon's new diplomacy also did not send the sort of chill down West German spines as it did in some Asian capitals. For one thing, the Nixon administration had kept its Western allies informed about a possible Pindi Belly for Kissinger, *unlike US indifference* towards some of its Asian allies, whom, the new China policy affects more directly; that explains the absence of the element of surprise in West German reactions. Besides, Ribbentrop's successors in the Foreign Office have never allowed themselves to pursue naively a policy of pleasing their friends by teasing their enemies. West German economic diplomacy has been geared to the task of winning friends—if not influencing them—without bothering about their political morals. *Ruhrgebiet* is as keen to bite its own share of the spoils in China so tantilisingly laid out by Washington. *Moves in this direction* appear to be already afoot. Finally, after all, Nixon's new China policy is, in more than one sense, the American version of the West German *Ostpolitik*, which directly follows from West Germany's *Weltpolitik*.

If any proof of the obvious German interest in the four-power negotiations on Berlin were necessary, it was provided by the emergency cabinet meeting of August 23 to ratify the ambassadorial draft. Twenty-three of the twenty-four cabinet members attended the meeting; the absent one sent his consent even before the draft was unanimously approved by the cabinet. On September 3, after a false start, the ambassadors of the four powers—after 34 official sittings spread over 17 months—signed the agreement. Almost three decades after the War the human problems existing in Berlin were recognised. It was agreed that these would be best solved directly by those immediately affected by them.

The new West German diplomacy has achieved one of its primary objectives. The post-War freeze has been defrosted and the first few necessary steps have been taken for Germany's emergence as, what Brandt called during his election campaign, a "liberated, not a defeated nation". As a price for the sins of an *earlier generation*, the Germans have now officially recognised the 'post-War reality' of a divided Germany.

Secret persuasion, much politicking and quiet diplomacy on the West German side, preceded the four-power agreement. The choice of timing to push through the new *Weltpolitik* coincided with the thaw in the cold war and the West German economic boom, when. West Germany meant so many things to so many countries: The US needed West German help to share its burden in the defence of West Europe. The Soviet Union needed troop reductions in Europe so as to be able to concentrate on its eastern frontiers and needed West German help to persuade the West to agree to a European security conference. The Soviet Union also wanted a treaty of non-aggression with West Germany. Britain wanted West German help to get into Europe. France needed West German co-operation for the proposed European federation.

Induced Uproar

The time was ripe for new West German *diplomatic initiatives. The* government announced that British entry, as much as Franco-German co-operation, were both necessary preludes to European unity; it promised to share the burden of Western Europe's defence and persuaded Washington to maintain its interest in Europe; it signed treaties of non-aggression with Moscow and Warsaw, and dangled the possibility of a European security conference, but demanded proof of Soviet intentions before ratifying the treaties or working for the conference.

At home there was a restive and harassed opposition and the formidable Springer press, *hostile to* "peace with communist aggressors". While the opposition had to be granted its constitutional right to be informed and consulted, the monopoly press had to be curbed in its mischief-making potential for whipping up popular emotions against the alleged "total sell-out". The leader of the parliamentary opposition was taken into confidence at various stages on the progress of the negotiations, but his oath of secrecy has proved to be a liability to him *vis-a-vis* his colleagues, *particularly in view of the impending* Christian Democrat party elections; he has been privy to the secrets without being able to influence the course of events. The press was looked after by a news leak which suggested that the West German State Secretary, Bahr, during his visit to Washington with the Chancellor, was persuading a reluctant State Department to concede to the Russians their fond desire for consular representation in West Berlin. The West German press raised a big 'hullabaloo', and along with the opposition fell into the trap. The induced uproar provided the government with an opportunity to test and prepare public opinion on this sensitive issue and to announce simultaneously a complete news blackout. *The entire negotiations* were kept secret till the government released the official text as a *fait accompli.*

The same procedure has been adopted in the present phase of the two-tier intra-German dialogue, following the ambassadorial agreement. At present Secretaries Bahr and Kohl, representing West and East Germany, and Miller and Kohrt representing the two parts of the divided city, are engaged in the "onerous and painstaking task" of implementing the *four-power agreement*, but this time with the official sanction, hitherto lacking, that can make all the difference.

The nature and origins of the Berlin problem were *once* more indicated by a simple but revealing oversight. The two great and the two not-so-great powers having agreed upon the English, French and Russian texts had forgotten to agree upon a German version of the text to form the basis of the intra-German dialogue on what should ordinarily have been purely a German problem. That the task was not merely a question of translation was proved the next day when the approval of the German text required a fresh series of negotiations and hard bargaining, a postponement of the signing ceremony, and also the diplomatic illness of the *US Ambassador*, Kenneth Rush. Finally, the official communique said that the German text was not binding upon the four powers, whose overall responsibility over the city of greater Berlin was

expressly acknowledged by the terms of the agreement. The West German government and the Berlin senate thanked the Western powers for protecting their interests and the East Germans expressed similar sentiments for the Russians.

The immediate results of the present agreement can be summed up as follows: acknowledgement by the four powers and by the Germans on both sides of the border of the special status of Berlin (the critics say that three German states have been created by the new agreement); unhindered movement of traffic from West Germany to West Berlin through East German territory; access from West Berlin to East Berlin; the West Berliners have also been allowed the right of consular representation through Bonn, a right hitherto denied them by Moscow and Pankow: in return, Moscow was given clearly defined rights of consular, trade and cultural representation in the western sector of Berlin. Referring to this clause, an opposition politician called the agreement an "exchange of an apple-garden for a piece of apple". Brandt in his national broadcast after the signing ceremony said: "who did not wish more could be achieved? But, at this stage, the reality of the wall has to be acknowledged. The greatest achievement of the Berlin agreement lies in the fact that Berliners will no longer have to live through crises". The next day, speaking in Berlin, Brandt was more cautious: "let us hope that there will no longer be a Berlin crisis". At about the same time a refugee was reportedly shot on the other side of the border, probably a stage-managed show to help the East Berliners draw the 'proper' conclusions about the agreement.

However, as the Chancellor said, the Russians have proved their *bona fides* through the agreement. They have bent their backs to push the agreement through. Many trusted friends have been cast aside. "For reasons of old age", Ulbricht was removed, first from the party post and ultimately even from his ornamental state position. In fact, Ulbricht's sudden "old age" was acknowledged in West Germany as one of the most significant events facilitating the agreement. Ambassador Abrassimov, who was retained in Pankow for nine long years to provide the link between Pankow and the Central Committee of the CPSU, of which he is a member, was replaced soon after the signing of the agreement in which he had played a major role. His successor is the tough Soviet diplomat who in 1968 in Prague smoothened out Dubcek. He can be trusted to see that the East German chief, Honecker, does not come in the way of the growing Soviet-West German friendship. The Russians have also not wasted any time in striking while, as a French newspaper said, "the iron is hot". In the same week as the signing of the Berlin agreement, the Soviet Ambassador in Bonn invited Brandt to visit the Soviet Union for the second time, much to the annoyance of the French. The French feel they have been pushed into playing second fiddle to the West Germans and are in the process of losing much of the headway they had made in East Europe during the de Gaulle era. The West German Chancellor is due to visit the Soviet Union towards the end of this month, before the Soviet leaders visit Paris in October in return for Pompidou's Moscow visit, when the French leader had helped to clear a bottleneck in the four-power negotiations.

Two-Germany Policy

Meanwhile the West Germans are planning trade pacts with Moscow, Warsaw, Budapest and Prague, and perhaps with Pankow. The Moscow and Warsaw Treaties are also likely to be ratified soon. Scheel, the Foreign Minister, will be in New York during the next UN General Assembly session, personally to ease the process of getting both the Germanies into the UN. It will be some diplomatic victory for Moscow, especially if the two-China policy fails at the same time as the two-Germany policy succeeds. Bonn will have helped Moscow, while Taipeh and perhaps also Tokyo, will have let down the US—and all are in different ways US 'allies'. This, and the proposed European security conference, is likely to give the sort of initiative to Moscow which it has been looking for in Europe for some time.

At the signing ceremony, Ambassador Rush sought to regain some lost ground for the US by underlining the US initiative in bringing about the Berlin agreement. He even tried to help launch Nixon's election campaign from the Allied Control Council building in Berlin. (Earlier, when the date of the signing ceremony was still undecided, on Rush's insistence the timing for the ceremony was fixed at 1 p m , Central European Time so that the NBC could relay it live at American prime viewing time). Rush spoke at length of Nixon's personal interest in the Berlin negotiations and drew a straight line between the agreement and Nixon's inaugural promise in 1969 to "end the era of confrontation and begin the era of negotiation". But it is doubtful if his speech cut much ice. The Berlin agreement was possible primarily due to Bonn's new *Weltpolitik* and the personal initiative of Berlin's former mayor, Willy Brandt. In this Brandt was helped by the mutual desire of Washington and Moscow to reduce their troop commitments in Europe, but the real achievement is Bonn's, even though Washington can, of course, claim that the agreement was a gain for the free world, etc.

At home, the position of the opposition is closely comparable to the position of the British Labour Party on the question of British entry to the EEC, with one difference. It is relatively easier for the West German opposition to find fault with a policy that it has opposed on principle than for the British opposition which sees the fruits of its own previous labour being robbed by the government. Besides, the impending Christian Democratic Union (CDU) party elections in Germany make all the difference. As a party, the Christian Democratic opposition refused to take any stand on the Berlin agreement for an inordinately long time. It even refued to participate in TV discussions on the subject, so indicating its embarrassment. At last after much consultation and more hesitation, it came out with only "some serious reservations". The smaller sister opposition party, the Christian Social Union (CSU) has already criticised the CDU leaders for their half-hearted opposition, thereby further disturbing the understanding between the CDU and the CSU.

Opposition leader, Barzel, though publicly insisting upon his right to be informed, seems to look for pretexts to avoid being consulted on the course of events which he cannot influence. Recently he refused an invitation by the Foreign Minister to discuss Berlin. Even the Russians have obliged the government by inviting Barzel to Moscow along with Brandt. He has not refused the invitation which is likely to embarrass him whether he accepts or rejects it. Due to their own compulsions, the Russians are co-operating with the government. This is the trump card of the Social Democrat government and the despair of the opposition.

New Directions in Aid

Annual Report 1971, World Bank and International Development Association, Washington, 1971, pp 116.

THIS report on one more year of the World Bank's operations clearly brings out the conflicting trends in international aid. Under Robert McNamara's leadership, the World Bank has expanded its operations and diversified into new fields. At the same time the general climate, with the major aid-giving countries facing inflationary pressures and balance of payments problems, has not been exactly the most conducive to aid operations.

First, the general context. Despite the initial hopes, the Western countries were not able to reduce the inflationary pressures in their countries. The remedies followed in some of them, particularly the USA and the UK, only succeeded in increasing unemployment without containing inflation. As a result, the overall growth rate in the advanced countries declined to 3 per cent in 1970 from the 5-5½ per cent achieved in the 1960s. The inflationary pressures have led to currency troubles which began in May 1971 and to protective measures by the US after the end of the World Bank year.

Unfavourable Climate

Gross foreign aid flow, according to OECD estimates, increased to $ 15 billion in 1970. However, as the World Bank Report points out (on the basis of a special study on debt-servicing problems), the increase was entirely in commercial credit provided on hard terms (relatively short period, high interest rates and high prices arising out of tied purchases). Evidently, governments of aid-giving countries, faced by internal problems, found it difficult to increase their aid commitments. This has happened despite the Pearson Commission's call for expansion of the official element in total aid to keep the servicing burden on borrowing countries at a low level.

The World Bank, despite the unfavourable climate, has continued to provide increasing aid for more diversified development activities. Its sanctions increased from $ 1,680 mn in 1969-70 to $ 1,896 mn in 1970-71. There was a marginal decline in IDA approvals, from $ 606 mn to $ 584 mn. But the overall operations in 1970-71 at $ 280 mn were higher than $ 2,286 mn in 1969-70. As the following Table shows, the operations were diversified both in their geographical and operational content.

IBRD-IDA Approvals, 1970-71 ($ mn)

A	*Geographical Distribution*	
	Africa	468.70
	Asia	838.50
	Europe	418.00
	Oceania	51.00
	Latin America and Caribbean	704.20
	Total	2,480.40
B	*Purpose-wise Distribution*	
	Agriculture	419.10
	Education	107.90
	Telecommunications	195.50
	Electric power	500.90
	Transportation	651.10
	Industry	32.00
	Technical assistance	4.00
	Development finance companies	253.00
	Water supply and sewerage systems	188.70
	Tourism	10.00
	Population	7.80
	General development	110.40
	Total	2,480.40

Taking IBRD and IDA together, out of approvals of $ 2,480 mn, while the bulk of the operations remained in Asia ($ 838 mn) and Latin America and the Caribbean ($ 704 mn), Africa took a substantial $ 469 mn or almost 20 per cent against its share of less than 10 per cent in the 1960s.

So also activity-wise, while infrastructure remains the staple of the Bank-IDA operations (with transportation taking $ 651 mn, electric power $ 500 mn, development finance companies $ 253 mn, and telecommunications $ 195 mn), some new activitives have begun to pick up: in 1970-71 agriculture took $ 419 mn and education $ 108 mn, and such unglamorous appurtenances of development like water supply and sewerage systems ($ 189 mn) have appeared in the Bank's operations. The small allocation of $ 7.80 mn to population control again reflects the Bank's concern for general factors in the development process.

The Bank has thus graduated from being a financier of infrastructure in developing countries to extending diversified support to the entire development process. It is now involved in activities like improvement of agricultural credit and has become interested in problems of urbanisation; for example, anti-pollution programmes are becoming an integral part of its financing operations. And the Bank is developing close relations with UN agencies like FAO, WHO and UNDP in the newer fields.

As the Bank's focus changes, India is becoming less important in the Bank's operations. In 1970-71 the Bank approved for India $ 243 mn (less than one-tenth of its total operations) — all of it out of IDA funds, which is clear evidence of India's declining development effort and its poor ability to service loans. These funds were mainly for agriculture and infrastructure development.

Lengthening Time-Lag

The time-lag between the Bank's disbursements and its approvals seems to be lengthening. Disbursements increased from $ 915 mn ($ 772 mn for the Bank and $ 143 mn for IDA) in 1969-70 to $ 1,190 mn ($ 955 mn for the Bank and $ 235 mn for IDA) in 1970-71. During the three years ending June 30, 1971 disbursements have been $ 2,489 mn (or 50 per cent of approvals of $ 4,975 mn) for the Bank as against disbursements of $ 2,230 mn (90 per cent of approvals of $ 2,563 mn) for the three years ending June 30, 1968. Even allowing for a normal time-lag between approval and disbursement, a showing down at the disbursement-end is evident. This may be for various reasons. It may be due to the fact that the Bank, in a hurry to make approvals, has been taking up projects prematurely. Or it might be that the borrowing countries' procedures are inordinately time-consuming; the Indian bureaucracy, for instance, is well known for its ability to hold up development programmes with its procedures (as it did in the case of the colliery loan). This is a matter to which the Bank needs to pay some attention.

Despite the difficult capital market conditions in advanced countries, finance has not been a bottle-neck to the Bank's operations. The Bank apparently believes that lack of money, rather than the cost of money, is a greater impediment to development and has continued to borrow, paying often 8 to 8½ per cent. In 1970-71 the Bank raised $ 819 mn net against $ 299 mn net in 1969-70. Besides the normal lending countries (the USA, West Germany and Japan), the Bank issued loans in such unlikely countries

My cup of tea

Yes, I'm choosy about my tea. I like it good and rich and strong... the way Richbru is.

Tops in taste, tops in flavour.

Cup after cup after cup, you get so many more from every pack of Richbru.

The tea that's setting a new trend in modern homes.

It's good and rich and strong

as the Netherlands and Libya.

The Bank has few illusions about the long-term prospects of aid. A special study of aid problems made by it shows that the external public debt of developing countries now amounts to $ 59 billion. On the bilateral official and multilateral debt of $ 43.4 billion, service payments of $ 19.8 billion fall due to be paid over the years 1970-75; on $ 15.3 billion due to private creditors, service payments due in 1970-75 amount to $ 13 billion. At the same time, the markets for the developing countries' products are not expanding, and the recent inflationary pressures in the advanced countries have helped to worsen the terms of trade for the developing countries. Clearly, there are limits to the financing of development with loans.

Policy Issues

There are three major directions in which aid policies will need to be directed. First, it is absolutely necessary that the 'cost' of aid be reduced. Despite the World Bank's attempts to soften the interest cost of loans, its loans, at 7¼ per cent, impose a substantial debt-servicing burden. IDA is one way out, but is increasingly coming up against the budgetary problems of aid-givers. One solution would be to require all countries in which purchases are made out of World Bank loans to provide to the Bank a budgetary allocation equal to 4 per cent of such purchases for a period of seven years. This would help the World Bank to soften its interest rates to between 3 and 4 per cent. The Bank also needs to have, instead of the present two-tier rate system (7¼ per cent on Bank loans and ¼ per cent on IDA loans), a multi-tier structure with the highest rate (and shortest period) for industrial loans, an intermediate range for infrastructure (power, transport, communications) and IDA terms for social projects (population control, water-supply and so on).

Second, if tied aid continues, the Bank needs to press for tied repayment; in other words, where aid is given on a tied basis, the lending country must be asked to obtain repayment by purchases from the borrowing country. The USSR and the East European countries already operate on this principle, and the Western countries need to be brought round to accepting it.

Finally, given the international trade structure and the terms of trade between developed and developing countries, the Bank needs to amend some of its policy dogmas. It is necessary that the Bank takes a long view of the development process and its viability. Particularly it needs to be more liberal in its attitude to import-substituting projects. Further, it needs to actively support the UNCTAD in helping developing countries to obtain preferences for export of their manufactures to the developed countries.

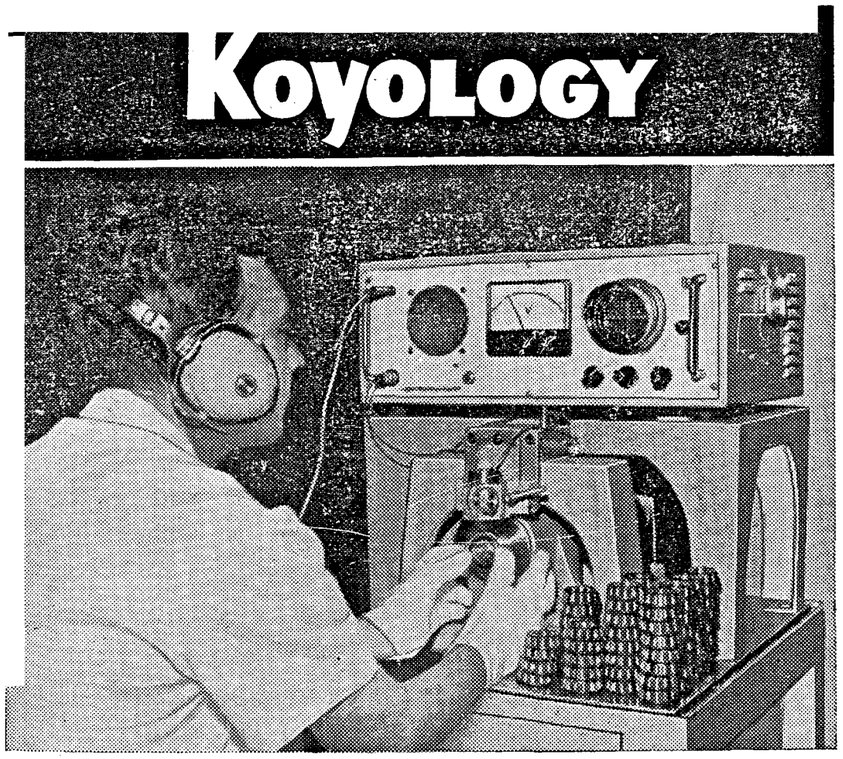
The World Bank is in the "development" business and has shown growing awareness of the problems inherent in this business. Its own policies are being increasingly adjusted to the newer facets of development, and it still remains the trend-setter, more than even the developing countries themselves, in anticipating these problems and seeking to meet them. Besides UNCTAD, it is the most influential lobby the developing countries have for development. These countries need to back it up in its efforts to push the development process along.

Back to the Gold Cross?

1971 Annual Report, International Monetary Fund, Washington, 1971; pp xv + 247.

THE Annual Report of the International Monetary Fund for the year ending June 30, 1971 gives no premonition of the events which were to envelop the developed countries in a currency crisis and to call into question the very *raison d'etre* of the IMF. Not that indications of a brewing crisis were not evident during the year covered by the Report. The Report notes that the rate of growth in the advanced countries had begun to slow down, being 3 per cent in 1970 against 5 per cent in the sixties. The major victims of this slow-down were the UK and the USA which seemed to be experiencing barely any growth of national income and which were faced with growing unemployment. Almost all advanced countries had been facing inflationary pressures at the rate of about 6 per cent a year. What is more important, these inflationary pressures had begun to percolate into international trade; of the 15 per cent growth in international trade in 1970, the IMF Report notes, a full 6 per cent was accounted for by price rises.

Comfortable Liquidity



It is at this point that differences between governments' actions and the IMF's mythology begin to appear. The governments, relying on an outdated version of the IMF mythology, had been seeking to curb inflationary pressures by resort to monetary policy. This failed to contain inflation, but led, in some countries like the UK and the USA, to increased unemployment. Apparently, the world was fast approaching the classic 1931 situation.

In the meanwhile, the international liquidity situation, as evidenced by total reserves and resort to IMF facilities was far more comfortable. Two tranches of SDRs, aggregating $ 6 billion, had been distributed and had been smoothly absorbed in international trading transactions. For the first time, the gold element in total currency reserves came down to below 50 per cent. And, thanks to the US payments deficits, holdings of reserve currencies had been rising. Japan, with the world's major undervalued currency, was a large holder of reserves in this form to stave off action by the US (which ultimately did act). However, while Japan went on absorbing dollars to soften the impact of US deficits on the US, other markets, freer than Japan's, could hardly be kept under control. The first wave of speculation was against the D-Mark, forcing it off its peg to a floating position.

Writing on the Wall

Yet the IMF Rip Van Winkles hardly saw the writing on the wall. To the IMF the external balance is everything, and all policies should be so adjusted as to maintain the external balance at fixed exchange rates. Having seen the failure of its earlier prescription to use monetary policy to control the domestic economy, the IMF, in its 1971 Report, prescribes a much stronger mixture: more active use of fiscal policies, adoption of an incomes (and prices) policy, and restrictions on capital transfers. It is evident that a free market in currencies is not part of the IMF mixture. All subsequent moves of the IMF indicate that the IMF is strongly tied to maintaining the position of gold. This is a position not dissimilar to that of France which holds all its reserves in gold.

The IMF's distrust of floating currencies is hard to understand. It arises mostly out of its faulty diagnosis of the problem. The IMF attributes the present currency difficulties entirely to

Bearing precision without precedence

KOYOLOGY is the science of bearing precision. It is unique and exclusive to KOYO SEIKO of Japan who invented it in their $1,000,000 Research centre.

Koyology utilises the norms of tomorrow to produce bearings today. Its tolerances are in terms of micro-millimetres, not in 'thous'. In raw materials, nothing but the best will do for Koyology. It will go to the end of the world to obtain them. The testing methods are the last word in sophistication. They reveal faults not only on the surface, but right down to the core. The oscillograph illustrated here, for instance, reveals noises which will escape the sharpest ear.

KOYOLOGY has come to India to produce KOYO-INDIA precision bearings. Drop a line if you want the world's finest precision bearings. Or if you want to know a little more about Koyology.

the manner in which deduction for current repairs has been provided for under the Indian Income Tax Act—especially, the way in which the provisions of the law in this regard have been interpreted lately by judicial authorities whose decisions in the absence of any definition of 'current repairs' in the Act play a crucial role in determining the scope of the provisions — does not reveal any appreciation of the precise function of maintenance expenditure *vis-a-vis* depreciation allowance in income-computation. The result has been an unnoticed, but not quite negligible, erosion of the tax base to the detriment of revenue — of course, to the benefit of a section of tax-payers.

II

Sections 30 and 31 of the Income Tax Act, 1961, which provide for *inter alia* deduction of expenditure on account of repairs, read as follows:

"Section 30. In respect of rent, rates, taxes, repairs and insurance for premises, used for the purposes of the business or profession, the following deductions shall be allowed —

(a) where the premises are occupied by the assessee —
  (i) as a tenant, the rent paid for such premises; and further, if he has undertaken to bear the cost of repairs to the premises, the amount paid on account of such repairs;
  (ii) otherwise than as a tenant, the amount paid by him on account of current repairs to the premises;

*

Section 31. In respect of repairs and insurance of machinery, plant or furniture used for the purposes of the business or profession, the following deductions shall be allowed —
  (i) the amount paid on account of current repairs thereto;
  (ii) the amount of any premium paid in respect of insurance against risk of damage or destruction thereof."

An odd feature of Section 31, as compared to the immediately preceding section, is that to get the benefit of deduction on account of repairs (and insurance) of machinery, plant, and furniture, an assessee need not be the owner of the equipment, while in the case of a building, allowance for repairs cannot be claimed by a non-owner "unless he has undertaken to bear the cost of repairs to the premises". The logic behind this distinction is not obvious. Why a mere hirer of machinery, who is under no obligation to maintain the machinery in a running condition or in a state which corresponds to its depreciated book value, should be entitled to claim deduction for repairs is puzzling.

That, even so, is a minor issue. The more important point to note about these provisions is that there is no attempt whatsoever to link the scale of allowance for repairs either to the depreciated value of the assets or to the rate of depreciation permitted in the rules for them. The operative words are: "the amount paid on account of current repairs thereto". It might be supposed that the word 'current' in 'current repairs' was intended to delimit the scope of the allowance for repairs strictly to the amounts which are required to keep the equipments in a running condition and not restore them to their original state. There is, however, nothing to warrant such a view. On the contrary, an examination of the judicial decisions amply shows that the courts have not been inhibited by any such consideration in their approach to the interpretation of 'current repairs'. In fact, brushing aside all contention for confining the scope of the expression to not-too-heavy repairs, High Courts in India have gone on to hold that expenditure incurred to restore an asset to its original condition or in some respects to an even better condition might qualify for deduction as revenue expense — the rate at which annual depreciation is charged evidently being of no consequence in their view.

A vague awareness of the issues involved is perhaps noticeable in two early judgments of the Allahabad High Court. In the first case, Ramkishan Sunderlal *vs* Commissioner of Income Tax,[7] the Court pointed out that the adjective 'current' in the expression 'current repairs' restricted its meaning to petty repairs carried out periodically. In the other case, L H Sugar Factories and Oil Mills Ltd *in re*,[8] the Court refused to allow deduction of expenses on re-roofing of labourers' quarters in consideration of the fact that the assessee was entitled to deduct depreciation in respect of the same structures. Yet the reasons on which the decisions were based were not spelt out clearly or convincingly and did not receive the attention they deserve in the judgments which followed from other High Courts of India.

The principle which has mainly guided the Indian rulings was that laid down by the Privy Council in Rhodesia Railways Ltd *vs* I T Collector,[9] where, out of a total length of 394 miles a stretch of 39 miles of the old track was replaced with new rails and new sleepers and for 40 miles of the track the old rails were relaid on sleepers which were replaced. The entire cost of these operations was allowed, by the Privy Council, as revenue expenditure. But there were two vital strands in this ruling which appear to have made no impression on the Indian courts who followed it. First, the principal argument advanced by their Lordships in the Rhodesia Railways case was: "It [the expenditure] did not result in the creation of a new asset; it was incurred to maintain the appellants' existing *line in a state to earn revenue*". The 'state to earn revenue', it might be presumed, was not the same as the original state of an asset. No Indian court which chose to follow the ruling seems to have paid any attention to this important distinction. Secondly, under the rules prevailing in the country from which the Rhodesia Railways case had gone up to the Privy Council, no allowance was admissible for depreciation of rails and sleepers. The Noble Lord felt that there might be some justification for refusing to allow any deduction 'in the name of depreciation', where deduction 'in the name of repairs' is allowed, but not the other way round, i e, not for refusing to allow expenses for repair of capital equipment on the ground that no depreciation was permissible for that equipment, as contended by the Revenue. Unfortunately, these observations, too, have not been considered to be of any significance by the Indian courts — except the Allahabad High Court in one of the cases noted above. The Indian decisions have centred round the view that there is no reason why repair expenses, however heavy, should not be treated as current repairs so long as such repairs help restore the asset to its original shape and not merely its depreciated book value. That it is primarily the task of depreciation allowance to ensure the maintenance of an investor's capital intact, and that to permit deduction for repairs to restore an asset to its original state where depreciation is already separately provided for is to allow deduction for the same item of expense twice over, seems to have been totally overlooked.

In fact, the courts have gone even further. Replacement of major parts of an equipment by new and decidedly better ones, resulting in an improvement of the equipment as a whole over

its original model, is categorised by the courts as current repairs, i e, maintenance. For instance, in a case where *the tax-payer replaced the petrol engines* of two of his buses with diesel engines, the Court held the replacement to be nothing beyond 'current repairs'.[10] The Tribunal, the highest fact-finding authority in income-tax matters, had observed: "It would have been possible to have replaced these petrol engines by new petrol engines. The object in fitting diesel engines was to decrease the running expenses. The diesel engines give more mileage per gallon and the cost of diesel oil is less than the cost of petrol". Yet the Court allowed the cost of installation of the new diesel engines to be charged against the income of the year as 'current repairs'.

Referring back to the rationale for treating maintenance expenditure as revenue expense, supplementary to depreciation allowance, one feels tempted to ask: If the new diesel engines improved the earning capacity of the asset (as they admittedly did) and hence its capital value, would not the deduction allowed for the cost of installation of the new engines result in an understatement of the income of the year unless the depreciation allowance for the buses was correspondingly reduced? Alternatively, in such a situation, should not the written-down-value of the asset be written up to the extent the new diesel engines had enhanced their market worth, and the resulting capital appreciation be charged to revenue by way of recaptured depreciation? Such questions, of course, were not before the Court to answer.

On similar reasoning, the Madras High Court held in a case[11] that the replacement of roller stands of textile machinery by an assessee with a more modern and efficient type of the same parts, constituted 'current repairs' and the cost of such replacement, even though considerable, was allowable as revenue expenditure. The Court observed that "even assuming that there was some improvement in the component parts and the improvement of these parts was publicised by the manufacturers, it did not necessarily follow that an enduring or new asset has been brought into existence". It must be submitted that it is not easy to see the logic in this argument. The court, no doubt, wanted to draw a line between the advantage derived by the replacement of the component parts of an asset by more efficient parts and the advantage imparted by the replacement of the asset as a whole or substantially the whole of it. But is this distinction of any relevance to the purpose on hand, *viz,* determination of the income of a given time period in a manner which leaves the tax payer's earning capacity unimpaired?

Besides, how thin the line is in practice, between the replacement of 'component parts' and replacement of substantially the whole of the asset, and how far afield the interpretation of 'current repairs' has gone, can be seen most clearly in the judgment of the Madras High Court in another case, *viz,* C R Corera and Brothers *vs* Commissioner of Income Tax.[12] In this case, the assessee incurred heavy expenditure (about Rs 32,000) in 'repairing' — rather, 'overhauling' — his cargo boats the original cost of which was about Rs 75,000 and which had been used for over 20 years that had brought down their written-down value to no more than Rs 4,248. The entire cost of overhauling the boats was declared by the Court to be allowable as deduction in one year as 'current repairs.' It was admitted that only "the skeleton of the boats was retained, all other structures upon the boats having had to be renewed", and the process of 'repair' involved a period of 16 months. Renewal of boats on this scale, which the repairs in this case clearly amounted to, apparently did not in the eye of the court constitute renewal of substantially the whole of it. If rational economic and accountancy principles were followed, the assessee could have claimed at the most a deduction for an amount equivalent to the written-down-value of the boats on the ground that they had become totally unserviceable and that, therefore, their written-down-value overstated their market worth. Cost of repairs, in excess of this amount, should have been treated as capital expenditure which it was open to the assessee to recoup through a depreciation allowance. To maintain, however, that the written-down-value was zero would be illegitimate as long as the skeleton of the boat had any scrap value. To justify deduction for an amount beyond the written-down-value would involve the assumption that the market worth of the depreciated asset had turned negative.[13] The Income Tax Officer who made the assessment in Corera Brothers' case had correctly sensed that expenditure of this order, when the written-down-value was so small, could not but be largely 'capital' in nature. "That" (i e, the magnitude of the expenditure on repair relatively to the written-down-value), declared the Court quite emphatically, "is not a circumstance at all germane for determining the nature of the repairs"!

It may thus be seen that, even the two main tests which the courts might seem to have adopted in deciding cases involving the question 'what constitutes current repair', *viz,* (i) that such repair did no more than restore the asset to its original condition, and (ii) that it did not involve restoration or replacement of the entire machinery or substantially the whole of it, have not been adhered to consistently by all courts — apart from the fact that these tests have no sanction in the principles on which measurement of annual income is based. This has, in fact, resulted in the inadvertent introduction of an element of double allowance — and even more, where improvement on the efficiency of a capital equipment as it originally was is effected through the repairs — on account of capital depletion in the computation of business income, allowances for which are notoriously more liberal than for income under other heads, resulting in discrimination especially against human capital.

III

The court rulings on this issue have eaten into the income base from another direction. An important tenet of income-accounting on an annual basis is that items both on the debit as well as the credit side of the profit-and-loss account should relate, as far as possible, to the transactions of the year in view. So, to qualify for a place on the debit side of the profit-and-loss account, an item of expenditure must be current or 'revenue', and not 'capital', in nature and any expenditure which begets an enduring advantage is considered capital. What precisely renders an advantage enduring is not laid down in the statute books. But it is only proper that all expenditure of which the benefit is derived over a fairly long stretch of time — logically, any period excluding an accounting year — should be classified as 'capital'. This assumption is implicit in most of the judicial pronouncements bearing on the question. Repairs accumulated over the years, but carried out at one time should on no account be regarded as 'current'. Presumably, to secure this objective, the Bombay High Court in one case, *viz,* New Shorrock Spinning and Manufacturing Company *vs* Commissioner of Income

Tax,[14] interpreted the word 'current' in this context to denote only such repairs as are attended to when the *need* arises and as are not allowed to fall into arrears or to be accumulated. But the test does not appear to have served the purpose for which it was intended. In almost all the cases which went up for consideration before the courts, a good part of the repairs carried out in the course of a year were undertaken plainly to remedy the accumulated wear and tear of many years but that did not deter the courts from treating them as 'current'. Even in the New Shorrock case, (in which the need test was enunciated) it is interesting to note, as the Madras High Court commented in the course of the judgment in Corera Brothers' case, that "the so-called current repairs involved the fitting up of a totally new device to the spinning machinery which actually rendered the working of the machinery easier and could from certain points of view be regarded as introducing an additional advantage. But nevertheless, the view was taken that the expenditure was incurred to preserve and maintain the asset and that it was current repairs even though it was incurred after more than 60 years".

Few of the other cases reveal any attempt to apply the 'need test' either. Thus, in Commissioner of Income Tax *vs* Ranjit Singh,[15] where the tax-payer had leased out his hotel for 20 years at an annual rent of Rs 50,000, expenditure of nearly Rs 25,000 for surfacing the approach roads to the hotel with concrete was allowed by Punjab High Court as 'current repairs'. Despite the fact that the roads were surfaced with concrete — definitely an improvement upon their old condition — and that heavy expenditure was incurred in a particular year to remedy the effect of several years of wear and tear or neglect, the Court felt that the repairs fell in the category of 'current repairs'.

Even if the 'need test' stood in the way of the admissibility of accumulated repairs as revenue expenditure, the omnibus provision in the Income Tax Act, 1961, *viz,* Section 37 providing for the deduction of all expenditure incurred wholly for earning income from business or profession which are not covered specifically in the other sections could be invoked in support.[16] This would be borne out by the following observations of the leading commentators, Kanga and Palkhivala on the law and practice of income-tax:

"The cost of repairs would be a revenue disbursement even though repairs may not be undertaken every year but may be effected when matters become serious. Accumulated arrears of repairs are nonetheless repairs necessary to earn profit, although they have been allowed to accumulate (Law Shipping Company Ltd *vs* IR)".[17]

In the Rhodesia Railways case, too, Lord Macmillan made it clear that to qualify for deduction, repairs need not be confined to the year of assessment "for very many repairs have the result of enabling income to be earned in future years"

Plainly, these dicta constitute serious impediments to any attempt to arrive at the income figure of each year separately with any degree of accuracy, though that is said to be the aim of both accountants and tax gatherers. These pronouncements, in fact, go against the criteria on which the distinction between revenue expense and capital expense is based, to which reference has been made earlier, *viz,* that the latter are those which confer 'an enduring benefit'. True, the degree of durability required to characterise a given item of expenditure as 'capital' has not been laid down with any precision and "depends upon the facts of each case", thus providing wide scope for arbitrary judgment. But if knives with an average life of three years could be held, as was done by the House of Lords in a case,[18] to be the capital assets of a cobbler's business, how, pray, can accumulated repairs of many years or extensive repairs, of which the benefit is reaped over several years, be treated as 'current' and the expenses involved considered deductible against the year's income in which they are incurred?

IV

It can, of course, be argued that the cost of repairs, after all, represents the actual outlay on capital in some form or other and that, like all capital expenditure, it deserves to be set off against income over the years whether by way of amortisation allowance such as depreciation or as revenue expenditure in one year. Indeed no exception could be taken to this plea had our income-tax structure been proportional instead of being progressive. It is salutary to remember that, even our corporate taxation has an element of progressivity. Secondly, a proportional tax, the benefit conferred by a capital allowance, is enhanced substantially, if it is accelerated in point of time, since with a long spread-over the value of the allowance gets considerablly reduced through discounting.[19] Thirdly, in the present framework of the Income Tax Act, "the balancing charge" or the recapture provisions apply only to the depreciation allowed in the computation of income for tax-assessment of earlier years and not to repair expenditure deducted in the past in respect of that asset. That is to say, on the disposal of an asset, only the excess of sale proceeds over the written-down-value (where the sale proceeds do not exceed the original cost of the asset) is brought back to taxation as ordinary income while no part of the expenditure on repairs, for which deduction has been allowed in the past assessments, comes within the purview of these provisions. Getting a capital outlay admitted by the revenue authorities as 'current repairs' thus confers advantage to a tax payer in more ways than one.

As it is, allowance for depreciation under the Income Tax Act, especially after the sweeping simplification made in the rules towards the end of 1969 is liberal enough.[20] Under the amended rules, depreciation is allowed in respect of machinery at the rate applicable for a whole year, even if the machinery is used just for a day before the close of the accounting period. In addition, special capital allowances are available in the Income Tax Act in the form of development rebate. Notice for its termination has been given only now. The further bounty to tax payers, which the liberal grant of deduction for none-too-current repairs has provided is hardly called for. The hope expressed by the Taxation Enquiry Commission, that the word 'current' would lend some precision to the expression 'current repairs'[21] has been totally belied. A fresh look needs to be taken at the provisions for current repairs and the damage done to the income base, and thereby to equity, by uninformed liberalisation of their scope through successive court rulings over the years.

The principle that the allowance for repairs should be so restricted as to ensure that the written-down-value of an asset corresponds to its actual economic worth, is not easy to implement; and in whatever manner this is attempted, some degree of arbitrariness is perhaps unavoidable. The aim, nevertheless, should be to achieve it to the extent practicable. This surely cannot be more difficult than ensuring that the repair of a given item of machinery does not restore it beyond its original state, and it has to be done if the

High Court rulings are to be implemented in practice. Imposition of a ceiling on the allowance admissible for 'current repairs' linked with the written-down value of the asset, such as 10 or 20 per cent of it, would perhaps be much less unsatisfactory than the principles on which deduction for repairs is currently allowed. It is worth noting here that, under the law with reference to which the Rhodesia Railways case was adjudicated, while deciding the amount admissible under 'repairs' of an asset, sums allowed on account of its wear and tear also had to be taken into account. Further, the recapture provisions in the Income Tax Act should extend to deductions allowed in the past assessments on account of repairs as well. There is little justification for treating expenditure on repairs, categorised as revenue in income-computation, differently from depreciation in this respect.

Notes

1 It is, of course, possible for the economic decay of an asset to fall short of the depreciation provided for in the accounts or in the IT Rules. How else does one come across — and such instances are not rare — assets in actual use many years after their written-down-values were reduced to zero? Distortions arising out of such situations are, however, seldom considered serious enough to merit any attention.

2 M J Bailey, 'National Income and Price Level' Appendix to "The Concept of Income".

3 The assertion made by L C Goyle in his article 'Current Repairs under the Income-Tax Law' (*Economic Times*, March 10, 1971) that "maintenance and depreciation are distinct and separate from each other and both constitue independent elements of cost", is based on a misconception of the role of the two debit items in income-accounting and is wholly untenable. The passage from Pickles's "Accountancy", quoted by Goyle in the article, does not seem to support his argument. It merely serves to underline the need for providing for depreciation in addition to the expenses for the upkeep of assets as the latter by itself can seldom be expected to cover fully the actual user cost of an asset. Pickles does not touch upon the delicate question whether, provision for depreciation should be reduced proportionately when upkeep expenses are unduly heavy — or conversely. The fallacious premise, that maintenance and depreciation are entirely separate and independent items on the debit side of a profit-and-loss account, perhaps explains Goyle's failure to see the obvious violation of the elementary rule of income-accounting involved in the assumption, that current repairs are meant to restore an asset to its original state and not merely to its depreciated book value. This assumption also underlies most of the Court rulings discussed in this paper. The case for further liberalisation of the provisions for current repairs, advanced by Goyle in the article, is based on an unquestioning acceptance of this erroneous assumption.

4 Vide, for example, Ved P Gandhi's 'Some Aspects of India's Tax Structure', Vora, 1970, p 56.

5 Viewed in this light, the provisions for amortisation of certain types of capital expenditure introduced in the Income Tax Act, 1961, by the Taxation Laws (Amendment) Act, 1970 (vide the newly inserted sections 35D and 35E), which were hailed so much by the business community offend horizontal equity, whatever their justification might be on other considerations such as 'growth'. (Of course, a vocal section did not fail to complain loudly of their niggardliness!) The equity implications of these provisions do not seem to have occurred at all to the Bhoothalingam Committee on whose recommendation they were introduced in the IT Act.

12 (1963) 49 Income Tax Reports 194-195.

13 Change in prices, no doubt, makes nonsense of capital values. But that is an entirely different matter. Widening the scope of repairs in income-computation, where depreciation is provided for separately, is a most clumsy and unsatisfactory way of tackling this problem. In any case, if that be the justification for countenancing double allowance on account of capital expenditure, in all fairness, it should be stated explicitly.

HARISH CHANDRA MATHUR STATE INSTITUTE OF PUBLIC ADMINISTRATION

Malviya Nagar, Jaipur (Rajasthan), India.

REQUIRES

MANAGEMENT ANALYST	able to initiate research in actual operations of government of Rajasthan in the area of O & M Work Study, Operations research etc.
	and
ECONOMIST	able to initiate researches in project planning and cost benefit analysis relating to State projects.

This Institute trains administrators of Rajasthan and conducts research in administration and development.

Adequate research qualifications with acquaintance of modern tools of analysis necessary. Positions will be equivalent to that of a Professor of an Indian University and persons will be on contract for three years.

Please write to the Director of the Institute stating details about your qualifications etc within one month of the publication of this advertisement.

Sino-Indian Relations

T Karki Hussain

In the wake of a significant electoral victory, the Government finds itself in a sufficiently strong position to move away from the old line on China. After an interval of several years it is showing signs of adopting a high-key posture in foreign policy, especially in matters of direct national concern. India can also gain impetus from the great fluidity in recent international dealings.

The crisis in Pakistan provides India with an excellent opportunity to reappraise the nature and scope of Sino-Pak friendship. India, till now, has missed the point that the collusion between China and Pakistan may not be total, though outwardly China might assure Pakistan of its support and sympathy.

There are, also, several stimulants on the Chinese side to normalise relations with India. In the seventies, China does not consider India a major competitor in the international field or a physical threat to its territorial integrity. It may, therefore, be persuaded to ease tensions with India in view of its concentration on the Soviet problem. Perhaps, the Sino-US detente *may lead to an improvement in Sino-Indian relations too.*

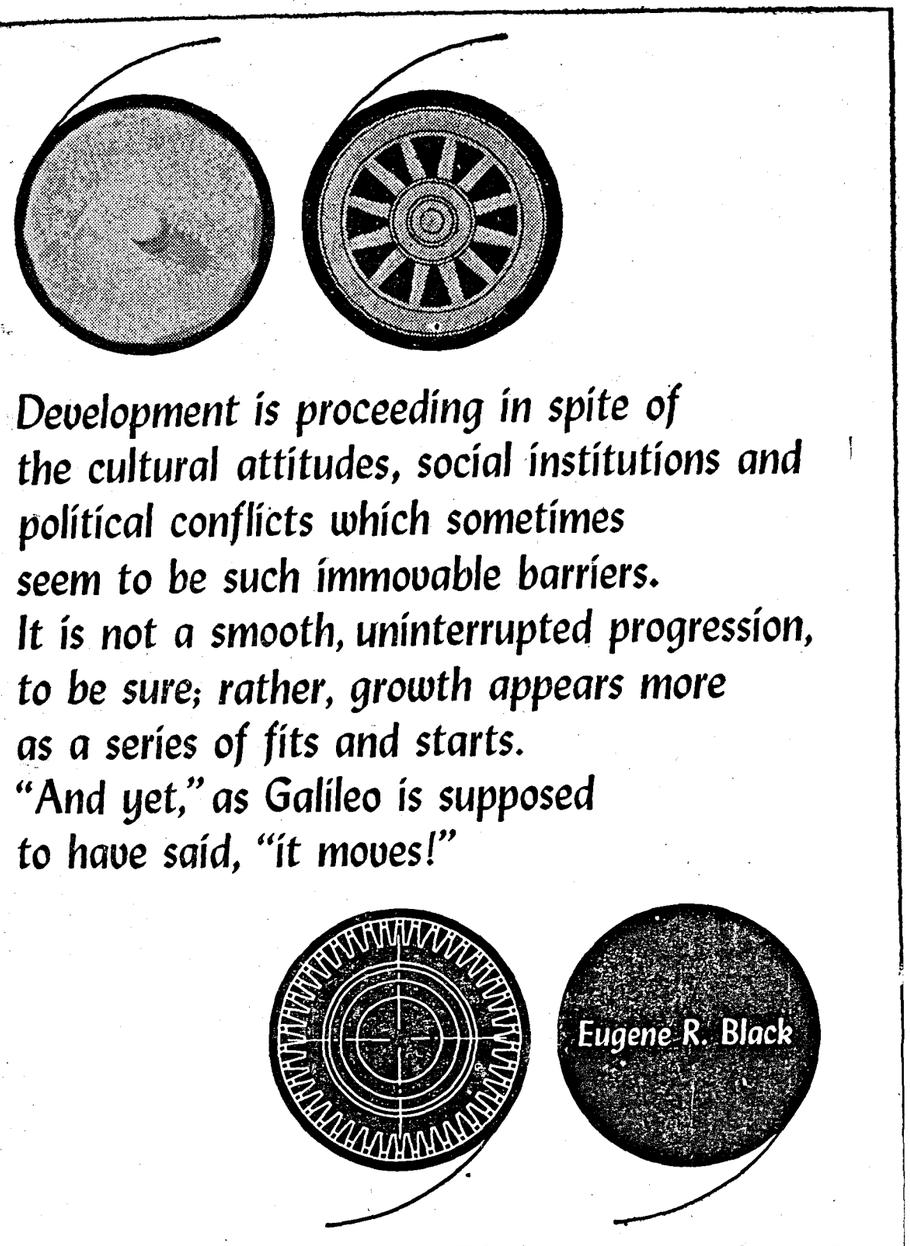
INDIAN leaders have often suggested that they are keen to re-establish friendly relations with China. But matters have not progressed much beyond the realm of public expression. It may be said that India's inhibitions regarding China are far too numerous to be easily dispensed with. These inhibiting factors include: a) bitter memories of the border dispute and the subsequent military reverses of 1962; b) China's 'new diplomacy' in the post-1962 period which succeeded in demolishing the diplomatic prestige gained by India in the fifties; c) China's friendly overtures towards Pakistan which has remained the traditional adversary of India; d) our increasing dependence on the two super powers, especially the Soviet Union, with which China fell out and remained on hostile terms throughout the sixties; and finally, the overpowering image of China in the Indian mind which makes us adhere to adverse value judgments on Chinese motives and actions—judgments which, in turn, inhibit us from fathoming the nuances and subtleties of Chinese political behaviour.

This last point, perhaps more than anything else, provides the clue to India's hesitation in being the first to initiate a positive move towards a *detente* with China. The fact that independent India suffered its first major political and military defeat at the hands of China, because it failed to assess China correctly, makes it shy away from attempting a fresh opening. Over the years, this fear became more intense and in several respects, more exaggerated, as India faced an ever stronger China. Up till recently, India had not been able to shake off its sense of frustration which clouded the mental capacities of all concerned, right from the political executive to the makers of public opinion.

But it is now possible that certain developments, within both China and India, might have an external impact which will be felt in the sphere of Sino-Indian relations as well. Establishment of normal, friendly ties with India might well be within the present scope of Chinese diplomatic objectives. Similarly, Indira Gandhi's Government might not find the shift from deadlock such an insurmountable barrier as it has hitherto proved.

In other words, just as China in its current phase of diplomacy is 'turning out', new political forces in India might also encourage a fresh look at old problems so as to arrive at new solutions. Resolution of the China 'problem' should have priority because China has been one of the dominant factors affecting several aspects of India's national policies. It should also be frankly admitted that India's options have been severely limited since the clash with China. The leadership which has come to power on the crest of mass popularity in the March 1971 election may, perhaps, in comparison to the earlier generation of leaders, see more clearly the relevance of a new China policy to the restoration of India's credibility as a major regional power.

That the favourable international climate could also be conducive to a 'turning out' for India is not to be doubted. But before visualising how this could happen, one may briefly examine some of the significant trends in world politics as viewed from India since the sixties.



General Developments since 1962

War with China produced a basic shift in India's understanding of world forces. India had all along refused to endorse the division of the world into two mutually hostile camps, headed by the United States and the Soviet Union. By its initiative, it had created a 'third force' which, though lacking actual force, was able to wield some influence over the warring camps (as in Korea and Indo-China). Thus, though technically and industrially very backward, India played both global and regional roles until the early sixties.

In the aftermath of the border war, India forfeited both roles. Though it still talked about non-alignment, in actual practice, it began to accept the bipolar reality of the world. It became *status quo* oriented to the extent of minimising the fundamental contradictions in the international situation. Differences with China made India vulnerable on the Afro-Asian front as well. India did not gain the sympathy of the Afro-Asian countries as it had expected.[1] Nkrumah, then Ghana's President, made a public protest against Britain's supply of arms to India during the 1962 war with China. Among India's immediate neighbours, Nepal remained strictly neutral and Pakistan, in fact, wanted to exploit India's predicament to its own advantage.

As a marked contrast to India, which changed its policy of equidistance from the two poles to equidependence on them, China entered the stage of bipolar antagonism precisely at that time. China rejected the very premise of the widely accepted distribution of power. It projected the super powers as 'paper tigers'. It challenged the leadership role of the Soviet Union among the underprivileged of the world, and asserted its claim to lead the anti-*status quo* forces against the duopoly of power shared between the United States and the Soviet Union. At the same time China went on to assure the rest of the world that it would never become a super power in the sense of dominating other countries.

China's anti-super power posture was

not merely confined to verbal polemics. However symbolic the instruments of its power politics and however slender its resources, it tried to break the hegemony of the super powers. SEATO, CENTO and the US-Pakistan Mutual Defence Pact notwithstanding, Pakistan became a close friend of China. In the Middle East, China's exports rose from almost nothing in 1962 to $ 120 million in 1969, whereas the relative share of the Soviet Union decreased.[2]

China's enhanced prestige in the 'third world', as compared to the decline in India's influence, was due to various reasons. Its emergence as a nuclear power in the face of all odds, especially the mass withdrawal of Soviet technicians along with their plans and the cancellation of Soviet economic and technical aid, was a major event for the Afro-Asian countries. It created in them a sense of awe and respect for China.

Diplomatic Leverage

Besides the psychological impact of China's new global status, quite a few countries whom China befriended in the post-1962 period, found that China's patronage gave them tremendous diplomatic leverage in pursuing their national interests. For instance, due to Pakistan's relationship with China, the United States found it hard to discontinue aid to Pakistan or to pressurise it in any other way. In order to minimise Chinese influence, the Soviet Union also found it expedient to woo Pakistan by providing it with economic assistance and arms. Similarly, Nepal which had been dependent on India, began to assert its independence forcefully, when it realised the value of the Chinese counterweight against India.

A major effect of China's rise as a great power, as far as the big two were concerned, was that they acquired a new appreciation of their limitations. The United States became gradually conscious of the fact that the policies it had pursued since the establishment of the communist regime had failed to weaken, isolate or contain China. In his report to the American Congress in early 1971, Nixon acknowledged that China had become a major power and said that the United States was ready to see it "play a constructive role in the family of nations". The US Government took the first steps towards 'accommodation' when it announced a five-step plan to promote trade and travel between China and itself. And three months later this was followed by Nixon's dramatic decision to visit Peking before May 1972.

The Soviet Union, though continuing its ideological warfare with China, also made a slight but meaningful shift from its earlier posture of hostility which had become pronounced during the years of the Chinese Cultural Revolution. The Soviet Union veered closer to the idea that though an identity in the world view of the two communist powers could not be achieved, they should work towards restoring their relations to the extent that they could co-exist. In a triangular contest for supremacy, the fact that the United States would derive the maximum advantage from a Sino-Soviet conflict could prove a strong incentive for both the Soviet Union and China to keep their differences within manageable limits. A restraining factor on all three could be the fear of the combination of two against one. This calls forth another option, i e, that the three could go their separate ways within the framework of the minimum understanding needed for a power equilibrium. In the light of such reasoning, the Soviet Union has moved towards improving relations with China and has begun negotiations with it.

Although international conditions have changed, India's position *vis-a-vis* China continues to be relatively stagnant. This might be due to the significant fact that each of the bigger countries proximate to India has one major enemy while India has on its flanks, two major enemies. China considers the Soviet Union its principal enemy and *vice versa*; Pakistan considers India its major rival but for India both China and Pakistan are major enemies.

Broad Range of Relationships

At the height of the Sino-Indian crisis in 1962, Pakistan took the position that China did not pose a threat to the security of the subcontinent. This was followed by a statement of the Pakistani Foreign Minister that an act of aggression by India against Pakistan would involve the "largest state in Asia", meaning China.[3] However, when India and Pakistan fought each other in September 1965, the Chinese did not go beyond strong public criticism of India's 'aggression' against Pakistan and serving ultimata on the Indian Government not to cross the Sikkim-Tibet border.

This period saw the emergence of the Soviet Union as an important element in the India-China-Pakistan triangle. Before its large-scale differences with China, India had consistently tried to exclude the great powers from the subcontinent. India's policy of non-alignment had been instrumental in establishing for itself a broad range of relationships with the United States and the Soviet Union, the ethos of which was to maintain a rough equidistance from the two. During the October War of 1962, India rushed into seeking assurance of protection from both. India intensified its relations with the Soviet Union, because it discovered in the latter an ideal equaliser. Although substantial military assistance was expeditiously provided by the Western countries, the Soviet response, in many ways, was crucial for India. Nehru acknowledged as much when he said that "Soviet neutrality in the conflict was of greater help to India than all the military aid received from the West in those days".[4]

Major Soviet Gains

The Soviet attitude which under the compulsions of its own differences with China changed towards active support of India achieved some significant results for both the countries. For India, on the positive side, the Soviet factor restricted possible Chinese moves southwards. On the debit side, however, India began to rely more and more on the Soviet Union whose record of support to it on the Kashmir and Goa issues had already earned the gratitude of the Indian Government. Given the power imbalance between the Soviet Union and India, the latter's dependence could work out to its disadvantage at some point. Great powers have a tremendous capacity to exert pressure on the less powerful states.

From the Soviet angle, the major gains were twofold: a) the impact of Western influence on India was neutralised and b) India moved into the orbit of Soviet influence. The geopolitical importance of India in the context of Sino-Soviet rivalry being a prime consideration in Soviet policy, it was indeed a significant achievement for the Soviet Union to have India within its power zone.

In the war with Pakistan, the Soviet Union not only refrained from taking India's side but in its new capacity as mediator, equated both India and Pakistan. Taking advantage of the new situation in the post-Tashkent period, it began to lay the foundations of a new policy towards Pakistan. Diversification of Soviet support to Pakistan was a most unwelcome development from India's point of view.

making intensive diplomatic efforts to get international support. A strong leadership at the centre can succeed in projecting a new policy towards China in view of the change in the political climate inside the country.

India can also gain impetus from the changing international situation in which it has become possible to conceive of major changes in Sino-US relations and for a general reduction of tension between the United States and the Soviet Union and among their various allies. In 1970, for example, there was extensive diplomatic activity including contacts, discussions and negotiations between the NATO and Warsaw Pact countries. The US and the Soviet Union continued with the Strategic Arms Limitation Talks. Treaties were concluded between West Germany and the Soviet Union and Poland; other signs of a thaw included the beginning of a dialogue between the two Germanies on Berlin.[18]

In this international climate, it might not be difficult for India to reconsider its policies at the regional level and adjust them to suit the emerging and changing situations. China's criticism of Indo-Soviet collaboration is indeed the mirror image of India's anxiety over the Sino-Pak combine. Just as India accuses China of forming a Sino-Pak axis, similarly China feels that the Soviet Union's close ties with India are directed mainly against its national interests. In fact, Soviet policy in Asia, a manifestation of which was the proposed Asian collective security scheme, is interpreted by China as motivated by Soviet antagonism towards it.

Conclusion

To sum up, in the 1970s, relations among the three powers, i e, India, China and the Soviet Union have assumed new dimensions. Sino-Soviet rivalry, for ideological and other reasons might continue to be a major feature of their interrelationship, despite their keenness to avoid a direct clash. Though India has benefited considerably from Soviet recognition, the Soviet Union has also gained from India's endorsement of the Soviet view on the Sino-Soviet boundary dispute. How far India's own interests will be safeguarded under the Soviet umbrella is difficult to predict. It may be suggested however that India would gain more flexibility in its foreign policy sphere if it were not too closely attuned to Soviet policy towards China.

The recent crisis in Pakistan provides India with an excellent opportunity to reappraise the nature and scope of Sino-Pak friendship. India, till now, has missed the point that the collusion between China and Pakistan may not be total, though outwardly China might assure Pakistan of its full support and sympathy. The foundations of Sino-Pak friendship are much weaker when compared to Indo-Soviet ties. India was already a factor in the Sino-Soviet dispute when the two communist giants began to look at various international issues differently. Pakistan became a factor in Sino-Indian relations after India's relations with China became estranged.

The nature of Sino-Pak collusion must be analysed so that one may understand where such collusion could take active shape and where it is merely a formality. As far as Chinese overtures towards Pakistan are concerned, one sees the absence of an active commitment to the causes which Pakistan holds most dear to its heart. The much criticised Chinese stand on Kashmir is indeed a neutral stance. China has not endorsed the Pakistani line that Kashmir belongs to Pakistan. It stops at supporting "the just struggle of the Kashmiri peoples for self-determination".[19]

Though China has come out in favour of the military regime in the Bangla Desh crisis, it remains to be seen how China's support to Pakistan could be extended. As the resistance continues and if or when the class nature of the Bangla Desh struggle gets transformed, China might revaluate the revolutionary potential of the situation and shift its position accordingly. China finds itself in a predicament of how to balance its dual and contradictory role of a socialist state committed to world revolution and a participant in the big nuclear power system which is principally interested in the preservation of the *status quo*.

There are several stimulants on the Chinese side as well to normalise relations with India. China is showing readiness to establish contacts with several countries of the world, including those which till recently have opposed its recognition as a state and its admission to the United Nations. In both cases, i e, recognition of China and its membership of the United Nations, India has extended its support. Rejecting an opposition proposal in parliament to revise the government's policy towards China, India's Foreign Minister said, "The records of the United Nations do not list any member called Taiwan... Taiwan belongs to China... Our relations with China may not be good now but tomorrow they may be better. Even in the present situation, I see no reason to recognise Taiwan."[20]

In the 1970s, China does not consider India a competitor in the international field or a physical threat to its territorial integrity. Instead, China may be persuaded to ease tensions with India in view of its concentration on the Soviet problem. Just as the Soviet Union has successfully diversified its influence in the subcontinent by befriending Pakistan since the mid-1960s, it might serve Chinese interests to make friends with India. In its major power role, China might not think it necessary any longer to continue the policy of isolating India and containing its influence. In India's case, it would be appropriate for the new leadership to think constructively in terms of playing a viable role in the South Asia region and this it can hope to achieve only by recognising the fast changing realities in international relations. Perhaps, the Sino-US *detente* presages a somewhat more positive effort on India's part to re-establish normal relations with China.

Democratic Interlude for Nation Building

Fifth Lok Sabha Elections

Iqbal Narain

How far the fifth Lok Sabha elections will prove to have laid the basis for enduring political development in the country, it is yet difficult to say. For the present, it is best to describe them as having provided a democratic interlude for nation building.

The fifth Lok Sabha elections were significant, above all, for the trends in party-building that they brought to light.

It has been suggested that the massive victory of the Congress presages a return to a one-party dominance situation. What is more likely, however, is that the forces of infrastructural politics may dominate in the state elections and the Congress may not in all cases sweep the poll as it did in the Lok Sabha elections. This tendency was evident in the state elections which were held simultaneously with the Lok Sabha elections. The poll verdict in the state elections did not indicate a trend towards return to the one-party dominance system. It is very likely that the state elections next year will confirm that India continues to move in the direction of a competitive democratic polity with the prospects of alternation of power between different parties.

It is also possible that India may come to have a more viable party system as a result of the fifth Lok Sabha elections through a process of merger and fusion of political parties. Thus we may be left with three or four major national parties and this may result in relatively stable and like-minded coalitions in some states, a two-party situation in others and majority rule in still others.

As for the Congress, it retains something of its earlier umbrella character, but the ruling elite in the party appears to be more prepared to opt in favour of the have-nots in the party's support structure. Nor is the Prime Minister banking only on the support of the rural masses; she has tried, with considerable success, to win the support of the urban voters, particularly the urban youth and the urban intellectual. If this trend persists, it should yield a more inclusive support structure for the Congress, covering both rural and urban areas. This rural-urban continuum in the support structure is also likely to force the pace of dovetailing of urban and rural development programmes to an extent never done before.

THE poll verdict at the fifth Lok Sabha elections surprised even the most abandoned optimist among the political analysts in India and abroad. No one expected the two-thirds majority that Indira Gandhi ultimately secured. The political soothsayers were, by and large, inclined to treat the mid-term poll as a political gamble and they were mostly betting around three alternative outcomes. First; Indira Gandhi may retain the number of seats that she was left with in the Lok Sabha after the Congress split. Second, she may improve her strength without necessarily converting it into a majority.[1] These two alternatives naturally assumed a coalition government at the Centre which may still have Indira Gandhi as the Prime Minister. Third, she may scrape through with a bare or a comfortable majority. The Indian voter, however, refused to oblige the political soothsayers in any one of the three categories; he was as unpredictable in the 1971 poll as he was in the 1967 general election. The importance of the fifth Lok Sabha elections, however, does not lie so much in the numerical strength that Indira Gandhi has mustered for her party, but in the promise of social justice and the commitment to its realisation in the life of the people. Only if this commitment is fulfilled will the two-thirds majority have any meaning and prove functional to the political development of the country.

Political analysts are busy attempting a characterisation of the fifth Lok Sabha elections and discussing its possible implications for the political development of the country. A similar effort is being made here with all the tentativeness that an attempt of this type naturally involves. We are still too near the event to evaluate the importance of the elections from a long-term point of view. The data are still pouring in and sophisticated comparative analyses are yet to be made. The field studies that have been launched in connection with the elections are yet to be completed. Altogether thus we are in a position only to offer notes towards an analytical overview rather than an empirically formulated study of the poll verdict.

I

The Intervening Perspective

It would perhaps be useful to preface this analysis with the identification of certain trends which might have been a factor in the voting behaviour of the people in the 1971 elections. Moreover, if we were to study the voting behaviour against the perspective of these trends, the poll verdict may not appear to be as surprising as it is often made out to be.

(i) With the breakdown of one-party dominance in the wake of the fourth general election, there began an era of coalition politics at the state level. The experience with coalitional politics was none too happy. There was quick rise and fall of coalition governments, rendered easy through the never-ending stream of defections. The result was political instability in the wake of which administration got paralysed and developmental processes came to a standstill. As if this was not enough, with the Congress split there came about a virtual coalition at the centre. also. The union government began to live a hand-to-mouth existence seeking support from different political parties from issue to issue and surviving on that basis. Its initiative was naturally reduced and its options got limited. The growing tension between the legislature and the judiciary on issues of social justice, increasing

TABLE 1 : PERFORMANCE OF THE PARTNERS OF THE 'GRAND ALLIANCE' IN 1967 AND 1971 ELECTIONS, BY SEATS AND AVERAGE VOTES

* For Punjab only; it also fought one seat in Haryana.

dependence of the central government on regional parties, and its failure to assert itself even on legitimate grounds against state governments and the political parties supporting it, can be cited as examples. Altogether thus it was being asked what would happen to the political system if as a result of the fifth Lok Sabha elections the virtual coalition was to become a formal coalition at the centre. The question became all the more agonising because of the underlying assumption that what happened at the state level may be repeated at the national level also.[2] This question was very much a part of the psyche of the voter and as such must have been one of the factors determining voting behaviour.

(ii) It may also be recalled here that agitational politics had been on the increase, particularly since the fourth general elections. Law and order had tended to deteriorate, especially in such states as West Bengal. Violence was also on the increase. The educated urban youth was impatient with unemployment. Landless labour was also restless in villages at least in some parts of the country. Since violence had as yet not become a part of India's political culture, the agitational and violent overtones in the style of Indian politics became a matter of grave concern both for the elite and the common man in the urban and rural areas. It was being argued on the eve of the fifth Lok Sabha elections that a strong and stable government alone could tackle the deteriorating law and order situation and address itself boldly to the tasks of nation-building.

(iii) More importantly, however, it is to be emphasised that Indira Gandhi, particularly since the Congress split, had been trying to convince the people that a new Congress was being born, which had faith in the creation of an egalitarian social order and which sincerely meant to make positive steps to move in that direction. In fact, she herself was tending to become a symbol of change-oriented and action-based politics and this naturally imparted a new image to her party. Bank nationalisation and the efforts at abolition of privy purses can be treated as strategic symbolic gestures in this process of image-building. The anti-Indira plank of the opposition political parties was too weak a substitute for the programmatic plank of the Prime Minister. Similarly, anti-Congressism no more possessed the psyche of the people as it had done on the eve of the general elections in 1967; in fact it had become outdated. However, the opposition political parties, particularly the SSP, still harped on anti-Congressism.[3] The non-programmatic four-party alliance thus turned out to be too negative to click in the changed political climate of the country. Therefore, it should not have been a surprise if the strategy of grand alliance ultimately failed. Table 1 bears this out.

The Table makes it clear that, despite the alliance, the parties could not register any appreciable improvement in the average votes per contested seat, let alone increase their total votes.

(iv) Significant shifts had also taken place in respect of the ethnic base of politics. The continuance of communal riots in the country and their aftermath made the Muslim leaders realise that their own organisations could not successfully operate as pressure groups *vis-a-vis* the parties which they had supported.[4] The failure on their part to get their community interests fulfilled as a *quid pro quo* for their support to non-Congress governments[5] made them turn back to Congress[6] which was earnestly trying to tilt the balance in its own.

II

Notes Towards a Characterisation

We would now turn to a characterisation of the fifth Lok Sabha elections. The following aspects deserve particular mention in this regard:

(i) The fifth Lok Sabha elections were peculiar and yet perhaps a case of *change in continuity*. They were peculiar because, for the first time, an all-out effort was made to convert the election predominantly into a battle over issues. This brought about the first ever serious confrontation between programmatic politics and politics of infrastructure in the history of democratic elections in India. It would thus be a repetition that the non-programmatic four-party alliance did not find favour with the voters because the fifth Lok Sabha elections were fought on programmatic grounds.[7] Further, the delinking of national and state elections also contributed to the peculiar character of the fifth Lok Sabha elections. It may be emphasised, however, that delinking was not important *per se;* its significance lay in the fact that it was part and parcel of a programmatic battle.

In spite of all this it will perhaps not be far wrong to treat the election as a case of change in continuity. It may be pointed out in this connection that the "breakdown" of one-party dominance in 1967 as also the landslide victory of the new Congress in 1971 represent two ends of a continuum in the psyche of the Indian voter. The voter has all through been in quest of economic justice and an egalitarian social order. This is understandable also because cultivation of egalitarian values and their appeal is inherent in the logic of the adoption of universal adult franchise in a developing country like India. If in 1967 the Indian voter registered a negative vote in protest against immobilism of the political elite and their failure to achieve social justice, he gave a positive vote for the promise of an egalitarian social order and commitment to its realisation in the life of the people in the 1971 elections. Thus interpreted, the Indian people would emerge as basically consistent in their voting behaviour.

(ii) It is also being emphasised that the Lok Sabha poll verdict embodies a vote for stability. This is so with a difference. It may be recalled here that the united Congress party had emphasised in the fourth General Elections also that it alone could give stability to the country. But the call of stability then had been ineffective because stability at the moment had come to symbolise stagnation in Indian politics and the Indian voter was naturally impatient with it. During the 1971 elections, however, the need for change towards a more egalitarian social order was the dominant note of the election symphony. The need for stability was being emphasised with, and more particularly for change in the direction of, social justice. Thus it would not be fair to the Indian people if the meaning of fifth Lok Sabha elections is to begin and end with stability; its true meaning is stability with accent on change towards social justice.

TABLE 4 : PARTY POSITION IN THREE VIDHAN SABHAS ELECTIONS TO WHICH WERE HELD IN 1971

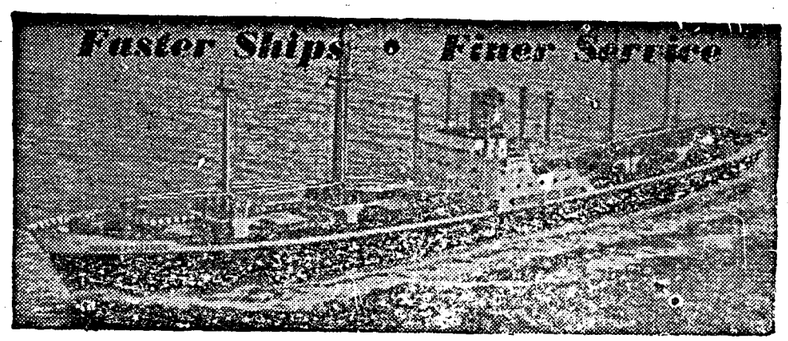
(iii) An allied issue has been whether the elections had been a prime ministerial election. It is true that Indira Gandhi played a critical role in the victory of her party and in a manner of speaking she can even be said to have been elected directly by the people as the Prime Minister of the country. But, as she herself is reported to have emphasised, it was not so much a personal victory as a programmatic victory.[8] She had come to symbolise the socialistic programme and, more importantly, the promise to fulfil it, and in that lies the secret of her poll victory.



An effort is, however, being made to explain the poll verdict in terms of a newly acquired charisma by Indira Gandhi.[9] The concept of charisma, in spite of the romanticism associated with it, does not help a political analyst. It is, in fact, one of those residual analytic categories which like allergy in the medical sciences is employed by a social scientist to cover a baffling socio-economic and political phenomenon, which he otherwise fails to explain. The use of the term charisma in the context of fifth Lok Sabha elections is thus more likely to mystify than to explain. Still if we want to use the term we should underline that it is a charisma with a difference. It is not hereditary charisma insofar as Indira Gandhi did not carry conviction with the people in the fifth Lok Sabha elections because she happened to be the daughter of Jawaharlal Nehru. It is also not a national-movement-based charisma because she did not try to win election on the basis of the record of the Indian National Congress in India's struggle for freedom. It is, in fact, a cultivated and a functional charisma which is built around and projects her image to the people as an agent of change-oriented and action-based politics and that also in the direction of economic justice in an egalitarian social order.[10]

(iv) It is thus obvious that the left-of-

centre programme of the new Congress and, more important, the emphasis on its implementation was largely responsible for its appeal to the people. This, however, raises another issue whether the fifth Lok Sabha elections had yielded an anti-polarisation verdict. This may not be necessarily so. It appears that the extreme left as represented by CPI (M) is getting crystallised. Of course, the secular right as embodied in the Swatantra party and the communal right as represented in the Jan Sangh appear to be in disarray. This may ultimately turn out to be a temporary phase, at least as far as the communal right is concerned, which may, once again, tend to consolidate its position in its pockets of influence during state elections in 1972 as also in local elections. [11] This may happen all the more because the princes which still have a significant, though progressively reduced, appeal and who are getting disenchanted with the Swatantra party may join the Jan Sangh. The cadre strength of Jan Sangh when combined with feudal hold should contribute in good measure to the consolidation of the communal right. Ultimately thus India may come to have a multi-polar model of democratic politics in which there may be competition for alternation of power among the extreme left represented by CPI(M), the communal right as embodied in Jan Sangh and a pro-left centrist party as represented by the new Congress with the other political parties trying to find a place for themselves in this broad spectrum of polarised politics.

(v) Finally, the fifth Lok Sabha poll verdict is also characterised by primacy of democratic politics and its growing autonomy of the infrastructure. With this the so-called gap between politics of developing and developed areas is tending to get bridged. It is, however, not being contended here that infrastructural pulls and pressures like that of caste have not mattered in election politics in 1971. They have continued to matter at micro levels but the secular forces have tended to cut across them at the macro level and as such their role cannot be treated as deterministic in the cumulative sense.[12] Similarly, the feudal hold is still important but its grip has been loosening. The case of Rajasthan would illustrate the point. As Table 2 shows, the performance of the princes and ex-jagirdars was poor even where they themselves were in the field; it was poorer still in the case of candidates who were backed by them. For example, the Jodhpur Rajmata won the election with a margin of just 20,000, while the candidates supported by her trailed behind Congress candidates in the predominantly rural areas of the constituencies. Thus the claim of the young Jodhpur prince that all the Congress (R) candidates within the territorial limits of the former Jodhpur state would be defeated did not come true. Again, out of 14 candidates supported by the princely houses, 9 were defeated and the winning candidates also succeeded with poor margins. The Raja of Bharatpur lost. Generally speaking, the performance of the princes was particularly poor in the rural areas. Madhya Pradesh was more or less in line with Rajasthan, while Gujarat and Orissa had a poorer record.

Furthermore, the fifth Lok Sabha poll verdict has been suggestive of a differentiated rather than de-regionalised politics. A differentiated secular and national loyalty structure appears to be in the offing. We had inherited such a loyalty structure as a result of the national movement but this had got dissipated in the pull and swing of democratic politics. Once again we appear to be regaining this loyalty structure

Our fleet of seventeen modern freighters offers fast, regular and dependable service between

through the differentiation of national, state and local levels of politics, though the process of differentiation has not been as complete as one would have liked it to be. It is also worthwhile to add here that unsatiated but positive regionalism, as represented by Telengana Samiti and regionalism having national linkages as seen in the case of DMK, still matters in Indian politics. In contrast satiated regionalism as represented by the Akalis and purely negative regionalism as embodied in the Shiv Sena appear to have lost their hold. Table 3 which shows the electoral performance of parties which fought the election on regional issues, strengthens our conclusion.

It may also be emphasised here that perhaps people had started thinking in terms of the parties of the rich and the poor and thus this type of class consideration in its embryonic and very generalised form tended to cut across the infrastructural pulls and pressures.

III

Implications for Political Development

We will now analyse the implications of the fifth Lok Sabha elections for the political development of the country in the specific context of prospects of national integration, economic development and party building.

As far as the prospects of national integration are concerned, if the hypothetical thesis of the emergence of a differentiated secular and national loyalty structure becomes a fact of life, it should go a long way in meeting the challenge of national integration. Similarly, if the Jan Sangh realises that for becoming a national political party, it will have to shed its communal overtones and soften its attitude on language, this, again, should strengthen secular forces.

Similarly, the accent on a socialist programme and, more particularly, on its implementation, the majority support to the national government and the consequent widening of options and release of initiative and, above all, the prospect of political stability should prove functional to economic development. It may, however, be emphasised here that they would only create conditions in which economic development will be possible; the use of these conditions would depend on the vision, sincerity and courage of the ruling elite in the new Congress.

It is, however, in the sphere of party building that the fifth Lok Sabha poll verdict may unleash the most significant trends. It is being argued that the Indian political system may revert to the one-party dominance situation in the wake of fifth Lok Sabha elections. It is difficult to take any categorical stand on this issue. It is, however, possible that forces of infrastructural politics may dominate state elections and the new Congress may not in all cases sweep the poll in the states as it has done in the national election. Factionalism in the new Congress still persists in several states and this may further contribute to this outcome. Moreover, the Indian voter, as voting behaviour studies show, has displayed a split psyche in terms of voting preference. He is capable of voting for one political party at the national level and another party or combination of parties at the state level. In fact, this tendency cannot be said to have been entirely absent in the state elections which were held simultaneously with the Lok Sabha elections in 1971. The poll verdict in the state assembly elections do not indicate in all cases a trend towards a return to the one-party dominance system. This will be borne out by Table 4. Further, as Table 5 would bear out, 251 seats (identified as party gains) are still in a state of flux and we do not know whether they indicate a firm shift in the support structure in favour of the new Congress. We should, therefore, keep our analytical options open in regard to the re-emergence of the one-party dominance situation. For, it is possible that the state elections may confirm that India continues to move in the direction of a competitive democratic polity with prospects of alternation of power between different parties at the state level and this may be a continuation of the process that started in the wake of the Fourth General elections.

It is also possible that India may come to have a more viable party system as a result of the fifth Lok Sabha elections through a process of merger and fusion of political parties. Though the struggle for the symbolic existence of political parties at the national level may continue for some time, it is becoming obvious that the Swatantra party is on the way out and Congress (O) has little future. Similarly, PSP and SSP do not stand to gain through a separate existence.[13] Thus we may be left with three or four major national political parties and this may result in relatively stable and like minded coalitions in some states, a two-party situation in others and majority rule in still others.

Finally, a word will not be out of place here about the new Congress. It is more homogeneous than before though factionalism is still there. Its leadership is stronger today than before, though the possibility of in-fighting, particularly at the state level, cannot be ruled out. What deserves particular mention, however, is an effort on the part of the new Congress towards a more differentiated and a more inclusive support structure. It still has the umbrella-type character which it had inherited as a national movement, but the ruling party elite, particularly Indira Gandhi, appears to be psychologically prepared to opt in favour of the "have nots" in the party's support structure, although Indira Gandhi is equally conscious of the fact that the relatively affluent sections of Indian society may still prefer to support her, though for different reasons. At the same time she is not merely banking on the support of the rural areas, but has tried to make a dent in the psyche of the urban voter, the urban youth and the urban intellectual. Her effort appears to have met with at least partial success. If this trend persists, it should yield a more inclusive support structure for the party covering both rural and urban areas. Of course, the rural-urban continuum in the support structure would imply continuity in the demand structure also, which should force the issue of the dovetailing of urban and rural development programmes to an extent perhaps never done before.

IV

Towards the Future

We may, however, emphasise in the end that the fifth Lok Sabha poll verdict marks only the beginning of a march to a destination which still lies far ahead in the future. The real significance of the elections would lie, not so much in the promise of social justice held out by it to the people, but in its realisation. This is not going to be easy — all the more because demands of rapid economic growth and pressures of social justice often tend to militate against each other and yet the promise of democracy in developing areas inevitably lies in the reconciliation of the two. The challenge of implementation is closely related to the need for the building up of a party cadre and a bureaucratic machine which may share the vision and earnestness of the ruling elites and work as the catalytic agent of change. This further assumes that the ruling elites are sincere in their professions about their commitment to

e goal of social justice and have the ıurage and the political imagination to anslate their professions in practice. ill the question of the fulfilment of e great promise is open, it is difficult say how far the fifth Lok Sabha ections would prove to have laid the ısis for enduring political development the country. For the present it is st to describe them as a democratic terlude for nation building.

Notes

E P W da Costa, basing his observations upon voting intentions as recorded in gallup poll surveys, contended that "the effective halving of the popular vote of the undivided Congress has made it virtually impossible for either Congress to reach a majority" and that "the emotional landslide assumed by many commentators to be the natural human response of the poor and illiterates to Mrs Indira Gandhi's new radicalism" was also not "borne out by the data". (*The Times of India*, March 3, 1971.) Even if allowance is made to the 2 per cent error margin that da Costa thinks possible, his estimates fall far below the actual number of seats won by the new Congress.

The leaders of the new Congress persistently harped upon the point that they alone could provide a strong and stable government. For example, Indira Gandhi appealed to the Gujarat electorate to vote for her party which alone could provide a stable government at the centre and take the country towards the goal of economic and social justice (*The Times of India*, February 2, 1971). The opposition political parties would, however, argue differently. For example, the Jan Sangh chief, Atal Behari Vajpayee, would tell Delhi voters that coalition governments could not function properly in the states because the central government did not allow them to. His logic was that if there was a coalition government at the centre, the coalitions in the states would automatically function properly (*The Times of India*, March 4, 1971). The complete rout of Jan Sangh in Delhi would, however, show that the argument did not click with the electorate. In fact, there was an anti-coalition climate working in the country on the eve of the elections. We may recall here a survey of the UP electoral scene where it was pointed out that "the four-party combine starts off on the wrong foot in this state because of the dismal record of two coalition governments UP has known since 1967," and, therefore, "the idea of a coalition at the centre is not a prospect many in this state relish" (*The Times of India*, February 23, 1971).

3 For example, Madhu Limaye, the SSP theoretician, argued that the four-party alliance aimed at ending the Congress(R) rule, because it would, despite some instability, pave the way for an alternative government. He also added that his party was not for the type of political stability of the past because it stood in the way of change. In view of the clear-cut aim, he maintained that no minimum programme was needed; it could be worked out later (*The Times of India*, January 27, 1971). Ram Manohar Lohia had argued in a similar vein on the eve of fourth general elections (for details see *Amrit Bazar Patrika*, December 14, 1966).

4 It may be recalled here that on the eve of the 1967 general election Jammat-e-Islam had indicated its preference for the Swatantra party. For, according to it the monopoly of power by the Congress and its authoritarian exercise frustrated the 'dreams' of opposition parties and led to a general decline in political life while the parties with leftist programe were un-Islamic (*Link*, January 15, 1967). The approach of Majlis-e-Mushawarat as outlined by its leader, Faridi, on the eve of the fourth general elections was similar. He was sorry at the sad plight of the Muslims under Congress rule, for changing which a deal was struck with the Swatantra and the RPI (*ibid*, January 22, 1967). But the Muslim leaders were soon disillusioned when even their minimum demands went unheeded under the new regimes. For example, Urdu was not accorded the status even of a second language in UP and Bihar. They, therefore, tended to rally back to the Congress.

5 The Muslim League openly argued that no party other than itself could promote the interests of the Muslims. Writing in the *Hindustan Times* of February 24, 1971, Mohammed Ismail, the Muslim League chief, used this argument in favour of the League's participation in the fifth Lok Sabha elections. In his own words, his party "is contesting the ensuing elections to the Lok Sabha in a comparatively big way with the objective of safeguarding and promoting the legitimate rights and interests of the Muslim community".

6 In Kerala, West Bengal and Tamil Nadu where Muslim League had developed roots, it fought the election on its own. In the north, however, the party, together with other Muslim organisations, extended support to Congress (R). There were, of course, exceptions as in Moradabad in UP where Jan Sangh and Muslim Majlis contested the election on communal grounds, in spite of there being a Congress (R) candidate in the field (*The Times of India*, February 18, 1971).

7 Minoo Masani, the Swatantra party chief, who had earlier unsuccessfully insisted on having a common manifesto as the basis of the alliance, remarked in sarcasm that people had clearly respected the slogan of "*Indira hatao*" (*The Statesman*, March 12, 1971).

8 *The Times of India*, March 11, 1971.

9 The opposition parties interpret it as personality cult. For example, Atal Behari Vajpayee described it as "the victory of the personality cult of Mrs Indira Gandhi, studiously built over the past year and a half..." (*The Times of India*, March 15, 1971). An editorial in *The Statesman*, dated March 12, 1971 entitled "The Personality Cult Wins" also interpreted the poll verdict in the same vein. Earlier the same paper contained a despatch from Rajasthan entitled "Where the Name Becomes *Mantra*" in which even M L Sukhadia, the Chief Minister, was reported to be seeking votes for Congress candidates in the name of Indira Gandhi, whose name he is said to have mentioned 113 times in a 30 minute speech (*The Statesman*, February 2, 1971).

10 One may recall here a perceptive comment of a correspondent published in *The Times of India* of March 23, 1971: "Mrs Gandhi's charisma has stopped on the borders of West Bengal, where the superior organisation of the CPM did not allow the socalled charisma to have its way in the support structure of this party."

11 The slight improvement in the position of the Jan Sangh in the civic elections after its rout in the Lok Sabha election in Delhi can be cited as an example.

12 One may recall here the case of Punjab. The 55 per cent Sikh population in the state could not help the Akali Dal (which claimed to represent both religious and regional interests) to retain the seats it held in 1967. Though it had an off-the-record understanding with Jan Sangh over some seats, the Akali Dal had taken into account all the caste and religious considerations; still it got only a solitary seat with a narrow margin and the Jan Sangh failed to secure any seat. In Hoshiarpur the Jan Sangh candidate, Yagya Dutta Sharma, failed to retain the seat against Darbara Singh of Congress (R), despite a vote splittter put up by the Akalis (for details see *The Times of India*, March 1, 1971).

Even at the individual constituency level, the caste factor did not always reckon in the ultimate analysis. For example, in Hapur the BKD candidate, Prakash Vir Shastri, claimed full support of Tiyagis, Jats, Raiputs, Brahmins, Mahajans and a part of Punjabis. The caste support in his favour tended to outweigh the support for B P Maurya, his Congress rival; yet he lost by about one lakh of votes.

13 The fifth Lok Sabha poll verdict can be said to have played a critical role in the process of the merger of PSP and SSP which is nearing completion.

Co-operative Marginalia

MANY pious hopes were expressed about the future of the co-operative movement by the Registrars of Co-operative Societies at their customary annual conference at New Delhi earlier this month. If the Registrars failed to get to the heart of the real problems, they were perhaps not to blame entirely since the formulation of policies for the co-operative movement has always been the preserve of politicians. Be that as it may, between the politician and the bureaucrat the co-operatives have remained a case of retarded growth.

The discussions at the Registrars' conference ranged over various aspects of the co-operative structure, though understandably the bureaucrats stopped rather short of retailing their experiences honestly and stating their views frankly for the benefit of the politicians. Thus while there was reference to the growth of overdues of co-operatives to 30 per cent in respect of short- and medium-term credit and nearly 22 per cent in respect of long-term credit, the factors responsible for these trends were not identified nor were steps to reverse them seriously discussed. Similarly, some procedural changes were suggested to facilitate larger flow of credit to small farmers but the more crucial problems of viability and efficient management of co-operative societies were hardly touched upon. As things are, a very large number of farm credit co-operatives have no chance of becoming viable and efficient in the near future. The Registrars might have usefully discussed the measures they have taken or proposed to take to ensure that all credit societies become viable in the next two or three years. Instead, they talked about cash credit facilities for cultivators when such a system is strictly not necessary in agriculture and, even if introduced, would benefit mainly the larger cultivators to whom credit facilities should actually be given on a restricted scale.

The Registrars of Co-operatives were right to emphasise that greater attention should be paid to provision of adequate loans in time to small farmers on a priority basis. On the question of the co-operatives charging a lower rate of interest to small farmers, they came to the conclusion that "it would not be practicable to attempt differential rates of interest at this stage". But while there is no case for making institutional credit to small farmers cheaper than it already is, it needs to be seriously considered whether money should continue to be doled out at these rates to those cultivators who are in a position to meet a large part of their credit needs from their own surplus income or to those who are likely to use cheaper co-operative credit to re-lend to weaker sections of the people in the villages. Ways have to be found to make credit costlier to these borrowers. The rates of interest could be raised progressively with increase in size of cultivated holding and size of loan. For holdings above 30 acres and loans above Rs 15,000, the rate ought to be made high enough to discourage cultivators from borrowing from co-operatives. In fact, some such scheme should be given a fair trial in respect of all agricultural finance, including that available from commercial banks.

The Conference of Registrars does not appear to have discussed the problem of co-ordination between the co-operatives and commercial banks. The absence of proper co-ordination among various credit agencies has already led to overlapping in financing of cultivators and consequent misutilisation of loans and difficulties of recovery.

While the credit sector of the co-operative system is beset with many problems, the non-credit sector appears to be doing substantially better, thanks to the "green revolution" and expanded procurement operations. Co-operative sugar factories now account for about 34 per cent of total sugar output; similarly, co-operatives distribute nearly 60 per cent of fertilisers used by farmers. Consumer co-operatives in urban areas have also gained momentum. Co-operatives were responsible for 50 per cent of the total procurement of wheat during the current rabi season. With the rise in the scale of procurement of foodgrains and supply of agricultural inputs, co-operative marketing societies have now a wide open field to emerge as viable bodies strong enough to withstand competition from private traders without having to lean on official crutches. But progress in this direction can be sustained only if the co-operatives are able, and are allowed, to build up a professional managerial cadre which would not be subject to the passing whims of managing committees. Many of the marketing societies are at present managed by people from the Government who have neither the training nor the aptitude for marketing work in the real sense of the term. The present prosperity of the marketing co-operatives is due not so much to their managerial competence as to the monopoly conditions in which they procure foodgrains, sell fertilisers and earn fixed commission. The real challenge for marketing co-operatives will come when, and if, these props are removed.

Resource Allocation in Indian Agriculture

Ranjit K Sau

The so-called New Agricultural Strategy was officially launched in 1965 but actually was quietly under way since 1959, thanks to the report of the Ford Foundation team of experts on "India's Food Crisis". The Fourth Plan relies on the New Strategy for as much as 66 per cent of additional foodgrains output.

What is the logical foundation of this strategy under Indian conditions? What are the alternative strategies, if any? In what respect is the New Strategy superior to these others, if at all? These questions have not been even posed, let alone examined. One is thus led to conclude that perhaps India has hardly ever taken such a momentous, far-reaching step, as the New Strategy is, with so little prior analysis.

The calculations attempted in this paper of the relative costs per tonne of wheat under two alternative strategies are admittedly crude and, hence, not necessarily conclusive. But the strategy of extending irrigation to hitherto dry land for cultivation with largely traditional methods may be even less expensive than the New Strategy based on 'modern' inputs.

It is well known that in India there exists a wide gap between the capacity of an irrigation system and the actual utilisation thereof. No less serious are the malpractices and inefficiency of actual distribution of irrigation water, the lack of drainage and the deficiencies in design of irrigation projects. It is all the more surprising, therefore, that nonetheless the contribution of irrigation water to agricultural productivity in India has been so significant.

The New Strategy benefits the relatively big farmers; and its overall impact on small cultivators and landless labourers still remains dubious. It has an inherent tendency to give rise to 'enclave' economies. In the perspective of acute rural poverty and unemployment, this strategy may not turn out to be an unmixed blessing. The entire gamut of resource allocation in Indian agriculture, therefore, calls for a fresh, rigorous scrutiny.

IN the year 1958, foodgrains output in India took a moderate dip. Apparently that was enough to raise doubt about the feasibility of the foodgrains target as initially envisaged in the Second Plan. The target in fact was surpassed; but that is a different matter.

A team of 'experts' sponsored by the Ford Foundation arrived in January, 1959. In ten weeks its report was ready — "Report on India's Food Crisis and Steps to Meet It".[1] And the die was cast.

In 1960-61 came the Intensive Agricultural District Programme (IADP), followed by the Intensive Agricultural Area Programme (IAAP) four years later. The High-Yielding Variety (HYV) of seeds appeared on the scene in 1965, and in due course the term Green Revolution got currency.[2] All this is aptly summed up in the so-called New Strategy which was officially launched in 1965, but actually was quietly under way since 1959, thanks to the 'crisis report'. The Fourth Plan indeed relies on the New Strategy for as much as 66 per cent of its additional foodgrains output.

What is the logical foundation of this strategy under Indian conditions? What are the other alternative strategies, if any? In what respect is the New Strategy superior to others, if at all? We have tried in vain to find satisfactory answers to these queries in the existing literature. It seems that these questions have not been even posed, let alone examined. One is willy-nilly led to the conclusion that perhaps India has hardly ever taken such a momentous, far-reaching step, as the New Strategy is, with so little prior analysis. There are, *no doubt, articles galore on the profitability* of HYV; but evidently that does not even touch the basic question.

Poor but Efficient

Theodore Schultz's "Transforming Traditional Agriculture"[3] is the bible of the New Strategy. The fundamental idea is as follows: The peasant community as a whole (not merely the individual farmers) in a developing country are 'efficient but poor'. So "no appreciable increase in agricultural production is to be had by reallocating the factors at the disposal of farmers who are bound by traditional agriculture".[4] It follows that tampering with the use of existing resources cannot transform traditional agriculture; only a massive infusion of new factors and techniques can do so. Such massive change, with India's enormous agricultural sector and limited savings and skills, implies selection of areas. Well-watered areas, especially if irrigated and hence already exposed to some use of non-traditional factors, are the obvious choice. Hence IADP, IAAP, and the New Strategy of concentrating agricultural inputs in selected areas of assured water supply.

The empirical basis of Schultz's propositions lies on two studies: one by Sol Tax on the village of Panajachel in Guatemala, and the other by David Hopper on the village of Senapur in India.[5] Schultz's own analysis of the 1918-19 influenza epidemic in India and the inferences drawn therefrom have been successfully demolished by Amartya Sen.[6]

Wellisz has made an attempt to provide much-needed additional empirical support to "the words of Theodore W Schultz [that] Indian agriculture is 'primitive but efficient'. To transform Indian agriculture it does not suffice to add to the existing factors.... What is needed is not merely more irrigation, or more tools and implements of the traditional types, but better seeds, which are fertiliser responsive, along with an adequate supply of fertiliser, and then additional water to match in an economic setting that would make these worthwhile."[7] His methodology, however, is open to serious doubts. We have dealt with this matter partly elsewhere,[8] and much more on this remains implicit in our analysis below.

As Dantwala puts it clearly, HYV and the consequent Green Revolution are largely a matter of technological breakthrough in which our economists and economic policies played a marginal role, if at all, except being passive instruments.[9] It is a technological breakthrough that originated elsewhere, in a different socio-economic milieu. The new technology is highly capital-intensive, and it demands a management skill of different order.[10]

Source: W David Hopper, "Planning 'Yardsticks' for Fertiliser and Irrigation", *Agricultural Situation in India* (September 1965), p 470.

Nature of State and the State of Science

Barbara Ward has a point when she observes: "This is a disproportion which the developed world never knew since it invented and pioneered and adapted its technology to its own needs as the process of development went on. But now the technology exists in its own right and can be purchased and introduced *into societies in which in fact* it is quite inappropriate. One can see the consequences of this maladjustment very clearly in some parts of Africa today. Inexperienced Governments, trying out their hand in economic decision-making, find it terribly tempting to buy the most up-to-date machinery which persuasive gentlemen from the North Atlantic area came to sell them."[11]

Technology is *not* something that is rigid and predetermined. It is a product of necessity. "If ... technique largely depends on the state of science, science depends far more still on the *state* and the requirements of technique If society has a technical need, that helps sciences forward.... The whole of hydrostatics (Torricelli, etc) was called forth by the necessity for regulating the mountain streams of Italy in the sixteenth and seventeenth centuries."[12]

The new agricultural technology, of course, has not been produced in India. In any case, have we ever paused to analyse whether or not it is appropriate for India? Have we explored what other paths are open to India? Have we examined their *relative* merits and demerits?

Expansion of Irrigation

In India, only 20 per cent of the cropped area has irrigation facilities; yet multiple cropping is practised in less than 15 per cent of the land.[13] It implies that agricultural output could be increased if just double cropping is extended to the whole of irrigated areas alone.

Irrigation plays three types of roles, depending upon the phase of growth of agricultural productivity. The first is the role of stabilising the harvest fluctuations due to deficient or untimely rainfall. In such cases average yield over the years increases while inputs other than irrigation remain more or less as before and only the irrigation network spreads. The second is the role of making possible the introduction of a second crop. And the third is the role of making possible the increased application of fertiliser, the use of better seeds, and the introduction of improved farming techniques. A cross-country, cross-section, and time-series analysis of six Asian countries, namely, India, Ceylon, Thailand, Malaya, Taiwan and Japan, reveals that when the productivity of land is relatively low (less than 0.92 tonnes of paddy yield per acre, for example), irrigation is the leading input for agricultural growth; at this stage it plays the above-mentioned first role. In successive phases of higher productivity, irrigation assumes the other two roles respectively.[14] But the history of other countries, in its full details, need not repeat itself in the Indian soil.

As for the contribution of irrigation in India in particular, the yield per acre of irrigated land is more than double of that of unirrigated land. Table 1 is the eloquent testimony. Referring to the pooled cross-section time-series equation of Table 1 we find that the all-India productivity per acre of wheat is 0.187 metric tonne (0.183 long ton) in unirrigated areas while it is 0.516 metric tonne (0.506 long ton) in irrigated areas. Similar figures for rice, total cereals and total foodgrains also are summarised in Table 2.

The findings of the Farm Management Surveys also are quite consistent in this respect.[15] Irrigated land is substantially more productive than unirrigated land (see Table 3). Correspondingly the cost data are presented in Tables 4 and 5 for wheat and rice respectively.

With these productivity and cost data at our hand, now let us ask: Which of the two strategies — the fertiliser-based, highly capital-intensive 'new agricultural strategy', or the largely traditional input based strategy of extending the irrigation network to the fullest possible extent, to begin with — is more economical in India?

It is estimated that about 50 per cent of the cropped area in India can be potentially brought under irrigation at a reasonable cost,[16] whereas the current, actual figure is roughly 20 per cent. That is to say, the present irrigated areas can be expanded by at least 150 per cent.

Irrigation projects are typically labour-intensive and quick-yielding, the gestation lag being small. By contrast, fertiliser projects are highly capital-intensive with considerable import requirements; their gestation lag is also quite long. Of course, irrigation and fertiliser are not always mutually competitive substitutes; however, in India today they are so, to a certain extent, at the macro-economic level.

We have posed a fundamental question; but the data to go by are terribly scanty. Evidently, the logic of the new agricultural strategy as such is not based upon a very sound empirical footing either; but that is no consolation. It makes the situation worse. We shall have to make some crude assumptions and rough approximations. The main purpose of this exercise would be served if it stimulates further refinements and better analysis.

Let us consider wheat only, and calculate the relative unit costs as between the two alternative strategies. Our estimate of the all-India cost of wheat per acre as of Table 6 are simply the arithmetic means of the respective data of Table 4. Again be it noted that we propose to relate these cost data of Table 6 to the all-India wheat yield data of Table 2.

According to Table 2, by applying irrigation along with the concomitant traditional inputs to hitherto unirrigated land, an additional output of 0.329 tonne can be produced per acre. That is to say, one tonne of additional output would require irrigation, etc, in 3.04 acres of dry land. Now, what is the cost of one tonne of wheat thus produced? Excluding land revenue and rent, the cost is Rs 72.24 × 3.04 = Rs 219.61, in terms of Table 6.

Irrigation charges as paid by farmers are Rs 3.07 per acre (Table 6). But this does not necessarily represent the true social cost of irrigation. Subtracting such irrigation charges, the cost per tonne of wheat works out to be Rs 210.28.

According to the Third Five-Year Plan (pp 413-14), the average cost of irrigation through multipurpose and major irrigation projects is Rs 360.77 per acre. It is not very clear whether this cost is only capital cost, or it includes partly operating cost as well. Let us suppose this is capital cost only.[17] In any event, the corresponding capital cost of medium and small irrigation schemes is presumably lower. So let us assume that the per acre capital cost of irrigation is Rs 350.00 on an average.

Suppose that 2 per cent of capital cost is the operating cost of an irrigation scheme.[18] And let 10 per cent be the rate of interest. Then the cost of irrigation per acre per year is : (0.10 + 0.02) × 350 = Rs 42.00. Hence the irrigation cost of one tonne of wheat is : 42.00 × 3.04 = Rs 127.68. We add this to Rs 210.28, and find that the cost of one tonne of wheat produced by extending irrigation facilities to hitherto dry land is Rs 337.96.

In a labour-surplus economy the shadow price of labour is likely to be well below the market wage rate.[19] The social cost of labour-intensive irrigation schemes, therefore, may be lower than their nominal cost. But we shall not go into that here. Let us subtract only the direct labour cost in wheat production which is Rs 24.53 per acre, including imputed value of the family labour (Table 6). Then the average cost of wheat under this traditional input-based strategy amounts to Rs 263.39 per tonne.

If this strategy is accepted in order to raise foodgrains production by, say 5 per cent per year, then the required programme for expanding the irrigation network can be solved from the following equation :

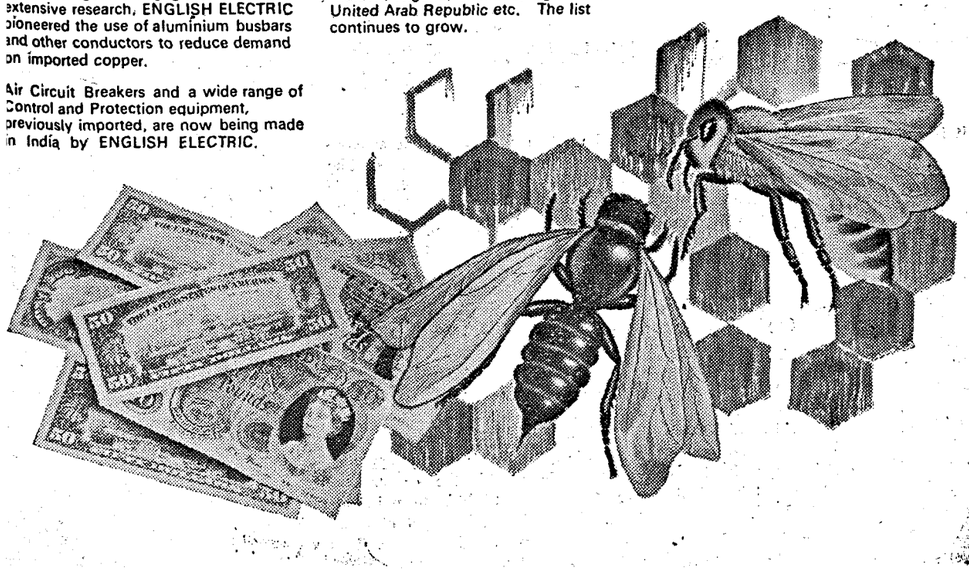
$$0.171\,(A-I) + 0.614\,I = Q\,(1.05)^t,\ I \leqslant \bar{I}$$

whereas A is the total foodgrains area, I the corresponding irrigated area, Q foodgrains output in the base year, and $\bar{I}$ the maximum acreage which can be brought under irrigation. Here A and Q are two given constants; and only I is the unknown variable. The productivity figures, namely, 0.171 and 0.614, are taken from Table 2.

English Electric conserve precious foreign exchange

through planned import substitution

To conserve the country's foreign exchange, ENGLISH ELECTRIC have been continuously developing designs of Control and Protection equipment based on the maximum use of indigenous raw materials and components.



A major breakthrough was achieved in the indigenisation programme in 1966 with the production of Steatite bodies for H.R.C. Fuses at the Madras Works. The import content in the present range of Fusegear and Switchgear is negligible. After extensive research, ENGLISH ELECTRIC pioneered the use of aluminium busbars and other conductors to reduce demand on imported copper.

Air Circuit Breakers and a wide range of Control and Protection equipment, previously imported, are now being made in India by ENGLISH ELECTRIC.

The import content of all this equipment is being progressively reduced aiming at self-sufficiency in the near future. In Electronics, the ENGLISH ELECTRIC MARCONI Signal Generator is a typical example of import substitution of a world-class instrument made in India with very high indigenous content.

On the export front, Indian-made ENGLISH ELECTRIC equipment is in service in Australia, Burma, Kuwait, Malawi, Nigeria, Thailand, Uganda, the United Arab Republic etc. The list continues to grow.

Control and Protection are the keys to ENGLISH ELECTRIC'S total involvement in India's industrialisation and power development. Pioneering in the indigenous manufacture of Control and Protection equipment, planned import substitution, sustained export drive and dedicated research and product development make ENGLISH ELECTRIC what they are today—trusted for quality and performance the world over.

'NEW AGRICULTURAL STRATEGY'

This strategy, in effect, calls for intensive use of fertiliser, HYV seeds and other 'modern' inputs in the areas of assured water supply which constitute roughly 15 per cent of the total cropped area at the moment. Assuming an output price of Rs 700 per tonne and the nitrogenous fertiliser (N) price of Rs 250 per quintal, the optimal dose of N per acre of Sonora-64 wheat is estimated to be 58.8 kgs which would produce 1.992 tonne of output.[20] Let us also note that the basal doses of phosphate (P_2O_5, or simply, P) and potash (K_2O, or simply, K) are respectively 24 kgs and 16 kgs per acre.[21]

As against the above-mentioned 1.992 tonnes of Sonora wheat yield per acre, the actual record so far is far below that. During 1968-69, Punjab was able to achieve the highest, namely, an average yield of 0.867 tonnes only, while the next highest performance was of the order of 0.680 tonnes attained in Haryana, for all high-yielding varieties of wheat taken together.[22] In some selected localities elsewhere the results are, of course, somewhat better. In Nenod (MP), Aligarh (UP), and Udaipur (Rajasthan), the average yields were 0.909 tonne, 1.105 tonnes, and 1.18 tonnes respectively (Table 7). Still these figures are well below 1.992. Nevertheless, in order to give maximum advantage to the new strategy, let us accept the yield of 1.5 tonnes per acre as feasible in practice, as distinct from controlled experiments.

On the other hand, we find that the actual fertiliser consumption in one small sample village (Nenod, MP) was as follows: 62.24 kgs of N, 22.51 kgs of P, and 18.11 kgs of K per acre, against the recommended doses of 66.69 kgs, 31.63 kgs, and 19.77 kgs respectively, for that particular area.[23]

We have already accepted a relatively high figure for all-India average yield (1.5 tonnes per acre); now we shall take relatively low figures for the corresponding fertiliser requirements, namely, 58.8 kgs, 24 kgs and 16 kgs of N, P and K respectively.

In 1964-65 the price of N (from ammonium sulphate) was about Rs 1.71 per kg, while in 1966 the prices of P (from superphosphate) and K (from muriate of potash) were Rs 1.56 and 0.50 respectively.[24] These prices include certain amount of subsidy; and what is more these are essentially ex-works or ex-jetty prices which do not include costs of transport to farms. In deference to Cummings, Herdt and Ray,[25] we shall put the price of N at Rs 2.50 per kg; and the prices of P and K would be rounded off at Rs 1.60 and Re 0.60.

Then the fertiliser costs per acre under the new agricultural strategy are Rs 147.00 for N, Rs 28.40 for P and Rs 9.60 for K which add up to Rs 195.00.

Table 7 shows that by switching from traditional variety of cultivation to the new strategy increases average yield by 73.6 per cent in Udaipur, 111.7 per cent in Aligarh, and 194.1 per cent in Nenod; under our assumptions the all-India estimate is as large as 191.6 per cent. Correspondingly, in Udaipur and Nenod, the cost of human labour goes

TABLE 6: ESTIMATED ITEMWISE COST PER ACRE OF WHEAT—1954-55/1956-57

up by 13.6 per cent and 35.5 per cent. Let us assume that in all-India, the labour cost would go up by 30 per cent. Again, in Nenod, the cost of bullock labour and seeds rises by 31.7 per cent; suppose that for all-India such costs would be higher by 30 per cent.

Now a word about the irrigation cost of the new agricultural strategy. Under this strategy, the HYV seeds, fertilisers, etc, are to be applied in those areas where irrigation facilities already exist. Hence apparently the construction cost of irrigation schemes is irrelevant; only the operating cost is to be taken into account. Above we have computed the operating cost to be Rs 7 per acre of irrigation, or 2 per cent of the capital cost of Rs 350.

But the HYV seed requires considerably more irrigation water as compared to the traditional one. Furthermore, it requires highly sophisticated water controls. Many of the old gravity irrigation projects were not initially designed to meet such demands. As a result, significant additional costs are involved in converting existing irrigation systems to the requirements of the new strategy.[26] Now, as compared to the operating cost of Rs 7 per acre of irrigation for traditional cultivation, and correspondingly the capital cost of Rs 35, let us assume that the total cost per acre of irrigation for the new agricultural technology is Rs 30. Admittedly, this is an arbitrary guestimate. Still this is less than one-fourth of Rs 114.50 which was paid by an average HYV farmer in Nenod in 1967-68.

All this explains how we have arrived at the all-India estimate of *operating* cost per acre of Sonora-64 as given in the last column of Table 7. Now we shall turn to the capital cost.

Again the ideal data are practically non-existent. But Ladejinsky gives us a clue with his statement: "It takes Rs 10,000 to Rs 12,000 to re-equip a seven- to 10-acre holding" for the new agricultural technology.[27] Presumably, this re-equipment refers to the preparation for improved water control ("each plot must be controlled separately throughout the growing season"), implements such as tractors, threshers, etc. On this basis let us say that the additional capital cost per acre for new technology is Rs 1,000. At the rate of interest 10 per cent, and the rate of depreciation 5 per cent, it means a capital cost of Rs 150 per acre per year. This amount can be compared with the capital cost (interest on capital, depreciation and other charges on machinery and equipment) of Rs 15.48 in a traditional irrigated farm of one acre (Table 6).

The cost structure of three types of cultivation — (a) traditional unirrigated (b) traditional irrigated, and (c) 'new strategy' — can now be put together (Table 8).[28] Accordingly, the costs per acre are Rs 49.63, Rs 160.80 and Rs 509.84.

We have already seen above that it takes 3.04 acres of land to raise one tonne of traditional wheat by introducing irrigation to hitherto dry land. The cost of producing one tonne this way is Rs 337.96 including direct labour cost, or Rs 263.39 excluding direct labour cost.

From the top row of Table 7 we find that approximately one acre of land is needed to produce an additional tonne of wheat through the new technology in an already irrigated, traditionally cultivated land. Now according to Table 8, the additional cost is given by: 509.84 — 160.80=Rs 349.04, including direct labour cost. If the direct labour cost is excluded, the cost amounts to Rs 336.45. Table 9 summarises the results.

Having done this exercise, one must be careful in interpreting the findings. Table 9 should not be construed as a blanket condemnation of the new agricultural strategy; nor should it be looked upon as championing the cause of a pair of bullocks, wooden plough and all that which constitute the traditional method of cultivation in India, to the exclusion of technological progress. In spite of all the approximations and arbitrariness behind it, Table 9 has at least one message: Resource allocation and technological change in Indian agriculture should be based upon scientific analysis of relevant data. More positively, expansion of irrigation in hitherto dry land deserves serious consideration.

Also it should be recognised that the cost of producing any particular crop, be it wheat, or rice, or anything else, is not the correct criterion for resource allocation in agriculture. The limiting factor is land; hence the productivity of land per year as a whole should provide the guideline. An acre of land can produce so much of wheat, as well as certain other crops within a given year. Those other crops cannot be ignored, as we have done in the above analysis.

THE WORLD SCENE

The experience of many other countries in the world also clearly underlines the crucial role of irrigation at the early stage of agricultural growth. Indeed, the rapid expansion of agricultural production in Japan after the Meiji Restoration (1868) was immediately associated with a fast rate of absorption of fertiliser. But one must not lose sight of the fact that the preceding Tokugawa period laid the massive infrastructure of irrigation, drainage, and flood control, whose contribution to the agricultural growth subsequently must have been immense.[29]

In partial support to his thesis, Schultz cites the phenomenal rise of agricultural output in Mexico.[30] The case of Taiwan as well is mentioned frequently in this connection. Let us quote K N Raj. With regard to Mexico (1939-59), he observes: "it is fairly clear that it [the agricultural growth] was largely a kind of 'enclave' development made possible by heavy investments in irrigation opening up new areas for cultivation..."[31] As for Taiwan (1948-63) his comments are as follows: the agricultural growth "was due in the main to extension of the cultivated area and technological improvements. Both, however, were dependent on a large-scale expansion of the area under irrigation. From around 30 per cent of the cultivated area at the turn of the century, the share of irrigated land in the total area under cultivation

Notes: (1) 'Not available' is denoted by—; and nil or negligible by ..
(2) The HYV strains in Udaipur and Aligarh are not specified.
(3) Price of fertiliser per kg: Rs 2.50 for N, Rs 1.60 for P, and Re 0.60 for K.
(4) The cost of Aligarh sample is the so-called Cost C that includes all current and capital costs.
(5) For Nenod, itemwise fertiliser costs have been computed by us with the data of Sisodia, *op cit*, pp 109 and 111.
(6) "Traditional" in this Table means cultivation of local varieties of wheat with irrigation and other traditional inputs; HYV or Sonora-64 refers to the New Strategy.
(7) The irrigation cost of "all-India traditional" is estimated by: (0.10+0.02)×350=Rs 42.
(8) All-India Sonora-64 in the last column: Quantities of fertilisers are as given by Cummings, Herdt and Ray; and Srinivasan. The costs of human labour, bullock labour and seeds are simply 130 per cent of the respective costs corresponding to the "all-India traditional". The costs of insecticides and irrigation are arbitrarily determined.

Source: S S Acharya, "Comparative Efficiency of HYVP: Case Study of Udaipur District", *Economic and Political Weekly* (November, 1, 1969); G S Lavania and R S Dixit, "Economics of High-Yielding Varieties in Package District, Aligarh", *Indian Journal of Agricultural Economics* (1968); J S Sisodia, "Some Economic Aspects of High-Yielding Varieties Programme of Indore District," *ibid;* and Table 6 above.

was raised under Japanese rule to nearly 62 per cent by 1940."[32] Raj continues: "A feature common to Mexico, Taiwan, the Punjab and Madras, ... is that they not only had considerable irrigation facilities as a result of past investments, but that there was an extension in the irrigated area during the period in which high rates of growth were recorded."[33]

Finally, China presents an interesting case. High-yielding varieties of seeds have been recently introduced there also. Thus China as well has adopted a sort of New Strategy for agricultural growth.[34] But in China as early as 1949, the crop yields per acre were quite high; they actually exceeded the levels attained in Meiji Japan. While yields per acre were relatively high, yields per man were quite low. This fact suggests that crop production in China had been pushed about as far as traditional practices and methods would permit, and that large improvements in farm output could be attained only through the introduction of new technology and improved practices.[35]

Furthermore, be it noted that China's multiple irrigation system, which is widely used, already plays an extensive role in its agriculture. The total area of irrigated farm land in China by 1960 was equal to about 170 million acres, which is more than 60 per cent of all the land of the country under cultivation — an increase of irrigated lands 3.5 times over that of 1950. The country at present occupies first place in the world in the acreage of irrigated land.[36]

CONCLUDING REMARKS

Our calculations of relative costs per tonne of wheat under two alternative strategies are admittedly crude and, hence, not necessarily conclusive. But, as shown in Table 9, the strategy of extending irrigation to hitherto dry land for cultivation with largely traditional method may be even less expensive than the so-called New Agricultural Strategy based on 'modern' inputs. This finding, however, goes against the spirit of the celebrated thesis of Theodore W Schultz.

It is well known that in India there exists a serious gap between the capacity of an irrigation system and the actual utilisation thereof. No less serious are the malpractices and inefficiency of actual distribution of irrigation water.[37] Still another aspect is the lack of drainage and deficiency in designs of irrigation projects.[38] What is all the more surprising is that nonetheless the contribution of irrigation water to agricultural productivity in India has been so significant.

In the nature of the things, all the input data of our analysis could not be expressed in terms of a single year's market prices. But what is more important is that the market prices of the inputs are not necessarily their respective 'shadow prices'. This assumes special significance in view of the labour-intensive character of the irrigation projects on one hand and large import requirements of fertiliser plants on the other.

The New Agricultural Strategy benefits relatively big farmers; and its overall impact on small cultivators and landless labourers still remains dubious. It has an inherent tendency to give rise to 'enclave' economies within India. In the perspective of acute rural poverty and unemployment,[39] this strategy may not turn out to be an unmixed blessing. The entire gamut of resource allocation in Indian agriculture, therefore, calls for a fresh, rigorous scrutiny.

13 Government of India, "Statistical Abstract of India, 1968"; and "Indian Agriculture in Brief" (10th ed), 1970.

14 S Ishikawa, "Economic Development in Asian Perspective" (1967). The yield of rice per acre was 0.544 tonne in India during 1955-56/1960-61 as compared to 1.016 tonnes in China, 1952-57.

15 Going through the Farm Management Survey Reports for Punjab (1954-55/ 1956-57), Bombay (1954-55/1956-57), AP (1957-58/1958-59), Orissa (1957-58), MP (1955-56/1956-57), Madras (1956-57), and West Bengal (1956-57), we could find the relevant data only in the first four cases. See Table 3.

16 "The ultimate area which can be irrigated from major and medium irrigation schemes is estimated at about 112 million acres (gross). The irrigation possibilities from minor irrigation schemes, i e, from small surface water schemes and ground water resources are placed about 75 million acres (gross). Thus the ultimate irrigation possibilities from major, medium and minor irrigation are of the order of 187 million acres (gross), against the net area sown at present of about 328 million acres, the corresponding cropped area being 376 million acres (gross)." Planning Commission, Memorandum on the Fourth Five-Year Plan (1964), p 38. See also Third Five-Year Plan, p 381.

17 The data of 41 multipurpose and major irrigation schemes are given in the plan document. Of these, we have excluded two schemes (Hirakud and Sirhind Feeder); the reason is that either the cost of irrigation alone is not separated from that of power, or the gross area of irrigation is not shown. The total cost of the remaining 39 schemes is Rs 9,564.8 million and gross area of irrigation is 26.511 million acres. See Third Five-Year Plan, pp 413-14.
Also note that in multipurpose schemes, the allocation of joint costs as between irrigation and other activities is largely arbitrary.

18 In the New DVC Canal System, total capital outlay upto 1959-60 was Rs 439.7 million, while operating expenses in 1959-60 was only Rs 1.9 million which is less than even 1 per cent of the capital cost. Still we have taken 2 per cent to be the operating cost. See S K Basu and S B Mukherjee, "Evaluation of Damodar Canals (1959-60)", p 137. See also N Ansari "Economics of Irrigation Rates", (1968), p 337.

Season-Wise Progress of High-Yielding Varieties in Andhra Pradesh

Role of Economic Variables

G Parthasarathy

D S Prasad

It was hoped that HYV rice cultivation would be taken to vigorously and that it would have a very sizeable impact on production. But, in fact, its progress has been far slower than expected, and slower in kharif than in rabi.

This article maintains that economic variables have been far more important determinants of that pace than is often realised.

Section I of the article examines data on trends in progress and varietal changes in relation to Andhra Pradesh. Section II identifies and compares the role of the economic variables with that of the agronomic and climatic variables in the slow progress in kharif.

DESPITE the hope that HYV rice will be moving from "unsteady infancy to vigorous adolescence"[1] its progress continues to be less than expected, and far less in kharif than in rabi. It is the contention of this paper that economic variables are far more important in explaining the tardy progress than is often recognised.

In Section I are examined the data relating to trends in progress and varietal changes in respect of Andhra Pradesh. In Section II, the role of economic variables as distinguished from agronomic and climatic, in explaining the slow progress in kharif is identified.

I

Details relating to the area under various HYV's for kharif and rabi, separately, have been obtained from the Directorate of Agriculture, AP. These official estimates are based on (a) quantity of seeds distributed and (b) the judgments relating to natural spread. The estimates are liable to error on several counts. First, the estimated acreage on the basis of the seed distributed, gives an exaggerated picture,[2] since the quantity of seed used per acre sown by the cultivator is generally found to be more than the recommended dosage. Secondly, the judgments relating to the estimates of natural spread are also liable to error and, in this case, even the direction of the error cannot be known. However, for judging the broad trends in progress the official figures, may still be found useful. The changes in area under kharif, in absolute terms, are quite impressive for the period 1967-68 to 1969-70 (Table 1). Even between 1969-70 and 1970-71, the state as a whole records a rise in area under high-yielding varieties. But, when we consider the year-to-year increase in

TABLE 1 : PROGRESS AND CHANGES IN THE AREAS OF HYV PADDY IN ANDHRA PRADESH DURING KHARIF 1967-68 TO KHARIF 1970-71 AND RABI 1967-68 TO 1969-70

Source : Reports of the Agro-Economic Research Centres, Madras-Waltair.

acreage, there was a remarkable fall in kharif 1970-71. This may be brushed off, as a temporary phenomenon, caused by bad weather conditions. But weather conditions were not exceptionally unfavourable in kharif 1970-71 as compared to kharif 1969-70. In the light of our results, presented later, relating to the uneconomic nature of cultivation of HYVs in kharif season, the fall in increase in acreage in kharif 1970-71, may suggest a slackening of the pace of HYVP and stabilisation at around 10 per cent of the total paddy area in kharif.

We do not have comparable data for the rabi 1970-71. But by rabi 1969-70, the area under HYV paddy exceeded one-third of the total paddy area in the state.

The official data provide variety-wise particulars and reflect the changing pattern in respect of HYVs (Table 2). In kharif 1967-68, TN-1 was the most widely practised variety. In kharif, 1968-69, IR 8 came with a big bang and swept TN-1 off the field and IR 8 maintained its sway even in 1969-70 kharif since, more cultivators were experimenting with IR 8 even then. But by kharif 1970-71, there were certain indications that IR 8 was giving way to other HYVs, of which CO-29 is prominent. The rabi picture also shows, that IR 8 is losing its relative importance to CO-29.

Examining the figures of area under HYVs in kharif 1970-71 as compared to kharif 1969-70, in East Godavari and Krishna Districts in coastal Andhra, in Cuddaph, Kurnool and Anantapur districts in Rayalaseema, and in Nalgonda and Nizamabad districts in Telengana regions, the area under HYVs declined. Even in other districts, the rates of growth slackened.

Among the major rice-growing districts in the state, the districts of Nizamabad and Krishna during Kharif 1970-71 show a much poorer percentage with around 5 per cent of its paddy area under HYV paddy as compared to the general average for the state which is around 10 per cent. In terms of percentage under HYV area, some of the Rayalaseema Districts, *viz,* Chittore, Kurnool, and Anantapur, show much better results, than the deltas of coastal Andhra.

A study of the area (by variety) under HYVs in kharif 1970-71 (Table-3) in each of these districts, shows that IR 8 maintained its importance, with about 70 per cent or more in the districts of Srikakulam, Visakhapatnam, West Godavari, Kurnool, and Nizamabad. TN-1 lost ground everywhere. Jaya, a variety released in 1968 "which has higher yield potential than IR 8", "a week earlier in maturity" and "has a very good stability"[3] is found significant in Krishna, Kurnool, Nizamabad and Nalgonda. Hamsa, released in 1968 by the Andhra Pradesh Agricultural University, "a variety with excellent grain quality but poor cooking characteristics" and "relatively low yield potential", "with earliness during rabi season"[4] is popular in Telengana and particularly in Hyderabad and Medak districts. CO-29, a variety which matures earlier than IR 8, is being experimented on a large scale in East Godavari, Krishna, Nellore, Anantapur and Chittore districts.

Considering, the picture of rabi 1969-70, the latest season for which official data could be obtained, IR 8 had lost its importanee to CO-29, in East Godavari, Krishna, Guntur, Nellore, Chittore and Anantapur Districts (Table 4). Among the important paddy growing districs, only in West Godavari IR 8 continued to be supreme. ADT-27 was far significant in Nizamabad, Warangal, Chittore, and Cuddapah districts. Hamsa and Jaya, were being tried in almost all districts on a small scale. But Padma "Suggestive of its gain type", "susceptible to bacterial leaf blight",[5] is being tried mainly in the districts of West Godavari, Kurnool, Mahaboobnagar, Warangal

hammam and Nalgonda.

The brief review, based on official ata, suggests two important points:

(1) the area under HYV in kharif, in AP seems to get stabilised, at around 10 per cent.
(2) the cultivators are still experimenting with one variety after another and even IR 8, which was popular in rabi, is yielding place to the new varieties which mature much earlier, like CO-29 though their yield potential is far lower than that of IR 8.

II

It is now generally known that the progress of HYVs is better in rabi han in kharif and this is attributed to number of agronomic factors which avour HYVs in rabi as compared to harif.[6] It may be true that agroomic factors are important. But what appears to have been ignored is he importance of economic factors in contributing to the differential progress. The data of the Agro-Economic Research Centres, Madras and Waltair, re analysed to throw light on these spects. The reports of these centres re available for West Godavari for abi 1967-68, kharif 1968-69, and rabi 1968-69, and for East Godavari for kharif 1968-69 and rabi 1968-69. These reports, besides giving details of HYVs and local varieties for participant farmers, present yield and cost details for local varieties on the holdings of non-participants also. To keep the managerial factor constant, yields of HYV and locals on the holdings of participants alone are considered.

The comparable figures of IR 8 and locals of kharif and rabi on cultivators' plots are available for these two districts (Table 5). The kharif yields of IR 8 are not found to be less than the rabi yields. Even the Crop Cutting Experiments conducted in several IADP districts for the years 1967-68 and 1968-69 do not show that rabi yields of IR 8 are uniformly higher than kharif yields (Table 10). The more significant part of the data relates to yields of local varieties. The yields of local varieties in kharif are far higher than the corresponding yields for rabi. As a consequence, the difference in terms of physical yields between HYVs and locals is far higher in rabi than in kharif. The differences between the gross value of IR 8 and the local variety in kharif, on the one hand, and the corresponding difference in rabi, on the other, is much more striking. In East Godavari, the difference between the physical yields of IR 8 and the local variety, in kharif 1968-69 is 639 kg and in rabi it is 1191 kg, the rabi excess being less than two times. But in respect of gross value, the excess of IR 8 over the local in kharif is Rs 178.10, while in rabi the corresponding figure is Rs 600.14, the rabi excess being more than three times that of the kharif excess. The explanation for this is the difference between kharif and rabi prices received by the cultivators. The rabi prices for both IR 8 and local are higher than the kharif prices (Table 9). This appears to be a part of the seasonal pattern. The rabi crop flows into the market when prices are generally higher, and the cultivator gains both on account of (a) yields and (b) prices, by growing an HYV.

The cost data are also equally useful to throw light on the economic factors contributing to the popularity of HYVs in rabi as compared to kharif (Table 6 and 7). Here again, it is the differential cost pattern of local varieties, and not IR 8 between rabi and kharif, that provides an explanation. The cultivator spends far less in kharif on

material inputs, and gains much more in yields. In rabi, expenditure on fertiliser exceeds Rs 100 for local variety and in kharif it is less than Rs 20 per acre. The unit costs of local varieties in rabi are two times those observed in kharif (Table 8). As a consequence, cost per unit of local varieties is found to be less than that of IR 8 in kharif, while in rabi the unit cost of local varieties is higher than that of IR 8. The result that IR 8 is not found to be economically more remunerative than the local variety in the kharif season, at the current level of cultural practices, is also seen in the comparative returns to owned factors between local and IR 8 in kharif as against rabi. The returns to owned factors in rabi for IR 8 are far in excess of returns to local varieties. But in kharif 1968-69, in the East Godavari district, IR 8 yielded less than the local. In West Godavari District, IR 8 yielded a little more but not substantially enough, for the managerial difficulties and risks involved in it.

The preceding analysis points to the need for adapting input use to the distinct economic variables that govern IR 8 in the kharif season, so that, the cultivation of IR 8 might be made economically more remunerative than the local variety. The two important variables, which we have identified and which account for the relatively low profitability of IR 8 in kharif are:

(a) lower product prices in kharif as compared to in rabi and

(b) the distinct cultural practices governing the local variety of paddy in kharif season, and very low cash expenditure, particularly on fertiliser as compared to local variety in rabi — making the difference in cash expenditure between IR 8 and local far higher in kharif than in rabi.

Since the product prices in kharif are lower, and, added to this, the product response of fertiliser is known to be lower in kharif than in rabi, the recommended optimum dose of fertiliser in kharif for IR 8 should have been far less as compared to rabi. But the recommended dosage for IR 8 for kharif and rabi is identical in West Godavari. In practice the cultivator in his enthusiasm used much higher level off (Table 11) 'N' than the recommended dosage observed that growing IR 8 in kharif was not economically more remunerative than local, and is not inclined to expand the area under IR 8. It appears to us that the overemphasis on the agronomic factors for the differential progress of high-yielding varieties between kharif and rabi has led to the neglect of obvious economic factors at work. The fact that product prices are lower in kharif warrant a lower level of use of fertiliser in kharif than in rabi. It will also be necessary to identify and separate the areas where the economic factors are more decisive in influencing the low rate of progress, so that appropriate policy measures could be devised.

Conclusion

The pace of progress of the HYV programme in kharif is slackening. It is generally believed that this slackening is due to agronomic and climatic factors. This may be true in some areas. But the data of West and East Godavari districts in Andhra Pradesh suggest that the slackening in kharif could be explained in terms of economic variables. It will be quite useful to study the problem area-wise to identify the economic variables at work, as distinguished from agronomic and climatic variables so that appropriate measures to quicken the progress of HYV could be taken.[7]

4 *Ibid*, p 17.

5 *Ibid*, p 17.

6 "Our data on farm participation in the use of HYV seed show a much greater, response during rabi than during kharif in several important paddy states. In Andhra Pradesh, for example, the kharif programme has stagnated at an extremely low level but there has been a steady increase in the number of farmers growing IR 8 as a rabi crop." P K Mukherjee and B Lockwood, "HYVP in India — An Assessment" (mimeo) p 14.

7 G M Desai, using the data of the Agro-Economic Research Centres, on HYV and locals, doubted the economic viability of HYVs replacing locals in many a situation. However, since his analysis was restricted to kharif season only, he could not bring to light adequately the differences in economic variables governing kharif and rabi cultivation and accounting for lower rate of progress in kharif season. (See G M Desai: "Some Observations on Economics of Cultivating HYV of Rice in India", Paper presented at the International Rice Policy Conference, Manila, May 1971, mimeo.)

Dharm Narain quoting R W Herdt, etc, noticed that IR 8 gets much lower price than locals and therefore the profitability on growing this variety gets reduced. But he failed to notice the huge price differences between kharif and rabi as a major factor influencing the higher rate of adoption in rabi as compared to kharif. (See Dharm Narian — "Rice: Policies and Problems", Paper presented at the International Rice Policy Conference, Manila, May 1971, mimeo).

HPF and Kodak

EASTMAN Kodak of the US has accepted an invitation from the Hindustan Photo Films Manufacturing, Ootacamund (a Government of India enterprise), to conduct a feasibility study for expanding the present facilities for manufacture of photo-sensitised materials in India.

Initial work on the study began in June, this year, when a six-man team of Eastman Kodak spent a few weeks in Ootacamund with officials of Hindustan Photo Films. The project would include preparation of estimates on current and potential market demand, cost of factory and manufacturing operations, profitability, and return on investment. The study is expected to be completed by about March 1972.

HPF currently manufactures only black and white films and other sensitised photographic products for sale in India and for export.

Kodak has had operated a marketing subsidiary in India since the turn of the century, supplying high-quality photographic products within the country.

Demand is increasing, however, and is for more various photographic products: for industrial and medical radiography, the graphic arts industry, education, and the mass communication media.

Capitalist Development in Agriculture

A Note

Utsa Patnaik

In recent years there has emerged a tendency towards profit-oriented production and investment in land by a section of the cultivating population. Many observers think they see a new class of capitalist farmers emerging. There had been, however, no quantitative studies attempting to isolate the characteristics of capitalist farmers or to apply any criteria to identify the capitalists.

Ashok Rudra with A Majid and B D Talib carried out a sample survey of big farmers in Punjab and, after attempting to isolate the capitalists from the sample by certain statistical methods, came to the conclusion that no group of capitalist farmers could be identified.

The author conducted a small survey in 1969 of 66 big farmers scattered over 10 districts in 5 states. The aim was to concentrate on detailed case studies of big farmers selected purposively with a wide geographical scatter.

The results of the survey show that a new class of capitalist farmers is emerging. This is a phenomenon common to every region, insofar as every area has been subject to the same forces — albeit operating with varying intensity — of an expanding market and enhanced profitability of agricultural production. The rate at which capitalist development is occurring varies widely in different regions depending on many historical and current circumstances; it may be near zero in some: but the reality of the process cannot be denied.

THE Indian agrarian scene has shown an unusual dynamism in recent years: there has undoubtedly emerged a tendency towards profit-orientated production and investment in land by a section—no doubt small, but significant—of the cultivating population. Many observers think they see a new class of capitalist farmers emerging. As early as 1962, Sulekh Gupta had discerned this tendency on the basis of data then available on rates of addition to capital stock by different groups of land-owners.[1] There had been steady inflation in agricultural and especially foodgrains prices since 1958, turning the terms of trade in favour of agriculture. It was with the particularly sharp improvement in the terms of trade from 1963-64 onwards,[2] however, and the consequent enhanced profitability of agricultural production, that the tendency for investment funds to flow into agriculture became visible. Daniel Thorner was the first to draw attention to the phenomenon of flow of urban funds into rural investment—the "gentlemen farmers" who invest in agriculture because it is profitable to do so.[3] The significance of such farmers lay not in their numbers (which were negligible), but in the fact that they were symptomatic of a new economic conjuncture.

No Quantitative Studies

So far however there had been no concrete quantitative studies attempting to isolate the characteristics of capitalist farmers or to apply any criteria to identify the capitalists. A Rudra with A Majid and B D Talib carried out a sample survey of 261 big farmers (defined as those operating more than 20 acres) in Punjab with the aim of filling this gap.[4] A great deal of interesting information was collected; however Rudra's conclusions were entirely negative: after attempting to isolate the capitalists from the sample by certain statistical methods, he found that no such group could be identified.

I too carried out a small survey in 1969 of 66 big farmers scattered over ten districts in five states—Orissa, Andhra, Mysore, Madras and Gujarat.[5] The aim was not to obtain a representative sample from which one could generalise about the population of big farmers as a whole—such a project would have been beyond the capacity of an individual—but rather to concentrate on detailed case-studies of big farmers selected purposively, with a wide geographical scatter. Information was collected on every aspect of the economic operations of these cultivators, with particular emphasis on their investment behaviour. I must admit to starting with a certain bias: an extreme scepticism about the significance of the new developments outside Punjab, and an assumption that research into conditions in other less-publicised areas would show that Punjab, the fastest growing state in India, was an exception. After completing the field work and going through the data, however, my view has altered completely. A new class of capitalist farmers *is* emerging: this is a phenomenon common to every region, insofar as every area has been subject to the same forces—albeit operating with varying intensity—of an expanding market and enhanced profitability of agricultural production. The rate at which capitalist development is occurring varies widely in different regions depending on many historical and current circumstances; it may be near zero in some: but the reality of the process cannot be denied.

A Historical Process

I suggest that Rudra's survey too clearly shows that the Punjab is experiencing this process of capitalist development, perhaps at a faster pace than any other region in India. The reason for Rudra's negative conclusions, in the face of his own very positive data to the contrary, is merely the fact that he applies, implicitly, an unhistorical and incorrect method of analysis to the phenomenon of capitalist development. This is reflected in the idiosyncratic way he sets about trying to identify the capitalists. His formulation of the statistical problem involved is quite incorrect as a result.

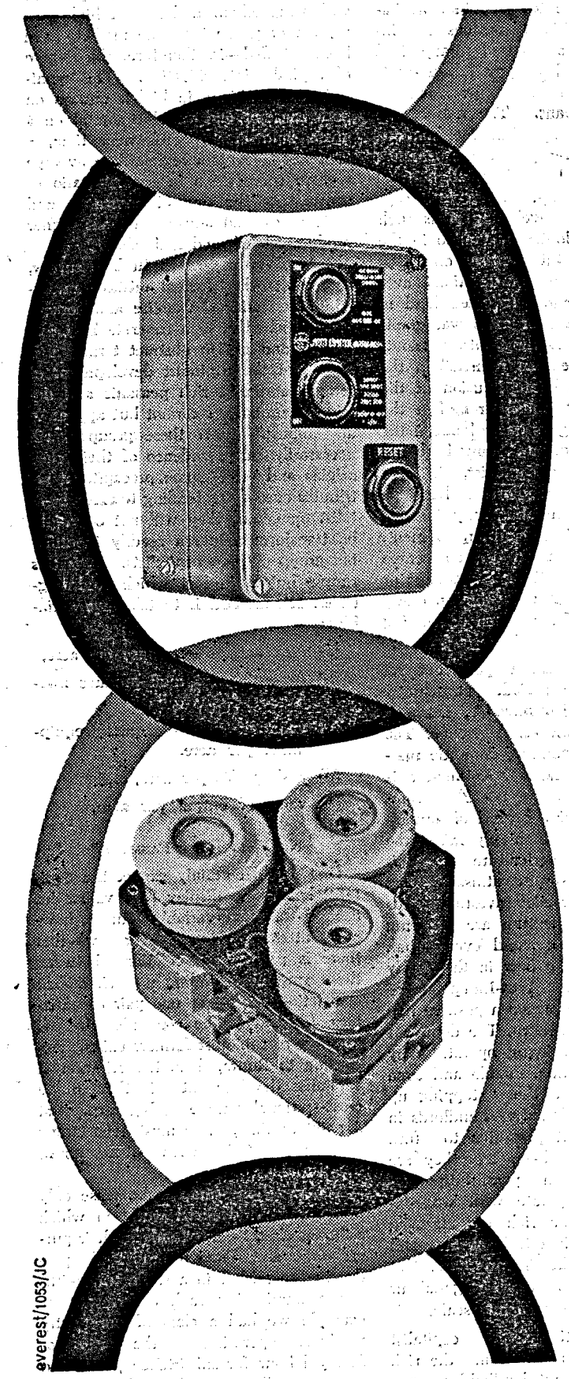
The development of the capitalist form of organisation must be looked at as a *historical process*, not as a once-for-all event. The capitalist does not suddenly appear out of the blue as a clearly-defined 'pure' socio-economic type: he develops within the pre-existing, non-capitalist economic structure. It follows that some understanding of the post-colonial agrarian structure is absolutely essential to an understanding of what is taking place today. In what sense was the agrarian economy in the colonial period just prior to and at In-

dependence, non-capitalist? (This term is preferable to "precapitalist", since the latter implies that capitalism has made no impact at all, whereas ex-colonial countries like India are characterised precisely by a limited and distorted development of capitalism which does not revolutionise the mode of production.) An answer to this question is necessary if we are to answer the question: in what sense is there a tendency towards capitalist development today which was not present earlier?

These questions are not as simple as they might seem. The unique feature about the Indian agrarian structure as it had evolved in the colonial period just prior to Independence (the feature which distinguished it sharply from other comparable ex-colonial countries), was the existence and growth of a large force of full-time agricultural labourers. The 1921 Census returned 21.3 per cent of population supported by agriculture, as labourers; by 1931 this had risen to 31.2 per cent, even if large numbers of unspecified and general labourers are excluded. (The majority of these were in fact likely to have been engaged in agricultural wage-labour. Their inclusion raises the percentages to 26.2 and 38.) Even the conservative estimates are very high indeed, as high as the proportions returned for many countries in capitalist Europe (Austria, Bulgaria, Estonia, Germany, Ireland, Lithuania, Sweden, Switzerland) as well as the USA and Canada at the same date.[6] In China, by contrast, an astute observer like Mao Tse-tung estimated the proportion of agricultural labourers at 3 per cent or less of rural population: petty tenancy, i e, rent rather than wage-exploitation, was on the other hand extremely widespread.[7]

Growth of Labour Force

How is the growth of such a large force of rural wage labourers to be explained and interpreted? Only in part and to a negligible extent can a pre-colonial source be traced in the labour force of slaves and serfs in South India who worked on large estates owned by big landowners.[8] The main source was the poorer majority of the peasantry which tended to become pauperised and proletarianised under the imperialist impact in the colonial period—in particular under the combination of a rigid demand for revenue by the State and increasing vulnerability to fluctuations in world prices as commercialisation grew. This is clear from the fact that in South India, as in every other region, the proportion of population dependent on wage labour rose in almost every decennial Census, far beyond the maximum possible proportion that the precolonial unfree labour-force could have contributed, and combined with the latter, led to a higher incidence of wage-labour in South India than in any other region.



Given a large regionally concentrated and predominantly free class of wage-labourers, does this imply that capitalist relations of production had already penetrated the precapitalist structure (at least in the regions of concentration) to a substantial extent, even in the colonial period: are we to regard the big landowner who operated entirely on the basis of free wage-labour, as a capitalist? If the answer is yes, we would have to argue that a substantial capitalist sector has existed in agriculture, covering as much as 20-25 per cent of cultivated area, ever since at least 1930 (even if the plantations are excluded).

This in my view would be a superficial and incorrect argument. Operation on the basis of wage-labour is a necessary but not a sufficient condition of capitalist organisation. The distinction is particularly important in the context of India which experienced the classic process of pauperisation and proletarianisation of the peasantry under the imperialist impact; but did not experience that parallel rise of modern industry at a pace fast enough to absorb the proletariat so created, which would have stimulated capitalist production in agriculture by steadily expanding the market for agricultural products. In other words, colonised India did undergo the first phase of the European bourgeois revolutions: the undermining and breaking-down of her pre-capitalist organisations, under the imperialist impact; but not the later phases of a complete reconstitution of these organisations on a more productive capitalist basis. While the dissolution of petty production and the creation of a class of people divorced from the means of production is a necessary condition for the rise of capitalism in agriculture—indeed of capitalism in general—it is not and in the colonial situation could never be, a sufficient condition. Functioning markets in land and labour developed in the colonial period; to apply E Mandel's valid distinction (valid in the colonial context), bourgeois property relations developed, without being accompanied by the development of capitalist relations of production in agriculture. In this unique context, the mere existence of a large force of free wage-labourers is no proof of the prevalence of capitalist organisation.

Dominant Landholders

The rural wage labourers in India are indeed free insofar as they are not generally tied to particular pieces of land: but, in the absence of alternative job opportunities, they are effectively tied to agriculture as a main source of livelihood, even though this source gave a casual adult labourer only 197 days of employment in the whole year in 1956-57. The absence of alternative employment imposes constraints analogous to the earlier explicit tying to the land. The totally unorganised nature of the destitute labour force combined with a vast underemployed reserve army ensures that wages are wholly demand determined and in practice barely enough for subsistence. The big landowner does not employ free wage labour for profit; he maximises the returns from destitute labour tied to agriculture and forced to accept bare subsistence wages. Such a big landowner, who has traditionally operated on the basis of hired wage labour rather than leasing his land out to tenants—as landlords typically do—I term the dominant landholder. He may be distinguished from the rich peasant who also employs wage-labour by the fact that he and his family members do not perform any manual labour but merely manage and supervise. Such a group of dominant landholders has been in existence for decades. The productivity on their holdings very often is no higher than the average for the peasantry as a whole, and even the share of output marketed may not be particularly high. The choice between operating with hired labour and leasing out to tenants may represent for such landowners a purely contingent, reversible decision taken on the basis of current circumstances—e g, the comparative terms on which labourers and tenants are available in that locality.

It follows from this argument that a landowner is not entitled to be termed a capitalist merely because he is entirely dependent on wage-labour. Nor is operation on the basis of wage labour a sufficient criterion, by itself, for isolating the capitalist sector of the agrarian economy, as both S C Gupta and G Kotovsky seem to think.[9] Both have attempted to estimate the proportion of rural households and area operated under capitalist organisation, by applying data on use of hired labour by holding size, to the overall all-India figures of distribution of households and area operated. They estimate that 6-7 per cent of households and about 25-30 per cent of area came under capitalist ope-

ration in 1953-54. Clearly, they have taken operation with wage-labour to be a sufficient condition of capitalist organisation, which in our view is incorrect. Their estimate of "capitalist" holdings gives merely the holdings satisfying only *one* necessary condition of such operation, that of being wholly dependent on wage labour. On this criterion, as mentioned earlier, there would have existed at least as large a 'capitalist' sector in the 1920s since the proportion of work-force dependent on wage-labour was no higher in 1953 than at the earlier date.

Generation of Surplus Value

Production for the market is, similarly, only a necessary condition. The colonial period saw a growing commercialisation of agriculture and greater regional specialisation. Sale of most of the produce on the market was not necessarily a characteristic of big landowners operating with hired labour, alone. Cotton-growers in Berar, jute-growers in Bengal or sugarcane growers in UP could as well be, and are, petty commodity producers operating with family-labour. Production for the market must not therefore be confused with capitalist production: the former antedates the latter and though necessary, is not sufficient for its development.

What of the dominant landholder who, by definition, operates entirely with hired labour, and who also sells a high proportion of produce on the market? Typically, even when fulfilling these two conditions, dominant landholders have not, by and large, attempted to raise productivity by capital investment in land. The characteristic of the capitalist is not merely appropriation of surplus value generated by the wage-labour he employs, but also accumulation and reinvestment of surplus value in order to generate more surplus value. The whole *raison d'etre* of capitalist operation is generation of surplus values on an ever-expanding scale. It is this crucial characteristic which dominant landholders have lacked, by and large, in the colonial period. High rates of surplus value were generated on the basis of destitute labour: but very rarely did this find its way back into agricultural investment, into capital intensification. The commonest avenues of surplus utilisation remained the precapitalist ones of moneylending, trade, and purchase of land to let out to tenants. In a few, exceptionally favoured areas some investible funds flowed into industry (for instance, most Coimbatore textile millowners started as dominant landholders and moneylenders). The reason was simply the high rates of return available on the traditional avenues of investment, given a mass of pauperised peasants prepared to pay hunger-rents for small bits of land and usurious rates of interest on loans. The risk of default might be high, but the landlord or moneylender always had the peasant's crops, his land, and failing all else his labour, as security. Even in exceptionally favoured developing areas such as the Canal Colonies of Punjab in the early decades of this century, one finds the same preference for traditional avenues of investment. Irrigated land in blocks of 100 acres or more was granted to what M L Darling, rather quaintly, terms the "yeomen farmers" in the hope that "a moderate infusion of the capitalist element would strengthen the colony". Darling goes on to bemoan the fact that the "yeoman" turned out to be anything but a capitalist, since he preferred, like the landlord, to lease his land out to innumerable petty tenants, put no capital into land-improvement, and usually lived as an urban absentee on rent. "The last thing a capitalist or yeoman contemplates is the spending of a large sum of money on developing his grant..."[10]

It is in this crucial respect that the post-Independence period, particularly from the mid-1950s onwards, marks a definite break with earlier trends. The creation of an expanding domestic market owing to the large investment outlays by the State under the Plans combined with a lagging behind of agricultural production, has sharply raised the profitability of agriculture *vis-a-vis* other avenues of surplus utilisation. For the first time in decades investible funds generated in agriculture are flowing back into the land, and even urban funds are tending to flow in this newly profitable direction. Post-Independence land reforms have played a positive role in penalising absenteeism. The dominant landholder is intensifying operations by investing in irrigation, double and even triple cropping, and thus stepping up cash outlays considerably. Landlords in many areas find it profitable to turn tenants off the land—in this they are helped by legislation permitting "resumption"—and operate with wage-labour instead. The rich peasant who can generate an investible surplus and has access to credit similarly intensifies operations, employs more wage-labour and moves up the economic scale.

The characteristic of the capitalist which distinguishes him from the rich peasant and dominant landholder—once the necessary conditions of operation with wage-labour and sale of high proportion of product on the market, have been satisfied—is, therefore, the degree of capital intensification. This manifests itself initially in higher outlays on both constant and variable capital on a given land area; with, over time, a tendency towards a higher than average organic composition of capital (ratio of constant to the sum of constant and variable capital) and consequent higher productivity of land and labour.

Let us revert now to Rudra's survey, and the methodological mistake underlying his statistical exercise and conclusions. Looked at as a concrete historical process and not in abstract terms, it is clear that the capitalist development of former landlords, rich peasants and dominant landholders cannot but appear in an "impure" form: these groups will necessarily carry evidence of their class origins and retain some precapitalist attributes even when tending towards capitalist operation; they will not overnight be transformed into a readily identifiable group of pure capitalists. It is this simple but basic fact which Rudra ignores. His method is to take five variables:

(a) cash outlays on wages per acre,

(b) percentage of total produce marketed,

(c) value of modern capital equipment per acre,

(d) cash profits per acre, and

(e) value of output per acre,

No Capitalist Farmers?

One would certainly expect the capitalist holding to display high values for each of these five variables. Rudra, however, attempts to discover whether there is positive association between these variables. Finding no significant association except for one pair of variables, (d) and (e) he concludes that no category of capitalist farmers exists. According to Rudra, then, the criterion of capitalist development is that in a cross-sectional sample of big farmers at a point of time, there must exist strong positive association between the above five variables.

This criterion would make sense only in an unreal, idealised world in which different classes existed only in their purest form, and different modes of production co-existed in a static way without contaminating each other. If for example we had a class of pure petty producers operating on the basis of family labour for subsistence juxtaposed to an equally pure class of capitalists

producing on the basis of wage labour for profit, then indeed with a Rudra-type cross-sectional study we would get strong positive association between the variables. The family-labour based producer would never sell most of his produce, and the capitalist operating with wage labour would never have a lower value of capital equipment per acre than the peasant, or produce for consumption. To put the same point in a different way, Rudra's criterion has a chance of being satisfied only if the process of capitalist development has been carried to its limit, so that capitalism is already the dominant mode of production which has eliminated all transitional forms. The criterion is thus relevant to a question he has not formulated, namely whether capitalism is already the dominant mode in Punjab's agriculture; his 'negative' result confirms what one would have presupposed, that it is not. The criterion is not relevant, however, to the question he *has* formulated, namely, whether it is possible to "define scientifically and identify empirically" a category of capitalist farmers.

In the concretely given, historically evolving agrarian structure we find that classes do not and cannot exist only in their "pure" form: there are a variety of transitional forms, a complex interaction of developing capitalism with precapitalist organisations. We find that family-labour-based holdings produce for the market, while wage-labour-based holdings do not necessarily invest in capital; that is, petty commodity producers and dominant land holders exist. Similarly, there is no reason to expect high rates of profit to be associated with high values of modern capital equipment per acre; dominant landowners may well appr priate high rates of surplus value, as we have discussed earlier, without investing in modern capital equipment.

It follows that we should not be at all surprised, as Rudra is, that in a cross-sectional study at a point of time there is no strong positive association between his variables. On the contrary, we should anticipate this so-called "negative" result, since as we have seen, many of the attributes of the capitalist are not unique to the capitalist alone when taken individually. Indeed it is the positive association reported by Rudra between one pair of variables which requires explanation, rather than the lack of positive association among the remaining variables. There is thus no reason whatever to expect that if a process of capitalist development is taking place, Rudra's criterion must be satisfied. As R S Rao in his critique of Rudra's work has pointed out,[11] the only situation in which a positive association between the different variables may be expected is when repeated samples are taken from the same population at consecutive points of time, and the estimated parameters studied as time series. A secular tendency for the proportion of output marketed to rise may well be accompanied, for instance, by a secular tendency towards greater monetisation of inputs.

Table 1: Rates of Profit on Capital Advanced and Rates of Surplus Value

Scale (Gross value of Output, Rs 000)	Rates of Profit A		Rates of Profit B		Rates of Surplus Value	
	p_1 (A) (per cent)	p_2 (A)	p_1 (B) (per cent)	p_2 (B)	s_1' (per cent)	s_2'
0 — 24.99	5.84	4.52	6.56	5.09	71.75	179.01
25.0 — 49 99	7.90	6.16	21.66	17.21	135.99	177.53
50.0 — 74 99	9.55	8.29	23.19	20.48	166.82	209.27
75.0 — 99.99	8.98	7.87	23.38	20.66	181.93	229.22
100.0 — 199.99	12.71	11.93	43.12	41.18	289.98	352.13
200.0 — 499.99	15.74	15.16	62.46	60.91	438.71	511.03
500 and over	23.93	23.74	75.76	75.82	420.44	586.00
All	14.83	14.10	46.43	44.76	307.28	400.39

Notes: (1) Profit rates A and B are calculated on concepts of capital advanced based on fixed capital stocks A and B respectively, where
Capital Stock A=Value of implements and machinery, livestock, all constructions, and land value.
Capital Stock B=Capital Stock A—Value of land.

(2) p_1, s_1' are calculated on total outlays, both cash and kind; p_2, s_2' are calculated on cash outlays only. Thus,

$s_1' = \frac{s_1}{v_1}$ where s_1 = Gross Value of Output — (Depreciation on fixed capital + all current productive outlays, cash + kind).
v_1 = cash wages + kind wages.

$p_1 = \frac{s_1}{c_1}$ where c_1 = Fixed capital A or B + value of average working capital in kind + average working capital in cash.

$s_2' = \frac{s_2}{v_2}$ where s_2 = Cash Receipts from Sales—(Depreciation on fixed capital + current productive cash outlays).
v_2 = Cash wages.

$p_2 = \frac{s_2}{c_2}$ where c_2 = Fixed capital A or B + average working capital in cash.

(3) Profit rates are, more correctly, surplus values calculated on capital advanced; i e, interest payments, which are a very small proportion of surplus value, have not been deducted.

Statistical Criteria

If the attributes of the capitalist, taken individually, are not all unique to the capitalist alone, how are the capitalists to be identified? Precisely by examining the holdings which display *all* the characteristics of capitalist operation, irrespective of whether the remaining holdings display some such characteristics or not. Rudra's statistical variables should in fact be expressed as statistical *criteria;* thus,

(a) higher than average value of cash wages (and cash outlays generally) per acre,

(b) higher than average ratio of sales to value of output,

(c) higher than average value of modern capital equipment per acre,

(d) higher than average value of profit per acre, and

(e) higher than average value of output per acre.

In addition, two criteria measuring capital intensity and labour productivity should be included:

(f) higher than average value of modern capital equipment per unit wage outlay, and

(g) higher than average value of output per unit wage outlay.

The average value may be either the mean or the median, preferably the latter since the mean is affected by extreme values. Other combinations of criteria are possible; in my sample (c) has been dropped and (f) and (g) included.

The set of holdings fulfilling one criterion would not be the same, necessarily, as the sets fulfilling any of the other criteria. Smallest of all would be the set of "pure capitalists" fulfilling every criterion, which would be the intersection set of the six sets fulfilling each criterion separately. In my

TABLE 2 : RATES OF RETURN ON LEASING OUT LAND

S.No.	Area Leased Out (acres)	Value of Land Per Acre (Rs)	Value of Output Per Acre (Rs)	Rent Per Acre (Rs)			Per Cent Rate of Return Col 6 ÷ Col 2	Rent as Proportion of Output Col 6 ÷ Col 3
				Value of Cash Rent	Value of Kind Rent	Total

sample this set of "pure capitalist" constituted about 16 per cent of the total sample. We may then relax one criterion after another to obtain various combinations of sets fulfilling the criteria taken five, four, three and even two at a time and resulting in larger and larger intersection sets of less and less "pure" capitalists. In my sample the least restrictive criteria were high land productivity and high cash inputs per acre; the most restrictive were high capital intensity and high level of sales to output, since with their inclusion the number of holdings in any intersection set was lowered considerably. It would be interesting if Rudra could give us the results of carrying out this exercise of isolating the pure capitalists and ranking the criteria according to degree of restrictiveness, on his sample of big farmers in Punjab. He does mention that a number of holdings had high values for every variable: the set of pure capitalists in Punjab would no doubt be fairly large.

SIZE AND SCALE

Secondly, it would be useful if Rudra could retabulate his data so as to make the scale effects clearer. Only in a stagnant agriculture with uniform techniques can the size of holding be taken as a proxy for scale of operation: as capital intensification by particular groups of cultivators takes place, the identification of scale with size becomes more and more unsatisfactory. Clearly, a small holding which is intensively cultivated with high levels of inputs, output and labour productivity, may well represent a larger, more capitalist scale of operation than a large, extensively cultivated low-productivity holding; and this is true even when gross sown rather than net sown areas are considered. As an example, take the 8-acre irrigated holding in my sample (which was one of three exceptions to my rule of studying farms of more than 20 acres); 11 acres of gross sown area under crops and fruit trees (sugarcane, high-yielding paddy, maize and tapioca, cocoanut) produced more than Rs 50,000 worth of output annually, with sales at nearly 95 per cent. Inputs per acre and yield were one of the highest in the sample, and the net investible surplus of Rs 20,000 (after covering all costs including depreciation and consumption of the small three member family) had been put into deepening the irrigation well and new pumpsets.

By contrast a 53-acre holding, with 50 acres gross sown area under crops (paddy, cotton, wheat, millets) produced a lower annual value of output, about Rs 33,000 and sold 85 per cent of this. Inputs per acre and therefore yield were lower than average, and there was no mechanisation. The holding supported a large joint family of 23 members, so that the net investible surplus was only Rs 5,000.

Evidently the 8-acre farm represents a more intensive, more capitalist scale of operation than the 53-acre one. The importance of distinguishing between size and scale, between extensive operation of large holdings and capitalist operation was pointed out decades ago by K Kautsky in his pioneering "Die Agrarfage" (which amazingly to this date has no English translation) and illustrated clearly by V I Lenin in his "New Data on Laws Governing Capitalist Development" (Collected Works, Vol 22) while analysing agricultural trends in the USA. Lenin showed that the smaller, intensively cultivated Eastern Region farms were more capitalist than the extensive grain farms of the Western US.

VALUE OF OUTPUT

For some reason—perhaps because it is an American practice? — the data collected in India on agriculture, whether by official agencies or by individuals, is almost invariably presented according to size of holding, which makes it useless for the purpose of ascertaining scale effects or the extent of capitalist operation. Thus a vast mass of raw data which could otherwise have been used, is available only by size of holding in the NSS Reports on landholding, and in the Studies in the Economics of Farm Management. (The All-India Rural Debt and Investment Survey marks a welcome departure by presenting the data by asset-groups: but this is still not the same concept as value of capital stock, which would be an adequate indicator of scale.) In any aggregative analysis by size of holding, it would still remain true that the larger size-groups would show on average a higher value of output, expenditure on inputs, etc, than a smaller size-group. However, the effect of aggregation on the basis of size is to blur the scale effects, since in the smaller size-groups the small but intensively operated capitalist holdings such as our 8-acre farm are lumped with low-productivity small peasant holdings, while in the larger size groups, similarly, the large extensively cultivated non-capitalist holdings such as the 53-acre farm, are lumped together with large but intensively operated capitalist holdings. The net effect is therefore to blur the distinction between the capitalist and non-capitalist sectors of the agrarian economy.

Much better indicators of scale of operation than size, are (a) the value of capital stock, and (b) the annual value of output. The first presents difficulties of measurement insofar as a part of capital stock is farm produced, and its evaluation must be more or less arbitrary. The second is the more convenient index of scale. When tabulated according to gross value of output the holdings in my sample show very striking scale effects: land and

labour productivity, the ratio of sales to output, inputs per acre and their degree of monetisation, and rates of profits all show a striking tendency to rise with expanding scale.

Rudra has a mass of valuable information on the economic operations of big farmers tabulated by size of holding. It would be interesting if he could give us the results of retabulating the data by scale of operation. In particular one would like to see what happens to the "discontinuities" he observes in some variables tabulated by size, when they are retabulated by scale. (Incidentally it must be pointed out that Marxists would be very poor Marxists indeed if, as Rudra suggests, they set about trying to define rich, middle and poor peasants on the basis of where discontinuities occur in "the important variables relating to farm economics" when tabulated by size. The Marxist distinction between classes within the peasantry is not derived from such a superficial statistical criterion but is a structural one based on the relations of production. The rich peasant is distinguished from the poor peasant by the fact that the former hires wage-labour to a considerable extent apart from engaging himself along with family members in cultivation, while the latter is forced to hire himself out as a labourer or lease in land on onerous terms in addition to working with family labour on his own land. The middle peasant operates mainly with family labour, neither exploiting much wage labour, nor being exploited himself: he represents the petty self-employed producer, the type that has been idealised, among others, by A V Chayanov in his notion of a "peasant economy" consisting of such "family farms." Rudra should be careful not to confuse undefined terms such as 'big' and 'small' peasant which may or may not be used by rural sociologists, with the very clearly defined Marxist categories of 'rich' and 'poor' peasant.)

RATE OF PROFIT ON CAPITAL ADVANCED

Finally, from Rudra's data it should be possible to work out (a) rates of profit on capital advanced, and (b) rate of surplus value appropriated. The variable he uses is profit per acre, which is adequate if one is interested merely in comparing the profitability of different crops or of the same crop on different holdings. For a comparison of the profitability of farms viewed as enterprises, or of agriculture viewed as an avenue of investment, vis-a-vis alternative avenues such as industry, moneylending, and trade, we need to look at the rate of profit on capital advanced. There are some conceptual and empirical problems here: what constitutes working capital in agriculture, for instance, and what is the period of turnover of this working capital. All outlays which need to be incurred by the producer in the process of production and before the product is realised, are taken to constitute working capital (this concept is basically the same as that discussed by A K Sen[12]); and since at least two and often three crops are raised annually the number of turnovers of working capital is taken as three. On this basis we find an average rate of profit of 14.8 per cent for my sample, when the value of land is included in the concept of capital advanced; the rate of profit rises with expanding scale of operation (Table 1). This average rate compares well with rates of profit in industry, while for the larger scale groups it outstrips the rate normally obtainable in industry.

TABLE 3 : RATES OF RETURN ON MONEYLENDING

S No	Amount Lent (Rs)	Period for Which Lent	Interest for the Period (Per Cent)	Interest per Annum (Per Cent)
3	10,000	2-3 months	10-12	60-48
7	20,000	6 months	15	30
9	12,500	2 mths to 2 yrs	8-36	48-18
17	2,000	1-2 years	9-18	9
26	15,000	1 year	12	12
27	10,000	1 year	15	15
29	100,000	1-3 years	15-36	15-12
30	10,000	6 mths to 1 yr	9-18	18
38	5,000	4-6 months	5-8	15-16
45	9,000	6 mths to 1 yr	9-12	18-12
49	50,000	6 mths to 1 yr	9-15	18-15
50	100,000	4 mths to 1 yr	8-18	24-18
51	12,000	6 mths to 1 yr	9-12	18-12
66	30,000	6 mths to 1 yr	9-12	18-12

The rates of return to leasing out land, and to moneylending have been computed as well from the data in my sample. (Table 2). The profitability of buying land to lease out is clearly less than that of buying land and cultivating with hired labour. It is not surprising therefore that there should exist an incentive to shift out of tenant-cultivation into wage-labour cultivation. Insofar as a landowner possesses land already and the choice is between cultivating this land with hired labour or moneylending the relevant profit rate is B, which is considerably higher at 46 per cent on average (the value of land being excluded from the figure of capital advanced). The rates of return to moneylending varied a great deal, were nominally quite high—though allowing for default the real rates would be somewhat lower—and compared well with the rate of profit in cultivation except for the larger scale holdings. One found in the field that moneylending had not been completely ousted by productive investment, but co-existed with it; the most capitalist of cultivators still tended to invest some amount in moneylending, though this was small relative to the amounts put into productive investment. This fact illustrates the point that preference for high-return precapitalist avenues of investment cannot be expected to disappear overnight; indeed given the continued existence of a mass of pauperised peasants and consequent high rates of return, the otherwise fully capitalist cultivator may regard moneylending as a way of diversifying his portfolio of assets and of ensuring a tractable labour supply.

The substantially higher rates of profit on the larger scale farms in the sample no doubt contain an element of differential rent, insofar as costs per unit of output are somewhat less on large-scale holdings than on small, and even the smallest scale holdings made an average profit of around 5.8 per cent. It would be interesting to see comparable estimates for profit rates on big holdings in Punjab, and the variation of the rates by scale of operation.

RATE OF SURPLUS VALUE

The rate of surplus value (ratio of annual surplus value to wage outlays) measures the degree of exploitation of wage-labour. In the field, one sees clearly the dichotomous results of capitalist development: high profits and superprofits for the new capitalists, combined with the continuation of meagre subsistence wages for the labourers, marking a worsening of their relative if not absolute position. The data confirm this impression, that high profits are based ultimately on the ability

of the new capitalists, given an expanding market, to exploit a destitute and unorganised labour force to the hilt. The average rate of surplus value for my sample is phenomenally high at 307.3 per cent; the rate shows a clear tendency to rise with expanding scale of operation. Such a high rate reflects the bare subsistence wages paid to labourers. Detailed information on wage-payment was collected: in a large number of cases farm servants were paid only in cereal (paddy in coastal areas, ragi, jowar and bajra elsewhere) and, the daily per capita quantity of unhusked grain worked out to 3.95 kg for men, and 2.77 kg for women. For the 508 adult male farm servants in the sample as a whole the annual per capita value of all wage payments worked out to only Rs 785.27. On all except two holdings the farm servants were landless; on a number of holdings they were in some form of debt bondage, the money advanced to them at the beginning of the year being deducted from their meagre wages. On large-scale farms with increasing mechanisation the wage bill is a lower proportion of total costs while productivity is higher than on small-scale holdings. Far from higher productivity labour receiving higher wages, if anything large-scale farms are often able to hire labour on more advantageous terms to themselves than are small-scale holdings.

One has heard a great deal about high wage rates and labour shortage in the Punjab. It would be interesting to see how the rates of surplus value appropriated by big farmers in the Punjab, compare with my estimates for other areas: it should be possible for Rudra to work out rates of surplus value, along with rates of profit at least for the pure capitalists in his sample. (Strictly speaking, of course, these concepts are only applicable to the capitalist holdings; we have applied them to all wage-labour based holdings only for convenience, to facilitate comparison.)

A final general comment: analysis of the agrarian structure today and particularly of its class nature, is bedevilled by the prevalence of preconceived formulae — e g, that the dominant relations of production are "semi-feudal". In fact, the post-colonial structure with its interaction of developing capitalism with precapitalist organisations is a great deal more complex than can be summed up in a single unqualified phrase. Not least important is the immensely uneven development of different regions, inevitable given the vast size of the country. It is necessary to analyse this complex reality concretely, and not evade the job by falling back on convenient formulae. Secondly, to recognise and analyse the reality of limited capitalist development which is taking place today is very different in my view, from putting forward the thesis that anything like a successful capitalist transformation of Indian agriculture is at all possible. On the contrary, it is necessary to analyse the nature of the capitalist development now taking place, precisely to identify its limits. People who profess to be interested more in the "red revolution" than in the "green revolution" tend, quite incorrectly, to regard the recognition of the fact of limited capitalist development as identical with a conceptual shelving of the "red" revolution in favour of the "green". Hence their eagerness to deny the reality of the process taking place. The casualty of such misconceived radicalism is concrete analysis.

GOVERNMENT OF INDIA

4¾ Per Cent Loan 1978 (Reissue) to be Issued at Rs. 100.00 Per Cent and Repayable at Par on 1st of July 1978.

5¼ Per Cent Loan 1986 (Reissue) to be Issued at Rs. 100.00 Per Cent and Repayable at Par on 1st of July 1986.

5¾ Per Cent Loan 2001 (Reissue) to be Issued at Rs. 100.00 Per Cent and Repayable at Par on 1st of July 2001.

Subscriptions to the above loans will be received simultaneously and will be limited to a total of Rs 100 crores (approximately). Subscriptions may be in the form of cash/cheque. Government reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

If the total subscriptions received for the loans exceed the notified figure plus the amount of ten per cent retainable as aforesaid, partial allotment will be made in respect of the subscriptions received and the balance refunded in cash as soon as possible.

Interest for the period 1st of October 1971 to 31st of December 1971 inclusive will be paid on 1st January 1972 and thereafter interest will be paid half yearly on the 1st January and 1st July. Interest on all the loans now issued together with interest on other previous Government securities and income from other approved investments will be exempt from income-tax subject to a limit of Rs 3,000 per annum and subject to other provisions of Section 80L of the Income-tax Act, 1961. The value of the investments in the loans now issued together with the value of other previous investments in Government securities and the other investments specified in Section 5 of the Wealth Tax Act will also be exempt from the Wealth Tax upto Rs 1,50,000/-.

Subscription lists will open on the 1st of October 1971 and close on 4th of October 1971 or earlier without notice.

Applications for the loans will be received at:—
(a) Offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi and Patna;
(b) branches of the subsidiary banks of the State Bank of India conducting Government treasury work except at the branch of the State Bank of Hyderabad, Gunfoundry, Hyderabad; and
(c) branches of the State Bank of India at other places in India.

For full particulars please apply to any of these offices or branches.

Weather and Reserve Stocks for Foodgrains

S K Ray

While sufficient meteorological and agricultural data are not available to make a historical analysis of the regional crop-wise variation in production due to the weather, the wide fluctuations in foodgrains production are associated with uncertain variations in the weather. Also, certain areas of the country are more prone to droughts and floods than are other areas. These factors have made sustained growth in production difficult.

Whatever the causes of fluctuations in production, the variability around the trend follows a pattern which is identifiable from an analysis of past production data and can be projected into future years with some probability. Since these fluctuations are evidently unavoidable, the best strategy is to stock a 'certain' quantity of foodgrains to buffer contingencies arising from natural factors.

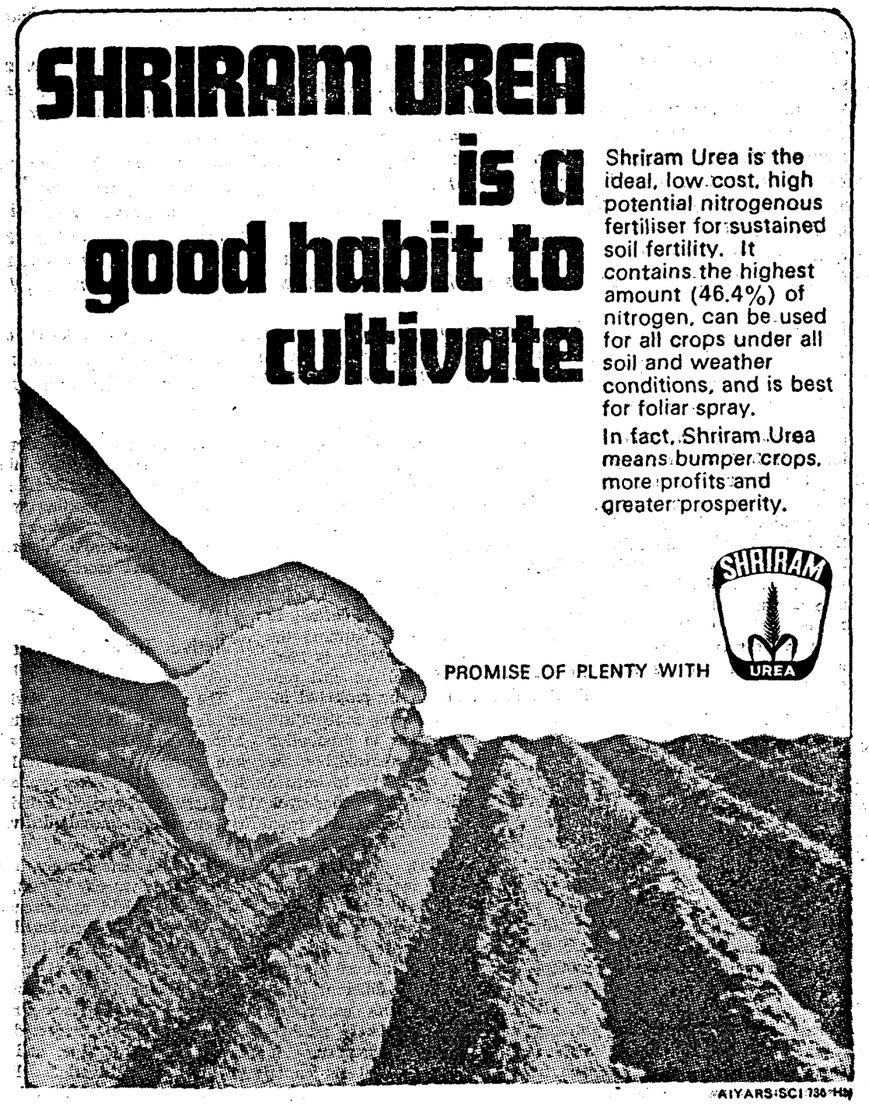
Scientific planning to meet such contingencies is possible only after an analysis of weather-induced fluctuations in production over different parts of the country. This article attempts to estimate production variations due to weather. Since rainfall appears to be the most important causal factor in fluctuations, suitable rainfall indices are computed to analyse the rainfall distribution pattern and its effect on crop output. Finally, these tools are used to determine the technical size of necessary reserve stocks. Economic constraints, however, are not considered here in determining the size of the required reserve stocks.

[The author wishes to express his gratitude to J S Sarma, S R Sen, A M Khusro, K Krishnamoorty, and C H H Rao, for their valuable help and suggestions in the preparation of this study. Louis H Bean also provided stimulation as the work progressed. The final responsibility for it, including that for the errors, is however the author's.]

THE wide fluctuations in the foodgrains production in India are generally attributed to the weather. Recurring droughts or floods have brought uncertainty in production levels and made sustained growth more difficult.

Sufficient meteorological and agricultural data are not available, however, to make a historical analysis of the regional crop-wise variations in production due to weather. All that is known from past data and various official and unofficial records is that, practically every year, some part of the country experiences famine or near-famine conditions due to either drought or flood. In some years the situation has been acute, resulting in a massive production shortfall. Also, certain areas in the country experience more frequent droughts or floods than do other areas.

Sen [1] for the first time provided some information about the historical variations in foodgrains production in India. He did not attempt to measure or isolate the magnitudes of the fluctuations in past foodgrains production data due to weather. But he did make some interesting observations. Foodgrains production during the first 24 years of this century showed a rising trend, punctuated however by sharp fluctuations. Also, the frequency of the fluctuations in production was quite high: there was a decline from the peak in one out of every 3.4 years. On the other hand, during the next 24 years, production was stagnant but less unstable. The most disturbing aspect as observed by Sen was that, from 1951-52, the frequency of fluctuation in foodgrains production in India was again showing a pattern similar to that noticed in the first quarter of this century.



There is a growing feeling that, whatever the causes of fluctuations in production, the variability around the trend follows a pattern which is identifiable from an analysis of past production data and can be projected into future years with 'some probability'. Since these fluctuations in production are to a great extent unavoidable, the best strategy would be to keep a 'certain' quantity of foodgrains-stock to buffer any contingency arising from natural causes.

Scientific planning, to meet the contingency of the inevitable year-to-year production fluctuations due to weather, is possible only in terms of probabilities determined through an analysis of the weather-induced fluctuations in production in different parts of the country. In this paper, an attempt is made to estimate production variations due to weather. As will be seen from the discussion in Part I, rainfall appears to be the most important factor in the sharp production fluctuations in this country. Suitable rainfall indices are computed to make a statistical analysis of the fall distribution pattern and its effect on crop output. These are given in Part II of this paper. Finally, in Part III, variations in production are analysed with the help of rainfall indices to determine the technical size of reserve stocks for meeting specific contingencies. No economic constraints are considered here in determining the size of reserve stocks.

I

Relative Importance of Various Climatic Factors

The production of a particular crop in any region is the resultant of the acreage and the yield per acre. Yield and acreage can be expressed as a function of a number of controlled variables like fertilisers, pesticides, irrigation, prices, etc, and an uncontrolled variable, 'U' comprising the various climatic factors like rainfall, temperature, run of dry days, humidity, day length, etc. Any variation in yield or acreage can thus be conceptually partitioned into two components — one arising out of the controlled variables and the other out of the uncontrolled variable 'U'. 'U' varies according to some natural law and thus causes unexpected variations in yield and acreage, and hence in production. The various climatic factors enter into the production function of a region as exogenous variables — they are determined or fixed by nature. The productivity co-efficients of the various endogenous variables in the system differ over space and time, because the magnitudes of the exogenous or nature-determined variables vary [2].

Variations in agricultural production can thus be man-made or made by nature. Even if the climatic factors follow some repetitive pattern, the production fluctuations would not be proportional unless the relative magnitudes of the effects of these factors on production remain constant over time. The physical frame of reference in agriculture is, however, not invariant with respect to time; men can influence it through technological advances. The variables which are currently exogenous can be made endogenous to the system through human skill and knowledge at a later period. Theoretically and conceptually, it is possible practically to eliminate the unexpected variation in production due to natural factors (for example, on an experimental plot, water, temperature, day length, humidity, wind velocity, etc, can be kept at desired levels through artificial techniques). This idealised proposition is, however, difficult to conceive when we consider the production function of a region or, for that matter, even a plot on the cultivator's field. Physical factors appear as constraints on the production surface; their basic differences from region to region lead to differences in land use and cropping pattern.

Soil is the 'staging area' for plant growth and at any location its quality is itself an expression of the climate. The biosphere over the soil depends on the climate and the basic soil productivity of an area is an expression of the interaction between the biosphere and the climate over years. This basic soil productivity at any location is not subjected to any year-to-year changes, but undergoes a very slow drift over a longer period. For all practical purposes, it is static and cannot be changed. Similarly, when we speak of a region or an area, the natural supply of light, temperature, water in the form of rain, etc, cannot be changed. Their presence or occurrence become inevitable events to the farmers. However, men can influence nature through technological advances. The technology of agriculture in any country, at any period, is an expression of the desire to influence the various natural factors which affect production.

Given the basic soil productivity and assuming no change in the technology of agriculture in an area, crop output fluctuates because the relative magnitudes and the occurrence of the various climatic factors at any time reference point vary from year to year. These variations in occurrence and relative magnitudes of the various climatic factors neither follow a unified pattern nor all of them appear as constraints on Indian agriculture. Some fluctuate more than others and make their impact felt on production.

Table 1 : Famine in India

Year	Parts of the Country Affected
1876-77	Madras (63.9), Maharashtra (67.0), Mysore (70.0), Andhra Pradesh (68.2).
1877-78	Madhya Pradesh (67.6), Gujarat (49.2), Rajasthan (35.2), All-India (75.0).
1878-79	Assam (128.6), Bihar (129.4), Uttar Pradesh (129.1), Gujarat (185.3), Maharashtra (137.7), Andhra Pradesh (153.6).
1884-85	Bengal (80.9).
1886-87	Madhya Pradesh (78.3).
1887-88	Orissa (78.9).
1888-89	Andhra Pradesh (66.9).
1890-91	Kerala (79.2).
1891-92	Bengal (79.4), Bihar (87.7), Punjab (72.7).
1899-1900	All India (73.0).
1905-06	Maharashtra (65.7).
1907-08	Uttar Pradesh (52.5), Punjab (61.3), Madhya Pradesh (75.0).
1918-19	All India (77.4).
1965-66	All India (84.5).

Note : Numbers in parentheses denote the cereals rainfall index.
Sources : Sen [1], Bhatia [6].

Table 2 : Decade-wise Mean Deviation in All-India Cereals Rainfall Index

Decade	Above Normal		Below Normal	
	Frequency	Mean Deviation	Frequency	Mean Deviation
1881-1890	8	4.7	2	4.9
1891-1900	5	12.9	5	10.3
1901-1910	5	5.4	5	15.7
1911-1920	4	11.4	6	13.0
1921-1930	5	3.0	5	6.0
1931-1940	5	6.3	5	5.8
1941-1950	7	5.7	3	4.5
1951-1960	7	9.5	3	12.0

Geographically, India falls within latitudes which encompass all the deserts in the northern hemisphere; it is the strategic locations of hills and mountains that saved her from complete aridity [3]. The escape is, however, not total. And the agricultural pattern differs significantly from region to region. In general, nature is bountiful in bestowing the countryside with all factors conducive to a rich agricultural economy, except one: the crucial water supply which depends mostly on the whims of the rain god.

The origin of the natural water supply in India in the form of rain, river waters, etc, is primarily from the four monsoon currents:

(i) South-west monsoon from June to September.
(ii) Post monsoon from October to December.
(iii) Winter monsoon in January and February.
(iv) Summer monsoon from March to May.

Of these, the south-west monsoon accounts for nearly two-thirds of the annual precipitation for most areas and influences directly more than 60 per cent of India's total foodgrain production. The uneven distribution of rainfall over India is due to wind currents as well as due to the elevation and topography of the land. The wind currents bringing the monsoons of India are very erratic and cause great variations in timing and amount of rainfall received, and hence also in production.

Studies carried out in many countries to examine the effects of various climatic factors on crop output have singled out rainfall and temperature as the most important influencing factors; the various other factors which affect the crops are largely rainfall or temperature dependent.[1] However, in India, temperature does not appear to be responsible for fluctuations in crop output. An analysis of data pertaining to about 50 meteorological stations of India, published in World Weather Records, indicated that month-wise variations in temperature over the years (data series ranging from 30 to 90 years) were not significant (some hilly areas were exceptions to this remark).[2] Also, some factors like snowfall, intensity of light, etc, which generally affect crop output in Western countries, pose practically no constraints on Indian agriculture.

On the other hand, variation in rainfall from one year to the next at any location in India and at any time reference point within a year is generally more than 100 per cent.[3] Too much

or too little rain, resulting in floods or droughts, occur every year in some part of the country and affect crop output. Irrigation and flood control can help, but so far their contributions to reducing the fluctuations in crop output are very nominal.[4]

The economic geography of Indian agriculture suggests that the rainfall distribution pattern is primarily responsible for differences in land use, cropping pattern, settlement and density of population in different parts of the country. When viewed in the light of the country's limited irrigation potential, the influence of rainfall on crop output will sustain and, perhaps, will be more pronounced as production increases at a faster rate. The uncertainties in rainfall will cause the same old concern and instability will continue to plague Indian agriculture.

II

Rainfall Distribution and Its Effect on Production

Our attempt to study weather-induced production fluctuations becomes simpler if we assume that, for any region in India and at any time reference point, (i) the year-to-year variations in the various climatic variables are, with the exception of rainfall, very small and, (ii) the effects of the interactions of rainfall with various other climatic factors on crop output are negligible. For, in that case, the fluctuations in production due to weather could be attributed mainly to rainfall, and one needs only to study the distribution of rainfall and its effect on crop output. This is probably an oversimplification of the actual mechanism through which the various climatic factors influence crop output. However, in a systematic study of the weather effect on crop output, an analysis of rainfall distribution pattern and its effect on crop output is an important first step—particularly in a country like India where agricultural production largely depends upon the vagaries of the monsoons. The need to consider other climatic variables will arise if rainfall is unable to explain the greater part of the fluctuations in production. As will be shown later, however, rainfall alone explains most of the variations in output due to uncontrolled factors.

There is another important reason for restricting our analysis to rainfall—*viz*, the paucity of fairly long time series data on various climatic variables. Fortunately, fairly long time series data on rainfall are available for a large number of meteorological stations in India. Meteorologists have divided India into 33 rainfall sub-divisions according to the rainfall distribution pattern. Data relating to approximately 232 stations are presently used in the published official weekly weather report. Of these, 136 stations, with 3 to 6 from each of the 33 sub-divisions, have rainfall records dating back from 1875.[5] The time series data of these 136 stations are condensed to 33 rainfall sub-divisions series (monthwise, from 1875 to 1966) by taking a simple average of the stations falling within each of the rainfall sub-divisions.

The effect of rainfall on crop output at any location is very difficult to measure precisely. For, it is not only the volume of rainfall but also its distribution at different stages of the plant growth which influences the total output. The adequacy and timeliness of the rainfall at sowing affect the sown acreage. Similarly, the volume and distribution of rain at the time of sowing, flowering, maturing, and harvesting, affect crop yield. Consideration of these issues would necessitate introduction of a large number of explanatory variables into the crop-rainfall relationship. The problem is, the short production data series of less than 20 years which is available does not provide scope for such rigorous analysis. Use of a large number of explanatory variables in the structural equation will reduce the precious degrees of freedom for estimating the parameters with adequate level of confidence. Again, the crop calendar is not same throughout the country. For example, rice produced in India is sown and harvested in the different states at different periods and is, therefore, influenced by the adequacy and timeliness of rainfall in the different states during the crop's growth. Taking account of all these differences poses serious problems in statistical estimation, unless the various factors are reduced to a manageable limit. Consequently, aggregation of the rainfall data from different parts of the country into some suitable rainfall indices at the state and national level becomes essential.[6]

We have constructed two rainfall index series at the meteorological sub-

divisional, state, and all-India levels—one for cereals as a whole and the other for rice, a principal crop in India, production of which is greatly influenced by the monsoons. The indices are constructed by assigning suitable weights to volume of rainfall in different periods within a year for each of the meteorological sub-divisions. Since our primary interest is to examine the variations in yield and acreage, and hence in production due to rainfall, use of production as weights seems appropriate. The average of 1959-62 production is taken as the base for computing the indices. All the index series are computed in such a manner that they have the same mean (rainfall index 100) but different dispersions.

The historical record of famines in India provides scope for testing the reliability of indices thus computed. In the early years, there was very limited movement of foodgrains among the different parts of the country and regional scarcities were attributed to crop failures due to floods or droughts. If the indices are fairly good, it should then record very abnormal values (too high or too low from the average) on famine affected years of different regions. That it was so is clearly evident from a comparison of the cereals rainfall indices with the historical record on famines in different parts of the country since 1875 (Table 1).

Moreover, if the indices are reasonably good, the distribution pattern from 1875 should have some semblance with the corresponding production pattern. The year-to-year fluctuation in the all-India cereals rainfall index was less severe during 1924-25 to 1950-51 than during the period 1900-01 to 1923-24 (Table 2). This is consistent with Sen's findings, and suggests that the relatively stable and unstable periods in past foodgrains production were, in greater part, due to rainfall.[7]

A strict comparison of the historical production pattern with the computed rainfall indices is, however, not possible. Evidently, the weights used in computing the indices would be different as we move into the historical past. The indices are, therefore, unlikely to provide a one-to-one correspondence with the historical production record, even if all details were available. The base period used in computing the rainfall indices reflects the current regional production pattern of different foodcrops and thus makes the indices more suitable for analysing the recent production data series.

For analysis of the rainfall effect on crop output, we will consider here the period 1950-51 through to 1964-65, the last year before the introduction of the 'New Strategy'. During this period, fertiliser consumption was quite low; irrigated acreage increased but the percentage to the total remained more or less constant; high-yielding varieties, with the exception of jowar, bajra, and maize, were not introduced and production increased mainly due to addition of new land and improved practices applied on existing technology. Identification and measurement of the various factors which contributed towards increased production during this period are practically impossible as there is hardly any representative data available for carrying out a rigorous statistical analysis. The cumulative effect of all these factors has, however, caused a trend-like movement in production. Both linear and exponential trend lines fitted to the area, production and yield data for cereals and rice from 1949-50 through to 1964-65 recorded significant time trend at the all-India level [7]. Fluctuations around these lines occurred owing to a host of factors, one of which was obviously rainfall. Therefore, it appears logical to consider the actual observation as a function of time (which serves as a proxy for inputs) and rainfall.

is the rainfall index for cereals or for rice.

Equation (1) is linear in time and rainfall; it ignores the adverse effect of rainfall such as a flood. The quadratic term u^2 in Equation (2) is included to take into account this effect; it introduces a single curvature in the regression surface. Area, production, or yield changes under this relationship occur from one index point to another with an optimum at $u = -a_2/2a_3$. Consistent result would require $a_2 > 0$ and $a_3 < 0$ (if too much or too little rain has a detrimental effect, the surface should record a single maxima on the positive quadrant). Equation (3) is the usual Cobb-Douglas type. Variations due to rainfall under this specification is superposed over an exponential growth curve. Since the marginal increase in production is likely to decrease with increase in u, we should expect a_2 to lie between 0 and 1.

Details of the regression analysis, carried out at the all-India level with the data from 1950-51 through to 1964-65 (Table 3), provided some interesting results (Table 4). Either Equation (1) or Equation (3) can explain more than 90 per cent of the variations in cereals area, production, and yield, and indicates strong positive effect of rainfall. For rice also, similar results are obtained; however, both equations suggest that rice acreage is not significantly influenced by rainfall. Equation (2) hardly improves the value of R^2 from that obtained by using either Equation (1) or Equation (3). However, in all cases, it provides u and u^2 co-efficients with consistent signs.

The insignificance of u and u^2 co-efficients does not speak positively against Equation (2). Consistent signs of the co-efficients rather suggest that the indices are probably not sensitive enough to measure the flood effect on area, production, and yield. However, even with very sensitive indices, it is difficult to measure the effect of flood from an all-India analysis. Although floods are frequent for the country as a whole, in that they occur in one part of the country or the other, their effect on the aggregate level is relatively small. Equation (2) will, therefore, be more appropriate to use for regional analysis.[8]

The significant co-efficients and high value of R^2 are not sufficient to attach confidence on the impressive results provided by either Equation (1) or Equation (3). In fact, they are misleading. The high value of R^2 is obvious because of the highly significant trend variable which practically explains all the variations. The value of D-Statistic, though not significant in most cases, is low enough to suspect positive serial correlation. This is particularly so for acreage and suggests that a linear time variable is not adequate to explain the trend in acreage; its use can be reasonably justified only for production and yield analysis. Even if we ignore these, there are some conceptual problems that speak against the use of Equation (1) and against the mode of analysis. Equation (1) has apparently provided good fit to area, production, and yield data. However, by definition, production equals yield multiplied by acreage, and if Equation (1) is accepted for yield and acreage, then for production the relationship ought to be different from Equation (1). Only Equation (3) satisfies the definitional identity, since

$$\log Y = \log (Ay) = \log A + \log y$$

Rainfall has a positive effect on acreage. With favourable rain, marginal lands are generally brought under cultivation. When this happens, cultivated acreage goes up but average yield figures go down. In an average-yield analysis, the effect of rainfall on productivity thus gets obscured by the interaction between acreage and productivity. In this context, a yield-rainfall analysis is of debatable value.

Our primary concern is to explain production fluctuations around its trend line. These fluctuations are due to the joint effect of yield and acreage fluctuations—and these, we postulate, arise mainly from the year-to-year variations in rainfall. If the indices are reasonably good, it should then be possible to explain a greater part of the residual variations in production around its trend line. Since an exponential growth curve explained reasonably well the trend in production during the studied

TABLE 7: SERIAL CORRELATION OF ALL-INDIA CEREALS AND RICE RAINFALL INDEX

18	—0.21	—0.26
19	0.10	0.11
20	—0.09	—0.03
21	0.01	—0.03
22	0.14	—0.01
23	0.06	0.03
24	0.15	0.19
25	0.03	0.03

period, it follows that, the year-to-year changes in production would have remained constant if there were no variations in rainfall from one year to the next. However, since the latter varied, the relative changes in production also recorded fluctuations. Taking the first differences, therefore, it follows from Equation (3) that:

$$\log Y_{r,t} = a_1 + a_2 \log u_{r,t} \quad \ldots(4)$$

where $Y_{r,t} = 100 (Y_t/Y_{t-1})$

and $u_{r,t} = 100 (u_t/u_{t-1})$

Equation (4) expresses relative changes in production as a function of relative changes in rainfall and explains the fluctuations in production around the assumed form of constant production growth rate (which is antilog of $a_1 + 2a_2$).

Equation (4), fitted at the all-India level to cereals and rice production data from 1950-51 through to 1964-65, provided the following results:

Cereals: $\log Y_{r,t} = 1.2024 + 0.4065 \log u_{r,t}$
(0.0953)
(R^2=0.60; D-Statistic=1.79) ... (4.1)

Rice: $\log Y_{r,t} = 0.7864 + 0.6149 \log u_{r,t}$
(0.1452)
(R^2=0.60; D-Statistic=2.42) ... (4.2)

The estimated equations now provide results impressive enough to speak with confidence about the effect of rainfall on cereals and rice production. In both equations, the co-efficient of $u_{r,t}$ turned out to be highly significant (significant at 0.001 per cent level). Moreover, they are reasonably stable, as is evident from a comparison of the results obtained from Equation (3) and Equation (4). The value of D-Statistic also increased significantly to remove the suspicion of positive serial correlation.

Thus 60 per cent of the past variations in cereals and rice production around their respective trend lines can be accounted for by rainfall alone. Weather-corrected growth rates, computed from these estimated equations, suggest that if rainfall were uniformly the same during this period cereals and rice production could have increased at higher rates than was actually recorded.[9] Assuming the production trend line as one corresponding to the average normal rainfall index of 100, an increase or decrease in the cereals-rainfall index by one point from the average has in the past caused cereals production to deviate from its trend by 0.4065 per cent; for rice it was 0.6149 per cent — more than one and a half times higher than the estimate for cereals.

Since production at the state levels exhibited different forms of trend, the above functional relationship is unlikely to provide significant results in a state-wise analysis. However, using the all-India estimates, rough approximation to the estimated effect of rainfall on state-wise production can be obtained. The amplitude of production fluctuation differs significantly among the different states of India. Rao observed [8] that irrigation and rainfall variability are the two main factors responsible for state-wise differences in the co-efficient of variation in yield. The states with lower variability in rainfall or more irrigated acreage recorded lesser variability in yield than the states with higher rainfall variability or less irrigated acreage.

Given the rainfall distribution pattern, and its variability, it follows from the above that, the causal effect of rainfall on production fluctuation will decline with increase in the proportion of area irrigated; and that, therefore, for the co-efficient of variability in production, the effects of the two are inversely related. As pointed out earlier, the proportions of area irrigated under cereals and rice, at the all-India level, remained more or less constant during the studied period. If we assume the same to be true at the state levels, then given the state-wise variability in rainfall indices, the effect of rainfall on production, estimated at the all-India level, will be relatively higher in those

states where the proportion of area irrigated under cereals or rice is less and will be relatively lower in the states where these proportions are high. Cereals area irrigated, relative to the all-India average, is very high in the states of Kerala, Punjab and Haryana, Andhra Pradesh, and Jammu and Kashmir, and it is very low in Madhya Pradesh, Gujarat, Orissa and Maharashtra; for rice this proportion, relative to the all-India average, is very high in Jammu and Kashmir, Andhra Pradesh, Tamil Nadu and Punjab and Haryana, and very low in Gujarat, Madhya Pradesh, Uttar Pradesh and Rajasthan (Table 5). Using the reciprocals of these relative proportions as weights, the state-wise estimates of the effect of rainfall on their respective average normal trend line production levels are estimated from all-India rainfall response co-efficients. The all-India rainfall index being a weighted average of the state-wise rainfall indices, it follows that the weighted average of these state-wise estimates with weights as used for computing the rainfall indices should equal the corresponding estimate derived at the all-India level. To take this into account, the state-wise estimates are adjusted by using the same correction factor.

We acknowledge that these are crude estimates and lack precision. However, as our interest on these estimates is only to examine the relative instability in production among the states, the results which we derive are unlikely to be radically affected. Further, we would like to add here that the accuracy in estimating the reserve stock size is of more importance at the national than at state levels. Given the level of stock to be maintained at the national level, the relative instability in production among the different states helps to identify appropriate areas for location of this stock and since foodgrains can be transported from one location to another without much difficulty, use of the above crude estimates will not be too erroneous.

Large sample tests, carried out on the observed frequency distribution of the rainfall indices, suggest that the assumption of normality in rainfall distribution is statistically valid for all the states' rainfall index series. The question which comes uppermost in one's mind, however, is whether the distribution of these rainfall indices on a time-scale follows a stochastic process. Specifically, the question is whether the realisation of different values of rainfall indices is independent of time or follows a definite pattern. As already pointed out, the all-India cereals-rainfall index series followed a pattern closely resembling the historical production record. The amount of oscillation in cereals rainfall index itself oscillated, recording alternately relative higher and lower oscillations of roughly 24-years' span. Is this phenomenon, which we have observed in the last 90 years' rainfall data, due to a chance relationship or is there any deeper significance in the relationship?

We confess that the available statistical tools are hardly adequate to solve the complexities of the problems involved in identifying the hidden periodicities in the rainfall distribution pattern. A rigorous study of the joint distribution of division-wise rainfall indices would involve mathematical complexities to the point of practical impossibility. Spectral and cross-spectral analyses provide some promise; unfortunately, the series which we have is short—too short to be amenable for the application of these sophisticated techniques.

The reason for opening this Pandora's Box here is sheer curiosity to understand the causal mechanisms behind the rainfall distribution pattern and our desire to extrapolate into the future. If, for instance, we know with some level of confidence about the future year or years which are going to record severe droughts or floods, the strategy for planning to meet these contingencies could be worked out in more concrete terms. On the other hand, if we assume rainfall to have a random distribution, simplicity in working out the strategy is obtained, but at the cost of precision. We would like to opt here for the less ambitious second alternative and examine whether, for our purpose, the distribution of rainfall indices could be treated as random. Since all our calculations will be based on the results derived from an all-India analysis, we will examine here for randomness only the all-India cereals and rice rainfall index series. It might be noted that the conclusions which we will arrive at are only approximate; for, the all-India series is an agglomeration of a complex phenomenon generating a substantial number of different rainfall distribution patterns in different parts of the country.

TABLE 10: FREQUENCIES OF DEVIATIONS IN PRODUCTION

(in million tonnes)

Deviations in Production from 1968-69 Normal Weather Production Level in Million Tonnes	Percentage Frequency

7.01 to 8.00	1.11	—
8.01 to 9.00	1.11	—
9.01 to 10.00	1.11	—

Three tests are applied. The first is a turning point test by counting the peaks and troughs in the series and comparing it with the expected number of turning points in a random series. If the series is random, the expected number o fturning points 'p' is given by $E(p) = \frac{2}{3}(n-2)$, with variance: $V(p) = (16n-29)/20$, where n is the total number of terms in the series (9). Also, the mean interval between turning points in a random series is about 1.5, with a variance of about 9/(10n). Against the expected number of turning points of 59.33 for randomness ($2 \times 89/3$ since n is here equal to 91, from 1875-76 to 1965-66), the actual number observed in all-India cereals and rice rainfall index were 66 and 60, respectively. Also, the mean interval between turning points obtained from cereals—and rice-rainfall index were 1.34 and 1.44. These values are reasonably close to a series with random nature.

The second test applied examined the distribution of phase length. In a random series, the probability of a phase of length 'd' either rising or falling is given by, $2(d^2 + 3d + 1)/(d+3)!$ [9]. If the series is random, the expected number of phases of length 'd' in a series of 'n' terms is given by

$$N_d = 2(n-d-2)(d^2 + 3d + 1)/(d+3)!$$

and the expected number of all possible phase lengths is given by

$$N = \frac{1}{3}(2N-7)$$

Table 6 provides the observed and expected number of different phase lengths in all-India cereals and rice rainfall index series. To examine the goodness of fit, x^2 statistic was computed and $\frac{6}{7}x^2$ was compared against the tabulated value for 2 degrees of freedom [9]. In both cases, the test for goodness of fit provided a positive answer, suggesting thereby that both the index series can be considered as random.

Finally we examined the serial correlations. Theoretically, in a random series, the serial correlation: r_k, of log k;[10] is zero for all k except for k=0 for which $r_0 = 1$. In short series, the observed serial correlations do not strictly assume the theoretical values. They fluctuate due to sampling effects and also they are biased downwards. This is evident from the first 25 serial correlations computed from cereals and rice rainfall index series (Table 7). The magnitude of all these co-efficients is, however, with the exception of r_{15} and r_{18}, very close to zero and justifies the assumption of randomness in rainfall distribution pattern. The reasons for r_{15} and r_{18} to record higher values are difficult to find out; they could be spurious or due to some hidden generating process. Since our short series do not provide scope for probing deeper into the causes for these higher values, we would like to give the benefit of doubt and assume the rainfall indices as randomly distributed.

TABLE 11: CUMULATIVE PRODUCTION DEFICITS (—) OR SURPLUSES (+) OCCURRING IN SEQUENCES

1950-53	—10.68	3	1955-57	6.31	2
1953-57	19.33	4	1957-60	—2.53	3
1958-62	10.72	4	1960-62	4.55	2
1962-64	— 1.79	2			

We acknowledge that the circular procedure followed here is not complete to arrive at a definite conclusion and that it demands much deeper probing than the preliminary tests that have been made here for randomness. However, in order not to make further digression from the topic of the present study, we would like to remain contented with the assumption of randomness while keeping the issue open for other research scholars to investigate.

III

Reserve Stocks of Foodgrains

We will first make an attempt to estimate the variations in future cereals and rice production in India due to rainfall. The crucial factors are evidently the distribution pattern of rainfall indices and their effects on production. The question is: Can we take these as invariant over time and, if not, what adjustment should we make to estimate the variability in future production due to rainfall?

The indices which we computed from past rainfall data were a single realisation from an unknown population. For each year 't', the rainfall index U_t is a random variable with unknown mean and variance and the actual value u_t observed is a single sample realised from this unknown universe. If the universe is itself undergoing changes (i e, if u_ts are samples from different populations), there is no way of estimating the parameters from sample observations recorded over time. If, however, we assume the stationarity in mean and variance i e, $E(U_t)$ and $V(U_t)$ to remain constant for all 't', then under certain conditions it can be shown mathematically that the sample mean and variance computed from the recorded time series data provide their estimates.

The question, therefore, is whether the pattern of rainfall is likely to undergo any change in the future. The answer to this question is, of course, not known to us. And even if the natural factors remain the same, there are other man-made factors that could disturb the assumption of stationarity. For example, if the countryside is gradually denuded of all forests, both the mean and variability in rainfall indices will undergo changes. The same will also happen if the technique of artificial rain-making becomes a practical proposition for wider applicability. Based on current technology and knowledge, how-

ever, these possibilities appear to be too remote and are unlikely to have any effect. If the past is any indication, the analysis made in the previous section suggests that the assumption of stationarity, in mean and variance in rainfall indices, is reasonably valid. We agree and assume that, for future years, rainfall indices will record the same distribution pattern as observed in the past.

The average normal weather production in any year being defined as expected production (trend level) corresponding to average rainfall index 100, the production will then be above or below the expected level—according as the rainfall index is above or below average. The question is: Will the probability distribution of production variations also remain invariant over time? In other words, will the percentage deviations in production, say, 5 per cent below expected, have the same probability for all future years?

We have estimated the effect of rainfall on production from past data. Since the rainfall response co-efficients are expressed as percentages of expected production, the deviation in absolute terms is a function of the expected level of production. If has production at a future date is 100 per cent higher than the present level, then the use of the same rainfall distribution pattern and its effect on output will also increase the absolute deviations by 100 per cent. Thus if the probability distribution in production variations, expressed as a percentage of the trend, is assumed to be the same for all future years the probabilities will increase of the magnitudes of absolute deviations in production increasing with increase in production. This is one extreme of the situations which we can think of for the future years.

The future production of India is expected to increase at a higher rate than that observed in the past. We envisage this higher growth rate to come from increased cultivation of high-yielding varieties and feel that, as cultivation of *high-yielding varieties depends on* assured water, future additional production will be proportional to increase in irrigated acreage. However, as observed earlier, an expansion in irrigated acreage reduces the effect of rainfall on production variations and the estimated rainfall response co-efficients are, therefore, likely to decline with the passage of time. If the estimated rainfall response co-efficients are agreed to reflect production variations with absolute production at 1968-69 level and then all sumed to decline at the same rate as production increases, then the co-efficient of variability in production around the trend will also record the same rate of decline. On such an assumption, the probability distribution of absolute deviations in production will remain constant for all future years. One has to compute the probabilities of absolute deviations in production by using only the 1968-69 estimated production.

The probability distribution of the absolute deviations in production will be somewhere between these two alternatives, and to compute the distribution of actual variations in production one has to continuously update the type of analysis made here. To simplify our calculations, we will consider here only the second alternative which provides stationarity in probability distribution of actual variations in production for all future years. On such an assumption, the future additional production over the 1968-69 level to meet population and per capita demand growth becomes free from any stochastic component. If the expected value of future production is assumed equal to the corresponding demand, then the per capita availability for any future year 't' is

$$X + [X + \triangle t - E(X)]$$

where X is per capita availability based on production at 1968-69 level and $\triangle t$ is the additional increase in per capita availability over the corresponding value based on expected normal weather production of 1968-69. Since $\triangle t$ is assumed free from any stochastic component, the per capita availability will equal corresponding demand only if the former is equal to $E(X) + \triangle t$. However, as X is a random variable, actual availability in any year 't' will fluctuate around the corresponding demand. To stabilise the per capita availability around the demand, the need to maintain stocks will, therefore, arise which will be released or replenished to reduce the amplitude of fluctuation in X.

Table 8 provides some basic data which we will use to determine the technical size of reserve stocks and its location in the different states. The 1968-69, normal weather production data in this Table are taken from an earlier paper of the present author [10]. The co-efficients of variation in production are obtained by multiplying the corresponding variabilities in rainfall indices and the respective rainfall response co-efficients. The standard deviations in production are obtained by multiplying the co-efficients of variability in production by the corresponding 1968-69 normal weather production.

Given the technical or economic size of the stock to be maintained at the all-India level, its location over the different states will normally depend on each state's level of production and the corresponding co-efficient of variability in production or simply the standard deviation in absolute terms [11].

Thus, for each unit of stock desired to be maintained at the all-India level, the size of the stock C_i to maintain in the i th state should normally be $K\sigma_i$ where σ_i is the standard deviation (in absolute terms) in the i th state's production, and $K = 1/\sum\sigma_i$ is a constant factor of proportionality. The state-wise relative weights for the location of a certain amount of stock desired at the national level are also given in Table 8. With such knowledge, we will now examine the technical size of the stock 'adequate' to smoothen out the amplitude of supply fluctuations arising out of output variations due to rainfall. Needless to say, the word 'adequate' here is in probabilistic terms; what we consider to be an 'adequate stock' might not be adequate for all occasions.

The standard deviations in all-India cereals and rice production due to rainfall with production at 1968-69 level are estimated at 3.6 and 1.9 million tonnes. Based on our assumption of stationarity, mentioned in the previous section, it follows that the average deviations in future cereals and rice production in India are expected to lie within the ranges $\pm$ 3.6 and $\pm$ 1.9 million tonnes. Also, since the rainfall indices have normal distribution, it follows that variations in production will also be normally distributed. Using the property of the normal distribution we can, therefore, conclude that a reserve stock, equivalent to twice the standard deviation, will be adequate in 95 per cent of the cases to offset any individual year's production fluctuation due to rainfall. This suggests the need to have a reserve of about 7 million tonnes of cereals with a rice component of roughly 4 million tonnes (Alternative I). However, a stock at these levels will fail to protect the farmers or consumers if the good or bad years come in sequences. The question, therefore, is: how frequent is the occurrence of these sequences and how severe is their impact on production?

With all-India rainfall indices as obtained from 1875-76 and production at 1968-69 level, Table 9 provides the year-to-year absolute deviations in cereals and rice production which would result if the same sequences of cereals and rice rainfall indices repeat in the future. Table 10, provides the frequency distribution of these deviations. There appears to be a roughly 20 per cent chance (i e, once in every five years) of cereals output recording fluctuations within $\pm$ 1 million tonnes and about 50 per cent chance (i e, once in every two years) of their recording fluctuations within $\pm$ 2 million tonnes. For rice, the chances of fluctuations lying within $\pm$ 1 and $\pm$ 2 million tonnes are roughly 0.3 and 0.7, respectively.

With worst rainfall indices, such as the one recorded for cereals in 1899-1900 and for rice in 1877-78, the corresponding production would record deviations of 9.55 and 5.30 million tonnes. Similarly, with an exceptionally good year, such as 1956-57, cereals and rice production would record deviations of 9.26 and 0.05 million tonnes. Thus to make liberal provision for any individual best or worst year in the future, it will be sufficient to maintain about 9 million tonnes of cereals reserve with a rice component of about 5 million tonnes (Alternative II). The chances of these type of events occurring are about once in a century and, with such a remote chance, the need to maintain the above levels of stocks can be questioned.

However, when we look into the sequences of good or bad years of production, the need to maintain higher levels of stocks appears important to some extent. With rainfall indices as obtained from 1875-76 and production at 1968-69 level, the cumlative production deficits or surpluses that occurred in sequences are given in Table 11. Notice that the sequences of surpluses are more than the deficits; this is due to our defining the average normal production corresponding to the rainfall index average rather than to its modal value. Also, the sequences of length 2 are more frequent than sequences of other lengths, [11] i e, two consecutive years of good or bad harvest are more likely than any other prolonged sequence. There are two sequences for cereals, one of length 3 (1892-95) and the other of length 4 (1953-57), in which the cumulative production surpluses are exceedingly high. If we omit these two sequences and consider the averages of the first three worst sequences and the next three best sequences then the cumulative production deficits and surpluses can be of the order of —11.5 and 10.1 million tonnes. This suggests the need to have a reserve stock of roughly 11 million tonnes to take into account most of the worst and best sequences of cereals production.

Similarly, for rice, there are two sequences—one of length 2 (1876-78) in which production recorded abnormal deficits and another of length 4 (1919-23) in which production recorded abnormal surpluses. If we omit these two sequences and consider the averages for the next three worst and best sequences, than the cumulative production deficits or surpluses can generally be of the order of —5.2 and 5.6 million tonnes. This suggests a reserve stock of about 6 million tonnes of rice. Thus to even out most of the worst and best sequences of production, it appears adequate to maintain 11 million tonnes of cereals with a rice component of about 6 million tonnes (Alternative III). The cumulative production deficits, which we recorded in 1965-67, are unparalleled in the history of Indian agriculture dating back from 1875-76 and in any case it is physically impossible to maintain stocks for evening out such production deficits.

Given the level of reserves desired at the all-India level, the quantity and location of these stocks in the different states will, as mentioned earlier, depend on their respective average production fluctuations. Using the state-wise relative weights, as given in Table 8, stocks that need to be maintained in the different states under the three alternative reserve levels, estimated at the all-India level, are computed and shown in Table 12.

Cereals include rice, wheat, and coarse varieties of cereals, and we have estimated the total stock requirements for cereals as a whole, and for rice separately. If we had estimated stock requirements for each crop under cereals, then total requirements for cereals would have been much higher than estimated under the three alternatives. This actually happened when we computed the rice stock requirements of Assam, West Bengal, and Kerala, which exceeded their corresponding stock requirements for all cereals. For these states, the rice stock requirements are not allowed to exceed their stock requirements for all cereals and the other states' rice stock estimates are then slightly adjusted upwards, by taking into account their future production pattern [10]. Cereals stock in seven states are thus envisaged to have only a rice component. The reason for considering rice separately arises from the fact that, unlike other crops, rice is in short supply in the world market and hence the need to maintain adequate rice stock is of special importance.

There is considerable flexibility in consumers' demand for various items under cereals. Government has at least the machinery of fair-price shops to impose forced substitution as occasion demands. However, as the two crops, rice and wheat, will have increasing importance in Indian agriculture it seems likely that the need to maintain stocks with the Government will in the future centre around these two crops. Wheat being the superior and consumer-preferred item than coarse cereals, supply irregularities due to production shortfalls in the latter can be evened out if adequate wheat stocks are maintained. On such an assumption, cereals stock will have two components, rice and wheat. Table 12 provides the state-wise breakdown of cereals stock into rice and wheat component; the residual of the cereals stock, after making provision for independent estimate of rice stock, is assumed for wheat. It should be noted that, while the state-wise estimates for cereals and rice stocks are based on their respective production fluctuations, the estimates for wheat stock include the production fluctuations for wheat or coarse cereals or both.

To sum up, it appears from past rainfall distribution pattern that reserves of 7 million tonnes cereals will be adequate in 95 per cent of the cases to offset any individual year's fluctuation. To increase this probability to a higher level will require about 9 million tonnes of cereals. However, if we consider the sequences of good and bad years, the need to maintain a higher level of reserve seems desirable. The past rainfall distribution pattern suggests that 11 million tonnes of cereals will be adequate to even out most of the worst or best sequences of production.

Notes

1 There are exceptions to this general statement. For example, the run of dry days which greatly affects the crops is independent of temperature and quantum of monthly precipitation.

2 Conclusion based on analysis of variance made on each of the meteorological stations data. To save space, the results are not presented here.

3 This variation is generally high at the beginning of the south-west monsoon which arrives at different dates spreading from May to July in different parts of the country (observation based on data described in the next section).

4 Some major irrigation projects and dams constructed after Independence have greatly reduced the damages due to floods. Also, unlike droughts, damage to crops due to floods is generally of localised nature and its effect on aggregate production is relatively small.

5 Rainfall data of these 136 stations are not available in published form. They are obtained through the courtesy of S R Sen and J S Sarma from the Indian Meteorological Department.

6 Many ambitious formulae have been developed for constructing composite weather indices. Of particular interest is the Program Windex developed by Oury [4] though its use in an aggregate analysis is rather difficult, See OECD [5] for a review of various formulae for computing composite weather indices.

7 The higher growth rate observed by Sen during the first quarter of this century was largely due to extensive cultivation. Production on poor quality land being more susceptible to the vagaries of nature, growth in production through extensive cultivation is likely to record higher instability than through intensive cultivation.

8 This is substantiated from an analysis of state-wise cereals yield. Equation (2), fitted to the cereals yield index from 1952-53 through to 1964-65, provided for all the states u and u^2 co-efficients with consistent signs. The states which provided significant results are given in the Table below.

9 Weather adjusted annual compound growth rates for cereals and rice were obtained as 3.6 and 3.8 per cent. The corresponding weather unadjusted rates were 3.16 and 3.37 [7].

10 For computational purpose we have used here the formula

$$r_k = \frac{1}{n-k} \sum_{i=1}^{n-k} (u_i - \bar{u})(u_{i+k} - \bar{u}) \Big/ \frac{1}{n} \sum_{i=1}^{1} (u_i - \bar{u})^2$$

where $\bar{u} = \sum_{i=1}^{n} u_i / n$

11 Exact probabilities of occurrence of these sequences can be easily computed [12]. To keep the discussion at elementary level, we have refrained ourselves from these mathematical niceties.

Land-Based Credit Policies and Investment Prospects for Small Farmers

N S Jodha

Although the problem of small farmers has received considerable attention and several alternatives have been suggested to make their economy viable, most of the solutions suggested require a resource base which is beyond the capacity of the small farmers. Any plan to revitalise the economy of small farmers would therefore require outright financial grants or liberal credit from external sources.

Lending policies of existing agencies that provide long-term farm finance, however, are biased against the small farmer who in their terms is not an attractive client. Even the land development banks which are co-operative institutions have lending policies that automatically discriminate against the small farmer.

This paper considers the availability of long-term finance to small farmers in the context of the lending policies of the Gujarat State Co-operative Land Development Bank which is one of the most successful LDBs in the country, and what changes may be necessary if small farmers are not to be excluded from the gains of agricultural development.

[The author is grateful to M D Desai for his valuable comments and suggestions.]

THE problem of small farmers has received considerable attention from economists and planners in recent years. Several alternatives — ranging from intensive cultivation through adoption of new technology to diversification of farm resource use through adoption of mixed farming — have been suggested for making their economy viable.[1] However, most of these alternatives require a restructuring of the resource-base of small farmers. This calls for investment capital among other things, which is beyond the capacity of the small farmers. Revitalisation of the economy of small farmers would, therefore, require outright financial grants or liberal credit from external sources.

However, the existing agencies engaged in providing long-term farm finance not only do not have a bias in favour of the small farmer, but even tend to benefit only the large and medium farmers. For understandable reasons, the small farmer is not an attractive client for commercial (including nationalised) banks.[2] The land development banks (LDBs), being co-operative institutions, have, therefore, to be the major source of investment credit for the small farmer for a long time to come. But the lending policies of the LDBs are also such that the small farmer stands automatically discriminated against. It has been clearly demonstrated, by various studies of rural credit in India, that the credit co-operatives, though conceived to be the strength of the weaker farmers, have in fact benefited only the better-placed sections of the farming community.[3] As far as long-term finance is concerned, a close examination of the lending policies of the LDBs shows that such a situation was inevitable, since the crucial variable determining the amount of long-term credit to a farmer is the area of land owned by him. The present paper attempts to analyse the question of availability of long-term finance to small farmers in the context of the present lending policies of the Gujarat State Co-operative Land Development Bank (hereafter called LDB-Gujarat) which is one of the most successful LDBs in the country.[4]

I

This article draws upon data collected from four selected branches of the Bank — two, each, in the Central Gujarat and Saurashtra regions of the State — by the Agro-Economic Research Centre, Vallabh-Vidyanagar, for a study which was part of an all-India study during 1969 of loans advanced by LDBs made by different Agro-Economic Research Centres. The data used here consists of (a) the details about the total number of borrowers (numbering 4,200), as collected from the Bank records, in the four branches during 1965-66 to 1967-68, and (b) details collected from 144 sample borrowers, selected from among the borrowers during 1966-67 and 1967-68, in the four branches. From each branch, which covered one taluka, 36 borrowers were selected, following the cluster sampling technique in the selection of villages and the stratified random sampling technique with PPS allocation in the selection of borrowers.[5]

Small Farmers and Their Share in LDB Loans

The definition of 'small farmers' raises several conceptual problems. Various criteria for identifying the small farmer could be indicated, but lack of usable data forbids use of most of these criteria. Therefore, despite the known limitations of treating the physical land surface as an indicator of the size of the farm business, we have used the same to demarcate the small farmers for the present exercise. Accordingly, the LDB borrowers have been classified into four groups, *viz*, farmers owning land (i) upto 5 acres, (ii) 5 to 10 acres, (iii) 10 to 15 acres and (iv) above 15 acres; this classification will also ensure comparability with the holdings classification as followed by the 1961 Census Reports. We have treated farmers in category (i) as small farmers.[6]

According to the Census 1961, the small farmers (owning land upto 5 acres) constituted more than 35 per cent of the total land-holders in the four talukas selected for the present study. There is no likelihood that their number has decreased — if at all, it might have increased.

Our data reveal that farmers in this category, in spite of their greater numerical strength as well as their greater dependence on external sources for investment capital, have not benefited from the LDB finances in proportion either to their number or their needs. According to Table 1, during the three years under review, their proportion in the total number of LDB borrowers was less than 9 per cent. On the other hand, farmers in category (iv) (i e, holding above 15 acres) constituted more than 42 per cent of total borrowers in spite of their relatively low proportion (22 per cent) in the total number of land-holders in the selected talukas.

Regarding the share of different holding groups in total credit advanced by the LDB during the period, the situation was still worse. While the small farmers accounted for only 5.41 per cent

TABLE 1: PERCENTAGE DISTRIBUTION OF LDB BORROWERS AND LDB LOANS IN SELECTED BRANCHES ACCORDING TO SIZE OF HOLDING 1965-66 to 1967-68

Holding Size Groups: (Acres)	Proportion in Total Holdings 1961 (Census)	Proportion in LDB Borrowers during				Percentage Share in LDB Loans during			
		1965-66	1966-67	1967-68	Total	1965-66	1966-67	1967-68	Total

Note: Date pertains to total borrowers in the four branches during three years.

TABLE 2 : HOLDING-WISE PERCENTAGE DISTRIBUTION OF LDB LOANS FOR DIFFERENT PURPOSES IN THE SELECTED BRANCHES, 1965-66 to 1967-68

Holding Size Groups (Acres)	Percentage Share in Borrowing for the Following							
	New Well	Repairs of Well	Oil-Engine	Electric Motor	Other Irrigation Facilities	Tractor	Others	Total
1	2	3	4	5	6	7	8	9
Upto 5	7.34	10.94	3.99	17.65	7.33	2.17	9.14	5.41
5-10	29.38	20.74	16.98	32.36	18.72	9.60	7.96	21.10
10-15	23.32	25.25	25.06	31.13	8.69	21.76	29.07	24.39
Above 15	39.96	43.07	53.97	18.86	65.26	66.47	53.56	94.10
Total	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00
Actual Rs (PC)	4166100 (31.82)	101000 (0.68)	8155487 (62.29)	239652 (1.83)	167937 (1.29)	179250 (1.37)	82900 (0.63)	13092326 (100.00)

Note: Data pertain to total borrowers in farm branches of the Bank during three years.

of total credit, the farmers with the largest holding group were able to claim more than 49 per cent of total credit. With minor variations, the situation during the individual years under review was broadly similar to this. No data are readily available on the position in earlier years, but in view of the circumstances responsible for it — which will be presently discussed — the situation could not have been any different during that earlier period.[7]

Even if the total LDB lending (Rs 130.9 lakhs) in the selected talukas during the three years is arranged according to the purpose of the borrowing (see Table 2), the situation depicted in Table 1 remains unaltered. For none of the purposes (except electric motors), did the share of small farmers in total borrowing exceed 11 per cent. The share of the largest holding group ranged between 40 and 66 per cent of total borrowing for different purposes. Thus, whichever way we look into LDB lending to farmers, it is quite apparent that small farmers have not benefited substantially in the matter of receiving LDB loans.

II

This situation is not the result of any deliberate attempt by the Bank to discriminate against small farmers. Yet, the operational policies of the Bank are designed to provide credit only after adequately safeguarding the interest of the Bank and do not keep in view the adequacy of the credit for the purpose for which it is given. Consequently, while the medium and large farmers can satisfy their full credit needs, the small farmer can rarely obtain the full credit he needs for making investment. This will be clear from the following discussion.

OPERATIONAL POLICIES

The most relevant problem in the present context is proper determination of the quantum of loan, so as to protect the interests of both the lender and the borrower. Ideally, the quantum should be determined such that:

(a) the loan sanctioned is sufficient to meet the proposed investment outlay.
(b) the repayment schedule is realistic enough so that the repayment instalments are in tune with the repaying capacity of the borrower (after taking into account the incremental income due to new investment).
(c) the loaning limit is fixed such that it leaves a sufficient security margin for the lending institution.

Thus, the operational policies for proper determination of loans should basically address themselves to three aspects:

(1) cost aspect of the proposed investment by the borrower.
(2) profitability of the investment and repaying capacity of the borrower.
(3) value of the security offered.

However, in practice, the LDB Gujarat (like most LDBs in the country) while processing loan cases concentrates, almost exclusively, on the third aspect, viz, the value of land offered as security. The other two aspects are looked into only casually.[8]

The actual practice in brief is as follows:

Before determining the quantum of loan, the Bank decides the value of the land mortgaged as security. Though land valuation is a highly specialised task, the Bank uses a ready-made formula for the same. Like other land banks in the country, the LDB Gujarat follows the method known as 'assessment multiple method,[9] under which the assessment rate of the mortgaged land plays a crucial role in the determination of the value of land. The assessment value is multiplied by another value (we may call it 'multiplier'), decided upon by the Bank from time to time. The present value of the 'multiplier' is 500.[10] Thus the value of a piece of land, according to the Bank, is equal to its revenue assessment multiplied by 500.[11]

Since, as per the Bank's by-laws, the loan limit is 50 per cent of the value of mortgaged land, the determination of the quantum of loan is reduced to a simple exercise of multiplying the assessment rate by 500 and dividing it by two. Other factors, like cost of the asset and repaying capacity of the borrowers are looked into as mere formalities and, in practice, they seldom influence the Bank's decision regarding finalisation of the loan amount. Thus the factors which ultimately affect one's borrowing from the LDB are:

(i) area of the land one owns (and is, therefore, able to mortgage);
(ii) assessment rate of the mortgaged land;
(iii) the Bank's safety margin.

The Bank's over-concern with the security (as reflected through 50 per cent safety margin), and the method of land valuation based on land assessment (which normally undervalues the land), tend to act as important limitations on the size of the loan — more so for the small farmer who is faced with the additional and most crucial constraint of paucity of owned land and because of which (unlike farmers with larger holdings) he is unable to counter (at least partially), the restriction on his borrowing imposed by the Bank's safety margin and method of land valuation.[12]

TABLE 3 : AVERAGE COST OF ASSET AND AMOUNT OF LDB LOAN PER BORROWER ACCORDING TO LAND HOLDING SIZE

(in Rs)

Holding Size Group (Acres)	Assets	New Well		Electric Motor		Oil Engine		Others		Total	
		Cost	Loan	Cost	Loan	Cost	Loan	Cost	Loan	Cost	Loan
1		2	3	4	5	6	7	8	9	10	11
Upto 5	2671	1463 (54.77)	—	—	3607	3366 (93.31)	—	—	3128	2779 (72.86)	
5-10	2727	1906 (69.89)	2758	2305 (83.58)	3321	3460 (104.19)	452	381 (84.29)	2727	2640 (96.81)	
10-15	2618	2489 (95.07)	3084	2798 (90.73)	3523	3889 (110.39)	602	512 (85.05)	2692	2768 (102.82)

Total	2765	2694 (97.43)	2886	2637 (91.37)	3522	3747 (106.38)	1264	1144 (90.51)	2957	2897 (97.97)	

Note: The details pertain to 144 sample borrowers. Figures in parenthesis indicate the LDB loan as percentage of actual cost of the asset.

III

The situation described above, has several far-reaching implications for the economy of small farmers. A few of them may be briefly discussed.

UNDERFINANCING OF FARM ASSETS

When the amount of land mortgaged is a principal consideration in determining the quantum of loan, the cost of the proposed asset, in practice, ceases to have any operational significance for the lender. Consequently, a situation may emerge in which farmers with sufficient land to mortgage would get a loan equal to, or at times greater than, their actual investment outlay. The small land-holders, on the other hand, would find that sanctioned loan covers only a part of their investment cost.

This was actually found in the case of sample farmers in the selected branches. As shown in Table 3, the average cost of construction of a new well was more or less similar (ranging between Rs 2,671 for small farmers to Rs 2,829 for large farmers) as between different holding size groups. But the average lending by the Bank to the small farmers for the same asset was less than half of the average amount advanced to the largest farmers. While the LDB loan constituted only 55 per cent of the cost of the new well for small farmers, the loan was 110 per cent of the cost of the well in the case of the largest farmers. On other assets, the disparity was not so glaring, yet it is clear from Table 3 that the LDB loan, as percentage of the cost of the asset, increased with the increase in holding size.

The phenomenon of overfinancing of assets in the case of big farmers and underfinancing in the case of small farmers, apart from encouraging the diversion of loans in both cases (for different reasons)[13] accentuates the already disadvantageous position of the small farmer *vis-a-vis* the larger farmer. For instance, in such situation the dependence of the small farmer on the traditional source of credit is perpetuated. This is partly seen in Table 4. In the case of the selected farmers, about 64 per cent of the assets (in value terms) acquired during 1965-66 through to 1967-68, were financed by the LDB. But the contribution of the LDB was the lowest to the farm-level capital formation of the small farmers compared with the other holding groups. The LDB contribution was only 50 per cent for the small farmers, while in other cases it ranged between 60 and 71 per cent. The small farmers had to depend on other agencies, mainly traditional ones, to the extent of 26 per cent of the asset value; while the corresponding dependence of the other holding groups did not exceed 11 per cent, although their investment in absolute terms was much higher than that of the small farmer.

TECHNOLOGICAL GAP

The limitation on borrowing, imposed by the holding size, compels the small farmer to opt for traditional assets which (even though less efficient) are relatively cheaper. This contention is partly supported by the distribution pattern of the assets acquired by about 4,200 farmers through LDB finance in the selected branches during the three years under consideration. The information has been summarised in Table 5. Of the total of small farmers who borrowed from the LDB, during the three years, about 70 per cent did so for meeting capital expenditure on traditional items like construction of wells, repairs of wells, bunding, etc. The proportion of small farmers going in for modern assets like oil-engines, electric

motors, pipelines, etc, was only 30 per cent.[14] The position got reversed as the size of holdings increased. In the largest holding group, the proportion of farmers borrowing for acquisition of modern and traditional assets were 67 per cent and 33 per cent, respectively. In view of the technical and economic superiority of modern assets, the implications of this are too obvious to need elaboration. If such tendencies persist — which is quite likely under land-based credit policies — the position of small farmers *vis-a-vis* big farmers would deteriorate even in terms of non-land farm assets, and there would be an ever-widening technological gap between the two.

Self Liquidating Loans

The rationale behind changing the character of land banks (*viz*, from being lenders for redemption of old loans to becoming creditors for more productive purposes) was that, by financing productive farm assets land banks would add to the production potential of the agricultural sector and that the loans would be self-liquidating. However, the extent to which a farm asset (say, construction of a well) adds to the production potential of the farm and makes the loan self-liquidating depends upon the extent and efficiency of utilisation of the asset; this, in turn, depends on (besides other things) the extent of supplementary investment that takes place to meet certain technical and economic requirements of the acquired asset. The simplest example is a completed well, which requires blasting (necessitating additional investment), to increase and stabilise the rate of recharge in the well. Several other instances, could be cited to show that the efficiency of a given asset remains substantially low unless it is complemented by another small or big asset. A well without oil-engine, a well equipped with oil-engine but without adequate field channels or pipeline, a well without proper drainage and land levelling in its command area, an oil engine without a machine-room on the well, a tractor without a trailer, etc, are a few such examples. In all such cases, the entire asset complex has to be looked at in its totality, while considering the production potential and self-liquidating character of the investment. However, under the land-based credit policies, it is not always possible to follow the approach described above. Hence, as permitted by the amount of land mortgaged (and its assessment rate), only a part of the "asset complex" can be financed.

TABLE 4 : AVERAGE VALUE OF FARM ASSETS ACQUIRED BY SAMPLE BORROWERS AND SOURCES OF FINANCE, ACCORDING TO HOLDING SIZE, 1965-66 TO 1967-68

Holding Size Group (Acres)	Average Value of Assets (Rs)	Percentage Share of Different Sources		
		LDB	Other Agencies*	Owned Funds
1	2	3	4	5
Upto 5	4069	49.80	26.33	23.87
5 - 10	4510	70.57	7.62	21.81
10 - 15	5128	69.48	3.22	27.30
Above	7420	59.54	10.99	29.47
Total	5730	64.01	8.93	— 27.06

* *Mainly include traditional agencies like money lenders, fellow farmers, etc.*

TABLE 5 : DISTRIBUTION OF THE LDB BORROWERS WHO BORROWED FOR TRADITIONAL AND MODERN ASSETS, ACCORDING TO SIZE OF HOLDING 1965-66 TO 1967-68

Holding Size Group (Acres)	Number of Borrowers	Percentage of Borrowers Who Borrowed for Assets	
		Traditional	Modern
1	2	3	4
Upto 5	377	69.89	30.11
5 - 10	1043	56.57	43.43
10 - 15	1011	44.71	55.29
Above 15	1770	33.04	66.96
Total	4201	46.54	52.46

Note : Date pertain to total borrowers during the three years.

Here, too, farmers with adequate land can manage to overcome the problem by mortgaging the remaining part of their land for second or third borrowing even before the earlier loan is repaid. But this facility, for making their assets more efficient and their loans self-liquidating through second or third borrowing (e g, for blasting the ground rocks in the well), is obviously not available to the small farmer. Table 6 illustrates this situation.

Out of the 144 sample farmers, nearly 32 per cent borrowed from the LDB for the second time before they could clear the earlier loans. Similarly about 5 per cent of the sample farmers borrowed for the third time. However, as Table 5 shows, most of these fortunate borrowers fall in the bigger land-holding groups. In the small-farmer group, there was not a single person who could borrow more than once. In the case of the biggest holding size group nearly 40 per cent and 6 per cent of the borrowers borrowed twice and three times, respectively.

Enduring Vicious Circle

The size of holding has been an important factor in creating the vicious circle of low output and low investment on small farms. The same factor under the land-based credit policies, also blocks the chances of breaking that vicious circle using borrowed capital. The new farm technology, by facilitating substitution of capital for land, has offered some scope for the small farmers to cross the viability limit. Due to its features, like divisibility and absence of scale bias, the new technology is considered the best hope for the potentially viable small farmers. But all high hopes would be belied and unique opportunities for progress towards viability would be lost to the small farmers, unless the capacity of small holdings to absorb new technology is raised—by enabling them to create an adequate farm-level infrastructure, again mainly through institutional credit. From this standpoint, the future of small farmers is closely linked to the basis for providing long-term credit needs.

IV

The present overemphasis on land in the credit policies of the land banks stems largely from the notion that, land is the most dependable security against defaults. Yet, apart from the problems of auctioning the defaulters' land, that land can hardly be considered an effective security against defaults as compared to the assured flow of incremental income from properly financed farm assets. This is more so in a changing agriculture, where due to the new technology land becomes a less predominant factor in growth, compared to capital.[15] Hence, in a rational credit policy, factors other than land should get due consideration. Thus, instead of taking decisions on loan applications with reference only to land offered for mortgage (and its assessment rate), the applications should be appraised as investment projects

TABLE 6 : DISTRIBUTION OF SAMPLE BORROWERS ACCORDING TO NUMBER OF BORROWINGS FROM THE LDB GUJARAT

Size of Holding Groups (Acres)	Percentage of Farmers Who Borrowed			
	Once	Twice	Thrice	Total
1	2	3	4	5
Upto 5	100.00	—	—	100.00
5 - 10	72.29	25.32	2.39	100.00
10 - 15	61.22	34.10	4.68	100.00
Above 15	54.40	39.72	5.88	100.00
Total	63.19	31.94	4.87	100.00

with technical and economic feasibilities playing a decisive role. In practical terms, it would mean introducing closer supervision (as recommended by the All India Rural Credit Review Committee Report),[16] so that proper assessment of the farmer's overall resource position and the likely impact of the LDB loan on his production potential and thereby on his repayment capacity becomes possible. The constraint on the borrowing by small farmers can also be reduced by introducing some degree of flexibility in the security margin and the repayment schedules determined by the Bank.

However, even after the credit policies have been thus rationalised, injecting permissible flexibility in the credit policy, a large number of small farmers would remain unaffected. In such situations, two innovations, tried by the LDB Gujarat, may prove partially helpful.

One of them is the provision of joint loans, where farmers can apply for a loan and acquire an asset, jointly. Repayment, however, remains an individual responsibility of the borrower. The scheme has worked successfully in some areas like Mehsana.[17] However, in the branches covered by the present study, no significant number of cases were found, except in assets like tractor, where mainly big farmers have taken advantage of the facility that was basically designed to help the small farmers. The most important factor preventing small farmers from taking advantage of this facility was the lack of physical contiguity of plots owned by them, because of which they could not go in for assets like wells or oil-engines—the only assets to which they aspired.[18]

Another innovation, very recently adopted by the Bank, is the system of marginal guarantee by government in the case of small farmers. Accordingly, recovery of that part of the loan which remains uncovered by the security offered by the farmer, is guaranteed by the state government. This system can be extended to other areas of the country as well, especially after the Small Farmers Development Agency starts its operations to help the small farmers in such areas.

However, the big question in these matters is to draw the line to demarcate the extent to which such guarantees could be offered. In view of the cost and risk involved and in the interests of a rational use of scarce resources, it would be essential to identify the potentially viable farmers for help through such guarantee scheme.

Finally, the small farmers, who are too small to sustain any capital investment and therefore cannot be helped by guarantee schemes, etc, have practically no future as farmers in a competitive agriculture—unless the custom service of agricultural equipment and machinery, through the Small Farmers Development Agency or other agencies become an effective reality within the means of such farmers.

Notes

   (i) Seminar on Problems of Small Farmers, Indian Society of Agricultural Economics, Bombay, Seminar Series—VII, 1968.
   (ii) Case Studies of Small Farmers in different parts of the country, summarised in the Report of the All India Rural Credit Review Committee, Reserve Bank of India, 1969, pp 548-562.

2 In the absence of data one is unable to comment on Nationalised Banks' performance *vis-a-vis* small farmers. However, in view of the existing low resources position and the extent of risk on small farms on the one hand and the Banks' insistence on 'deposits first', and system of guarantors on the other, it is not likely (unless some extremely welfare-oriented steps are taken), that small farmers will be able to depend on these banks on a sizeable scale for the satisfaction of their credit needs.

3 C H Hanumantha Rao, 'Farm Size and Credit Policy', *Economic and Political Weekly*, Review of Agriculture, December 26, 1970.

4 The LDB-Gujarat, successor in title to the Saurashtra Land Mortgage Bank is in the field since 1951. In a relatively short span of time, the Bank has achieved spectacular success. With its unitary structure, the Bank has branches in 181 out of 185 talukas of the state. It had covered nearly 79 per cent of the villages of Gujarat by 1967-68. The Bank advanced Rs 7,267.72 lakhs as long-term loans from its start to June 30, 1968. During 1967-68, the recovery was 91 per cent of the demand. Besides, development of minor irrigation (through wells and mechanical lifting devices) in the state is largely attributed to the LDB. However, the performance of the Bank regarding financing of the small farmers is not in tune with its successes in other directions. For details see, "Some Aspects of Long-Term Agricultural Finance—A Study of Two Areas in Gujarat", Agro-Economic Research Centre, Vallabh-Vidyanagar, Research Study Number 20, 1969 (*Mimeo*).

5 *Ibid.*

6 One may not agree with the idea of treating a 5-acre holder as small farmer in all talukas, irrespective of the inter-taluka variations in soil and water conditions. An attempt was made to analyse the available data by treating 5 acres as small farm in areas with relatively better soil-water conditions and 10 acres as small farm in areas with relatively poor soil-water conditions. The results thus obtained were also in line with the trends already presented in the paper, where holdings upto 5 acres have been treated as small farms in all the talukas. Moreover, assessment rates in the four talukas were not very different and hence, while appraising the land value (through assessment multiple method), the Bank has treated 5 acres in different talukas at par.

7 Data analysed for Gujarat state as a whole for 1967-68 and 1968-69, also depict a picture similar to that presented by Table 1. For details, see "Some Aspects of Long-Term Agricultural Finance", *op cit*, pp 134-136.

8 On the insistence of the RBI, the Bank does observe certain formalities (e g, collection of data to assess the repaying capacity of the borrower), but the manner in which this is done itself speaks for their ineffectiveness in determining the quantum of loan. For details, see "Some Aspects of Long-Term Agricultural Finance", *op cit*, pp 116-122.

9 It is understood that, a few months back, the LDB-Gujarat substituted the multiple assessment method by a new system, under which standard value of land for each taluka has been fixed by taking into account the actual productivity of the land. However, the present paper deals with the situation prior to this change.

10 The value of the 'multiplier' was 200 till 1964-65, and 350 upto 1965-66. At present it is 500. These

upward changes were made on the ground that market price of land has been increasing. However, the precise relationship between changes in the market value of the land and changes in the value of 'multiplier' is not known.

The LDB Gujarat also has three more methods for land valuation under which sales statistics of land, valuation by panchayat, and average assessment rate for the village as a whole, etc, are utilised for valuation of land. However, in practice the method described above is the only method generally used by the Bank for land valuation.

Of course, in some cases, where the proposed loan exceeds the eligibility limit, half of the cost of proposed investment is added subject to an overall ceiling equivalent to full value of the land. This in fact is a big step towards helping the small farmer. But, in spite of this concession, owing to low holdings most farmers fail to get sufficient funds.

13 See "Some Aspects of Long-Term Agricultural Finance", *op cit*, pp 162-174.

14 Partly, this phenomenon may be due to the danger of under-utilisation of modern assets on small holdings. But the widespread practice of custom service (including sale of water), underutilisation may not be a big factor for the above phenomenon. As noted earlier, it is their limited land-holding, which deprives them of the LDB finance for bigger investment needed for modern farm assets.

15 "Farm Size and Credit Policy", op *cit*.

16 *Op cit*, pp 580-581.

17 'Small Farmers in Mehsana District of Gujarat: A Case Study' (by RBI) incorporated in, "Organisational Framework for Implementation of Social Objectives"; (Report of a Study Group of the National Credit Council), RBI 1969.

18 One way to help the small farmers in such situation could be linking them with the neighbouring big farmers while granting the loan. It may be made obligatory for the neighbouring farmers possessing well (or oil-engine, etc), to supply water to the small farmer at reasonable rates. The justification for this lies in some lacuna in land rights prevailing in the country. Accordingly, the sole right for using the water from a well belongs to the owner of the plot where the well is located, notwithstanding the fact that utilisation affects the water table of the neighbouring fields, too.

Wages of Agricultural Labour

N Krishnaji

This paper seeks to use the data published by the Directorate of Economics and Statistics to study trends in agricultural wages since 1956. An attempt is also made to compare the current wage levels with those of 1951.

Since wages constitute the bulk of earnings for this class of the rural population, it is expected that the analysis of this paper will throw some light on trends in earings as well.

THERE were two comprehensive enquiries into the living conditions of agricultural labourers, one in 1951 and the other in 1956. The data collected in these two studies, although not strictly comparable, indicate that real wages in 1956 were below their 1951 levels almost all over the country. Apart from these surveys, the Government publishes on a regular basis wage data for a few villages in most districts of the country. The reason given for the collection and publication of these data is: "Agricultural wages constitute a major item in the cost of production of crops and it is essential to have an idea of agricultural costs"[1]

It is our purpose here to use this information[2] (data published by the Directorate of Economics and Statistics — DES for short) to study the trends in agricultural wages since 1956; we shall also attempt to compare the current wage levels with those of 1951. Since wages constitute the bulk of earnings for this class, we expect that such an analysis will throw some light on trends in earnings as well.

Methodology

Throughout this paper we shall be concerned with the wage rate for adult male labourers. For most of the states for which data are published, wages of field labour — presumably an average for all agricultural operations (ploughing, harvesting etc) — are available. For a few states, wages for the different kinds of operations are also given; in this case, we have taken the average over all agricultural operations. Thus we have developed data for the category of field labour uniformly for all the states. These data relate to the total cash equivalent of all payments made to labourers.

We may note at the outset that no information is available on how the villages are chosen within each district, except that villages are "so selected as to represent the wages and general agricultural conditions of the district".[3] Since there is considerable inter-village variation within the same district, it is difficult to assess the degree of accuracy in the resulting 'district averages'. Our final results are, therefore, subject to this important limitation.

A casual study of the wage data reveals that most villages do not exhibit any seasonal variation at all. This conflicts with the facts of real life and suggests that the data are of dubious value. We begin, therefore, by studying the pattern of variation over time (i e, months) and space, particularly to test the hypothesis that the published data do not reflect any seasonal variation. For this purpose we have selected the following four samples.

(A) 1956-57 — 16 districts in five states.[4]

(B) 1960-61 — All (20) the districts of Andhra Pradesh. In both (A) and (B) we have used averages of villages in each district as our basic data.

(C) 1960-61 — 20 villages from five states (two districts from each state and two villages from each district).

(D) 1964-65 — 12 villages from three states (two districts from each state and two villages from each district).

In respect of two samples, (C) and (D), the village wage rate was the basic variable while in (A) and (B) the basic variable was the district average. Analyses of variance of these samples is given in the Appendix, Tables (A), (B), (C) and (D), respectively. The analysis shows that most of the observed variation is accounted for by spatial variation; variation among months is insignificant in all but the 1956-57 sample. But in the 1956-57 sample, we have taken the district averages as the basic variable for the analysis of variance. On re-examination of the original data, we find that the number of villages available for estimating the district average is not the same over all months; moreover, in a few instances, even the villages (of a district) for which data are given

Table 1: Estimated Wage Rate of Male Agricultural Labourers

Mysore	90	92	99	107
Orissa	72	88	120	144
Punjab	184	218	117	98
UP	118	101	—	—
West Bengal	166	157	87	72

Note: 1950-51 wages were taken from "Agricultural Labour in India, Report on the Second Enquiry", p 110; 1956-57 wages were the result of adding 10 per cent to the 56-57 figures from the same source. Real wages were worked out using the price data given in Table 1.

are not the same in all months. Thus, what passes off as seasonal variation here includes a spatial component which cannot be separated. Also, the mean square among months (462) is very low compared to the mean square among districts (49405). All this goes to establish the fact that, if we ignore seasonal variation (i e, base our analysis on data for just one month), we shall not be losing much information (i e, our results will not be very different from those based on the data for all the 12 months).

A comparison of the 1956-57 DES data with the data from the Second Agricultural Labour Enquiry (1956) shows that the former are higher. While the two sets are not comparable it seems reasonable to conclude that the DES data conform to peak-season wages. We have accordingly chosen one peak season month for each state for estimating state averages: December for Andhra Pradesh, Assam, Bihar, Maharashtra, Gujarat, Mysore, Orissa, UP and West Bengal; April for Punjab and Himachal Pradesh; October for Kerala; November for Madhya Pradesh; and January for Tamil Nadu. We may add that, even if seasonal variation is present in the DES data (this can only happen if the samples we analysed were not representative — which is a very remote possibility), it will still be valid to compare wages prevailing in the peak season month in one year with those in the same month in another year to estimate annual changes.

For each district, we have computed the average of all the villages (each year) for which data are available. Since considerable inter-village variation (within districts) is present, this introduces a bias in the comparison of one year's average with another's if the villages are not the same. To estimate change over the years, therefore, it is essential to retain the same villages; but this will cut down the number of villages available for estimating the district average. We followed both procedures whenever sufficient data were available and found that the results are not very different except in one case. Details are given in the Appendix Table (E). Finally, we used the 1960-61 census figures of the number Male Agricultural Labourers in each district as a weight to compute the weighted state average wage rate for 1956-57, 1960-61, and 1964-65 (Table 1).

Trends in Real Wages

Table 1 also gives the Labour Bureau's Index Number of Consumer Prices for

Agricultural labourers. In the last two columns we give an index of real wages with 1956-57 = 100.

We can see that, in six out of the 14 states, *viz*, Assam, West Bengal, Maharashtra, Punjab, Himachal Pradesh and UP real wages in 1964-65 were appreciably lower than their 1956-57 levels. In Bihar, Mysore, Gujarat, and Madhya Pradesh they have remained more or less at the same level. It is only in Kerala, Orissa, and Andhra Pradesh, that we can say that real wages have risen during 1956-64.

We shall now attempt to compare the 1964-65 wage levels with those in 1951. Now, the wage data collected in the first (*1951*) and second (*1956*) *Agricultural Labour Enquiries* are not comparable because, in the first, kind payments were converted into cash equivalents at retail prices, while in the second, this was done at wholesale prices.[5] Available price data[6] relate to those prevailing in towns; but if we assume that similar relations hold in rural areas it appears reasonable to assume that retail prices were higher than wholesale prices by 10-20 per cent in different areas. To this we must add the fact that only about 50 per cent of the wage payment was in kind (in 1956, according to the Second ALE). It then follows that, if we inflate 1956 wage rates by about 10 per cent they would then be comparable with the 1951 figures. In Table 2, we give these estimates along with an index of real wages in 1964-65 with 1950-51 = 100. This last column gives us a magnitude of change in relative wages over the period that roughly corresponds with the first three plans. We can see that only in Kerala and Orissa real wages have increased during 1950-64 to a significant extent; on the other hand, they have fallen appreciably in Assam and West Bengal and possibly in the Bombay region as well; in all the other states, real wages have remained more or less at their 1950-51 levels.

To conclude this section, we must now ask whether these falling trends have been reversed after 1964-65. For 1968-69, data on the wage rate is published for a few villages in the recent issues of *Agricultural Situation in India*. By comparing these with the wages for the same villages in 1964-65, we find that wages have risen between 25-50 per cent in different areas. Price increases in the same period were 33 per cent, which shows that living conditions of agricultural labourers probably continue to be the same today as ever before.

We hear the argument that the Green

APPENDIX

Analysis of Variance

Sample (A):

1956-57, Assam — North Lakhimpur, Mangaldai, Barpeta and Karimganj.
Bombay — Ahmednagar and Kolhapur.
Madhya Pradesh — Sagar, Betul, Nimar, Chindwara and Raipur.
Mysore — *Chitaldurg, Kolar and Hassan.*
West Bengal — Midnapore and Hooghly.

TABLE (A)

Source of Variation	Degree of Freedom	Sum of Squares	Mean Square
Between states	4	646038	161509.50
Within states	11	95045	8640.45
Between districts	15	741083	49405.53
Between months	11	5079	461.73
Residual	165	36724	222.55
Total	191	782886	

Sample (B): 1960-61 — The 20 districts of Andhra Pradesh for which data were available.

TABLE (B)

Source of Variation	Degree of Freedom	Sum of Squares	Mean Square
Between months	11	4184	380
Between districts	19	170408	8969
Residual	209	54112	259
Total	239	228704	

Sample (C):

1960-61, (1) Andhra Pradesh — Hyderabad (Arutla and Vennachadu); Karim Nagar (Kodurpak and Cheppial).
(2) Gujarat — Bhavnagar (Kundla and Umrala); Amreli (Khambha and Lathi),
(3) Madhya Pradesh — Mandla (Shahpur and Bichhia); Betul (Samundra and Ranipur).
(4) Orissa — Cuttack (Mahanga and Jagatsinghpur); Keonjhar (Champna and Anandpur).
(5) Himachal Pradesh — Chamba (Sarol and Chowari); Mandi (Surajpur Bari and Kumi Behna)

In the following, a cell stands for the configuration of four villages of a state in a given month.

TABLE (E) Estimated Change in Wages by Two Methods (Per Cent)

State and Period		Method I	Method II
Andhra Pradesh	(1960-64)	42	40
Assam	(1956-60)	—2.6	—5.3
Bihar	(1956-60)	4.3	5.2
Maharashtra	(1956-60)	—17.6	—4.2
,,	(1960-64)	31.4	31.1
Gujarat	(1956-60)	27.5	24.8
,,	(1960-64)	49.1	52.6

Note: Method 1 refers to district averages based on whatever village data were available in each year. In Method 2 we retained the same villages at both points of time and is thus more reliable. The agreement is close except in the case of Maharashtra for the period 1956-60. Our final estimates for Maharashtra for 1956-57 are based on Method 2 together with the 1960-61 average wage rate.

Revolution will lift agricultural labourers above the poverty line through increased pace of agricultural activity, greater demand for labour, and higher wages. It is patently false because, in those small pockets where the Green Revolution has penetrated to a significant extent (like Punjab) wages are kept low through the import of labour from neighbouring states. Also, the Revolution is unlikely to spread wide enough to increase employment to a significant extent.

INTER-STATE DISPARITIES

Table 1 also gives us an idea of the trends in inter-state disparities in the wage rate. These disparities appear to be shrinking; the co-efficient of variation (a weighted index, with the number of male agricultural labourers as weights) has declined from 28.6 per cent in 1956-57 to 22.5 per cent in 1960-61 and to 19 per cent in 1964-65. This is, in a large measure, due to the fact that money wages increased at a faster rate in those regions where they were relatively low; in real terms, there were sharp falls in wages in Assam, Punjab, Himachal Pradesh and West Bengal, where the wages are relatively high. If this process of inter-regional convergence continues, the wage rate will settle at a uniformly low rate all over the country.

We do not attempt to 'explain' the inter-state disparties here; however, a few comments are in order. The states of Punjab, Himachal Pradesh, and Assam where the wages can be regarded to be relatively high, contribute barely 2.5 per cent to the total agricultural labour population. In other states, like West Bengal, Maharashtra, Gujarat, and Kerala where the wages are high compared to other states in the same regions, prices are also relatively high. If we take these two factors into account while reading Table 1, there is very little inter-state variation left to 'explain'. The conclusion is inescapable that, stagnant agricultural wages characterise the whole country.

Standard Mills

STANDARD Mills has obtained industrial licence for expansion of its chemical plant to the extent of 17,330 tonnes of caustic soda, 15,012 tonnes of chlorine, and 5,000 tonnes of hydrochloric acid and also a licence to import plant, machinery and mercury of the value of Rs 1.11 crores. This expansion does not fall under the provisions of the MRTP Act, because the project was initiated before the commencement of the Act. The company has also been issued a 'letter of intent' for the manufacture of carbon tetrachloride and chloroform. Government has intimated its willingness to issue an industrial licence as well as import licence, provided the company obtains foreign exchange loan, equivalent to a little over Rs 7 lakhs. Total cost of this project is estimated to be Rs 50 lakhs. These projects and the modernisation and renovation programme in the textiles division would together involve a capital outlay of over Rs 7 crores. Out of this, Rs 1.11 crores is to be provided by ICICI by way of foreign exchange loan on a deferred-payment basis to meet the cost of plant, machinery and mercury. A sum of Rs 2 crores would be raised by issue of 40,000 convertible bonds of Rs 500 each, and the balance amount would be found from funds generated through internal accruals like depreciation, development rebate and retained profits.

The convertible bonds will carry interest at 8 per cent per annum, subject to tax, payable half-yearly. The bonds will be repayable on expiry of 12 years from the date of issue, with liberty to the company to redeem them at par at any time after 10 years by giving 6 months' notice. These bonds will be convertible into equity shares on the holders applying for such conversion within the period July 1 to December 15, 1976. In exchange of each bond, the company will allot one equity share of Rs 100, fully paid up at a premium of Rs 275 and pay Rs 125 in cash. If, however, the company at any time before the end of 1976 were to issue bonus equity shares in the proportion 1:4, the basis of conversion would be that, for each bond, the company would allot one equity share fully paid up at a premium of Rs 200 and pay Rs 200 in cash. The holders of the bond will be entitled to interest thereon till the date of conversion, *viz*, upto December 31, 1976. The equity shares to be so allotted in conversion of the bonds will rank for dividend *pro rata* from the date of allotment. Application to the Controller of Capital Issues for his consent to the issue of bonds will be made in due course.

KEEPING A NATION ON THE MOVE

As many as 20 airlines of international repute avail of INDIANOIL's expert refuelling service. In the growth of India's transport and communications, INDIANOIL has been playing a distinct role. But that is not to belittle its contribution to the nation's agriculture and industry.

In a short span of a decade, INDIANOIL has emerged as the biggest oil refining and marketing organisation in India—meeting more than half of the nation's total requirements of petroleum products.

With a chain of refineries processing indigenous crude, a vast pipeline transportation system, and a countrywide storage and distribution network, INDIANOIL has ensured an uninterrupted flow of oil for India's defence and development.

As part of the nation's planned development INDIANOIL ceaselessly strives to take the country towards self-reliance and self-sufficiency in petroleum.

INDIANOIL

a national trust for economic prosperity

Emerging Consensus?

THE tenor and tone of Indira Gandhi's and other Central leaders' speeches does not in the least suggest that we are bracing ourselves for any kind of confrontation with Pakistan by embarking on a 'forward' policy in Bangla Desh. The Government seems to be much more occupied with other questions like Telengana, liberalisation of industrial licensing and most important, the politicking for the state assembly elections early next year. The build-up for the elections and the Bangla Desh plus refugee issue could be related but the Government and the Congress party are not attempting to establish any connection; it even seems possible that they are deliberately playing down the Bangla Desh question. But this does not mean that Bangla Desh can just be wished away.

In this context, the flights of statesmen between Delhi and Moscow assume significance. The Soviet top-level diplomat, S K Tsrapkin, flew into Delhi last Wednesday. D P Dhar flew to Moscow a short while back. Indira Gandhi will be flying there next Monday. Swaran Singh has flown to New York for the UN General Assembly session and seems to have been meeting Gromyko quite frequently. What is going on, especially over Bangla Desh? Are there any indications that a political solution is going to be imposed on the people of Bangla Desh or are we planning to be more forceful in their cause?

Indira Gandhi's letter to Chou En-lai may be an important pointer, as its timing and content could be based on a number of calculations. It could be thought of as a move to isolate Pakistan so that India would be relatively less inhibited in giving all-out aid to the Mukti Bahini. Or perhaps, South Block might have in mind the hope that closer relations with China, as well as the West and the Soviet Union (Indira Gandhi's projected flights to Moscow and the capitals of the West may be part of the strategy), could be used to arrange a political solution in Bangla Desh which would stop short of independence, so as to overcome at least some of Pakistan's susceptibilities, but provide enough autonomy and guarantees by the big powers, to satisfy a large number of Awami Leaguers.

The Chinese, it appears from a number of negative signs, might very well be reconsidering their thoughts on Bangla Desh and Pakistan. Radio Peking has not repeated its warnings about likely "Indian aggression" against Pakistan for some months now. Nor has there been any reply to Indira Gandhi's letter, though this might be due to whatever 'mystery' that might be unravelling itself in Peking these days, if Western and Japanese Press speculation is to be believed. The Chinese have also been noticeably quiet about the Indo-Soviet Treaty.

The goings to and fro between Delhi and Moscow may only mean that the Russians are worried about Indian intentions towards Peking. But the recent lack of any choice invective against Chinese policies is a likely indication of a Russian mood of conciliation towards China. *Izvestia* has, of course, again lashed out against Chinese external policies, but the finer print suggests that the Soviet Union is trying to establish some sort of *modus vivendi* with China. The Soviet news media have been repeating that China is weakening the anti-imperialist front and thus playing into the hands of the imperialists, but the implication is clear; the Chinese are still not considered to be quite in the camp of Russia's main adversaries, the (Western) imperialists. It follows that the Russians are probably groping towards an easing of tension on their Asian perimeter—with China and in the Indo-Pak subcontinent. In fact, the Pakistani Foreign Secretary, Sultan Khan, came back from a visit to Moscow brimming with joy which might well turn out to be justified. The Indo-Soviet Treaty does not prevent the Russians from strengthening their ties with Pakistan and trying another Tashkent trick.

On the Pakistani side, the long drawn-out struggle in the East, possible schisms within the ruling military *junta*, and Bhutto's renewed threats about mass direct action against the military regime, might have persuaded Yahya Khan to think again after his uncompromising barrackroom outburst in his interview with *Le Figaro's* correspondent. A calmer assessment of the East Bengal situation, especially when faced with the possibility of the Chinese cooling off towards Pakistan, may be taking place. The appointment of a civilian Governor in the East, figurehead though he is, might also be a sign of rethinking.

With the Americans and the Russians both obviously keen to bring about a political solution in East Bengal within the framework of an undivided Pakistan and the indirect, though significant gestures of India, Pakistan and China, showing that they are not altogether averse to working towards such a solution, a convergence of policies regarding East Bengal seems to be taking place. Gov-

ernments can be enormously flexible when faced with situations which threaten to get out of their control. And all the governments, whether American, Russian, Chinese, Indian or Pakistani, do not want the type of situation where an independent and politically conscious national liberation movement could grow up uncontrolled and, more important, uncontrollable, by them.

Food Surpluses

For Whose Benefit?

ONE more expert committee—appointed by the Planning Commission just over a year ago—has reported on storage requirements. It has estimated a capacity requirement for foodgrains storage of 9.12 million tonnes by 1973-74, implying the need to create 3.08 million tonnes of additional capacity; it has recommended that the central storage committee of the Union Department of Food should collect information on the foodgrains needs of the various districts, regions, and states, with regard to local conditions; and it has advised that the Reserve Bank, the land mortgage banks, and the Agricultural Refinance Corporation be geared to finance building up of storage capacity mainly *via* the co-operatives. While the Committee's recommendations are unexceptionable, they miss the nub of the food surpluses problem, which is that foodgrains surpluses as such are a regional problem confined to 'surplus' states whereas in the national perspective they must appear as problems of regional distribution and of equity. Overall, we have yet to reach the level of adequacy. Though the 'promised' ban on 'concessional' food imports is to be implemented, words have now been redefined: 'concessional' imports under soft loans are to be banned, but foodgrains imports financed out of grants are to be continued. Foodgrains for Bangla Desh refugees have come in under grants, which explains at least partly the Centre's confidence about its capability to meet foodgrains demand of the refugees as well as of the deficit regions.

Solutions to the two problems—of regional surpluses and of regional and class equity in foodgrains consumption—will have to be interlinked. The emphasis on 'fair procurement prices' to surplus farmers and the complaints against the Food Corporation of India at the Food Ministers' Conference last August reflected more the pressures on the Centre than the relative importance of the issues for the country as a whole. It may even be that, as usual, procurement prices will be pitched at levels that suit the margins of the surplus farmers, that the FCI may be expected to procure quantities that support the price, and that the related storage and movement problems approach in a way that meets these particular aims. In the process, however, the basic aims of food policy—to underpin growth with adequate foodgrains supplies, and to make food available to the poorer sections who cannot today express their need through effective monetary demand—may be lost.

While it would suit surplus farmers to have their stocks bought up at high government-fixed prices the procuring agency can, given its finances, procure that much less, the issue prices would be similarly higher, and alternatively the centre might have to make additional finances available to procurement or subsidise issue prices. Foodgrains prices, in fact, have failed to reflect fully the rise in foodgrains production. Progressive dismantling of the distribution network (which has also been under way) might on the other hand help the market oriented farmers to reach deficit areas independently. But it will also cut the ground from under an effort at price stability to sustain growth, not to speak of failing to reach the benefits of the Green Revolution to the poor. This year's floods may not have stalled the progressive rise in overall production to over 107 million tonnes, but even that production is still primarily dependent on the monsoon, failing which estimates are that an approximately nine-million-tonne buffer stock will be required excluding two-three million tonnes for operational stocks.

The point is that while the surpluses of the surplus areas need to be procured they need to be procured, stored, and distributed, not on the terms of the large surplus farmers of these regions but to meet the requirements of economic development. For this, a strong central agency is necessary with a wide and deep procurement and distribution network. This agency could be the FCI which with the help of the co-operatives and its own staff could directly reach even the small farmers in the surplus areas. But FCI's strength has been often sapped by the Centre's stop-and-go policy on distribution and zones, while its effectiveness has been limited by deficit as well as surplus states allowing it entry only when it suited them. Its past operations equip it to be the agency for assessing local needs and availabilities for planning and executing local as well as national storage programmes (on which now, thanks to the panic of affluent farmers, Rs 22 crores are to be annually spent, implying an increase over earlier Plan allocation). But FCI's energies are spent on *ad hoc* solutions to avoidable emergencies in highly surplus regions. Are the arithmetical exercises of the central storage committee of relevance then in the general confounding of policy directions?

ABC

Mum Is the Word

A Correspondent writes:

WHY did the Press not report the proceedings of the Audit Bureau of Circulation's annual general meeting? Whatever happened to those papers that are crying from the house-tops about losing their freedom?

For the second time in the 23-year old history of the Bureau, it almost looked as though the practices of the Bureau would burst out into the open. Fortunately for the ABC and rather unfortunately for the country, the professional peace-makers in the newspaper world were able to quieten the rebels. In effect they were successful in suppressing all dissenting voices.

Even before the Bureau's registered office in Ballard Estate, Bombay, could spew out its circulars announcing the date and venue of the meeting, some persons were busy collecting proxies. The war was certainly not between radicals and conservatives. Nor was it between liberals and rightists. It was being fought for the protection that is virtually gurarenteed if a publication is represented directly or otherwise on the council of management of the ABC.

No wonder then, the chief executives of leading newspapers were fighting it out to find a place in the council. For the four newspaper representatives' seats that were due to be filled by election, there were six contestants. One withdrew on the pretext that he was making room for younger blood in the council. The 'young blood' from Bangalore was in turn pressurised to withdraw in favour of 'new blood' from Calcutta. The pressure applied on the Bangalorean was unnecessary, as this publisher-editor knew quite well that the Calcutta man had all the proxies.

The point at issue is not the election itself. Such infighting is only to be expected in any such organisation. But being a member of the ABC's council of management guarantees tangible benefits. The circulation figures 'certified' by the Bureau are not always above question. The Bureau claims to make 'surprise' checks 'independently'. But those represented in the council know when these raids will be conducted. They can then make appropriate arrangements to welcome the raiders.

What do newspapers and other periodicals gain by inflating their circulation figures? First, the figures are used to sell space to advertisers. More important, they are also used by newspapers and magazines to raise advertising rates. Most important of all, the inflated circulation helps in converting black money into white. As a newspapers claims and gets its newsprint allocation on the basis of its circulation, a higher 'certified' circulation earns the newspaper a larger quota of newsprint. The income from selling surplus newsprint in the 'open' market can then be shown as the legitimate income from the (non-existent) high circulation.

It is about time those who shout the loudest about the freedom of expression acted with some restraint in exercising some of their other more dubious prerogatives.

Foreign Capital

Failing to Calculate?

A Correspondent writes:

WHILE rethinking on foreign investment and collaboration is reportedly going on in different Government departments in New Delhi, the absence of a central policy-making body, to which *all* matters relating to foreign investment and collaboration have to be directed, creates considerable confusion for would-be foreign investors. The Foreign Investment Board (FIB), established in 1968, is modelled on the Foreign Investment Council (FIC) of Japan; but the FIB has borrowed only the form, not the substance, of the FIC. Consequently, major policy decisions on foreign investment and collaboration are taken without reference to the FIB. This is partly because FIB's members (including its chairman) are mostly secretaries of ministries who do not have the necessary political sanctions to decide on major policy issues. Policy statements are issued by the various ministries, and these often reflect poor co-ordination.

The Foreign Trade Ministry, for example, takes policy decisions on Indian joint ventures in foreign countries. Also, it was at its instance that Parliament approved the policy of granting permission to foreign controlled companies and foreign subsidiaries to expand should 60 per cent of the incremental output be exported. But it is for the Ministry of Industry to decide on royalty rates and on the extent of foreign participation for different items of manufacture. Such overlapping of areas of decision-making creates confusion. Unless the present diffusion in policy-making on matters of foreign collaboration and investment is ended, unpleasantness to the intending foreign investors is inevitable.

Judging from the manner in which an Italian firm's proposal for shifting its scooter manufacturing plant to India was handled, Government seems still unclear about its own policy objectives. Lambretta, the world-famous scooter manufacturing firm, wanted to shift its entire plant from Italy to escape the higher labour costs in Italy. It was granted permission to establish its plant in India. Government apparently did not insist on the entire output being exported, but instead insisted on minority equity participation for the foreign firm. Lambretta at first grudgingly agreed to 40 per cent equity participation, leaving 40 per cent of the equity to the Indian Government and the remaining 20 per cent to the Indian public. Now, reports have it that, the firm has opted for Kuala Lumpur, Malaysia, even though Malaysia does not have as much supply of skilled and relatively cheap labour as India might have offered.

The issue involved in this case should not be overlooked. The Italian firm's offer was very attractive since it was willing to undertake export of the entire production from its plant. In the circumstances, was majority foreign participation too heavy a cost? Government's policy to refuse permission for formation of new foreign subsidiaries is based on the rationale that they would offer unequal competition to similar Indian enterprises, would involve higher dividend remittances, and would through their production policies create destabilising conditions in the national market. But if a foreign subsidiary undertakes to export its entire production these unfavourable repercussions are automatically avoided. Since the entire output would be exported, there can be no inequality in competition for Indian enterprises; and the foreign firms' production policies can hold no destabilising potential for the national market. As for dividend remittances, since the firm would earn foreign exchange from its exports, dividend liabilities would only be a portion of its own export earnings.

On the other hand, there are some obvious benefits accruing to the country from such proposals, despite majority foreign participation. There is in the country today abundant supply of skilled labour, either unemployed or not gainfully employed. Steps need to be taken to increase employment opportunities to the growing supply of technical and non-technical personnel. Part of the answer may be to allow access to export-oriented foreign firms. Offers similar to that of the Italian firm have been received from West Germany, Japan, and the United Kingdom, for manufacturing items such as calculating machines, jack and shock absorbers, electrical equipment, shaping machines, and machine-tools. While first reactions have been of suspicion, it is well to judge the motives of these firms only after looking to the growing labour shortage and the increasing labour costs in Europe and Japan that make these labour-intensive industries less profitable in these countries. If, after careful cost-benefit calculation, the units are permitted to operate in India, they could yet start a chain reaction of considerable employment opportunities while at the same time contributing significantly to our foreign exchange earnings.

Indeed, it seems to be increasingly recognised in several developed countries, that Indian labour costs are low and that Indian labour's productivity in relation to these wage costs is many times higher. It is also acknowledged that the present supply of skilled labour is high and that India has the necessary institutional set-up to keep up that supply. If India does not take advantage of these offers the firms will go to other developing countries even though these may not offer them as attractive an environment. Confusion at the policy level will foreclose the issue for this country.

Agricultural Prices Commission

The 'Revolution' in Perspective

A MAJOR contribution of the Agricultural Prices Commission's Report on the price policy for kharif cereals of the 1971-72 season has been to put in proper perspective the 'breakthrough' in foodgrains production and the 'massive problems of plenty' which received such resounding publicity at the recent conference of State Chief Ministers convened by the Union Ministry for Food and Agriculture. The report should help to subdue what, in the Commission's own words, is "an exaggerated impression of the success of the New Strategy" in agriculture.

The report underscores that "it would be helpful to recall that the foodgrains output for each of the years, 1967-68 to 1969-70, has been far below the corresponding values extrapolated for the years, on the basis of the trend line for the preceding period, 1949-50 to 1964-65.... There seems little basis here for the inference that the foodgrains output of the country in recent years has moved away to higher growth path". Even the exceptionally good showing in 1970-71, with its increase of 8 million tonnes over the previous year, is, according to the Commission, largely attributable to the "bounty of nature". The more enduring component of the increase due to developmental programmes suggests no marked departure from the historical growth rate realised earlier. Says the report: "With the exception of wheat and possibly maize, then, it is at best a story of something like the maintenance of historical growth rate". As for 'the exceptions', the Commission questions whether the dynamism that has been achieved in wheat production will itself endure at the pitch of the last few years.

Consequently, the immediate problems in the wake of the bumper harvest of 1970-71 — which had been described as 'massive problems of plenty' at the Union Food and Agriculture Ministry's recent conference — appear not as consequences of organisational bottlenecks arising out of the foodgrains output attaining "embarrassingly high levels", but as indicative of certain imbalances within the foodgrains production plan. Thanks to the sizable increase in wheat output, an additional 2 million tonnes of cereal did flow into the procurement net within a short period, creating problems of purchase operations, movements, and storage.

The Commission, therefore, stresses that the present euphoria in government circles and to some extent also in the Planning Commission should not be allowed to weaken the procurement effort (particularly in rice) or to curtail the public distribution system — though this has in fact been happening. The Commission holds that the likely demand on the public distribution system for rice will increase in the coming year and that, since market prices of foodgrains are again under upward presssure, the public distribution network actually calls for further strengthening.

BUSINESS

Internal Constraints

OF the Rs 117-crore increase in India's exports during 1970-71, the increase in iron ore exports contributed as much as Rs 20 crores. Nearly 21 million tonnes of iron ore were exported in that year, which earned Rs 115 crores in foreign exchange. An export target of 24 million tonnes of iron ore was set for 1971-72, of which 15 million tonnes were to be the responsibility of MMTC, and the remaining 9 million were to be exported by the private sector mainly from Goa. With nearly half of this year over, there are serious doubts about whether the export target of 24 million tonnes can be reached. What is significant is that it is not unfavourable demand conditions in the international market that are hindering exports but rather the supply bottlenecks at the mining and the transport stages. A major part of India's iron ore exports go to Japan, and almost all the exports by MMTC directed to Japan are on the basis of short-term and long-term contracts already agreed upon. Naturally, the MMTC export target of 15 million tonnes for 1971-72 was based on the understanding that it would be able to maintain its delivery schedule.

It is now anticipated that exports might be, in fact, 2 million tonnes short of the target in the current year and as much as 6 million tonnes short in 1973-74 for which year the target had been set at 31 million tonnes. This will mean a foreign exchange loss of over Rs 10 crores in 1971-72 and of Rs 30 crores in 1973-74.

Evidently, it is the growing inadequacy of port facilities at Madras, Vizagapatnam, Paradeep, Haldia and Marmugoa that is contributing to the lower level of performance. The harbour works have fallen behind schedules for several reasons, important among them being the shortage of equipment, steel, and other materials, and the delays in decisions and in clearances of schemes. Moreover, the National Mineral Development Corporation, which is in charge of supplies from Bailadilla, is facing mechanical difficulties and will thus be unable to give MMTC all the supplies it had contracted for. Another difficulty is the non-availabillty of wagons in the Barajamda area of the eastern sector from where ores have to be lifted.

MMTC needs to be fully aware of the implications of its failure to observe supply schedules, especially to Japan. Many of the Japanese steel mills are located along the coast and their spatial capacity to stock iron ore is very limited. The production programmes of these steel mills is therefore closely linked to regular and assured imports of iron ore from various parts of the world. Any discontinuity in the supply schedule by major suppliers, such as India, creates difficulties to these steel mills. It is partly because of India's unfavourable reputation that the Japanese have diversified their supply sources and sought new sources of ore in Latin America. In 1959, Japan's iron ore imports from Brazil, Chile, and Peru, were 0.3 million tonnes; by 1969 they had risen to over 20 million tonnes. In 1959, India's share in the Japanese market for iron ores was 32 per cent; by 1969, it had slumped to 15 per cent. Australia, which started with a minor export of 65,000 tonnes of iron ore in 1964, emerged by 1969 as the most important single source of iron ores for Japan. In 1969-70, Australia's iron-ore export earnings were $ 291 million, and by 1974-75 they will be between $ 600-775 million. World trade in iron ores has expanded rapidly during the past decade, yet despite its rich iron ore reserves India failed to gain fully from it. And unless we keep to the already agreed supply schedules to important and growing markets such as Japan, there is little hope of any sustained growth in this export sector.

Cotton Textiles

To Bolster Co-operatives

A Correspondent writes:

THE cotton textiles industry in Maharashtra is in for a bad time. The state's cotton crop will not be more than 10 lakh bales against the average of slightly over 15 lakh bales. And the state government has meanwhile decided to introduce a procurement scheme, the justification for which is not entirely straightforward. New Delhi initially objected to the move and subsequently relented on condition that it would be consulted before fixing the price to be paid to the farmer.

Under the scheme, the state government is to be responsible for procuring, processing and marketing the entire crop, valued at around Rs 150 crores. The mills in the state will now have to contend with two potent upward pressures on prices. There is, to start with, the shortage of cotton. Secondly, forays into cotton marketing by a state agency will inevitably lead to an artificial scarcity. The first year's experience with the Cotton Corporation of India, in canalising the import of cotton, is indicative. Not even half the promised imports were effected in the 1970-71 season, which contributed to the spiralling price trend.

In the statement of objects and reasons for the Bill, introduced in the Nagpur session of the state legislature, it was pointed out that "there are a large number of intermediaries and also defects as a result of which it is noticed that growers of cotton in the state do not get a fair or reasonable price." Yet those who have closely followed the marketing of cotton, especially in the last year, know that the farmers have made it good, obtaining unprecedented high prices. If there were isolated instances of cultivators getting low prices, they were themselves to blame having over-indulged in the practice of mixing of all shades of cotton to exploit the scarcity conditions.

The fact is that cotton is no longer free of political calculations — if it ever was. The reason for introducing the procurement scheme in the state is the need to revitalise the co-operative movement in the state. But if the co-operative societies in Gujarat, accounting for the bulk of the cotton marketing in the state, can flourish side by side with private cotton traders, why not the co-operatives in Maharashtra? Cotton has had a sellers' market for quite some time now. Then why this state solicitude for the farmer? And when the government agency becomes the only buyer in the market, how can the interests of the farmer be safeguarded?

Thus, while the advantage to the farmer is dubious, the mill industry, the ultimate consumer, will, judging by past experience, be called upon to pay a higher price for whatever cotton the state decides to make available. This apart, the mills will no longer be in a position to pick and choose as freely as they are used to in a free market economy.

The scheme is to be in operation till the end of June 1980. And, there is to be a nine-month interregnum in which private traders can take stock of the situation to decide whether they will stay in business. The Bill further provides that the season will start from July 1 and not September 1 as at present.

Export Promotion Councils

Much of a Muchness

THE committee set up under the chairmanship of Bhagawan Singh to review the working of the Export Promotion Councils (EPCs) has made its recommendations. These are, by and large, concerned with improving the constitutional machinery, the administrative set-up and the financial structure of the Councils. The Committee has suggested, *inter alia*, that the Councils should be freed from having to seek the government's approval for their budgets in respect of non-coded items and should get greater assistance from the Market Development Fund for their activities. It has also suggested concessional membership for small-scale exporters and the setting up of a Heavy Machinery and Transportation Equipment Export Promotion Council. Whether as a result of implementing these recommendations the EPCs will be able to offer better service to exporters is a moot point; more relevant perhaps is the need to define the role of the Councils in the overall institutional structure for export promotion that has developed over the past decade.

The process of establishment of specialised Councils for commodities that make a substantial contribution to foreign exchange earnings started in the mid-fifties with the setting up of the Cotton Textile Export Promotion Council. Since then the number of the Councils has swelled and at present there are some 19 of them. Initially, in the absence of specialised agencies for providing the necessary services to exporters, it was thought that these Councils would act as the collective instrument of manufacturers, exporters and government in promoting Indian goods abroad. Accordingly, their functions covered almost the entire range of export services including guiding new exporters, helping members with problems of export production, procurement and marketing, sponsoring trade teams and delegations, collecting and disseminating market information, programming for export publicity and what have you. The Councils have tried to offer all these services at varying degrees of competence, depending upon the budgetary position and quality of expertise of individual Councils. In the process they have stretched their efforts and resources over a vast area instead of building up specialisation in one or two important areas. Our export effort is hamstrung mainly by the non-availability of export samples, inadequate knowledge about the indigenous talent and material that can be harnessed to exploit overseas markets and lack of an effective forum for concerted export effort. It is to these areas that the EPCs should divert their attention.

EPCs are only one of the links in the broad export promotion set-up that we have. Since the beginning of the sixties, various autonomous specialised agencies have come up with government patronage to cater to the requirements of the exporting community. In addition to the Ministry of Foreign Trade's bewildering empire of territorial, commodity and service divisions, directorates of intelligence and statistics, exhibitions and publicity and the long arm of trade commissioners, we have now commodity boards, councils and panels with their export promotion cells. Then there is the Indian Institute of Foreign Trade, the Indian Council of Trade Fairs and Exhibitions, the Federation of Indian Exporters Organisations, and the services divisions set up in the public sector export corporations and the Directorate of Small-Scale Industries. Lately, the Trade Development Authority has also come into existence with its own package of services to offer.

The proliferation of these export promotion organisations has really brought to the fore the problem of

eliminating the development of parallel functions and duplication of work. It is to this question that we need to pay greater attention, if we are to avoid dissipating our export promotion effort.

Tractors

Lure of Imports

THE Planning Minister has evidently succeeded in committing the Government to a ban on tractor imports after 1972. At the same time, Government has recently controlled the distribution and sale of tractors and increased the deposit from Rs 100 to Rs 500. The control on distribution and sale was recommended by the Estimates Committee to curb blackmarketing in tractors where the premium ranged between Rs 6,000 to Rs 10,000. Blackmarketing flourished especially in Punjab and Haryana where the success of the high-yielding varieties has been the greatest.

The blackmarket in tractors, which has led to official control on distribution and sale of tractors, might lead one to believe that there is an acute shortage of tractors in India and that the ban on imports might therefore aggravate the shortage. In fact, however, the indigenous tractor industry has a sizeable stock with it and in 1970 it had curtailed its production by 25 per cent for want of demand.

Such demand as there has been for tractors has generally got diverted to imported tractors. The availability of imported tractors, the comparatively high price of Indian tractors and the narrow price differential among the various size-ranges, have been responsible for the restricted demand for Indian tractors. The low price differential among various sizes has also queered the pitch for small-sized tractors. For example, against the Rs 17,910 charged by Eicher for their 27 HP tractors, Hindustan market their 50 HP tractors at Rs 22,350 while TAFE charge Rs 21,140 for their 35 HP tractors. Affluent farmers using high priced Indian tractors therefore favour the higher horse-power tractors.

The narrow price differentials of the different capacities may be explained with reference to the highly individual designs of the different tractor makes and the tie-up between the local assemblers/manufacturers and their respective collaborators requiring the indigenous manufacturers to depend on their collaborator for their needs of basic components and parts. Besides, as the Tariff Commission pointed out in its Report in 1967, in a majority of the cases the royalty payable to collaborators increased in proportion to the indigenous content. Of the five existing units, four have entered collaboration agreements which require payment of royalty at 2-3 per cent for all imported components replaced; in one case, royalty is to be paid at the flat rate of 2.5 per cent on the total cost of the tractor irrespective of import content.

In the circumstances, farmers who are just outside the most affluent bracket have preferred to buy the lower capacity (12-14 HP) DBHP tractors imported from East European countries under barter arrangement. If demand for these tractors is depressed now and thousands of them are awaiting disposal with the State Agro-Industrial Corporations it is partly because banks and other institutions have reduced credit to farmers for the purchase of tractors (in 1970, three-fourths of tractor purchases were financed by banks and land mortgage banks). The Indian tractor industry, with its high-priced products is also finding it difficult to get customers.

A more long-term reason for the tractor surplus is the overestimation of tractor demand which led the Government to permit liberal tractor imports. In 1970-71 alone 35,000 tractors were imported. The Government also launched several measures to increase domestic production. The tractor industry was delicensed in the beginning of 1968 so that, technically, Government clearances are no longer necessary either for setting up new capacity or for expansion and diversification of installed capacity. However, all expansion programmes or new projects involving foreign collaboration or foreign currency have to obtain prior sanction of the Government, Licences to about 15 manufacturers and nearly 25 letters of intent were issued.

The annual offtake of tractors between the Second and Third Plans was expected to increase twofold from an annual average of 5,000 to an annual average of 10,000 tractors. Between the Third Plan and the initial Fourth Plan period demand was projected to increase threefold to 30,000. And by 1973-74 demand is expected to be around 68,000. Indeed, more recently the Planning Commission has put the requirement of tractors between 20 HP and 50 HP at 90,000 in the last year of the Fourth Plan. The special Committee set up by the Development Council for the automobile industry, on the other hand, placed demand at plan-end at 50,000 to 60,000.

The NCAER which has been asked to submit a fresh estimate of demand may make available yet another figure! While these exercises may not help the Indian farmers to obtain their tractors cheaply from domestic sources, they will have a longer-term impact *via* the import and licensing policies. But immediately, with the price of domestically produced tractors remaining beyond the reach of many of even the well-to-do farmers, imported tractors will continue to be demanded and the ban on imports while affording protection to the domestic industry will at the same time give a boost to the blackmarketing in imported tractors.

IFC

Slow Trot

THE annual report of the International Finance Corporation for the year ended June 30, 1971, shows that the institution has still to find its role in a world where it is semi-unwelcome. Initially, when IFC was started—this year's report, incidentally, contains an overall review of 15 years of IFC's operations — it was expected that IFC would operate as the private-enterprise, commercial financing part of the World Bank group, with IDA providing soft loans and the World Bank providing market loans for infrastructure.

Evidently, the world is not fitting into this neat picture drawn by bankers. The role of the private sector in underdeveloped countries — barring inconsequential exceptions like Taiwan, South Korea and Thailand — is actually declining with most African and Latin American countries opting for a strong government presence in industrial enterprises, in the absence of a local entrepreneurial class. Distrust of foreign capital is even greater than that of local private enterprise. Countries which encourage private capital are not eager to pay a high price for foreign capital, even if it be risk capital. The World Bank itself is gradually moving towards acceptance, and financing, of public sector industrial enterprises in developing countries.

It is not surprising, therefore, that IFC's operations showed little progress last year. Total sanctions amounted to $ 101.4 million, of which $ 88 million were for industrial projects. The sanctions covered 18 manufacturing enterprises in 11 countries — showing the limited regional and industrial coverage of IFC's operations. The largest sanction was for $ 13.1 million and the smallest for $ 49,467, the average being $ 4.2 million. The projects were mostly in the artificial fibre, cement and paper industries.

Clearly, IFC's role in international financing is marginal. It takes positions in a few high-profit operations and its major role is to support (and thereby reduce the stakes of) foreign companies which take up operations in developing countries.

Shipping

gh Cost of Collaboration

E excellent results reported by ith India Shipping for 1970 are in with the expectations of the shareders and should compensate for the ely disappointment at the failure hich appears inevitable) of the company's effort to acquire a controlling erest in Jayanti Shipping. What is nost as noteworthy as the performce of the company is the quality of e directors' report published with the counts for 1970. The report is rearkable for its comprehensive and pert analysis of the present trading nditions in shipping, particularly of e forces operating in the freight mart. The report could be emulated by her companies who use their directors' ports mostly to plead for more conssions from government.

South India Shipping's performance in ie seven years of its existence brings ut a few things very distinctly. The ompany started on a relatively small apital base and in consequence had a ery adverse equity-debt ratio of round 1:20. By now, however, it has een able to bring the ratio down to within the permissible limit of 1:6. This does suggest that there may be a ase for a flexible approach to such ssues as the capital base of a company, especially in an industry like shipping. Of course, South India Shipping has been able to improve its equity-debt position through the liberal tax concessions available to shipping as well as through the rather favourable market conditions. But this does not detract from the expect handling of the company's affairs by its management. Incidentally, the company can claim to be one of the few managed almost entirely by professional managers. The negotiation and fixing of successful contracts on the Rumanian trade by the Company in 1970 are an example of the sound judgment of its management since at the time these contracts were negotiated they did not look anywhere near as attractive as they do today.

The sale of South India Shipping's shares by its foreign collaborator, the P & O, had attracted much attention last year. At the time of floating the company it was thought that the collaboration with the P & O group would enable the company to obtain more remunerative fixtures and also better service facilities at various places on account of the collaborator's worldwide contacts. Similarly it must have appeared that the collaboration would contribute to operational and management efficiency. In retrospect one wonders how much the company has actually benefited in these respects from its collaborators. The major visible gain from the collaboration appears to have been the large amount of credit that the company was able to obtain from foreign banks. On the other hand, the gains to the collaborators have been the over threefold appreciation (net of taxes) of their initial investment in less than seven years. If it is in fact true that the major gain from the collaboration to the Indian company has been to make available foreign currency loans, then the price paid appears to have been rather high. Liberalising the terms on which Indian shipping companies are allowed to take foreign loans —such as permitting tax exempt interest rates of, say, upto 10 per cent, pledging of rupee deposits as security for such loans, etc — could be a cheaper way of arranging for the foreign credits necessary for the rapid development of the shipping industry than allowing collaborations.

Sugar

Volte Face

SUGAR was decontrolled on May 25 with Government maintaining that the sugar supply was so good that controls were not necessary. It expected prices after decontrol to stabilise around Rs 185 per bag. The industry responded by complaining that it was not being allowed its legitimate return. Sugar prices after decontrol did, in fact, fall from Rs 206, just prior to decontrol, to Rs 182 by June-end — in a month's time.

Meanwhile, monthly releases had been varied also to take care of prices. In April, releases were stepped up to 425,000 tonnes, then to 450,000 tonnes each in May and June which are the months of higher demand. The industry was vociferous in blaming Government for its liberal release policy. In July, the monthly release was reduced by 50,000 to 400,000 tonnes. And industry took full advantage of the cut to push up prices to Rs 189 per bag by July-end. The price push then continued in August and on August 19 prices touched Rs 205. Then, responding to the protests in Parliament, press and public, the usual monthy quota released on August 20 was raised by 25,000 tonnes to 425,000 tonnes. Paradoxically, after the release was announced, prices increased further to touch the season's high of Rs 209 on August 28. Government reduced the despatch validity period from 45 to 35 days. Banks were instructed to raise their margin on lapsed quota from 20 to 30 per cent. And factories were ordered that they may not sell more than 500 bags per day to the same recognised dealer. Further, on August 28, restrictions were put on stocks held by recognised dealers. The orders were modified on September 3 and the factory was permitted to sell 550 bags; further amendments followed on September 16. Mills were permitted to sell 2,250 bags per week. Calcutta dealers, importing sugar from outside of West Bengal, were allowed to stock 5,000 bags. Other dealers were allowed to stock 1,000 bags instead of 500 bags. The fall in prices to Rs 191 per bag has no doubt resulted from these measures.

Meanwhile, industry seems to have changed its tactics. At the beginning of the season, it was ostensibly sinking under the burden of stocks; now it is warning of an impending sugar famine. It is true that area under sugarcane has declined by 10 to 15 per cent; also, prices of gur, which competes with sugar, are ruling high at a record level. Recent floods in UP and Bihar will also delay crushing. Indeed, estimates of sugar production have been steadily falling, from 3.6 million to 3.0 million tonnes, within the space of 8 to 10 weeks. Yet the final figures of the area under cane for the 1970-71 season and the estimates of cane production are not published, though the 1971-72 season starts on October 1. But the industry has not been idling. Its lobby in Parliament and the Sugar Industry Development Council which is a tool in the industry's hands, have been active. The latter has already recommended that minimum cane price should be raised to Rs 10 per quintal. And the President of the Indian Sugar Mills Association has stressed the need for Government to announce its sugar policy for the new

season with a view to maximising sugar production; both the central and state governments should, moreover, give rebates in excise duty and cane cess on purchase tax to induce factories to start crushing early; and bank finance should be made available at far lower margins than at present.

Yet are such concessions and such pessimism called for? In 1969-70, Government had released 4.3 million tonnes. Total offtake, inclusive of exports, was less than 3.5 million tonnes. Stocks had thus increased by 800,000 tonnes to 2½ million tonnes. In the 1970-71 season, total production upto August 22 was 3.75 million tonnes. Total production for the season would, therefore, be about 3.8 million tonnes. Consequently, total availability would be of 5.9 million tonnes. Government has released 4.8 million tonnes for the season, but the offtake is unlikely to be much above 4 million tonnes. The next season will probably begin with a carry-over of about 1.9 million tonnes. So why all the talk about the impending sugar famine? If Government has learnt anything from its past experience, it should be that it is best to leave the industry totally 'free' now. In view of the record level of ruling prices of gur and khandsari, there is no reason for fixing a minimum price for sugarcane and then trying to regulate the price of sugar by so-called 'judicious' releases.

LETTERS TO EDITOR

Sleight of Accounting

YOU have done a national service by pointing out some of the rather curious motivations that presently rule the ritual of preparation and presentation of the Annual Report of the Bureau of Public Enterprises on the performance of Central Government Undertakings ("Sleight of Accounting", July 3). I have always believed that this ritual could have been avoided with a corresponding saving of cost of different kinds, particularly that of misleading, "blatant misuse of accounting terminology" (your words) and even lying. This Report comes in addition to the annual reports of the companies and corporations which are also placed on the table of Parliament. Then, there is the Audit Report (Commercial) of the CAG on which a good deal of discussion takes place in and out of Parliament and which provides a good deal of material to the CPU. The sum total of all this is the duplication or triplication of effort and the additional glare of publicity to which the undertakings are subject, jointly and severally. A large part of this could be avoided to provide the kind of atmosphere in which creative effort in the undertakings could flourish.

The Central Government has shown motives no different from those that one sees in the private sector. First of all, the craze for control by the Government has invariably underplayed sound and rational management policies and practices. Multiplication of control agencies and piling up of mountains of so-called management information have played fun with the entire paraphernalia in conditions in which almost no use can be made of such details. Secondly, almost all the government companies under the control of the central government are private limited companies with the word "private" dropped, perhaps in pursuance of the recommendations of the Krishna Menon Committee, but without transforming them into public limited companies as recommended by the Committee. The purpose behind keeping the HSL a private limited company may not be easily understood by many. Thirdly, shifting of objectives from partly social to fully commercial has not done justice to the undertakings which are criticised if they earned a profit and also if they incur a loss. It is natural for managements to feel desperate in the situation. The childish explanations that are given in support of either profit or loss only add insult to injury for these undertakings, which indeed have some of the most capable managers that the country has but who always suffer from being put into strait-jackets! Fourthly, some of the companies that now show profit should never have been companies at all. Take the example of the ITI. It sells almost its entire production to only one customer, the P and T Department of the Government. The profit of the ITI only adds to the cost of the Government. No attention has been given to this issue so far. Lastly, the BPE has hardly justified its existence. In terms of expertise, it is yet to show any distinction. In fact, I think the CAG could perhaps do the entire exercise much better, in the form of a comprehensive audit report and accounts of all the units now covered by the BPE. Even the journal of the BPE is fast becoming a conduit of prophetic gas.

However, the distinction between "shareholders" and "the Government" indicated by you is not one of "fine semantics" only. There are several undertakings included in the BPE report which are not hundred-per-cent Government owned. Control over these undertakings may have been with the Government by virtue of fiftyone per cent holding. Your criticism is thus relevant only to those undertakings in which all the shares are owned by the Government, though these are the majority.

PARESHNATH CHATTERJEE

Calcutta

Structure of Private Companies

THERE are two points I would like to make regarding the classification in V D Lall's study on the Structure of Private Limited Companies in Maharashtra (July 3, 10 and 17, 1971). Lall's first article includes a table (Appendix Table 2, p 1353) showing Asset Composition and Industrial Classification. It identifies service companies by their low proportion of plant and machinery and inventories of raw materials, but relatively large inventories of finished goods. The group 'Garage/Workshops' has large inventories and insignificant amounts of plant and machinery. It should accordingly belong to the 'service' group and should not be classified as 'others'. 'Navigation' has a very high proportion of net fixed assets and according to the basis of classification, it should not be included in the service section as shown.

Secondly, Table 2 (p 1445) shows the number of companies in each industry. The total number of companies in the service group adds up to 1,462. I have collected data for service companies for the same year (1963-64) and find that there are nearly 2,000 service companies. This discrepancy is probably due to the inclusion by Lall of many largely or purely trading companies in 'manufacturing' groups such as pharmaceuticals and textiles. If such is the case, Lall's group of trading companies, though large, is not comprehensive.

INDU KALE

Bombay

The Moscow Meeting

Romesh Thapar

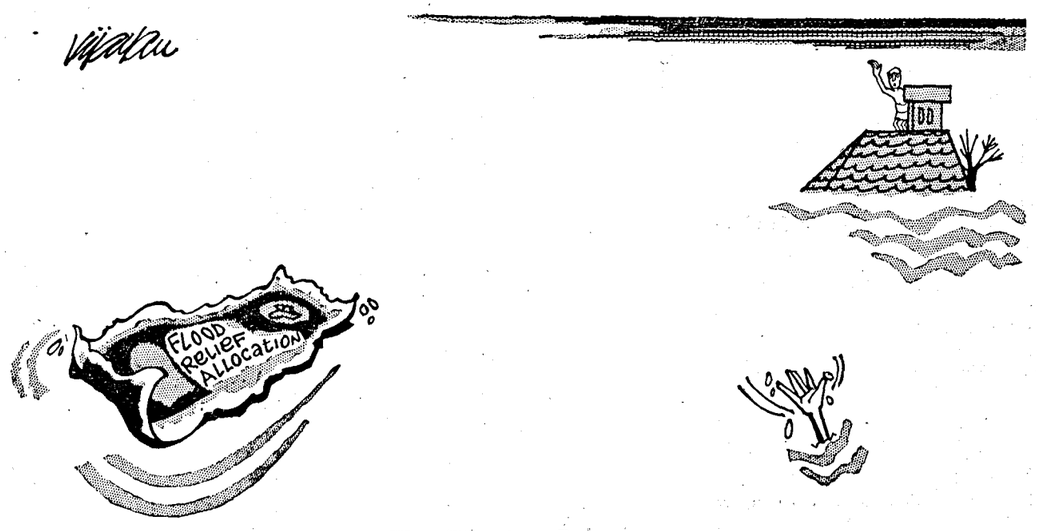
WANT to draw "the masses"? Well, it's becoming increasingly difficult, but three elements have magnetic power. Indira Gandhi as *mataji*, "fillum estars", male and female, in all their artificiality. And test cricketers, men who actually beat the British. These are the current goddesses and gods. Some kind of massive consensus exists about them across this varied subcontinent. As for the rest, they are busy tearing one another apart.

This thought is sparked by the dreary story of the International Conference on Bangla Desh. Originally mooted by Jaya Prakash Narayan to mobilise independent, non-official, world opinion behind the moves to establish an independent, sovereign Bangla *Desh—and warmly supported by official* India—the conference was inaugurated in an atmosphere of suspicion, innuendo, and political smear. Some 50 foreign delegates found themselves in a typically messy Indian situation.

Stories were current that, the late lamented "Grand Alliance" was staging a comeback (*sic*!), that the enemies of *Indira Gandhi were planning to embar*rass her from the platform of the conference, that the whole idea of such a conference was naive. It could be argued that, in the absence of a coherent Indian policy *vis-a-vis* Bangla Desh, there was little point in organising a conference; but the attempt to deflate it, once it was under way, was a disservice to the cause of Bangla Desh.

Who was behind this deflation operation? Why and how was the GOI made to withdraw its active sympathy? Are we being manipulated by forces which we do not understand and over which we have no control? The national press is so servile that it makes no effort to probe. As for the rest, they do not have the resources to operate. But the truth must somehow be uncovered. It is bound to throw a flood of light on our current contacts with the leaders of Bangla Desh and our thinking on the future.

Meanwhile it does not take much probing to discover that the Bangla Desh situation is to figure prominently in the three-day talks Indira Gandhi will have in Moscow with the Soviet leaders. This first meeting following the signing of the Indo-Soviet Treaty, is likely to set the style in our new relationship.



However, the ever-talkative and publicity-conscious D P Dhar needs curbing. His casual, but tell-tale, statements at airports and refugee camps convey the impression that he is the master of the show. Of course, those who know Madame Prime Minister are not impressed. But must we forever be at the mercy of garrulous ministers and officials? They need puncturing—and soon.

Let us hope that the Moscow meeting will go beyond the tidy frameworks provided by the bureaucrats and advisers. If the natural friendship between India and the Soviet Union is to be reinforced and not damaged by the new compact, we should stress the following aspects of friendship and co-operation:

1 Hardware supplies to our armed forces not only have to be smoothened and speeded, but an effective system for the improvement, modernisation and adaptation of the equipment has to be evolved. There is a dragging of feet on this vital aspect.

2 All Indo-Soviet projects must be put under fresh scrutiny to cut waste, to increase indigenous content, and to speed implementation, including expansion. This is particularly relevant in the case of Bokaro Steel and Heavy Engineering which, if allowed to continue unscrutinised by experts, might spell an economic disaster.

3 In the context of the treaty, we must make clear that certain crucial inputs are required in the Indian economy to balance its industrial base. Unless this base is balanced there can be no sizeable economic advance on this subcontinent. We need to study the Chinese experience.

The Floating Rupee

4 And we must constantly make clear that interference in Indian policy-making and implementation will be publicly denounced whenever it shows itself. This may sound naive, but it is the only way to neutralise the dangers of treaties and pacts between natural friends. We should know from our limited experience as 'big brother' in South-East Asia and in the Himalayan kingdoms that 'friendship' and 'co-operation' need their own special 'defence system'.

Much of the trouble we are facing these days, whether on the question of Bangla Desh or our relations with other powers, is rooted in our inability to build any credibility internationally. The Indian is emerging as some kind of specimen, individually talented and sensitive, collectively inane and impossible, but certainly not functioning on any known wavelength. The fact that we refuse to see this is a major part of the problem.

May be, now that we are beginning willy nilly to get involved internationally in the game of power, some of the confusion about us will dissolve. But let us help the process. Let us be down-to-earth, hard-headed, precise, and practical.

The Moscow meeting we shall watch with interest—if only to see whether the style is changing.

September 20

COMPANIES

Amalgamating Strength

Hansavivek

INDIAN CABLE is going ahead with a scheme of amalgamation with itself of Western Insulated Cables (formerly known as Henley Cables India), by allotting 5,72,427 equity shares of Rs 10 each fully paid up to members of the latter company as at the end of October next in the proportion of 16 shares for every 3 fully paid equity shares of Rs 100 each in WIC. The ratio of exchange of shares was agreed upon by the boards of both companies as a result of a joint valuation by two firms of chartered accountants. The equity shares to be issued will rank for dividend from November 1 next. WIC, incorporated as Henley Cables India in 1959, has its works at Hadapsar Industrial Estate, Poona. It has a modern plant that makes products complementary to those of Indian Cable. The unit resulting from the amalgamation can be geared to a higher turnover and gain the benefits of economies of scale being regionally diversified between Jamshedpur and Poona, and will thus be commercially more viable.

Meanwhile, with the finalisation of the Fourth Plan, Indian Cable witnessed an impressive increase in demand for cables and wires during its 52nd year ended March last. Also, better supply and availability of raw materials and practically no disruption of production contributed to the good results. There was serious shortage, however, of certain materials such as plasticisers, aluminium, steel wire, etc, and the supply situation was aggravated by the dock strike in July 1970. Prices of major raw materials continued to show an upward trend and further large increases resulted from customs duties on copper and lead in the recent budget. Issue of *ad hoc* import licences by DGTD during the latter part of the last year facilitated importation of required raw materials. D Fordwood, chairman, points out that rising prices of raw materials can seriously affect exports. Part of the increase in raw material prices is attributable to the prices charged by MMTC and STC and application of Sales Tax on all transactions with them.

SESHASAYEE PAPER has submitted an application for an industrial licence to increase its daily capacity from 105 tonnes to 150 tonnes (including duplex boards upto 10,000 tonnes per annum). With the accrual of full benefits from the earlier expansion and diversification, the company's production during 1970-71 reached 32,649 tonnes against 28,453 tonnes in the previous year. Production might have been higher, but for a 10-day strike in October-November 1970. The strike was withdrawn by workmen after an agreement in which the question of bonus amount was referred to the Industrial Tribunal, and pending adjudication the company agreed to advance 15 per cent of the annual earnings which would be adjusted against bonus as determined by the Tribunal. The company's agreement with the Tamil Nadu government for supply of bamboo from the government reserve forests expired on April 9, 1968, but the company was allowed to draw its requirements, pending decision on the terms for renewal of agreement. The state government has permitted the company to pay the same seigniorage till March 31, 1970. The terms governing renewal of agreement from April 1970 onwards are pending approval with the state government. Last year, the company obtained 57,019 tonnes of bamboo from government sources and 14,571 tonnes from private sources. Besides, 13,946 tonnes of pulpable wood were also procured. Efforts are being continued for use of more mixed hard woods to conserve bamboo. The company produced good results during 1970-71, despite increase in cost of production.

BHARAT STEEL TUBES is taking steps to implement a Rs 16.5-crore project for manufacture of hot rolled steel strips and skelp for which the Haryana government is to acquire about 60 acres of land. An application for import of capital goods is under process by the Central government, and an application for loans of Rs 10.5 crores is under consideration of IFCI, ICICI, IDBI, LIC, UTI, and other financial institutions. After clearance of the capital goods application and sanction, in principle, of loans by the financial institutions, the company will finalise the share issue proposals. It has set up a pipework engineering division to undertake complete designing, supply, fabrication, and erection of pipework required for power plants, fertiliser plants, refineries, petrochemical industries, chemical industries, and other industries where pipework is required. BST claims to be capable of handling the most complicated pipework job of any magnitude at home and abroad. The company earned Rs 108 lakhs in foreign exchange by exporting steel tubes and pipes last year, even though export efforts were inhibited by steel shortage. It has again been awarded a certificate of export recognition, by the Engineering Export Promotion Council, for "outstanding export performance" for 1969-70. The directors are of the view that, if requirements of steel can be met by government, there is much scope for improving export performance. The object clause of Memorandum of Association of the company is being amended to include manufacture of diverse products, such as automobile gears, scooters, motor-cycles, chemicals and fertilisers, and nylon and synthetics, and even for

carrying on of businesses of hotels and deep-sea fishing.

BINANI METAL's factory resumed work gradually after the 9-month strike of the preceding year was called off. Sales during the year to March last, therefore, amounted to Rs 4.50 crores, against Rs 1.16 crores in 1969-70; and the company was able to wipe off the entire loss incurred in the previous year. The results achieved so far in the current year have been encouraging, and the directors hope that if the pace of progress is accelerated the plant will again achieve the pre-strike position in the not-too-distant future. Approval of shareholders is being sought to pay to directors a commission of one per cent of net profits from January 1 last to March 31, 1975.

PREMIER TYRES' results for the 11th year ended March last, turned out to be the best in its career in terms of production and sales. This was brought about by the favourable conditions in the tyre market and the harmonious relations between labour and management. For the first time, there was one majority union of the workers and consequent absence of many of the problems that are generally created by inter-union rivalry. Given these favourable conditions, the company can be expected to produce still better results in the future. Premier has obtained a second sub-loan of about Rs 18 lakhs out of the AID loan from IFCI to meet cost of imported equipment required for implementation of licence for 60,000 automobile tyres and tubes, each, per annum. It has taken steps to expand capacity of automobile tyres and tubes to 6 lakhs numbers, each per annum, for which it has a 'letter of intent'. Also the industrial licence for manufacture of 20 lakh bicycle tyres and tubes, each per annum, is being implemented. ICICI has sanctioned a loan of Rs 49 lakhs for this project. The company's application for import of machinery for bicycle tyres and tubes is pending clearance. Meanwhile, production of scooter tyres and tubes is proceeding satisfactorily. Commenting on the last budget proposals, Chandrakant S Desai, chairman, observes that withdrawal of development rebate for new enterprises and expansion of existing units after May 1974 will retard progress of the industrial sector in the country.

BHARAT LINE, which is already repaying Rs 5 per share of Rs 10 each to shareholders, proposes to pay back another Rs 4 per share in two equal instalments, to reduce the paid-up capital to Rs 10 lakhs. Refund of capital has become possible following sale of m v "Bharatkumar" for $1,212,500 (equivalent to about Rs 91 lakhs) on deferred-payment terms. The company has also disposed of the s s "Bharatdeepak" for Rs 13 lakhs for break-up purposes and now owns only one vessel, "Bharatjal", of 4,993 GRT and 8,890 DWT. During the 25th year ended December last, Bharat Line's total income increased from Rs 66 lakhs to Rs 82 lakhs and the outcome was a surplus of Rs 3 lakhs — against a deficit of Rs 17 lakhs previously. The surplus was utilised to reduce the accumulated deficit to Rs 31 lakhs. No dividend is recommended.

Planning a mini steel plant?

HEC

CAN GIVE YOU MAXIMUM HELP BY MANUFACTURING

CONTINUOUS CASTING MACHINES

FOR THE FIRST TIME IN INDIA

HEC has the expertise not only to design and manufacture vertical/radial/curvilinear continuous casting machines geared to your production needs, but can also set up and commission plants to the exact technical requirements of blooms/billets/rounds you plan to make.

And to give you absolutely the latest know-how on continuous casting machines HEC has entered into a collaboration agreement with LICENSINTORG of USSR.

HEC can manufacture continuous casting machines for blooms/slabs in larger steel plants as well. These include low alloy constructional steels and high alloy steel products.

So why not reduce the acute billet shortage in the country by going in for continuous casting machines from HEC?

NEW DELHI

Fumbling with the Economy

IT was revealing of the approach and mode of functioning of the government that the disturbing trends in the economy were brought up for review in the Political Affairs Committee of the Cabinet just a day before the Finance Minister was to leave for the Commonwealth Finance Ministers' Conference and the annual meetings of the World Bank and IMF. The review is reported to have covered a wide ground, though no decisions could be arrived at. The failure to reach any decisions is the result of the need to delicately balance economic and political considerations, with the latter still exercising overwhelming influence on decision-making in the government.

The only positive outcome of the high-level review of the state of the economy is a little better awareness that the economic situation is becoming really difficult. It is now beginning to be realised that while election slogans have their place, difficult decisions, some of which may not be exactly popular, have got to be taken. But that is about all. When it comes to actually taking decisions, there is hesitation over political implications. The election to the state legislatures early next year is absorbing all the attention of the political leadership and everything else gets subordinated to electoral considerations. Hence the curious spectacle of different things being said at different places. The stark reality of rising prices, growing budgetary deficit and stagnation in development activity all round, particularly in industrial production, is plain enough, but it is not being squarely faced.

Budgetary Deficit

Take the question of deficit financing which has a vital bearing on price stability as well as on the financing of plan programmes in the public sector. If additional resources are not raised, the mounting budgetary deficit cannot be contained. But this simple issue is either evaded or side-tracked. All kinds of excuses are put forward. A marginal improvement in budgetary receipts during the current year found prominent mention in the discussion at the Political Affairs Committee meeting. The implied suggestion was that the budgetary deficit may not after all prove so large as is now feared. It is also suggested that economies in government expenditure, together with mobilisation of larger voluntary savings through public sector financial institutions, could contain overall deficit financing. In fact, neither of these devices can yield anything more than marginal results. There is almost a fear of proposing any measure to raise additional tax resources on the ground that this will evoke the hostility of vocal and influential sections. It was suggested at the Political Affairs Committee meeting that deficit financing may not after all turn out to be more than Rs 450 crores. Even if it is ignored that this order of deficit financing is large enough to cause distortions in the economy, the figure of Rs 450 crores does not represent the overall deficit but only the deficit of the Union Government. There are, in addition, the deficits of the state governments. Then there is the issue of expansion of bank credit to the private sector. It is taken for granted that further credit expansion will be necessary in the coming busy season to sustain even the present low level of industrial activity.

From the Government's pathetic inability to come to grips with the problem of resources flow Yojana Bhavan's fruitless exercises on the Plan and planning. Unlike the state governments of Maharashtra and Bihar, which have honestly come to the conclusion that there is no escape from cutting down plan outlays in their states, the Union government is reluctant to admit that the same fate is in the offing for this year's Central plan. There have been a number of statements by both the Planning Minister and the Finance Minister that there will be no cut in the Plan outlay. As matters stand, there may be no formal cut, but there will be the usual shortfalls in implementation, both in expenditure and, because of price escalation, in the physical content of programmes. In fact, in the Finance Ministry's calculations about the fiscal outlook and the budgetary deficit, substantial shortfalls in Plan outlay during the year figure fairly prominently. But this is not admitted in public — at least not yet.

In this context, the talk of a wages and incomes policy loses all point. When one specific aspect of this problem did come up in the Cabinet Committee discussion last week, it created a minor flutter. The Union Labour Minister, R K Khadilkar, has got himself into an awkward position. He has held out assurances to trade union leaders that the minimum statutory bonus will be doubled to 8 per cent of wages. This proposal came in for adverse comment in the Cabinet Committee discussions because, first, it was feared that it would be inflationary in its effect and, second, it was felt that it would hit the public sector enterprises the most since almost all of them have been paying the bare minimum of 4 per cent to their labour. The additional burden proposed by the Labour Ministry would thus add to their losses. As it is, the surpluses expected from public sector enterprises are not likely to materialise; present calculations show that there will be a shortfall of Rs 200 to 250 crores in the resources from these enterprises taken credit for in the Fourth Plan.

Sharp Dip

The most disconcerting part of the present economic situation which has given a jolt to the government is the sharp dip in the rate of growth of industrial production. The slack trend in industrial growth had begun in 1969-70, even before the much-talked-of recovery from the earlier recession had really got anywhere. Last year saw a definite decline in the rate of growth of industrial production; in the first six months of the current year the rate has further gone down to as low as 1.5 per cent. The consequences of this in terms of shortages of vital supplies and rise in prices can be hardly underestimated.

The explanations offered by the Industrial Development Ministry may be very sophisticated, but are hardly satisfactory. They did not impress even the Political Affairs Committee which is normally very prone to accept facile explanations. It was suggested that if the fall in production of some major items such as steel and textiles was ignored, the production index would not be found to be so depressed. Also, the argument was repeated that the index of industrial production did not properly reflect the level of industrial activity since it did not give adequate weightage to new lines of production and to small-scale industries. These arguments are not new and cannot obscure the very

GUJARAT

Socialist Forum Cut to Size

FACTION fighting in the state Congress continues unabated, despite the Prime Minister's renewed intervention. By rushing to the all-powerful matriarch in Delhi to voice their grievances, all the three faction leaders — Ratubhai Adani, Chimanbhai Patel and Himmatsinh of the Socialist Forum — have undermined their positions. Of the three, Himmatsinh, the socialist prince of Mansa, appears to have suffered the most. To begin with, he had backed the Adani-Ghia group against Chimanbhai Patel. Eventually Adani was installed as the GPCC chief by the PM. As part of the bargain, Himmatsinh and his Forum tried to foist men of their choice as office-bearers in the newly-formed district Congress committees which would wield much influence at the time of selection of party candidates for the coming Assembly elections. But when Adani refused to comply, Himmatsinh forged an alliance with Chimanbhai Patel whom he had earlier dubbed as a reactionary opportunist.

Himmatsinh was the first to rush to the High Command with a long list of complaints against Adani, specifically in respect of the formation of the district Congress committees in Rajkot and Jamnagar. General allegations about Adani's lack of commitment to the PM's socialist programme were also thrown in for good measure. But this attempt to make the Forum appear as the loyal watch-dog of the PM's interests to the GPCC did not pay off. On the contrary, Himmatsinh appears to have lowered himself in the esteem of the high command by seeking the support of Chimanbhai Patel. He was not even called to Delhi to plead his case. The backing of Chandrajit Yadav, the General Secretary of the party, did not help much either. The PM did not this time assign any important role to Yadav in sorting out the GPCC tangle.

Naive Slogans

For the time being, therefore, the Forum has no alternative but to lie low and withdraw from the power struggle. It is trying to revive its image as an ideologically-oriented body not interested in faction fighting or in taking over the GPCC. Towards this end a number of young Turks, including Chandrajit Yadav, Chandrasekhar and Shashi Bhushan have been persuaded to visit Gujarat recently. However, in the meantime, the Forum is itself disintegrating. Reports that in exchange for his support Himmatsinh had negotiated with Chimanbhai Patel for 50 tickets for Forum-sponsored candidates has damaged Himmatsinh's prestige. Such a bargain would have worked to Chimanbhai's advantage while the Forum, not having that many candidates to sponsor, would have been blamed for having helped "reactionary and opportunist" elements to capture the GPCC. Himmatsinh has now directed his ire against Jaswant Mehta, Finance Minister in the Hitendra Ministry. His complaint is that Jaswant Mehta, a former PSP-man, has been giving anti-socialist speeches. This has not endeared Himmatsinh or the Forum to former PSP-men like Chandrasekhar.

As part of the campaign to prove the Forum's ideological *bona fides*, and to divert attention from his failure to secure Indira Gandhi's support, Himmatsinh has raised the issue of nationalisation and has advocated takeover of the textile industry, the Gujarat Fertiliser Corporation and the foreign-owned oil refineries. However, the net result has been to convince even its supporters that the Forum cannot be taken seriously — for, who can hope to win elections in Gujarat by demanding nationalisation of the textile industry? Himmatsinh has no background whatever of political work in Gujarat and, after the recent setback, it will not be surprising if he soon disappears from the Gujarat political scene. The rise and fall of the Forum in the state Congress reveals that the basic power-struggle continues to be beween the two original contenders: the Adani group led by old loyalists and the Patel group led by new entrants into the party.

Ratubhai Adani has also suffered for having asked for the High Command's intervention in order to contain the growing opposition to his leadership. He tried to purge the party organisation at different levels of pro-Chimanbhai elements far too swiftly and crudely and thus played into the hands of the Forum. Adani's failure to exercise skilfully the powers entrusted to him seems to have displeased Indira Gandhi. But as was to be expected, in view of the approaching assembly elections and some consolidation of Congress(O) forces in the state, Indira Gandhi did not go to the extent of permitting GPCC a change of leaders in midstream. This does not mean, however, that Adani is to continue having a free hand to structure the party organisation as he likes. The High Command has checked Adani's authority by directing him to conform to 'democratic procedures' in the formation of executive committees in the districts where such committees have not been formed yet, particularly in Jamnagar and Rajkot. To tie Adani's hands still further, the High Command has sent Jaisukhlal Hathi as its representative to resolve the dispute between the pro-Adani and pro-Patel groups over the formation of DCCs in these two districts.

Complicated Intrigues

All these events have compelled Adani to negotiate at least a truce, though not a settlement, with the Patel group. These two factions are fighting not so much for offices in the DCCs as over the distribution of tickets for their men in the coming election and, ultimately, over the Chief Ministership after the election. Therefore the quarrel between them cannot be easily resolved. Hathi so far failed to bring them together. With the improvement in Chimanbhai's bargaining position, Manubhai Shah has also partly regained his importance in Gujarat politics. The Patel group is insisting that, as in the case of the DCCs, the question of party leadership, particularly after the elections, should be decided by majority opinion in the state party and not by the high command. The Adani group understandably wants the high command to choose the leader. The Forum faces a dilemma, for while it stands for the PM choosing the leader it does not want Adani as leader.

The intrigues are getting more complicated and there is bound to be another crisis in the GPCC at the time of selection of party candidates for the Assembly elections. Present indications are that the GPCC will continue to be dependent upon Indira Gandhi and, if the party wins the elections, she will look for a Barkatullah Khan. All attention is therefore focused on her short visit to Ahmedabad for the GPCC political session on October 13.

WEST BENGAL

A Pre-Puja Rite...

THE establishment press in Calcutta has gone into ecstasies over Governor A L Dias's offensive against the CPI(M) leaders of the state government employees. But it is hard to believe that members of so knowledgeable a tribe as Calcutta's top journalists would be so naive as to ascribe this initiative to the boldness of a single individual in the state. There are enough indications that the attack is part of wide-fronted operations, for cutting down CPI(M) to size in West Bengal, which were conceived in Delhi. Final touches to the plan were given by the Prime Minister herself, during her recent visit to Calcutta.

The solid strength of militant trade unionism right inside the citadel of state power — the Secretariat — has long been a thorn in the side of all anti-CPM forces in West Bengal. For years various attempts were made, first by the undivided Congress and then by CPI and its allies, to split the ranks by setting up splinter organisations; but without much success. During the recent 'democratic coalition' rule (of Congress(R), Muslim League, and Bangla Congress, supported by CPI and FB), there was even a mass raid on government employees in Writer's Building undertaken by youth brigades of Congress(R) under ill-concealed police protection. That raid, too, misfired — in that, instead of creating any terror or panic, the assaults further consolidated the mass of the government employees under CPI(M)-led organisations.

The last move of the crumbling coalition government had been to plant some thousands of their tough guys in government offices by appointing them to newly-created jobs. But the ministers had to quit before the plan could be fully put through.

Indira Gandhi, through her Secretary of State for West Bengal, Siddhartha Ray, and the new-found strongman, Governor Dias, is not attempting merely to complete the unfinished task — that has now devolved upon her since the collapse of the coalition cabinet — of lifting the CPI(M) siege on the citadel of Writer's Building. She has, it seems, embarked on something more; for, it must be remembered that West Bengal is a state that has posed a fundamental challenge to all that she stands for.

Moreover, Indira Gandhi has so far failed to score any significant points against CPI(M) in West Bengal, notwithstanding that thousands have been put behind prison bars and tortured in police custody, that police and paramilitary forces are having a field day each day, that political 'resistance parties' backed by the organs of state power have passed into open offensive in many areas of CPI(M) influence as in Alhadpur in Burdwan or in Jadavpur-Tollygunge in Calcutta. CPI(M) has, so far, held its ground.

There is thus nothing to assure that CPI(M) will be conclusively worsted at the next polls whenever they may be held. On the contrary, the party's efforts to mend its bridges to some other Left parties in the state, such as RSP, SUC, etc, have not been a total failure. And if the overtures, started by CPI(M), after its recent Central Committee meeting at Bangalore succeed, then Congress (R) might actually find itself in a rather disadvantageous position. Its relationship with Congress(O) has touched a new low; the split wing of Bangla Congress led by Sushil Dhara has ganged up with Congress (O); Forward Bloc has totally disssociated itself from the democratic coalition after the fall of that cabinet. So, there is no guarantee that, in the event of a new election, Writer's Building can again be kept out of bounds for CPI(M). On the contrary, the stepped-up factionalism within Congress (R) may jeopardise full mobilisation of its own resources for standing up to the CPI(M) challenge.

In the circumstances, Congress (R) High Command (signifying Indira Gandhi and her trusted aides) seem to have decided to give up their tactics of flanking movements against CPI(M) in favour of direct assaults, with the help of state power. The immediate aim is to provoke CPI(M) into some premature action and to use the occasion to substantially weaken it before the next election in the state. Despite the mounting provocations — the dismissal of the leaders of government employees has been followed by orders for pay cut of a large majority of them — CPI(M) has so far refused to oblige, even though its lower ranks seem very restive.

New Delhi is, of course, counting upon crucial tactical help from CPI. It was no mere coincidence that, despite the finalisation of its decision to attack the state government employees' movement much earlier, the actual orders were issued after the state conference of CPI had revealed that the party's Right-wing had further hardened its grip over its politics and organisation in West Bengal. New Delhi had, of course, judged rightly. CPI's state leader, Gopal Bannerjee, and its trade union wing successfully scotched all attempts to organise militant mass protests against Government's high-handed provocation.

For all the pious concern for the flood-affected millions and the evacuees from Bangla Desh, voiced by the West Bengal Government in the preamble to its communique on the dismissal of the employees leaders, only cynical disregard for the interest of rescue and relief operations was revealed in the timing of the orders. Without the least concern for the smooth running of emergency services which might have been thrown out of gear by subsequent protest actions, Government wanted to take advantage of the pre-Puja holiday mood of the Bengalis to forestall any widespread and persistent mass movement.

LUCKNOW

Deluge by Default

ADDRESSING a meeting of flood victims in eastern UP in 1937 Jawaharlal Nehru had said that the country wanted political independence because this would give its people the power to discipline those elements of nature that cause misery, devastation and destruction. As it happens, since Independence most parts of India have not done much to discipline nature, but UP has done the least.

Floods are a recurring phenomenon, destroying the bases of economic growth. The Chief Minister has stated on the Assembly floor that during the current season all the 54 districts of the state have been badly affected by floods. The information media have given the widest publicity to the floods caused by the Gomti in Lucknow. Impartial observers, including K L Rao, the Union Minister of Irrigation and Power, as well as the victims have felt that it is the neglect of anti-flood

measures that has brought the present terrible sufferings to one-third of the population of the city and paralysed it for over a fortnight. Normalcy is still not within sight. The official estimate is that the total loss because of the heavy rains and floods has been of the order of about Rs 400 crores. This estimate does not take into account losses due to closure of shops, factories and educational and other institutions. The Chief Minister has belatedly stated that the Fourth Plan will be re-oriented towards flood control.

In 1960 also the Gomti had touched an unprecedented water level and the city had faced a deluge. But the two factions of the Congress were then busy fighting the elections for the presidentship of the UPCC and nobody was interested in heeding the warnings issued from Sitapur, 50 miles upstream. This year the negligence was not that gross. 'Timely' warning was given, but some of those affected say that they were evacuated six hours after the flood waters had entered their houses. To understand the ravages of the Gomti it is necessary to state that the river bisects the city and four bridges provide the link between the two banks. The technical opinion after the 1960 floods was that three of these bridges be replaced by higher and wider new ones, the bed of the river between the two parts of the city widened and deepened and the two bunds — Butler Road and Birbal Sahni Road — be raised, widened and strengthened. The new bridges have been constructed, but the old ones have not been demolished. The raising of the two roads has actually led to more gaps so that the swollen Gomti was thus provided with easy channels into the city. K L Rao has been forced to admit that because of this state of affairs the flood waters were given avenues for creating havoc in the city.

Flood protection measures have not been completed during the past decade because of the neglect and 'departmentalism' of the state government. The old bridges have not been demolished, the UP Electricity Board has not taken down the telephone poles and the LSGED has not removed the water pipes from the river bed. Had they been removed the flood waters would have got a wider outlet to flow down their usual path. The gaps in the new bunds were not filled as the land acquisition processes proved to be time consuming and, above all, funds were not available. A Minister of the SVD Government had said that in future funds intended for flood control programmes would be diverted to rural areas and that cities would not be pampered. Even when the Army's help was sought in the first few hours of the recent floods, it was ordered to help the civil authorities instead of being allowed to take the initiative in the light of its own reading of the situation. For days, even as the low-lying areas were being flooded, the civil authorities could not decide whether this was the result of seepage or backwaters.

The Prime Minister's visit to the flood affected areas on September 20 has been used by the state government to press its demand for Rs 116 crores as flood relief and the appointment of a Central Flood Control Commission. While welcoming the latter idea the Prime Minister said that the demand for flood relief funds had to be seen in the national perspective. Full compensation for the loss suffered, she said, could not be given. Bihar had also suffered comparable damage and large areas of West Bengal had been badly hit by floods.

The common feeling is that flood control should be made a Central subject. In the meantime, the state government should appoint a commission to suggest long-range protective measures against floods. And so far as the city of Lucknow is concerned, a commission should be appointed to inquire as to why the anti-flood plan of 1961 was not implemented and to determine who the guilty men are. Taking the initiative in their hands, the affected localities of the city are forming their own committees of inquiry to identify the guilty men so far as their own areas are concerned. A Citizen's Committee is probing the possibilities of legal action against the authorities.

SINGAPORE

Friendship without Commitment

Harish Chandola

THIS is a very disciplined and proper country, and constantly struggling as it is to keep up its position as the communications and servicing centre of southeast Asia, it did not have time for ceremonials like flag-waving and lining up the arrival route with cheering crowds during President Giri's state visit, September 14 to 17. As a result about 20,000 Indian citizens here (not counting the 200,000 of Indian origin who are Singapore citizens) did not have occasion to welcome the President. Otherwise, the Singapore Government's arrangements made it a very pleasant visit. The inability of the President to visit Thailand and Malaysia during this tour (as had been expected earlier), also gave Singapore the chance to show their guest that while its two neighbours could not arrange for his visit at short notice, Singapore was always ready to receive him, because it was a true friend of India.

But did India really accept Singapore as its best friend in this region, people in government circles here asked? And if you questioned them further, they were prepared to provide you with the background for what they construed to be the uncertain attitude of India. In 1965, they said, Singapore had asked for Indian officers to train the Singapore Army. But none came. Singapore had then wooed Indian industrialists to invest here, and was prepared to give them all sorts of concessions including a tax holiday for a certain number of years. But the industrialists who made inquiries in Singapore, they said, then went on to set up factories in Malaysia. For these and other reasons it was assumed here that India was not too enthusiastic in participating in Singapore's efforts to industrialise itself and build a defence force.

It is in relation to this background that President B H Sheares of Singapore chose to say in his banquet speech that this visit was "an indication that relations between our two countries are growing closer." Sheares also clearly indicated Singapore's distrust of theocratic states, particularly the Islamic ones, when he said: "There was a time when communities, nations and empires were built on the basis of one thought or rather One Book — the Book. Anything that was not in the Book was falsehood, was evil. People who believed in other books were enemies to be converted or exterminated." He then added that it was Singapore's belief "that today the One Book nation is an anachronism."

One Book Theory

This was obviously said in order to remind India that Singapore and India faced serious problems because both had "One Book" nations as their neighbours (Malaysia in Singapore's case and Pakistan in India's). These remarks also seem to have been made with the purpose of bringing to India's attention the point that One Book nations had much in common and greater affi-

nity with each other than they had with non-One Book nations like India and Singapore. The view that the Islamic nations would always make common cause with each other in time of need and would readily forget their friendship with non-Islamic nations, has been expressed -- privately several times before by Singapore leaders to visiting Indian ministers. It was expressed by Prime Minister Lee Kuan Yew in April 1969 to Morarji Desai when he had visited this country as Deputy Prime Minister, and more recently, to Swaran Singh when he came here last month. Most subtly, it was also hinted that however much India might try to be friendly with Singapore's Islamic neighbour, Malaysia, that friendship would carry no weight if any Islamic country, including Pakistan, came up with the slogan of "Islam in danger".

This is of course Singapore's view which it wants to impress on India. But India feels that it can and should maintain friendly ties with both Singapore and Malaysia. Since India's friendship with them is for mutual cooperation and benefit, India does not regard its friendship with one as being detrimental to the interests of the other.

On the other hand, India would have very much liked the Singapore leaders to express their sympathy for the suffering of the refugees from Bangla Desh and for the burden that India is bearing. Giri referred to this in his banquet speech. But obviously the Singapore leaders though it unwise to say anything on the matter publicly. One cannot, however, lose sight of the fact that privately the Singapore leaders have expressed their concern and sympathy to visiting Indian dignitaries both for India and the refugees. In fact one of Singapore's most prominent leaders said last month that the sound of booming cannons had deafened the military rulers of Pakistan and wondered what would open their ears to the sufferings of their people, particularly those in East Pakistan?

Sympathy Wanted

It is true that there is very little that Singapore can actually do to impress upon Pakistan the need to settle peacefully the problem in East Bengal. But, all the same, the people of Bangla Desh still hopefully look forward to Singapore publicly expressing at least its sympathy some day.

It is felt that relations between India and Singapore could be consolidated if their leaders were to meet often enough. Towards this end, Giri has invited the Singapore President to visit India and has also extended a similar invitation to Lee Kuan Yew for next November. Sheares expressed Singapore's desire for close co-operation when he said that "it would be a pity if the close links between the two countries, which in modern times were forged as components of a now vanished empire, were allowed to rust away with the passage of years."

Evidence of growing co-operation already exists. A well known Indian industrialist is soon going to establish a joint venture in Singapore. Another has already done so. Three Singapore Army Officers are being sent for training to India, one to the Staff College at Wellington and two for special courses.

The visit has also been useful to the Minister-in-Waiting, Om Mehta, who otherwise is Union Minister of State for Parliamentary Affairs and Shipping. Singapore has become the third busiest port in the world because of improved harbour facilities, repair yards and its progress in cargo containerisation. As Minister of Shipping, Om Mehta saw how the port authorities have increased efficiency and have been able to unload and load ships speedily, have almost entirely eliminated pilferage and are now looking forward to establishing shipbuilding yards. He also learnt that over 300 ships flying the Indian flag call at this port every year and that Singapore shipping firms were placing orders for Indian-built ships.

The Indo-Soviet Treaty

Mohit Sen

IT would be quite wrong to imagine that there is a national consensus around the Indo-Soviet Treaty. Far from it. The speed with which it finally came through baffled the Right-wing, put them on the defensive and compelled a tactical approach of welcome. But the whispering campaign went on. After all had not the Jan Sangh and other Right parties made it one of their main planks in the recent mid-term poll that Indira Gandhi was a Soviet agent? Now, these Rightists whisper that the truth of the charge is proved but just now not much shouting can be done about it as the USA is 'stupid' enough to support Pakistan! But they will soon enough return to the subject.

It was also quite characteristic, but revealing nonetheless, that the monopoly Press turned overnight into passionate defenders of non-alignment which they now felt had been sold out. The monopoly Press began by asking "was it necessary?", declaring that the Government of India had overreacted to the Sino-US collusion and the stepped-up bellicosity of Yahya Khan. Within a few days they had changed their tune to pontificating that the Treaty would prevent the Government of India from helping the people of Bangla Desh even to the extent that it was now doing.

It was also quite characteristic, but the views of the monopoly Press being reflected and even improved upon by those who claim to be "Dynamic Centrists" and even "Leftists" up-in-arms against the Establishment.

What a marked contrast these posturings are to the feelings of the politically advanced masses in all parts of our country! The same cadres and activists who had swung into action against the danger of a Rightist takeover in the mid-term polls have equally enthusiastically hailed this Treaty. They correctly see in it a continuation of the same progressive process. Those who pontificate about dynamic Centrism and talk glibly about "elites" should try an experiment. Let them try to organise a campaign against this Treaty in India anywhere. Not only would the response they receive teach them, one hopes, a lesson but the company they would find themselves in would, one expects, make them retrace their steps.

The Indo-Soviet Treaty would have been impossible without the rout that Right reaction suffered in the mid-term poll. With Morarji as Prime Minister, Masani as Finance Minister, Vajpayee as Home Minister and Raj Narain as the Minister for Culture, one could scarcely have expected such a Treaty to be signed. This is the first point our pundits of "dynamic Centrism" and "pure Leftism" should think about.

The Indo-Soviet Treaty represents on a higher plane and at a further swerve of the historical spiral, a return to the days when the Panch Shila agreement was signed and the Bandung Principles were enunciated in 1954-55. It gives non-alignment a sharper and more direct anti-imperialist edge. It will be remembered that at that time, too, the US-Pak military collusion had come nakedly to light. The difference lies in

the betrayal by the Maoists of the process of unity of all anti-imperialist forces which they had initiated so splendidly.

Obviously, the Indo-Soviet Treaty's paramount significance lies in the deterrent effect it would have on Yahya Khan's proclaimed desire to settle accounts with the people of Bangla Desh through a war of aggression against India. Prevention of Pakistani aggression against India is precisely the best help that any international power can render to both India and Bangla Desh at this juncture. Or do the dynamic Centrists and the "pure Left" believe, *a la* the Jan Sangh, that an Indo-Pak war is the best way for India to aid Bangla Desh? Or do they believe that there is no danger of such a war brought on by Yahya Khan's desperation, in which case one must envy them their touching faith in the military dictator and the author of genocide in Bangla Desh!

It is in this sense that the Treaty provides a securer framework for such help being rendered by India to the freedom fighters in Bangla Desh as would best enable them to as swiftly as possible achieve their own emancipation. The rendering of such help would be greatly facilitated by the recognition of the Bangla Desh government by India and other countries. Or is it the belief of the dynamic Centrists and the "pure Left" that the only help India can render is to march the army into Bangla Desh? Rebuffing Pakistani aggression by all means is one thing and unilaterally marching into Bangla Desh is quite another. By providing a securer framework the Treaty thus gives India more chances and more options *vis-a-vis* Bangla Desh.

Unequal Treaty?

Two other points need to be taken up. The first is that the Treaty is "an unequal treaty" — the authors, one trusts, realise that this was the phrase used to describe the humiliating diktats imposed on China by the imperialist powers. What are the arguments advanced? One is that the Soviet Union is much more powerful than India and the other that "servile pro-Soviet elements" would now all the more easily infiltrate the Government of India.

If the Soviet Union is more powerful than India, it is scarcely the former's fault and still less is it to blame if it uses that power to shield India from US imperialist pressure and subversion —a factor which our dynamic Centrists and "pure Leftists" totally fail to mention, testifying to their political bankruptcy if not worse. As for the Soviet Union taking on the role of the "ugly American" let these scribes ask the people of Vietnam and the UAR about this!

As for Indian servility — this is a charge that can be made about many, depending on one's attitude. About infiltration — let the Indian Mcarthyites realise that they have come a little late in the day! They, surely, know which servile lot has done the infiltration and what a menace they are proving now that some desire to move ahead in a progressive direction is being manifested. Why no mention of these very real servile infiltrators, one wonders?

The second point is that the Indo-Soviet Treaty would help to maintain the *status quo* in India and is, therefore, to be opposed. This is an ancient argument with which one is familiar from the days of Lenin's struggle against the "Left" Communists during the negotiations leading to Rapallo and during the Stalin-Trotsky controversy. Any political and economic relations with a non-revolutionary or anti-revolutionary government can be called an act of betrayal on the part of the Soviet and other socialist states.

What the proponents of this argument fail to do is to make a concrete analysis of the concrete situation. In principle nobody can object to a socialist state strengthening its ties with a non-socialist one. What one needs to examine is what kind of non-socialist state is involved, the direction in which it is moving and whether the improvement of relations helps the progressive and revolutionary forces or the reactionaries — to whom does it provide leverage? Socialist states cannot substitute for the forces of progress and revolution within a country. Their relations with a given country should, however, be such as would facilitate the cohesion and advance of these forces. To do more would not only tantamount to interference in the internal affairs of countries but would help precisely the reactionary and *status quo* forces.

If one adopts this set of criteria, then, the Indo-Soviet Treaty certainly is a highly positive development in this sense as well. And this is how it has been seen by the progressive and revolutionary forces in the country. And this, incidentally, was the attitude that these forces adopted towards China in the days of Panch Shila and Bandung. Quite correctly so, through not without debate.

It is very likely that on the basis of the Indo-Soviet Treaty the Government of India would be able to, and by all accounts has, move in the direction of improving relations with China at the state level. This would be a welcome development and one which those who have stood for the strengthening of Indo-Soviet relations have always advocated. But what would our dynamic Centrists and the "pure Leftists" say to that development? How can they welcome it at the same time as they denounce the Indo-Soviet Treaty in the company of the monopoly Press, Morarji and the Jan Sangh?

Nireekshak

"WITH the ... invitation to India by the Sponsoring Committee of the Asian and African countries to participate in the table tennis tournaments to be held in Peking, and India accepting the gesture", wrote *Hitavada* recently, "a new era of international diplomacy and understanding has begun". Whether it has or not, many China-watchers have been busy airing their prognostications about the future of India-China relations. Earlier, all of them, without exception, had been smitten by Mao's smile. Their many interpretations of the smile would surely make Mao literally smile. But that was before the 'Sons of Heaven' showed a penchant for ping pong. Ping pong has since put the smile in the shade.

Useless as a Counterweight

As *Times of India* saw it, for example, "an improvement in Sino-Indian relations in the new context [evidently, the context of unanswered correspondence and Bangla Desh] has become contingent on a major change of policy on the part of Peking". Peking has to ditch Yahya Khan and "join Delhi in finding a political solution in East Bengal", it said, or "a fruitful dialogue between the two countries will have to await the establishment of an independent Bangla Desh". Projecting this train of thought a little further, the *Times* then went on to add, hopefully, that "once Pakistan breaks up into two and becomes useless as a counterweight against this country", Peking "is bound to respond to India's friendly gestures". However, few others seemed willing to wait that long. "There is a remarkable consensus in India", wrote *Tribune*, "on the need to explore fully the possibility of a rappochement with China .... However it would be unrealistic to proceed on the assumption that a reconciliation with China can be worked out in isolation from the other actors of the power drama". The Indo-Soviet treaty, *Tribune* thought, "should give an added incentive to China to make up with this country" for the Chinese "would know that India is not talking from a position of weakness or labouring under an inferiority complex". However, it won't do to be overoptimistic. "Probably we have read a little too much in Mao's smile", it said.

Probably so, affirmed *Hindustan Standard*. "Not too much can be read into Chairman Mao's smile which remains as inscrutable and as tantalising as Mona Lisa's". As for ping pong, "it has now been woven into the diplomatic fabric of Red China in such a way as to become a sort of symbol of reconciliation and friendship". New Delhi, the paper added, had wisely refrained from "getting into raptures over the invitation" it had received from China to participate in a ping pong game, and its decision "to play it cool", while also accepting the invitation, "is a prudent one".

Whatever the future holds for ping pong, Peking style, the game of blind man's bluff that Kerala's United Front had been playing with the Congress party there seems now to have come to an end. But not until it had yielded its quota of alarums and excursions. One interesting offshoot of the tussle, essentially between the CPI and the Congress (R), was that the *National Herald*, instead of standing up for the Congress, as it might have been expected to do, found itself arguing the brief of the Chief Minister. When the Congress rejected the Chief Minister's propoal for Cabinet expansion, *Herald* wrote: "By rejecting the United Front offer, the Congress in Kerala has created a deadlock which is not in the interest of the United Front or of the Congress .... On the face of it, the UF offer is sensible .... The Congress, it appears, has been bargaining for the sake of bargaining, and in a state like Kerala, such pettifogging can have disastrous results .... For some time to come, only a coalition Government can remain in office in Kerala, and the Congress should be aware of this and its own limitations." *Mail*, on the other hand, though no great friend of the ruling party, found itself defending the Congress. If the Congress had accepted the Chief Minister's proposal, the paper said, "the criticism would have been rightly made that, when it came to the question of office, the New Congress cared not for principles. No political party, least of all the New Congress which at the last poll improved its performance, can afford this."

The Congress stand that the Cabinet strength should not exceed 13 was in conformity with the recommendation of the Administrative Reforms Commission, *Deccan Herald* agreed. "Credit is [therefore] due to the Congress (R) in Kerala", it said, "for rejecting the Chief Minister's proposals". For sheer originality of interpretation of the Kerala deadlock, however, *Hindu*'s assessment is hard to beat. The breakdown of the negotiations for Cabinet expansion, it opined, could be the result of the "long-range calculations of some of the parties with an all-India stake." It was problematic, the paper said, whether the Congress would have at all agreed to "go through the motions of negotiations" for several weeks unless its objective was to "bring the conflict into the open and force another election in the near future from which the party could emerge with a clear-cut verdict". A mid-term poll in Kerala, along with the State Assembly elections elsewhere in February, was thus a possibility, the paper surmised, with Bihar probably following suit. "Whether such a poll is in the interest of Kerala which has not had a stable, or competent and constructive, Government for a long time is another question." According to *Hindu*, the only hope for Kerala lay in the non-communist parties "sinking their differences and getting together to purge the politics of the State of disruptive ideologies."

Barrack Room Manners

As a footnote to Mao's smile and Menon's frustrations, nothing is probably more appropriate than Yahya Khan's barefaced display of, what Lyceus of *Bharat Jyoti* termed as, "barrack room manners." Yahya's now notorious *Le Figaro* interview evoked sharp reactions in the press. "A mad man's ravings", said the *Indian Nation*. "The Pakistani President was talking like a coward and displaying utter lack of ordinary culture and courtesy by using unseemly language ..." Why, the man was a "moron and a maniac", wrote *Indian Express*. "The most charitable conclusion that can be drawn from General Yahya Khan's foul-mouthed attack on Mrs Indira Gandhi is that he is a psychopathic moron and should not be held responsible for what he says".

Middlemen's Margin

L S Venkataramanan

Cost of Marketing Cotton by M G Pavaskar and V Radhakrishnan; Department of Economics, University of Bombay, 1970; pp 55+viii; Rs 6.00

IT is commonly believed by the public and by the administrators in developing countries that prices at the producers' level are lower and at the consumers' level higher, relative to what is desirable, owing to the imperfect and monopolistic nature of marketing services. It is alleged that those who render marketing services such as grading, transportation, storage, and processing, earn an exploitative return at the cost of producers and consumers. A partial remedy, the administrators believe, consists in fixing a floor for the price to be received by the producer and a ceiling for the price to be paid by the consumer. Replacement of the traditional marketing organisation by governmental or co-operative agencies, the common view holds, would further improve the efficiency of marketing and reduce the marketing margin.

Agricultural marketing, contrary to popular opinion, is however highly competitive and it is not easy to lower the costs of marketing services. Analytical studies on the supply of agricultural marketing services in India are far fewer compared to studies on the demand for and supply of agricultural commodities. There have been a few notable studies on marketing services and pricing efficiency in recent years including those, by Ralph Cummings Jr,[1] Uma Lele,[2] Dutia and Ramesh Chandra.[3] We also have a good survey on 'The Development of Marketing Institutions' by Abbott[4] and an excellent survey paper by Raj Krishna,[5] where among other issues he deals with the pricing of marketing services. Considering the acute dearth of good empirical studies in this area, the work of Pavaskar and Radhakrishnan on the "Cost of Marketing Cotton" is a welcome addition to the stock.

To study the nature of marketing organisation, to find out whether it is competitive or monopolistic and whether marketing of the agricultural commodities is efficient, it is necessary to analyse the interrelationship of prices at the producer and the consumer level, the cost of marketing, and the profit margin. Several hypotheses can be set up and tested for evaluation of the competitive nature of the market organisation, the degree of market integration and the extent of pricing efficiency. One hypothesis would be that the larger the number of traders competing for a given share at any stage of marketing, the more competitive traders are. The size and the number of firms are, therefore, indicative of the degree of competition. Though a classification of the size distribution of traders is not easy to make, from observations it can be said that a large number of intermediaries take part in agricultural marketing and they compete for a very modest net return for services rendered by them.

The other hypotheses[6] that can be empirically tested relating to market competition, integration, and efficiency, are that the prices between primary market and terminal market, between one primary market and another primary market, and between one terminal market and another terminal market, are well-integrated. The hypothesis relating to market integration would be supported if it could be empirically proved that the price differences between primary markets, or between terminal markets, are not out of line with transport and merchandising costs necessary to move the commodity from one market to another. The test of the hypothesis on marketing efficiency would require an evaluation of the cost of marketing and the proportion that this cost bears to either the primary or the terminal market price. For any given quality of marketing service, the lower the marketing cost, the higher the degree of marketing efficiency.

Pavaskar and Radhakrishnan have indicated in common with other studies that there are three alternative cost-accounting methods for computing market shares, *viz*, (i) noting prices and charges at each stage of marketing for specific lots of produce as they move from the primary to the terminal market, (ii) estimating the gross returns and costs covering a specific stage and dividing the difference by the quantity of the commodity, and (iii) estimating the actual margin between prices prevailing at each stage of marketing. The third method, which the authors have used, has been the one most commonly adopted in estimating marketing cost because of difficulties in collecting data that are relevant to the first two methods. For their case study, they have selected four major assembling markets — in Dhulia, Shirpur, Jalgaon and Pachora in Maharashtra — and have computed the cost of marketing the Virnar variety of cotton for distribution at the terminal market in Bombay. Their study relates to the two years 1962-63 and 1967-68. Marketing margins have been computed for each season and also for each week in the season. From the computed margins, marketing costs have been deducted to arrive at net returns to merchants. For calculating the seasonal marketing margin, the daily reported prices of kapas were weighted by the volume of market arrivals of kapas, similarly the daily prices of cotton lint and cottonseed were weighted by the lint and cottonseed outturn of the same amount of market arrival of kapas. The difference between the weighted product price and the weighted kapas price, constitutes the marketing margin. The marketing margin was computed on the assumption of an average lint outturn of 38.5 per cent. The authors have inferred on the basis of the marketing margin estimates for the two years that khandesh cotton farmers receive around 90 per cent of the value of sold cotton lint and cottonseed — deducing therefrom that the marketing cost does not generally exceed 10 per cent of the value of sales. The study indicates that, for kapas weighing 260 kg, if the producer price is Rs 480, the assembling costs are about Rs 6, the processing charges about Rs 25, merchandising charges Rs 6, and transport and miscellaneous charges about Rs 5. The gross returns to the merchants is around Rs 15. To arrive at the net returns received by the merchants, it is necessary to deduct interest cost, expenses on establishment, etc. The results of the study indicate that the returns to cotton merchants are only 3 to 4 per cent of the value of aggregate sales.

The evidence, therefore, suggests that the middlemen's net return is small and that the cost of marketing is no more than what one would expect under competitive market conditions and market integration. The conclusions of the study are supported by similar studies on jowar marketing in Maharashtra and wheat marketing in Punjab.

The authors have done well in providing good evidence on marketing costs and in disproving popular misconceptions regarding inefficiency in the marketing trade.

Not for Debate

Yogesh Atal

Pakistan Elections: Background and Perspective by Asit Bhattacharyya; Compars Publications, Calcutta, 1970; pp 56; Rs 1.50.

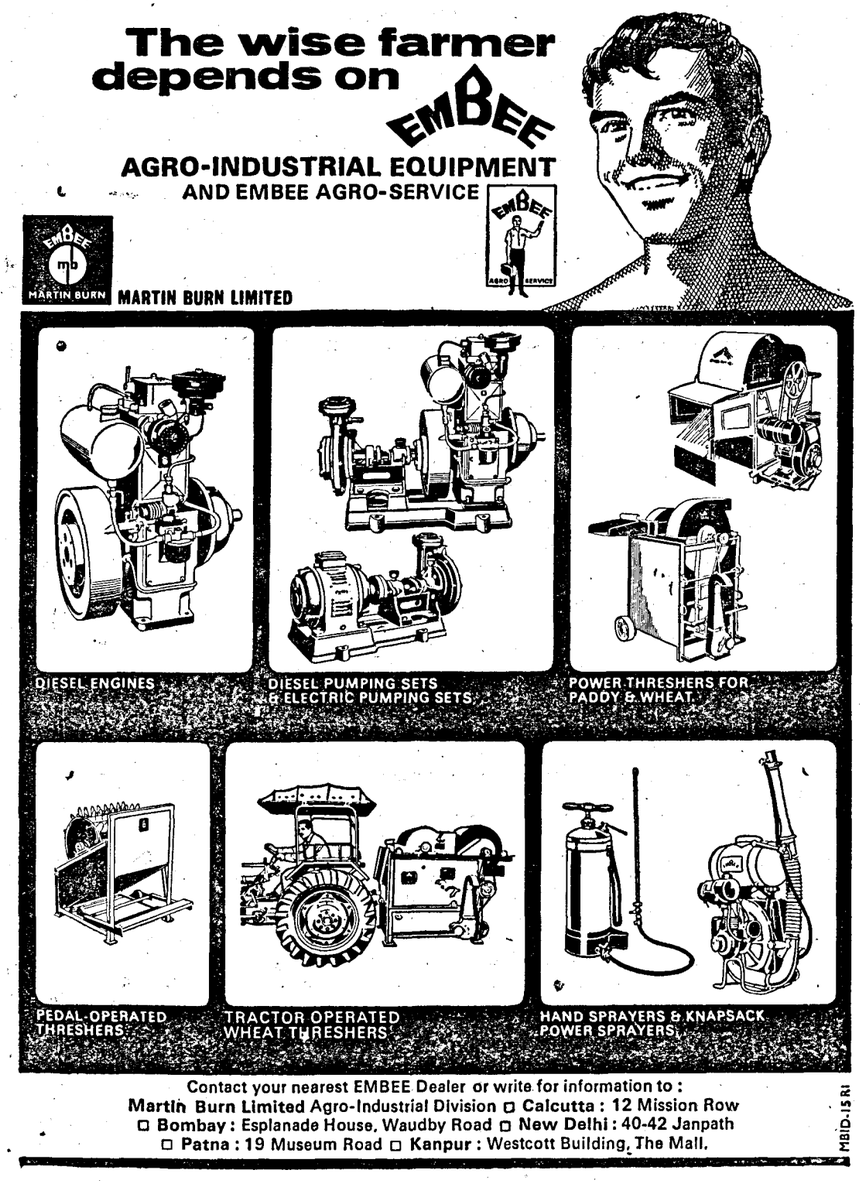
THIS is a pamphlet, not a book. It is a reprint of an article earlier published in a periodical. As the title would suggest, it is about a country which is, according to Panna Lal Das Gupta — who writes the preface for the pamphlet—"important for us". The author is an economist by training and he has chosen to write about the elections — a political theme — and that, too, from a distance. We are told that he "is a keen observer of the Pakistani scene, as far as observation is possible with the limited materials available here". Further, the writer is claimed to have "neither the hawkish approach of the reactionaries here, nor the woolly sentimentalism of the doves".

The pamphlet was written *prefactum*: it preceded the elections. It does not, therefore, attempt to present analyses which one finds in conventional, though modern and highly sophisticated, treatments on the subject. One would not expect Asit Bhattacharyya to present a trend of opinions based on a survey of a cross-section of people of the country where he cannot conduct investigations. Utilising the newspaper reports and other secondary sources of data available in India, Bhattacharyya has attempted an essay to provide a background and a perspective to the Pakistan elections. More appropriately, he is concerned with the situation brewing in East Pakistan. The politics of Pakistan is viewed as a politics of the two wings. The author feels that the high-handedness of the 'West Punjabis' over the 'East Bengalese', and of the communalist Muslims over the Hindus, has created a very alarming situation. The policy has persistently been followed by each successive ruler with greater vigour. The policy of 'crude communal xenophobia', of 'Olympian aloofness', of 'blunt and brutal' "manifestation of the leadership-principle in the executive organisation of the state", of "absolute centralisation of power and delegation of authority" was pursued by the Ayub regime, according to the author.

It is argued that Ayub's proposal for "a merger of Pakistan in a wider *Islamistan* with a number of other West Asian states" was virtually a confession of the failure of Pakistan as a state. The consequence was a policy of neglect towards East Pakistan and an attempt to externalise the internal conflicts.

It is in response to a dual policy of the military regime — that of favouritism towards West Pakistan and of neglect of East Pakistan — "Bengalese nationalism" is said to have taken birth under the leadership of Sheikh Mujibur Rehman, who formulated the six-point charter (whose demands are not, however, properly listed in the pamphlet). One of the demands was a total financial autonomy. Increasingly, the movement gained momentum and even Maulana Bhashani, a one-time opponent of Sheikh Mujib and an anti-Indian, joined hands with him.

Yahya Khan is described as "the legitimate heir to the illegitimate dictatorship of Ayub Khan", and he "started his rule on a deliberately set low key". We are told that his "strategic aim was to hold on to absolute power at the centre firmly but quietly, and to continue with the misappropriation of the export surplus of East Pakistan for the benefit of West Pakistan monopolists". This is how the author describes the tactical response of Yahya Khan to the demands made by East Pakistanis:



> to appear sympathetic and reasonable, avoid all blunt threats *a la* Ayub as far as possible, to specify what is proposed to be given in order to magnify the gift, and not to specify what the regime is determined to hold back in order to confound such issues in a welter of confusion, and even to bury them by a conspiracy of silence [p 10].

The circumstances prevailing in East Pakistan led the author to conclude that Sheikh Mujib will emerge victorious, and that if his demands were not enshrined in the Statute Book, a stalemate is the only consequence. "If this demand (for autonomy) is not realised through constitutional means, various extremists are only waiting on the wings to take over the leadership of the movement .... It should be obvious to any one that Pakistan, as it is now constituted, cannot last long" (pp 48-49).

The author bases his conclusion, which later events have amply validated, on the historical factors and on "two elements of unreality in the situation". It appears that the author regards the inclusion of East Bengal in the new state of Pakistan as unreal because of the sheer geographical distance between the two wings, and the wide cultural differences. It is culture, more than religion, which has provided a cement of solidarity to the people of East Bengal who have decided to move out of the unfortunate trap in the name of a theocratic Pakistan.

While the author's conclusions are largely valid, the style of the essay is charged with emotion. He has lumped all the West Pakistanis in the category of West Punjabis to be condemned and has forcefully aligned himself with the movement in East Bengal. It remains to be found out whether Ayub was a "political bankrupt", or that "poor Bhutto" is a "great fire-eater" who "outstripped Ayub in warmongering" and that he is a "budding fascist and heroding Herod in political viciousness".

Bhattacharyya's sympathies are clearly with the people of East Bengal, to whom he is culturally close and for whom he would like a free and flourishing nation. The sympathies of this reviewer lie there too. But the pamphlet reads more like a manifesto; it evokes emotion and sympathy: it is perhaps not intended for an academic debate.

'Freeing' the 'Free' Press

Pran Chopra

The main source of the shortcomings of the Government's current proposals to diffuse the ownership of newspapers is that they rely exclusively on the law and not at all on incentive. And that too they do by extending to such a varied and flexible industry as newspaper publishing the complicated provisions of India's most cumbersome piece of legislation, the Companies Act.

The aims of the law for the present purpose should be to

(a) curtail the power of non-publishing finance in the newspaper industry by liquidating the nexus with the high finance of business;

(b) discourage concentration of ownership of circulation by providing for more fair competition and greater dispersal; and

(c) ensure a reasonable degree of editorial independence.

These objectives can be achieved through two of the provisions of the proposed legislation — those relating to corporate finance and managerial personnel —, supplemented by

(a) either a price-page schedule or a steeply slabbed tax on all advertisement revenue above the level needed for comfortable viability at a circulation of, say, 100,000;

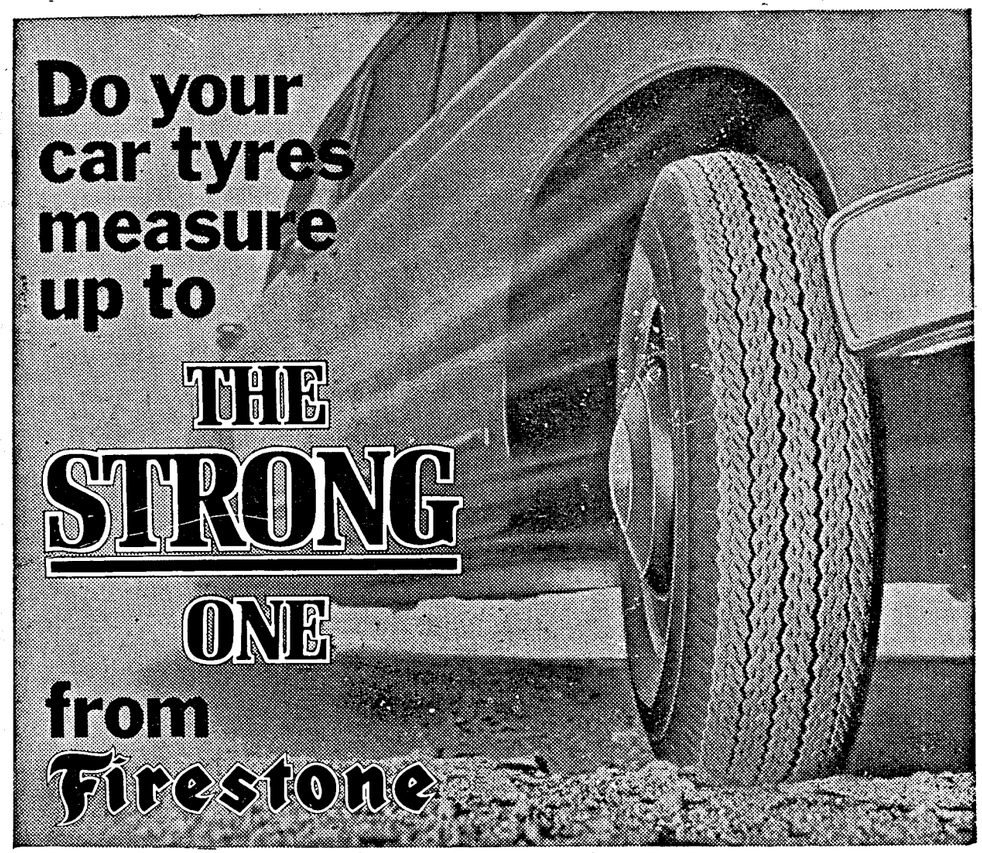
(b) a requirement that newspapers must provide safeguards for editorial independence; and,

(c) the power to treat each newspaper in a group as a separate entity for financial purposes but the group as a whole as a single entity for the allocation of newsprint.

Beyond that the government should only use, and needs to use only, incentives which are best applied through a newspaper finance corporation and disincentives which it has the power to apply so long as newsprint has to be rationed. As it is, the slabbed system of newsprint allocation has begun to have some impact: the dip in the statistics of the bigger newspapers between 1967 and 1968 has not been wholly made up. Further refined, and aided by the suggested supplementary legislation, these tools can bring about all the desired changes.

AFTER years of conniving with the big business baron to help him capture the Indian Press, the government is also going to take a bite at the cherry. It has put forward proposals for ending the control of leading newspapers by the top industrial and commercial houses. This is very welcome. Whether these owners prostitute this part of their property or not, using it to serve their other interests, they damage its most priceless virtue: its credibility with the reader. But the government would be doing exactly the same if its proposals went through unamended. This would be progress from the frying pan to the fire. To whom will the Press turn for protection if the government developed the same inclination which is suspected in the present keepers of the Press?

Two Alternatives



If this fate actually befalls the Press, the responsibility will mostly lie upon those who most vehemently oppose the present proposals. Towards a reform which in its essentials was long overdue, they have adopted an attitude which is wholly negative. This has had two consequences already: support for the proposals comes only from those people now who would make them even stiffer and in the process make them even less practicable in certain respects than they are already; and the choice has been reduced to only two alternatives, either the Press as it is or the proposals as they are. The situation is tailor-made for the proposals, which means the government can happily begin to carve a niche for itself in the boardrooms of all the more influential newspapers.

If these proposals or something more drastic are finally adopted by the country it will not be because slogans make policies and sense does not, but because no sensible man can look upon Press ownership as it is and honestly say that nothing needs to be done about it. Therefore if only the scheme in the field for doing anything is the one sponsored by the government, then this is what will carry the day. That is what makes it tragic that those who ought to know better are either silent or noisily resolute not to see the facts. There are a number of operational and even conceptual drawbacks in the government's scheme. But then someone should bring forward a better set, not turn an angry back upon the effort altogether and stump into a future which may well be worse.

The Statistics

The present is bad enough. I do not wish to overload the argument with statistics. The salient ones will do; they clearly flag the present and foreseeable dangers. Ten leading common ownership units, that is each owning more than one newspaper, controlled 48.2 per cent of the daily circulation in 1967 against 39.3 per cent in 1960.* Daily newspapers owned by all the (65) common ownership units (not to use the slightly pejorative word, "chains") together accounted for only 21 per cent of the number of newspapers but over 74 per cent of the daily circula-

* Almost throughout I have used the figures for 1967, not 1968. On account of a spate of strikes late in 1967 and early 1968, which affected mainly thhe major newspapers, the 1968 returns are contrary to the well-established previous trend and are unrepresentative. No further fall of any significance is shown in the more recent figures; in fact many have resumed the previous trend.

This is the tyre that was built taking into account the most demanding driving requirements. A tyre that can ride smoothly on even rough road surfaces. Can withstand the heat of summer, and provides the safety you need on wet monsoon roads. Can take the wear and tear of frequent stopping and starting.

You get all this toughness in a Firestone tyre, because of exclusive Triple-Strength Construction—that's a special method of bonding the tread to the tyre, reinforcing the sidewalls and insulating the cords.

When you want more kilometres and greater safety for your money—you need **'The Strong One'** from

Focus-W-24 (C)R

tion. Since 1963 their share had risen by over 34 per cent. Ninety-five per cent of the circulation of the daily newspapers in the four metropolitan cities was accounted for by the common ownership units in 1967. Among them the units which had most of this circulation — the exceptions are few but some among them are very honourable ones — were owned by people or corporations whose primary occupation and interest were not newspaper publication but some other industry, and most of them in turn — 80 per cent on a rough computation — were what the Monopolies Commission classifies as the top business houses.

Other figures show who controls the commanding heights over here. Because of the larger number of pages which the bigger newspapers can afford and the smaller cannot, their share of the total newsprint allocation and specially of the imported variety is twice as high as their share of the circulation. Their share of the advertisement revenue is higher still, and not only because with higher circulation they can charge higher rates but also because a much higher proportion of their space is taken up with advertisements. In fact newspapers with safe circulation leads occasionally cut back on the number of copies printed (unless they can find printing paper outside the quotas allotted by the government under the rationed distribution of newsprint, which is scarce) to bring out extra large "supplement" issues which are a favourite money earner; the ratio of advertisement space is even higher in them than in the normal daily issue which itself is above 50 per cent in 9 of the top 16 dailies and above 60 per cent in five. That means that while facilities are demanded, especially foreign exchange for the import of newsprint, in the name of freedom of the Press and the value of mass communication, a disproportionate amount thereof is spent upon increasing revenues some of which would otherwise go at least to those among the medium newspapers which circulate where the new agricultural consumer is.

I doubt that the self-interest of the advertiser sufficiently operates as a corrective to this because the highest advertisement revenues stand to the credit of those newspapers mostly which are owned by the top industrial houses, that is owned by those who are also by far the biggest purchasers of advertisement space in the Press. Add to this the fact that many of those who are industrialists plus advertisers plus newspaper owners have also increasingly begun to own or have an interest in advertising agencies, and you have a beautiful example of the circular motion of money: from the industrialist to the advertising agency to the newspaper to the newspaper owner, that is the industrialist.

Concentration *vs* Quality

Upto a point, concentration of resources and circulation in the hands of a few newspapers is justified by the resulting improvement in both the technical and what one may call social quality of the Press. But beyond that point it is not. To begin with, the battle is always between those with financial resources and those with only journalistic quality and value to help them; this is always an unequal battle in favour of the former because if the resources are weak the time for mortality comes much faster than fame for quality where the clientele is so vastly spread out. Only in the next phase is the battle between comparable resources and there, if the point of view does not distinguish one paper from another, as it does not when the ownership of the competing newspapers is in the hands of the same sort of people, as increasingly in India, the competition is only in entertainment value, the cheapest forms of sensationalism and popular appeal which have become the bane of the mass circulation Press in other countries. This has not happened in India yet because that point has not been reached in the circulation war. Once it is, it will. In the meantime, and because of Indian conditions, concentration is attacking quality on three other fronts.

First, like the industrial houses which increasingly own it, the Press is becoming more and more city oriented, more and more distant from its primary function, which is to be the voice and conscience of the whole community, not only of (hopefully) the urban middle class readership and the urban rich ownership. Nearly half of all the newspapers are published in the 12 biggest cities, and 12 of the 16 which have circulations of more than 1,00,000 are published from the four metropolises. Our Press as a national social institution would be much stronger on the whole, if, even at the expense of the technical quality now provided by the top newspapers, we had a hundred newspapers spread all over the country, each with a circulation of, say, a hundred thousand copies, than if all the ten million circulation were shared only by ten newspapers, all of them of excellent technical quality and all them concentrated in the four metropolitan cities. These figures, of course, are a breakdown of a total daily circulation which is only a fraction of what it should be; but the argument would apply more, not less, if the base figure were ten times larger and could be spread over a thousand viable newspapers instead of only over fifty affluent ones in half a dozen cities, all of them owned — as is nearly the case already — by business magnates who are wholly innocent of the qualities which make the true publisher, the man for whom the newspaper he owns is his main interest, not a decoy for his other interests.

The second front on which quality is losing to concentration — I mean the quality of the Press as a social institution, not as a show piece of good printing — is where the government as the political manipulator meets the industrial tycoon as the amateur politician. That is where the nexus between the Press and the leaders of business, and between them and the politician works to perfection. Our system is tailor-made for a particularly unhealthy kind of circular causation. The Press is free to criticise, the government is sensitive to criticism, the Press baron is sensitive to the government's industrial policy, in which free enterprise and regulation are two phases of the same game. If the government's only aim in bringing forward these proposals had been to gain control of the Press for its own purposes, then I would have simply described them as redundant. Government can gain this control — and this is the worst aspect of the present pattern of press ownership in India, so glaringly contrary to its independence that one is surprised to see it being defended in the name of the freedom of the Press — more easily by plying the industrialist owners of the Press either with favours or with the fear of its enormous and flexible regulatory powers; the scope for both tactics is inexhaustible. Fortunately, so far it has been used mostly for raising funds for the Congress, and from this point of view it is just as well that government thinks newspaper policies do not matter. Proprietors think they do, and so we find that while newspapers criticise the government very freely, their owners are rarely touched with the rod of editorial admonishment on the only kind of issues which matter to them.

In answer to this I have lately heard an argument of dazzling cynicism — that the smaller newspapers

bend the knee to the politician more shamelessly and more regularly than the newspapers owned by the big business magnates. But this is bound to happen with things as they are, and will happen even more as time passes unless it passes well for the small newspaper. If newspaper revenues flow in the closed circuit described above, then all those who are outside it are bound to run into extreme deprivation and either face extinction or survive by grovelling before anyone who will give them sustenance. The smaller Press is no better endowed with men of courage than the big Press is, and being without an assured future, such courage as it has runs out rather quicker. Perhaps it would not if the bigger newspapers set it a better example than they do of being fearless of pressure from any quarter, including the owner. But even then one can think of more tenacious fights by some medium newspapers than by those at the very top. One of them buckled in very quickly under pressure applied by the local governor; another made a rather quick change of policy after the last election; the editor of a third took shelter with the government when the proprietor showed his displeasure.

I cannot imagine that fear of the proprietor had nothing to do with the rather startling fact that when the "free enterprise" business magnates owning a leading newspaper, acting in a fit of frustration and personal venom, threw out of the window an eminent arrangement for ensuring editorial freedom against the owners' displeasure, not a single major newspaper in the country found the topic to be worthy of notice; it was the world's Press which reacted, not the Indian.

II

Some critics of the Indian Press sometimes describe it as a monopoly Press. They are factually wrong, and they make a tactical blunder in using this term. There is free enough competition between many of the rival groups of newspapers; they do not gang up against a newcomer any more than against each other; control over resources is not acquired by them by means more corrupt than are customary with their compatriots in other industries, such as fudging accounts. It is true that since everything turns on sales figures (circulation) and it is impossible for audit to check actual circulation, the fudging expert is at a special advantage in this industry. But all newspapers are at an equal advantage in this, whoever may own them and regardless of whether they are independent or "chained". Hence it is a factual error to say that the Press is already a monopoly.

The tactical error is that such a charge immediately attracts the reply that if this is the suspicion, government should first establish the facts and, if they warrant the next step, apply the Restrictive Practices Act instead of launching on the elaborate adventure of the contemplated legislation. The known facts do not suggest that remedy lies in the RP Act. Purely at the level of industrial practices, you will only discover that the race is being won by those who have the resources to offer quality on the requisite scale and stamina to outlast the financial losses. The word monopoly is a red herring; it is best avoided.

But that does not mean that the situation is best allowed to rip along the line of its logic. If it is, we will travel even faster than in the past few years towards a still greater concentration of circulation in the hands of a still smaller number of newspaper owners, and a still higher concentration of industrial and commercial power among them. Remedy will then be far more tenaciously resisted, and to be successful if will have to be far more drastic. India's own experience as well as that of other countries suggests that we will then have a situation which is truly monopolistic. Between 1963 when concentration of ownership was already serious enough, and 1968, the number of new newspapers and journals rose three times faster than the circulation. But most of those which had survived by the end of 1970 were the new members of common ownership families; the share of circulation of the industrially owned among them was higher than of those owned by professional publishers. The dynamics of concentration is therefore flawless, and it will gather further momentum as, with improvements in printing technology, plants are replaced and agglomerated finance acquires still greater advantage.

The British Press has left interesting footprints for us on the road to extinction followed by fine newspapers which, for all their professional excellence, could not keep up with the demands of finance and scale. Through the elimination of rivals, including some which died proclaiming circulations of several hundred thousand each, three leading common ownership units raised their share of the daily week-day circulation from 45 per cent in 1949 to 60 per cent in 1961 and of the Sunday circulation from 61 per cent in 1949 to 84 per cent in 1961. Anything these figures leave to the imagination was fully spelt out by the London *Times* in its evidence before the second British Press Commission in 1962. In a moment of premonition about it own demise as an independent paper in 1967, the *Times* said "To crystallise the matter at its extreme, if one man came to own all the newspapers in the United Kingdom and conditions were such that no one could successfully establish a rival newspaper, than the nation would be in danger".

Dying Competition

Anticipating by a decade an argument lately heard in India, that conditions of concentration in this country are not so serious yet as to warrant anything like what the government proposes to do, the British Press Commission, Hartely Shawcross presiding, said in a reference to the *Times* testimony, "It is possible to take the sanguine view that such results would never arise. It is not, however, prudent to wait till they do arise before taking any action. The conclusion which we have reached, although with some reluctance, is that the potential dangers of deliberately continued concentration of ownership cannot be dismissed and that some means should be sought to protect the order against them". Well may the Commission have uttered this warning: since the previous Press Commission had reported twelve years earlier, one national daily, four national Sunday papers, one provincial Sunday paper, one London evening paper, 12 provincial daily papers, 33 provincial weeklies and 40 national magazines had disappeared.

Across the Atlantic the position is worse. In the year of the latest available figures, 1968, there was no local competition between daily newspapers in 97 per cent of the country's 1500 cities. Fifty years ago the figure was 57 per cent. There were only 45 competing daily newspapers in 1968 against 288 in 1930, 159 chains and groups against 55 and they owned 828 papers against 311 in 1930. And even then, 159 common ownership groups accounted for only 46 per cent of the total daily circulation in the USA in 1968. In India 65 groups accounted for 74 per cent. Riding only the chariot of "free enterprise", the "free" press is travelling towards its nemesis much faster in India than it did in the USA, and it will be over the brink not too

far hence unless something is done about it now.

It matters very little to the reader whether his choice is whittled down by take-overs and mergers, as in Britain and the USA, or by the environment being what the *Times* feared it would become in Britain and as it has very nearly become in India, that "no one can successful establish a rival newspaper". In that statement lies both the justification and inadequacy of the present proposals of the government.

III

Classifying rather broadly, the state of the Press places six tasks before public authority:

(1) to de-link ownership of newspapers from corporations whose primary financial stake and professional interest are not publishing newspapers but other areas of business and commerce.
(2) to diffuse the ownership of newspapers which are of a size above a certain ceiling, however they may be owned, so that their shareholding is more widebased.
(3) to reduce the concentration of ownership of circulation by ensuring that more of the new circulation at least, and if possible the present circulation also, is shared by a larger number of newspapers.
(4) to promote dispersal of the centres of newspaper publication throughout the country, so that the contact between the Press and the community is more varied and extensive.
(5) to make employees of newspapers closer partners in running them.
(6) to ensure the independence of the editor against day-to-day interference by the proprietor, which in Indian conditions is a task of as high a priority as any listed above.

The government's proposals address themselves to the first two and the fifth objectives, and not at all to the third, fourth and sixth. For this reason one must call them very inadequate. Even in tackling what it aims to, the bill makes provisions which are complicated and cumbersome, open to misuse and evasion, and not all their drawbacks in these respects are capable of remedy within the present scheme. Remedy for them lies in an entirely new strategy.

The bill would effectively limit the aggregate participation of all corporation finance in the equity of a newspaper to a maximum of 20 per cent, that of interconnected corporations to 10 per cent and of a single corporation to five per cent. This is excellent. But there are several defects and, as remedies are suggested, the faults of the present strategy will become more clear.

First, the bill applies not only to mainly non-publishing corporations owning newspapers. That it should; but it equally applies to mainly publishing corporations, and the wisdom of that is open to question. After providing against the former pretending to be the latter, corporations whose business and interests are devoted entirely to newspaper publishing and allied activities should either be exempted or brought in only when they cross a much higher than the prescribed ceiling. Since the purpose of the entire bill, and of this provision in particular, is to cut the nexus between the leading newspapers and centres of industrial and commercial power, a distinction should be made between newspapers which are afflicted by the nexus and those which are not.

Second, there are no convincing safeguards against the shares required to be off-loaded by the corporate sector being picked up by it under different disguises. Newspaper employees themselves may be used for this purpose; being employees of a company in which the largest block of shares would still be held by the corporate sector, they would not be as far beyond manipulation by the real purchaser as one would want. Employees of other companies of the corporations may also prove to be handy. Or the apparent purchaser may be only the Trojan horse of other interests whose entry into newspapers claiming to be free and independent is best avoided. For example, political parties or employees of unions which are affiliated to parties. Means should be found for encouraging the desirable kind of purchaser and discouraging the undesirable. Two companion provisions may be worth considering: each purchaser should be required to satisfy designated authority that the purchase money is his own, and monetary assistance should be provided for those who are considered worth encouraging. One way may be to enable whole categories of staff, or even sub-categories, to buy shares against a cut in salary or provident fund, the shares being held, until the money is paid, by the public trustee (or trustees, if representing different categories) who should in such cases, be represented by nominees of the concerned staff.

Thirdly, it is very likely that all the shares will not be diffused in this way, and a substantial portion will go into the hands of the public trustee, a government nominee. This is a dangerous possibility and must be neutralised at once — for example, by laying down that the public trustee shall not participate in any discussion or voting on matters of editorial policy, unless by the methods suggested earlier, the need for appointing a public trustee is eliminated altogether. Alternatively only people of eminence in public life and independent of the government as well as commercial and industrial complexes, people of the kind suggested as trustees for a larger purpose in a later paragraph, should be appointed as trustees for this limited purpose as well.

Under Section 424H, the bill does a much better job of keeping the officialdom of non-publishing corporations out of the newspaper business. This is a swift and unambiguous provision. The way companies function is often determined much more by the nature of the management than by the nature of the shareholding community; hence the importance of this provision. But it needs to be extended. At present it only debars directors, managing directors and managers of non-publishing companies from holding such positions in a newspaper company; it should also debar other employees of the former. Similarly, such officials of one publishing company should also be debarred from holding such positions in another publishing company, to reduce chances of (a) inter-locking of publishing companies, which can also lead to unwelcome concentrations of circulation (b) an existing newspaper publishing company escaping the Act by breaking itself up nominally into companies of a size which is below the thresh-hold of the Act.

As in respect of its main purpose, in respect of one of the lesser ones — workers' participation in management — the bill picks up a good idea and then twists it into an impractical shape, making one wonder whether it is *intended* that the scheme should not get off the ground. As an industrial plant or as a management problem, a newspaper factory is no different from another. It is only as a member of the Press that it has a distinct place in a democratic society. Therefore it is only in its journalistic aspect that the newspaper industry qualifies for special treatment, not as an industrial plant. Why, then, should an accountant or mechanic or lorry driver in a newspaper be treated differently from those in a steel mill for giving them representation on the board of directors? Their claim for it is no less than, but also not more than, of comparable employees in other industries, and

should progress, as it should, alongside theirs. In the meantime, there can be a case, and a good one it is, for bringing journalist members of the staff into association with the management of the newspaper — as a newspaper, not as an industrial plant. Therefore a double distinction has to be kept in view: between the journalist and non-journalist members of the staff, and between the journalistic and non-journalistic functions of a newspaper establishment.

The bill not only ignores both these distinctions but gives to the staff half the seats on the board of directors without their acquiring any shareholding. This is a novel proposition, to say the least. If half the directors of a company have no financial stake in it beyond that of their jobs — which is not to be underestimated of course — then all kinds of short-sighted decisions may be confidently expected, for example on staff salaries. Therefore either these provisions should be substantially scaled down, keeping in view the distinctions mentioned above, or it should be provided that in any newspaper to which these provisions apply unaltered, wages would be directly related to profits. Otherwise the result may be that, like those who would have been tenants instead but became landless labour, newspaper employees will only be engaged as daily wage staff.

Much healthier in this respect is the provision that the bill will not apply at all to a newspaper pubised by a co-operative society of which not less than 51 per cent members are working journalists or other employees of the society. Here also there may be a problem of impersonation. India's experience of co-operatives is rather full of such examples, and various kinds of dodges will be easy to apply if only a small and tightly held co-operative society is formed to own and operate a big newspaper; one cannot see any safeguards in the bill against even the existing newspapers being put on that footing. A small body of "dependable" staff can be safely found which will qualify the society under the 51 per cent provision. But if means can be found for plugging these loopholes, and if financial institutions exist which will prime their pump for such co-operative societies, this provision is healthy encouragement for the right pattern of newspaper ownership. Economies of scale have a part to play so long as they do not get out of hand, and the bill rightly allows for them in the case of newspapers with a co-operative or diffused ownership.

Negative Approach

But the bill errs on the side of making only a negative approach to what is in all circumstances a desirable objective and will become increasingly desirable when newspapers have no additional readership to cater for and start to snatch readers from other newspapers. While correct in not placing a restriction on the rise in circulation of leading circulation papers provided their ownership schemes conform, the bill should even now encourage those newspapers, by discriminating in their favour, which do not form part of chains and groups and are not published fom the existing main centres of newspaper publication. To some extent, further concentration of circulation in a few hands and a few areas will be discouraged when the play of the powerful concentrates of urban-oriented industrial high finance is reduced in the newspaper industry and the terms of competition made less unfair. But it is not too soon to start giving positive encouragement to newspapers which can even now make a contribution to the diffusion of circulation.

The greatest lacuna in the bill, so glaring that one cannot assume the ommision is accidental, is this: No matter who the owner may be, it is one of the most essential requirements of a genuinely free Press that the owner should not interfere with the day-to-day responsibilities of the editor. But the bill is silent on this. If a proprietor desires such a close degree of control on his paper, he should appoint himself as the editor and not use another's shoulder for firing his ideological guns. The proprietor is fully entitled to lay down the broad policy mandate; he should be completely free to declare in it that he stands for the abolition of the Directive Principles of the Constitution or of all land legislation. But in fairness to the reading public the mandate should be laid down in a public document. Once the editor accepts it, he should be left free to work within its ambit, and the judgment whether he is faithful to it or not should neither rest with the editor nor the owner but with an agreed and declared third party of credible independence.

This was the essence of the scheme of editorial independence which the present owners of *The Statesman* accepted when the newspaper changed hands and subsequently, in an enormously irresponsible and arrogant act, abolished overnight in a manner humiliating to the third party, the Trustees, who were men of far greater public standing than any of the proprietors. The full story of that act has yet to be told, but there is no reason to fear that its repetition cannot be prevented. It may be impracticable to find suitable trustees for all the newspapers, but the difficulty is not insurmountable. A beginning can be made with half a dozen of the leading newspapers; they can set such an honourable example that it is bound to have a healthy effect upon all the rest. Or a common authority of the requisite standing can be set up for groups of newspapers or all of them. It can either be made obligatory for newspapers to accept such a scheme or they can be given the incentive of selective relaxation of other provisions of the bill. But it is important to realise that day-to-day proprietorial interference with the editorial mandate can be as bad in the case of a newspaper with one kind of ownership as with another kind. I would possibly exempt only party newspapers but would prefer not to.

IV

The main source of the shortcomings of the present proposals is that they rely exclusively on the law and not at all on incentive. And that too they do by extending to such a varied and flexible industry as newspaper publishing the complicated provisions of India's most cumbersome piece of legislation, the Companies Act. Law should be used only as a supplementary power, to do what cannot be done otherwise; then, in combination with other measures, it can be twice as effective. If it seeks to do much or many different kinds of things it becomes ineffective. That can be the fate of the intended legislation. In order to plug all conceivable loopholes it can make itself hopelessly complex. As it is, it has several more or less duplicating provisions, all trying to achieve broadly the same thing by different means because none of them is good enough by itself. And yet it leaves uncovered not only the loopholes and inadequacies mentioned already but a hole big enough for a Rolls Royce to go through: that a newspaper may escape the provisions of this bill altogether by converting itself into an individual ownership; or into several different editions, each below 15,000 copies but each claiming to be a separate newspaper sharing services with all the others. The fate of such laws is best reflected in what happened in the USA a couple of years ago: anti-cartel and anti-monopoly laws were found to have been so extensively violated that a law had to be passed to regularise the violations. The former laws disappeared over extensive areas of their previous jurisdiction.

The aims of the law for the present purpose should only be (a) to curtial the power of non-publishing finance in the newspaper industry by liquidating the nexus with the high finance of business, (b) to discourage concentration of the ownership of circulation by providing for more fair competition and greater dispersal, and (c) to ensure a reasonable degree of editorial independence. This it can do by using only two of the proposed provisions, those relating to corporate finance and managerial personnel, and supplementing them with: (a) either a price-page schedule or a steeply slabbed tax on all advertisement revenue above the level needed for comfortable viability at a circulation of, say, 100,000 (to be revised upward as total readership grows); (b) a requirement that newspapers must provide the suggested safeguards for editorial independence and (c) the power to treat each newspaper in a group as a separate entity for financial purposes but the groups as a whole as a single entity for the allocation of newsprint, the former to prevent the profits of a successful unit being used to subsidise new additional units, the latter to provide a more direct curb on the growth of chains and groups by slabbing down the allocation according to the total circulation of the group.

Beyond that the government should only use, and needs to use only, incentives which are best applied through a newspaper finance corporation and discentives which it has the power to apply so long as newsprint has to be rationed. As it is, the slabbed system of newsprint allocations has begun to have some impact: the dip in the statistics of the bigger newspapers between 1967 and 1968 has not been wholly made up though it has been largely. Further refined, and aided by the suggested supplementary legislation, these tools can bring about all the desired changes. More slowly but with much greater stability, reforming the Press instead of sending it into financial or professional doldrums.

Unemployment and Brain Drain

Kamalesh Ray

Unemployment and the brain drain necessarily co-exist in a developing country. Both reflect non-utilisation of human resources. Unemployment may be termed internal brain drain, while losing qualified personnel to foreign countries constitutes external brain drain.

Any desire or plan to stem the brain drain is obviously not motivated simply by a desire to hold people within the political boundaries of the home country. If it were so, the solution could be very simple.

Unemployment and migration of personnel become problems only in the context of work which has to be done and tasks which remain to be accomplished in the country. The potential contribution of the utilised work force need to be considered in planning for national reconstruction.

While Government has been anxious to obtain a correct account of the unemployment among scientific and technical personnel at home and of those who have chosen to live abroad, there has been too much emphasis on trying to improve the estimates and to perfect the statistics. But there is no reason why plans of action cannot be evolved on the basis of information already available. And the country does have working statistics for the purpose.

UNEMPLOYMENT and the brain drain necessarily co-exist in a developing country. Both reflect a non-utilisation of human resources. Unemployment may be termed internal brain drain, while losing qualified personnel to foreign countries constitutes external brain drain. Any desire or plan to stem the brain drain is obviously not motivated simply by a desire to hold people within the political boundaries of the home country. If it were so, the solution could be very simple. Unemployment and migration of personnel become problems only in the context of work which has to be done and tasks which remain to be accomplished in the country. The potential contributions of the unutilised work force need to be considered in planning for national reconstruction. It is estimated that over 100,000 persons with scientific, engineering, and medical qualifications are unemployed in India, and that about 30,000 more are abroad.[1]

While Government has been anxious to obtain a correct account of the unemployment among scientific and technical personnel at home and of those who have chosen abroad, there has been too much emphasis on trying to improve the estimates and to perfect the statistics. But there is no reason why plans of action cannot be evolved on the basis of information already available. And the country does have working statistics for the purpose.

Besides, a large number of vacancies exist in the country even today.[2] About half of the vacancies continued to remain unfilled for more than a year. Nobody seems to have inquired why. Unlike in other countries, recruitment at the intermediate and higher levels of scientific and technical work is not done through a 'talent hunt'. Government's embargo on recruitment in November 1966, its partial withdrawal in June 1968, and the ban again in November 1970, have left the various institutions and establishments confused. Meanwhile, several national tasks, requiring work by scientists and engineers, have remained unattended to — even as the country has continued to depend heavily on external assistance. Indeed, though external assistance

If yours is an industry dealing with petroleum, chemicals or explosive gases, there are two ways of dealing with the fire hazards. One is to get the most comprehensive fire insurance to compensate you after the event.

The other is to ensure, with Kirloskar Flame Proof Motors, that fires never occur.

What makes Kirloskar Single Phase Flame Proof Motors the best insurance against fire?

International Specifications

Manufactured to NEMA (US) Standards, and approved by CMRS (Dhanbad) CIE and Fire Insurance Pool Association, the motors are rigidly constructed with a steel shell, CI-covers and with the capacitor housed inside the cover to eliminate any possibility of sparks causing accidental explosions. Besides the perfect suitability of design and guaranteed performance, that only Kirloskar can ensure, with their two decades of experience of Indian Conditions.

So what's your problem? Inflammable gases? Combustible chemicals? Explosive petroleum? Nothing to get burned up about—if you use Kirloskar Flame Proof Motors, the only Single Phase Flame Proof Motors manufactured in India.

● Range: 0.18, 0.25, 0.33 kW continuous rated, 0.55 kW half-hour rated.
● Early Delivery.

All trade enquiries to be addressed to the Hubli Unit.

TABLE 1 : INDIAN SCIENTIFIC AND TECHNICAL PERSONNEL ABROAD
(estimated for 1970)

Field	Doctorate	Master	Other Levels
Physics	550	400	General
Chemistry	1,200	500	Science
Bio-sciences	500	250	Fields
Agriculture	250	200	
Other sciences	500	810	
Total science	3,000	2,160	840
Civil	100	1,000	900
Electrical	200	500	1,800
Mechanical	180	500	2,820
Chemical	200	650	650
Electronics and allied	100	250	350
Pharmacy	175	200	125
Other engineering and technology	545	1,400	2,355
Total engineering and technology	1,500	4,500	9,000
Medicine and surgery	500	6,000	2,500
Grand total	5,000	12,660	12,340

Source (and further details): *Technical Manpower*, Volume XIII, Number 2, February 1971.

and loans are by no means cheaper, indigenous talent is not given preference by the planners. "Indeed, Government officials have more than once said, they hoped that educated Indians in large numbers would not return, since the country has no way of putting them to work ... There is practically no one, in India or outside, who feels that India's economic growth is being held back because the country has lost educated manpower."[3]

Such observations are very common. The point is that participation of Indian scientists and engineers is very low (0.5 per cent of work force) in spite of their availability at home and abroad, and that India's economy and production have depended heavily on imported turnkey jobs, blueprints, knowhow, expertise, etc, that have made Indian engineers and scientists redundant and led to migration and unemployment. These factors act deeply and so indirectly that the correlation between slow economic growth and brain drain (external and internal) is difficult to perceive. Yet a country's economic development depends not on the dumping or pumping of foreign assistance, but on intensive utilisation of national resources of men and material.

A detailed breakdown of the brain drain is shown in Table 1. This may be taken for "order of magnitude".

Out of the 30,000 abroad, we may consider, in the first instance, the post-graduate categories as priorities. The post-graduates (17,000) make for 60 per cent of the estimated overseas scientific and technical personnel. Yet we have a backlog of unemployment among engineering and scientific personnel, of over 100,000. We need a plan against this *internal* brain drain. The present unemployment may be roughly estimated as in Table 2.

There is moreover no dearth of work. And, if there is work, how are trained people kept out? An idea of work and personnel is given in Table 3. Unemployment and brain drain of this magnitude can be tackled rationally and effectively in the organised sector if it is made a part of the national plan.

SELF-EMPLOYMENT

To start one's own industry or business can be exciting and challenging, besides being a trigger for economic development. About 4 to 5 per cent of our scientific and engineering personnel are already self-employed; as against about 2 per cent of the American science personnel, and 4 per cent of the engineers who are self-employed in the US.

Limited number of the scientists and engineers have the requisite competence and experience to start on their own. Financial requirements per entrepreneur would be larger than that required to employ one in an organised sector. It would appear, therefore, that the scope is limited in the self-employment field.

Also, its limitations should not be overlooked in the context of the large-scale unemployment and external brain drain.

Much can be said in support of medium- and small-scale industries in India today. Admittedly, large-scale industries are more efficient in terms of unit cost. It would be pertinent to question whether India should try for the advantages of super-duper plants for which foreign money and technological dependence become almost unavoidable. It has been India's experience that over-capitalisation of such plants can produce more goods than can be sold, and the plants have to be run at a partial capacity. This completely offsets the advantages of a large plant, retaining all the disadvantages.

With India's present technological and engineering capabilities it is possible to build up a self-reliant industry with indigenous knowhow which would be profitable but not as efficient as a large-sized outfit built with foreign help. Techno-economic studies for such alternatives can give a pronouncement on short-term and long-term economic benefits and losses. Our copying the methods and industrial philosophies of advanced countries often puts us on a wrong trail. Indigenously built industries could go a long way in stabilising our economy. Such a policy will give us, in the beginning, second-rate technology, but a higher real economic growth rate, and a future with technological advancement. In the other alternative, the borrowed economic culture will bring in prestigious sophistication at the cost of national economy and self-reliance.

Small-scale industries have thus a good place in the country. However, small-scale industry need not be primitive in technology. Modernisation of small-scale industry (as in Japan), run with power and standardised with instrumentation, can become a sound associate to larger industry, as well as being an industry of independent character.

EXAMPLES OF NEGLECT

Many of the employment sectors for scientists, engineers, doctors and other specialists are well known, such as education, research, industry, extension programmes, and resources exploration. I shall draw the reader's attention to a few areas which are vital but are neglected, and where scientists and engineers have to be engaged intensively.

(a) There are certain coal field areas (Raniganj) where coal seams are burning underground for the last few decades. It is a great national loss. Other countries have also experienced similar situations. Two methods are adopted: utilising the heat of burning, and gassifying the burning coal *in situ* for pipeline supply. Yet no scientist or technologist seems to be engaged on the problem.

(b) Floods continue to menace the country. What is more tragic is

that floods do occur even where dams have been built. The causative factors are identifiable, but have not been studied. 'Floods in spite of dams' needs an engineering assessment that can radically alter the dam-building and operational strategies. We need a number of scientists and engineers to study the problem.

c) Adulteration of food and drugs is on the increase. A network of laboratories are needed to test the sub-standard products in the market. A number of scientists will be required if the problems are to be handled seriously. Similarly, the shortage of forensic laboratories is hindering quick and adequate dispensation of justice in many criminal cases.

(d) The country has been heavily depending on foreign technical assistance and collaborations. This has undermined self-reliance, affected the operation of the national economy, and reduced employment opportunities. Direct outflows of money to foreign firms are also heavy. In 1968-69, the total remittances to four Western countries amounted to Rs 219 crores. Profits and dividends amounted to Rs 39.59 crores and interests on loan to Rs 179.63 crores. There is need for evaluation of collaborations, with the help of technologists, scientists, economists, and other experts, to guide the country's future policy in the matter.

These are some of the off-beat areas where scientific workers can greatly contribute.

TABLE 2 : ESTIMATED UNEMPLOYMENT (1970)

Field	Number
Science personnel (Post-grad)	10,000
Science personnel (Graduate)	50,000
Engineering and technical (Degree)	9,000
Engineering and technical (Diploma)	37,000
Medical doctors (Degree)	4,000
Total	110,000

COST ENGINEERING

The spiralling cost of manufactured goods has been causing anxiety, but it goes on unabated. There is no system of *technical* audit or assessment of cost of production which can show the validity of pricing. The entire consumer (community) is under the thumb of producers and sellers. It has to be the function of the engineers and scientists to assess the cost throughout the entire process of production. Engineering *costing* is not merely the examination of ledgers maintained by manufacturers. It involves in fact a complete engineering evaluation with expert knowledge and observations. The magnitude of the task for cost engineers can be appreciated if we consider that the national industrial product is of the order of Rs 5,000 crores a year. Cost engineering is also badly needed for public sector undertakings.

BACKLOG OF NATIONAL TASKS

Table 3 contains a list of suggested work and the corresponding additional employment potential in the next three or four years. The list of work and the allocated task force may be viewed in terms of our present deficiencies. There has been this backlog of work accumulating through the past years. Some illustrations are given to dispel any impression that the manpower requirements reflected in the Table may be unreasonably high.

Consider the first item. Two-thirds of our population depend on agriculture. Fertiliser production is being vigorously planned. Extension people are out in the field to advise the farmers. Yet, the regional characteristics of the agricultural soil are not adequately known. About 500 million acres are of interest in this connection. The extent of soil sampling and testing that has to be done is obviously very large. The basic tests are not of a sophisticated nature. These can be performed by science graduates (including agricultural graduates), under supervision of a few better qualified (post-graduate) scientists. To engage 50,000 science graduates for the basic tests would mean assigning 10,000 acres to each. This would mean some 300 samples per head per month for the next 3 to 4 years. And each soil sample is to be subjected to a number of tests. A few engineers and surveyors may also have to be attached to the teams for location and mapping. The size of the group is, therefore, not too large, and perhaps is even a little too small.

Similarly, while the primary health centres are required to be manned by medical graduates, a few biological and nutritional scientists would also be needed in the teams. A few science graduates can work with them in the infrastructure. The allocation of 5,000 doctors would mean 2,500 centres, i e, one centre for more than 200 villages. This is not extravagance.

Exploration and assessment of natural resources (mineral, ground water, forest, etc) need to be stepped up, since these are the bases of national economy. Considering the size of the country and the variety of resources

TABLE 3 : ADDITIONAL EMPLOYMENT FOR NEXT 3-4 YEARS

Area of Work	Scientific and Technical Personnel (in '000)						Annual Cost*	
	Post-Graduate Science	Engineering Graduate	Medical Graduate	Scientific Graduate	Engineering Diploma Holders	Total	Per Head (Rs '000)	Total (Rs crores)

* Includes salary, supporting staff, equipment, and other recurring and capital expenses.

available, we should need a very large number of scientists and engineers for exploration and assessment. But our geological personnel suffer the highest percentage of unemployment among post-graduate scientists.[4] Geological organisations showed the highest (25 per cent) proportion of unfilled vacancies.[5] Paradoxically again, we have given over major tasks of mineral and ground water surveys to foreign companies.

The manufacturers appear to be comfortably situated in a sellers' market. They often produce non-standard and sub-standard goods. Even the raw materials are undependable on quality from consignment to consignment. Quality control is not generally exercised. This affects the internal market as well as export. Quality control is a field in which many scientists and engineers have to be employed to make an impact on the country's economy.

Our Research and Development (R and D) is mostly technology based. Engineering R and D is advancing but slowly in the country. It needs to be accelerated by drawing more engineers into the R and D sector. Design and development with an eye on our future needs and projects have also to be consciously worked out.

A national plan in its various aspects depends on a proper understanding of the available technology and indigenous resources. These therefore need technical studies by our scientists and engineers. At present, the planning parameters — like techno-economic features, evaluation of material resources, utilisation of manpower, implications of foreign aid and collaborations, etc — are left to conjecture and opinion. These are to be studied in depth by scientifically and technically trained people in order to make the right choices and decisions.

The few items of work which have been mentioned in Table 3 show that in order to wipe out the backlog, would require more scientific and engineering personnel than the 150,000 who comprise the unemployed and the brain drain.

The presentation in Table 3 just shows the accumulated tasks and accumulated unutilised personnel; it also shows that the cost of the essential work is not frightfully high. The foundation of the national economy will remain weak if these are not accomplished.

At the moment, Rs 50 crores have been allocated for creating productive employment. The backlog of work and unemployment may cost 5 per cent of the total Fourth Plan allocations. This may signify a minor-sized reorientation, of a major character and consequence.

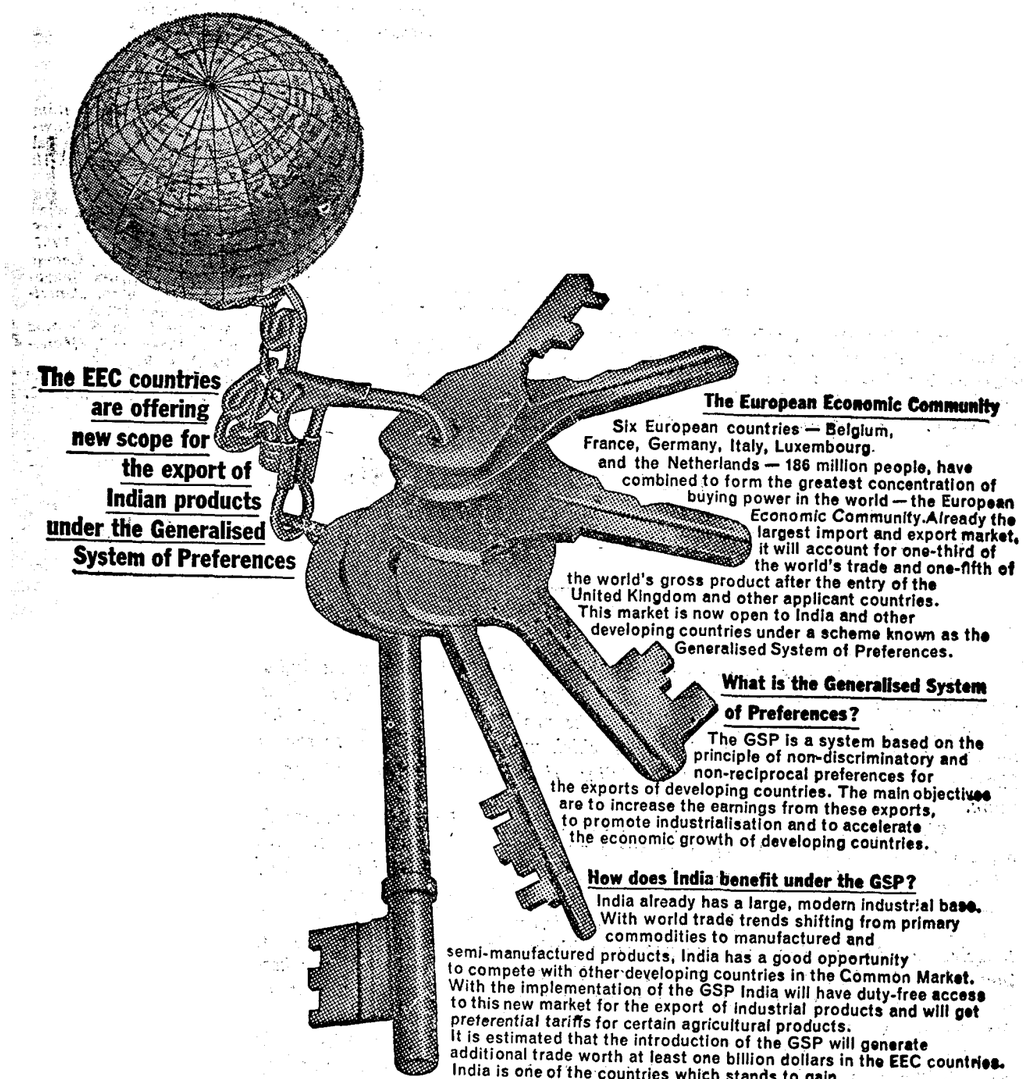
The Dollar Crisis

Possible Solutions and Their Implications for India

Samuel Paul

Charan D Wadhva

An attempt is made in this paper to examine the likely impact on India of the Nixon plan for saving the dollar and of some of the possible solutions which have been widely dicussed in the context of the current dollar crisis. An analysis of the problem from the short and the long term points of view reveals a number of implications for India which may not be obvious to the casual observer. The problems and opportunities created by the dollar crisis may not be as simple or marginal as many seem to think.



While it is true that the US import surcharge may have only a marginal immediate effect on our exports to the US, the real danger to our exports lies in the restrictive attitudes that may develop in the US in the wake of the wage price freeze. An overall reduction of even duty free imports into the US may occur and in that event is likely to hurt our exports on a wide front.

Prospects of foreign aid will turn worse irrespective of the solution that is finally hammered out to solve the dollar crisis. It does not seem likely that the EEC countries and Japan will fill the gap that will be left by the reduced role that the US will play as an aid donor hereafter. Given this situation and our growing burden of external debt servicing, there is no alternative for us but to go all out for stepping up our exports.

On the brighter side, there is the prospect that our exports to Western Europe may receive a much needed fillip as a result of an effective dollar devaluation. The revaluation of the EEC currencies will reinforce the push given to our exports by the general system of preferences. A similar trend may not develop in our trade with Japan. Because of our strict exchange control system, our import picture is not likely to change very much.

PUBLIC discussion in India has been dominated by a preoccupation with the stern economic measures announced by President Nixon in the wake of the dollar crisis, possibly because of the immediate impact they might have on the Indian economy. While this concern is understandable, it is important to remember that the Nixon measures are in

THERE IS A NEW MARKET FOR INDIA IN EUROPE – THE COMMON MARKET

The EEC countries are offering new scope for the export of Indian products under the Generalised System of Preferences

The European Economic Community

Six European countries — Belgium, France, Germany, Italy, Luxembourg and the Netherlands — 186 million people, have combined to form the greatest concentration of buying power in the world — the European Economic Community. Already the largest import and export market, it will account for one-third of the world's trade and one-fifth of the world's gross product after the entry of the United Kingdom and other applicant countries. This market is now open to India and other developing countries under a scheme known as the Generalised System of Preferences.

What is the Generalised System of Preferences?

The GSP is a system based on the principle of non-discriminatory and non-reciprocal preferences for the exports of developing countries. The main objectives are to increase the earnings from these exports, to promote industrialisation and to accelerate the economic growth of developing countries.

How does India benefit under the GSP?

India already has a large, modern industrial base. With world trade trends shifting from primary commodities to manufactured and semi-manufactured products, India has a good opportunity to compete with other developing countries in the Common Market. With the implementation of the GSP India will have duty-free access to this new market for the export of industrial products and will get *preferential tariffs* for certain agricultural products. It is estimated that the introduction of the GSP will generate additional trade worth at least one billion dollars in the EEC countries. India is one of the countries which stands to gain from this new Common Market policy.

Federal Republic of Germany

the nature of a holding operation and will, sooner or later, be replaced by a more permanent solution to the dollar crisis which is acceptable also to the European Economic Community (EEC), Japan and the International Monetary Fund (IMF). The likely implications of such longer term developments should be of even greater concern to India than the immediate consequences of the unilateral Nixon measures. The long-term answers are still in the process of being negotiated, although it seems fairly certain that a revaluation of the major European and Japanese currencies in relation to the dollar will be a part of the new international monetary system.

The new measures adopted by the United States include the temporary suspension of the convertibility of the dollar into gold or other reserve assets, imposition of a temporary surcharge of 10 per cent on all dutiable imports, a ten per cent cut in the foreign aid programme and a host of domestic fiscal policy measures to enable the economy to stand up to the requirements of its new balance of payments policy. These measures have far-reaching implications for the present international monetary system and for the prospects of achieving high rates of growth of world trade and domestic expansion of both the developed and the developing countries of the world.

I
The Background

The suspension of the convertibility of the dollar into gold or other reserve assets has shaken the very roots of our present international monetary system based on the gold exchange standard. By this act, the United States has violated its basic commitment to stand ready to convert dollars into gold at the fixed price of $ 35 per ounce which it has maintained since January 1934. This was the price agreed to by the IMF in 1947. It was partly because of this commitment which was not doubted by anyone until recently that the United States dollar acquired the status of a "reserve" currency which was not only "as good as gold" but in fact "better than gold", being an interest-yielding asset. The relative weakness of the pound sterling (which was the other reserve currency) after World War II imparted further strength to the mighty dollar.

Even though technically the world was on the gold exchange standard, it became customary for countries to define their parities in 1947 (after the coming into being of the IMF) in terms of the United States dollar. Under these conditions, the world might well have been described as functioning on the dollar exchange standard. The cornerstones of the international monetary system built around the institution of IMF in 1947 were the principles of promotion of freer world trade with relatively stable exchange rates, the convertibility of a few currencies of the major developed countries of the world guaranteed by the promise of one country—the United States—not to change the gold-dollar parity, and its commitment to defend this parity through unrestricted convertibility of dollars into gold (or other reserve assets) for the monetary authorities of the other countries of the world.

Events in recent years have changed the course of the functioning of the international monetary system and in particular the position of the United States in it. The persistent balance of payments deficits of the United States since 1951 together with its dwindling gold stock with the Treasury from $ 24.43 billion in 1949 to a little over $10 billion in 1970 through the continuous conversions of dollars into gold by France and other continental countries led to a build-up of speculative pressures on the dollar. Speculators expected a steady depreciation of the dollar or a rise in the official price of gold (which comes to the same thing as the devaluation of the dollar). Another factor on the changing international scene in the post-World War period has been the emergence of the EEC as a competitor of the United States in terms of the size of the market for traded goods in the world, balance of payments surpluses and strong reserve positions of the member countries. Moreover, productivity has grown faster in the countries of the EEC and more so in the case of Japan compared to the United States economy. The inflationary situation in the United States has also partly reduced the competitiveness of its exports. It is estimated that American prices are about 10 to 15 per cent higher than the prices of similar goods from other developed countries in the world market. Thus, the dollar appears to be over-valued in relation to the major currencies of Western Europe and more so in relation to the currency of Japan. In other words, the major currencies of Western Europe (D-Mark, Franc, Guilder, Lira, etc) and the Japanese Yen are undervalued in relation to the American dollar. Therefore, even within the framework of the present international monetary system, the need for a realignment of the major currencies of the world has become obvious. There is, however, much less agreement on the sharing of the burden of adjustment between the United States on the one hand, and the six countries of the EEC and Japan on the other.

The United States has taken the extreme position that it will not devalue the dollar (or raise the official price of gold) and that it should be the countries of Western Europe and particularly Japan which should revalue their currencies to bring about the appropriate realignment of the currencies of the world. It has used the additional 10 per cent tariff on imports as a power tool to bring pressure on these countries to revalue their currencies. The EEC and Japan have threatened retaliation in the same spirit of using tariffs as a bargaining tool for bringing about the desired realignment of the major convertible currencies of the world. France, in particular, has been equally tough in maintaining that it will not allow the franc to be revalued at least for normal *trade and governmental transactions* and that it is the United States which has the most serious problem of chronic deficits in its balance of payments which should devalue its currency by raising the official price of gold.

It appears that tariffs have worked well as bargaining tools on both sides. Japan was the first country to succumb to the pressure and has changed its position to letting the yen float against the dollar. The countries of Western Europe, including United Kingdom which is expected to become a member of the EEC but excluding France, have not been opposed to the revaluation of their currencies *vis-a-vis* the dollar. And the United States in turn has repeated its intentions of removing the import surcharge once the realignment of currencies has been secured.

II
Possible Solutions

The dollar crisis has once again pointed up the need for basic reforms in the present international monetary system where a few national currencies are relied upon for settling international transactions. These reforms pertain to the gradual replacement of the present reserve currencies (mainly the dollar and the pound) by the newly created Special Drawing Rights by the IMF and the devising of appropriate methods for sharing the burden of balance of payments adjustments between the surplus and the deficit countries. Pending the adoption of these long run reforms, at present four alternative solutions have

been discussed at the meetings of the countries comprising the Group of Ten and the EEC. These are likely to be discussed at the forthcoming annual meeting of the IMF also. Any one or a combination of these alternative solutions in some form is likely to be adopted by the world community soon. We shall now briefly analyse the salient features of these four alternative solutions and in the following section discuss their implications for India.

The first solution is obviously a formal devaluation of the US dollar by raising the price of gold by about 12 per cent. The EEC countries have now agreed at the Brussels meeting held on September 14, 1971 that they would favour the devaluation of the dollar. The IMF has already indicated that it would advise the US government to devalue the dollar.

The dogmatic position taken by the United States to save its face in the international monetary community is certainly unwarranted. A large part of the trouble in the current international crisis has been created by the persistent balance of payments the United States has been running since 1961 and its inability to meet its gold convertibility commitments to the creditor countries. There is no doubt that the United States can now be described as suffering from a fundamental balance of payments disequilibrium as evidenced by the emergence of a deficit in its balance of trade since 1970. The deficit is expected to grow from $ 1.2 billion in 1970 to twice as much in 1971. The facts of the case point only to one conclusion, namely, that the US dollar is overvalued by about 12 per cent in relation to the major currencies of Western Europe and Japan. The United States should accept the fact that under such conditions the demand for the devaluation of the dollar by the countries with balance of payments surpluses and huge dollar balances in their reserve assets is justified. The fact that most of these surplus countries are ready to revalue their currencies to some extent provided the United States devalues the dollar partially should be used by the latter to negotiate an appropriate realignment of the major currencies of the world.

If the first solution fails, the second alternative solution would be for the stronger currencies of Western Europe to be revalued by 10 to 12 per cent and the yen to be revalued by about 15 per cent. Since West Germany started floating the mark in relation to the dollar on August 23, 1971 the mark has already appreciated by about 8 per cent and since the yen started floating one week later than the mark, it (the yen) has by now gained about 6 per cent in value in relation to the dollar.

A third possible solution is to allow wider bands around the fixed parity (say, 3 to 10 per cent) compared to the present limit of allowing only a one per cent fluctuation by the monetary authorities. This solution has been proposed as part of the five-point proposal by the Office of the EEC for consideration by the member countries. This proposal is designed to lead to an effective devaluation of the US dollar through the interplay of market forces within defined bands rather than by official action to change parities. A variant of this proposal is the crawling peg solution where the parity itself is allowed to change by, say, 3 per cent every year in line with the trend of the market rates of exchange prevailing within the wider band proposal. This variant has not yet been discussed in the public statements made by the Office of the EEC but may be in the process of being discussed for presentation at the forthcoming annual meeting of the IMF.

The fourth solution which is different from the above-mentioned solutions has been put forward by the French. This relates to the institutionalisation of a new two-tier system of rates of exchange in international transactions — one relating to trade and governmental transactions and the other relating to capital transactions and tourism. It is proposed that there should be a fixed parity for the first tier transactions to remove uncertainties in conducting normal export and import trade and governmental transactions which should be allowed to fluctuate only within the presently accepted limits of 1 per cent around the defined parities, whereas market forces should be freely allowed to determine the exchange rate on the second tier of transactions. The purpose of this two-tier scheme is to insulate the genuine traders on the monetary authorities from the assaults of speculators on certain currencies which upset the normal functioning of the international monetary system. Besides the French, the Belgians and more recently the Swiss have endorsed this two-tier scheme and it is already in operation in France. This scheme has the potentiality of standing upto the immediate needs of the international monetary system but would need to be supplemented by longer run basic reforms in the system.

III

Implications for India

We shall analyse below the implications of the dollar crisis for the Indian economy under three heads: (1) the immediate impact of the Nixon measures of the import surcharge, foreign aid cut and wage-price freeze; (2) the effective devaluation of the dollar either through the revaluation of the key currencies or an increase in the dollar price of gold; and (3) the long-term prospect of a wider band within which exchange rates may be permitted to move or the adoption of a two-tier exchange rate system. The second and third are more relevant from a long-term point of view while the first concerns the present. A comprehensive analysis must cover both the short- and long-run consequences.

Impact of the Nixon Plan

Judging by the visible reactions to the dollar crisis, the impact on India's trade and money markets is anything but significant. There has naturally been a sense of anxiety in trade circles. Domestic gold price went up, possibly in anticipation of a rise in the dollar price of gold. The stock market, on the other hand, did not show any evidence of turmoil. Thus, by all indications, no crisis of any kind was precipitated in India by the Nixon plan.

When there is uncertainty about exchange rates, two activities which invariably get disrupted are trade and tourism. In the event of an expected realignment of exchange rates, trade transactions and travel plans tend to get postponed or cancelled, holding up productive operations or reducing the foreign exchange earnings of the country. In India, authorised foreign exchange dealers have by now adjusted to the new situation and reports are that transactions are not any longer held up because of the exchange rate uncertainty. As a result of the strict control over capital movements which has been in force in India for many years, disruptions due to speculative transactions can be treated as minimal. It is reasonable to conclude that the initial phase of mild confusion in trade and related transactions in India which followed the announcement of the Nixon measures is over.

The focus of the Indian public commentary on the Nixon measures has been on the likely impact of the import surcharge on our exports. It is estimated that only 15 per cent of our exports to the US would fall within the purview of the surcharge. Jute goods

Table: Distribution of Indian Exports and Imports by Major Markets (1969-1970)

(Per Cent)

Country/Region	Distribution of Exports from India	Distribution of Imports to India
(1) USA	16.9	29.4
(2) United Kingdom	11.7	6.4
(3) EEC	7.1	10.9
(3.1) West Germany	2.1	5.3
(3.2) Italy	0.9	2.5
(3.3) Others	4.1	3.0
(4) East European Countries	21.8	18.0
(4.1) USSR	12.5	10.9
(4.2) Czechoslovakia	2.1	1.5
(4.3) Others	7.2	5.6
(5) ECAFE	24.5	16.6
(5.1) Japan	12.7	4.3
(5.2) Australia	1.7	2.0
(6) Other Asian Countries	5.1	2.4
(7) Africa	6.1	9.0
(7.1) UAR	2.5	1.4
(7.2) Others	3.6	7.6

Source: DGCIS, Calcutta.

(except bags and yarn), cashew, fish, tea, spices, handicrafts, etc, which enter the US duty free account for nearly 77 per cent of the Indian exports to that country. However, the dutiable exports consist mainly of non-traditional items such as engineering goods, chemicals, textile and clothing items. Given this background, what is the overall impact on Indian exports likely to be in the short run?

Indian trade and financial analysts have been unanimous in their conclusion that the impact of the Nixon plan on Indian exports is likely to be marginal. After all, the lion's share of our exports will not be affected by the surcharge. However, this conclusion may be based on a superficial analysis for two reasons. Firstly, the non-traditional goods which fall within the dutiable category constitute the faster growing segment of Indian exports. The US import surcharge by raising the cost of our dutiable items, may reduce our competitiveness in that country and substantially hurt our strategy of expanding the non-traditional segment of exports in the single largest market in the world. Though quantitatively the reduction in exports may not amount to very much, the surcharge would have succeeded in putting an effective barrier on our export front.

Secondly, the import surcharge is only one of the measures announced by Nixon. The wage-price freeze and the general nationalistic fervour generated by the new Nixon policy are bound to have an indirect and adverse effect on all imports into the US. The freeze is no doubt aimed at controlling inflationary spending. A general freeze *per se* will not distinguish between the propensity to spend on domestic as against imported goods. However, when nationalistic feelings are aroused, there is no doubt that the scales will be tilted against foreign goods. At least it is easier to do so. This certainly has some implications even for our duty free exports to the US. Many of these items are consumption goods which become easy targets in an emergency regime of wage-price controls. Reports have recently appeared in newspapers about the serious setback experienced by our shrimp export to the US. Though the freeze is supposed to be lifted in November, some form of control over wages and prices is bound to continue in the US. This may well have an adverse impact on our tourist traffic this year which usually picks up in the winter season. The US today is our single largest trading partner (see Table) and a slump in our overall exports to the US cannot be brushed aside as marginal.

It is important to remember that we are concerned here only with the short-run impact of the Nixon measures. As a result of these measures the US may be expected to regain its strength and vigour eventually. By then the US may cast off its restrictive policies and support trade more willingly. But in the short run, i e, in the next one year or so, the outlook is not bright for such a change. Nor is it easy for us at short notice to make up for the decline in our exports to US by expanding our trade with other countries Some improvements perhaps in respect of jute exports may be feasible because of the turmoil in Bangla Desh. Thus, the short-run impact of the Nixon measures on Indian exports may well be more serious than is made out by most Indian trade analysts.

Implications of Effective Dollar Devaluation

It is expected that the effective devaluation of the dollar either through a revaluation of the major European and Japanese currencies or an increase in the price of gold will be of the order of 10-12 per cent. What is the likely impact of this measure on India's trade prospects and balance of payments?

India has declared her intention to maintain the rupee's parity with the dollar. Once the devaluation becomes effective and the US import surcharge is removed, we would be back to where we were before the Nixon plan in relation to the US. In other words, trade with the US which is our leading trading partner will not be disturbed on account of any change in the foreign exchange rate or extent of protection. However, as has been discussed above, there is a high probability that the new domestic policy of Nixon will cause the US propensity to import to decline at least temporarily.

Similarly, there is no reason to believe that our trade with the developing countries (Asia, Africa and Latin America) would be affected by the dollar devaluation. These countries are certain to maintain their parity with the US dollar and hence with the Indian rupee also.

Some changes, however, are likely to occur in our trade relationships with the EEC countries and Japan. Indian goods will become marginally cheaper in these countries and their products a bit more expensive (10-12 per cent) in India. In order to evaluate the likely developments, it is useful to have some background on our trade with these countries. The Table provides the required summary information for 1969-70.

Exports

In 1969-70, India's total exports and imports were Rs 1413 crores and Rs 1567 crores respectively. It will be noticed that with the EEC countries as a group, we have a trade deficit. The price advantage that the revaluation of their currencies bestows on us may help to increase our exports to them. This trend will be reinforced by the adoption by EEC with effect from July 1971 of the generalised system of preferences (GSP) under which imports from developing countries of semi-manufactured and manufactured goods will be permitted free of duty or at substantially reduced tariff rates. Revaluation together with GSP should give our exports to EEC a much needed boost. As a result, we may have a substantial advantage in the export of textiles, clothing, certain engineering and automotive products to Europe. It is important to remember, however, that we will have to face competition from other developing countries in our efforts to export more to Europe. Our only advantage over them is that we are a little ahead of them in terms of our industrial diversity and potential.

The other country against which our competitiveness will be strengthened is Japan. Theoretically, we should be able to persuade Japan to buy more goods from India. The only snag is that we already have a sizeable trade surplus

with Japan (see Table). Nearly 45 per cent of our exports to Japan consists of iron ore. If Japanese exports to US get hit and her iron and steel industry slows down, the chances are that our iron ore exports may also slump or at least lose momentum. The persistence of a trade surplus may also tempt Japan to bargain for bilateral agreements so that Indian imports from Japan increase. Unlike the EEC countries, Japan is not yet committed to a general policy of trade liberalisation. Faced with a growing threat to her export trade, she may well fall back on restrictive trade arrangements. Our trade relationships with Japan need to be examined closely in view of these potentially harmful possibilities.

India has a trade surplus with UK also. Since the pound will also be revalued, this trend will get reinforced. But our exports to UK consist largely of semi-manufactured goods where the import elasticities are small. Our exports to UK of items like textiles have in fact been declining over the years. The price advantage we gain through the revaluation of the pound will not therefore result in any significant increase in our exports to UK. On the other hand, the danger of UK adopting restrictive trade policies is less serious than that of Japan since as part of EEC she will be committed to increased trade liberalisation.[1]

The role of invisibles in the Indian balance of payments is relatively small. Our credits and debits in terms of tourism, transportation and investment income are on the whole marginal although remittances of profits and interest accruing to foreigners have been growing over time. Though European and Japanese tourists should find India a bit cheaper than before, one doubts whether their response will amount to very much since in this business culture, traditions and attitudes play a dominant role. If our tourism planners can successfully tackle the problem at this level, our increased price advantage may be used as an additional bait.

Imports

Our import prospects are not likely to be affected very much by the dollar devaluation. First of all, we operate within a regime of strict import control which minimises the scope for any major readjustments. Secondly, nearly 50 per cent of our imports are from the US and the East European block neither of which would change their prices for the Indian market as a result of the devaluation of the dollar. India will find imports from the EEC countries and Japan marginally more expensive. As a result, US imports will tend to become slightly more competitive from our point of view. This is an area in which considerations of technology, aid and collaborations play an important role. We do not therefore feel that the dollar devaluation *per se* will have a perceptible influence on the volume and direction of imports.

Transactions on Capital Account

What is likely to happen to long-term capital movements in terms of aid, private investments, etc? In the Indian balance of payments, official capital transactions dominate and account for over Rs 1,000 crores annually. Private transactions are negligible, being around Rs 60 crores. Since we have an overall trade deficit, it is obvious that the excess of imports over exports is financed largely by long-term official capital flows. Nearly 75 per cent of the official capital receipts came from governmental aid 40 per cent of which was accounted for by US aid in 1969-70. A decline in fresh aid authorisations is already evident. In 1969-70, aid authorisations have declined by a third compared to the preceding year and the share of US aid authorisation has dropped from 40 per cent to 33 per cent.

The deepening aid fatigue is likely to be accentuated by the dollar crisis. Nixon's 10 per cent cut in aid is symbolic of this trend. The US may be expected to progressively reduce its share of aid to developing countries. The Europeans have never really taken an active part in expanding aid. It is reported that the official developmental assistance by West Germany, France and Japan together has declined as a per cent of their GNP in 1970 as compared to 1969.[2] The total aid provided by them to India in absolute terms in recent years has been less than half the US official aid during the same period. It is reasonable to conclude, therefore, that the declining trend in foreign aid will be reinforced by the dollar devaluation. Nor is it likely that increased private aid will make up for the slack in official aid. Private foreign investment in India has been on the decline in recent years. The revaluation of EEC and Japanese currencies should make it marginally more attractive for the businessmen in these countries to invest in India. We doubt very much that this trend will develop in any significant fashion in view of our ideological hang-up on foreign investment.

Does this mean that a major foreign aid crisis will develop in India in the immediate future? The answer is "no". As of now, we would have a total of over Rs 900 crores of aid in the pipeline which will see us through at least another year or a little longer even if no fresh aid is forthcoming. What is to be noted is the lower rate of aid inflow to which the economy will have to get adjusted. The most effective way of adjusting to the new situation is by stepping up our exports. Instead of merely preaching self-reliance, we will now have to practise it with all our strength!

An important item in our external capital account is debt servicing. Total debt servicing which was Rs 275 crores in 1966-67 has risen to Rs 435 crores in 1970-71.[3] Nearly two-thirds of this amount is accounted for by amortisation of external debt. To the extent that some currencies of the creditor countries are revalued, the debt servicing burden will increase for the borrowers. It is estimated that of the loans India has to repay in foreign currencies, nearly 30 per cent are due to the EEC countries and Japan. Government as well as private firms which have utilised these loans will now find that the rupee cost of servicing their debt has gone up by about 10 per cent. The annual incidence of this increased cost will be of the order of Rs 15 crores for the economy. The cost of servicing dollar loans, of course, will not be affected at all. One consequence may be a move on the part of India to get a rescheduling of debt arranged with EEC and Japan. Once again, the increased burden of debt servicing underscores the importance of stepping up exports.

Implications of Wider Band/Two-Tier System

The impact of the proposed wider band/two-tier system on India's trade will not be significantly different from that of an effective dollar devaluation which has already been analysed above. However, a couple of comments are in order.

Firstly, under the two-tier system, the market determined exchange rate will apply to non-official capital flows and tourism. The uncertainty about rates may have an adverse effect on the growth of both these components of the balance of payments. In the Indian case, private capital movements are not significant and fluctuating exchange rates may reduce the prospects of these becoming important in the future. Indian investors abroad (joint ventures) will find that their remittances to India will be subject to greater uncertainty.

Tourism which is expected to grow may also receive a setback under the two-tier system because of the greater uncertainty which private travellers will have to face in exchanging currencies while abroad.

Secondly, the wider band may tend to make traders all over the world more cautious in their transactions. Only experience will tell whether this will result in a shrinkage of world trade. However, it is likely that in the case of most of the developing countries with presently overvalued currencies like India, the trend in the operation of the scheme for wider bands will be towards a depreciation of their currencies in relation to the currencies of the developed countries and its effect will be similar to that of devaluation. This may provide greater competitive advantage to Indian exports in the markets of the developed countries and reduce imports from them to some extent. It may make it easier for India to correct the extent of the overvaluation of the rupee in an orderly fashion by adopting a crawling peg scheme.

Impact on Exchange Reserves

India's total international reserves in January 1971 was of the order of $ 1.08 billion which was accounted for by gold worth $ 243 million, SDRs worth $ 162 million and foreign exchange of the order of $ 656 million. The dollar assets of India reported by the US Treasury in January 1971 amounted to $ 236 million or about Rs 182 crores.[4] An effective devaluation of the dollar by 12 per cent (either directly by the US or through the revaluation of the currencies of Western Europe and Japan) would have implied an exchange loss for India of about $ 28 million (Rs 22 crores approximately) in terms of the purchasing power of the dollars held by us *vis-a-vis* Europe and Japan. This effect will be neutralised to the extent that our holdings consist also of sterling and other major European currencies.

The raising of the official price of gold by the US and our maintaining the rupee-dollar parity would imply a capital appreciation in the value of the official gold held by us. The adoption of the wider band scheme or the two-tier system is likely to reduce the need for creating new SDRs in the coming years and India (like other countries of the world) may not count on getting a fresh supply of SDRs. The effects of these schemes on our level of reserves are hard to predict for much will depend on what happens to our export earnings, import bill, capital movements and foreign aid.

IV

Conclusion

In this paper we have examined the likely impact on India of not only the Nixon plan for saving the dollar but also some of the possible solutions which have been widely discussed in the context of the current dollar crisis. An analysis of the problem from both the short- and the long-term points of view reveals a number of implications for India which may not be obvious to the casual observer. The problems and opportunities created by the dollar crisis may not be as simple or marginal as many seem to think.

First of all, while it is true that the US import surcharge may have only a marginal immediate effect on our exports to the US, the real danger to our exports lies in the restrictive attitude that may develop in the US in the wake of the wage price freeze. An overall reduction of even duty free imports into the US may occur and in that event is likely to hurt our exports on a wide front. Secondly, prospects of foreign aid will turn worse irrespective of the solution that is finally hammered out to solve the dollar crisis. It does not seem likely that the EEC countries and Japan will fill the gap that will be left by the reduced role that the US will play as an aid donor hereafter. Given this situation and our growing burden of external debt servicing, there is no alternative for us but to go all out for stepping up our exports.

On the brighter side, there is the prospect that our exports to Western Europe may receive a much needed fillip as a result of an effective dollar devaluation. The revaluation of the EEC currencies will reinforce the push given to our exports by the general system of preferences. A similar trend may not develop in our trade with Japan. Because of our strict exchange control system, our import picture is not likely to change very much. The consequences of the wider band proposal may not be significantly different from those given above except insofar as it may facilitate a realignment of currencies to take place more easily than at present.

Notes

1 UK is not expected to adopt the GSP for a year even after joining the EEC. Our exports to UK will therefore be subject to higher tariffs *vis-a-vis* EEC.

Rehabilitating the Disabled

SOME 300 million disabled people throughout the world require rehabilitation services they cannot get. Motoring and industrial accidents are adding another three million crippled persons every year to the world total of disabled, adds a UN report. The survey of rehabilitation problems calls for increased international assistance for the training of specialists and the setting up of pilot programmes to help disabled people return to active community life. It also advocates more stringently applied regulations to curb traffic and industrial accidents, and stepped-up immunisation and medical programmes to lessen the incidence of crippling and disfiguring diseases.

It notes, for instance, that millions of blind people in the developing world could regain their sight if a simple cataract extraction operation was made available to them. The operation can be carried out by medical aides under the supervision of a doctor.

Wars and civil unrest, diseases of various kinds as well as accidents caused by traffic, work and other means still force millions of people to spend the rest of their lives handicapped by various disabilities, says the report. But nowadays, it adds, the possibility exists for most of them to return to normal active life.

The report points out that more than 850,000 children were being treated for leprosy in 1968, but they were only a small percentage of the sufferers of this crippling and disfiguring disease, and most of them cannot be rehabilitated under present conditions.

The rehabilitation problem is not confined to the developing world. In the United States, for instance, the report says that 207,000 persons were rehabilitated in 1968, but more than 300,000 new physical and mental disability cases requiring rehabilitation remained unattended.

A number of UN and non-governmental organisations have been involved in these rehabilitation programmes.

India Steamship Company Limited

Speech of the Chairman, Sir A Ramaswami Mudaliar

THE following is the Speech of the Chairman, Sir A Ramaswami Mudaliar, KCSI, DCL (Oxon), delivered at the Annual General Meeting of the Shareholders of India Steamship Company Limited on September 23, 1971:

GENTLEMEN,

The Audited Accounts and the Directors' Report for the year ending 31st March, 1971, has been in your hand for sometime and with your permission I shall take them as read.

I have to note with profound sorrow about the sad and sudden demise of our valued colleague on the Board, Mr S K Handoo. His ability, experience and valued counsel were assets to the Company. We all shall miss his matured and wise contributions to the discussion at Board Meetings. The Board has conveyed its condolence and sense of loss to the family of Mr Handoo.

FREIGHT EARNINGS

As the Directors' Report states, the freight earned during the year was Rs 14,20,17,295/- as against Rs 12,63,44,486/- in the previous year which is the highest amount of freight charges earned by the Company in a year so far. It has been explained in the Directors' Report that due to various factors the Company had to contend with during the year, Profit and Loss Account shows an unfavourable result after providing Rs 1,27,05,317/- for depreciation and meeting all other normal charges. It has also been explained that cost increase during the year was on a worldwide basis and quite unprecedented. Most of the costs were controllable in that they were imposed upon shipowners frequently without notice and invariably without any discussion or negotiation. Ports all over the world have been repeatedly facing increasing demand from water front workers, the burden of which Port Administration passed on to owners and shippers. Despite the efforts of the Lines engaged in Conference Service, the earnings could hardly cover the cost of operation and it was an inescapable conclusion that there will have to be additional revenue to meet the increased cost if the Conference services were to be maintained.

SOME BASIC CONSIDERATIONS

During recent months the Conference system has been under severe criticism on account of the approaches made for increase in freight rate levels. In several quarters views have been expressed questioning the efficacy and/or continued need for such type of shipping service. It therefore may not be out of place to point out some of the basic considerations relevant to this matter.

In the first place the nature of India's export trade is such that the main commodities moving cannot be regarded as being solely available from this country. It is an unfortunate fact the Indian exporters face competition, all too frequently severe competition, from alternative sources of supply of such commodities. Understandably Indian exporters therefore seek the lowest possible freight rates especially since commodity values are not at such levels for the freight factor to be regarded as an insignificant part of CIF value.

In recent months tramp rates are very firm. In the absence of a Conference liner service, exporters would find it extremely difficult to bear the level of freight the tramp can and does command. This is irrespective of the consideration whether or not the exporter can offer full ship loads on his own account or in consortium with other exporters. The Conference system of liner shipping offers a certain stability in freight rate levels. Before freight levels can be increased most Conferences (and certainly all Conferences of which the India Steamship Co is a member) engage in consultation with the Trade in an effort to achieve mutual understanding between the Trade and the Conference lines of each others problems, so that fair and proper rates may be fixed. No exporter wishes to see an increase in any factor affecting his costs. The Shipowner is also an exporter (even if his export is of the so-called 'invisible' variety) and he too derives no satisfaction from being compelled to accept increases in his costs. The considerable criticism levelled at Conference liner shipping has been, broadly, two pronged; on the one hand the exporter complains bitterly at the level of rates and on the other hand at the standard of service offered. On a hard freight market ships are not easy to find when required since very firm rates are only commanded when the demand for shipping exceeds available supply. On the other hand the Conference service maintains regularity, frequency and a far more stable rate level than does tramp shipping. The liner vessel rate does not rise to the level that tramp rates go, nor does the liner rate increase from day to day without notice as is the case with the tramp.

UNPRECEDENTED HEAVY INCREASES

The Shipowner, as earlier mentioned, does not derive any satisfaction being compelled to accept cost increases and in the last 12/18 months the Shipowner has been faced with unprecedentedly heavy increases in cost. A dramatic increase in the price of fuel oil; considerable increase in wages to labour at virtually all ports served has raised the cost of stevedoring and other port charges; salaries of the Shipowners' staff especially the floating staff have increased; to say nothing of the increased cost of buying a ship, maintaining it, storing it, and of interest charges and the cost of other aspects of shipowning and operating. It is to be stressed the Shipowner is left with no choice in the matter of accepting increases in cost of oil, stevedoring, port charges, since his position is the unfortunate one of either "take it or leave it". In the matter of negotiating increases in salaries the Shipowner is as responsible as the exporter, faced with the same problem. Shipping can and does operate at a loss for brief periods of time but it literally cannot and therefore does not operate at a loss all the time — no business does since obviously it cannot. I am constrained to make an appeal to exporters, Governmental authorities and to all concerned to be very objective in their assessment of whether or not a Conference service is required. I believe the vagaries of being solely dependent upon tramp shipping especially when mindful of the competing sources of supply of the commodities exportable from India, would introduce such instability, year by year, as would render any possibility of maximalising exports and therefore exchange earnings, an insurmountable task. Commodity prices

frequently rule high especially when the tramp rates rule high. If the commodity is from one source of supply only, the exporter may be in a happy position, but as stated (and it deserves re-stating) commodities moving from India unfortunately are not in such a happy position.

TWO-WAY TRADE

With 25 years of experience of the Conference system I venture to state that the opposition to the Conference system is not well considered and will prove disastrous to the country. It has to be remembered that shipping is a two-way trade and the Conference system sustains the two-way trade. The shippers attack the Conference system sometimes without proper realisation of the consistency of service and the two-way trade that it serves. There are obligations on the part of the members who serve the Conference system which should not be ignored. In times of difficulties in the past few years since Suez Canal is closed, Shippers do not realise how the Conference system placed liner vessels and has maintained a service that is comparatively realistic for its regularity in spite of the various factors that affect its long drawn route consequent on the closure of the Canal. It should be better appreciated that the liner trade has done its best to maintain the trade by its comparative regularity.

DEVELOPMENT REBATE

The pooling system which was introduced some years back has played a great part in securing cargo for the regular liner trade. The liner vessels, however, owing to the obligations to the Conference carried cargo which was not carried by any other system. I earnestly want shippers particularly those who have been associated with the Conference not to withdraw their assistance because they have to stand together through good and bad days. Apart from the question of freight, the Government of India and the Ministry of Transport have strongly supported the Conference system in the past and I hope with earnestness that any hasty condemnation under pressure from shippers will not be levelled at the Conference system. It will be a completely short-sighted policy whether on the part of the shippers or anybody to condemn the Conference system which is the prevailing practice all over the world.

Shipping as is well-known is a highly capital intensive industry and has long gestation period. I endeavoured to explain that due to several factors the industry had insufficient earnings and therefore was not in a position to build up adequate internal resources to meet the cost of expansion programme. The rate of Development Rebate was introduced because the Government acknowledged the characteristic features of the industry and was aware that the depreciation allowed was inadequate to absorb the phenomenal increase in the replacement cost. It is my apprehension that the Finance Minister's hope that the advance notice of abolition of Development Rebate would quicken the pace of investment, would so far as ships are concerned be frustrated. Because even if with the booking position of the world shipyards, it could be possible to place orders for new ships, it would be impossible to obtain deliveries of the ships before May, 1974 against orders placed now. The Fourth Plan envisaged achieving target of carriage of 40 per cent of country's overseas trade by her own bottom and to fulfil the target, it is necessary to order an additional half a million ton over and above the orders for new tonnage which have already been placed by different Shipping Companies. The meagre profitability of the industry burdened by additional tax as proposed together with the abolition of Development Rebate is not expected to create favourable condition for placing order for further tonnage. As a matter of fact, it will not be unrealistic to hold the view that conditions as presently imposed would put a complete stop to the acquisition of any further tonnage in future. Apart from the question of acquiring additional tonnage, it would be a difficult proposition to maintain the strength of the existing fleets by replacement of old and obsolete tonnage with the replacement cost being what it is at present.

REFUGEE INFLUX

From the consideration of national economy, it is not only desirable but essential that as quickly as possible Indian Shipping should be in a position to handle 50 per cent of the cargo moving in the foreign trade of the country. It is my earnest hope that the Finance Minister will see the imperative need for the availability of the relief in the form of Development Rebate to shipping and will reconsider the proposal for its withdrawal.

The year 1970 was a year of unfulfilled expectations and in the year 1971 a new problem has emerged which is staggering in its stupendity. With the influx of nearly 7 million refugees to the country, not only the shattered economy of West Bengal is passing through a great crisis, the country as a whole is confronted with a problem unprecedented in its history and its economy is strained to almost breaking point. In such a situation, the country cannot afford production loss or low productivity in any form which will cause an incalculable damage to employment potential. It is more than ever necessary now to quicken the pace of output and production in all spheres of industrial development.

Your Directors have reported about the sale of the vessel, "Indian Shipper" and the reason thereof. In pursuance of the policy of replacement of ageing ships your Company has placed order for construction of two ships with the Hindustan Shipyard. The launching of the first of the two vessels being constructed in Germany has been performed and that of the second vessel will be done sometime in the end of September or early October. Both these vessels will be added to the fleet of your Company before the end of the financial year and this new addition, I trust, will increase the earning potentiality of your Company.

We have a new Minister of Shipping and Transport, Shri Raj Bahadur. He is not new to shipping having successfully handled the intricacies and problems of this industry during his previous tenure. With his past background and knowledge, I have no doubt he will infuse a new dynamism which is needed in order that Indian Shipping can thrive and prosper in a growing competitive and complex international situation.

THANKS

The Secretary of the Ministry of Transport, the Joint Secretary and Director General of Shipping and his Assistants with whom we have been closely in touch have helped us greatly by their advice and valuable guidance. We are specially thankful to the SDFC for the co-operation and assistance we received from them.

We are thankful to the staff both afloat and ashore for the care with which they have looked after the affairs of the Company during the year; to them I should like to express our thanks. I would like to thank all the Officers and Staff of the Company in India and overseas for their interest in the progress of

the Company and for their diligence in carrying out their duties I should like specially to thank the staff in Office in Calcutta whose devotion to duty under the most difficult conditions has been highly commendable. Our thanks are also due to our Agents both in India and abroad for the care with which they have attended to our ships' requirements both in respect of freight and in other directions. Thanks are also due to the shippers both in India and overseas who have extended their continued and firm support to us.

Indian Rubber Regenerating Company Limited

Statement of the Chairman, Shri K M Philip

THE following is the Statement of Shri K M Philip, Chairman, Indian Rubber Regenerating Company Limited, on the occasion of the Tenth Annual General Meeting of the Shareholders of the Company at Bombay on September 24, 1971:

GENTLEMEN:

I have great pleasure in welcoming you to this Tenth Annual General Meeting of your Company. The Directors' Report and audited Statements of Accounts of the Company for the year ended 31st March, 1971 are already with you.

WORKING RESULTS OF THE COMPANY UNDER REVIEW AND RUBBER INDUSTRY'S PROGRESS

The working of the Company, as you may have observed from the Directors' Report and audited Statements of Accounts, has been satisfactory. During the year under review, the Company's turnover increased from Rs 97.70 lacs to Rs 110.80 lacs, i e, an increase of 13.4 per cent This has resulted in the increase of profits from Rs 15.55 lacs in the previous year to Rs 19.79 lacs. The Company has been able to achieve this performance despite the general slackness experienced by the Rubber Industry on account of constant labour problems and power failures. The production losses in the industry due to various factors have been substantially large. For example, the production of many factories in the Bengal region, which accounts for a good share of the Rubber Industry, was on many occasions interrupted due to the disturbed political situation there. These unexpected developments have considerably delayed the expansion anticipated in the Tyre Industry. Further, there had been no progress in setting up the new units recently licensed. However, with the stable Government at the Centre and more settled political and economic conditions, the Industry has every reason to be optimistic. The latest report indicates that normal production has been started in all Tyre companies from the month of August. Therefore, I anticipate a steep increase in the consumption of rubber from now onwards, and our total rubber consumption for 1971-72 may exceed 1.44 lacs tonnes as against 1.34 lacs tonnes reached in 1970-71.

PROGRESS OF THE COMPANIES

Tyre Industry is the major consumer of our reclaim rubber and because of serious power cuts, labour troubles and continuous strikes in some of the tyre units during the last year and the beginning of the current year, the production of tyres has been affected considerably. Consequently, the Government had to sanction an import of 60,000 tyres during the current year. With the development of the country's economy, the total demand for tyres and tubes and industrial products is growing. I am now very hopeful that the production of tyres during the second half of the financial year will improve considerably. I also expect that practically all the existing companies will complete their expansion plan by 1972-73, and from 1973-74 the production of automobile tyres will cross the 6 million mark from the 4 million reached in 1970-71. With this, the demand for reclaim rubber will also substantially increase. Your Company is ready to play its part in meeting the anticipated future demands for reclaim.

DEVELOPMENT AND EXPANSION

I am happy to say that the Company has received the necessary foreign exchange loan from ICICI and Rupee Term Loan from Dena Bank, for the purposes of implementing expansion and modernisation programme. I take this opportunity to thank both these institutions for the keen interest that they have shown in the expansion programme, the expeditious processing of the application and for the early disbursement of the funds for implementing the expansion. The expansion programme, which includes considerable automation, is expected to be completed by December 1971. With this, the Company would be able to enhance its production to meet the increased demand for reclaim rubber in the country. Even at the present scale of operation, the current year's production will exceed last year's figures and therefore, if the present trend continues and if no unforeseen circumstances develop, I assure you that there need be no anxiety about the future of the Company.

EXPORTS

During the year under review, we ahve exported goods worth Rs 3.48 lacs to Middle East and South East Asia, and Africa. I am happy to inform you that during the current year, we have made a breakthrough in several export markets in a big way and I am hopeful that our export sales will show an appreciable increase in the year to come.

TRAINING AND DEVELOPMENT

You are already aware of your Directors' constant endeavour of implementing changing technology in the field of management. As such, your Company has been giving high priority to training its officials at all levels. During the year several far-reaching recommendations of the National Productivity Council and Bombay Productivity Council were fully implemented. In the field of materials management, you might have observed that as compared to last year's Balance Sheet, this year's Balance Sheet shows considerable reduction in the inventory of Stores & Spares and Raw Materials. We have given intensive training to the materials management officers and staff in order that we may get further benefit in all the cost saving areas.

CONCLUSION

In the end, I would like to congratulate all the workers, staff and members of the management for their continuing efforts to make the Company's working successful.

Rural Electrification Corporation Limited

Address by the Chairman, Shri B Venkatappiah

THE following is the Address by the Chairman, Shri B Venkatappiah, at the Second Annual General Meeting of the Shareholders held in New Delhi on September 22, 1971:

GENTLEMEN

I am happy to welcome you to the Second Annual General Meeting of the Rural Electrification Corporation. My pleasure is all the greater because I am in a position to tell you that much progress has been achieved since we met last. You have before you the Statement of Accounts, along with the Auditors' Report, for the year commencing April 1, 1970 and ending March 31, 1971. In the Annual Report of the Board of Directors, you will find a detailed account of what the Corporation has been able to do during the twelve months of 1970-71. With your permission, I shall take these documents as read.

The first batch of loans passed by the Corporation dates back to March 1970; and, as I write this, the latest batch to receive sanction is no older than the end of August, 1971. The twelve months covered by the Directors' Report are thus part of the longer — but only slightly longer — eighteen months which represent the total active life of the Corporation. Perhaps it would be best for us, on this occasion, to look back at the eighteen months and put ourselves certain questions about what has been done hitherto and what is proposed to be done hereafter. I shall set down three questions and, in the paragraphs which follow, attempt to give the answers :—

I. What has the Corporation achieved so far in pursuance of its main objective as a financial institution, *viz*, the sanctioning of project-based loans for schemes of rural electrification sponsored by State Electricity Boards and Rural Electric Co-operatives ?

II. *In addition, what special measures* has the Corporation undertaken in furtherance of the policy directives by which it is governed ?

III. What steps does the Corporation propose to take for the benefit of areas backward in electrification or classes backward in economic development ?

I. OBJECTIVE AND ACHIEVEMENT

In dealing with the first of these questions, I shall refer to the financial results of the operations, then to the organisational set up and lastly, to the operations themselves.

FINANCIAL RESULTS

The operations of the year 1970-71 ended in a surplus of Rs 53.03 lakhs before deduction of tax and a net profit of Rs 26.13 lakhs after deduction. The Boards of Directors has recommended that out of this profit Rs. 5.45 lakhs should be transferred to the Special Reserve and Rs 10 lakhs to the General Reserve. The Board has also recommended that a dividend of Rs 9 lakhs be paid on equity capital. This leaves a small balance which, together with last year's balance will be carried forward to the ensuing year. I am sure that, equally with the Board of Directors, you are gratified at these results. Not only has there been a surplus for the second year in succession; but, in the very first full year of its working, the Corporation is in a position, after providing for reserves, to pay a modest dividend on that part of its corpus which represents the equity contributed by Government.

ORGANISATIONAL SET-UP

The financial resuts by themselves would signify little unless accompanied by a large expansion of the loan operations of the Corporation; and this in turn would not have been possible — in the context of the project approach which has been enjoined on the Corporation — without gearing the technical and administrative apparatus of the Corporation to its increasingly complex task. I shall have occasion later to refer to the administrative arrangements made for assisting rural electric co-operatives, to the special cell set up for devising and implementing measures of standardisation, and to the various steps initiated for the evolution and propagation of specialised techniques of project formulation, appraisal and execution. The main activity of scrutinising the project reports of State Electricity Boards, inspecting and verifying on the spot the field data on which those projects are based, suggesting modifications in design and forecast — all these and allied items of work which vastly increased during the year under report — could be attended to adequately because of the strengthening, both in number and quality, of the technical teams of the Corporation. Such teams, consisting not only of engineers, but of others with different types of expertise relevant to project evaluation, were constantly on the move for the inspection and appraisal of individual projects.

The extensive touring of different technical teams and the determination of the Board to meet practically once every month to take decisions on loan applications, are among the factors which have made it possible to effect a very large expansion in the main business of the Corporation, *viz*, loans for projects of rural electrification.

OPERATIONAL ASPECTS

During the eighteen months of its active life, the Corporation has sanctioned loans for as many as 137 projects spread all over India. Of these, 132 are projects sponsored by State Electricity Boards, while 5 pertain to co-operatives. The aggregate loan outlay sanctioned by the Corporation for the 137 projects is Rs 88.38 crores. The total number of irrigation pumpsets to be energised under these projects is over 2 lakhs, the exact figure being 2,14,911, which implies that, within a year and a half, the Corporation is already approaching half the target figure of 5 lakh pumpsets which had been set before it as its part of the energisation programme of the Fourth Five-Year Plan. The total of 137 projects hitherto sanctioned also covers 32,408 rural industries, including agro-industries, besides providing for a very large number of domestic and commercial connections. The projects are distributed over 108 districts in 16 States. It is worth noting that, of the 132 projects sanctioned for State Electricity Boards, an appreciable number, *viz*, 56, pertain to "backward" areas while the remaining 76 were classed as "other" areas. Of the 108 districts, as many as 41 are among those selected for the location of special programmes for the development of small farmers and marginal farmers, while 24 are covered under the rural works programme for drought-prone areas. Since the construction of wells and utilisation of ground water by energisation of pumpsets is often a substantial element in

these programmes for the weaker classes and the less favourably endowed areas, the significance of establishing projects of rural electrification synchronously with the special programmes can hardly be exaggerated. A small brochure which, among other things, illustrates the present position in this regard is being separately brought out by the Corporation.

Within the total figures I have given, those pertaining to the period covered by the Annual Report, *viz*, April 1, 1970 to March 31, 1971 may be very briefly indicated. The loan assistance sanctioned during this period was Rs 64.05 crores, of which Rs 12.81 crores pertained to the 5 pilot co-operative projects (all of which were launched during the course of the year) and Rs 51.24 crores to 91 projects sponsored by State Electricity Boards. The disbursements during the year amounted to Rs 4.61 crores for the co-operative projects and Rs 21.48 crores for the State Electricity Boards. Taking the proposals from the Boards and the Co-operatives together, the number of irrigation pumpsets covered was 157942 and that of rural industries 25673.

II. POLICY DIRECTIVES

The particular directives to which I shall now briefly refer are relatable to three important aspects of the Corporation's activities other than its purely financial role. These aspects may be broadly prescribed as promotional, consisting as they do of measures :

(1) to help State Electricity Boards to improve the quality of their projects at different stages of preparation and implementation ;
(2) to encourage the co-operative type of organisation for distribution of electricity in rural areas ; and
(3) to encourage local efforts to raise resources, e g, in the form of rural bonds or debentures, by making appropriate matching contributions to State Electricity Boards.

Under each of these heads, I shall mention a few of the more important measures undertaken during the year.

Project Techniques

In order to help State Electricity Boards to evolve guidelines for formulation and appraisal of projects, an initial step taken was to get together various experts in different fields for concretising the project concept as applied to rural electrification. This was done at a Seminar held in June 1971. A number of papers were prepared analysing various aspects of rural electrification, including the techniques of load forecasting. These constituted the background material for consideration at the Seminar. The experts themselves were drawn from different spheres such as banking, rural economics, electrical engineering and development administration. The conclusions reached at the Seminar are being followed up. Some of them are reflected in the new loan policies which the Board has approved and to which I shall later make some reference. It is being ensured that the State Electricity Boards, and in particular the staff engaged on rural electrification, are involved in the gradual adoption of modern techniques of project formulation, appraisal and implementation. Special attention is being paid to load forecasting and, with the assistance of experts, to the factor of availability of ground water in relation to the programme of energisation of pumpsets envisaged in individual projects. These functions have been entrusted to a "Project Cell" established for this purpose in the Corporation.

Standardisation

The Corporation attaches great importance to standardisation of both material and methods as one of the means of achieving economy in rural electrification. Attention has therefore been paid to the evolution of standardised specifications and designs with regard to equipment, construction techniques and construction practices. The Central Water and Power Commission, the Indian Standards Institution and other expert technical bodies in the country have done a great deal of valuable preliminary work in this sphere. It has been the Corporation's endeavour to carry the work further from stage to stage and on each item of importance such as poles, conductors and transformers, bring about a working consensus among all those concerned so that concrete and useful results would follow. I am glad to report that the efforts so far made have received wide welcome and that active co-operation has been forthcoming both from the State Electricity Boards and leading manufacturers of electrical equipment in different parts of the country. A 'Standardisation Cell' has been set up in the Corporation. It is expected that effective standardisation would lead to a reduction in the cost of material by not less than 10 per cent and that a further reduction of 10 per cent can be effected in the cost of construction by standardising the relevant designs and practices. If it is remembered that the benefits of standardisation would be available not only in respect of the projects financed by the Corporation, but also for the entire range of rural electrification undertaken by State Electricity Boards, it will be appreciated that the input of standardisation on costs can well be very substantial.

Co-operatives

I have alluded to the five rural electric co-operatives set up as a pilot experiment, one each in the states of Andhra Pradesh, Gujarat, Maharashtra, Mysore and Uttar Pradesh. The loan assistance of Rs 12.81 crores sanctioned for the projects submitted by these co-operatives involves, on the completion of the projects, the extension of electricity to 729 villages besides the energisation of 27,605 pumpsets and the provision of service concession to 1553 rural industries. As I have indicated, work has started on all these projects and an amount of Rs 4.61 crores was disbursed during 1970-71. In the light of its responsibility for the promotion of such co-operatives in future, as also of its special role at the present stage in regard to these five pilot experiments, the Board has agreed as an exceptional measure to waive the payment of interest by the five co-operatives for the first 5 years of the loan, on condition that in each case the Society credits an equal amount to a special fund created for purposes approved by the Corporation. The question of initiating feasibility studies for the eventual setting up of a few more projects is under the active consideration of the Board. Meanwhile a 'Co-operative Cell' has been established in the Corporation and the specialists in the Cell as well as the technical and other staff of the Corporation are in constant touch with the working of the five co-operatives. In this, the Board has throughout derived useful advice and assistance from the members of the team of the National Rural Electric Co-operative Association of USA. It has also been helped by an Advisory Committee on Co-operation which has met from time to time to review the progress of the Co-operatives.

Rural Bonds

The Corporation lays emphasis on rural savings being made increasingly available for rural electrification. Indeed, one of the policy directives says in explicit terms that "the willingness of the farmers to invest their own resources in rural electrification should be a factor in consideration of schemes to be financed." There is another and connected directive which calls upon the Corporation to support the efforts of the State Electricity Boards to raise resources in the form of debentures from the rural areas. Measures have been formulated to this end. It is proposed to make a beginning in districts which are not only advanced in themselves but are situated in States which have reached a level of electrification which is above the all-India average. Where, in such a district, one or more loans have already been sanctioned by the Corporation and a further project in the same district is sponsored for a loan, the Corporation on its part will limit such loan to 60 per cent of the cost, the balance having to be found by the State Electricity Board. It is hoped that in such a context the Electricity Boards will endeavour to raise at least half the balance of 40 per cent — *viz*, 20 per cent of the total cost—by way of rural electrification bonds subscribed by the people of the locality. In such an event the Corporation will be prepared to give, in addition to the direct loan of 60 per cent, a matching contribution in the form of subscription to the rural bonds. Such a subscription, not exceeding 20 per cent of the cost, will be also limited to the contribution actually made by the rural subscribers. The details of the scheme are being communicated to State Electricity Boards. While it is thus proposed to make a beginning with rural bonds in the context of local projects, a wider and more general scheme of rural electrification bonds will, it is expected, be introduced in the near future; its finalisation awaits the report of an Informal Group set up for this purpose last year by the Governor of the Reserve Bank of India.

III. SPECIAL CONTEXTS AND NEW MEASURES

Weaker Classes

The special contexts with which the Board has increasingly felt itself concerned could be described as (1) the weaker classes, (2) the backward areas, and (3) that category of States which is below the country's average level of electrification. The Rural Electrification Corporation has a positive contribution to make in respect of each of these groups, but only by way of ensuring that its own operations converge, in the relevant contexts and appropriate areas, with other and larger programmes initiated by the Central Government, the State Governments, or the State Electricity Boards. Thus where the producer happens to be one of those for whom a Small Farmers Development Agency exists, the Corporation's loan and the project financed thereby can be so located and phased that it supplements the efforts of the Agency. I have referred to some of the efforts already made in this direction. Indeed, more than half the districts in which the Small Farmers Development Agency exists and more than a third of the districts in which are located the Development Agencies for Marginal Farmers and Agricultural Labourers are already covered, in one or more parts of the concerned district, with rural electrification projects financed by the Corporation. Nearly a third of the programmes of rural works for drought-prone areas are also thus covered. The Corporation is anxious that, the maximum degree of co-ordination should be effected between the projects financed by it on the one hand and, on the other, those schemes of production or employment which are operative on the ground for the benefit of the weaker classes. This applies not only to the small and marginal farmers, but also to the small entrepreneur in the countryside for whom the provision of electricity would mean either the prospect of setting up a rural industry or of earning a larger income by raising the technological level of an existing unit which he is already operating. I have referred to the fact that, on the estimates made, 32,408 rural industries are covered by the projects hitherto sanctioned by the Corporation. In order to ensure the availability of raw material and other inputs, as well as of marketing facilities, for small industrial units of this kind in the project areas, various measures for co-ordination between the programmes of the State Electricity Boards and those of the Industries Departments of the States, at both district and State levels, have been recommended to all State Governments and have been adopted by several of them. The Corporation has decided actively to pursue such co-ordination in all the States.

Backward Areas and Specially Underdeveloped Hill Areas

As for "backward" areas, that is to say those areas (whether parts of districts or whole districts) which are deficient in electrification and irrigation as well as generally in economic development, it has indeed been a cardinal feature of the policy of the Corporation to devise realistically low "norms" for the return on capital invested in projects of electrification intended to help the development of such areas. Thus, on the basis that "viability" is attained when the net return on the capital is 3½ per cent, the Corporation has already decided to allow as long a period as 15 years for this stage to be reached in a "backward" area, whereas for an "advanced" or "other" area, the point at which "viability" is to be attained is advanced by 5 years, that is to say, on the completion of 10 years from the commencement of the project, instead of 15 years as in the case of "backward" areas. It is in this connection that the Corporation has been confronted with the special problem of under-developed hill areas, e g, some of the hill areas of Uttar Pradesh or Meghalaya, or one or two districts of Himachal Pradesh. Not all hill areas, of course, can be classed as under-developed, but in instances such as those I have mentioned, it is the experience of the Corporation that the attainment of "viability" is likely to take even longer than for what are ordinarily described as "backward" areas. Consequently, after investigation of the problem, the Corporation has decided to extend the relevant period by 5 years in the case of such areas as compared with projects for "backward" areas. In other words, a net return of 3½ per cent is stipulated for "specially under-developed hill areas" at the end of 20 years from the commencement of the project and not at the end of 15 years as for "backward" areas. It is hoped that this decision, which is fully in consonance with the charter of the Corporation, will help the Electricity Boards concerned to formulate suitable projects for such exceptionally undeveloped mountainous and sub-mountainous areas. It may at the same time be pointed out that this liberalisation will be meaningful only if tenable programmes of economic development—based, for example, on the utilisation of forests and forest produce, development of orchards, preservation of fruits, promotion of animal husbandry

and dairying—are in each case formulated, with the necessary expertise and in the requisite detail, for the hill areas in question. Electricity can only enter as an input, albeit an important input, into such a programme.

Agriculture in Its Wider Sense

I have alluded to forests, orchards, animal husbandry and similar items which are significant features of hill areas. Indeed such items along with the agro-industries that go with them, are an important characteristic not only of most hill areas—both developed and under-developed—but also of certain other agro-climatic regions where "agricultural" development in the wider sense is dependent, not primarily on ground water utilisation and pumpset energisation, but on the application of electrical energy to these other natural resources. This wider sense in which "agriculture" includes animal husbandry, orchards, forests, etc, has, as you are aware, found acceptance not only in ordinary usage, but in such statutory contexts as the Agricultural Refinance Corporation Act and the Agricultural Credit Corporation Act. In pursuance of this interpretation, the Board has decided that, while the main thrust of the Corporation's programmes as a whole will continue to be oriented to ground water and pumpset energisation, the wider connotation of "agriculture" will be kept in mind when the special circumstances of particular projects so demand from the point of view of viable economic development of the project area concerned.

Special Category of States

There remains the problem of those States which, as a category, are below the all-India average of village electrification. Investigation has shown that, in such States, one of the main obstacles to more rapid rural electrification is the relative sparseness of high tension transmission lines with the connected substations. The Corporation is concerned with transmission only insofar as it is a necessary preliminary to the building up of a rural load. The Board has decided that, in suitable instances confined to the category of States which I have mentioned, special loans for transmission may be given on certain stated conditions. One of these conditions is that the period of repayment will be 12 years; there will be a moratorium, so far as repayment of principal is concerned, for the first two years; the rate of interest will be 7¼ per cent with a rebate of ¼ per cent for prompt payment.

It is now possible to indicate what types of loans are now offered by the Corporation in pursuance of the decisions mentioned above, as also of a few modifications introduced for the purpose of rationalising the loan structure. The changes made do not, of course, affect the project loans already approved whether for Electricity Boards or for Co-operatives; in all such cases the terms will remain the same as before for the duration of the loan. In regard to future sanctions, *viz*, those subsequent to 31 August 1971, the position is broadly as follows:

There are three types of "ORDINARY" loans and two types of "SPECIAL" loans.

The Ordinary loans are:

(1) for advanced areas (to be repaid in 20 years: full "viability" in the 10th year),
(2) for backward areas (to be repaid in 25 years: full "viability" in the 15th year),
(3) for future Co-operative projects (to be repaid in 30 years).

The Special loans are:

(1) for projects in "specially underdeveloped hill areas" (to be repaid in 30 years: full "viability" in the 20th year), and
(2) subject to certain conditions and in appropriate cases, for transmission schemes in States which are below the all-India level of village electrification (to be repaid in 12 years).

CONCLUSION

It remains for me to express my grateful thanks to the Ministry of Irrigation and Power, and other concerned Ministries and agencies of the Government of India, as also to the United States Agency for International Development, for all the assistance and support which they have consistently extended to the Corporation. I am thankful to the State Governments, the State Electricity Boards, the five Rural Electric Co-operative Societies and the National Rural Electric Co-operative Association of USA for their ready response and help at all times. I would thank my colleagues on the Board of Directors for their advice and collaboration at this important formative stage of the work of the Corporation. The Managing Director, Shri A C Bandyopadhyay and the Technical Director, Shri P A Raman, have worked ably and with great dedication. I know that my other colleagues on the Board join me in recognising and appreciating the very substantial contribution they have made to the growth of the Institution. Finally, on my own behalf as well as that of the Board, I am happy to express my warm appreciation of the long hours of labour put in and excellent team work rendered by the officers and staff of the Corporation.

Thank you.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

World Bank Aid for Education

UP to June 30, 1971, the World Bank Group has approved financing of 57 education loans in 42 countries for a total amount of US $431 million. Africa, including North Africa, has received 27 loans and 44 per cent of the total lending volume; Latin America 15 and 22 per cent; Asia 12 and 25 per cent; and Europe three loans and 9 per cent of the volume.

So far 72 per cent of the Bank's education financing has been in secondary education. About 23 per cent has gone to universities and post-secondary education and 4 per cent to adult training, while primary education directly (as contrasted to the indirect effect of teacher training) has received little more than 1 per cent of the funds. The post-secondary non-university component has increased lately from 8 per cent to 13 per cent of the total. By curricula, general education, including pre-vocational options, comprises the most important project component both in number of student places provided and as a recipient of funds. The demand for general secondary education has, however, reached a saturation level in some developing countries during the last years, while important needs persist for teachers, technicians and engineers. Consequently, technical education and teacher training have received 48 per cent of student places provided through the Bank projects in 1970 and 1971, as against a 28 per cent average in the earlier period, while student places in general education are significantly reduced from 64 per cent to 45 per cent.

Medicine for the Few

IN countries where health and medical care comes predominantly through private medicine and private doctors, it is usual for the representative associations of doctors to work closely with the private pharmaceutical industry on matters of mutual interest. The outstanding example of this is, of course, the close collaboration between the American Medical Association and the Pharmaceutical Manufacturers' Association of the US. The two have made common cause on a number of issues; they have fought shoulder to shoulder to protect the fabulous fees of specialists and to defeat any undue expansion of the public health services.

The close rapport between private doctors and the drug industry is natural. For selling their products, the pharmaceutical manufacturers rely on doctors writing out prescriptions specifying drugs by brand names. Each manufacturer expends vast sums of money canvassing the merits of his own particular brands of drugs through detail men, publicity material mailed to doctors, advertisements in medical journals, sponsored conferences of doctors, and so on. The doctors, for their part, mostly pin their faith on the claims made on behalf of particular branded products; indeed, for all but the most conscientious, the brightly printed publicity material put out by drug manufacturers constitutes about the only source of keeping abreast of advances in pharmacology.

The above is, of course, as accurate a description of the situation in India as it is of that in any other country. It is, therefore, with a sense of disbelief that one reads reports of the President of the Indian Medical Association calling for nationalisation of the drug industry. Not that there is much chance of the suggestion being taken seriously by the Government; certainly not when the Government is feeling so smug about the much-touted achievements of its drug price control. What makes the proposal noteworthy is that it comes from the representative body of doctors in the country. The IMA president has also called for nationalisation of health services on the ground that under the present system of private medicine we have on the one hand a shortage of doctors and on the other unemployment and underemployment among doctors which compel large numbers of qualified doctors to migrate to "more affluent countries to work in inferior jobs". Similarly, he points out, while the countryside goes without doctors (there are hundreds of doctor-less primary health centres) there is a glut of doctors in the cities.

In a brochure on "Health in the Fourth Five-Year Plan" published earlier this year, the IMA had referred, *inter alia*, to the question of drugs and pointed out how the process of development of the drug industry had defeated the basic objectives of the Government, laid down in 1950-51, of making the drug industry self-sufficient and of seeing that "profiteering, at the expense of the health of the nation, was curbed". The rapid growth of the private sector in the drug industry had led, according to the IMA, to "an unregulated production of drugs of no consequence ... sold to unsuspecting and credulous buyers". Commenting on the multiplicity of brands of the same drug, the IMA had said: "Unrestricted production of more or less the same type of drugs by various private concerns upsets every type of control, even if the Government intends to impose much restrictions, on manufacture, distribution and price structure. It is known to everybody what colossal amounts of money are spent on advertisement, samples and *various types of presents*. After all, all the expenses incurred on these accounts are ultimately borne by the users of these drugs, with the result that even if there is a remedy for a disease it is not available to the diseased" (italics added). The IMA should know!

The IMA brochure also emphasised the need to make the country self-sufficient in respect of basic pharmaceutical chemicals and intermediates. It advocated production of the basic raw materials in the public sector and their equitable distribution to various drug manufacturers. Under the present system the makers of the basic raw materials, usually the large international companies, can, and naturally often do, starve other manufacturers.

Of course, none of this is very new. What makes these recommendations significant is that they come from the medical profession itself. Unfortunately, the Government has generally paid scant attention to what the IMA has to say on the question of drugs or on matters of public health generally. In fact, the brochure mentioned above complained repeatedly of the Government's failure to consult the IMA on health policies and programmes; and when the IMA had put forward proposals on its own, they had been brushed aside.

Not that the Government does not consult medical practitioners. There are doctors employed by Government who take a hand in the planning and administering of various aspects of the health services. Then there are the doctors

who are appointed to various consultative and advisory committees and panels. Finally, every health minister soon enough collects around him a group of doctors on whom he relies, often more than on those more formally associated with the Government. There is no denying that many of the doctors who have the Government's ear in one capacity or the other are highly successful professionals; some of them are also exceedingly competent. But taken as a whole they have done very well for themselves out of the system of private medicine to which they are fully committed; such knowledge as they have of public health services is gleaned from the advanced Western countries where these services are an adjunct to the system of private medicine. No wonder the pharmaceutical industry finds them —and not the IMA, ignored alike by the Government and the most successful and influential members of the profession—ideal conduits for influencing Government policies and decisions and uses them as such, with the *quid pro quo* taking the form of sinecure directorships, lucrative 'research' assignments, and so on. No wonder also that given the government/successful-private-practitioner/pharmaceutical-industry nexus, medical and health programmes for the vast majority of the population who simply cannot afford private medicine (at pre- or post-Drug Price Control prices!) do not stand much of a chance.

Moscow Visit

More Talk

OFFICIAL communiques issued at the end of international discussions are usually very staid documents and they often hide as much as they reveal. One aspect of the joint statement issued after Indira Gandhi's talks with the Soviet leaders is, however, most revealing. This is the constant harping on the strengthening, preserving and ensuring of peace and the solving of problems by peaceful means. Whether the region discussed is Europe, the Middle East, Indo-China or East Bengal, the communique ends up with some glib words like "policy aimed at strengthening peace, friendship and international cooperation". Which is all very well but for the point that nowhere does the Soviet Union commit itself to come to the aid of its friends and treaty partners. Not that a super power can allow itself to make precise and clear-cut commitments, but it would have been possible for the Soviet Union, had it so desired, to make a vague commitment to aid India in the case of external aggression.

Quite clearly, the Soviet Union is not willing to shake its ties with Pakistan. The operative part regarding East Bengal (in the Russian version of the text, it is consistently referred to as East Pakistan), does not go beyond expressing the same sentiments that Podgorny had expressed in his appeal to Yahya Khan, last April. This part of the statement reads: "... both sides consider that the interests of the preservation of peace demand that urgent measures should be taken to reach a political solution of the problems that have arisen there [East Bengal], paying regard to the wishes, the inalienable rights and lawful interests of the people of East Bengal-Pakistan as well as the speediest and safe return of the refugees to their homeland in conditions safeguarding their honour and dignity." And how do the two countries propose to arrange this political solution? Of course, this cannot be answered in a communique, but the next paragraph is, perhaps, a pointer: "Taking into account the seriousness of the situation which has developed in the Indian subcontinent, the two sides agree to maintain further mutual contacts and to continue to exchange views on questions arising in this connection."

Another significant pointer? Not a single word about China, though all sorts of other places are mentioned.

Bangla Desh Refugees

An Alibi?

A Correspondent writes:

IN the last few months Government spokesmen have never tired of repeating how the burden of taking care of the refugees from Bangla Desh has completely upset the country's development plan for the current year. At last month's meeting of the Political Affairs Committee of the Cabinet, the Finance Minister is reported to have warned of a budgetary deficit of Rs 600 crores (against Rs 220 crores provided in the Budget) and advised a 5 per cent cut in the Government's expenditure, both developmental and other.

What are the refugees really costing us? The Ministry of Rehabilitation released a pamphlet some time back giving, among other things, itemised break-up of the cost of maintaining the refugees. The pamphlet bears no date, but it purports to give the position upto June 22 by when 6 million refugees had registered themselves with the Indian authorities and were living in the refugee camps. The pamphlet estimates the cost of maintaining 6 million refugees for six months and puts the figure at around Rs 300 crores, which works out to Rs 1,000 per annum per refugee. This compares with India's per capita income of Rs 589 in 1969-70. Of course, the comparison is invalid since the figure of Rs 1,000 per annum per refugee includes not merely the refugees' consumption expenditure but also capital cost of things like tents, hospitals, transport vehicles, etc. The cost estimates are presented in the pamphlet in two statements, but the basis of classification is obscure since both statements include items involving current as well as capital and recurring as well as non-recurring expenditure. However, a rough selection of items of personal consumption gives a figure of Rs 449 as the consumption expenditure per refugee per annum. By reference to the computations of per capita consumption expenditure attempted by Dandekar and Rath in their study "Poverty in India", this gives the refugees a standard of consumption slightly higher than that enjoyed by the bottom five deciles (that is, one-half) of the Indian population.

Of course, this is not to say that the refugees are living it up or that we are spoiling them with riches. We are doing nothing of the sort. What the refugees are being given is the bare minimum to keep body and soul together. The squalid conditions of the refugee camps is something that no one who has visited them is likely to forget in a hurry. The purposes of the calculations attempted above are to suggest that (a) the estimates of expenditure on the refugees are exaggerated or (b) not all the money provided for the refugees' upkeep is in fact being spent on them. Both possibilities are plausible. The estimated expenditure of Rs 19.33 on cereals per refugee per month, Rs 5.17 on pulses and Rs 3.33 on edible oil is definitely high compared to the consumption standards of the majority of the Indian or Pakistani population. Similarly, the estimates of capital expenditure provide for one latrine for every 2 families when in the chawls of Calcutta or Bombay there will be hardly a family which does not have to share a latrine with four others. The estimates also provide for sinking one 'tube-well' per 10 families! If indeed the actual financial provisions are being made on these bases, then almost certainly there are substantial leakages flowing into the pockets of the contractors and other agencies which receive lump-sum allocations from the Government on the basis of the number of refugees under their care. Those who have visited the refugee camps know that in fact such leakage does take place, with estimates of the middlemen's illegal 'cut' as high as 10 to 15 per cent. Ten per cent of Rs 30 lakhs (roughly the allocation for feeding one lakh refugees for one month) is a cool Rs 3 lakhs. Refugee relief need not be, it seems, a labour of love!

The other aspect of the question is the direct draft the upkeep of the refugees constitutes on the Central Budget for the current year. In the calculations that follow we will broadly take the official norms of expenditure per refugee, inflated as they are. Assuming that on an average 8 million refugees have to be *maintained in the refugee camps* during the financial year 1971-72, upkeep expenditure on them will amount to about Rs 350 crores to which may be added another Rs 100 crores of expenditure of a mostly capital or non-recurring kind, giving a total of Rs 450 crores. Of this, if Rs 150 crores are taken to be the foodgrains component, that can be met by drawing down foodgrain stocks with the Government without constituting a budgetary outgo. Foregin aid in the pipeline or already committed is reported to be roughly Rs 100-125 crores, leaving Rs 200 crores or less as the net draft on budgetary resources. Of this Rs 60 crores had been provided for in the Budget. Thus on the whole the Bangla Desh refugees can account for a net worsening of the Government's budgetary position to the extent of only Rs 140-150 crores. If the budgetary gap of Rs 220 crores is indeed threatening to widen to Rs 600 crores, other explanations have to be sought for the development.

There may be some merit in depicting the burden imposed by the influx of refugees in the most sombre terms if the Government's purpose was to extract the maximum assistance out of the international community or to persuade the Indian public to submit to additional resource raising effort. The Finance Minister has repeatedly disclaimed any intention of doing the latter. In the circumstances part of the reason for exaggerating the budgetary cost of the refugees can only be to camouflage the basic collapse of planning and plan implementation which appears to have made it virtually impossible for the Government to step up developmental plan expenditure in the public sector.

Agricultural Finance

Growing Regional Disparities

WHAT lessons should we draw from the eight years' experience of the Agricultural Refinance Corporation? There can be no doubt that the Corporation has been doing a creditable job but then that may not be enough in the present context. Looking to the dimensions of the problems of agricultural development, the work has to be done much faster, over wider areas and in greater depth. Available data reveal that added thrust is required in the agricultural finance operations not only of ARC but also of the public sector commercial banks.

Since its inception in 1963, ARC has sanctioned financial assistance for 458 schemes involving Rs 293 crores, its own commitments totalling Rs 249 crores. But the amount actually disbursed comes to Rs 90 crores. Beginning from last year, the World Bank and the International Development Association have taken up seven agricultural credit projects in India involving financial assistance of Rs 124 crores, an amount which is roughly half of the total finance committed by ARC during its eight years of existence.

While these developments are encouraging, one should not lose sight of the fact that regional imbalances in agricultural finance have now become even more conspicuous than they were. Assam, Bihar, Orissa and West Bengal together account for only about 7 per cent of the total financial assistance sanctioned by ARC and Rajasthan, Madhya Pradesh and Jammu and Kashmir account for another 10 per cent. On the other hand, the relatively more advanced states of Andhra Pradesh, Mysore and Punjab have a share of about 38 per cent. Even the World Bank schemes leave the backward states high and dry; they will benefit UP, Gujarat and Punjab.

This lopsided development is largely due to the weaknesses of the organisational set-up in the backward states. Not only are the governments of these states slow in formulating schemes, but the banking set-up (both co-operative and commercial) there is not geared to the task. ARC is aware of this problem and it has now set up a Consultancy Service with headquarters at Lucknow. However, knowing the big gap between project formulation and implementation of schemes in the backward states, it is doubtful whether a consultancy service will make much of an impact on the backlog of development there. ARC has to become more dynamic and in this context it is necessary to once again emphasise the need for making ARC into a full-fledged Agricultural Development Bank so that it can assume direct responsibility for the promotion of agricultural development schemes in backward areas.

A point highlighted by the ARC's Chairman, P N Damry, in his speech at the Corporation's annual general meeting last month is that the ARC will now concentrate its attention on dry farming projects involving improved soil management and agronomic practices in unirrigated lands. ARC would take up for financing a package-type of development programme which would include bunding, levelling, terracing and reshaping of dry lands and generally toning up of the top soil and introducing water harvesting techniques. Damry has pointed out that the banks will have to lean even more heavily upon the state governments in the preparation of such schemes than in case of irrigation schemes. The capital-output ratio in the case of dry farming schemes would be generally very low, implying that the return would be spread over a long period and would be perhaps negligible if only the first few years are taken into account. Obviously, such schemes might not appear creditworthy and hence financial assistance of a different nature — such as that provided by the IDA — might have to be thought of. It may even be necessary for the ARC to consider setting up a subsidiary, a Dry Farming Area Development Organisation, so that a specialised agency with separately earmarked funds available to it on softer terms would be on hand to concentrate all its energies on development of dry farming areas.

Regarding the commercial banks' role in financing agriculture in backward areas, a perusal of the latest data on their advances to agriculture reveals that four states, *viz*, Assam, Bihar, West Bengal and Orissa, together have a share of only 5 per cent in the total outstandings as at end-March 1971. The advances in Meghalaya and Nagaland are negligible. Two other backward states, *viz*, Rajasthan and Madhya Pradesh, together account for only 7 per cent of outstandings. As against this, five states, *viz*, Maharashtra, Tamil Nadu, Andhra Pradesh, Mysore and Uttar Pradesh account for as much as 60 per cent of total agricultural outstandings.

Clearly, banks operating in the backward states have to adopt a more positive approach to helping agricultural development. But while the magnitude and direction of work to be done is obvious, the lack of an adequate organisational set-up in the backward states is, once again, the

major hurdle. The co-operatives in these states, it is acknowledged are too weak to be used as the village level agencies for undertaking a comprehensive agricultural credit programme. One has, therefore, to think of devising new ways of dispensing farm credit in these areas. It needs to be considered whether retail traders could be used as a channel for credit for doing extension work while individual engineers are encouraged to set up repair and other services as well as to undertake construction of wells, etc. In this connection, it may be useful to consider how the operations of the Agricultural Finance Corporation, which has already done some work in Bihar, can be reoriented to place on it certain specified additional responsibilities in backward states, with the ARC even financing it, if need be for shouldering these new tasks. Unless some programme on these lines is drawn up, the commercial banks are likely to concentrate more and more in the already agriculturally developed districts and in the process neglect those areas whose needs are much more urgent.

Education

No Partial Solution

A Correspondent writes:

UNIVERSITIES are in the news again. About half-a-dozen of them have been closed down indefinitely in the past two weeks. The immediate causes for the closure vary; at Bangalore the students have demanded an inquiry into the affairs of the university; at Benaras they presented a charter of demands which the vice-chancellor described as something no 'sane man' could accept. When a student threatened to immolate himself, the Benaras University vice-chancellor decided that he had no alternative except to close the university and eject all students from hostels. At Jodhpur the vice-chancellor resigned after being gheraoed by students.

University authorities claim that it is generally a small group of militant students with predominantly non-academic interests which disrupts the placidity of life on the campuses. If this were indeed so, it is regrettable that over all these years no method has been devised to contain the activities of such elements. But how seriously do those entrusted with administering universities themselves take their tasks? According to reports, only five of the nine members of the executive council of the Benaras University attended the meeting held to consider the situation at the University. This well illustrates how casually the authorities treat the closure of a university.

Perhaps lurking behind both the student agitations and the official apathy is a tacit admission of the total irrelevance of today's university education in the life of the nation. When what a student learns neither improves his chances of getting a job nor contributes to his cultural enrichment, neither he nor the teacher very much minds whether he is in the classroom or out of it. Also if after getting his degree he still has to lead the same meaningless, jobless existence, the student doesn't particularly care whether he takes four years or five or six to take his degree. Until our planners tackle this problem first, it is unrealistic to expect any improvement in conditions on our campuses.

World Bank

Not by Growth Alone

IN his address to the annual meeting of the World Bank's Board of Governors, Robert McNamara is concerned not with development only but also with "problems of development", which he enumerates as nutrition, employment, income distribution and trade. McNamara argues that even at a net reproduction rate of one (an average of two children per couple) reached by the year 2040 — "a possible but by no means certain achievement" —, the population of the developing countries would increase fivefold, from the present 2.7 billion to 14 billion. While more and more countries are shifting to population planning programmes, McNamara deplores "the absence of strong political support" needed to tackle the problem effectively.

Population growth and malnutrition are interrelated; wastage, through ill-health and early death, is the highest among the poor countries. Medical science has established a relationship between mental development and nutrition in the early years and McNamara notes that a small outlay of $ 8 per child per year can make up the deficiency in nutrition.

Without getting himself entangled in Brahminical nuances of meanings of words, as did the committee of economists on employment which reported some time back, McNamara estimates that "on reasonable definitions — including allowances for under-employment — unemployment approximates 20-25 per cent in the poorer countries". He argues the case for tackling unemployment at its source: in rural areas.

The failure of development policies has led to disillusionment with "growth as the primary development objective". Development policies must, therefore, "explicitly aim at greater employment and greater equality of income distribution". The lesson of the last decade has been that "we cannot simply depend upon economic growth alone to solve these problems" — a statement which must cause some raising of eye-brows among the protagonists of growth through incentives for private enterprise in this country.

Dealing with rural unemployment, McNamara notes the uneven impact of the green revolution ("limited to a few crops, limited to irrigated lands, and limited to a few countries") and its tendency to promote inequality. McNamara spikes the anti-land-reform argument regarding size of holding and productivity and urges land redistribution policies. He argues for greater support for small land-holders, stating that "the evidence already available does not indicate that greater attention to the poorer agricultural groups must inevitably entail sacrifices of economic growth".

It is in respect of industrialisation policy that McNamara reverts to traditional World Bank wisdom: export promotion rather than import substitution as the corner-stone of the strategy for growth. For once, he ignores historical experience and has to fall back on citing instances such as South Korea and Taiwan. Insofar as these examples have any relevance at all, it needs to be pointed out that Taiwan's and South Korea's achievements are due more to the level of investment (20 to 25 per cent of national income) than due to any export-oriented growth strategy.

McNamara supports his case also by reference to the developing countries' need for foreign exchange. At present, these countries earn two-thirds of their foreign exchange through export of primary commodities. To meet their increasing needs of foreign exchange, they would need to raise their manufactured exports by 15 per cent per annum in the seventies.

As regards aid, McNamara refers to the World Bank's efforts to expand its operations. Having reached the rate of growth set for a five-year programme for the Bank, he refers to the current planning at the Bank for the next phase of the programme, which he hopes to announce at the next annual meeting of the Bank. But as important as the increase in the quantum of its aid is the new social sensitiveness imparted to the Bank's approach to development.

Commodity Loans Not Enough

INDIA has made one more 'goodwill gesture' towards Ceylon. It has extended new lines of credit worth Rs 60 million and has promised to assist Ceylon's programme of industrialisation. This was evidently the most significant outcome of Swaran Singh's three-day official visit to Ceylon last month.

It is yet too early to say whether these recent Indian offers will amount to closer industrial and technical co-operation between the two countries and help to remove many of the irritants in their mutual economic relations. India has promised to open Indian markets to goods produced in Ceylon; to start with India would buy more of graphite, copra, coconut oil, high grade rubber and a few more consumer goods. Refractories, rubber-based industries, silica, paper and graphite have been identified as the five important spheres for India-Ceylonese joint ventures. Feasibility studies for these are to be jointly undertaken by consultants of both countries. Further, in order to strengthen relations between India and Ceylon, there are to be consultations on economic matters at regular intervals.

Reactions in Ceylon to these plans have been mixed. While Ceylonese official circles claim that this signified a breakthrough in economic co-operation, Ceylonese trade circles were sceptical about India's capacity to spare the funds for the joint ventures envisaged as part of the effort to step up the process of industrialisation in Ceylon. The scepticism has its roots in India's past performance.

During the past decade, while India made frequent goodwill gestures towards Ceylon, they remained merely symbolic and India took next to no corrective action to lessen Ceylon's adverse trade balance with it. India signed a trade agreement with Ceylon in October 1961 under which the two governments agreed that the pattern of trade should be conducive to mutual advantage and that possibilities for expanding trade should be explored in respect of new items. After this agreement consultations were made from time to time to expand bilateral trade. Seven years later, in 1968, the Indo-Ceylonese Joint Committee on Economic Co-operation was formed. The Committee met in January 1969. Faced with the problem of a continually falling volume of trade in the 1960s, it merely stressed the need for increasing bilateral trade, and pointed out that India could step up her exports of machinery, transport equipment, other engineering goods, and chemicals, while Ceylon could export traditional items like copra, coconut oil and rubber and rubber manufactured goods. No agreement was reached on the actual exchange of commodities. A working group on trade of the two countries, which met in New Delhi in November of that year, also agreed that both countries should make efforts to import more from each other and that India should consider the possibility of importing arecanuts, cloves, chanks and arrack from Ceylon. Once again, no agreement was reached about the commodities to be imported into India.

Meanwhile, India's exports to Ceylon had declined from $ 39 million in 1960-61 to $ 24 million in 1965-66, though it subsequently crept up to $ 34 million by 1969-70. Imports from Ceylon increased from $ 8.6 million in 1960-61 to $ 17.2 million in 1962-63, but thereafter they continually declined and in 1969-70 stood at about $ 4 million — less than half the 1960-61 figure. The lowest figure of Ceylon's adverse trade balance during the 1960s was $ 11.3 million during 1962-63. The adverse trade balance was as much as $ 30 million in 1960-61 and $ 29 million in 1969-70.

In the circumstances, India's reliance on only commodity loans to enable Ceylon to purchase more goods from India is hardly 'corrective action'. Prior to the latest line of credit of Rs 60 million, India had given three commodity loans amounting to Rs 120 million for purchase by Ceylon of such goods as textiles, dried fish, tools and various types of capital goods. Commodity loans, by themselves, cannot correct Ceylon's adverse balance of payments. In fact, they would worsen the situation when the loans have to be repaid. The terms of credit granted previously were also somewhat unfavourable. The credit was to cover only 90 per cent of the f o b value of goods from India and the Ceylonese importer was asked to pay the 10 per cent down payment in free convertible currency. It was maintained in Ceylonese circles that the schedules of repayment as well as the rate of interest charged were not favourable. It was alleged that the Indian counterparts did not pass on the advantage of lower freight rates to them but quoted the same c i f prices in Ceylon even when freight rates were lower.

India is frequently tapping on the doors of the ECM countries asking them to lower their trade barriers so as to reduce its own trade deficit with the ECM. India has championed the cause of increased economic co-operation among ECAFE countries for stepping up intra-regional trade, and also led the efforts to establish an Asian Payments Union for encouraging this intra-regional trade. Yet its specific actions in relation to Ceylon are out of alignment with its professed concern. Will it now consider seriously what it should do to reduce Ceylon's adverse trade balance, currently nearly eight times its exports to India?

Oilseeds

Bounty from Government

IN its Second Annual Report for 1970-71, the Groundnut Extractions Export Development Association (GEEDA) pats itself on the back for having consolidated and further improved upon its past achievements. No doubt, it is a matter of some satisfaction that exports of groundnut extractions increased from 6.84 lakh tonnes in 1969 to 7.60 lakh tonnes in 1970. But GEEDA can take little credit for this modest improvement in the export performance. Groundnut supplies were up by more than 15 per cent during 1969-70 over those in 1968-69. The increase in exports of just 11 per cent therefore really falls short of expectations.

But this is not all. What GEEDA conceals is perhaps far more revealing than what it discloses. Some of the facts which GEEDA conveniently omits to report need a little probing. World imports of oilcakes rose by more than 10 per cent in 1970. The prices of groundnut cakes in the international market were in fact up by nearly 13 per cent. Average groundnut oil prices in India were 24 per cent higher in 1970 than in 1969. The net result of all these developments was a favourable turn in the fortunes of the groundnut extraction units and the industry's processing margins showed an almost three-fold increase between 1968 and 1970

PROCESSING MARGINS OF THE GROUNDNUT CAKE EXTRACTION INDUSTRY
(Rs per tonne; annual averages)

	1968	1969	1970
Groundnut expeller cake price	559	675	709
Groundnut deoiled meal price	466	520	548
Groundnut extracted oil price	3012	4183	4822
Processing margins*	30	54.50	84.50

* Processing margin has been estimated on the standard assumption that one tonne of groundnut expeller cake yields 920 kg of groundnut meal and 60 kg of extracted oil.

as will be seen from the accompanying Table.

These favourable developments (in the making of which GEEDA had little share) apart, the Government of India offered freight assistance at Rs 26 per tonne on exports of groundnut extractions to the UK and West European destinations from January to March 1970, at Rs 15 per tonne in April and May 1970 and at Rs 20 per tonne from June to December 1970. And as if even this was not enough, the Government announced in addition development assistance of Rs 6 per tonne on aggregate exports to all destinations.

To sum up, the groundnut cake extraction industry had never had it so good as in 1970. And yet the exports of groundnut extractions in 1970 were barely 50,000 tonnes more than in 1968 when the processing margin of the industry was perhaps hardly adequate to cover processing cost. But in 1968 GEEDA was not in existence and this seems to have made all the difference. Today, with GEEDA, established in 1969 with the blessings of the Government, the industry's appetite for all sorts of concessions and subsidies is continuously growing. Little wonder GEEDA has now petitioned the Government to raise the development assistance for 1970. And, really, why should not GEEDA plead when the Government is so willing to give?

Licensing

Worst of Both Worlds

THE Licensing Committee, like all Government departments and agencies, has apparently learnt nothing from past experience. The Committee has issued a large number of licences simultaneously for scooters, tractors and mini-steel plants — not to speak of breweries and automobile tyres. The number of licences/letters of intent issued for tractors is understood to be 21, for scooters 18 and for mini-steel plants 25.

There are various factors making for decisions such as these. For one thing, there is a natural spurt in demand for licences once a commodity — be it beer or scooters — appears to be in short supply. This is a typical private enterprise response, but one would have thought that the rôle of planning was to prevent precisely such excesses of the free market. Then, perhaps, there are pressures from the different states — witness the applications of the State Industrial Development Corporations for breweries — which a federal Government might not be able to resist. Finally, the Licensing Committee which has been sitting on licence applications for the last three years, wants to show off its new-found dynamism in terms of the number of licences issued.

Whatever the reasons, it is necessary to examine the consequences of this proliferation of licences. Multiple licences create uncertainties about markets and, therefore, lead to non-implementation. They also create excessive pressure on resources — capital goods, finance, foreign exchange, materials, personnel — and result in their diversion, with a slack developing subsequently. Finally, in some cases the simultaneous completion of projects leads to a sudden glut in the market. The economic history of the early sixties is strewn with examples of this kind of folly.

Perhaps the worst consequence of multiple licensing is that it prevents standardisation in the economy. Earlier talk of centralised import of know-how is now no longer heard. Many of the multiple licences recently issued are in the engineering sector where standardisation is both possible and highly desirable. For tractors, for example, the range of engines could have been limited and body-styles defined. We simply cannot afford to have at this stage umpteen models of cars, scooters and tractors.

Cotton

Long and Lean

ARE farmers disillusioned by the poor returns from cultivation of long staple cotton? Reports from Gujarat in the last few days have been particularly discouraging. ISC from Kutch, one of the prized varieties of long staple cottons that this country produces, is currently having a lean period, with practically no buyers. There has been a price fall of Rs 1,000 per candy between January and now.

In the season that has just ended, there had been a perceptible shift in favour of growing Kalyan in place of ISC in some of the cotton tracts of Kutch, with an outturn of nearly 30,000 bales as against 4,000 bales two seasons back. The cultivators had obviously more faith in the steady returns that Kalyan offered throughout the season than in ISC with its fluctuating fortunes. Invariably, sellers of ISC tended to get very attractive prices from January to March. But thereafter they had to take their chance.

At present, the demand for ISC, whether from Kutch, AP Line or Sathamba, is particularly dull. With both the leading spot houses and the mills in no mood to extend their commitments, the possibility of the cotton being quoted still lower in the next few weeks cannot be ruled out. With a record low carry-over and the none-too-promising outlook for the 1971-72 crop, none could have visualised such a fate for the nation's recognised varieties of long staple cotton. Incidentally, India has yet a long way to go before any extra long staple (ELS) cotton of commercial significance is produced in the country. If the fortunes of long staple cotton are in such disarray, it is to be doubted whether the farmers would take to the cultivation of ELS cotton with any degree of confidence.

The Government would do well to undertake a probe into the marketing of ISC and similar long staple cottons in order to find out whether some steps could be taken to ensure a steady and reasonable return to the farmer for his stake in this cotton. It would seem that the cotton has an inherent weakness which manifests itself after the first flush of marketing is over. Maybe, all the lots that come into the market are not similarly afflicted and some of the buyers tend to exploit the anxiety of the seller on this score by putting off their purchases. Apart from correcting the technical handicap, Government should, if need be, take a hand in the marketing of this cotton to safeguard the interests of the farmer. The more long staple that we grow the less will be our dependence on foreign cotton. Confidence established among farmers growing long staple cottons is bound to pay rich dividend in attracting them to the cultivation of ELS cotton. On the other hand, Government's indifference at this stage can only lead to increased spending on foreign cotton.

Gleanings from Enterprise

Hansavivek

GARWARE NYLONS' chairman, B D Garware, says that production of nylon yarn commenced in the country in 1962 with an output of 175 tonnes per annum and increased to 10,000 tonnes in 1970. The present licensed capacity is around 16,540 tonnes. There are 140 applications for industrial licences pending decision. Garware feels that, instead of creating more and more small units of uneconomic size, existing nylon units should be allowed to expand to an annual capacity of 4,000-5,000 tonnes so as to benefit from the economics of scale, make yarn and fabrics available to domestic consumers at reasonable rates, and promote exports. As for the Tariff Commission inquiry, B D Garware maintains that the industry is of very recent origin and so cannot yet absorb the effects of such an inquiry. For the time being, its raw materials are being imported; it is capital-intensive and research-oriented; and it is subject to a high incidence of wear and tear and obsolescence owing to other chemical fibres like polyester, acrylics, etc. Says the chairman: "As such it would be a great burden to the industry to think of expansion and diversification and at the same time to get itself adjusted to the draconian framework that may be suggested or may result by this inquiry". According to Garware, a study of the price structure will have a semblance of reality catering to the needs of Government, the industry, and the consumer, only if for some years to come the industry is given freedom for growth till (i) the consumer preference is examined and developed in its true perspective, (ii) the raw material position is properly assessed, (iii) adequate reserves are built up for desirable expansion, and (iv) research and development and economies of scale are developed.

In addition, the industry should be given higher development rebate and other tax concessions—or, at least, there should be *status quo ante* so that it may go ahead with expansion plans and programmes and also attract more and more entrepreneurs for the achievement of higher targets.

DHRANGADHRA CHEMICAL has applied for a 'letter of intent' to expand capacity of its soda ash plant to 85,300 tonnes per annum. It is also exploring possibilities for manufacture of bromine and hexachloroethane for which it has received 'letters of intent'. Steps are being taken to increase production of beneficiated ilmenite, output of which was affected last year by the short supply of raw ore and operational difficulties in the acid absorber plant. A small quantity has already been exported to Europe, and negotiations are under way for exporting a substantial quantity to the US. The 40 MVA transformer was commissioned last February and it will help to stabilise production of the caustic soda unit. The Tamil Nadu Government issued orders, fixing power rates from April 1968 to September 1970 higher than those provided in the agreement. The amount due to the electricity board, as a result of the revision in the tariff, will be paid in instalments after a settlement with the State Electricity Board. Still higher rates have been fixed by the state government for October 1970 to September 1980. The electricity board and the state government have reserved the right to review power rates before the agreement expires. The revised power rate will add considerably to the company's cost of production. During the 32nd year ended March 1971, production of caustic soda at Sahupuram was 45,156 tonnes against 44,900 tonnes previously, although the unit experienced the usual trippings due to fluctuations in the incoming grid power. The tri/perchloroethylene plant registered higher output and sales in spite of inadequate supplies of calcium carbide. A small quantity of trichloroethylene was also exported. The liquid chlorine plant also performed well, with higher production and sales. Production of soda ash at the Dhrangadhra unit was slightly lower, at 43,410 tonnes (44,298 tonnes), owing to a labour strike early in the year and heavy rains that submerged equipment in the factory and intercepted supplies of grid power in September 1970. Higher sales and better realisation notwithstanding, gross profit turned out to be a little lower compared to the preceding year owing to increased costs of raw materials, packing, freight, and power. The report points out that this year's railway and central budgets will add further to cost. The subsidiary, Plastic Resins and Chemicals, has almost completed erection of plant and machinery for the manufacture of poly vinyl chloride. The plant is to be commissioned very shortly. With the expected shipments of beneficiated ilmenite, exports this year may exceed Rs 1.5 crores.

JIYAJEERAO COTTON is taking on lease from Eastern Spinning Mills a refractory at Bhandaridah in Bihar for 10 years and is seeking government's approval for this under the MRTP Act. Its application for expansion of soda ash capacity, from 500 to 800 tonnes, was turned down, but the matter is still being pursued by the management. For purposes of renovation and modernisation, machinery worth Rs 90 lakhs was installed at the mills last year. The company purchased Wadinar salt works along with its fixed and movable assets for over Rs 18 lakhs. During the year ended March 1971, Jiyajeerao's output of soda ash increased from 1,40,770 tonnes to 1,48,871 tonnes, caustic soda from 20,252 tonnes to 23,188 tonnes, refined sodium bicarbonate from 4,524 tonnes to 5,411 tonnes and ammonium carbonate from 144 tonnes to 394 tonnes. Supply of sweet water was considerably better during the year than in the past. Efforts are being made at early completion of Fadodraness scheme, which was delayed on account of some legal dispute between the contractor and the state government. Unseasonal rains adversely affected production at salt works which are all located in Saurashtra. Caustic soda and soda ash production is short of demand, and deliveries are delayed by 'acute shortage' of railway wagons. The company is using steamers for despatches to port towns. Prices of products were increased during the year owing to rise in costs of raw materials, fuel, hard coke, gunny bags, stores, spares, etc. The textile division experienced shortage and high prices of cotton. Production of blended fabrics was stepped up to suit consumer preference. With a bigger contribution from the chemical division, the company produced good results with rises in sales and earnings. On the company's application for issue of bonus shares, on a one-for-one basis by capitalisation of Rs 1.10 crores from preference shares capital redemption reserve and Rs 1.22 crores from general reserve, the Controller of Capital Issues intimated that capitalisation be made out of free reserves other than preference share capital redemp-

tion reserve. Accordingly, the company submitted a revised proposal for capitalising the entire amount from general reserve.

NATIONAL INSULATED CABLE COMPANY OF INDIA (NICCO) has been experiencing contraction of margins owing to rise in costs, especially in salaries and wages. As expenses are expected to increase further, the management intends to step up turnover by diversifying production and improving efficiency through replacement of old machinery and installation of balancing equipment. This will take considerable time, as suppliers of indigenous equipment quote long delivery periods and as delays are also involved in procuring import licences. Meanwhile, the company expects to increase turnover in the current year from fabrication jobs. Last year, too, fabrication jobs brought in about Rs 6 lakhs more at Rs 25 lakhs. Despite keen competition and reduction in incentives, the company was able to export materials worth Rs 25 lakhs against Rs 23 lakhs in the preceding year. A few sole selling agency agreements for certain territories were terminated from April last. Sales depots were established at Hyderabad, Gauhati and Cuttack to maintain sales in these territories. A sales depot is also being established in MP.

SIEMENS INDIA took two years to recover from the impact of the last recession and to reach a reasonable profitable level of operations. During the year to September 1970, total turnover expanded from Rs 20.31 crores to Rs 25.03 crores and net profit from a mere Rs 15 lakhs to Rs 127 lakhs, even though depreciation required as much as Rs 33 lakhs more at Rs 94 lakhs. Demand for the products and equipment manufactured by the company and its licencees continued to be good. The project business thus developed well. Product business in switchgear, motors and power transformers also expanded satisfactorily. The performance of the components, data and communications division, however, was affected by procedural delays in the issue of import licences and by the longer delivery periods asked for by suppliers. But the sales performance of the medical division was satisfactory. The company stepped up its import substitution drive. To initiate restructuring of its finances on a long-term basis, the company went public with an equity issue of the aggregate face value of Rs 1.20 crores and 8 per cent debentures of the total face value of Rs 2 crores.

FIBREGLASS PILKINGTON has carried through the first stage of expansion and is now in a position to offer much quicker deliveries and better customer service than a year ago. The company is devoting greater resources to technical development and proposes to build additional laboratories at Thana. With further progress in the year ended March last, the company was able to reduce the accumulated deficit to less than Rs 6 lakhs. V J Osola, chairman, stated at the annual meeting that even the balance loss was wiped out in the first quarter of the current year. Turnover in the first five months of the year increased by 16 per cent over that in the corresponding period of last year; profits also showed 'satisfactory progress'. The chairman expresed hope that the company would be able to pay a maiden dividend next year.

By-Election Pointers

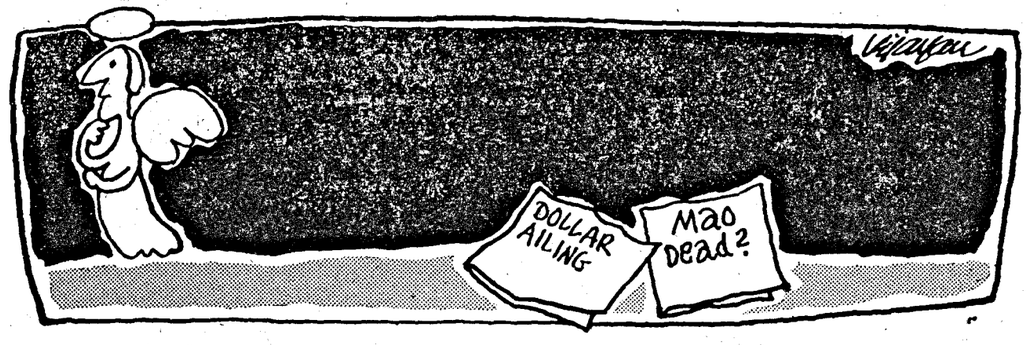
Romesh Thapar

FIRST, it was the Union Territory of Delhi which, voting within weeks of the "massive mandate" parliamentary election, shattered the lazy political forecasters by returning an unexpected Jan Sangh majority to the Metropolitan Council — and that, too, despite the incessant talk about the misuse of the democratic process by an all-powerful ruling party. Then, there were a few isolated pointers of solid opposition strength prevailing at the regional level, including the jitters that Planning Minister Subramaniam would undergo every time the DMK was reported to be thinking of double-crossing him in Tamil Nadu. But very much more significant has been the defeat of what one called "Indira Gandhi's candidates" in the Orissa by-elections.

Some of us, who have been working that the Indian people are voting at two levels of consciousness, the national and the regional, and that there could be a "massive mess" in the February 1972 elections to the state assemblies, can claim that the speculation is now getting a certain factual backing. Indeed, opposition parties, somewhat paralysed since the parliamentary elections, might begin to waken to the possibilities of power in the states. If Biju Patnaik can operate, what's to prevent others?

Interestingly enough, the ruling Congress heirarchy, under the energetic prodding of a Prime Minister who is no political chicken, has begun clearing the decks for the battles of 1972 which it expects will be severely contested. The ouster of powerful, but unpopular, chief ministers — and also of their cronies who have made too much money as politicians — is an acceptance of the thesis that unless the ruling Congress looks different and acts different it may well lose many vital contests in the states.

The argument persists that the clean-up in the states is too faction-oriented to really restore to the ruling Congress parties in the regions the dynamics needed to win massive mandates. Largely, the new provincial commitments are patchwork arrangements where the old bosses are attempted to be silenced by the exercise of the PM's power and patronage. Very often, the men — and women! — chosen to lead the new phase have little ballast. Of course, it is possible that these elements will "develop", but the state elections are only five months away.



In the confusion that is bound to develop following these reverses, the thesis is being advanced that those elements of the discredited Cong-O who are fed up with its moribund condition should be brought back to the ruling Congress party. This theorising has strengthened following the political broadside delivered against the Cong-O by Ram Subhag Singh, and the reported desire of Kamaraj to reconsider his opposition to Indira Gandhi (even though Karunanidhi of the DMK would have us think otherwise).

Naturally, a certain fear prevails that in order to prevent what could turn into a critical splitting of the vote it might be considered necessary to welcome back Cong-O members who have "seen the light". Such a development, forcing further factional adjustments at state level in an amorphous party, could again usher in a period of do-nothing politics and put a bigger question mark over the future of the party.

One of the positive outcomes of this situation is the emergence of a new realism at certain levels of policy-making. The rigid, mechanical slogans of the Left are at a discount. There is a groping towards solutions which will guarantee a just society. This groping had better become a systematic investigation designed to throw up practical panaceas. The unequal, corrupt, static power structure of India must be challenged with a viable alternative.

If this quest fails, we will be back to the adventurism of the Left — and even of the Right!

September 28

"No wonder men are losing faith in omnipotence and immortality!"

NEW DELHI

New Sources of Crude Oil

THE brief storm in the tea cup last month over the alleged refusal of the foreign oil companies to increase their throughput to meet emergency conditions and to help the country to build up stocks of petroleum products has quietly died down. It was certainly not a case of the oil companies refusing to co-operate in a national emergency as it was made to appear. One of the three foreign oil companies had readily agreed to step up production and actually did so. In the case of the other two, there were operational problems of which the Petroleum Ministry was well aware. In any case, the issue is no longer a live one. But the controversy once again highlighted the strained relations that have developed between the government and the oil companies, specially after the latest steep hike in crude prices.

Agreement with Iraq

A more important and fundamental development in oil policy was the signing last week of the Trade and Economic Co-operation Agreement between India and Iraq. Under the Agreement trade between India and Iraq is proposed to be increased threefold in the next two years. Crude oil and sulphur have been added to the list of imports from Iraq which hitherto consisted mainly of dates. In addition, the Agreement provides for identifying new fields of economic co-operation, including joint ventures such as an oil refinery in India based on Iraqi crude and a steel mill in Iraq based on Indian iron ore. There has also been some discussion on Indian collaboration for a fertiliser plant in Iraq based on natural and associated petroleum gas. The significance of all this is that a positive move has been made to establish new sources of crude oil based on a link-up with national oil enterprise in a crude-producing country.

The talk of nationalising the foreign oil companies, which has cropped up now and again during the past several years, has been more of a propaganda ploy used whenever difficulties arose with any of the oil companies in respect of crude prices or crude import arrangements. The government did manage occasionally to squeeze some small price concessions amounting to a few cents per barrel. This was not too difficult given the declining trend of crude prices, particularly in the West Asian oilfields. This did not in any way affect the entrenched position of the foreign oil companies in the Indian market. The fundamental vulnerability of the Indian position was sharply emphasised in the last few months when the oil producing countries of West Asia took concerted action to protect their rights and to prevent erosion of their incomes from their oil wealth. The oil companies have succeeded in passing on to us the entire increase in crude prices which they had been forced to yield to the producing countries. As a result, whatever small price concessions the government had been earlier able to extract from the companies have been wiped out and there has been a steep rise in prices of imported crude of the order of 35 cents per barrel, with the prospect of further increases to come. The crude import bill in the current year is estimated to go up by nearly Rs 36 crores over the Rs 102 crores paid out last year, all in free foreign exchange.

Import Arrangements

The weakness of the Indian position is further shown up by the fact that the price increases affect equally the public sector refineries based on imported crude; in fact, the Iranian suppliers of crude to the Madras refinery are charging a higher price than is charged by the three international oil companies.

Once the disadvantages of the special refinery agreements with international oil companies had become clear and the government had decided that further development of the oil industry would be in the public sector, efforts were made in the early sixties to bring in oil companies other than the 'oil majors'. The Cochin refinery was put up in collaboration with Phillips of USA. Then followed the refinery in Madras with Iranian and US collaboration. And now a refinery is under construction at Haldia with French and Rumanian collaboration. But whatever the collaboration arrangements for setting up the refineries, the crude import arrangements were similar. In all the cases India had no direct relationship with the sources of supply and foreign agencies were entrusted with making the imports against free foreign exchange to be provided by the Government of India. In addition, the agreements were in the nature of long-term contracts with clauses for price adjustments which have been taken full advantage of by the foreign suppliers. The Shantilal Shah Committee on Oil Prices had, in its report submitted in 1970, roundly criticised all these arrangements. The Committee had found that under the arrangements India could not take advantage of the falling trend of crude prices at that time. Now it is seen that they also offer no protection to India in conditions of price rises.

Meanwhile, a new situation in regard to crude imports is beginning to arise. In the fifties, the entire import of crude was for the foreign oil refineries. The first three public sector refineries were based on indigenous crude. But as indigenous production of crude has been steadily lagging behind requirements, the new public sector refineries which have been set up since or are now proposed to be set up (such as the one in the north-west) have to depend on imported crude. In the case of the three public sector refineries at Cochin, Madras and Haldia, foreign agencies have been entrusted with importing the crude. But with the growing dependence on imported crude, this arrangement obviously needs to be changed. An Indian agency in the public sector, fully equipped to arrange crude imports for the public sector refineries, must now come up.

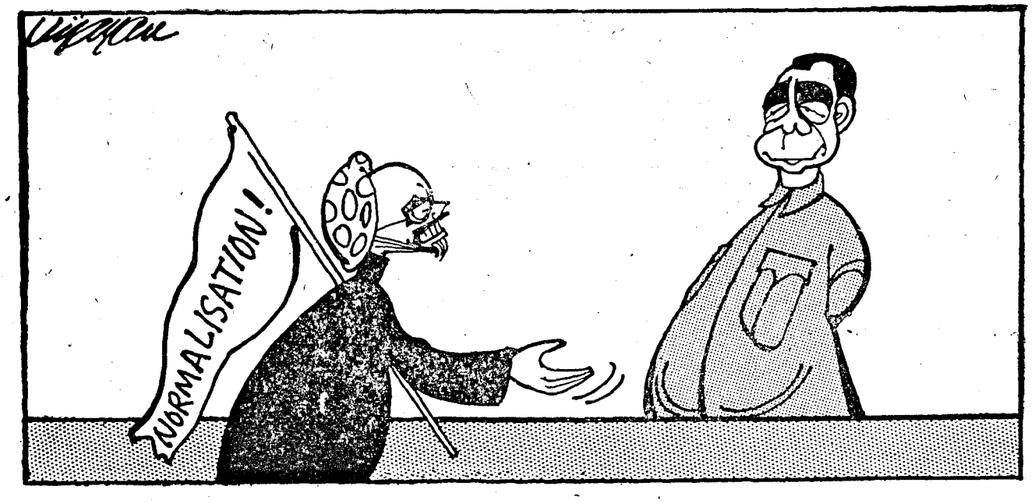
Direct Links

The idea that India should enter the international market as a bulk buyer of crude had been strongly canvassed by the Shantilal Shah Committee. It had recommended the setting up of a single agency to handle all import of crude by inviting competitive bids in the international market. The experience of Germany and Japan was cited in support of such an arrangement. However, this recommendation was based on the then-existing situation of falling prices and surplus supplies in the international oil market, which situation has now completely changed. Both Germany and Japan are now striving to get a foothold in the international oil business itself so as to gain a measure of direct control over supplies.

While the example of West Germany and Japan, which are for larger consumers of crude, may be only of limited relevance to India, developments in the West Asian oil market are propitious for making new arrangements for crude imports which will be advantageous to both India and the oil producing countries. The growth of national oil companies in these countries and their anxiety to establish direct links with consumers open up prospects for making new arrangements between them and India. In this context the trade agreement with Iraq is of great significance.

The Petroleum Ministry has in the past been too much obsessed by secondary and narrow considerations in approaching the problem of crude imports. The question of price is a case in point. In a direct deal with a national oil enterprise in a producing country, the question of the price of crude should be seen in the context of trade expansion and growing economic collaboration between the two countries. The trade agreement with Iraq correctly links up the question of crude imports with the other collaboration proposals, including that for the north-west refinery. The technical teams which are shortly to go to Iraq to initiate detailed negotiations should pursue matters in this perspective.

Meanwhile, the question of developing indigenous sources of oil remains as pressing as ever. It is to be hoped that the report of the Malaviya Committee on the Oil and Natural Gas Commission, the principal oil explorer in the country, will help to impart some dynamism in this vital area. But the decision to set up the Committee ought not to be made an excuse to sit back and do nothing. There is Oil India, an equal partnership between the Government and the Burmah Oil Company, whose affairs need to be looked into. The Burmah Oil Company is known to be keen to extend its area of collaboration with India to include joint ventures abroad and it has the resources for this. Even if exploration in India is reserved for the ONGC, the advantages of collaboration in oil exploration abroad need to be seriously examined.



In addition, the work of exploring the offshore areas needs to be taken up with greater speed. The ONGC seems to be struck with fixed platform drilling of the shallow structures off Cambay. Meanwhile drilling of the deeper waters with the assistance of the Japanese and the Americans will have to wait for another year, according to the arrangements arrived at late last year. Meanwhile, why should not arrangements for exploring other structures along the long coastline of India be taken in hand right now?

MAHARASHTRA

Shivaji Image Smudged

THE unanimous resolution adopted by Congressmen from Marathwada at their meeting in Nagpur last month demanding the chief ministership for their region has put Y B Chavan in a tight corner. The move was in effect, if not in intent, a revolt against the hitherto undisputed supremacy of the Union Finance Minister over Maharashtra Congress. The Nagpur meeting was held immediately after Chavan had declared that V P Naik would continue as Chief Minister after the 1972 elections and added, for good measure, that Naik was a "gift" to the state. He had implied that those who were raising the issue of chief ministership were guilty of trying to disrupt the party and had declared that they would eventually be "frustrated". Chavan had hoped that his statement would ring down the curtain on the wrangles over the chief ministership.

Chavan did not stop with issuing

"Actually, Mr Chou, we've become self-sufficient. We can make our own emergencies without your assistance."

his statement. His acolytes in the state party threatened Marathwada MPs, MLAs, district party chiefs and chairmen of zilla parishads with disciplinary action if they attended the Nagpur meeting. According to some reports the party General Secretary, Sharad Pawar, even told Shankarrao Chavan, the chief minister-aspirant from Marathwada, that he would not only not get the chief ministership after the 1972 elections but would not even be included in the next ministry. But these threats did not work and the meeting was held as scheduled. More recently Shankarrao Chavan has declared that if Marathwada's demand for chief ministership was not conceded by Chavan, it would be referred to the party's central parliamentary board and that Marathwada Congressmen would not hesitate to seek Indira Gandhi's intervention.

The revolt of the Marathwada Congressmen is significant for two reasons. First, contrary to earlier expectations — and reports circulated by Vasantrao Patil, the PCC chief —, Shankarrao Chavan has proved his claim that the entire Marathwada party is behind him on the demand that the chief ministership should go to the region. Secondly, and more important, the Marathwada party has flouted the wishes of Y B Chavan, thereby confirming that the Union Finance Minister is no more the undisputed leader of the state Congress. This has not, however, come as a complete surprise. The long reign of V P Naik which has lasted over eight years has made Maratha caste politicians in the Congress restive. The Maratha leaders fear that the changes that Naik has brought about in the power structure during his tenure have reduced their dominant position in the Government. Thus what the Maratha leaders are striving for is to reassert their dominance in the state Congress and in state politics. The demand that the chief ministership should go to the Marathwada region is a cover for this.

Although some political light-weights from western Maharashtra are still with Y B Chavan, there is a strong section from the region led by Y J Mohite which supports Shankarrao Chavan's demand. These leaders have little sympathy for Marathwada's claim to the chief ministership, but they fear that if Naik continues for another term of five years, followed by a term of five years for a chief minister from Marathwada, their own turn to be in power would come only in 1982, by which time they would all be old. So they have joined Shankarrao Chavan in his attempt to replace Naik in 1972 so that their own turn would come after five years.

The support of western Maharashtra politicians led by Mohite and others to Shankarrao Chavan has rattled the Union Finance Minister who feels that this development will undermine his position in state politics which, in turn, will weaken his already none-too-sure position at the Centre. Chavan knows well that the Prime Minister's moves to remove Naik are in fact directed at himself. The Prime Minister cannot hope to acquire control over the party machinery in Maharashtra unless Chavan's position as the undisputed leader of the state Congress is undermined. It follows from this that if the opposition to Naik's continuance gathers momentum in the party, Chavan may shift his stand in the interest of preserving his own leadership.

Meanwhile, the hold of the landed interests on the Maharashtra Congress as also that of the industrialists and property holders in Bombay, Poona and Nagpur on the state government was demonstrated by two important policy decisions announced by the Chief Minister. The state government has, contrary to its earlier resolve, decided not to enact legislation imposing a ceiling on urban property. Naik has also postponed amendment of the ceiling on land to change the unit of holding from the individual to the family. As regards the ceiling on urban property, the state government has now asked the Centre to pass uniform legislation on the subject. On changing the unit of holding from the individual to the family, Naik said that the state government would take a decision after finding out what other state governments were doing in the matter. These two decisions are significant insofar as the earlier decisions to enact legislation imposing a ceiling on urban property and to amend the land ceiling act had been paraded as two major items of the 15-point programme adopted by the Maharashtra Congress and later by the state government.

★

The Chief Minister specially invited journalists from Bombay the other day to visit his lush green farms in his home town of Pusad in Yeotmal district. The purpose was to refute the allegations made by the separatist Vidharba leader and Forward Block MP J B Dhote that the Chief Minister had amassed wealth amounting to Rs 1.19 crores. While V P Naik did not dispute the items of property listed by Dhote, he claimed that the value of the property had been exaggerated by Dhote. After taking the journalists on a conducted tour of his rich hybrid cotton farms, modern dairy, petrol pump and his brother's posh bungalow, Naik addressed a press conference. On the whole what Naik had to say about his assets raised more questions than it answered.

In the first place, all the items of property referred to by Dhote did in fact exist. As for their real value it was, after all, the Chief Minister's word against Dhote's. Secondly, the disclosures had been made belatedly, following reports that the house of one of Naik's close relatives had been raided by CBI. There are also reports that the Chief Minister had received a letter from the Prime Minister suggesting that he should disclose his assets since the allegations against him had been levied by an MP. On the other hand, his colleagues in the party leadership are unhappy at his action since they fear that he has set a precedent and that some of them would also be forced to declare their assets if similar allegations were made against them by opposition members in the state Assembly.

Turn in Andhra

Mohit Sen

THE exit of Brahmananda Reddi gives Andhra a chance to maintain its identity and to continue as an integrated state. If this had come about many months earlier, the people of the state would have been spared so much of anguish and waste of energy. It is, of course, absurd to hold that the ex-Chief Minister was the main reason for the agitation and struggle for a separate Telengana. There were deeper economic and psychological factors behind this demand. But Brahmananda Reddi became the symbol of the domination of and the injustices perpetrated by the landlords and the new rich of the delta areas of Andhra. And his attitude towards the movement made him the target of anger.

At one time it was argued that the removal of the Chief Minister would only whet the appetite of the separatists and make them more adamant. Exactly the opposite has happened. It is true that the sweeping victory of the Congress in the mid-term polls had a sobering effect on the leaders of the separatist movement. Their consistent support for the new measures and attitudes of the Prime Minister convinced the Congress High Command that they were not, in the main, to the Right of Brahmananda Reddi's Congress. Their success in the Telengana region was, therefore, taken as an expression of anger and discontent against the dominant Pradesh Congress leadership. Thus, blinkers were removed and prejudices dispelled. And after many months of probing and pressure, a Telengana Brahmin has emerged as the Chief Minister.

Quiet Exit

Behind the removal of Brahmananda Reddi there was, undoubtedly, the desire of the Prime Minister to cut to size the Pradesh Congress leaders who might act as alternative centres of power. The ease with which the removal was effected has important lessons and it can scarcely be disputed that the exit did not lead to the kind of rumpus that was predicted by many. Brahmananda Reddi is no saint and his final agreement to quit, after tenaciously holding on for so long, came only because the alternative was a clash with the Prime Minister in which he knew he would be worsted.

The first lesson to be noted in this context is the reality of an all-India consciousness and unity. The facts of uneven development and of the nationalities-basis of Indian development are realities that cannot be ignored. Nor can the reality of an emerging India with its corresponding all-India consciousness. Since Independence these two processes have both developed, sometimes convergently and sometimes contradictorily; but it would appear that all-India consciousness has grown faster. This is, above all, because the economic trends that in the final analysis determine significant developments have been more of an all-India nature. An all-India market as the main unit of capitalist development in the country is a more powerful reality than the local or state-wide markets. This has very serious implications for all political parties and personalities in the country, not least for those who strive for revolutionary change. The unit, the interconnected whole or totality, of the Indian revolution will be India and not some region based on localised economy.

The Cash Nexus

The second lesson to be underlined is the demolition of the myth of the 'powerful' Chief Ministers who in a conclave would decide the destiny of India. These Chief Ministers are not powerful since, essentially, they are manipulators. They are not even machinemen of the type that, say, Vallabhbhai Patel was. The doughty Sardar built up an organisation, moulded cadres, and moved the entire party when the occasion demanded. Besides, he represented a powerful Right ideological trend in the national movement which was, to some extent, associated with Gandhi—though this association has often been overstressed to the extent of ignoring Gandhi's connection with Jawaharlal Nehru. Brahmananda Reddi and those like him are not to be considered even as *chhota Sardars*.

The power of manipulation that these gentlemen are so skilled in using is essentially the power of their office and the patronage that they can distribute. There is no ideological binding force nor even the constructive grip of building and sustaining an organisation to weld together the masses for action. Thus, no loyalties develop and no permanent associations. The only connection is the cash nexus which dissolves once the public exchequer is no longer under control. Brahmananda Reddi, above all, knows this since it was he who used this fact to smash the influence of Sanjiva Reddy whose protege he once so pliantly was.

This does not mean that the ex-Chief Minister will now have no following at all or that he will be able to exert no influence on the politics of Andhra. He has used the power of patronage right down to the panchayat samiti level and these gentlemen would rally if all at once their power to make money was threatened. But they would not rally behind their erstwhile patron if their power was not threatened or if a discriminatory approach was adopted.

Shortlived Peace

It is true that P V Narasimha Rao has been a steadfast colleague of Brahmananda Reddi. It is also true that he has no mass base or factional group of his own. The fact that he is a Brahmin would also go marginally against him. But it is more than likely that he would soon shed the character of the ex-Chief Minister's colleague and establish direct contact with the Prime Minister. He could build a team of his own and go about the business of governance.

For some time it is likely that he would have a reasonably peaceful time as the people of the Andhra regions are relieved at the preservation of the unity of the state while those of Telengana expect that some of their economic demands would be met just as they feel that some of their hurt has been soothed. But this would be a pretty shortlived peace. The elections to the State Assembly are only four months away and the scramble for tickets, for particular seats and so on would certainly upset the Congress calm. The re-entry of the Telengana Praja Samiti Congressmen would strengthen the Congress but also complicate the party's internal squabbles.

More important, however, is the fact that the toiling youth of Andhra Pradesh are as impatient for change and growth as their counterparts in the rest of the country. And neither growth nor social change characterise Andhra today. The largely undifferentiated Congress, moreover, does not give even the semblance of a desire for these twin objectives. Spectacular political developments, therefore, are in the offing in this state.

An Infertile Lobby?

Dipak B R Chaudhuri

IT was on a Sunday morning last winter that the idea of a 'Fertiliser Promotion Council' was scotched on the advice of Cabinet Secretary T Swaminathan, who the evening before had finally consulted a few public sector technologists. Though not formally rejected, the proposal has been effectively shelved. What seems to have weighed heavily in the decision is the history and record of another such body, *viz*, the Fertiliser Association of India. The idea of a 'Fertiliser Promotion Council' had its origins in the recommendation of the Sivaraman Committee in 1965 for a 'National Fertiliser Promotion Corporation' to work on sales promotion and farmer education. The idea was develped later, envisaging a statutory board or council on a registered society basis. It was thought that Government must play a role in the distribution of fertilisers because of its responsibilities for increasing agricultural production and for seeing that there is social justice in economic development. The Fertiliser Committee in its report in 1965 thus spelt out three responsibilities: first, to carry the message of balanced fertiliser application to all parts of the country; secondly, to guarantee supply of fertilisers at fair prices, and thirdly, to build up a good fertiliser distribution system in the remotest corners of the country by activising the credit sector. Government would have a special role to play because sales promotion activities of private manufacturers would aim to boost the merits and sales of brand products. This would be to the detriment of balanced fertilisation. The Sivaraman Committee, therefore, felt it necessary to entrust basic promotion to a special representative agency that would supplement the work of the existing official agencies.

Ironically, the idea of the representative agency was subsequently taken up by private fertiliser interests to suit their own ends. When control on pricing and marketing was removed in 1966, private sector fertiliser business interests and the foreign suppliers of fertilisers and fertiliser raw materials started to campaign in favour of the Sivaraman Committee's recommendation in an attempt to dominate fertiliser marketing. The Fertiliser Association of India (FAI) was the major instrument used by this lobby in its attempt to obtain a favourable decision. Indeed, the FAI had by then acquired such power and connections that it was very nearly successful. But it was FAI's own record that finally weighed the scales against another council.

Of course, the FAI does not profess to be a lobby, and it has enjoyed the trust and patronage of successive ministers and senior officials in the Department of Agriculture. Constituted in the mid-fifties by private sector superphosphate manufacturers and by those interested in importing fertiliser raw materials, FAI even succeeded in getting the public sector Fertiliser Corporation of India (FCI) enrolled as its constituent corporate member.

Till 1966, nitrogen distribution was a government-cum-co-operative monopoly. Distribution of phosphates was handled by manufacturers through private dealers and through co-operatives. Till the mid-sixties fertiliser production was one of the areas of the economy reserved for the public sector and government resisted pressures for concessions from local business groups and American agencies. But when, in 1966, Asoka Mehta and C Subramaniam opened this industry to the indigenous and foreign private sector, FAI then found a role cut out for itself, and soon became the organ of propaganda for the private sector. This happened notwithstanding the fact that the public sector FCI, together with public sector FACT in Kerala, have been dominant in the field of domestic production. It is no secret that, though formally part of FAI, the public sector fertiliser managements consider FAI to be not only a lobby of the Indian private sector fertiliser industry and trade, but also a watchdog of American mineral and chemical industries. In fact, though FCI's directors have been included on successive FAI executive boards, the FCI has never taken any active interest in the house-running or operations of the FAI. Moreover, although it is the largest single producer, has multiple producing units and pays the heaviest subscription, FCI enjoys the right of only one vote — at par with smaller private units producing a single superphosphate or even simple mixtures. Yet, a single house or owner in the private sector may exercise multiple votes in the name of different fertiliser firms.

Conflicts of interest between FAI and FCI came into the open over the indirect American campaign against FCI, started when the Trombay unit went on stream and started to market high-analysis complex fertiliser known as ammonium-nitrate-phosphate (brand name Suphala). In Indian conditions, Trombay's ANP is vastly superior to any other complex fertiliser, such as DAP, which the Agriculture Ministry has been importing. The American chemical industry has faced a problem of 50 per cent surplus of DAP since 1963 when it expanded its fertiliser production capacity. Evidently, the US wanted to retain the Indian market; US AID was persuaded to develop a long-term market for it by training a corps of propagators for DAP and other such fertilisers. It is evident that US AID and FAI work in close liaison.

Similarly, the suppliers of sulphur and sulphuric acid and of rock phosphate and phosphoric acid put their fingers in the pie. The Indian subsidiary of a well known American minerals company is known to have retained at least a dozen retired ICS officers and CSIR administrators, not to mention politicians. In fact, ammonium-nitrate-phosphate (ANP) fertilisers, with or without potash, made by the nitric acid acidulation process at the Trombay plant, yield a suitably balanced, highly nutrient fertiliser at lower costs and without any significant use of sulphur. This fertiliser provides both types of nitrogen, *viz*, ammonical as well as nitrate and phosphates, in the water-soluble form and citrate-soluble form, and has been developed by local talent and team work. Its marked benefit is the use of nitric acid to release the P_2O_5, which process is more economic than the use of sulphuric acid, since nitric acid is cheaper. The need for imported sulphur is also eliminated, and no byproduct gypsum is produced even as additional plant nutrient 'N' becomes available in the form of ammonium nitrate.

The FAI also lobbied on a big scale for import of liquid ammonia for manufacture of fertiliser. Indeed, it seems that to facilitate Tata's Mithapur project in Gujarat, Asoka Mehta first cleared the Dharamsi Morarji project in Maharashtra — even though FCI did not support the cause of imported ammonia as feedstock.

But the FAI is not inflexible in its approach. When, at last, the Ministry of Petroleum and Chemicals concurred with FCI directors to let FCI leave the FAI, efforts to accommodate the giant public undertaking began to be made at once. A few weeks ago, there was a meeting between the FAI leadership headed by Charat Ram and the FCI directors. The FAI board agreed to amend the memorandum and articles of association within six months to allow a fair share of influence to multi-unit large-scale producers such as FCI.

Area Studies in Indian Universities

J A Naik

IN most Western countries the academic community gets its due share in shaping the nations' foreign policies. For instance, according to newspaper reports, when President Nixon decided to review his Vietnam policy, the State Department was working in consultation with more than 100 academics who had specialised in related areas. What is the situation in India? Even if the Government had decided to bring academics into the picture at some stage for such a major foreign policy decision as that to have a defence alliance with Russia, what could it do? Where are the persons who can discuss Soviet affairs with specialised knowledge? In the whole of India there might be at the most three or four academics who have taken the trouble of specialising in Soviet studies; similarly, in the whole of the country there is only one centre for Soviet studies employing one specialist. This is how we are approaching the task of encouraging study of an area which should be of the utmost importance to us.

Faultily Conceived Programme

The University Grants Commission had sanctioned a Soviet studies department at the Bombay University nearly four years back and the university had prepared a plan to employ two Sovietologists specialised in Soviet politics, sociology, economics or history. The idea apparently was that the selected specialists would work under the general guidance of the university professors in the department irrespective of whether these professors had any competence to guide the projects entrusted to the specialists. But what happened to even this faultily conceived programme of area studies? Some posts were advertised nearly three years back and the interviews were conducted a year afterwards. The only 'expert' who was invited to judge the competence of the candidates had apparently not so much as spelt the words 'Soviet Union' in his academic writings. To this date the posts remain to be filled. Although it is four years since the UGC sanctioned the department of Soviet studies, the Bombay University authorities have shown not the slightest sense of urgency in taking advantage of the UGC's offer nor has the UGC thought of shifting the department to some other university. The Delhi University already has a department of Chinese Studies; why should not the UGC shift the proposed Soviet studies department to Delhi University and build, on the model of the Columbia University's Institute for Communist Affairs, a centre for communist studies at Delhi?

Specialisation by Themselves

Looking at the 'research' interests of University 'professors' in India, area studies cannot be developed in the existing departments such as those of political science, history, economics, sociology, etc. Area studies are a specialisation by themselves and are unlikely to thrive in the general studies departments. The School of International Studies in New Delhi has produced more work during its existence of less than 15 years than the political science departments of most universities have done in the last 50 years or more. The School has achieved this largely because it was planned and developed as a centre for area studies. Unless the area studies programme is planned on similar lines it is unlikely to progress; and unless area studies are developed it is unlikely that we will have specialists who will be able to contribute to foreign policy debates in the country.

The Bombay University's approach to building a department of Soviet studies has been cited above, but it is by no means an exception. Around the time when the Bombay University was entrusted with the task of developing Soviet and African studies, the University of Madras was provided with grants for starting a South-East Asia studies department. As far as this author is aware, one post was advertised, some candidates were called for interview, but to this date the interview has not taken place nor has anything else been done to build up the department.

Besides the lack of professional competence of the generalists, what makes the task of developing area studies programmes in established general studies departments difficult is the dearth of facilities in these departments for development of area studies. To cite the instance of Soviet studies again, it is unlikely that a professor of sociology in an Indian University would appreciate the problems of developing Soviet sociological studies in India. Area specialisation develops through field trips to the concerned country, knowledge of the language of the region, etc. At present no Indian or foreign scholar can visit the Soviet Union for studying anything, except with the help of scholarships offered by the Soviet government or through cultural exchange programmes between the two governments. An Indian student specialising in American studies—or, for that matter in Saudi Arabian studies—can go to the country concerned and collect material for his research with funds released by the Government of India. The Soviet authorities are, however, still sensitive and selective in permitting study projects by foreign scholars. Recently an Indian scholar working on Soviet-Pakistan relations was not allowed to visit the Soviet Union. In the circumstances, to imagine that an Indian sociologist would be allowed to visit the Soviet Union to do field work on any sociological problem concerning the Soviet Union is to betray profound ignorance of the situation. And yet it is reported that the Sociology Department of the Bombay University is trying to have a sociologist in Soviet affairs!

Development of area studies raises another question. At a time when the Soviet Union has emerged as probably the single most important nation for this country we have hardly half a dozen specialists in Soviet economic and political affairs. Should we really waste money at this stage on studying Soviet family, marriage, folk dances, taboos, etc, and build up a department of Soviet sociology at the expense of producing specialists in the Soviet economy, foreign trade and foreign policy?

19th Century Syllabi

The content of our University education still seems to be based on the 19th century syllabi of British universities. British and (West) European history still dominates the teaching of history at all stages in the colleges and universities. American, Russian and Chinese history has not attracted the attention of our history professors. History of South-East Asia, which was once culturally a part of 'greater India', is hardly known even to university professors. Similarly, teaching of political science is still confined to political theory, constitution, etc, and no effort is made to train area specialists at the M A stage in any university. The emphasis in political science teaching in universities in the West has changed from political theory to political systems and foreign

policy studies. This has yet to happen here; nor will it happen so long as the university authorities do not give up the generalist approach. A lot of specialisation has taken place in technical education in India. Why should the same not happen to the social sciences? Cannot the UGC do something?

CUBA

Institutionalising a Revolution

Mohan Ram

EARLIER this year, the 12-year-old Cuban revolution admitted a new dimension by adopting the law against loafing. The law, as well as the intensive debate that preceded its adoption, epitomised the new political, economic, and social realities of a revolution that is yet to be institutionalised.

THOROUGH REVIEW OF JUDICIAL SYSTEM

But for two years now, Cuba has been engaged in a thorough review of its legal system. Thousands of jurists, members of popular courts, leaders of mass organisations, party cadres, and youth leaders, have been debating a basic project for a new judicial system for Cuba, proposed by a Commission of Juridic Studies. Although numerous laws have been passed over the past 12 years, Cuba is still governed by the Constitution of 1940, by the social defence code of 1935, and by the civil code dating back to the end of the nineteenth century.

The new judicial system that is expected to result from the debate should unite the existing jurisdictions—ordinary or common, revolutionary, popular, and military. The military jurisdiction will retain its present structure, while the other jurisdictions will be integrated into a court system having local, regional, and provincial levels, and falling under the people's supreme court.

The judicial system will be an organ of the revolutionary state and will, therefore, be subject to the control of the council of ministers even while it is expected to safeguard the independence of the judiciary in its functions. This feature, perhaps, will make the judicial system to emerge in Cuba unique among socialist judicial systems the world over.

The system is to be evolved on the basis of the experience of the revolutionary power in Cuba. It would also draw on the experience and legislation of other socialist countries.

As proposed now, the new judicial system provides for collegiate courts, to consist of professional as well as lay judges. Most of them would be elected for a specific term and would be subject to recall by the electors. Judges would in fact be accountable to the electors to whom they would have to make periodic reports. All judgments would be subject to appeal; but it is interesting that there are to be a few exceptions such as the verdicts of the Supreme Court when it has tried a president of the republic, members of the council of ministers, and the political bureau of the Cuban Communist Party.

According to Blas Roca, president of the secretariat of the Commission of Juridic Studies, it is for the following reasons that Cuba wants to unify the jurisdictions and review its civil and penal laws and legal procedures: There are different court systems (ordinary and revolutionary), each governed by different and separate authorities. This creates problems in the way of implementing any uniform policy in penal and correctional spheres, and can be remedied therefore only by unifying the separate jurisdictions, and creating a new system under a single supreme authority for all courts, in a common, structured, court organisation. At the same time, the jurisdictional, penal and civil laws have to be brought into harmony with the social, political and economic realities of the revolution. Some aspects of the civil and penal codes are obsolete for disputes and court cases arising out of the present-day reality.

What is significant is that the debate has revealed a large degree of accord on the new judicial system. The points on which the 'draft project' has been generally criticised are revealing. Some have insisted that the labour justice system should be part of the other jurisdictions. Some have maintained that there should be a military tribunal in the Supreme Court. Some have insisted that all members of the supreme court should be professional judges. Some have been opposed to banning private practice of law. The draft will be revised in the light of all these criticisms.

The process might yet take about a year to complete. It is possible, as Roca thinks, that all the laws examined and redrawn on the basis of the structural changes that have been brought about in Cuba might form the basis for Cuba's socialist constitution. When thus drawn up, the new constitution will institutionalise the Cuban revolution. And in the mean time, the institutions in Cuba would have been renovated and brought up to date.

RANGOON

Army Is in Control, But the Poor Are Better Off

THERE is no doubt that among middle-class Burmese living in Rangoon — and most middle-class Burmese have always lived in the economically dominant port city — there is considerable dissatisfaction with the Revolutionary Government of the Union of Burma headed by Chairman Ne Win and his recently appointed Deputy, Brigadier San Yu. The middle-class has lost jobs to the army officers, who are OSD (Officers on Special Duty) in nearly every important government office or Trade Corporation. They have lost the freedom to travel abroad, particularly to emigrate and earn the 'international salaries', which are so lucrative when compared with Rangoon's. They have lost the freedom to import cars, consumer durables, synthetic fabric clothing, lipstick, nail varnish and the thousand other small luxuries that make up middle-class life. They have, most importantly, lost most of the freedom to make profits and to become rich, although gem smuggling and profiteering in scarce black-market items do offer a chance of high profit with high risks. Under this series of burdens there can be little doubt that Rangoon's middle-class and the middle-class in Mandalay, Maulmein, Bassein and other Burmese towns would prefer U Nu, shuttling between the forests of the Thai border and Bangkok, to their present left-wing military rulers. The middle-class would gain enormously in terms of individual freedom and opportunities to make profits, but it is doubtful if Burma and the mass of the Burmese people have much to gain from a return of U Nu.

EXPORTS DECLINE

The chief problems of any regime in Burma are economic and relate to Burma's trade with the outside world. The prosperity in the years before the War (1936-1941) was built upon exports of rice, teak and petroleum products to British India and the exports of teak, tin, lead, zinc, silver and gems to western Europe and North America. The War, independence and Burmese treatment of the Chettiars and other Indian residents destroyed the pre-War economy. The post-War economy has had difficulty generating a rice surplus of adequate size, problems with the export of teak and a steady dwindling surplus of petroleum. Exports have fallen from 1,069 million kyats in 1964-65 to 574 million kyats in 1969-70 (4.76 kyats equal US $ 1 at the official exchange rate). The trade deficit in 1969-70 was over 160 million kyats and reserves have been steadily falling from 1964. Burma has suffered since 1967 from the gradual reduction of rice imports into India, South Vietnam, the Philippines and Malaysia, as these traditional large deficit countries began to move toward self-sufficiency through new seeds, fertiliser, and the other inputs of the "green revolution". At the same time, the United States and Japan began to sell or give rice as aid and the Hong Kong and Singapore markets were threatened.

The Burmese economy is highly inflexible. The size of the market is too small for production of most items of plant and machinery required for national development. Therefore, most intermediates, many raw materials and all capital goods must be imported. The speed of development depends on these imports and hence on the ability to export satisfactorily. A full-scale export diversification programme is required and the present government has been slow to exploit the opportunities. The petroleum sector is about to be developed with Japanese assistance. There are known reserves of tin and copper. The possibilities in seafood are very large: lobster, crab, prawns are all plentiful on Burma's coasts. The agriculture sector must be encouraged to expand production of lentils, maize, tapioca, beans, tobacco and tobacco products and jute, which can all be produced economically in various parts of the country. The handicraft sector could develop export lines in lacquerware, basketware and the fine cottons and silk. The tourist sector could be encouraged by offering a tourist exchange rate of 10 kyats/$ 1. The industrial potential of Burma in textiles, garments, leather and worked wood products will only develop when a more realistic exchange rate is adopted.

These measures to restore exports and enable the government to expand imports would be required under U Nu as much as under Ne Win. The gains to the Burmese people of a restoration of free enterprise, private capitalism and foreign investment would be very low in the short-term, even if these capitalist forms were 'more efficient' and very costly for Burmese economic welfare in the longer term.

GOVERNMENT'S ACHIEVEMENTS

The claims of the present government are very modest. Per capita income in constant prices has risen only 10-15 per cent since 1964-65 or less than 2 per cent a year (well within the margin of error allowed in such national income statistics). The government admits that the takeover of private trading has led to black marketing and inefficiencies in distribution. Similarly it is worried by the acute shortage of imported commodities. None of these failures is concealed in the English language or Burmese Press. There is little doubt that the economy can be run better.

The achievements of the government are clear-cut. They are providing education for a greater number, particularly in the primary school grades, although the output of university graduates with inappropriate liberal arts qualifications still exceeds the country's needs. They have provided adequate rice, fish and vegetables for the people. Most people have an adequate quantity of cloth for lungis. The gross disparities of wealth in pre- and post-War Burma have gone as the state really does control the means of production and distribution. It is true that the army officials enjoy a privileged position in terms of houses, servants, cars, and official jobs, but the disparities in income levels and styles of life are enormously muted compared to the recent past. In the countryside the bulk of rural indebtedness has been abolished and most farmers find it very easy not to repay state or co-operative loans. The banking system has been considerably extended. The literary programme, for which Burma was awarded a UNESCO prize this year, has made progress, if not all the progress frequently publicised. Medical care has been extended substantially in the rural areas as Burmese doctors are not free to leave for the UK or the USA as are their Indian, Pakistani or Filipino counterparts. An overview of Burma from 1962 might summarise the situation crudely, but accurately as follows: The rich are worse off, the poor are better off and the army is in control.

MINORITIES PROBLEM

The revolutionary government is not, however, in control of the Shans and the tribes in the extreme north on the Thai-Chinese border — 'the golden triangle' of opium—nor is it able to control the Akyab and Chin areas stretching down from the Chittagong hill tracts. Large areas of Burma are not under government control at night, but the same problem is there in Thailand, Philippines and other havens for Western enterprise and investment. The areas outside government control are away from the Irrawaddy delta rice fields and the main valley from Rangoon to Mandalay where 60-70 per cent of Burma's population is found. A weak government in Rangoon could certainly experience difficulties if the 'minorities' such as the Shans and Chins could form an alliance against the Burmans, but they seem very unlikely to be able to reach any such agreement.

The Revolutionary Government of the Union of Burma seems unlikely to be shaken by the middle-class discontent aroused by U Nu or by the 'minorities' backed by the People's Republic of China, but it is possible that a right/left split within the ruling army could prove very disturbing. Burma now needs a crash programme to expand exports. An essential first step would be a more rational policy of national investment raising agriculture's share from 7 per cent to 20 per cent of development expenditure. These economic policies would not involve any ideological conflicts, but they would improve overall economic growth and raise per capita incomes. Burma has achieved a great improvement in income distribution by dismantling private sector capitalism, but the time has come to improve the rate of growth of the economy.

To Make a Martyr

Nireekshak

BRAHMANANDA Reddi's decision to give up office ("because the Prime Minister asked me", as he put it), has earned him much praise in the newspapers. Naturally, opinion in Andhra Pradesh itself was somewhat more agitated than elsewhere. For, as *Deccan Chronicle* observed, "the resignation of Chief Minister Brahmananda Reddi and the decision of the Telengana Praja Samiti to merge with the Ruling Congress, both happening within a week with rapid succession, have added new dimensions to the political situation in Andhra Pradesh". Whether the resignation and the merger were two unconnected, merely coincidental, developments — as the Secunderabad daily implied — or had a causal connection, the paper had convinced itself that Reddi's "decision to step down [was] an act of great statesmanship", showing his "courage and determination".

Amrita Bazar Patrika, viewing the developments from distant Calcutta, and however less extravagant and more to the point in its estimate of the situation. "It is not easy to believe", it said, "that the resignation offer came from Mr Brahmananda Reddi." What had happened was that the Telengana Praja Samiti had won 10 out of 14 seats from the region in the mid-term Lok Sabha election, and, if the Samiti repeated this performance in the forthcoming State Assembly elections, it could "win 70 out of 100 Telengana seats". That was why, *Patrika* said, the Prime Minister had decided to "seek a political solution to the Telengana problem". However, her strategy could succeed only if "influential Congress(R) legislators [took] the ouster of Reddi with good grace". As things are, *Hitavada* interpolated, Brahmananda Reddi's resignation "is a case of political martyrdom". It must be feared, it added, that "if attempts are made to solve problems on the basis of personal animosities, real issues [might be] sidetracked and a premium placed on agitators' stubbornness". Also, it might create a "feeling of insecurity in the minds of able leaders at the state level and even at the centre."

Hardly anyone, in fact, viewed the developments with unreserved satisfaction. Brahmananda Reddi's "retirement after his long and distinguished service and at this stage", wrote *National Herald,* "can be justified only if the Telengana problem is solved and a united Andhra under a united Congress contributes to the social transformation in which the Congress majority in Parliament will be engaged for the next four years and more". If Reddi has been "an outstanding Chief Minister", *Herald* added, he has shown himself to be "outstanding in the way he has ceased to be Chief Minister". It was now "for others to play their part equally well".

Whether "others" will heed this advice or not, Congress politics was certainly in a state of turmoil. As the *Free Press Journal* put it, in direct reference to the dissolution of the Pradesh Congress Executive Committees and Election Committees of Congress(R) in five States, "the Ruling Congress was evidently undertaking a major organisational sweep". And, as for "the pathetic Congress(O)", *Tribune* commented, "both (its) jantar and mantar are fast falling". In Congress(R), *FPJ* noted further, "new power struggles are beginning and instead of old caucuses, new caucuses are in danger of being formed". Therefore, in any effort at reorganisation or revitalisation of the party, "the emphasis ought to be on content, not merely on traditional form, as had been mostly the case in the past". Modern democratic theory, it noted, recognised the party as an "intermediate action mechanism" and, if the Working Committee's decision was a "precursor to a comprehensive and effective programme of action..., it will certainly have done some good".

To a Friend

When the spotlight shifted from Congress politics and Reddi, it rested on another personality in another country: Nikita Khrushchev. The former Prime Minister and party leader of the Soviet Union had always enjoyed a good press in this country. And his death, if it was not received with a sense of personal loss by newspapers, was undoubtedly an event which saddened the press. The "end of a colossus", commented *Tribune.* "Among the most dynamic figures in modern international politics and a great benefactor of Soviet Russia, Khrushchev brought in a deep breath of fresh air into the stifling 'iron curtain' and broke the monolith of communism." He was an "exceedingly human, buoyant and becoming hero" who did not know what "ruthlessness and personal autocracy were." The Khrushchev era, the paper further noted, "was indeed a remarkable one" and "people in India, like those of several other countries, would miss a great friend and sympathiser".

The 'friend of India' theme was prominent also in the *Times of India*'s obituary remarks. "He went out of his way to befriend the non-aligned countries," the paper said, adding that "India has special reason to remember him." He it was who was responsible for "Moscow's political support to New Delhi", for its "generous" economic assistance, "especially for the development of heavy industry" and for the Soviet decision to "supply MiG aircraft, and military aid in other forms as well, to India". Khrushchev, *Times* concluded, "certainly left his country a better place than he found it, both in the eyes of the world at large and in those of a majority of his own people". In the view of *Hindusthan Standard,* while "life may have closed its account with Khrushchev, his account with history still remains to be settled". Khrushchevism, *Standard* recalled, did not die with the fall of Khrushchev. "It is unlikely to go to the grave with his mortal remains. Even those who robbed him of his power and denounced his ways in violent language have not wholly succeeded in effacing his influence on contemporary communist thinking. Even the free world of the West has been unable to escape the impact of Khrushchevism."

Yes indeed, *Deccan Herald* echoed, Khrushchev not only left "an enduring mark on international relations and on Soviet internal affairs but apparently continued to enjoy the affection of the Russian people". He established "close and warm relations" with India and this was of "inestimable value whether at the UN or in stimulating development growth". And the world at large will remember him "as the archetypal Russian peasant, genial, shrewd, unafraid, yet compassionate, the 'Merry Andrew' who did so much to relieve the acerbities of Soviet life and international diplomacy, an unforgettable figure."

Cost-Benefit of an Enquiry

B V Rangarao

Report of Committee of Enquiry, Council of Scientific and Industrial Research, New Delhi, 1971.

THE last five years of the council of Scientific and Industrial Research have been a dark period of suspicions, allegations, counter-allegations and enquiries resulting in a general crisis and desperation among scientists in this country. The CSIR is a major scientific and technological research organisation associated with several research centres through the grants and fellowships that are awarded and certain national responsibilities it has. Besides, scientists and technologists from other research organisations and industries participate amply in its policy formulation and decision-making machinery. This organisation has been a symbol of the state of science in this country.

Background

After Atma Ram took over charge in August 1966 as Director-General, there was a press release condemning several activities of the CSIR and making serious allegations against his predecessor and the Directors of the laboratories. This gave rise to agitated discussions in Parliament leading to the appointment of a Committee of Enquiry under the Chairmanship of Justice A K Sarkar, which in the scientific research community was familiarly known as the 'Sarkar Committee'. This Committee was appointed in May 1968 and it submitted Part I of its Report in February 1970 and Part II in August 1971. The enquiry was on three aspects of the functioning of the CSIR: (i) personnel policies followed and the allegations of irregularities in appointment of scientists and directors; (ii) the policies on royalties and consultation services; utilisation of the results of research conducted under the auspices of the Council; and (iii) review of the functioning of the Council and suggesting means of improvement. This Committee consisting of seven members of Parliament and four eminent scientists after working for more than three years found (Part I) that there were no irregularities in appointment of scientists or directors and that the information provided in Parliament about certain directors was wrong, though there was a need to reclassify the posts in the laboratories. It recommended (Part II) that (i) the programmes of research in the CSIR laboratories should be an integral part of the economic plans for the country's development to be prepared by a proposed national body; (ii) the governance of the CSIR should be vested in the person whose success is with the success of the organisation; (iii) there should be decentralisation of powers at each level and a collegiate system of administration in the laboratory; and (iv) future expansion of the CSIR should depend on its ability to contract sponsored research work from the Government or industry.

These conclusions have resulted after working for more than three years, considering memoranda received from about 150 individuals and societies, interviewing 50 scientists, industrialists and administrators, and most probably spending a few million rupees. It is of interest to note that there are memoranda from scientists—Indian and non-Indian, at home and abroad; almost every scientist in some position in the country has presented his views in writing as well as in person besides several top industrialists and many members of Parliament.

Stalemate in CSIR

During the last five years there were no planned programmes of research, the Director-General and the Directors were at loggerheads, the meetings of the Governing Body were rare and hardly any constructive programme was discussed. Even routine decisions were left pending on the pretext that the Sarkar Committee Report was awaited. The broad recommendations on the reorganisation of the CSIR are very similar to those made at a conference of Scientists, Technologists and Educationalists called by the Committee on Science and Technology in November 1970 in Delhi. Constitution of a National Council of Science and Technology is recommended to identify projects of national priority, plan scientific and technological research in close co-ordination with the socio-economic development plans and programmes of the Planning Commission, co-ordinate their implementation and function as an advisory body to the Government. It is also suggested by both that the NCST should have a strong technical secretariat and panels of experts. The Enquiry Committee recommends, as has been urged at several conferences of scientists, that the decision makers should not be those too busy and prestigious, but men who have technical knowledge, can spare time, put efforts to study problems and critically appreciate the programmes. The present Governing Body consisting of the important ministers of the Central Government, of industrialists, scientists and technologists and administrators, should be wound up. This body, with about 29 members, used to meet twice a year before 1966, but could not meet even once a year during Atma Ram's regime. There are also instances when this body took decisions in one meeting and reversed the decisions in subsequent meetings, in either case without serious consideration of the consequences.

Decision-Making Bodies

It is generally agreed that responsibility and authority should go together. Hitherto in the CSIR, as well as in other scientific organisations, policy making had become a profession of a small group moving from one meeting to another with no responsibility to implement. This had led to the creation of a very unhealthy hegemony in scientific research. In this context the constitution of a governing body with the Director-General as Chairman and four Directors and three members to be nominated by the Government of India from outside the CSIR to bring in expertise in economics, cost accountancy, production technology, industrial engineering, management, etc, along with the Financial Adviser, as members, with a condition that it should meet at least 5 times in a calendar year, introduces purposefulness in the top body.

This is extended to laboratory administration as well, but the participation at the laboratory level is confined only to the project co-ordinators. As stated in the note of dissent by S S Bhandari, this decentralisation has not percolated to the research workers as a community.

Though several of the committees proposed are supposed to have scientists also as members, their activities are limited only to specific issues. Mere nomination to some committees may only create misunderstanding instead of creating a new healthy laboratory cul-

ture. The recommendation about the transfer of some laboratories to research associations, etc, is probably made in a hurry. Scientific and technological research in developing societies is not only for commercial advantages but also for the social benefit of the community. The Enquiry Committee obviously has not made any study of the working of the Co-operative Research Associations in this country. Co-operative Research Associations even in countries like the UK, from where it was copied in this country a few years back, were found to be of doubtful value. In this country the laboratories of the Co-operative Research Associations are functioning as servicing departments for the member industrial units. To take the example of the Leather Research Institute, if it is managed by a Co-operative Research Association, since the small units engaged in leather processing in this country are unlikely to be members of an association of this type, they will never have the benefit of the results that are likely to be achieved even though the CSIR would be contributing 50 per cent of the total expenditure. The technological problems faced by the large industrial units are likely to be radically different from those of small tanners and leather goods producers, towards whom this society has a greater responsibility. Irrespective of the slogans about export promotion and import substitution, the basic duty towards the improvement of the lot of the most downtrodden cannot be left to the mercy of the industrialists in a Research Association or otherwise.

The policy decisions in the Co-operative Research Association would be taken by a body in which the representation from the CSIR or the Government is negligible. In developing societies public funds should be utilised more for the benefit of the community than for the commercial convenience of industrialists. Other methods should be evolved to make the industries pay for research in the respective fields.

Headquarters

Regarding the headquarters itself it has been clearly stated by the Committee of Enquiry that it should be a technical co-ordination and planning body instead of being an administrative office. It is stated that the Technical Divisions, which Atma Ram wanted to abolish, should work for the Governing Body to make it effective. Similar was a recommendation by the Third Reviewing Committee in 1965 and steps were initiated to implement it. But these steps were reversed in 1966 when Atma Ram took over as the Director-General. The Governing Body and the Government failed to direct the Director-General to carry out the decisions taken on this topic; instead confusion was created and the Sarkar Committee's enquiry was initiated. It is a matter of some satisfaction that the Committee of Enquiry, after prolonged deliberations, arrived at the same view and it is to be hoped that the Government and the appropriate authorities would implement its recommendations in the proper spirit for the advantage of scientific and technological research activity in this country.

The recommendation that the control of the Finance Ministry through the Financial Adviser should be budgetary but not regulatory is an important one, acceptance and implementation of which is vital. The Finance bosses are not likely to concede this easily.

Service Conditions

Minor issues, such as distribution of royalties and consultation fees, too low anyway at the moment, have been allotted considerable space in the Report. This reminds one of Parkinson's cycle-stand.

The vast majority of research workers are worried about the personnel policies followed in the CSIR. There are instances where people working for more than 12 years are unconfirmed in the CSIR organisations and are deprived of several benefits due to the permanent employees and even in emoluments there are discrepancies introduced by bureaucrats. The recommendations made by this Enquiry Committee have not clearly stated the suggestions in these matters. The controversy that had arisen in CSIR, even before the constitution of this Enquiry Committee, about dividing the staff into scientific and technical groups has been further accentuated on the authority of the Part I of the Report. While the Committee was of the view (stated in interviews) that there ought to be a clear classification of posts to specify the qualifications and did not mean that service rules should be different, the CSIR authorities were trying to introduce a caste system among people with similar qualifications and performing different duties in the broad chain of R & D activities, which are all considered equally important. It is strange that the five-year assessment is to be abolished at the instance of some directors, while merit promotion would be continued (which has so far benefited the higher ranks), though inconveniences of assessment should be similar to both.

It is stated in the Report that there should be proper evaluation of scientific research carried out in the national laboratories. As rightly stated, evaluation is not feasible as long as the goals are not specified and the responsibilities of different sections are not clearly understood and stated. This type of evaluation requires to be conducted in this country in all social activities including the functioning of committees for enquiries which have become a part of the socio-political life. In this context it may be worth evaluating the functioning of the Committee of Enquiry based upon the efforts of eminent people in different walks of life over such a long period, with a separate office, secretariat and so on. More important is the pretext it has provided for inaction in a research organisation employing more than 8,000 scientists, with a budget of nearly Rs 20 crores a year. The social cost is enormous. Are the results commensurate and such that they could not be arrived at with less cost?

It is symbolic that Part I of the Report had a note of dissent signed by four members while the note of dissent to Part II was signed only by S S Bhandari. The Grand Alliance of 1970 and its disintegrated state in 1971 have their varied contributions.

Effective Co-ordinated Functioning

It is broadly recognised that socio-economic prosperity comes out of effective, co-ordinated functioning of different sections of the society, of which scientific and technological research is only one component. Either for professional advancement of this section or the prosperity of the community in general, effective co-ordinated functioning is absolutely necessary. Whether this social order can survive and prosper depends upon the keenness and capacity of the Government and the different sections of society to function as an integrated system. No body need envy Nayudamma who has to function as DGCSIR with another Director-General (Vigilance) watching and scrutinising the organisation from the next room. It is time that radical changes are introduced to make the scientists and technologists work with pride, confidence and patriotism, to perform their duty in the complex process of attaining rapid socio-economic progress. However costly the Enquiry might have been, it should now be used in the right direction to achieve the noble goals. Even in India there are limits to patience.

Jumble of Sundry Facts

B V Nimbkar

Agricultural Research in India: New Horizons and Perspectives, Indian Council of Agricultural Research, New Delhi, July 1971.

THIS is a short 30-page booklet whose purpose seems to be to inform the layman about agricultural research in India. It gives a resume of agricultural research before Independence and then goes on to review the present scene. It points out the three main factors which gave a fresh impetus to agricultural research—the establishment of agricultural universities, the reorganisation of the Indian Council of Agricultural Research and the initiation of the All-India Co-ordinated Projects.

The booklet laments the fact that the states were tardy in coming forward with proposals for agricultural universities and, later, often half-hearted in implementing them. However, though slow in getting started, and still too few in number, the universities are already beginning to be strong centres of research and education.

Reorganisation of ICAR

The reorganisation of the ICAR in 1965 was an important step forward. From this date it stopped being a Government department. All the agricultural research institutions were taken from the control of the Food and Agriculture Ministry and placed under ICAR's control. ICAR was also given power to make direct recruitment of all staff and revise pay scales upwards to equalise them with those of other scientists in India. An important fact to note is that the 23 institutions now controlled by ICAR are not organisationally subordinated to ICAR, but work rather as constituent units, thus giving them considerable freedom of operation. All these changes make the ICAR and the constituent units much more effective than they were before.

The All-India Co-ordinated Projects were initiated to prevent wasteful duplication of work and to achieve co-operation among the best talents and facilities available in the country. In principle this should foster the ideal climate for agricultural research. In reality, as the booklet points out, the scope of such projects has been limited by limited funds, paucity of reseach centres with good physical facilities for research and scarcity of well-trained and experienced scientists. These limitations could be partially overcome, and a substantial contribution made to the projects by the inclusion of private research organisations. However, the booklet does not mention such a possibility.

This part is concluded after giving the Fourth Plan proposals and the total allocation for agricultural research—Rs 85 crores, which seems extremely low, considering the importance of agricultural research.

The next section, a much longer one, gives a resume of recent advances. It can best be described as an unorganised hodge-podge. In one sub-section certain aims of current research are set out. There follows a discussion of recent research on various crops, without any attempt at relating it to the aims of research. Sub-titles are given without regard to the contents of the paragraphs which follow. For instance, under the sub-title Commercial Crops, only cotton is discussed (with the surprising omission of MCU-5 and Hybrid-4, two new varieties which have generated a lot of interest among farmers all over). A discussion of sugarcane follows later under a separate heading. Several omissions, errors and misprints give evidence of carelessness.

A reference is made to a handbook on irrigation, without mentioning its title or date of publication. Mention is made of agricultural engineering research at the Indian Agricultural Research Institute without mentioning the fact that none of the implements, including the seed drill to which reference is made, developed by the IARI, has been manufactured on a reasonable scale and made available to farmers.

Misprints abound. Atrozine for Atrazine, orhar for arhar, Ploribunda for Floribunda and resin for raisin are just a few examples. The insecticide carbofuran is called a fungicide. In one place the author states that "application of 1 kg each of Simazine and Atrazine are sufficient to control weeds in Maize." One presumes he means Simazine or Atrazine, and the dose mentioned is per acre.

Yields are compared in percentages rather than in absolute figures. This can be a misleading technique, especially when absolute yields are not mentioned at all. An addition of 15 or 20 per cent to a very low yield does not necessarily hold true with a crop that has a high initial yield.

A sugarcane variety is mentioned which has over 18 per cent sucrose. Such a high sucrose content is so far unheard of.

A number of very obvious and elementary statements pass as discoveries. The author states that there is a higher response to phosphorous from crops in low-phosphorous soils than from those in medium-phosphorous soils; that correction of micronutrient deficiencies increases yields.

The first section of the booklet has a definite purpose in an age when everyone is talking and thinking in terms of agricultural research. It contains useful information about the whole organisation of governmentally directed agricultural research in the country, which may interest many who do not know very much about it. The addition of the second section is baffling, however. It is unnecessarily detailed if meant for a layman, and merely a jumble of sundry facts to the knowledgeable. The inaccuracies and errors could easily have been avoided and mar an otherwise attractively printed book.

World Monetary Crisis and Underdeveloped Countries

I S Gulati

There can be no doubt that

(a) the value of the dollar in relation to a few currencies which are now undervalued must be adjusted downwards; and,

(b) the Bretton Woods system of international monetary co-operation based on the key currency role of the US dollar must undergo a radical change.

If the new system which replaces it is to avoid recurrence of situations similar to the one now being faced, it must never again give the key currency role to any national currency or even a group of national currencies. Instead it must be based on an international reserve which is created and can be expanded to meet expanding world requirements under genuinely international auspices.

Unless the underdeveloped countries are alert to the present goings on among the developed countries, certain basic decisions might be taken with regard to the new world monetary system without their interests and requirements being sufficiently taken into account.

What the underdeveloped countries must aim at is to secure an agreement that any secular expansion in international reserves would be allocated exclusively *to them. They should never again settle for allocation in the manner of SDRs which was retrograde, regressive and inequitable.*

[The views expressed in this paper are the author's personal views.]

SO, the Gold Window has been formally closed. The US has withdrawn its commitment to convert *even* the official dollar holdings of other countries into gold. The obligation to convert non-official dollar holdings was withdrawn in March 1968 when the two-tier system of gold pricing was introduced.

Writing early this year ("The Price of Gold", Annual Number, January 1971), I had attempted a forecast that should dollar come under such pressure as compels the US Government to declare it formally inconvertible, "the likelihood is that such inconvertibility will stay on".

The question that confronts the world community is what are the prospects, now that the dollar has actually been declared inconvertible.

Let us first review the circumstances in which the US was forced to declare the dollar inconvertible. Principally, the circumstances that forced the hands of the US Government were:

(i) the price of gold in the free market shot up from \$ 40.70 to \$ 43.94 an ounce within a matter of three weeks between July and August 1971, thus widening the gap between the official price and free price of gold (the lowest price of gold in the free market during 1971 was \$ 37.39);

(ii) the official dollar holdings of the other countries were said to have reached almost \$ 50 billion by the end of July 1971 which meant an increase in US official liabilities to the tune of an estimated \$ 11 billion within a period of seven months (this was possibly the principal reason for the floatation of the German Mark in May 1971);

(iii) the US gold holdings (after allowing for the gold held on behalf of the IMF) were supposed to have gone down during the same period of seven months by almost one billion dollars (at the official price, of course), on account of official demands for the conversion of dollar holdings into gold;

(iv) there was a consequential decline in the ratio of US gold holdings to US official dollar liabilities (as represented by official dollar holdings abroad) from 42 per cent at the end of 1969 and 27.5 per cent at the end of 1970 to an estimated 20 per cent at the beginning of August 1971; and,

(v) finally, but probably most importantly from the point of the fundamental disequilibrium in the balance of payments, not only was the US deficit in the balance of payments "on an official reserve basis" running at the annual rate of \$ 22 billion as against the corresponding deficit of \$ 10 billion for 1970 and \$ 3 billion for 1969 but also, for the first time, the US balance on current account (i e, the balance on goods and services) showed a deficit of an estimated \$ 550 million for the second quarter of 1971.

That the US balance of payments was in a sort of fundamental disequilibrium which could not be corrected without the devaluation of the dollar has been generally recognised in recent years, particularly since the need arose to split up the gold market and to let the free market find its own level for the price of gold. The problem that has not been possible to resolve is how to go about devaluing the dollar. For any other currency, devaluation could be effected by reducing its par value in terms of gold. This would effectively devalue it in relation to all the other currencies. The dollar, unlike the other currencies, plays the role of a key currency or reserve currency. Therefore, if the dollar was devalued by reducing its par value in relation to gold, it would mean an effective revaluation of all the other 100 and odd currencies, all (certainly the majority) of which do not warrant revaluation. As a consequence, all these other currencies not in need of revaluation would have to take appropriate measures readjusting their own par values to put them back on the old dollar parities. If, on the other hand, the few countries with whom the US was principally in imbalance agreed to revalue their currencies by raising their par values in relation to gold and, therefore, to the US dollar, sufficiently to restore the US competitiveness, the problem of fundamental disequilibrium could have been easily solved without upsetting the par values of the vast majority of the countries. The difficulties now being faced have arisen because these few countries were reluctant to revalue their currencies sufficiently or at all, and thereby give up their competitive advantage over the US.

It might well be objected that the US reluctance (or refusal) to devalue in relation to gold derives less out of its regard for the present par value structure than out of a subjective irrational, almost religious, commitment to the gold par value of the dollar which has remained unchanged since before the Second World War.

US Violation

It still remains true, however, that the option which is open to an ordinary country with respect to exchange-rate adjustment is not open to a key currency country in the re-adjustment of the value of its currency in relation to other currencies of the world. But it could certainly be argued that as a key currency country the US was under a sort of obligation *not* to pursue policies which would impose an undue strain on its balance of payments. On this score, the US could, perhaps very justifiably, be placed in the dock for violating or disregarding its obligations as a key currency country by pursuing policies which could be said to be largely responsible for the emergence of the fundamental imbalance with the rest of the world.

In this context, it is pertinent to point out that while the US has incurred a balance of payments deficit on the official reserve basis for 7 of the past 10 years, it has (i) continued incurring sizeable military expenditures abroad, expenditures which averaged \$ 2.4 billion in the first half of the decade and had risen to \$ 3.4 billion in 1970; and, (ii) allowed the outflow of American private capital abroad, mostly to the developed countries, at an expanding pace. The net outflow of American private capital abroad which averaged \$ 4.5 billion a year in the early 1960s is estimated at \$ 6.4 billion for 1970. It is estimated that US direct investment abroad, which stood at \$ 33 billion in 1960 and \$ 54.6 billion in 1966, had reached \$ 71.5 billion by the end of 1970 — an increase of \$ 38.5 billion, which almost matches the increase in official dollar holdings in the same period, estimated at \$ 38.9 billion. Set against these figures, the flow of US official funds to the developing world, towards military as well as economic assistance, which had been running at the average of \$ 3.3 billion a year, had dropped to below \$ 3 billion in 1970.

Add to the above the fact that the US economy has been experiencing a persistent increase in price level for the last five years in succession. Though the rate of price increase had slowed down somewhat, it is generally agreed that the recent reflationary measures of the Nixon Administration would revive the old trend of price increase at around 6 per cent a year.

Prospective Parity Realignment

In the light of the above, there can be no doubt that (a) the value of the dollar in relation to a few of the currencies which are now undervalued must be adjusted downwards and (b) the Bretton Woods system of international monetary co-operation, which though formally on gold was to all intents and purposes based on the key currency role of the US dollar, must now undergo a radical change.

Already, the major currencies in need of revaluation in relation to dollar are "floating" upwards, although in almost all the cases the monetary authorities have not completely given up their intervention and are, in their attempts to keep their respective premiums low, still forced to increase their dollar holdings. It is now generally accepted that revaluation of these currencies is only a matter of time and negotiation. Until a new exchange relationship is agreed upon between the dollar and these currencies, the likelihood is that these latter currencies will continue to float.

The important consideration which would have to be borne in mind in the realignment of exchange rates is that the extent of realignment is such as would be sufficient not only to remove the immediate speculative pressure on dollar so that the present holders of large dollar holdings do not have to buy more dollars in order to support the new exchange rates but also to enable the US to regain its competitive position *vis-a-vis* these countries so that it can, within a reasonable period, reclaim the unwanted excess of dollar held abroad. It may, however, take quite some time to work out the new exchange realignments which satisfy these requirements.

In working out these new exchange realignments, the question of the dollar price of gold is bound to figure prominently. Supposing, for instance, it were agreed that the German Mark should be revalued by 15 per cent (the IMF is reported to have suggested 14 per cent revaluation for the Mark) in relation to the dollar, there might still be pressure to achieve this revaluation partly by the up-valuation of the Mark by say 7.5 per cent in relation to gold and the rest by the devaluation of the dollar in relation to gold. The Fund's Managing Director, Pierre Schweitzer, favours some such solution and so does the EEC, although there may be differences with respect to the weightage to be given to either of the two components of the new parity structure among the developed countries. We would have to return to the question of the price of gold a little later because it is closely related to the question of the role of gold under the new world monetary system. For the present, it is enough to say that devaluation in terms of gold would, if at all, be meaningful if gold is still to play an important role in the new world monetary system.

New Monetary System

Assuming that the new parity structure and the method of achieving it are agreed upon, it will still remain to work out a new international monetary system. President Nixon would not be alone in calling for "the necessary reforms to set up an urgently needed new international monetary system". Other countries too, particularly those now faced with a glut of dollar holdings, would want the new parity structure to operate under a system different than what was set up at Bretton Woods in which no one country or group of countries can so dominate the world monetary system as the dollar did under the Bretton Woods system. Under the new system the US should be in a position to devalue its dollar easily and straightforwardly rather than take to a circuitous method, as the one now under review, of securing the dollar's devaluation. At the same time, any other country should not feel obliged under the new system to hold more of the currency of another country than what it considers desirable.

The present crisis dramatises once again the failure of the gold exchange standard, which is what the Bretton Woods system was supposed to re-establish after World War II. The facts that (i) the parities were set formally in terms of gold and (ii) that the key currency country was placed under an obligation to maintain the convertibility of its currency into gold, were of little help when the key currency itself came under pressure. If, therefore, the new system is to avoid the recurrence of a situation similar to the one now being faced, it might never again give the

key currency role to any one national currency or even a group of national currencies.

The US is clearly in no mood now to continue to play the role of an exclusive key currency country. "The time is past", said President Nixon to US Congress, "for the United States to compete with one hand tied behind her back". Whether the US would agree, or could be persuaded, to the dollar playing the role of a key currency along with one or more other currencies, say, Mark and Yen, may be an open question. But even to raise this question amounts to a continued failure to recognise the fundamental fallacy of the very concept of key currency, namely, that while a key currency could *never* come under pressure, it would keep generating enough obligations abroad to meet expanding world requirements.

Whatever be the shape of the interim arrangements to be made, and these, as we note subsequently, could be quite important, the transition now *must* be from the present system based on a key currency to a system based on an international reserve which is created and can be expanded with a view to meeting expanding world requirements under genuinely international auspices. Under such a system adjustment of parities should be much easier even for the currency of what may still be an extremely important country from the point of view of world trade and payments.

It is not the purpose of this paper to go into the various questions as to the mechanics of the new monetary system such as the flexibility of exchange rates, the obligations on countries to make exchange rate adjustments in the event of persistent deficits or surpluses, regulation of 'hot' money movements, etc.

Developing World's Interest

What we do propose to raise and discuss is a question that should be of particular interest to the underdeveloped countries in the present context. It is our strong fear that unless the underdeveloped countries are sufficiently alert to the present goings on among the developed countries, certain decisions may be taken in regard to the establishment of the new world monetary system which do not take the interests and requirements of the developing countries sufficiently into account.

The above fear is not totally unjustified in the light of the basis decided upon for the *initial* allocation of the SDRs. The allocation of SDRs strictly in accordance with the Fund Quota of each participating country naturally meant that altogether only 25 per cent of the SDRs were allocated to the developing countries. The rest were shared by the developed countries among themselves.

To quote from a recent UN report, "the linking of reserve creation and aid has been broadly advocated in recent years as a way to bypass two of the obstacles to the flow of development assistance most frequently cited by the more advanced countries, namely, the balance of payments and budgetary constraints." Although the pleas and arguments to this effect were being made quite strongly in international forums for quite some years, these made no impact when the decision was taken to activise SDRs.

The argument most commonly adduced to counter these pleas for linking creation of reserves or liquidity to development aid has been that the problems of international liquidity are entirely different from the problems of development and that they raise entirely different issues. Therefore, it would serve no good to confuse the issues by linking liquidity creation with development assistance. But to argue like that is not very different than saying that credit creation within a country should not be linked to domestic development.

On a different plane, it is very interesting to note that while the underdeveloped countries kept arguing, without success, for some sort of a link between reserve creation and developmental assistance, the developed countries were prepared to hold billions of US dollars in their reserves all through the sixties which helped the US finance not only its direct investments abroad but much more. If today these countries are turning back on the US and saying "this is going too far", the fact still remains that dollar reserve creation (and acceptance) financed US direct investment abroad and much else as well. If as part of the overall agreement on steps towards the solution of the present crisis it is decided that surplus dollar holdings abroad should be "funded" by the issue of an international reserve, whatever be its name, it would amount to only a formal recognition of what was happening all through the sixties, namely, the finance of US direct investment by reserve creation. What the developing countries ought to be constantly harping on is that if liquidity creation could be used for the financing of US direct investment, it might as well be linked with development assistance on both moral as well as economic grounds.

What the underdeveloped countries ought to aim at is to secure an agreement that any long-term or secular expansion in international reserves, say at an agreed rate of 6 per cent per annum to match with the overall rate of increase in world trade, should be allocated *exclusively* to the underdeveloped countries. They should never again settle for the allocation in the manner of SDRs, which to say the least, was retrograde, regressive and inequitable. It would be silly on the part of the developing countries to start debating at this stage the criteria for the allocation of these additionally created reserves among themselves. As for the short-term problem of the surplus holdings arising of any currency abroad, including the immediate one of the surplus dollar holdings abroad, the funding in terms of the international reserve can only be regarded as a temporary accommodation which the country concerned must be under an obligation to reimburse in due course.

The claim of the less developed countries to the allocation of newly created international reserves is much stronger than that of the developed countries even on considerations of liquidity. If the need for a secular expansion in liquidity is genuine, then it must initially be placed in the hands of those who are more likely to use it than of those who are more likely to lock it up. Of course, when this consideration is combined with that of development assistance, the claim of the underdeveloped countries to the exclusive allocation of the newly created reserves should be very hard to contest.

Strategy

This brings us to the strategy which the underdeveloped countries ought to follow in the pursuit of their objective to secure the exclusive initial allocation of newly created international reserves. There can be no two opinions about the absolute importance of their acting in complete concert. As things stand, their combined voting power in the Fund adds up to only 25 per cent, whereas the Fund rules require 80 per cent approval votes for any basic change. Therefore, only by acting in complete concert can the underdeveloped countries block any change in the world monetary system without their collective position being fully considered.

But it is not unlikely that the underdeveloped countries may be in a position to win over some important votes from the other camp if they played their cards well on some of the other questions. For instance, on the question of gold the US is likely, though more for political than any other reasons, to put up the toughest possible fight against any suggestion for raising the dollar price of gold—a suggestion that the EEC would strongly urge. Here, the economic interests of the underdeveloped countries as a group should align them with the US.

As holders of monetary gold the underdeveloped world accounts for less than 9 per cent of the total stock of monetary gold. Therefore, the relative gain of the underdeveloped world taken together from the revaluation of monetary gold is likely to be far less than those of the developed countries as a group.

Also, to the extent that the revaluation of gold helps increase effective liquidity of the world monetary system, it will generate a demand for a corresponding reduction in the long-term rate of increase in the creation of international reserves. On the assumption that the entire increase in international reserves would be allocated to the underdeveloped countries, any increase in the monetary price of gold will directly impinge on the question of development assistance through the creation of liquidity.

If, therefore, US support for the claims of the underdeveloped countries can be won over by the latter offering in return to support the retention of the existing dollar price of gold, it will be worthwhile.

Similarly the IMF's support to the claims of the underdeveloped countries might be possible to win if the latter support the Fund on the basic rules for adherence to fixed parities, once the new parity structure is agreed upon. But the underdeveloped countries may have to give in to the suggestion for enlarging the margin on either side of the par value. This is a concession that they might well make if they can in return secure their claim to the newly created reserves.

Soviet View of the Treaty: Non-Alignment Plus?

Zafar Imam

The Soviet view seems to be that non-aligned countries can still play a purposeful role in the newly emerging world power structure, provided they are backed by institutionalised relations with the Soviet Union, as distinct from the traditional Soviet support given to them in the past. This 'non-alignment plus' (i e, non-alignment plus institutional ties with the USSR), as between the three poles of the world power structure, might well eventually emerge as the final pattern of Soviet policy towards the 'Third World'. But we do not know for sure yet. Much will depend on the final Soviet attitude to China's claim in the super power stakes and the Soviet rating of 'viable' and 'non-viable' countries in Asia. The Indo-Soviet Treaty could, therefore, prove to be either an exception or a trend-setter.

It is also necessary to grasp two ideological imperatives behind Soviet foreign policy in order to fully understand Soviet behaviour in world affairs. One is the Soviet preoccupation with the mechanism of social change within various countries and the other is the Soviet framework of looking at international politics as a confrontation between two systems — the world capitalist system and the world socialist system.

The first imperative explains why no government, other than the Soviet one, could have so seriously taken into account the importance of a favourable balance of social forces in India and the dynamic of Indian social change, before signing the Treaty.

ANALYSTS of Indian foreign policy have already said much about the Indian side of the story of the Indo-Soviet Treaty. This need not detain us here, particularly as it is now possible to piece together the Soviet side of the story.

The fact of the matter is that the Indo-Soviet Treaty has simply institutionalised the relationship between the two countries which has been developing at a steady pace since the mid-fifties. It is also true that given the realities facing the two countries, this steady pace of development of the Indo-Soviet relationship could have been maintained without institutionalising existing arrangements. Why then did the Soviet Union agree to sign a treaty suddenly after two long years of negotiations, as it is now known? What does it hope to get out of this institutionalisation of a relationship? We must try to seek answers to these questions in order to comprehend the full import of this treaty for the present and the future.

A quick glance at the policy-making process of Soviet foreign policy in Asia is relevant. Two sets of interrelated problems must be borne in mind here. One set is geopolitical and the other is ideological. The geopolitical problems are well known. The maintenance of peace and stability in Asia — particularly near the Asian borderlands of the USSR, the growing antagonism with China, the emerging tripolar (USSR, US and China) power structure in Asia, and defusing the intra-regional flashpoints, are the most important geopolitical problems of the area from the Soviet viewpoint.

Ideological problems are as a rule dismissed these days as irrelevant dogmatism in considering Soviet foreign policy, yet it is very clear that without their proper assessment Soviet behaviour and conduct in world affairs could never be fully understood. Two ideological imperatives behind Soviet foreign policy are crucial. One is the Soviet preoccupation with the internal mechanism of social change and the other is the Soviet framework of looking at international politics as a confrontation between two systems — the world capitalist system and the world socialist system The Soviet preoccupation with the internal mechanism of social changes is a complex process which calls for explanation. Broadly speaking, according to Soviet categorisation there are two types of countries in Asia, 'viable' and 'non-viable'. The 'viable' countries are those where there are distinct possibilities of accentuating the internal social contradictions in the not too distant future, and where the

flow of Soviet economic and military aid within a bilateral framework and on an institutionalised or long-term basis would eventually prove useful in tilting the balance of internal class forces in favour of desired social changes. Although the degree of change which could be effected might well vary (e g, today India under Indira Gandhi is, in this sense, more viable than Egypt or Ceylon), the overall objective remains the strengthening of the hand of those social forces in a given country which are struggling to bring about changes in furtherance of an eventual social revolution. On the other hand, 'non-viable' countries are those where the possibilities of accentuating the internal social contradictions are remote, even in the distant future. In these countries, a quiet diplomatic presence lying in wait for the objective situation to change favourably, is necessitated. The Soviet approach to these two types of countries is not, however, always sharply defined for it has to take into account so many complex and diverse variables, internal and external, that go into the making of foreign policy.

But the underlying philosophy behind Soviet foreign policy remains a crucial factor. Once this point is understood, the essentially different Soviet policies in viable countries like Vietnam, Laos, Cambodia, India, Ceylon, Burma, Afghanistan and Pakistan (in that order of rating), and in non-viable countries like Indonesia, Iran, Turkey, Malaysia, Singapore, the Philippines, Thailand and Japan (in that order of rating), fall into place like the pieces in a jigsaw puzzle.

The Soviet viewpoint of the confrontation between the two social systems, capitalist and socialist, being the most important determining factor in contemporary international politics, leads to the Soviet Union regarding the non-aligned and semi-aligned countries of the 'Third World' as having a crucial role. The Soviet Union has consistently claimed that the socialist system is gaining an upper hand over the capitalist system and in further improving this favourable situation, the non-aligned and semi-aligned countries of the 'Third World' have been making a substantial contribution. And this trend must be helped along by means such as the Indo-Soviet Treaty.

Lest there are accusations of overstating the case, it must be added that the two ideological imperatives mentioned above do not work out in practice in a straight line; neither do they always bring about the desired results. The changes — constant and temporary, internal and external — in 'reality' (i e, a given, existing situation), very often impose de-ideological behaviourism on Soviet norm and conduct in world affairs. Yet such norm and conduct simply amount to the rephasing of the ideological imperatives and the re-programming of strategies and tactics to achieve them but the organic continuity between ideology and policy is not allowed to disappear completely.

It is against this background of the policy-making process of Soviet foreign policy that the Soviet decision to sign the Indo-Soviet Treaty has to be examined. When Brezhnev first hinted at Soviet interest in an Asian balance of power, India's response was cool. In fact the Soviet leaders themselves then had no clear-cut formula for an Asian balance of power, and they fondly hoped that through discussions with friendly countries like India, a broad framework would eventually emerge. But India's cool response to Brezhnev's tentative proposal proved a hurdle.

Indeed Indira Gandhi then was not in a position to enter into fruitful negotiations with the Soviet Union in view of the precarious position of her government as a result of the Congress split. The Soviet Union certainly understood Indira Gandhi's problems and India's hesitancy amply confirmed their own assessment of the political situation in India. Hence, starting in mid-1969, Soviet news media began to criticise openly those forces that were totally opposed to Indira Gandhi, while undisguised satisfaction was expressed at Indira Gandhi's landslide victory at the polls last March.

The fact that the Soviet Union genuinely showed an understanding of the political situation in India and did not hastily pressurise the Indian Government to sign an Indo-Soviet Treaty —which the Soviet Union was in a position to do — is important. The Soviet Union fully realised that without a favourable balance of internal class forces such treaties as the present one are of no practical relevance to the signatories. They simply become pieces of paper like the ill-fated Treaty of Versailles or the Munich Pact. Perhaps no government, other than the Soviet Government, could have so seriously taken into account the importance of a favourable balance of social forces in India and the dynamic of Indian social change. (This approach must not be confused with the familiar method of rating governments as 'friendly' or 'unfriendly' while signing treaties, for there is an obvious distinction between the two approaches. The distinctive Soviet approach is directly connected with the ideological orientation of Soviet foreign policy, mentioned earlier).

Furthermore, the deterioration of Soviet relations with China and the spectre of a Sino-US *rapprochement* seriously jeopardised the precarious balance in the confrontation between the two world systems, as China was no longer content with merely developing a third ideological centre, but was increasingly pressing for a share in the super-power-oriented international power structure. China's formal invitation to Nixon to visit Peking for serious negotiations was the first concrete step towards staking its claim in the world power structure. Indeed China's ambition to super power status in Asia was known for quite some time but the proposed US presidential visit to Peking was the first practical step that China took towards institutionalising the tripolar power structure in Asia. For the Soviet Union this Chinese step was a new element which raised the ideological confrontation and the worsening of bilateral state relations to a higher plane—to the level of requiring readjustments in the world power structure, particularly in Asia. The question before the Soviet leaders became: what role must China be conceded in the traditional confrontation between the two systems. The Soviet view now is that China has formally joined hands with the US in forging an anti-Soviet world front, thereby weakening the socialist system as a whole. The possibility of a Sino-Soviet armed clash is, however, dismissed as propaganda emanating from Peking and Washington. But this is probably not the final Soviet assessment of China's future role. Much will depend on the results of Nixon's visit. In other words, there seems to be some confusion and hesitancy in evolving a final Soviet policy towards China, though the Soviet leaders have already begun the process of reassessment of the entire range of their policy in Asia.

It is precisely this period of transition which makes India vital from the Soviet viewpoint. China's formal notice for staking its claim as one of the super powers, in Asia particularly, brought home to the Soviet leaders that the role of non-aligned countries in the traditional bipolar contest must also be re-examined. The traditional Soviet view of non-alignment as the third force, in between the capitalist

system and socialist system but tending towards the latter, is no longer valid for China is now a new force to be reckoned with. Perhaps the Soviet Union will eventually look at non-alignment as between the three forces — a difficult and even futile exercise in practice. Yet in this period of transition, as a first tentative stop, the Soviet Union has opted for institutionalising India's non-alignment by institutionalising its own bilateral relationship with India. In other words, the Soviet view seems to be that non-aligned countries can still play a purposeful role in the newly emerging world power structure, provided they are backed by institutionalised relations with the Soviet Union, as distinct from the traditional Soviet support given to them in the past. This 'non-alignment plus' (i e, non-alignment plus institutional ties with the USSR), as between the three poles of the world power structure, might well eventually emerge as the final pattern of Soviet policy towards the 'Third World'. But we do not know for sure yet. Much will depend on the final Soviet attitude to China's claim in the super power stakes and the Soviet rating of viable and non-viable countries in Asia. Therefore, the Indo-Soviet Treaty could prove to be either an exception or a trend-setter. In any case, none of the two signatories of the Indo-Soviet Treaty would lose out in any way.

Geopolitical considerations are also important in the Soviet Union's choice of a country like India in signing such a treaty, even while Soviet policy in Asia is in a period of transition. The very popular theory of India counterbalancing China in the emerging tripolar power-structure in Asia, or such riddles as who needs whom more (i e, does the Soviet Union need India more or *vice-versa*), are hardly realistic. They are not realistic because we in this country, as a rule, tend to forget that India is not in a position to match China's growing might, and no country in the world, not even the Soviet Union, thinks otherwise. To the Soviet Union a frank admission of this fact does not necessarily mean an abject surrender by India of its interests in the face of Chinese might; on the contrary, such an admission could lead to the settlement of India's long-standing disputes with China. The Soviet Union certainly does not want to turn India into the main spring-board of its so-called grand design against China. What the Soviet Union would, however, certainly want from India is a helping hand in finally evolving a tripolar power structure in Asia and in strengthening 'non-alignment plus', as between all the three poles of power, i e, the US, China and the Soviet Union. Indeed the selection of India as a treaty partner is dictated by the Soviet opinion of India as the main stabilising force in the region which has shown the will and capacity to act with responsibility and mature judgment.

In all the crucial geopolitical problems of the region with which the Soviet Union is mainly concerned, namely, maintaining peace and stability in Asia—particularly near the Asian borderlands of the USSR, the emerging new power-structure in Asia and defusing the intra-regional flashpoints, India's role has not been unhelpful to the Soviet Union. More recently, India's policy towards Bangla Desh underscored India's responsible role. India's restrained Bangla Desh policy has certainly acted as a catalyst in hastening the process of institutionalising Soviet relations with India, for the Soviet Union became convinced that a treaty with India would not involve it in a self-defeating exercise, as has happened in its relations with the Arab countries. That is why, if and when an unwanted war is thrust upon India due to Bangla Desh or for its own territorial integrity, Soviet support to India is now assured by the treaty.

Other important factors in Soviet closeness towards India are, traditional Soviet interest in India's problems, genuine appreciation of India's rich cultural heritage and a happy record of Indo-Soviet relations during the last fifteen years. These factors are worth emphasising because they are now often dismissed as old fashioned, peurile arguments in these days of super power politicking. Yet these old, well-worn factors have influenced the Soviet policy-makers in deciding to sign the Treaty.

From the Soviet viewpoint the overall importance of the Treaty appears to be that it is a formal and solemn declaration of the Soviet Union becoming an Asian power desirous of operating unhesitantly in Asian environment. This is the culmination of the process which began during the Indo-Pak conflict of 1965 when the Soviet Union, for the first time, successfully groped with a distinctly Asian problem outside the framework of its traditional equation with the US. Not by the flag following the trade, not by military pacts and wars of intervention, and certainly not by drawing its line of defence beyond its borders, but by an evolutionary process of Asianising its own interests, the Soviet Union has now become an Asian power. The nature of this process is novel and its result is a new development which truly supplements the Soviet Union's position as a Western power. The future will show the behaviour and style of this great Asian power. But one thing is surely predictable: this new development is bound to contribute to the security and stability of the entire region *a la* Europe.

India must take the credit for drawing the Soviet Union to Asia and making it possible for it to become an Asian power. Even in future it must be the task of Indian policy to see that the Soviet Union remains an Asian power for quite some time to come. This would certainly prove conducive to the interests of India and the Soviet Union, in particular, and Asia, in general.

Asian Education

TOTAL school enrolment in 18 Asian countries has jumped from 90 million in 1960 to about 160 million in 1971. The countries are: Afghanistan, Burma, Cambodia, Ceylon, India, Indonesia, Iran, Formosa, Laos, Malaysia, Mongolia, Nepal, Pakistan, Philippines, Singapore, South Korea, South Vietnam and Thailand.

University education has grown especially fast, from 1.8 million in 1960 to about 5 million now. Secondary enrolment has also more than doubled, from 16.7 million to some 36 million today. Although the rate of increase in the number of children at primary schools has slackened recently (from an annual 6.4 per cent in 1960 to a little under 4 per cent now), nine of the 18 countries in the region have an enrolment rate at the first level of 90 per cent and over —compared with five in 1960. Five countries now have rates from 60 per cent to 90 per cent and four are below 50 per cent. A large number of those at primary school, however, are above the normal primary school age. In the region as a whole, less than 60 per cent of children of primary school age are in fact attending school.

Despite the considerable progress made over the last two decades, more than half of the adult population of 15 and over is still illiterate. In 1970, the adult literacy rate was estimated at 58 per cent, a sizeable reduction from the 66 per cent around 1960, and the 76 per cent around 1950.

Growth of Radical Economics in the US

Thomas E Weisskopf

The disaffection with orthodox modern economics that has led to the growth of the new radical economics in the United States is part of a more general process of change that has profoundly affected American society in the past decade.

The attempt to develop a new radical economics represents an effort to provide an intellectual basis for a more effective attack on the manifest ills of American society than the discredited liberals could mount in the past decade. The radical wants to understand better why poverty, racism and sexism persist in the United States, why American troops and bombs continue to be sent to distant lands to wreak their havoc on innocent peoples, why the natural environment is destroyed in the name of progress, why increasing wealth does not appear to lead to greater human welfare but only to a heightened sense of alienation on the job, in the community and at home.

The radical suspects that these problems are in fact deeply rooted in the basic institutions of American capitalist society. To understand and to combat these problems, the radical requires an analysis of the fundamental nature, structure and dynamics of that society.

This article seeks to describe briefly the origins and the content of the new radical economics that has attracted increasing attention and a growing following in the United States.

TEN years ago hundreds of thousands of American college students worked their way through Paul Samuelson's introductory text in an effort to learn the mysteries of economics. If they complained at all, they complained that the book was too long, or too dull, or too difficult. Today, many more thousands of college students continue to work their way through Samuelson. But now there are many more complaints; not merely about its length, its tedium, or its difficulty, but about its inadequacy, its biases, and its failure to deal with the significant issues. And where graduate students were at one time almost uniform in their admiration for Samuelson and his professional colleagues and wished only to become mathematical model-builders themselves, now an increasing number of students—and even some junior faculty members—are openly contemptuous of the "orthodox" economics that continues to prevail in most colleges and universities in the United States.

The signs of change within the past decade—and especially in the past five years—are numerous. Journals and publishing houses that had suffered from obscurity, if not bankruptcy, since World War II suddenly began to prosper because they provided a Marxist or neo-Marxist alternative to the standard economics fare. Long-time Marxist economists such as Paul Sweezy and Harry Magdoff found their books, their articles and themselves in great demand on campuses across the country. To provide an institutional focus for the growing body of dissenters among young American economists and would-be economists, a new organisation called the Union for Radical Political Economics (URPE) was established in 1968. URPE has formed chapters at dozens of universities, its paid membership has increased to more than a thousand, it publishes a regular quarterly *Review of Radical Political Economics* and frequent newsletters, and it holds an annual national conference as well as periodic regional meetings.

What is this new movement all about? Why has it arisen now after a long period of quiescence? In this article I propose to describe briefly to Indian readers the origins and the content of the new "radical economics" that has attracted increasing attention and a growing following in the United States.

I
Origins

The disaffection from orthodox modern economics that has led to the growth of the new radical economics is part of a more general process of change that has profoundly affected American society in the past decade. From World War II until the end of the 1950s, American society was characterised by an apparent stability, if not outright apathy. When conflicts arose, they were quickly mediated within the existing institutional framework; dissent was limited and moderate in tone; the end of ideology was declared to have arrived; cultural activities and life styles were generally sober and conformist; and campuses and ghettoes were quiet. Everyone, it seemed, was or could soon be satisfied under the existing order.

The falsity of this presumption, so well obscured in the 1950s, began to force itself upon Americans in the 1960s. Widespread poverty was "discovered" by Michael Harrington ("The Other America") in 1962. Racism in both the South and the North proved to be more tenacious than civil rights lawyers liked to think. The sexism—or male supremacy—inherent in so many American institutions and modes of behaviour became increasingly disturbing to women and some men too. The continuing poverty of almost all the nations of the Third World became more visible. And the irrationality of stockpiling more and more nuclear weapons, while cities were decaying and essential social services were going unmet, became difficult to conceal behind anti-communist rhetoric.

The initial reaction to these problems as they began to be perceived was an optimistic one; the problems could be solved if only they received the attention and the money that they had been denied when they were ignored in the 1950s. The election of John Kennedy—narrow as the margin was—seemed to promise much; liberals who had remained on the sidelines during the Eisenhower years could now go in and activate the machinery of government to intervene in the economy and the society.

Under Kennedy, and in the continuing Democratic administration under Johnson, the liberals did indeed have their way. A whole host of new programmes designed to improve the state of the world were ushered in: the Peace Corps, the War on Poverty, increased expenditure on education, on urban renewal, and on foreign aid, etc. And while government officials and agencies devoted more and more attention to manifest social ills, many students became active at home and abroad in efforts to help the oppressed help themselves to a better life. As Peace Corps volunteers, as teachers and organisers in Southern towns and Northern ghettoes, young Americans sought to work within the system to force it to perform more responsibly and more humanely than it had in the past.

But the optimism of the early 1960s led inexorably to frustration and to disappointment, as the efforts of the dedicated and the idealistic ran aground on the shoals of reality. Poverty, racism, underdevelopment, and all the social ills that had become so clearly visible did not yield to public speeches, to federal expenditures or to the work of the young activists. On the contrary, things only got worse—and as the aspirations that had been roused by the well-publicised efforts to improve things steadily outpaced actual achievements, the bitterness and militance of the victims of poverty and racism and all related forms of oppression began to rise.

Volunteers returned from overseas dismayed not only by the poverty they had seen—and their own ineffectiveness in trying to bring about any changes—but also by the pervasive and generally reactionary role of the US government. The Bay of Pigs adventure, the intervention in Santo Domingo, and the escalation of the war in Vietnam gave the lie to the rhetoric that accompanied US programmes of aid and the Peace Corps itself. While only a minority came home with the view that the United States represented the prime obstacle to the development of the Third World countries, many became cynical about their own idealism and about the sincerity of US efforts abroad.

Similar developments took place at home as it became clear that government programmes and student efforts had little impact on the prevailing pattern of oppression of the poor and the minority groups. Federal agencies and student activists succeeded mainly in arousing a justifiable sense of grievance on the part of those whom they were trying to help. Many blacks became hostile to the somewhat patronising efforts of whites; they began to rebel in the ghettoes and to raise their own banner of Black Power to oppose the dominance of white society. The poor became bitter and hostile as they discovered how long it took government money to trickle down, and then watched the Poverty budget eroded by the dramatically escalating cost of the Vietnam War. And many of the most idealistic and energetic of America's youth turned away from the frustrating and fruitless efforts they had been engaged in and began to look for an alternative route to a more decent society.

Thus the failures of American liberalism in general, and the escalation of the Vietnam War in particular, created a climate in which hostility to the existing social order could and would grow rapidly. Symptomatic of the change was the conversion of the Students for a Democratic Society (SDS) from an organisation espousing non-violent efforts to improve conditions within the existing system to an explicitly revolutionary group advocating the eradication of the capitalist system. The number and size of Left parties and associations grew to levels unparalleled since the Depression in the 1930s. While the strength of the Left in the United States today is still much less than in almost any other country within the non-socialist world, it is remarkable in the American context.

Out of the turmoil and discontent of the times there arose on campuses across the country a variety of organisations that gave expression to academic dissent. The Union for Radical Political Economics was one of these; others include the Committee of Concerned Asian Scholars (CCAS), organised around opposition to US policy in the Far East (it was a group of young CCAS members who formed the first party of American China scholars to visit the People's Republic this past summer); and caucuses of radical historians, radical anthropologists, radical scientists, etc, within the established professional associations. Each of these group draws its prime strength from younger members of the profession and especially from graduate students at the major universities. Most are motivated not only by disgust at American policy but also by a belief in the need for a profound transformation of American social and economic institutions in order to create a decent society. And all are convinced that the orthodox teaching and writing in their fields of study are not only largely irrelevant to their most pressing concerns but—still worse—serve to prevent the kind of understanding that is required to bring about necessary social and economic change.

II
Content

The attempt to develop a new "radical economics" thus represents an effort to provide an intellectual basis for a more effective attack on the manifest ills of American society than the discredited liberals could mount in the past decade. The radical wants to understand better why poverty, racism and sexism persist in the United States, why American troops and bombs continue to be sent to distant lands to wreak their havoc on innocent peoples, why the natural environment is destroyed in the name of progress, why increasing wealth does not appear to lead to greater human welfare but only to a heightened sense of alienation on the job, in the community and at home. The radical suspects that these problems are in fact deeply rooted in the basic institutions of American capitalist society. To understand and to combat these problems, the radical requires an analysis of the fundamental nature, structure and dynamics of that society.

What then is the content of the "radical economics" espoused by the adherents of URPE? Not surprisingly, one cannot speak of any single line or school of thought. What unites radical economists in the United States is primarily a critique of the orthodox "neoclassical" approach to economics, and as yet no fully consistent alternative has been formulated or accepted. A great number of radicals have been working and writing in different areas, moving from critiques of the current orthodoxy to attempts to formulate more fruitful lines of analysis. Radicals are inclined to differ among themselves as to what constitutes or should constitute radical economics; what follows here is hence necessarily a somewhat personal view of the subject.

The radical critique of neoclassical economics draws attention to a number of faults, among which I shall consider (1) its irrelevance, (2) its analytical inadequacy, and (3) its ideological bias.

(1) From the radical point of view, the neoclassical economist typically asks the wrong — or at least the most uninteresting — questions about a society and an economy. For example, the effort to identify, to describe or to invent optimal growth paths is viewed as arcane gamesmanship; preoccupation with planning models, shadow prices, optimal taxes and subsidies is considered myopic in the absence of any analysis of how decisions are in fact made in a society. The radical concedes that the use of neoclassical economics may at best help businessmen and government officials to administer an existing economic system, but it can say nothing about the far more interesting questions relating to the origins, the dynamics, and the possible transformation of that system. To the extent that it addresses itself to the real world at all, neoclassical economics confines its attention to short-run and marginal problems of possible urgency to the administrator or technician but of much less interest to the academic social scientist.

What the radical economist would prefer to investigate are the basic so-

cial and economic institutions that shape a society and the forces that determine its evolution. Instead of analysing a particular policy in an historical vacuum, he (she) would want to investigate what determines the range of alternative policies that are actually capable of being undertaken in a given situation, and why certain policies are generally implemented while others are frustrated. Aware of the constraints on decision-making imposed by the institutional and political framework of a society, the radical economist tends to be less interested in formulating or advocating economic policy than in explaining or predicting economic behaviour.

(2) But even where neoclassical economics does address itself to behavioural rather than policy questions, the radical economist finds it seriously deficient in explanatory power. The deficiency can be attributed to a widespread failure to take into account important non-economic variables, a typical tendency to shy away from the implications of power and conflict in determining outcomes, and a general reluctance to depart from the unrealistic model of a perfectly competitive capitalist economy. The limitations of the assumptions imposed on most neoclassical models need no elaboration here; they are familiar enough to anyone who has studied a real-world economy. What particularly disturbs the radical, however, is the failure of orthodox economists to recognise how power — economic or non-economic — is often exercised on behalf of a group or a class so that its collective interest is defended in a conflict with other groups or classes. In such circumstances, the usual neoclassical explanations based on individual maximising behaviour lose their explanatory ability; one must instead turn explicitly to theories of power, its acquisition and its use. This in turn obliges one to examine political and social variables and institutions that are usually considered outside the scope of competence of the economist.

(3) Finally, the radical focuses attention on the ideological implications and biases of orthodox economics. By concentrating primarily on questions of administration and on marginal changes in the existing socio-economic system, neoclassicists implicitly support the *status quo*. The possibility — and hence the desirability — of revolutionary changes in the social and economic order is studiously ignored. The overriding concern of neoclassicists with economic efficiency and growth becomes an implicit value judgment: objectives other than efficiency or growth are shunted aside, left to be taken care of by inexplicably omnipotent finance ministers or to be studied by other social scientists without a quantitative background. The glib identification of human welfare with money income — despite the lip service given to qualifications — informs almost all the work and the policy recommendations of neoclassical economists.

More specifically, the body of theoretical neoclassical economics is viewed by radicals as an apologia for capitalism. Labour and capital are pictured in the theory as meeting each other as equals in a harmonious economic game: it is suggested that any man could as soon become a capitalist and hire labour as sell his own labour to a capitalist. The return to capital is equated in ethical terms with the return to any other factors of production; the capitalist is legitimised — if not sanctified — as an economic agent. The ostensible effort by neoclassical economists to *describe* the capitalist system thus slides almost imperceptibly into an elaborate attempt to *justify* it on moral grounds.

Having rejected most if not all of neoclassical economics on grounds such as the above, the radical seeks an alternative approach to the study of the economic issues that seem most relevant. Some general characteristics of an alternative approach can be identified at the outset. First of all, the approach must be interdisciplinary; it must not be limited by the conventional confines of the discipline of economics. Both the problems in which the radical is interested, and the variables which appear important, call for an understanding of the functioning of social systems and sub-systems in all of their interrelated aspects.

Secondly, the approach must be historical in a significant sense. In part this is because the radical economist is generally interested in long-run issues relating to the origin, the evolution and the transformation of social systems. But it is also because the radical economist is basically oriented to empirical work rather than to abstract theorising. To explain how things have come to pass or how they are likely to evolve in the future (rather than how they could have occurred in the past and ought to occur in the future) requires that phenomena be placed in and related to the concrete historical circumstances.

Thirdly, the radical economist is generally persuaded of the significance of basic economic institutions in affecting the patterns of social, political and economic behaviour observable in any society. Thus in analysing different aspects of Western industrialised societies, great attention is paid to the fundamental institutions of capitalist societies (the market in labour, private property, and the legal relations of ownership, etc) and the way in which these institutions are related to and influence observable outcomes. The basic economic system of production, distribution and exchange is viewed as setting overall boundaries within which different social and political configurations can lead to different results.

Finally, radical economists typically focus on conflicts of interest and their resolution through the exercise of power. Unlike the neoclassicist, the radical does not view the economy or the society as an equilibrating mechanism through which conflicting interests are mediated, if not altogether harmonised. Rather, the radical draws attention to the way in which different groups or classes attempt to use their power to structure institutions or affect decisions in their group or class interest — thus confronting other groups or classes with variant interests. The rational self-interest always posited by neoclassicists for the individual is extended forcefully by the radical economist to the class as a whole, and struggle among classes becomes as important as competition among individuals.

Much, if not all, of the foregoing may not strike the reader as very new; in these general terms it sounds very much like an old-fashioned Marxist approach. American radicals have in fact been greatly inspired and deeply influenced by Marx's own writings as well as by the work of contemporary Marxists, notably the late Paul Baran, Andre Gorz and Paul Sweezy. Turning away from the narrow and often apologetic character of neoclassical economics, American radical economists were naturally attracted to the broad and critical spirit of Marxism.

If the recent growth of radical economics represented simply a dramatic surge of Marxism in the United States, that in itself would be important news — for Marx has never attracted much of a following among American students and intellectuals. Indeed, most of the new radical economists would probably describe themselves, however loosely, as Marxists. But there are several respects in which it would be misleading — if not altogether inaccurate — to equate the growth of radical economics with an efflorescence of Marxist economics in the United States.

In the first place, there is relatively little interest among radical economists in labouring through Marx's own writings. Althought most are quite familiar with the "Manifesto", the "Preface to a Critique of Political Economy", and selections from "Capital" and the "Economic and Philosophical Manuscripts of 1844", few have bothered to study a substantial part of Marx's work. In part this is due to the inherent difficulty of the task; but it is also due to a fairly widespread feeling that much of Marx's work, and especially the more narrowly economic theory, is simply not very helpful, if not actually mistaken. The basic Marxian concepts of the mode of production, the forces and the social relations of production, the surplus, the class struggle, the contradiction, and the general approach of historical materialism, are embraced by most radical economists. But relatively few have adopted the labour theory of value or the law of the falling rate of profit. In sum, the general historical and interdisciplinary approach embodied in Marxism has influenced most American radical economists, but much of the specific theoretical content has been rejected by all but a minority of orthodox Marxists.

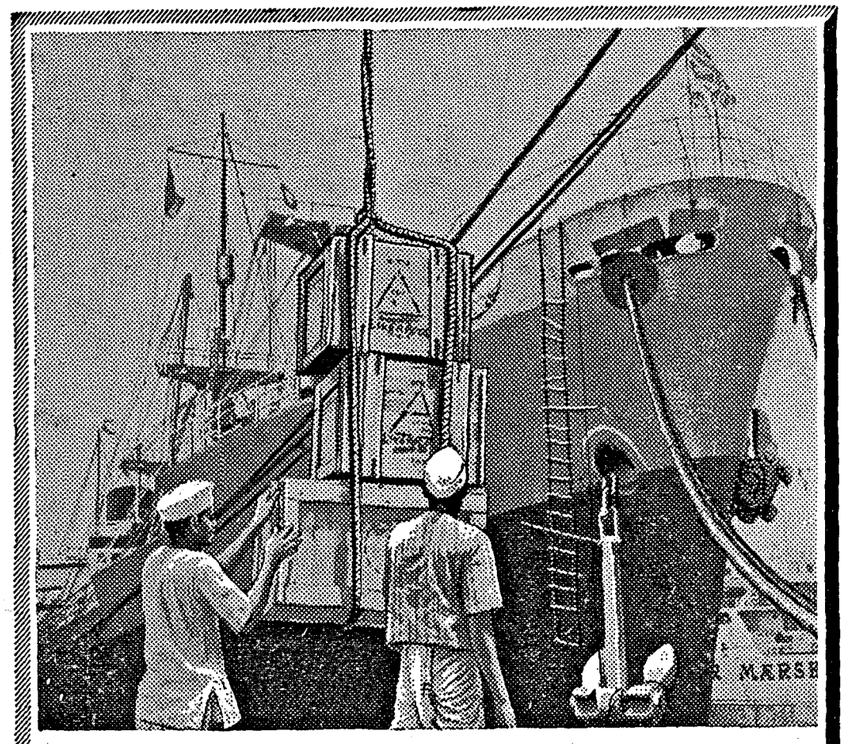
One element in Marx's own work that has held particular appeal for many American radicals is his early writing on alienation in the Economic and Philosophical Manuscripts. More than earlier generations of economists with some interest in Marx, most of the new radical economists are very much concerned with the social-psychological problems inherent in capitalist society. Concern over the failure to achieve human values of community, self-fulfilment and a meaningful life in the affluent post-War society has led to increased interest in the social-psychological aspects, and not simply the political and economic aspects, of social systems. Marx the humanist, as depicted by writers such as Erich Fromm, has shown more appeal than Marx the economist.

Consistent with this emphasis on the prospect of human liberation, the new radical economists in the United States generally show very little enthusiasm for the brand of socialism that has emerged in the Soviet Union and Eastern Europe. While these countries are seen as having made some important economic strides in increasing (and distributing more equally) welfare among their people, the maintenance of rigidly hierarchical structures of management and control, the lack of effective personal freedom and participation in decision-making, and the general trend away from the communist ideal of a co-operative and egalitarian society, are condemned as simply imitative of some of the worst features of Western capitalist societies. The ideal society of the new radicals does not require a strong centralised state to act in the public interest; on the contrary, it calls for as much decentralisation of economic and political power as possible. Social ownership of the means of production is necessary but far from sufficient to build the new society; there must also be an institutional framework which permits small but viable co-operative and egalitarian communities to flourish alongside one another without the oppressive burden of a huge state bureaucracy. This vision of decentralised or participatory socialism contrast starkly with the reality of most of the socialist nations in the world today; but the experiences of China and Cuba (and to some extent also Yugoslavia and the Israeli kibbutzim) are studied with great interest in the hope that they might serve in some ways as a model for a better future.

III
Conclusions

What has been accomplished by the radical economists in the past few years? Obviously there has been no transformation of American society: the same problems — inequality, alienation, imperialism, etc — continue as before. A new theoretical framework to drive neoclassical economics from the curriculum has not yet been developed. As yet only a minority of students of economics, and a much smaller number of professors, would wish to associate themselves with URPE or any other radical organisation.

Yet there is also much that has been achieved, and a promise of more to come. Radical economists, by developing new courses, reviving long-neglected work and contributing new work of their own, have awakened the new generation of students of economics to issues and perspectives that would have been denied them in the earlier period of unchallenged neoclassical hegemony. New fields of inquiry and new methods of analysis are permitting students to escape from the narrow confines of orthodox economics and to study problems of much greater personal and social significance. Students and teachers have been increasingly obliged to examine the relevance of what they are doing as well as the political implications of their work. Complacency in the American system in particular, and the capitalist system in general, is giving way to a much more critical and perceptive approach.



Political activities by radical economists have varied from one place to another. Along with other groups in the overall radical movement, the economists have participated in demonstrations, civil disobedience and other actions against the policies and agencies of the US government. Papers and pamphlets have been written to support the activities of militant organisations and activist groups on the Left of the American political spectrum. Efforts have been made to expose the complicity of universities and research institutions in many of the policies and activities of the US government, notably the War in Indochina. And some attempts have been made to promote student power within universities and to democratise the hierarchical structure of economics departments.

By and large, however, the major thrust of the new radical economists has been on an intellectual plane. This reflects a general belief that the necessary changes in American society cannot be brought about unless a process of demystification allows the American people to discard old myths and to acquire a new understanding of their society and the need to change it. Thus a great deal of effort has gone into analyses of the way in which the structure of the American capitalist system produces so many of America's current social problems, and the way in which contradictions in the present system may lead to possibilities for fundamental change in the future. For radical economists are no more economic determinists than was Marx; they believe that political action taken at the right time and with a correct understanding of the objective situation is essential for human progress. When that time will come, and what will be the nature of the necessary action, are questions that remain of course hotly disputed among all radicals today.

Bibliographical Note

[Readers who are interested in acquainting themselves further with the radical economics that is being formulated and developed in the United States may wish to consult one or more of the following sources. (1) Richard C Edwards, Arthur MacEwan and the Staff of Social Sciences 125, "A Radical Approach to Economics: Basis for a New Curriculum" (*American Economic Review*, Vol LX, No 2, May 1970, pp 352-363) describes briefly the content of a course organised by radical economists at Harvard University. (2) Richard C Edwards, Michael Reich and Thomas E Weiss-

kopf, "The Capitalist System: A Radical Analysis of American Society" (Englewood Cliffs, N J: Prentice-Hall, Inc, forthcoming January 1972) combines a selection of reprinted readings with original essays and introductory notes in a survey designed to introduce students to the field. (3) The *Review of Radical Political Economics*, published quarterly by the Union for Radical Political Economics since 1969, contains a wide variety of articles by radical economists. The July 1971 issue of this journal (Vol III, No 2) is devoted to a set of papers on "Radical Paradigms in Economics" seeking to define radical economics in relation to the current orthodoxy. Poverty in India – Policies and Programmes

A Comment

K Jayaraman

THE crucial part of the excellent study by V M Dandekar and Nilakantha Rath (*Economic and Political Weekly*, January 2 and 9, 1971) is Section VII in which the authors have given their solution to the problem of poverty in India "within the framework of private property". Having ruled out the communist solution of socialising all means of production and thus ensuring a socially equitable distribution of income, the authors have ruled out the other alternative as well, *viz*, of distributing equitably the means of production themselves: (i) land—on the grounds that there is not enough of it to redistribute to enable every one to employ himself and earn a minimum living and (ii) industrial capital—which too is in short supply and is very marginally distributed. Even a labour intensive technology, which with the available capital may be expected to provide employment to all, is not, in the authors' view, a feasible solution judging from the results of the Khadi and Village Industries Programme. A rural works programme of the magnitude of Rs 800-1000 crores, annually, to provide gainful employment to the vast number of persons with no means of production of their own is considered, by the authors, to be the only feasible way for lifting the poor above the poverty line. Even a programme of this magnitude will not, according to them, cover the poorest 10 per cent who will be thus left high and dry.

Where is the money to come from for financing this massive programme? In the authors' own words, "A 15 per cent cut in the consumer expenditure of the richest 5 per cent and 7.5 per cent cut in the consumer expenditure of the rich below them is all that is needed. The burden is not great if the rich will see reason. If they do not, sufficient political pressure must be brought to bear on them. At the same time, appropriate fiscal instruments will have to be designed to acquire the necessary financial resources from them."[2] The authors have not spelled out the details of the needed fiscal measures, except to say that, "both direct and indirect taxation will have to be employed", including a tax on large agricultural incomes and on all luxury goods (such as cars, luxury apartments in the cities, etc). They, however, concede that the additional income to be placed in the hands of the poor must come not from a net transfer of incomes from the rich to the poor but by a net addition of purchasing power in the economy. This accretion to the purchasing power could be mopped up, however, only by the supply of additional quantities of commodities of common consumption which the poor will need and which the rich will not release in any case. "In the ultimate analysis", to quote the authors again, "there is no way of improving the living of the poor without expanding the supplies of the commodities which they need".[3]

Basic Fallacies

There appear to be certain fallacies in some of the basic assumptions behind the suggested remedies for winning the battle against poverty in India. These are discussed below.

(i) In the first place, the assumption that "a large programme of rural works organised as a permanent feature for some years to come will enable some of the agricultural proletariat to withdraw permanently from agriculture and thus help rationalise the existing employment in agriculture", is belied by the experience of these programmes organised so far since the beginning of the Third Plan and in which several crores had already been invested in areas considered to be the pockets of unemployment and underemployment where agriculture offered no scope whatsoever as a means of employment during a major part of the year due to drought or scarcity conditions. As one intimately connected with the evaluation of these programmes in states like Maharashtra, Gujarat, and Mysore, during the last decade, it was appalling for this author to find that even in the so-called chronically scarcity areas the local labour force was, as a rule, either not available or was unwilling to participate in the works programmes of even the very limited nature that were organised. There were instances thus of outside labour having been hired at exorbitant rates to complete the works to fulfil targets. Often, in certain areas, for lack of local effort and participation, contractors were entrusted with the execution of these works. Thus the wages that really accrued to the labourers were minus the middleman's profit inevitable in the circumstances. It is futile to expect that in any massive programme of rural works this experience will not be repeated and that the huge expenditure proposed on such works will percolate to the bottom layer and add significantly to the purchasing power of the poor.

(ii) The more basic fallacy in the authors' argument, however, seems to lie in their assumption that a massive rural works programme of Rs 800-1000 crores a year can be financed by a cut in the consumer expenditure of the rich. True, in India, unlike in the West, the propensity to consume is fairly high at high levels of income, but fiscal and other measures of control have been ineffective both in restricting conspicuous consumption as well as in releasing black money. Rather, the effect of these controls has been to cast an unduly heavy burden on the middle and lower income groups, increasing social inequality and tension and at the same time inhibiting expansion of production and employment. We are, therefore, faced with a dilemma. Even assuming for the moment that fiscal measures alone (including taxation of agricultural incomes) will, as advocated by the authors, bring in the required funds for financing the massive programme to provide employment to the vast numbers in rural areas, where is the money to come from for investment in consumer industries of at least a similar magnitude to mop up the additional purchasing power created by the transfer of incomes? Without this, as the authors have themselves agreed, the purpose of the transfer of incomes will be defeated. Resort to deficit financing on a massive scale, with the inevitable consequences on the price structure, will then be inescapable. The poor, in any case, will not stand to benefit in such an eventuality. Even to date, the success claimed on the agricultural front has not arrested the price inflation. Even though more rapid development of consumer goods industries is urgently needed to mop up rapidly the growing agricultural incomes, basic consumer goods industries like textiles and vanaspati have not had a share in the up-trend of the other lines of industrial production. Engineering industries are also suffering for want of steel, and the shortage has raised their cost of production by forcing them to

produce below optimum capacity. Indeed, many Indian manufacturing operations are still too small to avail themselves of the technological economies of scale. What they need are facilities for fuller utilisation of existing capacity and expansion thereof, so that, through proper fiscal measures there may be considerable expansion of output and employment *via* the well known mechanism of multiplier-accelerator. The expansion of income, thus generated, would also lead to expansion of savings.

Alternative Solution

A far more practical, permanent, and rational solution to the problem would be to re-invest the funds generated by technological development. This will have to be done in a way to achieve an integrated development of agriculture and industry (large and small, alike), leading to the absorption of sizeable numbers of unemployed and underemployed from the rural areas in modern industries. Indeed the economists[4] who assembled in Gauhati last December were reported to have been unanimously in favour of the view (a) that for the first time science had brought about a breakthrough in Indian agriculture and thus enabled us to solve our food problem and the problem of *non-viable* sectors of the rural economy; (b) that with any revolutionary change in the technique of production and productivity, problems of income disparities and regional imbalances were bound to arise and what was called for was not to put any restrictions on faster progress but to take steps to minimise the disparities; (c) that the green revolution should spread not only over the different parts of the country but also in respect to different crops as far as possible, since intensive cultivation and multiple cropping had generated larger employment and a rise in the level of wages to the rural workers, and (d) that, as a corollary, mechanisation be looked upon not as a labour-saving device but as a productivity increasing technique and employment increasing source. The capital intensive nature of the new technology was also emphasised.

The authors of 'Poverty in India' have themselves recognised that "the technological programme (in the so-called developed countries) did not throw anybody out of employment permanently, but made it possible for everybody to be employed at a higher level of productivity".[5] The argument that, khadi and village industries with limited capital and using traditional skills have failed to make any impact on the employment situation, cannot rationally be used against small-scale industry of various kinds which could produce ancillaries required by the new technology in agriculture, could employ modern scientific skills, and could offer greater scope for permanent self-employment (as distinct from wage employment). In the words of the authors themselves, "In small-scale modern industry, a considerable part of the total employment can be self-employment from the point of view of industrial structure, location, and organisation. The principal feature of small-scale modern industry is the possibility of its dispersal in many locations, thus creating a decentralised but modern industrial structure. On both these counts it has much to commend."[6]

Indeed, Punjab and Haryana are two states which are standing examples of prosperity and affluence, where science and technology have played a notable part in bringing about an integrated development of agriculture and small industry on modern lines. In Ludhiana, an industrial complex, consisting of many small units of the specialist type, has already come into being. Most of the entrepreneurs have little formal education but are dynamic and innovative enough to venture into new lines, especially in skilled workmanship and design in the field of mechanical and electrical engineering. Quick to imitate any device, gadget, or machine, they have been largely instrumental in designing prototypes of several imported machines. What is more, large units depend upon scores of these small units for components, and this arrangement has proved economically viable.[7] Therefore, to dismiss labour intensive technology, with the existing factor endowments either of land or capital, as being not feasible in generating employment for the mass of the unemployed or underemployed labour and instead to resort to rural works which will have its base in unskilled work would appear to be taking the country backward and not forward. Any rural works programme can at best serve to supplement, and not substitute, the new technology.

The crucial question remains, how to generate the needed funds for productive investment. The two obvious sources are: taxes and money supply. As regards taxes, the basic assumption is that a country with a low tax ratio (i e, tax revenue as a percentage of the gross national product) has plenty of scope for mobilising internal resources through additional tax measures, while a higher tax ratio is indicative of higher economic growth. In fact, however, tax ratio and economic growth may not always move in the same direction. This is because, in a developing country, the proportion of non-development expenditure often tends to go up as a result of expansion of the administrative structure and increase in wages and salaries. Indeed, it would be a surprise if Parkinson's law did not operate with a vengeance in a massive programme of rural works of the kind advocated by the authors.

The annual growth rate of the real national product in India was only 2.9 per cent in the Third Plan as against 4 per cent in the Second Plan, though the tax ratio increased from 10 per cent in 1956 to nearly 14 per cent in 1966. The real indicator of growth, therefore, is the correspondence between the percentage increase of the tax ratio and the percentage improvement of the per capita income. Judged by this test, it is seen that, while the per capita real national income in India has grown on an average by 1.7 per cent per year between 1959-60 and 1968-69, the average annual growth of tax ratio has been 14.1 per cent. Although India's tax ratio is below that of other developing countries, such as Ceylon, Iran or Thailand, and also below that of developed countries such as Japan, the UK and the US, the annual rate of growth of taxation relative to that of real per capita gross domestic product is much higher here than in all those countries (seven times that of real gross per capita domestic product between 1960 and 1966, as against around two times in advanced countries like Japan and the US).

Adverse Effects

While there is thus a limit on any tax effort, growth in money supply also has its adverse effects on investment and, therefore, on employment. In economically advanced countries, an increase in money supply leads to a rise in demand and indirectly in employment; prices in their circumstances rise due to increase in money supply only after the full employment stage has been reached. In a developing economy, however, the increase in money supply pushes up the prices right away while wages and salaries lag behind. This reduces the purchasing power of the people and thus tells on the demand. Rising prices, however, could induce increased supply, but when supply outstrips demand a recession sets in. In other words, when aggregate supply is affected, growth in monetary resources only tends to aggravate existing imbalances between aggregate demand and aggregate supply.[8] Considerable distortions in the economy occur as a result of persistent inflation. "When an exceptionally large harvest is gathered in, an important addition is usually made to the quantity carried over into later years. The proceeds of this addition are added to the current incomes of the farmers and are treated by them as income; whereas the increased carry-over involves no drain on the income expenditure of other sections of the community but is financed out of savings. That is to say, the addition to the carry-over is an addition to current investment. This conclusion is not invalidated even if prices fall sharply. Similarly when there is a poor harvest, the carry-over is drawn upon for current consumption, so that a corresponding part of the income-expenditure of the consumers creates no current income for the farmers. That is to say, what is taken from the carry-over involves a corresponding reduction in current investment. Thus, if investment in other directions is taken to be constant, the difference in aggregate investment between a year in which there is a substantial addition to the carry-over and a year in which there is a substantial subraction from it may be large; and in a community where agriculture is the predominant industry it will be overwhelmingly large compared with any other usual cause of investment fluctuation. Thus it is natural that we should find the upward turning point to be marked by bountiful harvests and the downward turning point by deficient harvests."[9]

Not only the fluctuations in agricultural production but fluctuations in the prices of the agricultural products also affect the industrial sector. "It is not the absolute prices of the farm products but their relationship with the agricultural inputs that plays a significant role. The difference between the prices of the inputs and outputs constitutes the demand from the peasant community for non-food articles. If the farmers' net gains are high, the rural demand goes up. But, at the same time, if the prices of the agricultural produce are too high, the demand from wage earning consumers for non-food articles drops because of high outlays on the food stuffs. Also, the higher prices of the agricultural raw materials pushes up the costs, thus, causing an overall drop in the demand for industrial products due to higher prices.[10]

The key to the solution of all these problems, including the problem of mass unemployment, can only lie in a faster rate of growth of the gross national product, without which the growth in domestic demand following the accretion to the purchasing power in the economy will absorb most of the industrial products, leaving inadequate surpluses for export and pushing up domestic costs and prices to a point where our products become uncompetitive in world markets. There should be greater concern about the higher volume of imports per unit of production in terms of scarce raw materials, labour, power, transport, and managerial and human resources. This alone can bring about a more rapid transformation of the economy and provide a built-in spur to efficiency all around. "The cumulative rise in prices in recent years", as the Reserve Bank of India warned us a few years ago, "has resulted in a steady erosion of the real value of money incomes and savings. Unless the inflationary trend is arrested, it will be extremely difficult to find genuine savings for investment in both the public and private sectors."[11] In fact, though there has been an increase in national income at constant prices by about 19 per cent since 1964-65, the savings ratio has gone down from around 10.7 per cent to about 7.5 per cent or so, that is by nearly 30 per cent. The *modus operandi* of the massive rural works programme of the magnitude suggested by Dandekar and Rath is not calculated to arrest the inflationary trend and much less to generate *genuine* savings for investment in industry, private or public.

Japan's Foreign Trade: New Orientation

THE white paper on foreign trade published recently by Japan's Ministry of International Trade and Industry urges Japan to push trade and capital liberalisation while adopting itself to environmental changes at home and abroad, and to make positive contributions to the furtherance of free trade. The extraordinary expansion of Japan's trade has given rise to new problems in Japan's external economic relations. These problems, according to the white paper, include: (1) frictions in the world's major markets due to Japan's rapid trade expansion, (2) how the Japanese economy, heavily dependent on imported natural resources, should cope with the new development of the North-South problem, and (3) how Japan should adapt itself to the business recovery trend in countries of the Communist bloc and the development of East-West exchanges.

On the basis of this analysis, the white paper stresses the following tasks for Japan:

(1) Trade with advanced countries — promotion of "horizontal" commodity trade and diversification of export markets.
(2) Solution of the North-South problem — offering of preferential tariffs to help developing countries expand their exports.
(3) Promotion of imports — Japan has laid primary emphasis on the importation of natural resources required by the highly paced industrial activity, but hereafter it will have to make the most out of further imports due to the growing labour shortage and diversifying consumption.
(4) Economic development *vs* resources problems — the procurement of low-cost natural resources on a stable basis is essential to Japan's economic stability and expansion.
(5) Overseas investments — to head off frictions arising from Japan's increasing overseas investments, Japan should see to it that such investments will serve to promote economic co-operation with the recipient countries.
(6) Conversion to knowledge-intensive export structure — Japan should shift its export emphasis from the heavy and chemical industries to knowledge-intensive and research and development-intensive goods.

FROM THE CHAIR

The Indian Iron and Steel Company Limited

Statement by the Chairman, Sir Biren Mookerjee

THE following is the Statement of Sir Biren Mookerjee, Chairman, The Indian Iron and Steel Company Limited, at its Fifty-fourth Annual General Meeting held on September 22, 1971:

At the 54th Annual General Meeting of the Company held on the 22nd September, 1971, Sir Biren Mookerjee, Chairman made the following statement.

Before I proceed with the formal business set out in the Agenda for today's meeting I would like to say that as usual I have received many letters from shareholders and as usual some have suggested that the dividend be raised while others have suggested a reduction in the rate of dividend. I need not remind you that although you may, if you so desire, reduce the rate of dividend recommended by the Directors, you are not empowered to increase the dividend.

Profitability and Resources

In recommending a dividend your Directors give very careful consideration to various factors. Essentially there are two criteria for determining the rate of dividend in any responsible institution. These are firstly profitability and secondly availability of resources. You must be aware that much of your basic plant is old and although it is maintained as well as resources and the availability of foreign exchange permit, an old plant requires rehabilitation just as an old body requires medication. The rehabilitation of the major units of the plant requires a great deal of money and the only means of providing this money is through the depreciation charged in your accounts and whatever is transferred to reserve less the dividends declared.

The Middle Path

The Directors are faced with another problem: while shareholders naturally expect higher returns, the banks who are the Company's creditors and who provide it with the necessary working capital, look with disfavour on dividends being paid out of overdrafts. Therefore, your Directors have to tread a middle path in the matter of declaring dividends. The question of maintaining dividends is also of importance. Government's price control policy in regard to steel while the cost of raw materials, freight, consumable stores and labour continues to rise, means only that, other things being equal the available profits will continue to shrink. Maintaining dividends even at the rate of 6 per cent may well prove to be impossible of achievement unless there is a relaxation in the pricing policy. I, therefore, feel that the dividend of 6 per cent is fair in the circumstances and in fact is perhaps too fair. How important maintenance of the plant is will be evident to shareholders from the successive disasters which have struck major units of plant in the other integrated steel plants in India. That your plant has so far escaped such a calamity in spite of seven bundhs and the difficulty in obtaining essential spares and despite the restrictive tactics adopted by the labour speaks volumes for the efficiency of your plant management. It is true that very large sums of money are spent on the proper maintenance of plant, but it has also paid rich dividends so far. As the saying goes "a stitch in time saves nine", even so, the very best maintenance engineers in the world would not be able to properly maintain a plant if essential spare parts, accessories and implements were not made available to them in proper time.

Rigid Procedures

I am happy to say that Government have at last realised the importance of this aspect of plant operation. While the need to conserve foreign exchange is of paramount importance and the need to progressively intensify import substitution is equally so, some relaxation of these rigid procedures must become necessary especially in the case of continuously operating units such as integrated steel plants where delay in obtaining essential materials can lead and in some cases have actually led to drastic consequences.

Revised Scheme

You may well ask me about the present status of your balancing of plant project designed to increase your ingot capacity by some 300,000 tonnes per annum. I might tell you that a revised scheme is now under discussion between the Government and the Company. The only information I can give you at this stage is that the revised scheme will cost considerably more than the earlier schemes which had to be abandoned for reasons well known to you from my statements of earlier years. Since such a large sum of money will obviously not be available from shareholders, if the scheme is to be implemented, it will involve obtaining term loans from Government lending agencies as I hardly think any non-Government leading agency would be in a position to supply capital in the range of 60 or more crores that would be required now as against about Rs 11 crores that would have been required in 1962 had the scheme been implemented then. Loans obtained from Government lending agencies, will, under the new directive, entail incorporation of a conversion clause in the agreement. If the conversion of the loan into equity is implemented, then the share of the existing shareholders in the profits and assets of the Company will be reduced by two thirds. Even if the loan is not converted into equity, interest payments will make severe inroads into the profits of your Company, apart from the repayment of principal out of taxed income. However, before any scheme is finalised or arrangements made, I am sure that your Board of Directors will advise shareholders of all relevant considerations at the appropriate time.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

The Mettur Chemical and Industrial Corpn Ltd

Review by the Chairman, Dr P S Lokanathan

ADDRESSING the Thirty-fourth Annual General Meeting of the Mettur Chemical and Industrial Corporation Limited, at its Registered Office at Mettur Dam R S on Friday, September 24, 1971, Chairman, Dr P S Lokanathan said:

I have great pleasure in extending to you a warm and cordial welcome to this 34th Annual General Meeting of your Company. The Directors' report and the audited accounts for the year ended 31st March, 1971, have been in your hands for some time now and with your permission, I shall take them as read.

The spectacular victory of the Congress Party led by Mrs Indira Gandhi in the Centre and that of the Dravida Munnetra Kazhagam in Tamil Nadu led by Mr M Karunanidhi in the recent elections has already borne some dividends. The world outside has come to treat India with respect, on account of the strong political stability which the elections have brought about. We can derive comfort from the thought that the Government of India can now afford to do the right and pursue sound economic and social policies without yielding to the pressure of the extremist elements in the party. The crying need of the country is wise and strong leadership in the face of the complex and staggering problems we are confronted with, animated by a sense of realism and pragmatism without being dogmatic.

Towards a Better Life

There is broad agreement in the country about the goal of socialistic pattern of society or socialism. Every party has more or less accepted it. There are of course differences in respect of its content. For example, many people believe that the excessive emphasis on nationalisation by the ruling party is misplaced. In this respect the Ruling Party at the Centre is at least 30 years behind the time. Socialist theory and practice have undergone drastic changes on the issue of nationalisation in the last 50 years. In the 1920s, the common ownership of the means of production, distribution and exchange was the formula which expressed the prevailing socialist orthodoxy. Today, not a single socialist party in the world nor a single socialist leader of repute adheres to the old formula of nationalising all the means of production. In 1957, the socialist international, speaking for more than 30 socialist parties throughout the world adopted a programme that specifically rejected the old doctrine of total nationalisation. In 1959, the new German Socialist Democratic party adopted a programme in which freedom, justice and respect for the individual were declared to be its highest values. Nationalisation does not appear as an item in the programme of socialist parties of Great Britain. It is now recognised that every concentration of economic power even in the hands of the State spells danger and that there can be no individual freedom unless there is diffusion of economic power. In a democratic society, the economic power of private monopolists can be checked and opposed effectively by the political power of the State. When the monopolist is the State itself, who will protect the citizen against the State? We, in India, should therefore avoid this contingency. The pragmatic approach to nationalisation and the principle of selectivity which characterised our Second and Third Plans should continue to be our guiding policy.

The enormous losses which we have incurred through nationalised industries must be a warning that further expansion of the public sector should be both gradual and cautious. Nationalisation of Banks and of Insurance is now a *fait accompli*. It can only be hoped that this measure will justify itself through increased services to the economic and social sectors.

From the point of view of eliminating poverty and raising the standards of living of the masses of the population, nationalisation cannot have a high priority. The true element of socialism is not nationalisation; rather it comprises social and economic equality, social and economic welfare and the ushering in of a welfare State, of which we already have small beginnings. Our Prime Minister herself, in a nation-wide broadcast in 1966, affirmed her commitment to both socialism and democracy and gave us her own definition of socialism: "What we all want is a better life with more food, more employment and opportunity in conditions of economic justice, equality and individual freedom." We can all agree upon this. To attain the above ends, the essential condition is a more rapid growth of the economy. For this purpose, only the system of mixed economy which we adopted some years ago would serve our best interests. This means that anything that would hamper production whether in the private or public sector should be avoided. No expansion for the public sector should be permitted unless the results will definitely be more favourable than can be attained through the private sector, within the framework of a socialist economy.

The ending of inequality based on birth, wide education and opportunities for all, the sharing of wealth with the poorer sections of the society, through taxes and other means, provision of social security and the adoption of all welfare measures as quickly as possible should be our goal, the fulfilment of which requires a consensus on economic and social changes by all the political elements in the country.

The need of the hour is for the people to get together and work for a common programme, especially in view of the threat to our national security and of the calamity that has overtaken us, through the responsibility for the 10 million refugees from Bangla Desh. The social and economic consequences of the refugee problem are too grave to be minimised. The financial burden of feeding, housing and looking after the 10 million refugees would itself cost nearly Rs 800 crores annually. It is unrealistic to expect that all the refugees would go back after a year. A good half will remain in India and they will have to be rehabilitated and found employment. The social, economic and financial burden thrown on the economy by the refugees can be borne only if the people are prepared to make huge sacrifices in various ways, of which there is yet little evidence.

The growing unemployment in the urban areas and in the countryside is causing deep concern to all of us. The Rural Public Works programme and the so-called crash programme are no permanent solution. So far as rural India is concerned, the true problem is not unemployment but sheer poverty due to inadequate work opportunities, poor work participation, low intensity of work and social and other inhibi-

tions. What is needed therefore is the intensification of agriculture and other rural programme combined with social nd political changes. In the urban rea, it is a problem of more and more nvestment on sound lines. Industrial nvestment is still on the low side and Government policies have done nothing o accelerate it. On the contrary, they eem to have been designed to retard he growth of the private investment. mport policy is still restrictive; import ubstitution has been pressed beyond ts usefulness.

Our economy during 1970-71 has shown signs of strength especially in he agricultural and export sectors. At ong last, the food problem has been olved; there will be no food imports rom next year. Exports have also shown great resilience and the target-ed rate of 8 per cent growth has been exceeded. On the industrial sector, there was an increase of only 5 per cent which was far short of the levels of the growth laid down in the Plan. The shortage has been mainly due to lack of certain essential raw materials, continued under-utilisation of capacity and high unit costs. During the year, our balance of payment was not as satisfactory as it was at the end of 1969-70, despite the significant improvement in the export front. The shortage of steel, cotton, oils and oil seeds has necessitated large imports. President Nixon's action in levying import surcharge of 10 per cent on some categories of exports would also affect our exports adversely.

But more than the problems of the balance of payments, the matter of deepest anxiety and concern is the rising level of prices which already is causing distress and suffering to the people, thanks to budgetary factors and other newly emerging elements. The expenditure at the rate of 2½ crores of rupees a day on the refugees in the wake of a deficit budget of 1971-72 will undoubtedly add to the inflationary potential of the country. Unless the Government takes steps on two fronts, (a) to reduce the scale of Plan and Non-Plan expenditure, and (b) mobilise resources both from the tax and non-tax fields, inflation might get out of hand. This is the challenge that faces our country today, and how we meet the challenge will affect the future growth of the economy.

Satisfactory Results

I now turn to the working of our Company during the last year. As you will observe, the results are on the whole satisfactory; our turnover during the year registered an increase of about 8 per cent. This achievement is all the more gratifying because we have had to incur increased costs on raw materials both indigenous and imported, and encountered shortages of some of the most essential raw materials. The increase in freight rate on salt, our chief raw material, has also added to our unit cost. The increases in customs duty, imposed in the recent budget on the imported raw materials, like mercury, have also added to our cost. Another disquieting feature is the Government's insistence that several of the essential items needed by our company should be routed through the STC and the MMTC. The alleged reason for channelising through the State trading agencies is to exploit advantages that come through larger purchases and in the saving of transport costs. But here is an example of the wide gap between theory and practice. Our experience and that of several others have shown that all the items which are imported by the STC and the MMTC are not only more expensive but their delivery schedules were also very irregular. The withdrawal of the Development Rebate effective from 31st May, 1974, announced in the recent budget is singularly inappropriate. There was certainly no need to announce a policy so long ahead of time since the justification and soundness of the policy can only be judged against the economic conditions prevailing at that time. The announcement has, therefore, had a bearish effect on investment and has retarded modernisation of the economy. The imposition of heavy import duty on capital goods also lacked justification.

The major problem which your Company had to face during the year under review was the inadequate availability of graphite anodes. Many units had to curtail production by cutting out some of their cells due to want of anodes. However, the position has improved in the recent months. I am glad to report that utilisation of the co-product chlorine has considerably improved. Up to 1968, the utilization of chlorine was only of the order of 65 per cent but thanks to the exemption granted from the Excise duty and the initiative shown by the manufacturers together with the availability of chlorine at comparatively low prices, the percentage of utlisation has increased recently to as high as 86. But the budget for the year, 1971-72, did away with the exemption from Excise duty, and chlorine is liable to Excise duty at 10 per cent ad valorem. The resultant rise in the price of chlorine is bound to affect the demand for the product and the percentage of the gainful utilisation of the chlorine. We are also suffering from shortage of containers for chlorine. This has hampered our exploitation of our growing export market which has high potential for absorption of chlorine. We have now made a representation to the Government for the grant of actual user licence for import of chlorine containers.

The demand for caustic soda is rapidly increasing. The Government of India have taken note of it and have suggested both a crash programme to increase production in existing factories by 10 to 15 per cent and a programme for the establishment of fresh caustic soda capacity. We are trying to take advantage of both the proposals. We have submitted a scheme to increase our caustic soda capacity in our plant No 1 by 10 tonnes per day and simultaneously have made an application for substantial expansion of our capacity in our Rayon Caustic Soda plant by 50 tonnes a day. We do hope that the Government of India will grant us the necessary permission.

I am glad to report that our relations with our employees during the year were happy and cordial and I would like to record my sincere appreciation of the hard and conscientious work put in by our employees. A word of appreciation is also due to the Company's Distributors who have helped us in marketing our products. My thanks are also due to my colleagues on the Board for their counsel and advice. Finally, I would like to take this opportunity of conveying my sincere thanks to shareholders for their continued confidence and co-operation.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

West German Labour

RISING wage bills at home are forcing West Germany's large industrial firms to shift an increasing part of their manufacturing capacities abroad. India and other countries in Asia will be gaining from this new policy in as much as more private investment and modern know how will be available from West Germany.

Formerly, German industries would invest abroad mainly to be closer to export markets or to overcome import restrictions. But now the wage level has become the major consideration.

Kirloskar Pneumatic Company Limited

Speech of the Chairman, Shri S L Kirloskar

THE following is the Speech of Shri S L Kirloskar, Chairman, Kirloskar Pneumatic Company Limited, read out at the Thirteenth Annual General Meeting of the Shareholders held on Thursday, September 30, 1971, at its Registered Office at Hadapsar Industrial Estate, Poona 13:

Gentlemen,

I have pleasure to welcome you to to this the 13th Annual General Meeting of the Company.

The Directors' Report and the Audited Accounts have been in your hands for some time now and with your permission, I shall take them as read.

Business

This time last year I was cautiously optimistic about a sizeable increase in your Company's operations. The caution was induced by uncertainties regarding Government policies and the political situation on the eve of elections. It is gratifying to note that despite them, your Company was able to record a substantial increase in its operations. All the lines of manufacture in which the Company is engaged contributed to the increase but the progress was particularly notable in the sales in Transmission equipment and in turnkey assignments in the Air Conditioning and Refrigeration field. Exports once again made a handsome contribution of Rs 43.26 lakhs against Rs 27.25 lakhs in the previous year.

The increase in the activities, however, was not fully matched by a corresponding increase in profits. Higher raw material costs, higher import duties, a larger outlay on octroi and dearer finance took their toll of profitability. Conditions in some of the Compressed Air products were competitive. Besides, during the year the Company undertook the manufacture of new products such as Transmission equipment for Railways, Centrifugal Refrigerating machines and large capacity Air Compressors. It had to incur considerable expenditure on these in the initial stages.

Current Year

As in the past few years, the Company brought forward this year also a larger order book than at any time in the previous years. Sales during the first five months have been well maintained as compared with those of the corresponding period of the last year. With continued vigilance as regards changes in the requirement of the markets, the Company has, over the last few years achieved a remarkable range of diversification and this process is continual. The broad base of its operations has enabled it to maintain its position in the market firmly. It is, therefore, possible, given reasonable stability, especially in Government policies, to look forward to further growth during the year.

Government Policies

As you know, the climate last year, due to a measure of political uncertainty was not particularly congenial for industrial growth. That and a dearer money policy coupled with the enforcement of a rigorous plan for restricting credit tended to upset the planning of industrial production. Government's policies in regard to licensing, to sanctioning of proposals for expansion of the existing projects and of proposals for new undertakings also were not helpful for planning.

I hope the institution of a strong Government at the Centre following the elections will help stabilise Government's policies in these respects. In fact a bold and pragmatic approach in dealing with matters aimed at increasing production in quantity and variety would seem to be called for, for, after all it is only that policy which encourages growth, encourages creation of employment opportunities and encourages activity aimed at attaining conditions of adequacy if not abundance, in any sphere that can lead to the welfare of the community. If creation of employment opportunities is of paramount importance, conditions conducive to operations in that direction should be not only not hampered but encouraged. The present Government has the power to do this. I hope they would soon establish correct priorities that would promote industrial growth.

Dividend

As a sequel to the last budget, the residue of profits after taxation would shrink to some extent from the current year. Notwithstanding such a prospect as also the need to conserve resources with a view to meeting the Company's own expanding requirements the Directors have recommended a dividend of 15 per cent per annum, which I hope you will appreciate.

Expansion and Finance

I told you this time last year that your Company's increasing operations have called for a larger financial outlay. The Company has finalised a Debenture issue of Rs 1 Crore by negotiated subscription by a few financial and investing institutions. Legal formalities with respect to it are already under way.

Research

As you know the Company was engaged in instituting facilities of its own for scientific research in the sphere of its activities. I am happy to report that the research outfit which may be expected to make a significant contribution to your Company's bid for improved and new products was completed and inaugurated during the last financial year.

Thanks

I am sure you will want me to convey to your Managing Director, Maj Gen H M Mohite, his officers, workers and staff, our sincere appreciation and thanks for the splendid work done by them. I would also extend our thanks to the Industrial Credit and Investment Corporation of India Ltd and our Bankers who have from time to time provided finance to meet your Company's capital and current requirements.

Note: This does not purport to be the proceedings of the Annual General Meeting.

STC IN 1970-71
INTERNAL CONTROLS AND BOUNDARY RELATIONSHIPS

STATEMENT BY PRAKASH TANDON, CHAIRMAN, AT THE 15TH ANNUAL GENERAL MEETING

On the day our year finished, 31st March, 1971, we announced in the press STC's *provisional* results for the year together with the performance budget for the following year; an account of a task done and a task in front. In retrospect, the final figures show the degree of accuracy of the provisional figures :

	1970-1971 PROVISIONAL	1970-1971 FINAL	1971-72 BUDGET
	Rs. Crores		
Total sales	215.00	217.90	270.80
Exports	70.00	70.60	90.00
Imports	140.00	141.90	175.00
Domestic	5.00	5.40	5.80
Total costs*	5.10	5.30	5.20
Profit before tax	5.94	6.40	6.80

*Excluding provisions and write offs

The publication of provisional figures with such speed and accuracy, of which our Corporation can feel justifiably proud, signifies, first, that it has been able to achieve the new style of management accountability it set out to do, whereby it manages by objectives, measures performance, and self-appraises. The objectives are set out in a performance budget for the year, reviewed however at mid-year, when a new revised budget is prepared, while the actual performance against the budget is reported in detail in daily, weekly, monthly and quarterly statements. For instance, while we prepare a detailed monthly review and profit and loss account, each quarter there is a formal Audited Report and Accounts presented to the Board. This simplifies and speeds up the task of preparing the annual accounts.

Second — and this I suggest with some caution and humility — such a system of knowledge gives management *some* control over its destiny, by substituting a willed progress through the year for what might otherwise be akin to drift. A management that knows in detail within the week that its purchases or sales are going wrong, or within the month that its profit and loss account is wide off the mark, is a management informed in time and able to do something before the deviation takes it too far off course. Planning, performance budgeting, appraisal and timely correctives therefore give our management an excellent action substitute for what might otherwise have to be termed just bad luck.

I do believe too that the risk of failure today is gradually shrinking as the horizon of managerial knowledge recedes; and this is where we are putting our greatest emphasis in the Corporation — in extending our managers' knowledge and making available aids to decision-making; and at the same time reorganising the decision-making levels and processes to ensure greater participation, sounder decisions, and more speed.

As a direct consequence of the introduction of our accountability system and the financial disciplines that it has imposed on our internal operations, we have reaped some tangible benefits in economies and savings in the working capital employed and costs contained. A happy feature indeed was that we ran a Rs. 217 crores business on a self-sustained cash basis, and in fact earned a net interest of Rs. 30 lakhs in the year. To the Shareholders, it has meant that we have raised our equity capital from Rs. 2 crores to Rs. 7 crores, and shortly to Rs. 8 crores, through successive bonus issues, and the dividend is paid every quarter, instead of once a year. These are achievements our shareholders can well feel satisfied with in a public enterprise.

A public undertaking lives in a duality. On the one hand it is heavily dependent upon the will of others — and they are indeed many; and varied are the controls they exercise, directly and indirectly, over both policy and administration — and yet, on the other, while it is constantly under the public gaze, it lives in a near vacuum of *true* accountability of the modern industrial type, that does not just question but also helps construct.

What is perhaps needed is a new three-layered definition of accountability — internal, external and public. Internal accountability would serve as an instrument of knowledge and control by management, who in their appraisal would have to be their own best judges and worst critics. Externally, it would also be the instrument of knowledge and control by those to whom the enterprise is responsible, who therefore themselves possess the skills and sophistication of accountability that they would expect from the enterprises. To industry and public at large it would be the means of communicating the enterprises' activities and results. A brief analysis of this is the theme of my speech today, because I feel that as a public enterprise we have the twin responsibility of defining our self-accountability and placing before all those to whom we are responsible our views on how we feel our accountability might be improved.

A handicap to management and shareholders alike of public enterprises is perhaps the absence of market evaluation mechanism that places a value on shares day by day. Such an evaluation — influenced though it might often times be by such extraneous considerations of short-term nature as political and economic conditions in the country — is nevertheless firmly related in the long run to the performance of a corporation and its success or otherwise in the return it obtains on the resources it employs. A continued adverse market judgement can ultimately choke off its access to fresh funds. Another handicap might lie in the structure of its shareholding, in that it is not spread.

An answer to both might lie, I submit, in some thought being given to creating a new style of shareholding in public undertakings, broader based and well spread, over employees and the public, in the shape of "popular capital". To prevent speculation, several measures can be adopted; small-sized and limited holdings, control on transferability, etc. The concept would be that of a unit trust; in fact there could be a unit trust holding a portfolio of shares in public undertakings. The benefits would be many.

Employee co-determination and joint management would then acquire a new and *real* meaning. A share in equity would give employees not only a personal involvement but also a responsibility for the affairs of the Corporation at present sometimes missing on account of a near total job security. To small public shareholders it would be a new form of investment, but an investment that would be truly public; to the State it would mean a new form of savings; to the Corporation a new source of funds; and to the management a new dimension to their accountability.

Since performance would be constantly evaluated in terms of earning capacity and share values, it would create in management a professional outlook and financial discipline. For a Corporation in gestation the urge to go early on stream and reach profitability; for one in the red to go into the black; control over working capital and costs; a watch over break-even points, self-financed growth, rising premiums placed on shares; conversely, falling share values, lack of demand for shares, and external funds drying up: these would all be in-built challenges or deterrents to management, thus under constant test.

However, whatever form accountability takes at the boundary, internally the management of an enterprise has to evolve its own accountability and simulate its own judgements, which will put it under tests of its own, and subject it to performance pressures it otherwise would not have. This is what we in STC are trying to do — to judge ourselves, to create our own pressures. Heaven knows there are pressures enough upon us, but they are not of the kind that test and stretch us; they are mostly of the critical kind where the judgement is often delivered with a charge.

May I now explain how we are reshaping — at least trying to reshape — the Corporation to a new style of accountability.

We have first tried to give the Corporation an "accountable structure". Beginning at the top, our Board has divided itself into two layers: the total Board, consisting of the executive and non-executive directors, and a Committee of Management, consisting of the executive directors. The Committee meets every week, and sometimes oftener for sanctions and a detailed review of operations and of the work of its sub-committees on finance, personnel, credit services, and of expenditure and other items that are under permanent surveillance, such as travel, overtime, entertainment, debtors, stocks. It gives the executive directors a sense of joint responsibility for the total affairs of the Corporation, instead of a one-upon-one equation between a director and the Chairman. In the culture that prevails, it is altogether easy for a chairman to become the fountain-head of all wisdom and decisions; and yet no matter how able or well informed he is, there is a limit to his capacity for decision-making. Besides the many complex operational decisions, he has his useful boundary function and the promotion of forward planning and policy. He therefore has to regard himself as a modern co-ordinating and prima inte pares kind of chairman rather than the old-fashioned family business and proprietary boss, or the nineteenth century colonial district commissioner.

The Board, in return for this strict accountability and joint determination of the affairs by the Committee, has given it deep trust and wide powers. It however receives detailed reports to enable a Board member to take interest in as much depth as he wishes to. Significantly, the new schedule of powers, that has recently been approved by the Board, is a brief and simple document, in which the Chairman while declared totally responsible for all affairs of the Corporation, yet exercises his powers only jointly with the Committee; alone, he has no powers, except in an emergency, but then so has any other executive director. Then there are the new committees of management being formed in the marketing divisions, under the chairmanship of their own division chiefs.

I have spoken so far about accountability; but there is another important aspect of how we view our basic task. Accountability is at best a quantification of the task budgeted and done; there remains the task itself, and how well we do it to the satisfaction of Government, who set the task, and of industry, for whom we perform it.

Our relationship is dual, stretching to Government on one side and to trade and industry on the other, with us in the middle, as an instrument of one and agent of the other. This is where our task is at its most sensitive and most difficult; and here is where we receive most criticism — partly, I admit, because of our own failings; partly, I sincerely believe, because of the inherent difficulties in the situation in which we are often placed; and partly, too, from an unreasonableness. Let me expatiate.

Government has decided upon a policy of exercising an increasing interest in international trade, especially imports. Importing for long past has been done by merchants and actual users. Both of them are unsympathetic with this policy and regard STC as an intruder — and an inexperienced and inept intruder at that; in their opinion. Let me quote the shape of the problem, as the Review Committee on STC saw it.

> "Unprepared, the Corporation has had to step into fields where traditional trade had long experience and was naturally critical of its early errors and teething troubles. The criticism was sometimes unsparing and often unhelpful, and for the slightest mistake the Corporation was subjected to a strong glare of scrutiny and criticism without any appreciation of the fact that after all, entering these areas was not of the Corporation's own choosing, nor the unpreparedness its own fault. Furthermore, under circumstances of a crisis in supplies perhaps the knowledgeable would have fared no better."

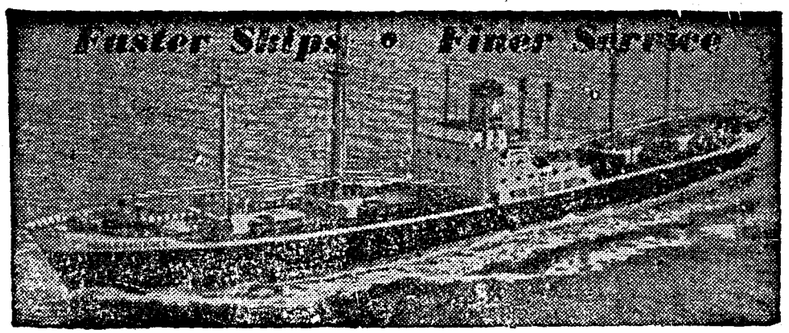
This is therefore where we are trying to put in our greatest effort. Whenever we are asked to move into a new canalised area, we realise that we have to play the role of a service agency to the industry concerned by importing raw materials of the quality they need, at the time they want it, and at the best possible price.

In the last two years, the accent on nationalisation of import trade has meant a spurt in the number of imported products handled by STC. For instance, our Chemicals Division alone has been asked to handle 28 new products since 1st April 1971; our Textile Division, six new products; and IRMAC, our new Industrial Raw Materials Assistance Centre is constantly scouting in new areas. We have evolved a drill, whereby we contact the experienced in industry, and particulary industrial associations, and meet them on a regular basis to find out their needs and how we could best fill them, though here we run into a problem.

We find that importers themselves often import haphazardly. Scarcity of foreign exchange and restrictions on imports have not been conducive to their planning their import needs; they imported as much as they could, when they could. When therefore an item is canalised, industry is inclined to inflate its demands, and if there is likelihood of a shortage developing, it tends to create sometimes a panic condition

to compel STC to import more than current needs. This has at least three disadvantages: it ties up valuable foreign exchange now; it builds unjustified inventories, and results in a carrying cost that at the present interest rates is at least 15% per annum; it may also adversely affect indigenous producers.

We can fully appreciate industry's miscalculations; but miscalculations in the past were of the individual and therefore limited in size. Once canalisation takes place and imports are made by one importer, STC, on behalf of many, they become magnified. The answer is for STC to learn fast and do its homework better by developing adequate market information and forecasting; but having done that it should be left to exercise its own commercial judgement. It would naturally help if industry too were to do its homework and ensure that the advice it gives to STC is fair and accurate, and expect it to import no more than it would have done in its own best commercial judgement. Industry should not regard STC as a surplus warehousing facility, but should commit itself for what it orders and share the consequence of under or over-ordering.



At the other end, in our relations with Government we regard ourselves as its instrument of national foreign trade policy and its cutting edge to ensure that implementation of the policy is done in the best commercial manner. We regard policy as government's prerogative; implementation ours. As an instrument of government, however, we do run into the interesting situation that where in the past, industry and firms made their own case with Government, once canalisation comes they regard STC as their "representative in New Delhi." It therefore lobbys, appeals, and pressures us to wrest the concessions that it used to try and do itself. This adds none too easy a dimension to our task.

I have tried to convey broadly how we view our task, both internally and at the boundary; where we feel our weaknesses lie—some inherent in the situation, others for us to repair; the delicate relationships at both ends; all this not as an apologia but as a perception of our task and problems. The Corporation and its management is placed today in perhaps the most sensitive area of the economy, and upon perceptions of the task will depend how well it performs in this delicate role.

To quote my Minister, the Corporation is doing a fine job. I would say that we are at least trying to, though also only too conscious of the long way we have to go. Of course an understanding by those, whose instrument and agent we are, does help. We do appreciate therefore all the support we receive from government and industry, and especially from our own Ministry; equally as I personally deeply appreciate the effort of our men and women who serve the Corporation in an exciting period of growth and development of a new national policy.

Bharat Heavy Electricals Limited

Speech of the Chairman, Shri O S Murthy

THE following is the Speech of Shri O S Murthy, Chairman, Bharat Heavy Electricals Limited, delivered at the Seventh Annual General Meeting of the Shareholders held on September 23, 1971, at New Delhi:

LADIES AND GENTLEMEN,

On behalf of the Board of Directors, I have pleasure in welcoming you to the 7th Annual General Meeting of your Company. The audited Accounts for the financial year ended March 31, 1971, and the balance sheet as on that date, together with statements containing statistical information on the important activities of the Company, are already with you and I will take them as read.

I am happy to report that during the year, your Company earned a profit for the first time. The net profit for the year was Rs 65 lakhs, after providing fully for depreciation, interest and contingencies. It is a big step forward in the onward march of this Company and although the net profit during the year is only modest, it signifies a new phase in the operations of the Company. An important factor contributing to this, was the good performance of the Tiruchirapalli Unit.

During the year, the value of production of your Company increased to Rs 48.26 crores from Rs 44.61 crores in the previous year. The production would have been higher but for strikes at Hyderabad and Hardwar Units. The workers at Hardwar Unit struck work on May 12, 1970, and although the general strike was called off on May 25, 1970, the Unit returned to normalcy only in August 1970, after the Agreement was signed by the Management with the recognised Union. Again at Hyderabad Unit, a section of employees went on strike on December 4, 1970. Subsequently, the Management was compelled to declare a lock-out in such of those factory blocks which were adversely affected. The lock-out was lifted in stages as the striking workers agreed to join duties. The strike was finally called off on January 12, 1971.

The measurable loss in production, as a result of these strikes, was about Rs 1.40 crores. The indirect loss was, however, greater as it takes time for employees to reach their normal production levels after resumption of duty.

PRODUCTION

Boilers and auxiliaries, manufactured at Tiruchirapalli Unit, accounted for over half of the total output of the Company during the year. With a gross output of Rs 26.52 crores, out of a total production of Rs 50.03 crores, including inter Unit transfers, the production at this Unit, during the year, was 25 per cent higher than in the previous year. The production of boiler components and auxiliaries increased to about 22,000 tonnes as against 18,800 tonnes in the previous year. More importantly, by off loading to other manufacturers, items of easy manufacture, the production of sophisticated part of the boiler, viz the pressure parts, was stepped up by 40 per cent over the tonnage in 1969-70. At the end of the year, the Unit was engaged in the manufacture of 20 boilers for Thermal Power Stations and 19 process boilers for industrial installations spread all over the country. The 60 MW boiler supplied to Delhi Thermal Power Station, the two boilers manufactured and supplied to Madras Fertilizers Ltd, and one industrial boiler manufactured for Fertilizer Corporation of India, Durgapur Unit, were commissioned during the year. The notable achievement of the year was the efficiency test carried out on the first 60 MW boiler supplied to Ennore Thermal Power Station last year. I am happy to report that, as against the guaranteed efficiency of 87.5 per cent, the efficiency attained was 92.3 per cent at the maximum continuous rating of 260 tonnes per hour.

Although the output at Hyderabad Unit in overall monetary terms declined from Rs 14.59 crores in the previous year to Rs 12.71 crores during the year, the "value added" — which is the true measure reflecting the efforts and the achievements in absorbing sophisticated know-how on the shop floor — increased from Rs 7.48 crores in 1969-70 to Rs 8.70 crores in 1970-71. During the year, the Unit completed two 60 MW sets, one each for the Harduaganj and Delhi Thermal Power Stations and one 110 MW set for Bhatinda Thermal Power Station. The set supplied to Harduaganj Thermal Power Station has since been commissioned and is operating satisfactorily. The Unit also successfully tested 110 MW set for Bhatinda Thermal Power Station. With this, your Company's factories have successfully tested sets for all the three ratings, viz 60 MW, 100 MW and 110 MW at their own works.

During the year, the Hyderabad Unit manufactured 194 nos circuit breakers — comprising 191 minimum oil circuit breakers and 3 air blast circuit breakers, valued at Rs 2.38 crores — as against 139 numbers, comprising 106 numbers of former and 33 numbers of latter, valued at Rs 1.68 crores during the previous year. The highlight of switchgear operations, was the significant reduction in cost of materials as a result of which the percentage of direct material to the value of production came down to 37 per cent as compared to 70 per cent in 1969-70.

At Hardwar Unit, the production increased from Rs 9.44 crores in 1969-70 to Rs 10.79 crores in 1970-71. In the last two years, the Unit's own contribution in the total value of production has nearly doubled. The work on the 100 MW set for Badarpur Thermal Power Station progressed as programmed. The work on the second 100 MW set for Obra Thermal Power Station was also completed, except for some minor assemblies.

By and large, the same deficiencies and obstacles, which hampered the production in the previous year, continued to prevail. Once again, the delays in the supply of alloy steel castings and forgings, both indigenous and imported, proved a major bottleneck in adhering to the production programme. The difficulties being experienced by the Company in the procurement of steel and critical castings and forgings is a matter of urgent concern and unless uninterrupted supplies of these items were ensured, production would continue to be adversely affected. This question is being pursued at the highest level and apart from various other interim measures, your Company has, as a long term solution, suggested to Government the

need for setting up the Central Foundry Forge Plant, to serve the special needs of Heavy Electrical Industry, at Hardwar.

Financing and Operating Results

Against a net loss of Rs 1.50 crores in the previous year, your Company earned a net profit of Rs 65 lakhs, after fully providing Rs 6.17 crores for interest on loan capital, Rs 4.74 crores for depreciation, Rs 1.35 crores for contingency reserve and Rs 1.52 crores expenditure on social overheads in excess of receipts. The manufacturing profit and the cash gain of your Company, during the year, amounted to Rs 11.88 crores and Rs 7.14 crores respectively. It is a matter of satisfaction that, although the Hardwar Unit which accounts for nearly 60 per cent of the total capital investment of your Company is expected to break-even only in 1975-76, your Company, as a whole, earned a profit during the year. This was possible because this multi-unit Company was conceived as a single financially integrated corporation manufacturing products for the needs of power generation, comprising Units having varying periods of gestation, so that it could steer clear of a heavy burden due to continuing losses at one or two of its Units over a long period.

You will recall that we were pursuing with the Government the need for reviewing the capital structure of your Company so as to bring it at least in conformity with the guidelines laid down by the Government for financing the capital investments in Public Sector Undertakings, which envisage that normally each project will be financed on the basis of one half of its capital being in equity and rest in the shape of loans. I am glad to report that, as a result of the efforts made in this regard, the authorised share capital of your Company has been increased from Rs 65 crores to Rs 80 crores. The additional equity capital is expected to be subscribed shortly by converting the loans of equivalent amount into equity. The reduction in financial burden during the development phase resulting from this improved debt equity ratio, which is likely to be of the order of Rs 1.05 crores per annum, will, however, accrue only from the current year.

Order Position

The total value of orders received by your Company, during the year, amounted to over Rs 180 crores. The new orders received include two 60 MW sets, one each for Harduaganj Thermal Power Station, UP and Faridabad Thermal Power Station, Haryana, seven 110 MW sets, two each for Gurunanak Thermal Power Station, Punjab and Panki Thermal Power Station, UP, one each for Ennore Thermal Power Station, Tamil Nadu, Barauni Thermal Power Station, Bihar and Harduaganj Thermal Power Station, two 30 MW hydro-sets for Umiam Hydro Electric Scheme, Assam and three 32 MW hydro-sets for Lower Jhelum Scheme in Jammu and Kashmir. Your Company has also received letters of intent for eight 200 MW turbo-sets and the associated boilers. The new collaboration Agreement with Messrs Combustion Engineering, USA, will provide the basis for the manufacture of 200 MW boilers.

The order book position of your Company is much better now than what it was one year ago. The improved position is the result of efforts made by your Company and the assistance given by the Ministries of Industrial Development, Irrigation and Power, Planning Commission and the State Electricity Boards. Your factories are gearing themselves up with enthusiasm to meet the diverse orders on time.

A satisfactory order book position, particularly in the initial years, when the skills are being developed and technology assimilated, is a prerequisite for a steady growth of heavy electrical industry. In the present context of difficult material position, this aspect has acquired added importance. It is, therefore, felt that there should not only be a perspective power development plan but also it should be translated simultaneously into definite orders for the manufacture of power equipment covering at least a period of 7 to 8 years. Otherwise, the "Power plan" will remain, as far as the manufacturing units are concerned, merely a paper plan. The recent power shortage in many parts of the country has highlighted the need for taking advance action for locating new schemes and it is gratifying that the Ministry of Irrigation and Power have prepared a power development programme for the "decade". In order to avoid periodic strains, arising out of erratic order position and consequential gaps in the utilisation of capacity developed at your plants, your Company has made a proposal to the Government, as a measure of advance action, to agree to placing an "imprest order" for the manufacture of a few turbo-sets in anticipation of their final allocation to definite projects. This proposal has been well received by the Government and it is expected that a suitable method of financing the "imprest order" will be evolved.

Diversification

During the year, the Company concluded collaboration agreements with Combustion Engineering Inc, the leading boiler manufacturers of the USA, for securing know-how for larger capacity boilers of 200 MW and higher ratings and a wider range of medium sized boilers for various industrial applications and special boiler house equipment, like Raymond Pulverisers. This collaboration will place the Tiruchirapalli Unit in a dominant position as a first rate boiler manufacturer to compete in the international market. The Unit is examining the question of setting up additional facilities for absorbing the Combustion Engineering technology and action on this will be taken up during 1971-72.

The Collaboration Agreement with Messrs Nuovo Pignone of Italy for know-how relating to Centrifugal Compressors extensively used in fertiliser and chemical industries, was also concluded during the year. These compressors will be manufactured at the Hyderabad Unit, which is taking the preparatory steps for procuring special equipment and setting up the requisite testing facilities. It is a welcome beginning that the Unit has already received letters of intent for 4 compressors for the fertiliser projects, being set up at Ramagundam and Talcher by the Fertilizer Corporation of India. A large number of inquiries for such compressors are under processing and it is expected that the order book for this new line of equipment will be quite satisfactory.

These diversification programmes will improve the economic viability of your Company.

Export

Considerable progress was made in the shipment of equipment for the first two boilers to Tuanku Ja'afar Power Station, Port Dickson, Malaysia. I am glad to inform, that during the year, Company has secured an order for 3 boilers of 120 MW each for the extension of the same power house in Malaysia. The total value of the order is Rs 9.3 crores approximately. The Hyderabad Unit received an order for one number 66 KV Breaker from Malawi, quoted as part of a composite offer by the Indian Consortium for Power Projects Private Limited.

Research and Development

With the increasing momentum of production at all your plants, the management is giving due attention to Research and Development effort. In an industry of this magnitude and nature, this an extremely important aspect if we are not to be left severely behind in the technological race. Your plants are making independent efforts and are also closely associated with the national organisations engaged in research and development, as for example, in the setting up of facilities for creep-tests in the National Metallurgical Laboratory, Jamshedpur.

Acknowledgement

I wish to thank the large circle of customers in the Public and Private Sectors who extended their patronage, our Collaborators at various Units, the Comptroller and Auditor General of India, various Ministries of the Central and State Governments, Planning Commission, Central Water and Power Commission, Messrs Khanna and Annadhanam and Messrs S Viswanathan, the Auditors of the Company for their valuable co-operation and assistance.

On my behalf, and on behalf of your Board of Directors, I acknowledge the contributions made by the employees of all categories and grades, who by their devotion and purposeful endeavour, have made it possible for the Company to earn profits. I have every hope that greater efforts would be forthcoming in the years to come in ample measure, so that the losses inevitable during the gestation period of the Company will be wiped off within the shortest possible time and surplus made available for nation-building activity in furthering the common good.

Finally, I will like to take this opportunity of thanking my colleagues on the Board of Directors for the consideration they have shown and for their unfailing help in the discharge of my functions as Chairman of this major Public Sector Undertaking.

O S Murthy
Chairman

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

Industrial Finance Corporation of India

Statement by the Chairman, Shri C D Khanna

THE following is the Statement by Shri C D Khanna, Chairman, Industrial Finance Corporation of India, at the Twenty-third Annual General Meeting of the Shareholders of the Corporation held on September 27, 1971, at New Delhi:

Friends,

I have great pleasure in presenting to you the Annual Accounts of the Corporation and the Report of the Board of Directors for the year ended the 30th June, 1971. The printed copies of the Accounts and the Report have been circulated to all the shareholders and I trust, I can take them as read.

Economic Situation

The overall economic situation in 1970-71, the second year of the Fourth Five Year Plan, continued to be satisfactory. The rate of growth in national income at constant prices, estimated at 5½ per cent, was equivalent to the growth rate achieved in 1969-70. The output of foodgrains in 1970-71, estimated at 107.8 million tonnes, was higher than the level of production in 1969-70 by 8.3 million tonnes. However, the production of commercial crops presented a mixed picture. Though the output of some commercial crops was higher than in the previous year, it was not sufficient for meeting the entire requirements of the industrial sector. Shortages were pronounced in respect of cotton and oil-seeds.

Industrial activity in the country has picked up noticeably after the recent recession. During 1970-71, marked improvement in the utilisation of existing capacity was witnessed in a number of industries, like electrical equipment, ball and roller bearings, electric cables, machine tools, aluminium, caustic soda, soda ash, synthetic fibres, paper, automobile tyres and tubes, etc. The cotton textile industry, however, continued to face difficulties, because of shortage and a steep rise in prices of cotton.

The revamping of lending policies of nationalised banks and financial institutions aimed at meeting the legitimate credit requirements of all the sectors of the economy, encouraging new entrepreneurship and bringing about balanced regional development are all significant factors, which are bound to have a healthy impact on economic growth in future years.

Working Results for the Year

The working of the Corporation during the year has resulted in a gross profit before tax of Rs 4.47 crores as against Rs 4.33 crores in 1969-70. After providing Rs 2.37 crores for taxation, the net profit was higher at Rs 2.10 crores as compared to Rs 1.96 crores in the previous year.

With the transfer of Rs 74.54 lakhs to the General Reserve Fund out of the profits for the year, the Fund became equal to the paid-up share capital of the Corporation as on the 30th June, 1971. As permissible under Section 32 of the IFC Act, the Corporation has declared a higher dividend of 5 per cent on its paid-up capital for the year ended the 30th June, 1971. I feel very happy to mention here that it is for the first time since the Corporation was set up in 1948 that it has been possible to declare dividend at the maximum rate provided under the IFC Act. I take this opportunity to thank the shareholders for the patience shown by them all these years.

Provision for Income-tax and Reserves

Out of the profits for the year, provision has been made for income-tax to the extent of Rs 2.37 crores. The total amount of income-tax already paid by the Corporation and that kept apart as provision for the years 1969-70 and 1970-71 for which assessments have yet to be completed, aggregates Rs 18.17 crores. It is a matter of no small satisfaction that as a public sector organisation, the Corporation is contributing its mite to the national exchequer.

During the year, additions made to reserves out of the profits were to the extent of Rs 1.69 crores. The total

reserves of the Corporation, including the General Reserve of Rs 8.35 crores, now amount to Rs 14.24 crores, which figure exceeds the paid-up capital by Rs 5.90 crores.

Operations during the Year

During the year 1970-71, the Corporation sanctioned total financial assistance of Rs 35.32 crores to 61 industrial units compared to assistance of Rs 19.38 crores for 49 industrial units approved during the previous year. Assistance disbursed aggregated Rs 17.35 crores, of which cash disbursements, i e excluding guarantees issued, totalled Rs 17.15 crores. Disbursements in foreign currency loans rose from Rs 1.69 crores in 1969-70 to Rs 3.10 crores in 1970-71.

The projects assisted covered a wide range of industries, including priority industries, like alloy steels, tractors, cement and aluminium. Other industries for which assistance was approved were sugar, synthetic fibres, iron and steel, electrical and other machinery, cotton textiles, metal products, chemicals and chemical products, coal, etc.

Eleven approved projects in 7 States, accounting for about 24 per cent of the total sanctions for the year, would be located in districts notified by the Central Government as industrially less-developed. The financial assistance extended to the co-operative sector during the year aggregated Rs 9.15 crores, i e, about 26 per cent of the total sanctions, in respect of 8 sugar co-operatives and 2 textile co-operatives. Two public sector undertakings were sanctioned loans for projects for the manufacture of telecommunication cables and electrical equipment.

Cumulative Sanctions and Disbursements

The net cumulative assistance sanctioned by the Corporation since its inception in July, 1948, amounted to Rs 365.67 crores. This comprised rupee loans of Rs 238.67 crores, foreign currency loans of Rs 43.58 crores, underwritings and direct subscriptions to shares and debentures of Rs 31.49 crores and guarantees to the extent of Rs 51.93 crores. Assistance actually disbursed upto the end of the year under review aggregated Rs 318.76 crores, constituting about 87 per cent of the total sanctions, this could be considered as quite satisfactory.

Of the total assistance sanctioned to 527 industrial projects, new projects numbering 351 claimed assistance of the order of Rs 233.28 crores and the balance of the assistance of Rs 132.39 crores was sanctioned for expansion, *modernisation* or diversification. In this connection, it has to be emphasised that in the case of a development bank like the Industrial Finance Corporation of India, the key-note of its financial assistance has to be seen in its far-reaching investment effect. It is a gratifying thought that the Corporation's assistance has helped mobilise financial resources of the order of about Rs 1,612 crores for the completion of the projects for which financial assistance was sanctioned.

Foreign Currency Loans

In October, 1970, the Corporation was allocated a further loan of DM 10 million, being the ninth line of credit, under an Inter-Governmental Agreement between the Governments of the Federal Republic of Germany and India, signed on the 19th November, 1970. With the allocation of this credit, the nine lines of West German credit to the Corporation aggregate DM 112.5 million. A notable feature of the DM lines of credit is that they can be utilised for the import of capital goods, engineering know-how and services, etc., not only from West Germany but also from other countries; except certain countries specifically excluded.

Under the UK/India Capital Investment Loan, 1969, the Government of India allocated to the Corporation in September, 1970, £ 1 million to enable it to finance the import of capital goods from the UK. A further allocation of UK Credit to the extent of £ 1 million has been made under the UK/India Capital Investment Loan, 1971. Though the UK lines of credit happen to be tied credits, these are welcome additions to the foreign exchange resources of the Corporation, which are of a limited nature in the absence of any line of credit from the World Bank or further loans from US AID or any other foreign lending agency except Kreditanstalt of West Germany.

As on the 30th June, 1971, the Corporation had sanctioned effective subloans aggregating DM 105.04 million, US $ 26.88 million, FF 12.97 million and £ sterling 0.12 million. While the two lines of credit from the US AID have already been fully utilised, the credits from the Kreditanstalt and BFCE (Paris) also stand almost fully committed. The Corporation is hoping that a further line of DM credit from Kreditanstalt would be made available to it out of the Consortium Aid to Government for 1971-72.

Assistance to Industrially Less-Developed Areas

As is well known, the Corporation has approved sizeable assistance for projects located in industrially less-developed parts of the country. Upto June 30, 1971, of the total assistance of Rs 365.67 crores sanctioned for 527 industrial projects, roughly about 33 per cent i e, Rs 121.80 crores, spread over 149 industrial units, was accounted for by Andhra Pradesh, Assam, Bihar, Madhya Pradesh, Meghalaya, Orissa, Rajasthan, Uttar Pradesh, Andaman and Nicobar Islands and Goa, which have been classified as less-developed States/areas.

The current thinking is that for bringing about a balanced regional development, special attention has to be directed to selected districts/areas. The Central Government have accordingly notified so far 204 districts in 19 States and 8 Union Territories, as eligible for concessional finance announced recently by the all-India financial institutions, *viz*, IFC, IDBI, and ICICI. Even before these districts and territories were notified as industrially backward, the Corporation in the course of its lending operations over the years, was giving special attention to applications for assistance to projects established in backward areas. It gives me particular satisfaction to mention that already in 61 districts and 3 Union Territories out of the notified districts and territories, 109 projects assisted by the IFC with financial assistance aggregating Rs 76.49 crores constituting 21 per cent of the total sanctions, have been or are proposed to be set up.

Financing of Industrial Co-operatives

Financing of industrial co-operatives has for several years now, been an important feature of the Corporation's operations. Upto the 30th June, 1971, financial assistance to the extent of Rs 77.31 crores had been sanctioned to 98 co-operatives and this constituted about 32 per cent of the total rupee loan assistance of Rs 238.67 crores. It is heartening to observe that in the implementation of projects in the co-operative sector assisted by the Corporation, financial resources of the order of about Rs 161 crores have been mobilised, the Corporation's contribution being about 48 per cent. In regard to sugar co-operatives, producer members contributed about Rs 34.41 crores as

share-capital. In addition, a sum of about Rs 20 crores has been collected by co-operative sugar factories which have gone into production by way of non-refundable deposits, as a result of deductions from the price of sugarcane payable to the growers. These figures are indicative of the extent to which financial assistance from the Corporation to sugar co-operatives has been instrumental in mobilising rural savings. In addition, sugar being a labour-intensive industry, sugar co-operatives have been responsible for creation of substantial rural employment.

Assistance to Public Sector Projects

In pursuance of the Central Government's policy announced last year that public financial institutions should also extend assistance to undertakings in the public sector, the Corporation has already sanctioned during the year assistance to the tune of Rs 1.80 crores to two public sector undertakings. The total financial assistance, so far, extended by the Corporation to five public sector concerns now amounts to Rs 6.42 crores. Most of the undertakings in the public sector are organised as private limited companies and are, therefore, not eligible for financial assistance from the Corporation under the IFC Act, as it stands at present. The Corporation has already moved the Central Government for amendment of the IFC Act so that public sector undertakings organised as private limited companies under the Companies Act may become eligible for financial assistance from the Corporation. One aspect of financing of public sector projects is that they would be considered for financial assistance on the same basis as industrial concerns in the private sector.

Conversion of Loans into Equity

In my statement last year, I had attempted to explain the rationale behind the right of development banks to convert, at their option, a part of the loans given by them into equity capital of the assisted concerns. The Central Government have recently issued detailed guidelines to the all-India financial institutions, *viz*, IDBI, ICICI, LIC, UTI and IFC in regard to the policies to be followed for conversion of loans into equity. Reference has already been made to these guidelines in the Annual Report of the Corporation. I would, however, like to take this opportunity of making a few observations on the subject to clarify the position. Conversion rights will not apply to past loans except where it becomes necessary to convert a part of them into share capital as a measure of relief to the assisted concern. Such a right will also not be exercised in case of sub-loans in foreign currencies granted against lines of credit with the Corporation from foreign institutions for sub-lending. The right of conversion will, however, apply to rupee assistance from the institutions to industrial concerns to enable the latter to purchase foreign exchange from foreign lines of credit operated by the Government of India or from any other source abroad. Furthermore, the terms of conversion of loans/debentures into equity capital such as, the quantum of loan to be converted, the issue price of the share, the stage/stages at which the conversion option might be exercised, the period during which the option would remain open, the period of notice, if any, to be given, etc. will be negotiated in each case and incorporated in the relative loan agreement. In the case of existing companies with reserves created out of past profits, in fixing the issue price of the share, consideration will be given to factors, such as the market value of the share, the break-up value of the share, dividend record, current and projected profitability, etc.

I am happy to mention that, despite hesitation in certain quarters, the philosophy governing conversion rights has already gained acceptance. During the year under review, the Corporation stipulated the condition relating to conversion of rupee loans into equity in respect of 21 concerns after negotiations with the promoters.

Bond Issue

As already announced in the press, the Corporation will be in the market with a cash-cum-conversion bond issue for Rs 8 crores from the 5th to the 8th October, 1971. I may mention, in this connection, that for financing its operations, the Corporation has not for the second year in succession borrowed any funds from the Government. I trust, that as on previous occasions, the shareholders of the Corporation as also other investors will give generous support to the bond issue and help make it a success.

Change in the Rate of Interest

During the year, there was a revision of the lending rates of the Corporation as also of the other all-India financial institutions. The effective rates of interest on rupee loans was raised from 8 per cent to 8½ per cent pa, with effect from the 5th December, 1970. The revised rate of interest, however, is not applicable to rupee loans on concessional terms to small and medium-sized projects as also co-operatives to be located in districts/territories notified by the Central Government as industrially less developed. The effective rate of interest on sub-loans in foreign currencies was also raised from 8½ per cent to 9 per cent pa, with effect from the 27th February, 1971.

Constitution of Regional Advisory Committees

With a view to rendering more effective service to its clients, as also to have first-hand knowledge of the industrial environment and for popularising the activities of the Corporation, steps have been taken recently to constitute Local Advisory Committees at the places where the Corporation has already established its offices. Their membership comprises, besides one or two directors of the Corporation, representatives of the financial institutions at the State level, important Chambers of Commerce and Industry, nationalised banks functioning in the area of jurisdiction of the Local Advisory Committee, the concerned State Governments, and a few prominent industrialists.

Additional Offices of the Corporation

In view of the increase in the number of projects financed by the Corporation and for exercising more effective supervision and follow-up of its existing and future investments as also for rendering technical assistance, particularly to new entrepreneurs, the Corporation is taking steps for opening additional offices. A sub-office at Gauhati functioning with effect from the 17th May, 1971. A branch at Ahmedabad was opened on the 18th August, 1971. Arrangements are under way for opening offices at other centres.

Some Reflections

The Corporation, as the first development bank in the country, has completed 23 years of its service to industry. During this period, which has been marked by rapid economic change and industrial progress, the Corporation has endeavoured to play its role in the field of industrial finance, in close collaboration with other financial institutions like the Industrial Development Bank of India, the Industrial Credit and Investment Corporation of India Ltd., the Life Insurance Corporation of India, the Unit Trust of India, State Financial

Corporations, State Industrial Development Corporations and commercial banks. Very often, it is asked whether it is necessary to have so many credit organisations in the field. This question, I submit, is not based on proper understanding of the situation. Each of the institutions mentioned has a definite role to play both at the national and state level. With the capital market in India not so highly developed as in some of the countries in the West and the savings habit through banking yet to grow to the extent required, the requirements of medium and long-term finance in the country are not only vast but continue to expand. In the financing of particularly large projects of high national priority requiring huge capital outlays, there has emerged the consortium approach between financial institutions at the all-India level, each contributing its share either by way of loans both in rupees and foreign currency or share capital. Thus the members of the consortium not only take care of the large financial requirements of a project but work in close co-operation with each other by mutual exchange of views and co-ordination of policies and procedures. Though joint financing of this kind is, on occasions, a time-consuming process, I am glad to say that it has come to be appreciated by entrepreneurs that it is, perhaps, neither desirable nor practicable for a single institution to meet the substantial requirements of a large project.

Each organisation has its special field of activity. There is no competition between the various agencies, but healthy rapport which should be welcome. Again, with the nationalisation of major Indian scheduled banks and with the intensification of activities of financial and developmental institutions at the State level, the area of co-operation, between the financial institutions is expanding, which augurs well for the economic development of the country.

Another matter of general interest to which I would like to refer, is the imperative need for not only setting up facilities for the training of personnel to man the institutions providing medium and long-term credits but also of having agencies for the development and training of entrepreneurial and managerial talent. With the gradual disappearance of family system of management of business, it is necessary to create in this country a class of professional managers with the requisite technical and financial expertise amongst the entrepreneurial strata. It is our experience that while a new class of entrepreneurs at the lower and middle levels of Society is beginning to emerge, it lacks the required training and experience to manage industrial undertakings. Unless such persons are trained in modern management techniques, the projects under their care are apt to come to grief with undesirable consequences for financial institutions and the public at large. I have been giving some thought to this problem and I hope that the Industrial Finance Corporation would be able before long to make a move in this direction and make its contribution towards the solution of this problem.

Changes in the Board of Directors

At the last Annual General Meeting held on the 30th September, 1970, Shri N V Nayudu was elected in a casual vacancy in place of Shri S D Srinivasan.

The Central Government nominated Shri B D Pande, Secretary to the Government of India, Department of Industrial Development, Ministry of Industrial Development, Internal Trade and Company Affairs, as a director in place of Shri T Swaminathan. Consequent upon his transfer from the Ministry of Industrial Development, Shri Pande tendered his resignation from the Board. In his place, the Central Government have nominated Shri B B Lal, Secretary to the Government of India, Ministry of Industrial Development. The Industrial Development Bank of India nominated Dr Samuel Paul and Dr V V Bhatt as directors respectively in place of Dr R N Bhargava and Shri S L N Simha.

On behalf of the Board, I take this opportunity of thanking Dr R N Bhargava, Shri S L N Simha, Shri T Swaminathan, and Shri B D Pande for the keen interest they took in the affairs of the Corporation. I would also like to thank Shri P S Rajagopal Naidu, Shri N Ramanand Rao and Shri N V Nayudu, who would be retiring from the Board from today, for the valuable services rendered by them to the Corporation. I would further like to place on record my thanks to all the present directors on the Board for their valuable co-operation and wise counsel.

Acknowledgements

I would be failing in my duty if I did not acknowledge with thanks the assistance extended to us by Kreditanstalt Fur Wiederaufbau of the Federal Republic of Germany, Overseas Development Administration of the UK Government, the United States of America Agency for International Development and Banque Francaise du Commerce Exterieur of France. Our relations with these foreign friends of ours have been very cordial and we look forward to having still closer ties with them.

I would also like to express, on behalf of the Board, our gratitude to the members of the Advisory Committees for their expert knowledge and experience placed at the disposal of the Corporation and to the non-official nominees on the Boards of Directors of assisted concerns, for looking after the interests of the Corporation.

I would also like to express, on behalf of the Board, our appreciation of the dedication with which the General Manager, other officers and staff of the Corporation have worked. The relations between the management and the members of the staff have remained cordial and I would like to thank the staff for their co-operation. I am particularly happy to mention here that the Directors have agreed to transfer Rs 1.00 lakh from the profits for the year to a Staff Welfare Fund which has been created for the first time.

Friends, I thank you for having spared time for attending the Annual General Meeting and hope that the Corporation shall continue to have your co-operation and goodwill in full measure in the years ahead.

Computers And Census Data

USE of computers to make the most of the information being gained through censuses in Asian countries has been recommended by participants in a training course held in Bangkok by ECAFE. Computer scientists from seven countries drew up a series of conclusions embodying these points:

"Without analysis, the value of census data is minimised."

In many countries of the ECAFE region, censuses have been taken, or are being taken, in 1970-71. Trainees felt, "there has been little provision for the analysis" of the data to be obtained, and there will be a serious time lag between collection and analysis unless the need is treated "as a matter of urgency".

The computer has proved to be a convenient and speedy tool for analysis, and the United Nations should encourage the use of computers in research work.

Moonshine on Software

IT is well known by now how, in the Government's decision-making on economic matters, one set of policies and objectives are often neutralised by another. Thus over the years, the objectives of promoting import substitution, of encouraging small-scale industry and of locating industry in backward areas have all come into conflict with and subverted basic investment priorities in industry. As a result, industries in which no investment should have been allowed have come up — on the ground that they substituted imports, or that they contributed to the development of a backward area, or simply that they were set up in the small-scale sector. More recently, with the accent on export promotion, an undertaking to achieve a minimum export performance has been used to get round other policies, whether on investment priorities, terms of foreign collaboration, or restrictions on large business houses. It may be readily conceded that different economic objectives may quite often come into conflict with one another and that the resolution of the conflict would entail sacrifice of one or the other set of objectives. What is a cause for concern, however, is that more often than not the conflict is resolved not on the basis of even very rough cost-benefit calculations but the momentary bargaining strength of different government departments. Thus it is seldom that the prospective export earnings from a low priority industry are weighed against the direct and indirect draft that it would make on scarce real resources. Of course, often even the original promise of exports does not ultimately materialise.

A recent instance of a minimum export commitment being used to get round established policies has been in the rather unlikely field of computers. According to a newspaper report, the Government has agreed to permit a Bombay firm to import a computer in the IBM 360 series on the basis of an undertaking by the firm that it would export software (the programmes by means of which human beings control the working and use of computers) worth twice the foreign exchange cost of the computer in a period of five years. This has come after a period of sustained propaganda about the vast possibilities of export of software from India. The claims have been based solely on the availability in the country of competent programmers at salaries much lower than, say, in the United States. But the cost of manpower is only one component of the cost of software. Software programmes have to be tried out on computers before they are ready for use and, in terms of the cost of computer-time needed for this, we have a cost disadvantage compared to the US or the UK where computer-time is understandably cheaper. That apart, one has only to visualise the potential Indian software exporter, working on a single IBM 360 installation in an environment where the use of computers has scarcely developed beyond routine payroll kind of applications, to get some idea of his competitive position vis-a-vis the US or the UK. Of course, one can go into details of different types of software and mark out the types in which the constraints on the Indian software maker would be relatively less stringent. What is sought to be stressed is that the glib talk of feasible software export from India needs to be far more critically examined than has been done hitherto.

That apart, let us take the commitment to export twice the foreign exchange value of the computer at its face. What is this commitment likely to amount to? The world's leading computer makers (IBM has something like 80 per cent of the world market) follow flexible pricing policies for their machines — depending, among other things, on the age of the machines. The IBM machine proposed to be imported under the software export scheme will be an already used, reconditioned computer. Further, since it has been a major objective of IBM's operations in India to secure Government's permission for import of machines in the 360 series into this country, IBM would not hesitate to offer a pricing arrangement which will appear, on the face of it, quite attractive if that will help it achieve its general objective. For instance, it may be prepared to accept in foreign exchange as little as 15 per cent of the price-tag that it decides to put on the machine (which, for a used machine, will be an arbitrary one anyway) and take the rest in rupees. Thus what the Indian firm in question may be undertaking to do is to export, over a period of five years, twice this arbitrarily scaled-down foreign exchange component of the cost of the computer. Thus the export commitment, on the machine ultimately costing the Indian firm, say, Rs 60 lakhs, may not be more than Rs 15 or 20 lakhs.

This might be acceptable, provided the agreed foreign exchange component of the price of the computer represents the final foreign exchange cost of the machine to the country. However, this is not the case. For one thing, a part of the rupee component of the price, payable to IBM World Trade Corporation, India, will be repatriated abroad. Second, there will be the inevitable

ervice contract for maintenance of the omputer and for supply of components nd spare parts the pricing of which an be suitably adjusted to make up or the relatively small foreign exchange ayment for the original machine. Simiarly, IBM exports keypunches, manuactured by it in this country; the exort prices of these can again be adusted to suit the pricing arrangements hosen for computers imported into his country.

It should be obvious from all this how meaningless any export commitment, linked to the nominal foreign exchange component of the price of the computer, could be — though even this nominal undertaking may not be fulfilled and the Government may be able to do precisely nothing about it. In either case, everything points to the use of the computer installation primarily as a service bureau for routine business data processing which, given the demand for this kind of service in a place like Bombay, would be a very paying proposition indeed. Clearly, there can be no safeguards against this type of 'misuse' of the computer.

None of this would have deserved much attention had it not been for the wider implications. Without these implications, it would have been just another case of business freewheeling in search of a quick buck which is such an accepted feature of our kind of economic system that we do not even call it freewheeling but entrepreneurship! As it happens, the decision to allow a private firm to import an IBM 360 computer subverts the accepted Government policy of setting up regional computer centres with large-scale systems to meet the computation needs of small users and also to meet the requirements for problems calling for large-scale systems. This policy is intended to get the maximum returns out of whatever investment the country is able to make in computers.

The optimum use of investment in computer installations in the country depends on several factors, such as the suitability of the system for a wide variety of applications, its ready accessibility to a wide range of users, and the kinds of auxiliary services provided by the organisation responsible for the installation (e g, programmer and user education, service programming, consultancy in problem formulation and analysis, etc). The policy of setting up regional computer centres based on large, versatile systems and managed as a service facility by an organisation capable of providing training and education to the community of potential users is based on the assumption that the above-mentioned objectives can be best achieved under such a pattern.

By contrast, with some exceptions, the existing pattern of investment in and use of computers is inimical to the achievement of these objectives. Except for a minority of installations, the others are restricted in what they can offer by way of services to a wide class of users. The high proportion of investment in a rather narrow group of commercial data processing systems and the concentration of these in agencies which limit access to them to outside users have resulted in a good deal of the investment in computers in the country being wasted from a national point of view. This waste was brought out by the Work Study Group on Office Automation appointed by the Maharashtra Government whose report became available last year. To quote from the Group's report: "... the feasibility studies which preceded the computer installations generally were overwhelmingly techno-commercial in nature rather than socio-economic in character..."; "... the *more usually* [emphasis in original] selected jobs for computerisation are payroll, financial accounting, production statistics and inventory control..."; "... in general commercial and industrial sector, the decision-oriented applications do not as yet play a prominent role". Stripped of jargon, this means that computers are being used largely for substituting manual work and the considerations behind their adoption are commercial. On the other hand, one of the areas in which the advent of large-scale computers has had a revolutionary influence is that of decision-making. Computer-based management information systems, operations research techniques applied to planning problems, simulation of socio-economic systems, and a wide variety of other complex physical and behavioural systems have altered in a significant manner decision-making processes in the technologically advanced countries. In India, however, there has been no significant application of computers in these areas.

The question then is: do we want, on the basis of specious export claims, to further strengthen a pattern of investment in computers which inevitably leads to their wasteful use in substituting manual work? Clearly, this is an area where the private costs of the individual computer-using firm are bound to be completely different from the social costs. The Government, in its policies, has to be concerned with the latter rather than the former. In any case, even if the most optimistic assessment of the potential for export of software from India is accepted, the capabilities, in terms of the size and range of computers as well as skilled programmers and analysts, which already exist and which can be created at a computer centre such as the one at the Tata Institute of Fundamental Research in Bombay, cannot be matched by a private service bureau type of installation.

There are elementary considerations which should have been obvious to a body such as the Department of Electronics of the Government of India. That in spite of this, it should have, as reported in the papers, agreed to license a private firm to import an IBM 360 computer at a time when the policy of developing regional computer centres is slowly taking shape is proof, if proof were needed, that the association of technical experts with bureaucratic decision-making is no safeguard at all against thoroughly perverse decisions being taken.

The President's Car

$ 27,500 Worth of Dignity

A Correspondent writes:

THANKS to *Current*, the Bombay weekly, a particularly distasteful instance of vulgarity on the part of the New Delhi Establishment has been brought to public notice. In its issue of October 9, the journal has published news of the arrival in Bombay port of a Mercedes-Benz 600, latest model, reportedly the world's most expensive luxury car, for the "personal and official use" of the President of the Republic, V V Giri. The list-price of this six-door giant of a car is said to be $ 27,500 (about Rs 210,000), though it must have cost the Government a great deal more after allowing for freight, handling charges, etc. The *Current* estimates that if the car had been imported by an ordinary citizen it would have cost him $ 81,000 (about Rs 610,000) at current rates of customs and other duties.

Even more reprehensible than the waste of public funds — and scarce foreign exchange at that — is the attitude of mind implicit in the whole business, that the dignity of the office of the President of India remains somehow impaired if he does not have the world's most expensive car. The *Current* report mentions Queen Elizabeth and President Yahya Khan as being among the heads of states who already have similar cars. In that sense, therefore, V V Giri can tell himself that he is now a *complete* President.

Some months ago the marriages of the son and daughter of a Congress member of the Maharashtra Assembly attracted much public attention for their ostentatious display of wealth. There was much indignation at what was considered, quite correctly, an exhibition of feudal pomp and show wholly out of tune with the temper of the times. The Prime Minister herself reportedly wrote to state chief ministers pointing out the impropriety of such vulgar displays by members of the Congress party. But the question is: Is not the decision to import the world's most expensive car for the "personal and official use" of the President on par with the Akluj MLA's extravaganza — except that, unlike in the latter case, the pampering of the President's sense of dignity has been achieved at the cost of the public exchequer?

The argument that President Giri was not personally responsible for the decision to import the car, which would not belong to him personally but would be part of the presidential estate for the use of successive presidents, does not convince. Since one does not know all the facts, one need not go so far as to suggest that the decision to import the car was taken at the instance of the President, but it is impossible that it could have been taken without the President's consent and, had he been moved by any sense of propriety, he could have refused his consent. This is what would have been expected from one who is so fond of referring to his trade union background and to his continuing concern for the 'common man'. Unfortunately, the President does not seem to have seen things in this light.

The only defence that the President can advance is that his conduct in this matter has been all of a piece with what the Establishment in New Delhi and in the state capital is doing day in and day out. It is well known how ministers on assuming office spend more on furnishing their bungalows than what the majority of Indians — those fortunate enough to find employment — earn in their whole working lives! A commentator writing in *Times of India* recently reflected on how Indian delegations going abroad instantly convert themselves into "purchase missions" to grab whatever foreign-made articles they can lay their hands on. No wonder one of the first uses that the Finance Ministry officials found for the country's improved foreign exchange balances was the import, through liberalised baggage rules, of television sets and electric shavers, among other things.

It may be readily conceded that in this grab-what-you-can-while-the-going-is-good milieu, the President's newly acquired six-door, $ 27,500, Mercedes-Benz 600, merits no particular attention — or criticism.

Common Market

Agriculture and the Dollar Float

THE international currency crisis has disturbed the tranquillity of agriculturists in the European Common Market (ECM) countries. Except the French franc the other ECM currencies are all floating. As a result, the price parities fixed earlier for agricultural commodities are subject to continuous disturbance. Fortunately, complications are reduced to some extent due to the Benelux countries' decision to operate a joint float against the dollar under which the Belgian and Dutch central banks intervene to prevent their currencies moving more than 1.5 per cent away from each other in either direction. Since the Italian lira has not moved much away from its old parity and with France deciding not to float its franc in respect of its commercial transactions, Italy and France are clubbed together as one zone under the changed agricultural policy of the ECM. West Germany and the Benelux countries with their floating currencies constitute the other two zones. With the upvaluation of the Mark, agricultural imports into West Germany have become cheaper and so German agriculturists would be adversely affected. Moreover, frequent variations in exchange rates might lead to instability in agricultural prices and distort normal channels of trade among the ECM countries. To avoid such a situation the Brussels Commission has worked out a complicated system of border taxes and corresponding rebates which are linked to an average level of exchange rates in the three zones against the dollar.

The system of border taxes and rebates is, however, far too complicated even for the Dutch farmers who are familiar with the intricacies of foreign trade. According to the Dutch, much of the present trouble is due to France refusing to float its currency in line with the others. But the French government holds firmly to the view that the interests of farmers are best protected through a regime of fixed foreign exchange rates which imparts stability to international trade in agricultural commodities. French farmers have started grumbling at the border taxes imposed against their agricultural exports and the rebates given on imports. They complain that it is unfair to subsidise exports of rich countries like West Germany and the Netherlands and impose taxes on imports from poorer countries like France and Italy. The French farmers who have benefited considerably from the ECM argue that free trade in agricultural products is an integral part of ECM arrangements; they also believe that a climate of stability is essential for agricultural trade and that if the recent floats are continued too long they might lead to trade distortions. Both the Dutch and the French are worried that if the present arrangement of border taxes and rebates continues for long and gets established, member countries, especially West Germany, would be tempted to pursue "go it alone" policies.

It appears that the border tax/rebate system might lead to fresh trouble among the partners of the ECM. Such a system is likely to affect the psychology of farmers by generating a state of continued uncertainty with changing border taxes or rebates. As the border taxes are fixed on the basis of weekly averages they tend to be unrealistic whenever exchange rates fluctuate sharply in either direction. Additional difficulties are created when spot rates differ widely from forward exchange rates. But whatever be the disadvantages of the border tax/rebate system the ECM partners are forced to rely on it until they agree to realign their currency parities. According to the rules established by the Community, common farm prices are fixed in units of account (expressed in terms of gold parity). If the exchange rate of one of the member countries, for instance, moves upward, prices of its farm products would be made cheaper by the extent of the upward movement of the exchange rate. This objective is now achieved by imposing a border tax on its imports or granting rebates on its exports so that its farm prices continue to be quoted at the old rates. Now that the IMF deliberations are over, fresh attempts are likely to be made by the French to open the issue of realignment of the ECM currencies at new parities. The problem has remained intractable due to the refusal of the United States and Japan to budge from their respective positions. It is unlikely that the ECM countries would decide to realign parities of their currencies before Japan and the United States settle their scores with each other. Or the ECM partners might wait until the IMF comes out with its own solution and then decide their course of action. They cannot afford to quarrel among themselves too loudly as that would put common market trade in agricultural products, which has increased more than five times from about $ 1 billion in 1958 to $ 5.5 billion in 1970, in jeopardy.

Accent on Promotion —also Action?

THE Annual Report of the Industrial Development Bank of India for 1970-71, released last week, is noteworthy for two reasons. First, the data contained in it show a very sharp rise in the level of the IDBI's operations. Second, there is a refreshing awareness of the promotional role of the IDBI running through the report.

Aggregate assistance sanctioned by the IDBI in 1970-71 amounted to Rs 131.1 crores or over double the figure for the previous year (Rs 65.2 crores). The sharpest increases took place in direct loans to industrial units (Rs 48.8 crores against Rs 13.7 crores), refinance of industrial loans (Rs 25.6 crores against Rs 14.3 crores) and refinance of export credits (Rs 13.7 crores against Rs 1.3 crores). Of course, in judging these figures it needs to be borne in mind that in 1969-70 there had been practically no increase in the level of the IDBI's activities. A substantial part of the assistance sanctioned in 1970-71, therefore, represents assistance to projects which have been in the pipeline for quite some time and which, for one reason or another, had not fructified in 1969-70. This is evident from the detailed list of the projects which received IDBI assistance in 1970-71.

Of total direct financial assistance to industry of Rs 48.8 crores sanctioned by the IDBI in 1970-71, Rs 27.4 crores went to four large projects and another Rs 10 crores to three others. Of the remaining Rs 11.4 crores, Rs 4.5 crores were accounted for by so-called 'supplementary' assistance to 15 projects to meet cost over-runs, erosion of liquidity, etc. Also, two of the projects in the list, for which assistance of Rs 4.8 crores had been sanctioned, are unlikely to materialise, at any rate not in their present form. While fresh sanctions went up so sharply, disbursement of loans to industry actually declined from Rs 10.9 crores in 1969-70 to Rs 4.9 crores in 1970-71. While partly this reflects the slack in fresh sanctions in 1969-70, it also points to long delays in the processing of projects after assistance has been sanctioned.

The other major component of the rise in the IDBI's direct assistance to industry is refinancing of industrial loans, which increased from Rs 14.3 crores to Rs 25.6 crores. The major beneficiaries of this facility have been the State Financial Corporations, to attract whom the IDBI has been steadily raising the proportion of loans (other than to small industries or units in backward districts) refinanced at the concessional rate of interest of 6 per cent. It has been suggested to the IDBI that it should give up its project-by-project system of refinancing in favour of a system of allotting lines of credit to each SFC and relying on overall performance assessments along with efforts to gear up the SFCs' organisation, procedures and technical competence. The IDBI's annual report does not say if anything has been done to improve the organisation of the SFCs, though it is mentioned that the procedure for refinancing loans up to Rs 2 lakhs has been liberalised so as to make such refinance "near-automatic".

Export finance is an area in which the IDBI has over the last few years developed substantial operations and also considerable technical expertise. However, presumably because of the drop in steel exports, direct loans to exporters remained static at around Rs 11 crores in 1970-71, of which Rs 4.9 crores was in respect of exports to rupee payment countries.

In the discussion in the annual report of the new initiatives taken by the IDBI, prominent mention is made of its efforts to formulate criteria for project selection. The two criteria mentioned are the internal rate of return and the domestic resource cost of earning/saving foreign exchange. In respect of the former it is stated that "a norm of the internal rate of return has been tentatively fixed in the light of the development objectives relating to the growth rate of industrial output" — though, curiously enough, it is not disclosed what this norm is. As for the other criterion, it is prescribed that the domestic resource cost of earning/saving foreign exchange "should not be higher than the prevailing Reserve Bank exchange rate". But would any of the 40 projects which received direct assistance from the IDBI in 1970-71 have passed muster under this criterion? No wonder then that the report proceeds immediately to add that a project rejected on the basis of these criteria could still be taken up "if it is likely to result into demonstrable external effects or extra-economic benefits that subserve the broad development objectives". Surely, almost every large project of the type that IDBI takes up for direct financing would have external effects and would also yield some extra-economic benefits. What then is the relevance of the two criteria in respect of them? Another point which needs to be stressed is that there is a dimension to project selection other than that implicit in either of the two criteria; this is that of deciding the priority to be attached to a project in terms of its social relevance. Or does the IDBI think that its purpose is merely to tote up impressive figures of financial assistance sanctioned without bothering about whether it might not in the process be contributing, directly or at one remove, to the already galloping proliferation of articles of U-Sector consumption?

The major focus of the discussion of the IDBI's promotional role in the annual report is on its efforts to develop industry in the backward states. In this context there is reference to the surveys of industrial possibilities of backward areas which have apparently been completed in all the backward states with the exception of Andhra Pradesh and Himachal Pradesh. One would have, however, liked to know a little more about the follow-up action taken; after all, some of the survey reports have now been available for over a year. The IDBI report also refers to the Technical Consultancy Service Centre (TCSC) which is proposed to be set up in each of the states. Without detracting from the useful work that these Centres might do, it needs to be emphasised that such outside advisory agencies can never make a decisive difference to the industrial development of the backward states; quite often they might end up by being just another hurdle that projects which would have come up in any case are forced to clear. Setting them up cannot, therefore, be a substitute for tackling the more difficult task of strengthening and activising the existing state-level agencies: the State Industrial Development Corporations and the State Industrial Investment Corporations, in addition to the State Financial Corporations.

Shipping

Assisted Growth

IT has been a success story all the way for Shipping Corporation during its first decade of activities; its fleet increased from 19 ships of 194,000 DWT in 1961 to 78 ships of 1,368,000 DWT in 1971. The composition and charter of its fleet were diversified to match the changed pattern of India's international trade. Cargo liner tonnage which constituted 82 per cent of the company's tonnage in early 1962 now accounts for only 44 per cent of the total tonnage. Cargo lifted by its liner vessels increased almost threefold from 870,000 tonnes in 1961-62 to 2,430,000 tonnes in 1970-71 and the number of liner services operated by the company also showed a rise to 21 from 8 in 1961-62. Operating earnings as a result jumped from Rs 7.89 crores in 1961-62 to Rs 64.84 crores in 1970-71 and net profits which were only about Rs 1 crore in 1961-62 increased to Rs 6.9 crores in 1970-71. Total capital employed by the company which was Rs 36 crores in 1961-62 increased to Rs 175 crores in 1970-71.

As is the general case in the shipping industry, a large portion of the Shipping Corporation's expansion programme was financed through internal resources. Self-generated funds amounted to about 37 per cent of the total financial outlay of Rs 175 crores as at the end of March 1971.

It must, however, be noted that the very impressive results of the Shipping Corporation have been made possible by several advantages enjoyed by the company. First, unlike other established companies like Scindias, the Shipping Corporation's entire fleet is almost new, so that no occasion has arisen for scrapping of old vessels. Second, almost 75 per cent of the tonnage acquired by India from East European countries during the sixties under government-to-government credits went to this public sector enterprise. Third, the Shipping Corporation has been the single largest recipient of SDFC funds from government and its dividend payment in the last decade has been pegged at a low level — something which the major private shipping companies have not been always in a position to do.

The accelerated growth witnessed by the Shipping Corporation since the mid-sixties is expected to be maintained in the seventies and on the basis of orders already placed (1,06,200 DWT) its fleet strength is estimated to exceed 2 million DWT by the end of 1974. If negotiations for additional orders currently on hand fructify, the tonnage is expected to cross the 3 million mark in 1975-76 (which would give the company a share of over 50 per cent of the country's tonnage as against its present share of about 43 per cent). It is also reported that the entire fleet of tankers to be acquired under the loan from the IBRD will be passed on to the Shipping Corporation.

However, the overall profitability of the company is bound to be under severe strain in the immediate future partly because of declining profits in liner operations, despite periodical hikes in freight rates, and partly because of the rather steep fall in tramp market rates. Spot charter rates which have been seriously affected by the cut-back in Japanese steel output are, however, reported to be rigged up by the Japanese and more normal conditions are expected to prevail after a short while. While external finance may not prove to be difficult for the company to obtain, the withdrawal of the development rebate is bound to retard cash generation, forcing the Shipping Corporation to increase its share capital (which remained unchanged during the sixties) by the mid-seventies.

Rural Electrification

REC Doing Well

IN its 18 months of operation, the Rural Electrification Corporation has done well in terms of the targets and objectives set for it. Envisaged under the Fourth Plan to be the financial institution for sanctioning project-based loans for rural electrification sponsored by the state electricity boards and rural electric co-operatives. With its capital base of Rs 150 crores of Plan funds and major drawing rights on PL-480 funds, the REC was to help energise 5 lakh pumps under the Plan. With the inspiration coming from the National Rural Electric Co-operative Association of the US (whose representatives have been helping its operations), it is geared to the self-help objective — which, in the Indian context, necessarily precludes borrowers and areas that are truly backward and needy, though this policy directive may be justified in terms of viability.

Within these limits, the Corporation has performed very competently. In the first year and a half of actual operations, it has sanctioned loans that will energise 2.15 lakh pumpsets — against the Plan target of 5 lakhs. Similarly, it has sanctioned loans for over 32,400 rural industries, including agro-industries. These various schemes are covered by 137 projects — 132 sponsored by state electricity boards and the rest by the five experimental rural electric co-operatives. Evidently, state electricity boards, saddled thus far with the unprofitable rural electrification programmes have been gladly turning to REC for financial and other help. The five electric co-operatives represent emulation of the US experience.

REC has done some excellent organisational work. It has not only built up a body of experts to assess data, evaluate projects, and suggest alternatives to the sponsors of projects that come up to it, but has also built up a 'Standardisation Cell' and a 'Co-operative Cell' with the longer term objectives of saving on equipment manufacture (10 per cent saving by standardisation) and on equipment laying and servicing in the rural areas (another 10 per cent saving), and of developing rural self-help centres through the co-operatives for further electrification and servicing. The financial performance of the Corporation for the year April to March 1970-71, partly reflects this competence. REC is one of the still small number of public sector corporations to have shown a surplus (Rs 53.03 lakhs). It had a net profit of Rs 26.13 lakhs of which, after assigning Rs 5.5 lakhs and Rs 10 lakhs to the Special and General Reserves respectively, Rs 9 lakhs are to be paid as dividend on equity capital.

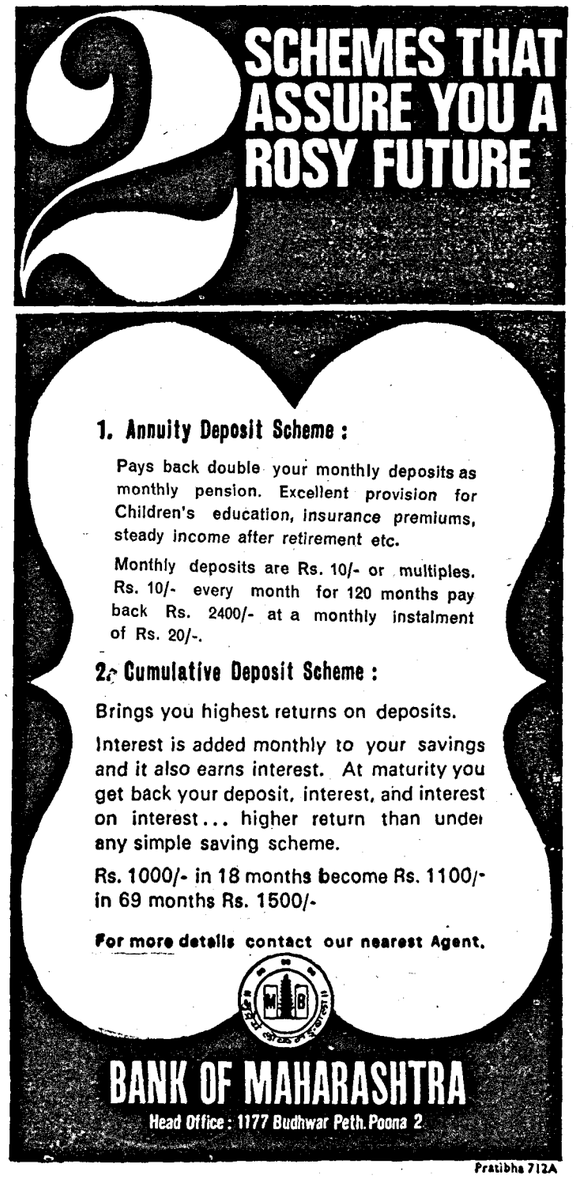
Partly, at least, REC's immediate viability has depended on the choice of projects and areas. Notwithstanding constant references to a significant proportion of projects being for backward areas and sections, these in fact happen to be areas and sections that fall under the special purview and grace of institutions such as the Small Farmers' Development Agencies and the Rural Works Programmes aimed at marginal farmers and agricultural labourers. REC has, in its chairman's words, made sure that its efforts "converge, in the relevant contexts and appropriate areas, with other and larger programmes initiated by central and state governments, electricity boards" etc. Often this means not just the technical but also the financial feedback of one public sector agency to another.

Industrial Production

Purposeless Survey

THE Reserve Bank began some time back gathering data on current trends in production and investment directly from industries. The results of the latest survey covering the period July-December 1970 are published in the *RBI Bulletin* of August 1971. They show the hazards of such surveys.

The Reserve Bank's sample is limited. It covers only growth industries and within these only 301 companies with paid-up capital of Rs 50 lakhs and over. Despite this, the response must be considered unsatisfactory. Only 154 companies (half the sample approached) covering 222 industrial units responded (100 companies with 136 industrial units had responded to the earlier survey of the Bank).



Of the 222 units, 156 reported increase in production and 56 decrease. Significantly, of the latter 56 units, 33 were in engineering industries. Capacity was not a major constraint on higher production. Only 42 reported capacity as not being sufficient to deal with orders on hand, while 169 had adequate capacity.

As regards sales, 159 units reported increase in sales and 47 decline. Of the 47, 24 were in the engineering sector and 11 in the chemical sector. Exports reflected a similar trend; of 122 units, 73 reported increase and 48 (31 in engineering) decline.

Expansion data show the clear slack in investment in these "growth" industries. During July-December 1970, 40 units reported expansion and 182 reported none. As regards proposed expansion during the next 6 months, 71 proposed to expand, while 151 had no expansion programmes.

Yet industry remains optimistic; 139 units expected to increase production during the following six months (January-June 1971). Actually, production data for this period show that growth of production almost came to a standstill during January-June 1971. This is not surprising. Of the common units between an earlier survey and the current one, only 8 had forecast lower production in July-December 1970 whereas 34 units, as it turned out, actually had lower production during the period.

There are two main advantages of this survey method: it gives a more accurate reflection of expected trends and the results are available ahead of statistical data. It is obvious that in India businessmen are not used to intelligent guesses about — let alone scientific analysis of — production trends in their own units, much less in their industries. The results of the Reserve Bank's survey have been published in October 1971, 9 months after the close of the period to which it relates, by which time even more detailed statistical data have become available right upto June 1971. What purpose does the survey then serve?

IIFT

Too Thinly Spread

THE Indian Institute of Foreign Trade (IIFT) has made fairly satisfactory progress during its seven years. From its activities it appears that the IIFT is well set to achieve the objectives before it. At present, its major programmes and activities relate to creating export management personnel, research into problems and functional areas of foreign trade, making overseas market surveys, commodity studies, area surveys, country surveys and export potential surveys of states. The Institute appears to have made some progress towards self-reliance; nearly two-thirds of its expenditure was met by its income earned through conducting training programmes and export market surveys. Out of its total expenditure of Rs 31.4 lakhs, Rs 12.3 lakhs were financed by government grants.

During the last seven years, the Institute has organised 58 training programmes, ranging in duration from one week to 10 months, and trained 1,900 executives belonging to trade and industry as well as central and state governments. On the research side, the Institute undertakes research both in general fields relating to problems of foreign trade and also in specific areas like overseas market surveys, commodity studies, country surveys and export potential surveys. During the last year a project report on export potential of coir and coir-based products was completed. The Institute is exploring possibilities of securing assignments to conduct market surveys for commodities like shrimps in the US and woollen products in Europe. An important project for exploring export potential in different states is in progress, and studies on Andhra Pradesh, Mysore, Tamil Nadu, Maharashtra, Orissa, Bihar and Haryana have been completed. The Institute's country studies are essentially desk-based and they are designed primarily to examine export prospects in selected markets, to suggest suitable export strategy for selected African and Latin American countries.

However, in view of the limitations of time and resources, IIFT may be spreading its net too wide and as a result the quality of its studies may well suffer. It is difficult to understand, for instance, why the Institute should venture into general research at the present stage of its development. The country's needs of personnel trained in export management are immense and it would be well worth the Institute's while to concentrate on improving the quality of its various short and long duration courses and exploring whether new courses need to be devised. It would also be fruitful to open 'chapters' of the Institutes at important trading centres such as Bombay and Calcutta for courses at more frequent intervals. Some of the projects of general research — like improvement in administrative and procedural matters of the Foreign Trade Ministry, export prospects under GSP, or survey of the traffic potential of Dahej port — might be better assigned to some other agency more suited to undertaking them. The two major fields, of providing training to personnel in the exports field and of market research and consultation, are so vast that they should absorb all of the IIFT's energies.

LETTER TO EDITOR

Bangla Desh and India

YOUR Special Correspondent ("Bangla Desh and India", September 4, p 1907) and I share the same views as far as the role of the Indian Press and its correspondents in the Bangla Desh crisis is concerned — a role both inept and unprofessional. However, an analysis of such a scandalous performance had better be left to the self-appointed guardians of the morality of the Fourth Estate who will no doubt come out with suitably convincing explanations of how and why

(a) Correspondents sitting in Calcutta and Agartala datelined their despatches "Somewhere in Bangla Desh" and
(b) the Mukti Bahini's future battle-plans were disclosed in the Indian papers to pander to the readers' day-dreams and to titillate the egos of the editors.

The point under discussion here is Bangla Desh and the appropriate response to the last few months' developments. It is at this stage that I have to unfortunately part company with your Correspondent when he makes his seemingly confident forays into political sociology without waiting to find out whether his supply lines are extended.

Your Correspondent asserts that "in bourgeois states, classes exist and the Governments of such states represent the overall interests of the upper, ruling classes". Contrary to what many people think, this is not even an exclusively Marxian position. Other sociologists, including Pareto, Mosca and Michels, have studied the phenomenon of the ruling class and the governing elite (Vilfredo Pareto: "Mind and Society"; Gaetano Mosca: "The Ruling Class": Roberto Michels: "Political Parties".)

However, when any theoretical framework is sought to be applied to current problems, it is essential that there be an empirical element in the analysis. Your Correspondent's entire effort rests on the central thesis that the nature of the Indian ruling class and its "extreme dependence" on its international creditors "substantially circumscribes its freedom of action". Yet nowhere in the article does one find the remotest attempt at actually identifying the Indian ruling class. Since your Correspondent accuses me of taking cover behind the notion of a blanket "national interest", it is surprising that his "ruling class" should remain such a faceless, amorphous spectre. Others, including Ashok Mitra and B V Krishna Moorthy have, however, attempted to do what your Correspondent fights shy of (see J Bhattacharjee: "Mass Participation in Politics", Annual Number, January 1968).

However, this is only an incidental criticism of your Correspondent's approach. The main objection to his analysis is his inadequate appreciation of Marxian political sociology on whch he bases his whole attack. What I am referring to is of course the distinction between antagonistic contradictions and non-antagonistic contradictions. At present the primary antagonistic contradiction is between the urge for physical survival of the 75 million people of Bangla Desh and the determination of a ruthless Pakistani military clique to subdue them at all costs. All other contradictions, like class differences within Bangla Desh, are non-antagonistic and secondary to this main issue. It is at this stage that

one can legitimately use the concept of "national interests". As far as India is concerned, the spill-over effects of the Bangla Desh crisis, namely, the presence of 10 million people and the staggering economic costs to the *whole* Indian nation, ensure that the antagonistic contradictions at this stage are between West Pakistani colonialism and the *entire* Indian people. Given the existing resource-scarcity within the country, it is futile to pretend that an additional burden of Rs 500 crores per year will not adversely affect the landless peasant of Midnapore, to use your Correspondent's example. One can go even further and speculate what would happen if the Bangla Desh refugees were to enter the job market, a possibility which cannot be ruled out if the Bangla Desh movement is allowed to be throttled by Pakistan and there is no possibility of the return of the refugees. Which section of the population would then be affected? Surely, not the jute magnates of Calcutta.

I am afraid that your Correspondent will have to admit that in this case there is a clearly definable national interest involved, overriding class differences which undoubtedly assume importance in different spheres. My intention was not one of "masking and obfuscating the underlying reality of the class-struggle" but of placing the Bangla Desh issue and the desirable Indian response in their proper context, which is that of a national liberation struggle of the people of Bangla Desh also involving the people of India. There have been instances in history where foreigners have helped to liberate a country resisting alien invaders. These foreigners then left the people of the newly liberated country to sort out their own affairs — a course of action which I have advocated. The best example is that of France in 1944 when the Allies, with the help of the Maquis, the French underground, and the Free French forces of De Gaulle, pushed the Nazis out of France and then left the French to sort out their own political problems (Robert Aron: *"Historie de la Liberation de la France"*).

Your Correspondent also makes a number of asides which need not be taken up at length. One case where he completely misfires is when he accuses me of advocating a friendly Bangla Desh which would be a "happy hunting ground for Indian capitalists". If economic complementarity and comparative costs make the entry of Indian goods, specially those from West Bengal, into Bangla Desh easy, this surely does not make Bangla Desh a captive market, which is what it was for West Pakistan.

Finally, your Correspondent's habit of labelling! Is his revolutionary conscience all that clear that he can afford to point accusing fingers at others? The first duty of a revolutionary is to make revolution; or is this part of Marx unfamiliar to your Correspondent? It is getting a trifle boring to hear Indian *"revolutionaries"* sitting on their high horses and preaching to all and sundry. As Lenin once remarked to some pretty passive revolutionaries, *"On s'engage puis on voit"*.

J BHATTACHARJEE

Bombay

Our Special Correspondent writes:

THERE are two separate issues involved here. One, what the Indian Government *can* do in the Bangla Desh crisis and, the other, what the Indian Government *should* do. J Bhattacharjee's *original piece* was addressed to the latter proposition, while my comment was devoted to the former. I merely pointed out that considering the international constraints, the latest being the Indo-Soviet Treaty which had not been announced when I wrote the piece, *under* which the Indian Government operates it was not in a position to follow Bhattacharjee's advice.

As for the Indian ruling classes, I did not go into details for the simple reason that my article was about Bangla Desh not the Indian ruling class. But for Bhattacharjee's benefit, I shall append the following elementary facts: The Indian ruling class consists of the semi-feudal landlords and their allies, the rich peasants in the rural areas, the capitalists and bureaucrats of all varieties in the urban areas and the retainers (including politicians), hangers-on, families, etc, of these groups. The composition and distribution of these elements among the population varies from region to region. Their precise enumeration is only a question of measurement; it does not affect the qualitative picture. It is surprising that Bhattacharjee describes this as a "faceless, amorphous spectre". One would have thought, on the contrary, that the visibility of this class is such as to make its presence felt to even casual observers of the Indian scene. I reiterate that the Indian Government represents the overall interest of the groups described above which constitute the Indian ruling class.

Coming to Marxian political sociology, the question of antagonistic and non-antagonistic contradictions refers to conflicts between classes, not to conflicts between nation-states. Bhattacharjee is, of course, free to extend this notion as he likes but he should then acknowledge the originality of his contribution. (Incidentally, this particular classification of contradictions is due not to Marx but to Mao Tse-tung.) It is quite correct to say that the principal antagonistic contradiction at this stage of the Bangla Desh crisis is between the entire people of Bangla Desh, except for a handful of quislings, and the military rulers of Pakistan. Class differences in Bangla Desh are secondary and the liberation struggle there is "a war of national liberation" — for the people of Bangla Desh. To go on to say, however, that because of the spill-over of refugees, "the antagonistic contradictions at this stage are between West Pakistani colonialism and the entire Indian people" is too much of an oversimplification. The initial acceptance of refugees was clearly a diplomatic manoeuvre of our Government to embarrass the Pakistan regime in the eyes of world opinion. What if our Government had refused to accept the refugees? Then this contradiction would cease to exist. The backfiring of particular diplomatic moves should not be elevated to the level of genuine contradictions.

Finally, to come to what the attitude of revolutionaries (passive or otherwise) should be. "The first duty of a revolutionary is to make the revolution." (Hardly to go around offering advice to bourgeois governments on how to conduct their foreign policy, one might add.) Will Indian military intervention in Bangla Desh help to make the Indian revolution? To pose the question is enough. Moreover, the beneficial effects of Indian intervention in Bangla Desh itself is a matter of opinion. The example of France proves nothing. One can counterpose to it the examples of Philippines and Greece where the Allied "liberation forces" did not exactly leave the people "to sort out their own political problems".

Although he deigns to quote from Lenin (and in French, at that), one does not get the impression that Bhattacharjee is too engagé himself; merely enragé.

Relevant Radicalism

Romesh Thapar

THESE days, with all and sundry claiming to "have the ear of Indira Gandhi" — or her big toe! — a great deal of confusion is sought to be created on most matters, some vital and some trivial. However, the realisation that the Indo-Soviet treaty is not what the CPI is trying to make it out to be has now dawned. The Moscow parleys and the so-called "joint statement" have helped to shed light on Soviet commitments and underlined the urgent need for independent assessments by India.

Of course, this is easier said than done. To make such assessments and to act on them sparks the search for a *functioning* Foreign Office and *functioning* economic ministries. The GOI cannot hope to survive in a power entrusted world with the kind of naive attitudes which pervade these critical areas of its policy-making. The experts are few and far between. And when they do exist in strength, their expertise is weighed down by bureaucratic consideration.

In the Capital, the thought is often expressed that the men who hold the future of the nation literally in the palms of their hands are very ordinary creatures without even the "chemicals" required for a thrust into the future. This is equally true of other nations at this sad moment of international bankruptcy in human imagination, concept and perspective. But others of comparable status to India are building expertise behind the ordinary men who rule. Here, in the Capital of 550 million, the quest has yet to be launched with vigour.

We seem to be content with legalistic "noughts-and-crosses" (a game which must have originated in Bharat!) designed to puncture the possibility of any movement in any direction or with high-sounding theory which elevates certain principles which it is not anyone's intention to follow. These exercises were harmless until they entered the area of economic policy. A major research project awaiting attention is our special ability to clothe all manner of contrary ideas in the most radical phrases and offer them as policy.

May be, this game could have gone on for a long time had it not been for the sudden crisis around Bangla Desh. In a flash, we stand exposed to all manner of dangers. We are at last compelled to think of action, action which will ride roughshod over fancy theories, ideological cliches and revivalist euphoria. Clutching the *Gita*, playing legalistic noughts-and-crosses, composing mantrams of various description, we will have to act.

The stir in economic thinking has begun. Easy formulas have become suspect. Greater attention is being paid to the specific characteristics of the Indian class structure and its relationship to a range of developmental challenges. The problems of the transition to a socialist society rooted in Indian reality are sought to be singled out for discussion and study. This kind of economic inquiry might help us to build a relevant radicalism for this country. It is good to see the discussion spilling over on to the pages of rather orthodox leftist journals.

At last, dull economics is becoming an obsession. And about time. If a relevant radicalism emerges, it must have its impact on the key ministries. The GOI can no longer afford to drift. There are five months to the elections to the State assemblies. By then, it should become clear what is being planned for India's 550 millions.

As for those who want to keep the ruling Congress party paralysed on slogans which cannot be implemented politically, the sooner they are neutralised, or axed the better.

October 4

"The British, for instance, weren't forthcoming even with a Master's degree—"

Aggressive Rayon

Hansavivek

GWALIOR RAYON has applied for an industrial licence for setting up a paper plant in Mysore state with a capacity of 150 tonnes a day. It is also seeking a licence for establishing another caustic soda project with an installed capacity of 33,000 tonnes per annum in that state. A major portion of the production would be diverted to the company's own rayon grade pulp and staple fibre plants in Kerala and Mysore. Government has been requested that decision on the company's application for an industrial licence which was made three years ago should be expedited. The application was for production of 36,5000 tonnes of staple fibre per annum at Harihar, in Mysore state, where its pulp plant is under construction. The engineering division is looking into the possibility of manufacturing some more sophisticated industrial equipment, at present imported by the man-made fibre industry, by entering into collaboration with foreign firms, if necessary. The company is also awaiting the 'carry-on-business' licence for the rayon grade pulp project, for which it had applied in March 1970. Meanwhile, the caustic soda factory under construction is expected to be ready for production by September 1972. The rayon grade pulp project at Harihar is expected to be ready for trial runs by the end of 1971 or beginning of 1972. During its 24th year ended March last, production of staple fibre amounted to only 58,456 tonnes owing to serious labour trouble at Nagda, arising from "rivalries among the various labour unions". Rayon grade pulp output was better at 64,120 tonnes (60,940 tonnes) because of the use of various species of available woods in view of the shortage of bamboo and eucalyptus. By an Ordinance issued in May last, the Kerala government nationalised all private forests in the state. The private forest owners and the company moved the Supreme/High Court and, in pursuance of the stay order, granted by the court, the removal of woods from forests, which met about 60 per cent of the raw material requirements of the company's plant, came to a standstill. Representations have been made to the state and central governments to ensure supply of required quantities of raw material. The 30,000 acres of land at Nilambur, purchased by the company for eucalyptus plantations under an agreement with the state government in 1965, whereby it was guaranteed that the land would not be nationalised for 60 years, have also been brought within the purview of the Ordinance. The company moved the High Court in the matter. The state government has since decided not to give effect to the Ordinance, but has introduced the Kerala Private Forest (Vesting and Assignment) Bill 1971. The company has in hand a modernisation scheme of its weaving, processing and finishing departments with fully automatic, specialised and versatile machines, to maintain its leadership in the man-made textile field. New machinery incorporating the latest techniques has been installed, and more is in the process of acquisition. The engineering division continues to meet the needs of the staple fibre, viscose rayon, other synthetic fibres, and pulp and paper industries for various equipment. Fibreglass reinforced plastic for anti-corrosive lining and other industrial uses have been further perfected to meet the specific requirements of various chemical industries. Researches have been carried out for developing a new and more useful process for the manufacture of dicalcium phosphate and other alternative uses of chlorine and hydrogen which are by-products of caustic soda. The company has contributed Rs 20 lakhs to Birla Institute of Technology and Science, Pilani, Rs 8 lakhs to the Research Centre of Bombay Hospital Trust, and Rs 2.21 lakhs to Birla Research Institute for Applied Sciences, Nagda.

INDIAN IRON AND STEEL COMPANY's Burnpur works suffered further deterioration in production during the year ended March 1971 owing to go-slow tactics and other restrictive practices adopted by labour despite new concessions given under the wage settlement for the industry which were to cost the company more than Rs 5 crores per annum. Production of pig iron declined from 1,100,174 to 930,337 tonnes, coke from 1,203,180 to 1,162,608 tonnes, steel ingots from 699,768 to 626,965 tonnes and saleable steel from 567,784 to 508,475 tonnes. Similarly, despatches of pig iron, coke and steel showed all-round fall. Both production and despatches at the Kulti works increased — the former from 120,702 to 140,713 tonnes and the latter from 121,247 to 142,575 tonnes. Despite a revival of demand and a full order book, continuous labour trouble prevents further rise in output. Also, frequent labour trouble, particularly at the East Mine at Chasnalla, caused by temporary labour engaged on construction work, created a difficult situation at the mines and the East Mine was completely flooded because there was a total strike, paralysing operations for several weeks from the end of March last. The coal washery at Chasnalla handled about 3.3 lakh tonnes of raw coal. The main ropeway from Chasnalla to Burnpur transported 2.86 lakh tonnes of washed coal. Occasional sabotage of the ropeway in certain sections is still continuing. In spite of these difficulties, supply of coal by the ropeway helped to maintain a reasonable stock of coking coal at Burnpur even when all other steel plants in the country had difficulty obtaining supplies of coking coal owing to acute wagon shortage. The loan obtained by the company from the World Bank in connection with the phase one balancing of plant project, which was suspended pending reappraisal, has since been cancelled. In regard to the shares held in trust under a Trust Deed dated December 18, 1957, as modified by a supplementary deed dated June 25, 1963, the directors say that the suit filed by certain shareholders in 1969 was dismissed on December last. But a fresh suit has been filed by another shareholder substantially for the same reliefs; the suit is still pending. With increase in turnover, the company earned a higher profit. The directors complain that, while prices of most inputs continue to rise, the industry has had a price freeze imposed on it. Representations are therefore being made to Government.

tonnes in the preceding 18 months. Production might have been higher still, but for a 'go-slow' by some operators which affected output for a few months. It is stated that, in spite of an award on wages given by the Industrial Tribunal in August 1969, further demands for revision of wages and scales were put forward. With the intervention of the labour authorities, some of the demands were referred to arbitration and some to adjudication. With an improvement in labour discipline, production has increased since March last. Higher production contributed to good results and so did the higher selling prices of certain varieties of paper. Royalty rates on Bhabar grass were increased by about 20 per cent in 1970 — for three years as from July 1968 — and were further stepped up by about 27 per cent for three years from last July. Since a major portion of the earnings have been utilised for depreciation and development rebate, no dividends have been recommended. The interim payment on all classes of preference shares for 6 months ended March 1970, already declared, will be paid out of the profits. Arrears of cumulative dividends on preference shares exceeded Rs 14 lakhs. Moreover, development rebate reserve, to be created out of future profits, was about Rs 10 lakhs. Equity shareholders have had to go without any return for the fourth year in succession. With a view to creating capital redemption reserve of Rs 30 lakhs for the 6.5 per cent second preference shares, which were to be redeemed last month, a sum of over Rs 19 lakhs was withdrawn from general reserve.

KHATAU MAKANJI has received further 169 automatic looms, making a total of 281 automatic looms, 12 super-spinners ring frames, etc, for replacement, rehabilitation and modernisation of plant and equipment. Orders worth Rs 1.80 crores have been placed for the modernisation programme. But the directors complain that efforts for economy and efficiency are being neutralised to a great extent by continuous cost escalation arising out of government levies, increased costs of services and materials. During the year ended March 1971, net sales were Rs 80 lakhs higher, but gross profit turned out to be Rs 5 lakhs lower. Even considering that Rs 5 lakhs provided in the accounts for gratuity has lowered the profit, the contraction of margins is conspicuous. This is attributed to shortage of cotton which lifted prices to an 'all-time high'. Further, there was delay on the part of government in arranging additional imports of cotton and in taking decision as to the manner in which additional imports should be distributed. In order to discourage mills from carrying cotton, the rate of interest was enhanced and the margin limit raised. These measures not only made the cost of the raw material 'prohibitive', but also resulted in a credit squeeze at a time when prices were so high. Excise duty in this year's budget was increased from 84.4 paise to 93.9 paise per square metre on printed mercerised superfine fabrics. The company finds it difficult to recover all cost increases in prices. No provision has been made in respect of present liability for future payments of gratuity upto June 30, 1970. As per the practice in the past, it will be charged as and when paid.

FROM OUR CORRESPONDENTS

NEW DELHI

The Heaven-Born Fight to Keep Their Place

THE move to take disciplinary action against a senior officer of the Central Information Services working in the All-India Radio has created a flutter among non-IAS, professional personnel in the government. The charge against the officer is that he wrote a letter to newspapers which was published early in April last year. The issue has been raised forcefully by the Association of CIS Officers and its stand has been backed by the Confederation of Central Government Officers' Associations which was formed two years ago with the ostensible purpose of promoting administrative reforms but really to win recognition for the professionals in the services and to weaken the tight grip of the ICS-IAS cadres on the administration.

A Confrontation

Since its formation the Confederation has been quietly canvassing support for its ideas. Now the issues raised by it have been brought to a head by the move to take disciplinary action against one of its leading office-holders. The letter to the newspapers was written at the instance of the CIS Association and had criticised the proposal to appoint an IAS officer to the post of Director of the Indian Institute of Public Administration. It will be remembered that the proposal was resented within the Institute and had to be dropped after it was strongly criticised in Parliament. The stand of the Information and Broadcasting Ministry in initiating the disciplinary proceedings against the CIS officer is that no government servant can criticise in public any government policy or action and that by writing the letter the officer in question had violated the conduct rules. The case is growing into a confrontation between the professional-technical personnel and the IAS officers. In any case, relations between the two parties have been far from cordial for quite some time.

As the activities of the government have expanded and diversified over the years, there has been a considerable influx of professional and technical personnel into the government. These professional and technical personnel perform complex and skilled jobs and for some time they have been seeking a measure of authority commensurate with their responsibilities. But the Ministries, tightly in the grip of the ICS-IAS cadres, have seen to it that the professionals are kept in their place in the official hierarchy and so far as decision-making in the government is concerned. Towards this end, in addition to making full use of the procedures and rules inherited from the colonial era, the ICS-IAS administrators have devised additional procedures of functioning which effectively maintain intact their supremacy.

Exercising Options

The presence of administrative cadres in public sector industrial enterprises has been a matter of public discussion for some time. After protracted rearguard action to prevent erosion of their position in these enterprises, where they had invariably proved themselves to be flops, the generalist administrators, on deputation from the Ministries, have had to give way slightly. This happened when they were confronted with the choice of either retaining their position in the enterprises or reverting to their parent administrative departments. But even in this matter it has not been easy; it would be wrong to imagine that the administrative cadres have finally reconciled to themselves to staying out of the public sector industrial enterprises. In the first instance, they successfully stalled for two years the government's decision to force them to choose between staying on in the enterprises and reverting to their parent departments. Only now has the option had to be exercised in the case of the top-most posts in the enterprises; for the rest of the posts the deputationists have been given time till early next year to exercise their option.

But even as the elaborate procedure of exercising options and settling down to the positions of their choice is being completed, moves are afoot already for a new influx of administrative personnel into public sector enterprises in the name of preventing management gaps from arising in these enterprises in the absence of suitable alternative arrangements. The argument is being advanced with much sophistication that a cadre of professionally competent officers has not been developed for the public sector and that, therefore, it would be wrong to bar competent officers already in the government from running these enterprises. When it is suggested that gaps, if any, in the public sector could be filled by competitive recruitment from among all those, from within as well as outside government, who may offer themselves for the purpose, the objection is raised that persons employed in the government cannot be treated on the same footing as candidates from outside since they cannot be expected to give up the security they enjoy in their present posts. They, therefore, have to be treated differently from other candidates, it is argued.

Only Unifying Force!

The question of special privileges of the administrative officers is not confined to public sector enterprises alone. These privileges have been carefully cultivated by the ICS-IAS cadres as part of the effort to protect their positions in the face of the swelling ranks of professional and technical personnel in government services. This effort has been under way for long, but lately the ICS-IAS group appears to have become quite brazen about it, particularly since the Administrative Reforms Commission's report on reforms in the government's administrative structure and practices. In a circular sent out in confidence to its Members last year the IAS Association took the stand that the administrative cadres alone were "an integrating force and a unifying factor" in the prevailing conditions in the country; it had, therefore, to try to establish control over as many public institutions as possible. The leaders of the Confederation of Central Government Officers' Associations claim that the attempt to foist an IAS officer on the Instiute of Public Administration had to be seen in this light. The IAS cadre had meanwhile successfully established its position in the technical departments of the government and even in the Planning Commission. The posts of chief administrative officers in the various technical departments, such as the Bureau of Mines and the Geological Survey of India, were quietly occupied by IAS officers. In certain cases, the position of heads of these organisations too were sought to be held by IAS officers.

Besides its desire to protect its position in the face of a possible challenge from professional and technical personnel, another reason for the hasty manner in which the IAS cadre sought to spread itself was that in the period of slow down of developmental activity after the close of the Third Plan, when there was also a drive for economy in government expenditure, there appeared a glut of IAS officers. The problem had become acute for the IAS in 1968 and 1969 and this was one reason why the Cabinet decision on deputationists with public sector enterprises was kept in abeyance for two years. Apprehensive of their career interests in these conditions, the ICS-IAS officers also took great pains to protect themselves more fully than ever before, in total disregard of all other considerations. New posts of additional chief secretaries were created, the selection grade quota for the IAS was increased from 5 per cent to 15 per cent and a provision for special allowances for IAS officers in state government establishments was sought. The IAS being a state-based cadre, IAS officers get deputation allowance when they go to the centre. It is now proposed that when they return to their own states from the coveted posts at the centre, they should not lose the special allowance. Hence the special posts of additional chief secretaries, the special allowance for district collectors and the increase in the quota of selection grade posts.

Career Management: The Contrast

Career management of IAS officers has been given such meticulous care that it is now recognised as government policy that an IAS officer must get into the selection grade of Rs 1800-2200 in the 14th year of his service and that he must enjoy the status and salary of a joint secretary in the 19th year of his service. Contrast this care for the elite service with the plight of other government employees who remain in casual employment for long years without being confirmed or are put in *ad hoc* positions with the threat of reversion constantly hanging on their heads. Then there is the infamous practice of the so-called 'confidential reports' on the conduct and performance of government employees which govern their promotion and which are dexterously managed and manipulated not only for reasons of favouritism and nepotism but also for the larger purpose of maintaining the supremacy of the IAS bureaucracy. The practice of CRs has become a scandal and needs to be changed immediately.

It is revealing of the anxious state of mind of the ICS-IAS that, side by side with all this, the rod of discipline is sought to be wielded with greater energy than ever before. One of the circulars issued recently lays down that unlike other citizens no government servant can ventilate grievances in respect of the working of public utility services even when they directly effect their and their families' daily lives. According to this circular, a government servant is liable to disciplinary action if he criticises in public the working of, for instance, the government health scheme or the city transport system. There is also a move to place curbs on government servants going to court to secure redress of their grievances and to protect themselves against gross injustices. It has been noted that in many cases of this kind the judgment goes against the government. But surely that is no reason why redress in courts should be denied to government servants; on the contrary, what seems to be called for is the framing of rules which will provide for penalties for arbitrary treatment of government servants when it is established in the courts that such treatment was unlawful and wrong. Indeed, one of the problems of government administration at present is that the entrenched bureaucracy gets away with almost anything without attracting punishment for default or high-handedness. If there were penalties for wrong doing, the higher-ups in the administrative structure might conceivably exercise greater care and show greater regard for fairplay and justice.

Communism and Nationalism in India

M. N. Roy and Comintern Policy 1920-1939

JOHN P. HAITHCOX

This book on the career of Roy, the founder of the Communist Party of India, traces the development of communism and nationalism in India from the Second Comintern Congress in 1920 to the defeat of the left wing of the Indian National Congress in 1939. Professor Haithcox challenges previous interpretations of Roy's role in the development of the Indian Communist movement, and provides new material on many subjects. *Princeton Rs 85*

The United Nations in International Politics

Edited by LEON GORDENKER

Six authors, all of whom have been associated with the Centre of International Studies at Princeton University, take the occasion of the twenty-fifth anniversary of the United Nations to re-examine the UN's role and work in the world today and to anticipate its future. *Princeton $7.50*

BHUBANESWAR

Patnaik in the Arena

THE sweeping victory of the ruling United Front in the four by-elections to the State Assembly last month has come as a morale booster for the three-party coalition government. But in a slightly longer-term perspective, the election results may not be without some adverse consequences for the stability of the government.

Three of the four by-elections had been caused because the candidates elected from these constituencies in the last election had also won elsewhere and so had to vacate these seats. In addition, one other candidate elected last time preferred to continue in the Rajya Sabha of which he was already a member. In the by-elections, the United Front routed the Congress by retaining its two seats (Rajnagar and Koksara) and wresting the other two (Rourkela and Bhadrak) which the Congress had won by thumping margins barely six months ago.

The Swatantra party retained the Koksara seat largely due to the efforts and influence of P K Deo, the Maharaja of Kalahandi. Thus the party has established that it continues to hold sway over Western Orissa as it has done for the past two decades. The erstwhile Ganatantra Parishad, which merged with the Swatantra party on the eve of the 1962 General Elections, had till then won most of the Assembly seats from the mineral-rich western districts. These districts had been a part of princely India until their merger with Orissa in January 1948. The Utkal Congress, a state-based party founded by Former Chief Minister Biju Patnaik, retained the Rajnagar seat which had been won by party leader, Prallahad Mallik, in the last election.

Opportunistic Alliance

The ruling United Front consists of the Swatantra party, the Utkal Congress and the Jharkhand party. The Chief Minister, Biswanath Das, is a non-party man. It will be recalled that after the last elections to the state Assembly the Utkal Congress had tried unsuccessfully to form a coalition with the Congress, with the Congress leader Harekrushna Mahtab as the Chief Minister and Nilamoni Routray of Utkal Congress as the next in command. The move was nipped in the bud by the Prime Minister. Biju Patnaik's personal stock was then rather low since he had been defeated from as many as four Assembly constituencies and one Lok Sabha constituency. Eager to install his party in office, Patnaik then struck an alliance with the Swatantra party. This was unmistakably a marriage of convenience, given the differences between the left-oriented Utkal Congress and the Swatantra party.

In the elections the Swatantra party had captured 36 seats and the Utkal Congress 32. The Congress had won 51. One of the newly-elected Swatantra members opted to continue in the Rajya Sabha, thereby reducing the strength of the party to 35. Similarly, the Utkal Congress leader, Prallahad Mallik, had won from two constituencies and so resigned from one, reducing the strength of his party in the Assembly to 31. The two parties thus had a combined strength of 66 in a House of 140, which was still five short of an absolute majority. The Jharkhand party, which stands for a separate state for Adivasis comprising the contiguous tribal areas of West Bengal, Bihar, Orissa and Madhya Pradesh, was therefore roped in, but only after one of its four MLAs broke off to be an 'associate member' of the Congress and sit in the Opposition. And so, with the support of three Independents, the three-party United Legislature Party was formed in late March with a combined strength of 72 members.

There still remained the problem of agreeing upon a leader. With Biju Patnaik outside the legislature, the Utkal Congress could not project anyone whom the Swatantra party would accept as leader of the alliance. Similarly, the Utkal Congress would not agree to R N Singh Deo lest that should tarnish its left image. Eventually the choice fell on Biswanath Das, the 82-year old former Governor of Uttar Pradesh, who had been Orissa's first Prime Minister (as they were then called) in 1937. Das was not, however, a member of the Assembly and so had to be elected to the Assembly within six months. It is against this background that last month's by-elections in which two of the seats were contested by the Chief Minister (Rourkela) and Biju Patnaik (Rajnagar) assumed special significance.

The Congress had nursed hopes of defeating the Chief Minister and bringing down the six-month-old ministry. Perhaps to suit these designs, a new Governor, Sardar Jogendra Singh, had assumed office in succession to S S Ansari. Ansari, it will be recalled, had refused to yield to the pressure from the Congress leader, Harekrushna Mahtab, that he be invited to form the ministry after the last election. The Union Government had been equally unhappy about the way Ansari had earlier handled the resignation of the Singh Deo Ministry which had led to the imposition of President's rule. But wranglings within the state unit of the Congress, want of proper leadership, the poor shape of the party's election machinery and, finally, the faction-fight between rival groups in the Rourkela unit of the INTUC prevented the Congress from winning this crucial seat. The Congress candidate was the Convenor of the party's state unit, Binayak Acharya, who is also the Leader of the Opposition in the state Assembly. The Congress High Command itself had chosen him to stand against the Chief Minister. In the last elections, the Rourkela seat had been won by the Young Turk leader, Shyam Sunder Mohapatra, by a flattering margin of nearly 13,000 votes. This time Binayak Acharya polled 19,456 against 21,308 polled by the Chief Minister.

Unsettling Factor

At Rajnagar, Biju Patnaik romped home with a record-breaking tally of 54,689 votes against his only rival, Dhruba Charan Routray of Congress who polled only 19,942 votes. In the last election the Utkal Congress had won this seat by a margin of only 5,000 votes. The massive Congress defeat was all the more unexpected because the party had the support of both CPI and the PSP. To add to the party's disgrace, the Bhadrak seat, which had been won by Mahtab only six months back, was wrested by the Utkal Congress. The Utkal Congress once again put up Balaram Sahu who had been defeated by nearly 11,000 votes last time. Sahu, however, avenged his defeat by polling 21,491 votes against 15,504 polled by the Congress candidate, Prafulla Kumar Samal, a student leader.

With the results of the by-elections, the United Front now has a strength of 77 against 63 of the combined Opposition. The break-up of the Treasury benches is Swatantra 37, Utkal Congress 35, Jharkhand 3 and Independents 2, including the Chief Minister. The Opposition line-up is Congress 51, PSP 4, CPI 4, CPM 2, Jan Congress 1 and rebel Jharkhand 1. So on the face of it, it might appear that the position of the coalition Government has been significantly strengthened. In fact, however, the election results might have quite the contrary impact.

Paradoxically enough, the major unsettling factor is the entry into the Assembly of Biju Patnaik, the architect of the coalition. Out of office since he resigned under the so-called 'Kamaraj Plan' in October 1963, Patnaik has been nursing his ambitions of returning to Chief Ministership. Now, armed with the massive mandate of the people and with the support of the 34 other members of the Utkal Congress and the three members of the Jharkhand party, who are nearer to him than to the Swatantra party, it would be very unlike Patnaik not to make a bid for power.

Observers have noted Patnaik's recent statements that there were no ideological differences between him and Indira Gandhi nor between his party and the Congress. He has made no secret of his desire to return to the Congress if only "obstacles like Nandini Sathpathy and Harekrushna Mahtab were removed" — to use his own words. As an alternative, he is also toying with the idea of bringing together the Utkal Congress and the Orissa unit of the Swatantra party (which in any case was a state party known as Ganatantra Parishad until 1962) to form a state party on the lines of the DMK in Tamil Nadu. However, so as not to cause too much alarm Patnaik has proclaimed that he was in no hurry to hold high office and that he is satisfied with the chairmanship of the reconstituted State Planning Board. But not even Biju Patnaik's most ardent admirer would believe that Patnaik has so completely lost his appetite for power.

KERALA

Congress Takes Over

M S

THE leaders of the CPI-led Front and those of the Congress have, after several weeks of tortuous negotiations, agreed upon the terms of the latter's induction into the Achutha Menon Ministry and the new ministers have been sworn in. The state CPI's last-minute and somewhat sudden decision to climb down on the issue of the size of the Cabinet and to accept the Congress's demand for a compact ministry of 13, ended the stalemate. The common fear that if things were allowed to drift the CPM might take advantage of the situation certainly helped to induce the CPI and others concerned to realise the need for a quick settlement. In return for the good sense shown by the CPI, the Congress agreed not to press for the Deputy Chief Ministership and also to give up its demand for the Industries portfolio in addition to Home already conceded by the Muslim League. Thus an altogether new phase in the politics of Kerala begins with the Congress overtly participating in a Ministry formally led by the CPI, a pattern not seen elsewhere in the country. Does this new development improve the prospects of survival of the Achutha Menon Ministry? Or does it portend problems and difficulties for the Ministry which has thus far been able to function with a measure of cohesion and mutual understanding among its partners, rather unusual in the volatile politics of the state?

On the face of it, it would appear that the prospects of stability of the Ministry have brightened. The leaders of the CPI-led Front, who had reason to be unsure of the Congress's continuing support so long as it kept out of the ruling coalition, have at last the satisfaction of seeing that party lined up beside them. Yet, despite the superficially reassuring signs, it would perhaps be not correct to say that all is going to be smooth sailing for the Achutha Menon Ministry.

Fight for Ministerial Stakes

The prestige of the Congress on the one hand and of the CPI-led Front on the other has tended to suffer somewhat on account of the zest with which both of them fought for ministerial stakes during the several weeks of hectic negotiations. While the Congress with its numerical preponderance tried to establish its supremacy in the expanded ministry, the partners of the CPI-led Front fought every inch of the ground in an attempt to retain their hold on important portfolios even while admitting the Congress into the ministry. The CPI in particular, which had been privately hoping all along that the powerful and vocal youth wing in the Congress would eventually succeed in preventing that party from joining the ministry, showed the most determination in the attempt to prevent the Congress from seeking to undermine its leading position in the Cabinet. This was evident not only in its stubborn opposition to the creation of the post of Deputy Chief Minister for the Congress, which it thought would dilute the role of the CPI Chief Minister and create a dual centre of power within the Ministry, but also in its dogged reluctance to hand over the lucrative Industries portfolio. Obviously, with the ninth congress of the party less than a few weeks away the CPI did not wish to surrender this crucial portfolio and to suffer the implied loss of stature. The Achutha Menon Ministry is as much a feather in the cap of the CPI on the eve of its ninth party congress as the then Namboodiripad Ministry was at the time of the extraordinary congress of the party in 1958. Similarly, though the Muslim League quickly agreed to give up the Home portfolio to the Congress, the remaining partners of the Front, the RSP and the PSP, were determined to hold on to the crumbs of office in their possession.

Thus it is in an atmosphere suffused with politicking of a fairly malodorous sort that the Congress has joined the Achutha Menon Ministry. The important question now would be whether the partners of the expanded Cabinet would be able to function with the necessary cohesion once the dust of controversy settles down. However, from the look of things this is perhaps too much to expect. Sooner or later, the Congress's dominating strength with 32 MLAs as against the 37 of the CPI-led Front as a whole, is likely to give rise to the same charge of 'big brother attitude' against it as was levelled against the CPM in the former Namboodiripad Ministry and, on occasions, even against the CPI itself in the present Achutha Menon Ministry. Already once during the painfully long negotiations the CPI demanded in frustration that the Congress should form a ministry on its own, with the CPI-led Front supporting it from outside. If differences arise in the ruling alliance, which prospect is made likelier by the bitterness and hostility generated over weeks of discussions, the Front might again threaten to quit. Charges of corruption, an issue of baleful potentialities for any ministry in Kerala, may also raise their ugly head and cause mutual discord among the partners of the alliance. In all this, the Congress's handling of the crucial Home portfolio, particularly its attitude to questions of law and order in CPM-sponsored agitational campaigns, coupled with other controversial issues such as the implementation of the Maintenance of Internal Security Act, handl-

ing of the Naxalites, etc, would play their part. The attitude of the Youth Congress, which despite its formal acquiescence at the behest of the all-India leaders of the party is still not too enthusiastic about the party joining the ministry, would also matter a great deal. It is likely to show its impatience for change even more sharply, now that the Congress is part of the ministry and would demand that the party steal the radical thunder of the CPI. The practical difficulties of doing so, coupled with the question of mutual relationships within the Cabinet would subject the Congress ministers to difficulties which the Youth Congress, in its happy divorce from the realities of power, is unlikely to appreciate fully.

The attitude of the CPI to the whole issue of Congress participation in the ministry eloquently demonstrates the dilemma facing it. With the ministry surviving at the mercy of the Congress, the unexpected legacy of CPI's decision to forsake the CPM and join hands with the Congress in the mid-term poll of September 1970, the question of its actual participation in the ministry had to arise sooner or later. However, the need to retain what little political credibility that it has does not permit the CPI to move too close to the Congress. Hence, the humming and hawing by the party. Available evidence suggests that the party is not wholly reconciled to Congress participation in the Government even now. It sought to justify the move by pointing to the progressive character of the Youth Congress in Kerala, in marked contrast to the Congress in the rest of the country. As though this was not enough, the party also sought to demonstrate its *bona fides* to the public and to a section within itself which has always been critical of hobnobbing with the Congress, by adopting a resolution calling for the formulation of a time-bound programme for implementation by the expanded ministry. However, by further adding that it was never the intention of the party to form an anti-CPM front in Kerala, the CPI made an ill-concealed bid to make its peace with the CPM, in the event of the Congress deciding to dispense with it. Thus, the CPI is compelled, by its own policies and postures, to mediate uneasily between the 'sectarianism' and 'adventurism' of the CPM and the still incomplete 'revolutionary character' of Congress.

As far as the Muslim League is concerned, ever since it was rebuffed by the Congress at the ministry-making stage following the 1960 mid-term poll for the state assembly, its attitude towards that party has been tinged with suspicion. Yet, except in 1967, when E M S Namboodiripad successfully roped it into his anti-Congress united front, it has generally been more favourably disposed to the Congress than to any other party. With the Congress firmly in saddle at the Centre, and showing unexpected chances of recovery in Kerala, there is all the more reason for the Muslim League to move closer to it. As the party of a minority community, the Muslim League can best expect justice from the Congress, the ruling party at the Centre and virtually the ruling party in Kerala. Hence, its consistently correct attitude on the Bangla Desh issue and its fairly quick decision to surrender the Home portfolio to the Congress in the event of its joining the ministry.

CPM Strategy

The RSP has travelled a long way since its equivocation towards the ministry over the issue of the support of the Congress which it did not then consider to be progressive enough. It has not only joined the Ministry knowing fully that it survived at the sufferance of the Congress, but has now made every attempt to stick to its ministerial position even in the event of that party actually joining the ministry. The PSP, a party of only 3 MLAs, but of crucial significance to the Achutha Menon Ministry in view of its razor-thin majority in the Assembly, also showed an awareness of its importance during the negotiations and may be expected to continue to do so in the future.

The CPM, still the largest single party in Kerala, despite the Congress's impressive showing in the last mid-term poll for the Assembly and the more recent Lok Sabha poll, has been declaring that the only correct course open for the CPI would be to repudiate its line of collaboration with the Congress and take its place among the democratic left opposition forces in order to participate in joint struggles. The CPM is convinced that the CPI's continued association with the Congress, which is being compelled by the pressure of events to display its reactionary character more and more openly, cannot but lead to its own isolation and still further expose its pretensions of being a Marxist-Leninist party. Ever since its ouster from the government in October 1969 and its defeat in the mid-term poll of September 1970, the CPM has shown less anxiety to prop up an alternative ministry than to unleash agitational campaigns calculated to embarrass the ministry led by its erstwhile revisionist partner and to maintain its party organisation in readiness to face the next poll when it comes. Its recent campaigns over the tax burdens, price rise, 'black laws', etc, while not oversuccessful, have nevertheless provided fresh evidence of its considerable mass base and organisational capacity. Thus the party would surely take a hand in shaping the agitational campaign now in the making among sections of students, teachers, government servants and industrial and toddy workers. With the Congress holding the Home portfolio, the CPM should not find it too difficult to precipitate a major law and order situation and to seek to accentuate the contradictions among the partners of the ruling alliance, particularly the Congress and the CPI.

Thus the balance of political forces in the state continues to be delicate, appearances to the contrary notwithstanding. A look at the disposition of political parties in the state assembly would bear this out. The ruling alliance, with the 32 MLAs of the Congress as its pivot, has a strength of 72 in an Assembly of 134. This includes the two MLAs of the recently formed Congress Socialist Party which consists of politically unstable elements. The opposition, with the 32 MLAs of the CPM as its pivot, has a strength of 62 including 13 of the Kerala Congress and 3 of the Congress(O). In order to place the majority of the Achutha Menon ministry in doubt the CPM needs only to win over some 6 MLAs—not an impossible proposition considering the fickleness of political loyalties among socialists of various hues in the state and the rapidity with which alignments could change in the face of a crisis over some important issue or other inside the state Assembly or outside it.

What has now come into existence in Kerala is virtually a Congress ministry, despite the CPI's success in temporarily retaining its formal leadership. Thus, ironically, the wheel has come a full circle on the CPM's attempt, during the fourth general election, to organise a broad based anti-Congress united front and the Congress party finds itself once again in virtual control of political power, with the CPI for an embarrassed partner, capable of being thown out of the ministry and left to the tender mercies of the CPM at any time of the Congress's choosing. This is perhaps not an enviable lot for the CPI but it is no more than the logical consequence of its desperately unsuccessful and rather make-shift efforts to find for itself an independent political identity in Kerala following the split in the united communist party in 1964.

DROUGHT RELIEF

A First-Hand Account

Balmohan V Limaye

Madhav D Rahalkar

PAITHAN taluka, which lies on the left bank of the river Godavari in the Aurangabad district of Maharashtra, comprises 184 villages. Of these, an overwhelming majority, *viz*, 172, are rabi crop villages. Situated on the leeward side of the Western Ghats, the region is frequently subjected to drought. This has been one such year. When, in May, the 'Anewari' went below the prescribed lower limit, these villages were declared 'scarcity areas', and when till August 12 only 43 mm of rain had been received, hopes of natural reprieve faded. There was only a little rain in the last week of August and almost no rain thereafter. Even such kharif crop as there was, was thus lost and both landless labourers as well as most small farmers were driven to the only other means of making a living: employment in government relief works. Paithan is thus part of the drought relief programme instituted by the State Government. In fact, it has become a political tradition for Government to respond to drought conditions by starting some kind of relief works. To call it a programme would imply planning of the sort of projects most required in the area as well as a systematic way of distributing work and payment. Our observations, alas, suggested that such project planning and thoughtful execution simply do not exist.

We went to Paithan out of curiosity. What did a drought mean in terms of everyday living conditions? During our visit, which lasted from September 20 to 24, we were able to see 'relief operations' as well as some of the regular PWD work at close quarters. The following is an impressionistic account of this trip. We merely list some of the feautres that were obvious to the eye and which didn't always 'fit'.

The Collector of the district co-ordinates the various segments of work manned by the Zilla Parishad through the Panchayat Samitis in the talukas, by the Irrigation and Power Department, and by the Building and Communications Department. In Paithan taluka, the relief work consisted of bunding, road building and creating a catchment of water (Pazar *tâlao* or tank) to increase the flow of water to nearby wells. Besides, work on the right-bank canal of the huge Jayakwadi dam was undertaken in the middle of August. Since the only work that we could see in progress was road and canal building, we shall restrict ourselves to these. As of September 10, earth work on roads of a total length of 88 km had been completed, at a cost of Rs 2.39 lakhs. As against this, the sanctioned road length had been 188 km expected initially to cost Rs 13.30 lakhs. Why this disproportionately low expenditure on the constructed length of road? We were told that rural estimates of distances between any two given villages vary and that cost estimates were not be taken seriously. We also found that quite a few of these relief roads converged on one village, Balanagar, which happens to be the village of the chairman of the Paithan Panchayat Samiti.

Gentlemen's Agreement!

How do the authorities set about organising the work? When it is decided as to which two villages a road is to link, the next task is to acquire the land for this purpose since the road usually cuts through several farms. If the land revenue is one rupee per acre, the compensation for this acquisition is about Rs 1,000 per acre. But as the land is generally saleable at Rs 5,000 per acre, farmers are reluctant to let a road pass through their fields. It must then depend simply on who has more weight and prestige. Obviously the authorities do win out. But in Katpur village, we saw the road painfully winding its way around particular fields (the local word for such detours is *golai*). On investigation, we found these belonged to members of the family of a state minister. When we talked to an official in Paithan about the existence of a conflict of interests, he merely maintained that it did not really exist; in fact, the magnanimity they portrayed was incredible: people, they said, would willingly let a road pass through even standing crops.

Building a road involves digging up earth on both sides, dumping it on the proposed road, and flattening it down to make a hard surface. Usually a man digs and his wife dumps the earth. The scheduled rate for both operations combined is Rs 1.35 per cubic metre which is equivalent to Rs 3.80 per brass (100 cubic feet). A part of road construction has been assigned to a private contractor (thekedar or guttedar) who has been asked to pay labourers at this rate or at a minimum of Rs 3 per brass. What if some contractor didn't pay a labourer his due share? Was there an assured legal or other remedy? The answer was no. It was "a gentlemen's agreement". We saw this gentlemen's agreement at work. In Katpur village, in the week we were there, the labourers were paid Rs 2.50 per brass, and the rate in a previous week, we were told, had been lower at Rs 2.00 per brass. It is not that people are paid at a formally lower rate. Where they lose out is on the measurement or assessment of work done.

Starvation and Suicide

We found that the villagers, including their mukadams, know absolutely nothing about the metric system of measurement or about proportionate calculation. They only know what a brass is. Some of them even believed that there must be a different metric brass, and the announced rate which seemed unjust must refer to that as at the end of the week they got paid less. They look with awe at the binoculars used by an overseer to look at a pole held in the bed of the canal and measure depth. They have, we found, little clue as to how much they have worked in a week and how much they should expect at the end of it. Some of them said that at times they had worked more but were paid less and at other times been paid rather more after having worked less. It was appalling to see the official indifference to this. Nobody had tried to explain to the labourers what length a metre is, or how to gauge the volume of a trapezoidal solid (which is what the canal is). Nobody seemed to see the point of doing so either.

Nor is it simply in terms of due rates that relief is failing to reach the people. When we were there, very little work was actually available. On the average, a couple could secure work for only 3 days in a week — and that too for not more than one brass per day. If you take into consideration the young children and the old members of a family and the current rate of jowar (Rs 6 per *payali*), it becomes obvious that the people are half-starved. They

talked about hunger deaths or suicides if this situation continues. Villagers also complained about uneven distribution of the available work and, of course, of favouritism. On the day we were there, a contractor distributed the available work, worth Rs 100, among eight couples, leaving the other five score people who had arrived from surrounding villages to roam about with nothing to do. And that must be a usual feature. Most people walk to the site of work from their own villages, thus walking anything between two to four hours a day in addition to their hours of work.

Chasing the Tikli

Work and payment practices are by no means standardised, but people seemed used to this as even in the routine projects in the area unaccountable variations and exploitation of labour are endemic. The enormous Jayakwadi dam project across the river Godavari, which is going to be the biggest irrigation dam in Maharashtra with a capacity of 3,600 cubic feet of water flowing in the canals per second, offered some interesting examples. The left-bank canal — i e, the one on the same side of the Godavari as Paithan — has been under construction now for a few years. Structurally, a canal should run perpendicular to the dam, flowing along the slope determined by the river itself. But the left-bank canal doesn't quite do that. Also, just near the gates of the canal it passes through a siphon and an aqueduct in order to cross two natural streams. But these two streams meet a little distance further, so that if the canal were to be made slightly closer to the river it could have crossed just the joint stream needing only one structure worth about Rs 13 lakhs in place of the two structures (a siphon and an aqueduct) that have had to be built costing Rs 22 lakhs. Was this lack of planning or a deliberate attempt to avoid crossing a certain large piece of land belonging to the family of a political VIP with statewide stakes?

The left-bank canal work has been distributed among private construction companies, each getting about a mile or so of it. These companies in turn have assigned the work to smaller contractors (thekedars) who directly employ labour. Among the labourers, there are mukadams who normally do no physical work but get the work done. We found that a male labourer here was paid Rs 3 a day (8 hours). Till some months ago, even a woman labourer used to get similar daily wages; but now a curious system called *"tiklya"* prevails for them. The customary work for women is carrying and dumping of earth from one place to another. We saw women carrying metal trays full of heavy earth from one bank of the canal to the other, running down one slope and then climbing up the other bank—a distance of about 100 feet. As they dumped the earth on that side, a small metal token (*tikli*) was thrown in their tray. Then they wuold run back to make the second trip. At the end of the day these tokens are counted. Each token, we found, was worth one paisa! One hundred such trips, with this long lead, to earn one rupee. We were aghast. Women with babies only 6 months old were working thus in the scorching heat of the Marathwada sun.

Was the rate completely unrelated to the distance to be covered? The thekedar explained that if the distance was too much, the women were given two tokens per trip. When we probed further, the labourers told us that it was only in the last hour of the day, when the women were exhausted and were ready to go home that the contractor used this two-tokens-a-trip 'incentive' to induce them to stay. We also discovered how arbitrarily changes in the wage rates are made. While we were there, the rate of one rupee for 100 tokens was reduced to 75 paise for 100 tokens. The labour was simply told that if they were willing to work at the new rate they could do so or please themselves and leave. Needless to say, with the abundant supply of labour, the famine conditions and the absence of other work meant that nobody left. Similarly, lack of organised labour means that different people get different rates for the same work. On the same site of work on a canal, two women making these trips side by side are not necessarily paid the same amount. If they 'belong' to different thekedars, one gets 88 paise for 100 tokens, whereas the other 100 paise.

The right-bank canal work was started in the middle of August as part of the relief work programme. There are no private thekedars here. The length of the canal is divided into 20-metre sections and one section is assigned to a gang of about 50 people belonging to a single village. One of them who has had primary education is made their chief (mukadam) and he supervises the work. A number of overseers measure the work done. Above them are two deputy engineers and one executive engineer. The work consists of digging up the trapezoidal canal and throwing the clay and the hard murum at a distance of about 50 feet on either side of the canal. The rates for this work are good on paper. They are Rs 1.80 per cubic metre for clay and 'Rs 2.30 per cubic metre for murum, as against Rs 1.35 per cubic metre in road construction. The work done by a gang in a week is measured at the end of the week and the total money earned given to the mukadam. He is to distribute it equally among the members of the gang (including himself). For the week, September 13 to 18, the earnings of a few gangs were as follows:

Mukadam	Village	Rupees per Day	
		Men	Women
Mohammad Pathan	Tandulwadi	1.65	1.25
Laxman Rambhan	Kavsan	1.40	1.10
Prabhakar Bheemrao	Sonewadi	1.85	1.35
Ravsaheb Dagadu Girji	Tandulwadi	2.60	1.85

We found that the maximum a man earned was Rs 2.75 per day whereas the minimum was Re 0.55. Allowing for differences of capacity to work and organise among the various gangs, it is still surprising that the average rate per day per man was nowhere near the Rs 3-4 claimed by the officials in Paithan. The reason given for this low rate was the standard one: they don't work hard. Well, we saw them work. And they do work hard. It is impossible not to. At the going price of jowar—and they subsist on jowar *bhakris* and chutney—and given the dependents at home, they cannot but work hard.

As we were about to leave Paithan taluka, the rains came. The villagers were overjoyed. "This is no rain, this is *amrut* (nectar)." Yet, even if there is some rainfall now, they would need the employment for three more months. The crop cannot have been unaffected by the drought and besides there can be no real work in the fields until the crop is a foot tall. If the rains are nominal for the crop output, relief work will have to be extended for many more months. Has the Government the vision, or even the commitment to start with, to plan and execute such a programme? These areas have been chronically affected by drought and yet the choice of projects for relief work lacks responsible planning. When there are no rains for 2 to 3 months, a survey is hurriedly made for roads to be built. In most cases the villagers claimed they did not need the roads. They needed wells. For villagers it is hard to decide where the wells should be dug as that requires some knowledge of soil structures and water tables. This the State could well undertake through consultants. True location would still pose a problem of intra-village feuds, but these surely can be thrashed out with the co-operation of the villagers. After all, even today solutions are imposed on the villagers on the excuse of the dire famine and scarcity conditions. The wells would at least increase agricultural productivity.

We were struck by the lack of organisation among the labourers themselves, despite the appalling terms and conditions of work. At many places they asked us whether we belonged to some union. They seemed eager to contact trade union people. They have no political organisation and, in the prevailing labour 'surplus', there is no minimum value their labour can fetch. As we were bicycling from Paithan to Katpur, we met a regular PWD road maintenance worker. He told us that till that day the rate was Rs 4.21 per man and Rs 3.35 per woman per day, and that from the following day it was going to be Rs 2.50 per man and Rs 2.00 per woman. No reasons had been given. He seemed at a loss as to how to cope with the changing situation.

COLLIERIES

Alternative to Nationalisation

D C Kale

THE scare regarding nationalisation of coal mines has not yet died down, in spite of almost eight weeks having passed since it first took root. The travelling symposium on the coal industry held its last meeting in New Delhi in late August, and everybody attending it seems to have gathered the impression that Government was bent on taking over coking-coal mines immediately. The effects were immediate, but not profound. In mid-September, the Minister for mines said in Bokaro that government was not likely to nationalise coal mines immediately, but his remarks lacked credibility and were only politely accepted at face value. The uncertainty can only make the situation worse and can bring about very undesirable effects. The Minister went on to threaten that Government would not stand idly by if colliery owners were to let their collieries got flooded (this is the worst time for flooding) or started taking out mining equipment or laying off workers. Once again, these threats could only have been received with sardonic disbelief by the hard-headed colliery owners. The plain fact is that as things stand today, government lacks the power to do anything in the matter or even to get reliable information. It would be no exaggeration to say that collieries in the Jharia and Raniganj fields could get away with practically anything before government even comes to know of what is afoot.

To start with, virtually every government official is in the pay of, or substantially obliged to, persons in and around the coal industry. This is true of both Bengal and Bihar. This includes inspectors of all kinds — safety, provident fund, labour relations — as well as police, revenue, railway and sales tax staff. This may sound a broad and sweeping statement but one has to accept it as a fact of life in the coalfields. (It may surprise readers to know that even forms for renewal of the road permit for vehicles, or for submission of income-tax returns, are *sold* by the 'concerned clerk' for as much as Rs 2 in Bihar.) There are famous collieries which have mostly second-grade coal seams, yet which have been selling 'first-grade' coal for years, complete with independent test/analysis certificates of wagon-loadings. In short, unless a complete purge of hundreds of minor and major officials can be put into effect, government may as well forget about making empty threats. Even then, there is always the possibility that the collieries will corrupt newcomers in a short time.

To look at the genuine difficulties of colliery owners, they are faced with three major obstacles to planned progress, even if they wish to achieve it. Firstly, the lack of an assured market over the long term. This aspect has been aired thoroughly in recent months, and unless a firm policy decision is taken in favour of utilisation of coal in selected industries over the next, say, 25 years, this will remain the root cause of the industry's ills. Secondly, the labour situation in the coalfields is about as bad as it can be. Wage Boards and liberal awards notwithstanding, labour is irresponsible in the extreme, insatiable in its demands, and poorly led. It does not help matters that employers adopt underhand methods to pay a man less than his due, nor that union leaders are ever ready to accept gratifications from employers. Barring a few honourable exceptions, one can say that morality in the matter of labour relations is unheard of in the area. Thirdly, the industry has suffered for want of wagons for years and years. Even when it produces enough coal, the industry cannot despatch it; like the quality of mercy, coal can bless him that gives, and him that receives. Today both sides are suffering because railways have failed to measure up to the demands made on them. They have failed to make wagons available; they have failed to control their staff, which resorts to strikes and go-slow tactics at the slightest excuse in this area: and they have failed to check corruption and thefts. Railways have lost valuable freight, and an artificial shortage of coal has led to profiteering by opportunists.

It is doubtful if nationalisation of coal mines can do anything about coal demand or the railways' ineptitude, and hence it is doubtful if it will achieve anything except increasing the labour bill and thereafter the price of coal. The principal justification for nationalising would be the preservation of limited reserves of coking coal. This can be achieved by adopting an open strategy on the following lines:

(1) Setting a realistically high target for coal over the next twenty years. This should cover non-coking as well as coking coals with a slight edge provided for non-coking coal in order to encourage its use.

(2) Amalgamation of small and contiguous areas, which will allow coal seams to be worked in a more scientific way should be encouraged or enforced. It will then be possible to reduce the coal left as pillars, and larger outputs from single collieries will reduce costs of production. This measure has been under "active consideration" for a long time and action is overdue.

(3) Gradual mechanisation, using not necessarily the most advanced automated equipment but more reliable, sturdy and locally made coal-cutters and conveyors. This will have the additional benefit of boosting manufacturing units in the area, including the ailing MAMC at Durgapur.

(4) A firm commitment from the government that it will *not* nationalise any of the mines adopting (2) and (3) for another

25 years, and then only after giving ample warning. As a corollary, collieries which do not act purposefully can be merged or taken over, without further warning.

(5) Public financial institutions should help collieries liberally, but they must retain voting rights and demand follow-up of the steps promised at the time of taking loans.

It is hardly necessary to state that this strategy will not work in patches. Nor will it work if government is suspected of going back on its words, particularly regarding nationalisation. This is the crux of the matter.

There is ample money in the coalfields. Unfortunately, much of it is unaccounted money: it has to be, since it is used largely for bribing various parties. Two communities are particularly to blame for the spread of corrupt practices in the area. This has the effect of widening the gulf between rich and poor in the coalfields to unbelievable proportions, and gives rise to great bitterness. Bigger and better organised units, with professional managers, can do much to curb this evil and to bring some semblance of business ethics into this troubled area.

Government can certainly enforce amalgamation of suitable areas, and set up companies to start practically *de novo*. However, a single corporation will have the same fate as NCDC, with every good intention lost in the tabernacles of so-called decentralised working. There are not sufficient men of calibre for another giant corporation. Anyway another giant corporation is strictly unnecessary in the present circumstances. Let the industry reorganise itself at its own cost, but with a fair chance of making profits. It has the ability to do so but not the will. Surely, a strong government can provide that?

The Drugs Muddle

M D Nalapat

THE control on drug profit ratios has had predictable effects: (a) flight of capital from drug manufacture; and (b) increasing management attention paid to non-drug (and inessential) lines. Both these effects are manifesting themselves.

The alien companies are removing hefty chunks of capital from the industry. On average over 25 per cent of the invested capital was removed in 1970-71. Pfizer, for example, *raised* its dividend (to Rs 100 lakhs) even while its net profits *fell* by Rs 38 lakhs (to Rs 150 lakhs) in 1970-71.

As for the shift of attention to inessential lines, companies like Warner Hindustan and Richardson Hindustan are rapidly developing into Hindustan Lever-type consumer goods marketeers. There is thus a very strong case for discontinuing the benefits enjoyed by them for being in a priority industry.

Apart from distributing excessive dividends, the drug companies made no effort at broadening their ownership base in India. The present (overwhelmingly foreign) shareholders are however frequently rewarded with, besides dividends, bonus issues. Richardson Hindustan, for example, issued bonus shares last December on a two-for-five basis. The company then declared the same *rate* of dividend, thus paying out 40 per cent *more* dividend income to each shareholder.

These problems could be mitigated by

(a) *Dropping the limit on profitability ratios* and bothering about prices instead. We could fix sensible prices for the drugs and let the efficiency of company executives determine the profit ratios of their companies. Simultaneously, to prevent lowering of production volume as a response to lower prices, we could :

(b) Curb production of inessential items by the drug companies, asking them to spend their money on improving the range and quality of their drugs.

(c) Levy a penal, progressive surcharge on *dividends* in excess of (say) 15 per cent on capital, even while:

(d) Blocking the issue of bonus shares or resort to rights issues (although this is preferable to the first alternative). The companies would thus be forced into a horizontal expansion of shareholding if they want to raise dividend quanta without being bit by the surcharge.

There is one loophole leading to excessive profits that has been fully exploited by the companies. This is their overcharging on branded ethical products. It is to perpetuate this that the companies hire and send out hundreds of medical representatives to tout their particular brands. The profits made are of course well worth this expense. Tetracycline, for example, was offered for sale to the US Army by Bristol Co for 17 cents a capsule, while its production costs were under 2 cents per capsule. For most companies, the bill for advertising and sale comes to many times that for production — an expense that has to be needlessly footed by the consumer.

To remedy the situation, it may be suggested that:

(i) We ban the sale of all branded ethical products by the companies, forcing them to market each item under its generic name.

(ii) We set up a standards institute for drugs that would examine the products of companies and permit them to market their products provided specific quality levels were maintained.

(iii) Companies be barred from selling or otherwise distributing those items in their range that are judged substandard by the Institute proposed above.

(iv) Wherever possible an ABC system could be adopted by the Institute, to mark off drugs of a given type (but produced by different companies) that are (C) just up to standard; (B) above standard; (A) much above standard. These and similar ratings of the Institute could be used by the companies to justify prices that are higher than the general level towards which competition makes them tend.

(v) In drug manufacture the main determinants of quality are the bulk materials from which the drugs are processed out. As far as is feasible, the import, home production and distribution of these materials should be in the public sector. When individual brands vanish the price of these bulk materials will be the major cost component and the largest determinant of final product prices. At this stage the prices of these bulk items could be greatly reduced. To ask the STC, for example, to reduce its bulk prices *now* would mean denying the STC its pound of flesh from the drug trade; for there will be no incentive for the companies to lower their product prices as a *quid pro quo*.

(vi) We could also utilise a successful technique of the European countries, who have refused to award patents on *products*, awarding them instead on *processes*. If a company discovers a new drug, it should not have the monopoly of production of that drug under the Patents Act. If another company is able to develop a new (and perhaps better and cheaper) process for producing that drug, it should be allowed to manufacture it. This would aid the drug companies in developing better processes and in keeping a wary eye out for competition.

DAR-ES-SALAAM

The Struggle in Mozambique

A K Essack

IT was on September 25, 1964, that FRELIMO (Mozambique Liberation Front) militants launched their armed struggle by simultaneously attacking Portuguese strongholds all over Mozambique, and guerilla warfare took root. Samora Machel, President of FRELIMO, in his commemorative message celebrating the seventh year of the struggle has said, "A year is ending when our struggle has been consolidated and expanded. With the seventh year our certainty of victory grew and with it the confidence of our political line". And revealing the successes, as well as the tasks and problems ahead he continued, "Three provinces are at war but six others are not. More than a million Mozambicans are living in freedom but another seven million are enslaved. About a quarter of the territory is free but three-quarters has still to be liberated. The schools, the cooperatives, the hospitals, everything which has been created and growing in our country was because of the 25th September .... but there are many unresolved problems in the liberated area. The medical care is not sufficient; the number of schools is far from meeting our needs and production still falls short. We feel that there are shortcomings in our political work".

FRELIMO had originally launched its armed struggle without a vanguard party and without a clear-cut ideology. All that the militants were united in was that the armed struggle should be launched and the Portuguese oppressor should be dislodged. What society was to arise from the ashes of the old was not clearly thought out. However after seven years of armed struggle there has been increased recognition that in such a protracted war the people must be revolutionised. Machel is convinced of this, for he says, "The seventh year started with the transformation of our armed struggle into a revolution with intense battle to create a new mentality. The seventh year was the point of departure of conscious development of the nature of our organisation; of its development into a vanguard party with a vanguard ideology."

The first phase of the struggle was characterised by the liberation of the provinces of Niassa and Cabo Delgado and the consolidation of base areas. It also witnessed the phenomenal growth of the people's armed forces from a mere 250 combatants to a guerilla army of over 10,000 which tied down a force over six times its own strength. But precisely because of this growth, a fierce class struggle broke out within FRELIMO between those who only wanted to replace the Portuguese and those who wanted to end all exploitation. It ended with the rout of the Simango-Kavanfame faction and the victory of the forces of revolution. As a result of this struggle the Mozambican Revolution was able to vitalise itself and forge ahead.

The decision by FRELIMO to transform itself into a vanguard party with a vanguard ideology has come not only from its own practical experience, but also from the experience of countries like China and North Vietnam, where protracted people's wars resulted in a victory of the revolution because the national fronts were led by vanguard parties with a revolutionary ideology.

The move towards an ideologically-based struggle is usually the result of the recognition of the grim reality that in the early phases of the struggle it is the people who are outnumbered; it is they who have insufficient experience. It is the rulers who have superiority in arms, firepower and intelligence systems. They also have greater international support. All the guerillas have are the people, who have to be philosophically and militarily made conscious. What this means has been put very aptly by Machel when he comments that, "We are in a position increasingly to transform our growing political consciousness into a material force which will crush the enemy no matter how powerful he may be". It is this growing consciousness which has heightened the peoples vigilance, exposed subversive infiltrated agents and defeated the enemy's offensive.

One of the three tasks which Machel lists as vital in the coming period is to enhance the political consciousness of the cadres. He says, "Cadres are decisive in the implementation of our political line, our ideology. Those who have waged an internal battle against the vices and shortcomings of the past, those cadres who have already assumed our new mentality, those who hold the revolution close to their hearts, who create new ideas and fresh initiatives amongst the masses and fighters are the most vital representatives of FRELIMO. Intensifying work amongst the cadres means in fact creating conditions for stepping up ideological work among the masses ... this can only be achieved through the method of combining the practice of combat and production with study, ensuring regular discussion, criticism and self-criticism, not falling into routine, combining study with practice".

And warning against the growth of a bureaucracy, which has become a major problem in many African states, he says "We must use the democratic method of leadership, so as to reach decisions collectively and always avoid the use of administrative methods to solve political problems. By doing this work we shall create favourable conditions for the expansion of combat zones.

A recent Portuguese communique, however, claims, "As a result of massive operations, bombing of targets, assaults by commandos and paratroopers we completely annihilated the key bases known as 'Beira' and another base named 'Limpopo'. We captured 11 tons of ammunition". But these claims can hardly be believed, as the Portuguese regime, just like the Johnson and Nixon administrations, has got used to employing the 'big lie' technique. The Portuguese think that control of the press, the radio, the pulpit, etc, gives them the opportunity to broadcast one lie after another and so convince people in Portugual and the colonies that they are winning the war. Like Johnson and Nixon, they will soon learn that defeats cannot be turned into victories by issuing self-deluding communiques. According to these communiques, the liberation forces have been completely annihilated several times over.

But now it seems that even Portugal's close allies are having doubts. Commenting on two landmine incidents early this month, the *Rhodesian Herald* commented, "It has become apparent that terrorist activity in the Tete and Caborra Bassa region represents a greater danger than official communiques have disclosed. The published records have been of Portuguese success and it was stated that subversive activity in the Tete district had been on the decline ... In the continuing absence of the Portuguese to disclose the real situation, the Rhodesian authorities have publicly announced that the Tete road is unsafe".

In fact, the liberation forces are mounting offensives all along the line and the occupying forces are being forced onto the defensive. The biggest setback for the 70,000 Portuguese army has been its inability to prevent the liberation forces from crossing the Zambesi river. The Portuguese did everything possible to prevent the crossing. They deported people *en masse* to 'strategic hamlets', a euphemism for *concentration camps; they shot* and murdered peaceful peasants; their aircraft maintained constant aerial surveillance. But all these measures failed. FRELIMO commandos have crossed the river and have begun military operations in the southern half of *Mozambique.*

Reflecting Disenchantment

Nireekshak

WHEN U Thant said, in his annual report to the UN General Assembly, that the crisis in East Pakistan was one of the important problems facing the world, *Hindustan Times* promptly concluded that Bangla Desh had indeed now become "an international issue". Another weighty reason for believing so, the Delhi daily implied, was the holding of the 'international conference' on Bangla Desh in New Delhi.

Most newspapers have all along echoed the official line that Bangla Desh is indeed an issue for the "international community"; and, like the Government of India again, they have held nevertheless that it is an internal issue of Pakistan and a matter for settlement between the Government of Pakistan and the people of Bangla Desh. This confusion of thought persists in most comments even now. What leader writers and others probably mean when they describe Bangla Desh as an 'international issue' is that they would very much like this 'internal issue' of Pakistan to become an international issue, though not an Indo-Pakistan issue at the same time! Which only shows how complicated the motives involved are.

However, in spite of having helped at last to put Bangla Desh on the world map as *Hindustan Times* noted, U Thant who has generally been a popular figure with the Indian press has been severely criticised for his report. The New Delhi conference, too, and to some extent Jayaprakash Narayan personally, have attracted unfavourable criticism for not doing enough or not doing the right thing by Bangla Desh. U Thant's approach, *Amrita Bazar Patrika* said, was "clever... credulous" and could bring "solace" only to Yahya Khan. "In view of the power politics of the Big Powers, the Secretary-General has to do a bit of tight rope walking", the paper wrote, "but he is doing incalculable damage to the world body by his evasion of the grim realities in this case". He had expressed anxiety about the financial bankruptcy of the UN but "what should worry him most is the political bankruptcy of the organisation which has made itself too weak to play the role of an independent world body".

Tribune gave marginally more credit to U Thant. "Bangla Desh has now gripped the world's attention", it wrote, "and even U Thant has adopted a more realistic stand". There was realisation at the Delhi conference, *Tribune* noted, that "the time had come for 'univeral action' to alleviate human suffering caused by Pakistan's military junta". However, it went on to say, it was "futile to sustain the illusion of success in effectively mobilising world opinion" on the issue of a "political solution" of the Bangla Desh problem.

And Jayaprakash Narayan, observed *Deccan Herald,* has to realise, "regrettable" as this may be, that "moral pressure has ceased to be a force in international relations". It was "difficult to believe", it said, that the international conference "has materially advanced the cause of the suffering people of Bangla Desh.... The hope that a Government, like the one over which General Yahya Khan presides, is amenable to moral pressure is quixotic." As *Hitavada* noted, "if a firm believer in *shanti* (peace) like J P has to think in terms of an armed international brigade for upholding human rights and democratic values in Bangla Desh, lesser idealists would cease to believe that human problems can be solved through peaceful methods. Would it be wrong to say that evasiveness shown by the nations of the world in the case of Bangla Desh is only the opening chapter of greater tragedy and chaos that are in store for the world?" Frankly speaking, added the *Indian Nation,* "the unfortunate people of Bangla Desh have been let down by the world as a whole".

From the world stage to the infinitely narrower stage of the politics of Orissa is perhaps a climb-down, but things have been happening in Orissa which have shocked some and gladdened others. "The reverses suffered by the ruling Congress party in (the) Orissa" by-elections, asserted *Free Press Journal,* "amount to an incredible rout". The party had regarded the by-elections "not only as prestigious, but also as a hopeful means of installing its own Government in the state. It has received a rude shock." A thorough probe was necessary and it should be ascertained "whether the reverses are due to initial overconfidence or inherent weaknesses in the organisation". Perhaps it was "more prudent and profitable" for the party, *FPJ* thought, to try to "tone up the organisation from the grass-roots level."

Searchlight argued, on the other hand, that the results of the by-elections "clearly show that there has been a marked shift in public opinion in that state during the last six months". The defeat of the leader of the Orissa Congress (R) Legislature Party was a "particularly heavy blow" to the party's prestige. "It is not quite correct", *Searchlight* added, "to say that what has happened in Orissa will necessarily happen in all states. The political situation in all the states is not the same. But the Orissa verdict is a clear warning which the Prime Minister cannot ignore.... If undeserved and corrupt people are placed in positions of authority and power whether in the Government or in the organisation, Mrs Gandhi should be prepared for electoral reverses."

As *Indian Express* saw it, "the new Congress will take time to recover from the shock" of its defeat in Orissa. "But what should worry the New Congress leadership is that the party's debacle in Orissa has perhaps more than purely local significance. Does it mark the beginning of popular disenchantment with the New Congress, whose *Garibi Hatao* programme has so far made no difference to the life of the common man? After the Orissa by-election, one cannot be certain how the New Congress will fare in the Assembly elections to be held in several states early next year."

Black Power *vs* Power to the People

M S Prabhakar

The American Negro Revolution: From Non-Violence to Black Power, 1963-1967 by Benjamin Muse; Lalvani Publishing House, Bombay, 1970; pp xii + 345; Rs 7.

Post Prison Writings and Speeches by Eldridge Cleaver; Random House, New York, 1969; pp xxxiii + 211; $ 1.95.

Soledad Brother: The Prison Letters of George Jackson; Jonathan Cape and Penguin Books, 1971; pp 290; 35 p.

ONE of the most important problems faced by the black citizens of the United States from the time they became conscious of their political and civil rights has been (one cannot avoid using the cant phrase here) the problem of 'identity'. Take, for instance, the very nomenclature identifying black Americans as a group. Till very recently, the black citizens of the USA resented any reference to them which explicitly identified them by their colour. The proper way to identify them was as 'negroes' (only the black muslims spoke of 'so-called negroes'), a term which is now considered by most militants among them as even more insulting than 'nigger'. The word 'negro' does not even occur in the letters of George Jackson, except in a couple of places, and that too, in a pejorative sense. Cleaver too writes of 'black people', not about 'negroes'.

The origin of this identity problem can be traced to the very beginning of the struggle of the black people in the USA. From the beginning, there were, broadly speaking, two main trends in the movement of the black people, apparently mutually exclusive, but actually sharing a common ideological basis. One tended to romanticise the black man's African roots and, in some extreme instances, seriously proposed a 'back to Africa' move (a move, incidentally, which has always been supported by white racists in the US and was even at one time officially encouraged by the US government).[1] The other trend completely accepted the American ideal, and wanted nothing less than total absorption into the American mainstream, demanding the black man's legitimate share of the American pie (which George Jackson repeatedly characterises as 'putrescent' and would have no piece of it).

Both these trends had their moderate as well as their militant spokesmen: Garvey and Du Bois; Booker T Washington and Frederick Douglas. But moderate or militant, romantic Africanist or diligent American bent on self-improvement and thrift, they all thought of the black man's position in the USA and his problems within a political and ideological framework (convention politics, the two-party system, the immortality of American corporations, etc), that did not question any of the basic assumptions of the American way of life. Du Bois might seem an exception, since he joined the Communist Party of the USA towards the end of his life and since he was actually hounded out of the USA by the American ruling classes. But even Du Bois was not being very heretical, for by the 1960s the CPUSA had come to accept the American Ideal.[2] In fact, even in the bad old days when the party was actively persecuted, it had never seriously questioned the American Ideal. As far as the party was concerned, the foundations of the American nation were healthy; only the superstructure had become corrupt. Washington and Jefferson were cited in the party polemics almost as frequently (and reverentially) as Marx and Lenin, and for the CPUSA, the Declaration of Independance was almost as revolutionary a document as the Communist Manifesto. So, even Du Bois, heroic as he was in his life and achievements, handcuffed, fingerprinted and tried as the agent of a foreign power, did not question the foundations of America.

Loyal to the Ideal

Slavery was seen by all these as an aberration, a departure from the American Ideal. Of course, they were all aware of the fact that the founding fathers of the Republic were in many instances themselves slave-owners; that indeed, the Constitution of the USA (which the CPUSA repeatedly pledged allegiance to)[3] clearly gave official recognition to the institution of slavery and actually designated the negro slave as only three-fifths of a person (US Constitution, Article 1, Section 2, subsection 3). And yet, almost all the Negro leaders, including those who called themselves Communists, repeatedly pledged their loyalty to the ideal, demanding to be accepted fully as Americans. By implication, this meant that they not merely accepted the historical origins of the USA, not merely accepted its history as it was made by the majority of the white people, but further, demanded to play an active part in the furtherance of America's historical goals. It is significant that the black people have always volunteered to serve in the American fighting forces; in Vietnam, not merely is the black man 'over-represented', but he has been 'distinguished' for his fighting qualities against the Vietnamese. Such a heroic resister of white racism as James Meredith has also gone on record as saying that he considered the war in Vietnam as one of the best things that could have happened to the black man in the USA.

The problem, of course, (to go back to the beginning) lies in the ambivalence of the black man, *vis-a-vis* his remote and immediate past, his present status within the US, and his future, especially in the light of the continuing struggle in the poorer regions of the world, which, broadly speaking, have been and will continue to be 'anti-American'. There is an instinctive pull towards identifying oneself with the forces of future, but immediate self-interest demands that one should seek accommodation with the present, with the white majority. Like any other 'pragmatic' American, the black man has been trying to have the best of both worlds. The nomenclature 'Afro-American' is only one of the many examples of this ambivalence. But unfortunately for the black man, he cannot remain both an African and an American, for in the final analysis, the interests of the African and the American just cannot be reconciled. It is the unwillingness of the majority of the black people to really confront *themselves,* to accept what they are, that has caused much confusion and frustration among them in their search for freedom. The near-total surrender to a cultural ethos which had evolved under white domination has been only one of the many instances of the continuing slavery which the black people have been under in the USA.

Then, of course, there has been 'civil rights', the struggle for 'equality'. But equality with whom? Equality to continue the exploitation and suppression of the poorer people of other, distant lands? Is the 'nigger' only demanding the right to torture the 'gook', *along with his white comrade-in-arms? Unfortunately, many of the* demands put out by respectable civil rights organisations seem to amount to not much more than such rights, such *demands for 'equality'*. There was, of course, along with this dominant trend in the respectable civil rights movement, a heretical trend; but black nationalism, without a correct analysis of black society, invariably led to false romanticism, a dead-end which ultimately glorified even the most oppressive of black societies, even those black oligarchies which worked parallelly and in active co-operation with the American government. But at least in one important respect, both the respectable civil rights organisations and black nationalists agreed; they both eloquently articulated the rhetoric of the cold war; both were virulently anti-communist. Partly due to the compulsions of cold war, but even more so, due to the nature and objectives of the respectable black leadership (like that of the NAACP and the Urban League), the civil rights movement in the USA was often *more* American than the white power structure. The black leadership was loyal, self-consciously and aggressively loyal (though this did not spare the NAACP from being attacked as a 'communist outfit' by such defenders of the American values as *the HUAC).*[4] The leadership was always zealous in weeding out 'communists' and leftist dissenters of all hues, and Philip Randolph and Roy Wilkins were always quicker to see the red peril than even some white sympathisers. The ultimate gesture of repudiation of all signs of red contamination was of course the expulsion of Du Bois by the NAACP.

It was a perfectly natural and predictable act, for apart from an instinctive affinity to the rhetoric of cold war, the respectable negro leadership had developed its own stakes in the survival and prosperity of the American system. Like the large majority of the American working class which accepted (and stoutly defended) the benefits it derived from the exploitation of the 'underdeveloped' regions by the USA, the negro leadership too found that working within the system had its advantages. Their whole demand was for *civil* rights, manifest most vividly in the opposition to jim crow laws. The right to sit at the same counter with a redneck, and to have one's hair cut by a white barber, to be completely absorbed by the American mainstream — these were the revolutionary demands of the civil rights movement. And it was for the realisation of these American dreams that countless courageous and idealistic young men and women were marshalled in the years following the US Supreme Court judgment of 1954, which had declared the 'separate but equal' status (in public utilities) unconstitutional.

Radicalisation

But mass movements attain a momentum and a direction of their own, under the impact of dynamic forces released by the involvement of a large mass of people. It can certainly be said that the direction the civil rights movement has taken in the 1960s has been something that the leaders had not quite bargained for; certainly, the leadership had not been ready for the explosiveness of the movement, the seemingly sudden transformation of the meek negro archetype into a proud, scornful malcontent, ready to fight in self-defence. "Blood may flow in the streets of Montgomery before we receive our freedom, but it must be our blood that flows and not that of the white man. We must not harm a single hair on the head of our white brothers." Thus spake Martin Luther *King Jr.*[5] *But Robert Williams* was more in touch with his constituency when he organised his Deacons for Defence. In fact, Robert Williams can legitimately be considered the spiritual forerunner of the Panthers.[6] Above all, there was Malcom, who overcame the acquired criminality of his ghetto environment, but who was able to articulate the rage and aches of his people, even the lowest of them, far more eloquently than any respectable negro leader. *In a sense, Malcom and Robert* Williams have provided respectively the theoretical and practical background to the radical elements of the struggle in the USA. An increasingly large number of the ghetto youth now respond to ideas and programmes of action which a decade ago could never have been considered feasible.

But the radicals are themselves not without problems and schisms, and the recent splits among the Panthers, as well as the earlier break between sections of the SDS and the Panthers, are certainly not going to be the last. But these differences are only tactical, not fundamental like those between, say, the leaders of the Urban League and proud 'black communist guerillas' like Jonathan Jackson. Part of the reason for the dissensions among radicals in the USA lies in the very conditions under which they have to work. Being a radical in the US is a bit of a tough job, for after overcoming such problems as are presented by The Man, one has to come to terms with one's comrades as well, overcome the novelly of being hip. American society itself seems so strong, so resilient, so 'accommodating', i e, possessing the capacity to incorporate the most revolutionary kind of radical rhetoric — even radical action, within limits — within a broad liberal consensus; the system is ever ready to crush you by embracing you; it seems to have all the answers to all the questions. For the black radical, The Man and the world he has created present problems enough; but there is still another problem in the person and ideas of the white radical. During the initial stages of the movement, there was a clear coalition of the whites and the blacks, both mostly young. But since at least 1967, the black and the white, even among the radicals, have tended to work separately, though parallelly. 'Separate but equal' status continues to survive, in odd ways. The history of the SNCC and SDS, during the past decade, presents the kind of changes, the tensions and suspicions, that have characterised the relationship between the blacks and the whites in the American radical movements.[7]

If SNCC tended increasingly to get obsessed by whitey, nobody could blame them; but there was still hope for united action by both white and black radicals. The Panthers provided both an organisation as well as an ideology which envisaged such a joint attack on the enemy. And it was precisely because of this potentiality of the Panthers that they often drew upon them the mighty wrath of the American police forces, often resulting in the murder of individual Panthers. Cleaver's book helps in destroying two chief myths about the Panthers; one, that it is a party of 'reverse racists', and too, that it is only another black nationalist group. Cleaver's writings in this collection, as well as the Open Letter he wrote to Stokely Carmichael since the publication of this volume (published towards the end of 1969 in *Ramparts* repeatedly make it clear that joint action with the whites is possible, provided the comradeship is based on class. This does not of course mean that there is going to be an immediate alliance of the poor black and the poor white against the black and white exploiters. For one thing, as things stand, the 'poor white' are often among the most racist sections of American society, and the leading role in any anti-black riot in the suburbs is taken by these. But such an alliance is one of the strategic goals of the Panthers. Nor are the Panthers just another black nationalist group. No black nationalist would speak of Whitney Young in the way in which Cleaver and George Jackson do. Their distinctiveness is not merely in their contempt for 'self-improvement', but in their rejection of any possibility of coalition with the Enemy. One of the tragedies of the 'old left' in the US has been that its reformist programme has absolutely no relevance in a society which is committed to a kind of welfare capitalism. But the Panthers have revitalised the concept of class struggle, first, by refusing to enter into any coalition with the Enemy, and second, by internationalising the struggle and emphasising the identity of the struggle of the black people with the struggle waged against US imperialism in other parts of the world.

That real liberation of the black people would never come about till America itself was changed is accepted by both Cleaver and Jackson. The realisation, now taken for granted by most radicals, was slow in coming. Of the 'Big Five' civil rights organisations (NAACP, UL, CORE, SCLC, SNCC) listed by Muse in his useful survey of trends in the movement during the years between 1963 and 1967, clearly it was the SNCC which showed an awareness of the necessity for radical change in the whole system. The differences between SNCC and NAACP were not merely one of age, style, rhetoric and sexual habits, as Muse would have one believe; they were working towards quite different goals. Bob Parris, the SNCC activist in Mississippi spoke about SNCC goals thus: "The Negro seeks his own place within the existing institutional framework, but to accommodate him, society will *have to modify its institutions and in* many cases to make far-reaching, fundamental changes... The function of the white American is not so much to prepare the Negro for entrance into the larger society... but to prepare society for the change that it *must* make to include Negroes..."[8]. Muse is clearly disturbed by the radical implications of the SNCC philosophy, and he makes no effort to conceal his distaste for the style as well as the substance of the SNCC demands. His work, while useful in providing factual information about the movement during a brief period, has to be used with care; for underlying the factual survey are *certain clear prejudices*, particularly against those elements of the movement which threatened to challenge the whole system. He clearly approves of the 1963 March on Washington, the rank after rank of calm, happy, optimistic negroes, with a large sprinkling of whites, and the Graceful Presence in the White House that received them. He has nothing but a deep and abiding faith in the American Ideal, in the essential fair-play that is a feature of American character. Muse's whole account is designed to show how progress *is being made (albeit without 'all deliberate speed'), and he exhorts that* the move towards 'equality' should be speeded up. The fact that the black man has reached a stage beyond civil rights is not recognised by him. Rather, he sees the evolving political consciousness as a result of 'radical extremists' taking over the movement. He is unhappy the white establishment is not doing enough to wean the ghetto youth away from extremist mischief.

A Dead End

But the dichotomy implied in the title of Muse's book is not actually there. *From* Non-violence *to* Black Power: the sub-title implies a movement, a journey. Clear alternatives are implied, while they actually present not alternatives, but means and an end postulated by the same ideology. The people who shouted for 'Black Power' soon realised that the correct slogan was 'Power to the People', white and black. Unless such a transfer took place, mere creation of a black power structure would again lead the black man to a dead end. Carmichael was right when he said that LBJ killed the civil rights movement the moment he stood before nationwide TV and said, "We shall overcome". But he was certainly wrong when he said that "he [LBJ] will never stand before the nation and say, 'We want Black Power'."[9] For, everybody is for Black Power, and that includes Nixon, who has been striving to broaden the base *of black capitalism. So, there was* no need for Muse to feel any alarm at the increasingly loud demands for Black Power. But to be fair to Muse, the slogan did sound tremendously revolutionary, when it was first uttered. And it was uttered so menacingly, clenched fists and all, not to speak of Stokely's leather jacket and dark glasses.

Muse's distaste for SNCC did not come about after the Black Power slogan was raised; the distaste is evident from the very first chapter. This dislike is quite consistent with the cold war rhetoric that he liberally employs throughout the book (Big Four, Big Five, Infiltration of Communists and criminals, etc). It is also evident in his boundless faith in the American system, when he speaks of 'the liberal tidal wave of the Negroes' Great Day, ten days after which, the sixteenth street Baptist church in Birmingham, Alabama, was to be dynamited, causing the death of four children; two more were to die in the aftermath.

The black man's disillusionment with the procedures and established political processes in the USA has been a long, slow process. Like Eldridge Cleaver's father, most black men "woke up on *the white man late in their lives and* are very bitter to learn that they have been tricked". The near-impossibility of organising politically outside the two recognised political parties is only one of the many frustrations that any radical has to face. Traditionally, the 'Democratic' party was supposed to champion the cause of labour and ethnic groups. But it was the same 'Democratic' party which also firmly held the loyalties of outspoken racists *in the South. That great liberal* democrat Adlai Stevenson carried only nine states against Eisenhower in 1952, of which at least seven were such citadels of democracy like Arkansas, Louisiana, Mississippi, Alabama, Georgia, South and North Carolina. The black man was caught up in a situation from which there seemed no legitimate escape. You *had* to work within the established political structure, and the established political structure had *no* place for you.

In retrospect, one can say that at least the SNCC did make an attempt to work within the system; it did try to take conventional electoral politics (i e, the principle of sending up delegates to national conventions of parties, which in theory nominated the party

candidates for president of the USA) *seriously*, and working at the grassroots level, it organised the Mississippi Freedom Democratic Party (MFDP) and sent a multi-racial delegation to represent the people of Mississippi to the national convention of the Democratic party in Atlantic City in 1964. Of course, the MFDP delegation was thrown out, and constitutionalism and order were established. The temper and tone of Muse's book can be seen in his account of the events at Atlantic City. For him, the whole thing was only an 'embarrassing hassle'; "Their [i e, the regular Mississippi delegation's] status was technically more nearly legal than that of the MFDP delegation, and to allow an improvisation like the latter to participate in national convention decisions might have set a dangerous precedent."

Pure, Liberated Hatred

Well, the kind of 'dangers' that Muse saw in the MFDP challenge have themselves been overtaken by events. Both Eldridge Cleaver and George Jackson, in their own ways, are outside 'technical legalities'; they cheerfully improvise; they would never, never participate in a 'national political convention'. And, of course, they are dangerous; *so dangerous, that one has been* put away in jail for life (and now faces a death sentence)* on a charge of driving a getaway car in a $ 70 holdup; and the other had to flee the country to escape almost certain assassination by the police. Both the books present careers which one, who has no experience with the police, would consider just incredible. The accounts are also very instructive, in that they reveal how a liberal state system can practice repression in quite an efficient and ruthless manner, how practically every branch of the liberal state system is loaded against the rebel. Challenge is permitted, but only within limits. Thus, the SNCC volunteers are applauded as idealistic young men and women, and the liberal speaks of "Robert Moses's heroic summer project in the state of Mississippi". But if the same workers presented a real challenge, then they pose a threat to the "most delicate conjunction of the American political process"[10] (which is how those who are sold on American mythology view the stage-managed buffoonery, gaiety as well as the pre-arranged 'deals' and 'tensions' of the political convention), and the volunteers are expelled. It is the refusal of people like Malcom and Cleaver and George Jackson to accept the American mythology that has caused them to be outcasts. In a sense, they *are* un-American, and are quite clearly and explicitly committed to overthrowing the American political and social system. They neither ask for, nor give any quarter; it is hate that motivates them. Liberals are horrified that anyone could be motivated by *hatred;* but it has taken a long time for the black man to finally accept himself, to be possessed by some pure, liberating kind of hatred towards his oppressors.

The black man in the USA has passed through many phases: the picturesque negro, singing hymns and idiotic songs about his massa to whom he was pathetically loyal; the happy, grinning negro, lazy and licentious, the happy coloured people. As John O Killens mockingly reminds, "Harlem was the Cotton Club, fish fries, Saturday Night Functions, rent parties, after-hour joints and jam sessions. It was the land of the exotic where wealthy white folk went slumming to get their everlasting kicks. White men wrote songs about this fabulous era, this picturesque place, where 'nobody worked and everybody played'."[11] Oh, how happy everybody was, in those days! How ungrateful of the negro community to have produced *criminals* like Malcom and Cleaver and George Jackson! If only they directed their energies upon self-improvement, join the system and become better Americans! Join the Union, join the democratic party, practice coalition politics. But the rebels and the outcasts have done none of these.

The awakening has been slow in coming, and though the generation of Cleaver's father woke up too late on the white man, the generation of his children has been forced to face itself and its environment right from the beginning. Jackson and Cleaver, condemned as criminals and put away for long periods, were deliberately dehumanised and were even encouraged to cultivate criminal tendencies. But they became threats only when they became 'political', when they started relating their 'criminality' not to any subjective criminal tendencies in them, but to their objective status as an oppressed and exploited minority. There is not a trace of self-pity in either of these accounts; nor do they make any attempt to cover up the past, or be apologetic or shamefaced about it. These writings show how one can present a threat to the American establishment, and resist co-optation; how one can remain ever watchful of white gestures, and yet maintain warm personal relations with the whites, and more importantly, how while making a revolution, one also transforms one's own personal being. The words used by George Jackson to describe his dead brother may as well be applied to him; and it is clear that he too, along with many other people, is going to follow Jonathan before real freedom for the black people is going to be achieved. All Power To The People.

* This review was written before George Jackson was shot dead in Soledad prison last month.

Diversion of Long-Term Agricultural Finance

A Study of Past Trends and Future Strategy

M L Bhat

Lack of adequate long-term developmental finance has been an important factor slowing down the rate of agricultural growth. Though co-operative land development banks have partially met this need, their impact on the farm economy has been far below expectations. This has happened mainly because their credit has not been entirely used for the agreed purposes but has been partially diverted.

This paper studies the extent and nature of the diversion in some selected districts, the factors responsible for the diversion, and the policy implications of this analysis.

I

ONE of the important reasons for stagnancy in Indian Agriculture has been the lack of long-term developmental finance. This has depressed farm productivity and retarded sectoral growth. For some time now, Co-operative Land Development/Mortgage Banks (LDB) (hereafter referred to as 'Banks') have to some extent filled in the void, but their impact on the farm economy has been much less than was expected. This is mainly because their credit was not entirely used for the agreed purposes but was partially diverted.*

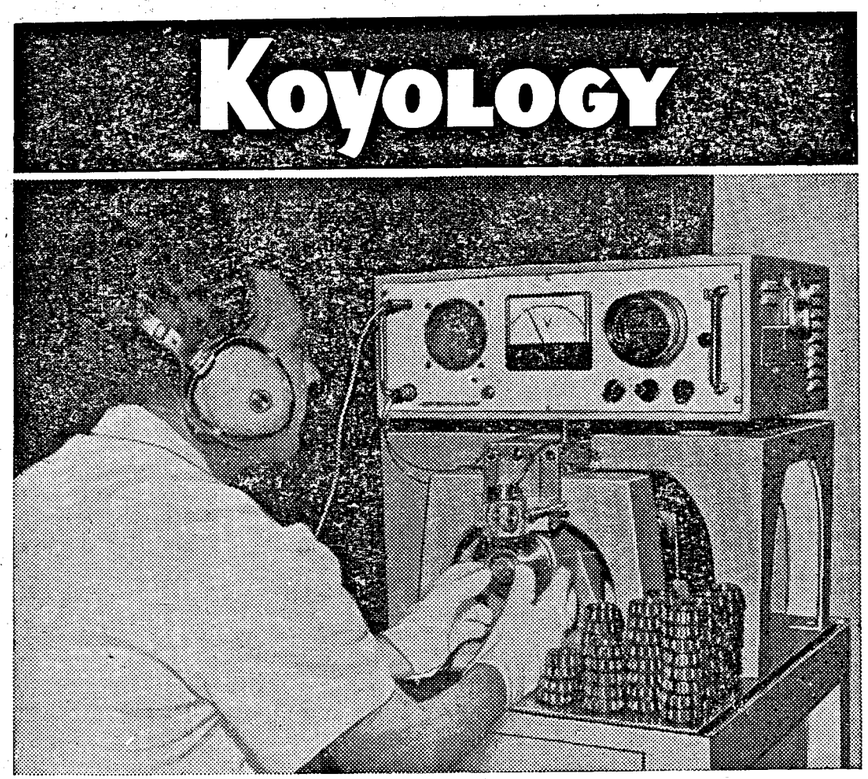
This article studies (a) the extent and nature of diversion of the long-term agricultural finance, advanced by Co-operative Land Development Banks, in 10 selected districts of five states—Andhra, Assam, Gujarat, Orissa and Madhya Pradesh; (b) the factors which have induced or compelled farmers to divert these funds; and (c) the policy implications emerging out of (a) and (b).

The discussion is based mainly on the data collected by Agro-Economic Research Centres working in these five states. These centres were required to follow similar methodology, sampling design, and manner of analysis. Two district banks with the highest loan advances were to be selected in each of these states, and from each district two clusters of villages with the highest concentration of borrowers were to be demarcated. From each of these clusters, 30 borrowers were to be selected by stratified random sampling. The reference years suggested for the study were 1966-67 and 1967-68, but wherever data for 1968-69 were available, the latest two years could be adopted.

Not all the centres adhered strictly to the specified design. Deviations were made in respect of the reference year as well as the number of borrowers. Similarly, while in four states, data for each selected district bank were presented separately, the fifth report pertaining to Assam, has combined the details of the selected districts. To ensure comparability, we have combined the data for two years in each Bank area, and used the averages for purposes of illustration.

Diversion of Funds

Land Development Banks advanced large amounts of credit in Madhya Pradesh for sinking and repairs of wells followed up by land improvement and redemption of debt, in Assam and Orissa for land improvements, and in Andhra Pradesh and Gujarat for creation and stabilisation of irrigation facilities (Table 1).



Even within the same state, there was considerable diversity in priorities accorded to the different loan purposes in selected districts. A large percentage of funds (51 per cent) were given for land improvement in Bilaspur district (MP), whereas sinking and repairing of wells and redemption of debt received highest priority in Ratlam district of the same state. In Ganjam district of Orrisa, 50 per cent of the total loan was advanced for developing irrigation facilities and 47 per cent for land improvement. But in Koraput district, land improvement alone claimed 69 per cent of the total loans. In Krishna district of Andhra, bore wells received top priority whereas sinking of wells and purchase of draught cattle received priority in Krishna district.

Extent of Diversion

The diversion of funds was highest in Madhya Pradesh, and 37 per cent of the total amount of loan obtained by selected borrowers was diverted. The proportion was much higher (41 per cent) in Bilaspur district of the same state. The corresponding percentages in Assam and Orissa were 21 and 23, respectively. In Gujarat, which is supposed to have the most efficient and progressive Land Development Bank in the country, nearly 11 per cent of the total amount was not used for the prescribed purpose. In Junagadh district, the percentage of diversion was as high as 25. Diversion of funds was the least (9 per cent) in Andhra Pradesh. But, in selected Bank areas of this state, the amount diverted varied between 12 and 32 per cent of their total advances (Table 2). The proportion of loan misutilised ranged between 20 and 25 per cent in Akola district (Maharashtra). It may be noted, however, that the estimates on utilisation of loans are based on the verbal statements of the borrowers themselves, and the amount of diversion would, in reality, have been much higher than what has been stated.

Taking together all the loan cases for particular states, and the total amount of loan diverted, diversion per borrower was Rs 1340, Rs 1043, Rs 467, Rs 289, and Rs 870 in Assam, Madhya Pradesh, Gujarat, Andhra, and Orissa, respectively. If only such borrowers who actually diverted the loan are taken into consideration the extent of diversion in each bank would be much higher.

* The term 'diversion' in this paper, connotes the use of funds (in part or full) for purposes (desirable or undesirable) other than for which the loan was originally sanctioned. This is in actually the difference between the total amount borrowed from the bank and the total amount utilised for the approved agricultural purposes. The diversions for long-term loan were observed to be of three types (a) when LDB deducts a certain amount (between 5 to 15 per cent) out of the sanctioned loan by way of share capital, compulsory purchase of rural debentures etc; (b) when it takes place at the cost of intended purpose (on investment); and, (c) when loans made available are in excess or short of actual requirements.

Bearing precision without precedence

KOYOLOGY is the science of bearing precision. It is unique and exclusive to KOYO SEIKO of Japan who invented it in their ¥1,000,000 Research centre.

Koyology utilises the norms of tomorrow to produce bearings today. Its tolerances are in terms of micro-millimetres, not in 'thous'. In raw materials, nothing but the best will do for Koyology. It will go to the end of the world to obtain them. The testing methods are the last word in sophistication. They reveal faults not only on the surface, but right down to the core. The oscillograph illustrated here, for instance, reveals noises which will escape the sharpest ear.

KOYOLOGY has come to India to produce KOYO-INDIA precision bearings. Drop a line if you want the world's finest precision bearings. Or if you want to know a little more about Koyology.

19 Others	—	—	—	—	—	—	—	—	—	—	12.90	6.42	7.33
Average diversion as percentage to total loan distributed	40.82	35.83	37.48	21.58	23.50	21.64	22.62	18.47	4.36	9.03	19.89	25.16	11.26
Amount diverted per selected borrower	753	1338	1043	1240	7060	786	870	289	186	283	281	212	467

As many as 41 per cent of the selected borrowers in Assam admitted to having diverted a part or all of the sanctioned loan. All the selected borrowers in one selected bank of Andhra, and 39 per cent and 11 per cent of borrowers in two other banks, respectively, had misused the funds. In Gujarat too, 14 per cent of the total borrowers had diverted the loan. This was the situation in other states also.

Analysis of the diversion of credit indicated no correlation between size of land holding or size of borrowing (partially indicating the asset position of the borrowers) and the extent of diversion. Instead, it was the nature of the purpose for which the loan was taken, which explained the extent of diversion.

Manner of Diversion

The scope for and the extent of diversion was substantial where borrowers were free to spend the money on their own or where physical verification of assets was not easy.

Taking all the five Banks together, one-half of the total amount of loans provided for sinking or repairing wells, the entire amount of loan for construction of irrigation channels, and more than one-third of loan for land improvements, were not utilised properly. The position varied considerably in each state. The utilisation of loans provided for bore wells, electric motors, oil engines, tractors, and sheds, was satisfactory in selected bank areas in Andhra. On the other hand, the misutilisation of loans for levelling and bunding, initial manuring, purchase of draught cattle, and redemption of old debts, which claimed a substantial amount of total loans, was quite high. Diversion was highest in case of initial manuring (to the extent of 91 per cent), sinking of wells (74 per cent), land development (25 per cent), and draught cattle (14 per cent) in Nalgonda district. On the other hand, as much as 63 per cent of total credit for land improvement was diverted in Krishna district of the same state. In Assam, the borrowers utilised, properly, the entire amount for purposes of pesticulture, but a considerable amount of loan obtained for purposes of land development (22 per cent), horticulture (28 per cent) and what is known as 'joint purposes' (28 per cent), was not used for the purpose stipulated. In Orissa, 55 per cent of the total loans advanced for land development, and one-fourth of the loan for digging of irrigation channels got diverted. In Koraput district, in particular, the entire amount advanced for development of irrigation channels was diverted. In Madhya Pradesh, also, 55 per cent of loan advanced for sinking of wells and 39 per cent of that advanced for land development was not used for specified purposes. The diversion in respect of repairs of wells might be much higher if we recognise the fact that many of the wells repaired were used entirely for domestic purposes and not for irrigation (Bilaspur). Hardly any amount was spent on fencing and construction of irrigation channels in Bilaspur district (Madhya Pradesh). Nearly, 29 per cent, each, of the total credit advances for wells and oil engines was diverted in Junagadh and Baroda district of Gujarat state.

II

Reasons for Diversions

A study of the diversions shows that there were generally four important factors to which such diversions may be attributed: (i) Absence of effective supervision, (ii) Inability of Banks to make reliable estimates of the cost of a project which gave scope for lending more or less than what was required, (iii) Restrictive lending policies which led to granting loans without fully taking into account the cost of the purpose; and, (iv) the long time-gap in disbursement of loans.

The Banks have no machinery to supervise the utilisation of loaned funds. This is left to the good sense of the borrowers. Banks pretend to act on the maxim of integrity and honesty of the borrower rather than on imposed supervision. An idea of the inadequacy of the staff can be had from the fact that the Land Development Bank in Gujarat has two supervisors for as many as 2,200 accounts or more. Even this prescribed norm is not uniformly adhered to in all cases. In Assam, supervision of utilisation of loan is the primary function of the Co-operative Inspector-cum-Secretary of the Primary Bank. In addition, the Apex Bank has provided the services of one supervisor each to Primary Banks to assist in supervising the loans. A heterogeneous group of officials, such as valuers, co-operative extension officers, and bank supervisors, is required to verify the utilisation of loans in Madhya Pradesh. But these arrangements are alleged to have remained unimplemented due to the lack of proper co-ordination. The strength of supervisory staff in Andhra is determined by the size of the loan operations of a Primary Bank. On an average, there is provision for one supervisor each for a loan outstanding of about Rs 12 lakhs, involving 495 accounts. Existing supervisory staff in all concerned banks bears no relation to the terrain, number of villages and, above all, the number of total land holders who after all are the prospective customers.

The arrangement is unsatisfactory because, even an experienced whole-time supervisor cannot attend to more than 150 to 200 cases since he is expected to look after other important activities. They have definite responsibility in canvassing of loans, achieving their allocated targets within a time limit, canvassing contribution to Rural Debentures, collecting and processing the loan applications, and also recovery of the instalments. If they complete their job, it is naturally at the expense of reliability and efficiency.

Even if, the Banks do have adequate staff, they are not in a position to supervise certain types of loans which they advance. These include purchase of cattle, repairs of wells, loans for initial manuring, land reclamation, Pati-earth, buildings etc. Verification of these components is extremely difficult. Banks do not insist on detailed estimates of cost at the time of sanction or verification.

Lack of Technical Personnel

While the Banks have developed necessary legal and administrative expertise, there is complete absence of technical personnel like engineers, agronomists, soil chemists, or economists, who could examine the technical feasibility of investment or at least lay down a broad framework for loan operations for each geographical tract to serve as a guideline for the entire field staff.

In the absence of technical guidance, an investment proposal is entertained, once it fulfils the legal and security requirements prescribed by the Banks, irrespective of its operational feasibility and the physical constraints in the area. The inadequate appraisal of investment proposals has led to over capitalisation in certain areas while in some other areas, the sanctioned amount does not fully meet the needs of the farmers. For the same reasons, loans are given to those areas where there is little justification on technical grounds.

In some cases, the state governments have provided the services of experts to the Banks. But such departmental advice, apart from being of a temporary nature, is time-consuming. Since these experts have no direct stake in the projects referred to them by the Banks, and since the Banks have no administrative control over them, their technical advice lacks necessary depth. This is borne out

y the fact that various special schemes, ormulated by the Banks with the tech-ical help of these experts, are reported o be shuttled between the Agricultural tefinance Corporation and the Banks ecause of technical flaws. Wherever, ne technical advice was sound, the lanks could not actually follow it in he field for lack of junior technical taff. Consequently, a good number of uch schemes in each state could not ake headway, and often the funds got ither blocked or diverted.

Fake Utilisation Certificates

The long-term loan, for purposes other than pumpsets and machinery, is given in two instalments. The last instalment of the loan is advanced on the basis of a certificate from village officials (such as presidents of village panchayats, village-level workers, and patwaries in Gujarat, sub-assistant registrars in Orissa*, secretaries of primary banks in Assam and Madhya Pradesh). These are individuals whose certificates are considered sufficient evidence of proper utilisation of funds by the borrower. This arrangement is, no doubt, administratively convenient and cost-reducing but, in reality, it is ineffective for preventing diversion of funds. Those who know something about village life may appreciate that, issue of such certificates is normally a matter of mutual accommodation. The borrowers as well as those who issue these certificates look upon them as mere formalities.

It is alleged that local officials issue prescribed certificates indiscriminately, quite often without ascertaining the facts, because, they cannot risk unpopularity among the villagers. Being defaulters, then, they would not offer themselves to public exposure. Quite often, the supervisor of the Bank, the village level worker, or the co-operative extension officer, having recommended an unsound case for various reasons, find it difficult to comment upon their own doing.

Yet another important reason for diversion of funds is possibility of over-financing or under-financing by the Banks. Neither the inspection reports of the officials of the Bank, nor certificates issued by local authorities and others, mention anything about the cost components or probable cost of items financed by the Banks. The borrowers, therefore, make alterations in allocating the loan funds among the different purposes depending on their needs and preference.

Closely related to the cost factor is the indifference of banks to geo-physical features. The Banks have been advancing loans for purpose of digging of wells, regardless of the type of soil. This policy is highly unrealistic—particularly for those areas where the subsoil is hard and full of rocks and the water level is low (e g, Gujarat, Madhya Pradesh, and Orissa). Because of underground rocks, the deepening of wells by means of blasting and boring becomes essential in these states. Blasting is costly and boring is risky. Neither government nor Banks have provided these facilities. Private agencies charge exorbitantly for these operations. The amount sanctioned by the Banks thus generally falls short of actual requirements.

This is seen in the fact that, 105 out of 144 borrowers in selected areas in Gujarat state had to borrow, on an average, Rs 741 per borrower in addition to what they had received from the Land Development Bank in order to complete the project. This supplementary finance accounted for 23 per cent of the total cost of the assets created. Even in Andhra Pradesh, between 85 to 78 per cent of total borrowers could not complete the proposed projects with the Bank funds. They borrowed an additional Rs 953 each, from sources other than LDB which accounted for 18 to 35 per cent of the total cost of asset. The inadequacy of the LDB funds in relation to the cost of the project was particularly high in Nalgonda district (Andhra Pradesh), where borrowers had to supplement the LDB loan by 40 per cent.

Two Alternatives

Whenever the funds were inadequate, the borrowers had two alternatives (a) to obtain additional credit which is difficult to get once all the land of borrowers has already been mortgaged to the bank; (b) to invest the available funds without completing the project and thereby block the funds; and, (c) to invest only a small amount in order to obtain the final instalment of the loan from the Banks and to divert the rest of the funds. The latter rather than former was quite common.

The diversion in the case of oil engines and electric motors, where Banks pay directly to the dealers, takes place in a peculiar manner. Dealers in pumpsets and machinery are alleged to charge borrowers between Rs 400-600 more than the market price by over-invoicing, if the payment is to be made out of LDB loans.

Overpayment of this sort may not indicate diversion in the accounting sense; nor does it signify diversion from the point of view of individual farmer. But if we take into account the spirit of the transaction, it is clear that only a part of the credit goes into capital formation while the rest goes to other agencies. Whatever is paid over and above the actual cost of the equipment is a concealed diversion.

Defective Loaning Policy

Most of the Banks (Andhra, Orissa, Madhya Pradesh) advance loans for levelling of land, raising of seed beds, bunding, and drains, without any proper examination. Similarly, loans were advanced for 'protection of land from floods' (Assam) to individual borrowers. It is not clear how an individual borrower can construct flood protection bunds without pooling with farmers in the neighbourhood. Given the local prejudices of villagers, these bunds never come up.

Moreover, loans for sinking of wells have been advanced in areas where well irrigation is either impracticable (hilly areas of Gujarat) or unsuitable (Madhya Pradesh). One can hardly expect these borrowers to invest in the projects. Banks follow this policy, for want of technical personnel, for lack of adequate and realistic regional data, and by following a hit and miss policy.

It has been found too that, when the loans are granted for joint projects, such as machines and machine-rooms or the well and the machine simultaneously, a part of the fund is paid directly to the borrowers. In such cases, the actual investment is much less than the amount disbursed.

In Andhra, long-term finance for reclamation of land is given at fixed rates. But the cattle component of the loan has flexibility. This often leads either to the diversion of the cattle component or to additional borrowings from non-institutional sources.

Bulk of the loan for wells is advanced in June, presumably in order to include them in the year's 'progress' made by the bank. But farmers are unable to use the loans because of the inopportune timing from the point of view of their operations.

Even the size of the instalments failed to conform to the actual needs. The first part of the well construction required between 60 to 70 per cent of the loan being advanced by the Banks for this purpose. But the Banks released only 50 per cent of the loan. In addition, some deductions amounting to nearly 15 per cent by way of share capital, compulsory purchase, of rural debentures were officially effected from even the 50 per cent of the loan released.

Hush and Reception Expenditure

The procedure of loan disbursement is quite lengthy. Except in Gujarat where between 47 and 77 per cent of the loan applications were processed in the relatively short period of three months, the time lag in disposal of loan cases was quite long in four other states. In Assam, only 3 per cent of the applications were processed within six months. Even in Bilaspur (Madhya Pradesh), only one fourth of the total applications were finalised during the corresponding period. The number of applications which were not finalised even for two years was quite substantial in Madhya Pradesh, Orissa, and Assam (Table 3). It is obvious that, once the funds are not made available at the proper time, the farmers cannot resist the use of the money in the alternative way he prefers most.

To expedite the loan cases at different stages, the farmers had to make frequent visits (between 5 to 30) to headquarters of the Banks and other offices. To meet, what may be called 'hush expenditure' and 'reception expenditure', an average borrower was found to have spent Rs 189, Rs 42, Rs 53 and Rs 30 per loan, in Gujarat, Orissa, Assam and Andhra, respectively. In Assam and Orissa, each borrower had to spend Rs 61 and Rs 19, respectively, in order to get a loan of Rs 1000. Nearly 45 per cent of borrowers in Madhya Pradesh, and between 55 to 78 per cent of borrowers in Andhra Pradesh had to incur such costs. In other states, too, this practice was quite common.

Farmers, particularly with small holdings, obtained fresh loans from money-lenders at an exorbitant rate of interest, of 3 per cent a month, to meet such unscheduled costs. The longer the delay in disbursement of the loan, the greater is the amount of interest to be paid to the money-lenders, and such money is inevitably paid out of the money advanced by Land Development Banks. Thus a good part of the loan is diverted for the purposes of repayment of loan incurred for the purpose of securing the loan from Banks.

The scope for misutilisation of loans is quite high because the practice of Banks of taking land as security is quite illusory in the rural context. For reasons of existing land laws, Banks are generally unable to auction the land mortgaged with them, because there are no buyers of such 'disputed' lands at the village level. Even when the Banks finally decide to acquire the mortgaged land, there is a provision (as in Gujarat) that, after acquisition of land, it should be handed over for cultivation to the owner and the recovery of outstanding loan realised from the proceeds of the farm. But this creates problems of supervision for the Banks. Therefore, Banks generally refrain from taking this step. Knowing well the helplessness of the Banks, and being sure that land will ultimately be handed over to them again, the farmers feel free to use the funds as occasion demands.

III

Strategy for Future

The preceding discussion highlights the fact that LDBs will have to take various corrective measures, both on organisation as well as at procedural levels to improve their operations and to put a stop to the present misutilisation.

The immediate need is to employ additional supervisory staff wherever the existing staff is found inadequate for processing of the loan cases and supervision of credit. There should be one supervisor per 150 to 200 accounts. Besides, wherever possible, their functions should be allocated such that a supervisor has to look after only one aspect of the loan operation. The sooner the multipurpose character of the supervisors is ended, the better it will be for both the LDBs as well as the borrowers. Till this is done, a cadre of roving supervisors could be created at the apex banks, and their services made available to those primaries/branches where workload is higher.

The responsibility of enforcing proper utilisation of credit should be entrusted, as a matter of policy, to a single agency of the Banks instead of the heterogeneous group of state officials, as happens at present in some Banks.

To lend some genuineness to the 'utilisation certificates' as proofs of the borrower having utilised the loan, the by-laws of the Banks need be amended so as to enable the Banks to recover the entire amount of loan from certifying authority in case the misutilisation of such loans (in part or full) is exposed and proved at any stage. This should apply equally to Bank personnel and to those outside its administrative control.

The Banks should, as a matter of policy, advance adequate credit to cover a particular project, keeping in

* There is only one sub-Assistant Registrar for each Primary Bank who is solely in charge of issuing utilisation certificates to the borrowers. It is physically impossible for one officer to verify a large number of cases spread over a number of villages.

Table 3 : Time Taken between Date of Application and Date of Receipt of Loan

(Percentage)

Disposed between Months	Assam	Orissa			Madhya Pradesh			Gujarat		
		Total	Koraput	Ganjam	Total	Bilaspur	Ratlam	Total	Baroda	Junagadh
Upto 3 months	1.70	14.36	16.33	13.75	—	—	—	67.60	53.05	72.30
3 - 6	1.70	17.15	14.29	17.98	46.24	21.66	70.84	21.28	33.80	17.20
6 - 12	11.70	40.62	30.05	43.72	30.44	41.66	19.16	11.12	13.15	10.50
12 - 24	38.30	21.02	29.14	18.65	23.32	36.68	10.00	—	—	—
24 - 36	15.00	5.93	9.32	4.95	—	—	—	—	—	—
36 - 48	8.30	0.92	0.87	0.95	—	—	—	—	—	—
48 and above	23.30	—	—	—	—	—	—	—	—	—
Total	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00	100.00

view the natural and geographical variations. A rigid and uniform policy is neither a virtue nor a necessity. Banks can do it if they have the benefit of advice of an expert body consisting of agricultural experts, engineers, hydrologists, geologists, etc, who can prepare a blue-print of credit operations indicating (a) areas of development in different areas (b) priorities of development and scale of finance in each area and (c) technical advice.

In each Bank the expert body should be supported by a strong and active research and planning unit which should carry out area studies to collect the basic data, regarding cropping pattern, prices, income and expenditure, soil types, irrigation potential etc. Decisions based on reliable regional data, are then likely to be objective and realistic.

To introduce dynamism in the operation of the Banks, a research organisation on the lines of the Plan Evaluation Organisation of the Planning Commission, Government of India, should be set up under the All India Co-operative Land Development Banks Union, which should apprise at regular intervals the loaning policies of the Banks and its impact on agricultural development. This will, at one end, bring together the lender and the borrower, and, at the other, keep the Banks on guard.

The disbursement of loan for construction of wells in two instalments should be continued. But a revision of the cost estimates should be undertaken before the disbursement of the second instalment of the loan. If at that time, the cost is found to be higher than the sanctioned loan, an additional amount may be sanctioned without stipulating any conditions or without asking for additional security. Conversely, if the loaned funds exceed the actual cost, the second instalment may be scaled down proportionately.

Change in Valuation of Land

The rationalisation of the method of valuation of land is necessary. The present method of land valuation by banks, based on the land revenue rates, is not unscientific and unfavourable to the farmers. Worse still, farmers get just 27 to 50 per cent of the already underestimated value of land from the LDBs.

A scientific method of land valuation has to take into account different factors affecting farm income, including soil type and its input absorption capacity, cropping pattern, crop yields, and the price trends, which fall in the field of farm management. True, consideration of these factors for each farm may prove quite difficult and highly expensive for the Banks. Therefore, to start with, a compromise solution may be adopted. The Banks may, with the help of technical experts, divide each area (block or district) on the basis of homogeneity of the agricultural situation. For each homogeneous tract, Land appraisers may determine the average value of land separately for dry/irrigated land, which may serve as a standard, and the individual cases in the tract may be decided in the context of the standard. The extent of arbitrariness in determining the value of land, even under this arrangement, can be minimised by fixing the credit limits beyond which the actual value of land should not deviate from the average value of land in the tract.

The situation may improve, if the Banks increase the credit limit of borrowers to at least 80 per cent of the value of hypotheticated land. This is quite consistent with the safety and the interests of the Banks. Adoption of the new technology by a large number of farmers has made the task of Banks much easier.

In combination, loan proposals should be disposed of within 45 days of their submission. Disbursement of loan within a reasonably short period would reduce the cost of loan, increase the scope of its full utilisation, and be helpful to individual borrowers in removing their long felt grievances against the financing of Land Development Banks. For this purpose, Banks may not press for certain documents which are operationally redundant. As far as essential records and certificates are concerned, the Banks may arrange these through their own staff and charge a reasonable amount from the clients.

Reorientation of Loaning Policy

For reducing the possibility of diversion of funds advanced for sinking of new wells, loans should be given in those areas where the chances of striking water are technically assured. Again, to ensure that borrowers are able to dig wells with the sanctioned amount, each Bank may consider purchasing of a few blasting rigs to facilitate the sinking of wells in rocky areas. To finance this new venture, Banks can create a 'special fund' to which a specified amount could be deducted from each loan advanced or from the annual bonus payable to the shareholders. Knowing well the utility of this equipment, farmers may not grudge unorthodox deductions. The Banks, and even the state governments, can contribute to this fund on a matching basis.

It is also worth considering, if Banks can form a 'risk-sharing fund' to which Banks, government, and borrowers, would contribute. Proceeds from this fund could be used to supplement the resources of genuine cases where the initial Bank loans is not sufficient to complete the project on account of unforeseen natural conditions. This will leave the financial interests of Banks intact and, on the other hand, induce the farmers who are otherwise likely to divert the funds, to complete the project.

Loans issued for levelling of land, raising of seed beds, raising of bunds, and construction of drains, without any estimate, are very indefinite and misleading. The Banks should not, as a matter of policy, encourage such loans, except in special circumstances. It is felt, that, farmers can finance some of these items from their own resources.

Regulation of Price

The diversion of loans in the case of oil engines or overfinancing can be curtailed if Banks are authorised to regulate directly or indirectly the price as well as quality of the machinery. This can be done by empowering the Bank (a) to restrict the number of suppliers on area basis; and (b) to grant licences to suppliers against a suitable security, liable to be forfeited in case of contravention of terms and conditions of licence. Alternatively, the Banks may consider making bulk purchases of machines from recognised firms and supplying these to the prospective buyers. This unorthodox step will not only ensure the supply of standard equipment but also make entry of dubious agencies and their substandard products difficult. It is rather ironical that Banks, in spite of being the biggest indirect purchasers of the pumps and engines, have to rest content with the terms dictated by private agencies. The farmers, the financing agency, and the whole economy thus lose.

The ultimate security of the loan is effectively ensured by the flow of income (and, therefore, saving) generated by the use of funds provided by the LDBs. Unless the money is properly used, the flow of fresh income and, therefore, recovery of loans is adversely affected. It is in the interest of the Banks to reduce the extent of diversion of funds by strengthening and activising their own administrative machinery and by adopting realistic, broad-based and sound loaning policies consistent with the regional needs.

Desirable Features in a New International Monetary System

C Rangarajan

The new international monetary system that is being hammered out in Washington now must build on the lessons learnt during the 25 years of experience of the Bretton Woods arrangement.

Beginning early Sixties a major concern with international monetary experts has been the adequacy of international reserves to enable international trade to grow without restrictions. Many steps taken in the past indicate that the shortage of reserves is not a myth. The present dollar crisis more than any other incident that occurred previously has forced attention on the adjustment mechanism that must go along with a system of fixed exchange rate system. Another complication noted in the working of the IMF system arose from the dollar being treated as a reserve currency.

It is suggested here that the new monetary system that emerges must be composed of the following three elements :

(1) The authority to 'create' additional reserves through SDRs, when necessary ;

(2) Introduction of the 'band' proposal so that rates are allowed to fluctuate over a wider margin than is permitted now ; and

(3) A machinery for examining and advising the proper parity among currencies.

The ability to enlarge the reserves coupled with the scope for larger fluctuation in the exchange rate would make the system more viable.

A modified fixed exchange rate system such as the one envisaged alone would require India to decide on the currency to which the rupee should be tied.

THE new international monetary system that is being hammered out in Washington now must build on the lessons learnt during the 25 years of experience of the Bretton Woods Arrangement. The system of fixed exchange rates has run into severe difficulties in the last few years. The periodic crises that developed were solved only by rising huge sums of money to prop up the currencies under attack and the countries involved also sought to introduce more and more controls. The current crisis is however qualitatively different because by unilateral action, the United States has knocked out two of the important features of the present system. The Bretton Woods Conference went in for a system of fixed exchange rate because such a system was considered as most conducive to a rapid growth of international trade. However, unlike gold standard, the system provided that in case of chronic difficulties member countries could readjust the par value of their currencies. That is why the system came to be known as a system of "adjustable peg". To this must be added another feature which was the declaration of the United States that it would be willing to convert dollar obligations held by foreign central banks into gold at a fixed rate of $ 35 per ounce. The Nixon announcement has broken the link between the dollar and gold and it has also let the dollar float moving away from a system of fixed exchange rates. It is not, however, the intention of the United States to take the world to a system of freely fluctuating exchange rates. On the other hand, the whole set of measures is designed to go back to a system of fixed exchange rates with a readjustment of the parities. However, in framing a new scheme of international monetary arrangement, it is not enough to take into account the present crisis. One must look at the history of the last 25 years and find an arrangement that is capable of meeting the various kinds of difficulties that arose at different times.

The literature on the subject of international finance is legion. Experts in the field of international economics, practitioners in the field of foreign exchange business and the officials connected with various governments and international bodies have written extensively on the various problems relating to international monetary arrangements. The purpose of this paper is simply to pin point some of the weakness and difficulties that came to surface in the working of the IMF Agreement and to indicate the directions in which a solution must be sought.

I

Shortcomings of the IMF System

Adequacy of International Reserves

Beginning early sixties a major concern with the international monetary experts has been the adequacy of international reserves. The term international reserves is taken to include the member countries' holdings of gold and foreign exchange assets (primarily dollar) and the gold tranche position in the IMF. The question of adequacy has largely been discussed in terms of the relative growth of these reserves and international trade. It has been pointed out that between 1954 and 1966 international reserves grew at an annual rate of 3 per cent while international trade grew at 8 per cent per annum.

The purpose of holding reserves especially in a system of fixed exchange rate is to enable member countries to tide over temporary difficulties in the balance of payments without having to make drastic changes in the internal policies. Lack of adequate reserves could therefore lead to abrupt changes in the domestic situations of member countries. In the immediate post-war years with the acceptance of dollar as a reserve currency, the deficits of the US provided a means of enlarging reserves. However, with the continuing deficits of US the confidence in the dollar was eroded and therefore US deficits became a less important source of enlarging the reserves. Many economists have drawn attention to the weakness of an international monetary system where a national currency becomes a reserve currency.

It must be obvious to any one that

the question of adequacy is closely tied to the adjustment mechanism. A system in which the adjustment mechanism works poorly would require a larger level of reserves. The freely fluctuating exchange rate system would of course require no reserves even as a fixed exchange rate system which demands a strict adherence to certain disciplinary measures could get along with smaller volume of reserves. Given the present temperament of member countris to regard domestic considerations as paramount, the attention given to the problem of adequacy of international reserves is not unrealistic. It must also be pointed out that the inadequacy of reserves was not felt uniformally. Between 1954 and 1965 the reserves of the Group of Ten as a whole increased around 3 per cent per annum while the reserves of the Group of Ten excluding the USA and UK rose by 9 per cent per annum. It is therefore no surprise that some European countries talk more about the embarrassment of riches rather than of scarcity.

The shortage of reserves however is not a myth as evidenced by a number of steps taken by the IMF to augment international reserves. The General Agreement to Borrow made an addition to the pool reserves. The 'Swap' arrangement between central banks, an increase in the quotas of member countries and last but not the least, the creation of Special Drawing Rights were all steps taken into the direction of increasing the reserves. The SDRs or paper gold as it is popularly called is a bold innovation since this was the first attempt in the world history to generate international reserves by 'created money'. Many European countries blessed with increasing reserves were not very enthusiastic about creation of SDRs even though they finally came round to accept the proposal. The working of IMF in the last 25 years does indicate that a system of fixed exchange rates can run into the problem of inadequate international reserves and any new arrangement must contain a facility which can take care of such situations.

Adjustment Mechanism

As already mentioned the IMF Agreement provides that in the case of 'fundamental' disequilibrium, member countries can alter the par value of their currencies. Except for this there is no adjustment mechanism specified in the Agreement. It has not laid down any rules to be followed by surplus and deficit countries to correct imbalances. The present dollar crisis more than any other incident that occured previously has forced attention on the adjustment mechanism that must go along with a system of fixed exchange rate system.

A system of fixed exchange rate can function smoothly only if the parities are properly set. In the present situation, the US feels that Japan and West Germany and to some extent other West European countries must revalue their currencies upward consistent with their balance of payments surplus in relation to US. The European countries on the other hand, contend that the US Government has not done enough to put its economy in order, consistent with the deficits in the balance of payments. It is further contended that if the US is unwilling to apply any restrictive measures on the internal economy, it should be willing like other deficit countries to devalue its currency.

The gold standard was a typical example of a fixed exchange rate system. But theoretically at least the system had an adjustment mechanism built into it. As the text books used to say: The golden rule of the gold standard is "Expand credit when gold is coming in and contract credit when gold is going out". Many writers have argued that this rule was not in fact practised faithfully even during the hey days of the gold standard mechanism. However, it goes without saying that the fixed exchange rate system can function only if corrective measures internally are undertaken whenever imbalance makes its appearance. The time for introducing corrective measures can be postponed to the extent that a country has a large volume of gold reserves or foreign exchange holdings. Alternatively as it happened for almost 15 years after the establishment of IMF, the deficits of USA did not cause much concern as surplus countries were willing to hold dollar as a reserve currency. When there are no automatic rules to follow under conditions of surplus and deficits, a system of fixed exchange rate can function effectively only if there is a certain amount of understanding and mutual co-operation among the countries participating in the system. In the current crisis, the US believes that in view of the past contribution it has made to the recovery of the European countries and Japan, it is entitled to a considerate treatment. It also feels that Japan has built up its massive surplus in balance of payments without liberalising import restrictions. The 10 per cent surcharge on imports which the American administration has imposed is specifically intended to bring home this point. Thus while the US is asking the surplus countries to revalue their currencies upwards the European countries and Japan want a devaluation of the dollar.

The crucial question that has come up therefore is the proportion of responsibility to be borne by the surplus and deficit countries for the imbalances that may arise. Also if the adjustment of parities is considered the most important means of bringing about a balance, what role does IMF itself play in the setting up of parities? In the past the IMF (and much more so that World Bank) has taken the initiative in advising a number of developing countries to devalue their currencies to correct their imbalances. It looks as if the IMF will have to play a much more direct role in relation to all countries with respect to the fixing up of parities. However, too frequent adjustments of parities would take away all the advantages of a fixed exchange rate system. Thus the new system must be more explicit than the current system on the adjustment mechanism.

Dollar as a Reserve Currency

Another difficulty noted in the current working of the IMF system is the role of the dollar as a reserve currency. In the immediate post-war years, when the gold holdings of USA amounted to $26 billion, the deficits of the US did not cause much concern and many surplus countries preferred to hold dollar obligations than gold. However, the emergence of a national currency as a reserve currency is rooted in a contradiction. While deficits create such reserves, the continuance of deficits beyond a point undermines the confidence of the currency also. This is what has happened to the dollar. The official dollar holdings of foreign central banks which showed a steady increase upto 1964 increased only very little between 1964 and 1968. Since 1968, there has been a further increase in official dollar holdings, prompted more by political rather than economic considerations.

One of the complaints of European countries, particularly France is that the use of dollar as a reserve currency has enabled the US to incur deficits without being compelled to take any corrective measures.[1] There are also other complications. With large dollar holdings held by a number of central banks, a decision for example to devalue the dollar in terms of gold, would mean a depreciation of the value of these assets. People in this country can recall that the British decision to devalue the pound by a substantial margin in 1949 meant a large reduction in the value of our sterling balances in terms of dollar.

The development of dollar as a reserve currency was a 'natural' phenomenon. It was not imposed on any central banks. Perhaps given the present position of dollar, there would be a definite discouragement to the growth of dollar as a reserve currency. Faced with inadequate growth in reserves, there was a suggestion in the early sixties, that many strong currencies could also develop as reserve currencies. The experience of the last two decades points to the desirability of preventing the emergence of national currencies as reserve currencies than encouraging such a practice.

II

The New System

In working out a new arrangement, there are two questions to be answered. One is whether the new system should be based on fluctuating exchange rate, or a fixed exchange rate as it is now operating or a modified fixed exchange rate which allows a greater degree of fluctuation than is permitted under the present system. The second question is regarding how the parities of various currencies should be fixed. The second question does not arise if the answer to first question is fluctuating exchange rates system. But if the answer is any of the other two choices, the second question becomes extremely relevant and important.

Fixed or Fluctuating Exchange Rate

Many influential economists in the US feel that the way out of the difficulties of the IMF system is to go for a system of fluctuating exchange rates. Such a system will do away with the need for holding any sizeable amount of reserves. Depending on supply and demand for currencies, the rates will fluctuate.

The experience of the world in fluctuating exchange rates system is limited. The experience of inter-war period in this regard is not a fair analogy. The contention of economists who do not favour such a system is that speculation in foreign exchange market can be destabilising. The supply and demand curves need not be as 'well behaved' as we normally visualise them to be so, that deviations could be cumulative. More than the academic economists, the professionals in foreign exchange business fear the consequences of a fully fluctuating exchange rate system.

It may be pointed out as an aside that this question of fluctuating versus fixed exchange rates system is not relevant to countries like India. We have no free foreign exchange market wherein we allow the unrestricted supply and demand conditions to be reflected.

The adoption of a fluctuating exchange rates system even by advanced countries appears to be remote. But there may be a move towards a modified fixed exchange rates system.

We have already noted the difficulties of operating a fixed exchange rates system which demands no immediate action on the part of surplus and deficit countries. It has therefore been suggested that a widening of the limits within which the rates can be allowed to fluctuate can be a good compromise between rigidity and flexibility. This is known as the 'band proposal'. Under this system exchange rates are allowed to fluctuate within a wider range or 'band' than the very narrow margins that are now permitted. This proposal, like the gold points under gold standard establishes two support points. Fluctuations within the band can indicate the basic strength or weakness of any currency. There is of course the theoretical possibility that the rates can get stuck at the support points. However, if the parities are set up properly and if the right width is chosen for the band, this need not happen.

The 'band proposal' is worth a trial. However, if the band spread is fixed too wide it almost becomes a fluctuating exchange rates system. The present temporary phase of floating of currencies could give a clue as to how wide the band should be. Perhaps five per cent on either side could be the maximum one could think of. The introduction of such a proposal would call for a more active forward exchange market. The cost of hedging would become high only if the experience turns out to be one of a high degree of fluctuations in rates.

Realignment of Parities

Any type of fixed exchange rates system including the 'band' proposal would require immediate attention to be paid to the question of realignment of parities. This is what has precipitated the present crisis. Here again we need to distinguish two issues. One is to fix right now the 'correct' parities and the other is to evolve a method or mechanism for solving such questions on a periodic basis.

It is rumoured that the IMF Staff has examined the balance of payments situation of the leading industrial countries and has arrived at the extent of revaluation or devaluation for each currency. The claim of the US that the surplus countries should revalue their currencies while the dollar in terms of gold will remain where it is now cannot be accepted. Whatever may be the reasons, the deficit of US has become chronic. Hence some extent of devaluation of the dollar becomes inescapable. Since the US has imposed an import surcharge of ten per cent, that can be taken as the level of devaluation that it called for. Since most of the countries having dollar holdings have themselves suggested a dollar devaluation, it means they would not mind the depreciation in the value of their dollar holdings in terms of gold. It must be clearly understood that the suggestion for increasing the price of gold is not motivated from the angle of increasing the availability of international reserves. The problem of adequacy of international reserves should continue to be handled by the regulation of the issue of SDRs. It goes without saying that the US must withdraw the surcharge on imports.

As part of burden sharing, the surplus countries on the other hand should agree to a revaluation of their currencies.

If crises like the one that we are witnessing today are to be avoided, the IMF must play a more active role in prodding and getting countries agree to reasonable parities. There have been even suggestions that the 'band' proposal should be combined with 'crawling' parities so that when rates get stuck at any one of the extreme points the parities must automatically be changed. Even if such changes are not made automatic, they would atleast provide a cue for further action.

A revision of rates will come only after hard bargaining. No country is going to be quite willing to revise its par value upwards. The ten per cent import surcharge imposed by the US administration is presumably a tool for extracting concessions from other countries. Many decisions connected with IMF have been political starting with

quota allocation. But if all countries are to gain from a system of a fixed exchange rates, some give and take is necessary. The adoption of a 'band' proposal will to some extent minimise the need for international reserves. But this should not preclude the creation of SDRs as and when necessary.

It is suggested that the new monetary system must contain the following three elements:

(1) The authority to 'create' additional reserves through SDRs, when necessary;

(2) An exchange rate system where rates are allowed to fluctuate over a wider margin than is permitted now; and,

(3) A machinery for examining and advising the proper parity among currencies.

While the immediate attention of the experts is going to centre around the second and the third elements, the importance of SDRs as part of the long term arrangement should not be lost sight of. The quantum of SDRs to be created in any given period can be determined only by mutual consent among all members. In fact there is urgent need to re-examine the basis on which the SDRs are distributed. The IMF quotas are an inappropriate basis for the distribution of 'created' reserves. Under the original arrangement since the quotas determined the composition of the pool of currency available with IMF, there was a justification for allocating larger quotas to industrially advanced countries with convertible currencies. But this basis has no validity when reserves are created to be distributed to meet 'liquidity' needs. That more careful attention was not given to the basis for distribution may be deemed an unfortunate necessity to gain acceptance of the Scheme initially. This need not be the case, however, for future distribution.[2]

Mutual Settlement

It was suggested earlier that in rearranging the parities it may become necessary to devalue the dollar in terms of gold. But the devaluation of the dollar can however raise an important issue as to how to handle the existing dollar holdings of foreign central banks. With the devaluation, the US may not be willing to restore the convertibility obligation between dollar obligations and gold. The problem can be solved only by mutual settlement between those countries and the US as was done in relation to sterling balance between the UK and other Commonwealth countries. Some estimates put the dollar obligations held by the other countries at $ 50 billion. A settlement of this huge amount is not going to be an easy matter.

It must also be noted that the 'band' proposal is not a 'fool proof' arrangement for correcting disparities in exchange rates that may arise. It does two things which the fixed exchange rate mechanism does not do. First, this allows for some adjustment in the exchange rate without a 'stigma' being attached to a fall in the value of the currency. It becomes part of the system. Questions of prestige are not entirely outside the realm of international finance! Second, it provides a clue to further action, as pointed out earlier, when the rate falls or rises to the support points. In this sense it performs the same function as the inflow or outflow of gold. If the 'band' proposal had been in force for the last ten years, the dollar in relation to yen would have fallen to the lower supporting point and would have stayed there. In that situation it becomes easier even for an international organisation to ask for a change in the parity. Thus the 'band' proposal reduces but does not eliminate all the problems that arise in readjusting parities. If countries consider their parities with other currencies as 'sacrosanct' there is no escape from trimming the internal economy according to fluctuations in the balance of payments.

Implications for Developing Economies

On the question of determining the appropriate parities between the dollar and the currencies of Europe and Japan, India and other developing countries could exert very little influence. But on the general pattern of the system to emerge they must put forward their views.

The problem of inadequacy of international reserves is not confined to the industrially advanced countries. Developing countries face a purely 'liquidity' problem apart from their developmental needs. The introduction of SDRs was a bold innovation and the developing countries must see to it that no damage is done to this scheme.

As mentioned earlier, the facility to allow exchange rate to fluctuate within a band will have no particular significance to currencies like rupee because there is no free foreign exchange market. However, the introduction of such a proposal will raise some other problems for countries like India. India must, for example, decide the currency to which it should be tied. If it is tied to dollar at a fixed rate, then the rupee would fluctuate in relation to sterling, say, according to the fluctuation in dollar-sterling rate. We face right now a problem and we have decided to stay with dollar. This is easy enough to decide since the dollar is losing in relation to other major currencies. This implies a *de facto* devaluation in relation to other countries. However, things could change and dollar can firm up against other currencies. Thus logically a decision should be made on our expectations of the behaviour of the currency with which we decide to link the rupee. Besides this, there are three other factors which are relevant the direction of our exports and the elasticities of demand for our exports in different regions, the composition of our international reserves and the burden of repayment in different currencies. But the issue of which major currency to which the rupee should be linked must be taken up for periodic examination if any modified system of fixed exchange rate is introduced as part of the new international monetary settlement.

Notes

1 Writing in 1967, Otmar Emminger, one of Europe's best known central bankers pointed out that between 1964 and 1966, the official dollar holdings of foreign central banks decreased by about $ 1 billion. He adds: "This means of course that since 1964 the United States has no longer had any help from the gold exchange standard which for all practical purposes has been dead since 1964...Nevertheless—and this is most significant—the fact that the United States has been since the end of 1964, in effect, no longer on a gold-exchange standard but on a pure gold standard has not had any perceptible impact on the balance-of-payments adjustment policies of that country. This must give us some food for thought regarding the alleged balance-of-payments discipline entailed by being on a pure gold standard." See Otmar Emminger, 'The Gold Exchange Standard and the Price of Gold' in Randall Hinshaw (ed), "Monetary Reform and The Price of Gold", p 100.

Provisional Population Totals of the 1971 Census

Comment—I

S Raghavachari

WHEN the first results of the census are out after a long wait it is a natural temptation to look for the extent of the coverage error by comparing the census totals with similar data drawn from other available sources like the Houselist and Population Projections. Such external comparisons are always fraught with the danger of leading to untenable conclusions unless the relative merits of the different sources are kept note of and the analysis is built on valid foundations. Pravin Visaria in his article "Provisional Population Totals of the 1971 Census: Some Questions and Research Issues" (July 17, pp 1459-65) recognises these dangers and puts in a word of caution here and there but still the comparisons he has made tend to give a stilted picture of the accuracy of the provisional census results. The purpose of this rejoinder is, therefore, to put the census in proper perspective *vis-a-vis* the other sources of data with which Visaria has compared it.*

No doubt the census has in the nature of things a certain unavoidable net under-count built into it. Public awareness of this fact is amply revealed by the numerous letters and news items in the papers during and soon after the census enumeration. It is to evaluate the extent of this undercount that a Post Enumeration Check has been conducted on a sample basis immediately after the census date.

Basic Premise

Even so, compared to the houselist and the projections the provisional census data provide the most reliable snap-shot of the population to-date. An analysis of the census results at present should, therefore, start with this basic premise and discuss the question why the population figures from other sources like the houselist and the official projections differ from the census figure.

Generally in any statistical comparison of similar data from two sources, the scientific approach should be to designate the series which has been assembled with greater care and attention as the "truth" and then to pit the other series against it. While doing so a word of caution is, of course, necessary that the comparison is conditional on the relative accuracy of the series which is designated as the "truth". With this basic rule in mind let us now discuss how justifiable is the claim of the census provisional total to this position relative to the houselist and the projections.

Only those who have participated in the census-taking could really appreciate the superhuman efforts made to obtain a complete coverage of all the normal residents of a household. It is not true to say, therefore, that nuances in instructions regarding enumeration of persons has had a limited influence on the enumerators, as has been implied by Visaria in his paper. A casual omnibus question on how many males and females are living in the household as was put during the houselisting operations, has a large error content of unknown magnitude. In fact, if the houselist was expected to give an accurate count of the population, the cent per cent count embarked upon subsequently could have conveniently been replaced by an effective sample survey for the tabulation of the other characteristics of the population! To get an accurate account of the population is *not* the aim of the houselisting operation at all. The complex system of enumeration is split up into two distinct stages each aiming at one aspect only of the census at a time, *viz*, complete listing of the houses and households at the time of houselisting to serve as a frame for the second stage, namely, achieving a complete enumeration of persons at the time of actual census taking. It is pertinent to mention here that in order to ensure as complete a coverage as possible at the 1971 census systematic efforts were made in all the States to prepare notional maps of every village/town identifying the location of every house therein. The population data collected in the houselist, therefore, are intended only to give a rough estimate of the spatial distribution of the population necessary for carving out enumeration blocks of roughly equal size, to aid in planning the printing of forms and to get an idea of the room/population ratio which is an indicator of the acuteness of housing conditions.

Crude Estimate

The houselisting was done in most of the States during 2-3 consecutive months spread over a long period of three quarters of a year from March to November 1970. The population according to the houselist presented by the Registrar General in his paper on 'Provisional Population Totals' is rather a crude estimate built-up by averaging the population over the period of houselisting in a rough and ready manner. In fact the foot-note to the relevant table explains the way the houselist population shown therein had been estimated. Visaria recognises these limitations, as he himself states that "the results of an attempt to record only the total male and female may not elicit as complete information as enumeration in which the names and characteristics of each member of the household are recorded". The Registrar General had presented the population estimates according to the Houselist only to show how well the houselist had brought out the order of magnitude of the population despite the casual way the question on population was asked therein. This indirectly reflects also on the conscientiousness with which the houselist enumerators had discharged their functions in spite of their newness to the task. However, this fact alone cannot lend respectability to the houselist population to be considered on par with the census count in terms of its accuracy.

In such a situation it appears to be a rather futile area for research to inquire even into the reasons for the deviation of the houselist population from the census figure, not to speak of the reasons why the census has differed from the houselist. Table 1 of Visaria which labours hard to lift the accuracy of the houselisting population up to that of the census count is, therefore, entirely misleading. The fantastic positive and negative annual growth rates that Visaria has given in the last column of this Table prove only too tellingly how stastistics could give rise to absurd conclusions as a result of shift of emphasis in the reading of the basic records.

Table 2 of Visaria presents the dif-

* The author alone is responsible for the statements made or views expressed here.

ference between the census population and the projections State-wise. Reading through his discussion of this Table one again gets the impression that he *is actually comparing the census with the projection instead of doing the converse.* Constrained by lack of reliable data, the Expert Committee had to rationalise on 'expert opinion' and stipulate certain plausible though arbitrary assumptions on the future trends in the components of population growth. In fact it had assumed no migration in any of the States for want of adequate data, hoping that the net balance between the assumptions on fertility and mortality could account at least partly for migration also. Hence in the absence of census age distribution and migration data it is not appropriate to read too much into the differences between the State level projections and census figures. The reasonable approach at the present moment could only be to analyse the assumptions on which the projections were based to see how they should be modified, if possible, to reproduce the observed census population. Some work in this direction has already been initiated in the Office of the Registrar General with a view to revising the existing official series of projections for all-India and States in the light of the Census Provisional Totals but pending the release of the census age distributions.

In his enthusiasm to advance a research programme on the compatibility of census and Houselist totals Visaria doubts the efficacy of the Post Enumeration Check. He has questioned the usefulness of the Post Enumeration Check on the ground that (i) it is subject to more or less the same set of limitations as the initial census and (ii) the field worker seldom appreciates the objective and usefulness of checks which are feared as likely to reflect adversely on their colleagues. As an alternative he advocates an internal consistency check on different characteristics of the population and their plausibility in the light of other known facts or alternative sets of statistics.

Actually, besides having been evolved scientifically, the Post Enumeration Check had also been conducted in the field by a better set of enumerators drawn almost entirely from the Headquarters staff of the census organisation who had not participated directly in the census field-work earlier. A series of intensive training programmes and discussions were held impressing upon the entire hierarchy of officers connected with the Post Enumeration Check that it is an objective survey which tries to bring out how well the census has been conducted and not how badly. To reduce any possible conditioning effect, steps had also been taken to change the jurisdiction of the enumerators at the different stages of the Post Enumeration Check field-work from primary re-listing and re-enumeration to field reconciliation. It is indeed surprising that Visaria has greater confidence in the Houselist rather than in the Post Enumeration Check to provide a valid comparison with the census to bring out the coverage error.

The internal consistency check as has been advocated by Visaria may not be an effective alternative. For one thing the internal consistency of estimates regarding various characteristics in different tables in the census will in no way reflect the overall deficiency in coverage. The houselist and the census records are, however, two independent sources relating to different points of time. A comparison between the two is in fact an external check rather than an internal check. Some limitations of a comparison of the census with the houselist data based on their reliability have already been mentioned in the earlier paragraphs.

In the same connection Visaria has suggested that the Post Enumeration Check should be supplemented by a comparison of the houselist population data with the Census Population Record at least in a few villages so as to find out whether the number of normal residents was overstated during the houselisting or there was an undercount of population during the actual census. This comparison, apart from being invalid due to differential accuracy of the two records, will not be fruitful because the time-lag between the houselist and the census, which is nearly one year, makes it next to impossible to collect accurate details about individuals retrospectively. This problem is made more complex and formidable by the fact that the houselist contains only aggregates and not particulars of each individual. Further, correspondence or otherwise of the total number of individuals in the aggregate between the two records means little because of movement of population and natural changes, unless the individuals are matched unitarily. Incidentally it may be mentioned that the Post Enumeration Check emphasises a unitary check, namely, matching of individuals, with the help of census records and field reconciliations. That is why it is conducted immediately after the census, say, within a month or so, so that the people will largely be able to recall details about the composition of their household during the census enumeration period. In the latest Post Enumeration Check, recognising the difficulties of matching even immediately after the census, we have introduced a modest programme of tracing into the census records those persons who are absent normal residents or visitors.

While discussing the possible reasons for the differences between the 1971 census population and the projected population Visaria has surmised at the beginning of his article that "a third possible explanation of a difference between the census count and the projection can be a somewhat greater undercount than in the 1961-census". As stated earlier, this type of comparison is untenable. Under the present conditions when reliable information on natural increase and migration during the past and present decades are not available, only the Post Enumeration Check could bring out valid estimates of the coverage error. However, the generally increasing trend in the growth rates of most of the states from one decade to another, presented in the Table do not suggest *prima facie* greater under-count particularly in the 1971-census compared to the 1961 census. Even in the four states of Assam, Haryana, Punjab and West Bengal the decrease (this is only slight in Assam and Punjab) in the growth rate for 1961-71 compared to that of 1951-61 may be attributed in all probability to (a) decreasing tempo of movement and resettlement of displaced persons in the succeeding decade as compared to the earlier one and/or (b) possible reduction in natural increase due to impact of Family Planning, rather than differential coverage error in the 1971 census.

TABLE: ANNUAL GEOMETRIC GROWTH RATE OF THE MAJOR STATES OF INDIA DURING THE DECADES 1951-61 AND 1961-71

S No	State	Annual Geometric Growth Rate	
		1951-61	1961-71
1	2	3	4
	INDIA	1.98	2.21
1	Andhra Pradesh	1.14	1.87
2	Assam	3.05	2.97
3	Bihar	1.82	1.93
4	Gujarat	2.41	2.58
5	Haryana	2.95	2.74
6	Jammu and Kashmir	0.90	2.60
7	Kerala	2.24	2.31
8	Madhya Pradesh	2.19	2.48
9	Maharashtra	2.14	2.42
10	Mysore	1.98	2.16
11	Orissa	1.83	2.24
12	Punjab	1.97	1.91
13	Rajasthan	2.35	2.45
14	Tamil Nadu	1.12	1.99
15	Uttar Pradesh	1.55	1.81
16	West Bengal	2.88	2.42

A word more about the percentage difference between the census and projections state by state given by Visaria in Table 2 and discussed elaborately by him in the latter part of the article, though he has admitted that "the usefulness of such effort is limited by the fact that the empirical basis of population projections for states and union territories was weak". The assumptions on fertility and mortality trends over time were chosen, in the official projections, to be more or less uniform for all the states or a group of states. This expediency was unavoidable since even the base line data on fertility, mortality and migration were very meagre. The utility of such expediency could be appreciated if it is understood that the purpose of the projections was to provide a magnitude of the population for Plan purposes rather than to predict the actual population at a specified point of time in future. In view of this, the projections do not reflect accurately the relative intensity of the family planning programmes in the states with the result that at the state level it is frustrating to compare the projection figures with the census figures state by state so as to impute reasons for the differences specifically to one or more of the components of growth. Therefore, whether the census count is below the projections as in the case of Punjab or above in Tamil Nadu may be totally fortuitous. In the circumstances it seems more fruitful to inquire into the patterns of growth of population in the last two decades namely 1951-61 and 1961-71, on the basis of the actual figures of the population available from the 1951, 1961 and 1971 census counts rather than to string up conjectures on the differences between the census figures and the projections state-wise.

Comment—II

K N Shrinivasan

I WISH to offer a few comments on one of the many issues raised by Pravin Visaria in his thought-provoking article "Provisional Population Totals of the 1971 Census : Some Questions and Research Issues" (July 17; pp 1459-65).* The issue pertains to the validity of a comparison of the growth rates of population, estimated on the basis of the 'houselist estimate' of the population and the final census count.

As Visaria no doubt knows, recording of the number of males and females done during house-listing is meant primarily to give a very broad order of the count that could be expected at the census so that the census commissioner could finalise suitable administrative measures including the printing-order for census schedules. As such, the "estimate of house-list population" would not be precise enough for anybody to read too much in it. It would not, therefore, be right to use those 'estimates' either to infer any large undercount in the 1971 census or to confirm "the picture revealed by the final census count of 1971".

The point may be elaborated as follows.

Let P_1 and P_2 be the true populations of an area at two points of time separated by n years, leading to the true annual rate of growth, r, given by $P_2 = P_1 \exp(n.r)$. Let the actually counted populations at those two points be P_1' and P_2' giving the apparent annual rate of growth, r', by $P_2' = P_1' \exp(n.r')$. Again, let e_1 and e_2 be the errors in the two counts, given by (i) $P_1 = P_1'(1 + e_1)$ and (ii) $P_2 = P_2'(1 + e_2)$. It can easily be seen that

$$r - r' = \frac{1}{n}\left[\log(1+e_2) - \log(1+e_1)\right] \quad .. \quad (1)$$

$$= \frac{1}{2n}(e_2 - e_1)(2 - e_1 - e_2)\dagger \quad .. \quad (2)$$

if e_1 and e_2 be small positive fractions so that their cubes and higher powers could be neglected, as would be the case in most population counts including the Indian counts. If it is assumed that the value of r remained constant through the entire period between March 1, 1961 and April 1, 1971, we have to compare r against three values for r' given by three pairs of counts and estimate:

(a) the 1961 census count and the March 1, 1970 Houselist estimate
(b) The 1961 census count and the 1971 census count;
(c) the March 1, 1970 Houselist estimate and the 1971 census count.

One could reasonably say that $(r - r')$ varied directly as $(e_2 - e_1)$ and inversely as n. As n would be much larger than either e_1 or e_2 (usually small positive fractions less than 0.05), we can conclude that the value of r' derived from the pair (c) would be much more erroneous than those derived from the other two pairs. This is why it is not very proper to use the Houselist estimates either to infer an undercount in, or to confirm the count of, the 1971 census, especially when we have no knowledge of either r, or e_1, or e_2.

If a comparison is at all to be made between the houselisting and the census succeeding it, the following would be a valid way of doing it: Let e(H) and e(C) be the counting errors in the house-listing and the census respectively; r' (H) and r' (C) be the apparent annual rates of growth derived by the house-list and by the census, respectively, *vis-a-vis* the preceding census held n_1 years and n_2 years before the house-listing and the census respectively. If e_0 be the counting error in the preceding census, we would have

$$r'(C) - r'(H) \doteq \frac{e(H)}{n_1} - \frac{e(C)}{n_2} - e_0\frac{(n_2 - n_1)}{n_1 n_2} \quad .. \quad (3)$$

In the case of 1971-census and its house-listing, $n_1 = 9$, $n_2 = 10$, we would have

$$r'(C) - r'(H) \doteq \frac{e(H) - e(C)}{10} \quad .. \quad (4)$$

if we neglect the small value of the term $\frac{e(H) - e_0}{90}$. If equality (4) is to be of any use, r'(c) — r' (H) must be significant, and then, again, we could only say something about the relative efficiency of the house-listing *vis-a-vis* the census and *not* their individual efficiencies. As to when r'(C) — r'(H) becomes significant (and when not) is only to be left to the judgment of users. I, for one, would not consider r'(C) —

* The views expressed or statements made here do not necessarily reflect the views of the organisation with which the author is associated.

† By Taylor's theorem $\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} \ldots$ for $-1 < x \leqslant 1$.

r'(H) significant at all, unless it exceeds a third of r'(H), given the ways the house-listing and censuses are conducted in India.

Visaria's proposal to undertake a sample match of the house-list estimates of population and the 1971 census count bristles with difficulties. If a household returned, say, four males and four females both on the day of house-listing and on the day of census enumeration, would one say that the counts matched? It may be that between the two days, a female may have died and another married into the household. How to account for such cases? In case the two counts differed, how is one to reconcile the difference, without more details than are available in the house-list? No matching such as Visaria proposed could, therefore, be conclusive as to whether the house-listers counted one too many or the census enumerators counted less than they should have or both, even if we discount recall-lapses involved in the matching.

An attempt to secure local assistance of village officials might help in reconciling some of the discrepancies. However, the task would prove extremely difficult particularly because of the long time-interval between the house-listing, the census and the proposed check.

Reply

Pravin Visaria

I AM grateful to S Raghavachari and K N Shrinivasan for their comments on my paper and welcome this opportunity to clarify or elaborate some points.

I am sorry that Raghavachari could find words of caution in the original article only "here and there". One's vantage point tends to influence the evaluation of such matters. However, I hope he would extend to a few non-participants in the census undertaking the privilege of being able to appreciate the "super-human efforts made to obtain a complete coverage" of population. I did mention in the article the difficulties of a census conducted under severe financial constraints. And I fully agree with the observation made three decades ago by M M Yeats, the Commissioner for the 1941 Census, that "no census... can rise above the level of the people... In any census, anywhere, the citizen's part is the more important and fundamental, for our enumerators are primarily scribes and it is the citizen's collaboration which produces the valid record".[1] The census office cannot, therefore, be blamed for less than complete coverage, if it occurs. In any case, my main objective in this reply is to help avoid any misunderstanding of my article.

First, I am unable to find in my article any suggestion that the comparison of the provisional figures of the 1971 census with the projections would provide a clue to the extent of undercount or coverage error in the census. The use of the census count as the numerator and projected figure as the denominator for calculating the percentage differences shown in Table 2 certainly did not imply a greater faith on my part in the projections. (I had an alternative Table showing the difference between the projection and the census count — instead of that between the census and the projection — and it was a sheer accident that the Table actually published was preferred to the alternative). The exercise did help to point toward the need for first priority attention to the data for Punjab and Tamil Nadu. My discussion of the data for Tamil Nadu considers at the district level the consistency of intercensal growth rates during 1951-61 and 1961-71, such as has been discussed by Raghavachari with the help of a Table in the latter half of his comment on my article. Similarly, my discussion of the 1971 census figure for Punjab does not imply that the almost 11 per cent difference between the projection and the census is due to undercount in the census. I have only discussed this observation against the background of data on the proportion of eligible couples reported to be practising contraception. I have seen comments in the press interpreting the census data for Punjab as showing that "as in the case of the green revolution, Punjab now seems to have shown the way in population control".[2] I was mildly cautioning against too ready an acceptance of such a conclusion without ruling out the possibility that fertility in Punjab might actually be declining. Indeed, according to the NSS data, the birth rate in rural areas of Punjab (including Haryana), Delhi and Himachal Pradesh (all together) had declined from about 41.2 in 1958-59 and 1959-60 to 37-38 (per 1,000) in 1963-64 and 1964-65. (The NSS estimates of birth rates suggest even sharper declines in the case of Kerala.) The registered birth rates of Punjab (excluding Haryana) also suggest some decline in the birth rate. However, in view of the well known limitations of the NSS estimates of vital rates, as well as the registered vital statistics one hesitates to accept such suggestions of a decline in birth rates without finding further confirmation.

Further, I would indeed reiterate the caveat permeating my article that even the consistency of or trend in intercensal growth rates for successive decades should be examined with due regard to *possible* biases (in different directions) in various censuses. Without any offence to any of the dedicated census officials and workers, most analysts would consider such a caveat not unwarranted. As Raghavachari rightly points out, reliable information on natural increase and migration is certainly lacking in India. However, in comparing the "annual geometric growth rates of the major states", during various intercensal decades, one needs to examine not only the direction of change but also the magnitude of change. The 1971 census results have caused a surprise not only because the projections overshot the 1971 count or the 1971 count is short of the projection. The surprise arises partly because for India as a whole, the intercensal annual (geometric) growth rate increased sharply (by more than 50 per cent) from 1941-51 (1.25 per cent) to 1951-61 (1.92 per cent, after making allowance for the migration of refugees from East Pakistan during 1951-61 and also their progeny born in India), and then, instead of a smooth progression of the trend (such as was envisaged in the projections), we observe a sudden flattening out or deceleration of the rate of increase of the growth rate. Admittedly, the latter is not impossible but it naturally raises some questions. Therefore, it is not quite adequate or convincing to argue, as Raghavachari does, that "the generally increasing growth rates of most of the states from one decade to another do not suggest, *prima facie*, greater undercount particularly in the 1971 census compared to the 1961". Of course, the possible explanations for the observed phenomena include a relatively higher undercount not necessarily in the 1971 census but also in the 1961 census (perhaps in Tamil Nadu) or the 1951 census (perhaps in Punjab, Haryana and West Bengal?). It would not be easy, or perhaps even possible, to find satisfactory evidence to prove or disprove any of these alternative hypotheses. However, it should be the objective of the analyst to weigh carefully the various alternatives without any extraneous considerations. Some consensus might emerge if all the relevant data are pooled together for dispassionate scientific discussion and evaluation.

I agree that the identification of the reasons for differences between the projections and the census figures is a difficult task but it is unlikely to be more frustrating than an effort to find out what modifications of the initial assumptions of projections would reproduce the population reported by the 1961 census. (As Raghavachari certainly knows, it is very difficult to choose from the several combinations of modifications in the assumptions that would reproduce the census population.)

TABLE A: DIFFERENCES BETWEEN THE HOUSELIST POPULATION AND THE PROVISIONAL POPULATION FIGURE FOR SOME STATES OR UNION TERRITORIES, CENSUSES OF 1951 AND 1961

(*All figures in thousands unless otherwise stated*)

Census Year/ State or Union Territory	Period of Houselisting	Houselist Population	Provisional Population Total	Final Population Total	Percentage Difference between the Houselist and the Provisional Population Total*
1961 Census					
Assam	Sept/Nov 1960	11,770	11,860	11,873	— 0.76
Gujarat	Oct/Nov 1960	20,765	20,621**	20,633	+ 0.70
Himachal Pradesh	May/June 1960	1,368	1,349	1,351	+ 1.41
Tamil Nadu	Oct/Nov 1960	32,848	33,651	33,687	— 2.39
Maharashtra	Sept/Oct 1960†	38,987†	39,504	39,554	— 1.31
Punjab	May/Oct 1960	20,261	20,298	20,307	— 0.18
Rajasthan	November 1960	20,109	20,146	20,156	— 0.18
Uttar Pradesh	November 1960	73,899	73,753**	73,746	+ 0.20
Manipur	Sept/Oct 1960	776††	778	780	— 0.26
Tripura	Sept/Oct 1960	1,120	1,142	1,142	— 1.93
1951 Census					
West Bengal	October 1950	25,512	24,787	24,810	+ 2.92

* The signs preceding the percentage figures in the last column of the above Table are the opposite of those in Table 1 of the article under the heading "Difference between March 1, 1970 and April 1, 1971". A negative sign shows that the houselist estimate was smaller, as would be expected, than the provisional census figure; a positive sign shows the contrary.

** The figures are those published in the brochure on Provisional Population Totals released after the 1961 Census in March 1961. They differ somewhat from the figures printed in the Administration Reports as provisional population figures.

† In Greater Bombay, the houselist was prepared during April-September 1960.

†† The figure differs from the sum of figures shown for various subdivisions of Manipur. The latter add up to 766,000.

POST ENUMERATION CHECK

Secondly, I have certainly not questioned the usefulness of the Post Enumeration Check; nor do I consider or advocate internal consistency checks as an alternative. In the jargon of economics, the two are complements rather than substitutes. The evaluation of data in a country like India requires one to explore all possible avenues and choice is relatively limited. I have used the results of both the 1951 and the 1961 checks in my studies, despite their limitations. Further, I am happy to learn that the 1971 Post Enumeration Check has been conducted by a "better" set of enumerators from the Headquarters of census organisation, after intensive training. I also trust that in the statement that "the check is an objective survey which tries to bring out how well the census has been conducted and not how badly", the concerned officers paid more attention to the words "objective survey" than to the qualifying clause. I am sure the users of the 1971 census data will eagerly look forward to the report on the Post Enumeration Check. However, the reservations regarding the results of the Post Enumeration Checks are not based only on the one or two points noted in my article; and they are unlikely to disappear altogether. However, Raghavachari's efforts to design a scientific check and ensure its proper conduct will certainly earn him the grateful thanks of census analysts.

I turn finally to the major issue regarding the efficacy and propriety or advisability of comparing the houselist estimates of population and the final count. I agree with both Raghavachari and Shrinivasan that the estimates of population based on the houselist would not be as precise as the final count and recognise the limited objective(s) of the houselists count of population. However, I wonder why even a broad consistency between these figures at the level of our large states should be considered an unreasonable expectation. Shrinivasan holds that the 'estimates' can be used neither to infer any large undercount in the census nor to confirm the picture revealed by the final census count. In regard to the latter, Raghavachari reports that the presentation of the population estimates according to the Houselist in Paper 1 of 1971 on the

Provisional Population Totals of the 1971 Census was "only to show how well the houselist had brought out the order of magnitude of the population despite the casual way the question on population was asked therein". This is an interesting clarification. However, I plead guilty to the charge that I did not think that the question was asked in a "casual way". Yet, the sentence from my article quoted by Raghavachari makes it evident that I did not equate the accuracy of the houselist estimate with that of the census count. My reference to the limited effect of nuances in instructions on enumerators pertained to the extent to which the enumerators actually do include or exclude a person from either the houselist or the final census count on the basis of the criteria laid down to define normal or usual residents. It is not an uncharitable view of the realities of the situation that only a few enumerators worry about the marginal cases.

Houselist Estimate

Turning now to Raghavachari's attack on the last column of my Table 1, I accept Shrinivasan's convincing logical deduction that the growth rate during the period between March 1, 1970 (the reference date of the houselist estimate) and April 1, 1971 (the reference date of the 1971 census) is subject to greater error than either the intercensal growth rate or the growth rate between March 1, 1961 and March 1, 1970. The influence of errors or biases is indeed evened out over a longer time interval and the average annual growth rate over the 13 months preceding the 1971 census (the last column of Table 1 of my article) may not be of much significance.

Shrinivasan further argues that if a comparison is at all to be made between the houselist and the census data, it should be for the longer time intervals (of 9 and 10 years) and proposes a value of one-third of r'(H) as the criterion to judge the significance of the difference between r'(C) and r'(H). It might perhaps be worthwhile to record here the fact that the difference between r'(C) and r'(H) does just exceed one-third of r'(H) for Uttar Pradesh and West Bengal and may be significant. (The difference is even greater in the case of Jammu and Kashmir but the latter is not really significant for reasons noted in my article.) However, one might perhaps question the basis of the criterion of one-third the value of r'(H) to evaluate the significance of the difference between r'(C) and r'(H). I should, therefore, leave this point for the statisticians to examine.

It needs to be emphasised that I never ruled out the possibility that the houselist estimates of population might involve an overcount although I could not find any basis to expect such a bias. Even now, I cannot help the feeling that the houselist figures are being dismissed too lightly. However, in continuation of my earlier analysis, I have collected and present here in Table A some not readily available data on the houselist estimates of population compiled before the 1961 census. The Table also shows the figures of population collected during the housenumbering operation in West Bengal, undertaken prior to the 1951 census.

It is evident from the Table that population figures collected during houselisting have exceeded the census count in the past also. The 1951 census activities in West Bengal were carried out under a constant threat of "communal disturbances, strikes or agitation". Asok Mitra has explained the difference between the housenumbering and census figures of population on the ground that "(a) at the housenumbering stage many householders gave the approximate number of the inmates of their households; (b) the food crisis being at its worst about this time and modified rationing prevailing in most rural areas, people mistakenly linked up rationing with the preliminary count and were inclined to give fictitious figures".[3] It is also possible that the difference was partly because of the return to East Bengal of Hindus who had moved to India in the first few months of 1950 in the wake of communal disturbances. (According to the 1950-51 Report of the Ministry of Rehabilitation, the Nehru-Liaquat Ali Khan Pact in April 1950 did stimulate some return migration to East Pakistan.)[4]

In appraising the population figures based on the 1960 houselisting operation, one must note that the time interval between the houselist figures and the provisional population totals was shorter than that of the 1970-1971 data under discussion. If the figures given in the Table were used to estimate the population on March 1, 1960, the figures for Uttar Pradesh and Gujarat would have shown positive growth of population during 1960-61. In the case of Himachal Pradesh, also, the absolute difference would have shrunk.

It seems possible that there perhaps exists a tendency to overstate the number of usual residents in a household during a quick inquiry such as is undertaken during the houselisting. The extent of such overstatement seems to vary in different parts of the country, even within the states. Perhaps, the out-migrants from the household are included among the usual residents. If so, since males seem to migrate more often than females, an examination of the houselist estimates of population by sex should prove useful. In any case, an exploration of reasons underlying the differences between the responses about residents during a quick inquiry and a detailed enumeration seems to be a promising area of methodological research. Admittedly, my article understated the difficulties of a sample match of houselist data with those reported during the final census. Even in the 1961 post-enumeration check, the number of persons whose omission from or double count during the census could not be confirmed was quite high. Such 'not known' persons formed about 25 per cent of the total including them and the missed or overcounted persons in the re-enumerated houses, both in rural and urban India.[5] However, some alternative studies might be possible particularly because the Office of the Registrar General also administers the sample registration scheme in a fairly large number of villages in different parts of the country. Such methodological studies deserve a higher priority in the allocation of resources of census organisation than surveys of villages, towns or crafts, which are certainly very interesting but could also be undertaken under other auspices.

The India Cements Limited

Speech of the Chairman, Rao Bahadur Ramjeedass Iyer

THE following is the Speech of the Chairman, Rao Bahadur Ramjeedass Iyer, at the Twenty-fifth Annual General Meeting of The India Cements Limited, held at Madras on September 27, 1971:

FRIENDS:

On behalf of the Board of Directors and on my own behalf, I extend a cordial welcome to all of you to the TWENTY - FIFTH Annual General Meeting of your Company.

Before proceeding to the main business of the day, I have to perform a melancholy duty. One of the founder-directors of the Company, Sri C S Loganathan passed away on the 11th of May this year. His demise leaves a great void in our midst which cannot be easily filled. He was associated with the Company right from its inception and was all along a tower of strength and support to the management. He was a self-made man and built up a reputation for keen entrepreneurship which has left its mark on many industries in this country. This meeting should have been presided over by Sri P Suryanarayana. For the last few years he has been presiding over the Annual General Body meetings and has been conducting the proceedings with great ability and tact. We were shocked to hear that he suddenly passed away on the night of 22nd of this month, that is, just a few days ago. Sri P Suryanarayana, like Sri C S Loganathan, has been associated with the Company from its inception. With his passing away another vital link with the past has been snapped. His loss is well-nigh impossible to replace. It would have been in the fitness of things for them to have been present to usher in the Silver Jubilee year of the India Cements. I request your permission to convey our condolences to the members of the families of late Sri C S Loganathan and Sri P Suryanarayana.

I am glad to inform you that M/s S L N Simha and J H Tarapore have been appointed as Directors of your Company in the place of Messrs. C S Loganathan and P Suryanarayana.

Silver Jubilee Year

The year under review marks the Silver Jubilee of the Company. We are Twenty-five years old and I may be permitted to digress a little on a brief history of the Company's growth during the last 25 years. The Company was incorporated on the 21st February 1946. The first cement plant of 1 lakh tonnes capacity was commissioned at Talaiyuthu, Tirunelveli District in August 1949, and thereafter within a short span of ten years, the capacity was progressively increased to approximately half-a-million tonnes. In view of the continued scarcity of cement, a crash programme of expansion to augment cement production under the Five-Year Plans by a further one million tonnes was launched in 1965-66. Two additional units of two lakh tonnes capacity each were commissioned between 1969 and 1970, thereby raising the total capacity at the Talaiyuthu plant to nearly one million tonnes per annum. A second factory was set up at Sankaridrug, Salem District with an initial capacity of two lakh tonnes in 1963 which again, within a short span of 7 years, was increased to six lakh tonnes per annum with the commissioning of one kiln under the one-million tonne expansion scheme on 21st June 1971. The rated capacity as on date is 1.5 million tonnes per annum.

Besides the two cement factories, a Foundry Unit at Nandambakkam at Madras was acquired in 1965 primarily to cater to the needs of the cement units in respect of grinding media and other spares. Besides meeting such requirements in full, the Foundry is in a position to supply quality castings to various customers in the automobile, insulator and other industries. The capacity of the Foundry presently stands at 5280 tonnes of castings per annum.

The progress achieved during the last 25 years has been exclusively due to the progressive policies of the management and the full co-operation of the staff and labour at all levels. It is a happy story of industrial enterprise on the one hand and administrative and labour execution on the other. In this connection it is but fitting that I should pay a tribute to the two architects of the Company namely Sri S N N Sankaralinga Iyer and Sri T S Narayanaswami. Sri Iyer is happily with us and we wish him many years of life. Mr Narayanaswami is no longer with us but his name will be remembered as long as this institution exists. In 1946, just after the war the country was awakening into a dawn of political freedom. But the entire economy was at a low and halting level and required the vision and energy of industrialists and the help of the Government to achieve a break-through in industry. The cement industry especially was practically unknown to Southern industrialists and Sri Iyer was in every sense of the word a pioneer in the field. His practical experience was combined with robust optimism and to him we owe the birth of this Company. In subsequent years, however, and especially during the days of its expansion, Sri T S Narayanaswami guided its destinies and brought it to the eminence of a leading industrial unit in South India. On this occasion, it is appropriate that we remember both of them, one to whom we shall personally convey our tribute and the other whose memory we will cherish.

Financial Results

The financial results of the Company for the year 1970-71 have been generally satisfactory although there is a fall in the net profits from Rs 88.02 lakhs to Rs 53.24 lakhs. This has occurred in spite of increased production and despatches. The Sankarnagar factory produced at 91 per cent of rated capacity, while the Sankaridrug factory produced 101 per cent of rated capacity. Though the production at Sankarnagar factory shows an improvement over the previous year, the failure to achieve full rated capacity has been due to delay in the delivery and consequent commissioning of the cement grinding mills and the clinker conveyers for the new kiln commissioned in April 1970. In spite, however, of increased production from 9,90,704 tonnes during last year to 11,78,293 tonnes, the rising cost of materials and other charges have swallowed up a considerable proportion of the income that has accrued from the extra production. It is needless for me to go into the details of the increases that have taken place in the price of furnace oil, grinding media, firebricks etc, or to further expatiate on the larger sums that we have been compelled to pay as bank interests on hypothecation loan and interest towards capital borrowed for financing the expansion

schemes which have been completed. I would, however, like to make special mention that the latest Railway budget has envisaged a steep increase in the freight on coal which itself accounts for an increase of Rs 1-23 in the cost of production per tonne. I have taken special pains to acquaint you with these financial details because they conclusively establish that the reduced profits of this year are not due to falling off in production or efficiency of economy in administration and management but are due exclusively to extraneous causes over which the industry has no control.

As a result of these increases in cost, the industry has been urging on the Government the imperative need to sanction an increase in the price of cement. Industrial investment has to compete with other forms of investment and, *ceteris paribus*, has certainly to be a little above the deposit rates which the banks are offering. This is a salvation minimum below which no industry can maintain itself in the financial market. Otherwise the result will be an unhealthy unloading of industrial scrips in the market and their conversion into other methods of saving and investment which offer not merely comparable interest rates, but also more readily acceptable securities for borrowings. This is one side of the picture. On the other side, the industry itself is entitled to a reasonable remuneration on the capital employed and in the context of the general rise in the price level it is not fair that the cement industry alone should ask to bear an unequal burden.

So far, the Government have not taken into account these escalations in costs in order to arrive at a suitable retention price. However, based on the representations made by your Company and the Cement Manufacturers' Association, the Government of India in the Ministry of Industrial Development have now referred the issue to the Cost Accounts Branch of the Ministry of Finance. It is hoped that Government will take a decision on this issue as early as possible.

Sales

Sales of cement showed appreciable increase being Rs 16.05 crores as against Rs 12.76 crores during the previous year. The increase in sales is on account of two factors. The first is that the higher installed capacity as well as fuller production in the two factories resulted in greater production of cement. The second is that on the side of demand although the full anticipated increase did not materialise there was yet a definite sign of an upward revival which is promising. If this trend continues, we hope to achieve a higher volume of sales during the current year. The sales include 54,826 tonnes of cement and clinker on account of exports to Ceylon and the Middle-East. The production and despatches during the current year, i e, from 1-4-71 to 31-8-71 were 356,477 tonnes and 360,915 tonnes at the Sankarnagar factory and 190,021 tonnes and 181,513 tonnes at the Sankaridrug factory. The working of the Foundry during the same period has also been very satisfactory.

The Industry and Government Policy

In the speech last year, the Chairman referred to the policy of the Government towards the cement industry. I drew your attention to the order of the Government in April, 1969 announcing the de-control of cement as from the 1st January 1970. The cement producers, helped by numerous political and other leaders, and also consumer interests made strong representations to the Government that such a policy would adversely affect both producers and consumers of cement in the country, and more especially the producers in the South and consumers in the North and North-East of India. It was specially pointed out to the Government that the temporary surpluses prevailing just prior to time of the Government Order were not an indication that supply had become equal to demand but were due almost exclusively to the aftermath of the industrial recession and poor harvests. The Government then stayed the order of de-control, and as a result the even distribution of cement all over the country continues as before, with benefit to agriculture and industry alike.

Trends in Demand and Supply

As far as one can see, the demand for cement will outstrip the supply during the next few years. Cement production and despatches in the country during 1970 totalled 13.876 million tonnes and 13.58 million tonnes respectively. During the year under review serious scarcity of cement has been reported from many parts of the Northern and Eastern regions. The best possible estimates of projected capacity at the end of 1972 and 1975 put the figures respectively at 19.7 million tonnes and 23.4 million tonnes. Committed schemes extend only upto 1972. If one takes realistic despatches at 85 per cent of rated capacity, taking into account inevitable transport difficulties and internal production problems arising from short supply of raw materials, machinery and labour problems, one may say the total quantity of cement available by 1972 will be a little more than 16 million tonnes and by 1975 a little less than 20 million tonnes.

While this is the picture on the side of supply on the side of demand, one has to take numerous factors into account. The first is the definite stabilisation of agricultural production at a high level and the scientific promise of further increases in agricultural production. The second is an upward trend in industrial production which in the coming years will be visibly supported by increasing consumer demand from the rural sector which constitute 70 per cent of the population. The third is the national awakening in regard to better roads and the plans for improvement and extension of Highways and feeder roads. Neither the public nor the Government seem to be fully aware that the prosperity of the farmer, the evening out of the prices of agricultural produce all through the year, the ready and timely supply of raw materials to the factories and of the means of production to the fields depend to a large extent on good feeder roads which connect the villages to the Highways. Similarly, there is a real awakening among the masses in regard to better housing. Several State Governments have taken up massive housing schemes in the cities, partly as development and partly as slum clearance. But the real revolution in housing is yet to come about and will consist of modernising rural homes. When this is taken up as it is bound to be, the demand for cement will be much greater than even what the present projections envisage. In addition, there are subsidiary demands like concrete flooring for irrigated agriculture and the lining of canals so as to effect economies in water distribution.

Thus, as far as one can see, both as a result of general economic revival and as a result of the special demand that are likely to be created for cement, the demand for the product in the next five years will certainly be very much more than the arrangements for supply which have been made so far.

Policy for Price-Control and Location of Factories

This in turn raises the question of the general policy that is suitable for the

producers and the public in the circumstances and projections made above. In the first place there is the imbalance between the supply and demand for cement. The imbalance is total for the country and also acute in certain regions like the North and North-East. There are several problems which arise as a result of the supply being unable to meet the full demand. The first is that as long as such a situation continues Government will be ill-advised to de-control such a vital commodity as cement which enters into every aspect of the economy, agriculture, industry, transport, electrification, housing and the like. Secondly it underlines the need for continuing the present arrangement for freight pooling which is the only method by which the consumer in the country can obtain cement at a uniform price although the cost to the individual producers may vary. To interfere with freight pooling at this stage will be to invite undesirable interference with the selling price in the scarcity pockets and to put the Southern producers who have surplus of production into a difficult position from which they cannot extricate themselves. Thirdly it raises the major question of the location of cement factories. The Government of India are applying their mind seriously to starting new cement factories in the deficit areas of the North and North-East. Basic industries are located by reference to the availability of raw material in adequate quantity and of proper quality. It is on these considerations that many of the cement units in this country are located in the Southern and the Western regions. Just as the jute industry is based in Bengal and the iron industry in Bihar and Bengal and textiles in the South and the West, so also the principle of regionalisation can be applied rationally only by locating suitable industries in suitable areas. It is for the Government to consider whether the location of the cement industry in the North and the North-East is the proper application of the principle of regionalisation and whether it will not involve the introduction of a permanent subsidy in the selling price from those units. The problem has to be examined from the point of view of the consumer and the producer alike, and in this context the starting of Government units for cement production in the South is a pointer.

Taxation and Industry

There is one other point to which I would like to make a reference. The latest budget of the Government has created new problems for industry. Apart from the high individual assessment on income and wealth which have a deleterious effect on saving and investment, I particularly refer to the imposts on corporations. The increase in the rate of surtax on company profits from 25 to 30 per cent (where chargeable profits exceed 15 per cent), the withdrawal of the development rebate from 1974, the deletion of the cement industry from the list of priority industries, the scaling down of the special tax exemption limit from 8 to 5 per cent of the profits of priority industries, the removal of debentures and long-term borrowings in the computation of the limit of 6 per cent of capital for purposes of tax exemption of new industrial undertakings, the negation of the facility to enjoy tax free income upto Rs 3,000 a year from investments in specified financial assets by Companies, and the denial of concessional tax in dividends received by foreign companies will cumulatively lead to a reduction in the flow of funds for new ventures or any type of expansion by existing ventures. Further, the raising of surtax from 25 to 30 per cent will certainly penalise further the more efficient industrial units. I would like to recall that the companies (Profits) Surtax Act which came into force in 1965 took the place of the Super Profits Tax Act 1963. Both these measures increased the tax burden of the more efficient companies and it was the harsh impact of the surtax on the working operations of the corporate sector which induced the Government to reduce its incidence in two stages from 40 to 25 per cent. While making the second reduction the then Finance Minister said in 1969-70 that it was intended as a spur to efficiency. It is strange that almost within a year such a spur is no longer considered to be necessary.

I have mentioned these problems to you frankly so that it may be realised that the cement industry is working under difficult conditions arising out of Government policies both industrial and fiscal.

Labour

The relation with labour and staff at the factories and the staff at the Head Office continues to be cordial as usual. On behalf of the Management and on behalf of all of you, I take this opportunity to accord our thanks to all the employees of the Company for their unstinted co-operation and hard work during the year. The Company looks forward to their continued services and co-operation in the coming years.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Nuclear Energy and Pollution

THE Director-General of the International Atomic Energy Authority, Sigvard Eklund, in his annual address to the Economic and Social Council of the United Nations in Geneva, recently stated: "Every person who feels a sense of responsibility for the future must welcome the world-wide debate that is going on about the environment. I am sure that most of us have been shocked by some of the things we have learned about the impact that our modern society is having on the environment. Nuclear energy is a growing part of this modern society. To judge its impact in true perspective, however, it must be seen from several points of view.

"Firstly, compared with the radiation does that every man receives from nature itself, the dose to which he is exposed from manmade sources of radiation is minute. In turn, the use of nuclear energy to produce electricity contributes only a small part of this fraction. Greater exposures result from nuclear weapons testing and far greater from medical X-rays . . .

"Secondly, nuclear energy presents very minor environmental problems compared with other technologies and industries. However, the real question we must face is: what is the best way — what is the least damaging to the environment way — of meeting the rapidly growing need for energy, and especially for electricity, of developing and industrial countries alike?

"Since the natural resources of hydro-electric power are limited, we must either burn a fossil fuel — coal, oil or gas — or use nuclear energy to meet our needs. By providing an alternative to fossil fuels, whose eye-catching impact on the landscape is there for all to see, nuclear energy will diminish pollution and contribute to a cleaner environment."

Unit Trust of India

Statement by the Chairman, Shri R S Bhatt

THE following are extracts from the Statement by Shri R S Bhatt, Chairman, Unit Trust of India:

The Unit Trust of India completed, as of June 30, 1971, its seventh year of operations and its accounts have been audited and published.

The Trust has declared an income distribution to unit holders, at the rate of 80 paise per unit i e 8 per cent. This dividend is the highest so far declared by the Trust and compares with 7.2 per cent paid in the preceding year. The income distribution to the initial capital contributors is 5.25 per cent.

During the year under review, the income of the Trust amounted to Rs 8.41 crores (inclusive of profit from sale of securities of Rs 27.89 lakhs) as against Rs 6.28 crores in the preceding year. Total expenses, including expenses on administration, provision for sundry liabilities etc, also rate to Rs 80.00 lakhs from Rs 67.31 lakhs in the preceding year. In terms of Sections 24 and 25 of the Unit Trust of India Act, 1963 (as amended), the net income allocated to unit holders amounted to Rs 758.17 lakhs. This, together with the balance of Rs 19.24 lakhs in the Unit Capital Appropriation Account—in all Rs 777.41 lakhs—is available for distribution to the unit holders whose names were on the Register of the Trust as on June 30, 1971. The income distribution to unit holders will absorb Rs 738.01 lakhs leaving a balance of Rs 39.40 lakhs. The income distribution to the initial capital contributors will absorb Rs 26.25 lakhs leaving a balance of Rs 10.58 lakhs. The aggregate transfer to General Reserve amounts to Rs 27.89 lakhs. This will leave Rs 12.94 lakhs and Rs 9.15 lakhs to be carried forward in the respective Appropriation Accounts.

Fall in Sales

Sale of units during the year at Rs 1,799.67 lakhs was lower than the record level of Rs 2,283.40 lakhs in the previous year. The sales were, however, higher than those in any of the earlier years, 1965-66 upto 1968-69. The fall in sales during the year may be attributed to the general hardening of interest rates, increase in interest rates in rival channels of investment and also, to the change in the scheme of tax concessions introduced last year. Almost, the whole of the investments in units made during the year was by individuals who accounted for Rs 1,736.17 lakhs. Institutions invested only Rs 63.50 lakhs.

During the year, sale of units to non-residents amounted to Rs 42.93 lakhs as against Rs 48.36 lakhs in 1969-70; the number of applications received was also lower at 440 as against 603. As of June 30, 1971, units sold to and outstanding with non-residents amounted to Rs 161.50 lakhs under 2,205 applications.

Larger Repurchases

Repurchases by the Trust during the year were larger, viz, Rs 3.19 crores under 12,698 applications as against Rs 2.03 crores under 9,480 applications in the previous year. Repurchases this year worked out to 3.3 per cent of the aggregate funds invested by unit holders.

Total investments of the Trust as on June 30, 1971 amounted to Rs 105.14 crores as compared with Rs 88.18 crores at the end of the previous year.

The Trust participated in the underwriting of 16 issues to the extent of Rs 3.05 crores during 1970-71 as compared with 21 issues totalling Rs 9.69 crores in the preceding year. By far, the bulk of the underwriting was claimed by debentures (Rs 138 lakhs). The balance comprised ordinary shares (Rs 94 lakhs) and preference shares (Rs 73 lakhs).

The capital market remained sluggish during the year under review, and the total capital issues (July-June) amounted to about Rs 50 crores (including initial issues of equity and preference shares, right issues and debentures) as compared to about Rs 80 crores during the previous year. In the stock market also, after an initial firmness till about September 1970, share prices started sliding down, the pace gathering momentum as the year wore out.

The slump in the stock market prices towards the close of the accounting year had its impact on the market value of the Trust's investments, which in relation to their book value, as on June 30, 1971 showed a smaller appreciation of 7.5 per cent as against 9.6 per cent at the end of the previous year. The appreciation in the portfolio was accounted for by ordinary shares. Taking into account the appreciation in the Trust's investments, the net value of the assets of the Trust as on June 30, 1971 amounted to Rs 106,12,46,387. During the year under review, 24 companies whose securities are in the Trust's portfolio, issued bonus shares. The ratio of bonus shares to existing shares ranged from 1 for 10 shares to as high as 4 for 5.

The Trust continued its efforts to popularise units as a medium of investment in the countryside. The Trust's agency force was further expanded; the number of approved agents at the end of the year stood at 2,756 as against 2,303 in the previous year. The number of approved brokers on the recognised Stock Exchanges was 320 as against 315 a year gao. Besides the Trust's various offices, units continued to be on sale at over 10,000 branches of the leading banks throughout the country and at about 18,000 post offices. The Government of India's grant towards the Trust's publicity expenses was scaled down further. For the financial year 1970-71, the grant sanctioned was Rs 5 lakhs as against Rs 7.5 lakhs for the previous year. The Trust's outlay on publicity from its own revenue was Rs 1.08 lakhs during the year.

Further Progress in Reinvestment

The Trust's Reinvestment Plan 1966 recorded further progress during the year. The total amount reinvested during the year with respect to income distribution relating to the year ended June 1970 was over Rs 50.44 lakhs, the number of applications being 15,660. With respect to income distribution for the year ended June 30, 1971, the number of new applications for reinvestment received by the Trust totalled 4,193 involving 20,33,750 units.

Sale of units under the Voluntary Savings Plan 1969 during the year amounted to Rs 1.58 lakhs. The number of savers participating in the Plan at the end of the year was 682.

The Children's Gift Plan launched by the Trust on July 1, 1970 has made a promising beginning. During the year, units worth Rs 56.32 lakhs were sold, the number of applications being 2,388.

The Unit-linked Insurance Plan, reference to which was also made in my previous statement has been finalised. The basic objective of his plan is to offer to investors, especially from the relatively small and medium income groups of the community, a facility for regular savings and investment of such savings in the units of the Trust, combined with the advantage of life cover during the period of the plan.

China in the UN

THE Kuomintang, the Nationalist Party now ruling Taiwan as the Government of the 'Republic of China', had lost the battle for the right to represent China as long ago as in 1945. The communists had to be recognised in constituting the delegation to the San Francisco Conference that year. The delegation which went to San Francisco was not an exclusively Kuomintang one. There was a lone communist member in it. This was Ting Fi-wu, today the acting Chairman of the People's Republic of China. It has taken 26 long years for the Kuomintang to be finally told the very obvious reality that it does not rule China, that what obtained on mainland China was not, as it claimed, a continuing rebellion but a very organised and responsible government. The Chinese people had made their choice in 1949 and their choice was *not* the Kuomintang.

But then it would be only a half-truth to say that the defeat is that of the Kuomintang. It is, in simple terms, a defeat for American foreign policy. It is true that the Americans were reconciled to it. It is also likely that Kissinger, during his first trip to Peking and more recently when he was there last week, must have made it clear to the Chinese that the Americans did not mind a few people in Mao jackets arriving in New York. But that they had reconciled themselves to the inevitable does not detract from the defeat the Americans have suffered.

In other words, President Nixon in spite of himself has begun to preside over the liquidation of the American empire. China's entry into the United Nations signifies, above all, that this process of liquidation has begun. When Nixon goes to China next year he may well find the Chinese extremely cooperative in hastening the process. For the Chinese, one obvious lesson of the UN voting has been that if they stuck to their guns, the 'imperialists' would bend. The Chinese had maintained all along that there would be no 'two Chinas', nor 'one China, one Taiwan', nor 'any other similar solution'. There was only one China, and Taiwan was an integral part of it. The reluctant West and the recalcitrant Americans had to accept these terms. At any rate, the General Assembly has accepted them. Presumably the same realism, however belated, would inform the positions of the West and the Americans in the Security Council.

There is yet another important aspect to this development. All through the fifties, the number of States voting for China's entry had always exceeded that of those voting against it. (China, nevertheless, could not come in because of the US resolution making its admission an 'important question' necessitated a two-thirds majority.) However, during the sixties, beginning literally with 1961 (the voting figures for 1961 were 37 for, 48 against and 19 abstentions) the number of States voting against the Chinese delegation occupying the China seat always exceeded that of those who voted for it (with the very understandable exception of 1970). This change between the fifties and the sixties is significant, for it was precisely during the sixties that the much-talked-of decolonisation took place in Africa. While the 'third world' was being more and more talked about, it seems to have behaved in a peculiar way on the question of China's representation in the UN. Obviously, quite a few of these 'independent' States were amenable to pressure from the United States. Political independence in many of these countries is still no more than a mirage.

For the Chinese, again, the point must be obvious. The United Nations reflects the present world order, dominated by the US and the USSR. What happened on Tuesday, October 26, in the General Assembly showed that quite a few of these not-so-independent States were able to enjoy the liberty that they did mainly because the US policy of 'containment of China' had come to naught. Americans could no longer pretend to be unaware of the phenomenon of China. Kissinger was flown to Peking—to prepare the way for a visit by the US President himself. And then suddenly many States became brave. Their patron was helpless; so they could have a little elbow-room.

But no more than elbow-room. The voting in the General Assembly has changed the representatives of China. It has not substantially changed the international order. Or not just yet. It is, therefore, necessary not to read too much into the euphoria evidenced in the General Assembly on Tuesday. Presumably, the euphoria had more to do with America's defeat than with China's success. If so, nothing could have been more premature. The decision of the General Assembly demonstrated that if a nation were to persevere in its opposition to the world power system, it would certainly make a dent in it, eventually to weaken it. China's entry into the UN is one such dent. China might try and make further dents. But for the present while China's entry has been a blow to the world power system, it would be unrealistic to exaggerate its importance.

Bangla Desh

Escalation with Purpose

APPREHENSIONS that the end of the monsoon would be marked by a sharp build up of tension between India and Pakistan have come all too true, unfortunately. Pakistan has been trying from the beginning to conceal the true character of the freedom struggle in East Bengal by making it appear as an India-Pakistan affair. In the last few weeks India too has begun to give wide publicity to its own defence preparations. And to show that the Indo-Soviet treaty is no paper tiger we have promptly invoked article IX of the treaty which provides for mutual consultations to 'remove' any threat of attack facing either of the signatories. This brought the Soviet Deputy Foreign Minister to Delhi — with what results it is not immediately clear.

In terms of the freedom struggle in East Bengal the two armies have tactical objectives only on the eastern border. Preparatory to an all-out offensive against the freedom fighters, the Pakistani army has been straining to close the East Bengal border so as to cut the movement of help from India. India, on the other hand, has an interest in keeping a strip of territory along the border relatively free from Pakistani army operations, as has been the case so far.

These limited tactical objectives apart, there are weighty political considerations in favour of escalating tension. Pakistan hopes that the major powers will be so convinced of the imminence of a war that they would pressurise India into accepting a mutual withdrawal of troops from the border — which would check the flow of help to the freedom fighters. The same threat, India hopes, will persuade the big powers to put pressure on Pakistan to the point of finally compelling President Yahya Khan to start negotiating with the Awami League for a political solution.

While in military terms India's position is vastly superior, its attitude to the freedom struggle in East Bengal remains ambivalent. Ideally, it would perhaps like the Awami League to be installed in power within a framework of autonomy. Very likely this is what the 'provisional government of Bangla Desh' is also playing for, despite its affirmations of commitment to total independence. Yahya Khan may not be prepared to accept this yet, but it is perhaps only a matter of time before he, or whoever replaces him, is forced to accept this as the best bargain in the circumstances. The elements who may spoil this eventual consensus may be the freedom fighters themselves. After all the promises of a free Bangla Desh will they be fobbed of with autonomy and an Awami League government? Fissures between the 'provisional government' and the freedom fighters are already beginning to surface. Only this week the 'provisional government' has had to 'dismiss' another sector commander of the freedom fighters. No one has suggested that these dismissals have been on account of inefficiency.

Levies by Ordinance

Farcical Irrelevance

THE recent tax measures by three Ordinances to yield Rs 30 crores in the current year would not be worth a comment—except for the fact that they, and the official statements that have followed them, signify government's reluctance to seriously grapple with the total economic situation.

It has been made out time and again that the burden of Bangla Desh refugees is at the bottom of the present 'financial crisis'. But the crisis is more than merely 'financial' and the Bangla Desh refugees are a convenient cover for it. If the refugees are costing us anywhere near what government has made out, then the yield from the latest levies can hardly make a dent on the problem. But if the fact is that the refugees by no means account for the major part of the Government deficit (Rs 350 crores in the first six months against Rs 220 crores planned for the whole year) what is the relevance of the levies which, apart from being trivial in their yield, have been repeatedly described as 'purely temporary'. Even last year, the deficit at Rs 408 crores had well exceeded the planned level of Rs 225 crores.

At Thursday's luncheon meeting at the Press Club in Delhi the Finance Minister repeated that the levies would not cause inflationary pressures, that prices had gone up because of shortages and increase in money supply, and that they would have to be checked by measures to increase production ('especially industrial production') and curb expansion of money supply. Yet how is all this to be achieved? The growth rate of industrial production sagged miserably to around one per cent in the first half of the current year. And though agricultural production—foodgrains production, mainly—has given rise to such euphoria as to lead to considerable dismantling of the official distribution system, there may be cause for regret if, as the Agricultural Prices Commission has pointed out, next year's monsoon is not as favourable. Besides, adequate supply of foodgrains can at best lend stability to a growth effort, not by itself trigger off growth. The growth effort has to be in the industrial sector. Industrial production has lagged largely because public investment has not picked up. Shortages of industrial raw materials, especially steel, have been felt acutely. And industry in West Bengal has yet to be 'reconstructed'. To these problems the Finance Minister's solutions may be less than adequate. Ad hoc measures, of which the latest levies are a particularly farcical instance, cannot lead to sustained growth. And so the government is driven to search for alibis.

What gives equal cause for concern, however, is the opposition parties' approach to the present situation. At its conference at Valwan in Maharashtra, the Socialist Party attacked the recent tax measures not for their gross inadequacy and irrelevance but on the ground of their having been introduced via ordinances in trespass of 'democratic' ways!

Science Policy Planning

No Takers?

FOLLOWING what seems to have become common practice in such matters, the Government has begun appointing the National Committee on Science and Technology (NCST) on instalment plan basis. The names of 10 members were announced on Monday last; the appointment of the chairman as well as five other members is to follow. However, it is not necessary to wait for the constitution of the Committee to be completed to make some general comments.

The NCST, which replaces the infructuous Committee on Science and Technology (COST), will be the top policy-making body in science and technology, and is charged with the preparation of a national plan for science and technology to be dovetailed with the socio-economic development plans. In addition, the Committee will have the following specific functions: to decide on the pattern of development of scientific and technological research, including inter-sectoral resource allocation and measures needed for correcting imbalances that may arise; co-operation and communication between government, semi-government and non-government scientific and technological institutions and professional bodies in the country; taking decisions on international scientific and technological matters including import of knowhow; and negotiating bilateral agreements with foreign governments.

The Sarkar Committee of Enquiry into the CSIR, as well as the conference of scientists, technologists and educationists which met in Delhi in November last year, had indicated some guidelines to the Government in regard to the setting up of the NCST. It had been recommended that the NCST should be a compact body of full-time members with an adequately staffed secretariat. But the NCST now in the process of being formed is neither a compact body—it is to have 16 members—nor is it to consist of full-time members. And without full-time members one might as well give up any hopes of the NCST acquiring an effective secretariat. Who would direct the work of the secretariat? Clearly, the constitution of NCST does not appear to have been in the least influenced by the lessons of the failure of COST.

This must have been obvious to the government. The significant question to ask then is why the government has constituted the NCST in the manner in which it has. Reports suggest that the government had to fall back on part-time members because few, if any, of the scientists considered for membership were prepared to give up their present assignments and join the NCST full-time. This is interesting, indeed. One has heard our scientists ever so often bemoan the lack of an overall national plan for science and technology and complain how vital decisions in such areas as import of foreign technology are taken without a long-term scientific and technological perspective. And yet when presented with the opportunity to play a role in national policy-making, they seem to prefer their present (mostly executive) specialist assignments.

Having said this, it has to be added that the portents have never been particularly auspicious for any group of scientists and technologists to commit themselves to the task of national policy-framing in science and technology. Inter-agency rivalries and the absence of a shared perspective on the approach to science policy among top scientists have always been discouraging factors to reckon with. At the present moment an even more important dampening factor is the virtual collapse of such socio-economic planning as we ever had in the past. The NCST is expected to frame a science and technology plan to be dovetailed with the plan for national development. But where is this development plan?

Perhaps the scientists who politely but firmly declined to be full-time members of the NCST have a point, after all.

Nobel Prize

Logical Sequence

A Correspondent writes:

THE third Nobel Prize for economics has been very deservedly awarded to Simon Kuznets. In the typical Wesley Mitchell tradition, Kuznets has worked all his life for the development of quantitative economics. He made national income analysis of operational significance by putting the economic data for the United States in meaningful form. In fact, Keynesian analysis would not have been carried forward in empirical terms but for the work done by Kuznets. More than this, Kuznets has done monumental empirical work by organising available data for analytic purposes with regard to the characteristics of economic growth in the developed as well as the developing countries. In fact, this work would be the basis for considerable analytical work on economic development.

In its choice of economists for award of the Nobel Prize, the selection committee seems to have proceeded in a very systematic manner so far. The first award for Tinbergen and Frisch was for contributions to the development of econometrics — a breakthrough in techniques of analysis without which economics could never have become an empirical science. The second award went to Samuelson for his profound contributions to economic theory. And now the third time the award has gone to Kuznets, without whose work it would have been difficult to carry forward the tradition of economic analysis either in the field of econometrics or in that of operational theory.

Just as Kuznets has made the Keynesian system workable, similarly Wassily Leontief has made the Walrasian system of operational significance. These are the two fields — national income analysis and input-output analysis — which have formed the basis for much of the progress in economic science in recent years. It would indeed be logical, therefore, if the next Nobel Prize in economics is awarded to Leontief.

BUSINESS

Gamble in Coking Coal

Magnus writes:

GOVERNMENT has taken the first step in control of the country's coking coal mines by taking over the management of 214 mines in Bihar and Bengal. The Press Note issued on October 16 is phrased felicitously, if rather pompously, and conveys to the uninitiated an impression that the industry's troubles will soon be over. While not wishing the Government ill, one can nevertheless only keep one's fingers crossed about the future of the coal industry.

Writing in this journal, a contributor had recently maintained that "collieries in the Jharia and Raniganj fields could get away with practically anything before Government even comes to know of what is afoot" (D C Kale: "Alternative to Nationalisation", October 9, pp 2143-4). The truth of this statement about the Government's total lack of control in the coalfields has been amply borne out by the rather peevish complaint of the new Custodian-General for the coking coal mines that when his underlings took over control of management, they found little cash in the tills, hardly any stores or spare parts in stock, and no surplus machinery anywhere. Nothing better could have been expected considering that rumours of nationalisation had been in the air for weeks in advance. Matters have been further complicated by the fact that most mine-owners have non-coking as well as coking coal mines and the former provided a ready refuge for surplus assets. It was naive of the Ministry of Mines to expect that colliery owners would behave like good boy scouts to the last, when their earlier performance had been so manifestly different; indeed, the whole exercise of nationalisation had become necessary allegedly because of the mine-owners' reluctance to co-operate with the Government in improving the working of the mines.

Some of the leading colliery companies had got into financial difficulties quite some time back. For example, it is widely believed that when Mundhra acquired control of Turner Morrison, he promptly drained the cash reserves of their Lodna group of collieries and thwarted their modernisation. There are other similar cases. It is also true, as the Press Note points out, that efforts made by the Government to secure voluntary amalgamation of small mining units into larger units have failed. There are two courses open to the Government at this stage when it has taken over management

but not yet ownership. It can amalgamate the collieries rationally and hand back the mines to the previous owners or it can pay compensation and take over ownership. On the face of it, the latter course would seem preferable.

The Press Note says somewhat pontifically: "Full economies of scale can be achieved only if the units produce a minimum of 3,000 to 4,000 tonnes per day. Capital formation and reinvestment are also inadequate to meet the needs of this industry." This would appear to suggest, first, that smaller collieries can never be efficient or profitable and, second, that collieries producing over 4,000 tonnes per day (the magical figure) are necessarily profitable. The Press Note is wrong on both counts, particularly the second — and that is where the danger lies. The NCDC has an installed capacity of 18.2 mn tonnes and it produced 13.8 mn tonnes last year. In due course, it is expected to produce 30 mn tonnes per year, of which 9.5 mn tonnes will be coking coal. In spite of these large capacities, NCDC has consistently run at a huge loss.

Finally, is it desired to conserve coal resources at any cost as a matter of principle? If, as the Press Note would have it, the long-term interests of the steel industry are at the heart of the matter, the question of costs arises at once. The need is for regular supplies at steady prices over a long period. Any solution which meets these objectives best should be adopted. Unfortunately, one cannot avoid the feeling that coal prices will go up in the very near future.

Shipping

Teja's Treasure

THE vigorous efforts that were being made behind the scenes by some of the leading Indian shipping companies to acquire the shares of the erstwhile Chairman of Jayanti Shipping Company have become a matter of historical interest now. The Government has, by an ordinance issued on October 17, acquired all the shares of the company. For the 2,88,128 shares of a face value of Rs 100 each, the compensation has been fixed at Rs 4.5 crores. As against this, the private sector bidders for control of Jayanti were reportedly prepared to pay up to Rs 5 crores for the 2,12,472 shares of a face value of Rs 2,12,47,200 owned by Dharma Teja which the Bombay High Court had ordered to be auctioned. And this in spite of the fact that the Shipping Corporation has claimed before the Delhi court trying Teja that Teja had still to pay about Rs 95 lakhs in respect of the shares standing in his name. Then there was the prospect of the buyer having to take on other liabilities as yet uncovered. That all this notwithstanding there should have been such keenness on the part of established private sector shipping companies to get hold of Jayanti was surely an unintended tribute to the essential judgment and enterprise of the founder of Jayanti which, at that time, these very companies had decried and sought to run down. Jayanti's fleet constitutes about 12 per cent of the country's total shipping tonnage even today.

According to the ordinance, the Government proposes to transfer all but 100 of Jayanti's shares to the Shipping Corporation of India which has managed Jayanti since June 1966. Whether SCI will continue to manage Jayanti as in the past or whether Jayanti will be merged with it or, again, whether Jayanti will operate as a separate shipping company has not been evidently decided yet. Whatever the form ultimately decided upon, the nationalisation of Jayanti has sharply raised the public sector's share of national shipping tonnage. Till now the public sector in shipping comprised the *Shipping Corporation of India* and the Mogul Lines which together accounted for about 38 per cent (904,690 grt) of the country's gross registered tonnage. With the nationalisation of Jayanti (295,298 grt), the State's share in the country's shipping tonnage has jumped to 50 per cent. The share will go up further if we consider the total tonnage on order at present. Of the 62 vessels of 11.51 lakh grt on order, SCI's share is 32 ships of 6.72 lakh grt or about 58.4 per cent. The Government's declared policy in the matter has been that the public sector should eventually own 50 per cent of the national tonnage. This objective appears to have been secured painlessly — thanks to the misfortunes of Dharma Teja. The ball is now squarely in the court of the private sector companies who will have to show greater dynamism if they are not to collectively trail behind the public sector.

Export Promotion

Zeal without Co-ordination

THE Indian Institute of Foreign Trade presented its report on the export potential of Bihar, comprising six bulky tomes, to a gathering of VIPs the other day in Patna. In addition to providing broad guidelines for generating export surpluses in selected industries and for finding markets for them, the report suggests, *inter alia*, the constitution of a State Export Promotion Board. An attempt is also made to outline a pattern of development for establishing new export-oriented industries, especially those based on the mineral resources of the state. This is probably the sixth in the IIFT's series of reports on the export potential of the different states; Andhra, Mysore, Maharashtra, Tamil Nadu and Haryana have already been covered and two more surveys, of Madhya Pradesh and Kerala, are reportedly in the offing.

The logic of the IIFT's surveys is that state governments have an important role to play in developing the export base of their states and in taking steps for expanding exports within the framework of the Union Government's national export policy. In addition, such efforts may also aid the states in generating new economic activities. The surveys are expected to provide the necessary information and guidelines to the states in this endeavour.

Almost all the surveys that have been completed by the Institute so far follow a uniform pattern in their approach. The Institute, in consultation with the concerned state governments, selects a few score of commodities and compiles, by the survey method, information on them relating to production, raw material availability, export marketing, etc. In preparing the compendium, generally a few suggestions are thrown in for commodity export development and institutional effort. Finally, voluminous statistical appendages appear to be a must.

Unfortunately, multiplication of export organisations, whether for sales or service, is hardly the answer to our export problems. Already too many organisations are engaged in parallel functions without any co-ordination whatsoever among them at any level. Creation of more organisations will only add to this avoidable wastage. Similarly, efforts to develop new industries in the zeal for export promotion must also be examined in the all-India context and from the standpoint of costs and benefits to the nation. Otherwise, every state would be going ahead with the setting of industries on the basis of half-baked ideas about their export potential — a luxury which a country with an already high-cost industrial structure can ill-afford.

US-Japan Textile Pact

Holding Them in Check

AFTER initial resistance, Japan signed a textile pact with the US on October 15—the deadline set by the US, after which it was to impose mandatory textile import quotas. The pact does not demand a reduction in the existing volume of textile exports but restricts the future growth of exports of synthetic and woollen textiles to an annual growth rate of 5 to 7.5 per cent. During 1965 to 1970, exports from Japan of non-cotton textiles increased at an average annual rate of nearly 13 per cent and of clothing at 10 per cent. Similar pacts were signed also with other major textile exporters to the US, *viz*, South Korea, Taiwan and Hong Kong. The Japanese 'gain', *viz*, the abolition of the 10 per cent surcharge by the US, was no real gain as the duty had been imposed only as a temporary measure by the US.

The pact has been resented by Japan's enterprising textile industry. Total Japanese exports increased over eight-fold, from $ 2 billion in 1955 to $ 19.3 billion in 1970. During this period, though the share of textiles and clothing in total exports declined, from 35 per cent to 11 per cent, the absolute value of textile and clothing exports increased over threefold, from $ 692 million to $ 2,207 million. Synthetic and woollen textiles and clothing were responsible for this. While exports of cotton fabrics declined from $ 230 million in 1955 to $ 188 million in 1970, exports of synthetic and woollen textiles and clothing increased nearly fourfold during this period. The recent pact between the US and Japan does not cover cotton textiles—exports of which are governed by an international trade agreement. The pact thus implies that the Japanese industry will have to adjust itself to a much smaller growth rate of exports since the US has been Japan's most important export market. It was during the 1960s that the US emerged as an expanding market for Japanese textiles. In 1969, it absorbed over one-fourth of Japan's total exports of textiles and clothing. And, while between 1962 and 1969, the share of all developed countries in Japanese textile exports remained stagnant at 46 per cent with Western Europe's share actually declining from 8 per cent to 7 per cent, the share of the US increased from 24 per cent to 26 per cent.

Although the Japanese textile industry's overall dependence on export markets declined over the last 15 years, the textile and clothing industry is still the most export-intensive in Japan, with exports constituting 26 per cent of total production. Between 1955 and 1969, exports as percentage of production declined for cotton fabrics, spun rayon fabrics, and rayon filament fabrics. As against this, between 1961 and 1969, exports as percentage of total production, increased for wool fabrics and synthetic fibres. The increase in exports of synthetic fibres and woollen textiles was partly a response to the limitations on the exports of cotton textiles, imposed from 1962 by the multinational framework. Growth of labour productivity in the textile industry lagged behind in the 1960s—being almost one-half the rate of growth of productivity in the other major industries like engineering and chemicals. With rising wages then, unit labour costs in weaving and finishing were rising fast, but the synthetic textile industry could cope with these rising costs because of the continuous fall in fibre prices resulting from an extremely rapid growth of productivity in the chemicals industry. The new pact, therefore, comes as a setback to the growth sector within Japan's textiles exports.

STC

The Nazrana Helps

A Correspondent writes :

IN your editorial note on the STC ('Limited Accountability', October 16, pp 2176-7) you ask the very pertinent question whether the STC does not have goals beyond creating a streamlined structure of management accountability and keeping down costs of operation. However, I would go further and examine rather more critically than you have done the STC's claims that it has cut operating costs and improved its cash management to the point where it was able, in 1970-71, to run "a Rs 217 crores business on a self-sustained cash basis".

I shall refer only to STC's import business of which I have some first-hand knowledge as I am connected with one of the associations of established importers dealing in an item import of which has been 'canalised' through the STC. What canalisation amounts to in our case is that the import licences for the item in question are issued in the name of the STC, which endorses them in favour of our association. This having been done, the STC takes no further part in the import or marketing of the item. Our association negotiates the purchases abroad, makes the necessary financial arrangements with commercial banks, attends to the customs formalities, including payment of customs duty, looks after warehousing, etc, and then distributes the imported item among its members who, in turn, sell it to industrial users of the item. And yet the association is required to pay the STC 'service charges', which are calculated as a proportion of the net value of the import licences endorsed in favour of the association by the STC. In 1970, our association paid to the STC 'service charges' amounting to a good deal more than Rs 10 lakhs. I must add that import of the item dealt in by our association is relatively small—rather less than Rs 3 crores last year.

The imports, though effected by the association, are deemed to be on behalf of the STC and are, therefore, added to the STC's business turnover. Yet the STC incurs absolutely no expense. So its aggregate costs-to-turnover ratio stands automatically reduced. So also, it would appear at the end of the year that the STC has handled a larger volume of business with no increase in cash requirements—naturally, since it is our association (which, incidentally, paid out Rs 3 lakhs or so by way of interest and bank commission in 1970) that has to make the arrangements with banks. It would be interesting to know how much of STC's imports of Rs 142 crores in 1970-71 were effected in the manner described above.

When import of an item is canalised, the importers have no alternative but to pay the stipulated *nazrana* to the STC. But compulsion apart, the importers do not fare badly at all under the arrangement. Considering the large profit margins on most imported items, payment of STC's 'service charges' is no skin off the importers' backs. Besides, the importers often find the STC a persuasive pleader on their behalf in New Delhi. It is, therefore, a satisfactory arrangement for all concerned. The Government gets credit for advancing the cause of socialism by canalising imports; the STC gets its cut and is even able to show expanded turnover without effort or cost or financial outlay; the importers get their imports and, once they pay STC's 'service charges', are left free to squeeze all they can out of the market.

Towards a Tripolar Game

Dhananjoy

THE announcement that a Soviet-American summit will take place in May will cause little surprise in the world. Both the Super Powers had been maintaining mutual contacts at various levels for over a decade and meetings at the highest level have also taken place in the past. Nixon himself will be no stranger in Moscow though he may not conduct a kitchen debate this time. There is more important business to be negotiated: it will be appropriate for a Soviet-American summit to announce some progress in the Salt Talks just as it might declare the intention of both Governments to seriously consider schemes of balanced troops reduction in Europe. The number of agreements that have already been negotiated between the United States and the Soviet Union is by no means insignificant. Ever since the non-proliferation treaty, the two Powers have found it possible to agree on a number of subjects like prohibition of biological warfare, non-use of sea-beds for military purposes and providing safeguards against accidental nuclear war. Of still greater significance is the recent agreement on Berlin which clears the way for a new approach to European security.

The real meaning of the Nixon visit to Moscow may, however, have to be found in wider terms than bilateral Soviet-American relations alone. The rules of the game of a tripolar balance are now being evolved and a new world political system is in the offing. The essence of this system would be the existence of three different limited adversary relationships — the Soviet-American, the Soviet-Chinese and the Sino-American. Each of these relationships will be based on the principle of controlled competition and a minimal accord. Subject to the existence of these three relationships, it will be the effort of each of these Powers to promote its own interests by making it hard for the other two to agree. Since the United States is playing a leading role in the enunciation of the rules of this game, it is worthwhile to watch American policies carefully.

Evidently, what would suit the Americans most is a situation in which Washington not only maintains good relations with both Moscow and Peking but makes it impossible for Moscow and Peking to evolve equally good relations. Simliarly, from the Soviet point of view, the ideal situation would be one in which its own relations with both China and America are stable and friendly while Sino-American relations become strained. In a less obvious manner, Peking also has been trying to achieve the same objective of exacerbating the Soviet-American conflict to a point where both would consider good relations with China to be an important national objective.

What shape the world will ultimately take is still uncertain. What is less uncertain is that the present moves are meant to create a world of three Powers. There will be too many detractors in the world to permit such a near triangular balance to emerge. Neither the West Europeans nor the Japanese are likely to remain idle while others try to build such relationships. Few of the second-rate powers can be expected to take a posture of open challenge to this evolving system. In all probability, they will try to modify it to their advantage by offering limited support to these trends. But these nations could derive considerable sustenance from unexpected sources if they attempted to obstruct the implementation of the Nixon model. Is it entirely without meaning that North Korea's Kim-Il-Sung has just made a new gesture towards Japan and offered to rebuild Japanese-Korean relations?

The more important snag, however, is that one of the three Great Powers, namely China, may find it too status quo oriented a model to suit its interests and objectives. China is very much the weaker party in the triangular game. Recent American statements have sought to attribute to China a degree of progress which would appear somewhat exaggerated. For example, the American contention that in the field of nuclear research, China is now as good as the other two Super Powers, is obviously an attempt to convey to Peking the message that the Americans think that it has already arrived. The Chinese themselves do not share this view and over and over again the leaders of China had made it quite clear that their country is still underdeveloped in many ways. The attempt to create a stable triangular balance at this time with its unmistakable emphasis on global status quo could, therefore, fail to receive China's enthusiastic support. Could it be that by announcing his visit to Moscow, President Nixon is trying to tell Peking that should it fail to respond to his gestures and to agree to participate in the making of a tripolar world, the United States can fall back on the old model of a Soviet-American system in which China is the world's odd-man-out?

Going Strong

Hansavivek

ALUMINIUM INDUSTRIES completed the switchgear project and began commercial production last year. The company supplied the first 66 kV and 33 kV oil circuit breakers and current transformers to various electricity boards in India during the first quarter of 1971. Diversification of production in switchgear and other lines of activity is being considered by the management. During the 25th year ended March last, production of bare conductors increased from 6,682 tonnes to 10,070 tonnes, and sales increased from Rs 6.69 crores to Rs 9.62 crores—even though the company continued to face difficulties in procurement of aluminium and steel. The position in aluminium eased slightly towards the close of the year. The year's profit as well as the writeback of about Rs 5 lakhs from development rebate reserve have been utilised to reduce the accumulated deficit to Rs 1.01 crores. There is also a contingent liability on cumulative preference shares for dividend exceeding Rs 21 lakhs. Other liabilities include Rs 3 lakhs due to the Trustees of the Employees Provident Fund and about Rs 2 lakhs on account of income-tax deducted at source.

The directors visualise "much better" prospects for the current year. The order book for bare conductors, switchgear and wire working machinery is satisfactory. The switchgear and machinery manufacturing facilities are expected to be fully in operation during the current year. Total orders outstanding for exports are worth over Rs 47 lakhs, including one from the USSR for bare conductors. Alind has also been able to secure business for the newly-formed consultancy and engineering services division involving the supply of machinery and the imparting of technical knowhow.

INDIA CEMENTS completed the first phase of its one-million-tonne expansion with the commissioning of the third kiln at its Sankaridrug factory last June. The rated capacity after the expansion is 1.5 million tonnes per annum. The second stage of the one-million-tonne expansion scheme envisages two more kilns at the Sankaridrug factory. Since Government's policy is based on locating new cement factories with a view to correcting regional imbalances and since there is already surplus of cement in the southern region, the question of taking up further expansion will be decided shortly in consultation with financial institutions. The company has also been registered under the MRTP Act. During the 25th year ended March 1971, production of both clinker and cement at the Sankaridrug factory continued, as in the preceding year, to be above rated capacity. Though production at the Sankarnagar factory improved over the previous year, it failed to reach full-rated capacity due to delays in the delivery and consequent commissioning of cement grinding mills and clinker conveyors for the new kiln commissioned in April 1970. The rated capacity of this unit is now 8.63 lakh tonnes of portland cement. The foundry division made a small loss due to steep increases in the cost of production, accompanied by a prolonged stay-in-strike and go-slow by workers. The expansion work undertaken at the foundry in 1969 has been completed, and the unit can now cater to larger demands of castings. Cost of production of cement increased during the year on account of revision in pit-head price of coal, increase in railway freight on coal and gypsum, rise in prices of various items of stores, and rise in labour cost due to variable dearness allowance. The increase on account of railway freight has been further enhanced by the last budget. The validity of the Amendment Order introducing uniform retention price of cement was challenged by the company as well as by some other producers in different high courts. The Madras High Court originally upheld the company's contention that the Order was *ultra vires*, but this judgment was reversed in appeal. The question of taking up the matter further is being examined.

RAMON AND DEMM continues to have on hand orders in excess of its production capacity and, therefore, proposes to undertake expansion. Meanwhile, the installed capacity of various types of gears is to be increased from 600 tonnes to 650 tonnes, by addition of certain balancing plant and equipment. As the proposed expansion will involve additional long-term borrowing, the Board's borrowing limit has been increased from Rs two crores to Rs four crores. With better utilisation of plant capacity, the company had good results for the seventh year ended March 1971. Not only has it wiped off the entire debit balance of about Rs 18 lakhs, but has also paid a maiden dividend of eight per cent all of which is exempt from tax.

SHRIRAM BEARINGS has received a 'letter of intent' for manufacturing cylindrical and tapered roller bearings upto nine lakh numbers per annum. For this purpose, the company is establishing a new unit at Aurangabad in Maharashtra. Steps have been initiated for early implementation of the project. Meanwhile, the company's existing factory at Ranchi is working satisfactorily. With the installation of some balancing equipment, the operations are likely to show further improvement. During its 11th year ended June 1971, there was a strike by workmen on two occasions and about seven weeks' production was lost. Even so, sales looked up by Rs 10 lakhs to Rs 2.60 crores but, with contraction of margins, gross profit was Rs 5 lakhs lower at Rs 63 lakhs. Dividend stepped up 2.5 points to 12.5 per cent was still covered 2.29 times.

UNIT TRUST OF INDIA's sale of units during the year ended June 1971 was lower at Rs 18 crores in the preceding year (record level of Rs 22.83 crores). The fall in sales was due to the general hardening of interest rates, increase in interest rates in rival channels of investment, and change in the scheme of tax concessions introduced last year. Almost the whole of investment in units was by individuals, who accounted for Rs 17.36 crores. Repurchases by the Trust were larger at Rs 3.19 crores under 12,698 applications, as against Rs 2.03 crores under 9,480 applications the year before. Total investments increased from Rs 88.18 crores to Rs 105.14 crores over the year. The Trust participated in the underwriting of 16 issues to the extent of Rs 3.05 crores, as compared with 21 issues totalling Rs 9.69 crores. Underwriting comprised debentures (Rs 138 lakhs), equity shares (Rs 94 lakhs), and preference shares (Rs 73 lakhs). During 1970-71, the Trust's income increased from Rs 6.28 crores to Rs 8.41 crores, and total expenses were also up from Rs 67 lakhs to Rs 80 lakhs. Net income allocated to unit holders amounted to Rs 7.58 crores. This, together with the balance of Rs 19 lakhs in the Unit Capital Appropriation Account meant

that, in all, Rs 7.77 crores were available for distribution to the unit holders. The income distribution to unit holders, stepped up from 7.2 per cent to 8 per cent, would absorb Rs 7.38 crores and to the initial capital contributors Rs 26 lakhs. As at the year-end, the Trust's investments showed appreciation of 7.5 per cent in relation to their book-value compared to 9.6 per cent a year ago. R S Bhatt, chairman, commenting on the smaller appreciation in the value of investments, says that slump in the stock market prices towards the close of the accounting year had its impact on the Trust's investments.

INDIAN IRON AND STEEL's chairman, Biren Mookerjee, told shareholders at their annual meeting that a revised scheme to increase ingot capacity by some 300,000 tonnes per annum was under discussion with Government. It would require over Rs 60 crores, as against only Rs 11 crores that the scheme would have required had it been implemented in 1962. Loans would have to be obtained from official lending agencies for implementing the scheme. That would entail incorporation of a conversion clause in the agreement, which would reduce the share of the existing shareholders in profits and assets of the company by two-thirds. Even if the loan was not converted into equity, interest payments would reduce the company's profits. Justifying the board's decision on the payment of a dividend of six per cent for last year, Mookerjee pointed to the need to conserve resources for rehabilitating the plant. He stated that, even maintaining dividends at that rate might be impossible unless there was a relaxation in the official pricing policy. With the cost of raw materials, freight, consumable stores, and labour continuing to rise, he felt that available profits would shrink.

KAMANI ENGINEERING CORPORATION embarked on their export drive at the beginning of the sixties amidst much scepticism about whether India possessed the knowhow for designing and manufacturing such a specialised product as transmission line towers. Yet, within a little over a decade, the company's exports have reached Rs 42 crores and its towers have reached countries like New Zealand, Philippines, Taiwan, Thailand, Malaysia, Iran, Kuwait, Sudan, Tanzania, Nigeria, West Indies, Canada and even the US. The company has just completed a turnkey project valued at over Rs 6 crores in Sudan. The Rs 20-crore Indo-Iranian Power Development Package Deal, signed with the Government of Iran, is progressing according to schedule and is more than half way through. Further orders for turnkey and supply projects, collectively valued at over Rs 16 crores, have been received by the company. The orders are from Iran (Rs 6.1 crores), Libya (Rs 6.6 crores), United States (2,000 tonnes of high-tension transmission line towers) and Thailand (Rs 3 crores). Kamanis acknowledge the support they have got in the form of export finance from the commercial banks and the Industrial Development Bank of India. With a decade of experience in international marketing, Kamanis have now set up a full-fledged Export House, recognised by the Government, with a network of offices, agents and business associates in all parts of the world.

NEW DELHI

To Impress Aid Consortium?

THE official announcement of the promulgation of the three ordinances imposing fresh levies on railway passenger fares, postal articles and on certain kinds of financial transactions makes it pointedly clear that they are a temporary measure "to meet the financial burden caused by the influx of refugees from Bangla Desh". They will come into force on November 15 — more than three weeks after the promulgation of the ordinances.

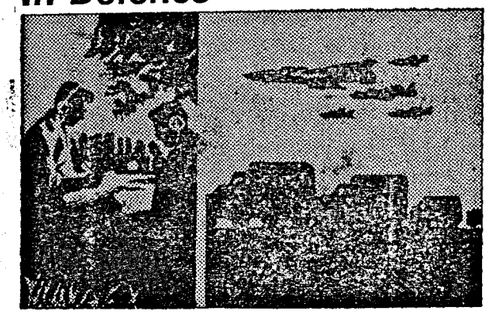
The official announcement also explains that the additional levies are in pursuance of discussions with the state Chief Ministers at their conference held ten days earlier at which it was agreed that revenues from these levies which accrue to the states would be made available to the centre for refugee relief. In addition, the state governments are expected to levy a surcharge for refugee relief on items within their legislative competence. The items suggested for such surcharge are understood to include power rates, sales tax, betterment levies, etc. The total yield of the measures introduced by the centre and those expected to be introduced by the states (and not from the central levies alone as press reports have suggested) is estimated at Rs 70 crores in a full year and Rs 25 crores in the current year.

It is not clear why the government's ordinance-making powers had to be invoked when the levies in question are to come into force only in the middle of next month when the Parliament is scheduled to begin its autumn session. If the levies were not to become effective at once, legislative procedures might have served to obtain similar results which, in any case, are not very impressive considering the magnitude of the financial burden imposed by the influx of refugees from Bangla Desh. Could it be that the government rushed through with the ordinances mainly to impress the Aid India Consortium which is shortly meeting in a special session to consider aid specifically for refugee relief? Also revealing of the state of mind in the government is the apologetic manner with which the new levies were justified. Planning Minister C Subramaniam went out of his way to hold out the assurance that this was not part of any resource raising effort and that the government had no intention of levying additional taxation.

The issue of finding resources to look after the refugees and to finance economic development — which is the promise repeatedly made by government leaders, very much like the slogan of achieving both national defence and national development in the early sixties after the border clash with China — thus remains to be resolved. The puny effort implied in the latest levies clearly bears no relationship to the task involved. An idea of the magnitude of the task may be had from the tentative study of the resources position for the Fourth Plan carried out in the Planning Commission. The study does not take account of the extended commitments assumed by the government since the Plan was formulated in respect of reducing inequalities, removing poverty and promoting employment nor of the new burden of Bangla Desh refugees. The results of this study were before the last full meeting of the Planning Commission but a discussion on the subject was put off with the suggestion that a more thorough study of the resources problem might be made in the coming weeks.

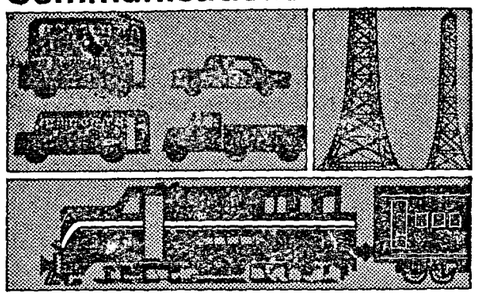
The Planning Commission's study is based on certain assumptions. Some of these are that national income in real terms will continue to increase at the compound rate of 5.5 per cent in the remaining period of the Fourth Plan; that prices will remain stable; and that money supply will grow at the compound rate of 7 per cent per annum which is set down as the safe limit for money creation. The study does not make any provision for extra DA or pay increases for government employees beyond the present levels nor for a larger subsidy on foodgrains released through the public distribution system. It assumes that expenditure on refugee relief would be pegged at the original budget provision of Rs 60 crores plus the supplementary demand of Rs 200 crores later passed by Parliament. All these assumptions are obviously unrealistic and as a result the resources gap is shown to be far smaller than it actually is.

On the basis of the above assumptions, the study found a shortfall of Rs 1,550 crores, or about 10 per cent, at the price levels in the first two years of the Fourth Plan and at 1971-72 prices for the remaining two years compared to the resources taken credit for in the Fourth Plan as originally formulated on the basis of 1968-69 prices.



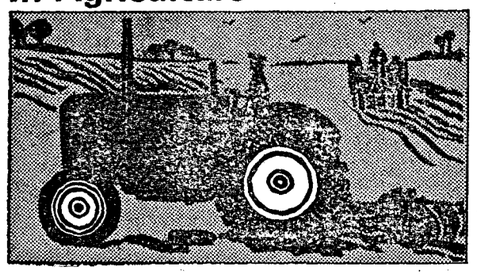
The shortfall is not so much on account of slackness in resource-raising in the first three years of the Plan. As in the previous plans, and in the Third Plan in particular, the additional resources raised have been quite impressive. The problem arises from the erosion of Plan resources and the diversion of a large proportion of resources to meeting current expenditures unconnected with the development effort postulated in the Plan. Measures already undertaken by the centre are estimated to raise additional resources of the order of Rs 1,986 crores as against the target of Rs 2,100 crores set for the entire Plan period. The states have taken steps to raise Rs 814 crores against the target of Rs 1,098 crores. And yet the estimates of the centre's balances from current revenues have shrunk from Rs 1,625 crores to Rs 706 crores. Taking into account the position of the states, there is estimated to be a net shortfall of Rs 861 crores in balances from current revenues.

Another major factor responsible for the erosion of Plan resources is the failure of public sector enterprises to yield the anticipated surpluses. As against a total of Rs 2,029 crores estimated to be available from public sector enterprises at the centre and the states, the amount likely to be available is now assessed at only Rs 1,192 crores. A shortfall of about Rs 70 crores in external assistance is also anticipated. Small improvements on account of market borrowings and small savings are indicated. Deficit financing during the Plan period is also taken at Rs 1,203 crores instead of Rs 850 crores assumed in the Plan. Even so, a considerable shortfall in resources clearly emerges.

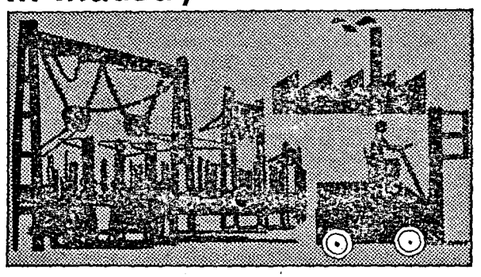


To meet the gap, the centre is expected to go in for additional resource-raising to the extent of nearly Rs 300 crores in the remaining Plan period. The states are similarly expected to raise additional resource of the order of Rs 550 crores. Some improvement in the surpluses from public sector undertakings is also assumed. Even after all these revisions, the rate of investment and the rate of savings in the economy —which were proposed in the Fourth Plan to be stepped up to 14.5 per cent and 13.2 per cent, respectively—will go up to only 14 per cent and 13 per cent,

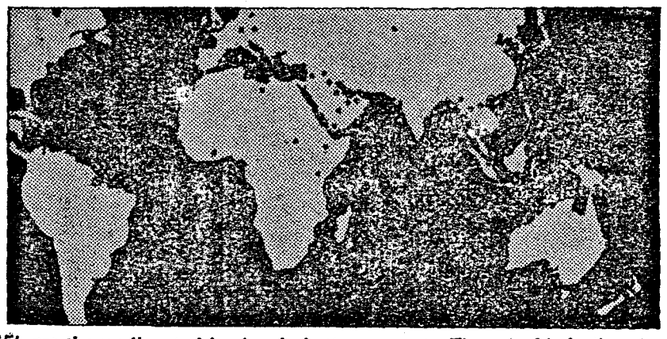
ABMEL's role in the nation's economy



In Defence



In Transport and Communications



In Agriculture

In Industry

And above all, in EXPORTS

ABMEL are the undisputed leaders in battery exports. The proof is in the consistent repeat orders from more and more countries all over the world. Twenty-four countries now insist on the unbeatable quality of batteries and components from ABMEL—and the list is multiplying.

ABMEL makers of Exide

ASSOCIATED BATTERY MAKERS (EASTERN) LIMITED

EBSC-115R

respectively. But what is more significant is that these projections are based on assumptions which are unlikely to materialise.

The whole exercise does, however, give an idea of the magnitude of the resource-raising effort called for. At the recent conference of state Chief Ministers, the idea of an integrated income-tax on all incomes, whatever the source, was reported to have been canvassed by the Union Finance Minister and the Planning Minister. What is more, the central government ministers have claimed that the idea met with much less resistance than they had apprehended.

The only specific outcome of the Chief Ministers' conference was the appointment of a committee to go into the question of an integrated income-tax and to propose an acceptable machinery for collection of the tax. The Chief Ministers, it would appear, regarded the committee as yet another device to put off decision and action, but the central government has claimed that the appointment of the committee signifies acceptance in principle by the states of an integrated income-tax and that what the committee would do was to work out the precise manner in which the tax is to be levied and collected. The state Chief Ministers evidently had the coming Assembly elections uppermost in their minds. Once it was decided that the committee would have six months to submit its report—as against the suggestion first made that it get its report ready in time for the meeting of the National Development Council next month—the state Chief Ministers were satisfied that the proposed tax would not become a problem for them in the management of the elections.

Opposition to the very principles of a tax on agricultural incomes came, it is understood, from only three states—Haryana, Madhya Pradesh and Maharashtra. The opposition from Kerala and Tamil Nadu was not to taxing agricultural incomes but to the idea of an integrated income-tax to be levied and administered by the Central Government. They were only jealous of the states' autonomy and authority. To this the Planning Minister is reported to have argued that the Centre had to undertake the job if tax evasion was to be avoided.

An important point made in favour of an agricultural income-tax as well as of enhancing irrigation rates was the analysis of the cost to farmers of using different forms of irrigation. In the case of small farmers using bullock power for irrigation, the cost of irrigation per acre worked out to about Rs 250 crores. It was less in the case of tube wells run by electricity and still lower for those benefiting from canal irrigation. Thus the better-off farmers who used canal and tube well irrigation spent less than those depending on bullock power. Yet there is a hue and cry whenever marginal increases in irrigation rates are proposed!

Intellectuals Who Deceive

(From a Special Correspondent)

RECENTLY the Indian School of Social Sciences held a conference of Marxist scholars at Madras. As reported by Radhika Ramasubban ("Character of State Power and Strategy for Revolution", October 16, pp 2188-9) there was a preponderance of scholars sympathetic to the CPI (M). Going through the papers one is sorely tempted to attempt a thorough-going review of the positions held (which are, of course, remarkably consistent). That task, however, will have to wait a while. It seems more urgent to expose the pretensions of at least some of our 'Marxist' leaders and scholars—for which we shall consider some points raised by E M S Namboodiripad and Prakash Karat.

To quote from the report by Radhika Ramasubban: "Making a distinction between progressive and proletarian literature, he [E M S] warned that in this phase of the struggle the working-class movement cannot afford to alienate those progressives who 'do not have the working-class view but are ready to fight the domination of the foreign, feudal, monopoly capital to a limited extent'." "This phase of the struggle" is the democratic revolution; the aim of which is to crush by force the anti-democratic forces—foreign capital, monopoly capital and landlords (accepting for the moment that analysis of Indian society). The working-class is not alone in this struggle. Its allies, notably the peasantry and the petty-bourgeoisie, will also conduct revolutionary struggles against the established order. The literature of these classes while not embodying the working-class point of view would nevertheless be revolutionary. On the other hand, besides the main forces in society there are also the middle-forces—whose ideological representatives generally would be the liberal bourgeoisie. The liberal bourgeoisie would be willing to "fight against the domination of the foreign, feudal, monopoly capital to a *limited* extent" (emphasis added). Since limited struggles (i e, struggles whose objective is not to smash the existing order) have a role to play, we cannot afford to ignore all those persons who will come in for these limited struggles. At the same time we must realise that the class nature of these persons (or ideologies) is such that they will not carry the struggle through, i e, they will not be consistent. What then can it mean to say that we must not alienate those progressives who are willing to "conduct *limited* struggles"? So long as the struggle is limited they will not be alienated; but once it goes beyond to question or shake the roots of the existing system they will be alienated. Must the working class then limit its struggles?

To put E M S's position plainly: The working-class movement must not alienate the progressive writers who only conduct limited struggles against reactionaries. Revolutionary struggles will alienate them. So, the working-class (and its allies in the democratic revolution) must not conduct revolutionary struggles.

There are undoubtedly many writers, painters, etc, who are willing to conduct limited struggles against religious obscurantism, feudal ideas of privilege, imperialism in education, etc. The working-class must *utilise* the efforts of all such persons. But "... while in a certain measure affecting an alliance with the progressive section of the bourgeoisie, Communists and all consistent materialists should *unflinchingly expose that section when it is guilty of reaction*". (Lenin: "On the Significance of Militant Materialism"; emphasis added.)

The difference between these two approaches is as follows: E M S would like to subordinate the working-class movement to the interests of the liberals. Some other persons would like to subordinate the "liberal" and "progressive" writers to the interests of the working-class movement.

The armed forces are the principal component of state power and a study of the specific characteristics of this in-

stitution of coercive power can help us to understand the connections between the armed forces and the state. This, Prakash Karat's paper does to some extent. He also sets himself the task of arriving at "conclusions regarding the revolutionary party's approach to the question of the armed forces in India". Before commenting on them we shall reproduce those conclusions, leaving out his third conclusion which is entirely unintelligible.

Conclusion 1: "The mercenary/colonial origins of the army have yet to be erased. To do this some form of universal armed training is essential. Such training should be imparted to all able-bodied men and women of India. The people should be equipped for defence and only this will reduce the evils and importance of a professional army. More reliance should be placed on people's defence."

Conclusion 2: "The Arms Act 1959 and the Arms Rules 1962 are based on the colonial Indian Arms Act 1878, which restricts small-arms to the armed forces and a privileged few by licence. This should be scrapped. Every citizen should be given the right to bear small-arms. This is not necessarily a revolutionary demand, but very much a bourgeois-democratic step."

Not Clear Enough

Karat's own analysis of the bourgeois-landlord state should lead him to expect a professional army or a professional/mercenary army. His paper, in fact, shows very well that there has been *no significant change* in the structure of the armed forces from its colonial days. And yet he says that the armed forces' mercenary/colonial origins "have yet to be erased". This is not clear enough. Does he mean that the basic tasks have not yet been fulfilled; or, that it is a matter of completing a task which has in the main been accomplished? The attitude of the revolutionary party will differ substantially as between these two formulations.

Transforming the defence forces into a people's army is something that is only possible when the state power has been captured by the democratic forces. It is only then that there could possibly be military training for all able-bodied persons. A party that calls itself revolutionary and a person that seeks to arrive at "conclusions regarding the revolutionary party's approach to the question of the armed forces" must necessarily analyse the process whereby one form of army is substituted for another. They would then realise that this is part of the process whereby one form of society is substituted for another, *viz,* class struggle which overthrows one system and establishes another. They would then realise that the revolutionary party's approach to the question of the armed forces is not one of raising meaningless slogans like "[Military] training should be imparted to all the able-bodied men and women of India". Perhaps Karat would like to go to Birbhum (or, Calcutta where policemen now chain their rifles to themselves) and raise the slogan: "Every citizen should be given the right to bear arms". And, of course, he could always justify this to Indira Gandhi saying: "After all, this is not a revolutionary demand, only a bourgeois-democratic step."

Since it is too much to expect of our 'Marxist' scholars to ask the right questions, we would like to suggest that the following questions need to be asked: how are the people's armed forces to be built up and how are the ruling classes' armed forces to be countered? What will be the internal organisation of the people's army? What will be the relation of the army to the party and of the army to the people? What is the relation of the ruling classes' armed forces to the people? What will be the attitude to the enemy troops? etc.

Cultural Attitude

What is this 'Marxist' party's attitude on the cultural front? E M S says, "The central task is to carry on a simultaneous, determined struggle against all the legacies of the caste, communal and tribal institutions which have existed for centuries and which have left their imprint on the cultural make-up of our people, even while directing well-aimed blows on the various manifestations of the decaying imperialist and Indian monopoly culture." This is quite an impressive list. But in the next paragraph we read: "It [i e, this task] should place before itself the objective of wresting from the ruling classes all the media of mass communication, such as the newspapers, the radio, the television and so on." Strange isn't it? The objective of all that struggle is not to increase the political consciousness and raise the cultural level of the people but to wrest from the ruling classes all the media of mass communication!

We wonder how this objective will be achieved. The newspapers are owned by the ruling classes and their agents, and radio and television are controlled by the same ruling classes through the ruling regime and the bureaucracy. Will the 'revolutionary' party wrest the newspapers, etc, by buying out their owners? And will they raise the money for this venture by levying a special tax on the people? Or, will they use force — occupy with militant cadres all the newspaper buildings and radio and television stations? And, when the ruling classes send their police and army, does it matter if a few cadres (not intellectuals or leaders) get clubbed or shot? The next day there will be mass meetings in Kerala and West Bengal, where E M S and Jyoti Basu will denounce the "anti-people policies" of the government. And *People's Democracy* will conclude (as it does ever so often) "Yet another step towards the police state!"

And what about the *"objective" of the "central task" (!)* of wresting all the mass media? Class forces, unfortunately, are very stubborn, and the ruling classes (backed by their army and police) continue to maintain control.
